In 1963 a large, well-funded U.S. expedition under Norman Dyhrenfurth set out to reascend the southeast ridge route and, if possible, link with a second expedition attempting the unclimbed west ridge. Both succeeded. Tom Hornbein and Willi Unsoeld scaled the west ridge with a roped rock climb and met Barry Bishop and Lute Jerstad, who had climbed to the top via the south col route that day. On the way down all four had to endure a forced bivouac in the dark (a first for men on Mount Everest). However, the mountain had been traversed from one side to another for the first time. Alas, the Khumbu ice fall, always dangerous, claimed its first victim: Twenty-seven-year-old Jake Breitenbach was killed when an ice serac (a pinnacle, sharp ridge, or block of ice among the crevasses of a glacier) collapsed on him.

From then on ascents were made with increasing frequency. In 1978 Reinhold Messner and Peter Habeler astounded the world medical community by scaling the mountain without artificial oxygen. In 1980 Messner reached the summit via the Hornbein couloir (a steep mountainside gorge) alone—and again without the use of oxygen.

In 1981 a U.S. expedition under Lou Reichardt reconnoitered the east Kangshung Glacier face. In 1983 and 1988 two U.S. expeditions returned to climb two variant routes successfully (aided, to be sure, by the British Stephen Venables). Other first ascents included the difficult southwest face and the north face, Japanese, French, and British expeditions playing leading roles.

By 1989 244 climbers had made 274 ascents (some climbers, especially Sherpas, climbed more than once).

Mountain Medicine

A well-rounded climber should have a good working knowledge of advanced first aid, but mountaineering has one problem peculiar to itself, that of hypoxia: problems stemming from lack of oxygen. At 14,000 feet, air pressure is reduced 40 percent. Here, science can be used with precision, and some of the best studies of human adaptation to altitude have been done in the United States and Canada (including those done by Dr. Charles Houston, the same man who led the attempts on K2 in the 1950s).

Medically, the conditions most peculiar to mountaineering are HAPE (high altitude pulmonary edema) and HACE (high altitude cerebral edema). Often misdiagnosed and treated, unsuccessfully, as pneumonia, these are now seen as distinct syndromes with treatment regimens unique to themselves (the

best treatment of all, where feasible, is to descend as rapidly as possible to a much lower altitude).

A very few mountaineers, Reinhold Messner being the most noted, are able to climb to extraordinary heights without any artificial oxygen at all. On 8 May 1978, Messner and his partner Peter Habeler climbed Mount Everest (29,028 feet) completely on their own and without artificial oxygen. Messner went on to climb all fourteen of the peaks over 8,000 meters (26,240 feet), often alone and usually without artificial oxygen. He has fervently expressed his opinion that the use of any kind of artificial aids (bolts, pitons) as well as artificial oxygen takes the adventure out of climbing. Supremely conditioned, a super-climber in every respect, he is today in a league of his own!

By 1996 four thousand people had attempted Mount Everest, 660 successfully (16.5 percent). One hundred forty-two (3.6 percent) had died. From 1997 through 2002 807 more people scaled the mountain. Forty-two climbers were killed—one for every nineteen who reached the top.

The oldest person to reach the summit is Ramon Blanco (sixty), and the youngest is Bertrand Roche (seventeen). In 2002 a blind man climbed Mount Everest.

A. F. Mummery, the best British climber of the nineteenth century (and the first to die attempting to climb a Himalayan peak—Nanga Parbat in 1895), loved to quote Sir Leslie Stephen, a cofounder of the Alpine Club (and father of the English author Virginia Woolf) as follows: “Every mountain goes through three stages: at first it is deemed unclimbable. Next, it is said to be very difficult. Finally, it becomes an easy day for a lady!”

The first woman to scale Mount Everest was Junko Tabei of Japan on 16 May 1975. Eleven days later a woman named “Phantog” of China was successful from the north col-north ridge side. On 29 September 1988, Stacy Allison became the first U.S. woman to reach the top. On 10 May 1993, Rebecca Stephens became the

first British woman. More than thirty women have climbed Mount Everest.

So far, in eighty-one years, no one has seen, photographed, trapped, or hugged a yeti.

In 1991 the fee for an expedition from the Nepal side was set at \$2,300. By 2001 it was \$70,000 plus an extra \$10,000 for every member after the first seven. Amounts charged each person to join a commercial expedition now average \$64,000. However, no shortage of customers eager to pay for the adventure of a lifetime exists. In 1996 three commercial groups became so intermingled and disorganized that eight persons died, including Yasuko Namba (at age forty-seven the oldest woman to reach the summit) and two of the most famous guides: Scott Fischer of the United States and Rob Hall of New Zealand.

Most ascents, and by far the majority of commercial ascents, have employed the route to the south col and thence up the southeast ridge—the way pioneered by Hillary and Tenzing Norgay in 1953. Indeed, some of the Sherpas now call this “the yak Route.”

However, Mount Everest is still Mount Everest—the highest mountain on Earth, with the thinnest air, some

of the most prodigious winds, snowfields known to avalanche at the least provocation, and ice falls replete with hidden dangers (especially the Khumbu ice fall, a different challenge every year). Its monsoon summers virtually preclude climbing. Its winters feature polar cold. Each of the two “windows” supposedly opportune for climbing (the premonsoon spring and the post-monsoon early autumn) have frequently been known to unleash storms of unpredictable severity.

Mount Everest is a mountain that can, when it wishes, protect itself very well.

Mountain Biking

Mountain biking is a form of recreational and competitive bicycling in which cyclists navigate off-road terrain. It started in the late 1970s in Marin County, California, when creative cyclists modified their bikes using parts from motorcycles, bicycle motorcross (BMX), and cruiser bikes. Soon after the early mountain bikes were created, affordable “production” bikes were developed, and mountain biking became extremely popular. Mountain biking differs from road biking in that mountain bikes are built with heavy-duty frames, fat tires, shocks, and disc brakes. These features, among others, allow a mountain bike to go where a road bike cannot, and the upright riding position is more conducive to scenery viewing. For mountain-biking enthusiasts, the attraction lies in pedaling up a steep mountain grade and later flying down that same mountain at extraordinary speeds.

The history of mountain biking is often debated, but Joe Breeze, an engineer, is generally credited with creating the first “mass produced” off-road bike in 1977. The first bike sold for \$750. In 1979 Gary Fisher, Charlie Kelley, and Tom Ritchey formed “Mountainbikes,” a group that sold custom bikes for \$1,500. In 1982, at the Long Beach Bike Show, Specialized, one of the premier bicycle manufacturers, teamed up with a Japanese builder to make the Specialized Stumpjumper. Their success was phenomenal. They sold 500 bikes for about \$750 each.

In the United States, mountain biking continues to grow in popularity as indicated by bike sales and participation. Factors such as advances in equipment and technology, media coverage of events, increase in type

and number of race events and governing bodies, and the popularity of the sport's best riders have contributed to this trend. Mountain biking is so appealing today that bikes with "fat" tires account for the majority of total bicycle sales in the United States, and as sales go up, so do the number of riders. The total number of participants in the sport has continued to grow over the past decade, and according to the National Sporting Goods Association's annual survey (www.nsga.org), this trend is in contrast to decreasing participation in the majority of the most popular sports in the United States. Along with the increase in popularity, the sport faces some critical issues, such as increasing damage to trails and the surrounding environment, a subsequent decrease in access to trails, and a high incidence of injuries.

Bicycle Technology

New technology and advances in equipment have helped popularize mountain biking by making it safer and more comfortable to navigate off-road trails. One key aspect of technology that has revolutionized the sport is the development of suspension or shock absorption components. A suspension bike, with shock absorbers in front (hard tail), or in front and rear (full suspension), was developed with the idea that it would enhance cycling velocity and braking capacity as the result of better contact between the tire and the ground. Proponents also claim that they expend less energy and experience less physical stress with these bikes because they are not subjected to the full impact of bumps and vibrations. Innovations in shocks include "lockout" and "self-adjusting" technology. The lockout option enables a rider to "lock" the shock to a position so that it doesn't bob during uphill climbing efforts when pressure is applied to the handlebars. The self-adjusting technology differentiates between a hard uphill effort and a series of downhill bumps and adjusts itself accordingly. Another innovation is the use of twenty-nine-inch wheels—instead of the standard twenty-six-inch wheels. The use of larger tires theoretically enhances climbing ability and improves a bike's

ability to navigate bumpy terrain. Lastly, the addition of disc brakes to a mountain bike enables riders to brake more quickly and effectively in *all* conditions—including wet terrain.

Media Coverage

Media coverage of mountain biking exploded in the 1990s. Outdoor Life Network (OLN) provided extensive coverage of professional mountain-biking events for both men and women. Unfortunately, in 2003 major sponsors pulled their funds from the National Off-Road Cycling Association (NORBA) events, perhaps because of the sluggish economy, forcing a major "reorganization" of NORBA events. Today, TV coverage focuses mostly on "extreme" types of mountain biking, such as downhill and freeriding (e.g., X Games and Red Bull Rampage), but coverage of the World Cup and NORBA events is available via Webcast for a small fee (www.1010tv.com). Despite the waning TV coverage of mountain biking in the United States, interest in mountain biking is still strong worldwide. Almost 25,000 spectators watched the 2003 World Cup opener in St. Wendel, Germany.

Arguably, the most dramatic increase in media coverage of mountain biking has occurred through the development of several outstanding websites. These websites include such information as gear reviews, international trail guides, races and events, racing tips, classified advertisements, and message boards (see www.dirtworld.com, www.mtbr.com, www.mtbiking.com, www.mbacktion.com, www.singletrackworld.com, and www.bikemag.com). One website, available for a small yearly fee, provides topographic maps and trail information for a variety of areas (www.trails.com).

Biking Events

Concurrent with the increase in media coverage is an increase in event offerings. For the recreational rider, a variety of "fat-tire festivals" exists. These festivals give participants an opportunity to learn basic skills via clinics and "sample" some of the area trails, while being led

by a knowledgeable (local) guide. In addition, cycle manufacturing companies set up “demo” tents so individuals can try some of their latest bikes. Some of the largest festivals in the United States include those in Moab, Utah; Slatyfork, West Virginia; and Fruita, Colorado.

For young riders the Canadian Cycling Association has developed “Sprockids.” This is a program designed to introduce children to cycling by teaching them skills specific to cycling and life. These courses include instruction in riding, safety, and etiquette, as well as mechanical issues related to cycling. Additionally, interest in mountain bike racing is growing at the high school level. Northern California has a four-year-old high school mountain bike league. There are already over thirty schools that participate, and sponsors support a six-race series that begins in February and ends with the state championship in May.

Competitive mountain biking offers various options. Types of races include cross-country, short track, point-to-point, hill climb, downhill, dual slalom, mountain cross, observed trials, stage, marathon, and ultraendurance. The cross-country race is a mass start event of 3.2 kilometers or longer that takes place on dirt roads and trails. NORBA—the national governing body for mountain bike competitions in the United States—recently added the short-track race, which is perceived to be more spectator friendly than other races because the competitors start as a group and race multiple 1 kilometer laps for about thirty minutes. The point-to-point race is a mass-start event that begins at one point and ends at another. Some races require riders to ride loops; the difficulty in the point-to-point race, however, is that riders do not become familiar with the course, as they would if they were riding a loop. The hill climb is a timed event designed to see who can reach the top of a summit in the least amount of time. The downhill event also is a timed event, running in the opposite direction. The winner covers the course in the fastest possible time at speeds up to 60 mph. Clearly, downhill events are the most dangerous mountain bike races. The dual slalom requires riders to compete next to each other (side by

side) in a format similar to dual slalom ski racing (that is, with penalties for false starts, crashing, or missing a gate). Each rider must go through the gate from his or her course, and riders switch courses for the second run. The best combined time from the two runs wins the event. Mountain cross is the newest form of mountain bike competition. Similar to the dual slalom, 4-cross (as it is sometimes called) is contested by four riders, with the first two riders to cross the finish line advancing to the next round of competition. In an observed trials event, a rider must negotiate an obstacle course typically consisting of rocks, water, and other natural hurdles without using a hand or putting a foot down for balance. A stage race typically combines several types of races, such as cross-country, uphill, and downhill. Winners of each event in a stage race are placed based on their combined time. Those with the fastest combined times are designated overall winners. Elite competitors typically specialize in either downhill (including dual slalom) or endurance-type (cross-country and short-track) events. Ultraendurance events, which are typically longer than 121 kilometers, are often held in scenic locations such as Durango, Colorado, or the Wasatch Front in Northern Utah. In 2003 the World Mountain Biking Marathon Championship consisted of a 78-kilometer ride through the Swiss Alps that included 9,300 feet of climbing. The winner of the women’s event, Maja Wloszcowska from Poland, was riding in her first marathon mountain-biking event. The NORBA National Championship series has included marathon events at four of its eight venues for the 2004 season. Another emerging phenomenon is the twenty-four-hour race. This race, not for the faint of heart, can be done as a relay team or solo. Riders complete as many laps as they can in a twenty-four-hour period.

Other types of events include stunt competitions, in which competitors jump over logs, curbs, or even park benches, and mountain bike polo, in which riders mount bicycles instead of horses—matches consist of two ten-minute halves, and each team has four players. At the Winter X Games (a principal competitive forum for

extreme sports), riders stud their tires with quarter-inch wood screws and edge them into the slopes like a set of skis for competition in snow mountain bike racing.

Arguably, the ultimate mountain-biking competition is the Olympic Games. In 1996 cross-country mountain biking was added to the Atlanta, Georgia, games as an Olympic sport. The women's cross-country race featured thirty entrants from twelve countries who raced about 24 miles around a loop course, while being watched by 35,000 to 40,000 spectators. Paola Pezzo from Italy placed first, followed by Alison Sydor from Canada and Susan DeMattei of the United States. Pezzo won the gold medal again in the 2000 games in Sydney, with Barbara Blatter of Switzerland in second and Margarita Fullana of Spain in third.

Governing Bodies

As the number of competitive events has grown, the need for official governing bodies has increased. The Union Cycliste Internationale (UCI) is the international governing body for cycling, and it oversees seven different cycling disciplines, including mountain biking (www.uci.ch). The UCI recognized the first world championships in 1990, and the next year, it began sponsorship of a World Cup series for the sport. In addition to promoting cycling worldwide, the UCI organizes cycling events at the Olympics on behalf of the International Olympic Committee. Competitions sanctioned by this organization offer valuable UCI points to individual riders, which are then tallied to determine the number of starting

slots a nation is awarded for world championship and Olympic contests. Countries who want their cyclists to compete at the international level have to create an organization that reports to the UCI to ensure that all courses and athletes meet UCI standards.

In 1983 NORBA formalized competitive mountain bike racing in the United States. NORBA, whose membership is predominantly male (89 percent), was designed to guide, service, and promote mountain biking as a competitive sport and outdoor activity (www.usacycling.org/mtb/). U.S.A. Cycling, the governing body for cycling competition in the United States, bought NORBA in 1989 with the aim of unifying the sport. After 1989 NORBA grew by 100 percent and peaked in 1996 with 34,000 members. In 2004 NORBA membership has leveled at about 11,500. The organization issues more than 1,000 permits per year for off-road events in the United States. The rise in the cost of NORBA racing licenses encouraged the growth of smaller, regional mountain bike racing organizations in the past decade. These smaller organizations enable amateur racers to buy less expensive

annual licenses to compete in local races that are not sanctioned by NORBA.

The UCI and NORBA each offer a championship event, in addition to an overall series crown for the World Cup and NCS (National Championship Series), respectively. Currently, the UCI awards championships in cross-country, downhill, 4-cross (or, mountain cross), and marathon events. The classic disciplines recognized by NORBA championships include cross-country, downhill, mountain cross, and short track.

In addition to UCI and NORBA, other governing bodies have been founded, some to promote women's participation in the sport and some to promote the sport internationally. For example, the Women's Mountain Biking and Tea Society (WOMBATS) were founded by Jacquie Phelan of Marin County, California. The WOMBATS provide a forum for women to find riding partners, stay current with riding trends, and enhance awareness of bicycles as modes of transportation. Women who join the WOMBATS also receive a newsletter and may take part in riding clinics, organized trips, potluck dinners, and general female camaraderie. There are three international chapters (British Columbia, Sweden, and Norway), four regional chapters in the United States (California, Colorado, New Mexico, and Massachusetts), and twenty-one local chapters.

The International Mountain Biking Association (IMBA) was founded in 1988 (www.imba.com). IMBA works to create, enhance, and preserve trail opportunities for mountain bikers worldwide. This organization has a membership network that includes 32,000 individuals and over 450 bicycle clubs, plus corporate partners and bicycle retail members. In addition to building and maintaining trails, IMBA is an advocate for mountain biking through educational efforts and lobbying and partnering with governmental agencies (international, national, regional, state, and local) regarding trail access and management issues.

The IMBA suggests six rules that safe and courteous mountain bikers should observe. First, ride on open trails only. This means that riders should respect trail and road closures and avoid riding on private property.

Second, leave no trace. Riders should not pedal in conditions that will cause them to leave evidence of passing, nor should they leave trash on the trails. Third, always stay in control—which means maintaining a reasonable speed. Fourth, always yield on the trail. Riders should let others know (via bell, horn, or voice) that they are approaching, and they should assume that others may be around blind corners. Fifth, never spook animals. Sixth, plan ahead. No rider should try a trail without knowing his or her equipment, how it matches riding abilities and the terrain and weather in which the rider will be riding. Further, helmets are mandatory, and supplies such as sunscreen and extra food are highly recommended.

Women Mountain Bikers

As the sport has grown, several unique female personalities have emerged. Jacquie Phelan is considered one of the premier mountain bikers. She won every race she entered between 1980 and 1986, including NORBA world championships in 1984 and 1985. She was known for her riding skills as well as her “off-mountain” antics. She entered races using “Alice B. Toeclips” as her pseudonym, she posed for a Rockshox advertisement wearing only mud and a feather, she advocated for equal pay for women racers, and she founded the WOMBATS.

Other cross-country riders of note include Cindy Whitehead, who won the 1987 women's division of the Raleigh Technium World Mountain Bike Championships (downhill), and the 1986 NORBA National Championship; Ruthie Matthes, the 1992 World Cup champion; and Silva Furst, the 1992 cross-country world champion. Juli Furtado won seventeen major events in a row in 1993—one of the longest win streaks in off-road history. Unfortunately, after setting that record, she experienced two seasons of disappointing results. Shortly thereafter, she was diagnosed with lupus and retired. Paola Pezzo won the gold medal for Italy in the inaugural appearance of mountain biking as a cycling event in the 1996 Summer Olympics. She followed that with another gold medal at the 2000 Summer Olympics in Sydney, Australia, and has recently

come out of retirement to compete again. Today's top cross-country riders to watch include the "Alisons": Alison Sydor, a Canadian who has won three world championships and an Olympic silver medal, and Alison Dunlap, from the United States, who was a gold medalist at the Pan Am Games and U.S. National Champion in 1999. In 2002 she won the overall World Cup championship. Other cross-country stars to watch include Gunn-Rita Dahle from Norway and Sabine Spitz of Germany.

Missy "The Missile" Giove, is a daring downhill diva who revolutionized the sport with her two-toned shaved haircut and piranha around her neck. Although she has broken thirty-three bones throughout her career, she won the 1994 downhill world championship. Despite being challenged by recovery from her injuries, Missy has had many podiums in NCS events since 1994. In 2002 she won the Durango, Colorado, NCS race and placed 3rd in the World Championships in Austria. In August of 2003 Missy Giove announced her retirement, but has competed in a few NORBA races since then, ending up 26th in the US for the 2004 season. Another "storied" competitor is Marla Streb. She recently wrote an autobiography, *The Life Story of a Downhill Gravity Goddess*, and she starred in an IMAX film called *Top Speed*. In today's races Anne-Caroline Chausson is the competitor to beat. She started competing at age ten on the French BMX team. In 1997 she won her first world cup title and world championship, and she has won every downhill world championship since.

Problems of Mountain Biking

In addition to the positive aspects of the sport, it is worthwhile to mention its potential negative impact. Naturalists, hikers, and horseback riders who share trails with bikers are increasingly critical of mountain biking and in some cases seek to have bikers banned from trails because the sport, they say, causes erosion and other damage to ecosystems and interferes with the aesthetic beauty of wilderness areas. Some bikers, for example, fail to ride along designated trails. In the desert this means soil erosion, which disrupts plant life

and diminishes the already sparse food supply available to desert wildlife. Other bikers lock their rear brakes on descents, creating gullies that can lead to increased erosion. Most conflict between mountain bikers and hikers occurs close to urban areas. Hikers tend to dislike bikers due to trail displacement, right of way and speed issues, and altered-trail experiences.

Trail-user conflict can also be linked to the perception of mountain bikers as daredevils or as being unconventional. Marketing campaigns often construct the sport's culture as centered around loud music, a brash attitude, extreme terrain, big air, and big crashes, thus creating an image of mountain bikers as out of control—and proud of it. Despite the stereotypical portrayal of riders, and the fact that mountain biking clearly does impact the environment, research indicates that this sport is no more damaging than other forms of outdoor recreation, such as hiking, horseback riding, or trail running.

As mountain biking continues to draw interest as both a competitive pursuit and a recreational activity, the issue of access is central to the sport. Creating more access to spaces for riding, and perhaps more critically, protecting and preserving existing trails, remain important considerations for the elite and recreational mountain bikers. Trail access is an issue that mountain bikers will ignore at their own peril. One way that mountain bikers can combat the somewhat erroneous perceptions of them is to participate in trail building and maintenance. On the first Saturday of June each year, mountain bikers across the United States join with other trail users to celebrate National Trails Day, an event organized by the American Hiking Society. Mountain bikers of both sexes face the challenge of convincing critics that bikers can be responsible trail users.

With increased participation in mountain biking and increased access to trails, the number of mountain-biking-related injuries has increased. Causes of injury are typically related to the rider (e.g., muscle fatigue, inattentiveness, inappropriate braking), terrain (e.g., loose gravel, mud, loss of traction, collision with tree or

rocks), and/or bicycle (e.g., flat tire, brake failure, pedals, forks). Interestingly, compared with male competitors, female competitors are twice as likely to injure themselves during mountain biking and four times as likely to sustain a fracture. There is speculation that the reasons for these differences may include fewer years of racing experience and less upper body strength. According to a recent review on mountain-biking injuries, the most frequent mechanism of injury is a forward fall over the handlebars while going downhill, affectionately known as an “endo.” This type of action typically results in injuries to the head, torso, and upper extremities. Ways to prevent injuries include perfecting technical skills and increasing fitness level, becoming aware of one’s own riding abilities and limitations, conducting thorough preride maintenance checks, and using helmets.

During 2003, 31.6 percent of mountain bikers were female, as indicated by the annual survey of the National Sporting Goods Association. Mountain biking attracts younger (25–34), more educated, and more affluent men and women. Researchers conducting a qualitative study with mountain bikers from Australia found that most riders ride for fun, health, challenge, and socializing. They also ride to experience nature, relax, and use an environmentally friendly and inexpensive mode of transportation. More experienced riders want technical challenges, fast downhills, and steep slopes and jumps. Recreational riders, who ride two to four times per week for 10–16.5 kilometers per ride, seek rides with water access and route markers. Interestingly, many females also report using their mountain bikes for on-road, as opposed to off-road, riding. In 2002, for instance, more than twice as many females used their bikes on roads, rather than on trails. The upright seating position and stability of the fat tires may appeal to the more recreation-oriented rider.

The Future

Mountain biking is a relatively new sport that engages and challenges risk-takers. This sport enables adventurers to explore more wilderness and backcountry under human power than ever before by foot. The bike indus-

try has grown quickly in the past three decades and has generated a wide range of equipment to meet the needs and comfort of many varied off-road applications. The recent inclusion of mountain biking in the Olympic Games is strong evidence that this sport is very popular.

Mountaineering

Mountaineering, as it has evolved since the late eighteenth century, consists of two basic elements: (1) a search for adventure—savory surprise—by scaling on foot (or skis) a mountain, cliff, glacier, or snowfield by a route that offers (2) difficulty and, potentially, danger.

The adventure may range from nothing more profound than satisfying idle curiosity (What’s it like up there? What can be seen? Can it even be climbed at

all?) to seeking what the U.S. writer Henry Thoreau would call “moments of transcendental awe” (a streak of mysticism is not uncommon among many climbers) to searching for what many younger climbers, venturing out to the extreme edge of what is technically feasible, refer to as an “adrenaline rush.”

However, the primary goal of mountaineering is pleasure. No matter how arduous the ascent or the descent, the goal is finding pleasure, not finding gold, achieving fame, discovering a lofty perch for religious ceremonies, earning the right to have a mate, and so forth.

Mountaineering qualifies as a sport in that it does indeed have certain rules, sometimes rather arbitrary and sometimes based on common sense. For example, no honor is lost in turning back when risks threaten to become excessive. One must not “damage” a mountain by chopping holds in the rock. Nor should dynamite be used to blast out campsites on steeply tilting slopes, as was done on one Himalayan attempt in an effort to honor a South American dictator.

Like most sports, mountaineering has developed specialized gear, language, and athletic moves that are unique.

Gravity (especially the effect known as “falling”), wind, wet, and the onset of darkness are the principal sources of accidents in the mountains. Mountain craft consists largely of mastering the specialized skills and technology devised during the past two centuries to avoid or minimize injury or even death. These are “objective” dangers. “Subjective” dangers include inexperience, incompetence, exhaustion, and what the Greeks would call *hubris* (self-blinding pride).

With the possible exception of bull fighting, no other sport requires a person to pay such unremitting, moment-after-moment attention to avoid becoming a casualty. So why engage in such an absurd activity?

The English climber George Mallory’s answer—“Because the mountain [in his case, Everest] is there!”—has been a standard reply since the 1920s. Most climbers know that although everyone has a natural fear of heights from childhood on, with training and practice and a little first-hand experience with the ropes and other climbing paraphernalia, climbing becomes—mysteriously—a

great joy for both men and women. An average climber, then, reasonably fit and practiced, differs from other lovers of the outdoors by deliberately going out of his or her way to avoid the easy path. Scalable cliffs or sheets of tilted ice, never or seldom previously trod, are what are wanted. Even if a route has been previously climbed (common nowadays), the mountaineer seeks the adventure of doing it again with its attendant dangers, possible adrenaline rushes, and high mountain views unattainable by normal mortals.

Early History

Mountains abound all over the Earth, and people live in them and somehow learn to cope. However, not a single mountain culture—even in the Alps, the Andes, the Rockies, or the Himalayas—is known to have developed a sport remotely akin to climbing the local peaks just for fun. To be sure, mountains were sometimes climbed for religious purposes. Bear Butte, now a state park in South Dakota, is still used by Lakota and Cheyenne Native Americans as a mountain on which to conduct vision quests (solitary vigils by Native Americans seeking through a vision spiritual power and wisdom, usually revealed by a guardian spirit—a bird or animal).

The Navajo considered Sierra Blanca, a 4,372-meter peak in the Colorado Rockies, to be sacred. When Franklin Rhoda, a government surveyor, scaled the peak in 1875 in the mistaken belief that it was the highest peak in North America, he discovered ceremonial altars on the summit built centuries before for Native American ceremonies. He himself did not climb the peak for fun or the joy of making a hypothetical first ascent. He was a member of the Hayden Survey, and neither he nor his fellow surveyors nor the Native Americans before them would qualify as “mountaineers” as we use the term. Likewise, neither would the Spanish conquistador Hernan Cortes’s soldiers who ascended Popocatepetl (5,440 meters) in Mexico in 1521. They were practical men, seeking sulfur to assist in making gunpowder, not the sheer pleasure of climbing high.

Mount Kailus (6,714 meters) is a mountain in Tibet sacred to millions of Hindus and Buddhists. Thousands

scenery. In 1280 Peter III of Aragon reported encountering a dragon on a summit in the high Pyrenees. As late as 1723 Johann Scheuchzer, professor of physics at Zurich University in Switzerland, announced that he had solved the question as to whether there were really dragons in the Alps. Oh, yes, he had sworn testimony from reliable witnesses. (For that matter, no end of locals in the Himalayas today are ready to swear that they have seen

make the pilgrimage every year, ideally encircling the mountain by stretching out their prone bodies in an endless path around its base. However, if Euro-American climbers come by and suggest climbing Kailas, the locals are horrified. To do so would be akin to rock climbing up a cathedral.

No Greek or Roman in classical times would have dreamed of trying to climb Mount Olympus, home of the gods. Likewise, although Japanese pilgrims frequently hiked up Mount Fujiyama (3,777 meters) after its first ascent in 663 CE, they warned that to climb it once undoubtedly earned one valuable karma, but to climb it a second time would make one a fool.

The Roman historian Livy's description of the Carthaginian general Hannibal somehow marching the bulk of his elephants across the Alps to invade Rome is one of the great passages in ancient literature involving mountains. However, Hannibal wanted the lowest, shortest route through the Alps. He was in no way a "mountaineer" as we define the term. The Alps to him were an obstacle, a nuisance (as they were to Napoleon two thousand years later).

Throughout the Middle Ages mountains in general and the Alps and Pyrenees in particular were awesome places of doom. Travelers forced by cruel necessity to cross an Alpine pass were sometimes carried blindfolded lest they be overwhelmed by the awfulness of the

yetis, the so-called abominable snowmen. In addition, the presence of Sasquatch, or Bigfoot, lurking in the woods of the U.S. Pacific Northwest has been attested to by many upright citizens, although purported photographs are far from convincing.)

In 1335 the Italian poet Petrarch, famous for his sonnets, actually climbed a mountain—Mount Ventoux in Provence, France (1,908 meters)—for pleasure. True, in recounting this feat to his confessor, he worried lest he had had too much pleasure doing it—perhaps he had endangered his immortal soul by spending a whole day in such a flippant, and at times scary, activity? A far more "modern" approach to mountaineering would be that of Conrad Gesner (b. 1516), a professor of philosophy at Zurich University, who announced that everything delighted him about Alpine climbs—the joys of remembered toil and danger, the summit panorama, and the echoes of the celestial spheres. In 1541 he announced that from then on he would climb one mountain a year. On the summit of the Stockhorn (2,189 meters) he and a friend discovered an ancient Greek inscription cut into stone that succeeding climbers have treasured ever since: "The Love of Mountains Is Best."

Technical Climbing

True mountaineering, as we know it, began as a form of scientific exploration during the late eighteenth century.

Mountaineering

How Tough Is the Climb?

There are numerous systems around the world that rate the difficulty of a climb, and every area seems to have its own method. Obviously, each system is entirely subjective—there can be no “scientific” way to measure how hard a climb is.

The earliest, a British system, consists entirely of adjectives: *easy/moderate/difficult/severe*. Many climbers in the American West use the modified Yosemite Decimal System, especially appropriate for rock climbing. Grades 1 through 4 cover easy walking up through terrain that requires initial roping up. Grade 5, roped climbing with or without occasional use of nuts or pitons for safety, has now been decimally extended up to 5.14, and this may theoretically increase indefinitely as climbs come closer and closer to the absolute limit of possibility. Grade 6 means that pitons, nuts, chocks, or drilled expansion bolts must be used for direct aid (that is, in place of nonexistent hand and foot holds). With the aid of the UIAA (Union Internationale des Associations D’Alpinisme), some fourteen to twenty different grading systems have been identified around the world. All remain entirely subjective.

Educated climbers, even as they began to enjoy high places, proved their seriousness by lugging barometers all over the Alps. Altitude and weather data were the goals. In 1760 the Swiss scientist H. B. deSaussure offered a prize to the first person to climb Mont Blanc—at 4,810 meters on the French-Italian-Swiss border the highest peak then known in Europe. Jacques Balmat, a crystal hunter, and Michel Paccard, a doctor in Chamonix, France, claimed the prize in 1786.

Gradually the wealthy began to not only visit the Alps to view glaciers and high peaks but also to actually walk upon them, allowing local peasant guides to supply ladders and iron-pointed staves for climbing. Even ropes were carried, although no method of belay-

ing or catching serious falls had yet evolved. Indeed, some so-called guides felt that ropes are useful only on glaciers and snow climbs. On steep rocks they often insisted that their patrons unrope—on the grounds that if one person in a roped party slipped, all would be carried to their doom.

In 1851 mountaineering received enormous publicity when Albert Smith, a young English surgeon, was so smitten by his ascent of Mont Blanc that he created a public lecture complete with lantern slides that played for months at the Egyptian Hall in London. Even Queen Victoria was impressed.

In 1857 the Alpine Club was founded in London. An era (often called the “golden age of mountaineering”) began in which wealthy or at least upper-income Englishmen took annual vacations in the Alps, invariably accompanied by local guides, who often began as daring chamois hunters (a chamois is a small goat) but found guiding an easier way to earn a living. A string of first ascents, by the easiest and most feasible routes, became the goal. Then, as all of the more prominent summits were climbed, first ascents by more difficult routes began to count. The English paid the fees, the guides did the leading, often carried the packs, and cut ladders of steps up whatever glacial ice had to be ascended.

In 1865 the most famous moment in mountaineering history occurred: the tragic first ascent of the Matterhorn, at 4,475 meters on the Swiss-Italian border the most daunting “impossible” peak in the Alps. Edward Whymper, an English artist and not quite a true “gentleman” (a fact that bothered him and many more orthodox members of the Alpine Club), had been obsessed with the mountain for a decade. After six unsuccessful attempts in as many years from the Italian side, he noticed that a ridge viewed from the Swiss hamlet of Zermatt appeared to have its layers of strata so tilted as to create sharp foot holds rather than down-sloping slabs. On 13 July 1865, Whymper and three other Englishmen (one an English lord) set out with Michel Croz (one of the best guides of the time) and two porters to scale the Matterhorn by the northeast ridge.

It worked.

Then, peering down the Italian side they saw a group led by the mountaineer Jean Carrel, once a guide for Whymper but now a fiercely patriotic Italian determined that *his* people would make the first ascent of the peak. The Italians were only a few hundred feet below and would undoubtedly have reached the summit. However, Whymper and his comrades not only shouted down at them news of their own triumph but also tossed a few stones—not to hurt anybody but just to get the attention of the Italians.

Then tragedy struck: All seven descending climbers were tied into the same rope (actually two ropes, tied together—something no modern climber would have done). The youngest climber, Douglas Hadow, slipped while guide Michel Croz was attempting physically to place his feet for him on the proper holds. Hadow's weight pulled off Croz and then the two climbers below. The rope broke, and all four fell some 1,200 meters to the glaciers at the base of the mountain. Whymper was left stranded with the two porters. Somehow, he guided them down to eventual safety.

The accident caused a profound sensation in England. Queen Victoria is said to have asked her prime minister whether mountain climbing could be banned. She was especially shocked that one of the Englishmen killed was a peer of the realm: Lord Francis Douglas.

However, the genie was out of the bottle. Often inspired by Whymper's *Scrambles amongst the Alps*, printed in 1871 (and surely the most reprinted and influential of all Alpine books), dozens of otherwise civilized men and women began to seek out wild places in the mountains.

At first, members of the conservative Alpine Club considered guides to be mandatory. At least one guide per climber was recommended. The Guides Association in Chamonix originally recommended a minimum of four but failed to make this recommendation stick.

Gradually more climbers began to guide their own climbs. In 1881 the English climber Albert Mummery made a series of "guideless" climbs, including the second ascent of the notorious Mummery Crack up a granite needle called the "Grepon" in the French Alps. (On

the first ascent he had teamed up with a single guide. Thereafter, Mummery led all his climbs himself.) Two fiercely competitive women climbers, Miss Annie Peck and Mrs. Fanny Bullock Workman, essentially organized and led their own pioneering climbs in the Andes and Himalayas—each vied for years for the title of highest-climbing woman.

Then the English began to climb the steep cliffs on their own isle. Rock climbing became a sport somewhat distinct from the rock-and-ice challenges in the Alps, although ice and snow climbs in Scotland in winter were soon discovered to rival those on the European continent in challenge.

Basic Procedures in Modern Climbing

By the twentieth century most European climbing was conducted along fairly standardized lines (climbing in North America did not catch up until well after World War I): (1) The climbing party is organized as a small group: two, three, rarely more than four; (2) members of the group are roped together by a single rope, often 25 to 50 meters (160 feet) long; (3) the rope is strong enough that when well secured it can hold a falling person; and (4) when the climbing is difficult or dangerous, only one person moves at a time, well belayed by partners.

Until after World War II the best rope was made of Manila hemp, although sisal hemp was often substituted in the United States. A manila rope could hold many falls into crevasses or down a slanting slab of rock. A direct free fall (as off an overhang) of more than 3 to 6 meters would likely break it. Various "dynamic" belays were taught in which the person trying to stop the falling climber would allow the rope to slide around his or her waist and through his or her hands for as long as 1 to 5 meters, thereby lessening the initial shock and bringing the falling climber to rest as gradually as possible.

Today all climbing ropes are made of nylon or similar synthetic fiber, sometimes sheathed to cut down on abrasive wear. Unless cut by sharp rock, a nylon rope

is essentially unbreakable. Thus, if a belay stance is “bombproof” (that is, the person feeding out rope to the climber above is so anchored that he or she cannot be pulled off), repeated leader falls are possible and sometimes indulged in when attempting rock so difficult as to be at the absolute limit of climbing possibility (or past it).

Typically a modern leader will commence by climbing 3 meters to as much as 30 meters above the second climber who is feeding out rope and will try to catch his or her fall, if it occurs. (Here a basic law of geometry arises—unless protected by intervening pitons, chocks, or slings tied to protruding rocks or trees, a falling leader must fall twice the distance that he or she has gained above the belayer. This experience wonderfully concentrates the mind of even the most experienced leaders.)

Having gained a secure stance, the leader can belay climber number two up, and so, in turn, the other climbers on the rope. Obviously, when belayed from above, climbers can fall only a few inches, unless they are making a traverse, in which case ideally they would be belayed by a buddy on each side.

The photo that beginning climbers most enjoy sending their parents or friends is one in which they are rappelling down a steep cliff face. With the rope wrapped about their body or threaded through a metal friction device, they place both feet against the rock and lean out backward, allowing their body weight, suitably slowed by friction, to slide them down the cliff. Indeed, the best way is to simply walk down the cliff, facing up. The rappel (called an “abseil” by the Austrians and Swiss and indeed by most Brits and Scots) looks spectacular.

A rappel is often the easiest—perhaps the only—way to get down from a climb. Because well over a third of mountaineering accidents occur on the way down (when people are tired, often careless), learning to do an efficient rappel is invaluable to the novice. Nevertheless, rappels take time to set up, are often difficult to belay satisfactorily, and are—statistically—more dangerous than generally believed. Usually they are made by sliding down a doubled rope, anchored at its middle high above. Once landed, the climber retrieves the rope by pulling on one end. One of the truly vexing moments in the climber’s life occurs when the rope snags on something and cannot be pulled down. Determining how to retrieve it is an exercise in Zen imagination.

Apart from learning elementary rope management, learning to tie the most essential knots in the dark, and handling an ice ax without injuring oneself or one’s colleagues, the accomplished climber must learn far more than can be detailed in a handbook. Most of this learning can come only from experience, hopefully augmented by experienced mentors. The climber must learn how to handle unexpected storms, ferocious winds, rain and sleet, and sometimes lightning. (Hypothermia

is a condition in which the body's temperature has been radically lowered, resulting in impaired judgment, or, if prolonged, death.) Even in summer, on high peaks cold weather can move in, chilling the underequipped climber to the bone. Climbers must keep track of time and manage the available stock of daylight. They must know how to use map and compass (and today the Global Positioning System). Because most climbing is done in small groups, climbers must learn to pay attention to partners and, when dictated by a crisis, become a group leader with a handy knowledge of group dynamics. This learning need not require a course in college. By watching veteran leaders, one easily picks up a stock of useful tricks and stratagems, a lifetime pursuit by the serious and careful climber.

Rules and New Tools

As in any other sport, in mountaineering rules evolve but remain fairly simple:

- A climbing party must never abandon one of its members; no summit is worth the loss of a single life.
 - If a climbing party finds itself close to another group in serious trouble, the first group is morally obligated to give aid, even if it means giving up its own objectives for the day. Remarkable examples exist of groups rendering such aid, especially in the Himalayas. A few examples to the contrary also exist. A few persons have been expelled from climbing clubs for needlessly endangering or abandoning their comrades. Sometimes climbers have been left behind by mistake. Thought to be dead, they may sometimes survive on their own, reappearing hours or days later, to the joy and consternation of those who went on without them.
 - Geoffrey Winthrop Young, perhaps the finest English climber in the years just before World War I (he taught George Mallory how to climb), felt that climbers have a moral duty to take stock of their nerves just before a climb. If they feel at all shaky, they owe it to their companions to let them know. In such a case not being called upon to be a lead climber that day should be no loss of honor.
- Indeed, the concept of taking stock of nerves can be extended to feelings—vague, perhaps mere intuition—that something is not quite right about the climb itself, or the proposed route, or the proposed climbing team. Acting on such insistent uneasiness has occasionally saved lives, even whole parties, particularly in the Himalayas, where thin air and growing exhaustion impair judgment.
 - Increasingly important in recent years has been the rule not to needlessly destroy or spoil wilderness climbing areas. Whole expeditions are now mounted on Mount Everest to pick up the trash that climbers, guides, and porters have witlessly cast about them. The Himalayan forests are being denuded as campfires are being built to feed climbers as they march up to the mountains. Efforts to replant and to teach lessons in conservation are just beginning.

As for tools, a piton is a small metal blade (with a hole or ring to attach a carabiner, a metal snaplink) that can be hammered into cracks in rock. For decades pitons were standard tools to safeguard high-angle rock climbs. When the Californian Yvon Chouinard noticed that the endless pounding of pitons into the cracks used to climb the steep walls of Yosemite National Park was permanently enlarging the cracks and disfiguring the rock, he promoted the use of metal chocks and nuts, which can be wedged into cracks, instead of pitons.

The meteoric rise in the use of specially manufactured chocks and nuts (one can hardly drive a piton into a rock crack anymore without an attack of conscience) exemplifies the torrents of new technology that now inundate mountaineering every year. The first rule of nineteenth-century climbing—the leader must not fall—can now be modified. With the rope no longer tied in a single loop about a climber's waist, the climber now wears a harness seat, usually of nylon webbing and tied directly to the climbing rope. This arrangement makes a fall—if indeed one does fall—considerably more comfortable and vastly less likely to crush or constrict the rib cage.

The venerable ice ax—long enough to serve as a “third leg” or a cane when negotiating streams or

complex rock piles and always useful for catching falls when plunged to the hilt into steep snow slopes or at the edge of glacial crevasses—has been modified when steep ice or frozen waterfalls are to be ascended. Now a climber has two small axes, one for each hand, that become in effect movable handholds. The equally venerable crampon, an iron claw with sharp points to be strapped onto the bottom of the climbing boot, now has two extra blades that point forward. When kicked straight into the ice, the blades stick and afford a practicable foothold even on vertical ice. Stamping their feet alternately into the ice and plunging the small ax in either hand as high above the head as possible, climbers have scaled incredibly steep and long routes.

Now, alas, even nailed boots have been replaced by boots with rubber-lugged soles. Prior to World War II all serious climbers wore nailed boots on major Alpine climbs. The nails were large Swiss hobs of soft iron rounded out with *tricouni* nails with hardened steel points. Such boots worked well on steep slopes of snow, wet moss and tundra, and rock even when it was wet. True, they were heavy and hard to learn to use, but one of the special delights of climbing was to watch another party descend at night. One could trace their route by the sparks that their boots struck.

Short Climbs and Expeditions

People once took it as an article of faith that mountains such as the Alps were designed for mountaineering because most of the principal peaks can be climbed, up and down, in a single day. This fact was still true in the United States when major climbing areas were opened in the U.S. and Canadian Rockies, the Sierras, the Northern Cascades, and parts of the Coast Ranges. A partial exception was Mount Rainier in Washington and its volcanic sisters, mostly covered with glacial ice, which often took two days or even three. The Grand Tetons in Wyoming include a half-dozen truly Alpine peaks sporting glaciers, ridges, and cliffs and affording some of the finest all-around climbing in the United States. These, too, could generally be climbed in a day from a suitably high camp.

In California's Yosemite Valley, the 900-meter walls of near-vertical, sometimes overhanging granite may be the best "big wall" climbing (in a temperate climate) in the world. Virtually all the most difficult routes, which once required multiday sieges with ladders of pitons and sometimes drilled bolt holes, have now been climbed in a few days or less. Indeed, the truly spectacular Nose on El Capitan was free climbed in 1993 by the U.S. woman climber Lynn Hill in a single day.

The higher mountains in Alaska and the Canadian coastal ranges are of a size and scale far beyond one-day ventures. Denali (Mount McKinley), at 6,193 meters and far closer to the North Pole than anything in the Himalayas, has probably the fiercest storms on Earth, even sometimes in summer. Although gear and supplies can be flown in to a fairly high level, the actual climb is a major challenge requiring days. Likewise, such peaks as Mount Logan (at 5,958 meters the highest in Canada) and Mount Foraker (5,301 meters near Denali in Alaska) require a heavy use of small airplanes, ski equipped, if climbers are to avoid multiday treks just to get to the base of their objective. The U.S.-Canadian tradition from the beginning emphasized small-group ascents (two to six climbers), climbers carrying their own supplies on their backs after they had left their base camps. Denali itself was first climbed in 1913 by Hudson Stuck and three companions after a long pack-in using dogsleds.

Siege Techniques for Big Mountains

In the Himalayas mountaineering evolved into huge expeditions such as those launched by the British in their attempts on Mount Everest (8,847 meters) during the 1920s and 1930s. In 1953 the New Zealand climber Edmund Hillary and the Sherpa (a member of a Himalayan people known for providing support for climbers) Tenzing Norgay reached the summit just in time to celebrate the coronation of Queen Elizabeth II of England. In siege techniques the actual climbing is still done in small groups of two or three or four. Sherpas and supporting teams follow, using fixed ropes and

Mountaineering

The Origin of Nuts and Chocks

With the realization that driving pitons into rock is enlarging cracks and disfiguring mountain surfaces, specially manufactured “nuts” and “chocks” are now the preferred tools for safeguarding high-angle climbs. The use of nuts and chocks in mountaineering was an idea pioneered in Wales. British climbers, who did not much believe in pitons anyway, had long put small stones in their pockets to stuff into cracks so that slings could be threaded behind them. Shortly after World War II, they found when walking along railroad tracks in Wales that they could pick up occasional loose nuts, an inch or so in diameter. These could be wedged or lightly tapped into place in suitable cracks, usually far wider than a piton blade. Best of all, with a twist of a hand, the nut could be removed and used again with very little wear and tear on the rock itself. A chock is a glorified nut often manufactured in various wedge or hexcentric forms, ranging from very large to truly tiny.

Stan Boucher

sometimes aluminum ladders to carry loads of supplies up to higher and higher camps. Finally, from the highest camp of all, a summit team of two is launched. Throughout the 1930s, five separate German and Austrian teams attacked Nanga Parbat (8,125 meters) in the Himalayas with similar heroics on a similar scale. All told, this mountain has endured twenty-two attempts, mostly German, with thirty-six lives lost.

The attempt on Mount Everest by a U.S. team in 1963 was perhaps the pinnacle for large expeditions: nineteen climbers, thirty-two Sherpas (later thirty-seven), and 909 porters carrying 26 metric tons of food and equipment, broken down into 29-kilogram loads. Some veteran participants protested that a far smaller group would have been more efficient. However, apparently some of the commercial sponsors wanted spectacular size and lo-

gistics. Indeed, occasional gigantic expeditions still get launched, clumsy and obsolete but wonderful for media opportunities and advertising impact.

Alpine Style

Today most big-mountain climbing of fresh routes in the Himalayas and the new areas such as Greenland, Antarctica, Ellesmere Island in Canada, and barely explored parts of western China and central Asia is conducted by small groups—two to perhaps a dozen members. Porters may be used to help pack supplies to the mountain’s base, but then they are often discharged. A few Sherpas may be taken, but now they are considered true members of the climbing team. Indeed, today’s Sherpas sometimes launch high climbs completely on their own. Once above base camp, members of the climbing team carry their own supplies on their backs.

The advantages are speed, flexibility, and economy. The disadvantages are obviously in narrowing the margins of safety. If one of a party of two is injured, the odds of getting back down to safety are tiny.

The advantages of small groups had already been realized in Alaska and northern Canada by such climbers as H. Adams Carter, Charles Houston, Robert H. Bates, and Brad Washburn. The use of dogsleds, horses, or small planes with skis somewhat did away with the need for armies of porters. Eric Shipton and H. W. Tilman, two maverick British climbers, were already extolling the virtues of Alpine style, even in the Himalayas, during the early 1930s. In 1936 they joined a tiny team that included the U.S. climbers Carter and Houston and the Everest veteran N. E. Odell in climbing Nanda Devi in the Indian Himalayas. At 7,816 meters, it was the highest mountain yet climbed anywhere.

Houston went on to use small teams, largely U.S., in two remarkable attempts on K2 in northern Kashmir, at 8,611 meters the second-highest mountain in the world. His small reconnoitering team in 1938 came within an ace of grabbing the summit, defeated by storms and by depletion of supplies. His return attempt in 1953 was defeated when victory seemed certain. One of the group, Art Gilkey, came down with a blood

clot in the leg. At once, although realizing they might all be killed in the attempt, members of the team set about lowering him on an improvised stretcher, hoping to go all the way down to base camp, thousands of feet below. The retreat, recounted by Bates and Houston in their book, *The Savage Mountain*, is perhaps the greatest tragic saga in U.S. mountaineering. When one climber tripped on a crampon point, he pulled his partner off; the two then slammed into a second pair, pulling them off; and all four fell into the tangle of ropes surrounding the stretcher and a fifth climber trying to guide its bottom. For a time Pete Schoening, belaying the stretcher from above with an ice ax plunged behind a stone frozen in the ice, was holding the weight of five tumbling men. The shaken men left the stretcher anchored to two ice axes while they gathered in a nearby tent to recuperate and assess the situation. When two men then climbed back up to where the victim had been left on his stretcher, they found that he had disappeared along with his stretcher and anchoring ice axes, caught in a tiny but lethal avalanche.

Clubs for Teaching and Promoting Climbing

The venerable Alpine Club, founded in London in 1857, was soon matched by mountain clubs in Austria (1862), Switzerland (1863), and France (1874). On the European continent such clubs tend to centralize activities such as training, mountain rescue, and so forth. In Britain the Alpine Club never sought such authority, and a number of other clubs soon proliferated. In Scotland a separate club for women climbers emerged with its own journal. After World War II the British Mountaineering Council was formed as an advocate and clearinghouse for climbing groups in the United Kingdom.

In 1902 the American Alpine Club was founded. It publishes each year *The American Alpine Journal*, which has become the “journal of record” for most new ascents in the Himalayas and other exotic parts of the globe. In addition, the AAC is a major advocate for

mountaineering throughout the world as well in the United States. Its library, located in Golden, Colorado, is the largest mountaineering library in the Western Hemisphere.

Numerous local and regional clubs exist in the United States, many of them offering training in climbing techniques. The pioneers have been the Appalachian Mountain Club (founded in Boston, 1876), the Sierra Club (San Francisco, 1892), the Mazamas (Portland, Oregon, 1894), the Mountaineers (Seattle, Washington, 1907), and the Colorado Mountain Club (Denver, 1912).

In 1906 the Alpine Club of Canada was founded, partly inspired when the Canadian Pacific Railroad opened up access to dozens of new peaks in the Rockies and Coast Ranges of Canada. Indeed, the railroad hired Swiss guides to popularize climbing for potential customers.

“Sport Climbing”

During the final years of the Soviet Union climbing was developed as a mass sport, and competitions, especially speed ascents up carefully marked routes, were common. With the fall of the Soviet Union, this movement shifted to western Europe, especially France. Climbs were staged up rocks and hotel walls and could be watched by large crowds (and easily filmed by TV crews). Today championship matches are held throughout Europe and occasionally in the United States. Even so-called world cup competitions are held.

A further development has been the construction of artificial climbing walls in gymnasiums, sporting goods stores, and even in or outside of abandoned silos in the Midwest.

However, in true mountaineering people confront large mountains, cliffs, or slopes of snow and ice. An element of danger (hopefully minimized by skill, proper tools, and reasonable luck) and a chance for adventure should exist—not from facing the terrors that kept medieval Europeans out of their mountains but rather from mastering enjoyable novelty: savory surprise.

Finally, every climber should contemplate these words at least once a month: “There are old climbers, and there are bold climbers, but there are very few old bold climbers.”

Movies

Sports on the silver screen have ranged from fluff pieces designed to dramatize the lives of hero athletes to hard-hitting exposés that educate viewers to the troubled world of big-time sports. In either example, sport is commonly used as the venue to make a larger moral point. Gary Cooper as Lou Gehrig (*Pride of the Yankees*, 1942), demonstrating tremendous courage and optimism in the face of imminent death; Nick Nolte as unscrupulous basketball coach Pete Bell (*Blue Chips*, 1994); or Parminder Nagra as Jess Bhamra (*Bend It Like Beckham*, 2002) have depicted characters whose stories dealt with more than winning or losing games. Sport, because of the inherent drama found there, is employed in these movies to make a larger point about the individual and the society that promotes sport as an important feature.

The 1920s to the 1960s: All that Is Good

Movies about sport, in the American market, have focused primarily on baseball, football, and basketball, the most popular American team sports. During the first period, from the early days of motion pictures to the 1970s, sport films tended to use sport to exemplify all that was positive in American culture. Whether biographical pictures, dramas, or comedies, the all-American values of sportsmanship, hard work, and honesty were realized through participation in hard competition. Movies such as *Knute Rockne*, *All American* (1940) and *The Jackie Robinson Story* (1950) highlighted sport's

role in fostering the American dream of allowing people born to less privileged backgrounds to rise to stardom through their athletic prowess.

In Rockne's case, the movie told the story of his immigration to the United States and the hard work that made him a successful and legendary football coach at the University of Notre Dame. The film traced Rockne's legendary invention of the forward pass and his inspirational half-time talks during his years as the coach of the Fighting Irish. Ignored in the mythology surrounding Rockne's story were the lengths the coach would go to in order to win, as well as the less-than-savory background of George Gipp, who became saintlike only in his famous last words.

For Robinson, gaining access to the American dream meant surmounting the tremendous barriers that kept African-Americans from sharing in the opportunities extended to those whose skins were white. As the first black player to break the color line in major-league baseball, Robinson faced hurdles even higher than those faced by a recent immigrant to the country. *The Jackie Robinson Story* depicted some of this but focused mostly on the transformational power of sport. A subplot involves a white New York trucker who falls in with a crowd of virulently racist Southerners and becomes a kindred spirit. Upon Robinson's promotion to Brooklyn, the trucker continues to deride the star, despite sitting near a well-dressed African-American woman. However, Robinson's play on the field wins over the racist, and in the climactic game, he jumps up from his seat in jubilation at Robinson's spectacular play, overcome with such excitement that he hugs the woman whom he had previously slandered.

The film version of Robinson's groundbreaking first years, which starred the player as himself, was part of a tightly focused media campaign to tell his story to accomplish a higher purpose. A series of articles in *The Saturday Evening Post*, the film, newspaper accounts, and a comic-book version of the story all focused on the potential for Robinson's entry into professional baseball to transform the hearts of white baseball fans and positively impact racial relations in American society.

The theme that the team was the thing ran strongly through sport movies in the period up to the 1970s and beyond. This was particularly important for American culture, as it responded to pressure from the Soviet Union during the Cold War (1946–1991). During the 1950s, any deviation from this theme and its promotion of American culture could bring dire consequences upon filmmakers.

AN EXCEPTION TO THE RULE: SATURDAY'S HERO

In a departure from the paradigm of sport movies during the Cold War, *Saturday's Hero* (1951) chose to present what was arguably a more realistic view of big-time college football. The story followed the exploits of Steve Novak (John Derek), a poor athlete from a New Jersey mill town. In order to escape his humble beginnings, Novak accepts an offer to play football for Jackson University, a prestigious southern university. As part of the deal offered by wealthy alumnus T. C. McCabe (Sidney Blackmer), Novak is paid handsomely to play for Jackson. All goes well until Novak is injured and no longer a valuable commodity. Disillusioned with big-time sport and the corruption it brought to the university, Novak quits the team and returns to his family, planning to attend night school while working in the mill to finish his education.

Citizens concerned with the message of corruption at the core of not only American sport and the universities but also the nation itself picketed the opening of the movie, and Sydney Buchman, the screenwriter; Millard Lampell, who wrote the novel on which the movie was based; and Alexander Knox, who played one of Novak's professors, were accused of being communists. In 1952 Buchman was called before the House of Representatives' Un-American Activities Committee, and when he refused to attend, he was charged with contempt of congress. He was subsequently blacklisted by the movie industry.

The 1970s: All that Is Bad

During the second period, which roughly encompasses the 1970s, Buchman's vision of the corruption that lies at the heart of sport and American culture came to the forefront as the Hollywood blacklist and the Cold War

consensus faded. Movies during that era focused on the often-harmful effects of sport on the culture and on the athletes.

One of the first movies in this subgenre was *The Bad News Bears* (1976), a comedy that critiqued and poked fun at the American win-at-all-costs mentality. The story centered on Morris Buttermaker (Walter Matthau), a down-and-out pool cleaner who had once played baseball briefly in the major leagues. Hired by a wealthy businessman to coach his son's Little League team, Buttermaker shows up drunk, insults the players, and shows little interest in the sport or the team. When he finally displays some interest in winning, he decides to cheat, tracking down Amanda Whurlitzer (Tatum O'Neal), a young female con artist who can throw a wicked pitch. Buttermaker and Amanda also attract another ringer, who passes his time as a juvenile delinquent. Together they produce a competitive team, but in the final game, Buttermaker realizes that his actions have made him just another win-at-all-costs automaton that he despises. Instead of playing his ringers and keeping Amanda in the game with a sore arm, Buttermaker plays everyone, and loses the game.

While *The Bad News Bears* was exposing the dark side of Little League baseball, *North Dallas Forty* (1979) critiqued professional football. The movie presents a portrait of football players as nearly subhuman barbarians, coaches as mindless junior executives ruled by computer printouts, and owners as sinister figures who abandon players whenever they exhibit any spark of independence.

One on One (1977) told essentially the same story as *Saturday's Hero*. The young star plugged into the corrupt college program in this case was Henry Steele (Robbie Benson), who is paid by the university to keep alligators out of the gym (in the Rocky Mountains), is given a private tutor to do his work for him, and is generally pampered as long as he produces. When Steele clashes with his coach (G. D. Spradlin), who demands a robotlike, controlled style of play, which inhibits Steele's natural talent, the young star abandons the program after winning the big game, telling the coach, in no uncertain terms, what he can do with his scholarship.

One of the most popular football movies of all time was *The Longest Yard* (1974), which told the story of a football game between prison guards and an inmate team led by exprofessional quarterback Paul Crewe (Burt Reynolds). Football is presented as a way of transcending prison walls, but the tone of the movie is decidedly antiestablishment, presenting the warden (Eddie Albert) and all of the guards as sadistic tyrants.

Movies dwelling on the corporatization of sport and the corrosive effect of winning at all costs were common during the seventies. These movies, such as *Fast Break* (1979), which featured a talented African-American woman (disguised as a man) helping to save a struggling basketball team, challenged the status quo and sought to bring new voices and new sports into the mainstream of sport movies.

A rare hockey movie presented the same jaundiced view of society and professional sport. *Slap Shot* (1977) tells the story of Reggie Dunlop (Paul Newman), an aging veteran playing with and coaching a collection of misfits, which includes the Hanson brothers (Jeff and Steve Carlson, David Hanson), psychopathic triplets who wrap their knuckles in aluminum foil before games to give them an edge in the regular brawls that intersperse the games.

The tone of sport movies during the 1970s reflected disillusionment with American society in the wake of Vietnam and Watergate. However, sport was not often the target of the dark vision presented. Rather, the target of filmmakers was the regimentation of American society by corporate power, the skewed values of American parents, and the corrosive power of the status quo. Those themes became less prominent as filmmakers seemed to take their cues from a former actor that had risen to become president of the United States. Ronald Reagan's presidency set off a wave of nostalgia in sport movies that posited a glorious past in which athletes played for the adulation of children and for love of the game.

The 1980s: Nostalgia for Love of the Game

The new theme for sport movies first appeared in 1984 with the release of *The Natural*, which tells the story of

Roy Hobbs (Robert Redford), a young phenom whose career was cut short when he was shot by a mysterious woman. Attempting a comeback as a middle-aged rookie, Hobbs is able to recapture some of his former magic and become a star, and he remains unsullied by the corruption that surrounds him. He wins the big game, hitting a massive home run into the lights, which flash sparks onto the field as he rounds the bases in slow motion. The film is filled with adoring children who idolize Hobbs for his baseball prowess, including Hobbs's son who plays catch with his father in a sun-drenched wheat field at the end of the movie. The movie's message was that baseball still held the power to transform individual lives and could return the nation to a time when all was well.

The same theme echoed strongly through *Field of Dreams* (1989), which tells the story of Ray Kinsella (Kevin Costner), a man who hears a voice ordering him to build a baseball field in the middle of an Iowa cornfield. When he does, the apparitions of the 1919 White Sox, banned from baseball for throwing the World Series, appear and play games there. Despite a minor subplot that critiques the conservatism of rural America and the corporatization of family farms, the story sticks closely to a theme of redemption exemplified by the values found in baseball. At the end of the movie, Kinsella and his estranged and deceased father play a symbolic game of catch, a favorite image from movies of this type, thereby reconciling through the transcendent power of baseball.

Basketball also served as a venue for the return to traditional values in the 1986 movie *Hoosiers*. Gene Hackman plays Norman Dale, a basketball coach with a checkered past who leaves the big time to coach an Indiana high school team. Dale is every bit the control freak that the coach in *One on One* is, but by 1986 control had become a virtue, and his team wins the state basketball championship.

The 1990s and Beyond: A Mixed Bag

Since the resurgence of the positive sport movie in the 1980s, the genre has become more complex, with films

encompassing several messages at once being common. There also has been a huge outpouring of movies in the sport genre, making any interpretation of trends problematic. Sport movies such as *Bull Durham* (1988), *Major League* (1989), *For Love of the Game* (1999), *Any Given Sunday* (1999), and *The Replacements* (2000) present often sharp critiques of the current state of professional sport but avoid a concurrent criticism of the larger culture. They also offer an often-nostalgic view of how sport could be improved by players who care more for the team than individual glory. *The Program* (1993) and *Blue Chips* (1994) do the same for college football and basketball, respectively. Inspirational sport movies such as *Rudy* (football, 1993), *Remember the Titans* (football, 2000), *The Rookie* (baseball, 2002), *Finding Forrester* (basketball, 2000), *Bend It Like Beckham* (soccer, 2002), *Radio* (football, 2003), and *Miracle* (Olympic hockey, 2004) are films that tell of individuals and teams finding personal fulfillment through sport.

Women and Sport

Women were not prominently featured in sport movies until the 1970s and even then were often featured as anomalies, such as Amanda Whurlitzer and Lucy Draper (Kathy Ireland), the female soccer player pressed into service as a kicker in *Necessary Roughness* (1991), or as evil influences who hinder the athlete/hero. An exception to this rule was *A League of Their Own* (1992), which tells the story of the Rockford Peaches of the All-American Girls Professional Baseball League, which played during World War II.

Minor Sports

While most American sport movies have focused on major team sports, there are a few notable exceptions. Movies have also explored high school wrestling (*Vision Quest*, 1985), golf (*Tin Cup*, 1996), soccer (*Victory*, 1981), Olympic bobsledding (*Cool Runnings*, 1993), running (*Chariots of Fire*, 1981), and even chess (*Searching for Bobby Fisher*, 1993). Boxing and horseracing also have been the subjects of several movies but have had less impact on the culture. One movie that com-

It's what you learn after you know it all that counts. ■ JOHN WOODEN

bined critique of modern sport, an unabashed love of sport, and a hybrid sport, was *BASEketball* (1998), which told of a group of disaffected sport fans who invented their own game in disgust at what sport had become. The movie's opening narration contains as complete a critique of the ills of modern sport as can be found in any movie.

The Future

The success of sport movies such as *The Natural* and *Field of Dreams* in the 1980s led to an explosion of sport movies in the 1990s, and the trend seems to be continuing. Throughout the history of film, sport has been used as a medium to present stories of personal growth, rebirth, and redemption. The presence of certain outcomes, of winning and losing, of us versus them, and the human drama associated with sport lends itself readily to telling these stories. As long as world cultures continue to make heroes of sport figures, the sport movie is likely to flourish.

Multiculturalism

Multiculturalism began in education in the 1970s and 1980s in the United States and Canada as a debate about expanding the core curricula in universities and schools to include not just works by white European males, but also the works and histories of

marginalized ethnic and racial groups and women. In the 1980s it extended into identity politics, with marginalized minority groups criticizing the liberal humanist focus on the protection of individual rights, and arguing that rights should also be guaranteed to groups defined by a shared cultural identity.

This linked with a growing international concern in the 1980s and 1990s that a singular global culture, which was largely white and European, was rapidly wiping out local diversity around the world. Multiculturalists tended to focus on cultural institutions such as schools and museums, and cultural performances such as ethnic song, dance, dress, as sites where cultural diversity could be preserved and displayed. As an important genre of cultural performance, sports could have been an important realm for the multicultural debate, but they were not.

Spread of Multiculturalism into Sports

In the 1980s the end of state-supported socialist sport in Europe and the rapid globalization of sports produced a backlash. There was a multiplication of international competitions and sports festivals celebrating alternative local and ethnic identities, such as the First Games of the Small Countries of Europe, the First Inter-Island Games, the First Eurolympics of Minority Peoples, and so on. Although multiculturalism had begun in Canada, it did not enter the realm of sports in a big way there until the organization of the first North American Indigenous Games (NAIG) in 1990. The NAIG included "traditional aboriginal" sports such as archery, canoe, and lacrosse, as well as global sports such as track and field, basketball, volleyball, boxing, and others. Thus, within this important multicultural intervention in sports, both global and indigenous sports symbolized ethnic identity.

Multiculturalism in the Olympic Movement

One of the most visible manifestations of the global order of nationally organized international sports is the Olympic Games, which began as an educational

movement at the end of the nineteenth century that in many ways prefigured multiculturalism. In his biography of Pierre de Coubertin, founder of the modern Olympic Games, John MacAloon portrays Coubertin's philosophy of "internationalism" as a respect for each national culture as expressed through the festive performance of difference. In an essay on "Mutual Respect," Coubertin acknowledged that in the modern world it was not possible for a single faith to be valid for everyone, and therefore moral education should teach tolerance; mutual respect was the foundation of democracy. Neise Abreu observes that in some publications Coubertin distinguished nation from culture and advocated the doctrine of "all games, all nations" in the Olympic Games. However, this doctrine seemed to disappear after he withdrew from the presidency of the International Olympic Committee in 1925, when it was overshadowed by his notion of Olympism as a set of universal humanist values that places sport in the service of humankind.

Lamartine DaCosta advocates that the current emphasis on the universalistic traditions of Olympism needs to be balanced with a new pluralist humanism, and criticizes Olympic leaders and sport scholars for failing to put pluricultural Olympism into action. Konstantinos Georgiadis, the dean of the International Olympic Academy in Olympia, Greece—which in the past forty years has provided more educational seminars in Olympism to young people and educators from around the globe than any other single institution—also complains that multicultural education is underdeveloped within Olympic education. He states that good methods for teaching multiculturalism through sports have not been developed, that teaching materials are inadequate, and that teachers need to be aided in developing multicultural sensitivity.

Multiculturalism in Global Sports

Is the globalization of sports a process of homogenization or diversification? At the end of his survey of the

global diffusion of sports through colonialism, Allen Guttman argues against those who claim that the diffusion of sports is an imperialist destruction of authentic native cultural forms, although he admits that the standardized universality of modern sports represents a loss of diversity. Indigenous groups are active participants in the borrowing and they change the sports in the process.

MacAloon states that sports of Western origin have, over time, been emptied of their original cultural content and refilled with diverse local meanings by the people who practice them. Sports constitute "intercultural spaces" for cultural interaction, and cultural differences are created during the process of integration.

Joseph Maguire argues in a similar vein that globalization should be understood as a balance between diminishing contrasts and increasing varieties. Global sport both fosters a cosmopolitan consciousness and strengthens feelings of ethnic identity. Adding power differences into the picture, he advocates a process-sociological perspective that places questions of power, elimination struggles, and civilizational hegemony at its center. He notes that it is not inevitable that globalization will result in the continued rise of the West; the commingling of cultures through globalization could result in the decentering of the West.

The Future

The multicultural debate was slow to arrive in the world of sports and remained underdeveloped, even within the Olympic movement, which embraces more member nations and territories than any other major world organization. Scholarship on the sports of non-Western and marginalized minority groups was sparse. Despite the paucity of specific historical and ethnographic studies about how globalization actually occurs on the ground and what happens to indigenous sports when international sports are adopted in local communities, a few key theorists developed theoretical formulations that saw cultural diversification and homogenization not as mutually exclusive, but as multilayered simulta-

neous processes. As multiculturalism had already started to wane in other fields at the turn of the millennium, it was not clear that the multicultural debate would ever take off in the realm of sports.

Naginata

Naginata is a Japanese martial art practiced by women—and some men—in virtually all schools and colleges in Japan. Outside Japan men and women practice in about equal numbers. Around the world eighty thousand people practice naginata, usually *atarashii naginata*, the modern sport form. Naginata began as a system of warfare; it is not a modern means of self-defense. Instead people practice it as a physical discipline and method of personal development.

History

Japanese warfare underwent radical change during the ninth century with the increased use of the *tachi* curved cavalry sword. This change corresponded with the rise of the mounted *bushi* (upper-class warriors). Lower-ranking warriors began fighting with a weapon consisting of a slightly curved blade mounted on a stout oak shaft, similar to a European halberd or glaive. This weapon was known as a “naginata,” meaning “long blade” or “reaping blade.”

This single-edged weapon was fashioned from the same laminations of hard and soft steel used for sword blades. The proportion of shaft to blade has varied, but the overall length of the weapon has almost always been the same: between 2.1 and 2.4 meters.

Warriors used these first naginata to cut the legs of horses and to slash through an enemy’s defenses. Naginata were also heavy and were used in thrusting attacks, with either the blade or the metal-capped butt. During

the fourteenth century naginata began to be supplanted as spears were reintroduced for fighting. Warriors could more easily use spears in close formation, and spears required far less training time to be effective. By the mid-sixteenth century naginata became a rather uncommon weapon of war.

Women and Naginata

Traditionally the naginata weapon was associated with women. People considered it most appropriate to women's physique and to the circumstances in which women would fight, which were, generally speaking, in defense of their home. A strong, lithe woman armed with a naginata could keep all but the best warriors at a distance, where the advantages of physical strength were slight.

During the early seventeenth century the imposition of the Tokugawa government (1600/1603–1868) led to strict social controls on all strata of society—controls that greatly affected women. *Bushi* women were expected to center their life on unquestioning service to their family, much as the samurai (warrior aristocracy) were expected to center their life on service to their lord. The naginata weapon became an emblem of a glorious past, a means of training women to stoically accept a life of subservience. The use of the naginata became more stylized and formalized in specific *ryu-ha* (martial traditions), which then became associated with women. Movements became quick and precise, and the weapons had light shafts and small, slender blades.

Japan began to consolidate as a modern nation-state during the mid-1800s, and the new grammar school

system played a significant role in that consolidation. Martial arts training became a regular part of the curriculum. Because the traditional martial arts, with their emphasis on forms, did not lend themselves to teaching students en masse, they were restructured into martial sports such as judo and kendo (a Japanese sport of fencing, usually with bamboo swords).

This restructuring brought the practice of naginata to a crossroads: People had developed judo, kendo, and later karate to be practiced in standardized forms. This development had not yet occurred with naginata, which was still split among a plethora of groups, each with its own curriculum. Therefore, competitive practice became more popular as a means both of training among different groups and of holding the interest of modern young women.

At first practitioners used light wooden practice weapons covered with leather; later, for safety, practitioners attached bamboo strips to the end of a wooden shaft. This modern replica is light and whippy, allowing movements that would be impossible with a real naginata. As practitioners developed rules and agreed on point targets, the techniques that worked best in competition began to differ from those used by the traditional martial arts, which had been developed for different terrain and different combat situations. Thus, naginata was transformed into a sport and became known as *atarashii naginata* (new naginata).

During World War II some naginata teachers, notably Sakakida Yaeko, devised a set of standardized forms that consisted of choreographies of one naginata form against another. In 1953, after a hiatus created

***Tendo ryu* naginata features kata that pit a naginata against a sword.**

when the occupying forces banned martial arts after World War II, Sakakida and several leading naginata teachers created the All Japan Naginata Federation.

Play and Rules

Atarashii naginata has two parts: form practice and freestyle competition. Forms (kata) are sets of simple movements that require straight posture and sliding footwork. Practitioners use these forms in contests, in which two pairs of contestants perform simultaneously and are judged on the correctness of their movements. Practitioners use solid wood naginata weapons for kata practice. Practitioners rarely use live-blade naginata weapons today.

Freestyle competition resembles kendo competition. Contestants wear protective gear and have ten designated targets on the body of the opponent. Contestants make strikes to the ribs (at the side of the chest), the top and sides of the head, the throat, the shins, and the wrists. The hip protector is not a target. Referees decide winning points; a contestant must strike a target with authority and accuracy. Contestants hold their body upright on the balls of their feet to be able to slide and jump quickly toward or away from their opponent.

Since World War II *atarashii naginata* has spread around the world; international tournaments have been held since the early 1990s. In 1974 Helen Michiyo Nakano and Yasuko Yamaguchi established the United States Naginata Federation, the first federation outside Japan. People also have established naginata federations in France, Belgium, Netherlands, Sweden, Brazil, and New Zealand. Because naginata is one of the least known martial arts, many students are geographically isolated and must travel to gatherings for practice and competition. Women participate in the sport throughout the world. Women make up about 50 percent of U.S. naginata students. Naginata students commonly practice other martial arts, especially kendo and aikido.

Atarashii naginata is neither an archaic system of warfare nor a modern system of self-defense. It is instead a method of personal development. Practitioners believe that by confronting one's own weaknesses,

which are revealed by dedicated practice, by repeatedly failing and succeeding, and by modeling one's instructor (a person farther down the same road of personal development), they can achieve the ideal of calm and self-mastery.

Narrative Theory

Although narrative theory can seem like a somewhat arcane approach to anyone outside of the English departments where it originated, it has much wider applications today. Some cognitive psychologists such as Mark Turner argue that narrative is central to everyday thought and action—that the most basic operations of the mind are literary in their use of story, projection, and parable. Story, Turner notes, organizes our experience, knowledge, and thinking. One story helps us make sense of another as we project the terms of the first onto the second, a process known as “parable.” Such processes, far from being arcane practices of an educated, dated elite, are basic cognitive principles that

show up everywhere, perhaps especially in the ways we give meaning to sports.

Theories of Narrative

“Nothing,” narrative theorist J. Hillis Miller (1995) notes, “seems more natural and universal to human beings than stories.” The basic principles of narrative show up in everyday “texts” of all kinds, from novels and short stories to television and film to advertisements, news, and information available on the Internet. Sports narratives are a classic example of these everyday texts. The “triumph over adversity” stories that are such a characteristic feature of sports discourse give shape and meaning to what might otherwise be a perplexing phenomenon: athletes obsessively repeating training regimens for years, devoting a large portion of their time and energy to this strange thing called “sports.” The ways we come to understand this activity are fundamentally narratological. The formal features of narrative include plot, character, setting, and diction. Plot is what happens, a chronological progression of events with a beginning, middle, and end. *Character* refers to the actors within the action, the agents of the events. Setting is where the events take place, and *diction* refers to the way in which the story is told. These are the basics of narrative upon which almost everyone agrees. However, not everyone agrees on why humans need stories and the exact function or purpose that stories serve and how they serve it.

Schools of Narrative Theory

Several schools of narrative theory exist. Although the schools from earlier periods are not as influential as they once were, they have a residual influence on more contemporary schools. Many narrative approaches blend several aspects of the different schools.

RUSSIAN FORMALISM

The Russian formalists—precursors to proponents of the U.S. “new criticism”—were part of the larger movement of literary modernism early during the twentieth century, which, in all of the arts, was a movement

against the social realism of the nineteenth century. Formalists exclude the nonliterary from literature or art more generally because they see life and art as opposites (art for art’s sake). Works of art refer only to themselves, not to the world outside of them. The form of the art, rather than its content—how it is made, rather than what it says—is what is most interesting and important. For Russian formalists literature is characterized by what differentiates it from other orders of facts and uses a “higher,” more sophisticated form of language than that of everyday speech. In this view sports would be a vulgar form not possible to analyze from a formal perspective. This view is at least partially responsible for the long-held bias against scholars who study sports, who tend to be linked with “dumb jocks”—that is, the body rather than the mind.

DIALOGICS

Narrative theory of the dialogic form is based on the work of Mikhail Bahktin and is opposed to the work of the Russian formalists. For Bahktin linguistic production is dialogic in that it is formed in the process of social interaction. Whereas the formalists emphasize works of art divorced from their social and historical contexts, in dialogic theory we cannot separate the two. Language is always political and ideological in that for Bahktin it is characterized by “heteroglossia,” the competing voices and dialects within a language. Although dominant culture may claim that its terms are monologic (one form) and authoritative, contesting definitions or forms always exist. Bahktin sees this most clearly in parody, texts that, through a deliberate displacement and subversion of the dominant language and ideas, reveal those ideas to be changeable. Many voices and stories, not just those of the dominant discourse, exist. Within sports studies, texts that take a critical view of sports as well as emphasizing sports’ positive aspects would be “heteroglossic” in this sense.

NEW CRITICISM

Associated particularly with the work of R. P. Blackmur and Cleanth Brooks, new criticism dominated English

departments from the post–World War II period through the late 1960s. The new criticism looks at a text as completely distinct from its social and historical context, concentrating instead on the formal patterns present in each text. The text should be studied as an art object in and of itself, this school argues, for the specific formal literary properties it contains. Literary properties are not found in anything but literary texts. For a new critic the study of sports would be an anathema, but for media researchers who analyze the text of a magazine article for its patterns regarding the representation of gender, for instance, the close reading of texts that new criticism advocates serves as a (perhaps unconscious) model.

SOCIOLOGICAL

In direct opposition to the new criticism, the sociologically oriented narrative studies the way economic and cultural institutions shape the particular kinds of stories we tell. Frederic Jameson, for instance, was one of the first to rigorously argue that “facts” that we take as a given, such as historical narratives, are actually textual. A traditional conception of history would say that the narrative accounts of what happened faithfully record what happened—an event took place, and the story is the account of that event. For Jameson and other sociologically oriented narratologists, however, the stories we choose to tell about what happened are based on our own standpoint in relation to the dominant culture. Those who have power tell a different story than do those who don’t. The revisionist history currently taught in high school curriculums regarding, for instance, the representation of Native Americans, is largely the result of theorists such as Jameson who insist on a critical interrogation of relations of power and how these affect what stories get told by whom. Those people who own the National Basketball Association would tell a different story about its practices than would a late-round draft pick.

READER-RESPONSE

Like audience reception theorists in media studies, reader-response theorists concentrate on the reception

of texts, on the particular meanings that readers make from texts rather than the texts themselves. Reception studies are a neglected area of sports research that has just recently become a growth area. Because a focus on representation—how women athletes are portrayed in *Sports Illustrated*, for instance—can tell us only about that representation itself, not about how that representation is used by its audiences, the assumptions that some textual analysts make about the effect of the representation can be only assumptions. Reception studies either prove or disprove those assumptions (or somewhere in between), but they tell us a great deal more about actual cultural beliefs and practices than does a purely textual analysis.

DECONSTRUCTIONIST- POSTSTRUCTURALIST

Deconstruction, a term coined by the French philosopher Jacques Derrida, is a particular kind of poststructuralist approach. Whereas other poststructuralists such as Michel Foucault focus on institutions and how we construct our paradigms (frameworks) for knowledge, Derrida focuses on language itself as the original medium for all thought. This method assumes that “there is nothing outside the text” and that we know the world through language. Derrida questions the world-text opposition (and every other kind of binary opposition): Everything is a text and thereby subject to interpretation. No “real” exists in that no set, fixed referent or world of things outside of the language we use to name it exists—only “an immense linguistic structure in which we move and have our being” exists. In this structure words usually have several and often conflicting meanings, which makes meaning provisional and contextually based.

Therefore, deconstruction revises the representational theory of language in which language is taken to transparently represent some “real” outside of itself, “the thing itself.” Things were thought to have fixed, set, determined essences that language then represented. Deconstruction offers a nonreferential theory of language or

Sports is human life in microcosm. ■ HOWARD COSELL

linguistic construction of reality that sees language as constitutive rather than purely reflective. Representation, instead of describing an already existing reality, helps to create it. Representation is “the real” in this sense. This means that meaning, our ways of knowing, is linguistically rather than referentially based—we come to know through language.

Acts and practices that make up the “real world” are inseparable from the discourses (social systems of meaning) out of which they arise and are thus open to interpretation. The emphasis on the indeterminacy of meaning that follows from this fact is one of the more controversial aspects of deconstruction, as many critics have misunderstood indeterminacy to mean that no meaning exists. This is an inaccurate characterization of Derrida’s theories because for him the principle of indeterminacy that he claims is central to language (and therefore everything is decentered, and meaning is contextual) is not a statement of meaninglessness but rather of the possibility of many meanings, of multiplicity. Meaning is then determined through dialogue and consensus rather than written from on high.

Regardless of their particular approach, all schools of narrative deal with the problem of the origin of meaning and study how the human mind makes sense of and gives order to the random stream of events that characterizes daily life. Most recent approaches presuppose that we create rather than reveal the world through the narratives we tell about it and that “the way things are” is in large part determined by narrative. In these approaches the world has no inherent order in itself but rather is made meaningful through narratives. Our world, then, is the result of a story, a speech act: A story is a way, as J. Hillis Miller puts it, “of doing things with words.” Those things we do, the stories we tell, make our worlds meaningful.

Narrative Approaches to Sports

Particularly the poststructuralist approaches have relevance to the ways narrative theory is used in sports

studies. The narrative theory of sports is the application of the methods and perspectives of narrative theory to sports as a subject matter or object of analysis. Much as literary critics once took novels or poems as the object of their analysis, today scholars of the narrative approaches use various aspects of sports as their object of analysis. Anyone doing a media analysis of sports necessarily uses narrative theory broadly defined.

Because from a poststructuralist standpoint *everything* is narrative, including history, the distinctions that literary critics once drew between the “high art” of canonical literary fiction and poetry and the “low culture” forms such as television and film have broken down. This breakdown has opened up the possibility of discussing sports in much the same way one once discussed, say, the novels of Charles Dickens. Anything and everything are fair game for analysis, and the application of narrative theory to sports studies has allowed a new breadth and depth in the field. A critical awareness of one’s standpoint as a researcher, for instance, and an awareness that the researcher is always necessarily telling a story in which he or she has a particular investment have led to exciting new approaches in ethnography (the study of culture) such as the critical autobiographical practice that Susan Birrell identified in narratives written by women of color.

A focused and specifically named application of narrative theory to sports appeared in 2000 when a special issue of the *Sociology of Sport Journal* was devoted to what issue editors Robert Rinehart and Jim Denison called “sociological narratives.” The issue called for a narrative component to social science research and for ethnographic writing practices as a valid method of research. Literary narratives provide “thick description at its thickest,” and so the editors called for the use of “fiction and stories as nuanced ways in how to write up experiential ethnography.” These would include “combined theory/narrative pieces” that use fictional strategies to make their conclusions more explicit. The issue

included framing articles that articulated a theoretical framework for this methodology, articles that were combinations of theory and narrative, and pieces that took the form of creative nonfiction that are examples of how the narrative imagination works and how it can be most effectively applied to sports. In *Built to Win: The Female Athlete as Cultural Icon* (2003), Heywood and Dworkin utilized these frameworks in an argument for a methodology that combines narrative and theory, analyzing the images of women athletes during the 1990s for the stories they tell about gender. Robert R. Sands (2002) discussed the application of narrative theory to ethnographic method in *Sport Ethnography*. Jim Denison and Pirkka Markula (2003) discussed the validity or even necessity of narrative approaches to sports in *Moving Writing: Crafting Movement in Sport Research*. Like generations of literary theorists before them, sports researchers working in narrative today have discovered the power of narrative forms and the ways those forms can complicate and extend traditional sports research.

Native American Games and Sports

The first inhabitants of North America—the indigenous or Native American peoples of Canada and the United States—have always embraced games and sports as an integral part of their cultures. Occasionally Native American athletes excel in “mainstream” sporting events organized and operated primarily by non-Native Americans. Among this group of athletes are Olympians such as Billy Mills (long-distance running), Sharon and Shirley Firth (cross-country skiing), Alwyn Morris (kayaking), and Waneek Horne-Miller (water polo), as well as professional athletes such as Notah Begay (golf), Jim Thorpe (football), Louis Sockalexis (baseball), and George Armstrong (hockey).

However, Native American athletes also participate in competitions organized and operated by Native Americans, including “all-Native” competitions and “traditional” sports competitions. All-Native competitions, such as National Indian Athletics Association tournaments, the Indian National Finals Rodeo, and the North American Indigenous Games, are limited to participation by people of Native American ancestry. Events focus primarily on sports that have developed in non-Native American cultures, such as sports of the Olympics. Traditional sports competitions, such as powwows, Northern Games, Dene Games, the World Eskimo Indian Olympics, and snowsnake competitions, focus on activities that originated within Native American cultures. Organizers do not restrict who can participate in these competitions; however, participants are primarily of Native American ancestry.

History

Indigenous peoples have inhabited North America for at least twelve thousand years. Oral histories provided by Native American peoples (Inuit [Eskimo], American Indian, and Metis)—complemented by the writings of European travelers who began to arrive in North America

during the sixteenth century—inform us that Native Americans played games and sports for enjoyment, but also for education and for preparation for subsistence activities such as fishing and hunting. Furthermore, games could be a part of celebrations or religious interventions, and they functioned in the redistribution of wealth through gambling games and games of chance.

Games of chance consisted of dice games and games that involved hiding a marked item, then guessing where it was located. Hand games were a popular example of this activity. Accompanied by energetic drumming, they involved many deceptive and skilled movements. Hand games were a method of redistributing wealth as winners claimed the stakes put up as part of the games.

Skill-based activities required physical strength, endurance, and/or speed and often involved pain tolerance and self-testing. Physical competitions involving running, jumping, swimming, boxing, wrestling, pushing, or pulling helped prepare people for the demanding subsistence life they led. These activities often took place when people gathered to celebrate and at times were used to settle grievances, as was the case, for example, with wrestling matches organized among the Inuit. Ball games were especially popular and widespread, often involving heavy gambling. Teams could number in the hundreds. *Tewaarathon* (lacrosse) is the best known of these games, in part because non-Native Americans created formal rules for this game and made it part of mainstream sports during the mid-1800s. Lacrosse involved two teams and a ball that was caught and thrown toward the opponent's goal with a racket shaped like a basket. Matches extending over several

days were often arranged to provide religious intervention on behalf of a member of the community. Other games involved directing the ball toward the opponent's goal by kicking (e.g., kickball), throwing it (e.g., mooseskin handball), or propelling it with a stick (e.g., shinny) or throwing two balls attached together with a thong (e.g., double ball). Both men and women played ball games, but they were often segregated by gender, and some games were specific to men or to women (e.g., double ball tended to be a female activity, whereas lacrosse was a male activity).

Dancing, usually accompanied by drumming, was another activity, whether it involved one dancer and his or her drum (e.g., among the Inuit), round dances involving the whole community (e.g., among the Athapaskan), or specialty dances as part of powwow celebrations in the southwestern regions of North America.

Euro-American Impact

After the United States (1776) and Canada (1867) achieved nationhood, official policies aimed at “civilizing” and assimilating Native American peoples were implemented. This implementation involved banning many traditional Native American activities and encouraging Native American involvement in non-Native American cultural practices. For example, government officials in both Canada and the United States outlawed certain traditional cultural practices during the late 1800s, including the potlatch and the sun dance, which were ceremonies that were of fundamental importance in Native American culture. At the same time, the Canadian government funded “appropriate” activities for Native American peoples, such as agricultural fairs, plowing matches, celebrations of the queen's birthday, brass bands, select sports, and physical activities emphasizing calisthenics. U.S. government officials encouraged rigid exercise programs at off-reservation

boarding schools such as the Carlisle, Pennsylvania, training school for Native American youth, opened in 1879. Boys were also encouraged to play mainstream sports such as football, baseball, basketball, and track and field. Many talented athletes from these schools went on to compete in sports against athletes representing some of the best universities in the United States during the early 1900s.

In both countries traditional Native American sports and games were thus actively suppressed as part of the federal attempt to replace Native American culture with “appropriate” non-Native American social practices. Mainstream sports were one effective avenue for completing this task, although discrimination against Native American participants did occur. For example, in 1880 the National Amateur Lacrosse Association in Canada categorized all Native American athletes as “professionals,” thus using racial criteria to exclude them from participation in amateur lacrosse competitions. This categorization occurred even though Native American participants had been involved in lacrosse competitions with non-Native American athletes to that time, and Native Americans had introduced non-Native Americans to the game. Native American athletes were likewise banned from competing against non-Native Americans in activities in which they were perceived to have a “natural” advantage. For example, in snowshoeing competitions and rodeos during the late 1800s Native American athletes had to compete in separate events and were not allowed to compete in the open races against non-Native American athletes.

Government policies that promoted cultural assimilation were rescinded during the 1930s, but by then Native Americans had ceased to participate in many of their traditional cultural practices. The subsequent closing of many U.S. residential schools worsened the problem. A number of Native American male athletes, especially those from the Carlisle Indian School or the Haskell Institute, had experienced success against non-Native American athletes by that time, both at the elite amateur and the professional levels. They were now left

with few opportunities for developing sports skills in the mainstream schools or sports leagues. Moreover, they often faced racism both in sports and in the wider community. Native American athletes thus largely disappeared from mainstream sports participation. One way to increase their access to mainstream sports eventually arose out of the creation of all-Native sporting events.

All-Native Sporting Competitions

An all-Native sports system was created to provide Native American athletes with mainstream sports opportunities and an enjoyable, culturally supportive environment to improve sporting skills and to celebrate their heritage. Organizers of all-Native sporting events, which are often invitational in nature, ensure a Native American participation base through race restrictions for competitors. Rules can be fairly broad; for example, one all-Native bowling tournament required that participants be American Indian or married to an American Indian. More limiting conditions ensure that all players are of Native American heritage. For example, the 1980 Women’s Fast Pitch National Championship required that athletes be at least one-quarter American Indian. Criteria for the Little Native Hockey League demonstrated even more restrictive criteria, employing government-defined proof of American Indian status. Participants had to produce their federal band number to compete. All-Native sporting events are often annual tournaments and can be held at interreserve, provincial-state, national, and/or North American levels. Mainstream sports, such as golf, rodeo, bowling, basketball, hockey, fastball, tennis, and lacrosse, are the focus of these tournaments. Organizers finance events through a combination of entry fees, community fund-raising, and occasional government grants.

The creation of all-Native sports organizations has helped to standardize these events. In the United States the All Indian Rodeo Cowboys Association was formed in 1957 as the first formal American Indian professional rodeo association. Other Native American rodeo

Hopi Running and Racing in Arizona

Running, racing, and gambling contests of various kinds appear not only in stories of individual adventure and achievement but also in myth-legends, clan and village “histories,” and tales of awe and wonder. Fleetness of foot and endurance are regarded as supreme psycho-physical accomplishments. We hear again and again of races between villages and of individual running feats, not only in the old stories but in recollections of more recent times. In Oraibi there are older people who recall challenges by footracers of Walpi, and in Walpi there are stories of challenges from Oraibi. People speak of how only a few generations ago the men and boys of Oraibi would gather early in the morning to run in a group to Moencopi (some fifty miles away), cultivate their gardens there, and then return running to Oraibi.

In Walpi there are recollections of Hopi mail carriers who ran mail from Keam’s Canyon to Holbrook, about seventy miles, in a single day. Such stories and the exaggerations they may have undergone in the telling reflect the traditional value placed on footracing, not only as social competition but also as an expression of community (and religious) vitality. The so-called kachina races, in which young men attired in kachina costumes challenge the young men of neighboring villages, are believed to bring a blessing or good medicine to the people. In the kachina races of earlier years, religious connections

were more visible than now. The personators of the kachinas prayed and purified their thoughts in the kivas before the races took place. Festive and secular as the races might seem, they carried the meaning of good fortune, rain, and fertility. The racing that takes place each year in the Horn and Flute rites is strictly ceremonial.

In the old stories about clans and villages, racing usually takes place as a result of invitation or challenge. Though the races begin in a social atmosphere, in the end they may prove to have important, even grave, consequences. In many tales, the races escalate from tests of speed and strength to competitions between medicine and counter-medicine, witchcraft and counter-witchcraft, drawing on the dynamic forces of nature that reside in animals or inanimate objects. In “The Races at Tsikuvı” (text 20), for example, both sides invoke the intervention of magical elements, and the consequences of the races are so serious that the people of Payupki are forced to abandon their village. Even where witchcraft is not introduced, as in “The Dispersal from Sikyatki, I” (text 11), the contest may be laden with serious implications. The Sikyatki race ends with death and the scattering of the people of the village.

organizations were soon created in both Canada and the United States, and the first National Indian Finals Rodeo was held in Salt Lake City, Utah, in 1976.

The National Indian Activities Association was formed in 1973 to showcase Native American athletes through national competitions while helping Native American youth develop pride in their heritage. An all-Indian men’s championship in basketball was the first event sponsored, but other sports were soon added, including softball, golf, and bowling, with opportunities

provided for both men and women to compete. All competitors must be at least one-quarter American Indian. This organization, renamed the “National Indian Athletic Association” in 1990, continues to offer yearly sports championships in a variety of sports.

In Canada the Aboriginal Sport Circle was formed in 1995 as the national organization overseeing Native American sports in Canada. Member organizations from across Canada arrange for participants to compete in all-Native events such as the North American

Indigenous Games. A group of Native American leaders from Alberta organized the first North American Indigenous Games, held in Edmonton, Alberta, in 1990. These games, which are restricted to persons of Native American heritage, involve athletes from both Canada and the United States. Teams from a variety of provinces and states compete. Subsequent games have been held in Saskatchewan in 1993, Minnesota in 1995, British Columbia in 1997, and Manitoba in 2002. Mainstream sports are the focus of these games. Thus, the 2002 games included 3-D archery, athletics, badminton, baseball, basketball, field lacrosse, boxing, canoeing, golf, rifle shooting, soccer, softball, swimming, tae kwon do, volleyball, and wrestling. Medals are awarded to the winners. Organizers generate funds through entry fees, community and sponsor contributions, and government grants. Cultural activities are an integral part of the games, providing athletes and spectators with the opportunity to celebrate Native American traditional practices as well as mainstream sporting activities.

The North American Indigenous Games, in conjunction with the work of national sports organizations and the inception of national awards for Native American athletes such as the Canadian Tom Longboat Award (begun in 1951) and the American Indian Athletic Hall of Fame (begun in 1972), have created an environment that enables Native American role models to emerge and be recognized in mainstream sports

Traditional Sports and Games Competitions

A number of competitions involve traditional Native American activities. These competitions maintain contemporary interest in traditional Native American sports and promote community spirit and pride in being Native American. One of the oldest competitions is the powwow, a summer celebration that dates back to the Plains warrior organizations of the 1870s. Powwows had almost died out by the 1930s because of government legislation against traditional Native American cultural

practices. However, Native American organizers began to host powwows to honor the American Indian veterans returning to their reserves from the two world wars. Powwows grew in popularity as cultural awareness and pride in being Native American increased during the later decades of the twentieth century. Today more than 100 powwows occur annually in North America, both on reserves and in urban areas, as part of a “powwow circuit.” Large money prizes are awarded at major competitions, although some reserves prefer to hold “traditional” powwows, encouraging the audience to dance for fun rather than for money. Native American participants of all ages compete, and both Native American and non-Native American people attend as spectators. Although dancing is the primary focus, organizers sometimes include traditional foods and crafts, rodeos, hand games, giveaways, and parades. Powwow participants in part view these events as sports; however, Native American people also see these events as a place where Native American values can be reproduced through their connection with Native American ways of viewing the world.

Native Americans in northern parts of North America have also created traditional sports competitions. The World Eskimo Indian Olympics were established in Fairbanks, Alaska, in 1961 and have been held every year since. Events in 1961 included seal skinning, blanket toss, finger pull, high kick, and neck pull, as well as four dance groups. In Canada the Northern Games and the Dene Games were created during the 1970s. The Northern Games began in 1970 as a weekend festival of traditional Inuit (Eskimo) and Dene (American Indian) games involving Native American participants from the Northwest Territories, the Yukon, and Alaska. Events included primarily Inuit activities; in 1970 events included one- and two-foot high kicks, arm pull, wrist pull, and Inuit drum dancing. Originally only males entered these events; however, female participants now compete. Men and women competed in jigging and kayak racing. Female participants originally competed in the Good Woman contest, which included activities performed by women on the land. In 1970 this contest included tea boiling, bannock (frybread)

making, seal and muskrat skinning, fish roasting and boiling, dry fish making, and traditional sewing. Athletes have also participated in Dene traditional activities on occasion; the 1970 games included stick gambling. A separate Dene Games began in 1977 in the Northwest Territories, and Arctic sports (added in 1974) and Dene Games (added in 1990) have become events within the biennial Arctic Winter Games.

The Iroquois in Ontario and New York host competitions in snowsnake, which is a traditional winter activity. These competitions involve sliding a spearlike stick, about 3 meters long, as far as possible along a flat, smooth track (now an artificially created trough in the snow). Each team includes a shiner, a thrower, and a marker. The thrower sends the snowsnake down the track, but the shiner often makes the snowsnake and is responsible for choosing the proper snowsnake and wax for the snow conditions. The marker determines the final landing place for his team’s snowsnake. Competitions are held weekly on various reserves in January and February. They involve primarily adult male competitors, although children, including occasionally young girls, also compete (this game was traditionally played only by males). Prizes are awarded to competitors who throw their snowsnakes the farthest.

Traditional sporting activities, such as powwows, Inuit and Dene Games, and snowsnake, combine with all-Native and mainstream sports competitions to provide a rich cultural context for Native Americans across North America.

Significance

Sports and games are an important part of all cultures because they are activities through which people express their values, know their bodies, and develop a sense of community through shared practices. Native Americans have always embraced sports and games, but they have been encouraged by non-Native American government policies to adopt mainstream activities, often at the expense of decreased involvement in their traditional cultural practices. Native Americans have developed an ability to embrace both traditional and mainstream

sports and games. Mainstream sports are most often organized by non-Native Americans, but through the efforts of many Native American organizers and Native American sports organizations, all-Native competitions have become a meaningful means of aboriginal engagement with sports. Traditional games and sports have also become institutionalized through events such as powwows, Inuit and Dene Games, and snowsnake competitions. These events enable Native Americans to find meaning in physical activities that trace back to their heritage as well as to create new traditions as they embrace non-Native American sporting activities.

Netball

Netball, like many other sports, evolved after another sport was transplanted. In 1895, Dr. Toll, a U.S. educator who was visiting a college of physical training in London, introduced netball to England as the indoor game of basketball. Dr. Toll taught the women students of the college how to play basketball, but she did not distribute a book of rules, and the playing area was of an indeterminate size. The goals were wastepaper baskets hung on the wall at each end of a hall—an arrangement that mirrored that of Canadian-born Dr. James Naismith (1861–1939), who invented basketball in Massachusetts in 1891 and used peach baskets as his goals.

During the early years of the twentieth century netball—a sport of stop, start, catch, and shoot compared with the all-action fluidity of basketball—became popular in the girls' schools of the British empire and frequently was an integral part of physical education programs.

Although netball has never entered the Olympic arena, it does have its own world championship. In 1999 Australia won its eighth championship. It continues to be the dominating presence in the sport. During the 1980s and 1990s the West Indies and Australia had the most exciting teams. In 2005 the United States of America Netball Association will host the World Youth Netball Championships of the International Federation of Netball Associations in Florida.

The Ling Association, founded in England in 1899 to represent the professional and academic interests of physical educators, played a major role in the development of netball. The Ling Association saw the educational potential of the sport if only the motley assortment of rules could be condensed into one standard set. Thus, a Ling committee drafted a set of rules that established a transatlantic compromise: Goals as a unit of scoring were replaced by points, and a shooting circle was introduced. These elements were part of the U.S. sport. However, the

size of the ball (68 centimeters in circumference) was similar to the size of an English football (soccer ball), which was 10 centimeters smaller in circumference than a U.S. basketball. The original baskets were replaced by goal rings and nets, goal rings were reduced from 46 centimeters in diameter to 38 centimeters, and the height of the post rose to 2.5 meters. With the disappearance of baskets, people began to use the term *netball* rather than *women's basketball*.

These English changes were introduced in 1905 to Scotland, Wales, and Ireland, as well as Canada, the United States, France, and South Africa, and people hailed netball for the sense of control it gives players. Control is critical to understanding why athletic administrators and educational leaders so strongly supported such a distinctly unmodern game: Netball lacks rhythm, speed, contact or collision, and all-out aggression, and points are not scored as a frantic climax to a sequence of strategies. To early players netball epitomized rational recreation and a qualified acceptance of liberation for women on the playing field. It reaffirmed society's views of how women should behave: They could run and catch and be competitive, but the unrestrained athleticism of other ball games (such as women's field hockey) was outlawed. Indeed, netball's set shot—when a player sets up and attempts a scoring shot—is a frozen moment with a virtual absence of offensive or defensive movement. Observers have likened the jumping up and the attempting to thwart the set shot by the defense to the irritation of a housefly. This action is in contrast to that of a woman basketball player as she drives toward the hoop and attempts a lay-up as every player on the court is involved in a demanding sequence of movements, accelerating or backpedaling at high speeds. The tension and athletic dynamism are palpable. In netball, although skill and tactics are required, athleticism is compart-

mentalized and contained. Netball is orderly and disciplined; team tactics and intelligent distribution of the ball take precedence over muscular exuberance and individual flair.

Ling Association

As noted, the Ling Association contributed to the spread of netball. Physical education teachers “exported” the sport around the world, including to Australia, the West Indies, western Europe, Myanmar (Burma), and India.

According to Janice Brownfoot, during the 1920s sports such as netball grew in popularity and availability among women in Malaya. A decade later netball was so popular that interscholastic contests flourished, and people sought adequate playground space to play the sport. Netball was not played only by girls in English-language schools; Muslim communities in Malaya also embraced netball. In 1935, when the Malay Women Teachers Training College opened in Malacca, netball was part of the physical education curriculum.

In 1926 the All-England Women's Netball Association was founded; of the ten committee members five were Ling Association representatives. Many county netball associations were formed in England during the 1930s.

From 1935 to 1956, despite World War II, netball expanded significantly. Two publications devoted to the sport were founded: *Netball Magazine* (1935) and *Netball* (1949). The British Broadcasting Corporation broadcast its first radio coverage of a netball game in 1947, the same year a British netball team went abroad. The fact that the team visited Prague, Czechoslovakia, is noteworthy because the Iron Curtain was firmly in place, and a cultural tour of Communist satellite countries was rare.

A major reason for the growth of netball since World War II has been the

sport's shift from its school base to a broad base of community, club, and college support. For example, in 1970 the All-England Netball Association had nine hundred member clubs in addition to two thousand school affiliates.

In 1963 New Zealand, Northern Ireland, Australia, Ceylon, England, Jamaica, Scotland, South Africa, Trinidad and Tobago, Wales, and the West Indies participated in the first world netball tournament.

However, netball does have its critics, as Colin Tatz said: "There has been some denigration of the game, with critics claiming that only thirty-six countries play it, and that competition comes from 'lightweight' nations such as Hong Kong, Singapore, and Malawi, and the like. This is unfair: there would hardly be thirty-six nations playing field hockey at international level; one would be scratching to find more than half a dozen countries playing league [rugby], and nobody else plays Aussie rules [football]."

Meanwhile netball adapts to the changing needs of different cultures and communities. In New Zealand a new version called "kiwi netball" is designed for younger players. Boys or girls or coed teams can play it. The ball is smaller, the goal posts are lower, and different scoring systems provide more scoring opportunities for participants. Nevertheless, this children's version stays true to the essence of the adult version. For example, movement with the ball is limited: A player who catches the ball may move from the place where the ball was caught but may not move the first landing foot while still in possession of the ball. If the player lands on both feet simultaneously, either foot may be moved. However, the second foot moved may not be regrounded while the player still possesses the ball.

A netball team has seven players, and the traditional uniform is a bib. Players can play only one positional role. These roles are C (center), GS (goal shooter), GA (goal attack), WA (wing attack), WD (wing defense), GD (goal defense), and GK (goal keeper). A game is played in four quarters.

Scholarly Inquiry

Netball has not received the same exhausting scholarly examination that other sports have received. However, in 1995 John Nauright and Jayne Broomhall, in an article entitled "A Women's Game: The Development of Netball and a Female Sporting Culture in New Zealand, 1906–70," noted that despite "patronizing attitudes" among male media personnel, netball gained popular appeal in New Zealand as a result of netball broadcasts on New Zealand television during the last fifteen years.

Almost from the beginning media and health professionals hailed netball as a great game for women, especially because it fits into the dominant conceptions of proper women's behavior and physical activity. Thus, netball succeeded in part because it fit the male hegemonic (relating to influence) system so well. As a sport netball does not seriously challenge notions about ways in which women should express themselves physically and therefore does not pose a threat to the gender order in the ways that many other sports, such as women's rugby or soccer, do.

The Netherlands

The Netherlands is a modern, industrial nation in Western Europe, and borders the North Sea, Belgium, and Germany. The capital city is Amsterdam, although The Hague is the seat of government. The Netherlands is a small but densely populated country, with a population of 16.3 million—that is 393 people per square kilometre. In a prosperous and open economy, the per capita purchasing power parity of the Dutch is \$28,600, which is comparable to Australia, Germany, or Canada.

Sport occupies an important place in Dutch society. The majority of the population actively participates in sport, and Dutch elite athletes are ranked at the top of many branches of international sport. Dutch sport is dominated by an extensive network of sport organizations, which are supported by or have close relationships with local governments, the business world, and the media.

History

In a survey of Dutch pastimes conducted in 1871, the historian Jan ter Gouw identified ice skating, yachting, and horse racing as national pastimes with a long history. He also mentioned running and cycling races, billiards, archery, and rifle shooting. Traditional activities such as *klootschieten*, *beugelen*, *kolven*, and fives were also still popular at regional levels at that time. Strikingly, though, ter Gouw's survey does not once mention the word *sport*. Yet only a quarter of a century later, football, tennis, field hockey, athletics, and cricket all had their own league competitions, clubs, and umbrella organizations in the Netherlands.

The introduction of these English sports in the last quarter of the nineteenth century was not an isolated phenomenon. As a result of Britain's prestige as a major power at that time, a general interest in the lifestyle of the British arose all over Europe. However, physical education teachers were far less enthusiastic about these new English products. Instead, they propagated alter-

natives that they believed would improve the nation's mental or physical strength, like gymnastics, swimming, handball, and *korfball*, a Dutch derivative of early-American women's basketball.

American sports like basketball, volleyball, and baseball entered the Netherlands after World War I. In 1980, the membership in Dutch clubs playing these sports had risen to 197,000, after which the numbers stabilized. American football, on the other hand, received more than incidental attention in the Netherlands only after 1980. At that time, the Dutch sport culture was also exposed to two other American influences. First, there was the huge growth of new sports, like fitness, skateboarding, snowboarding, and extreme and adventure sports, which young people were adopting from the United States through commercial satellite television and the Internet. These new sports were not part of the typical European (and Dutch) sport club structure, but developed in the context of new commercial relationships and on the streets. Second, there was growing media attention on American professional sports, particularly on teams belonging to the National Basketball Association and the National Football League.

Sport in the Netherlands receives substantial governmental support. In 2003 alone, some €700 million were given at a municipal level, and by far the greatest part of this was invested in the construction and maintenance of sport facilities. Financial assistance at a national level is less substantial (€74 million) and focuses on improving volunteer expertise, reducing the use of performance-enhancing drugs, and advocating elite sports events. Funds from national lotteries (€38 million) are also pumped into sport. In addition to this, the business community is closely involved, particularly with respect to broadcasting rights (which provide an income of €100 million for sport) and sponsoring (€500 million).

Participant and Spectator Sports

In 2002, about 65 percent of the population claimed to have participated in a sport at least once a month.

Swimming, fitness, walking, and cycling were particularly popular. Roughly 28 percent of the population participates in a sport within the context of a sport association. Here football is by far the most popular sport, followed by tennis, gymnastics, golf, and ice skating.

In general, Dutch elite athletes are most successful at football, cycling, speed skating, swimming, field hockey, and equestrian sports. Since the 1980s, their performances during the Olympic Games have continued to improve.

They reached an all-time high at the Sydney games in 2000 when the Netherlands won eighth place in the medal ranking. Celebrated Dutch sporting events are the Rotterdam Marathon, the Dutch TT Motorcycle grand prix, the International Nijmegen Four Day Walking Event, and the Eleven City Ice-Skating Marathon.

During important international sporting competitions, especially football, the multitudes of Dutch fans clad in orange are particularly conspicuous. This is the way that the Dutch express their “orange feeling,” which alludes as much to the House of Orange as to national unity and identity.

Women and Sport

During the first half of the twentieth century, sport was primarily an activity for young men. Since then the situation has changed so radically that women are now represented more or less equally. This equalization also occurred at the elite sport level. Since 1988, women on the Olympic team won just as many medals as their male counterparts. Nevertheless, major differences still remain. Men continue to be overrepresented in football, golf, and basketball, whereas women predominate in gymnastics, equestrian sports, volleyball, and aerobics. In a variety of other sports, the ratio is more or less equal, such as in tennis, which is the most popular sport among women. However, women are still greatly underrepresented in administrative and managerial positions within sport.

Youth Sports

Young people in the Netherlands are involved in sports on a huge scale. In 1999, roughly 91 percent of six- to eleven-year-olds participated in sports outside of school; 74 percent did so within the context of sport clubs. However, as young people get older, participation tends to decline significantly. Given the increasing prevalence of sedentary lifestyles, this is a source of concern for both sport organizations and the government. To encourage youth participation in sports, sport organizations are now adjusting the sports they offer to better reflect young people’s experiences and desires. Moreover, municipal governments grant subsidies to sport clubs in proportion to the number of youth members they have.

Organizations

Although the popularity of commercial fitness centers is increasing, competitive sport in the Netherlands is mainly practiced in the context of sport associations. There are some twenty-nine thousand sport clubs throughout the country. These private volunteer organizations have a total of around 4.5 million members and are affiliated with national sport federations, which in turn belong to NOC*NSF (a merger of the Netherlands Olympic Committee and the Netherlands Sports Federation).

Sports in Society

During the second half of the twentieth century, sport came to occupy a central position in Dutch society.

Netherlands

From *Kolf* to Golf

Many people wonder whether the word golf is actually an acronym. The name, however, has its origins in the Dutch game, kolf. Here's how the United States Golf Association explains it:

... it derives linguistically from the Dutch word "kolf" or "kolve," meaning quite simply "club." In the Scottish dialect of the late 14th or early 15th century, the Dutch term became "goff" or "gouff," and only later in the 16th century "golf."

The linguistic connections between the Dutch and Scottish terms are but one reflection of what was a very active trade industry between the Dutch ports and the ports on the east coast of Scotland from the 14th through 17th centuries.

Some scholars suggest that the Dutch game of "kolf," played with a stick and ball on frozen canals in the wintertime, was brought by the Dutch sailors to the east coast of Scotland, where it was transferred on to the public linkslands and eventually became the game we know today.

Source: *Golf history*. (2005). Retrieved March 10, 2005, from http://www.usga.org/questions/faqs/usga_history.html

Today sport is practiced and watched on a huge scale and there is a broad base of social support for its subsidization by the government, media, and business. The income and social security position of elite athletes has greatly improved, which means that an increasing number of people can practice elite sport professionally. However, the attention to and appreciation of elite sport is highly disproportionate, directed mainly toward football and a limited number of other sports.

The Future

There are signs that sport participation has stabilized and is possibly even on the decline, in particular among adolescents and young adults. Indeed, how people can be encouraged to partake in physical exercise is a hot issue in current sport policymaking. This policymaking

also focuses on the elderly, although it appears that participation in sport is continuing to increase significantly among this group. The growing number of immigrants also forms a new disadvantaged group in the area of sport. Along with this, the problems of performance-enhancing drugs, hooliganism, and sports injuries also warrant structural attention.

In the field of elite sport the costs continue to rise. While professionalization and commercialization are responsible for increased revenue, these developments also raise important questions—for example, what is the influence of commerce on sport and what will be the consequence of increasing pressure on elite athletes to remain at the international top at all costs?

New Zealand

New Zealand is a country formed of two major islands in the southern hemisphere, lying between 34 and 46 degrees of latitude south in the Pacific Ocean, a similar distance from the equator to Spain or California. Its nearest neighbor is Australia, which is 1,500 kilometers (930 miles) to the northwest. The population is just over 4 million and the capital city is

Wellington. New Zealanders like to think of themselves as a sporting nation, and there is little doubt that sport played a significant part in the formation of a national identity. Within this national identity, rugby, the “national game,” has played a pivotal role, and it remains a dominant cultural discourse despite sweeping social changes that have occurred in recent decades.

History

Evidence suggests that the earliest inhabitants of New Zealand, the Maori, first settled in New Zealand in the thirteenth century. No single word for “sport” existed within Maori society and sportlike activities such as wrestling and swimming were integrated into everyday life, the activities being inseparable from ritual and survival skills. Many of these indigenous activities, which were primarily seen as cultural rather than sporting, largely disappeared under the forces of nineteenth-century European settlement and the attitudes of the early missionaries.

Sport and games were seen as important aspects of the cultural transfer from Britain to her colonial empire, and most of these imported sports gained ready acceptance in the young colony. Even before New Zealand became a British colony, cricket had been introduced by missionaries in 1825, and other major sports such as rugby, croquet, yachting, boxing, curling and golf (the influence of the Scottish settlers in the south of the country), hockey, lawn bowls, wrestling, cycling, tennis, rowing, and foot races were successfully established by the turn of the century. A modified form of basketball (renamed netball in 1970) was introduced in the early years of the twentieth century and has become the dominant sport for women in New Zealand today.

Maori involvement in many of these sports was initially insignificant, but they were involved in rugby from the very early years of the sport in the 1870s. Jack Tairaroa and Joe Warbrick were two outstanding members of the first New Zealand rugby team, which toured Australia in 1884, while Tom Ellison, the first Maori to qualify in law in New Zealand, was the first to captain an official New Zealand rugby team on their Australian

tour in 1893 following the formation of the New Zealand Rugby Football Union a year earlier.

One of the great sporting stars of the colonial era was Bob “Ruby Robert” Fitzsimmons, at differing times a triple world boxing champion as a middleweight, heavyweight, and light heavyweight. When he defeated James J. Corbett at Carson City, Nevada, in 1897 for the world heavyweight title, a fight still considered one of the great title fights and a ring classic, the bout was watched by such famous personalities as Bat Masterton and Wyatt Earp.

As early as 1840, the 2,000 European settlers in New Zealand were catered to by billiard halls and gambling houses. Gambling and prostitution were part of the frontier life for many New Zealand males, and horse racing (initially established by the British elite) also became one of their favored pastimes. While private bars and “members’ stands” at racecourses preserved distinctions between the upper and lower classes, there was a “wide following for racing and trotting, and almost every public bar in the country had ‘bookies’ operating illegally to take bets” (King 2003, 308).

Voluntary and commercial sectors met most of the organized sporting needs of New Zealanders in the latter part of the nineteenth century and for much of the twentieth century, with local government playing a role in the provision of fields and facilities. It was not until the 1970s that this situation changed. The Recreation and Sport Act 1973 was instrumental in funding and developing sport and recreation in New Zealand and the new Ministry of Recreation and Sport created by the act was to actively support this process.

Participant and Spectator Sports

Although it began as a sport for the elite in Britain, rugby soon became the sport of choice for males in New Zealand. It fitted well with the physical and social needs of frontier life, and the rough surfaces of the typical sports “fields” were more conducive to rugby than to soccer or other competing forms of football. By the early part of the twentieth century, the success of the 1905 New Zealand rugby team (the All Blacks) on their

tour of Great Britain and the pride New Zealanders displayed in their achievements “suggested that a large part of the country’s emerging identity would be invested in this particular sport” (King 2003, 280). Rugby took “quick root in the distinctive male culture of New Zealand” (Phillips 1996, 95), and from the beginning of the twentieth century rugby was more than a game—as Jock Phillips suggests, it became a barometer of the nation’s health.

Other team sports have also figured prominently in New Zealand’s international successes, with the New Zealand men’s softball team, the Black Sox, winning world championship successes in 1976 (joint winners with Canada and the United States), 1996, 2000, and 2004, and there was a gold medal triumph for the men’s field hockey team at the Montreal Olympics in 1976. Water sports have also given the country significant success at the Olympic Games, with five gold medals in rowing including Rob Waddell in the single sculls in Sydney and the coveted eights in Munich in 1972, four gold medals in sailing and two in board sailing, and five gold medals in canoeing, four of these going to New Zealand’s most successful Olympian, Ian Ferguson. In addition to this, Peter Blake and Grant Dalton have both had major successes in ocean racing, each winning the Whitbread Round the World Race.

One of New Zealand’s earliest sporting heroes was the highly gifted tennis player, Anthony (Tony) Wilding. Wilding won the Australian singles title in 1906 and 1909 and the Wimbledon singles four times in succession from 1910–1913, and he was a member of the

Australasian team that won the Davis Cup in 1907–1909 and again in 1914. The victory over the United States in 1914 almost coincided with the outbreak of World War I, and it was a war from which Wilding did not return, as he was killed in action at the age of thirty-one in France in 1915. John Edward “Jack” Lovelock was another incomparable athlete, setting a world record for the mile in 1933 and winning the gold medal in the 1,500 meters at the Berlin Olympics, also in world record time. He was another to die tragically, falling under a subway train in New York at the age of forty. Peter Snell, one of New Zealand’s most famous sporting sons, won gold in Olympic record time with his upset win in the 800 meters at the Rome Olympics in 1960, and completed a very rare double in the 800 meters and 1,500 meters in Tokyo four years later. A holder of world records for the 800 meters, 880 yards, and the mile, Snell’s time for the 800 meters at Tokyo in 1964 would have been good enough for a silver medal thirty-six years later at the Sydney Olympics, a measure of his remarkable ability.

The great golfer Bob Charles was the first left-handed player to win a major title in winning the British Open in 1963, and this was a record he held for fifty years. A multiple winner on both the European and the PGA Tours, Charles continued his successful career on the Senior Tour with a further twenty-four titles, and he was knighted in 1999. In addition, the New Zealand team of 1992, a team that included two outstanding Maori golfers, Michael Campbell and Phil Taitaurangi, won the world amateur teams golf championship for the Eisenhower Trophy, defeating a United States team including Justin Leonard and David Duvall by seven strokes.

In motor sports, New Zealand has had some outstanding successes. Denny Hulme was world Formula One champion driver in 1967, while Chris Amon and Bruce McLaren were also successful drivers in the sport, McLaren also making an enduring contribution as an engineer and inventor. Since McLaren cars first appeared

In addition, John Britten was a revolutionary motorcycle designer whose Britten V1000 motorcycle not only broke four world speed records in 1994 but was exhibited in the Guggenheim "The Art of the Motorcycle" exhibition in 1998. Britten, who died of melanomic cancer at only forty-five years of age in 1995, was placed equal with the four founders of Harley Davidson as Motorcyclist of the Millennium.

To this list can now be added the former world number one ranked triathlete, Hamish Carter, who gained his greatest reward at the Athens Olympics in 2004, where he won the gold medal from his New Zealand teammate and 2004 world champion Bevan Docherty in the Olympic triathlon.

Women and Sport

Hockey was the most popular team sport for women in New Zealand in the latter part of the nineteenth century and the early decades of the twentieth century. In 1935, the New Zealand women's team was the first national women's sporting team to travel overseas with its highly successful tour of Australia. Netball, which was becoming much more prominent by this time, toured Australia for the first time in 1938, and it was beginning to

replace hockey in many areas as the dominant female sport. The New Zealand Silver Ferns have been world netball champions in 1967, 1987, and 2003, and the sport can now be considered to be the “national game” for New Zealand women. Over the last decade, the development and growth of women’s rugby has also been highly significant. In a sport that has been so important to male culture in New Zealand, the acceptance of women on the playing field was difficult to achieve, but the great accomplishments of the New Zealand women’s team, the Black Ferns, in winning the Women’s World Rugby Cup in 1998 and 2002 have brought a great deal of support for the game. The New Zealand women’s cricket team won the World Cup in 2000, the New Zealand women’s softball team has also tasted international success, winning the world championship title in 1982, and the Kiwi Ferns were successful in the first Women’s Rugby League World Cup in 2000 and again in 2004.

New Zealand women can fairly claim to have produced some of the major highlights in New Zealand’s brief sporting history. At the Helsinki Olympic Games in 1952, Yvette Williams became the first female gold medalist for the country with her Olympic record in the long jump, and in 1954 she achieved the supreme distinction of breaking the world record in this event. Allison Roe reached the pinnacle of her running career in 1981 with wins in both the Boston and New York City marathons, and her time in the latter event was the fastest run by a woman at that time. Susan Devoy was a four-time world champion who won eight British Opens in squash and was continuously ranked number one from 1983 until her retirement in 1992. Almost unbeatable on the court, she was undoubtedly squash’s most formidable woman player of her era. Former British Open champion Leilani Rorani (nee Joyce), who took out the first women’s doubles championship with Philippa Beams, has also achieved notable success.

Erin Baker, perhaps the most complete female triathlete and multiple world champion in the 1980s, and Barbara Kendall, a three-time world champion windsurfer who won Olympic gold at Barcelona, silver at At-

lanta, and bronze at Sydney to become the country’s foremost female Olympian, have kept the flag flying high for New Zealand sportswomen. More recently, at the Athens Olympic Games, the Evers-Swindell twins, Caroline and Georgina, kept a three-year unbeaten record intact when the double world champions took a gold medal in rowing in the double sculls. Sarah Ulmer became New Zealand’s first Olympic gold medalist in cycling when, after winning the individual pursuit and breaking the world record at the 2004 World Championships, she completed an identical feat at Athens, a magnificent achievement.

Youth Sports

Physical training, games, and sport have been part of the curriculum in New Zealand schools since the passing of the Education Act in 1877. Sport has had a high profile in New Zealand schools from the early years of education in this country, and the earliest high schools quickly established sporting contests with other schools, a pattern that was to continue, to broaden in scope, and to intensify in the twentieth century. In 1988, KiwiSport was introduced into New Zealand elementary schools for 7–13-year-old pupils. A program of modified sports (based on the Australian Aussie Sport model), it has grown to the extent that almost every young New Zealander is now exposed to this program. While there has always been some tension between physical education and sport in schools, the national curriculum adopted in 1999 acknowledges that sport is integral to New Zealand’s culture and is an important part of the overall development of students. The development of sports academies has escalated over the past decade in New Zealand high schools. The academies provide specialized programs within the school timetable for talented or elite athletes who have been identified through a variety of methods determined by individual schools. More recent developments have involved the appointment of sports coordinators in New Zealand high schools with funding provided by the government and support from Sport and Recreation New Zealand.

Rugby in New Zealand

Because it took such quick root in the distinctive male culture of New Zealand, rugby was at first regarded with a good deal of ambivalence by the more respectable middle class despite the game's public school origins. Respectable people judged it to be 'a rough and dangerous game', as a Dunedin paper claimed in 1875, and an excuse for anarchy and violence. The 'sober-minded folks' watching a game in Wanganui in 1875 were 'heard giving expression to their feelings of contempt'. When in 1877 Frederick Pilling was killed in a club match, the coroner claimed that 'the game of football was only worthy of savages'. Such racist associations were not, of course, relieved by the quick enthusiasm with which Maori took up the game. As the *Wairarapa Star* claimed, Maoris were believed to be 'warm-blooded animals' whose interests easily degenerated into pugilistic encounters. During the 1870s many respectable folk of wowsy sympathies must have shared the view of the *New Zealand Herald* in 1878 that 'Bull-baiting

and cock-fighting have more to commend them as recreations than the rough-and-tumble hoodlum amusement yclept football which our youths seem to take so much delight in'. Even as late as 1889 the Wellington Rugby Football Union complained of their game: 'Somehow it has got a bad name and a large section of the public are never done condemning it. It is brutal, it is coarse, it is not scientific'. Rugby was seen as encouraging all the less desirable elements of male culture—fighting, drinking, swearing. The latter, in particular, was a cause of some concern. The *Temuka Leader* commented after a match with Timaru: 'The abominable conduct and the oaths and filthy expressions made use of by some of the young roughs from Timaru were disgusting in the extreme . . . If such conduct is not stopped, no parents will permit their boys to mingle with such low young rascals.' (Phillips 1996, 95)

Organizations

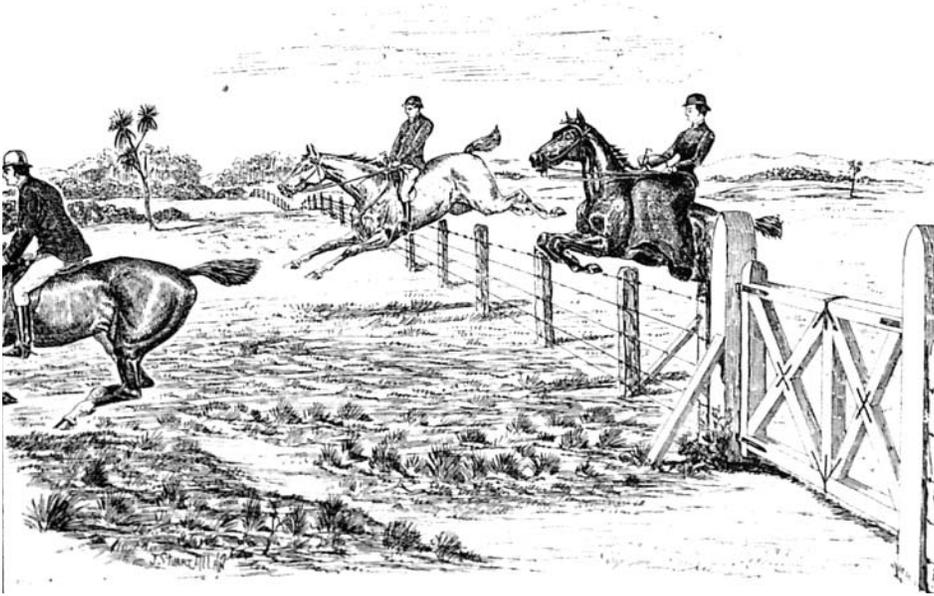

At a national level, the Ministry of Recreation and Sport was replaced by the Hillary Commission for Recreation and Sport in 1987, named in honor of the conqueror of Everest and one of New Zealand's most famous sons, Sir Edmund Hillary. The commission was in turn replaced by Sport and Recreation New Zealand (SPARC) in 2002. The latter's mission is to promote active lifestyles for New Zealanders through effective sport and recreation systems, and to promote sport at the elite level, particularly in those sports that are significant to New Zealanders. One of SPARC's responsibilities includes the New Zealand Academy of Sport, which was established in 2000 to support elite athletes.

The New Zealand Assembly for Sport claims a collective membership of more than 1.5 million and provides advocacy and information services and sports law resources, and also has a system for supporting prom-

ising athletes. The New Zealand Olympic Committee (NZOC) oversees the administration, selection, development, and funding of teams that compete at both the Olympic and Commonwealth Games. Regional sports trusts provide a regional voice for sport and, with support from the Hillary Commission and SPARC, they have had a major impact on the local and regional scene. The New Zealand Sports Foundation, the New Zealand Federation of Sports Medicine, Coaching New Zealand, and Sport Science New Zealand have all made significant contributions to New Zealand sport, although some of these organizations have now also been subsumed by SPARC.

Sport in Society

While rugby has been the national game since the latter part of the nineteenth century, it has not been without moments of great controversy, none more so than the massive social upheaval created by the tour of

Foxhunters jumping a barbed wire fence in early twentieth century New Zealand.

New Zealand by the South African rugby team, the Springboks, in 1981. “The prolonged . . . relationship with South Africa and its rejection of Maori players, the upsurge of female resistance to the game, and the growth of a wide range of other sports contributed to the weakening of the near-exclusive hold of rugby over male leisure” (Hindson et al. 1994, 35). Not only was rugby in disrepute, but this was the very time when the success of the New Zealand soccer team, the All Whites, in qualifying for the World Cup in 1982 greatly furthered the popularity of that sport. For the next decade, the Rugby Union attempted to counter the effects of the “near civil war of 1981” (MacLean 2000, 256), and it took the success of the All Blacks under David Kirk in the inaugural Rugby World Cup in 1987 to restore the national game to a preeminent place in New Zealand sport. More recent rugby successes on the world stage have assisted in rehabilitating the sport, including wins in the Women’s World Rugby Cup, the World Rugby Sevens, and a gold medal to the Wheelblacks in the Wheelchair Rugby final at the Paralympic Games in Athens.

In yachting, Team New Zealand’s magnificent victory in the America’s Cup in 1995 in San Diego was only the second time in the event’s 144-year history that a non-American team had won the coveted silver trophy. However, the reign of the cup holders was to end in considerable controversy. Successfully defending the Cup in Auckland in 2000, where they became the first

non-American team to retain the Cup, the Team New Zealand crew then suffered the loss of its skipper, Russell Coutts, and several other key members to rival Swiss syndicate Alinghi, and it was the latter who successfully wrested the cup from Team New Zealand in the America’s Cup challenge in 2003.

The Future

While sport clearly still holds a privileged position in New Zealand, major social and cultural changes in the 1970s and early 1980s saw new activities and alternative approaches to sport begin to flourish, and older cultural or sporting forms were replaced or swept aside by the new, the novel, and the fashionable. Extreme or action sports are now attracting growing numbers of young people who are opting out of adult-controlled, structured sport activities, and there is a growing preference for unstructured physical leisure activities (e.g., skateboarding, roller blading, mountain biking, snowboarding, etc.). These activities have a youthful demographic and an attachment to youth culture with its associated clothing fashions and music.

In addition, many New Zealanders can no longer participate in regular sporting competitions because of longer and sometimes irregular working hours, and this, too, has increased the popularity of individualistic sporting and recreational pursuits. This further erodes the popularity of team sports (from a participant but not a spectator level), and means there are fewer people committing themselves to such activities. While sport is still a major aspect of New Zealand culture, its centrality to national identity is now frequently challenged and called into question. Despite this, sport continues to hold a very significant place, and rugby and netball, the national games, retain a high profile.

Newspapers

Every day around the world millions of people collect their daily newspaper from the mailbox or buy it on the way to or from work, read a version on the Internet, or listen to radio or television summaries of the headlines. For many readers the sports pages are a large part of the attraction of the newspaper.

The huge popularity of sports with newspaper readers is evident in the high proportion of editorial space given to coverage of sports. Around the world research suggests that newspapers in both developed and developing nations dedicate between 15 and 20 percent of editorial space to sports. The daily sports pages are primarily a record of what has happened during the previous twenty-four hours, focusing on those people and events deemed to be of most importance or interest to

the general public. As David Conley puts it, “If the media acts as society’s scoreboard, journalists are its scorekeepers. Some might think that the score is padded, or that someone cannot count, but few can deny that journalists are daily historians, recording a community’s best and worst moments” (Conley 1997, ix).

Changes in the Sports Pages

Tradition has largely determined the sports that receive the most coverage. Those sports that received early coverage—such as boxing, horse racing, and baseball in the United States, rugby in New Zealand, soccer and cricket in the United Kingdom—have maintained their dominance despite an explosion in new sports and events since the 1970s. Since their early days newspapers have focused on those sports that appeal to the perceived interests of their readers. This focus has meant an emphasis on sports played or watched by an educated, literate, and middle-class readership. John Stevens argues that the strongest evidence of middle-class bias in news coverage appears in the sports pages, which fail to cover sports, such as stock car racing, bowling, or rodeos, that attract large blue-collar followings.

Instead, American newspapers large and small devote space to elite or middle-class sports: golf, tennis, skiing, and distance running. Boating and yachting are covered out of all proportion to their popularity, and sports editors tend also to give space to “country club” sports like women’s golf and tennis. (Stevens 1987, 10)

The development of television through the 1960s had profound effects on newspaper coverage of sports. Most obviously, it generated a shift away from stories that focused on results and descriptions of play. No longer could sportswriters assume that most readers had not “seen” the game. Instead, coverage became more analytical and focused on in-depth analysis of why and how particular results occurred. The challenges posed by television also led to a broader range of stories being found in newspapers as “reporters began to look into boardrooms, courtrooms, and training rooms” (Garrison and Sabljak 1993, 31). Today’s sports sections are a mix of

in-depth analysis, feature material, opinion, and behind-the-scenes or nonevent coverage. As sports have become big business, and as athletes have become celebrities, sports stories have begun to appear throughout the newspaper. Serious issues such as gambling, drugs, sex scandals, and restraint-of-trade legal cases often appear on the front page rather than in the sports section.

Acquiring Male Readers

Even a cursory reading of most daily newspapers shows that the sports pages are far from a record of the full diversity of sports being played or watched. Instead, because newspapers are in the business of selling readers to advertisers, coverage is dedicated to those athletes and sports that are believed to attract the readers that advertisers want to target. "In effect, readers are a commodity generated by the news industry . . . and access to them is sold as advertising space" (Lowes 2004, 131). Advertisers want to purchase clearly defined and highly concentrated audiences of people likely to buy their products. Stevens points out that publishers developed special sports sections to help advertisers reach male readers "just as they packaged fashions and society for women and comics sections for kids" (Stevens 1987, 7). The trend continues today with metropolitan daily newspapers selling advertisers on the ability of the sports section to attract the highly desirable demographic of males aged eighteen to forty-nine with disposable income. Lawrence Wenner suggests that "in many ways, the sports press provides a socially sanctioned gossip sheet for men . . . a place where a great deal of conjecture is placed upon 'heroes' and events of little worldly import" (Wenner 1989, 15).

In a recent study of work routines on a large metropolitan Canadian daily newspaper, Mark Lowes discovered that the newspaper openly courted male readers by focusing on commercial spectator sports that are widely considered as the most appealing to male readers. "The prevailing philosophy in the news industry is that the most effective way to attract male readers is to provide extensive coverage of commercial spectator sports" (Lowes 2004, 131). As a result, non-

commercial sports were largely absent or covered as an afterthought at best.

Reflecting Cultural Values

Like all forms of mass media, newspapers select between different sports for those believed to have the widest appeal to readers. Within each sport newspaper coverage highlights particular aspects and downplays or ignores others. Research consistently reveals the cultural assumption that *men's* commercial sports sell newspapers and advertising and have the widest appeal. In comparison, women's sports, masters-level competitions, and events such as the Paralympics are believed to have a much narrower focus. However, evidence from Australia that few newspaper sports sections actually conduct market research means that the content of the sports section reflects the assumptions and choices of editors, journalists, subeditors, columnists, and photographers, the overwhelming number of whom are white, male, and middle-class. Their decisions, which are often explained as "natural" or "normal," are in fact trained by on-the-job practices and years of consuming mediated sports.

The increasing coverage of commercial sports reinforces the idea of sports as an entertainment spectacle to be purchased or consumed. The mostly male professional sports from which money can be made via tickets, merchandise, and television rights receive the most coverage. The process of assigning reporters to cover specific professional sports beats also contributes to the high level of coverage for commercial sports. Reporters on a beat are "forced to come up with something, even if it's the most banal story imaginable. . . . Lack of activity on a sports beat is . . . insufficient grounds for a reporter not to generate news" (Lowes 1999, 43).

Overall, newspapers' choices *among* sports tend to mean commercial rather than amateur, male rather than female, able-bodied rather than Paralympic, and elite rather than masters-level sports. Choices *within* sports tend to reinforce rather than challenge cultural beliefs and ideas about gender, race and ethnicity, age, disability, and national identity.

Influencing Readers

The stories and images in the sports pages reflect and contribute to readers' understandings of the society in which the readers live. As Stuart Hall puts it, rather than telling us *what* to think, the news media tell us *what to think about*. Media coverage does not directly affect behavior but slowly transforms what appear to be "the most plausible frameworks we have of telling ourselves a certain story about the world" (Hall 1984, 8). Phillips argues that "regardless of what is actually happening, it is the media's interpretation of that event that shapes our attitudes, values and perceptions about the world and about our culture" (Phillips 1997, 20). Therefore, media versions of particular cultural events—particularly those with which fewer people have direct experience such as the Gay Games or masters games—are important to how those events and the people who participate in them are seen by the general public. When newspapers give saturation coverage of the Olympic Games but virtually ignore the Paralympics, this choice sends an important message about what kinds of sport "really" count and are valued by society.

Representing Gender Differences

Generally, newspapers' choices tend to reflect cultural beliefs of their time. For example, during the early 1900s sports stories about women tended to focus more on women's ability to serve tea or their involvement as spectators rather than participants. Although sportswomen received coverage through the 1920s and 1930s, the sports pages after World War II reflected cultural expectations that women would return to motherhood, homemaking, and domesticity. In Australia coverage of women's teams and international tours decreased in the face of a belief that "the only fitness women needed in postwar Australia was the fitness required to produce healthy babies" (Stell 1991, 232). Even during the 1970s a judge in a North American case over equal access to sports was reported to have said: "Athletic competition builds character in our boys. We do not need that kind of character in our girls, the women of tomorrow" (Dyer 1982, 109).

Worldwide research shows that the sports pages are dominated by stories and images of men's sports, particularly those commercial team sports that are also linked to national identity and culturally valued ideals of masculinity. Many newspaper stories and images focus on men's courage, toughness, physical aggression, and ability to withstand pain. The sports pages carry images of bloodied men, bone-crunching tackles, and bandaged and taped body parts. As well, most images of male athletes are in action, performing physical feats of skill and daring.

Similarly, coverage of women also tends to support cultural ideals of femininity. Historian Murray Phillips's assessment of media coverage in Australia reflects the results of hundreds of international analyses: "As all the surveys since 1980 have indicated, women have struggled to get consistent, long-term and supportive media attention. . . . In reality the media profile of women's sport is inconsistent, short-term and focused on sensational stories" (Phillips 1997, 19). Media descriptions often emphasize women's physical traits, clothes, emotions, and relationships and focus on conventionally attractive or sports-sexy athletes such as tennis player Anna Kournikova. Photographs reinforce the sports-sexy image by focusing on women's buttocks, breasts, hips, thighs, and lips. Overall, most coverage is ambivalent, meaning that "positive descriptions and images of women athletes are juxtaposed with descriptions and images that undermine and trivialize women's efforts and successes" (Wensing and Bruce 2003, 388).

This focus on traditional notions of masculinity and femininity translates into higher levels of coverage for men in physically dangerous or contact team sports such as rugby or soccer and for women in individual, aesthetic, and noncontact sports such as tennis, ice skating, swimming, golf, gymnastics, and diving.

Representing Racial Differences

Newspaper coverage has long reflected cultural beliefs about race. Newspapers during the 1930s equated black athletes with animal imagery and represented them as unequal to white men. Stereotypes such as laziness and

Accuracy in Sports Reporting

This letter to the editor from the early 1800s comments on the need to report sports events accurately and also offers advice to the reporters.

To the Editor of the Spirit of Times—The utility and the beauty of the reports of all races is their strict and rigorous accuracy; and rather than have the most humorous and witty account of a race which draws upon the fancy at the expense of truth and the facts of the case, all true sportsmen would prefer the bare statement of facts, without note or comment. Indeed, justice to horses and their owners or breeders demands this, or your records cease to be looked to as the standard of the merits of the horses of the day which they propose to notice, and may loose, if they be allowed to be inaccurate, all the advantages proposed by them, for after, as well as the present, times. One acknowledged inaccurate report, unless it be corrected, may vitiate the credit of a dozen reports from the same source, which may be rigidly correct as to the time made, and other matters.

Under this impression, and with this view of the subject, I consider that the interests of the American Turf demand that every intelligent Turfite should regard it as his bounden duty to have corrected through

your paper, any errors that may be officially reported, when there is a certainty that a mistake has been made—else we shall soon have *doubted* the record of a number of extraordinary durability or bottom. The report of a race should not be regarded as only a newspaper flourish, but a strict record of names and pedigrees, of distance, of time, and of the places of the different horses that run as they come in, if they *can be placed*. And for this purpose the person intending to make the report should hold pencil and paper in hand, and note the facts as they occur, and not depend upon his memory to record the particulars of several races which occur so near together in the same day as to be almost jumbled up together in the memory at its close. Nothing should be said by the *reporter* like these things—that “*Boston*, has he been pressed, could have made his 4 miles in this race in the astonishing time of 7:36”—or that “this heat by *Balie Peyton* and *Duane*—7:42 [1/2]—is the best on record”—or that “in this there were three second rate nags, and three certainly not above third rate.” Facts alone should be stated, and these facts left to deduce their own commentaries.

ability to cope with pressure were widespread. For example, in a description of U.S. boxer Joe Louis in 1939, reporter Paul Gallico wrote: “Louis, the magnificent animal. . . . He eats. He sleeps. He fights. . . . Is he all instinct, all animal? Or have a hundred million years left a fold upon his brain?” (Coakley 1998, 258).

Although as time passes stereotypes change along with cultural beliefs and values, the echoes of the past can easily be heard in sports coverage that emphasizes black athletic superiority with little reference to hard work or intellect. Although several studies point to a wider array of representations and a decreasing reliance solely on the “black athlete” metaphor, more than twenty-five years of analyses suggest that much

media coverage reflects conventional racial stereotypes about black and white athletes. For example, black basketball players are, as McDonald and Andrews argue about U.S. basketball star Michael Jordan, frequently linked with lingering codes of natural athleticism that recapture the mind-body dualism that has dominated popular racial discourses. “This discourse of extraordinary athleticism relies upon common sense assumptions of an innate Black physicality, a racist characterization once used to justify the institution of slavery and Social Darwinist constructions of White supremacy” (McDonald and Andrews 2001, 25). One of the key effects of such coverage is the polarizing of distinctions between “races” so that they become

I always turn to the sports page first, which records people's accomplishments. The front page has nothing, but man's failures. ■ EARL WARREN

understood as *more* rather than *less* different. The stereotypes produced by the media are repeated so often that they become accepted as cultural “facts.” They have significant effects because people come to see them as accurate and informative. For example:

If a coach believes that the black sportsman he is helping to prepare is naturally endowed with the physical equipment to produce fast sprints . . . it will affect his judgment as to the areas of specialty into which he should channel the efforts of that sportsman. (Cashmore 1982, 44)

Representing National Uniqueness

The media are a powerful tool in the symbolic imagining and (re-)creation of a nation. In particular, the Western sports media reinforce and re-create particular imaginings of national identity that hark back to past successes. Media coverage of international sports often emphasizes shared values and draws attention away from internal divisions such as race, class, religion, and gender. Rowe and colleagues suggest that “there is surely no cultural force more equal to the task of creating an imaginary national unity than the international sports-media complex” (Rowe, McKay, and Miller 1998, 133). Overwhelmingly, each nation’s media coverage of international sports events focuses on representing “us” as joined together and sharing in the successes of “our” athletes. When newspapers cover athletes from “other” countries, the coverage tends to draw upon and reinforce stereotypes about the personality traits of different nations or groups within nations such as the flamboyant Italians, the inscrutable Chinese, the hardworking British, or the hot-headed and unpredictable South Americans.

Despite the media representing a nation as united, sporting national identity is strongly gendered. Rowe and colleagues (1998) argue that the sports media almost exclusively concentrate on men as the carriers of national character. They point out that although the achievements of individual women athletes may be of great media significance, “at the level of team sports, where the source of pride is collectivized, women are denied the status of bearers of national qualities that the

media and the apparatus of the state conventionally accord to men” (Rowe, McKay, and Miller 1998, 126).

The Future

The trend of condensing media ownership, supporting fewer newspapers, and having less media competition continues apace throughout Europe, Australasia, and North America. Many markets today have only one daily newspaper. However, as Conley points out, “Despite periodic assertions—first by the broadcast industry, and currently on behalf of the information superhighway—that newspapers are destined to become fossils, there is still no sign this is occurring” (Conley 1997, 31). To date newspapers have successfully adapted to each challenge and maintained a steady share of the sports news market.

The focus of newspaper research is likely to remain on commercial sports and global events such as the Olympics, tennis Grand Slams, and world cups that receive the most coverage. Except for those women’s sports that can sell themselves as sports-sexy, coverage of women’s sport is increasingly likely to be found in niche publications such as *Sports Illustrated for Women* or on the Internet, which offers publicity options for those sports that are ignored by mainstream newspapers.

Nextel (Winston) Cup

The Nextel (Winston) Cup is a U.S. stock car racing series that was sponsored by R. J. Reynolds tobacco company from 1971 to 2003 and by Nextel communications company since 2004. The series is the most famous governed by the National Association for Stock Car

Auto Racing (NASCAR), the main motor sports sanctioning body in the United States. The winner of the series is determined by points awarded at races throughout the season. Part of the appeal of the Nextel Cup is the fact that drivers race in stock cars; fans can drive home in the same kind of car that they saw win a race. Seven million fans saw Nextel Cup races in person in 2003.

Origins

Stock car racing grew in popularity in the southeastern United States during the 1940s, with many organizations trying to promote and control the sport. Bill (“Big Bill”) France Sr. consolidated these organizations into NASCAR in 1947. NASCAR started the “Strictly Stock” national point series in 1949, followed by the “Grand National” series from 1950 to 1970. However, the series was often won by any team who could simply get a car to all the national races because often more than fifty races a year were held.

Junior Johnson approached R. J. Reynolds about sponsoring his racing team in 1970 for \$800,000. The timing was good; Reynolds had extra advertising money to spend because it could no longer advertise on TV and radio, so Reynolds sponsored the entire series. In December 1970 Reynolds pledged \$100,000 for a special point fund for the 1971 NASCAR season, creating the Winston Cup points series. Soon after, the number of races was reduced significantly so that drivers would be able to show up at all races.

In 1972 the name of the series changed from “NASCAR Grand National” to “NASCAR Winston Cup Grand National,” then to the “NASCAR Winston Cup” in 1986. Reynolds’s promotion, along with the growth of corporate sponsorship across the board, brought the sport to a new level. The stars of the series—Darrell Waltrip, Dale Earnhardt, and Richard Petty—also helped the series become popular. U.S. President Ronald Reagan’s visit to the Firecracker 500 race in Daytona, Florida, to see the final win of Petty’s career in 1984 brought national coverage to the sport. Other bonus payouts such as the Winston Million and No Bull 5 brought further interest in the series.

When Nextel became the series sponsor in 2004, the series was renamed the “NASCAR Nextel Cup Series.” Reynolds could no longer sponsor the series because of the 1998 legal ruling that tobacco companies would not be permitted to sponsor sporting events in most states.

Teams

Forty to sixty teams compete in the series each week from mid-February to mid-November. To ensure close races, cars must have equal weight and the same size gas tank and use the same kind of gasoline and tires. Drivers are limited to driving a few makes of U.S.-made, steel-bodied passenger sedans: Chevrolet Monte Carlo, Ford Taurus, Pontiac Grand Prix, and Dodge Intrepid. Stock parts such as doors, windows, passenger seats, and the ignition are removed from the cars.

Teams are made up of at least forty people, including the crew, pit crew, spotters, mechanics, managers, and scorers. Sometimes teams support more than one car; this arrangement helps distribute costs and allows drivers to share information.

Drivers

Drivers must be at least sixteen years old. Originally NASCAR drivers were hard-racing, hard-fighting, hard-living folks from the southern United States. Now drivers are more down to earth and family oriented, coming from all over the United States and overseas. Drivers and team members are still mostly white males, with a few minority members and women involved (although women make up about 50 percent of the fans of the sport).

Drivers must be versatile because the series is raced on four types of

tracks: superspeedways (more than 4 kilometers), intermediate (1.6–3.1 kilometers) tracks, short (.8–1.2 kilometers) tracks, and road courses. Richard Petty and Dale Earnhardt won the series championship seven times each. Petty also won the most races (two hundred).

Scoring

The points system used until 2003 was invented by Bob Latford in 1975. The Nextel Cup winner receives 175 points. Each of the next five places receives five fewer points for each place (170, 165, and so forth). Places 7–11 receive four fewer points each, and places 12 and higher receive three fewer points each. At most forty-three drivers start a race, so the forty-third-place finisher would receive thirty-four points. In order to win points, a car must start the race and complete one lap. Five bonus points are awarded to any car that led at least one lap (counted at the start/finish line), and five more points are awarded to the car that led the most laps. At the end of the season the series winner is the driver with the most points.

The points system was changed in 2004 in an attempt to reward wins over consistent finishes. Points were tallied as described earlier until after the twenty-sixth race of the season. At that time the top ten drivers and any driver within four hundred points of the winner are the only drivers whose points are reset for the “Chase to the Cup.” The top driver gets 5,050 points; the second-place driver gets 5,045 points, and each driver after that gets five points less. Thereafter, races count the same as described earlier.

The Future

Interest in the Nextel Cup and NASCAR is no longer confined to the southern United States as stock car racing has grown faster than all other U.S. national sports leagues during the last decade. Every large track is adding seats, perhaps to the detriment of the smaller tracks used in the series, and almost all series tracks are owned by corporations now. The U.S. television ratings are second only to those of the National Football League. Stock car racing is a \$2 billion annual business, with \$1 billion of that coming from souvenir sales. NASCAR is attempting to become a more diverse sport through initiatives and minority-owned teams.

Nigeria

Nigeria, the most populous black nation in the world, is located along the west coast of Africa. Traditionally Nigerians—120 million people of diverse cultures and traditions—are sports-loving people. Traditional sports such as fishing, hunting, moonlight wrestling, and traditional dancing are organized competitively among cities, especially during festivals often staged during the harvest seasons and in the evenings after a hard day's work on the farm.

Modern Sports

Nigeria's real sports progress began with formal sports organization in 1910 and its extension from teacher training colleges to secondary schools when Empire Day competitions were organized about 1928. The establishment of mission schools assisted the development of new sports and games, which were challenges to students. In spite of these challenges, sports brought Nigerians together.

The period between 1920 and 1940 marked the beginning of modern sports in Nigeria. In 1933 the British syllabus was imported through missionaries. This syllabus included sports such as soccer and gymnastics. Then, between 1940 and 1960, the government backed sports in Nigeria, giving them legitimacy. Competitions—for instance, the Grair Powell Cup competition and the Principals Cup competition for secondary schools—were introduced, organized, and developed. These two competitions served as a way to select outstanding athletes to represent Nigeria at the 1950 Commonwealth Games.

The first appearance of Nigeria at the Olympic Games—as a British colony in 1952 at Helsinki, Finland—further helped the development and acceptance of sports in Nigeria. Nigeria won its first Olympic gold medals in the women's long jump and men's soccer in Atlanta, Georgia, in 1996.

The period of 1960–1970 marked a turning point in the history of sports in Nigeria. During this period,

In the extract below, British missionary George Basden describes games and sports among the Ibos of Nigeria.

Ordinarily the Ibo is a very serious person. At the same time he has a well-developed humorous side to his nature and he can, on occasion, give play to his emotions with complete abandon, so much so that he becomes totally oblivious of things around him.

The games commonly played by boys and girls have been described in Chap. V [turning somersaults in the air, shooting with bows and arrows, wrestling

and dancing]. In the case of adults it is not always easy to distinguish between recreation and serious occupation; sometimes the two are combined, as in shooting. In the case of dancing it is often difficult to differentiate between that which is simply recreative and that which is the physical expression of religious enthusiasm. Shooting, wrestling, dancing and swimming are the sports of men; comparatively few of the women swim, but all indulge freely in dancing. The national game of Okwe is common to both sexes.

because of the acceptance of the educational values of sports, many institutions established departments of sports. Nigerian universities also formed the Nigerian University Games Association (NUGA) during this period.

Participant and Spectator Sports

Soccer, the most popular sport in Nigeria, got its first boost when Governor Arthur Richards donated the Challenge Cup in 1945. Nigeria's first attempt at international sports occurred when Dr. Nnamdi Azikiwe represented Nigeria in the 440-yard race at the 1934 Commonwealth Games in London. Nigeria participated in the Commonwealth Games from 1950 onward: Auckland, New Zealand, in 1950; Vancouver, Canada, in 1954; and Britain in 2002.

Sports have helped Nigeria to unite its diverse ethnic groups when politics has failed. Indeed, sports have been used to arrest the drift toward intertribal war such as the Nigerian Civil War of 1967–1970. The National Sports Council was established to govern sports in Nigeria. The biggest sporting event in Nigeria, the national sports festival, was introduced by Nigerian sports enthusiast and organizer Jerry Enyeazu in 1973 after the civil war, and it is still the most celebrated sports event in Nigeria, staged every other year.

Today Nigeria participates in twenty-six international sports and five traditional sports. Nigeria has also introduced para-soccer (soccer on skates for paraplegics) to the

rest of the world. After soccer, the most popular sport in Nigeria is track and field (athletics).

Women in Sports

Traditionally Nigerians had seen sports as an activity for men, whereas they had seen sports as a distraction for women rather than as a fundamental part of a healthy life. Nevertheless, women's historical struggle for increased opportunities has resulted in changes that only a few years ago were unimaginable. Women now participate in a vast range of sports in Nigeria. They are no longer content to be spectators either in public life or in sports. Nigerian women have continued to boost the country's international image through sports. They have shown some supremacy over men. For example, Nigerian women athletes during the 1996 Olympics in Atlanta won four medals (one gold, one silver, and two bronze), whereas the men won one gold and one bronze. The first gold medal by Nigeria after thirty-eight years of Olympics participation was won by Chioma Ajunwa in the women's long jump. Nigeria's women's national basketball team represented Africa in the 2004 Olympic Games in Athens.

Youth in Sports

The establishment of the Nigeria Schools Sports Federation (NSSF) in 1978 has helped youth participate in sports at local, national, and international levels. Sports

are organized for the primary schools and secondary schools at local and zone levels to accommodate participation by a large number of schools. This organization is coordinated by school sports officers who are officials of the federal Ministry of Education in collaboration with Ministry of Education sports officers under the supervision of the NSSF. Youth participate in sports such as basketball, handball, tennis, swimming, football, track and field, chess, and gymnastics. The Youth Sports Federation organizes youth competitions, mainly in soccer.

Some sports are sponsored by corporate bodies, private organizations, and government bodies. Private organizations include Nestle PLC (basketball), Shell Petroleum (soccer), MTN (marathon), and Nigeria Breweries PLC (various sports). Others are Guinness, Coca-Cola, Seven-Up, First Bank, Coscharis, Cadbury, and Globacom.

The Nigeria Football Association and other sports federations have been helping young people to partici-

pate in international competitions in England, Norway, Italy, Spain, and Portugal, in addition to regional competitions within Africa.

Issues and Controversies

Sports influence the politics, economy, and social life of Nigerian people. Issues and controversies arising from these three areas also influence sports. Poor management is a major hindrance to sports development in Nigeria. Sports administrators tend to mismanage the human and material resources entrusted to their care. Sports administrators also often depend too much on foreign-based athletes who are more committed to their respective clubs than to national assignments.

Another problem confronting Nigerian sports is the sudden and irrational change of technical crews at crucial times because of the desire to win all competitions. This behavior can discourage coaches and render a team's program useless.

The attitude of some of foreign-based athletes concerning wearing their national colors is another problem. Facilities and equipment are another issue. The government has tried to address this issue because sports administrators do not maintain facilities and equipment well enough. More funding should be directed toward the maintenance of sports facilities.

Poor officiating is also a major issue. Poor officiating often mars soccer games in Nigeria and has resulted in violence by spectators that has caused serious injuries and loss of lives and property.

Another issue is the selection of athletes for national and international competitions. This issue has become an obstacle to sports development because selection of athletes has been politicized in some sports.

These issues notwithstanding, Nigerian elite athletes are well recognized by the government and by citizens. They are heroes and role models, some of whom have received national honors.

The Future

Many Nigerians want to be like the Nigerian soccer star J. J. Okocha. Youths want to play soccer, and many

don't care to finish their secondary education before entering professional sports. With the number of interest groups in Nigeria, sports clubs are likely to go to the stock exchange as public liability companies in the near future. However, this change will occur only when coaches and club management become business oriented and players improve their standard of play to attract more spectators.

The government should control the privatization and commercialization of sports to attract stakeholders and to induce investment, giving people the opportunity to invest in sports in areas such as production and distribution of sports equipment and the construction of facilities, physiology and research laboratories, and community sports centers, even in rural areas. The National Institute for Sports and Universities in Nigeria should provide sports information centers to enrich students' knowledge of sports and related issues.

Norway

The Norwegian population is very physically active in its leisure time—seven out of ten Norwegians between sixteen and seventy-nine exercise at least once a week. Many exercise with friends and family, but more than half exercise alone. The most popular activity is hiking in the forest, followed by bicycling, cross-country skiing, and swimming. While 18 percent exercise in a private fitness studio, 13 percent exercise in a sport club. Members of sport clubs are more physically active than those who are not members.

Organized Sport

Sport is important to Norwegian society, both as physical activity and as entertainment. More than a third of the population of 4.5 million is engaged in organized sport in some way. The Norwegian sport federations and the regional sport organizations formed the Confederation of Sports in 1861. Today the Confederation's formal name is the Norwegian Olympic Committee and Confederation of Sports. It is the country's largest voluntary organization, has close to 2 million members, and consists of more than 12,000 sport clubs, which belong to one or more of the 55 different sport federations. And the number of people active in sport clubs is increasing. During 2002, about 500 new clubs and 30,000 new members were registered. Many sport clubs are quite small, with fewer than 100 members, but a few clubs are very large: About 10 percent of clubs have 40 percent of all members. The most popular participant sports are soccer, skiing, golf, and team handball.

"Sports for all" is the long-term objective of the Norwegian Olympic Committee and Confederation of Sports, which works to ensure that the people of Norway are able to engage in sports according to their wishes and needs. It is also responsible for the administration of and preparation for Norway's participation in the Olympic Games, where Norway has been relatively successful, especially considering that it is a very small country. Norwegian athletes usually win more medals in the Winter Olympics, but Norway became the best of the Nordic countries in the Summer Olympic Games in Athens in 2004, where its athletes took five gold medals.

Voluntarism, democracy, loyalty, and equality are essential values in all sports in Norway. Traditionally, the sport clubs have been formed by friends or fellow workers, or simply by people who find a mutual interest in one or more branches of sport, and democratic elections have always been an integral part of them. The general assembly of the Norwegian Olympic Committee and Confederation of Sports consists of representatives of the federations and of the regional bodies. It meets

every four years to draw up objectives and strategies, to pass sport laws, and to elect the Board of Sports.

Financing

The most important income sources for the sport organizations are the lottery money from the Norwegian state, money from sponsors, and different forms of voluntary work and of money raised by club members. The budget for the umbrella organization (the Norwegian Olympic Committee and Confederation of Sports) shows that two-thirds of its income comes from the state lottery. This percentage diminishes at the lower levels of the organization. Only 16 percent of the average sport federation's budget comes from the state, and at the club level it is only about 10 percent. Here the major source of financing comes from the 24,000 man-years of voluntary work and of money raised by all members—including contributions by the parents of the 500,000 children and youth who belong.

Leadership and Gender

In spite of the fact that Norway is known internationally for its work for equality between the sexes, only 7 percent of the presidents of sports federations are women.

The women in Norwegian organized sport count for 38 percent of all memberships—a percentage that has remained relatively stable over the last ten to fifteen years. Among the executive board members in all sport federations, women make up 29 percent. This is higher than it was ten years ago, probably due to the fact that the law of the Norwegian Olympic Committee and Confederation of Sports states that all boards and committees in the organization shall consist of both genders, and that the gender proportions should reflect the proportion of membership in the organization. From an international perspective, this is relatively radical. However, at the sport club level, more than 80 percent of the leaders are men.

Membership by Sport and Gender

More than half (55 percent) of the members in the sport clubs are twenty-five years old or younger. The age group nine to fifteen has by far the largest membership—65 percent of all boys and 51 percent of all girls. The differences between girls and boys are largest among sixteen- to twenty-four-year-olds, where 25 percent of females and 42 percent of males belong to a sport club. The most popular sports among young female club

members are soccer, team handball, and gymnastics. The boys' favorites are soccer, skiing, and team handball. Six- to twelve-year-old girls also favor soccer, but among them, skiing is more popular than handball. Among boys in the same age group, soccer is followed by handball and skiing. Among men over twenty-five, soccer, golf, skiing, and

shooting are the most popular sports. Among women in the same age group, golf, skiing, soccer, and gymnastics are the most popular sports.

Females in Soccer

What is most interesting in these numbers is that soccer, which until 1975 was a sport only for men in Norway, has grown to be the largest female sport, with some 95,000 active players in 2003. One reason for this may be a shift in the position of women in Norwegian society, which is probably linked to Norwegian legislation for equal rights. In addition, since accepting women and girls as members, the Norwegian Football Association itself has worked systematically to recruit and keep girls in soccer.

Nutrition

The ability of a person to exercise or to participate in sports is impaired if the person's diet is inadequate, although the concept of dietary inadequacy may be quite different for an active person than for a sedentary person. Conversely, performance may be improved by dietary manipulation, but we still have an incomplete understanding of how best to control diet to optimize sports performance. The same general nutritional prin-

ciples apply to all activities in which people need optimum exercise performance.

At the highest level of competition, where competitors are predisposed to success by genetic endowment and have undergone the most rigorous training, nutritional intervention may make the difference between success and failure. We should not be surprised, therefore, that sportsmen and sportswomen generally are concerned about their diet, although this concern is not always matched by an understanding of basic nutritional principles. Nutrition in sport has been a concern since antiquity. Some of the dietary practices followed by athletes in pursuit of success are sound, but others have no beneficial effect and may even be harmful. As in other areas of nutrition, these practices are often encouraged by those who stand to gain financially from sales of dietary supplements.

We should consider two aspects; the first is the diet during training that must be consumed on a daily basis for a large part of the year, and the second is the diet during the immediate precompetition period and during competition itself. Considering the range of activities encompassed by the term *sport* and the variation in the characteristics of the people taking part, we should not be surprised that nutritional requirements vary. For noncompetitive activities and for the person who exercises for recreational and health reasons, the daily diet forms part of a lifestyle that may be quite different from that of the competitive athlete, but the nutritional implications of exercise participation apply equally, albeit to different degrees.

Nutrition for Training

An athlete in training needs a diet that meets the additional nutrient requirements imposed by the training load. In sports involving prolonged strenuous exercise on a regular basis, participation has a significant effect on energy balance. The metabolic rate during running or cycling, for example, may be fifteen to twenty times the resting rate, and such levels of activity may be sustained for several hours by trained athletes. Evidence suggests

that the metabolic rate may remain elevated for at least twelve and possibly up to twenty-four hours if the exercise is prolonged and close to the maximum intensity that can be sustained; however, some experts have disputed this evidence, claiming that the metabolic rate would not likely remain elevated for long periods after more moderate exercise. If body weight and performance levels are to be maintained, the high rate of energy expenditure must be matched by a high energy intake. Available data for most athletes suggest that they are in energy balance within the limits of the techniques used for measuring intake and expenditure. This fact is to be expected because a chronic deficit in energy intake would lead to a progressive loss of body mass.

However, data for women engaged in sports in which a low body weight, and especially a low body fat content, are important, such as gymnastics, long-distance running, and ballet, consistently show a lower than expected energy intake. No obvious physiological explanation exists for this finding other than methodological errors in the calculation of energy intake and expenditure, but that these errors should apply specifically to this group of athletes seems odd. Many of these women do, however, have a low body fat content: A body fat content of less than 10 percent is not uncommon in female long-distance runners. Secondary amenorrhea (abnormal absence or suppression of menses), possibly related more to the training regimen than to the low body fat content, is common in these women but is usually reversed when training stops.

Athletes engaged in strength and power events have traditionally been concerned with achieving a high dietary protein intake in the belief that this intake is necessary for muscle growth and repair. In a survey of U.S. college athletes 98 percent believed that a high-protein diet would improve performance. Although a diet deficient in protein undoubtedly will lead to loss of muscle tissue, no evidence supports the idea that excess dietary protein will drive the system in favor of protein synthesis. Excess protein will simply be used as a substrate for oxidative metabolism, the series of chemical

reactions in which the energy contained in carbohydrate, fat, and protein is made available and these fuels are converted to carbon dioxide and water, either directly or as a precursor of glucose, and the excess nitrogen will be lost in the urine. Exercise, whether it is long-distance running, aerobics, or weight training, will increase protein oxidation compared with the resting state. Although the contribution of protein oxidation to energy production during the exercise period may decrease to about 5 percent of the total energy requirement, compared with about 10–15 percent (i.e., the normal fraction of protein in the diet) at rest, the absolute rate of protein degradation is increased during exercise. This increase leads to an increase in the minimum daily protein requirement, but this requirement will be met if a person consumes a normal mixed diet adequate to meet the increased energy expenditure. In spite of this fact, however, many athletes consume large quantities of protein-containing foods and expensive protein supplements; daily protein intakes of up to 400 grams are not unknown in some sports.

The timing of protein consumption relative to training may be more important than the amount of protein consumed. Remodeling of muscle tissues, the process by which structure and function change in response to an imposed stress, takes place in the hours and days after the training stimulus has been applied: Consumption of small amounts of protein can ensure positive protein balance. As little as 6 grams of essential amino acids, or 30–40 grams of mixed protein, ingested either just before or soon after training may help promote that adaptations taking place within the muscles.

The energy requirements of training are largely met by oxidation of fat and carbohydrate. The higher the intensity of exercise, the greater the reliance on carbohydrate as a fuel: At an exercise intensity corresponding to about 50 percent of a person's maximum oxygen uptake, approximately two-thirds of the total energy requirement is met by fat oxidation, with carbohydrate oxidation supplying about one-third. If the exercise intensity is increased to about 75 percent of maximum

oxygen uptake, the total energy expenditure is increased, and carbohydrate is now the major fuel. If carbohydrate is not available, or is available in only a limited amount, the intensity of the exercise must be reduced to a level where the energy requirement can be met by fat oxidation.

The primary need, therefore, is for the carbohydrate intake to be sufficient to enable the training load to be sustained at the high level necessary to produce a response. During each strenuous training session glycogen stores in the exercising muscles and in the liver are depleted. If this carbohydrate reserve is not replenished before the next training session, training intensity must be reduced, leading to corresponding decrements in the training response. Any athlete training hard on a daily basis can readily observe this; if a low-carbohydrate diet, consisting mostly of fat and protein, is consumed after a day's training, the athlete will have difficulty repeating the same training load on the following day.

Eating a high-fat, low-carbohydrate diet for prolonged periods has been shown to increase the capacity of muscle to oxidize fat and hence improve endurance capacity in rats but may not be effective in humans; similarly, short-term fasting increases endurance capacity in rats but results in a decreased exercise tolerance in humans. The training diet, therefore, should be high in carbohydrate, with a large proportion of total energy intake in the form of complex carbohydrates and simple sugars; this suggestion conforms with the recommendations of the U.S. Government Expert Committees on Health that carbohydrates provide at least 50 percent of dietary energy intake. In a study, a high-carbohydrate diet enabled runners who were training for two hours per day to maintain muscle glycogen levels, whereas if the carbohydrate content was low, a progressive fall in muscle glycogen content occurred. A dietary carbohydrate intake of 500–600 grams was necessary to ensure adequate glycogen resynthesis. Rather than think of carbohydrate needs as a fraction of total energy intake, we might do better to prescribe intakes in absolute terms relative to body mass. Thus, an intake of 6–8 grams per kilogram of body mass may be necessary

for athletes training hard. These high levels of intake are difficult to achieve without consuming large amounts of simple sugars and other compact forms of carbohydrate as well as increasing the frequency of meals and snacks toward a “grazing” eating pattern. Athletes may find that sugar, jam, honey, and high-sugar foods such as confectionery, as well as carbohydrate-containing drinks such as soft drinks, fruit juices, and sports drinks, can provide a low-bulk, convenient addition of carbohydrate to the nutritious food base. No evidence indicates that this pattern of eating is harmful; for the person who has to fit an exercise program into a busy day, changes to eating patterns inevitably must be made, but these changes need not compromise the quality of the diet.

Failure to meet carbohydrate needs may also make the athlete more susceptible to minor infectious illnesses. Exercising with low carbohydrate reserves can result in increased levels of stress hormones, which in turn impair the functional capacity of the immune system. Although usually trivial in themselves, these illnesses can disrupt training and prevent participation in important competitions.

Micronutrients and Dietary Supplements

With regular strenuous training, total intake must be increased to balance the increased energy expenditure. Provided that a reasonably varied diet is consumed, this increased intake will supply more than adequate amounts of protein, minerals, vitamins, and other dietary requirements. No evidence suggests that specific supplementation with any of these dietary components is necessary or that it will improve performance. Athletes who chronically restrict energy intake to limit body mass, and especially fat mass, may benefit from a broad-spectrum vitamin and mineral supplement. Athletes with limited finances, little interest in the foods they eat, or lacking food preparation skills may also fail to consume a varied diet. Although supplements are no substitute for good dietary choices, they may have a use in some of these situations.

good source of calcium in an energy-restricted diet.

A wide range of supplements is on sale to athletes, often with exaggerated claims of efficacy. Many of these claims are not supported by evidence of either their effects on performance or their safety when taken in high doses for prolonged periods. Sports supplements that may be useful in helping the athlete meet nutri-

The only exceptions to the generalization about the value of dietary supplements for meeting micronutrient needs may be iron and, in the case of active women, calcium. Highly trained endurance athletes commonly have low circulating hemoglobin levels, although total red cell mass may be elevated because of an increased blood volume. This condition may be considered to be an adaptation to the trained state, but hard training may result in an increased iron requirement, and exercise tolerance is impaired in the presence of anemia, the state in which the blood level of hemoglobin is below the normal level. Low serum folate and serum ferritin levels are not associated with impaired performance, however, and correction of these deficiencies does not influence indices of fitness in trained athletes. Moderate weight-bearing exercise has been reported to increase bone mineral density in women, and this increase may be a significant benefit of exercise for most women. Hard training, however, may reduce circulating estrogen levels and hence accelerate bone loss. For these athletes an adequate calcium intake should be ensured, although calcium supplements themselves will not reverse bone loss while estrogen levels remain low. We must emphasize that iron or calcium supplements should be taken only on the advice of a qualified practitioner after suitable investigative procedures have indicated an inadequate intake. Even then, alternatives to supplementation, specifically alterations in the selection of foods to achieve a higher intake, must also be considered. Low-fat dairy produce, for example, is a

tional goals during training and competition include sports drinks, high-carbohydrate supplements, and liquid meal supplements. These supplements are more expensive than everyday foods but often provide a convenient and practical way of meeting dietary needs in a specific situation. Evidence suggests an ergogenic (enhancing physical performance) effect of a few supplements, including caffeine, creatine, and bicarbonate. The use of caffeine in high doses by an athlete in competition formerly was likely to result in a positive doping test, but this restriction was removed by the World Anti-Doping Agency (WADA) in January 2004. Caffeine in small doses—typically 2–4 milligrams per kilogram of body mass can improve performance in a variety of exercise tasks, with greater effects generally seen in prolonged exercise, probably by actions on adenosine receptors in the central nervous system. Creatine—in the form of creatine phosphate—acts as an energy source for adenosine triphosphate (ATP) resynthesis in high-intensity exercise. Meat eaters normally obtain about 1 gram per day from their diet, which is about 50 percent of the daily requirement, with the remainder synthesized from amino acids. Ingestion of 10–20 grams of creatine daily for four to six days can increase the muscle creatine content by 10–20 percent, leading to improvements in strength and sprint performance. The biggest improvements in performance are generally seen in repeated sprints with limited recovery. Acute ingestion of large doses of sodium bicarbonate (about 0.3 grams per kilogram of body mass)

can increase the extracellular buffering capacity and improve performance in exercise lasting from about thirty seconds to about ten minutes.

Of concern about many supplements on sale—apart from the lack of evidence of efficacy and safety—are reports of contamination of supplements by prohibited substances, including stimulants and anabolic steroids. The amounts of such substances are generally too small to be effective in improving performance but can cause a positive drug test.

Nutrition for Competition

No doubt the ability to perform prolonged exercise can be substantially modified by dietary intake during the pre-exercise period, and this fact becomes important for the person aiming to produce peak performance on a specific day. The pre-exercise period can conveniently be divided into two phases—the few days prior to the exercise task and the day of the exercise task itself.

Experts have recommended dietary manipulation to increase muscle glycogen content during the few days prior to exercise for endurance athletes after observations that these procedures increased endurance capacity in laboratory designed cycle ergometer exercise lasting one and a half hours to two hours. The suggested procedure was to deplete muscle glycogen by prolonged exercise about one week prior to competition and to prevent resynthesis by consuming a low-carbohydrate diet for two to three days before changing to a high-carbohydrate diet for the last three days, during which little or no exercise was performed. This procedure can double the muscle glycogen content and increases cycling or running performance. A considerable amount of evidence indicates that a person does not have to include the low-carbohydrate glycogen depletion phase of the diet for endurance athletes. A person must just reduce the training load during the last five or six days before competition and simultaneously increase the dietary carbohydrate intake. This practice avoids many of the problems associated with the more extreme forms of the diet. Although an increased pre-

competition muscle glycogen content is undoubtedly beneficial, the rate of muscle glycogen utilization is faster when the glycogen content itself is increased, thus nullifying some of the advantage gained.

Consumption of a high-carbohydrate diet during the days prior to competition may also benefit competitors in sports such as rugby, soccer, or hockey, although these players often do not pay attention to this aspect of their diet. In one study players starting a soccer game with low muscle glycogen content did less running, and much less running at high speed, than did those players who began the game with a normal muscle glycogen content. Players commonly have one game in midweek as well as one at the weekend, and full restoration of the muscle glycogen content likely will not occur between games unless a conscious effort is made to achieve a high-carbohydrate intake.

Although this glycogen-loading procedure is generally restricted to use by athletes engaged in endurance events, some evidence indicates that the muscle glycogen content may influence performance in events lasting only a few minutes. A high muscle glycogen content may be particularly important when repeated sprints at near-maximum speed have to be made. Short-term high-intensity exercise can also be improved by ingestion of alkaline salts prior to exercise to enhance the buffering of the protons produced by anaerobic glycolysis, the process whereby glucose is broken down to pyruvic or lactic acids, releasing some of the energy available in the glucose molecule and, because there is no oxygen involved, generating energy very rapidly.

Scope for nutritional intervention during exercise exists only when the duration of events is sufficient to allow absorption of drinks or foods ingested and where the rules of the sport permit. The primary aims must be to ingest a source of energy, usually in the form of carbohydrate, and fluid for replacement of water lost as sweat. High rates of sweat secretion are necessary during hard exercise to limit the rise in body temperature that would otherwise occur. If the exercise is prolonged, this rise leads to progressive dehydration and loss of elec-

trolytes (ions that in biological fluid regulate or affect most metabolic processes). Fatigue toward the end of a prolonged event may result as much from the effects of dehydration as from substrate, or fuel, depletion.

The composition of drinks to be consumed during exercise should be chosen to suit individual circumstances. During exercise in the cold, fluid replacement may not be necessary because sweat rates will be low, but a need remains to supply additional glucose to exercising muscles. Although consumption of a high-carbohydrate diet during the days prior to exercise should reduce the need for carbohydrate ingestion during exercise in events lasting less than about two hours, a person cannot always achieve this; competition on successive days, for example, may prevent adequate glycogen replacement between exercise periods. In this situation more concentrated glucose drinks are preferred. These drinks will supply more glucose, thus sparing the limited glycogen stores in the muscles and liver without overloading the body with fluid. Many sports have little provision for fluid replacement: Participants in sports such as football or hockey can lose large amounts of fluid, but replacement is possible only at the

half-time interval. Most athletes finish endurance events with some degree of dehydration, but some slower performers may consume fluid in excess of sweat losses. This situation is not helpful to performance.

During the postexercise period replacement of fluid and electrolytes can usually be achieved through normal dietary intake. If a person needs to ensure adequate replacement before exercise is repeated, extra fluids should be taken, and additional salt (sodium chloride) might be added to food. The other major electrolytes, particularly potassium, magnesium, and calcium, are present in abundance in fruit and fruit juices. Salt or mineral supplements are not normally necessary.

Officiating

In any organized sporting event, someone must govern the contest. Those who oversee sport competitions are known as officials. Depending on the type of sport, an official may be referred to as a referee, umpire, or judge. In all cases it is the duty of the official to make competition as fair as possible and to make sure it is played by the existing rules of the sport. An official has been defined as “a person who is knowledgeable in the rules and mechanics of the game and applies them to make the contest fair for all participants and comports him- or herself as a professional at all times” (Sabaini 2002, 19).

Of all of the groups involved in sports, including athletes, coaches, and spectators, officials may receive the least attention. In fact it is sometimes said the best way to tell if the officials have done a good job is if nobody noticed them. Most officials will agree that the focus should remain on the athletes. Indeed, on the limited occasions when officials receive attention, it is often due to a decision perceived to be incorrect or a controversial call. Regardless of the lack of attention generally given to officials, they represent an essential component of any organized sporting event.

The Official's Job

The official's job can be understood by dividing it into three major components: knowledge, application, and comportsment. Knowledge includes understanding the rules of the sport, as well as strategies used by athletes

and teams. An effective official not only knows the rules listed in the rule book, but also remains current with the types of plays and maneuvers used in the sport. Knowledge also includes correct officiating mechanics, which refers to the physical movements and positions that the official should exhibit. For example, when signaling that a rules infraction has been committed, the official must use hand signals that are specified in the sport's rule book. In addition, in many sports there are appropriate physical positions for officials to adopt for a given game situation. Most baseball spectators will recognize, for example, that the first-base umpire changes his or her location on the field when a runner reaches first base.

The second component, application, includes qualities such as being honest, fair, consistent, using sound judgment, and having good communications skills. An effective official not only thoroughly knows the rules, but also applies them in the proper manner. Certainly, if an official is not fair and free of bias, the integrity of the entire contest is compromised. Additionally, while most rules are stated clearly, interpreting a particular action according to the rules often involves a certain degree of judgment (e.g., whether a foul was flagrant or unintentional). Therefore, judgment is an important factor in officiating. An official must also strive to be a good communicator, so that he or she can be understood by all interested parties.

The third and last component of officiating is comportment, which includes displaying a suitable demeanor and behaving appropriately under pressure. Officials strive to exhibit a sense of authority and con-

trol over a contest, but without displaying a superior attitude. Demonstrating respect for coaches and players even while making unfavorable calls according to the rules is an aspect of comportment. Also, officials often must perform their duties under a great deal of pressure. Effective officials are able to perform well under stressful conditions without being inappropriately influenced by athletes, coaches, or spectators.

One way to understand the job of an official is to consider the rules of the sport as laws to be upheld. In this way officials function as the sport's law enforcement officers (indeed, both "official" and "officer" are derived from the same Latin word, *officium*, meaning "duty"). They are the final authority in determining the legality of any action and ensuring that an athletic competition is conducted according to the rules. Also, like police officers, sports officials place the highest priority on safety. In many instances players and coaches are familiar with the rules, and officials go largely unnoticed as they monitor the contest. However, when a question arises, the officials are charged with the responsibility of interpreting and enforcing the rules.

Depending on the sport and level of competition, the rule book may be several hundred pages long, and it is the official's job to know it all. Rulings that are visible to spectators in stadiums or on television reflect only a portion of the decisions that officials make. When a team of officials arrives at a competition site, they begin their work. Before a contest begins, officials verify the legality of equipment, facilities, and uniforms. In most sports one or more officials will check to ensure that the dimensions of the playing area are in accordance with

the rules; meet with coaches and athletes to answer questions and discuss certain issues, such as those regarding sportsmanship; and communicate with support staff such as scorers and timekeepers. In sports where weight classes are used, wrestling and judo, for example (in addition to youth sports in which eligibility is determined by weight), the officials conduct weigh-ins. If a significant event should occur before, during, or after a contest, the officials are responsible for communicating the ruling and circumstances surrounding the event to league administrators. Often, this will involve reporting player or coach ejections, so that the league can take appropriate action.

Officiating in Different Sports and Competition Levels

All officials have an interest in ensuring a safe and fair contest, but the specific actions and decisions that they make depend largely on the sport itself. In sports where form and aesthetics partially determine an athlete's score, such as gymnastics, figure skating, and diving, officials are referred to as judges. Generally, a panel of judges evaluates each athlete's performance. The judges remain relatively stationary in a location best suited to view the performance and make independent conclusions regarding scores. Here, the independence of each official's ruling is of primary importance, allowing each judge to make decisions according to his or her interpretation of the rules without being influenced by another judge. In most cases the actual score recorded represents an average of judges' rulings.

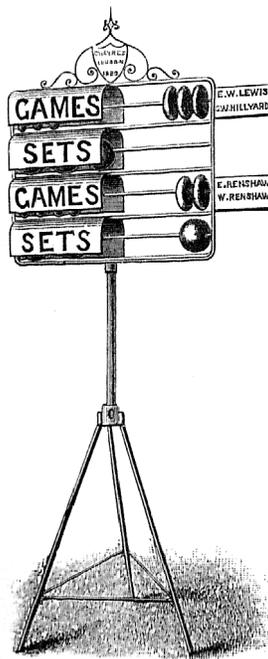

In contrast to the independence of judges, referees and umpires in many sports work together as a team—often referred to as an “officiating crew”—where each official openly communicates with the others. Sports where officiating

crews are used include soccer, American football, baseball, basketball, and hockey. Especially in team sports, where many athletes are on the field, too many activities occur simultaneously for one official to monitor them all. Therefore, each crew member has a specific assignment and area of responsibility. When disagreements arise, the official in charge of the crew may convene a brief conference before determining the appropriate ruling. In such a conference, the official who was in the best position to view the action is encouraged to suggest the proper decision, though the individual in charge of the crew is ultimately responsible for the ruling.

Even in sports where winners are determined largely by clear objective measures, such as time or distance (e.g., swimming and track and field events), officials are essential to the conduct of a safe and fair competition. In such sports the officials are responsible for monitoring the legality of equipment and infractions such as faults and false starts, along with other rules and procedures.

Officials are used at all levels of competition, from youth leagues to professional sports. At the professional and international levels in some (but not all) sports, officiating is a full-time job. At the collegiate, club, recreational, and youth league levels, however, officials mostly work on a part-time or contractual basis. Usually, the official gets paid for each competition, with a fee that is agreed on ahead of time. In addition to the extra money provided, officials have cited interest and enthusiasm for the sport, challenge and excitement, and a sense of control as reasons for officiating. Often at amateur levels of competition and in youth leagues, officials will volunteer their time, perhaps receiving only a free meal as compensation for their efforts.

Even within a particular sport, the rules that officials enforce differ for varying levels of competition. These differences include specific actions that are

Officiating

Officiating: A Dangerous Vocation

Violence towards officials—both in the verbal and physical form—is a phenomenon that is all too familiar. In many circumstances, verbally berating game officials is common practice. More troubling is the occurrence of physical assaults perpetrated upon officials. Surveys have shown that as many as 84 percent of officials have been assaulted during their careers, and one would be hard pressed to find an experienced official who has not at least been threatened with violence. Physical actions against officials range from spitting—such as an incident in 1996 when baseball star Roberto Alomar spat in the face of umpire, John Hirschbeck—to life threatening forms of violence. Such incidents have occurred throughout nearly all levels of sport, from youth leagues to the professional ranks.

The pervasiveness of such incidents is underscored by the fact that insurance companies offer special

policies to cover the risk of injuries to officials due to violent acts towards them. In addition, as of October 2004, eighteen U.S. states had passed legislation specifically to protect officials from violence.

Why does such violence occur? One possible explanation is that when players, coaches, and fans are upset about the outcome of a sporting event that matters a great deal to them, the officials provide a convenient target for their anger. According to C. W. Smith in a 1982 article (“Performances and Negotiations: A Case Study of a Wrestling Referee. *Qualitative Sociology*, 5, 33–46), an official, “. . . Has responsibility for maintaining social order in an extremely tenuous social situation. In a very real sense he or she functions as the communal ‘scape-goat.’”

David Neil Sacks and Loretta A. Handegard

prohibited for younger age groups, different dimensions on the playing field, and various other technical aspects of the sport, such as whether a receiver must catch a pass with one or two feet in bounds for the play to be ruled a completion in American football. An official who works at various competition levels in a sport must govern the competition according to the rule of the particular league.

Selecting and Evaluating Officials

Becoming an official at lower levels of competition is a fairly straightforward process. If someone is interested in officiating, he or she can often become an official simply by volunteering. Sometimes, volunteer officials are required to pay a nominal fee to cover insurance costs and undergo a security screening. At higher levels of competition, the process becomes somewhat more involved. In addition to paying a registration fee, most high school sports officials in the United States must earn a minimum score on a rules examination and attend regular rules clinics. As the level of competition increases, so do the requirements for officiating at that level.

Given the lack of monetary compensation available for officials in many leagues, as well as other demanding aspects of the vocation such as the threat of verbal and physical assault, the demand for officials often outweighs the supply. Officiating organizations therefore devote a fair amount of effort to recruiting new officials. This usually means encouraging athletes who are toward the end of their playing careers to consider officiating as a means of maintaining involvement in their sports.

Once an official is registered, he or she may be selected to work at an actual contest. Typically, newer officials are expected to prove themselves at lower levels of competition (i.e., junior varsity contests at the high school level) before being assigned to major games or tournaments. Just as athletes strive to reach championship level competitions, so too do the officials. The method by which officials are assigned varies from one organization to the next, with many having no specific method in place. According to one study conducted in 2002, 52 percent of officials associations in the United States that responded to a survey did not use a standardized system for awarding tournament assignments.

Various systems have been used, however. These methods include selecting officials based on evaluations conducted by veteran members of the association, rules test scores, coaches' requests, and seniority. An additional factor in selection is neutrality. In playoff competitions, for example, when teams from two different conferences play one another, the officiating crew is usually made up of officials from a third conference. Likewise, in major international competition, for reasons of fairness the officials selected typically hail from a country other than those represented by the athletes.

One of the difficulties in selecting officials stems from the inherent challenges in evaluating an individual's or crew's performance. Unlike assessing which team deserves to advance, which easily can be determined by the score, it can be difficult to ascertain how well an official has performed. Methods of evaluation can include written exams, oral quizzes with veteran officials, direct observation, and review of videotapes. Evaluators can include officiating assigners, commissioners, peer officials, state association members, and coaches. Due to the wide range of possibilities, when it comes down to how an official is evaluated, it is up to the officials' governing body to standardize and implement the evaluation process.

Officials and Errors

Officiating has been humorously described as the one job where someone is expected to start out being perfect—and then to improve from there. Some officials observe that they are held to higher standards than other sport participants, pointing out that athletes and coaches regularly make mistakes without incident, while a single bad call by an official attracts a great deal of criticism. Officials, of course, like anyone else, do sometimes make mistakes. With as many as several hundred or more decisions to make during a competition, errors are inevitable.

Notwithstanding these imperfections, there is evidence that officials at the professional level are quite effective in making correct decisions. For example, in Major League Baseball in the United States during the

2004 season, a computer system indicated that umpires correctly called more than 93 percent of pitches as balls or strikes. The error rate also may be overestimated by the public because attention tends to shift to officials only when an error actually occurs. If spectators notice the official, it is almost always because a possible mistake has been made. In contrast, during the majority of the time when officials are performing adequately, they go largely unnoticed. In addition many calls that are perceived to be in error are actually correct. The rules of a sport typically require a good deal of judgment on the part of an official, and he or she generally has a better understanding of the rules than other interested parties. Considering that coaches, athletes, and spectators almost always have a subjective interest in the contest, officials represent the only group charged with maintaining a neutral, objective stance. Thus, their judgment is often appropriate, even when perceived as being flawed by a majority of viewers.

A baseball fan is a spectator sitting 500 feet from home plate who can see better than an umpire standing five feet away. ■ UNKNOWN

Some officials have joked that since there are two sides to a contest, an official is perceived to be right only half of the time.

Nonetheless, officials do attempt to minimize the number of errors made. In fact, rule books for most sports include procedures for correcting errors when they do occur—if the error is detected within a certain time frame. In addition, toward the end of the twentieth century, major sports organizations began using technology to improve officials' rates of correct calls. Perhaps the most conspicuous use of technology involves video replay. As of 2004 professional basketball, hockey, and American football organizations were using some form of video replay to review officials' initial decisions, with Major League Baseball, the National Collegiate Athletic Association (in football), and the United States Tennis Association also considering its use. Supporters of this type of technology in officiating claim that procedures such as viewing video replays of "close calls" increases the proportion of correct decisions. Others argue that officials must be entrusted with a degree of judgment, and the fact that they are human and, thus, imperfect, is part of the game. Indeed, it is likely that no matter how much technology advances, officials' errors, like mistakes made by athletes and coaches, will remain a necessary aspect of sport.

Changing Rules over Time

As all officials strive to conduct a contest according to the rules currently in effect, many are involved in evaluating the rules and, when deemed appropriate, suggesting changes. An historical review of nearly any sport will reveal that the rules have changed over time. These changes occur for a variety of reasons. In some cases officials recognize that competitors exploit a technical oversight in the rules to gain an unfair advantage over opponents, and that this oversight must be corrected. At other times innovations in competitive techniques and strategies require a change in the rules to address the most modern forms of play. On occasion rules are altered in order to increase public appeal by encouraging such things as higher scores or faster-paced play. An-

other frequent reason for rules changes is to better ensure the safety of the participants.

Often, a rule modification will occur first at high levels of competition before trickling down to the rule books for the lower leagues, such as those at the youth level. For developmental and safety reasons, however, some modifications nearly always remain in the rules for younger competitors. On occasion trends in youth sport influence the rules at elite levels of play. For example, in addressing the need to promote sportsmanship among high school athletes, Mike Pereira, director of officiating for the National Football League, stated, "The pros and college sports have a huge impact on the play of the game at lower levels. To turn our backs on that is a huge mistake" (Arehart 2002, 25).

With rules changing over time, officials must constantly evolve with a sport. One cannot memorize the rule book and be prepared indefinitely. To be effective an official must know the rules and the underlying intent, apply the rules during competition, and comport him or herself appropriately. Officials are expected to fulfill their assignments under stressful conditions and to maintain their composure and neutral stance despite sometimes harsh criticism. It is a difficult job, with recognition coming primarily when something goes wrong. Nonetheless, most officials express a fondness for the vocation, as well as for the sports in which they serve.

Olympia

Olympia was the site of the ancient Olympic Games, the oldest and biggest of the four Panhellenic (relating to Greece) religious, athletic, and cultural festivals. The other three festivals were the Pythian Games at Delphi, the Isthmian Games at Corinth, and the Games at Nemea. The festival at Olympia was celebrated every four years.

The Olympic Games supposedly began in 776 BCE, but they may have started many years earlier. They continued until 393 CE, when the Roman emperor Theodosius banned all heathen cults.

Different theories explain the origin of the ancient Olympic Games. Some theories say the games were invented by Pelops, who gave his name to the Peloponnese Peninsula. He defeated Oinomaos, king of Pisa, in a chariot race. Oinomaos had an eligible daughter, Hippodameia. Prospective suitors had to defeat Oinomaos in a chariot race. By trickery Pelops won the

race. He replaced the bronze axle pins of the king's chariot with wax ones. As the chariot crashed, Oinomaos was thrown to the ground and killed. Pelops became king, and the games were celebrated in his honor at his grave. Another theory says the games were founded by Heracles (Hercules) after he had defeated Augeas, king of the Greek city-state Elis. Olympia belonging to Elis. Probably the games were a cult festival celebrated by the pre-Indo-Germanic rural population during the third millennium BCE. Later the festival became a festival for Zeus organized by the migrating Achaeans and later by the Dorians. Evidence of this change may be seen in the Temple of Hera next to the Temple of Zeus and the position of the female goddess Demeter, whose priestesses were the only married women allowed to sit at a place of honor on the spectator wall in the stadium at Olympia. Apart from these women, however, married women were banned from the stadium.

In the beginning only one footrace of more than 182 meters was run. This measure was called a “stadium.” The modern word *stadium* is derived from this measure. The competition was called a “stadium race.” The Olympic stadium was a bit longer than 192 meters. The starting point of the race was a line of stone plates with grooves for the runners' toes. Twenty stone plates existed, which meant that a maximum of twenty runners could compete in the race. After 724 BCE the *diaulos* and the *dolichos* were invented as second and third footraces. The *diaulos* consisted of two lengths of the stadium, whereas the *dolichos* was run over twenty or twenty-four lengths. In 708 BCE wrestling was added, and in 688 BCE boxing was added to the program. After 708 the pentathlon was added, with its disciplines of the discus; the jump with weights, called “halteres”; the javelin; a footrace more than five lengths of the stadium; and wrestling. Always a big attraction was the pancratium, added in 448 BCE. This discipline was a mixture of boxing and brutal, all-in wrestling. In addition to these athletic disciplines competitions were held in horseracing and chariot racing.

Runners at ancient Olympia.

Special competitions were also organized for boys. After 396 BCE the games began with a contest of heralds and trumpeters.

Olympic Truce

Initially the games lasted one day, later three, and finally five days. Whereas during the first decades most of the athletes were from the Peloponnese, the games were attended by citizens from the whole of Greece and from Greek locations in the Mediterranean. The athletes had to be freeborn and of Greek descent. In the Roman empire these rules were not followed closely. To ensure that athletes and pilgrims travelling to and from Olympia would have a safe journey, the Olympic Truce (*Ekecheiria*) was introduced; it lasted three months in the end. To announce the truce and its exact dates, heralds were sent out from Elis to every Greek state. Today the truce is often confused with a period of peace. It is often believed that the Greeks were not at war during the celebration of the games. However, numerous sources tell us that the Greek city-states indeed did make war against each other during the games.

Olympia was not a permanent place of residence. It was a site with athletic venues and the *altis* (sacred grove) with temples. Athletic venues were within the stadium walls, having space for forty thousand spectators, the hippodrome, the palaestra, and the gymnasium. The palaestra and gymnasium were training sites. The

main temples were erected to pay homage to the goddess Hera and the god Zeus. The Temple of Zeus, with its 13-meter-tall statue of Zeus designed and built by the Greek artist Pheidias, was one of the Seven Wonders of the World. Also honoring Zeus was an altar. During the Olympic festival one hundred oxen were sacrificed to Zeus on this altar.

After each competition an award ceremony was celebrated. Only the athletes who placed first in the competition were crowned with an olive branch. Athletes who had won one competition were honored with a statue; for athletes with three victories a portrait sculpture probably was designed. The victorious athletes were much honored in their home towns and were showered with valuable presents. The title *periodonikes* was given to athletes who had won a contest in all of the four Panhellenic games. This title is comparable with today's Grand Slam title in tennis. The greatest athlete was probably Milon from Croton in southern Italy. He was a wrestler who won six times at Olympia and won another twenty-eight victories at other games. He became a quadruple *periodonikes*.

Olympia Lost

During the sixth century CE two earthquakes destroyed the temples and other buildings at Olympia. The Alpheios and Kladeos Rivers burst their banks, destroying almost all of the *altis* and sport venues. The area was covered with 6–8 meters of clay. After that, for a long time the location of Olympia was unknown. Archaeologists exploring Greece with the permission of the Ottoman Empire at the end of the eighteenth century were the first to search for Olympia. They attempted to follow the steps of the Greek historian Pausanias, who wrote a travel report on Greece in the middle of the second century CE. In 1766 the Englishman Richard Chandler discovered Olympia. Numerous researchers and

The ruins of the grounds at Olympia in 2003

archaeologists followed and began excavation. Excavation was conducted between 1875 and 1881 by German archaeologists. The Germans Ernst Curtius and Friedrich Adler succeeded in excavating the *altis*, but the stadium was completely excavated between 1936 and 1961 thanks to the German sports leader Carl Diem. Almost two-thirds of the gymnasium is not yet excavated. Of course, all of these endeavors were observed worldwide and were one reason why the French Baron Pierre de Coubertin thought of recreating the Olympic Games during modern times in 1896.

Today Olympia is a major tourist site. Tourists from all over the world visit not only the excavations but also four museums focusing on ancient physical education, the history of the excavations, excavation exhibits, and the

history of the modern Olympic Games. The importance of Olympia as a historic sports site was emphasized at the 2004 Olympic Games in Athens as the men's and women's shot-put competitions were held with a crowd of forty thousand watching on the grass slopes.

Olympic Stadium (Berlin), 1936

References to the Olympic Stadium in Berlin, Germany, are either to the colossal sports complex called the *Reichssportfeld*, which hosted most of the sports competitions during the 1936 Olympic Games, or to the stadium itself, which was the center for the Olympic ceremonies and sports competitions. As part of the legacy of the Nazi period, the much-debated historic buildings, the stadium, and the whole *Reichssportfeld*, are now subject to a preservation order.

The Location

The origin of this site as a sport venue goes back to the beginning of the twentieth century when, between 1907 and 1909, a hippodrome was built in the western suburb of Berlin called Grunewald. The German Olympic Reich Committee for the Olympic Games submitted Berlin's bid to organize the 1912 and 1916 Olympic Games, but this first bid was withdrawn. Nevertheless, through the efforts of the committee, a stadium (with a swimming pool) called the *Deutsches Stadion*—"German Stadium"—was built between the hippodrome's tracks and inaugurated on 8 July 1913. But the 1916 Olympic Games, which were to be celebrated in Berlin, were canceled because of the ongoing World War. The German Higher Education School for Physical Education (founded in 1920) was housed in the *Deutsches Stadion* and extended to the *Sportforum*, a set of sports facilities and buildings for the school.

On 13 May 1931, Berlin was chosen as the host for the XIth Olympic Games to be held in 1936. The *Deutsches Stadion* should have been the main facility for the event, but little work had been done to improve the stadium's features by the time Adolf Hitler was appointed German chancellor on 30 January 1933.

The Nazis quickly understood that the Olympic Games could be orchestrated for propaganda purposes. The proposed *Reichssportfeld* with its Olympic Stadium was

to become the site of Nazi sport. Indeed, the *Deutsches Stadion* was not considered luxurious enough to show the world how generous the "New Germany" was and how determined it was to succeed in gaining the world's esteem. Visiting the education and sports grounds on 5 October 1933, Hitler personally changed all the previous plans in deciding to build an Olympic arena worthy of the "New German spirit."

Building the Olympic Stadium

The architect Werner March (whose father built the *Deutsches Stadion* and who had already designed the *Sportforum*) was given the responsibility for creating this new Olympic arena. The facilities of the *Reichssportfeld* were the Olympic Stadium, the swimming pool, the field for public and military parades (*Maifeld*), the old-fashioned amphitheater (*Dietrich-Eckart-Bühne*), the Reich Academy for Physical Education, the House of German Sport, the hockey field, the horse-riding field, the tennis courts, the basketball courts, and a restaurant.

POLITICAL INVOLVEMENT IN SPORTS ARCHITECTURE

The *Reichssportfeld* can be considered a turning point in sports architecture because its dimensions and the architectural balance of the whole complex were unprecedented achievements. Moreover, these grounds and the Olympic Games of 1936 were and still are primary examples of political involvement in sport.

The Olympic Stadium with its capacity of around 100,000 and the *Maifeld*, which can hold over 106,000 people on the field and 60,000 people in the stands, clearly show the size of the task of organizing "the biggest and most beautiful Olympic Games the world has ever seen," but also the degree to which it was successful.

The Olympic Stadium is at the center of two axes that shape the landscape. The north-south axis, running through the swimming pool, the stadium, and Courbetin Square, crosses the chancellor's private loggia inside the stadium. The east-west axis is almost the continuation of the straight thoroughfare that runs through

Adolf Hitler Enters

The arrival of Adolf Hitler at the stadium was a major event. Australian swimmer Pat Norton recalls his arrival:

We four girls in our team stood without rest for two hours before entering the stadium, but the air of excitement and noise among the teams drove our tiredness away. While we were making friends with the only girl in the Argentinian team of 90 men, who were standing next to us, the teams suddenly became quiet at the sight of Hitler and his entourage striding down between the teams. He looked neither to the left nor right and gave no sign of greeting or welcome. It was my first direct look at the man who was the talk of the world, and a more uninspiring-looking person would be hard to find.

the city and that Hitler wanted to become a Berlin *via triumphalis*. The *Reichssportfeld*'s east-west axis is composed of the Olympic Portal, the stadium, the Marathon Portal cut into the stadium's west stand, and the *Maifeld*. It finishes at the chancellor's private loggia and the *Glockenturm*, that is, the bell tower, overhanging the parade field. On the first level, the *Langemarckhalle* is a meditation hall in honor of the German soldiers who were killed in action during World War I. Towers and sculptures complete the axial scheme.

The perfect symmetry and the monumental size of the buildings can seem to be highly oppressive, but at the same time they give the impression of being a perfect architectural creation.

IDEOLOGY IN STONE

The impressive surroundings built for the Olympic Games crystallize the greater part of Nazi ideology. It is plain that the very construction of the *Reichssportfeld* and its architectural and esthetic features perfectly em-

body the Nazi vision of society. The *Reichssportfeld* is the most successful of completed Nazi buildings. In line with the "ruin's theory," according to which thousand-years-old ruins are an evidence of a civilization's greatness and the ambition of building an empire of a thousand years, the *Reichssportfeld* was considered a model of Nazi artistic style. Indeed, it mixes ancient and modern artistic elements. But the opposition between the traditional and modernist features was hidden: Whereas the stadium and the bell tower are made of reinforced concrete, they are tidily covered with natural German stone. Hitler himself demanded those facings and influenced the esthetics of the facilities. Official speeches always stressed the degree to which German nature and tradition were present in the *Reichssportfeld*. The *Dietrich-Eckart-Bühne*, surrounded by woods, is emblematic of the desire to combine sport and culture—the Nazi idea of culture. It is not surprising to note that the *Reichssportfeld* unites sports and military facilities (*Maifeld*, *Langemarckhalle*). And indeed it was turned into a military base, when it was a stronghold in March–April 1945 and when British troops and their headquarters were there until 1994.

The Venue Today

The *Reichssportfeld* lost its nationalistic name and nowadays is called simply the Olympic Stadium. Whereas the complex itself has not changed much in appearance, renovation work has been carried out in order to adapt the facilities to current safety standards. The Berlin soccer club Hertha BSC has its home at the Olympic Stadium and the other facilities are still used for training.

Berlin's unsuccessful bid to host the Olympic Games in 2000 and the organization of the soccer World Cup in Germany in 2006 still regularly raise the problem of how to deal with this monumental symbol of Nazism.

Olympics, 2004

The modern Olympic Games have become the world's foremost multisport, multination event. Baron Pierre de Coubertin, a French nobleman, is the acknowledged father of the modern Olympics, but many persons and forces in society—such as innovations in transportation, communication, urbanization, and industrialization—influenced their beginnings.

During the middle of the nineteenth century people had a particular interest in ancient Olympia after extensive archaeological discoveries made during the mid-1870s. Coubertin was fascinated by these discoveries because he was able to interpret the ideals and objectives of the ancient Olympic Games to inculcate the values of “muscular Christianity” that he had perceived in British education and that had become more widely known as “athleticism.”

Of course, the true lover of sports was the amateur. The word *amateur* is no longer in the Olympic Charter, but amateurism was a class-based issue during the late nineteenth and early twentieth centuries. The International Athletic Congress in Paris in 1894 organized by Coubertin was called ostensibly to discuss matters of amateurism and professionalism. Coubertin arranged the agenda so that the Congress broke into two sections, one of which discussed the revival of the Olympic Games within the framework of “advantages from the athletic, moral and international standpoints.” The International Olympic Committee (IOC) was established at that congress, and participants decided that the Olympic Games would be revived as an international

amateur sports festival. Two years later more than three hundred athletes from thirteen countries assembled in the renovated Panathenaic Stadium in Athens to take part in the Olympic Games of 1896.

The events of the 1896 Olympics included rifle and pistol shooting, lawn tennis, fencing, track and field events, cycling, and gymnastics. The games were such a success that some people suggested that Athens become the permanent site for the quadrennial games. U.S. athletes made this declaration to Constantine, crown prince of Greece, on 14 April 1896:

We, the American participants in the International Olympic Games of Athens, . . . express entire satisfaction with all the arrangements for the conduct of the games.

The existence of the stadium as a structure so uniquely adapted to its purpose; the proved ability of Greece to competently administer the ages; and above all, the fact that Greece is the original home of the Olympic Games; all of these considerations force upon us the conviction that these games should never be removed from their native soil.

King Giorgios (George) I of Greece soon expressed his support for holding future Olympic Games in Greece. Coubertin was not president of the IOC at the time but certainly was the driving force. He negotiated a compromise with the Greek king. However, not until 1901 was a proposal presented to the IOC recommending that “international competitions will take place every two years, alternating between Athens and other large cities of the cultured states.” Many people, not only Greeks, wanted the Olympic Games to be held in Greece every four years from that time onward.

First Victory for Athens

Athens won the right to host the 2004 Olympics after eleven cities expressed interest: Athens, Buenos Aires, Cape Town, Istanbul, Lille, Rio de Janeiro, Rome, San Juan, Seville, Stockholm, and St. Petersburg. The IOC decided in 1994 to implement a two-phase election procedure, and in 1997 Athens was elected from the remaining cities. The final vote was sixty-six votes for

but by perseverance.* ■ SAMUEL JOHNSON

Athens and forty-four for Rome. The other cities, in elimination order, were Buenos Aires, Capetown, and Stockholm.

After some early organizational problems during the first few years of the Athens Olympic Organizing Committee (ATHOC), steady progress was made when Gianna Angelopoulos-Daskalki took over the leadership in 1998. With the election of Athens's first woman mayor, Dora Bakoyannis, in 2002, the 2004 Athens Games were the first to have two women in such significant administrative roles.

A major concern, expressed frequently in the international media and cited by many IOC members, was the delay in construction of much of the infrastructure for the Olympics and for the city of Athens generally. Although the international airport was ready, the major arterial roads were still under construction. Much of the delay in completion of the subway was caused by the numerous archaeological finds during construction—many of these finds are displayed in situ (in the natural or original position or place), especially at Syntagma Square station.

The provision of stadiums was to be a combination of construction of new stadiums and reconstruction and reconfiguration of old sites. The venues were: Athens Olympic Sports Complex, including the bridgelike main stadium with its elliptical arches reaching high into the sky (hosting athletics, basketball, cycling, diving, gymnastics, soccer, swimming, synchronized swimming, tennis, trampoline, water polo); Panathinaiko, the main site of the 1896 and 1906 games (hosting archery and the marathon finish); Goudi (hosting badminton and modern pentathlon); Peristeri Hall (hosting boxing); Faliro Coastal Zone Olympic Complex (hosting beach volleyball, tae kwon do, and volleyball); City Center (hosting cycling and modern pentathlon); Parnitha (hosting mountain biking); Vouilgameni (hosting cycling and triathlon); Markopoulo Equestrian Center; Markopoulo Shooting Center; Schinias (hosting canoeing, kayaking, and rowing); Galatsi Hall (hosting rhythmic gymnastics and table tennis); Ano Liossia (hosting judo and

wrestling); Agios Kosmas Sailing Center; Karaiskaki (hosting soccer); and Nikaia (hosting weightlifting).

A special venue, which highlighted the relationship of the 2004 Olympics and the ancient Olympics, was used for the shot-put event. Many Greeks feel that they “own” the Olympic Games, but the residents of the village of ancient Olympia on the Peloponnese Peninsula feel that they are the real owners. Although the shot put was not part of the ancient Olympic Games, shot putters competed in the historic Olympia stadium in front of fifteen thousand spectators. The winners, following tradition, were crowned with an olive wreath pruned from the sacred Kalisthenos olive tree; their medals were presented in the Olympic Stadium in Athens two days later.

Light on Their Feet

The torch relay for the 2004 Olympics was the most extensive staged since the relay was introduced for the 1936 Berlin Olympic Games. Lit in Olympia on 25 March 2004, the flame traveled to five continents in seventy-eight days and visited every previous host Olympic city. More than ten thousand people, chosen for their commitment to the Olympic movement, ran with the torch.

Most of the 10,500 athletes and 5,500 team officials from 201 National Olympic committees competed in the Athens area. More than 21,500 members of the media (approximately 16,000 broadcasters and 5,500 print and photographic journalists) covered the games.

The opening ceremony, with a live audience of 70,000 and an estimated audience of 3.5 billion worldwide, featured technological wizardry and more than 2,400 dancers and performers. Highlights included replicas of an ancient Greek ship floating across a massive tank of water—2 million liters—that took six hours to fill but only three minutes to drain. On this sea a young boy sailed homeward in a paper boat waving the Greek flag. Later a statue of a giant emerged from the water and split into fragments shaped as torsos of classical Greek statues, symbolizing the Greek islands. The production manager of the ceremony, David Zolkwer, stated that the ceremony was done on an “epic scale,”

with the largest moving light rig (two thousand lights) ever installed for a single event.

IOC President Jacques Rogge paid homage to Greece for giving the world the ancient games and then reviving them. He stated, “Athens, I turn to you now. . . . Through your conduct give us reasons to believe in sport that is increasingly credible and pure, by refusing doping and respecting fair play.”

Alas, these words were largely overshadowed by a major drug scandal involving a Greek sports hero and one of the nation’s strongest medal hopes. Sprinter Costas Kenteris (Kederis), gold medalist of the 2000 Olympics in Sydney and the first Greek to win a medal in athletics at the Olympic Games since 1896, and fellow sprinter-girlfriend Katrina Thanou were hospitalized after what was later allegedly a faked motorcycle accident a few hours before they faced an IOC disciplinary board for failing to attend a drug test. The Greek Olympic Committee voted to withdraw the two sprinters from the Athens games, but four days after the opening ceremony the two disgraced athletes announced their withdrawal from the games.

Despite the credo of the Olympic movement, sports and politics were intertwined. Iranian judo champion Arash Miresmaili withdrew from the Olympics because he refused to compete against an Israeli opponent. Judo (gentle way) is an Olympic ideal in microcosm. As one journalist observed, “to avoid a judo bout to make a political statement is to miss the point both of judo and of the Olympics.”

Nonetheless, many great performances and examples of the Olympic motto of “*citius, altius, fortius*” (swifter, higher, stronger) occurred. Athletes competed in sizzling summer temperatures. Fortunately organizers had incorporated *mesimeriano ipnako*—the afternoon snooze. Nonetheless, during the women’s marathon, despite starting at 6 A.M., the heat affected reigning world champion Paula Radcliffe of Great Britain, who collapsed about 6.5 kilometers from the finish. The winner, Japan’s Mizuki Noguchi, won with a time of 2 hours, 26 minutes, 20 seconds—11 minutes outside

Radcliffe’s world record and 3 minutes outside the Olympic record set at the Sydney Olympics.

The swimming events included some sensational performances. Nineteen-year-old U.S. swimmer Michael Phelps won eight medals (six gold and two bronze)—perhaps a better achievement than Mark Spitz’s seven gold medals in 1972 because far more countries now have accomplished swimmers. Australian Ian Thorpe won four medals (two gold, one silver, one bronze), including one in the 200-meter freestyle competition, which many people regarded as one of the most exciting contests of the 2004 Olympics: Pieter van den Hoogenband of the Netherlands, who beat Thorpe in Sydney, came in second, with Phelps third.

In running, Great Britain’s Kelly Holmes won both the women’s 800 meters and 1,500 meters. Hicham El Guerrou of Morocco, considered by many to be the greatest distance runner in history, finally won the 1,500 meters after stunning upsets at Atlanta and Sydney, which were two of only four losses in his 1,500-meter running career. He also won the 5,000 meters, becoming the first runner since Paavo Nurmi to win both races at the same Olympics. El Guerrou’s peer athletes at Athens elected him to IOC membership. Other athletes elected were Rania Elwani, Frank Fredricks, and Jan Zelezny.

Highs and Lows

Many surprises and disappointments occurred at the 2004 Olympics. Reigning 100-meter hurdles world champion Perdita Felicien of Canada after running seven steps out of the blocks hit the hurdle, taking Russian Irina Shevchenko crashing down with her. The U.S. men’s basketball team, without thirteen National Basketball Association stars, was disappointed to win only the bronze medal.

Justin Gatlin of the United States was the surprise 100-meters winner in one of the fastest (9.85 seconds) and closest Olympic sprints since Moscow in 1980. In the 200 meters Gatlin came in third to fellow U.S. runner Shawn Crawford. The absence of Greek Olympic

champion Costas Kenteris hung over that event as crowds shouted “Hellas, Hellas,” delaying the start of the race for several minutes.

Argentina won the soccer final against Paraguay. Paraguay’s silver medal was that country’s first Olympic medal in any sport.

Windsurfer Gal Friedman won Israel’s first gold medal since Israel entered the Olympics at Helsinki, Finland, in 1952.

Brazilian marathon runner Vanderlei Lima was grabbed by a spectator dressed in Irish traditional costume when leading the race about 5 kilometers from the finish. Although the altercation lasted only seconds, it clearly upset Lima, who was soon overtaken by the winner, Italy’s Stefano Baldini. When Lima ran into Panathenaic Stadium, venue of the 1896 Olympic Games, members of the crowd who had seen the altercation on a huge screen acknowledged the demonstration of sportsmanship. Along with his bronze medal Lima was presented with the Pierre de Coubertin Medal by IOC President Rogge for demonstration of fair play and Olympic values.

Artists from thirty-nine countries exhibited sculpture and other art pertaining to the theme “sport and Olympism.” The IOC awarded the Olympiart prize—established in 1992 to recognize artists who contribute through their work to the promotion of sport, young people, and peace—to Greek composer Mikis Theodorakis. Renowned for his score for the film *Zorba the Greek*, Theodorakis has also composed works for the Olympic Games—*Canto Olimpico* and *Homage to Greece*—for the 1992 Barcelona Olympics.

The presence of the World Anti-Doping Agency (WADA) at the 2004 Olympics was evident. More than three thousand tests were undertaken, and more than thirty athletes at both the Olympic and Paralympic Games were caught using banned performance-enhancing substances. WADA head Dick Pound said that “far from tarnishing the Games, catching the athletes enhances them.” On a more optimistic note, more than 250 athletes a day throughout both the Olympic

and Paralympic Games visited the WADA Outreach Center in the Athletes Village to participate in educational programs, especially the “Doping Quiz” game, which has been translated into nine languages.

The final medal count per country included the United States with 103 (35 gold, 39 silver, 29 bronze); Russia with 92 (27, 27, 38); China with 63 (32, 17, 14); Australia with 49 (17, 16, 16); Germany with 48 (14, 16, 18); and Japan with 37 (16, 9, 12).

The Paralympic Games were held in Athens on 17–28 September. The games attracted many athletes with physical disabilities, but no athletes with intellectual disabilities were permitted by the International Paralympic Committee to participate.

Overall, the 2004 Olympics were successful. Many of the concerns leading up to the games were allayed, although concerns about the readiness of venues, accessible transport, security, and accommodations kept away thousands of spectators. However, the sports venues were ready, the traffic flowed and, as the IOC president remarked during the closing ceremony, security was “flawless.” Of course, 45,000 security personnel (25,000 police, 7,000 military, 3,000 coast guards, 1,500 firefighters, 3,500 private security contractors, and 5,000 trained volunteers) had been used to ensure safety. One journalist remarked that “security was omnipresent without being smothering.”

Attendance was disappointing during the early days; ticket sales fell short of the predicted 65 percent of the total 5.32 million tickets sold by the commencement of the games. However, venues filled as the competitions moved closer to finals. The global broadcast of the 2004 Olympics broke all records. Three hundred channels broadcast the games to 220 countries and territories, thereby providing thirty-five thousand hours of dedicated coverage (two thousand hours per day to an audience of 3.9 billion people). Several technological firsts also occurred in electronic coverage. Some countries made streaming video and highlight clips of the Olympic Games available through mobile phone handsets and the Internet.

We all experience doubts and fears as we approach new challenges. The fear diminishes with the confidence that comes from experience and faith. Sometimes you just have to go for it and see what happens. Jumping into the battle does not guarantee victory, but being afraid to try guarantees defeat. ■ BRIAN GOODELL

In general, the majority of respondents surveyed felt positive about the 2004 Olympics and Greece. Citizens in five major countries (United States, United Kingdom, Spain, Germany, and France) considered Greece to be a “safe destination,” a “modern European country” that organized “technically excellent” Olympic Games with a “human dimension.” A nationwide survey showed that a majority of Greeks believe that the success of the 2004 Olympics enhanced the position of Greece on the international stage.

Cost of Success

In November 2004 the Greek government announced the cost of the 2004 Olympics. At approximately \$11.6 billion, they were the most expensive Olympic Games ever. The security expenditure alone—\$1.39 billion—almost equaled the total cost of staging the Olympics in Sydney (\$1.5 billion). Greek Deputy Culture Minister Fani Palli-Petralia stated, “We had very successful and very safe Games but we also had very expensive Games.”

Fears by the IOC that it had awarded the 2004 Olympics to a small, poor country were unfounded. Members of the IOC and many others left the closing ceremony with images that linked Greek history and its modern reality as the music of *Zorba the Greek* rose to a crescendo. The Olympic symbol of five interlinking rings, along with the emblem of the 2004 Olympics—a branch from an olive tree intertwined in a circle—reached an audience that no other event can reach. Jacques Rogge wrote in the final issue of the Olympic Village bulletin: “All together, we have shared in the emotion and passion generated by the Olympic Games, this universal rendezvous symbolized by tolerance, peace and friendship.”

Olympics, Summer

The Summer Olympics are the world’s biggest sports event. At the first modern Olympic Games in Athens, Greece, in 1896 fewer than 250 athletes from thirteen nations participated. Today more than ten thousand athletes from around the world participate. The Athens Olympics in 1896 and 1906 lasted only ten days. In contrast, the games between 1900 and 1928 lasted several months; weekly periods of competitions were interrupted by breaks. In 1930 Olympic officials decided that the games should last only two weeks over three weekends (sixteen days). Seventeen days have been permitted when the opening ceremony is held on a Friday.

The time between the quadrennial Summer Olympic Games is an olympiad; each olympiad begins with the opening ceremony of the Summer Olympics. Each Olympics and each olympiad are designated by Roman numerals; for example, the 2000 Olympics in Sydney, Australia, were the XXVII Olympics, and the 2004 Olympics in Athens were the XXVIII Olympics. If the games are cancelled for any reason the number designation of the olympiad remains the same. Thus, although the 1916 games in Berlin, Germany, were cancelled because of World War I, the period between 1916 and 1920 remained the VI modern olympiad. Since 1994 the Winter Olympic Games have not been held in the middle of an olympiad. From 1924 until 1992 Summer and Winter Olympic Games were held in the same year.

Baron Pierre de Coubertin (1863–1937) of France is known as the founder of the modern Olympic Games. However, even before Coubertin people had attempted to reestablish the ancient Olympics of Greece. However, these attempts—in Greece, France, England, and the United States—failed because they lacked the internationality that has been the elixir of today’s modern Olympic Games.

Coubertin did not reintroduce the Olympic Games merely to stage an ancient sports festival but rather to

offer nations of the world a chance to peacefully compete. He hoped that young people would develop a maturity that would lead to an ability to cope with social, political, and economic challenges of the early twentieth century and become responsible and democratic citizens. Coubertin and his supporters also hoped that the Olympic Games would foster “international contacts,” allowing people to represent their country and get to know people of other countries and encourage a reduction of hatred, distrust, and prejudice. Nationalism and internationalism do not, in Coubertin’s opinion, exclude each other. Coubertin believed that, properly understood, peaceful internationalism corrects a narrow-minded nationalism but also acknowledges the differences and characteristics of other nations, thus disas-

sociating itself from superficial cosmopolitanism. By reintroducing the Olympic Games Coubertin planned to consolidate and extend interest in international competition. The Olympic Charter—the rules and regulations of the Olympic Games and the International Olympic Committee (IOC)—addresses this goal: “The goal of the Olympic Movement is to contribute to building a peaceful and better world by educating youth through sport practiced without discrimination of any kind and the Olympic spirit, which requires mutual understanding with a spirit of friendship, solidarity and fair-play.”

Revival

The Olympic Games were reestablished and the IOC founded in 1894 at the Olympic Congress in Paris.

**Pierre de Coubertin,
founder of the
Modern Olympics.**

Coubertin was the organizer of the congress and was supported foremost by Charles Herbert of England and William Milligan Sloane of the United States. Athens was chosen as the first host city, and amateur rules were established. Coubertin was an advocate of amateurism. To Coubertin and Sloane, only amateur sports can attain the educational goals of athleticism. Both men—as well as other early Olympians—believed that the pursuit of money in professional sports often goes along with corruption, unfairness, and an unlimited exhibition of ambition. The question of amateurism was hotly disputed through many decades.

Athletes repeatedly were excluded from the Olympics because they violated the amateur rules. For example, the 1912 gold medalist Jim Thorpe of the United States lost his Olympic eligibility for violating the amateur rules. Thorpe was stripped of his gold medals because he was paid for playing semiprofessional baseball in 1910. The IOC returned Thorpe's medals to his family in 1982. During the 1970s the amateur rules were liberalized. At the 1981 Olympic Congress in Baden-Baden, Germany, international federations were asked to modify their rules to allow professionals to compete in the Olympic Games. At the 1984 games in Los Angeles professionals were allowed to participate. The highly paid professionals of the U.S. National Basketball Association competed as the Dream Team at the 1992 games in Barcelona, Spain, to much acclaim.

Coubertin regarded the Olympic Games as the institutional framework of his "Olympic Idea": Moral perfection can be realized by education of mind and body alike. Therefore, he felt, the Olympic movement should not be limited to sports alone: It should be defined in

a broader sense. Coubertin therefore established the Olympic Congresses. Until his resignation as IOC president in 1925, Coubertin organized eight such congresses. The IOC organizes Olympic Congresses at undetermined intervals. The 1914, 1921, 1925, and 1930 Olympic Congresses dealt with Olympic rules, the program, and the amateur question. The congresses of 1973, 1981, and 1994 dealt with the future of the Olympic movement, focusing on the amateur question and its liberalization, sports in modern society, and sports and the media in a social context.

Coubertin felt that only men should participate in the Olympics. However, since the 1900 games in Paris women have taken part in various Olympic sports such as tennis and golf. In 1912 women began to participate in swimming. Because the IOC refused to admit women to track and field events after World War I, the Federation Sportive Feminine Internationale (FSFI) was founded to organize a women's olympiad in 1922. At the proposal of the International Amateur Athletic Federation (IAAF) in 1928, the IOC admitted women for track and field events to avoid a rivalry. Since that time the Olympic program for women has been substantially extended. For the last twenty-five years only sports for men and women have been admitted. Today the number of women athletes is about 40 percent that of men athletes.

In 1913 Coubertin designed the Olympic flag with its five rings: the blue, black, and red rings at the top, interlaced with yellow and green rings at the bottom against a white background. The flag was hoisted for the first time at a sports festival in Alexandria, Egypt, and then at the Jubilee Olympic Congress in 1914 in

Paris. The flag was renewed by the South Korean National Olympic Committee (NOC) in 1985.

Torch Relay

The German sports leader Carl Diem in 1931 proposed a torch relay from ancient Olympia in Greece to the venue of the upcoming games to stress the link between the ancient and modern Olympic Games. In 1931 the IOC approved a torch relay at its session in Athens. The relay was first held for the 1936 Berlin games and has become a tradition. Whereas in 1936 relay runners ran the shortest route from Olympia to Berlin, today the route allows as many runners as possible to carry the torch through the host country. In the months before the games the flame of the torch is lit in the sacred grove at ancient Olympia with a concave mirror and sent on its journey.

The Greek composer Spyros Samaras wrote a hymn for the 1896 Athens games. The Greek national poet Kostis Palamas set the hymn to music, and it was played at the 1896 and 1906 games in Athens. From 1932 to 1960 musicians from the host country composed the Olympic hymn. In 1954 the IOC announced a competition for a permanent Olympic hymn. Michael Spisak of Poland won the competition, but, because of a money shortage, the Olympic movement returned to the hymn of Samaras in 1964.

Since 1952 the Olympic Village has been an institution of the games. At the 1928 games in Amsterdam, Netherlands, and at the 1932 games in Los Angeles, athletes were accommodated in cabins. In 1936 in Berlin, athletes were accommodated in houses for the first time.

Festive highlights of the Olympic Games include the opening, award, and closing ceremonies at the Olympic stadium. The opening ceremony begins with the arrival of the host country's head of state, who is accompanied by the IOC president and the president of the Organizing Committee. Then comes the march of the nations, organized in alphabetical order according to the alphabet of the host country, but the first nation to march in is always Greece. The last nation is always the host coun-

try. After the march of the nations, the president of the Organizing Committee and the IOC president deliver speeches. Then the Olympic hymn is played, and the Olympic flag, unfurled horizontally, is brought into the stadium and hoisted on the flagpole. The Olympic torch is brought into the stadium by runners in relays. The last runner circles the track before lighting the Olympic flame. The lighting of the flame often is followed by a symbolic release of white doves. The flag bearers of all nations form a semicircle, and a competitor and a judge from the host country successively recite the Olympic oath, which is included in the Olympic Charter: "In the name of all competitors I promise that we shall take part in these Olympic Games, respecting and abiding by the rules which govern them, committing ourselves to sport without doping and without drugs, in the true spirit of sportsmanship, for the glory of sport and the honour of our teams."

At an award ceremony the top three athletes in a competition are awarded gold, silver, and bronze medals. An award ceremony takes place after each competition. The national flags of the three medalists are hoisted, with the flag of the gold medalist in the middle. During the hoisting of the flags the national anthem of the gold medalist is played. From 1928 until 2000 the front and reverse sides of the medals were designed by the Italian sculptor Guiseppe Cassioli. The top eight athletes in a competition receive a diploma. All athletes receive a campaign medal and a campaign diploma.

The closing ceremony ends the Olympic Games. The flag bearers of each national delegation enter the stadium, followed by the athletes, who since 1956 have not been categorized by nations in order to demonstrate international friendship among all athletes. The flags of Greece, the host country, and the host country of the next (winter) games are hoisted, and the national anthems of these countries are played. The mayor of the host city hands over the Olympic flag to the IOC president, who delivers the flag to the mayor of the next host city. Before the flame of the torch is extinguished and the Olympic hymn played, the IOC president officially closes the Olympic Games.

How Lady Heath Saw the Olympic Games (1928)

Lady Heath, the famous British airwoman, utilized her ability as a pilot in a novel way to secure admission to the Olympic Stadium at Amsterdam.

When the British women athletes decided to stay away from the Olympiad, Lady Heath's name was erased from the register of officials, but she did not intend to miss the Olympiad, and finding there were no tickets, she set out in her aeroplane, and circled above the Stadium.

Then she dropped a note to this effect: "I shall continue circling around until tickets of admission are left at the front office. When these arrangements are made, place coats in the shape of a cross in the centre of the Stadium and I will immediately make a landing and come along."

The request was complied with. Lady Heath returned to the Stadium by car, and had since acted in an official capacity.

The global reputation of the Olympic Games has increased with modern communication technology. The IOC reports that the 1996 games in Atlanta, Georgia, were broadcast to a worldwide audience of 2.3 billion and that the 2000 games in Sydney, Australia, drew a broadcast audience of 3.7 billion people. Pictures of Olympic competitions were first televised live at the 1936 games in Berlin. They could be watched in more than twenty-four viewing halls throughout Berlin. The first international broadcasts of Olympic competition occurred at the 1956 winter games in Cortina, Italy. The broadcasts could be watched in eight European countries. With the growing popularity of broadcasting the Olympics in the 1950s, the IOC recognized that the sale of broadcast rights could finance the games and the expenses of the IOC. The European Broadcasting Union paid \$660,000 for the broadcast rights for the 1960 winter games in Squaw Valley, California. The

price has escalated: The NBC television network paid \$3.5 billion for the rights to broadcast the five Olympics from 2000 through 2008.

Commercialism

However, the selling of broadcast rights is only one aspect of the marriage of commercialism and the Olympic Games. Sponsorship and advertising contracts are as profitable as ticketing and merchandising. The unlimited commercialization of the Olympic Games began with the 1984 Los Angeles games. After the financial disaster of the 1976 games in Montreal, Canada, which created \$990 million in debt for the host city, few cities except Los Angeles were interested in hosting the 1984 Olympic Games. For the first time the organization of the Olympic Games was put into the hands of a privately financed organizing committee—the Los Angeles Olympic Organizing Committee (LAOOC). Sponsorship programs for local, national, and international companies, the sale of broadcast rights, tickets, and Olympic coins led to a surplus of \$225 million. The LAOOC demonstrated that corporations are willing to spend huge sums of money to associate themselves with the Olympic Games. Thus, the IOC invented the program TOP (The Olympic Program) to allow corporations to become Olympic sponsors for four years by paying millions of dollars.

Since 1984 the prospect of financial gain has led to constantly increasing competition among cities to host the next games. Apart from the financial advantage, the Olympic Games increase the tourist appeal of the host city. Even after the Olympic Games end millions of tourists who watched the Olympic Games on television visit the host city. Before the 1992 Olympic Games in Barcelona, the city ranked sixteenth among favorite European travel destinations; seven years later Barcelona ranked third. Likewise, the number of tourists in Australia increased after the 2000 games in Sydney. Of course, competition to host the next Olympic Games has led to corruption inside and outside the IOC. For example, during the application procedure to host the 2002 winter games IOC members accepted gifts from

I always felt that my greatest asset was not my physical ability, it was my mental ability. ■ BRUCE JENNER

applicant cities. After some IOC members were expelled, the IOC modified the regulations for application.

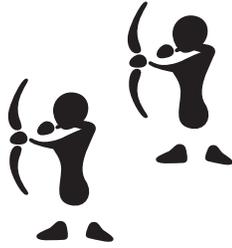

The modern Olympics have always been affected by political tensions. When Greece could not afford to host the 1896 games in Athens, Prime Minister Charilaos Trikoupis refused to host the event. He had to resign when the opposition demanded that Athens host the event. Because the founder of the modern Olympics was French, the German Gymnastic Association did not participate in the 1896 games, motivated by narrow-minded nationalism. During the 1930s fascist governments tried to use the games for political purposes. The most hotly disputed modern games were probably the 1936 Olympics in Berlin. Then the ideological conflict between East and West bedeviled the games between 1952 and 1990. Three boycotts, however, were unable to stop the Olympics: In 1976 seventeen African and Arab nations boycotted the games in Montreal, Canada, protesting a visit by the New Zealand rugby team to apartheid (racially segregated) South Africa. Four years later about sixty nations, led by the United States, boycotted the Olympic Games in Moscow to protest the Soviet Union's invasion of Afghanistan in December 1979. In return, the former USSR, with about twenty other nations, foremost from eastern Europe, did not participate in the 1984 games in Los Angeles. In defense of that boycott, some people said that the safety of east European athletes could not be guaranteed in the United States. The greatest political tragedy occurred at the 1972 games in Munich, Germany, when twelve Israeli athletes and coaches were either murdered by Palestinian terrorists or died when German police stormed the terrorists.

The Olympic motto, “Citius, altius, fortius” (faster, higher, stronger), was officially used for the first time in 1921. This Latin motto, with its message urging athletes to strive for their natural best, is often perverted at the games by the misuse of performance-enhancing drugs. Drug tests were first used at the 1968 games in Mexico City. Four years later the IOC officially established drug tests. Anabolic steroids, synthetic male hormones, and erythropoietin (EPO) are probably the most abused illegal substances in elite sports. New methods of doping, for which methods of detection have yet to be developed, are widely available. A clear warning signal against drugs was sent by the founding of the World Anti-Doping Agency (WADA), funded by the IOC.

The IOC is the supreme authority of the Olympics. It is a nongovernmental and nonprofit organization based in Lausanne, Switzerland. At the proposal of Coubertin, the IOC was formed in 1894 at the Olympic Congress. Initially the IOC consisted of thirteen members. Today it consists of more than 130 members. The IOC is a self-recruiting body. New members are elected

by the membership. Membership is limited to resident citizens of countries that have national Olympic committees (NOCs). Members are not representatives of their country or of their NOC but rather are ambassadors of the IOC in their country.

IOC

IOC members are elected, with the option of being reelected. The IOC meets at an annual session to elect a president and a vice president, nominate cities to host the games, and approve the budget. Formerly the president was elected for life. Today the president is elected in a secret vote for eight years and can be reelected for a term of four years. The Olympic Congress in 1894 decided that the president should be born in the nation that would host the next Olympic Games. Therefore, the Greek Dimitrios Vikelas became founding president and served as president from 1894 until 1896. His successor was Coubertin because the games of 1900 took place in Paris.

When William Milligan Sloane of the United States refused to become president for the third Olympics in St. Louis, Missouri, in 1904, Coubertin remained in office and was reelected several times. In 1925 he resigned the presidency and became honorary president. He was followed by the Belgian Count Henri de Baillet-Latour, who remained in office until his death in 1942. Baillet-Latour was followed by his vice president, Sigfrid Edstrom of Sweden, who was elected president in 1946. Other presidents were Avery Brundage (United States) from 1952 to 1972, Lord Killanin (Ireland) from 1972 to 1980, and Juan Antonio Samaranch (Spain) from 1980 to 2001. Jacques Rogge of Belgium was elected to the post in 2001. The Executive Committee founded by Coubertin in 1921 acts as the cabinet of the IOC. It meets at least three times a year and executes business between sessions.

During the first years of the twentieth century national Olympic committees were founded in countries that participated in the games regularly. In order to send athletes to the Olympic Games the NOCs must be recognized by the IOC, and their statutes must be in ac-

cordance with the ideals of the Olympic Charter. The charter was set up by Coubertin in 1921. Today its official version is available in French and English.

During the 1920s members of the International Sport Federations affiliated and formed the Bureau Permanent to have more influence on the Olympic program and its amateur rules. In 1967 the General Assembly of International Federations (today called the "General Assembly of International Sport Federations"—GAISF) was founded. The Association of Summer Olympic International Federations (ASOIF) represents the sports associations that take part in the Olympics. The sports disciplines that are not in the Olympic program but that are recognized by the IOC have been affiliated in the IOC-recognized International Sports Federations.

Olympics, Winter

At the IOC session in Budapest on 24 May 1911, the Italian IOC member Count Eugenio Brunetta d'Usseaux proposed to include a winter sports week in the program of the 1912 Stockholm Olympic Games featuring skiing in particular—but Colonel Victor Balck, the organizer of both the Nordic Games and the Stockholm Olympics, scheduled for 1912, did not want his Nordic Games being internationalized nor changed from 1913 to 1912. The latter was thus a clear step

backward compared with the 1908 London Games, where figure skating for men, women, and pairs was included in the program. The competitions were held in the Prince's Skating Rink in Knightbridge. Ulrich Salchow from Sweden who won gold, would make a remarkable comeback in Antwerp in 1920, where he finished fourth at the age of forty-two. A clear distinction between Summer and Winter Games was only made from 1924 onwards.

Probably the simple fact that the ice rink of the Palais de Glace happened to be there was good enough reason for the organizers of the 1920 Antwerp Games to program figure skating and ice hockey. These events took place five months before the official opening of the Games, from 24 to 27 April. Swedish figure skater Ulrich Salchow, who had been amateur world champion eleven times, only finished fourth, but his young compatriot Gillis Grafström won the gold medal. Magda Julin, also from Sweden, won gold in the ladies competition. American figure skater Theresa Weld was the darling of the Antwerp public, but she had to be content with a third place due to a partial jury. The Canadian ice hockey team, entirely made up of players of the Winnipeg Falcons, won this Olympic premiere by beating the American team.

Early Winter Games

The IOC decided on 26–27 May 1921, in Lausanne, to take up once again the question of the winter sports. Sweden, Norway and Finland voted against Olympic winter sports. Nevertheless, the conference participants voted in favor of a resolution proposed by marquis de Polignac on behalf of the French, the Swiss, and the Canadian Olympic committees. As the 1924 Games were to be held in Paris, the French Olympic Committee received permission to choose the site of the so-called Winter Sports Week in France. Chamonix, which had already organized the French skiing championships in 1906 and 1908, was chosen.

The Winter Sports Week of the Eighth Olympiad was inaugurated at Chamonix in February 1924. Athletes from sixteen nations entered the first Winter Olympic

Games. The program consisted of ice hockey, bobsledding, figure skating, skiing, curling, and speed skating, but women could compete only in figure skating. The skating competitions took place outdoors and were thus seriously affected by the weather conditions. Canada and the United States were the finalists in the ice hockey competition. People watched from rooftops to see the Canadians win by 6–1. The Scandinavians dominated four out of the five events: figure skating, bobsled and Nordic combined. Norway won 4 gold, 7 silver, and 6 bronze medals. Finland ended second with 4 gold, 3 silver, and 3 bronze medals.

At the twenty-fourth IOC session in Prague on 27 May 1925, the Winter Games were officially included in the Olympic program. The 1928 Summer Games were given to Amsterdam and the Winter Games to St. Moritz, Switzerland.

Of the 495 competitors in St. Moritz only 27 (5.4 percent) were women. St. Moritz programmed the first Alpine skiing competitions. Norway excelled again by winning seven gold medals. One of them was won by the fifteen-year-old figure skater Sonja Henie, who would repeat this feat at the two following Olympics. Henie thus became the youngest winter Olympic champion of all times. The Canadian hockey team, composed of University of Toronto students, completely ruled the ice and won its final three games by scores of 11–0, 14–0, and 13–0.

The little-known village of Lake Placid in the Adirondack forest of New York managed to become the venue for the 1932 Winter Games. Lake Placid native Jack Shea, who had taken the Olympic oath, won the first gold medal in the 500-meter speed skating event. He also won the 1,500-meter (and went on to later become mayor of Lake Placid). American skater Irving Jaffee won both the 5,000- and 10,000-meter distance races. Edward Eagan, who had won the light heavyweight boxing title at the 1920 Antwerp Games, now won gold again as a member of the U.S. four-man bobsled team. Swedish figure skater Gillis Grafström, who had won gold in 1920, 1924, and 1928, was outclassed by Austrian Karl Schäfer. Four years earlier, Schäfer had

participated in the Amsterdam Summer Olympics as a breaststroke swimmer. Sonja Henie won her second gold medal at Lake Placid and became the darling of the public. At Lake Placid women's speed skating became for the first time an Olympic sport. The Canadian ice hockey team was victorious again.

When the 1936 Olympic Games were awarded to Germany, the German organizers were also eager to host the Winter Olympics. The neighboring resorts of Garmisch and Partenkirchen were chosen because they featured all the necessary infrastructure, including ski jump and bobsled facilities. Alpine skiing competitions were for the first time included in the Winter Olympic Games. Combined events, a downhill race and two slalom races, were scheduled for both men and women. Christl Cranz was the first to win the new event for Germany; her compatriot Käthe Grasegger finished second. One day later, German skier Franz Pfnür won the Alpine combined for men. Also new was the 4×10-kilometer Nordic relay, won by the Finnish team. The British hockey team that took to the ice consisted of thirteen players; all but one of them were Canadian trained. The Canadians had protested that two members of the British team had not obtained proper transfer papers from the Canadian Amateur Hockey Association. In the end the Canadians, winners of all former Olympic competitions, were eliminated after a 2–1 loss to Great Britain. The German Winter Games organizing committee was well aware that the organization of the Summer Games would be at risk if anything should go wrong. They did their utmost to create a friendly climate of Alpine “Gemütlichkeit” on the one hand, and a perfectly planned program on the other hand.

War and the Games

The city of Sapporo, Japan, was awarded the 1940 Winter Games. (Tokyo had already been given the 1940 Summer Games.) As the Fédération Internationale de Ski rejected the IOC's decision to exclude “professionals,” the IOC canceled the Alpine ski competition for the 1940 Sapporo Games. Japan, in the meantime, was at war with China, and the Japanese Olympic Committee

decided in early 1938 to cancel their hosting of the Summer and Winter Games. St. Moritz was awarded the 1940 Winter Games, having already demonstrated its organizational capacities in 1928. The Swiss, however, refused to reinstate ski jumping as a demonstration sport, as the IOC had decided. The IOC held a secret vote and took the Games away from St. Moritz and gave them—again—to Garmisch-Partenkirchen, but World War II began with the German invasion in Poland on 1 September 1939, and neither the 1940 nor the 1944 Winter and Summer Games took place.

The Cold War Games

St. Moritz, in neutral Switzerland, was the ideal site for the postwar 1948 Winter Games. Two rival American hockey teams appeared in St. Moritz: one from the Amateur Hockey Association (AHA) and one from the Amateur Athletic Union (AAU). The AHA team finally finished fourth but was later disqualified by the IOC. There were more troubles: the Canada versus Sweden hockey match ended in a fistfight, speed skating rules were heavily criticized, and a Swiss policeman was accidentally shot by a competitor in the pentathlon. Despite all of this, the St. Moritz Games added men's and women's downhill and slalom ski races. Gretchen Fraser from the United States took gold in the slalom and became the first non-European to win a skiing event. Skeleton sledding reappeared, having made its first appearance in 1928, and the ill-starred winter pentathlon was included as a demonstration sport.

The 1952 Winter Games were held in Oslo, Norway. Snow was so scarce in February 1952 that volunteers and soldiers had to move large quantities of it to the downhill courses. For the first time a torch relay was part of a Winter Olympics. The West Germans participated in the Oslo Winter Games because their national Olympic committee had been recognized by the IOC, whereas the status of the East German Olympic committee was not resolved yet. The Oslo Games added the giant slalom race for both men and women to the program and the 10-kilometer Nordic cross-country race for women. The Alpine combined for men and women

was, however, dropped. American figure skater Richard “Dick” Button not only repeated his 1948 victory, he also amazed the enthusiastic crowd with a never before seen triple jump and double axel. Canada finished first and the United States second in the hockey competition after playing to a 3–3 tie in the final game. The Norwegians had opted for bandy, a Scandinavian variant of ice hockey, as a demonstration sport.

The Olympic oath was for the first time taken by a female athlete, Italian skier Giuliana Chenal-Minuzzo, in the Cortina d’Ampezzo Winter games of 1956. The Italian national broadcasting company RAI produced the first live television coverage of the Winter Games. This was the Soviet Union’s first appearance at Winter Games. Soviet speed skaters entered the Olympic Winter scene *en grandeur*, winning the 500-, 1,500-, and 5,000-meter events. Soviet women won the 10-kilometer cross-country ski race and the 4 × 10-kilometer cross-country relay race. Moreover, the USSR hockey team captured Olympic gold, leaving the silver and bronze medals to the United States and Canada, respectively. The star athlete at Cortina was Austrian skier Toni Sailer, who was the first skier to win all three Alpine events: slalom, giant slalom, and downhill.

Among the new technologies introduced during the Squaw Valley Games of 1960 was artificial indoor and outdoor ice and electronic timing and scoring devices. In contrast with these technological changes, Piutte Indians performed ritual snow dances on the eve of the 1960 Games. The winter biathlon, which consisted of cross-country skiing and shooting, was on the program for the first time. Women’s speed skating was also contested for the first time.

Innsbruck, the capital of the Tyrol region of Austria took the preparations of the Ninth Winter Olympics very seriously. The French sisters Catherine and Marielle Goitschel finished first and second in the women’s slalom then traded positions in the giant slalom. Soviet speed skater Lydia Skoblikova became the first athlete to win four individual gold medals in a single Winter Olympics by sweeping the 500-, 1,000-, 1,500-, and 3,000-meter events.

Grenoble marked the beginning of the media era in the Winter Games. *Gigantism* was the term used by IOC president Avery Brundage to describe the capital involved, which according to the official report amounted to a total expenditure of just over 1 billion French francs (US\$240 million). The decentralization of the 1968 Games generated great criticism. Only the skating and ice hockey events were held in Grenoble itself. In the meantime the IOC had introduced doping control. Sex-testing measures, too, were first introduced to the Winter Games at Grenoble. Jean-Claude Killy duplicated the historical feat of Austria’s Toni Sailer by winning three gold medals in the Alpine events: the downhill race, the slalom, and giant slalom. Killy was an enfant terrible in Brundage’s eyes; Brundage saw in him the personification of commercialism in sport. U.S. figure skater Peggy Fleming became the uncontested Olympic Games ice princess of Grenoble.

The 1972 Winter Games went to Sapporo, Japan. Avery Brundage had demanded that ten prominent skiers be excluded because they had been compensated for their participation in a ski camp. All major European ski countries threatened to boycott the Winter Games if Brundage did not back away from his demand. He eventually did. In the absence of Austria’s Karl Schranz, the giant slalom was won by Gustav Thöni from Südtirol in Italy. Slalom gold went to Francisco Fernandez Ochoa from Spain, who won his country’s first ever Winter Olympic medal. Ard Schenk from the Netherlands won the 1,000-, 5,000- and 10,000-meter speed skating. Two U.S. women speed skaters won gold medals: Anne Elizabeth Henning in the 500-meter race and Dianne Mary Holum in the 1,500-meter race. The USSR again very convincingly won ice hockey; the U.S. team finished second.

Austria was awarded the 1976 Winter Olympics as a recompense for the exclusion of its national skiing hero Karl Schranz from the 1972 Sapporo Games. As in the 1952 Oslo Games, Innsbruck had to launch an “Operation Snowlift” in which soldiers had to move large quantities of snow to the ski runs.

Another concern that haunted the organizers of the Innsbruck Games was the threat of terrorism, especially

Olympics, Winter

Snowball Fights

Snow is a requirement of many winter sports. The following description is of snowball fights among the Saami (Lapps) of Finland in the nineteenth century.

Snowball fights (t shkki = hard snowball, muoht-spab'b = soft snowball) are popular and are practiced as often as the weather is suitable. Two children stand opposite each other, while the others watch. The starting distance is fixed at seven or eight fathoms, but as the fight warms up, the two fighters approach each other until it becomes almost a close combat (sm ogkodeäbme) in which there is no time to make balls and they can only throw snow by double handfuls on each other. The one who takes to his heels is the loser. They may also form two parallel rows, with the oldest participant settling the combination of the two parties in such a way that they are equally strong. Now begins a general contest: Whoever is hit by a ball is out. They proceed in this way until one side is empty. If only one or two children are left on each side, they will approach each other and finish with a hand-to-hand fight. Anyone who has behaved contrary to the rules is punished, e.g. by having his trousers filled with snow.

after the terrorist massacre of Israeli athletes at the Munich Games in 1972. The Olympic Village, housing 1,650 athletes and officials, looked very much like a fortress with a two-to-one security-to-athlete ratio. East Germany (GDR) won all five bobsled and luge events. The Soviet Union once again led the medal count, winning a total of twenty-seven medals, of which thirteen were gold. Soviet cross-country skier Galina Kulakowa, became the first woman to win five gold medals. Her bronze medal in the 5-kilometer individual race was taken away, however, after she tested positive for ephedrine use.

The small Adirondack ski resort of Lake Placid, New York, obtained the Games for the second time in 1980. Because very little housing was available in the village of Lake Placid itself, spectators had to find lodging in

far away hotels and motels. As a result the three two-lane roads that were the only access to the village became the scene of a transportation nightmare. Among the top athletic achievements in Lake Placid were the double slalom victories of Swedish Ingemar Stenmark for the men and Hanni Wenzel from Liechtenstein for the women. American speed skater Eric Heiden realized what no other athlete had done before, or since, in the Winter Games, capturing five gold medals, one in each speed skating event. Pairs skating was won by the Soviet couple Irina Rodnina and Alexander Saizew. The spectacular ice hockey victory of the young American team over the much more experienced Soviet team was generally acclaimed as a symbolic victory of the free world over a totalitarian regime. Although the Soviet athletes won more gold, the East Germans won an overall total of twenty-three medals against twenty-two for the USSR.

The IOC awarded the XIV Winter Olympics to the city of Sarajevo in Yugoslavia. The athletes/journalists ratio at these Olympics was stunning: An Olympic Village was built to house 2,200 athletes and delegates, whereas the village for the press had room for 8,500 journalists! The athletic highlight for the local population occurred when Slovenian skier Jure Franko won the first-ever Yugoslavian Winter Olympic medal, capturing silver in the men's giant slalom. "Billy D" Johnson, often called "crazy boy" by his U.S. teammates, won the gold medal in the downhill race. U.S. skiers Debbie Armstrong and Christin Cooper finished first and second respectively in the giant slalom. Scott Hamilton from the United States won the gold in the men's figure skating. Katarina Witt of East Germany made her Olympic debut and won the first of her eventual two gold medals in women's figure skating.

On the Paskapoo slopes west of the city of Calgary, Canada, a US\$72 million Olympic Park was constructed for the 1988 Winter Games. Sixty thousand spectators attended the opening ceremony in the McMahon Stadium. Over 8,000 performers staged a spectacular show of old and newly invented Alberta traditions. Soviet Union won her eighth and ninth cross-country medals. The star athlete in ski jumping was Matti Nykänen from Finland. However, British ski jumper Michael Edwards, better known as “Eddie the Eagle,” who finished last in both jumping events, got an abundant amount of public acclaim as a satirical antihero. Italian super skier Alberto “la

Bomba” Tomba excelled in both slalom events. Vreni Schneider from Switzerland was his female counterpart in the slalom and giant slalom. Brian Boitano from the United States and Katarina Witt from the GDR won the figure skating events for men and women, respectively. Dutch speed skater Yvonne van Gennip captured triple gold. The two-man and four-man bob races were won by the USSR. The Soviet hockey team won its last Olympic golden medal. Free style or “hot dog” skiing and short-track skating were programmed as demonstration sports. Curling, which had been on the men’s program in 1924 and 1932, made its reappearance—as a demonstration sport for men and women.

Olympics in the Post-Cold War World

Albertville was chosen during the ninety-first IOC session in Lausanne. The 1992 Winter Games were the first Olympics since the collapse of the Communist Bloc states. The former Soviet Union sent a Unified Team, consisting of athletes from Russia, Ukraine, Belarus, Kazakhstan, and Uzbekistan. Germany, East and West, now united, sent a joint team for the first time since the 1964 Innsbruck and Tokyo Games. The Albertville Games opened with a futuristic mass spectacle, with thirty-six countries represented. Newly introduced as Olympic events were short-track skating (4 events), freestyle skiing (2 events), and biathlon for women

(3 events). Free-style ski ballet and aerials, speed skiing, and curling figured as demonstration sports. The most successful athlete of the Games was female cross-country skier Ljubov Egorova of the Unified Team, with three gold and two silver medals. Her compatriot, forty year-old Raisa Smetania, competing in her fifth Winter Olympics, won gold in the 4 × 5-kilometer cross-country relay. Alberto Tomba successfully defended his gold medal in the giant slalom. So did Bonnie Blair from the United States in the 500-meter speed skating; she also won the 1,000-meter event. Toni Nieminen from Finland was only sixteen when he won gold in the long ski jump and bronze in the short jump. The Unified Team continued the old time Soviet tradition by winning the ice hockey competition. The reunified German team went home with the most medals won: 10 gold, 10 silver, and 6 bronze.

When the IOC decided to alternate the Winter and the Summer Games every two years, starting in 1994, the little Norwegian ski resort of Lillehammer took up the challenge by presenting a new bid to compensate for its loss of the 1992 Games. The Lillehammer Winter Olympics qualified as the first “green Olympics.” Schoolchildren were called on to help with the planting of “Olympic forests” and to transplant rare wildflowers from ski or bobsled construction sites. And up-to-date energy-saving techniques were used. Stein Gruber made a thrilling ski jump with the Olympic torch at the open-

ing ceremony. Johann Olav Koss—“Koss is the boss”—became Norway’s national sport hero by winning three speed skating gold medals in world record time in the 1,500-, 5,000-, and 10,000-meter events. Bonnie Blair, who had already captured gold medals in two previous Olympics, won gold again in the 500- and 1,000-meter speed skating races. Her U.S. teammate Dan Jansen finally realized his Olympic dream by winning the 1,000-meter speed skating race. With a gold medal in the slalom, Swiss skier Vrenie Schneider became the first woman to win three gold medals in that event. Although Russia ended in first position with a total of 23 medals (11 gold, 8 silver, and 4 bronze), the Norwegians did almost as well with a higher total of 26 medals (10 gold, 11 silver, and 5 bronze).

When the Japanese city of Nagano warrowly beat out Salt Lake City (by a vote of 46 to 42) as the host city of the 1998 Winter Olympics, environmentalists were very concerned that some of the Games-related construction would damage protected mountain forest areas. The official program of the Nagano Games increased to seven sport disciplines and sixty-eight events with the addition of curling for men and women, women’s ice hockey, and snowboarding. The two most successful athletes were two cross-country skiers: Larissa Lasutina from Russia (with 3 gold, 1 silver, and 1 bronze medal), and Norwegian Bjorn Daehlie (with 3 gold and 1 silver medal). Local ski jumper Kazuyoshi Funaki captured gold in the 90-meter ski jump and silver in the 70-meter ski jump; Austrian alpine skier Hermann Maier won gold in the giant slalom and in the super G after having survived a disastrous fall in the downhill race. The Czech ice hockey team, which counted the fewest NHL players in its ranks, won convincingly. The U.S. women won the first female ice hockey event; Canada and Finland were second and third, respectively.

Salt Lake City finally won the right to stage the 2002 Winter Olympics after thirty years of unsuccessful bids. The preparations were, however, tainted by a bribery scandal. The Salt Lake Organizing Committee (SLOC) had not only given scholarships to IOC relatives but also gifts, favors, and cash payments to IOC members.

Then, the terrorist attack on September 11, 2001, on the World Trade Center in New York and the Pentagon in Washington, D.C., happened just five months before the start of the Olympics. Security measures were therefore greater than at any previous games. The United States was at the Salt Lake City Games the second most successful winter sports nation with thirty-four medals, only one less than Germany. New IOC president Jacques Rogge solved the figure skating judging controversy by declaring the Canadian pair of Jamie Sale and David Pelletier co-winners of the Olympic gold with Elena Berezhnaya and Anton Sikharulidze from Russia. Thanks to extensive testing before the Games, there was little doping news during the Games. On the last day of the Games, however, three Nordic ski medalists, one from Spain and two from Russia, were disqualified for using darbepoetin. Women’s figure skating gold was won by American Sarah Hughes. Canadian men and women’s teams triumphed in hockey. Janica Kostelic from Croatia won four medals (three golds), the most by an Alpine skier in a single Olympics. Norway’s Ole Einar Bjoern-dalen won four gold medals in biathlon and Finland’s Samppa Lajunen three gold medals in Nordic combined. The young Swiss ski jumper Simon Ammann won both events. Third-generation U.S. Winter Olympian Jim Shea and his compatriot Tristan Gale won gold in the skeleton. The 2002 Winter Games were a popular and financial success and were followed in March by the first Winter Paralympics under Olympic patronage.

Orienteering

Orienteering, which enthusiasts refer to as “the thinking sport,” was developed in 1895 in Scandinavia. People of all ages and fitness levels can practice it alone or as a competitive sport; it requires minimal equipment; and it is environmentally benign (although some people disagree). An orienteer uses a topographical map and a specially designed compass to follow a cross-country course and walk or run through woods and fields, navigating streams and conquering or avoiding hills and other rough terrain.

Orienteering, first popularized during the early twentieth century, has an estimated 800,000 enthusiasts in about fifty countries. Events are held for individuals and for teams, and orienteers compete in both national and international championships. Variations of the sport include ski orienteering, developed in Norway during the late nineteenth century, and bicycle orienteering, which has more recently become especially popular in Germany and France. Orienteering enthusiasts often refer to their sport simply as “O,” whereas they refer to its variations as “ski-O,” “bike-O,” and so forth.

Origins

Orienteering, developed in what was then the kingdom of Norway and Sweden as a military exercise, was designed to train officers to find their way swiftly over a course through unfamiliar terrain. The exercise also had an athletic component: Winners were determined by a formula that included elapsed time, pulse rate at the finish line, and participants’ ability to deliver a verbal report immediately after completing the course.

As a military exercise orienteering has proved its worth numerous times. Its popularity in Scandinavia during the 1930s is credited with helping the Finns resist the Soviet invasion in 1939 and enabling Norwegian resistance fighters to escape to Sweden after the German invasion of 1940.

Scholars believe that the first nonmilitary orienteering event took place near Bergen, Norway, in 1896. Sigge

Stenberg, a Swedish engineer who wrote about orienteering after visiting Kristiania (now Oslo, Norway) in about 1900, introduced the sport to Sweden. Several Swedish athletic clubs, inspired by Stenberg’s reports, began to hold small orienteering events. The first Swedish national orienteering event was held in 1902 near Stockholm, but because of bad weather only five people competed.

The Swedish scouting movement soon adopted orienteering as part of its outdoor training program. Historians of orienteering consider Ernst Killander (1882–1958), a Swedish scoutmaster and president of the Stockholm Sports Federation from 1917 to 1934, to be the father of orienteering. He organized the first major orienteering event at Saltsjoboden, Sweden, in 1919. The 12-kilometer event had 155 participants; O. B. Hansson had the fastest time: 1 hour, 25 minutes, and 39 seconds.

Development

Norway and Sweden competed in the first international orienteering competition in 1932. During the 1930s the sport spread elsewhere in Europe. Competitions were held in Hungary and the Soviet Union (1933), Switzerland (1938), Czechoslovakia (1950), Yugoslavia (1953), and Bulgaria (1955). The first European championships were held in Loten, Norway, in 1962, and the second in Le Brassus, Switzerland, in 1964.

Bjorn Kjellstrom (1910–1995), a former Swedish orienteering champion and lifelong promoter of the sport, coined the word *orienteering* in 1946. Kjellstrom later helped popularize orienteering in the United States. The International Orienteering Federation (IOF) was formed in 1961 by Norway, Finland, Sweden, Denmark, Switzerland, Hungary, Bulgaria, Czechoslovakia, West Germany, and East Germany. Orienteering federations were formed in Britain in 1966, in Canada and Israel in 1967, in Japan in 1969, in Australia and France in 1970, and in the United States in 1971.

Equipment

The design of modern orienteering maps owes much to the IOF Map Committee and Harald Wilbye, a

*To venture causes anxiety, but
not to venture is to lose one's
self.* ■ SOREN KIERKEGAARD

Norwegian computer consultant. The IOF during the late 1960s introduced a standardized approach to the design and layout of orienteering maps that could be used internationally. Wilbye created the first multicolor orienteering maps based on aerial photographs and complete with IOF symbols; they set the standard for future orienteering maps.

Maps use five colors and a 15,000 to 1 or 10,000 to 1 scale in detailed terrain. For educational and introductory purposes even bigger scales are used. The equidistance (i.e., the vertical distance) between contour lines is normally between 2.5 and 5 meters. Map symbols are standardized, allowing competitors from different countries to compete equally.

Kjellstrom and Gunnar Tillander developed the principle of the modern orienteering compass during the early 1930s: A liquid-filled magnetic compass revolves on a transparent base. The base also serves as a protractor and contains various markings to help orienteers read maps and determine location, direction, and distance.

Event Types

The lengths of orienteering courses range from 1 to 15 kilometers, and variations in terrain determine the degree of difficulty. At competitive events officials set the course in advance, having first marked checkpoints (places that each competitor must reach) with orange-and-white flags. Each competitor is given a map on which the control points have also been marked. Competitors begin the course at intervals of from two to five minutes. Using compass and map, they find their way sequentially from one checkpoint to the next as fast as they can. To prove that they reached each checkpoint, competitors use a special punch provided at each checkpoint to punch a hole in a control card that they carry with them. An electronic recording system more recently has replaced punches, allowing instantaneous registration of all intermediate times for all legs of the course.

Point-to-point orienteering, the classic form of the sport, is used in regular competitions. A person called

the “course setter” selects control points in the field, and participants find their own routes from one control point to the next, trying to find each control point in the predetermined sequence in the shortest time. Point-to-point orienteering has numerous variations, including Score-O, in which competitors locate control points in any order, trying to find as many as possible within a time limit; ROGAINE (rugged outdoor group activity involving navigation and endurance), in which teams compete over a much larger area during a period of six to twenty-four hours using the Score-O format; and Relay-O, in which teams of three or four compete, with each team member using a different course.

In some orienteering events, mainly for beginners and children, the course setter presets the routes that competitors follow. This preset-course version is more relaxed than point-to-point orienteering and is a good introduction for novices. A variation of the preset-course version is line orienteering, in which the course setter establishes five to twelve control points along the route and marks them on a master map. A route between the control points is then plotted. Competitors’ maps are marked with the route, but the control points are not indicated. Each competitor must navigate the route, marking the map with the location of each control point as it is found. In such events time is not the main factor; the objects are to locate and plot as many control points as possible. Other variations of preset-course orienteering exist, such as route orienteering, in which colored streamers mark the route.

Persons with physical disabilities may compete in handicapped-O; they may receive help in moving along the course but must do their own plotting to find the control points.

Specific Demands

Map reading is, of course, the fundamental skill required in orienteering, but participants must also be able to compare features on a topographical map with actual features of the terrain. Participants use the compass to turn the map toward the north and sometimes to take a bearing in a certain direction.

Whereas beginners normally use most of their time interpreting the map and making decisions, accomplished orienteers expend a great deal of physical effort. Their main challenge is to avoid making mistakes in reading the map and using the compass while moving quickly over uneven terrain.

Organization

The IOF (www.orienteering.org) has sixty member nations. The IOF hopes to develop orienteering worldwide by setting international standards for mapping and course planning, establishing competition rules, and organizing international events. In 1966 the first World Orienteering Championships (WOC) were held in Finland. Since 1979 the championships have been held in odd-numbered years. An official World Cup and ski WOC are held in even-numbered years. Orienteering organizations continue to lobby to have the sport included in the Olympic Games.

The IOF publishes an annual magazine *Orienteering World*, and since 1985 the Scientific Group of the IOF has published *Scientific Journal of Orienteering*, the first international sport-specific scientific journal, and international symposiums are conducted regularly.

The Future

Orienteering attracts people who enjoy using their minds while engaging in vigorous outdoor activity. For aesthetic as well as competitive reasons, they also want to protect the natural environment. In some countries conflicts between hunters, environmentalists, and orienteers arose during the 1980s, although studies have shown that orienteering events harm neither animals nor plants if certain precautions are taken.

Hundreds of orienteering events, most of them for all age groups, both genders, and different levels of competitiveness, are organized around the world these days. Multiday events are becoming popular. One of the biggest is the annual Swedish *five-dagars* (five-day) event, which attracts as many as twenty-five thousand orienteers of all ages.

Osteoporosis

Osteoporosis is basically a pathological depletion in the calcium content of a person's bones, with little change in other components of the tissue. Osteoporosis may be either primary or secondary in type. Primary osteoporosis reflects the effects of age and changes in secretion of the sex hormones, whereas secondary osteoporosis is caused mainly by some other disease or condition (such as thyrotoxicosis, chronic liver disease, rheumatoid arthritis, diabetes mellitus, alcoholism, or an excessive secretion of hormones from the adrenal cortex). Primary osteoporosis is important in sports medicine because development of the condition leaves the affected individual vulnerable to fractures and because the likelihood of the problem can be greatly reduced by physical activity that maximizes calcium stores as a young adult and reduces calcium losses in later life.

Manifestations of Osteoporosis

Manifestations of primary osteoporosis may be either generalized or localized to a few bones. The disorder is most commonly observed in the spongy, trabecular type of bone (where the turnover of minerals occurs six times more rapidly than in compact cortical bone). The loss of calcium weakens the bone structure. The affected tissue becomes porous and brittle, predisposing it to what are termed pathological fractures—injuries sustained as a result of minor falls or vigorous muscle contractions, or sometimes with no obvious external cause at all.

Courage is resistance to fear, mastery of fear not absence of fear. ■ MARK TWAIN

The commonest sites of injury are the spine, the hips, the neck of the femur, and the wrist. The U.S. National Osteoporosis Foundation estimated that in 2002 the following injuries were attributable to osteoporosis: 700,000 vertebral fractures, 300,000 hip fractures, 250,000 wrist fractures, and 300,000 other fractures. Osteoporotic fractures of the hips are particularly dangerous. Many elderly people who sustain such injuries do not walk again. About half of them require care for the remainder of their lives, and 20 percent die of complications in the year after the fracture. Osteoporotic deterioration of the vertebrae is also common in those over the age of seventy; it leads to compression and curvature (kyphosis) of the spine, often with a substantial (5–8 cm) decrease in standing height.

The Influence of Age and Sex on Bone Calcium Content

Osteoporosis is often not diagnosed until the eighth decade of life, but exercise behavior as early as adolescence can influence the likelihood that this problem will develop. In most people, the calcium content of the bones reaches its peak at twenty-five to thirty years of age, and thereafter it shows a slow but progressive decline. Eventually, in old age, the extent of mineral loss is sufficient to allow pathological fractures.

The pattern of calcium loss is different in men and women. In men, there is little loss of bone mineral before the age of forty years. A loss of 0.5 percent per year develops between the ages of forty and sixty, and depending on subsequent deterioration in gonadal function, losses can amount to as much as 4 percent per year after the age of sixty. In women, there is a loss of 1 to 2 percent of bone calcium per year beginning around the age of thirty-five, but this accelerates in the five years following menopause, when there is a cumulative loss of about 20 percent.

The peak bone calcium is generally lower in women than in men, probably because women secrete only very small quantities of testosterone and related hormones. Moreover, on average women live longer than men, so that there is more time for them to develop osteoporosis before they die.

Factors Predisposing to Osteoporosis

Among the factors that predispose people to osteoporosis, several are potentially modifiable. These include a lack of adequate physical activity, dietary restrictions, the deliberate suppression of hormone secretions, and lifestyle choices such as smoking and excessive alcohol consumption.

INADEQUATE PHYSICAL ACTIVITY

Perhaps the commonest adverse influence upon bone density is a lack of adequate habitual physical activity. The deposition of calcium in the bones is facilitated by the application of mechanical forces to the bone structure—either gravitational forces or vigorous muscle contraction. Thus, bone density is generally greater in athletes than in sedentary people. The benefit is most noticeable in those body parts that are used in performance of the sport; for instance, bone density is enhanced in the serving arm of a tennis player. However, forms of physical activity that minimize gravitational forces (for example, recreational swimming or pool exercises) provide little stimulus to bone mineralization. The impact of a lack of gravitational stimulation is particularly marked during long space voyages; the preservation of bone mineral content in a zero-gravity environment is a major challenge for interplanetary astronauts, and as yet agreement is lacking on the ideal type of exercise to take inside a space capsule. Immobilization by a plaster cast following a fracture is another common cause of local osteoporosis, and it is important to prescribe local exercises to restore bone mineral content after such an injury has healed.

INADEQUATE DIET

For various reasons (including a low level of habitual activity), old people who are living alone may have a diet that provides inadequate amounts of energy, protein, vitamins, and minerals, predisposing them to osteoporosis.

Several categories of young female athletes such as gymnasts and figure skaters are also liable to develop an inadequate diet. One reason why they do not eat enough food is that their events are judged in part on their

appearance; in order to keep a slim figure, these young athletes restrict their overall intake of food energy and thus of protein, calcium, and vitamins. Production of the sex hormones declines, menstruation may cease, and there is a parallel reduction in bone calcium content. Even if the decrease in bone calcium is insufficient to cause fractures immediately, osteologists argue that the reserves of bone calcium are diminished by deliberate dietary restriction during adolescence, increasing the risk that affected individuals will become osteoporotic during old age.

THERAPEUTIC SUPPRESSION OF TESTOSTERONE SECRETION

Men who have developed a prostatic cancer are increasingly undergoing a form of treatment in which irradiation of the tumor is combined with the injection of substances such as leuprolide, which counter the action of luteinizing hormones. Leuprolide administration reduces the circulating concentrations of testosterone. This decreases the likelihood that a prostatic tumor will recur, but it has the unfortunate side-effect that vulnerability to osteoporosis is increased, much as it is in women at menopause.

ADVERSE LIFESTYLE CHOICES

Cigarette smoking and an excessive consumption of alcohol both increase the risk of osteoporosis. However, it is difficult to be certain of the magnitude of the effect of these adverse lifestyle choices, because smoking and an excessive consumption of alcohol are commonly associated with sedentary behavior.

Diagnosis of Osteoporosis

Local loss of bone mineral following immobilization can often be detected semi-quantitatively by comparing standard radiographs of healthy and fractured limbs. A more formal diagnosis of local or generalized osteoporosis is usually based on bone scans.

Dual-energy x-ray absorptiometry (DXA) measures the bone mineral density (BMD) in such regions as the lumbar spine or the proximal femur; calcium content is

reported per unit of cross-sectional area (g/cm^2). Measurements can be made quite rapidly, and the x-ray exposure is less than a tenth of that received during a standard chest x-ray. The alternative technique of computed tomography measures bone density per unit of bone volume (g/cm^3). Some research laboratories are also beginning to develop methods of detecting an excessive rate of bone turnover.

The World Health Organization regards a bone as osteoporotic if the BMD is more than 2.5 standard deviations (SD) below the average value found in a young adult. Osteopenia (a low bone mass, and an important risk factor for osteoporosis) is diagnosed if the BMD is 1.0 to 2.5 SD below the expectation in young adults.

Population Magnitude of the Osteoporosis Problem

The risk of a hip fracture increases threefold with each 1 SD decrease in bone density at the hip. Various archeological reports note evidence of osteoporosis in antiquity. However, perhaps because the energy requirements of daily living have decreased in recent years, the prevalence of this disorder has increased over the past fifty years.

Some investigators suggest that currently 10 percent of women eventually succumb to osteoporosis. In the United States alone, there are now over 40 million cases of osteopenia, and about 10 million diagnosed cases of osteoporosis (80 percent of these are in women). The incidence of pathological fractures is 1.2 million per year; indeed, the risk of an osteoporotic fracture of the hip in elderly women equals the combined risks of breast, uterine, and ovarian cancer. Moreover, if the rate of increase in the prevalence of osteoporosis continues unchecked, 61 million U.S. citizens over the age of fifty will have osteopenia or osteoporosis by the year 2020.

Prevention and Treatment of Osteoporosis

The prevention and treatment of osteoporosis are based mainly on an adequate intake of food, calcium, and vitamin D, along with adequate daily physical activity.

Possible pharmaceutical treatments include hormone replacement therapy (estrogen-progestin), estrogen receptor modulators such as Raloxifene (in postmenopausal women), administration of phosphonates (Alendronate or Risedronate), and (again, only in postmenopausal women) dosage with calcitonin.

DIETARY REQUIREMENTS

To keep bones healthy, the overall intake of food must be sufficient to maintain body weight. The diet should include an adequate quantity of good quality protein (0.7–1.0 g/kg of body mass per day in the general population, but as much as 1.5–2.0 g/kg in some categories of athlete). Calcium supplements are commonly needed, particularly in older individuals, since a daily intake of around 1,500 milligrams is required, and, particularly in soft-water areas, the normal nonathletic diet may provide only 500 to 750 milligrams of calcium. A poor intestinal uptake of calcium in the elderly increases blood levels of parathyroid hormone, which in turn increases bone turnover.

An adequate intake of Vitamin D is important for the incorporation of calcium into bone. The body synthesis of vitamin D varies with exposure to sunlight and decreases with age. Since 2002, the recommended intake of Vitamin D has been increased from 400 to 1000 International Units.

PHYSICAL ACTIVITY

Regular daily physical activity plays an important role in ensuring an adequate intake of both calcium and vitamins. Dietary deficiencies that predispose to osteoporosis are most likely in elderly people who take very little physical activity. Laboratory studies, cross-sectional comparisons of sedentary individuals and athletes, and longitudinal training trials also show that physical activity has a direct influence on the retention of calcium by bone.

The mechanical forces associated with vigorous exercise stimulate piezo-electrical activity in the bone cells. The magnitude of the piezo-electric effect seems to depend more upon the intensity of loading than on the

number of cycles of bone loading that are undertaken. A bending or vibration of the bone induces a difference of electric charge across the cells, favoring the deposition of calcium ions on the side of the cell which has become negatively charged. Piezo-electric effects also stimulate the bone cells to produce adenosine 3-5 cyclic monophosphate (cAMP) and prostaglandin E₂, and this in turn facilitates bone formation. Finally, benefits may also arise because of exercise-induced increases in blood flow to the bone.

Optimal training programs for maximizing bone density have yet to be defined. Part of the problem in determining the merits of various types of sport and leisure activity is that a positive response probably requires an overloading of the bone. The optimal stimulus thus depends on the initial fitness and bone density of the individual. Further, calcium retention cannot occur if the intake of calcium and vitamin D is inadequate.

The increase of bone density is specific to the bones that are placed under stress. Benefit is obtained from exercises that yield skeleton-loading ground reaction forces through high-intensity impact, and also from nonimpact resistance exercises that stress the skeleton through vigorous eccentric muscle contractions. Positive effects are large in sports such as weightlifting and weight-throwing, and benefit is also seen from the repetitive weight-bearing of distance running and Nordic skiing, but the bone density of swimmers differs little from that of sedentary controls. Bone density is positively correlated with peak muscle torque and thus the forces exerted on specific bones, but bears little relationship to the individual's cardiorespiratory fitness. Even if the forces applied to the bone are increased progressively as a conditioning program continues, returns diminish as the exerciser approaches his or her ceiling of bone density.

The current consensus for the prevention and treatment of osteoporosis thus calls for a long-term, progressive regimen, using either high-impact aerobic exercise or resistance exercise. Relatively intense muscle contractions are needed, with only a small number of repetitions per session. A meta-analysis of some sixty-two studies conducted over a thirty-year period found

that on average exercise programs of six to twenty-four months duration prevented or reversed bone loss by 1 percent per year relative to controls. Additional benefits from programs of longer duration are less clearly established.

A small number of studies have suggested that individuals who have already developed osteoporosis can still benefit from a program of progressive resistance exercise. Indeed, because of a low initial bone density, the response is likely to be greater than in those who begin an exercise program with good bone health. The type of activity that is prescribed must be selected carefully in order to avoid fractures from falls and violent body movements. On the other hand, a reduced risk of falling is a second important consequence of muscle-strengthening exercise in the frail elderly.

PHARMACEUTICAL TREATMENTS

It is still not altogether clear how the sex hormones influence bone mineralization. However, estrogen receptors have been detected on bone-forming osteoblasts, and administration of estrogens increases the number of vitamin D receptors on the osteoblasts. Estrogens are also thought to stimulate the production of calcitonin (which inhibits the resorptive process) and bone growth factors (insulin-like growth factors 1 and 2), while inhibiting the production of interleukins 1 and 6 (which seem to promote osteopenia).

Until recently, many authorities have recommended prolonged hormone-replacement therapy (HRT)—typically, combinations of estrogen and progestin—to prevent osteoporosis in postmenopausal women. Such treatment may be warranted during the phase of very rapid calcium loss, but there is growing recognition that any advantages of prolonged HRT are more than offset by increased risks of cardiovascular disease, strokes, and breast cancer. Raloxifene (Evista) is an estrogen-receptor modulator for use after menopause, which is currently being evaluated for the prevention and treatment of osteoporosis. It slows bone loss and slightly increases normal bone growth, but it may have some of the drawbacks of hormone replacement therapy.

Alendronate (Fosomax) is a drug that decreases bone turnover by causing a selective death of osteoclasts, the cells that remodel bone. Controlled trials have now shown that if Alendronate is administered once weekly, this somewhat drastic form of treatment can cause a clinically valuable decrease in bone calcium loss. Risedronate (actonel) is a biphosphonate drug somewhat similar in its action to Alendronate. Calcitonin has theoretical potential in the treatment of osteoporosis, but currently it has only been approved for the treatment of established osteoporosis in postmenopausal women.

Implications for Prevention and Treatment

Most adults show a weakening of bone structure from the combined effects of aging and the associated decrease in habitual physical activity. The loss of calcium predisposes older people to pathological bone fractures, which can often shorten their lives. More research is needed to determine the optimum pattern of physical activity recommended to prevent the factors that predispose people to osteoporosis. However, the current consensus calls for repeated bouts of vigorous activity at high peak loads, coupled with an adequate intake of protein, calcium, and vitamin D.

Ownership

Ownership is a vital aspect of the development and growth of sports from the latter part of the nineteenth century to the present day. In sports, the organizational model that predominates is based on the historical power exerted through ownership. Privately owned clubs or franchises dominate the sporting landscape, despite some notable and successful publicly owned teams.

Organizational Background

Recent research highlights the importance of the business and economic history of sports. The role of entrepreneurs is vital in considering developments in sports and recreation relative to the broader concept of ownership. Sporting goods manufacturers were the first notable group of owners to make their presence felt, and the best example of this was A. G. Spalding and his role in the development of baseball's National League during the 1870s. Spalding was the owner of Chicago's National League team who played a significant role in moves toward establishing a salary cap. This in turn led to the formation of a players' union (Brotherhood of Professional Baseball Players) in 1885. Spalding also sought to export baseball overseas to Europe, Australia, and North Africa. Clearly Spalding's motives were at least in part driven by the opportunity to develop new markets for his sporting goods. Certain forms have traditionally dominated the structures of sports organizations, and this has been affected by the developing influences of the commodification and commercialization of sports throughout the twentieth century. Indeed, sports as an enterprise has been directly affected by shifts in the standard model of ownership.

An organization can be viewed as a system that draws on a network of contributing participants for adding value through the acquisition, allocation, and commitment of resources. Sports can be viewed as a model of mutually beneficial exchanges where participants receive a tangible, material benefit in return for resources. This process will have slightly different outcomes depending whether fans, players, or communities provide the context and how stakeholder objectives are managed. In many cases, the key stakeholders are the shareholders of the venture or organization. Just as vital to the operation of the team or franchise, however, are the individuals that make up the workforce. This group remains crucial to the operation of the business. Without an effective and productive workforce, a venture can quickly become very undesirable for both owners and shareholders. The stakeholders in sports include the fans who support the team, the cities and nations that the team represents, and

At one point the players took the matter of ownership into their own hands. The short-lived Players League is described in the following account from the Chicago Tribune, titled: Magnates declare war. They will fight the Brotherhood to the bitter end. League directors authorize the expenditure of unlimited blood and treasure in defeating the "Conspirators."

New York, Nov. 15-[Special.]-The National League finished up its business today and adjourned. . . .

The league men met about 11 o'clock and devoted three hours to the consideration of the desertion of their players and the Players' League. Director John I. Rogers stated that it was a notorious fact that a number of players reserved by league clubs have declared their intention to violate said reserve, notwithstanding notices of their respective clubs of said reserve and of the latter's option to renew the usual form of contract with such players for the season of 1890. Also that the opinions of eminent counsel had

been received affirming the legal and equitable rights of said clubs under said contracts to the services of their reserved players for the season of 1890, and that therefore he moved the following resolution:

"Resolved. That this league hereby declares that it will aid each of the club members in the enforcement of the contract rights of said clubs to the services of its reserved players for the season of 1890 and that a committee of three be appointed by the league with full power to act and so formulate and carry out the best methods of enforcements of said contract rights of said clubs, and that said committee be authorized to draw from the guarantee fund of the league such amount as may be necessary to carry out the intent and purpose of this resolution."

The resolution was adopted and Messrs. John I. Rogers, Charles H. Byrne and John B. Day were appointed as the law committee.

those who exert power through their financial ownership. Suppliers, employees, agents, and consumers also play roles within this wider dynamic. Stakeholders broadly represent any group that has an actual or potential interest or impact on a sports organization's ability to achieve its objectives. Furthermore, a number of different groups claim an interest or stake in the sporting venture, which creates multiple publics.

Applying traditional business models to the sporting environment has brought about a change in focus and thinking. Notably, pressure groups that include citizen-action publics and local publics (including councils and civic authorities as well as government more generally) also directly affect the practicalities of ownership. Indeed, the business aspects of sports have become increasingly important in recent years. It is useful to gauge the reactions of these diverse groups when foreign owners become involved in local companies and sports teams, as the proposed take-over of

the Manchester United Football Clubby by American billionaire Malcolm Glazer (owner of the Tampa Bay Buccaneers in the National Football League [NFL]) in 2004 illustrates. A fringe group of the Manchester club's supporters, who also happen to be shareholders in the publicly limited company, attempted to disrupt the deal with protests at games, appeals to the club's fans not to purchase club merchandise, and attempts to gather support from other nonaligned shareholders. This illustrates how situations in the United States and the United Kingdom (U.K.) and differ yet might interact.

The intrinsic value of involvement in sports has continued to fuel its development, yet the perceived investment value of sports has also been important to this process. For most shareholders and owners, maximizing profits continues to be a strong motivation for involvement, particularly because sports are increasingly being organized as industries. There has been increasing con-

vergence between sports organizations. The importance of the process of exerting control over the product is vital to understanding the finer points of ownership and an owner's initial reasons for involvement.

Ownership becomes a privileged position with access to assets such as goodwill and the brand name. This can provide economies of common governance and tends to affect the broader situation for sports leagues. The disorderly accumulation of economies enables owners to offer innovatory or complementary services that reinforce their competitive positions. The emergence of team credit cards and other financial services during the past decade illustrates this process of diversified revenue streams. In many ways, a sport becomes a commodity when its owners and producers transfer it, via exchange, to a separate group of consumers. This takes place every day with the televising of sports events from around the world. The best illustration of this in the United States is the long, invariably capital-driven history of franchise relocation. Indeed, the role of owners in organizing, regulating, and controlling the spread of their club and the sport itself is central. Furthermore, it is important to understand that the sports product does not exist in isolation. Invariably, the prevailing cultural climate, as well as historical developments, dictates both taste and ascribed values, which in turn affects the popularity of the sports event. Without the sport developing a growing and consistent popularity, profits do not develop.

Models of Ownership

The traditional sports owner was primarily philanthropic or paternalist in outlook. Maximizing profits was an important but not always a primary concern of sports teams' owners during the nineteenth century. For many owners, establishing a coherent and stable market in which to operate was as important as profit. There is a clear difference between being involved for the perceived psychic income or utility and being involved solely for profits. Profit utilization means that although many owners will seek maximum profits, this is not likely feasible for every team or franchise in every situation.

Changes in the economic situation throughout the twentieth century dictated that businesspeople and rich individuals became increasingly vital to the ownership and stewardship of sports. It is difficult to quantify the importance for sports clubs and organizations of being able to draw on the expertise of this newer style of owner, particularly throughout the transformation into more capitalist operational structures within sports. In the United States, capitalist structures were central to the organization and development of sports from the early 1870s on. Notably, this did not exist in most other countries that were developing recognizably modern sporting forms. Differences become obvious when examples are drawn from various countries because individual national structures depend on the particular social, political, and economic climate within each territory. These differences are themselves subject to varied rates of change. Attempts at drawing conclusions that can apply to every sport and its specific context complicate the situation even more. Those clubs and organizations operating on a more obviously business-based model have benefited from the opportunities afforded by the growing market for sports, particularly since the end of World War II.

Traditional owners could be described as paternalist, philanthropist, or hobbyist. These individuals tended to act as the guardian of the team and the club, often at their own personal expense. This model of ownership was widespread in the latter part of the nineteenth century but has gradually declined throughout the twentieth.

- The paternalist owners are not averse to flamboyant promotional activities. For example, Charles Comiskey's antics and marketing efforts in seeking maximum attendance for his baseball franchise, the Chicago White Sox, provides an illustrative example. Comiskey was particularly notable in that he pioneered many of the innovations that we now take for granted. These include fireworks displays, musical interaction between fans and the stadium announcer, as well as meet-the-players sessions.

Sweat plus sacrifice equals success. ■ CHARLIE FINLEY

- Philanthropic owners often get involved in sports in the same way that someone donates to charity.
- Hobbyist owners act more like star-struck fans than like business managers.

Sometimes, the motives of these individuals directly conflict with those of the key people within a club or franchise, including the players and the fans. All three types of owners often provide significant financial support for their clubs, yet are less interested with profits than with other benefits.

A subgroup of this more traditional ownership model includes owners who can be viewed as being performers. These individuals are primarily concerned with promotional and marketing gimmicks and tried anything to make sure the fans turned out for the games.

The dominant model of ownership includes high-profile individuals who are driven to succeed by relying on their business backgrounds. These people are often successful tycoons and bring a capitalist emphasis to their operations. The Busch family and its stewardship of the St. Louis Cardinals baseball franchise is a good example. Since the end of World War II, this type of owner has become increasingly ubiquitous. In the United States, the traditional sports team or franchise owner has been Caucasian and male, but during the last twenty years, this has begun to change:

- Notable female owners of sports franchises have been Marge Schott, majority owner of the Cincinnati Reds baseball team from 1984 to 1999; Georgia Frontiere, owner of the St. Louis Rams NFL team; and Denise DeBartolo York, owner with her husband of the San Francisco 49ers NFL team.
- In 2002, billionaire Robert L. Johnson became the first African-American majority owner in a major U.S. sport, when the National Basketball Association (NBA) granted him an expansion franchise for the Charlotte (North Carolina) Bobcats. Some observers have likened this shift to Jackie Robinson breaking the color bar in baseball fifty years ago.

Other minorities (and even foreign nationals) are increasingly involved in owning shares of professional sports teams, which indicates how sports ownership is likely to develop in the future. The take-over of the Chelsea Football Club by the Russian billionaire Roman Abramovich in 2003 provides a key contemporary example of this capitalist dynamic. In this case, Abramovich bought the club and its debts then spent more than 100 million pounds on new players. This injection of cash transformed a sluggish and uncertain transfer market, especially given the paucity of revenue streams within European football at that time.

Capitalist structures are the currently prevailing organizational structure within western sports, and although there are notable exceptions, the trend is clear. Another trend is that during the last twenty years, the number of these owners has declined as an increasing number of sports teams now have corporate owners. The Walt Disney Company's ownership of the NHL team the Mighty Ducks is an interesting example, because the team was actually named after the title of one of the company's films. This capitalist emphasis forces other sports clubs, franchises, and even the leagues themselves to re-think strategies and organizational structures as they attempt to control the financial and operational aspects of their sport.

The exceptions, however, are notable and important:

- The successful NFL franchise, the Green Bay Packers, is owned by the community of Green Bay, Wisconsin, rather than by an individual or corporation.
- In the United Kingdom, lower-league soccer teams in Northampton, York, Exeter, and Lincoln are among a number of examples of supporters' trusts, therefore fans effectively operate as stakeholders. This government funded scheme aims to increase supporter influence within their local team. While this directly affects notions of ownership, it is noteworthy that such concessions will not be applied at the top end of sport, as the finances at the elite level are far more secure and stable.

Ownership

Landing a Franchise

Obtaining a team was what made someone an owner. To do so required the approval of the existing team owners. This account from the Chicago Tribune of February 10, 1886 indicates some of the issues considered and which influenced the decision.

It is quite safe to say that there were few happier men in Chicago yesterday than were those composing the delegation from Kansas City in attendance upon the league committee meeting held at the Tremont House yesterday, and at which the metropolis of Western Missouri was chosen as the eighth member of the league circuit for 1886. The committee, composed of Messrs. Spalding of the Chicago Club, Lucas of the St. Louis Club, and Marsh of Detroit, met in Parlor A yesterday morning, the session being a private one, with President Spalding in the chair. The Milwaukee delegation, composed of Messrs. Forth, Harry Quinn, and G.M. Kipp, were first admitted and their claims for representation listened to and discussed for an hour or more. The advantageous location of the Cream City, the rivalry that had existed between its club and the Chicagos in days gone by, the alleged willingness of the people to support a National

League team there, and their readiness to give to the league such reasonable guarantee as it might ask for the faithful fulfillment of their contract were all gone over, after which the Milwaukeeans were permitted to withdraw. Kansas City was then called, and while the members were awaiting the appearance of those representatives President Spalding read to the committee a letter from the Indianapolis Club voicing its claim to recognition. The committee's attention was then given to the Kansas City delegation. . . .

The new league city has a population of about 135,000, and that of the suburbs within a radius of ten miles will swell it to fully 180,000. Within two-hours' ride of the city are the populous cities of Lawrence, Atchison, Topeka, St. Joseph, and Leavenworth, with an aggregate population of 140,000. All of these points, it is promised by the Western delegates, will send down generous delegations to the league games. With the advent of league games at Kansas City it is predicted that the game will receive a boom there which it has not before know (sic) west of Chicago.

The key to the success of such organizations seems to be a broad mix of individuals making decisions. The situation in different sports is also illustrative, in that depending on the activity, the diversity of ownership can be more extensively considered. For example, horse racing is a sport where owners are feted openly at presentation ceremonies as equal partners in the venture alongside the trainer and the jockey. The historical development of an activity determines the form of ownership that predominates as the sport progresses.

Some of the more notable historical aspects of how notions of ownership have continued to develop, particularly in the United States, relate to the slow shift

from traditional notions of sport history. The focus was often based on a history of social processes; however, current research considers the influence of economic and commercial factors on sport history. More generally, the importance of such ownership models and notable examples to current research within sports can also directly affect social change within the social sciences themselves. The commercialization and commodification of sports increased throughout the twentieth century. As society in general has developed a more businesslike focus and, particularly since the end of World War II, sports organizations have also adopted business and commercial practices more like that of the business world.

Ownership

The First Female Owner

In the excerpt below, Helene Britton, St. Louis Cardinals' owner from 1911–1917, reflects on being a woman in baseball.

I can honestly say that I have always loved baseball. My father and uncles talked about baseball ever since I can remember. My father insisted that I keep score. . . . I grew up . . . in an atmosphere of baseball. I even played it when a girl and am glad to know that the game is played in a somewhat modified form in hundreds of girl camps and elsewhere by young ladies all over the United States. Played in that way, I believe

it is a healthful and interesting diversion though I realize that anything which resembles a professional type is distinctly a man's game. . . .

I realize that my position as the only women owner in the major leagues is a peculiar one. And I don't pretend to know the game as intimately from a playing stand-point as a man might do in my place. I appreciate the fact that baseball is a man's game, but I also appreciate the fact that women are taking an increasing interest in the sport.

Source: My experience as a league owner. (1917, February). *Baseball Magazine*.

It is also important to consider the darker side of ownership and consider how corruption throughout history has been relevant to notions of ownership. In some cases, the owners of sports teams take advantage of situations, but end up harming the team and the sport, such as the following:

- In 1998, the Olympique de Marseilles association football team was relegated to second division from the top league of French football, following a match-fixing scandal involving Bernard Tapie, the president and owner of the club. He was eventually convicted and sent to prison.
- The Chicago Black Sox scandal of 1919 is another instance when the negative side of commercialism and gambling impinged on the sporting arena. In that case, a betting conspiracy led to eight members being banned from the Chicago White Sox baseball team.

The Future

Those who own a sports club or franchise have the opportunity to shape both their organization and the direction of the sport itself. Responsibility for individual sports often lies in the hands of a few, yet issues related to ownership allow us to question who the owner actually serves. Their financial backgrounds and the self-

imposed requirement that they maximize their investment act as strong motivating factors for many owners. Significant issues present themselves within the prevailing capitalist model of sports remain the following:

- Who is going to pay for the development of future sports stars?
- How should sports exist within their social context?
- What should be the balance between profit and filling a social, or other, need?

Sports are currently regulated by the laws that govern the operations of businesses and organizations, meaning that sports teams have become corporate enterprises legally. This is a telling and significant indicator of how sports and notions of ownership relate to the wider society.

The Legendary Steinbrenner

Perhaps no team owner has gained more notoriety than George Steinbrenner. Since he bought the New York Yankees in 1973, Steinbrenner has enraged his managers and players, as well as the media and the fans, with his no-holds-barred comments and actions. As Steinbrenner puts it, “Look, I’m not saying that I’m a calm, peaceful guy. I’m not Marian the Librarian. I’m a hard-driving guy, and sometimes I get upset.” And many would agree with former Yankee Graig Nettles’ comment, “It’s a good thing Babe Ruth isn’t still here—George would have him bat seventh and say he’s overweight.” And the media had a field

day with the fact that Yankee managers have come and gone so often—most notably Billy Martin, who was hired and fired five times by Steinbrenner, who denied that these were publicity stunts, noting:

I did not fire managers to get the headlines. Never did. The thing is, New York’s a very demanding city. You’ve got three tabloids battling with one another: the *Post*, the *Daily News* and *Newsday*—all good papers. All you have to do is walk into New York on any given day, look at the newsstand and see the headlines. All sensationalism. Some of it accurate, some of it not, but *all* of it meant to do one thing: sell those papers.

Pain

Pain, not unlike love, is one of the basic human experiences that forms us and makes us who we are (Morris 1991). The fullness of our life embraces the contradiction between pleasure and pain and poses the critical question as to why pain has become so unacceptable in Western culture. The sensation of pain can influence the self to the point at which nothing else is felt. “Pain appears to be what is most personal, which enables the self. Since pain is the self’s possession—a possession which admittedly no one else wants—the only possession, that no jealousy seeks to acquire” (Schmid 1999, 341). Pain also opens the way to care for one’s self. It is an existential experience of life that can be sensed.

Pain research in general covers a wide field. Historical, philosophical, theological, sociological, and cultural approaches have been attempted (Bendelow and Williams 1995, Fichter 1981, Honkasalo 1998, Le Breton 2000, Morris 1991, Rey 1998, Scarry 1985). The medical, the psychological, and the psychosomatic discourses of pain research are well developed and have brought about different methods of pain management (James and Large 1992, Melzack and Wall 1983, Uexküll 1997).

What Is Pain?

The current definition of pain from the International Association for the Studies of Pain is “an unpleasant sensory and emotional experience associated with

actual or potential tissue damage, or described in terms of such damage” (Pain Terms 1979). This definition is the background of a larger part of the research studies.

Using this definition as a starting point, it will be enlarged by discussing pain as an expression of a communication. Parts of the communication are the subject, the health system, and the social surroundings. (This communication is discussed in the section below on sport and pain.)

The History of Pain

The story of pain can be told in different ways and marked with different causes and by different periods. Recent pain research locates pain and its sensation in DNA. In this way pain is associated with smaller and smaller physical units, even though it includes more than medical causes. Yet pain is more than a matter of neurotransmitters and pain receptors.

Historically, pain has also always been a magical and/or religious concept. Suffering could be seen as an unavoidable part of existence, but also as something that, when it gives meaning, needs to be worked through. The history of pain also includes a story that is seldom told by the history of medicine—namely, the story of the healers and midwives who effectively administered their knowledge and craft independent of prevailing medical discourse.

Changing Pain Paradigms

Until the 1960s a split between physical and psychological pain shaped the dominant pain paradigm. In the tradition of Descartes, it was normal to separate the

body from the psyche and correspondingly also to separate physical pain from psychic pain. In this respect pain is either a sign of tissue damage or, as in the Austrian psychoanalyst Sigmund Freud’s thinking, an injury of the psyche. Pain has the important function of warning the body and protecting the body and the psyche.

In the 1960s the traditional dualism was challenged by the gate control theory of Ronald Melzack and Patrick Wall (1983). This theory postulated that pain was not a simple mechanical process between a stimulus and a response, but rather a complex event. Otherwise, it would not be possible to explain phenomena like the anaesthetic reaction when pain disappears though the existing tissue damage remains present, nor the opposite phenomena, like the phantom pain in an amputated limb, when pain is present without a somatic basis. Pain can be described in many different ways: as a sensory quality (sharp, burning, pulsating), as an affective quality (merciless, punishing), or as a relative quality (uncomfortable, unbearable). What is important is that these qualities are subjective. The experience of pain depends on individual factors.

Melzack and Wall used the metaphor of a “gate” in the spinal cord that controls and regulates whether pain impulses are sent on to a higher cerebral level or not. The intensity of the pain impulse will depend on factors like awareness, fear, or concentration. There is no such thing as objective pain; instead, the experience of pain depends on subjective factors. That is why in the highly emotional atmosphere of competition or sexual activity, a person can cross over limits and only later—occasionally painfully—first become aware of it.

*There is no coming to consciousness
without pain.* ■ CARL JUNG

The gate-control theory has become a dominant paradigm in recent pain research, though, since the 1990s, theories that attempt to base pain sensitivity and pain memory in genetic factors (the so-called neuromatrix theories) have gained in importance. But due to the gate-control theory, it became possible to explain many phenomena that could not be understood within the Cartesian paradigm. For example, in sports athletes experience in different ways the pain that arises in situations of competition as compared with the pain that is part of training.

Sport and Pain— Coping with Sport Injuries

The definition of pain as an “unpleasant sensory and emotional experience associated with tissue damage” seems to be too narrow when applied to the pain in sport. Take, for example, the case of Kerri Strug. In the 1996 Olympics the American gymnast Kerri Strug was turned into a media star because she took a running approach to a jump over the horse although she had an ankle injury. Her technique brought the American team the gold medal.

How can we explain that Kerri Strug could run although she was heavily injured? According to the gate control theory of pain, we can explain her actions by her high degree of concentration. She focused on the jump, not on her injury.

Pain in sports tells us many stories. Modern performance sports demands time and resources. The pressure can lead to major psychic and social burdens. Recent sport research refers to this milieu in terms of stress, social pressure, and plain “burnout” (Nixon 1994). Raedeke 1997).

Since the subjectivity of pain and injury plays a central role in recent sport psychology literature (Brewer 2001, Nixon 1996, Taylor and Taylor 1998, Udry 1997, Williams 2001, Williams and Roepke 1993), a

deeper analysis of the psychological aspects of sport injuries is necessary. Precisely who is injured when or how a rehabilitation process will proceed is not simply a matter of coincidence

One model that has proven valid over the years is the *stress and athletic injury model* of Williams and Anderson (in Williams 2001). Recent research has applied this model in many different ways to different populations. The research around the Williams and Anderson model is mainly concentrated on coping of pain and on pain prevention following a sport-medical intake. But it is also interesting to analyze how sport *expresses* pain. Sport is—besides masochism—one of the few fields where pain is expressed or accepted voluntarily.

The research on pain in the field of sport psychology is mostly connected to injuries. Injuries can have a negative impact on the mind, the emotions, and the body of an athlete. The rehabilitation period after an injury is

often a time of emotional distress. Interventions stemming from sport psychology can minimize these negative experiences and maximize recovery from injury.

By the 1960s it was postulated that the personality of the athlete had an influence on the rate of injuries and pain (Ogilvie and Tutko 1966). In 1993 Heil's *Psychology of Sport Injuries* offered the first general view of the role of personal and social factors, coping-strategies, and possibilities of interventions. The last decade produced much follow-up research in the field of the psychology of pain and injury, focusing especially on the ways of coping with the injuries (Brewer 2001, Taylor and Taylor 1998, Udry 1997, Williams 2001, Williams and Roepke 1993). Relevant personal factors were named, and stress, anxiety, and coping strategies connected with pain were analyzed for a lot of populations (e.g., Johnson 2000). Sport psychology showed that factors like stress and burnout can lead to overtraining and loss of balance in an athlete's life.

While it is true that pain in sport is usually connected with injuries, other aspects of pain should not be overlooked. When athletes experience pain, their experiences can have very different meanings. Besides being a sign of injury, pain can also provide a "kick" and become the ultimate limit in the experience of the self. Runners especially often describe the "high" experienced as part of an endurance event. The limits of the body are explored out of a simple desire to do so or out of curiosity about how far a person might extend his or her own limits, how far a person can grow beyond his or her "normal" self. It appears as though pain serves as an indicator that the limit has been reached and "self-enhancement" has begun (Roessler 2004).

To overcome pain and to exceed one's limits is another characteristic of the attractive and voluntary aspects of pain. People often tell the story of establishing their own psychological and physical limits, for example, when they run a marathon or compete in a triathlon. They control the pain by an act of will, and they experience this pain as a way of testing the limits of their self-control. Sports can be intoxicating activities that evoke pleasure even when they hurt. It is not a

product (performance), but rather an *activity* itself (the delightful search for limits) that is the key. One not only has to be in the best possible physical condition, but also in top mental form. The winner must be able to cope with the pain in order to integrate the pain. The 3,000-meter steeplechase runner has to integrate the fact that running rhythm is broken by hurdles and by a water jump. It hurts to have the rhythm broken because these interruptions jar and detract from the trance of long-distance running.

Different Ways of Reacting to Pain

There are different ways to react to pain in sports. The most obvious way (from a medical perspective) of dealing with pain is to look for *treatment*. The athlete who trails his leg alongside a hurdle and stumbles is hurt. The injury is probably to the knee. This kind of pain is quite mechanical, we can call it an objective pain, one that can be localized in physical receptors.

Pain feels like an unpleasant stimulus, like an unpleasant sensation. The athlete is hurt and the injury can be acute or chronic. The control of this kind of pain is a success story for medical science. Help in dealing with these injuries is also a success story in sport psychology.

Understanding the *expression* of pain and the general significance of pain events in the life of an athlete, however, is more complicated. Runners in a 400-meter race have to decide at the 300-meter mark if they want to overcome the pain—if they wish to "run through the pain barrier." This kind of pain has quite another quality than pain calling for a treatment. To establish one's own psychological and physical limits is a challenge. The pain is controlled by an act of will, and the experience of pain is a way of testing the limits of self-control.

Understanding the experience of pain demands on further analysis a focus on the individual and cultural processes of communication. Pain not only can be experienced as an individual trauma, but also as an accepted by-product of sport ("no pain, no gain"), especially achievement sport; as a way of finding one's self (e.g., the kick of running); or as a narrative (Allen

2003). To find out which it is, we have to ask the athlete of his or her own interpretation of pain.

The Future

Future challenges in the pain research of sport science and especially sport psychology should focus more precisely on the aspects of communication and culture. Pain and injury in sport might fruitfully be analyzed as an expression of a communication problem between the athlete and his or her body, between the athlete and the trainer, and/or between the athlete and the surrounding culture.

Pan American Games

The Pan American Games are the grandest sports festival of the Americas, offering a large Olympic-type program, with additional disciplines reflecting special sports interests of the region for all countries of the hemisphere (more than forty now eligible to participate). The games' slogan, "América, Espíritu, Sport, Fraternité" (America, Spirit, Sport, Fraternity), uses the hemisphere's principal languages: Spanish, Portuguese, English, and French.

History

Discussions of regional games for the Americas were held during the 1932 and 1936 Olympic Games. In 1937 several Latin American countries, Canada, and the United States competed in Dallas, Texas. The first Pan American Sport Congress, held in Buenos Aires, Argentina, in 1940, established the games on a four-year cycle starting in 1942, but World War II interrupted these plans. Since 1951 the Pan American Games have been held every four years, with the athletic program and numbers of participating countries and athletes expanding dramatically.

Pain is inevitable; suffering is optional. ■ UNKNOWN

The Pan American Sport Organization (PASO) is headquartered in Mexico City. Early leaders of PASO (known until 1955 as the “Pan American Sports Committee”) were Avery Brundage (United States, 1940–1951), José de Jesus Clark Flores (Mexico, 1951–1955 and 1959–1971), Douglas Roby (United States, 1955–1959), Sylvio de Magalhaes Padilha (Brazil, 1971), and José Beracasa (Venezuela, 1971–1975).

In the first games (Buenos Aires, 1951), twenty-one countries (approximately twenty-five hundred athletes) participated in nineteen sports: baseball, basketball, boxing, cycling, equestrian events, fencing, gymnastics, modern pentathlon, polo (never again included), rowing, yachting, shooting, soccer, swimming and diving, tennis, track and field, water polo, weight lifting, and wrestling. Only a few U.S. athletes attended these games. The United States won men’s basketball but lost baseball to Cuba. Argentina won boxing, soccer, water polo, polo, rowing, tennis, shooting, and cycling and ended well ahead of all others in gold and total medals. Outstanding men athletes included Brazilian triple jumper Ademar Ferreira da Silva (winner also in 1955 and 1959), sprinters Rafael *Fortún* (Cuba), Arthur Bragg (United States), and Herb McKenley (Jamaica), shot and discus athlete James Fuchs and pole vaulter Bob Richards (both United States), and diver Joaquín Capilla (Mexico). Women participated in track and field, fencing, swimming, diving, and tennis. In their four track and five field events, women athletes from the United States, Argentina, Brazil, and Chile figured most prominently. U.S. women won the 4 × 100-meter relay, as they would in many future games. Pat McCormick (United States) won diving gold and silver medals, and U.S. men and women exhibited an overall superiority in swimming that lasted throughout later years. The United States was second in shooting but dominated this sport in future games.

The 1955 games in Mexico City dropped polo and yachting and added women’s basketball and synchronized swimming and men’s and women’s volleyball. Twenty-one countries (2,583 athletes) participated.

The United States won the most gold and total medals, as in all future games except for 1991. Guatemala’s Mateo Flores won the marathon, Brazilian da Silva’s triple jump was a world record, and Argentinean Osvaldo Suarez won the 5,000 meters and 10,000 meters (winning gold or silver in both events again in 1959 and 1963). Rodney Richard (United States) won three sprint events. Boxing was dominated by Argentina and United States. Dominican Republic won baseball. U.S. women won basketball, as they would in many later games. Mexican women and U.S. men won volleyball.

For the 1959 Pan Ams, designated host Cleveland, Ohio, and alternates Guatemala City, Guatemala, and Rio de Janeiro, Brazil, withdrew, and Chicago was chosen over São Paulo, Brazil. Synchronized swimming was left out and yachting renewed. Women began competing in gymnastics and equestrian events. More than two thousand athletes from twenty-four countries participated. Oscar Robertson led the U.S. men’s basketball team to victory. Venezuela won baseball. The United States and Canada began a dominance in gymnastics that would last until 1971. Lucinda Williams and Wilma Rudolph (both United States) finished first and second, respectively, in the 100 meters, and Williams repeated her victory in the 200 meters. Both were on the winning 4 × 100-meter team. Althea Gibson (United States) won tennis singles and second place in doubles. Brazil won women’s volleyball, and the United States won women’s basketball (second of three consecutive victories in the games).

In 1963 for the São Paulo games, men’s judo was introduced, and the women’s program added yachting and restored synchronized swimming. The new 800-meter race was the first women’s track event longer than 200 meters. Twenty countries (1,665 athletes, the smallest number ever) participated. Impressive victories by host Brazil included three first places in boxing and the soccer championship. The Brazilian Maria Bueno won tennis singles, and Darlene Hard (United States) won third in singles and first in doubles. Mexico won its fourth consecutive title in tennis mixed doubles.

Winnipeg in 1967

At the Winnipeg, Canada, games in 1967 new sports included men's field hockey (won by Argentina at four consecutive games) and women's pentathlon. Modern pentathlon, women's yachting, and again synchronized swimming were dropped. Canoeing was a demonstration sport. More than two thousand athletes from twenty-nine of the thirty-three eligible nations participated. The United States won ten times the number of gold medals won by second-place Canada. U.S. athletes Don Schollander (three golds) and Mark Spitz (five golds) starred in swimming. Cuba's three boxing victories (Rolando Garbey's gold medal to be repeated in the next two games) presaged Cuba's future dominance in this sport.

For the Cali, Colombia, games in 1971, judo and tennis were dropped and synchronized swimming restored. Women's track added 400-meter, 4×400-meter, and 100-meter hurdles. Thirty-two countries (2,935 athletes) participated. Cuba doubled the number of medals it won in 1967 to begin challenging U.S. supremacy. Cuban triple jumper Pedro Pérez Dueñas set a world record, and gymnasts Jorge Rodríguez and Jorge Cuervo won a total of eleven medals, beginning years of strong Cuban performances in men's gymnastics. Cuba's successes in men's and women's fencing would accelerate in future games. Frank Shorter of the United States set records in the 10,000 meters and marathon, and Jamaican Donald Quarrie won the 100 meters and 200 meters, tying the world record in the 200 meters. Brazil won men's basketball—the first time the United States had not won. Cuba won women's volleyball, and Brazil won women's basketball.

Greco-Roman wrestling was added, and tennis and judo returned to the program in 1975. These games were originally awarded to Santiago de Chile, but Chile's new military government declined to hold the games. First alternate, São Paulo, withdrew, and Mexico City stepped in with only ten months left for preparation. CBS-TV covered the first of three games. More than three thousand athletes from thirty-three countries participated. Brazilian Joao Carlos de Oliveira (who

won again in 1979) had a world-record triple jump. Janice Merrill (United States) won the new women's 1,500 meters. U.S. women won basketball and continued to dominate gymnastics. Ray Leonard (United States) won light welter boxing.

Sixty million dollars went into facilities constructed for the 1979 games in San Juan, Puerto Rico. New events were men's and women's archery, softball, and roller skating (including men's hockey on skates). Thirty-four countries (thirty-seven hundred athletes) participated. Cuba won baseball and five gold medals in boxing and dominated fencing, weight lifting (eight of the ten categories), and men's gymnastics. The United States won most wrestling medals and dominated tennis, roller skating, shooting, and swimming and diving. Pan Am records were set by U.S. women runners Evelyn Ashford (100 meters and 200 meters), Essie Kelley (800 meters), Mary Decker (1,500 meters), Janice Merrill (3,000 meters; her record in this new event was never broken), and the 4×400-meter team. Records were set in all throwing events (by three Cuban women, three U.S. men, and a Canadian man) and by U.S. high jumper Louise Ritter. Cuba's María Colon won javelin. Colon became the first Latin American woman to win an Olympic gold medal (1980). U.S. women won softball (repeating in most future games). Tracy Caulkins of the United States won four individual swimming medals and two relays. She would repeat her gold medals in the 200-meter and 400-meter medleys in 1983. Brazil won soccer, tying with Argentina at four games victories each. Archery was dominated by the United States in these and all later games. Canada won men's softball (repeating through 2003).

The program for the 1983 games in Caracas, Venezuela, dropped roller skating and added men's and women's Sambo wrestling (a Venezuelan specialty, never again included) and table tennis. Other new women's events were the 400-meter hurdles, heptathlon (replacing the pentathlon), shooting, judo, and rowing. Women's yachting was restored. Thirty-seven countries (3,426 athletes) participated. Drug testing was initiated, and several athletes left the competition before testing or

Pan American Games

Latin American Sport Festivals

Since the early 1920s a variety of Olympic-type sport festivals have been established for the countries of Latin America and the Caribbean basin. The first was the Central American Games, held in Guatemala City in 1921 as part of Guatemala, and the region's, independence centennial celebration. Athletes representing Costa Rica, Honduras, El Salvador, and the host nation competed in six sports. The series failed to develop in the 1920s, and the project was dropped until 1973 when it was renewed on a much larger scale in Guatemala. Subsequent CA Games were held in San Salvador, El Salvador (1977); Guatemala City (1986); Tegucigalpa, Honduras (1990), which was the first inclusion of all seven countries of the region; San Salvador (1994); San Pedro Sula, Honduras (1997); and Guatemala City (2001). This festival was established for the purpose of providing athletic competition at levels attainable by most Central American countries, without the dominating influence of sport powers in their region, such as Cuba and Mexico (as well as the United States, Canada, and powerful South American nations in the Pan American Games).

The first South American Games were held in Rio de Janeiro in 1922 as part of Brazil's centennial celebration of independence. This series also failed to develop fully at the time but was reestablished in 1978 in Bolivia and continued without interruption to the present (Rosario, Argentina, in 1982; Santiago, Chile, in 1986; Lima, Peru, in 1990; Valencia, Venezuela, in 1994; Cuenca, Ecuador, in 1998; and Rio de Janeiro in 2002).

The Central American and Caribbean Games began in Mexico. Inspired by a visit from International Olympic Committee (IOC) Vice President Henri Baillet LaTour in 1923, promoted by the IOC and with preliminary planning during the Paris Olympics of

1924, the "First Central American Games" were held in Mexico City in 1926. Fourteen countries were invited from Central America, the northern tier of South American countries, and the Caribbean. Only Mexico, Cuba, and Guatemala participated. However, the series became well established, with subsequent sites in Havana (1930); San Salvador (1935); and Panama City (1938). With the fourth set of games in Barranquilla, Colombia, in 1946, the event was renamed Central American and Caribbean Games, to reflect the actual geographic region of the participants. Subsequent games have been held in locations from Puerto Rico to Panama. This festival has expanded to more than thirty nations and a large sport program. Cuba has dominated the competition with Mexico usually occupying second place.

The Central American and Caribbean University Games were held first in San Juan, Puerto Rico, in 1972, with eight nations participating in four sports. Subsequently the festival has grown in participation and sports program, being held in Mexico City (1975); Santo Domingo (1977); Barquisimeto, Venezuela (1982); Havana (1986); Guatemala City (1990); Guadalajara, Mexico (1997); and San Germán, Puerto Rico (2000). The Games scheduled for 2002 in Medellín were canceled due to security concerns in Colombia. Cuba has dominated the University Games.

The Bolivarian Games include the six nations whose wars of independence from Spain were led by General Simón Bolívar: Venezuela, Colombia, Ecuador, Peru, Bolivia, and Panama (formerly part of Colombia). This festival was first held in Bogotá, Colombia, in 1938, and subsequently in locations ranging from Lima, Peru, in 1947 to Ambato, Ecuador, in 2001.

Richard V. McGehee

were disqualified. Mexican men set records in race walking, continuing the tradition they started in 1975. Canada's Charmaine Crooks set a record in the women's 400 meters. Cuba won men's volleyball for the fourth consecutive games. Cuba, the United States, and

Brazil (and Peruvian women) have dominated volleyball overall.

Political conflict between the United States and both Cuba and Nicaragua was played up by the media during the tenth games in Indianapolis, Indiana, in 1987.

Modern pentathlon and men's and women's roller skating were restored. Men's and women's team handball, men's taekwondo and canoe-kayak, and women's cycling, field hockey, kayak, marathon, 10,000-meter run, and 10-kilometer walk were introduced. Thirty-eight countries (4,453 athletes) participated. Brazil won men's basketball. Carl Lewis of the United States bettered the long jump record by 0.45 meters, and Cuba's Javier Sotomayor set a record in the high jump. Ana Fidelia Quirot won the 400 meters and 800 meters (setting records and setting records again in both events in 1991). Jackie Joyner Kersey (United States) won the women's long jump (a record). Costa Rica's Sylvia Poll won eight medals (three gold) in swimming (and another gold medal in 1991). The United States dominated women's cycling (continuing in future games).

The first winter Pan American Games, canceled the previous year, were held in September 1990 in Las Lenas, Argentina, and included Alpine skiing for men and women. Other events had to be eliminated because of poor snow conditions, and no results were officially recorded for skiing competition. Winter games were planned again for 1993 in Chile but canceled because of poor snow conditions.

Cuba in 1991

Cuba hosted the games in 1991, and records were set in the numbers of countries (thirty-nine) and athletes (4,519) participating. The U.S. economic embargo and travel restrictions made financing of the games difficult for the host. Initially the U.S. Treasury Department would not allow any payments to Cuba, but after court contests, ABC-TV and Turner Network Television were allowed to send personnel and equipment with severely restricted crew sizes and spending limits. The events were held in new facilities, such as the Pan American Stadium, a velodrome (a track designed for cycling), and tennis and swimming complexes, as well as many existing sports facilities in Havana and Santiago de Cuba. Modern pentathlon was dropped; new sports were rhythmic gymnastics and men's and women's bowling. Seventy-four Pan Am records were set. Pro-

fessionals were allowed to participate in tennis, and Pam Shriver (United States) won women's singles and doubles. Puerto Rico won men's basketball. Cuba won eleven of the twelve boxing categories, all ten weight-lifting golds, and the men's 4×100-meter relay (marking only the second time the United States had not won). Overall, Cuba passed the United States in gold medals (the only time the United States was not first since 1951) and was second to the United States in total medals.

The games returned to Argentina (Mar del Plata) in 1995. New sports included men's and women's badminton, karate, racquetball, squash, triathlon, water skiing, and women's taekwondo. The women's 3,000 meters was replaced by the 5,000 meters. Jai alai was a demonstration sport. More than five thousand athletes from forty-two countries participated. Women's basketball was canceled because of the small number of entries, but U.S. women again won softball. Argentina won men's basketball and volleyball. The United States sent a record 746 athletes and won an all-time high of 424 medals (169 gold).

The 1999 Pan American Games were held in Winnipeg, Canada. About five thousand athletes from forty-two countries competed in forty-two sports. Men's and women's beach volleyball and women's soccer (won by the United States) were introduced. Modern pentathlon returned to the program and was offered for the first time for women. The women's 20-kilometer walk replaced the 10-kilometer walk. Brazil won women's volleyball (and beach volleyball), ending Cuba's string of seven consecutive victories begun in 1971. Canada won men's beach volleyball. Pan American and world record-holding high jumper Javier Sotomayor (Cuba) tested positive for cocaine and was disqualified after winning what would have been his fourth consecutive title.

Santo Domingo, Dominican Republic, held the 2003 games. More than five thousand athletes from forty-two countries participated. The host nation won ten gold and forty-one total medals, its best Pan American performance to date. Dominican world champion hurdler Felix Sanchez won gold, and his nation took sil-

ver in men's basketball and gold in women's volleyball. Cuba won baseball (the eleventh time) and women's basketball. Only Cuba, Brazil, and the United States have won more women's basketball. Argentina won men's soccer, and Brazil won women's soccer. Four doping violations were detected, and as a result the United States had to forfeit gold medals in the 100 meters and the 4×100-meter relay.

Through 2003 the United States had won far more Pan American medals (3,787) than any other nation, followed by Cuba (1,671), Canada (1,456), Argentina (859), Brazil (758), and Mexico (705). Gold medals follow the same trend. Countries winning the fewest or no medals tend to be relatively poor and/or small, such as Guyana and some Central American and Caribbean nations. However, some small countries, such as Jamaica and Costa Rica, commonly figure in the medal counts.

PASO also offers Pan American Wheelchair Games and Pan American Games for the Blind. The Wheelchair Games have been held twelve times between 1967 and 2003, not always in the same year as the regular games or using a four-year interval. Former sites include Winnipeg; Buenos Aires (twice); Kingston, Jamaica; Lima, Peru; Mexico City (twice); Rio de Janeiro; Halifax, Canada; San Juan; Caracas; and Mar del Plata. Winning over strong competition from San Antonio, Texas, Rio de Janeiro, Brazil, will host the 2007 Pan American Games. The 2007 Wheelchair Games, to be held two weeks after the regular competitions, will be hosted by Rio de Janeiro.

Significance

At a lower level than the Pan American Games are national competitions, university games, and several regional festivals (South American, Central American and Caribbean, and Central American Games) for Latin American and Caribbean countries. These regional events are lead-ups to the Pan American Games and Olympics and thus are accorded high regard in the region. For most Latin American and Caribbean athletes, the Pan American Games represent the highest level of athletic competition to which they can aspire. Thus,

these games are of great importance in the sporting life of their nations, and the preparations for, daily progress, and results of the competitions receive wide coverage in the media. Those countries that offer monetary compensation to their medalists consider Pan American Games victories inferior only to Olympic victories. On the other hand, the United States commonly places less value on Pan American Games results and may send athletes of less than Olympic caliber. The U.S. news media rarely give much attention to the games. However, hosting the Pan American Games is considered a prize by all nations of the Americas.

Parachuting

Parachuting as a modern sport began during the early twentieth century and was a crowd pleaser at air shows that featured aerial stunts and aerobatics such as formation flying and wing walking. In 1930 the first competition in parachuting took place in the Soviet Union. Two years later forty parachutists took part in the U.S. National Air Races.

Experience is a hard teacher because she gives the test first, the lesson afterward. ■ VERNON LAW

Parachuting initially revolved around target jumping, but, thanks to French experimentation during the late 1940s and early 1950s, freefalling was introduced, leading to the addition of style and “relative jumping” competition. Five European countries took part in the first world championships in 1951 in France. The Federation Aeronautique Internationale has supervised biennial world championships since 1954.

Origins

Parachuting began as early as the twelfth century, but until the invention of the hot air balloon and the airplane, parachuting served no purpose other than to display inventiveness and provide simple entertainment. In China people amused themselves by jumping from high places with early parachutes that were constructed like umbrellas. Leonardo da Vinci (1452–1519), the Italian Renaissance man and innovator, designed a wooden, pyramid-shaped parachute during the late fifteenth century. In 1595 the Hungarian mathematician Fausto Veranzio created a wood-framed canvas parachute, which he used to leap from a tower in Venice. During the 1600s tumblers from royal courts launched themselves from high places holding two large umbrellas. In 1783 Sebastian Lenormand of France jumped from a tower in Paris using a parachute.

Also in 1783 the parachute made an important transition from a means of entertainment to a means of safety. In that year the Montgolfier brothers of France made their first balloon flight, which made the escape means provided by a parachute important. Another significant development in that year was a collapsible silk parachute, designed by J. P. Blanchard (1753–1809) of France. Earlier parachutes had been held open by a rigid frame.

The French aeronautical pioneer Andre Jacques Garnerin (1769–1823) in 1797 made what scholars consider to be the first parachute jump when he jumped from 600 meters over Paris from a hot air balloon. In 1802 he jumped from more than 2,400 meters above London. Jodaki Kuparento of Poland in 1808 became the first person to use a parachute to escape death when

he jumped from his flaming hot air balloon over Warsaw. Confidence in the parachute as a safety device grew, and in 1838 John Wise of the United States intentionally exploded his balloon nearly 4,000 meters above ground and parachuted to safety.

Development

A series of developments transformed da Vinci’s wood-framed parachute into the modern parachute. The first development was Blanchard’s creation of the collapsible silk parachute. The second development was the harness that replaced the basket structure of parachutes. Captain Tom Baldwin of the United States created the harness in 1887. The next development was the coatpack, a parachute worn on the back like a modern parachute. Charles Broadwick of the United States designed the coatpack in 1901. A. Leo Stevens invented another device, the ripcord, in 1908. Broadwick’s adopted daughter, Georgia “Tiny” Broadwick (1893–1978), was the first person to jump with a manually operated parachute after her parachute line caught on the tail of her airplane in 1914, and she cut the line.

Parachuting was being transformed from a safety precaution into a military maneuver as well as a popular sport. In 1928 U.S. Army General Billy Mitchell demonstrated the military effectiveness of the parachute as he deployed airborne soldiers (paratroopers). Both sides would use paratroopers during World War II. At a festival in the Soviet Union in 1930 parachutists competed in a landing accuracy contest.

As parachuting gained popularity, in 1951 the first World Parachuting Championships were held. Four years later the United States formed a team and competed in the world championships in 1956. The United States fielded a women’s team at the sixth world championships in 1962.

During the mid-1960s the challenge of parachuting in formations was added to the sport. A six-man star-shaped formation was achieved in 1964 and, a year later, an eight-man star. In 1970 a twenty-person star was achieved in the United States. The sport was flourishing by 1978.

Practice

Relative work—the maneuvering of two or more parachutists close to one another during freefall—is one of the most popular forms of parachuting. Relative work began as two people parachuting together but now can involve as many as 150 people. Body position is the key to relative work. To drop from the airplane and become level with the rest of the group, parachutists use the “delta” position. The “boxman” position is a series of 90-degree angles. The parachutist arches the back and raises the legs and torso to create a U shape or a 90-degree angle. Parachutists can also spread their legs at a 90-degree angle and hold both arms in an L-shaped 90-degree angle. In the boxman position parachutists close their legs and hold their arms against their sides and assume a dive position toward the meet-up area.

Participants must flare (open the arms and legs) before reaching the meet-up area so as not to go too far off course or collide with fellow parachutists. After reaching the meet-up area, parachutists need to dock. To dock, parachutists use a no-tension grip, that is, the parachutists fly in close proximity without touching. After the parachutists are in place the grip is used to keep the formation steady. Relative work can yield extraordinary results. For example, above Quincy, Illinois, in 1988 a 144-person formation was achieved.

The popularity of parachuting is growing because of the thrills that it provides. One of its greatest thrills is the experience of altered states of consciousness. For example, on exiting an airplane a parachutist experiences the excitement of feeling one’s body accelerate from 0 to 175 kilometers per hour in a matter of seconds.

Moreover, technological advances make parachuting safe, and modern lightweight sport parachutes make soft, stand-up landings reasonably easy.

Competition

More than three hundred people competed in the 1995 National Skydiving Championships in Florida, and when fifty-four teams registered for the four-way event, they broke the record of forty-seven set in 1978. The championships offered medals to the winners of four-, eight-, and ten-way competitions, as well as a twenty-way competition.

At Raeford, North Carolina, in 1995, during only twenty-four hours Cheryl Stearns of the United States, considered by some people to be the most successful competitive parachutist in the world, broke three world records. On 8 and 9 November she broke the women's record for jumps in a twenty-four-hour period (352) and the overall record (331). She also set a record for the most dead-center landings on an electronic sensor pad (188).

Freestyle competition is another element of parachuting. Freestyle parachuting is essentially a choreographed repertoire of creative movements.

Parachuting is still a minority sport and does not have the popular appeal of major sports such as track and field or soccer. Nonetheless, it can be found in all corners of the globe. Hundreds of clubs exist in the United States and in other countries in Europe, South America, and Asia.

Parachuting has also caught on in Australia, where the first parachute club was formed in Sydney in 1958. That year the Federation of Parachute Clubs and Centres, later called the "Australian Parachute Federation" (APF), was formed. A number of states have parachute councils. Interested persons can become involved in relative work, canopy relative work, classical style and accuracy, and freestyle. Clubs under the APF exist across Australia for beginners and professionals.

Virtually anyone can participate in parachuting. Jim Thomas of the United States says parachuting requires neither athleticism nor physical skills. He took up the

sport at the age of thirty-four to overcome his fear of heights. Clearly he achieved his goal and, after more than forty jumps, continues to love the sport's "sensory overload." He said, "Sport parachuting is all about an adrenaline rush and a thrill a second. At the completion of each jump there is a euphoric sense of achievement." However, he pointed out that the equipment for parachuting (such as main canopy and reserve canopy) can cost \$5,000.

During World War II, Dr. Ludwig Guttmann (1899–1980) worked as a physician at the Stoke Mandeville Hospital and introduced physical activity and sport as part of the physical and psychosocial rehabilitation of wounded soldiers, mainly those with spinal cord injuries. He was also the first to organize competitions in wheelchair sport and initiated the first multi-sport games at Stoke Mandeville. These games started on the same day as the opening of the Summer Olympic Games in London, 28 July 1948, and marked the beginning of the Paralympic movement. Four years later, athletes from England and the Netherlands competed in the second Stoke Mandeville Games, following the four-year period of the Olympiad.

It was the vision of Dr. Guttmann that athletes with physical disabilities should be given the same opportunity for international competitions as able-bodied

athletes at the Olympic Games, and that they should receive worldwide recognition for their sporting excellence.

In 1960, for the first time in history, the Stoke Mandeville Games were held outside of England in Rome, Italy, following the Summer Olympic Games in the same

city. During an audience at the Vatican, Pope John XXIII received Dr. Guttman and the athletes and recognized the remarkable contribution of Dr. Guttman by calling him the “Coubertin of the Paralyzed,” after the founder of the modern Olympic movement.

The year 1960 marked the beginning of the Summer Paralympic Games, which are held every four years. Since 1976, Winter Paralympic Games have been organized, also with growing numbers of participating nations and athletes.

In 1952, based on the initiative of Dr. Ludwig Guttmann the International Stoke Mandeville Games Federation (ISMGF), later renamed the International Stoke Mandeville Wheelchair Sports Federation (ISMWSF), was founded for persons with spinal cord injury. This was followed, again on the initiative of Dr. Ludwig Guttmann, by the foundation of the International Sports Organisation for the Disabled (ISOD) in 1964, which was open to persons with amputation and other physical disabilities (*les autres*).

In 1968 the International Cerebral Palsy Society was established in England, which ten years later led to the Cerebral Palsy-International Sport and Recreation Association (CP-ISRA).

In 1981 a separate organization was established for visually impaired and blind people, the International Blind Sport Association (ISBA), while in 1986 the International Sports Federation for Persons with Mental Handicap (INAS-FMH) was formed. This organization was renamed in 1999, replacing “Mental Handicap” with “Intellectual Disability.” It is now known as INAS-FID.

In the early 1980s a number of communication and coordination difficulties existed between the various organizations, both with regard to internal processes and communication with the International Olympic Committee (IOC). This led to the creation of an International Coordinating Committee (ICC) in 1982.

Under the rotating leadership of the presidents of the different international organizations of sport for the disabled, several meetings were held to reach agreement among themselves and with the IOC, in particular with regard to the organization of the Paralympic Games.

A meeting of the ICC in September 1989 in Düsseldorf, Germany, culminated in the foundation of the In-

ternational Paralympic Committee (IPC). The first president of the IPC was Dr. Robert Steadward (Canada). In addition to the national sport organizations for persons with a disability, six international disability sport organizations became members of the IPC: ISMWSF, ISBA, ISOD, CP-ISRA, INAS-FMH, and CISS (Comité International des Sports des Sourds—The International Sport Organization for the Deaf). In 1995 CISS decided to leave the IPC, because of their strong desire for more autonomy and interest in keeping their long tradition of organizing their own World Games for the Deaf, which started in 1924.

Following the Summer Paralympic Games in Barcelona in 1992, for the first time in history, games were held (in Madrid) for athletes with intellectual disabilities. This event was called Paralympiada.

During the 1996 Summer Paralympic Games in Atlanta, athletes with intellectual disabilities were included with full medal status, but this changed following the 2000 Summer Games in Sydney due to problems related to clear eligibility criteria.

Significance of the Paralympic Movement

Since its beginning, the Paralympic movement has rapidly developed, with the Paralympic Games now bringing together athletes with a disability at the highest level of performance.

Among the most important issues and challenges facing the Paralympic movement are the following:

- The relationship of the Paralympic movement and Paralympic Games to the Olympic movement and Olympic Games
- The development of fair classification systems for athletes with different disabilities
- An increased efforts toward inclusion (e.g., demands for the introduction of events for athletes with a disability in Olympic Games and World Championships with full medal status)
- Media, marketing, and sponsoring
- Professionalization of the whole Paralympic sport system
- Ethical aspects of Paralympic sport
- Discrepancies between “developed” and “developing” countries (e.g., with regard to the availability of sport equipment, wheelchairs, prostheses, etc.)
- Doping and performance-enhancing methods
- Eligibility criteria
- Barriers to sport participation and retirement from high performance sport
- High performance sport for children and youth with disabilities
- The voice and the role of athletes with a disability

Since the foundation of an IPC Sport Science Committee in 1993, important initiatives have been undertaken toward the development of scientific knowledge and increased research efforts in Paralympic sport. This effort is also reflected in the close cooperation that exists between IPC and the International Council of Sport Science and Physical Education (ICSSPE).

Close cooperation also exists between the IPC and the IOC, based on formal contracts. The current president of the IPC, Philip Craven (England), is a member of the IOC, and future host cities of both Summer and Winter Olympic Games will also organize Paralympic Games in the same venues.

The Paralympics and the Paralympic movement have made tremendous progress with regard to the level of performance by athletes with disabilities and recognition given by the public and media. The number of participating nations in the Paralympics has grown remarkably

since the 1970s, reaching 136 at the 2004 Paralympic Summer Games in Athens, Greece.

Pebble Beach

Pebble Beach Golf Links, located near Monterey, California, is one of the most beautiful golf courses in the world and has been the location of many important golf events, including several memorable U.S. Open Championships.

History

The first golf course in the Monterey area was the Del Monte, opened as a nine-hole course in 1897 and extended to an eighteen-hole course in 1903, but the origins of the Pebble Beach course lie in the appointment of Samuel F. B. Morse in 1915 as manager of the Pacific Improvement Company's land holdings, which included the whole Pebble Beach area. After starting to sell off the land holdings as housing plots, Morse had a vision of developing a scenic and challenging golf course along the edge of the ocean. He formed the Del Monte Properties Company, bought a 7,300-hectare unit including the Hotel Del Monte, and began to buy

back the plots he needed for the course. Two amateur golfers, Jack Neville and Douglas Grant, were employed as course architects, and the Pebble Beach Golf Links was opened in 1919.

Course

The intention of the architects was to locate along the ocean as many of the holes as possible, and so imaginatively were the holes laid out that most of them have remained largely unchanged ever since. Jack Neville said in later years that the terrain was such that nature seemed to have intended the land to be a golf course and that the architects had to do relatively little, but he was almost certainly being overly modest.

However, the eighteenth hole was initially a 315-meter par four and was considered too easy for championship golf; it was extended twice, and on the second extension in 1922 William Herbert Fowler changed it to a 501-meter par five, one of the best finishing holes in the world. Seven years later, prior to the first U.S. Amateur Championship on the course in 1929, the greens were reshaped and rebunkered, several holes were reconfigured, and length was added to a few others.

The only really significant further change to the course came in 1998. Samuel Morse had been unable to buy back one piece of land overlooking Stillwater Cove, and so the original fifth hole had to be built away from the shoreline. However, during the 1990s the Pebble Beach Company managed at last to buy back that piece of land, and the U.S. golfer Jack Nicklaus was asked to design a new fifth hole, which was opened in 1999. This development finally fulfilled the vision that Morse had had for the course more than eighty years earlier.

The Monterey Peninsula Open was held at Pebble Beach in 1926, the U.S. Amateur Championship in 1929 and 1947, and the U.S. Women's Amateur Championship in 1940 and 1948. However, despite the stature of these and other tournaments, the course was

not in those years crowded every day with golfers as it is today and was inexpensive to play—a green fee was as little as \$5 well after World War II. However, in 1947 the Bing Crosby National Pro-Am moved to Pebble Beach, and the renown of the course grew rapidly after televising of this tournament began in 1958. In 1986 the “Crosby Clambake,” as it was informally known, became the AT&T Pebble Beach National Pro-Am.

The Pebble Beach Resorts now comprise four courses; in addition to the original Del Monte Golf Course and the Pebble Beach Golf Links itself are the Links at Spanish Bay (opened in 1987) and Spyglass Hill Golf Course (opened in 1966). The latter, together with the Poppy Hills Golf Course, opened by the North California Golf Association in 1986, are used along with Pebble Beach for the AT&T pro-am.

U.S. Open at Pebble Beach

Jack Nicklaus won the U.S. Amateur Championship when it was played for the third time at Pebble Beach in 1961, and he figured largely in the first two U.S. Opens to be played at the course in 1972 and 1982. In each case the par-three seventeenth hole was crucial. In 1972, in windy conditions on the last day, Nicklaus hit a one-iron to within a few inches of the hole, and this shot gave him a margin over his nearest challengers that secured his victory. In 1982 he had already finished his round and was tied for the lead with Tom Watson when Watson came to the seventeenth hole and hit a two-iron into the rough beside the green; at this point Nicklaus

Pelota

looked to be the likely winner, but Watson sank his sand-iron shot from the rough for a birdie and went on to win.

In 1992 the U.S. Open was played at Pebble Beach for a third time, and playing in high winds in the final round Tom Kite achieved a par score of seventy-two, most remarkable in the conditions, and won his first major championship. Equally remarkable was the play of Tiger Woods in the hundredth playing of the U.S. Open in 2000, when his opening score of sixty-five was the lowest round ever recorded in a U.S. Open at Pebble Beach, and he went on to not only equal the lowest-ever total score for the tournament—272—but also to finish fifteen shots ahead of his nearest rival—a margin of victory four shots greater than in any other U.S. Open.

The Future

Pebble Beach has been long regarded as one of the best courses in the United States; it is ranked the number one public course in the country. Given its great natural beauty and the presence of a number of other high-quality courses nearby, golfers of all standards will always be drawn to play at Pebble Beach regardless of expense, and it will continue to be a regular venue for important championships.

Pelota is a sport in which players propel a ball with their hand or an instrument. The antecedent of pelota is *jeu de paume* (French for “palm game”), a sport that spread rapidly throughout Europe during the thirteenth century. In the rural Basque (relating to people inhabiting the western Pyrenees on the Bay of Biscay) provinces of northwestern Spain and southwestern France pelota acquired a unique identity.

People came to play two forms of pelota on three types of courts: the *place libre*, an open outdoor court with a single wall at one end; the fronton, which includes both covered and outdoor courts with two or three walls; and the *trinquet* (or *tripot*), a small, rectangular covered court. In the villages of Basque country most often the wall or arches of a church were used for pelota. Courts were “never more than a stone’s throw from the church” (Gallop 1970, 49) because the fronton and the church were the two centers of village life.

The original form of pelota is *jeux directs* or *juegos directos*. This form is descended from the outdoor game of *jeu de paume* known as “*longue paume*,” which two or more players played by facing each other and beating a ball back and forth across a net or line in any convenient open space. *Rebot*, for example, was a five-per-side form of *jeux directs* played with leather gloves or *chisteras* (baskets) in a *place libre*. A ceremonious and traditional game, *rebot* is now played only rarely on Sundays after Mass in Basque villages.

Basques also play *pasaka*, a two-per-side version of *jeux directs*, only rarely now. Bare hands or leather gloves are used to propel the ball over a net inside a *trinquet*. Playing in *trinquets* became popular in France during the fourteenth century, and many spaces were enclosed and roofed in for the sport. Although *trinquets* were eventually standardized, the earliest courts were rarely identical either in size or detail because most were converted from stables, barns, or unused houses. Nets were high and strung

Pelota

Pelota among the Basques in Chino, California

The first handball court in Chino was built around 1927 or 1928 by Loran Arretche on an empty lot on Ford Street next to his house. Handball games were held at the fronton on Sundays. Basques came from Los Angeles and the surrounding area to play. This lasted one year and then the court fell down in a strong Santa Ana windstorm. This was during Prohibition and Mr. Arretche sold beer and wine, at least, during the games. These Sunday handball games drew large Basque crowds and the neighbors and a church complained about the noise so Mr. Arretche never repaired the fronton.

Mr. Arretche sold the blocks from the ruined fronton to a Mexican, Julian Montez, and he constructed the second handball court in Chino. Although it was used by Mexican players, the Basques played there every Sunday. In time, Montez sold the court to another Basque, Joaquin Ezurdiag.

across the center of the court. In both *rebot* and *pasaka* scoring is similar to tennis, and a match consists of thirteen games.

Rebot and *pasaka* were played before the introduction of rubber balls during the eighteenth century. Such balls may derive from Mesoamerican (relating to the region of southern North America that was occupied during pre-Columbian times by peoples with shared cultural features) rubber ball games observed by Spanish conquistadors. The introduction of the rubber ball revolutionized pelota. It not only modified existing games, but also set off a whole range of new games. The new games came to be known as “*jeux indirects*” or “*juegos indirectos*,” meaning that the ball was hit “indirectly” to the opposing player by the use of walls.

Variations

The new games were much faster and were normally played with only one or two persons per side, whereas the older games required more players. The new games were so popular that they almost completely displaced the older games. Many variations of *jeux indirects* exist, including *main nue*, *cesta punta*, *remonte*, *yoko garbi*, and *grand chistera*. They share similar tactics and strategies.

People play *main nue en place libre* (bare hand in open court) either in singles or doubles against a single wall in an open court similar to that used for *rebot*. The game is simple: The ball must remain within the limits of the court and of the wall. *Main nue en trinquet* or *en fronton* (bare hand in court or fronton) is a more popular form of handball for singles, doubles, or three-per-side because of the hazards of the walls. In Basque countries the champions of *main nue* are the elite of *pelotaris* (ball players) because *main nue* is not only a physically demanding game but also wearing on bare hands.

Cesta punta, known as “jai alai” in other countries, is a two-per-side game played with a long *chistera* (basket) in a three-sided court. *Remonte* (Spanish for “to return”) is similar, but the basket-glove used for *remonte* is narrower and less curved than that used in other *chistera* games. Rattan canes replace the osier (a type of willow) twigs of the standard *chistera*, and the inside curve is polished. The ball appears to rebound instantaneously, but in fact hits the *chistera* near the wrist, travels down it, and flies out the far end. The rubber ball, the length of the court, and the pace are demanding. *Remonte* and *cesta punta* are pelota’s fastest and most difficult games.

Yoko garbi (pure game or clean game) is a three-per-side form played with a small *chistera* in an open court with a single wall. The court is like that used for *main nue en place libre* except it is longer. *Yoko garbi* is played with two players near the wall and one in back. The game is fast because of the shallow curve of the small basket-glove. *Grand chistera* is a three-per-side variation played with even longer *chisteras*. These games are played most often by professionals in Spain, where gambling is popular and demands a consistently high standard of play.

Basques venerate the best *pelotaris*. The first was Perkain, born in the French village of Les Aldudes about 1765. Perkain helped to put pelota on the map. The balls used by Perkain weighed as much as 907 grams and were hit back and forth. Perkain was succeeded at the top by two Spanish Basques: Jose Ramon Indart, called “Michico,” and Bautista de Arrayoz. Then came the French Basque Jean Erratchun, born in 1817 and known as “El Gaskoina” (the Gascon). Gaskoina played games that were basically the same as those played by Perkain, except for the change in the shape of the glove. He used a longer glove with a deep curve in its end in which the ball could be held for an instant before it was hurled back against the wall. This slice shot was known as “*atchiki*” (to hold). The Spaniards took advantage of the new glove and began to dominate the sport.

Although the new glove made pelota faster and more spectacular, its popularity declined for physical and economic reasons. When *chisteras* and rubber balls were introduced almost simultaneously, the impact on pelota was revolutionary. The final decade of the nineteenth century was a significant period for pelota as it developed into a sport of worldwide renown. Expansion took place mainly in South America, particularly in Argentina, which became a mecca of the sport. The new way of swinging the *chistera* led to pelota’s vogue as a spectator sport, which increased its professionalism and, in turn, gambling.

Governing Body

The Federacion Francaise de Pelote Basque, led by the French Basque Jean Ybarnegaray (1881–1956), was formed in 1921. This federation codified the various forms of the sport, wrote the rules, classified the players, and generally gave the sport a responsible authority. Spain and the South American countries followed suit. In 1924 pelota was included in the Olympic Games held in Paris, and five years later the Federacion Internacional de Pelota Vasca was founded and, with Ybarnegaray as president, became fully operative in 1945. The federation organized its first world championship in 1952 in San Sebastian, Spain. The federation

also gave pelota a patron saint: the sixteenth-century Basque Jesuit missionary, St. Francis Xavier, the co-founder of the Jesuit order. (St. Francis was a *pelotari*: A commission found on his skeletal right hand the tell-tale deformation of the phalanges that marks all hand-ball players.)

People now play pelota in countries wherever the Basques immigrated, including South America, Cuba, Mexico, and the United States. Although its popularity is worldwide, nowhere does it remain more popular than where it evolved—in the Basque provinces of Spain and France.

Pentathlon, Modern

The history of modern pentathlon, unlike that of most sports, is well documented. For the program of the 1912 Olympic Games at Stockholm, Sweden, the French educator and sportsman Baron Pierre de Coubertin (1863–1937), founder of the modern Olympics, suggested the addition of a multisport competition for soldiers, referring to it as a “military pentathlon,” probably to distinguish it from the five-event competition that was already a part of the program.

De Coubertin based modern pentathlon on the series of challenges that a military courier or spy might have encountered during the Napoleonic era. Such a person,

alone behind enemy lines, might have to ride a strange horse over broken country, fight a variety of opponents with a rapier and a pistol, ford a deep river, and run cross country over unfamiliar terrain.

By the 1920 Olympic Games at Antwerp, Belgium, people were referring to the competition as the “modern pentathlon” to complement the ancient or classic pentathlon with its military overtones. Until 1952 most pentathletes were military men.

Development

The modern pentathlon has always consisted of the same five events, although the specifics and scheduling of each have changed over time. The events are (1) riding cross country for a distance of between 2,500 and 5,000 meters over unfamiliar ground, on a horse drawn by lot, against time and with penalties for faults; (2) fencing with an epee (a fencing or dueling sword), with a round-robin during which every pentathlete fences every other sometimes lasting fourteen hours; (3) shooting twenty shots at a silhouette target from a distance of 25 meters with a .22-caliber rapid-fire pistol; (4) swimming freestyle for 300 meters against time, conducted in heats; and (5) running cross country for a distance of about 4,000 meters over unfamiliar ground against time.

Through the years the order of pentathlon events changed occasionally, but one event was held per day for five days until 1984, when two important changes were made. First, the five events were compressed into four days, with the fourth day beginning with shooting and ending with running. This change was made to counteract any attempt by pentathletes to take sedatives or beta-blockers (drugs that decrease the rate and force of heart contractions and lower high blood pressure) to steady themselves for the pistol shoot because this would have had an adverse impact on their running. Second, to create a more dramatic finish, the cross-country run was conducted with a staggered start; the leader after the first four events started first, and each competitor followed at a handicapped lag that

The winners in life think constantly in terms of I can, I will, and I am. Losers, on the other hand, concentrate their waking thoughts on what they should have or would have done, or what they can't do. ■ DENIS WAITLEY

reflected how far behind the leader each was. As a result of this change, the order of finish in the run was the order of finish for the entire competition.

In 1988 another change converted the cross-country riding competition into a stadium jumping competition. The jumping course now consists of twelve obstacles over a course of between 350 and 450 meters. Also, effective with the 1996 Olympics at Atlanta, Georgia, the .22-caliber rapid-fire pistol event was converted into a 10-meter air pistol event. Moreover, the five events have been further compressed into a single day. All these changes reflect the continuing pressure on the Olympics to emphasize events that are more suitable for televising.

Practice

Until 1956 modern pentathlon scoring was determined by adding the places that a competitor earned in each event, with the lowest score winning; a perfect score would be five. The finest performance ever turned in under this method of scoring was by Captain Willie Grut of Sweden at the 1948 Olympics in London. He won riding, fencing, and swimming and took fifth at shooting and eighth at running for a total score of sixteen.

Scoring for the modern pentathlon now resembles that of the decathlon (a ten-event athletic contest). A set of charts assigns one thousand points to a standard result, and a competitor receives more or fewer points depending on how the competitor's result compares with the standard result.

Modern pentathlon is, by its nature, a competition among individuals. However, adding the individual scores of three competitors from each nation creates a team event. This practice was done on an informal basis for many years before the 1952 Olympics at Helsinki, Finland, at which time it was formalized and a medal event created. The team event was discontinued in 1996, in part because the International Olympic Committee (IOC) decided to discontinue what are considered to be artificial events created by adding results from disparate competitions.

When de Coubertin introduced his new sport at Stockholm, it proved to be very popular with the host nation: Swedes took six of the first seven places. In first place was Gustaf Lilliehook; in fifth place was Lieutenant George S. Patton (1885–1945) of the United States, the future World War II general. Patton might have won had he not done so poorly in the shooting event, where he insisted on using his service revolver while the remainder of the field used target pistols. Patton also insisted that he was wrongly penalized by the judges, who failed to detect that he put a second shot through a previous bull's-eye.

Sweden continued to dominate modern pentathlon during the ensuing decades, producing eight of the first nine Olympic champions. Hungary and Russia have dominated since the 1950s; Poland, Finland, Italy, and occasionally the United States also have done well. The Olympic community has long recognized the modern pentathlon champion as the best all-around athlete in the world. When recruiting pentathletes, coaches have traditionally looked for prospects who excel at running and swimming. Coaches believe that shooting, fencing, and riding can be taught to athletes who have a solid background in the first two activities.

The first nonmilitary modern pentathlon champion was Lars Hall of Sweden. He was also the first modern pentathlon champion to win the Olympics twice: in 1952 and 1956. Andras Balczó of Hungary won three Olympic championships: two team in 1960 and 1968 and one individual 1972.

The modern pentathlon until 1949 was the only event at the Olympic Games that was actually conducted under the auspices of the International Olympic Committee itself—a tribute to de Coubertin, the founder of both. In that year the International Modern Pentathlon Federation was created, and it now conducts the world championships, the junior world championships (for competitors under twenty years of age), and the pentathlon events of the Olympics.

Modern pentathlon, like many other sports, has endured its share of scandal. The most notorious scandal

in the history of modern pentathlon occurred at the 1976 Olympics at Montreal, Canada, when Boris Onischenko of the Soviet Union, a member of the defending Olympic championship team and the defending individual silver medalist, was discovered to be using a rigged epee during the fencing event. The epee contained a switch that enabled Onischenko to register a touch without actually hitting his opponent. His deceit was detected by James Fox, a British pentathlete, and the Soviet was disqualified.

A variation of modern pentathlon was featured as a demonstration event at the 1948 Olympic Winter Games at Saint-Moritz, Switzerland. The winter pentathlon consisted of Nordic (cross-country) skiing, Alpine skiing, pistol shooting, riding, and epee fencing. The winter pentathlon was held only once, and Sweden took the first three places. The winner was Gustaf Lindh, and one point behind in second place was Captain Willie Grut, only six months before his triumph in the modern pentathlon in London. This winter pentathlon undoubtedly served as a model for the biathlon, combining Nordic skiing and rifle shooting, which was introduced at the 1960 Olympic Winter Games at Squaw Valley, California.

The Future

The future of modern pentathlon is not especially bright. It is an expensive sport for a person to pursue. It is not “mediatique” (readily broadcast on television); thus, commercial sponsorship is unlikely. Modern pentathlon's public image has been repeatedly damaged by cheating and other scandals. Finally, the advent of triathlon events (swimming, cycling, and running) threatens the continuation of modern pentathlon on the Olympic program.

Performance

Performance can be defined as an accomplishment or how someone functions during a given task. Performance is often used as a measure of one's success at accomplishing one's mission—that is, good performance is synonymous with success, and poor performance is akin to failure.

Early History of Performance

Athletic ability, physical fitness, competition, and play have always been major components of our world's culture. Performance has often been linked to an individual's physical ability and success in athletic competitions. As early as 3000 BCE, however, performance was linked with a much more essential element of life: survival. Civilizations relied predominantly on the physical ability and performance of their people for survival. People needed to be able to find and kill food to survive during dangerous times. Successful performances led to more food and greater chances of survival, according to English scientist Charles Darwin's "survival of the fittest" theory, which states that survival depends on people's ability to adapt to their environments. As sport moved into the modern age between 1820 and 1870 CE, however, performance became linked more heavily with sport success rather than survival. Successful performances were no longer necessary for survival; rather, performance started to bring great wealth and fame.

SUMER

From 3000 BCE to just after 2500 BCE Sumer was the world's predominant society. Hunting and warfare were key components of Sumerian life; thus, performance was easily measured: If you were able to hunt and fight without dying, you were successful. There were no statistics or competitions: performance was judged by life and death. Those who were most proficient at hunting and warfare were looked upon with great honor.

One of the most popular sports in Sumer was lion hunting because it was thought to teach men bravery

and prepare them for war. Groups of men were asked to surround several lions to prevent them from escaping until the leader of the men was able to kill the lions. Many men were killed during these hunts, and performance was assessed by the soldiers' ability to live. Sumerians also competed in other combat sports such as wrestling and boxing where performance was again linked to survival.

EGYPT

Like the Sumerians, Egyptians were exceptional warriors and placed value on one's ability to fight. From 3000 BCE to 30 BCE, the Egyptians showed their ability to fight and survive. Skills with a bow and arrow and foot speed were highly desired characteristics. Similar to the Sumerians, performance was judged by survival. Although successful performance was easily judged by life and death, the Egyptians were also one of the first civilizations to keep performance records. Scribes accompanied soldiers during combat and kept records of every spoil taken during battle. They also recorded the numbers of captured soldiers. This bookkeeping served as an additional way to measure performance.

The Egyptians were also accomplished hunters and, much like the Sumerians, judged performance on a man's ability to provide food for his family. Unlike combat situations, records were not kept during hunting trips, so performance was gauged solely by one's ability to gather food. Much like the Sumerians, Egyptian measures of performance were easy to assess: The most successful performers were those who were alive.

CHINA

Ancient Chinese history runs from approximately 2500 BCE to 900 CE and contains many components of performance that are similar to those of both Sumer and Egypt. Combat was an important aspect of the Chinese life, and soldiers often had only their athletic prowess and skill with weapons to keep them alive. In addition to the bow and arrow used by Egyptians, Chinese warriors were skilled with axes, spears, and daggers.

An English country footrace in which the thinner man carries a human jockey.

This focus on fighting led the Chinese to incorporate combat sports such as boxing to their daily lives. The predominant focus on boxing was on appropriate offensive tactics, thus making skilled boxers better soldiers. Similar to combat situations, performance during boxing was gauged by survival. Martial arts were thought to build more potent warriors. This focus on building successful soldiers through boxing and martial arts highlights the link between performance and survival.

GREECE AND ROME

Much like civilizations before them, the ancient Greeks (1000 BCE–300 CE) competed in combat sports. These warrior sports included chariot racing, wrestling, boxing, javelin throwing, and foot races. Severe injury and even death were commonplace during these competitions. Although the Greeks participated in many activities in which performance success was gauged by survival, they also began competing in more modern sporting activities.

Starting in 1000 BCE, the Greeks competed in games at Olympia every four years; these games were the beginnings of the modern Olympics. Success in these games, which were less combat-like than previous activities, was connected with glory, honor, and prizes; successful athletes received cash prizes as well as living

expenses. Although no records were kept to measure performance, the most successful athletes at these competitions were given great power and advantages over the less-dominant athletes. Performance during ancient Greek civilization became less about survival and more synonymous with honor and power.

Ancient Romans (500 BCE–500 CE) participated in more dangerous games than the Greeks did. Romans viewed athletic events as preparation for combat, therefore, they competed in warrior games. Their competitions included mortal combat with lions, tigers, and panthers as well as gladiator fights.

For the most part, women were not allowed to participate in Greek or Roman games. Athletic performance was not thought to be a feminine characteristic, thus women were discouraged from competing in athletic competitions. However, evidence indicates that a small number of female gladiators did exist during Roman times.

A few Greek women held their own games at Olympia, but their reputations were seriously damaged as questions were raised about their femininity and sexual orientation. In addition, the achievements and performances of these women were not publicized as were those of their male counterparts.

Sport Performance in the Middle Ages

The most popular sporting activities during the Middle Ages (500 CE–1453 CE) were warrior games designed to prepare soldiers for combat. Tournaments were quite similar to actual battles. Death and serious injuries were common, and the victors often left with the loser's possessions and took the defeated as prisoners. These competitions were drastically different from modern sporting events. There was no measurement or record keeping of athletes' performances during these events; the only way to measure the competitors' performance was through their ability to survive.

Athletic prowess was not a desired characteristic of women during this period, either. Thus, women did not take on many athletic endeavors. They were expected to

be subservient and rarely left their homes because physical activity was not thought to be feminine. Overall, women avoided physical activity, and the few activities they did take part in were considerably less physical and dangerous than those of their male counterparts.

Sport Performance in the Twentieth Century

As sports moved into the twentieth century, more formal methods for gauging performance became popular. With the advent of professional leagues in baseball, football, basketball, and hockey and professional tours in sports including tennis, golf, and volleyball, sport performance began to be quantified through statistics and record keeping. Instead of gauging performance through one's ability to survive combat-like contests, modern sport performance is measured by wins and losses and how individuals compare with their competition. Books, newspapers, and websites are replete with statistics and records from every sport imaginable. These performance measures provide valuable information and are studied by sport fans around the world. Performance records are well known by both fans and competitors, and an athlete's value is linked with these records.

Unlike previous centuries when successful performance led to survival, triumphant performances in the twentieth century, and moving into the twenty-first century, provide wealth, honor, and recognition. The athletes who perform at the highest levels make enormous salaries and are looked up to by thousands of fans. Thus, it is not surprising that many athletes use several methods designed to improve their performance, including proper nutrition, strength and conditioning, and mental training.

NUTRITION

Recently, there has been increasing interest in the positive effects nutrition can have on performance. Athletes have begun to monitor their diets in attempts to stay in ideal physical shape and improve their performance. Proper nutrition has also been shown to reduce the risk of injury and help speed injury recovery.

The two major categories of food that athletes use for energy are carbohydrates and fat. Athletes report receiving 45 to 55 percent of their energy intake from carbohydrates and 35 percent from fat. Nutritionists suggest meals high in carbohydrates eaten three to four hours before exercise can improve performance. In addition, carbohydrate intake during activity can further enhance endurance, work output, and performance. Despite opinions to the contrary, no evidence indicates that carbohydrate intake thirty minutes or less before exercise has adverse effects but, rather, often has a positive effect. Diets high in carbohydrates have been shown to have the most positive effect on endurance sports.

Fat is twice as energy dense as carbohydrates and is the predominant source of energy for those engaging in moderate levels of activity for extended periods. Despite the predominance of low-fat diets, many nutritionists have suggested that diets high in fat can improve performance for athletes who engage in regular activity. However, several studies have shown that diets high in fat provide no more positive effects than high carbohydrate diets do. Over time, high-fat diets have been shown to have negative effects on performance when compared with diets high in carbohydrates. Therefore, many nutritionists have concluded that there is no performance advantage to high-fat diets when compared with high carbohydrate diets and, thus, suggest that athletes should be getting 60 to 65 percent of their energy intake from carbohydrates.

STRENGTH TRAINING

Strength has always been synonymous with survival and athletic success. Since 2500 BCE, athletes have used strength training to improve performance. Strength training was initially used to improve health, strength, and performance on the battlefield; athletes competing in warrior games used strength training to increase their chances of survival.

More recently, strength training has been used as another way for athletes to gain an advantage over their competition and improve their performances. Currently, every professional and college team and many high

school teams employ at least one strength coach and encourage their athletes to take part in a strength training program. In recent years, strength training has become more sport-specific to improve performance in specific sports. Athletes competing in sports that require muscle mass and quick bursts of power (weight lifting, football, sprinting) employ different strength programs than do those competing in endurance sports (swimming, cross country). As a result, strength coaches have begun to specialize in different sports, helping athletes to improve their performance.

MENTAL TRAINING

Mental training, or sport psychology, is a relatively new field aimed at studying how people behave in sport and exercise. The aim of mental training is to help athletes achieve effective mental states and peak performance. In 1898, Norman Triplett began the first investigations into the psychological aspects of sport. Triplett studied why cyclists seemed to ride faster in groups than when they were alone. Coleman Griffith continued to study the mental aspects of sport performance and developed the first sport psychology lab in 1921. Griffith was also one of the first sport psychology consultants to conduct applied work with coaches and teams—he provided services to the Chicago Cubs Professional Baseball team and Notre Dame Head Football Coach Knute Rockne.

In 1917, the Soviets began to study the psychological aspects of performance. Attempting to develop elite soldiers, the Soviets used mental training with their military personnel. After World War II, the Soviets began using mental training to improve the performance of their Olympic athletes.

Modeling the Soviet system of mental training, several Eastern European countries began to offer sport psychology services to their athletes.

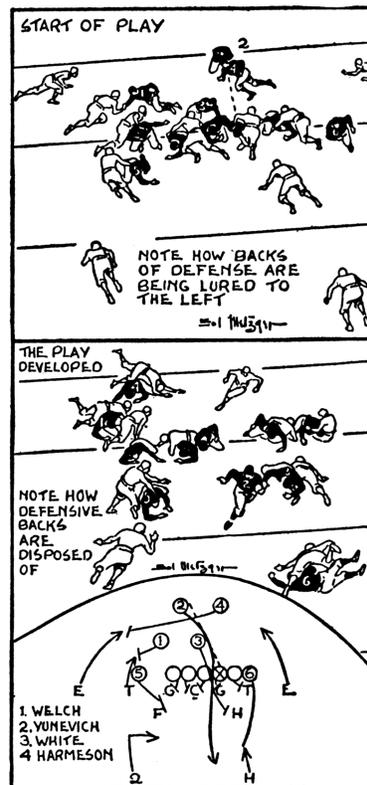

Noticing the success of Soviet Olympians (80 gold, 69 silver, and 46 bronze medals in 1980), the United States began to extensively integrate sport psychology into their athletic programs in the 1980s. The United States Olympic Committee now employs several sport psychology consultants to improve U.S. athletes' performance.

During the last twenty years, increasing numbers of athletes and coaches have begun to use sport psychology in attempts to improve their athletic performance. Sport psychology consultants work with athletes on various issues including concentration or focus, confidence, relaxation, goal setting, performance preparation, anxiety or arousal, positive self-talk, stress management, career termination, injury rehabilitation, burnout, dealing with distractions, imagery, leadership, and group or team dynamics.

Sport psychology consultants teach various mental skills to athletes to help them become self-sufficient and have begun to branch out into other performance domains, such as working with business executives, surgeons, actors, and other performers to improve their professional enjoyment and performances.

The Future

With the increasing emphasis on winning and the opportunities for earning money and fame in modern sports, it is not surprising that athletes have begun to seek out numerous performance enhancement techniques. Athletes at all levels

The inside guard plunge play requires each player to perform his specific assignments.

have begun employing their own nutritionists, strength coaches, and sport psychology consultants to work with their sport coaches. In addition, many parents are sending their children to specialized sports camps and academies where they work with nutrition, strength training, and sport psychology specialists. Methods of performance enhancement have become an inextricable part of athletics and will continue to grow in years to come.

Performance Enhancement

Performance enhancement in sports has taken on added importance during recent years as athletes try to gain an edge over opponents in an increasingly cut-throat sporting environment. In an effort to enhance their performance, athletes have turned to nutritional supplements, a variety of drugs, physiological agents, and even sports psychology.

Ancient Times

The record of performance-enhancing drugs dates back to 400 BCE in Greece, when achievements in sports were first found to increase social status, political power, and economic well-being. Although the crown of olive leaves was the only "official prize" for an Olympic victory, records indicate that Olympic winners could gain great wealth from lucrative prizes awarded by their city-state. In addition to money, winners might receive homes, food, tax breaks, and even exemption from duty in the armed services. Because the stakes were high, athletes were open to any means that gave them the edge over opponents, such as ingesting mushroom extracts, plant seeds, or any concoction thought to enhance performance.

During the Roman period chariot races and gladiator competitions filled the stands with spectators. Knowing that a victory could be their ticket to social and economic prosperity, competitors fed their horses potent mixtures of herbs and other plants to make them run faster. They also fed themselves herbal substances that acted as doping agents to make for a more intense and bloody battle, one that would satisfy the adoring crowds.

Ancient games were ended during the Christian era in 396 CE when the Roman Emperor Theodosius banned all forms of "pagan" sports. People were encouraged to develop their minds during this time. Because physical development was viewed as a hindrance

Steroids Become All the Rage

Anabolic steroids were introduced during the 1950s. A synthetic form of the male sex hormone testosterone, anabolic steroids increase muscle mass, strength, and endurance capacity while facilitating in the recovery period after ex-

hausting workouts or training sessions. In 1956 at the World Games in Moscow, U.S. doctor John B. Ziegler learned of steroids after watching Soviet athletes urinate using a catheter because their prostates had become so enlarged that urination was difficult. Overshadowing the negative side effects, Ziegler was more impressed as the Soviets shattered all of the weight-lifting records. When Ziegler returned to the United States, he helped a team of scientists develop the steroid dianabol, hoping to help U.S. athletes compete against the Soviets. Dianabol was immediately embraced by the athletic world, and use was widespread.

Because succeeding in sports had reached new proportions in terms of political, social, and economic power, athletes were largely unconcerned with side effects of steroids and instead considered them just another sacrifice in reaching the top.

Media's Influence on the Reemergence of Sports

During the late nineteenth and early twentieth centuries sports in North America became increasingly popular because of coverage by mass media such as newspapers and magazines, and spectator sports such as football and soccer attracted hundreds of thousands of fans. As more stadiums were built and international play increased, sports became more than just a frivolous activity to be played during free time. Instead, the professional athlete was born, and with the professional athlete, a life of fame and fortune.

During this time athletes began to use pain killers and stimulants to gain an edge over unsuspecting opponents. In 1886 cyclist Arthur Linton died from an overdose of the stimulant trimethyl during a race, the first recorded drug-related death in sports. Marathon runner Thomas Hicks nearly died during the 1904 Olympics in St. Louis, Missouri, after ingesting a mixture of brandy and strychnine, a drug used in "street" varieties such as LSD, heroin, and cocaine. Using a combination of alcohol and strychnine as a perceived performance enhancer was popular during the early twentieth century, along with heroin, caffeine, and cocaine, which were available without a prescription. During the 1930s amphetamines—stimulants that increase mental alertness, elevate mood, decrease the sense of fatigue, and produce a sense of euphoria—began to replace strychnine as the drug of choice.

Some countries sponsored drug use as they strived for the international recognition that often accompanied achievement in individual and team sports. The former head of the East German sports federation, Manfred Ewald, and medical director Manfred Hoepfner gave what they called "vitamins" to unknowing athletes as young as eleven years old. The athletes later found that the "vitamins" were heavy doses of steroids and other performance-enhancing drugs. As a result, East Germany became a sports powerhouse during the 1970s and 1980s, but not without a price. The physical and psychological damage done to the more than ten thousand athletes who were systematically doped was

Cocaine and Horse Racing

Within a recent period cocaine has come into use on the race track, as a stimulant. Horses that are worn and exhausted, or are uncertain as to speed and endurance, are given ten to fifteen grains of cocaine by the needle under the skin at the time of starting, or a few moments before.

The effects are very prominent, and a veritable muscular delirium follows, in which the horse displays unusual speed, and often unexpectedly wins the race. This agitation continues and the driver has difficulty in “slowing down” the horse after the race is over; not unfrequently the horse will go half round again before he can be stopped. The exhaustion which follows is not marked, except in the great thirst and loss of appetite. Sometimes diarrhea and trembling follow. But good grooms give unusual attention to rubbing and bathing the legs in hot water and stimulants. The general effect on the horse is depression from which he soon recovers but it is found essential to give cocaine again to make sure of his speed. The action of cocaine grows more transient as the use increases, and when a long period of scoring follows before the race begins, drivers give a second dose secretly while in the saddle. Sometimes the horse becomes delirious and unmanageable, and leaves the track in a wild frenzy, often killing the driver, or he drops dead on the track from the cocaine, although the cause is unknown to any but the owner and driver. Some horses have been given as high as twenty grains at a time, but this is dangerous and only given to worn-out animals, who may by this means win a race. It appears that cocaine is only used in running races, and as a temporary stimulant for the time. It is claimed that the flashing eyes and trembling excitement of the horse is strong evidence of the use of cocaine.

horrific. The long-term medical effects of steroid use included increased aggression, testicular atrophy, masculinization in women, personality disorders, liver damage, and cardiovascular disease. Some of the athletes died prematurely. East German shot-putting champion Heidi Krieger eventually had a sex change because of the physical changes her body endured because of extensive drug use and now goes by the name “Andreas Krieger.” In July 2000 Ewald and Hoepfner each received suspended jail terms of one to twelve years.

The use of steroids continued to grow despite increasing evidence of harmful side effects and the sanctions put into place by sports authorities. Nineteen athletes (including two U.S. athletes) willing to risk their health and reputation to earn a place on the medals stand during the 1983 Pan-American Games were disqualified for steroid use. Five years later Canadian sprinter Ben Johnson—who raced to a world record finish in the 100-meter dash—was stripped of his Olympic gold medal in Seoul, South Korea, after testing positive for the anabolic steroid stanozolol.

Athletes Turn to Supplements

In 1998 St. Louis Cardinals first baseman Mark McGwire and Chicago Cubs outfielder Sammy Sosa of Major League Baseball broke New York Yankee Roger Maris’s home run record, a record that had stood for thirty-seven years. People later discovered that both players were using an over-the-counter supplement called “creatine,” a protein-based ergogenic aid that has been shown to increase strength and muscle mass. McGwire was also taking androstenedione, better known as “andro,” which is said to increase testosterone levels. McGwire’s home run record was challenged by opponents who said he did not earn the record without the help of a questionable substance, which is banned by the International Olympic Committee but not by Major League Baseball. After much debate officials resolved the issue by placing an asterisk next to his name in the record books, noting the use of supplements.

national sports organizations followed suit by banning illegal substances so all athletes could compete fairly.

BALCO Debacle

In June 2003 track coach Trevor Graham, who once trained Olympic sprinters Marion Jones and Tim Montgomery, called the U.S. Anti-Doping Agency (USADA) and told it that an anabolic steroid was being distributed to athletes by Victor Conte Jr., owner of Bay Area Laboratories Co-operative (BALCO) in San Francisco. Graham sent the agency a syringe of the clear liquid, which was identified by scientists as tetrahydrogestrinone (THG). Referred to as a “designer steroid” because it is synthetically created by chemical engineers, THG is a steroid that builds muscle mass and strength, allowing athletes to train harder for longer periods of time. Although not specifically banned at the time, THG was a derivative of other steroids that had been banned by the USADA. Al-

Sports Authorities Take a Stand

Although athletes today are well aware of the health risks of taking performance-enhancing drugs and supplements, many are willing to take those risks if the result is athletic success. During the late 1990s Dr. Robert Goldman surveyed 198 past and aspiring Olympians, asking them if they would take a banned drug with the guarantee that they would both win the competition and not get caught. Only three said they would not take the drug.

In 1968 the International Olympic Committee was the first sports organization to compile a banned substances list and began testing athletes after years of drug use suspicion. Many professional and inter-

though tests on possible side effects have been limited, the USADA has warned that THG can cause liver toxicity, excessive hair growth in women, and infertility and baldness in men, based on its similarities to other steroids. Although the athletes themselves were not under investigation, several Olympians, NFL players, MLB players, and even a professional boxer were subpoenaed to testify against BALCO, which was under investigation by federal authorities as to the source of numerous illegal performance-enhancing substances. Among those subpoenaed were Jones and Montgomery, Oakland Raiders linebacker Bill Romanowski, and All-Star San Francisco Giants outfielder Barry Bonds.

If you don't do what's best for your body, you're the one who comes up on the short end. ■ JULIUS ERVING

Ephedrine—A Deadly Risk

Ephedrine, also known as “ephedra” or “ma huang,” is a stimulant that is often found in asthma medications and is structurally similar to amphetamines. Athletes began using ephedra in the form of pills or drinks during the early 1990s to lose weight and improve their athletic performance. In the sports world ephedra-containing products have been blamed for the death of several up-and-coming athletes. In July 2001 Minnesota Vikings tackle Korey Stringer collapsed during a training camp session and later died after taking an ephedra supplement prior to practice. A month later Northwestern University football player Rashidi Wheeler collapsed and died during a workout after drinking an ephedra-based sports drink before practice. In February 2003 Baltimore Orioles pitcher Steve Bechler collapsed on the mound and died after taking an over-the-counter ephedrine supplement sold to boost energy and help in weight loss. Ephedra was banned by the National Collegiate Athletic Association (NCAA), IOC, the National Football League, and minor league baseball, prior to a ban by the U.S. Food and Drug Administration in 2004.

Human Growth Hormone

Athletes also have used human growth hormone (hGH) as a performance enhancer, largely because it was undetectable by the International Olympic Committee until 2004. Produced by the pituitary gland, hGH was originally used to stimulate the growth of muscles and bones in children suffering from a deficiency of the hormone. Over time medical officials determined that hGH increases lean body mass and reduces fatty tissue, which was attractive to elite athletes. Some athletes also believe that hGH increases energy, a claim unsubstantiated by the limited research conducted on the hormone. Although it is expensive (reportedly in excess of \$1,000 a unit on the black market), some elite athletes opted for the hormone because it was more difficult to detect than steroids. Marion Jones was accused by her ex-husband, Olympic shot putter C. J. Hunter, of using hGH, an allegation she repeatedly denied.

Blood Doping—Elite Athletes' Newest Rage

Tempted by the lure of big contracts and lucrative endorsements, many athletes have also turned to blood doping. Athletes will donate their own blood months in advance, then receive a transfusion of their own blood prior to a major competition to increase the volume of red blood cells in their body. Studies have found that as little as one pint can increase the blood's oxygen-carrying capacity, resulting in increases in maximal oxygen uptake, time to exhaustion, and actual performance. This technique is particularly attractive to athletes in endurance sports such as marathon running or cycling. Blood doping can result in blood clotting or heart failure, challenging the popular credo of athletes that “more is better.”

Erythropoietin (EPO), a naturally occurring hormone that stimulates red blood cell production, is reproduced in a synthetic form that can be injected by a syringe. EPO has been the blood doping method of choice in the cycling world since it was introduced fifteen years ago. Although dozens of elite cyclists have died from complications attributed to EPO, many continue to take the risks that they believe are necessary to win. In the 1998 Tour de France bicycle race the grueling competition was overshadowed by drug allegations surrounding EPO after officials found bottles and bloody syringes near a hotel where several teams were staying. Seven people were placed under investigation, one team was expelled, and six teams dropped out in protest. Some high-profile athletes claimed they used the hormone and never tested positive for it because the test is effective only if given within seventy-two hours of an injection.

At the 2002 Olympics in Salt Lake City, Utah, a new blood-boosting substance, darbepoetin, was discovered by drug testers. A drug similar to EPO, darbepoetin in its medical form is used to treat anemia and severe kidney problems. Athletes used darbepoetin because of its longer-lasting effects and because they falsely believed it is undetectable by drug testing.

Performance Enhancement

Performance Enhancing “Medicine” in Alaska

Like many other drugs, those that enhance performance can be found in nature. Below are anthropological accounts of “medicines” used by the Tlingit of Yakutat Bay in southeastern Alaska in the early 1950s.

This magical root does not have to be procured from a shaman; in fact, some old men and women in Yakutat are reputed to know what plant to take and to have gathered it on Haenke Island, although our informants could not identify it for us. “If you know about it, you can go out, get it yourself before you eat.” It must be gathered early in the morning. “Just the way they say, that kayaní strong when you get it in the morning before you eat. After you eat it wouldn’t help you.” The gatherer did not have to fast the previous day, but was supposed to have refrained from sexual intercourse, although the informant did not know for how long.

After the user has been successful, he must dispose of the root. This rule applies to all kayaní. “When he gets his wish, he puts it under a rotten tree. If he keeps it, it will bring bad luck.” It was never speci-

fied, however, whether the magical root could be used only for a single hunt or contest, or whether it might be employed for a whole season.

Another medicine was used to shoot straight, although I did not learn its native name. It was effective for basketball. “I know a boy from southeastern Alaska. He graduated from college. He is thinking about his uncle, and about basketball dope. And his uncle said, ‘If you live right and take my word, you’re gonna make it.’ So he takes his uncle’s word. He told me all the story. By the time his uncle made it for him (in 8 months) he feel like he’s going to fly. He can catch the ball and put it in the basket from anywhere. And he wins two stripes at college. And after, when it was condemned for him (you must destroy it before it’s too late) he tried to play basketball and he couldn’t play it at all. . . . They wanted to make that medicine for the Yakutat Basketball Team, but they wouldn’t live pure 8 months keep away from their wives and keep clean, and so on.”

Teens and Performance-Enhancing Drugs

Although the focus of illegal drug use tends to be on elite athletes, many athletes begin experimenting with performance-enhancing drugs during adolescence. Millions of athletes—both men and women—use steroids regularly, and the majority are in their late teens. Children as young as thirteen have been known to use steroids to enhance their performance at the high school level. No matter what the risk, teen athletes are even more likely to take performance-enhancing drugs and supplements as they strive to mimic their idols: Olympians and professional athletes who live lives of fame and fortune. Infrequent testing and peer pressure are additional factors contributing to teen use.

Sports Psychology—A Safer Avenue to Athletic Success

Sports psychology has been practiced since the turn of the twentieth century but has greatly increased in popularity during recent years. Sports psychology is a means by which athletes prepare their minds for competition, and successful implementation can give them a safe and legal edge over competitors. Ninety-five percent of athletes blame their mistakes during competitions on mental errors, although these same athletes say they prepare mentally for competition only about 5 percent of the total time they practice.

Norman Triplett conducted the first known sports psychology experiment in North America in 1897. Testing cyclists during racing conditions, he obtained results that indicated that paced bicycle races result in faster

times than do individual efforts and that the presence of an audience enhances arousal levels of cyclists.

During the 1920s Coleman Griffith opened the first sports laboratory at the University of Illinois, conducting psychological research on the psychomotor skills of athletes, as well as their performance, personality, and motivation. Later he served as a sports psychologist for the Chicago Cubs. Interest in sports psychology plummeted for decades, likely because of the Great Depression and World War II. Although sports psychology did not regain popularity until the 1960s, Griffith is often referred to as the “father of sports psychology.”

In 1967 the sports psychology movement began to make headway, highlighted by the first annual meeting of the North American Society for the Psychology of Sport and Physical Activity (NASPSPA). Bruce Ogilvie, a leader in the advancement of applied sports psychology, began to work with athletes one-on-one, helping them to understand that their minds are just as important as their bodies when it comes to performance. Ogilvie worked as a consultant with multiple professional teams, including the San Francisco 49ers, Oakland Athletics, Dallas Cowboys, Portland Trailblazers, and the U.S. Olympic Team. He was known for helping athletes make the necessary adjustments between collegiate and professional athletics as well as helping create facilitative team dynamics.

By the 1984 Olympic Games sports psychology consultants were working with U.S. athletes from the track and field, volleyball, weight lifting, skiing, synchronized swimming, fencing, cycling, archery, shooting, and boxing teams. However, a rule stipulated that none of the consultants could provide on-site services for the athletes during competition because none was credentialed by the United States Olympic Committee (USOC). That rule was changed for the 1988 Olympic Games.

Sports psychologists, sometimes referred to as “head” coaches, work with athletes and teams on a variety of mental skills. Goal setting, self-talk, imagery, and relaxation are just a few of the techniques on which sports psychologists may focus to improve motivation, self-

confidence, mental toughness, and concentration while decreasing stress and anxiety. Team dynamics can be an ongoing struggle, particularly among professional athletes because they rarely remain with the same team throughout their career. Job security in professional sports is nearly nonexistent, trades are commonplace, and retirement because of injury is frequent.

Fear of the Sports Psychologist

Although many athletes won’t think twice about trying a drug that could seriously harm them, those same athletes may be apprehensive about seeking help with their mental skills because they fear that their teammates will view them as weak or incompetent. This stigma has diminished slowly through the years, however, as more professional and elite athletes seek the help of sports psychology consultants.

The USOC has its own sports psychologist on staff. Most Olympic sports teams have their own sports psychology consultant as well. Sports psychology also is popular in Canada and many parts of Europe, Australia, and New Zealand. Professional, elite, and amateur athletes are increasingly seeking the help of sports psychology consultants as they realize the importance that mental skills play in achieving a peak performance.

The Future

Sports officials have faced an uphill battle in a quest for drug-free athletics. Although antidoping initiatives have reached an all-time high within the professional sports world, chemists are creating undetectable drugs faster than sports laboratories can create tests to detect them. Newer drugs mimic natural bodily processes and are becoming more difficult to detect. With the possibility of genetic enhancement (genetically stimulating muscle growth in athletes) in the years to come, detection and elimination of performance enhancement will become an even tougher challenge.

More and more athletes will explore the world of sports psychology in an effort to hone their mental skills.

However, if the current trend continues, they likely will do so in conjunction with performance-enhancing drugs, supplements, or physiological processes as they go for the gold.

Personality

Marathon runners are loners and introspective; football players are extroverts. Such stereotypes pervade popular thinking about personality and sports, but do these labels have any basis in fact? For decades people have debated whether aspects of people's personalities influence their choices of which sports to play and their success in those sports. A bias behind part of this debate has been the idea that sports build character. Much research has been conducted to determine the role that personality plays in sports. This research has been framed within three major theories of psychological thought: psychodynamic, dispositional, and phenomenological. Although personality traits may be associated with sports in some way, thus far no conclusive evidence indicates that popular stereotypes have any validity.

Personality Defined

Personality was defined in a variety of ways during the last century. Common aspects of these definitions include a focus on psychological aspects (thoughts, emotions, behavior, motives) that make up a person's identity, on how people differ from one another, on behavior that is controlled from within people rather than from the environment, and on how different aspects of a person form an integrated whole. An example of a definition of *personality* comes from Lazarus and Monat, who defined it as "the underlying, relatively stable, psychological structure and processes that organize human experience and shape a person's activities and reactions to the environment" (Lazarus and Monat 1979, 1).

Psychodynamic Theory

Psychodynamic theory emphasizes the importance of early life experiences in determining current psychological makeup and the role of the unconscious. During the first three decades of the twentieth century the Austrian psychoanalyst Sigmund Freud laid the foundations of psychodynamic theory, and theoretical

Are Athletics Making Girls Masculine? (1912)

Some of the specific mental and physical qualities which are developed by athletics are increased powers of attention, will, concentration, accuracy, alertness, quickness of perception, perseverance, reason, judgment, forbearance, patience, obedience, self-control, loyalty to leaders, self-denial, submergence of self, grace, poise, suppleness, courage, strength and endurance. These qualities are as valuable to women as to men. While there is some danger that women who try to excel in men's sports may take on more marked masculine characteristics . . . this danger is greatly lessened if the sports are modified so as to meet their peculiar qualifications as to strength, height, weight, etc.

Inasmuch as the average woman is inferior to the average man in nearly all physical qualifications, all the apparatus used and the weights lifted, as well as the height and distance to be attained in running, jumping, etc., should be modified to meet her limitations. Considering also the peculiar constitution of her nervous system and the great emotional disturbances to which she is subjected, changes should be made in many of the rules and regulations governing the sports and games for men, to adapt them to the requirements of women.

development was continued by Adler, Erikson, Fromm, Horney, and Jung. Although some authors in sports psychology have speculated that psychodynamic theory may contribute to understanding why people tend toward participation in some sports and not others, no evidence has been provided to support their speculation.

Dispositional Theory

Dispositional theory focuses on the characteristics of a person's behavior that are relatively consistent through time and between situations. Personality represents a combination of these characteristics. Four theories that focus on a person's stable and enduring characteristics are trait, dispositional state, biological, and motive or need theories.

TRAIT

Traits are those internal characteristics of a person that are highly stable between situations and over time. Trait theorists (such as Allport, Cattell, Eysenck, and Guilford) contended that traits lie beneath people's behavior.

During the 1920s Coleman Griffith conducted some of the first research into personality and sports. To determine the personality profile of the successful athlete, Griffith observed and interviewed college and professional athletes. Eleven traits were common among them:

ruggedness, courage, intelligence, exuberance, buoyancy, emotional adjustment, optimism, conscientiousness, alertness, loyalty, and respect for authority.

During the 1960s and 1970s research on personality in sports, based on trait theory, was prolific, with more than one thousand studies conducted. Research could be conducted relatively easily, with investigators administering personality questionnaires from mainstream psychology (such as Hathaway and McKinley's *Minnesota Multiphasic Personality Inventory*, Cattell's *16 Personality Factor Questionnaire*, Eysenck and Eysenck's *Eysenck Personality Inventory*) to athletes. In 1969 a sports-specific questionnaire (Tutko, Lyon, and Ogilvie's *Athletic Motivation Inventory*) was developed to assess eleven personality traits (drive, determination, leadership, aggressiveness, guilt proneness, emotional control, self-confidence, conscientiousness, mental toughness, trust, and coachability), which have some similarity to the traits that Coleman had identified more than forty years earlier.

Using these questionnaires, researchers looked for differences between athletes and nonathletes, between athletes from one sport type and athletes from another sport type, and between athletes at different levels of ability. Although various studies have identified differences between groups (e.g., athletes versus nonathletes),

Concentration is the ability to think about absolutely nothing when it is absolutely necessary. ■ RAY KNIGHT

no consistent findings have come from this research. That is, no clear and enduring personality differences have been found between athletes and nonathletes, between athletes from different sports, and between athletes of differing ability.

Some researchers have speculated that personality may be connected with various sport behaviors (e.g., successful sporting performance). To date, no evidence supports this claim.

Another subject of research has been whether sports build character. Although a small number of studies have been conducted on this subject, they have consistently concluded that no relationship exists between sports and the development of character.

DISPOSITIONAL STATE

Dispositional state theories consider the interaction between personal characteristics and the environment. Dispositional state theorists consider dispositions to be less rigid than traits. Both these personal dispositions and the environment determine personality. Two models that have received extensive research attention in sports are Morgan's mental health model and the individual zones of optimal functioning (IZOF) model, applied by Hanin and Syrjä in their research on emotion and sport.

In 1980, with the mental health model, Morgan proposed that positive mood states facilitate higher athletic performance than do less positive mood states. Morgan and later researchers measured mood using the six subjective mood states of the *Profile of Mood States* questionnaire, developed in 1981 by McNair, Lorr, and Droppleman. These mood states include tension-anxiety, depression-dejection, anger-hostility, vigor-activity, fatigue-inertia, and confusion-bewilderment.

Through research with different athletic populations, a distinct athletic profile was developed. The profile was characterized as higher vigor-activity levels than the population norm and lower levels of tension-anxiety, depression-dejection, anger-hostility, fatigue-inertia, and confusion-bewilderment than the population norm. Based on the graphical representation, this pattern was named the "iceberg profile."

The iceberg profile, however, is not related to sporting performance. Some athletes perform well despite having a profile that is considered to be "negative." Issues that may confound the mood-performance relationship include athletes' perceptions of their moods and the type of sports they play. Athletes' perceptions of their mood as facilitative or deliberative may influence performance to a greater extent than does the mood itself. Some sports may require mood profiles different from those of the iceberg profile. The mental health model may be more useful for charting differences between athletes and relating these differences to performance than for relating the profiles of many athletes to performance.

In 1995 Hanin and Syrja developed the IZOF model. With this model as a base, Hanin asked athletes to rate previous successful performances with regard to the intensity of a range of positive optimal emotions (i.e., eager, sure, determined), negative optimal emotions (i.e., tense, furious), positive dysfunctional emotions (i.e., calm, nice, content, pleasant), and negative dysfunctional emotions (i.e., slack, lazy, unwilling, tired). Greater success was associated with positive and negative optimal emotions of a high intensity and positive and negative dysfunctional emotions of a low intensity. The few studies that have been conducted have shown the IZOF model to be predictive of performance. Although not a personality theory, consistency of emotional state was being examined with the collection of data on successful and poor performances.

BIOLOGICAL

Some theorists (e.g., Kretschmer during the 1920s and Sheldon during the 1940s) have contended that personality is related to bodily configuration. For example, people with lean, linear body types were suggested to be tense, inhibited, and introverted. Later researchers during the 1960s, 1970s, and 1980s reasoned that personality is related to nervous system function.

Few biological studies have been conducted in sports. Studies have tended to investigate whether physiological and psychological processes are associated

Mental will is a muscle that needs exercise, just like muscles of the body. ■ LYNN JENNINGS

and whether physical and psychological measures, in combination, can predict behavior. A study conducted by Hardy, McMurray, and Roberts in 1981 exemplifies the first type of research. These researchers investigated whether people with type A personalities (i.e., people who tend to be strict, rigid, perfectionistic, and mindful of time) respond differently to exercise than do people with type B personalities (i.e., people who tend to be more relaxed). The results showed that people with type A personalities experience greater negative psychophysiological responses, at higher intensities of exercise, than do people with type B personalities. At light and moderate intensities, people with type A personalities had greater positive psychophysiological responses than did people with type B personalities.

MOTIVE OR NEED

For motive or need theorists (e.g., Murray, McClelland, Atkinson), specific motives or needs are the drivers of personality. In 1957 Atkinson published his achievement motivation theory, which grounded later sports research. The need to achieve formed the basis of Atkinson's theory. The theory has received some empirical support. For example, in 1965 Ryan and Lakie found that people with a need to avoid failure that is stronger than their need to succeed perform better in noncompetitive situations than do people whose need to succeed is stronger than their need to avoid failure. In competitive situations the reverse was true.

Zuckerman's work on sensation seeking, conducted during the 1970s, has been the foundation of several sports studies. Sensation seeking is the need for intense, novel, and varied sensations. Several studies have found sensation seeking to be higher in people involved in high-risk sports. Some evidence also indicates that sensation seeking can explain people's degrees of involvement in high-risk sports as well as the sports they choose.

Phenomenological Theory

Phenomenological theory emanated from the initial writings of Husserl in 1911 and is based on the premise that all people perceive the world and themselves dif-

ferently. Behavior is shaped by people's subjective understanding of themselves and the world in which they live. Personality is assessed by asking people how they would feel or behave in a given situation. Three phenomenological approaches are actualization/self-determination, cognitive information processing, and social-cognitive.

ACTUALIZATION/SELF-DETERMINATION

Theories developed during the 1960s, such as Maslow's theory of hierarchy of needs and Rogers's self theory, focused on people's achievement of their own potential. Although Maslow's theory does identify some basic human needs, experts assumed that everybody has the same needs. The emphasis was on the fulfillment of those needs in an attempt to achieve self-actualization.

In sports, research has been based on the cognitive evaluation theory of motivation, which Deci developed in 1975 and elaborated on with Ryan in 1985. Core to their theory is the idea that people have an innate psychological need to show competence and self-determination. Competence is people's perceptions of their ability to interact successfully with their environment. Self-determination is the degree to which people perceive that they are free to choose their own behaviors. People will be intrinsically motivated (that is, engage in an activity for the pleasure associated with the activity itself) to the extent that they are able to show competence and that they are free to choose to engage in an activity.

COGNITIVE INFORMATION PROCESSING

Cognitive information-processing theory emphasizes the individuality of how people actively make sense of their own behavior and the world around them. In 1955 Kelly developed the personal construct theory, in which he hypothesized that the dimensions of personality are constructed on an individual basis. These dimensions act as lenses through which people view the external world. If people's lenses continue to help them to predict the world around them, then people see no need to change these lenses.

Few studies have been conducted on personality and sports using the personal construct theory. In 1976 Lerch explored how four track athletes perceived their preseason, in-season, and postseason experiences and found that each athlete had unique perceptions of his or her athletic involvement.

In sports a greater amount of research has been conducted using Weiner's attribution model, which he developed and refined during the 1970s and 1980s. The central aspect of this model is that, following achievement behaviors, people will search for causes of those behaviors. The three general causes that experts have identified are controllability, locus of causality, and stability. Controllability is the degree to which the cause of the achievement behavior is under the control of the person making the attribution or under the control of other people. Locus of causality is whether the cause of the behavior is internal or external to the person making the attribution. Stability is the consistency of the cause over time.

Sports researchers have also investigated cognitive consistency theory. The premise that underlies this theory is that people strive for consistency in their attitudes, beliefs, and behaviors. Sports performance has been associated with less cognitive conflict and the greater use of methods to reduce conflict, whereas dropping out of sports has been associated with cognitive conflict.

SOCIAL-COGNITIVE

Social-cognitive theories explain behavior as the interaction between behavioral, cognitive, and environmental factors. In 1986 Albert Bandura described self-efficacy theory, which is a social-cognitive theory that has, during the last twenty years, underpinned more research than any other personality theory. Self-efficacy is people's perceptions of their ability to perform desired tasks. Much of the research using self-efficacy theory, however, was not directed toward investigating differences in people's personalities.

Reminiscent of researchers conducting trait studies during the 1960s and 1970s, researchers using social-cognitive concepts have outlined the characteristics of

successful athletes. These characteristics include self-confidence, the ability to stay focused, the capacity to regulate arousal, positive emotions and thoughts toward sports, high commitment to excellence, and determination.

Implications

People harbor popular notions that personality traits are connected to sports, and maybe in some ways personality traits and sports *are* connected. No evidence indicates, however, that our popular notions have any basis in reality. With the lack of a "sports personality," the common argument that sports build character also seems tenuous. People with a broad range of personality characteristics participate in and are successful in sports.

Physical Education

Extract from *Tom Brown's Schooldays* by Thomas Hughes (1857)

In the extract below from this classic English novel, Tom Brown—the main character—wonders about school customs for a type of English football that evolved into rugby (the name of the school Tom attends).

“But why do you wear white trousers in November?” said Tom. He had been struck by this peculiarity in the costume of almost all the School-house boys.

“Why, bless us, don’t you know? No; I forgot. Why, to-day’s the School-house match. Our house plays the whole of the School at football. And we all wear white trousers, to show ‘em we don’t care for hacks. You’re in luck to come to-day. You just will see a match; and Brooke’s going to let me play in quarters. That’s more than he’ll do for any other lower-school boy, except James, and he’s fourteen.”

“Who’s Brooke?”

“Why, that big fellow who called over at dinner, to be sure. He’s cock of the school, and head of the School-house side, and the best kick and charger in Rugby.”

“Oh, but do show me where they play. And tell me about it. I love football so, and have played all my life. Won’t Brooke let me play?”

“Not he,” said East, with some indignation. “Why, you don’t know the rules; you’ll be a month learning them. And then it’s no joke playing-up in a match, I can tell you—quite another thing from your private school games. Why, there’s been two collar-bones

broken this half, and a dozen fellows lamed. And last year a fellow had his leg broken.”

Tom listened with the profoundest respect to this chapter of accidents, and followed East across the level ground till they came to a sort of gigantic gallows of two poles, eighteen feet high, fixed upright in the ground some fourteen feet apart, with a cross-bar running from one to the other at the height of ten feet or thereabouts.

“This is one of the goals,” said East, “and you see the other, across there, right opposite, under the Doctor’s wall. Well, the match is for the best of three goals; whichever side kicks two goals wins: and it won’t do, you see, just to kick the ball through these posts—it must go over the cross-bar; any height’ll do, so long as it’s between the posts. You’ll have to stay in goal to touch the ball when it rolls behind the posts, because if the other side touch it they have a try at goal. Then we fellows in quarters, we play just about in front of goal here, and have to turn the ball and kick it back before the big fellows on the other side can follow it up. And in front of us all the big fellows play, and that’s where the scrummages are mostly.”

Tom’s respect increased as he struggled to make out his friend’s technicalities, and the other set to work to explain the mysteries of “off your side,” “drop-kicks,” “punts,” “places,” and the other intricacies of the great science of football.

Journal of Epidemiology, European Journal of Applied Physiology, British Journal of Sports Medicine, and scores of other publications now provide extensive evidence that validates physical education’s importance. The basic components of healthful living remain those set forth in the writings of Hippocrates and the Greco-Roman physician Claudius Galen: exercise, proper diet, rest, cleanliness, control of the emotions. The field that historically has been most concerned with exercise—

and with related health and developmental matters—is *physical education*, now often called kinesiology, exercise science, or one of several other designations.

Earlier referred to as gymnastics or sometimes physical training, physical education has a long, albeit uneven, tradition. In the *Republic*, Plato set forth two branches of education: that over which the Muses preside for the mind, and *gymnastics* for the body. The desired goal was balanced development of the two.

Although it may not be readily apparent, contemporary physical education retains certain aspects of classical approaches to health and hygiene. Since the late 1800s, as physiology and psychology took form as experimental fields, efforts have been made to incorporate relevant findings into the various programs that have been designed for children, youth, and sometimes adults.

National interests, cultural traditions, politics, the economy, matters pertaining to class and gender, and much more have influenced views of physical education. Efforts to integrate it into the school curriculum have been affected by contending beliefs regarding what is the best form of exercise, issues related to public health, long-standing beliefs that matters pertaining to body are less important than those pertaining to mind, and many other things. During times of conflict such as World War I and World War II, physical fitness (especially muscular strength and endurance) has received particular attention. In the 1930s and 1940s, Fascist regimes promoted both sport and physical education for military preparedness and to advance their authoritarian goals.

At Rugby, Harrow, and other English “public schools,” athletics (which were believed to develop “manly character”) became part of the school experience considerably earlier than elsewhere. By contrast, the typical form of exercise in British state-supported schools was gymnastics/calisthenics. Thomas Hughes’s *Tom Brown’s Schooldays* (1857), which romanticized games-playing at Rugby, was enormously popular for decades on both sides of the Atlantic. Although Archibald MacLaren, director of the Oxford Gymnasium, acknowledged their value, he was concerned that athletics did not adequately develop all parts of the body—a belief that many American physical educators held in the late 1800s. In most English-speaking countries athletics remained the province of students, but in the United States highly organized intercollegiate programs with “professional” coaches were well established by the 1890s. Interscholastic programs (for boys), which sought to emulate these, grew rapidly in the twentieth century.

Although they may seem similar, physical education and interscholastic/intercollegiate athletics differ in their goals and in other significant ways. By 1920, organizations such as the philanthropic Carnegie Foundation became concerned about commercialism and various excesses associated with intercollegiate sports. The 1923 formation of the Women’s Division of the National Amateur Athletic Federation, which had been created the previous year, provided a useful focus for those who already were rejecting the male model in favor of a broadly based “A Sport for Every Girl: Every Girl in a Sport” approach and the creation of play days and sports days in place of intercollegiate/interscholastic contests.

Although not accepted by all female physical educators, this philosophy dominated during the middle decades of the twentieth century.

Eighteenth-Century Antecedents

As new ideas about human nature emerged during the Enlightenment, a remarkable number of treatises declared that exercise appropriate to a child’s age was an essential part of education:

- John Locke’s *Some Thoughts Concerning Education* (1693), which opens with the words *mens sana in corpore sano* [a sound mind in a sound body], was frequently cited.
- Physician Jean Charles Desessartz’s *Traité de l’Éducation Corporelle des Enfants en Bas Âge* [*Treatise on the Bodily Education of Young Children*] (1760), which some suggest influenced Jean-Jacques Rousseau’s *Émile* (1762), would have boys engage in activities such as running, jumping, shuffleboard, skittles, swimming, and fencing.
- Desessartz and the Comtesse de Genlis (*Leçons d’Une Gouvernante à ses Élèves*, 1791) were among several who declared that girls should receive much more exercise than their education typically provided.
- In *A Vindication of the Rights of Woman* (1792), early feminist Mary Wollstonecraft insisted that girls should be allowed to engage in the same exercises as boys.

- Johann Basedow's *Philanthropium* (1774) gave three hours a day to recreations.
- *Gymnastik für die Jugend* (1793), one of several books written by Johann Christoph Friedrich Guts Muths (a respected teacher at the Schepfenthal Educational Institute), divided exercises into three classes—gymnastics, manual labors, social games—and was influential in several countries.

Nineteenth-Century Developments

Seeking to revitalize the strength, will, and patriotism of the German people following victories by Napoleon's armies in 1806, Friedrich Ludwig Jahn established a program of outdoor exercises (e.g., running, jumping, vaulting over apparatus, games) to which he gave the name "Turnen." Adolph Spiess, who is usually credited with introducing gymnastics (*Schulturnen*) for girls as well as boys into German schools, emphasized their pedagogical rather than political aspects. Ferdinand A. Schmidt—physician, Turner, and an early leader of the sport movement in Germany—subsequently challenged what he considered to be the empiricism of Spiess's system and began to advocate the value of folk games and English sports. By the 1920s, large numbers of German youth and adults were engaging in sports and recreations in natural settings.

Following the Revolution of 1848, many Turners immigrated to a number of countries. The Cincinnati Turnverein (Gymnastic Society), founded in 1848, was the first of more than 150 Turnvereins that were established in the United States, where Turners campaigned vigorously to have their form of gymnastics become the basis of the public school program.

The major competition was from the Swedish system Per Henrik Ling created in 1814. Educators and physicians in several countries considered this system better designed to systematically exercise each part of the body and more appropriate for females. Nils Posse and Claes Enebuske (who both taught at the Boston Normal School of Gymnastics) brought this Swedish system to American attention. During a several-month tour of Europe, where he investigated various aspects of medi-

cine and physical training, Edward M. Hartwell (PhD in biology from Johns Hopkins University; MD from Cincinnati's Miami Medical School) visited Stockholm's Royal Central Gymnastics Institute (RCGI). Following Hartwell's appointment in 1890 as director of Physical Training for the Boston Public Schools, Swedish gymnastics became the basis of the program. Hartwell's contemporary Lillian Welsh, MD, Director of Physical Training at Goucher College, recruited her instructors from the Stockholm's RCGI and from England's Dartford Physical Training College, founded by Martina Bergman-Österberg and built upon the Swedish system. (Women trained in Swedish gymnastics were among the first to become "reconstruction aides"—a precursor to the physical therapist—following World War I.)

Links to Health Reform and Public Health

In 1826, the *American Journal of Education* declared, "The time we hope is near, when there will be no literary institution unprovided with proper means of healthful exercise and innocent recreation." Although it would take decades before anything approaching this goal was attained, numerous antebellum physicians and health reformers urged parents and teachers to pay attention to the laws of growth, health, and exercise. Articles appeared in the *Boston Medical and Surgical Journal* (today's *New England Journal of Medicine*) as well as in educational and literary publications. Catharine Beecher's popular *Physiology and Calisthenics for Schools and Families* (1856) included chapters on the circulatory and other systems of the body and described (with illustrations) many schoolroom exercises for girls and boys. Men and women with medical training were directors of many college and university departments organized before 1915; one example is Harvard Medical School graduate Edward Hitchcock who headed the Department of Physical Culture, which opened at Amherst College in 1860, for nearly fifty years.

During the last decades of the nineteenth century, as public health received increasing attention in several

Students in nineteenth century Europe line up in physical education class.

countries, sections dealing with physical education were included in meetings such as the International Hygiene Congress held in connection with the 1878 Paris International Exposition. Physician Eugène Dally spoke favorably of developments in Belgium and Germany and called on his compatriots to create normal schools to prepare teachers of gymnastics. The final report of a French Gymnastic Commission headed by physiologist Etienne-Jules Marey was published in 1889. That same year, the well-attended Conference in the Interest of Physical Training was held at the Massachusetts Institute of Technology to assess which “system” of exercise was the best: German gymnastics, Swedish gymnastics, that devised by Dudley Allen Sargent, MD (director of the Gymnasium at Harvard University), or military training. The opening remarks by United States Commissioner of Education William T. Harris, who observed that an important aspect of physical education was to understand how involuntary functions (e.g., heart, lungs, digestion, nervous system) “may be assisted and influenced by voluntary action” (muscles, skeleton) reflected embryonic efforts to bring experimental science to the study of exercise.

The American Association for the Advancement of Physical Education (AAAPE, but today known as the American Alliance for Health, Physical Education, Recreation, and Dance) was founded in 1885. Nine of the first ten AAAPPE presidents possessed medical degrees. Among active members in the late 1800s and early 1900s were individuals like the neurologist D. F. Lincoln and the anthropologist Franz Boas. Membership of Britain’s small National Society of Physical Education (founded 1897) consisted largely of teachers in government schools and commercial establishments;

the Ling Association (founded 1899) was open to women who had completed the two-year course at Dartford Physical Training College or Stockholm’s RCGI. In France, the Ligue Nationale de l’Éducation Physique (1888) competed with the hygiene-oriented Ligue Girondine de l’Éducation Physique, founded by physician Philippe Tissié, and the Comité pour la Propagation des Exercices Physiques dans l’Éducation, created by Pierre de Coubertin to advance what would become his Olympic ideal.

Connections with Many Fields

Over the decades, physical education has developed important connections with other fields and organizations, but the nature and extent of these vary from country to country:

- Luther Halsey Gulick (president of the American Physical Education Association, 1903–1907) was the first president of the Playground Association of America (founded in 1906), and for several years secretary of the Physical Department of the International YMCA of North America.
- In 1913, the YMCA sent Charles McCloy to China, where he trained teachers, founded the journal *Tiyu jikan* (*Physical Education Quarterly*), and developed physical ability tests for boys and girls, among other significant contributions. Programs that he devised during the 1920s were used in Nationalist Chinese Schools through the 1940s.
- In 1878, the Japanese Ministry of Education established the Gymnastic Institute to train instructors for primary schools. Its first director, George Leland, had been a student of Hitchcock at Amherst College.
- In Russia, the biologist Pyotr Lesgaft founded the Society for the Encouragement of the Physical Development of Student Youth in 1892. Its courses were reorganized following the 1917 Revolution and became Leningrad’s Physical Culture Institute.

Physical educators also have been associated—more in some countries than in others—with organizations

First Day's Order at Harriet Trask's School (1904)

Attention! Class—stand! One! Two! Three!

Order. Class—attention! Left foot in place—rest!

Leg. Class—attention! Feet—close! Feet—open! Right foot in place—rest!

Head. Head backward—bend! Raise!

Arm. Hips—firm! Position!

Breathing. Deep breathing—One! Two!

Class—sit! One! Two! Three! Rest!

In sitting, “attention” means to sit well back in the seat, but not to lean against it, back erect, hands on top of the desk. Class—stand! One! Two! Three! On “one” bring the hands to the sides; on “two” the left or right foot into the aisle; on “three,” stand in the fundamental position.

Order. Class—attention! Brings to the fundamental standing position, which is: heels together and toes turned out, knees straight, body erect, with chest high, head up and hips back, arms, straight at the sides, fingers straight and close together, palms toward the body. “Class—attention!” is always given after “In place—rest!” to call the class to the fundamental position.

Left foot in place—rest! Place the left or right foot diagonally forward and stand at ease, but never in a lounging position. Do not give the rest position with one foot more often than with the other. “In place rest” must always be given after each exercise—after

the order, the leg, the head, etc. It is always taken from the fundamental standing position.

Legs. Feet—close! Bring the inner sides of the feet together. In doing this, raise the balls of the feet and use the heels as pivots. The feet must not slide along the floor; the heels must be kept together; there should be a little motion of the body as possible.

Head. Head backward—bend! Start by pulling the chin back and then bend the head back as far as possible without relaxing the neck muscles. In raising the head, stop at the highest point. “Head backward bend” may be given in a lesson whenever it is needed to correct a bad head position.

Arm. Hips—firm! Place the hands upon the hips, thumbs back, fingers together, to the front and pointing obliquely downward, wrist straight and elbows back. Position! Brings to the fundamental standing position.

Breathing. On “one” inhale, on “two” exhale. Give this movement, always in the rhythm of deep breathing, several times. The arms may be turned, palms forward, as the breath is taken in.

Class—sit! One! Two! Three! On “one” place the foot toward the seat, on “two” sit, on “three” take the fundamental position, which is the position of attention.

“Rest!” is the word for ending the lesson. Sit as ease.

whose declared focus is sports medicine. During the late 1800s, German-speaking countries led the world in experimental physiology. Ferdinand Schmidt's comprehensive *Unser Körper* (1899/1909) was more informed by relevant scientific findings regarding the effects of exercise on the body than any book in English-speaking countries would be for a number of years. American naval surgeon Henry Beyer considered the 1911 Dresden International Hygiene Exhibition superior with regard to the study of hygiene and physical education to anything that existed in the United States. It included a sports division, organized by physician (and Olympian)

Arthur Mallwitz, with a special laboratory where things like the effects of exhausting exercise could be studied.

The Deutscher Ärztbund zur Förderung der Leibesübungen [Association of German Physicians for the Promotion of Physical Exercises] (founded 1924) preceded by three decades the British Society of Sports Medicine (founded 1953) and the American College of Sports Medicine (founded 1954). ACSM membership, a substantial portion of which consists of dietitians, physical therapists, sport psychologists, physical educators, and so on, now exceeds 20,000. The Deutsche Hochschule für Leibesübungen [German College for

Physical Education], which opened in Berlin in 1920 with the physician August Bier as director, offered perhaps the most comprehensive training program that was then available. The inspiration for its founding had come from Carl Diem, whose membership on the German Olympic Committee in 1906 began his many significant contributions to physical education and sport. Diem was instrumental in reopening it as the Sporthochschule (sports College) in Köln in 1947. The Deutsche Hochschule für Körperkultur in Leipzig (DDR) received the right to award the Pedagogical Doctor degree in 1955.

A Multidisciplinary Field

Physical education draws from both the biological and the psychosocial sciences. Like medicine, physical education has significant applied aspects. At the 1890 AAPE meeting, Gulick delivered a paper titled “Physical Education: A New Profession” setting forth a message that is remarkably similar to that which Franklin Henry (a major contributor to motor control research) articulated three-quarters of a century later in his influential paper, “Physical Education—An Academic Discipline.” This “new profession,” Gulick declared, offered “a large and broad field of intellectual activity, involving . . . physiology, anatomy, psychology, history, and philosophy.”

The achievement of the research bases Gulick called for—now an essential component of departments of physical education, kinesiology, human performance, and so forth at major universities in several countries—was not easy to accomplish. One and two-year courses offered by teacher training schools were the norm. These involved, at best, very limited study of physiology and psychology. An exception was the Boston Normal School of Gymnastics (1891), which subsequently became the Department of Hygiene and Physical Training at Wellesley College, which called on faculty from Massachusetts Institute of Technology and Harvard to teach courses in anatomy, physiology, and sanitary science and required some laboratory work of its female students.

The four-year BS degree that George Fitz, MD, established at Harvard in 1892 (terminated in 1898/99) to prepare men to be gymnasium directors or enter the third year at the Harvard Medical School was rigorous even by late twentieth-century standards. Belgium’s Higher Institute of Physical Education, founded in 1908 at the University of Ghent within the faculty of medicine, offered candidate, licentiate, and doctoral degrees.

The University of Birmingham initiated physical education as an academic study in 1946; however, British teachers of physical education continued to be educated at specialist colleges until the 1970s when several were incorporated into polytechnics.

In the United States, the University of California and the University of Nebraska created programs to prepare teachers of physical training in 1897. In 1929, thirty-six state universities and colleges, forty-nine endowed colleges, and thirty state teachers colleges were preparing physical educators; the emphasis was training teachers, supervisors, and administrators. Fifteen institutions offered graduate work. New York University and Teachers College, Columbia University had the largest enrollments. By 1942, fifty-six institutions of higher learning had master’s degree programs; of these, twenty offered doctoral work.

Conceptional and Curricular Changes

During the twentieth century, games, sports, and dance increasingly replaced gymnastics/calisthenics as the focus of the curriculum. In the 1890s psychologist G. Stanley Hall and his students at Clark University began investigating psychosocial aspects of childhood play. In 1891, Hall initiated *The Pedagogical Seminary* (today the *Journal of Genetic Psychology*) to disseminate the results of numerous diverse studies. Inspired by Friedrich Froebel’s “kindergarten,” cities in several countries developed playgrounds, cités-jardins, and similar facilities. Young people found the activities these offered to be more appealing than routine exercises. Gulick established the New York City Public School

Dumbbell exercises for young women and men.

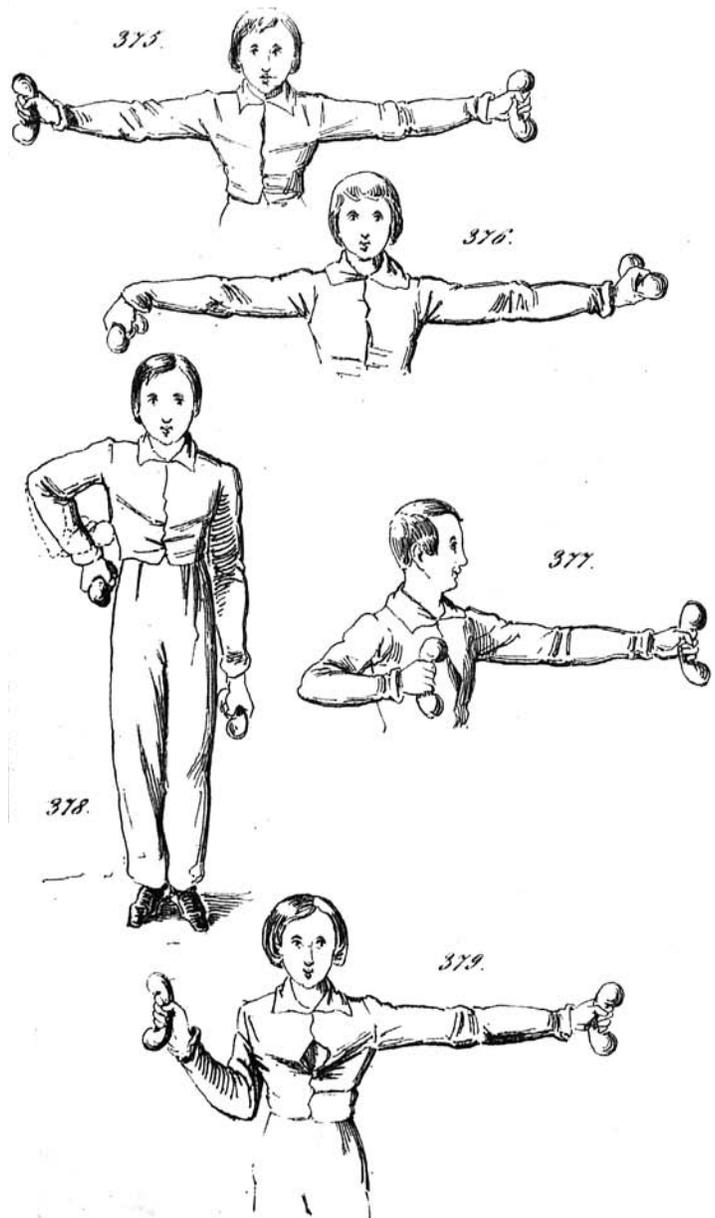

Athletic League in 1903 to provide “educational athletics” for large numbers of boys and girls.

“Health and Education,” which Thomas Denison Wood, MD prepared for the *Ninth Yearbook of the National Society for the Study of Education* (1910), has been credited with helping to establish the rationale for what became known in the 1920s as “the new physical education.” This gave particular attention to personal and social development. Clark Hetherington’s *School Program in Physical Education* (1922) and other writings set forth the objectives: organic, psychomotor, intellectual, and character development.

Wood (for many years an officer of the American Child Health Association) was one of several physical educators who developed important connections with the school health movement of the 1920s and early 1930s. Thomas Storey MD, the first State Director of Physical Education (New York in 1916), was among those who believed that the goals of school hygiene and physical education (which put textbook information into practice) were identical because the object of both was health. By 1930, thirty-six states had enacted laws requiring physical education in public schools.

Rhythmic activities (e.g., folk and clog dancing) had been taught in the early 1900s. Following World War I, modern dance increasingly became an important part of the curriculum for college women and at some high schools. Visits by noted artists such as Germany’s Mary Wigman helped foster its growth. Margaret H’Doublér created the first dance major in the United States in 1926 at the University of Wisconsin.

During the 1950s, “movement education,” which drew from Rudolph von Laban’s approach to dance, attained a notable following among British physical educators. In the United States, followers considered its experiential approach (especially for young children) a palliative to the overemphasis on routine activities and the competitiveness of sports. A 1953 report that asserted that European and Japanese children had scored

better than American children on a series of flexibility and power tests, as well as Soviet successes in space and at the Olympic games, prompted a resurgence of “physical fitness” during the 1960s.

Early Research Efforts

During the late 1800s, considerable attention was given to anthropometry, the assumption being that a symmetrically developed body was important for health and that proper exercise could help achieve this. Over the decades, a small, but growing, number of individuals associated with physical education conducted exer-

cise and pulse rate, reaction time, metabolic, growth, motor development, and other investigations. Articles appeared in a variety of journals, including the *American Physical Education Review* (1896–1929). The *Research Quarterly* (today the *Research Quarterly for Exercise and Sport*) was initiated in 1930. In 1949, the American Association for Health, Physical Education, and Recreation (AAHPER) Research Council published *Research Methods Applied to Health, Physical Education, and Recreation* to assist the growing numbers of faculty and graduate students who now were engaging in such work.

The comprehensive 1960 book *Science and Medicine of Exercise and Sports*, which brought together contributions from leading researchers on topics ranging from physiological, psychological, and therapeutic dimensions of physical activity to cultural and historical aspects of sports, opened with the observation that physical education, like medicine, “reaches into many fields for much of the data upon which it bases its practices.” Henry’s 1964 article “Physical Education—An Academic Discipline” launched two decades of discussions and disputes about the nature of such a discipline. As more physical educators began to engage in research in a particular area (e.g., exercise physiology, sport psychology, biomechanics), concerns arose that faculty were abandoning what had once been a reasonably unified vision—and that this could lead to fragmentation and the ultimate demise of the field.

Similar concerns were occurring elsewhere (e.g., Canada, Germany, Great Britain, Belgium, the Netherlands). The first international discussions of such matters appear to have been in Israel at the Wingate Institute for Physical Education and Sport in 1974. Agreement has not yet been achieved. Since the 1970s, the volume of research across subdisciplines has increased enormously, as have the number of national and international organizations and journals (e.g., *Journal of Sport Psychology*, *International Journal of Sport Biomechanics*, *International Review of Sport Sociology*, *International Journal of the History of Sport*) dedicated to the various scholarly and scientific

areas that constitute what was once known as physical education.

Outlook

During the last three decades, the opportunities for females to participate in highly competitive sports have grown rapidly, at least in some countries. Paradoxically, this same period has witnessed a decline of opportunities and incentives for large numbers of children and youth. Since 1990, growing concerns have been expressed in many countries about obesity. These frequently are accompanied with proclamations about the importance of regular physical activity (e.g., “Epidemic Increase in Childhood Overweight, 1986–1998,” *Journal of the American Medical Association* [2001]). Although the data supporting the importance of regular physical activity are now extensive, the programs to put “theory into practice” seem too often to be missing. The title of an article published in the *International Journal of Sports Medicine* in 2000 aptly reflects current needs: “The Integration of Clinical Practice and Research: The Challenge of the New Millennium.”

Pilates

Pilates (pronounced Pi-LAH-tes) is a body conditioning system that focuses on strengthening and lengthening muscles while alleviating back pain and protecting against injury. Often described as a cross between yoga and weight training, pilates works to bring balance to the body, promotes correct alignment, and improves muscle strength, balance, coordination, and flexibility without dramatically increasing muscle mass.

Pilates is seen as useful for both men and women of all ages, however, it has been noted as an effective anti-aging exercise because it strengthens muscles with very little stress on the joints. Pilates has also been used as an effective rehabilitation aid for hospitalized patients. Recently, the benefits of pilates on pregnant women have been widely discussed. In addition to its traditional benefits, pilates can help pregnant women improve their concentration and balance as well as improve their muscle tone after pregnancy.

From a Fragile Childhood to Hollywood

Born in Germany in 1880, Joseph Pilates was a fragile child who suffered from several physical limitations. He was able to overcome his physical shortcomings through vigorous exercise and strength training and became accomplished in several sports including gymnastics, skiing, boxing, and diving. In 1912, he moved to England and became a self-defense instructor for detectives working at Scotland Yard.

At the onset of World War I, Pilates was detained in England because of his German heritage. During this ordeal, he shared his beliefs on exercise and strength conditioning with his fellow detainees. In addition, he helped those suffering from disease and physical injury with their rehabilitation by focusing on improving their abdominal and lower back strength. His ideas were based on principles of yoga, Zen, and physical fitness programs used in ancient Greece and Rome, and they later became the foundation of his pilates exercise program.

He returned to Germany after being released from England and continued to refine his methods of exercise. His methods became very popular with dancers in Germany, and in 1926, he decided to bring his techniques to the United States.

Pilates opened up his first studio in New York in 1926. By the early 1960s, his studio became very popular with actors, dancers, and athletes. Two of his students, Carola Trier and Bob Seed, opened their own studios in New York in an attempt to further the growth of pilates. Pilates died in 1967, but his exercise method continued to gain followers. In 1970, another of Pilates' students, Ron Fletcher, opened the first studio in Los Angeles where the pilates method became very popular with Hollywood celebrities.

With an increasing number of Hollywood stars practicing pilates, its notoriety began to swell. By the late 1980s, pilates started to reach the mainstream media. Currently more than five million Americans practice pilates.

Pilates is seen as a safe alternative to traditional methods of exercise because it puts very little stress on joints, and people who practice pilates report very low incidence of injury.

Unlike most exercise and strength methods, which tend to increase muscle strength of the already strong muscles while ignoring weaker muscle

groups, pilates focuses on creating an evenly toned and conditioned body. Muscular imbalance can cause undue stress on joints and can lead to injuries and chronic pain. Therefore, pilates aims to balance muscle tone throughout the entire body, thus promoting proper posture, balance, and flexibility.

The breathing exercises included in pilates exercises support a mind-body connection that improves body awareness, relaxation, and levels of stress. Those who practice pilates become more aware of how their bodies feel and how to control their movements in an efficient and powerful manner.

Implications

Although widely accepted as a beneficial exercise and rehabilitation technique, pilates is not recommended as a substitute for physical therapy. In addition, because of its low-impact nature, pilates does not provide a truly effective cardiovascular workout. However, pilates can be an effective method of general fitness because it offers an effective alternative to traditional exercise and strength training for a variety of individuals including athletes, dancers, and those looking to get in shape and avoid the effects of aging.

Pilates Principles

Borrowing from both Eastern and Western philosophies, pilates focuses on breathing, balance, coordination, body movement and positioning, and strength. Similar to yoga, pilates promotes individual improvement in a nonthreatening, noncompetitive environment. Pilates includes more than five hundred exercises based on the following eight principles: (1) concentration; (2) control; (3) centering; (4) stabilizing; (5) breathing; (6) alignment; (7) fluidity; and (8) integration.

Pilates instructors generally assess their clients' posture and movements during their initial meetings and then design a specific program to fit their client's needs. Exercise sessions generally last twenty to forty-five minutes and focus on smooth movement and breathing.

The two primary exercise machines used in pilates are the Universal Reformer and the Cadillac. These machines allow people to perform several different exercises from varying positions, including lying down, so they are effective for bedridden patients.

Benefits of Pilates

Pilates offers a viable alternative to traditional strength training and conditioning, as well as improvements in flexibility, core (abdominal and lower back) strength, balance, posture, circulation, coordination, range of motion, mobility, agility, stamina, injury prevention, rehabilitation, increased strength without unnecessary muscle mass, and reductions in stress.

Play vs. Organized Sport

Play is exercise or other action for amusement or recreation. The sociologist Jay Coakley provides a more enlightened definition: “Play involves expressive activity done for its own sake; it may be spontaneous or guided by informal norms” (Coakley 2004, 23). In considering physical activity that people engage in as play, as opposed to physical activity organized as sport, the key element is the idea of engaging in play for its own sake. All children engage in play—society sanctions childhood as a time when play is appropriate. As one grows older (into adolescence and adulthood), play is less appropriate, seen as not serious enough to warrant taking time from other pursuits. Yet, play is important at all ages—the idea of doing something for its own sake, for the pure fun and enjoyment of the activity, seems a necessary part of life whether one is a child or an adult.

Although one can discuss play in terms of childhood activity with dolls or trucks or building sand castles or playing hide-and-seek and the like, the focus is on physical activity. People often talk about playing a sport, clearly integrating the two concepts of play and sports into one entity.

Many of the games and other activities that people play as children quickly become sports at an early age. Coakley defines *sports* as “institutionalized competitive activities that involve rigorous physical exertion or the use of relatively complex physical skills by participants

motivated by internal and external rewards” (Coakley 2004, 21). Activities such as baseball, softball, soccer, basketball, and football are most commonly played by children and adolescents. At seemingly earlier and earlier ages (T-ball leagues for four- and five-year-olds), sports become institutionalized by the following characteristics: (1) The rules of the sports become standardized, (2) official regulatory agencies take over rule enforcement, (3) the organizational and technical aspects of the sports become important, and (4) the learning of sports skills becomes formalized. Although these characteristics are not all seen among four- and five-year-olds, by the time children reach adolescence, the leagues in which they play (e.g., Little League baseball, Pop Warner football) do reflect these characteristics.

Good Old Days

The distinction between play and organized sport is seen more clearly in differentiating between what Coakley calls “informal, player-controlled sports” and “organized, adult-controlled sports.” Sports psychologists and sociologists wax nostalgically about the “good old days” when children were engaged in informal, player-controlled sports to a much greater extent than they are today. Informal, player-controlled sports are close, if not identical, to what people generally think of as “play.” Children would just hop on their bikes and ride to the nearby schoolyard or play in the streets outside their homes for hours, adjusting games such as baseball or basketball or football to meet their needs in terms of number of participants, playing field available, equipment, and so forth. Informal, player-controlled sports are “primarily action-centered,” whereas formal, adult-controlled sports are “primarily rule-centered” (Coakley 2004, 139). A considerable amount of action always results when children engage in informal, player-controlled sports.

Coakley and his students identified four elements as characteristic of informal, player-controlled sports: “(1) action, especially leading to scoring, (2) personal involvement in the action, (3) a challenging or exciting

A young girl swinging her doll.

supervised by adults, so that they know where the children are at all times. Even the possibility that keeping one's children inside the home might lead to a more sedentary lifestyle (with the attractions of television, computers, and video games) seems to outweigh the perceived risks of letting one's children play outside.

Scheduling comes into consideration with both parents working in many households, having several children, and all family members having different activities at different times and needing to keep track of one another. Knowing that Johnny or Susie is at soccer practice from four to six o'clock on Tuesday is more comforting and fits into people's seemingly more organized lifestyles than does the idea that Johnny or Susie is off playing in the neighborhood somewhere until dinner.

Stars in Their Eyes

Visions of college scholarships and even professional careers also drive parents to sign up their children for sports leagues in the hopes that their children will be the ones lucky enough to "make it." Making it means not having to pay for college (a considerable expense these days) or even reaping the benefits of a professional career. Of course, few children receive scholarships, and even fewer make it to the professional ranks, but each parent thinks that her or his child might be "the one" and that participating in an organized league, rather than letting Johnny or Susie just play in the neighborhood, is the path.

Formal, adult-controlled sports take on the characteristics of the institutionalized sports noted earlier. This is not to imply that anything is wrong per se with formal, adult-controlled sports. They have their place in society and can serve an important function in teaching children and adolescents the rules of games, helping children develop skills, teaching children how to work together as a team, and other aspects of "learning the game." However, formal sports leagues are only as good as the parents and coaches who organize them, and too often parents and coaches adopt an almost professional sports model, emphasizing winning above all else and

experience (for example, a close score in a competitive contest), and (4) opportunities to reaffirm friendships during games" (Coakley 2004, 139). This is play at its best—sports being engaged in for their own sake. Children (and adults, too) engage in these activities to have fun, to be active, to meet the challenges of the activities, and to be with friends. One learns to get along with others (otherwise one cannot play), organize a large group of children (if lucky enough to have many children playing), adjust rules as needed to account for varying skill levels or changing environments, change teams in the middle of the game if the score is lopsided, negotiate disagreements as they arise, solve problems as they come up, and so forth.

Why does it seem that today only formal, adult-controlled sports exist and that we rarely see informal, player-controlled sports? The issues of safety, scheduling, and scholarships come into play here. Parents are more worried about letting their children just play "in the neighborhood," be it out front of the home or at the local playground. They would rather have their children inside the home or in the backyard or at a game

Sacrilegious Sunday Baseball

In the 1908 poem below, author William Kirk pokes fun at the proper lady who is outraged by the “frolicking urchins” who play ball on Sunday.

The East Side Terrors were playing the Slashers,
Piling up hits, assists and errors.
Far from their stuffy tenement homes
That cluster thicker than honeycombs
They ran the bases 'neath shady trees
And were cooled by the Hudson's gentle breeze.

Mrs. Hamilton-Marshall-Gray,
Coming from church, chanced to drive that way.
She saw the frolicking urchins there,
Their shrill cries splitting the Sabbath air.
“Mercy!” she muttered, “this must stop!”
And promptly proceeded to call a cop,
And the cop swooped down on the luckless boys,
Stopping their frivolous Sunday joys.

Mrs. Hamilton-Marshall-Gray
Spoke to her coachman and drove away
Through beautiful parks and shady roads
Past splashing fountains and rich abodes.
Reaching home, she was heard to say
“How awful to break the Sabbath day!”

The Terrors and Slashers, side by side,
Started their stifling Subway ride
Down through the city, ever down
To the warping walls of Tenement Town.
Reaching their homes, the troublesome tots
Crept away to their shabby cots,
And thought of the far off West Side trees
And the cool green grass, and the gentle breeze,
And how they had played their baseball game
Till the beautiful Christian lady came.

behaving in ways (Little League Parent Syndrome) that would be embarrassing even in professional contexts. Administered correctly, with coaches and parents emphasizing having fun, participating, learning skills, and being active, organized sport can be a wonderful adjunct to the informal, player-controlled sports that are so important in the psychosocial development of children.

Ideally, the goal should not be debating play versus organized sport, but rather achieving a combination of the two wherein children and adolescents reap the benefits of both to facilitate their psychosocial, physical, and skill development.

Play-by-Play Announcing

Few sports fans in the twenty-first century could imagine watching or listening to their favorite sporting events without commentary. No matter whether they are listening in the car or glued to the TV screen, it is the voices of the announcers that take them to where the action is. On radio the announcers' voices create the pictures that allow listeners to imagine the play. On television the announcers bring meaning to the kaleidoscope of images and sounds that make up live sports coverage. They turn the mix of slow motion, instant replay, and close-up images, graphics, and high-quality sound into a coherent narrative that is a large part of the enjoyment of televised sports. As media scholar David Rowe summarizes: “What is required of the sports commentator . . . is to enhance the experi-

ence of watching by various means—through poetic powers of description and evocation . . . to provide supplementary information . . . to supply the kind of ‘insider,’ expert knowledge that is gained by playing sport at the highest levels” (2004, 122).

In most Western nations today, more spectators experience their sports via television than attend events live. Advances in technology have also meant that viewing at home is a superior experience to watching live in the stadium. “Viewers may lose out on uniquely atmospheric moments of the sporting drama, but their perspective is enhanced in other ways which can make live spectating a humdrum experience” (Barnett 1990, 155).

The Broadcast Team

Live sports television is a high-pressure, high-stakes environment, particularly for announcers who are the public faces and voices of the production team. Overall, their role is to describe and dramatize the action, provide historical and contextual information, and evaluate performance and game flow. Getting all this correct is a challenging task, made no easier by the knowledge that their every word is avidly picked over by fans who take great pleasure in noting mistakes.

The usual mix includes two announcers—a play-by-play announcer and an expert analyst, also known as a color commentator. The play-by-play announcer is usually a trained broadcaster whose primary role is to anchor the narrative of the game, calling the action as it occurs, identifying key plays and players, and providing regular updates on the score and time remaining. The analyst, usually a former athlete or coach, contributes when play has stopped, adding insider information and taking the audience into the minds of the athletes and coaches playing the game. “The advantage in this practice, and one still put forward by media organisations, is that the expert knows what it is like to be ‘in the middle’ of high-class sports action” (Stoddart 1986, 94). Increasingly, televised major sports also include a sideline announcer, who may be either a trained broadcaster or former athlete, who explains the state of the playing sur-

face and the game-time atmosphere, provides updates on substitutions, chats with famous people in the crowd and, in sports like football and rugby league, conducts postgame interviews with players and coaches.

The Beginnings of Play-by-Play Announcing

From their beginnings with radio broadcasts in the 1920s, announcers have tried to recreate the atmosphere of “being there” for their audiences. The first significant live sports broadcast—a heavyweight boxing match in the United States between Jack Dempsey and French champion Georges Carpentier—was broadcast in 1921 primarily to theaters across the United States and Europe because so few people owned radio receivers. Major J. Andrew White, the announcer, prepared for the event by shadowboxing in front of a mirror and singing out each move to himself. Realizing that he could not describe each blow individually, White devised the practice of “collecting” punches that remains familiar to boxing fans today. Historian David Halberstam argues that “the experiment was such a success and showcased radio in such a glittering and indispensable light that it resulted in a proliferation of radio stations and spiraling consumption of radio receivers” (1999, 3).

Despite this early success, regular live announcing of out of town events did not occur until the mid-1950s, when telephone technology developed to the point that it was cheaper and easier to send an announcer on the road. Before that, much “live” commentary was in fact a re-creation in the studio, based on information transmitted by telegraph from hundreds of miles away and embellished by the announcer to create the illusion of actually being at the game. Former baseball broadcaster Byrum Saam said, “Re-creations planted the seeds of our coverage—they were the nectar from which most listeners drank” (Schultz 2001, 4). Australian radio announcers are credited with one of the most ingenious broadcasts in radio history—the 1934 ball-by-ball descriptions of cricket Tests held in England that were

recreated in Australia by the Australian Broadcasting Commission. “Short, descriptive telegrams were sent from the grounds to the Sydney studio where they arrived approximately five minutes apart. Scores, weather, field placings and other aspects of the game were all included. A studio team of commentators then ‘described’ play to an enthralled audience. Sound effects heightened the dramatic impact—a pencil tapped against a piece of hollow wood reproduced bat on ball, a sharp click of the pencil did for a boundary” (Stoddart 1986, 93).

Early Resistance

In the early days of announcing, when sports organizations resisted rather than welcomed the broadcast media, access to events was never guaranteed. Many sports organizations so feared the impact of live broadcasts on gate receipts that they denied announcers access to competition sites or at least tried to prevent transmission of home games to local audiences. This meant, for example, that early Australian horse-racing announcers went to extraordinary lengths in their attempts to cover events. “Many commentators had to describe races while clinging to trees outside club premises or perched on shaky scaffolding erected in the front yards of houses overlooking the course. Authorities switched the race order at the last minute to create confusion. The callers developed marvellous skills under these conditions” (Stoddart 1986, 96). Even when they gained access, announcers seldom had the best seats. Instead, they were located far from the play with a poor view of the action. In American football “simply following the ball and identifying the players correctly were achievements for the first football broadcasters” (Oriard 2001, 46).

Since early announcers described only what they saw on the field, their commentaries bear little resemblance to what listeners expect today. Analyzing radio broadcasts from 1926, Michael Oriard writes, “What’s missing is most striking: no ‘expert’ analysis, no prediction, no comment on who’s favored, what the

teams’ records are, what the game means in the standings” (2001, 47).

An Entertaining Style

Maintaining the right balance between information and entertainment has long provided a tension within sports announcing. As Garry Whannel describes it, “there is on one hand the impulse to describe the scene, show what’s happening, give the audience an accurate picture, and on the other the impulse to get people involved, keep up the interest, add suspense, shape the material and highlight the action (1992, 26).

American announcers are credited with the fast-paced, entertainment-oriented style of sports broadcasting that dominates television coverage today. The seeds for this style emerged early in radio when the personality of the announcers became as important as the news they were conveying. Beginning in 1923, American announcer Graham McNamee attracted radio audiences for the next nineteen years with his vivid, breezy, and colorful delivery despite grumbles from experts that he did not know the sports he was describing. *Time* put him on its cover on October 3, 1927, noting that McNamee’s bosses felt that “colorful, general reports are more satisfying to the masses than accurate, technical descriptions” (Oriard 2001, 42). Such was the popularity of boxing in 1927 that McNamee spoke to “more people at any one time than any man ever had” when he called the Gene Tunney versus Jack Dempsey heavyweight boxing match. “Beyond Soldier Field, 50 million people gathered by their home radios as announcer Graham McNamee . . . blurted out the news in his cracked, quavering voice. . . . Nine people died of heart attacks listening to that broadcast, three of them during McNamee’s blow-by-blow of the seventh round” (Nack 1997).

However, the market-driven American model was not the only influential approach to announcing. The public service environment of British broadcasting resulted in a slower paced commentary style that focused on educating the audience. In 1952 the BBC guide to

As technology developed, television's offerings improved from distant, black-and-white, blurry pictures to clear, close-up, and colorful images enhanced by slow motion and instant replays. By the 1970s, when color television became more widely available throughout the world, "TV wasn't as good as being there anymore—it was better" (Sugar 1978, 287).

the new practice of television commentary "stressed the need to watch the monitor, to add to the picture rather than interrupting it, not to be afraid of silence, to leave the picture to tell the story" (Whannel 1992, 28). British announcers also recognized that differences between sports required a variety of announcing styles. "Cricket . . . needed an adequate supply of background information and the ability to keep the commentary going without obvious padding, without making the listener feel bored. With rugby football, the difficulty was to keep up the pace—getting out the words swiftly and accurately enough to tell people what is going on without lagging behind the play" (Whannel 1992, 27).

Early radio and television announcers in sports such as cricket, motor racing, cycling, baseball, and football have built lengthy careers, some spanning fifty years. Some, like British motorsport announcer Murray Walker who broadcast Formula 1 from 1949 to 2001, became so associated with the sports they covered that fans could not imagine the event without them: "The drivers and teams changed, but for as long as most people can remember, Murray Walker—fast, furious and very flappable—was the voice of Formula One" (Hankin 2002). Racing driver David Coulthard said, "Murray made every race like losing your virginity. It was always that exciting" (Henry 2001).

By the 1950s television had challenged radio's position as the national provider of live sports coverage.

Monday Night Football: Attracting Casual Viewers

In many countries live sports played and broadcast at night are now taken for granted. Yet, when *Monday Night Football* debuted in 1970 during prime time evening viewing in the United States, it was a radical break from traditional weekend afternoon games and largely expected to fail. However, under the guidance of ABC head of sports Roone Arledge, *Monday Night Football* took the focus on spectacle and excitement to new heights. It introduced three announcers, rather than the usual two, including Howard Cosell, whose critical comments on the first broadcast drew thousands of angry letters from fans. Cosell—"the man Middle America loved to hate"—so polarized viewers that he received death threats and verbal and physical abuse from football fans, but at the same time became a celebrity in his own right (Sugar 1978, 280).

As Cosell describes it, in order to succeed, *Monday Night Football* had to transcend sport in order to attract casual male viewers and women as well as those who already knew the game. "Survival would depend, in large measure, on the guys in the booth and the entertainment value of the show" (Cosell 1985, 86–87). The show became an American institution by dramatizing the event and humanizing the players and coaches through stories that brought them to life and allowed viewers to empathize with them.

The success of shows such as *Monday Night Football*, *Hockey Night in Canada*, and events such as Australia's one-day *World Series Cricket* that focused on a showy entertainment style quickly showed that television could use this approach to expand its core audience of committed sports fans. As Steven Barnett points out, channel-hopping American viewers are unlikely to continue watching games with little obvious action, "hence the need to exaggerate the artificial drama, to contrive excitement, glamour and spectacle where none might naturally exist" (1990, 127). However, Britain has resisted this approach with cricket announcers showing "no compulsion to fill in the action gaps" and commentary directed toward fans rather than "the sporting ignorant" (Barnett 1990, 168).

Former Athletes and Coaches in the Broadcast Booth

There has been much debate over the practice of using popular retired athletes and coaches as announcers. As Jay Coakley describes it: "Some people complain that ex-athletes have few skills to make them successful broadcasters, but most television executives realize that media spectators identify with athletes and also with coaches. So they put former athletes or coaches in the broadcast booth for entertainment purposes" (1999, 355).

Most athletes and coaches move into the expert analyst role where they are expected to take viewers "inside the game." Successful analysts have both firsthand experience of their sports and the ability to explain to viewers what they can see happening. One example is Marcus Allen who became a studio analyst in 1998 after sixteen years as a top NFL running back. CBS Sports president Sean McManus said, "Ninety seconds into Marcus' audition, you could see that he had all five of the qualities we were looking for: high credibility, deep understanding of the game, ability to express that understanding, star quality and personality" (Lainson, 1998).

Those taking up the role of former-athlete-as-analyst have faced criticism for their lack of training in the basic principles of journalism. For example, in comparison with newspaper journalists, they are seldom critical of

Men forget everything, women remember everything. That's why men need instant replay in sports. They've already forgotten what happened. ■ RITA RUDNER

sport or sports organizations, in part because of their loyalties to former teammates, teams, and leagues. With huge sums paid for television rights to prestigious sports and the need to retain the goodwill of the sporting organizations who grant those rights, television companies in the United States have often acceded to sports organization demands for input into the selection of announcers, further reducing the likelihood of critical commentary. This means the announcer's role "is seen as more closely resembling an ambassador and enthusiastic follower of the sport than an objective reporter" (Barnett 1990, 163).

Women Announcers

Announcing continues to be dominated by men although women have made some inroads, particularly in televised sports that women play such as swimming, tennis, netball, and basketball. *Women in Sportscasting: A Brief History* identifies eighteen women, including Gayle Sierens (NFL, 1987), Robin Roberts (NCAA basketball, early 1990s), and Suzyn Waldman (New York Yankees baseball, mid 1990s) who are among the first women to have done play-by-play announcing for major men's sports. However, the general industry belief remains that "when women call games which do not include female athletes, the listening audience does not accept women sportscasters as readily as men" (Schwartz 1999).

Influencing Viewers

Announcers have considerable power to influence audience interpretations and understandings of sport. American research in the late 1970s and early 1980s showed that commentary that stressed rough or violent play, even when it did not exist, led viewers to see the play as rougher than it actually was and appeared to increase their enjoyment. Other research consistently shows that although commentary differs by nation, as announcers unconsciously reflect the values that are important in their countries, in each case it tends to reinforce rather than challenge dominant cultural ideas about issues such as race, gender, and national identity.

The Future

While the visual presentation of live sports continues to push the boundaries of what is possible—such as miniature cameras worn by baseball catchers or suspended trapeze-like above open-air rugby fields—the basic expectations of television commentary have changed little. However, with growing media consolidation and satellite technology taking nationally produced broadcasts worldwide, it is possible that existing cultural differences will gradually disappear in favor of something approaching an international announcing standard.

Poland

In Poland, sport fulfilled—and still fulfills—an important role as a means of national identification because the state's sovereignty and the unity of the nation have been historically uncertain. The Republic of Poland is located on the Eastern border of Central Europe. In July 2004, it had a population of 38,600,000 people and the city of Warsaw as its capital. Since 1 May 2004, Poland has been a member of the European Union.

Physical Culture

By the eighteenth century, during the last years of the Republic ruled by Polish nobility, the first European Ministry of Education, Poland's Komisja Edukacji Narodowej (Commission of National Education, 1773–1794), required the development of physical culture in the school system. From 1795 until the creation of the second Republic of Poland in 1919, the country was divided between Germany, Austro-Hungary, and Russia. Each part of the country took part in the process of social and political modernization in a different manner according to the policies of the rulers. This was a determining prerequisite in the nineteenth century for the development of sport and physical culture. The cultural

autonomy was greatest in the Austrian part of Poland. In Galicia, a regional Board of Education (Rada Szkolna Krajowa), under Polish leadership, was created as early as 1867. In the city of Lwów, the first Sokol club for gymnastics was created the same year. The Polish Sokol followed the tradition of the Czech Sokol, which was created in 1862 with the goal of emancipation from the Austro-Hungarian predominance. By 1884, Sokol clubs had also been created in the parts of Poland ruled by Germany, but the clubs were forbidden in the Russian part of Poland, except for a short period following the 1905 revolution. The Sokol movement in Poland tried to follow the traditions of the German "Turnen," of "Turnvater" Friedrich-Ludwig Jahn (1778–1852), with its nationalistic revolutionary nature. At the same time, the Polish Sokol adapted an eclectic ap-

proach to physical activities. Whereas German "Turnen" was adapted by the army as well as by the school system, French and Scandinavian influences could also be found in the Sokol. In Galicia, paramilitary exercises were also added to the program. Especially in the Polish diaspora in Germany and in the United States, track and field as well as soccer entered the curricula as pioneers of modern sport. By the nineteenth century, sport clubs, not connected with the Sokol movement, were established in Warsaw, Kraków, Poznan, and Łódz. One of the most important pioneers of the Polish sport movement was the physician Henryk Jordan (1842–1907) from Kraków, who established playgrounds for children and youth, according to the American model, and who fought for the introduction of mandatory physical activities in high schools and for the employment of school physicians. The "skauting" movement, an adaptation of the Boy Scouts movement, fulfilled an important role in the physical education of the youth.

Given the partitioned country, representatives of Polish origin could be found in the Austrian and Russian Olympic teams in the 1912 Games in Stockholm.

Participant and Spectator Sports

The Second Polish Republic, created following World War I, was characterized by high percentages of national minorities, Jews, Germans, Lithuanians, and Ukrainians, representing about 30 percent of the total population. Sport was to assist in integrating those minorities, both in daily internal life and in representing the state in the international scene. Many modern sport clubs and associations, both national and ethnic in nature, were created. The Polish Olympic Committee (Polski Komitet Igrzysk Olimpijskich; since 1924, Polski Komitet Olimpijski) and the Polish Track and Field Association (Polski Związek Lekkiej Atletyki) were created in 1919. The first organizations of female sports catered to the spread of sports among women. Polish athletes of both sexes participated in the Olympic Games with success, gaining twenty Olympic medals between 1924 and 1936. The first Olympic gold medalist was Halina

Konopacka, who won the women's discus throw in 1928. The long-distance runner Janusz Kusocinski, who won the 10,000-meter race at the Los Angeles Olympics in 1932 and who was killed while fighting against the German occupiers of his country in 1940 near Warsaw, fulfills a special role for the cultural commemoration of Polish sports. An important international track and field meeting, the Kusocinski-Memorial, takes place annually in the Polish capital.

World War II and the German occupation were a national catastrophe for Poland, including the sports movement. An enormous number of people were killed and murdered. Fifty percent of the athletic infrastructure was destroyed. Under the leadership of the Communist administration following 1945, however, a phenomenal rise of the sport movement occurred because of the centralized direction of sports and massive financing of them.

- The Polish track and field "Dream-Team" earned seventeen Olympic medals between 1956 and 1968.
- Irena Szewinska was the outstanding figure of female track and field from the 1964 Tokyo Games through the 1976 Montreal Games—she gained, in the sprints and in long jump, three Olympic gold medals and two silver and two bronze medals. Szewinska, who is now a vice-president in the National Olympic Committee and has been a member of the International Olympic Committee since 1998, built the bridge between the Communist and post-Communist eras in Polish sports.
- A further positive example of the "state-sports" era were the achievements of the national soccer team, which captured third place in both world championships of 1974 and 1982. Grzegorz Lato, Kazimierz Deyna, and Zbigniew Boniek were the stars of the team, and Lato is credited with the title of the top scorer of the 1974 world championship.

Sports in Society

Following the political changes of 1990, the difficult transition from state-run sports into sports financed by private financial sources and organized by nongovern-

mental bodies took place. Poland could not compete with the monies offered in other countries, so large parts of the youth training programs disbanded and an exodus of top athletes into the professional ranks abroad started. Accusations of corruption and hooliganism prevailed in the sport of soccer, which had previously been a positive example. As a result, spectators began to stay away from the games. Conversely, further improvements could be seen in individual sports.

- Robert Korzeniowski, who won four gold medals in the Olympic competitions of 1996 (Atlanta), 2000 (Sydney), and 2004 (Athens) soon turned into a national hero, especially when he became the first athlete to win the walking competitions for both distances—20 and 50 kilometers—which he achieved in Sydney in 2000.
- Adam Ma'ysz was world champion in ski jumping three years in a row (2001–2003) and winner in the famous international competition "Vierschanzen-tournee" in 2000/2001.
- In female sports, the swimmer Otylia J'drzejczak has captured world and European titles since 1999 and won the gold medal for the 200-meter butterfly in the 2004 Athens Olympics Games.

The Future

The further development of sports in Poland will depend largely on the success of Poland's economic integration into the European Market and political integration into the European Union, and this is being recognized by ever-growing parts of the population, including those responsible for sport politics.

Governing Bodies

Sports in Poland are organized by the Ministry of Education and Sport (Ministerstwo Edukacji Narodowej i Sportu, www.menis.gov.pl), the Polish Sport Confederation (Polska Konfederacja Sportu, www.pkSPORT.pl), and the Polish Olympic Committee (Polski Komitet Olimpijski, www.pkol.pl).

Polo

Polo is probably the oldest ball game in the world and is the only major “goal sport” to be played on horseback. It has been traced back to nomadic peoples from the steppes of Central Asia. From there it spread quickly throughout the Persian Empire, China, India, and as far as Japan. Usually played by mounted tribesmen, there were a number of brutal, local variations of the activity. Polo often enjoyed aristocratic support and was popular as a method of military training throughout Central Asia.

The Practicalities of Polo

The dynamic spectacle of both rider and animal straining to remain controlled while striving to gain an advantage makes polo unique. The rules of polo are simple for the uninitiated to understand, yet the tactical side of the activity and the handicapping system are increasingly complex. In practice polo is a game played between two teams of four players with each player fulfilling a specific role in attack, midfield, or defense. Each player is on horseback, and using a mallet the player attempts to strike a ball between goalposts at opposite ends of the field of play. The best polo ponies are specifically bred and trained for use in polo as agility is as important as speed.

The basic rule in polo that contributes to the spectacle and the uniqueness of action, relates to “right-of-way.” This rule states that the right-of-way extends ahead of the player and in the direction in which that player is riding. Players must only hit the ball on the right side of the pony. Safety of both players and ponies are key to the application of this rule. Matches last between four and eight periods of seven minutes each, depending on the event. Players have an official handicap that corresponds to their general standard of play. Ten goals are allocated to the best players, with minus two being assigned to beginners. It should be remembered that polo still retains a traditionally amateur aura throughout its organization and participation.

Historical Background

The first record shows polo being played in approximately 600 BCE, with the Turkomen defeating the Persians in what is considered to have been a diplomatic match. Indeed, many of Central Asia’s key historical figures are associated with the sport. Alexander the Great and Darius of Persia were both known to have played the game in the fourth century BCE. Variations on polo are known to have existed in China, Japan, and Russia, but it was in Persia’s ancient capital of Ispahan that a sixth-century BCE polo ground was found.

The British in northern India first encountered polo during the 1850s. History credits Lieutenant John Sherer with further popularizing it with British planters and soldiers. The pastime and its accompanying social aspects rapidly spread throughout India. Indeed, the Indian ruling classes and the British on empire duty enthusiastically took up the game. After Indian independence in 1948, polo almost vanished entirely from the subcontinent. This was partly due to the costs involved as well as due to the activity’s associations with the British Empire. In the United Kingdom, civilian clubs were formed from the 1870s onward by many who had returned from service abroad. It was not long before they had established their own match dates, which eventually led to the rules of the game being formally instituted.

This Japanese woodcut from 1877 shows a British-style polo match.

International Diffusion

The growth of polo was static throughout the years between the First and Second World Wars, but polo in the United Kingdom continued to be organized along clearly demarcated class-based lines. Nowadays in the UK at least, this is less rigid a divide than it once was. While polo has traditionally been a game of the affluent, it remains a popular sport for those who have a link with either the farming tradition of working on the land or those from a military background. Many participants are dedicated to polo due partly to the excitement involved, but also due to the social distinction associated with the sport. For many the high cost of involvement is simply accepted as the price of participating in their chosen activity. It is worth noting that since the 1880s, there have been attempts to promote a version of polo among the working classes, using bicycles rather than horses. Despite having peaks of popularity in the early decades of the twentieth century, and having an international federation since the 1960s, bicycle polo remains a largely peripheral pastime.

The proprietor of the *New York Herald*, James Gordon Bennett, is credited with bringing polo to the United States in 1876, where the sport developed quickly. The main polo centers are located in the north and east of the country. Polo continued to spread in countries that had

been British or European colonies to such an extent that the game is now regularly played in more than forty nations across the world. In terms of an international ranking order, Argentina is consistently ranked first in the world, followed by the United States. The other notable polo-playing nations include England, Mexico, Uruguay, and Spain. Despite the ongoing process of cultural exchange, and while many of these nations view polo as a spectacular sport, it remains a relatively minor one in terms of ascribed importance within many societies.

At the top level of competition are such events as world championships, and the different championships between nations. These are followed by national championships of which the Argentine, U.S., and British Opens are the most prestigious. At a lower level are many and varied tournaments, ranging from gold cups just below open level to more minor interclub events. The only world polo championship took place in Argentina in 1949 with a victory for the host country. The prevailing amateur character of polo seems to have affected the attempts by those in control of the sport to significantly expand the number of participants.

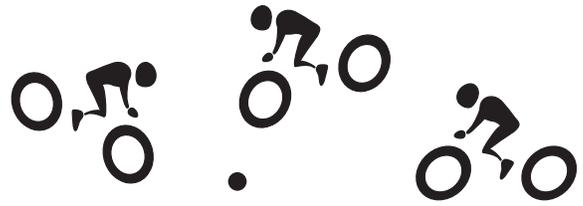

The Future

The underlying tension between popularizing the sport and maintaining its distinctiveness is best illustrated in the attempts to have polo included in the Olympic Games. Notably, to date these efforts have not yet been successful. It is important to recognize the specific structure of the sport and the related experiences of amateur and professional polo players today. Despite the undoubted spectacle involved, economic and conceptual barriers act as fundamental structural issues that will affect any initiatives to promote polo to a wider international and less-class-based audience.

Polo, Bicycle

In bicycle polo, which derived from pony polo, riders on specially adapted bicycles use long-handled mallets to move a ball along a grass field, scoring goals through a defended goalpost. Skill and daring are required to move the ball down the field and to avoid collision.

History

The first reference to bicycle polo described a game played in the United States during the early 1880s by the trick cyclists Kaufman and MacAnney, who rode Star brand bicycles. Star bicycles, used for bicycle polo during that era, were invented by W. S. Helley in Burlington, Vermont. Similar to a high-wheeler bicycle but with the smaller of the two wheels at the front, a Star was treadle-driven at the rear, not driven by cranks, chain wheel, or chain and sprocket, as are modern bicycles. The Star driving mechanism consisted of two ratchet-and-pawl clutches, one on each side of the rear wheel. When the pedal was depressed, a leather connecting strap caused the drum to revolve. A pawl on the wheel spindle engaged with one of the ratchet teeth inside the drum, and the road wheel was rotated. On the upward stroke of the pedal, the clutch went out of action in a manner similar to that of a modern ratchet-and-pawl free-wheel. Thus, both pedals could be at the top of the stroke, enabling greater thrust.

In Ireland during the 1890s R. J. Macredy, editor of the periodical *Cycling*, took up bicycle polo after he re-

tired from bicycle racing. Macredy's touring club, Ahne Hast (Hasten Slowly), first played bicycle polo on or about 5 October 1891, while on a Saturday trip in County Wicklow, near Dublin. Although some people considered it a dangerous pursuit, even women took up the new sport, complete with loop frames and full-length dresses.

Within four years bicycle polo had also become established in England. As it spread to other parts of Europe, an international match between Ireland and England was played at the Crystal Palace in London on 28 September 1901 (Ireland won 10 goals to 5). In 1908 Ireland played Germany at an exhibition match at Shepherds Bush Stadium in London as part of the Olympic Games.

In the beginning European bicycle polo (played in France, Britain, Ireland, and Belgium) modified the rules of pony polo to accommodate the use of bicycles, whereas in the United Arab Republic, India, Pakistan, Singapore, Ceylon, and Malaysia the sport was based strictly on the rules of pony polo.

During its early years bicycle polo was an exuberant game. One goalkeeper named "Andrews" frequently saved a sure goal by his uncanny trick of swinging the mallet behind his back and backhanding the ball out of the goal—with both feet on the pedals. Another player, Len Baker, would ride straight through a group of players, flattening opponents left and right. He would then return, pick up a winded and muddled opponent, and politely announce, "It's all in the game, ol' man." Ching Allin of the Norwood Paragon cycling club in England possessed the ultimate ability: He would scoop the ball up onto his mallet, cycle with it the length of the pitch (playing field), toss the ball into the air, and smash it into the back of the goal; the goalkeeper was powerless to stop it.

Practice

Bicycle polo is played on a pitch that is a rectangular grass field 100 meters long. At each end are upright bamboo goalposts 3.5 meters apart and 2.7 meters high. The pitch is divided by a center line and 23-meter

Things could be worse. Suppose your errors were counted and published every day, like those of a baseball player. ■ UNKNOWN

lines between the center and goal lines. A semicircular penalty area with a radius of 4.5 meters is located in front of the goalposts; in this area the goalkeeper is protected from being charged or obstructed. The mallet has an 81-centimeter or 86-centimeter leather-bound cane handle and a boxwood head that is 15 centimeters in length and 6.3 centimeters in diameter. Players must hold the mallet in the right hand. They cannot use wrist straps, and metal must not be incorporated into the mallet head, although this restriction does not apply to the shaft. The ball is made of bamboo root and is painted white; it must not exceed 112 grams in weight and 8 centimeters in diameter. Recently players have had limited success using a plastic ball, which tends to last several games, as opposed to a bamboo ball, which usually must be replaced every fifteen minutes.

As many as eight players—of either gender—make up a team. An ideal number is six, four of whom take the field (the fullback, halfback, and two forwards) along with a goalkeeper. The referee (on foot) is usually assisted by two judges and two linesmen, who are necessary because of the fast pace of the sport.

Periods of play are called “chukkers”; a game consists of six fifteen-minute chukkers separated by one-minute breaks. At the beginning of each chukker or after a goal is scored, the players from each team line up on their respective goal lines to the left of the goalposts. The referee places the ball at midfield (the sprinters’ line), and at the referee’s whistle one player from each team sprints for the ball while the other three players ride down the field in covering positions to intercept the ball or the opposing sprinter, if he or she should gain possession of the ball first. Players must not cross the sprinters’ line until one team has possession of the ball to avoid collisions. Players then drive the ball up the field toward the goal. Players can use not only their mallets, but also their hands (but not to catch the ball), their feet (only if the ball is in the air, not on the ground), and the front wheels of their bicycles to block the ball. Players must not be dismounted while playing the ball (not even a foot on the ground), and playing the ball includes any contact with bicycle or body. Defenses in-

clude tackling (with the bicycle), shoulder charging, hooking a mallet, and riding off an opposing player challenging for the ball. Strict rules of play help minimize collisions, and penalties are levied for stealing ground before the whistle, playing dangerously, and deliberately obstructing. The two teams change ends when a team scores a goal and at midgame.

Speed and maneuverability are most important; thus, the modern polo bicycle has a shortened wheelbase, fixed wheel, no brakes, and a low gear ratio.

Polo, Water

Water polo can be traced back to Great Britain, where it has roots in both England and Scotland. In November 1868 the heads of six London swimming clubs met and founded the Metropolitan Swimming Association (MSA). At the same time they drew up an inventory and established a code of rules for all issues relating to amateur races, notably including a number of aquatic games. In what was called “water derby,” for example, swimmers rode astride barrels with wooden horse heads attached and used a crude type of oars to move around. Other games like a so-called “water polo” imitated polo, where the players perched on barrels to compete for control of a floating ball, using their oars as a crosse. And then there was “football in the water,” which consisted of two teams competing to carry an object to a determined place (often a boat), however they could. On 12 May, 1870, those in charge of the MSA (which soon metamorphosed into the Swimming Association of Great Britain, or SAGB and, later on, the Amateur Swimming Association, or

Polo, Water

An Olympic Victory Becomes a Political Message

The Hungarian men's water polo team won medals in twelve successive Olympic Games between 1928 and 1980. As the Athens 2004 Olympic website points out, among all these victories, the Hungarian win in the summer of 1956 over the Soviet team was especially important for Hungary's national identity. That fall, Hungarian citizens would launch a heroic (though ultimately ill-fated) revolt against Soviet rule.

The Magyar supremacy continued in Melbourne in 1956, in a tournament held in the shadow of the Soviet invasion of Hungary. The game between Hungary and the USSR was a bloodbath, with fighting breaking out between the two teams. The Swedish referee was forced to suspend the game, which Hungary won

4-0. It was a victory with a political message because, as the Hungarians later pointed out, they wanted to use the match to raise the morale of their people. For them, victory over the Soviets and winning the gold was a matter of life and death. They became Olympic champions without losing a single match.

The political events of 1956 had their effect on the national Water Polo team as well. Half of the champions at Melbourne refused to return to their country, while the captain, Dezso Gyarmati, who opposed the regime, went into self-imposed exile in the United States in 1957, and was barred from re-entering the country for two years.

ASA) more closely defined the rules for this last game, taking their inspiration from the "football of Rugby." Even so, until 1888 clubs practiced "water-baseball" or "aquatic handball" games that often departed significantly from the rules set by the MSA.

This relative failure to enforce MSA rules left the way open for other initiatives. In Glasgow the president of Associated Swimming Clubs of Scotland, William Wilson, sought ways to spark interest in the swimming competitions put on by local clubs. In 1877 he used his knowledge of popular games to invent a set of rules for aquatic football. Two teams of three players each competed to capture a bladder ball. As this initial experience was rather unimpressive, Wilson worked to make the game more interesting and spectacular, this time using a basin and fresh water and changing the rules somewhat. He introduced a goalkeeper based on the football association model, increased the number of players to nine, and barred standing on the pool bottom. In 1879 this set of rules was distributed to all Glasgow swim clubs.

From 1885 to 1888, the SAGB worked to integrate the English and Scottish sets of rules. An analysis of the eleven rules from the original water-polo code shows the influence of both rugby and football (soccer). As the rules evolved, however, references to football (soccer)

gradually won out over rugby. Handling the ball with more than one hand was prohibited, as in football (soccer), and the goals resembled those in football (soccer). Water polo became less of a combat game and more of a passing game as free throws and out-of-play rules were established and the number of players dropped to seven. With a more or less stabilized set of rules, by the 1890s the game was winning over countries where there was a tradition of aquatic sports meetings. It became an appealing and spectacular "extra" in swimming events. In Europe it became established in Germany (1893), Austria (1894), France and Belgium (1895), and Hungary (1897). In the United States, it was practiced in Boston as early as 1888, and later on the West Coast. However, since it focused on a rougher game and rules that were influenced by American football, American water polo (still also called "softball" water polo) began to move away from the original principles as the Federation Internationale de Natation (FINA), the international swimming association, began in 1908 to enforce the British rules internationally.

Nature of Water Polo

Although the techniques, strategies, and rules for water polo were initially modeled after rugby and then

football (soccer), since the 1970s the influence has come more from handball. Basically, the game features two teams of seven players each, competing in an area 20–30 meters long, 10–20 meters wide and at least 1.8 meters deep. The ball is 68–71 centimeters in circumference and weighs 400–450 grams. Two referees and two goal judges are required for a match, which has four periods of live time (actual play) lasting seven minutes each. Besides the offside rule, the major aspects concern the ball, which may not be held underwater or touched with both hands at once (except by the goalkeeper). It may be thrown or pushed during dribbling but kept no longer than thirty-five seconds at a time. Any direct action on a player without the ball is prohibited, but the ball handler may be pushed underwater. Fouls are penalized by a free throw or a penalty throw, depending on how serious they are.

Water polo is a sometimes violent contact sport, and women were left on the sidelines for a long time. Women's teams have existed since the early 1900s, but only the Dutch during the 1950s, the Australians during the 1960s, and the Americans during the 1970s were able to pull women's water polo out of the torpor it went into in the period between the World War I and World War II.

Competition at the Top

Water polo is the oldest Olympic team sport. Although it was already around in 1896, it was not actually organized before 1900. Given the geographical origins of water polo, it follows that the most difficult regional competition is the European championship (created in 1926). A world championship has been held every two years since 1976.

Except for the Olympic Games held in Saint Louis in 1904, the major international competitions of the early 1900s were won hands down by the English, who were Olympic champions from 1900 to 1920, followed by the Belgians. The French briefly picked up the torch in 1924, and then the game's techniques and strategies were totally renewed by the Hungari-

ans, who powered their way past the ever-increasing competition (first from the Germans and Italians in the 1930s and 1940s, then from the Yugoslavians and Russians during the 1950s and 1960s) to become the world's top players. In 1956 their legendary match against the USSR—after the invasion of Hungary by the Soviets—at the Melbourne Olympic Games contributed to reinforce the Hungarian national identity around the sport. From the 1970s up to now, besides the United States, the water polo elite include mainly the Central and Southern European nations: Hungary, Italy, Spain, Greece, Russia, and the Baltic states. These are also the countries where the sport is practiced the most and where the only professional players are to be found. Women's water polo also follows this pattern, with the addition of Holland and Australia.

Governing Bodies

In the different countries where it is practiced, water polo is governed either by an independent federation or the national swimming association. Since 1908 water polo has answered to the FINA at the international level. In 1928, however, the sport was provided with an International Water Polo Board, which was created for the purpose of unifying the rules. In 1951 the board made an important break in tradition by ending the obligation for players to stop moving after the referee blows the whistle. Before, as long as the players were immobile for a free throw, the only possible defensive tactic during play was to stay in contact with the offense's players to avoid being left, in case of foul, with an isolated player to whom the ball might be passed. From then on it became possible to use a defensive style of play whereby the offense's players without the ball theoretically had more incentive to distinguish themselves. Throughout the century most of the changes proposed by the board were influenced by preoccupations with decreasing the violence, accelerating the game, and making sure all action is seen by the referees.

Portugal

Located in extreme southwestern Europe, Portugal has a population of 10.5 million, including its capital city of Lisbon. Portugal's sport history reflects European aristocratic sport and leisure traditions, with influences from other nations such as Sweden, Belgium, and Britain. During the Estado Novo dictatorship, sport and physical education became a political tool of the state. The end of the dictatorship in 1974 began a new era with renewed interest in the Olympics and in international sports such as soccer.

Middle Ages

Fencing and horse riding, as well as dance, were a significant part of education for the nobility, from the eleventh to the end of nineteenth century. Hunting on horseback (*montaria*), with birds (*cestaria*), or with hounds, was an important activity. During the Middle Ages several books recorded the lifestyle of the nobility for future generations. For example, *Livro da Montaria* by D. João I (1356–1433) describes hunting wild boar on horseback with spears and a pack of hounds. Falconry was a popular form of hunting, and falconry books were popular, each one rich with details about bird behavior, diseases, and feeding. Hunting also prepared men for battle by providing practice with the bow and arrow, and was encouraging especially for

young men. Horseback riding was another important activity and a noble duty. Tournaments and jousting were always accompanied by other activities such as horse races, running and jumping games such as páreo, canas, tavoloado, or bafordo. King D. Duarte's (1391–1438) *Livro da Ensinanca de Bem Cavalgar toda a Sela* written in the 1430s is considered the first horse-riding book in European literature

Archery, péla (throwing a small ball sometimes with secret love messages on it), hand-to-hand fighting, and bullfighting were common physical activities. Other common recreational activities were ball dancing, feasting, music and singing, and games like chess, dice, and playing cards.

Seventeenth and Eighteenth Centuries

Fencing was another physical activity of the nobility and a symbol of their high social status. Several books were written on fencing, and one of the more interesting was by D. Francisco Manuel de Melo (1608–1667) —*O Fidalgo Aprendiz* (1665). It was a satire about all those who without any noble ancestry or fortune sought to social climb by learning to fence.

In the eighteenth century the image of the nobleman was central to a philosophical debate in Europe. In this context three Portuguese intellectuals expressed concern about the education of youth by the dominant group. Martinho de Mendonca e Melo (1693–1720), António Nunes Ribeiro Sanches (1699–1783), and Luís António Verney (1713–1792) called attention to the need of developing a curriculum that valued experience. Dance, horse riding, fencing, and swimming were some of the activities presented as having a positive influence on character building and health.

In 1761, the Real Colégio dos Nobres de Lisboa (1761–1837) was founded to teach young aristocrats the liberal arts as well as introducing them to new areas of study, like geography, physics, and natural sciences, to prepare them properly for a changing society. Dancing, horseback riding, and fencing were part of the curriculum.

Modern Sport

Modern sport has evolved through five phases. The first period, from 1855 to 1875, was marked by the founding of the first sport association and the publication of the first sports newspaper. The second, from 1875 to 1900, was a period of rapid growth with the founding of more associations, the appearance of more newspapers, and the spread of sports across the nation. The third period was from 1900 to 1925 and was marked by the consolidation of rules and regulations and cooperation among sporting associations. It was also during this period, after World War I, when aristocratic influence in sports declined. During the fourth period from 1926–1974 the Estado Novo dictatorship took control and used sport as a tool for political and ideological control with a focus on youth and worker sports. The final period began with the 25th April Revolution in 1974 and continues to the present.

As elsewhere in Europe, sports developed in the last half of the nineteenth century. By that time, concerns with health led aristocratic and wealthy people to the seaside. In 1850 they organized the first yachting race

and others soon followed. The first Portuguese sports club, the Real Associacao Naval, was founded in 1855 and others followed: Real Club Naval de Lisboa (1892), Liga Naval Portuguesa (1902), Grupo Náutico Português (1925), the Federacao Portuguesa de Vela (1927).

Sport took a bit longer to attract large numbers from the lower classes. Cycling became popular in the 1890s and soccer in the 1920s. Several newspapers were devoted to cycling: *O Velocipedista*, *A Bicicleta*, *O Ciclista*. The *União Velocipédica Portuguesa* was founded in 1900. Sports associations then appeared in greater numbers. By 1902, Porto had five sporting clubs (hunting, rowing, sailing, gymnastics and fencing); in 1903 Lisbon had seventeen, and twenty-three one year later. Sports books also proliferated, from five in 1885 to eighty-eight in 1936.

The Estado Novo dictatorship (1926–1974) considered health and education as the primary national problems. Hygiene, health, and physical education became one of the major areas of political ideology. The goal was to change the old order so that Portugal would remain independent. Sport was seen as an instrument of ideological action, both in national and international terms, and promoting youth and worker (men and women) sports was a main concern. An athletic elite was seen as the symbol of national power. Sports medicine was used to find and select the best *materia prima* backed by support for sports such as athletics, yachting, rowing, swimming, and gymnastics in the schools. The 25 April Revolution

ended this approach and soccer and the Olympics regained a new importance.

Gymnastics and Physical Education

In 1836 Dr. Guilherme Centazzi wrote *Consideracoes Gerais Sobre os Exercícios Gymnasticos e as vantagens que delles resultão* calling the attention to the advantages of regular exercise for health and education. This brought gymnastics to the attention of education officials and it was introduced into the curriculum in 1836. Through the influence of Jean Roger, Paulo Lauret, and then Adolfo Filipe Simões gymnastics became more popular and a component of the curriculum for boys and girls. For years, gymnastics was mainly military and acrobatic. In 1903 the Real Gymnasio Club Portugues (founded in 1875) adopted Swedish gymnastics. The publication of the *Regulamento Oficial de Educacao Física. Gimnástica Educativa. Jogos. Gimnástica aplicada*, in the year 1920, underlined the interest of the state in a gymnastics in public education to build national health and education. The plan followed closely the work of the Belgian Lefebure (*Une Méthode de Gymnastique Educative*), and was totally inadequate for Portugal, which lacked a central education system and adequate facilities. In 1932, the National Assembly established a new policy based on Swedish Gymnastics. Sport was considered to be too liberal with gymnastics preferred because it encouraged structure and discipline. In 1935 the Fundação Nacional para a Alegria no Trabalho (FNAT) was founded to integrate gymnastics, folk dance, sports, and outdoor activities to control leisure activities.

In 1936 the Junta Nacional de Educacao was created as the central sports authority with control over all aspects of sports and physical education. The agency utilized sports medicine to identify the best youth athletes. Arsénio Cordeiro and José Salazar Carreira were two of the best-known directors of this center. Carreira took part in athletics, fencing, swimming, handball, rugby, and tennis competitions. He was the Portuguese champion of 100m, 200m, 800m and 400m, as well as in

400m hurdles. In 1944, he was nominated Inspector dos Desportos da Direcção Geral de Educação Física, Desportos e Saúde Escolar. Carreira was also a physician and wrote several books on physical education, sport medicine, and athletic training.

The Organizacao Nacional da Mocidade Portuguesa (ONMP, or simply MP) was created in the same year to promote civic and patriotic pride as well as physical and pre-military training. Girls were included, for the very first time, in the national organization through the female section, the Mocidade Portuguesa Feminina (MPF), created in 1938. Gymnastics, games, swimming, and outdoor activities such as camping, walking, snow skiing, were promoted until the MP closed in 1972. In 1938 the Swedish teacher, Anna Ingrid Ryberg, was hired to develop girls physical education for the MPF. In 1940, the Instituto Nacional de Educacao Física (INEF) was established to train physical education teachers. Half the students were women. In 1944 the Estádio Nacional was opened.

Olympics

Portugal first participated in the Olympics in 1912 in Stockholm, with six athletes competing in track and field, boxing, and fencing. Since then, Portuguese involvement has increased, both in the number of sports and number of athletes.

Women competed for the first time in 1952. The first Portuguese gold medalist was Carlos Lopes in the marathon in 1984 and the first woman gold medallist was Rosa Mota in the marathon in 1988.

Sports Today

Sports and physical activity is now important across Portuguese society. Soccer is the most popular sport and many Portuguese closely follow their favorite teams—Porto from Porto and Sporting or Benfica from Lisbon. Track and field, auto racing, wind surfing, yachting, and inline hockey are also popular. Watching sports on television is often a group activity in restaurants and bars. The government has been promoting golf to attract tourists and there are many courses near the

Algarve and the Estoril coasts. Maintaining an ancient tradition, in the fall people hunt for wild boar, partridge, and pheasant. Swimming, boating, surfing, and wind surfing are popular summer sports. Portugal continues to host bullfighting, although it is far less popular than in Spain. It differs from Spanish bullfighting as the fighters ride on horses and the bull is not killed in the ring.

Postmodernism

The term *postmodern* has become a buzzword, and people often declare that we live in a postmodern society. Despite the fact that theories of postmodernism have secured a prominent place in mainstream sociology, only recently have sociologists of sport turned toward such theories to explain sports or even the emergence of "postmodern" sport in society.

What Is a Postmodern Society?

The term *postmodern* refers, at its simplest, to an era after modernity. The term originated in the artistic world, in which *postmodernism* emerged as a term that expressed dissatisfaction with traditional literary models, art, and dance. In terms of academia, and in particular sociology, the term was borrowed from the artistic world to express a concern, dissatisfaction, and frustration with existing modernist theories and modernist thought.

Modernism refers to an era when people tried to organize society rationally, an era that has been referred to as the "enlightenment period." It was an era when people thought that we can easily categorize society and that one truth exists about how society functions. In contrast, a postmodern society is considered less regimented. Social life and culture are deemed disjointed and fragmented. Some theorists celebrate this aspect of a postmodern society because it means in

Postmodernism

Postmodernism and Sports

In the extract below, writer Nathan Bierma muses about being a postmodernist and a sports fan.

Can a true postmodernist yell at the refs? Isn't that forcing your beliefs on others? Is there such a thing as a bad call in the age of virtual reality? Or does it all depend on your point of view, your background, your bias, as so much supposedly does these days?

Could it be that sports are the last part of society where objective truth is the norm? I'm not kidding around: I'm wondering what it says that the solid, fixed foundations of organized sports, where baselines and sidelines are columns and pillars of certainty, have endured in an age of questioning, satirizing and re-imagining our basic assumptions about the rectitude of social institutions.

Organized sports were established in the 19th century in schools as a way to teach discipline, morality and character. With their straight lines, umpires and thick rulebooks, sports are now a throwback to an age of reason, staying alive in an age of relevance.

The court and the field are still rigidly rectangular. A first down is still ten yards, a made jump shot is still two points (except for the very postmodern three-pointer, converted behind a brash curved line), and if you have a problem with that, you don't play. [. . .]

Sports have not been untouched by postmodernism. Changing stadium architecture, athletes recording rap albums, the rise of ESPN and the upheaval of gender roles have turned what was once a predictable, monotone, masculine sector of society into a maelstrom of change and a laboratory of social trends.

Still, in a Western world that spells "truth" with a small "T" and where skepticism and skewed reality trump history and heritage, the pillars of sports stand firm. The sideline is still out of bounds and a swing and a miss is still a strike, no doubt about it. You either crossed the goal line or you were down at the one. No non-linear reality here.

society "anything goes." This suggestion would indicate a mixture of tastes and cultural lifestyles as well as alternative lifestyle choices that have been widely accepted.

Sociology and the Postmodern Invasion

We might fairly say that no definition of *postmodernism* exists, the term is so diverse that one author declared that "postmodernism is like jelly, not at all easy to nail down." The term means different things to different people; however, certain ideas in postmodern thought differ from ideas in modernist thought.

Sociology, including the sociology of sport, during modernism was dominated by the theories of the German political philosopher Karl Marx, the German sociologist Max Weber, and the French sociologist Emile Durkheim. These theories are known as "grand narratives" because they concentrate on how aspects of soci-

ety "fit" together as a whole, specifically the way people are constrained by the society they live in. As a result, these theories are often referred to as "macro" because they focus on the structure of society rather than on the individual. These theories have one grand theme or model, and this model is used to explain all aspects of society. For instance, theorists working within the Marxist paradigm (framework) would apply the ideas of Marx to understanding sports in the same way that they would apply them to making sense of, for example, the criminal justice system. Thus, what is being studied does not matter; the application of the theory remains the same. One model was followed because of the underpinning belief of modernism that one definite truth exists about society and that how it works is waiting to be discovered. After this discovery, a "better" society, one without inequalities such as class and race, can be created.

How does postmodernism differ from modernism? Postmodernists reject these "grand narratives" because

Modern bodybuilding is ritual, religion, sport, art, and science, awash in Western chemistry and mathematics. Defying nature, it surpasses it. ■ CAMILLE PAGLIA

these theories are applied in order to find fixed meanings, certainties, and truths. Postmodernists do not believe that one all-encompassing truth is waiting to be discovered, and they criticize modernists for not understanding that society is too complex to be explained by one theory.

Another shortcoming of modernism, according to postmodernism, is that it has failed to understand that different people experience different inequalities. Therefore, we cannot suggest that people from lower working-class groups have less access to sports because this suggestion ignores the fact that some working-class families may also face race and gender discrimination.

The closest that we can come to defining postmodernism is to say that it is a rejection of the modernist search for truth and the era of “grand narratives.” For those people who embrace postmodernism, truth is relative, and they suggest that we would more adequately speak of multiple truths, which are situational. The impact of postmodernism on, for instance, social research is to cause people to consider research to be a representation of a reality and at best a partial and biased one. However, as Best and Kellner have suggested, “there is no unified postmodern theory, or even a coherent set of positions. Rather, one is struck by the diversities between theories often lumped together as ‘postmodern’ and the plurality—often conflictual—of postmodern positions.”

Postmodernism versus Poststructuralism

Some people have suggested that some of the influential postmodernist theorists are Foucault, Baudrillard, Jameson, and Derrida; however, some people disagree about whether these theorists should be identified as poststructuralists as opposed to postmodernists. Andrews criticizes the tendency of authors who use these two terms interchangeably. He argues that postmodernism is an ambiguous term that refers to changes in social life from art, architecture, and cinema to sociology. Poststructuralism, according to Andrews, is a distinctly intellectual movement, and despite the fact that

poststructuralist theories are postmodern in the sense that they reject objective truths, the extent to which they engage with postmodern philosophy differs.

Andrews seems to be suggesting that poststructuralism is a more precise analysis of academic theories and that poststructuralism can perhaps be considered as a subdivision of the postmodern movement. Therefore, he argues that Baudrillard and Foucault are poststructuralists. Such an argument demonstrates a lack of clarity and agreement among those working within the postmodern movement, especially with regard to defining terms.

Power, Sports, and Foucault

The work of Michel Foucault has been influential in the sociology of sports because Foucault’s main work, *Discipline and Punish: The Birth of the Modern Prison* (1970), alongside *The History of Sexuality*, focused on understanding how bodies have historically become subjected to disciplinary procedures.

According to Whitson, Foucault’s understanding of the “discipline and pleasure that surround the body in modern societies has much to offer students of sport” because sports can be seen as a product of a disciplinary society. Sports, according to Pronger, no longer promote freedom of movement. Sports are subject to and a product of scans, electromagnetic tests, training programs, and computer simulation. This fact means the sporting body has become strictly regulated by technologies, which in turn dominate the way physical educators and sports professionals practice.

Markula, a sports feminist, uses Foucauldian concepts to understand the experiences of women who participate in aerobics. She discusses the way that these women, despite wishing to have an ideal woman’s body shape, ridicule the shape of women models and actresses as being unobtainable. This fact highlights women’s ability to resist dominant notions about them because they do not accept unquestioningly the notion of a perfect woman’s body. Power, according to Foucault is diverse and is operated in a variety of ways by a variety of people. Having total power is rare, and we

*Men are the sport of circumstances
when it seems circumstances are
the sport of men.* ■ LORD BYRON

cannot create counter ideologies and therefore contest power. He also argues that power is not always negative because “where there is power there is resistance” (Markula 2003, 93). In every relationship power exists; yet, power, although it may appear unequally, is never uncontested and can be resisted.

The work of Rail and Harvey offers an in-depth understanding of Foucault’s concepts, especially in relation to sports, power, and the body. They highlight the fact that in France a number of theorists use Foucault to analyze the nature of sports; yet, these theorists have been ignored by English-speaking sports sociologists. They also highlight the four strands of research utilizing Foucauldian concepts, which are cited in Andrews as (1) work that highlights the importance of Foucault’s work to academics working within the sociology of sport, (2) studies that use Foucault’s early work and archaeological approach, (3) research that uses Foucault’s concept of Panopticon and examines the way sports have become a “modern disciplinary power,” and (4) studies that examine Foucault’s work on technologies of the self and apply this to the study of sports.

Foucault has become a popular theorist for those people turning to postmodernism to analyze issues of sexuality, power, and the body in sports.

Baudrillard, “Hyperreality,” and Sports

Another major contributor to postmodern thought is Jean Baudrillard, whose research suggests that society has become so dominated by signs that nothing is real. As a result of the domination of signs he argues that everything that we think that we see is merely an image of reality and is “hyper real.” *Hyperreality* refers to the problem of distinguishing between reality and appearance. Baudrillard uses Disneyland in the United States as an example of hyperreality. Disneyland, he argues, is a place where nothing is real; it is made up of signs and images. Yet, because Disneyland presents itself as a fantasyland, people must assume that everything outside of Disneyland or any other theme park is real. Baudrillard argues that this assumption itself is an illusion because

U.S. society is so made up of images that each image is made up from a different image or from a variety of images. If this argument is true, then everything we understand about the society we live in, from the sports on TV or the Gulf War, is influenced by the images we are presented with. If we accept this theory, then we can’t distinguish between the reality of the game of football and the television, magazine, and billboard image of football.

Because Baudrillard’s work has focused on examining and understanding events that are “mediatized,” and because we could argue that sports are a media spectacle, his work has attracted interest among sociologists of sports. For instance, Redhead says that because of the globalization of football, many people experience the sport only through television viewing. We may think that watching the sport on television is “better” than watching the sport in real life because of the benefits of replays and new technology such as Hawk Eye in cricket. Hawk Eye can “tell” the viewer whether the umpire’s “leg before wicket” (LBW) decision was correct. By computer simulation the program predicts whether the ball actually would have gone on to hit the stumps. This situation has led to media speculation about the role of the umpire in cricket and whether the umpire will be replaced by television cameras.

Baudrillard, unlike mainly social theorists, comments directly on the culture of sports in relation to his theory. He cites a European match played between Real Madrid and Naples that, because of violence at previous matches, was played without spectators. Instead, the match was shown to fans on television. Baudrillard predicts that postmodern sport will have no spectators and that no one will experience the real event. Instead spectators will see only images of the real event. He is suggesting that sports will become “a pure event . . . devoid of any reference in nature, and readily susceptible to replacement by synthetic images” (Baudrillard 1990, 80).

In some respects events such as the Olympics have already been replaced by “synthetic images.” Despite the fact that the Olympics are watched worldwide on television, because of the cost of traveling to the event and the cost of tickets, relatively few people are able to

experience the event itself. As a result, everything we think we know about the ethos (distinguishing character, sentiment, moral nature, or guiding beliefs) of the Olympic games is presented to us via the images we are given in newspapers, television programs, and magazines. These images, although presented as real versions of the event, are partial and themselves are based on other images and representations. Thus, Baudrillard would argue that we never truly know what it is like to experience the Olympics, that we experience only the image of the event.

Baudrillard's model suggests that the image has become the reality. For instance, from television programs that show live police officers in action, "real police" officers may get ideas about how to behave, so the virtual representation of what it is to be a police officer is simulated and becomes the actual model. If we relate this notion to sports, Baudrillard seems to be suggesting that the television model of sports has become the actual model that people would expect when they see live events.

Researchers such as Rail have used the work of Baudrillard to look at sports culture and consumption. Andrews has used it to look at how the 1996 Summer Olympics were designed to encourage women viewers. Wenner has used it to study the hyperreal nature of sports bars. Despite the fact that these researchers have expressed caution about some aspects of Baudrillard's theory, they insist that aspects of his work can help to explain the nature of certain aspects of postmodern sports.

Postmodern Controversies

One of the main concerns that people have with postmodernism is the lack of consensus about what actually constitutes postmodernism. The term itself is "discontinuous," and for this reason Dunning (1996) suggests that the term fails to "capture the balance between continuity and change in the processes which have contributed to the development of the present-day world" (Dunning 1996, 185). He goes on to argue that because social life will always change, why create

a term such as postmodernism that suggests a static moment in time? Surely, he argues, to do so would mean that after social life changes again, soon we would have to speak of a post-postmodern society and then a post-post-postmodern society, and where would this end? Although careful not to dismiss postmodernism altogether, he criticizes the movement for being overly philosophical and theoretical and thus failing to provide research grounding for its claims.

Do we really live in an "anything goes" society? Have the inequalities of modernism been overcome? In sports, in particular, we can point to continuing gender inequalities. Stereotypes remain about the capabilities of black and Asian people. Furthermore, homosexuality in sports is still considered a taboo. If these inequalities exist, then do we too soon speak of "postmodern" sports? To what extent can postmodernism explain these inequalities and ultimately eradicate them? These issues and controversies need to be addressed and clarified by scholars using postmodern theories.

The Future

Researchers working in the sociology of sports inevitably will increasingly use the postmodern theories of Foucault, Haraway, Derrida, Butler, Lyotard, Baudrillard, and Jameson to understand social issues in sports. Some theorists may continue to dismiss these theories and pursue a modernist agenda, whereas others may adopt certain aspects of postmodern theories and fuse them with modernist theories. The sociology of sports inevitably will follow in the footsteps of mainstream sociology in developing more eclectic ways of understanding the complexities and contradictions evident in "postmodern" sports.

Powerlifting

Powerlifting is an offshoot of weightlifting and weight training that emphasizes pure strength more than speed, flexibility, and technique. It is also an exercise format that promotes health and fitness, and its movements are utilized in bodybuilding and strongman competitions. At first limited to North America and Northern Europe, powerlifting achieved worldwide popularity by the late twentieth century.

History

The historical roots of powerlifting are identical to those of weightlifting, traceable to strength feats that were practiced by the ancient Chinese and Egyptians and the Homeric Greeks. The legend of Milo of Crotona, the Greek strongman who devised progressive resistance training by carrying a calf daily until it became a bull, is also relevant to powerlifting. The powerlifter’s physique,

however, would resemble more the mythical representations of the Farnese Hercules than the streamlined musculature of Apollo, an archetype for Olympic weightlifters. Likewise, at the dawn of modern weightlifting in the late 1800s, the so-called strongman era, powerlifters would find greater inspiration in the ponderous strength of the Quebec colossus Louis Cyr than the more versatile showmanship of Eugen Sandow. But powerlifting as a separate athletic endeavor did not emerge until the mid-twentieth century.

What did exist were various health, fitness, and training movements that resembled powerlifts. Most of them related to the dead lift. One of the earliest exercises was the health lift, introduced by Harvard-trained physician George Barker Windship in Boston in the 1860s. A partial dead lift, it utilized the large muscle groups of the hips and thighs. Later versions were often done with machines, using handles, yokes, and harnesses. Windship once harness-lifted 2,600 pounds. Another variation, once barbells came into general use, was the Jefferson lift, a dead lift done while straddling the bar. German-born Hermann Goerner was the greatest practitioner of the two-hand dead lift. At 6'1" and 220 pounds, “Goerner the Mighty” dead lifted 360 kilograms (794 pounds) in 1920. Only occasionally was the dead lift performed competitively.

Similarly, the squat (deep knee bend) was never contested and rarely used to build basic lower body strength. One of the first weightlifters to realize its importance was Henry Steinborn who, as a German prisoner of war in Australia during World War I, became the first man to squat 500 pounds. Given the nonexistence of squat racks, he had to set the barbell on end, lean under the bar, and tilt it on his shoulders before executing the lift. Steinborn also performed a single leg squat with a 192-pound barbell. But the strongman most responsible for popularizing the squat was Joseph Curtis Hise of Homer, Illinois, in the 1930s. His technique of using squats to develop the lower *and* upper body was spread by Peary Rader, editor of *Iron Man*, in subsequent decades. Remarkably, the bench press, eventually the most popular barbell exercise, was not done.

Costumes for Powerlifters on a Budget

From the humor section of e-normous.biz, a website for and about powerlifters:

Like anyone, I like a good Halloween party. Sometimes times get tight though, and you don't have a lot of money to spend on elaborate costumes. Well we've got some good news for you. We have some great halloween ideas for powerlifters that won't break the bank. We're not suggesting that you go as a powerlifter, that's too obvious. We do have some suggestions on how to incorporate your gear though.

THE HULK: This one is very simple. 1. Buy some cheap green paint. 2. Throw on some clothes you used to wear before you started powerlifting and flex. 3. Paint any exposed skin once your clothes are sufficiently torn and you are instantly Lou Ferrigno himself.

FRANKENSTEIN: So you want to pull off a classic like it has never been done before. Powerlifters can pull this one off better than anyone. Break out that old suit of yours and a pair of work boots. Before putting them on, simply put on your squat suit, your bench shirt and knee wraps. Have someone help you get the suit on over top of this gear and you will have the Frankenstein walk down to perfection. To add to the effect, you'll grunt every time you need to bend over to pick something up or sit down. The discomfort will eventually drive you insane until you take out your rage on all of the town's people at the party. This could easily be the most frightening of all Halloween costumes this year.

Most resembling it was the supine press, with the lifter lying flat on the floor. Joe Nordquest of Ashtabula, Ohio, prone-pressed 388 pounds during the World War I era, but it was rarely practiced thereafter.

THE PRECOMPETITION ERA

What brought the powerlifts into vogue after World War II was the increased popularity of bodybuilding. Then called the odd lifts, or strength sets in England, the squat, bench press, dead lift, and curl were utilized to develop the most fundamental (and showy) muscle groups of the thighs, chest, back, and arms, respectively. While they also promoted Olympic weightlifting (press, snatch, and clean and jerk) in their muscle magazines, Joe and Ben Weider of Montreal were the foremost proponents of this new approach to using barbells.

POWERLIFTING BECOMES A SPORT

During the 1950s the popularity of the Mr. America contest, sponsored by the Amateur Athletic Union (AAU) and promoted by Bob Hoffman of York, Pennsylvania, drew further attention to powerlifting. But it was Peary Rader who first suggested the idea of a power-

lifting championship. By this time Hoffman, Rader, and the Weider brothers were marketing apparatus, squat racks, and benches with stirrups, for powerlift training. Finally, Georgia strongman Paul Anderson, a gold medalist at the 1956 (Melbourne) Summer Olympics, was a major source of inspiration. His unofficial 1,200-pound squat, performed at a Reno hotel, had a profound impact on a generation of future powerlifters.

The transformation of "odd lift" training into a sport occurred during the early 1960s, largely as a spin-off of Olympic weightlifting. In 1963 Hoffman launched *Muscular Development* as "the powerlifter's organ," and in the following year, he conducted a national tournament in York, consisting of the bench press, squat, and dead lift. At the first national powerlifting championships, sponsored by the AAU in 1965, superheavyweight Terry Todd of York narrowly defeated Gene Roberson of Birmingham, with a final dead lift of 740 pounds. By this time a national rules structure was in place, and powerlifting was administered by the national AAU weightlifting committee. The new sport grew rapidly, and the number of participants soon surpassed those engaged in Olympic lifting. In 1971 Hoffman hosted

These lines from Sir Walter Scott's The Lady of the Lake (canto V, verse 23) immortalize the prowess of the participants in an ancient contest of strength.

Their arms the brawny yeomen bare
To hurl the massive bar in air.
When each his utmost strength had shown,
The Douglas rent an earth-fast stone
From its deep bed, then heaved it high,
And sent the fragment through the sky
A road beyond the farthest mark.

the first world powerlifting championships at York. The following year witnessed the formation of the International Powerlifting Federation (IPF), consisting of twelve countries, with Bob Crist of Hampton, Virginia, as its president. Increasingly, powerlifting was becoming popular in other countries, especially England, Canada, Scandinavia, Japan, and Australia. In 1975 the world championships took place outside the United States for the first time, in Birmingham, England.

By the end of the 1970s, women were also becoming powerlifters. In 1977 Joe Zarella, AAU powerlifting chairman, organized the first women's championships at Nashua, New Hampshire. It included twenty-seven lifters, the best lifter being Cindy Reinhoudt in the 165-pound class, with a 360 squat, 210 bench press, and 375 dead lift. In 1978 women's powerlifting gained official (AAU) status, with Jan Todd as first chair of the women's committee. At the ensuing national championships, she deadlifted a record 453 pounds. In 1980 the first world powerlifting championships for women was staged at the University of Lowell (Massachusetts). Terry Dillard in the 114-pound class was the outstanding lifter with a 765-pound three-lift total.

GROWING PAINS

Powerlifting, however, was plagued by image problems from the outset. As a result of its sudden growth and in-

formality, it was stereotyped initially as a junk sport whose participants showed up in bare feet, cut-off jeans, and tank tops. And since flexibility, speed, and free movement were not required, powerlifters adopted extensive knee and elbow bandages, oversized belts, stiff work boots, body wraps, and even bedsheets to add tensile strength and boost the number of pounds they could lift. Briefly in the early 1970s, the AAU national committee restricted such practices, banning knee and elbow wraps, but with the creation of the IPF, knee wraps were brought back at the insistence of the British. This compromise led to the addition of a host of other supportive aids over succeeding decades.

No less serious was the problem of drug use, especially steroids, to induce strength. Although powerlifters were not subjected to the experiments of Dr. John Ziegler, "Father of Dianabol," at York, steroid use rocketed through the sport during the 1960s. And not being an Olympic sport, powerlifting escaped the drug testing imposed by the International Olympic Committee in 1976. A 1983 report from the National Strength Center at Auburn University estimated that competitive powerlifting (at 99+ percent) had the highest ergogenic drug use of any sport. Not until the 1985 world championships in Espoo, Finland, did the IPF institute drug tests.

POWERLIFTING'S BREAKUP

By this time drug and supportive apparel problems were exacerbated by a proliferation of powerlifting federations. This devolution of authority began when the National Sports Act (1976) separated weightlifting, powerlifting, and bodybuilding into autonomous bodies, with minimal AAU influence, resulting in the United States Powerlifting Federation (USPF). Then, in a dispute over lifter representation at the 1980 world championships, nine-time world champion Larry Pacifico formed a rival organization. Although a compromise was reached, further disputes over drug testing resulted in the formation of the more loosely regulated and lifter-friendly American Powerlifting Federation (APF) by Pacifico and Ernie Franz in the mid-1980s.

The parent USPF remained more prestigious, with its IPF ties, but these internecine struggles led to the formation of other federations, including an American Drug Free Powerlifting Association, which, by the 1990s, had 5,000 registered lifters. When Franz relinquished his organization to Kieran Kidder in 2003, APF lifters were making the most spectacular gains, but by this time there were sixteen national and eleven international federations, including one for raw (nonsupportive apparel) competitors, vying for attention. Seemingly, their only common bond was *Powerlifting USA*, a periodical edited by Mike Lambert that covered all federations.

Prodigious Performances

Despite drugs, supportive gear, and interminable controversies, the feats of individual powerlifters have been impressive. Most notable were those of Lamar Gant, who was world bantam/featherweight champion fifteen times from 1975 to 1990. At the 1979 world championships in Dayton, Ohio, Gant made a five-times-bodyweight dead lift of 617 pounds, nearly 70 above the world record. Ed Coan of Chicago was another all-time great, credited with a 2,403-pound total including a 959 squat, 545 bench press, and 901 dead lift (at 220 bodyweight), at the 1991 USPF nationals. But a three-time (1985, 1989, 1996) drug suspension in world competition hampered his brilliant career. Only in December 2000 was the 2,500-pound barrier broken by 375-pound Gerry Frank, with a 940 squat, 675 bench press, and 890 dead lift at an APF meet in Indiana.

With continued advancements in supportive apparel, produced mainly by Inzer Designs of Longview, Texas, it is not surprising that records soared in the twenty-first century. In September 2000 Markus Schick, at 4'8", 152 pounds, bench-pressed 562 pounds, pound for pound the best bench press ever. At the 2003 Arnold Classic in Columbus, Ohio, Steve Goggins, weighing only 265, squatted 1,102 pounds, while Frank, in April 2004, squatted 1,085, bench-pressed 837, and dead-lifted 881 for a 2,803-pound total. Most remarkable,

however, is the 975-pound bench press performed by Gene Rychlak, 6'1", 380 pounds, at an APF meet in October 2004.

Rapidly rising records were no less evident in women's competitions. In December 2002 Becca Swanson, at 220 pounds bodyweight, laid claim to the title of world's strongest female by squatting 705 at an APF meet in Nebraska, and Tina Rinehart, weighing only 132 pounds, bench pressed 402 at the Arnold Classic in March 2004. At the 2003 IPF women's world championships, Svetlana Dedyulya of Russia totaled 1,449 pounds, exceeding Cindy Reinhoudt's best lifter total in the same class at the first women's competition by 504 pounds.

Strongman competitions, an important spin-off of powerlifting, were first staged at Universal Studios in Hollywood in 1977 and broadcast on *CBS Sports Spectacular* for ten successive weeks. The first winner was Olympic lifter Bruce Wilhelm, but it was an IPF world champion powerlifter, Bill Kazmaier, who contributed most to the sport's popularity by winning the title of world's strongest man in three successive years in the early 1980s. Eventually, strongman events, featuring an international field of contestants and broadcast regularly on ESPN, exceeded Olympic weightlifting and powerlifting in audience appeal.

Powerlifting Basics

The objective of powerlifting is to register the highest three-lift total in the squat, bench press, and dead lift. Each lifter gets three attempts in each lift, with the highest weights respectively added to his/her total. If a lifter misses all three attempts in either lift, he/she is eliminated from competition. In the event of a tie, the lighter bodyweight lifter receives higher placement. Officiating is carried out by a head referee and two side judges. At least two of three white signal lights are required for a passing lift. Strategy in powerlifting comes into play toward the end of the competition when each athlete tries to choose a final dead lift that will yield a total that other lifters cannot surpass.

In the first lift, the squat, the lifter takes the weight on the shoulders from the racks and, on a signal from the

referee, lowers it until the tops of his thighs break parallel. Then he or she lifts the weight to a standing position and, with a second signal, returns the barbell to the racks. The lifter may not move his or her feet, and the bar may not move downward during the lift. In the bench press, the lifter lies on the bench, removes the weight from the stirrups, and lowers it to the chest until it is motionless. On a signal from the referee, the lifter raises the barbell until the arms are locked out and, with a second signal, returns it to the stirrups. Feet, buttocks, and shoulders must remain in place, and the bar may not move downward while being pressed. In the dead lift, the lifter bends over, grasps the barbell with both hands, and pulls it until standing erect. On a signal from the referee, the lifter returns it to the floor.

Weight Classes and Equipment

Men's competitions usually consist of eleven body-weight classifications: 52 kg (114 pounds), 56 kg (123 pounds), 60 kg (132 pounds), 67.5 kg (148 pounds), 75 kg (165 pounds), 82.5 kg (181 pounds), 90 kg (198 pounds), 100 kg (220 pounds), 110 kg (242 pounds), 125 kg (275 pounds), and over 125 kg. There are ten weight classes for women: 44 kg (97 pounds), 48 kg (105 pounds), 52 kg (114 pounds), 56 kg (123 pounds), 60 kg (132 pounds), 67.5 kg (148 pounds), 75 kg (165 pounds), 82.5 kg (181 pounds), 90 kg (198 pounds), and over 90 kg.

Equipment employed in competitive powerlifting consists of the barbell, a steel bar that weighs 25 kg (55 pounds) and measures 2.2 meters (7 feet) to which cast-iron or steel disk weights are attached at each end on a revolving sleeve. The range of weights added are 50, 25, 20, 15, 10, 5, 2.5, 1.25, .5, and .25 kilograms. All lifts are performed on a square platform that measures no more than 4 meters on each side.

Perspectives

Since its emergence from Olympic weightlifting in the 1960s, powerlifting has attracted a large number of enthusiastic competitors worldwide. It has been dominated by the United States since its inception, the

twenty-first century epicenter of the sport being the Westside Barbell Club, coached by Louie Simmons, near Columbus, Ohio. Powerlifting has always been highly individualistic, attracting competitors who seek greater self-esteem, eschew team sports, and do not want to master the more technical Olympic lifts. Despite a promising beginning, the image of powerlifting became tarnished by problems involving drug use, supportive apparatus, and governance. And with an endless variety of federations and competitive subdivisions in the 1980s, the sport was trivialized, losing audience appeal and any possibility for television contracts or financial gain for its participants. Most seriously, as long as powerlifting is viewed by the general public as a subculture and a sport out of control, it will unlikely gain the status of an Olympic event. But as a training aid for athletes in other sports (including bodybuilding) and as a means to improve health and general fitness, powerlifting will continue to earn the respect it deserves.

Governing Bodies

Powerlifting is administered by sixteen national federations in the United States and eleven international federations, the most notable being the International Powerlifting Federation (IPF, www.powerlifting-ipf.com) and the World Powerlifting Congress (WPC, worldpowerliftingcongress.com), with affiliations to the United States Powerlifting Federation (USPF, www.uspf.com) and the American Powerlifting Federation (APF, www.apa-wpa.com), respectively. Additionally, there are national federations in other countries and state committees in the United States.

Prayer

Prayer is a concept with many meanings. It can be a mental or spoken communication made to God or another object of worship. It can also be the asking of a favor, a petition, or a request to God or some other object of worship. Additionally, prayer may be initiated by individuals or groups and may be planned or spontaneous.

People have responded to the implementation of prayer in sports with a wide array of emotions. Some people see prayer as an important part of the athletic experience, whereas others see prayer as pushing religion into sports environments, especially in public schools. In such instances the concept of the separation of church and state has built a large barricade on both sides of the issue.

Coaches commonly have implemented the use of religious practices to supplement practical athletic tech-

niques or to help coaches and athletes deal with stressful situations. According to the sociologists D. Stanley Eitzen and George H. Sage, prayer is “perhaps the most frequently employed use of religion by coaches and athletes” (Eitzen and Sage 1997, 163). Prayer is used throughout professional sports, collegiate sports, interscholastic sports, and municipal adult and youth sports. People sometimes initiate prayer to develop a “we” feeling, using prayer as a form of team ritual, a means of dealing with the uncertainties of sport, a vehicle for bringing forth God’s intervention, or a way of making a variety of requests such as for safety in competition, good performance, and even victory.

Prayer and the Personal Freedoms

The issue of prayer as it pertains to athletics is centered on the personal freedoms. We can trace efforts to establish the appropriate relationship between government and religion in the United States back to the nation’s origins. A central concept of the U.S. Constitution is that a civil society and civil religion need to be separate entities to function effectively.

In issues of religion the federal government is to serve in a state of “benevolent neutrality,” establishing a foundation in which government is not to promote any specific line of religious participation, nor is government to stand in the way of people’s right to practice their religious beliefs.

Religious Freedom Clauses

The First Amendment of the Constitution, as it applies to the protections of freedom of religion, provides two clauses: the establishment clause and the free exercise clause. By establishing the freedom to exercise one’s religion and by prohibiting government’s establishment of religion, these clauses have established separate issues of case law (law established by judicial decision in cases).

The basic concept of the establishment clause is that government is not to establish religion or force religion onto people. “The Free Exercise Clause embraces a freedom of belief and conscience that has close parallels in the speech provisions of the First Amendment, but the

From an Ancient Tablet in Carthage

I swear, whoever you are, invisible spirit . . . [horses' names]. Bewitch their gait, their feet, the victory, the start, the life, their speed. Take away their victory, hobble their feet, trip them up, slice their sinews, cripple them, so that they can't get to the circus tomorrow. They shouldn't run or move about or win or make it out of the starting gates . . . nor should they round the turning column. They should crash together with their charioteers Dionysios of the "Blues" and Lamarus and Restituanus.

Establishment Clause is a specific prohibition on forms of state intervention in religious affairs with no precise counterpart in the speech provisions" (Sawyer 1997a, 355).

The free exercise clause basically allows people to freely exercise their religious beliefs and "embraces the concepts of freedom to believe and to act." These concepts establish that civil authorities are not to "intervene in affairs of the church from exercising its authority through the state" (Sawyer 1997b, 27).

Taking the Issue to the Courts

"In the United States, many of the battles to establish the boundaries of religious influence on civil government have been fought on the playing fields and in the classrooms of public education" (Alexander and Alexander 2000, 130). The First Amendment's protections of religious freedom, and more particularly the considerations pertaining to the establishment clause, were addressed in the court case *Santa Fe Independent School District v. Jane Doe, et al.* in 2000. Among the issues addressed by this case were the acceptability of "private speech." The establishment clause protects speech by not allowing the government to endorse religion in the form of public speech.

The *Santa Fe* case revolved around pregame prayers that were delivered over the public address system at

high school football games, administered by a student-elected student council chaplain. Two students—one Mormon and one Catholic—and members of their families objected to this use of prayer and filed suit under the establishment clause.

In deciding the *Santa Fe* case, the U.S. Supreme Court made its most definitive decision to date pertaining to prayer in public school sports. In a 6-3 ruling the court held that public school districts are not allowed to let public, student-led prayers occur at high school games. The ruling established that prayers such as those at issue in the *Santa Fe* case are, in fact, public prayers and are not properly considered private speech. The court felt that even though the prayers were delivered by an elected student representative, they filled the role of public, rather than private, speech.

The court's decision was guided by the decision in the court case *Lee v. Weisman* (1992). That case held that a graduation ceremony prayer led by a rabbi violated the establishment clause. The court held that the government is not to coerce people to participate in or to support religion or the exercise of religion and that if such coercion were to occur it would establish a state religion of sorts.

People have debated the role of the establishment clause and the free exercise clause. Many people feel that the abolishment of public prayer restricts people's right to freely exercise their religious beliefs. Such was the feeling of U.S. Supreme Court Chief Justice William Rehnquist in his dissent of the *Santa Fe* decision when he stated that the decision was flawed and contradictory. He stated that if that line of reasoning is used, even the national anthem would violate the First Amendment. The split in the court's opinion is illustrative of the larger split in the public concerning the issue of prayer. Furthermore, the *Santa Fe* case concerned the rights guaranteed by the free exercise clause. People such as Attorney Misti Weeks (2000) stated that the *Santa Fe* decision shut the door on true freedom of religion as guaranteed by the Constitution.

Some sports teams and organizations have attempted to maneuver around such court decisions. For example,

pression opens the door to a variety of problems, including dissention, resentment, and administrative and even legal concerns.

Concerns about the violation of constitutional rights, team disunity, individual isolation, and other issues have

schools have ignored such decisions, fought them, and tried to invoke their own policies. People probably will continue to battle, ignore, and subvert the *Santa Fe* decision.

Additional Issues

People need to address other issues that relate to school athletics and religion, particularly prayer in athletic settings—issues such as the risk of coercion, the risk of team conflict and disunity, and the risk of making students feel isolated and ostracized.

Coercion has been a major issue in prayer in athletics. Courts have ruled against practices that are coercive, but coercion can be a double-edged sword. Coercion has been addressed in settings such as school classes that include subjects such as evolution—subjects that may be in direct conflict with students' religious beliefs.

In addition to the presence of team prayer, concern has also been expressed over silent prayer and casual religious conversation. Though individuals may decide to take part in private, silent prayer, such actions may be objected to if it is endorsed by team or league representatives. Such prayer may be viewed as a violation of the First Amendment if it promotes religion.

Individuals should assess situations regarding tolerance and the acceptance in terms of the use of prayer and other forms of religious expression. Stifling religious ex-

pression opens the door to a variety of problems, including dissention, resentment, and administrative and even legal concerns.

Concerns about the violation of constitutional rights, team disunity, individual isolation, and other issues have caused administrators to shy away from the issue of prayer, but administrators, as well as athletes and coaches, need to address the issue rather than ignore it.

Prayer in sports is an issue of risk management. For example, denying people the right to pray could lead to litigation, as could leading a team prayer, game invocation, or other religious action. Indeed, the emotional and legal components of the issue of prayer in sports probably will create a tremendous "gray" area for some time to come.

Court Cases

- Santa Fe Independent School District v. Jane Doe, et al. 120 S. Ct. 2266 (2000).

Professionalism

The level of professionalism within sports relates to status behaviors associated with the formulation of class and social groups within sports and is affected by the following:

- Eligibility criteria and status traditionally associated with sports
- Moral ambiguity
- Amount of commercialism
- Development and change within the historical context

In current notions of sports eligibility, merit often defines status, although not in every national, social, or sporting context. There is a significant degree of difference when comparing the practicalities related to professionalism. What further complicates this is that over time the emphasis on elements of eligibility has changed.

What Is Professionalism?

Amateurism and the notion of the “gentleman” in sport became important at the turn of the twentieth century, particularly in Britain and the United States. The Henley-on-Thames Rowing Regatta was an annual

event that was patronized by the moneyed (or amateur) classes. The Henley Rowing Stewards were charged with ensuring the amateur and social standards of the event were upheld. The role of the Henley Rowing Regatta Stewards and the definition of eligibility criteria at the Olympic Games were crucial in separating notions of what constituted amateurism and, by extension, professionalism. The traditional notion of amateurism can be summarized in the following quotation:

An amateur oarsman or sculler must be an officer of her Majesty’s Army, or Navy or Civil Service, a member of the Liberal professions, or of the Universities or Public Schools, or of any established boat or rowing club not containing mechanics or professionals; and must not have competed in any competition for either a stake, or money or entrance fee, or with or against a professional for any prize; nor have ever taught, pursued, or assisted in the pursuit of athletic exercises of any kind as a means of livelihood, nor have been employed in or about boats, or in manual labour; nor be a mechanic, artisan or labourer. (Lowerson 1995, 159)

In current usage, the term *professional* often acts as a compliment, although the specific use of the term can provide insights into the changing position of the professional within society. For example, golf retains some moral values and qualities related to amateurism while remaining openly professional in organization.

The primarily English notion of the “gentlemen amateur” influenced the traditional Olympic notion of eligibility and, particularly, the status as described in the preceding quotation. The associations with the lofty ideals of muscular Christianity and the cult of athleticism developed within the English public schools during the late nineteenth century. The ongoing situation regarding the status and eligibility of athletes and performers was significant, in the sense that any infringements of the amateur code and its associated values usually resulted in banishment from competition. This was generally part of a haphazard process that emphasized the desirable aspects of getting involved in sport and doing so for the love of the game itself rather than

*It's not the load that breaks
you down, it's the way you
carry it.* ■ LENA HORNE

for any particular result or reward that may accrue. These values became subject to change and adaptation at an increasing rate, especially as capitalism began to dominate the political economy of sport. As different sports federations began to establish their own eligibility criteria, however, inconsistencies and problems became obvious.

The International Olympic Committee's (IOC) attempts to control this issue were not always successful. Certain Olympic presidents have been notable in their stances regarding the eligibility criteria within world sports.

- The founder of the modern Olympic Games and first hands-on president of the IOC, Baron Pierre de Coubertin, viewed sport as an end in itself. He believed that a person could not want more reward than to be able to participate in friendly and constructive competition within sports. This Corinthian ideal has looked increasingly dated once the different practices within affiliated nations became known, particularly following World War II.
- The American Avery Brundage, who served as IOC president from 1952 to 1972, was staunchly conservative in his views related to relaxing the amateur eligibility criteria. He even banned athletes for displaying sports logos on their clothing at the 1972 Winter Olympic Games in Sapporo, Japan. Brundage was a controversial figure because he displayed little flexibility in seeking to keep professionalism out of the games.

The situation regarding professionalism in different nations is directly related to how early in their histories each nation's sporting structure incorporated an openly commercial emphasis. The precursor to open acceptance of a professional emphasis is the development of a commercial dynamic within the sporting context. Each sport has been influenced by professionalism in very different ways; for a significant number of sports and activities, professionalism is not an issue because they have not developed commercially orientated structures. Comparing fencing, archery, and rifle shooting

with the more high-profile professional sports such as tennis, baseball, and football shows that the former activities have not developed a commercially dynamic structure. This has been affected by the level of television and media coverage different sports enjoy and, in turn, has precluded some sports from developing professionalism. The quadrennial Olympic Games remain the pinnacle for those sports that have not yet developed a commercial emphasis.

Current terminology suggests that something described as amateurish denotes that it is flawed or has obvious deficiencies. Notably, within sports reference it is occasionally made to a "model" professional, which refers to a talented player or competitor whose conduct on and off the field fits desirable values within society, invariably including fairness and politeness. Furthermore, reference is often made to the "professional foul" where cheating occurs in the interests of one's team. The inference is that the professional foul is not something likely seen from a model professional. However, we should guard against transposing the situation at the elite level of sports to all those who participate in and clearly enjoy their sports. For many fans and occasional players, the act of competing is still the main pleasure of sports. Sports provide a means of detaching and distancing ourselves from the workplace and its environment.

As sports performers participate in an event where revenues are generated, it is only a short step for them to demand recompense because those revenues depend on their involvement in the sport or activity. The process of change and adaptation within sports has been a slow yet inexorable one overall; however, the rate and acceptance of change has varied for different sports. In rugby, the split between the northern English clubs and the southern English clubs in 1895 led to the formation of two distinct sporting forms: a union of amateurs and a league of professionals. The eligibility criteria imposed by the southern amateurs were so strict that even playing on a rugby league pitch could lead to banishment from the union game. Given the fractured nature of class relations in late nineteenth century England, it is not surprising that attitudes hardened on both sides.

The difference between the impossible and the possible lies in a man's determination. ■ TOMMY LASORDA

Notably, almost 100 years following the split, the amateurs of the Rugby Union decided to open their sport and allowed professionals both on and off the field. There has since been an increasing amount of cross-fertilization between the codes. The importance of this example, however, relates to the timescale involved.

Practicalities

The exact relationship between the notion of professionalism and the development of commercialism within sports can be seen in the growth of professional organizations within the sports context. This process can be best described as the professionalization of the sporting structure. Many believe that amateurism within sports is still desirable. This is evident within the Olympic context, where the authorities still relate some of the robust and worthy qualities associated with amateurism to the ongoing Olympics project, even though the term *amateur* was officially removed from the Olympic Charter in 1972.

Professionalism as a concept that affects the sporting context was first developed during the early stages of commodification and codification of sports in the United States. The team owners and governing bodies were quick to emphasize the business and commercial aspects of sport, but professional players in the main team sports have only had a significant role in controlling their careers since the early 1970s. The anachronistic position of the reserve system was partly perpetuated by the antitrust exemption enjoyed by professional sports and by the paternalist position of many sports franchise owners. The development of sports as an integral part of U.S. culture (as well as the association of particular sports and pastimes with notions of American citizenship) gathered momentum following World War I.

The legal position of professionals in individual sports differs depending on the activity and even, on occasion, between athletes in the same sport. Their legal status often depends on what athletes must do to train and qualify for competition in their sports. This can depend on individuals such as a manager or promoter in boxing

or membership in a professional organization that restricts eligibility such as in golf or tennis. Professional sports make some pretensions to the notion of what constitutes professionalism within the wider society, with coaching certificates and a distinct language of technicality. As a distinct cash-flow dynamic develops, there is more open acceptance of commercial structures within sports. The lack of reverence associated with professionalism develops because the activity and its outcome are not ends in themselves. Traditionally, people are fearful of commercialism within sports because of an implicit belief that commercialism has the capacity to infect and destroy those institutions in which commercialism has become increasingly central to their culture.

The centrality of gambling within East Asian sports places the commercial dynamic at the center of why sports are popular. The increased injuries in the Rugby Union since 1995 provide an interesting example of how this shift can have a detrimental effect on the practicalities of sport. *Rugby World* magazine has estimated that the incidence of incapacitating injuries in the English Rugby Union has risen fivefold since the open acceptance of professionalism. Current research suggests that a player's livelihood can be affected adversely by not performing to a given standard. The implication is that a more professional emphasis in sports directly affects the practicalities of the sport itself. This example has significant implications for the players and the clubs, and, it can be argued, affects the ability of the sport to provide a spectacular product for the fans and spectators on television. Jonny Wilkinson's ongoing absence from England's international rugby team because of a recurring shoulder injury illustrates this issue. Of great concern is the reaction and attitude of younger, developing athletes because they must determine for themselves what is acceptable.

Including professional athletes in the Olympic Games provides noteworthy examples. At the 1992 Barcelona Games, the U.S. basketball "Dream Team," which included Larry Bird and Magic Johnson, signaled the end of amateurism as a philosophy influencing

Olympic eligibility criteria. Notably, and rather predictably in this instance, the competition was little more than a procession toward the gold medal for the U.S. basketball team. However, the concessions made to tennis professionals at Barcelona meant that the quality of competition improved significantly, which the media coverage reflected.

There are still differences in the practice of professionalism, with specific governing bodies of each sport determining their own rules and regulations. Although greater regulatory consistency within sports will remain an issue, it is not the biggest issue in this area. The status issue that underpins this topic and the significant influence of social control between the diverse groups within the sports context directly influence the development of amateur and professional practices. In many ways, the uneven distribution of revenues associated with professional sports forces a decline in the unpredictability of outcomes. This uncertainty remains vital to the success of sports and crucial to the revenues that sustain them. Without a broad range of uncertain outcomes, sports become predictable. The role of the amateur in sports is still significant, if only to provide some form of perceived moral strength and legitimacy for those professionals who, by implication, may have lost their moral direction and sense of sportsmanship.

Implications

Professionalism within sports remains only a minor dimension in the decline of amateurism, especially compared with the more comprehensive opposing force of commercialism. Significant differences between national cultures usually affect those values related to sport. The professional emphasis in sports has led to increasing specialization by athletes. The downside of commercialism, and the attendant concentration of revenues at the peak of sports, means that to achieve success and access the associated rewards, some participants may consider trying to enhance their performances by resorting to illegal means. The effect of such professionalism on the actual daily practice of sports varies. Yet, the influ-

ence of professionalism on sport is largely negligible—most participants will continue to remain involved because of their love of the game.

Psychology

The rapid evolution of individual and team sports, as one of the most popular human activities in modern society, has attracted the attention of researchers as well as practitioners in a variety of domains such as education, medicine, psychology, sociology, industry, and, more recently, molecular biology and genetics. Sport and exercise psychology is the scientific study of individuals and their behavior in sports and exercise contexts—the academic discipline and profession in which the principles, methods, and findings of psychology are applied to sports and exercise settings.

Sports as a worldwide cultural phenomenon has stimulated individuals to study its ancient roots, impact on human behavior, and contribution to human

*Your body hears everything
your mind says.* ■ NAOMI JUDD

development. However, formal sports such as basketball, boxing, soccer, and track and field are only part of active human life. Individuals also take part in other activities that demand physical and mental effort, such as scuba diving and mountain climbing. These individuals are searching for new adventures and challenges to meet their unique personal goals. Other individuals show interest in moderate physical activities such as yoga, Feldenkrais, and tai chi, or in recreational and leisure activities such as walking and fishing. Researchers and practitioners want to understand the motives for participation in these types of activities and their influence on the active participant's behavior.

The increased number of individuals who have become active in sports and exercise has led to other worldwide phenomena: The number of spectators who watch sports events, either at the stadium, gym, or pool or on their home TV screens, has increased dramatically, and large parts of the population—male and female and young and adult—now spend a great deal of time watching sporting events, many of them on a daily basis. Given that the annual number of national and international sport events has gradually increased, and that many of these events are frequently televised worldwide, many individuals from countries all over the globe have become addicted to watching sporting events. Researchers and practitioners are interested in studying why sport has become such a powerful attraction for sport spectators and have attempted to explore why, for many spectators, sport has emerged as a secondary or even a primary religion.

The physical activities of the body are planned, directed, and controlled by the human mind. Thus, biological and physical factors must be involved in any theoretical discussion aimed at understanding why individuals decide to participate in a sports activity or in any activity that requires exercise. Sport scholars agree, however, that psychological factors are also involved in the selection of the activity and in other decisions made by the individual that are related to the selected activity, such as the following:

- Number of activity sessions in which the individual participates
- Amount of time he or she spends on the selected activity
- Intensity level involved

The discipline of sport and exercise psychology attempts to study those psychological factors involved in sports and exercise, as well as in other modes of physical activity to understand the following:

1. *Why* individuals and groups are eager to invest so much time and energy in improving their kicking, jumping, running, throwing, and other sporting skills
2. *How* individuals who are involved in sports activities can enhance the physical, motor, cognitive, and social skills that are related to sporting activities

Scope

During the second half of the twentieth century, sport psychology began to emerge from its origins in the academic interests of physical educators. Slowly at first, and then ever more rapidly, sport psychology influenced elite sports and mass participation before expanding more generally into exercise and physical activity. Starting largely in Western countries known for their high involvement in sports, sport psychology has spread around the world, closely following the globalization of sport.

The discipline of sport and exercise psychology denotes a subcategory of psychology that focuses on athletes, exercisers, and physical activity participants. Researchers and practitioners aim to identify principles and guidelines that can be applied by professionals such as coaches, physical educators, consultants, and administrators in helping individuals benefit from the experience of sports and exercise. Sport psychology knowledge is applied to a broad range of individuals. Elite athletes have benefited from theoretical and practical knowledge in sport psychology, as have children, youth, disabled individuals, children-at-risk, seniors,

and individuals who participate in sports and exercise “just for the fun of it.”

Theoretical and practical knowledge in sport and exercise psychology is necessary for those involved in sport and exercise settings, as the following examples show:

- *Case 1.* Tom is an eighteen-year-old basketball player on a high school team. In the final games of the season, he did poorly when standing on the line; he made the basket only five of seventeen attempts. His self-confidence dramatically decreased, and he realized that poor free-throw performances would lessen his chances of playing for the team.
- *Case 2.* Natalie is a nineteen-year-old soccer player and a member of the college team. During her first year, she was highly motivated to excel. She performed well on and off the court and became a role model for the other players. However, at the start of the second year, she had lost her mental energy for playing. Her motivation was low; she missed many practices and arrived late at many others.
- *Case 3.* David is a forty-five-year-old pharmacologist. He had been working in a large firm and had become a manager of a large pharmacy store in his hometown. He knew most of his clients personally and used to spend a few hours each day talking to them. However, during the last several weeks, he preferred to be left alone in his office. He started to feel unhappy about his body and gained 15 kg during the last two years. Although he had started to exercise in the local fitness club, he did not lose any weight.

Sports and exercise psychologists could help the performance of these individuals and help improve their attitudes and mental outlooks.

Research, Teaching, and Consultation

Within sport and exercise psychology subdivisions, contemporary sport psychologists pursue and serve three major professional roles: conducting research, teaching, and consulting

RESEARCH

To advance theoretical and practical knowledge in the area of sport and exercise psychology, laboratory and field investigations have been conducted on a variety of issues, including the following:

- *Motivation in sports and exercise*—intrinsic and extrinsic motivation, achievement motivation, and attributions in sport
- *Psychological techniques for individual performance*—goal setting in sports, imagery, self-confidence, and self-regulations techniques
- *Skill acquisition*—feedback, attention, and developmental stages in motor learning
- *Psychological characteristics of high-level performance*—modeling, personality and the athlete, development of talent in sports, stress and anxiety, self-efficacy, and psychophysiology of sports and exercise
- *Exercise and health psychology*—physical activity and mental health, injury risk and prevention, and injury rehabilitation
- *Life-span development*—moral development and behavior in sports, career termination among athletes, and psychological considerations in youth sports

Research findings emerging from laboratory and field inquiries can be found in a variety of international scientific journals in sport and exercise psychology, including the following:

- *Journal of Sport and Exercise Psychology*
- *Journal of Applied Sport Psychology*
- *Sport Psychologist*
- *International Journal of Sport and Exercise Psychology*
- *Psychology of Sport and Exercise*

Scientific and applied texts on sport and exercise psychology are also widely available today for sport psychology students, professionals, and the public at large.

TEACHING

Academic programs in sport and exercise psychology exist in almost every country. Students can study courses

in many areas related to sport and exercise psychology, such as the following:

- Sports psychology
- Exercise psychology
- Psychology of coaching
- Applied sport psychology

These courses are taught at both undergraduate and graduate levels.

Certification in sport and exercise psychology can be obtained in only a few countries (e.g., Australia, Canada, Germany, and Italy). The reason for the low number of certification processes is that many countries have disputes about which organization may provide certification in sport and exercise psychology: Psychology departments within the academic institutions insist that the certification process should be under their academic representation, whereas the human movement departments believe that they should provide the certification process.

CONSULTATION

Athletes and coaches have become aware of the benefits that can be achieved by effective implementation of sport-enhancement psychological techniques such as imagery, goal-setting, focusing attention, and biofeedback. These techniques provide the athletes with instructions as well as training directions regarding the use of effective strategies during practices and competitions.

Sport psychology consultations are not only for the benefit of elite athletes. Clinical sport psychology consultations are available today for all athletes and exercisers, even those who develop serious emotional disorders such as depression and suicidal tendencies. Clinical sport psychologists are trained in clinical psychology but specialize in sport and exercise. In addition, educational sport psychology consultations are available for young athletes and exercisers as well as for school-age participants in physical activity. The main objective of these psychological consultations is to assist young sport participants in developing basic psychological skills, such as anxiety management, confidence development, and com-

munication. Another educational objective is to emphasize a fair play approach among competitive athletes and teams, as well as among spectators. Educational sport psychologists are not required to be clinical psychologists. Instead, they should have extensive training in sport and exercise science, physical education, and kinesiology. In addition, they are advised to take advanced classes in psychology and counseling.

Sport Psychology Societies

Interest in sport and exercise psychology can be found all over the globe. Interaction between sport psychologists from different countries is frequent, often occurring at scientific and applied conferences. A few active worldwide and continental societies provide professionals from different parts of the world with opportunities to exchange ideas, promote theoretical and practical knowledge, present new research findings, and seek new, effective interventions, strategies, and techniques.

INTERNATIONAL SOCIETY OF SPORT PSYCHOLOGY (ISSP)

ISSP, the major international professional organization for sport psychology, was founded in 1965 at the First World Congress of Sport Psychology in Rome to promote the development of sport and exercise psychology around the world through a wide range of activities. The principal activity of ISSP is the organization of the World Congress of Sport Psychology every four years. World Congresses have been held in Washington, D.C. (1968); Madrid (1973); Prague (1977); Ottawa (1981); Copenhagen (1985); Singapore (1989); Lisbon (1993); Netanya, Israel (1997); Skiathos, Greece (2001); and Sydney (2005). The *International Journal of Sport Psychology* (IJSP) was first published by ISSP in 1970. In 2003, the *International Journal of Sport and Exercise Psychology* (IJSEP) was established and became the major scientific communication of ISSP. The IJSEP provides an opportunity for sport psychologists from all over the world to publish their work and provides opportunities for communication, whether it is face-to-face or in print, and has been and remains the major

mechanism by which ISSP encourages the development of the field internationally. More information on activities and initiatives of ISSP can be found in its website: www.ISSPonline.org

ASSOCIATION FOR THE ADVANCEMENT OF APPLIED SPORT PSYCHOLOGY (AAASP)

AAASP is an independent, multidisciplinary organization of professionals and students interested in applied sport research and service. AAASP is the largest sport psychology organization in North America and encourages membership of professionals and students from around the world. The Association's annual meetings and publications (such as the *Journal of Applied Sport Psychology*, a biannual journal that focuses on empirical and applied articles highlighting the application of research to practice) provide a forum for discussion on applying psychology and sports science research to promote performance excellence in the athlete, the performer, and the person. See the AAASP website (www.aaasponline.org) for more information.

ASIAN SOUTH PACIFIC ASSOCIATION OF SPORT PSYCHOLOGY (ASPASP)

ASPASP is a relatively recent addition to the roster of regional organizations that aim to coordinate the development of sport and exercise psychology across a number of countries within a specific geographical area of the world. The mission of ASPASP is to promote sport psychology in Asian and South Pacific countries and territories. Among its purposes are to

1. Facilitate information, documentation, and dissemination services among members with respect to sport psychology,
2. Organize regular ASPASP congresses and support the organization of symposia devoted to topics in sport psychology,
3. Advise and facilitate the establishment of national societies of sport psychology.

For more information about ASPASP, contact Tony.Morris@vu.edu.au.

EUROPEAN FEDERATION OF SPORT PSYCHOLOGY (FEPSAC)

FEPSAC is composed of national societies for sport psychology in European countries; its mission is to

- Promote scientific, educational, and professional work in sport psychology;
- Maintain social and scientific relations between individuals and groups working in sport psychology;
- Encourage young scientists in sport psychology to be productive and active in the field.

FEPSAC organizes a European congress of sport psychology every four years, which is the most important scientific function of the federation. Visit the FEPSAC website (www.fepsac.org) for more information.

SOUTH AMERICAN SOCIETY OF SPORT PSYCHOLOGY (SOSUPE)

SOSUPE helps organize and lends its support to the various sport psychology congresses that occur in South America. The society also organizes introductory and advanced seminars for psychologists, physicians, physical education teachers, trainers, coaches, and physiotherapists. Most of the academic activities of SOSUPE relate to providing introductory courses in sport and exercise psychology and seminars in psychology of coaching. For more information on SOSUPE, contact lgrabin@psi.uba.ar.

The Future

Sport scientists and sport scholars have predicted that sport will continue to be a worldwide cultural, economical, and political phenomenon. Sports, as well as any other type of physical activity and exercise, will probably maintain and even strengthen its highly regarded status within the modern society. Therefore, researchers and practitioners in sport and exercise psychology will continue their quest to provide athletes, exercisers, and the sport community at large with updated theoretical and practical knowledge through the following avenues:

Success must be felt within before it can be seen on the outside. ■ UNKNOWN

1. Sport psychology will be actively marketed to professional athletes, professional teams, young athletes, and exercisers of all ages, particularly the middle-aged and elderly population.
2. Graduate programs in applied sport psychology will become accredited. More certification programs will be available for professionals in the future. These programs will enable professionals to provide athletes, coaches, teams, and exercisers with theory-based psychological services.
3. Technology will play a major role in the practice of sport and exercise psychology. More athletes and exercisers will use microcomputers and minicomputers to record their psychological responses before, during, and at the end of the activity, and to be provided with instant feedback and advice about enhancing performance.
4. Sport and exercise psychologists will emphasize a health-related approach. Particular interest will be directed to the youth and the geriatric populations, with attempts to promote healthy lifestyles in early years that will be maintained in later years when exercise often decreases.

Psychology of Gender Differences

In a television advertisement a few years ago young women argued that they would be better physically (have less risk of cancer and heart disease, for example), mentally (experience less depression), and socially (enjoy better grades, less teenage pregnancy, and greater career success) “if you let me play sports.” That ad indicates the corporate world sees females as athletes and athletic consumers. Moreover, a growing research base documents these claims and supports the many benefits of sport participation for women. Women’s sport participation has exploded in the last generation. Still, the numbers of female and male participants are not equal, and, more important, women athletes are not the same as men athletes. Gender does make a difference. To fully understand the psychology of gender in sport one must look beyond numbers, biological sex, simple sex differences, and individual differences between women and men to the powerful, gendered social context of sport.

Gender in Women’s Sport

The Olympic motto, “Citius, Altius, Fortius” (“swifter, higher, stronger”), calls attention to the physical and biological nature of sports. That motto also defines sport as competitive and hierarchical. So defined, sport emphasizes sex differences, but most scholars who take a feminist or social dynamics approach to gender and sport argue that sport does not have to be higher, faster, stronger—on the contrary, sport might call for fun, flair, and friendship.

Gender is a key feature of social context and social processes in sport. Gender varies with culture, and in fact, culture defines gender. Although biological sex is innate, all the meanings, social roles, expectations, standards of appropriate behavior, and ideas of beauty, power, and status are created by culture. Women are not born to wear high heels or high-top sneakers. And gender also varies with other cultural categories. For

example, in the United States, field hockey is almost entirely a women's sport whereas in India field hockey is largely a men's sport, and in Australia and New Zealand both women and men play.

To illustrate the influence of gender on social context, consider how gender affects interpretations, responses, and the possible approaches to the following athletes:

- A soccer player who lacks control and is prone to angry outbursts,
- A basketball player who is tentative and lacks confidence, and
- A sixteen-year-old figure skater with signs of an eating disorder.

Would a coach, sport psychologist, trainer, or parent behave the same with a female as with a male athlete? Trying to be nonsexist and treat everyone the same ignores the powerful influence of gender. Gender is so pervasive in society that it is impossible to pinpoint that influence. Sport is no exception, and anyone seeking to understand the psychology of women in sport must consider gender influences in the larger society and within the sport world.

Sport Psychology Research

Research on gender in sport psychology largely follows gender research within psychology. Generally, that research has progressed—from sex differences, to an emphasis on gender role as personality, to the more current social psychology model that emphasizes social context and processes.

SEX DIFFERENCES

The early sex-difference work, summarized in Eleanor Maccoby and Carol Jacklin's classic 1974 review, assumed dichotomous biology-based psychological differences—male and female are opposites, and in practice we should treat males one way and females the other way. Today, however, most experts hold that psychological characteristics associated with females and males are neither dichotomous nor biology-based, and that even most biological factors are not dichotomously divided either.

For example, while the average male basketball center is taller than the average female center, the average female center is taller than most men.

For psychological characteristics such as aggressiveness and confidence, even average differences are elusive, and the evidence does not support biological dichotomous sex-linked connections. Serious criticisms of the sex-differences approach were made, and the failure of this approach to shed light on gender-related behavior led psychologists in the 1970s to turn to the study of personality.

PERSONALITY AND GENDER-ROLE ORIENTATION

Psychologists focused on gender-role orientation as the relevant personality construct, with Sandra Bem's 1978 research leading the way. The basic proposition was that gendered personality is *not* a function of biology. Instead, both males and females can have masculine, feminine, or androgynous (both) personalities. Advocates of androgyny argued that "masculine" and "feminine" personalities should be encouraged in all people. However, the masculine and feminine categories and measures were widely criticized as imprecise, and in a 1993 book Bem herself moved to a more encompassing gender perspective. However, most sport psychology gender research is still based on her early work.

Overall, this research suggests that women athletes possess more masculine personality characteristics than do women nonathletes. This conclusion has been criticized as not particularly enlightening. Sport, especially competitive athletics, demands goal-directed assertive behaviors, and the higher masculine scores of female athletes probably reflect an overlap with competitiveness. Today most psychologists recognize the limits of earlier sex-differences and gender-role approaches, and look beyond the male-female and masculine-feminine dichotomies to social processes for explanations.

For example, gender issues emerged in 1993 research by the author that used a multidimensional measure (competitiveness, win, and goal orientations) to examine competitive orientations. As might be expected,

Tough-guy boy football players.*Source: istockphoto.com/ pbcpa.*

males were more competitive than females in almost all the samples tested. Male college and high school students were more competitive, and especially higher on win orientation, than females, but females were just as high, and sometimes higher, on goal orientation.

Research on high school students who participated in competitive sports, non-competitive sport activities, or nonsport activities showed similar results. Boys were more likely than girls to participate and have experience in competitive sports, but girls were just as likely or more likely to participate in noncompetitive sports and nonsport activities, and scored as high or higher on general achievement orientation. Overall then, the gender differences in competitiveness did not seem to reflect either achievement orientation or an interest in sport and physical activity per se, but a specific emphasis on competitive, win-oriented sport competition.

Extension of the research to intercollegiate men's and women's athletic teams, elite athletes in Taiwan, and ultramarathoners found the same trend. Athletes were much higher than nonathletes on all scores, and overall men were higher than women on competitiveness and win orientation. But those gender differences were minimal with the athletes. The women athletes were higher on competitiveness than male nonathletes and similar to men athletes. Gender differences were greater for nonathletes. Similarly, in Taiwan, intercollegiate athletes were higher than nonathlete students, and international caliber athletes were even higher. Moreover, gender differences were minimal in Taiwan.

The ultramarathoners, a unique sample in many ways, were competitive, extremely high on goal orientation, but quite low on win orientation in comparison to other samples. And there were not the same gender differences as in the other groups. In fact, the women ultra-

marathoners were slightly higher than the men on competitiveness and win scores.

Overall, the gender message from the competitive orientation work is that experience and opportunity have a much greater influence on competitive orientation than does gender. When women and men have similar sport experiences, the competitive orientation is similar. But the catch is that women and men rarely have similar sport experiences, even when it appears that they do.

GENDER AND SOCIAL PROCESSES

In the 1980s gender research moved away from the sex-differences and personality approaches to a more social approach that emphasized gender beliefs and stereotypes. The basic proposition was that how people think males and females differ is more important than how they actually differ. Although actual differences between females and males on such characteristics as independence and competitiveness are small and inconsistent, people maintain their stereotypes. People

If a woman has to choose between catching a fly ball and saving an infant's life, she will choose to save the infant's life without even considering if there are men on base. ■ DAVE BARRY

often exaggerate minimal differences into larger perceived differences through social processes. These perceptions exert a strong influence that may lead to further gender differences. This cycle reflects the feminist position that gender is socially constructed.

These persistent gender beliefs and stereotypes are found everywhere. Socialization pressures are pervasive and strong and begin early. Parents, teachers, peers, and societal institutions treat girls and boys differently from birth. Overall, differential treatment is consistent with producing independence and efficacy in boys, and emotional sensitivity, nurturance, and helplessness in girls.

Sport confidence provides a good illustration of the role of social context. Considerable research suggests that females typically display less confidence than males across varied situations (and sport is certainly one of those situations). Ellen Lenney, in the 1970s, concluded that the social situation was the primary source of gender differences—specifically, that gender differences emerged with masculine tasks in competitive settings when clear, unambiguous feedback was missing. Several studies with motor tasks, and some of the author's own research, confirm Lenney's propositions. But all this research involved experimental studies with novel motor tasks in controlled lab settings that purposely stripped away social context. In the real world sport is typically seen as masculine, competition is the norm, and males and females develop their confidence along with their sport skills and behavior patterns through radically different experiences and opportunities—in different worlds.

If experience and opportunity are the keys to competitive orientation and, in turn, participation and behavior in physical activity, then we might expect few gender differences after more than thirty years of mandated nondiscrimination. The number of girl's and women's sport teams in public schools has exploded since 1972, and we see athletic shoe ads promoting the benefits of sport and exercise activities for girls and women. But the real world with its pervasive gendered social context continues to exert strong influence on both women and men in sport. The real world, and par-

ticularly the real world of sport, is not gender-neutral. According to noted sociologist Jessie Bernard in her 1981 book, women and men live in different worlds, even when the situation seems to be the same. For example, the world is different for starting centers on the men's and women's basketball teams, for the boy and girl pitching the Little League games, and for the woman and man jogging in the park. The real worlds of sport are gendered.

Although the number of females in high school and university athletics has increased about six-fold since 1972, to about one-third of the total number of participants, the numbers are not equal. More telling, the numbers of females in other sport roles has not increased so dramatically, and in several ways women and girls have lost ground. Most dramatically, the number of women coaches and athletic administrators has decreased since Title IX. Competitive sport retains a gendered, hierarchical power structure. And it maintains the emphasis on and channels resources to competitive, elite sports, reducing the options and alternatives for both females and males.

Even a casual review of media reports on sport reveals gender influence, and research evidence confirms the bias. Females received less than 10 percent of the media coverage in terms of column space, photographs, and television time. Moreover, coverage is different; athletic ability and accomplishments are emphasized for men athletes, but femininity and attractiveness are emphasized for women athletes. For example, a *USA Today* report on figure skating (20 March 1997) opened with the line, "Tiny Tara Lipinski, figure skating's high-jumping sweetheart, can become the youngest world champion in history Saturday." The emphasis on young and petite contrasts with an accompanying photo insert caption reporting that Elvis Stojko (the male skater) hits quad, triple jump, and wins his third world title.

Observations of recent Olympic and NCAA tournaments suggest less stereotyping and trivialization of female athletes, but institutional change is slow and overall, gendered beliefs seem alive and well in the sport

Psychology of Gender Differences

The Girl and Her Recreations

The following excerpt describes an early attempt to explain the differences in recreational patterns between girls and boys.

Some manifest differences have been noticed between the relation to play of women and girls and that of men and boys. Some plays are more natural to boys than to girls, possibly because of the fact that the fighting element does not enter into the play of girls. This is decidedly a boy trait, and comes perhaps from the early days when men engaged in battle while women superintended the work of the home. The team game has its place, however, in the sports of girls,—not for competitive excellence, but for that association and co-operative play which shall prepare the players for the place in social life which women are more and more destined to fill. Woman's place in athletics and physical education is also different from man's, for many of the more strenuous exercises helpful to men are not recommended for women, Elizabeth Burchenal, prominent in the physical education of girls in New York City, recommends as sports for women: Basket-ball, indoor baseball, field-hockey, tennis, golf, walking running, climbing, skating, horseback riding, snowshoeing, skiing, paddling, and

coasting. At the same time she discourages participation in track athletics and record contests. Most women, however, are inclined to take too little physical exercise of the exhilarating sort. Our American girls need to cultivate that hearty love for the athletic which is shown in English women who walk miles for the love of walking "hike" are antidotes to the headaches caused by poorly ventilated rooms, and melancholia yields to the healthful association with congenial companions in the recreational life.

Noting the further difference between girls and boys in relation to amusement, it is of value that we see the kind of organizations into which girls combine. According to Dr. Sheldon, girls form three times as many secret societies as boys, five times as many social societies, three times as many industrial, twice the number of philanthropic, and three times as many literary societies, but only one-fourth as many predatory, and one-seventh as many athletic societies. Physical activity is found prominent in only ten percent among the boys. The study of the voluntary organizations of boys and girls shows that the two sexes seldom organize themselves together.

world. Sport activities are gender-stereotyped, and the sex-typing of sport activities seems linked with other gender beliefs (for example, physicality). Stereotypes are of concern because people act on them and thereby exaggerate minimal gender differences and restrict opportunities for both females and males. Overt discrimination is unlikely, and participants may not recognize the influence of gendered beliefs in themselves or others. Both girls and boys can participate in youth gymnastics or baseball, and at early ages physical capabilities are similar. Yet children see female gymnasts and male baseball players as role models, peers gravitate to sex-segregated activities, and most parents, teachers, and coaches support "gender-appropriate" activities for children. Similarly, many sport administrators and

participants fail to recognize gender beliefs operating when athletic programs developed by and for men, stressing male-linked values and characteristics, are opened to girls and women.

So the research does not support dichotomous sex differences; males and females are not opposites. But women and men are not the same and gender cannot be ignored. Gender is part of a complex, dynamic social network, and a particularly salient, powerful force within sport. Clearly, recognition of gender and diversity is critical to effective sport-psychology practice.

Sport-Psychology Practice

Applied or practical sports psychology involves using psychological principles and methods to enhance sport

performance or make it more meaningful. The gender social process approach to gender differences in sport has encouraged what can be called a feminist approach to applied sport psychology. Feminist practice incorporates gender research, emphasizes often ignored women's experiences (for example, sexual harassment), and takes a more nonhierarchical, empowering, process-oriented approach that shifts the emphasis from personal change to social change.

The feminist approach suggests going beyond gender awareness in the scenarios presented earlier. An aggressive soccer player could be male or female, but a male soccer player is more likely to grow up in a world that reinforces aggressive behavior, and a male athlete is more likely to continue to have such behaviors reinforced. The less aggressive, more tentative approach is more typical of women. Even talented, competitive female athletes are socialized to keep quiet, be good, and let others take the lead. Moreover, most women athletes have a male coach, trainer, athletic director, and male professors, and deal with males in most other power positions.

Overly aggressive, uncontrolled behavior is not exclusively male, nor are tentative styles exclusively female. Still, gender-sensitive sport psychology will work more effectively if gender influences in the athlete's background and situation are recognized. Anger control or confidence building has a different context, and probably requires different strategies for women and men. Behavior is not just within the athlete, but within a particular sport context, and within a larger social context, and both the immediate situation and the larger context are gender-related.

Consider a scenario with clear gender implications—a figure skater with a potential eating disorder. Information on psychological disorders and diagnoses indicates that females are nine times as likely as males to exhibit anorexia or bulimia. Moreover, the incidence is increasing, the disorders are more prominent in adolescence and early adulthood, and participants in certain activities, including dance and sport, may be at higher risk. The figure skater is much more likely to be female than male (as well as white, middle-to-upper-

middle class, and adolescent). But personality and gender are not the only considerations; eating disorders are social phenomena and body image plays a major role. Those who take a more active feminist approach suggest that professionals might move to social action—by educating others and trying to change the social system that leads athletes to pursue an unhealthy body image.

The Future

Gender makes a difference. Gender is a pervasive social force in society, and the sport world reflects society's gender hierarchy. Gender is so ingrained in sport structure and practice that we cannot simply treat everyone the same. But neither can we assume that women and men are dichotomous opposites and treat all males one way and all females another way. Gender is a dynamic influence that varies with the individual, situation, and time, as well as with sociocultural characteristics.

Race Walking

Walking is commonly known as a low-impact form of aerobic exercise that's enjoyed by millions of people. It is also a competitive track and field event as race walkers compete in local 5Ks, college track meets, the Olympics, and ultramarathons.

Early Years

Competitive walking traces its roots back to eighteenth-century England. One notable "pedestrian," as they were called at the time, was Foster Powell (1734–1793), who twice walked from London to York and back, a total of four hundred miles, in less than six days. Powell, who wore knee-length breeches, a jacket, and buckled shoes and drank brandy and water for sustenance, also clocked one hundred miles in twenty-one hours and twenty minutes.

Another famous early pedestrian was Captain Robert Barclay (1779–1854), who, in 1809, accepted a challenge to walk one thousand miles in one thousand hours. Barclay rented a house in Newmarket, a town north of London, measured out a one-mile path through the heath, installed gas lamps to light his way at night, and walked that path once an hour. After each loop, he'd retire to his room to rest, eat, and be administered to by doctors. Thousands of people gathered, from dukes and earls to commoners, to watch the Scotsman, who had lost thirty-two pounds during the effort, walk the final mile. Barclay won the bet, earning the equivalent of twenty years' income in just under

forty-two days in what was hailed then as the “greatest ever sporting event.”

In America, Edward Payson Weston (1839–1929) was the most famous walker. He had bet that Abraham Lincoln would lose the 1860 election. When Lincoln won, Weston made good on his bet by walking from Boston to Washington, D.C., in 1861 to witness the inauguration. Although he arrived in the capitol several hours after the event, that walk launched his career as a professional pedestrian. He went on to earn \$10,000 in 1867 for walking from Maine to Chicago in a month. Weston, who never walked on Sundays, trekked from coast to coast several times, earning thousands of dollars each time. He even had a business sponsor: the makers of Weston Heel and Toe Walking Socks. Up into his seventies, he was still walking long distances, including a sixty-day walk from New York to Minneapolis at the age of seventy-four.

These solo feats led to races between multiple competitors. Of note are the numerous Six Day Races that took place on indoor tracks. The winner was the person who walked the most miles over the course of six days. These events drew thousands of spectators, many of whom had wagered on the outcome. Bands provided live music as walkers logged more than five hundred miles. These races were a top spectator sport in Europe and America during what’s now known as the “Pedestrian Age” (1860–1903).

Twentieth Century

During the 1900s, the sport of walking lost its spot as a popular spectator sport and became more formalized

with international competitions and rules. Two walking races were added to the 1908 Olympics with Brits taking home five of the six medals. Four years later in 1912, a Canadian won the one Olympic walking race and the International Amateur Athletics Federation (IAAF), the organization that governs international walking events, established a Walking Commission to develop rules for the sport.

There are two rules in race walking: one foot must always be touching the ground and the advancing leg must remain straight while striding forward. These rules are designed to make sure competitors are walking and not running. During official events, between five and nine judges closely watch the walkers. If a judge sees a loss of contact with the ground or a bent knee, the judge cautions the athlete either verbally or by holding up a card or paddle. If three different judges warn the same competitor, that athlete is disqualified.

Race walking differs from ordinary walking. The arms are bent at the elbows and pump back and forth while the hips are pushed forward to gain extra inches with each step. This unusual-looking stride earned walkers the name “wobblies” in the nineteenth century. Still today unflattering things are said about race walkers. A *Sports Illustrated* writer reporting on race walking at the 2000 Olympics wrote, “It isn’t fast. It isn’t graceful. It isn’t even natural. It’s a Fourth of July picnic event.” However, journalists in countries that win walking medals don’t dismiss the sport. The Greek press lauded Athanasia Tsoumeleka’s gold in the 20K in 2004; one article in the *Athens News* hailed her and a medal-winning female hurdler as “Greco-Girl power at its best.”

Race Walking

Endurance Records

In the 1800s race walking often took the form of endurance contests in which a single walker would walk for many hours back and forth over a short course. The following is a newspaper announcement of an upcoming endurance walk to be performed by the well-known pedestrian, Mrs. Bentley.

In our last we stated that Mrs. Bentley has arrived in town, and would perform a pedestrian feat in a few days, but her agent not furnishing the information, we were unable to say where. It was announced in one or two of the morning papers, at the close of last week, that the female pedestrian would perform the laborious feat of walking thirty consecutive hours, without rest, at the Broadway tabernacle, commencing at 4 o'clock, Monday evening, April 27th, and closing at 10 o'clock Tuesday evening, the 28th. She commenced the feat at the appointed time, under the care of Mr. And Mrs. Post, of Ohio, her attendants, and walked through the night, and up to our present writing—late Tuesday afternoon. She is, however, greatly fatigued, and illustrates the peculiar and manifest effect upon exhausted nature, by outward circumstances such as the elivening music of the band, the cheerful conversation of friends, and other seductive influences. We have but little doubt but that she will succeed in completing the thirty hours, as she is a woman of proverbial fortitude and untiring energy.

Walking races range in distance from 1,500 meters to 50,000 meters and take place on indoor tracks, outdoor tracks, and roadways. College athletes typically compete in three-kilometer and five-kilometer races while twenty kilometers and fifty kilometers are the standard distances in men's international events and ten kilometers

and twenty kilometers the standard for women. The men's 50K is the longest event in the Olympics, outdistancing the running marathon by five miles. The first Olympic 50K in 1932 was walked in four hours and fifty minutes. By 1992, the winning time was three hours and fifty minutes, a full hour less.

From walking's first Olympic showing in 1908 through the 2004 games, Russia, Great Britain, Italy, Germany, Mexico, and Sweden have claimed the most medals in the men's events. Repeat winners include Italy's Ugo Frigerio (two golds in 1920, a gold in 1924, and a bronze in 1932), Russia's Vladimir Golubnichiy (a gold in 1960, bronze in 1964, gold in 1968, and a silver in 1972), and most recently Poland's Robert Korzeniowski, who won three straight 50K races (1996, 2000, and 2004) and also won the 20K in 2000 in record-breaking time. Women's races entered the Olympics in 1992, first as 10Ks and then lengthened to 20K in 2000. In the first four Olympic contests for women, China won one-third of the medals. Race walking world championships have been held every other year since 1961 for men and 1979 for women. Walking races are also held during regional competitions such as the Asian, European, and Pan American Games. Since race walking entered the Pan American Games in 1984, Mexico has dominated both the men's and women's events. Two standout American walkers are Ron Laird, the four-time Olympian who won sixty-five national championships, finished third in the 1967 and 1973 world championships, and wrote an early textbook on race walking, and Larry Young, a two-time Pan American gold medalist and the only American to win two Olympic medals, taking the 50K bronze in 1968 and 1972.

The Future

The future will likely bring more controversies about how race walking events are judged. In the 2000 Olympic games, Mexico's Bernardo Segura crossed the 20K finish line first, completed a victory lap, and was being interviewed when the judges notified him that he had been disqualified. In the women's 20K that same year, the first three athletes to enter the stadium for the

final stage of the race were disqualified before the finish line. The possibility of using video cameras or installing an electronic device on the competitors' shoes to detect loss of contact with the ground may become a reality by the 2008 games when walking begins its second century as an Olympic sport.

Racism

The term *racism* is used widely and in many cases loosely in accounts of world sport. This is one reason why it matters. It is often associated with many other terms, most notably, *race*, *racial*, *ethnicity*, *multiculturalism*, *multiracial*, and *discrimination*. The literature and research on racism in sport is also dominated by the use of certain terms such as *black*, *white*, *Afro-Caribbean*, *African*, *African-American*, *Asian*, *people of color*, and many other terms that are used in campaigns to symbolize and assert differences between people in sport and in other areas of life (Coakley 2003, Eitzen 2003, Jarvie 2002). The terminology is in constant flux, and historically the generic term black has at times included and excluded different groups of people. There is also instability in the capitalized “Black” and “White” that has served as a reminder of the historical and social fluidity of the terms while at the same time being used to distance discussions of racism in sport from the logical and historical fallacy of treating “racial” terms as if they were natural categories. In the literature about racism and sport, the term racism then very specifically refers to a belief system or systems that sustain racial-

ism, often linking certain characteristics with negatively valued social, psychological, or physical traits. Racism in sport is often closely linked to notions of prejudice and the unequal distribution of power resulting from racist behavior. It is crucial not to generalize and in this sense it is important to be aware of *racisms*.

Influences of Racisms

Racisms in world sport have shaped both the literature and practice of sport in a number of ways (Bass 2002, McRae 2003, Plowden 1996, Remnick, 2000). The following introductory list includes some but not all of the most prominent areas of print, discussion, legislation, and injustice:

- In the period of *apartheid* sport in South Africa from 1948 to 1992, specific racial legislation that separated the practice of sport by racial groupings gave rise to the international slogan, “You cannot have normal sport in an abnormal society.”
- The practice of *colonialism* in many parts of the world formed the backdrop to sporting relations between many countries. For example, during the 1960s and 1970s the cricket rivalry between England and the West Indies reflected racial tensions and racism rooted in years of colonial struggle. Terms such as *White Wash* and *Black Wash* were used to refer to English or West Indian victories, while at the same time, sport took on the mantle of symbolic colonial/anticolonial struggle not only in the rivalry between the two teams, but also in the selection of the West Indian cricket team, as is explained in C. L. R. James’s (1963) classic period account of West Indian cricket, *Beyond the Boundaries*.
- The popularity and worldwide coverage of sport has meant that *sport as vehicle for protest* has been a successful medium for drawing attention to racism—in the treatment of black Americans as second-class citizens in the United States and in American sport, for example, by the “Black Power” protests at the 1968 Mexico Olympic Games; or the extent to which Aborigines or Inuit peoples have been marginalized

Racism is not an excuse to not do the best you can. ■ ARTHUR ASHE

in mainstream Australian or Canadian sport, for example, by the fact that much of the coverage of the 2000 Sydney Olympic Games revolved around the coverage of the 400-meter Olympic gold medalist Cathy Freeman and the plight of Aborigine's living in contemporary Australia.

- Legislation such as the Race Relations Acts of 1976 and 2004 in Britain provides the legal machinery of the law to investigate and act against racism in all walks of life in Britain, including sport.

SYMBOLIC MILESTONES

Equally, there are important historical moments that can symbolize a prejudice, a protest, an ideology, or a breaking down of barriers. Historically, sport has been racist, but it has also provided some of the most poignant anti-racist moments. In 1881 Andrew Watson became the first black player to play football (soccer) for Scotland. In August 1936, Jesse Owens won an unprecedented four gold medals at the Nazi Olympic Games in Berlin. Two years later, Joe Louis crushed Max Schmeling to signal the end of white supremacy in boxing.

In 1967 Muhammad Ali, boxing's world heavyweight champion, condemned the war in Vietnam, arguing that he did not have any quarrel with the Vietcong. One year later, in October 1968 three American black athletes protested from the Olympic medal rostrum against the treatment of black people in America and elsewhere, notably South Africa. Evonne Goolagong Cawley became the first aboriginal Australian to play in a Wimbledon tennis final in 1971, four years before Arthur Ashe became the first black American to win the Wimbledon Men's Tennis Championship in 1975.

In 1995 Nelson Mandela, following South Africa's victory in the rugby's World Cup, talked of sport as a force that could mobilize the sentiments of a people in a way that nothing else could. Three years later, when Zinedine Zidane lifted the football (soccer) World Cup for France, the French president talked of the French team as being symbolic of the new multiracial integrated France. In 2001 Pele, arguably the world's greatest footballer (soccer player), endorsed a worldwide

antiracist campaign in his sport, saying that racism is cowardice, and cowardice comes from fear, a fear of difference. In February 2002, Vionetta Flowers became the first African-American to win a gold medal at the Winter Olympic Games.

Forms of Racism

The popularity and social significance of sport has meant that it often has been influenced by a multitude of racial contexts and tensions at different points of time in different parts of the world. Sport itself has had to address and think about challenging specific problems emanating from at least three forms of racism. *Structural racism* refers to racism embedded within the history of societies and the extent to which this structural racism has had an impact on sport. Factors commonly associated with structural racism include gaps between different racial and ethnic groups in terms of income, education, health, and employment. *Institutional racism* refers to the practices and procedures within sport that discriminate against people. Areas commonly associated with institutional racism in sport include the gaps between different discriminated-against groups in terms of holding positions of influence and power in sport or the extent to which tensions between different groups become visibly crystallized at sports events because of institutional racist practices and procedures. *Individual racism* refers to the actions and attitudes of individuals toward members of ethnic or racial groups. Such actions and attitudes support and often reproduce discrimination and racism through sport.

Racism and Ethnicity

There is no simple answer to what constitutes racism and yet it is important not to confuse the two terms *racism* and *ethnicity*, which are often used interchangeably. Both ethnicity and racism have been used in a multitude of ways. Even those who argue that ethnic minorities are united by a common experience of racism often fail to be sufficiently alert to the diverse ways in which racism has an impact on different social divisions in sport.

Native Americans as Mascots

Resolution to eliminate the use of depictions of and cultural references to American Indians as mascots, logos, and team nicknames in Wisconsin public schools.

WHEREAS, The Great lakes Inter-Tribal Council, Inc., is a consortium of twelve federally recognized Indian Tribes native to the region of the North American continent and the area around Lake Superior; and

WHEREAS, the strength of GLITC lies in the resolve of the tribes to be independent, yet to come together in a unified forum to address those issues which require intertribal unity and attention, and

WHEREAS, “Indian” mascots and logos are offensive, disrespectful, and demeaning; “Indian” logos mock Indian people, cultures, and traditions; “Indian” logos contribute to a societal environment that is racist, oppressive, and harmful to harmonious relationships between people; and

WHEREAS, all children in schools depicting “Indian” stereotypes are encouraged to tolerate, perpetrate, and maintain racist practices against a group of people, and

WHEREAS, children in Wisconsin schools have been exposed to this form of racial, ethnic discrimination since the early 1920’s, and continue to be exposed to such racism today, although other forms of stereotyping such as blackface minstrel shows have long since disappeared from the American landscape, and

WHEREAS, the presence of these symbols in state-supported schools, at the expense of Indian and non-Indian taxpaying constituents constitutes state-supported racism, and

WHEREAS, appropriate means of recognizing Native American people exist through teaching Native American history accurately, by treating Native American students with the same respect afforded other students, and by removing “Indian” mascots and logos, and

WHEREAS, Native American Indian Tribes and other organizations have voiced their condemnation of such images by adopting similar resolutions, providing education, and taking political action.

NOW THEREFORE BE IT RESOLVED, the Great Lakes Inter-Tribal Council, condemns the use of “Indian” logos as offensive and will work alone and in concert with other organizations to eliminate the use of depictions of and cultural references to American Indians as mascots, logos, and team nicknames in Wisconsin public schools.

BE IT FURTHER RESOLVED, that this form of racism which damages Native American children and cultures be removed from Wisconsin Public Schools before the new millennium.

The case of Hassiba Boulmerka—a much loved Arab-African sportswoman who was forced at a particular point in her career to leave Algeria for France in order to escape a backlash from Muslim zealots—may be illustrative. Winner of the women’s 1,500-meter final at the 1991 World Athletic Championships, Boulmerka became the first Algerian, first Arab, and first African woman to win a gold medal at any world athletic championship. On her return to Algeria, the then-president, Chadli Benjedid, greeted her as a national heroine. But Muslim zealots denounced her from the pulpit for bar-

ing her most intimate parts (her legs) before millions of television viewers. President Benjedid was himself publicly denounced for embracing a woman in public. The row at the time underscored the clash between modernity and Islamic fundamentalism. It was a clash that was all the more surprising given Algeria’s position in the Arab world as the torchbearer of modernism, socialism, and the successful struggle for independence from colonial rule. Hassiba Boulmerka moved to France, and Islamicists lost an opportunity to promote national unity in Algeria during the early 1990s. What

is the best way to study this event, from the standpoint of ethnicity or gender or colonialism or racism—all of which would only provide a partial explanation?

The “New Politics” of Race

Mention must also be made of what came to be called in the early 1990s the “new politics” of race and racism. A number of commentators suggested that while black physical prowess had in the 1990s been acknowledged and exploited as a fertile zone of profit within American society, the symbolic dangers of black sporting excellence needed to be highlighted (Cashmore 1997, Dyson 1994, Markovits 2003). Because of the marginalized status within the overall sphere of American sports, black athletic activity, argued Dyson (1994), often acquired a social significance that transcended the internal dimensions of the game, sport, and skill. Black sport then becomes an arena for testing the limits of physical endurance and forms of athletic excellence, while repudiating or symbolizing the American ideals (often mythical) of justice, goodness, truth, and beauty. It also becomes a way of ritualizing racial achievement against socially or economically imposed barriers to sporting performance. That is to say that many sports celebrities or athletes of color may be equal when they line up at the start of an Olympic final, but the social, economic, political, and emotional struggles that any given athlete has to overcome to get to that final are far from equal.

There is a danger too in celebrating uncritically any black or other sports industry. The question that is posed in both Hoberman (1997) and Cashmore (1997) is whether there can be such a thing as an authentic black sports culture when so many white-dominated corporations control the sports industry that produces it. Is this a form of institutional racism? In developing a history of black culture in the West from 1960s to the present, Cashmore (1997, 172–181) argued that inflating the value of a commodified black sports culture may actually work against the interests of racial justice. Black entrepreneurs, when they have reached the top,

have tended to act in much the same way as their white counterparts in similar circumstances. They failed to destabilize the racial hierarchy and yet remained part of an African-American elite. Add to this the fact that Arthur Ashe used to be critical of any policy that specifically channeled minorities into particular sports because it often closed off other channels of social mobility. In that same year, Ashe pointed out that of the 3 million black kids in America who committed themselves to the athletic dream, only 900 managed to make a professional living from sport. Thus the “sport as a field of dreams” thesis has to be qualified because for many it can lead to dangerous fantasies.

Empirically, there is also the danger of overstating the athletic, physical dominance of black athletes in American sport. Statements such as those made by John Hoberman in *Darwin’s Athletes: How Sport Has Damaged Black America and Preserved the Myth of Race*—that “there is not a white star left in the National Basketball Association” (1997, 64) or that “the idea of a white quarterback in today’s National Football League” (1997, 85)—have to be treated as historically specific to a particular year or phase or even sport. Both statements, several years later, are untrue, with Jason Sehorn, the white defensive back of the New York Giants up until March 2003, being known for his natural athletic ability, while a white player, Brent Barry, won the 2002 National Basketball Association’s annual slam dunk competition, the league’s purest test of exuberant physical creativity. The influx of white European stars into American basketball has also offered renewed evidence that athletes are produced by complex cultural, social, and physical interactions and not simply racial differentiation. Thoughtful black and white players have taken the occasion to dispel racial/ethnic myths. At the end of the 2001 season, Chris Webber said of Turkish guard Hidayet Turkoglu, “This summer I am taking Hedo the hood with me to play. By the end he will be the god of my hood” (Markovits 2003, 153). Of course to the extent that such claims perpetuate the stereotype, the white player’s brilliance can only be viewed in

the context of black athleticism. The point guard Jason Williams was dubbed “white chocolate” to reflect what was seen as an element of African-American improvisation in his style. Yet the point to be made is that such examples may belong to transitional stages of hybrid sports that may eventually dissolve rather than reinforce notions of racial differentiation.

At times it may be useful to think of forms of racisms in sport in terms of the politics of identity and differences. First, there is racism as legitimizing identity produced by the dominant institutions of society aimed at extending and rationalizing their domination. Second, there is racism as resistance identity generated by people concerned with challenging and freeing sportspeople from the logic of racism that supports legitimizing racist identities. Finally, there is racism and antiracism as project- or social-movement identity through which actors or collective groups aim to build new types of identities through specific projects such as the “Kick Racism Out of Football” campaign in Britain (www.thefa.com/TheFA/EthicsAndSportsEquity/RacialEquality/).

What Can We Say About Sport and Racism?

Many popular arguments about sport and racism have contributed to a number of racist beliefs about different peoples’ sporting abilities. A number of popular arguments have contributed to particular explanations of race relations within discussions of sport, culture and society. The coverage of sport and racism in this article is by no means exhaustive, but it might be suggested that core arguments have tended to rely on some of or all of the following arguments: that sport (a) is inherently conservative and helps to consolidate patriotism, nationalism, and racism; (b) has some inherent property that makes it a possible instrument of integration and racial harmony; (c) as a form of cultural politics has been central to processes of colonialism, imperialism, and postcolonialism in different parts of the world; (d) has contributed to unique political struggles that have involved black and ethnic political mobilization

and the struggle for equality of and for black peoples and racial minority groups; (e) is an important facet of racial identities; (f) has produced stereotypes, prejudices, and myths about groups that have contributed both to discrimination against and an underrepresentation of ethnic minority peoples within certain sports; (g) is not immune to the cultures of racism and anti-racism, and that race and ethnicity continue to affect peoples’ decisions to join or not join certain sports clubs; (h) needs to develop a more complex set of tools for understanding the limits and possibilities that influence and combat sport and racism, in particular the ways in which such categories historically articulate with other categories and social divisions.

Racquetball

Many people consider racquetball to be the fastest racquet sport in the world. Indeed, some have called it “high-speed tennis in a box.” At the elite level the speed of a serve can near 320 kilometers per hour, but even in amateur competition diving retrievals and heated rallies characterize the sport.

Players use a strung racquet to serve and return a ball. The objective is to win each rally by serving or returning the ball so that the opponent is unable to keep the ball in play. A rally ends when a player (or a team in doubles) is unable to hit the ball before it touches the floor twice, is unable to return the ball in such a manner that it touches the front wall before it touches the floor, or when a “hinder” is called. Only the serving side scores points—when it serves an irretrievable serve (an ace) or wins a rally. Losing the serve is called a “side-out” in singles.

History

Joe Sobek invented racquetball in 1949 on a Connecticut handball court. He designed the first short strung paddle, created rules combining the basics of handball and squash, and called his modification “paddle rackets.” The sport caught on and evolved into racquetball as we know it today. By the early 1970s every state had court clubs, and the sport enjoyed a steady rise in popularity. When the fitness craze began, and people in the United States began searching for challenging athletic activities, the timing was perfect for racquetball; court clubs were available throughout the country, and racquetball was easy to learn and fun to play. During the late 1970s and early 1980s racquetball became one of the fastest growing sports in the United States; thousands of racquetball courts were built to satisfy the demand.

However, the sport saturated the market and reached its peak during the mid-1980s; the sport’s popularity waned, and many clubs either closed or began converting courts to other uses. By 1987, however, the

decline leveled off, and racquetball regained a steady growth rate.

The growth of the sport during a short time can be attributed to the relative ease with which the sport can be enjoyed. It has been designated one of the best all-around sports for aerobic development. People use racquetball as a conditioning sport for swimming, football, basketball, track and field, and many other Olympic sports. A tournament-caliber player burns more than eight hundred calories per hour.

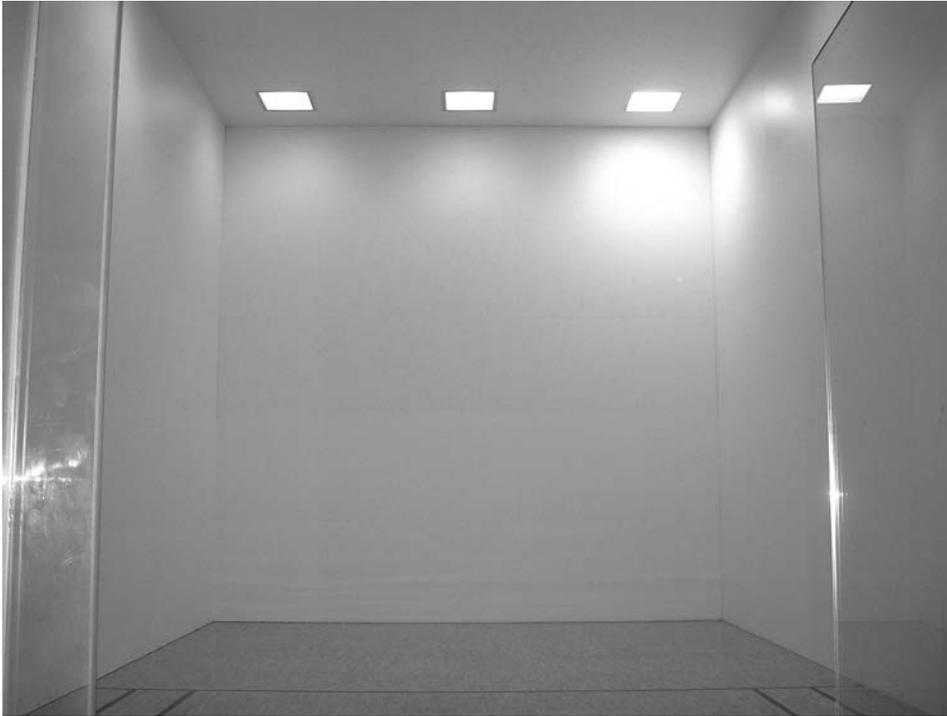

Courts are located all over the world, and equipment is easily accessible at minimum cost. Internationally approved competition sites are located near major metropolitan areas throughout the world, and the number of courts worldwide is estimated at fifty thousand.

During racquetball’s formative years its leadership recognized the need for international development and decided to try to have racquetball recognized as an Olympic event. The first racquetball world championship was held in 1981; one year later the United States Olympic Committee recognized the American Amateur Racquetball Association (AARA) as the national governing body for the sport. Racquetball continued to advance in the Olympic structure and in 1989 became the youngest sport to achieve full member status on the U.S. Olympic Committee. This status brought new levels of exposure to the sport, which is now featured in U.S. Olympic Festivals and in the planning phases of future Olympic Games. More recently racquetball debuted as a full medal sport in the 1995 Pan American Games.

Practice

Power and speed aside, racquetball in its basic form shares strategies with other racquet sports. For example, as in tennis, a player retrieves each shot on one bounce. Unlike in tennis, points are scored only by the server. As in squash, players use the walls strategically to place the ball, and themselves, in scoring position. Unlike in squash, the lower the shot, the better.

To begin, the server stands between two solid lines at midcourt that mark the service zone. The service motion is limited to that area, and the ball is put into play after

A state-of-the-art racquetball court.

contacting the racquet, hitting the front wall, and passing into the back court. During its course, the ball can touch one side wall but no more. If the ball hits three surfaces (including the ceiling or back wall) before bouncing, a “long” or fault serve is called. A serve that does not carry beyond the midcourt service line is “short” and is also a fault. The server is given two chances to put the ball into play (although international rules permit only one serve to put the ball into play).

After the ball is put into play, no limit exists on the number of walls that can be used for shot variation during a rally. A side-wall-to-front-wall shot is called a “pinch,” and a slow series of high ceiling-to-front-wall combinations is called a “ceiling ball rally.”

In a standard fifteen-point game players earn points or win the serve by ending a rally. “Good shots” hit the front wall so low that they can’t be returned before the second bounce. Errors, or “skipped” balls, hit the floor before reaching the front wall.

Two or four players can play racquetball. When played by two, it is called “singles,” and when played by four, “doubles.” A nontournament variation played by three players is called “cutthroat.” A doubles team consists of two players who meet either the age requirements or player classification requirements to participate in a particular division of play. In tournament play a team with

different skill levels must play in the division of the player with the higher level of skill.

A match consists of the best two out of three games. A game is won by the first player to reach fifteen points. If each side wins one game, the two sides play a tiebreaker game to eleven points. No human error is possible except when the referee makes a subjective decision, but this rarely happens. Time is not a factor. To study the play-by-play action, one should remember these basics:

(1) Watch the ball, (2) players must retrieve the shot on one bounce, (3) only the server scores points, and (4) the ball must reach the front wall to remain in play.

Governing Body

The American Amateur Racquetball Association (AARA) is a not-for-profit corporation that promotes the development of racquetball in the United States. Since 1968 the AARA has offered a broad base of programs for competitive and recreational players; state associations; certified instructors and referees; disabled athletes; junior, high school, and intercollegiate athletes; undergraduate scholars; and U.S. adult and junior national teams. The association also maintains programs for state, regional, and national rankings; elite training camps; court club facilities; a six-event series of national championships and U.S. team qualifiers; and a regional qualifying series.

The International Amateur Racquetball Federation was founded in 1979 in Memphis, Tennessee, with thirteen charter countries and took over the leadership role in guiding the worldwide development of the sport. The federation dropped the word *Amateur* from its name after the phenomenal growth of the sport during the 1980s and thereafter was known as the “International Racquetball Federation” (IRF). The sport’s original base

of fifty thousand players in the United States in 1968 has grown to more than 5.6 million in the United States and 14 million players in more than eighty-three countries on five continents.

The IRF held its first World Congress in 1980 and its first world championships in 1981, attracting full teams from six countries. Worldwide growth has continued to be steady, with attendance increasing at each successive world championship. Racquetball complies with the Olympic Charter, particularly in regard to all competition being conducted under the auspices of the IOC and the spirit and letter of its rules and regulations. Racquetball is now a full medal sport in the Pan American Games, the South American Games, the Central American Games, the Pacific Rim Championships, and the Bolivian Games.

The Future

Racquetball holds the promise of exciting competition well into the twenty-first century. With increasing exposure to a previously untapped market of recreational players, combined with the sport's record of steady growth and the promise of becoming an Olympic event, racquetball is well positioned for the future.

Radio

The relationship between the U.S. mass media and sports is a long and intimate one. Details of sporting events, athletes, and other people involved in sports fill the pages of newspapers, magazines, books, and In-

ternet websites as well as countless hours of radio and television programming. People in every community around the country form long-lasting bonds with sports teams and athletes. These bonds are exemplified by the inhabitants of "Red Sox Nation": Millions of fans arrange their daily schedules around listening to, watching, and reading about Boston baseball games. The mass media play an important role in these bonds. All forms of mass media bring athletic events to the fans, no matter where the fans are.

Conceivably radio has had more impact on sports and audiences than has any other form of mass media. Perhaps no other form of media covers the levels and varieties of sports more than does radio. Everything from high school basketball to professional auto racing fills the airwaves of many of the more than thirteen thousand radio stations in the United States and the newest creation, satellite radio.

Radio also has traits that other forms of mass media don't have. The first trait is the connection formed between the broadcaster and the audience. Former Major League Baseball (MLB) player and long-time announcer Bob Uecker says he prefers radio to television. "You paint a picture in the mind. It's a kick to make baseball come alive to a guy hundreds of miles away who's never seen your home park" (Smith 2001, 267). Jimmy Dudley, voice of the Cleveland Indians for twenty years, recounts a letter he received from a fan. The fan was a blind boy who wrote in Braille. "[The fan] signed off by saying, 'Remember, Jimmy, you are my eyes. Don't ever let me down.' It taught me never to forget my obligation as a representative of the fan" (Smith 2001, 267).

The second trait is accessibility: People can consume radio where they cannot other media. Besides being able to listen to radio at home, people can listen as they work, as they exercise, or as they drive. Other forms of media, such as television and the Internet, require unmanageable devices for use or are intrusive in their use. Kenneth Costa, former marketing vice president of the Radio Advertising Bureau (RAB), contends that "there are twice as many car radios in use (approximately 140 million) as the total circulation (60 million) of all

daily newspapers” (Keith 2002, 1). Costa further asserts that radio reaches four out of five adults each week.

Since the 1950s radio has splintered into many formats, most of them centering on music. However, during the last twenty years an explosion has occurred in the number of stations that specializes in sports-only content. “[T]he proliferation of the all-sports format has boosted the popularity” of nonmusic-format radio (Keith 2002, 90). Thus, we should ask when this relationship between sports and radio began, who some of the important people are, and where this relationship is headed in the future with the rapid development of digital television and the Internet.

Beginnings of Radio and Sports Programming

Three sports and four electronics manufacturers/communications companies dominated early mass broadcasting in the United States. According to Michelle Hilmes (2002, 106) sports were professional boxing, professional baseball, and college football and that the World Series attracted “by far the most radio attention” and inspired “the earliest networking experiments.” The four companies were Westinghouse, General Electric (G.E.), American Telephone and Telegraph (AT&T), and Radio Corporation of America (RCA). Much of the early sports content was scores of games or re-creations of games.

The original radio technology did not allow live broadcasting from the site of an athletic event. Radio station operators had to rely on reports and scores of an event to be either telephoned or telegraphed to them after the conclusion. Historians consider experimental radio station WWJ, in Detroit, Michigan, to have been the groundbreaker in bringing sports to the U.S. public. Announcers from the station gave the results of the Jack Dempsey–Billy Miske heavyweight fight in September of 1920. Less than a month later the station’s listeners heard the first scores of a World Series to be broadcast.

The era of commercial radio began in the autumn of 1920, and sporting events were prominent. Westinghouse engineer Frank Conrad built the first nonexperimental

licensed station, KDKA in Pittsburgh, Pennsylvania, and it began broadcasting on 2 November 1920 with music and presidential election results. Five months later the station broadcast a blow-by-blow account of the Johnny Ray–Johnny Dundee prize fight. RCA station WJY cemented the sports–radio relationship with the broadcast of the Jack Dempsey–Georges Carpentier heavyweight title fight in July of 1921. Smith (2001, 19) says this broadcast is “one of the two key events in the development of sports broadcasting” because it fixed the nation’s interest on radio.

Westinghouse officials were not to be outdone as they introduced the national pastime to the airwaves. The seemingly unimportant game between the first place Pittsburgh Pirates and the last place Philadelphia Phillies ranks as one of the most historic events in broadcast history. Westinghouse engineer Harold Arlin sent details of the game back to KDKA for broadcast through a converted phone. “Arlin’s play-by-play demonstrated to the public that baseball could be brought into the American living room with immediacy and intimacy” (*Sports Illustrated* 1991, 19). WJZ in Newark, New Jersey, another Westinghouse station, was the first to broadcast the 1921 World Series. Tommy Cowan re-created the games between the New York Yankees and New York Giants from reports that were phoned in from the stadiums. The next year WJZ broadcast the entire series using renowned sports journalist Grantland Rice as lead announcer.

College football games also produced a big impact on radio broadcasting. Although the first broadcast of a college football game occurred in 1912, a decade would pass before the impact would be felt. KDKA aired the 1921 game between the University of Pittsburgh and West Virginia University, known as the “Backyard Brawl,” as a commercially sponsored game. This game is important for two reasons. First, AT&T-owned station WEAJ is considered to have been the first station to introduce advertising in 1922, which this game predated. Second, most college football games in the 1920s were aired on what was termed “sustaining broadcasts.” This meant that colleges were not charged

for airing rights, nor did stations receive income from advertising during the games. Smith points to the WEAF broadcast of the 1922 Princeton University–University of Chicago football game as one of the key events in the development of radio and college sports. He asserts that starting with this game “radio had made itself part of the nationalization of football, by making interregional competition immediately available to masses through the airwaves” (Smith 2001, 17).

Chicago Tribune-owned radio station WGN (World’s Greatest Newspaper) began to compete with its East Coast rivals on a significant basis in 1924 and 1925. The station aired the 1924 Indianapolis 500 auto race, marking the first auto race broadcast in history. That autumn the station broadcast football games from all the Big Ten campuses, as well as University of Nebraska, University of Pennsylvania, and University of Southern California games. The next spring WGN brought the Kentucky Derby into homes across the Midwest.

Concern over a U.S. government investigation changed the structure of U.S. broadcasting. AT&T used its ownership of phone lines to build a twenty-six-station network that stretched across the nation, with WEAF in

New York City as its flagship station, by 1924. Because of fears of a monopoly in network broadcasting, AT&T sold its stations to RCA in 1926. David Sarnoff, RCA chairman, created the National Broadcasting Company (NBC) and the NBC-Red network. The network proved so successful that a second network, NBC-Blue, was created shortly afterward. The initial broadcast was the 1927 Rose Bowl game between the University of Alabama and Stanford University. This was the first coast-to-coast broadcast in U.S. history.

The relationship between sports and radio has not always been smooth. Major League Baseball owners and officials from various colleges and athletic conferences across the nation began expressing concern over radio’s impact on game attendance. Smith says that the emergence of radio sportscasting encountered hostility from baseball team owners. Many teams banned the broadcasting of home games in their cities, despite the increasing number of people who listened to regular season games and the World Series each year. By 1932 the owners saw the advantages of game broadcasts and voted to allow each team to adopt its own policy. The largest media market in the United States, New York City, did not have daily game coverage until after the 1938 season. The owners of the Yankees, the Giants, and the Dodgers all felt that fans wouldn’t come to the games if they could sit at home and listen. Sponsorship of games by General Mills cereal changed their minds.

College officials had no consensus about radio broadcasts of football games. Some colleges sold their rights to individual stations, whereas others voted on a conference-wide basis to restrict or ban broadcasts. The biggest argument against the broadcasting of football games was the shift by U.S. radio stations from sustaining broadcasts to advertiser-supported broadcasts. Prior to the 1930s colleges did not ask for compensation because they received free promotion during game broadcasts. Now people on both sides realized that broadcasters were making money; the issue was no longer promotion. The Southern Conference (now the Southeastern Conference) was one of the first to ban the broadcast of inter-sectional games. The ban had to be

lifted so that the Alabama–Stanford Rose Bowl game could be aired on NBC.

Because of the Depression, which began in 1929, game attendance began to decline, and many institutions and conferences banned radio broadcasts. In 1932 the Eastern Colleges Athletic Conference, the Southern Conference, and the Southwest Conference voted to ban or restrict game broadcasts. Individual colleges began selling game broadcast rights. The University of Michigan sold its rights in 1934 to WWJ for \$20,000, and the next year the Big Ten Conference proposed selling its rights to all games for \$100,000. By the end of 1935 all conferences had lifted bans and restrictions on radio game broadcasts, and the National Collegiate Athletic Association (NCAA) appointed a committee to study the effect of radio broadcasts on game attendance. The positive relationship between radio and sports would flourish for decades, despite the introduction of television.

Important Radio Sportscasters

The historical landscape of sports broadcasting on radio is populated with significant people. The late President Ronald Reagan began his media career as an announcer of University of Iowa football games in 1932 and later re-created Chicago Cubs games for station WHO in Des Moines, Iowa. Former CBS-TV *Nightly News* anchor Walter Cronkite's first venture into broadcasting involved college football games on WKY in Oklahoma City, Oklahoma. Many of the most important people involved with radio gained notoriety for their later work with television.

Any discussion of the most prominent sportscasters has to begin with Graham McNamee. Lou Schwartz, president of the American Sportscasters Association, calls McNamee “the best in the business” and says that McNamee “started everything.” Although McNamee would become the preeminent radio sportscaster, spending decades covering sports for NBC, he intended to become a professional musician and had taken his first announcing job until a better music position opened. He was thrust into the spotlight when Grant-

land Rice suddenly “retired” during the fourth inning of the third game of the 1923 World Series. McNamee never looked back as he brought events such as the Kentucky Derby, flier Charles Lindbergh's return from France, and “one of his most vivid experiences”: covering both 1924 political party national conventions for AT&T.

Ted Husing's sportscasting career began in 1925 when he re-created the World Series for WJZ from ticker tape reports. He worked closely with Major Andrew White, another early and influential sportscaster. Husing joined the fledgling Columbia Phonograph Broadcasting System (now CBS) shortly after it formed in 1927 and spent two decades with the network. He is best known for the creation of the annunciator or spotter board. This electronic device allowed the announcer's assistant to quickly identify players on the field for the announcer. Husing claims to have first used the annunciator at a Princeton–Navy football game in 1926.

Mel Allen's familiar voice called out to TV viewers of *This Week in Baseball* for years, but older fans recall his decades-long radio work with the New York Yankees. His signature “How about that!” was familiar to baseball fans across the country. Allen called more World Series (twenty) and All-Star Games (twenty-four) on radio than anyone else in history. From 1939 to 1942, while working for CBS, he was the main radio announcer for both the Yankees and Giants baseball teams. Famed sportscaster Lindsey Nelson called Allen “the best *ever* to broadcast the game” (Smith 1995, 56).

Bob Costas may be best known for his NBC television talk show or his documentary-style interview program on Home Box Office (HBO), but his work on radio is formidable. Costas began his broadcast career on KMOX-AM, the home of Hall of Fame broadcaster Jack Buck, announcing American Basketball Association (ABA) Spirit of St. Louis games. He was the voice of University of Missouri basketball games and also did regional reporting on the National Football League (NFL) and National Basketball Association (NBA) for CBS radio until 1979. During his one season as the radio voice of the NBA's Chicago Bulls, Costas joined

NBC. A repeat winner of the Sportscenter of the Year and Emmy Award, Costas has covered the World Series, the Super Bowl, and the Olympics and hosted a weekly sports-related radio call-in program.

Rise of Sports-Only Radio

The concept of a radio station that caters to sports fans was a dream only twenty years ago. The RAB's *2004–2005 Marketing Guide and Fact Book* lists all-sports radio as the seventh most applied format, with 470 stations. Brown says this “format has been on a record-breaking pace for the past ten years” (Brown 1998, 50). The programming content of these stations ranges from game coverage to “sports news” updates and programs to call-in shows. Networks such as ESPN Radio, Fox Sports Radio, and Sporting News Radio have been created during the last decade to meet the growing demand for this type of programming. The two major satellite radio companies, XM and Sirius, have also joined the sports-content revolution by entering long-term agreements with major sports associations such as the National Association for Stock Car Auto Racing (NASCAR) and Major League Baseball.

The groundbreaker in the all-sports format was WFAN-AM in New York City, which went on the air in July 1987. In its first decade the station became the first to top \$50 million in advertising billing. Its website boasts that WFAN is the flagship of four New York professional sports teams. The explosion of this format is not limited to large cities/markets. All-sports radio stations have started in Gainesville, Florida; Atlantic City, New Jersey; and Chattanooga, Tennessee, and none of these cities has major sports franchises. Perhaps the biggest surprise is Salt Lake City, Utah, where four radio stations have started or switched to the all-sports format. Salt Lake City has only one major sports team, and other cities/markets with multiple teams may have only two or even only one radio station with this format.

However, when games aren't being played, what is the programming content of all-sports stations? The answer is simple: the fan and the host of the call-in show. We can compare this situation to “playing the

hits” if the station had a Top 40 music format. ESPN Radio executives Pete Gianesini and Bruce Gilbert believe that sports talk-show topics are like records and that stations have to keep finding the right one. The search for the “hit” is even more difficult when one considers the amount of sports-talk programs or what is called “sports chatter” in the market today. The *Dan Patrick Show*, the *Jim Rome Show*, the *Mike and the “Mad Dog” Show*, and the *Mike and Mike Show* are just a few of the nationally syndicated programs. Radio stations also have local sportscasters who host programs to give their stations local appeal for the audience.

The Future

The future of the all-sports radio station looks bright. Lou Schwartz of the American Sportscasters Association says that although “no one knows the impact of satellite radio,” radio may “increase its influence.” Griggs says “sports radio fills a growing demand . . . for sports scores, news and analysis around the clock” (Griggs 2004, D1). The satellite radio companies will continue to expand the available content, which includes a new contract for NFL and MLB games. The Internet will be available on cellular phone to deliver messages about the latest trades. Despite these developments, sports radio will thrive because people like to talk to each other, especially about sports.

Religion

As the Fellowship of Christian Athletes and other evangelical sports groups thrive, chaplains have become a fact of modern life for professional sports teams of all kinds. Displays of religion abound at every level of sport and in every discipline, from amateur high schoolers to elite professionals, from the golf course to the boxing ring. Signs with biblical references sprout like mushrooms among the fans; coaches and athletes participate in highly visible pregame and postgame prayer, in pious gestures of supplication, and in televised nods to God for games won. Religion and sport march hand in hand, each reinforcing the other.

Old Gods and Games

Although this union of religion and sport manifests itself in a uniquely modern form, it represents nothing new in world history. Except for rare moments of antagonism, sport has always been closely aligned with religious mythology and ritual. Through ceremonial dances and competitive games, the ancients sought to appease their deities in order to win fertile wombs, good crops, successful hunts, and victorious wars. Native Americans surrounded various kinds of ball games and foot races with religious ritual; Central American Mayans and Aztecs built elaborate stone courtyards adjacent to their religious temples, and on those courts they competed fiercely with a solid rubber ball that they could hit only with their hips.

Ancient religious myths often explained the origins of things with stories about competitive games. For example, some Central and South Americans accounted

for the existence of the sun and moon with a bizarre tale about a ball game that took place at the dawn of civilization. Twin brothers challenged the gods to a game. The brothers lost the game, then their heads on the sacrificial altar. One of the heads was placed in a tree, and it began spurting a stream of sperm when a virgin girl passed that way. Impregnated, the girl bore twins. After they were grown to young manhood, the twins challenged the gods to yet another ball game. This time the gods lost the game, whereupon the severed heads of the two original twins ascended into the heavens and became the sun and the moon.

Ancestor worship joined fertility rites to produce funeral games in honor of deceased kin and chieftains. Feasts, music, prayers, and tests of strength and speed celebrated the vigor of the departed; commemorative festivals kept fame alive. In a portrayal of Greek life around 1000 BCE, the Greek poet Homer's *Iliad* gives a richly detailed account of some funeral games held in honor of a Greek soldier slain in battle at the gates of Troy. As young warrior-athletes engaged in chariot races, boxing and wrestling matches, and discus and javelin throws, they affirmed life in the face of death.

In Homer's rendition the gods took active interest in the events. Like modern athletes who chalk up wins or losses to "the will of God," those ancient young Greeks blamed or praised the gods depending on the contest's outcome. An archer supposedly missed his target because he had failed to promise the god Apollo a sacrificial offering. Presumably, Apollo begrudged him victory. When a chariot driver dropped his whip in the midst of a race, he blamed Apollo for knocking it out of his hand but thanked the goddess Athena for helping him retrieve it. As early as 1000 BCE athletes looked to their deities for assistance. Eager to win the prize for a foot race, the Greek leader Odysseus charged down the stretch praying to Athena, "O goddess, hear me, and come put more speed in my feet!" Old funeral games and religious festivals provided the basis for the first organized sport in ancient Greece. Hundreds of local religious-athletic festivals thrived around the Greek-influenced rim of the Mediterranean, each one in honor of a Greek god. For

Character Through Recreation

Various influences have led the Church to a larger regard for the play life of mankind. The Young Men's Christian Association was probably the most effective teacher of the need of a gospel that reached the physical and the social side of young men and boys. For many years past it has appealed to the physical side of young life with gymnasiums, and to the social side by an active interest in sports and amusements.

It may be said that with the organization of the wide-spread young people's movement in our churches began the first serious effort to furnish an all-round development of the youth under Christian auspices. Though there were several organizations more or less local in character previous to that time, the new era of the Church's interest in youth began with the rise of the Christian Endeavor movement in 1881. A number of denominational societies also sprang up, each, in common with the Christian Endeavor, having a department of work specially devoted to the directing of the recreation of its members. Valuable suggestions concerning proper amusements are constantly given in the periodicals of these young people's societies, and various books of games and plays furnish the basis for a healthy amusement life.

all their emphasis on rationality and human achievement, the Greeks were polytheists; they looked to specific gods for assistance in specific spheres of life. They appealed to Artemis to help them in the hunt, to Poseidon to help them sail the seas, to Aphrodite to help them in matters of love. The Greeks firmly believed that all the gods, whatever their specialty, look with favor on the male warrior virtues of physical strength, agility, and endurance. These warrior skills were best taught and practiced in athletic contests such as wrestling, chariot

racing, and throwing the discus and javelin. By the fifth century BCE four major festivals dominated the Greek athletic circuit: (1) the Pythian Games at Delphi in homage to Apollo, (2) the Isthmian Games honoring Poseidon at Corinth, (3) the Nemean Games in Nemea, and (4) the Olympic Games at Olympia, the latter two in the name of the mighty Zeus.

Zeus, reckoned to be a vigorous warrior god who cast thunderbolts like javelins from the sky, bestrode the Greek pantheon just as surely as the Olympic Games dominated the athletic circuit. Sometime around 1000 BCE myth and ritual established him as the patron deity at Olympia. The actual origins of the games are shrouded in mystery, but one legend depicts Zeus and a rival god, Cronus, engaged in a wrestling match in the hills above Olympia. Zeus won the tussle, inspiring religious ceremonies and quadrennial athletic contests as testimonies to his prowess. By the supposed authority of Zeus, athletes, trainers, and spectators were guaranteed safe passage every four years to Olympia, even in times of war.

After they arrived at Olympia, athletes had to swear by Zeus that they had been in training for the past ten months and that they would play fair and obey all the rules. If they broke their oaths, they were required to pay fines, which went toward the building of statues in honor of Zeus. During the fifth century BCE a huge temple was erected of local limestone for the worship of Zeus. Shortly thereafter the most famous sculptor of the day, Phidias, constructed a magnificent statue seven times larger than life, encased in gold, silver, and ivory. It depicted Zeus sitting on a throne in the inner chamber of the temple. Visitors never failed to comment on its memorable finery and proportions. Admirers thought it to be one of the Seven Wonders of the World; critics complained about its outlandish size. If Zeus stood up, they noted, he would poke his head through the roof.

Of the five-day program of Olympic events that became fixed during the fifth century BCE, athletic contests consumed only two and a half days. The entire first day was devoted to religious rituals—a kind of prolonged opening ceremony when religion mattered more than patriotism or commercial glitz. Athletes and

their trainers offered oaths, prayers, and sacrifices to Zeus. They presented gifts at the statues of past Olympic victors who had been deified, at the shrines of various lesser gods, and especially at the altars and statues of Zeus. Well into the first evening, Olympic participants marched in solemn processions and sang hymns of praise and devotion.

Then came a full day of athletic contests: chariot races and horse races in the morning, the pentathlon (discus and javelin throws, a broad jump, a sprint, and wrestling) in the afternoon. As soon as the sun set, however, attention shifted back to religious activities. By

the light of a midsummer full moon, a ram was slain and offered as a burnt sacrifice to the accompaniment of prayers and hymns. On the following morning priests led Olympic judges, Greek city-state officials, athletes and their kin, and trainers in a colorful procession to the altar of Zeus, where one hundred oxen were ceremoniously slain. The legs of the oxen were burned in homage to the gods; their carcasses were roasted for a big banquet on the last day of the festival.

Confirming this conjuncture of religion and athleticism, the Greek poet Pindar lauded “the expense and toil” that enabled the athlete to take advantage of his

“high gifts shaped by the gods.” Olympic laurels set an athlete “on the farthest edge of bliss,” insisted Pindar, “and the gods honor him.” Long before the Greek Olympics came to an end in the fifth century CE, faith in the old gods waned to such an extent that Olympia’s religious trappings lost much of their original meaning. Other gods beckoned in the Greco-Roman world. The Romans largely took their gods from the Greeks, changing merely the names. In Roman hands, Zeus became Jupiter, but with a difference: Jupiter never became associated with competitive sport. Although some Roman “entertainments” were also based on ancient religious festivals, religion and sport momentarily parted company in the brutality of the Colosseum and amid the gambling frenzy that surrounded the Circus Maximus.

Sport and Spire

Early Christians largely accepted Greek athletics. The apostle Paul frequently mentioned them to illustrate the spiritual race to be run and the incorruptible prize to be won by Christians. Roman sport was another matter. For well more than two centuries, Christians were unwilling participants in Roman spectacles. Thrown into the arena as punishment for their unorthodox religious beliefs, they inevitably lost the lions-versus-Christians game. Yet, even when the persecution ceased, Christians continued castigating Roman sport’s “pagan” basis, its open association with gambling and prostitution, and its inhumane brutality. The North African theologian Tertullian was the harshest critic of all. In a treatise entitled *On Spectacles*, written around 200 CE, he urged Christians to have “nothing to do, in speech, sight, or hearing, with the madness of the circus” or “the savagery of the arena.”

With the collapse of the Roman empire, the interaction of religion and sport shifted to northern Europe. Ancient games such as German *kegels* (bowling), French *soule* (association football), and the stick-and-ball games of Irish hurling and Scottish shinty all had religious associations akin to the competitive fertility rites of Native Americans. Light toyed with darkness, warmth with cold, and life with death in the pre-Christian mytholo-

gies of Europe. Muslims contributed during the eighth century when they brought old Egyptian fertility rituals across the narrow neck of the Mediterranean into Spain. For several centuries Muslim, Christian, and pre-Christian practices blended harmoniously, especially around the annual rites of spring renewal that Christians called “Easter.”

Various forms of ball play became an integral part of Easter season ceremonies all over Europe. Colorfully garbed French priests near Paris chanted a traditional liturgy and passed a ball back and forth as they danced down the church aisle celebrating springtime signs of Christ’s resurrection. An archbishop near Lyon, France, regularly led a ball game immediately after an Easter meal. As late as 1165 a theologian at the University of Paris protested church-sponsored ball play at Poitiers and Rheims. It derived from old pagan customs, he insisted. He was right, of course, but no one seemed to share his alarm.

While incorporating ball play within its religious program, the medieval church helped to popularize ball games and other recreational activities. The church provided a time for parishioners to play. For six days of the week peasants and household servants worked. On Sunday they were expected to worship at the village church, yet no puritan pall hovered over Sunday. After the morning sermon and sacraments, villagers lounged or played in the afternoon. Because the church’s holy days aligned with ancient seasonal holidays, villagers also played at festive occasions around Easter, during the harvest season, and at Christmas time. On such holidays various regional versions of competitive sport flourished. Italians regularly scheduled *palio* (horse races) on several of their many saint’s days; each spring in England peasant football thrived around the food, drink, music, and dance of Shrove Tuesday, just before the onset of Lenten austerity.

In addition to providing a calendar that allowed time for play, the medieval church provided physical space. In that time before public parks, playgrounds, and schoolyards, villagers usually played on a village green or some other “commons” normally set aside for grazing cattle. In

Tossing on the Walrus Hide

The extract below describes a sports ritual of the Chukchee of Siberia:

The “tossing on walrus-hide” forms among the Maritime Chukchee, and especially among the Asiatic Eskimo, an extra ceremonial, which is arranged in early or middle summer in order to ward off danger from contagious diseases or to assuage too long and violent tempests. The “tossing on the walrus-hide” is considered akin to the races, and the family who arrange the ceremonial are called simply “racers” or “masters of the race” . . .

On the day chosen for the ceremonial, numerous guests gather at the house of the “racers.” The women of the family bring sacrifices to “all the directions.” Then a feast follows, at the end of which the housemaster, or still better a shaman from among his nearest relatives, if there be any such, paints with red ochre the faces of all those who have recently been taken ill; also those who look sickly, and concerning whom there might be apprehension of an attack by ke’let [evil spirits]. Small children, with hardly an exception, are painted. The marks of the painting are varied, and closely resemble those of the painting with reindeer-blood in the “slaughtering-ceremonials” of the Reindeer Chukchee.

After that [the painting with red ochre], the tossing begins. Men and women seize a big walrus-hide (split in two; make it thinner), grasping it firmly by loops

cut around its outer edge, and lift it from the ground. Then the young men and girls, one by one, or in pairs consisting of a man and a woman, try their skill. For this, the performer plants himself firmly in the middle of the hide, and with a sudden jerk those who hold it send him upward, often to the height of five metres. After that involuntary jump, he falls back on the skin, and is safe from harm. The greatest skill is in coming down on the feet without losing one’s equilibrium. Women are more clever than men at this, and there are those who can keep upright for three successive jumps. The “tossing on walrus-hide” often assumes the character of a contest, in which a prize is offered to the winner. Every one who has taken three jumps successfully may stop, and wait his turn to compete with a performer who has achieved a similar success. . . .

Like the reindeer-races of the Reindeer Chukchee, the “tossing on walrus-hide” of the Maritime people takes on the character of a sport, and is frequently arranged merely for amusement, without connection with any religious or superstitious purpose. From the Maritime people the “tossing on walrus-hide” spread to the Reindeer Chukchee, among whom it is, however, much less in use, and serves only for a merry social exercise.

those villages that had no commons, the churchyard or cloisters often served as the venue for mass recreation. Spires and stained-glass windows served as backdrops for wrestling matches, juggling exhibitions, and board games. A fourteenth-century English clergyman unintentionally admitted the popularity of these practices when he attempted to banish “dancing,” playing at quoits (throwing iron rings onto a peg, similar to the U.S. frontier game of horseshoes), bowling, tennis, handball, football, stoolball, and all sorts of other games on church property.

Medieval football, an ill-organized, uncodified game that had no physical boundaries or limits on team size, required open land. That land was also owned by the church and rented out to wealthy landlords, who traditionally turned it over to peasant sport shortly before spring crop planting and just after the autumn harvest. English and French clergymen frequently complained about property being damaged by hordes of drunken football players. A few critics pointed to the roughness of the game. In 1440, for example, a French bishop denounced football as a “dangerous and pernicious”

activity that caused "ill feeling, rancor and enmities" under the guise of "a recreation pleasure." He banned football games within his diocese. Medieval church leaders looked more benignly on upper-class sport. Like modern ministers who cater to early Sunday morning golfers, priests happily dispensed "quickie" communions at the break of dawn to aristocrats eager to get to the fields for hunting and hawking. Bishops sat jowl to jowl with the castle crowd at ceremonious jousting contests. Churchmen especially looked with favor on royal tennis because the game apparently originated with French monks, abbots, and priests in monastic and church cloisters as *le jeu de paume* (palm game). Players hit a small ball with their open hand over a rope stretched across the middle of the space available. They played the ball off walls and onto sloping roofs that efficiently kept the ball in play. According to legend, a French king visited a monastery, saw a game of tennis, and admired it so much that he had it copied in his royal palace. The term *tennis court* probably derives from the game's early location in the courts of European monarchs.

Renaissance churchmen enthusiastically linked tennis to the Renaissance ideal of well-balanced mental and physical skills. The Christian humanist Desiderius Erasmus, a former monk, lauded tennis as an ideal game for exercising all parts of the body; England's Cardinal Thomas Wolsey arranged the construction of an indoor tennis court for King Henry VIII at Hampton Court. An Italian monk, Antonio Scaino da Salo, produced a treatise in 1555 that established the first simple set of written rules, a standard court size, and a scoring system. Tennis was "the most appropriate sport for the man of letters," Scaino insisted.

Puritans Make Their Mark

Protestant reformers gave a more mixed message about sport. The German Reformation leader Martin Luther encouraged his followers to participate in "honorable and useful modes of exercise" such as dancing, archery, fencing, and wrestling. For his own exercise, Luther engaged in the old German game of bowling. When the bowling ball banged against the pins, it reminded him

of the Christian's duty to knock down the devil. The French reformer John Calvin, too, enjoyed bowling. He also played quoits, but he was critical of most other sports. Zealously devoted to the task of cleaning up the morals of the city of Geneva, Switzerland, he saw sport as a hindrance to holy living. Most games seemed too intimately associated with carnal pleasure on the one hand, idleness on the other. Competitive games also meant gambling and desecration of the Christian Sabbath, two of Calvin's great taboos. For Geneva's public policy as well as for private piety, Calvin was quite prepared to lump most sports with thievery and prostitution and to ban them all.

Protestant exiles from England, Scotland, and Holland flocked to Geneva, where they imbibed Calvin's ethical mandates as well as his theological beliefs. Most of all, they partook of his supreme self-confidence that came from believing in the notion that each human being acts as an agent of divine redemption before acquiring eternal bliss. When they turned northward to home, they put their shoulders to the task of moral reform. English Calvinists led the way. Their zealous crusade to purify both church and society provoked people to call them "Puritans."

This Puritan sect represented no monolithic bloc of opinion or practice. Its members often disagreed with each other over specific evils that needed to be eradicated. Puritan merchants and businessmen thought and acted quite differently from village farmers; ministers sometimes preached one thing, while their congregations did another thing. When a preacher in the 1600s denounced "wakes or feasts, may-games, sports and plays, and shows, which trained up people to vanity and looseness, and led them from the fear of God," one could be sure that many people in England were still finding pleasure in these traditional pastimes.

Popular or not, folk games closely resembled old pre-Christian fertility rites and Roman Catholic holy days, inspiring the Puritans all the more to suppress them. The Puritans first tried moral preachments in the home, at church, and in the marketplace. When sermonizing met with negligible success, they went after the political

work ethic made sense, was to enjoy a renewal in Victorian England, but it was much too ethically rigorous for the more traditional, casual life of preindustrial England. In the end only the Puritan Sunday survived the Restoration of 1660. Until late in the twentieth century, Sunday remained sacrosanct in a fashion uniquely English, free of public amusements and sports as well as commercial activity.

means of reform. English Puritans during the early seventeenth century put themselves forward as city councilors, mayors, and members of Parliament. They also seized positions of power in the army and rode that horse to victory in a civil war that appropriately began while King Charles I was on the links of Leith, near Edinburgh, Scotland, playing golf.

Briefly in power for a decade or so during the mid-seventeenth century, the Puritans appointed army officers to serve as guardians of public morality. They struck at the heart of old church festivals and folk games by leveling fines and imprisonment against any display of public intoxication or gambling and against any desecration of the Sabbath. People, however, clung to their playful ways. Rigid prohibitions occasionally stirred hostile protests. According to a report from an Essex village, when the local Puritan vicar began the Sunday morning service in the parish church, “the people did usually go out of church to play at football, and to the alehouse and there continued till they were drunk, and it was no matter if they were hanged.”

This rural resistance to Puritan reform finally won the day. English villagers continued living out their lives in seasonal cycles with periodic festivals and games compensating for times of intense agricultural labor. Puritanism, largely confined to urban merchants and business classes for whom moral discipline and the

Puritanism also met with mixed success in the English colonies of North America. Passions waxed and waned against activities reminiscent of old village pastimes. Moreover, in their prohibitions against gambling and Sunday amusements, New England clergy were joined by Pennsylvania Quakers and New Netherlands Dutch Calvinists. Only those diversions that demonstrably led to the fulfillment of one’s “call” to work found favor in earnest colonial eyes. Eighteenth-century Bostonian John Adams phrased it best in his diary entry on 24/25 May 1773: “I was not sent into this world to spend my days in sports, diversions, and pleasures. I was born for business; for both activity and study.” The Great Awakening, a religious revival during the middle years of the eighteenth century, produced an even dimmer view of sports, as did the Second Great Awakening during the early years of the nineteenth century.

Muscular Christianity

Finally, rapid industrial and urban growth fostered a reassessment of the relation of religion and sport in Victorian England and the United States. Medical as well as moral concerns prompted liberal Anglicans Charles Kingsley and Thomas Hughes (author of *Tom Brown’s Schooldays*) to articulate a “muscular Christianity” for Britain; Boston Unitarians Edward Everett Hale and Thomas Wentworth Higginson did the same in the

United States. All the while a new international organization, the Young Men's Christian Association (YMCA), added health programs and competitive sport to its pietistic, evangelical purposes. Exposure to the YMCA convinced a Canadian ministerial student, James Naismith, that "there might be other effective ways of doing good besides preaching." While at the YMCA training college in Springfield, Massachusetts, Naismith invented the game of basketball.

Sport and recreation programs became central features of the social gospel espoused by turn-of-the-century liberal churches. Ministers as diverse as Washington Gladden, a Congregationalist pastor in Columbus, Ohio, and William S. Rainsford, rector of St. George's Episcopal Church on the Lower East Side of New York City, nudged their churches to sweeten the gospel with

church gymnasiums and bowling, softball, and basketball teams sponsored by the church. The movement for urban parks and public playgrounds, too, stood high on the social gospel agenda.

Whereas the social gospel was largely a Protestant commodity in most U.S. cities, in Chicago it was primarily associated with the Roman Catholic Church. By 1910 Chicago's Catholics boasted the largest church-sponsored baseball league in the United States; two decades later Bishop Bernard J. Sheil founded the Catholic Youth Organization with the intention of using boxing and basketball programs to prevent juvenile delinquency. During the 1920s a nearby little Catholic college, Notre Dame, emerged as a national football power. Religious and sport mythology mingled freely in the virtual canonization of all-American

halfback George Gipp and coach Knute Rockne; the famous metaphor of the Four Horsemen came right out of a biblical text.

For American Jews, too, religious traditions blended with the immigrant need to adopt sport as a means of Americanization. Jews especially took to the favorite immigrant sport of prizefighting, frequently with the Star of David emblazoned on a boxer's trunks. Less predictably, they also competed enthusiastically in the YMCA game of basketball, particularly in the New York City area. For purposes of becoming fully American, however, the "national pastime" of baseball was essential. Many Jewish authors feature baseball games and allusions to the game in their stories. Two Jewish baseball stars—Hank Greenberg in 1934 and Sandy Koufax in 1965—established themselves as ethnic heroes by refusing to play ball on the Jewish holy day of Yom Kippur.

Until shortly after World War II, Protestant evangelicals refrained from mixing religion and sport. Southern Baptists and Methodists especially had a long history of hostility toward competitive sports. They saw college athletic contests as occasions for raucous partying; they viewed professional sport as a Yankee invention for purposes of gambling, strong drink, and desecration of the Sabbath. After 1945, however, southerners took the lead in yoking sports to evangelical Protestantism. The evangelist Billy Graham initiated the practice of having star athletes publicly "share" their conversion experience. Graham appropriately thought of his evangelistic organization as a "team" and frequently used sports stories and metaphors in his sermons. For purposes of association as well as mere space, he selected famous sports venues such as Yankee Stadium, Madison Square Garden, Wembley Stadium (London), Boston Garden, and the Los Angeles Coliseum for his early crusades.

Mixed with Cold War rhetoric and a market mentality that hawked Jesus as if he were a breakfast cereal or bar of soap, this marriage of sport and born-again religion produced several new organizations. Sports Ambassadors (founded in 1952), the Fellowship of Christian Athletes (1954), and Athletes in Action (1966) are merely the top three of many booster

groups that capitalized on athletics as a means of winning converts to Christ. These groups catered primarily to high school and college athletes, but by the 1960s the evangelical spirit had also invaded professional locker rooms. It began with National Football League (NFL) teams, then moved to Major League Baseball. By 1975 every major professional football and baseball team employed a chaplain or at least scheduled religious services of worship prior to Sunday games.

A small but prominent group of athletes has turned from Judeo-Christian traditions to a Black Muslim allegiance to Allah. Heavyweight champion Cassius Clay led the way during the 1960s, changing his name to "Muhammad Ali." College basketball great Lew Alcindor similarly converted to Islam and took the name "Kareem Abdul Jabbar" for his professional career. In the spring of 1995 boxer Mike Tyson emerged from prison wearing the garb and speaking the language of Islam. Racial pride apparently weighs heavily in the decision to become a Black Muslim.

Religion, Sport, and Women

Religion also determines what opportunities and barriers women encounter in physical education and sport. Women play particular roles in each religion, and those roles influence if and how women may be physically active.

Among Christians for centuries the attitudes of the Catholic church toward sports in general and women's sports in particular determined whether women participated in sports and, if they did, when and how. During the Middle Ages, for instance, a strong strain of asceticism physically immobilized many women in convent cells, but the church had no objection to other women participating in Whitsuntide ball games or in aristocratic pastimes such as falconry. In early modern times the church tended to adopt conservative attitudes toward social change. From the middle of the nineteenth century to the latter half of the twentieth century, the church demonstrated mistrust in sports. The church viewed the body with suspicion and perceived sports as sensual if not positively sinful. Church doctrine, too,

prized the soul above the body; consequently, the church had little interest in physical education for boys and even less for girls.

Today the influence of the Catholic church in sports has greatly diminished. Recent popes have softened traditional views of human sexuality, and the sensuality evident in sports is now widely accepted—within limits.

Protestant churches were, on the whole, quicker to accept sports, including women's sports, as a legitimate activity. Seventeenth-century Puritans admitted that men and women needed "lawful recreations"—as long as the Sabbath was not disturbed. During the eighteenth century Anglican ministers looked kindly upon women cricketers (but disapproved of lower-class women boxers and wrestlers). Although the "muscular Christianity" of the nineteenth century was meant primarily for men, the Young Women's Christian Association (YWCA) and the church-related women's colleges of Great Britain and the United States advocated field hockey, basketball, and other appropriate sports for young women.

Jewish women's participation in sports has changed through time and still differs within the Orthodox and more liberal sectors of the religion. Orthodox Jewish attitudes are sticking to the same rules they had a hundred years ago—even turning on the lights is forbidden on the Sabbath. However, most Jewish women and girls who are not Orthodox would generally participate in any sporting event, even those that might take place on the Sabbath.

Islam has no general interdiction of sport, even for women, and the Prophet Muhammad apparently favored physical activity for girls and women. However, through time, this early openness has been transformed to a far more restrictive outlook.

Perspective

Religion has certainly weighed heavily in the history of sport through the ages. Religious folk have frequently supported and even lauded sport as an ally that supports social cohesion and moral principles. Sometimes they have protested sport's specific violations of current religious principles; occasionally they have lambasted

sport in its entirety. Yet, never have religion and sport been totally separate or indifferent to each other.

Reproduction

The reproductive health of women participating in sport has been a controversial area of discussion for many years. One such controversy was the issue of jumping. Based on myths and theories, the medical profession suggested that jumping displaced the uterus and caused reproductive abnormalities (Lenskyj 1986). Because of this medical advice, it was 1992 before women were able to compete in the triple jump at the Olympics. As modern medicine advanced and scientific evidence accumulated, this issue has been somewhat resolved. Exercise in moderation can be beneficial, and more women are leading active, healthy lifestyles with little or no problems with reproductive health.

An active lifestyle is important for women of all ages, particularly because regular physical activity has been associated with the prevention of osteoporosis, breast cancer, heart disease, and depression (Charkoudian and Joyner 2004). Regular activity does not affect the menstrual cycle, and it is only when rigorous training is coupled with inappropriate energy-intake compensation, in which reproductive hormones are affected, that problems with the menstrual cycle are observed (Harber 2004).

Benefits of Exercise During Pregnancy

For women with a normal menstrual cycle, moderate physical activity should play no role in preventing conception. Once conception has occurred, recreational activity in moderation has not been linked to early pregnancy wastage or miscarriage (Clapp 1996a). Traditional medical advice has been for women to rest during pregnancy (Wolfe et al. 1994). That outdated medical advice does not address the increasing participation of pregnant women in sports and recreational activities; in addition, there is a growing population of women who work throughout pregnancy in strenuous, nontraditional occupations (such as police work, firefighting, and military service).

Because pregnancy is a unique process in which almost all of the physiological systems of the body are modified in an attempt to maintain the maternal and fetal environment, the addition of exercise may represent a significant challenge to maternal and fetal well-being, especially at higher intensities of physical work. The scientific literature suggests, however, that mild- to moderate-intensity exercise in a healthy pregnancy can be beneficial to mother and baby. Some of these benefits include improved physical fitness and muscular endurance, improved stamina for labor and delivery, the promotion of appropriate maternal weight gain throughout pregnancy (Kardel and Kase 1998; Wolfe et al. 1994; Wolfe and Mottola 2002), improved mood and decreases in states of anxiety and depression following pregnancy (Koltyn and Schultes 1997).

Guidelines for Exercise during Pregnancy

According to recent medical advice from the American College of Obstetricians and Gynecologists (ACOG 2002), a woman with a low-risk pregnancy can participate in moderate exercise for thirty minutes or more a day on most, if not all, days of the week. Although this advice is more modern than the traditional advice of "resting," it does not give pregnant women concrete guidelines for exercise. No formal guidelines for exercise during pregnancy existed until 1985, when ACOG published a bulletin that suggested guidelines for exercise during pregnancy.

The most controversial guideline for exercise was that a pregnant woman should not let her heart rate rise above 140 beats per minute (ACOG 1985). Even though these guidelines caused quite a discussion amongst physicians and health care professionals, ACOG was the first organization to put any guidelines for exercise during pregnancy in writing and to publish and distribute them to other organizations. In 1994, ACOG released another bulletin on guidelines for exercise during pregnancy. The controversial issue of exercise heart-rate guidelines is ignored in this bulletin (ACOG 1994) and also the latest (ACOG 2002), so

there are now no guidelines in the United States for target exercise heart rates during pregnancy.

In Canada, exercise and pregnancy guidelines are found in the “PARmed-X for Pregnancy” document, developed by Dr. Larry Wolfe from Queen’s University and Dr. Michelle Mottola from the University of Western Ontario, which was published by the Canadian Society for Exercise Physiology (CSEP) in 1996, endorsed by Health Canada, and revised (Wolfe and Mottola 2002). The “PARmed-X for Pregnancy” includes a medical prescreening questionnaire to identify contraindications to exercise during pregnancy, a list of safety considerations, and aerobic- and muscle-conditioning guidelines. The “PARmed-X for Pregnancy” document was endorsed by the Society of Obstetricians and Gynecologists of Canada (SOGC) (Davies et al. 2003) and the CSEP (Davies et al. 2003a). These documents are available on the CSEP website: www.csep.ca, which also includes the “PARmed-X for Pregnancy” document, free of charge. Recently, the American College of Sports Medicine (ACSM) has also endorsed the SOGC/CSEP joint position paper, “Clinical Practice Guidelines for Exercise in Pregnancy and the Postpartum Period” (Davies et al. 2003a), in which the “PARmed-X for Pregnancy” document is highlighted (ACSM 2004).

Need for Medical Prescreening

It is important to confirm a healthy pregnancy with a physician or midwife before engaging in an exercise program. In the “PARmed-X for Pregnancy” document there is a list of contraindications to exercise for the health-care professional to check. Medical prescreening is recommended due to several potential risks that have been identified in the early scientific literature, and each appears to have a dose/response relationship to the intensity of maternal exercise, in that, as the intensity of maternal exercise increases, the risk of the hypothetical effects also is augmented. Wolfe et al. (1989), Wolfe et al. (1994), Clapp (1996b) and Wolfe and Weissgerber (2003) provide excellent reviews on the effects of maternal exercise on maternal and fetal well-being. In a healthy pregnancy, mild- to moderate-intensity exercise

appears to pose no threat to mother or fetus (Wolfe et al. 1994).

Since no threshold has been determined for intensity and duration of maternal exercise above which problems occur, it is important that medical screening take place before maternal exercise begins to ensure a healthy pregnancy. Guidelines promoting exercise intensities of 60 to 70 percent of maximum oxygen consumption (moderate aerobic exercise) are within accepted levels for healthy pregnancies (Wolfe and Weissgerber 2003). The “PARmed-X for Pregnancy” document provides guidelines within these intensities. “Aerobic activity” is defined as exercise in which large muscle groups are being moved to improve heart and lung health, such as walking, stationary cycling, swimming, aquatic exercise, or low-impact aerobics.

Monitoring of Intensity

Monitoring of intensity of exercise is extremely important for pregnant women. The “PARmed-X for Pregnancy” form provides three ways to check that the aerobic activity is not too high. The first is through a chart of exercise heart-rate (pulse-rate) guidelines based on the age of the pregnant woman. Women who are younger than twenty should exercise between a target heart rate of 140 and 155 beats per minute; women twenty to twenty-nine years old should exercise between the ranges of 135 and 150 beats per minute; women between the ages of thirty and thirty-nine should exercise from 130 to 145 beats per minute target heart rate; and women forty and older should stay within the range of 125 to 140 beats per minute (Wolfe and Mottola 2002).

The second way to ensure the appropriate intensity for exercise is to ask the pregnant exercising woman how hard she perceives she is working. On a 20-point scale (rating of perceived exertion scale, Borg 1962), she should be within 12 to 14, which is labeled as “somewhat hard” (Wolfe and Mottola 2002). The final check for intensity is called the “Talk Test,” in which the exercise intensity is excessive if the pregnant woman cannot carry on a verbal conversation while she is exercising (Wolfe

and Mottola 2002). If she is out of breath, is breathing heavily, and cannot talk, she must reduce the intensity to lower her heart rate. A healthy pregnant woman who has not exercised before should begin at the lower end of the target heart-rate zone for her age (Mottola and Wolfe 1994) and monitor her intensity closely.

A pregnant woman should exercise at a frequency of three times per week, especially if she is just beginning an exercise program, increasing to a maximum of four times per week. Caution is suggested with exercise frequency of five or more times per week, as this has been associated with an increased risk of delivering small-for-gestational-age babies (Campbell and Mottola 2001). Perhaps the best way to begin an exercise program is to have a day of rest in between the exercise days to avoid undue fatigue. The time of each exercise session should be approximately fifteen minutes at the target heart-rate intensity, increasing the time of the exercise session by two minutes every week until a maximum of thirty minutes per session is achieved. Intensity and time of each exercise session should not be increased past the twenty-eighth week of gestation (Wolfe and Mottola 1993) because of the possibility of fatigue. Many women in the third trimester decrease intensity and duration of each exercise session because they tire more easily.

Each exercise session should start with five to fifteen minutes of warm-up and five to fifteen minutes of cooldown at a lower intensity of activity. All pregnant women should know the safety signs and consult a physician should any contraindications to exercise occur. These are listed in the “PARmed-X for Pregnancy” document (Wolfe and Mottola 2002).

THOSE WHO EXERCISED PRIOR TO PREGNANCY

Women who have been exercising prior to pregnancy have been advised by the medical profession to continue exercise during pregnancy. However, it is necessary to determine frequency, intensity, duration, and type of exercise before advising pregnant women to continue exercising. In addition, medical prescreening must occur to rule out contraindications to exercise. The aerobic guidelines presented above for women who have not exercised

before pregnancy are also suggested for the recreational athlete, but the recreational athlete may be able to exercise at the higher end of the target heart-rate zone based on age, for the maximum of thirty minutes—three to four times per week. If a woman has been jogging before pregnancy, she may continue within the aerobic-exercise guidelines, unless she develops joint problems or is uncomfortable with this mode of exercise. Switching to a stair climber (with no jarring movements) or to body-weight-supported exercise (such as swimming or biking) would be recommended.

Muscular-strength or -conditioning exercise is activity that includes stretching, abdominal exercise, and resistance or weight-lifting exercise. The “PARmed-X for Pregnancy” document also includes suggestions for these activities. The major precaution for muscular-conditioning exercise is that no activity should be performed lying on the back past four months into pregnancy. This guideline has also been suggested by the ACOG (2002) because of possible blocking of the inferior vena cava or the abdominal aorta (major vessels in the abdomen) by the weight of the pregnant uterus pushing on them while the mother exercises on her back. The inferior vena cava is the major vein that returns blood to the heart, and the abdominal aorta is a major artery that supplies the lower body with blood, including the pregnant uterus. As a precaution, sit-up exercises for the abdominal muscles can be done in a side-lying, sitting, or standing position instead of lying on the back, past four months into pregnancy.

THOSE WHO DID NOT EXERCISE PRIOR TO PREGNANCY

Previous medical advice suggested that women who have not exercised should not start an exercise program during pregnancy. However, recent scientific literature and guidelines would suggest that if no contraindications to exercise exist and if the pregnancy is healthy, women may start an exercise program in the second trimester (Mottola and Wolfe 1994). Exercise should not be started in the first trimester because of potential risks. In addition, many women do not feel well in the

first trimester and may be discouraged from continuing to exercise if the activity program is started at that time. The best time to start an exercise program is in the second trimester, around twelve to thirteen weeks.

Athletic Competition

Pregnancy is not the time for engaging in athletic competition or strenuous activity that would place the mother at risk for bodily injury (Mottola and Wolfe 2000). This includes avoiding activities or sports in which there is a potential for falls or body contact. Women who have been exercising strenuously prior to pregnancy should reduce the intensity, frequency, and duration of exercise to follow the exercise guidelines recommended above. There are no known benefits to the fetus from strenuous high-intensity maternal exercise. In this situation, the risks to the fetus far outweigh any maternal benefits, and reduction in intensity and duration are highly recommended. The literature describing the effects of strenuous exercise on mother and fetus are limited. Most of the studies presented are case studies that describe the efforts of one individual or are reports of past activity and not scientifically controlled experiments. Thus, no guidelines exist for pregnant women who engage in strenuous exercise, although scientific investigations are currently being conducted in this population group of pregnant athletes.

Effects of Strenuous Occupations

The "PARmed-X for Pregnancy" document has a question about activity performed during the pregnant woman's occupation, whether she is a homemaker or working twelve-hour shifts and lifting heavy objects. Determining the activity level of the pregnant woman as she performs everyday activities is important and must be considered when prescribing an exercise program. If the pregnant woman is engaging in high-intensity physical activities in her occupation, it is important that a recreational-exercise program complement the activities performed in everyday life. This will prevent unnecessary fatigue and overuse injuries and will decrease the potential risk to the fetus.

The effects of occupation on pregnancy outcome are reviewed in Wolfe et al. (1994). Additional recent studies suggest that physical activity on the job may play an important role in pregnancy outcome. Military women on active duty who gained less than twenty-five pounds during pregnancy developed an earlier labor more often (Magann et al. 1996). The risk of early labor was also increased in women who worked regularly in the evening or at night and had occupations with long hours of standing and who continued work through late gestation. These conditions increased the risk of delivering an infant before forty weeks (the due date) (Fortier et al. 1995). However, in an epidemiological analysis of 529 women, there was a lack of association with occupational exposures, physical exertion, and low birth weight (Campbell and Mottola 2001).

In a national survey of U.S. nurses, factors significantly associated with earlier birth included number of hours worked per week, per shift, and while standing. Other factors were noise level, physical exertion, and occupational fatigue (Luke et al. 1995). In addition, Spinillo et al. (1995) associated moderate- to high-intensity physical activity in the workplace with a twofold increase in the risk of severe high blood pressure compared to mild activity on the job.

In a review article on physical work and pregnancy outcome, epidemiological evidence would suggest that occupations including prolonged standing or walking that continued into late gestation, as well as work encompassing several strenuous factors in combination, appear to increase the risk of earlier delivery (Ahlborg 1995). It was also recommended in the same article that working pregnant women avoid extremely heavy physical exertion (that is, close to maximum) in early pregnancy and late gestation.

Studies on the results of heavy lifting on the job and the impact on spontaneous abortion are inconclusive and require further study. Thus, because of the varied conclusions on occupation and birth outcome, before exercise can be prescribed for pregnant women in the work force, it is important to determine how physically

active they are in their current occupation so that overexertion and undue fatigue are avoided.

Returning to Exercise after Pregnancy

Many pregnant women are concerned about when they can safely return to exercise after the baby is born. The timing of return to exercise depends upon the number of complications during labor and delivery. If labor and delivery are uncomplicated, a postpartum (post pregnancy) woman normally can return to aerobic exercise once vaginal bleeding from delivery has stopped, and her postpartum check-up with her physician is normal (usually between six and eight weeks after delivery).

It is recommended that she begin an exercise program at the lower-intensity heart-rate range based on age and follow the same guidelines as if she were pregnant (Mottola 2002). Avoiding unnecessary fatigue is an important consideration for any new mother, and starting off with walking while pushing a baby carriage is an excellent way to regain activity. If the postpartum woman has had a cesarean section or complications during labor and delivery, it is recommended to wait at least ten weeks or until labor and delivery complications have been resolved and the woman's health has returned to normal.

Muscular-conditioning exercises are also recommended for the postpartum woman, and returning to these exercises is suggested after the first postpartum checkup with the physician and vaginal bleeding due to delivery has stopped. Abdominal exercises can be started as well and may be performed while lying on the back (Mottola 2002).

Breast-feeding and Exercise

Women who breast-feed and choose to exercise usually have no problems (Carey and Quinn 2001). Postpartum exercise of mild or moderate intensity has little adverse effects on milk quality (Carley et al. 1997), quantity, or infant weight gain (Dewey et al. 1994). Infants detect sweet and sour tastes (Wallace et al. 1992), and the literature has suggested that infants may refuse to nurse or

may fuss during a feeding after the mother has been exercising due to an increase in the lactic-acid content of the breast milk, which may produce a sour taste (Wallace et al. 1992).

Maximal exercise has been shown to increase the amount of lactic acid in breast milk postexercise, which leads to decreased acceptance of the postexercise milk (Wallace et al. 1992). However, aerobic exercise of mild to moderate intensity performed four or five times per week beginning six to eight weeks postpartum had no adverse affect on breast-feeding (Dewey et al. 1994). In a more recent study that was well controlled, moderate- or even high-intensity exercise during lactation did not change the infant acceptance of breast milk taken one hour postexercise (Wright et al. 2002). Thus, maternal exercise is well tolerated postpartum, but strenuous (near-maximum) aerobic activity should be avoided until breast feeding is terminated, due to the potential of fatigue of the new mother.

Making Lifestyle Habits Permanent

Engaging in mild- to moderate-intensity exercise should not be a problem for the reproductive health of active women. Pregnancy is a time when women make beneficial alterations in health habits to provide a good environment for the unborn. These changes include adopting improved eating habits, abstaining from smoking and alcohol consumption, and starting or continuing an exercise program. All of these changes can be carried forward into the postpartum period, and many health professionals believe that pregnancy is a good time to incorporate healthy lifestyle habits that are permanent. Integrating activity into a healthy, active lifestyle leads to healthy moms and healthy babies.

Revenue Sharing

In professional team sports leagues revenue-sharing rules are applied to gate revenue, local revenue (concessions, premium seating, parking, other venues, and local TV), and league revenue (national TV broadcast rights, team license fees, and league sponsorship). In the early years gate revenue was the dominant source of revenue, but in recent years other revenue sources have increased dramatically, especially TV revenue.

Winning isn't everything, it's the only thing. ■ VINCE LOMBARDI

Revenue sharing is undertaken by sports leagues for two main interrelated reasons. The first is to ensure financial stability of teams and the second is to improve competitive balance (the evenness of competition) by offsetting the inequality in market size in which teams are located. Revenue sharing improves the financial stability of teams (the ability of teams to survive financially), but the impact on the distribution of player talent and hence competitive balance is less straightforward.

Gate- and Local-Revenue Sharing

The extent of gate-revenue sharing varies across sports, but teams in the National Basketball Association, the National Hockey League, and European soccer and Australian leagues typically keep 100 percent of their home gate.

In the National Football League the split is 60:40, where the home team keeps 60 percent of the gate with the remaining 40 percent pooled and distributed equally, a so-called straight-pool system. Prior to 2001, owners received an equal share of other teams' contributions of 40 percent of their gate revenue, but not of their own contribution. The net result of the 2001 change was to lessen the amount of revenue redistributed from large gate-revenue teams to small gate-revenue teams.

From 1995, Major League Baseball changed from the 80:20 home-visitor split of gate revenue in the American League and the 95:5 split in the National League to a more general revenue-sharing arrangement of all net local revenue (such as from local television, cable, radio, gate, concessions, premium seating, parking, and sponsorships, less stadium-operating, debt-service, and rental costs). There is a huge variation in local TV revenue of teams in MLB. This system taxes each team a percentage of its reported net local revenue (initially 17 percent in 1995), which is pooled and shared equally. Under the so-called split-pool system introduced in 2001, 75 percent is shared equally and the remaining 25 percent distributed to teams in proportion to how much their net local revenue is below the league mean. The immediate effect is to increase the contribution of large-revenue

market teams and the amount received by small-revenue market teams. But, competitive balance might actually worsen if it gives (profit-maximizing) small-revenue market teams the incentive to reduce payrolls, perform poorly on the field, underperform financially as a result, and so collect more from the pool. From 2003, a 34 percent net local revenue tax has been distributed equally on the straight-pool basis, with additional central MLB funds distributed on a split-pool basis.

In English soccer, the net gate was split 80:20 from 1920 until 1983, but since 1984 teams have kept their home gate, as have teams in the Premier League, which was formed in 1992. Gate revenue constituted as much as 80 percent of total revenue in the 1950s, but by the 1990s had fallen below 40 percent. Another scheme was the payment of 4 percent of all national receipts into a pool that was distributed equally among the league teams, reduced to 3 percent in 1987 and abandoned for Premier League teams from 1993.

Leaving aside the greater likelihood of financial survival provided for small-revenue market teams, economic theory suggests that no matter how gate revenue is divided, there is no effect on the distribution of talent and hence competitive balance in a league comprised of profit-maximizing teams. However, the greater the degree of gate sharing the lower is the value of acquiring extra talent (and hence wages) to win more because teams only capture a fraction of any increased revenue at home games. Moreover, this fractional increase in revenue is also offset by a loss of revenue from the away teams, which win less. The impact of local revenue sharing under profit maximization is less clear, but in general, unless the sharing involves revenue that depends on winning, local-revenue sharing will not improve competitive balance.

By contrast, in a league comprised of win-maximizing teams, the greater the degree of gate sharing the greater is the move toward competitive balance. The effect of both gate- and local-revenue sharing is to decrease the average revenue of large-revenue market teams and increase the average revenue of small-revenue market teams thus tending to equalize teams' ability to acquire talent.

League-Revenue Sharing

League-negotiated broadcasting revenue is typically pooled and distributed equally in the United States, Europe, and Australia.

In the NFL the only TV contract is a league-negotiated national TV contract, which is shared equally. There is therefore much less revenue disparity between teams in the NFL than in other leagues, such as MLB, the NBA, and the NHL, where there are separate national and local broadcast agreements, and often significant variation in local broadcast revenue. Despite MLB's sharing of net local revenue, the New York Yankees' local TV revenue is so large the Yankees still have much greater revenue than other teams in smaller-revenue markets.

In England's Premier League, and some other European soccer leagues, revenue from the sale of broadcast rights is not shared equally but roughly split into three parts. About a third is shared equally, another third distributed according to the on-field performance of the team and the final third is distributed according to how many times each team has been seen on television. By contrast, in Italy's Series A, every team sells its own broadcasting rights (to its home matches), while in the Spanish Primera League, the most popular teams sell their rights individually and the least popular teams sell their rights collectively.

The effect of sharing league-negotiated (say, national TV broadcast) revenue is to change the distribution of revenue from what it would be if, for example, teams generated their own (say, local TV) revenue. Revenue from a league-negotiated contract is likely to be greater than that if all teams negotiated their own individual local contracts. Furthermore, large-revenue market teams, which contribute more than small-revenue market teams, subsidize the latter because each team receives an equal share of league revenue, thereby improving the financial stability of small-revenue market teams.

However, an increase in shared league revenue should have no effect on competitive balance. A lump-sum transfer from the league will not change the incentives for a profit-maximizing team owner, leaving competitive balance unchanged. Under win maximization, however, the effect of a lump-sum transfer is to in-

crease the average revenue of small-revenue market teams more than it increases the average revenue of large-revenue market teams, with the result that competitive balance increases.

The Future

Revenue sharing improves the financial stability of teams in the league, but the economic literature is less clear in its conclusion about the impact of revenue sharing on competitive balance in a league. In particular, exactly which factors affect teams' revenue and whether teams are profit- or win-maximizers are both crucial in determining whether various types of revenue sharing will improve competitive balance.

Ringette

Ringette has adapted the aspects of older sports, including ice hockey, basketball, soccer, and team handball. It requires complex motor skills within an

environment of explosive speed and finesse and is one of the fastest sports in the world.

Ringette combines skating on ice in full equipment (helmet with face mask; skates; elbow pads; neck protector; girdle with genital, hip, and tailbone protection; shin pads; and gloves) with carrying a stick, controlling a ring, reading and reacting to a changing environment, receiving and delivering passes, and starting and stopping at full speed.

Origins

Sam Jacks of Canada invented ringette in 1963 to provide girls with a safe winter activity that does not involve body contact but that they can play to develop their skills, court sense, and fair play. The first set of rules was developed in 1965 and has been revised during the past forty years. Ringette has evolved in response to the women who play it: Players today are faster, stronger, and more strategic than their predecessors were.

Ringette's inaugural season was 1963–1964, and the sport grew from slightly more than four thousand registered players in 1979 to more than twenty-one thousand in 1985. During the early and mid-1980s ringette was one of the most popular team sports in Canada and *the* winter team sport for females in Canada. That time was the height of ringette's growth phase—the sport increased fivefold in seven seasons. During the mid-1980s Ringette Canada, the association governing the sport in Canada, used the slogan “the winter sport for females.” However, today, with more sports opportunities available, that slogan is not accurate. Nonetheless, Canada today has twenty-five thousand players.

The rules of ringette have evolved to meet the needs of the players, and so have the events. The first Canadian Ringette Championships were held in Winnipeg, Manitoba, in 1979. These championships have grown to become the annual elite ringette showcase. Players at lesser levels also compete in tournaments and other events. In all countries where people play ringette, most clubs offer or attend some type of organized tournament each season.

In the 2002 Canadian Ringette Championships in Saskatchewan, Ottawa defeated Alberta in the open division (age nineteen and older), Alberta defeated British Columbia in the junior division (ages fourteen and fifteen), and Manitoba defeated Alberta in the belle division (ages sixteen through eighteen).

The International Ringette Federation (IRF), ringette's international body, was established in 1986 by six countries under the direction of Betty Shields, president of Ringette Canada. The IRF sanctions the World Ringette Championships, which have been held every other year since 1990.

In the 2004 World Ringette Championships, Finland finished first; Canada, second; the United States, third; and Sweden, fourth.

Along with Canada, Finland has long been an international leader in ringette. Finland was the first European country to play ringette—in 1978. A hockey coach, Juhani Wahlsten, developed the sport in Finland and helped found the first ringette club, Turku Ringette. Since then, ringette and its infrastructure have developed steadily. In 1983 the Ringette Association of Finland (renamed the “Finnish Ringette Association”—FRA) was formed, and in 1985 the Finnish Central Sports Federation accepted the association as a member, making ringette an official sport in Finland. The Finnish team won the world champion title in 1994 and the 1998 Summit Series. Three thousand members support the FRA and its national team program (since 1990), junior national team program (since 1996), and a strong grassroots youth leadership program, Nuori Suomi (Young Finland). Players age twelve and younger, called “E Juniors,” wear arm bands that determine with whom they play. This arm band system ensures that all players have equal playing opportunities. It teaches fair play and team skills.

People in the United States have played ringette since at least 1986, and Minneapolis, Minnesota, hosted the 1994 world championships. The sport is also expanding in France, Sweden, Germany, and Russia, and all of these nations compete at the international level.

In order to win you must be prepared to lose sometime. And leave one or two cards showing. ■ VAN MORRISON

Play and Rules

Ringette has gained attention mostly for its scoring object and the method of controlling that object. Ringette is played without pucks or balls. Instead it is played with a ring, made of blue rubber for ice or hard plastic for gym and asphalt. Players control the ring with a straight stick whose shaft tapers slightly at the tip for better control. Many sticks are wooden with tips of aluminum, steel, or hard plastic.

A ringette team has five players and a goaltender. Much as in indoor soccer or basketball, the five skaters or “out players” are broken down into two defense players, two forwards, and one center. Players wear long pants and loose-fitting jerseys. Most players wear smaller equipment to balance safety with agility. For example, hockey players may wear wide shin pads to help block shots, whereas ringette players lean toward narrower shin pads to allow better speed and agility. Regardless of the position they play, players must wear full face mask, helmet, padding, gloves, and skates. The object of the five skaters is to move the ring toward the opposition’s net with control, with the ultimate goal of shooting and scoring. The goaltender’s job is to prevent the opposition from scoring and to assist in the team’s defensive unit breakout.

Ringette’s equivalent of a jump ball or face-off is the free pass. The free pass allows a player from one team five seconds of protection to make a pass from a predetermined spot on the ice. Many teams use this possession to key on set plays or skating patterns that enable the other four skaters to become open. One of the original ideals of ringette was team play. When Sam Jacks devised the first set of rules, he had the players pass over a blue line. In soccer or basketball players can control the ball and make their way down the court or field without having to pass to any teammates. In ringette players may not carry the ring from end to end. Players must pass over each blue line because they are not allowed to carry the ring across these lines. The ring must touch another player (of either team) before the player can again touch the ring on the other side of the blue line. Today that emphasis on team play continues.

The ring must be passed, shot, batted, deflected, or legally kicked to another player across each blue line.

Ringette has received some attention because its target group is women. Although no competitive events exist for coed teams of any age, some recreational tournaments allow coed teams. Internationally, organizers have made few attempts to include male players, nor have any national or international events allowed male participation.

Some proponents of ringette cite the lack of male participation as an explanation of why the sport is not more popular. Others disagree, pointing out the positive: Ringette has evolved from a slow and controlled sport to a fast-breaking, dynamic sport of ring skills and skating and has gained many female participants. For either argument, ringette is based on speed and fitness, not gender.

Rituals

Scholars in anthropology and the sociology of sport often tap into functionalist frameworks such as that of Durkheim (1976), which provide insight concerning the value of rituals in ceremonies. Faure (1996, 89) refers to Durkheim as “the zealous propagandist of national consensus” because of his interpretation of ritual as affirming group solidarity. In this sense, Durkheim identified the symbolic role of elite athletes as serving as a unifying and identification symbol for the collective imagination that conveys a collective identity for citizens and other aspiring athletes within a given social and cultural context. Acknowledging the “integration and consensus” framework, Light (2000) illustrated the interrelatedness of intra- and inter-group social integration through ritual activity in the sporting context.

A baseball ritual in which players line up along the foul lines when introduced at the start of the game.

known rainmaking rituals, first-fruit ceremonies, and hunting rites were performed to symbolically demonstrate the significance of the worship and “magic power” to be evoked.

In traditional African societies today, rituals are performed to mark special occasions, celebrations, and a change of lineage-composition, status, and identity during

The strength of Durkheim’s interpretation of ritual lies in the reality of people acting together in rituals that bind them (Kertzer 1988). Durkheim’s discussion on rituals and Goffman’s theoretical work broaden the argument and interpret ritual activity in sport as social products that positively affect support and performance of sport teams (Ward 1998). The public expression of group solidarity, according to Bourdeau (1991), also signifies a contextual group identity that is ritually expressed and confirmed. The experience of “emotional flows” and the perception of togetherness, are thus affirmed through different ritual pathways (Maguire 1992, 104).

Behavior and Social Construct

In *From Ritual to Record* (1978), Guttman suggests that the ritual dimension of sports held special significance in primitive and ancient civilizations such as in the ancient Greek religious festivals in which artistic expressions and physical body culture were intertwined. In the traditional society, ritual life is centered in the religious belief of the ancestor cult in which ancestors were daily worshipped through offerings and rituals acknowledging their influence in the lives of their descendants. Rituals in the African traditional religion mainly include rites of passage, calendrical rituals, and crisis rituals (Olupona 1990). Calendrical rituals ensure the continuity of life force, whereas crisis rituals prevent annihilation of human life by supernatural agents. Well-

births, marriages, deaths, and initiation ceremonies. Traditional values and tribal laws are still taught and gender-specific roles are enforced through ritual behavior and specific rites. Rituals of kinship, also known as “ancestor rituals,” stressed kinship, and the local structure expressed “symbolically the unity of family and descent group and handling the problems of individuals in the specific domestic sphere” (Hammond-Tooke 1974, 354).

Moving beyond the restrictive definition of ritual that carries overtly religious content and identification with the supernatural, *ritual* also refers to culturally standardized, repetitive activity that is primarily symbolic in nature and aims to influence human affairs; it may involve the supernatural realm or may be merely profane in nature (Kertzer 1988, 8–9). In a religious context, rituals with religious or supernatural content may carry symbolic meanings in which a god, ancestors, or a society worships it(self) and thus gives expression to a social dependence. Blanchard (1995, 54) suggests that “secular ritual” is such an “all-compassing category that it may have limited utility in understanding sport.” Despite the parallels between ritual and sports, ritualistic elements in sports are mainly symbolic statements that express a social message of significance to the structure and cohesiveness of a group or groups within a given society or context. The ritual symbol often provides an understanding of the cultural meaning of a physical

The Ritual of Sport

Unlike any other business in the United States, sports must preserve an illusion of perfect innocence. The mounting of this illusion defines the purpose and accounts for the immense wealth of American sports. It is the ceremony of innocence that the fans pay to see—not the game or the match or the bout, but the ritual portrayal of a world in which time stops and all hope remains plausible, in which everybody present can recover the blameless expectations of a child, where the forces of light always triumph over the powers of darkness.

Lewis H. Lapham

contest such as in public hunting traditions (Blanchard 1995) or warlike nature and the celebration of masculinity in modern sports (Light 2000).

The symbolic meaning of rituals and ritual behavior is imbedded in the culture of a particular group that is also referred to by Blanchard's (1995, 51) description of ritual as "a facet of culture" to be "viewed as the symbolic dimension of social activities." Sporting rituals are evident in the expression of "brotherhood" and within the global sphere of modern competitive sport, as seen at the opening and closing ceremonies of the Olympic Games.

At such events, the ritual content is mediated for entertainment as social theatre, and the ritualistic displays have become significant in portraying a contemporary social order in a global context, of awarding recognition for local and global order through cultural content and symbols of the host nation, and for Olympism as a global sporting culture. In this instance, a symbol such as the five Olympic rings signifies "unity between the contents" (Olympism) and simultaneously signifies the ancient "pattern of five intersecting rings inscribed on an altar at Delphi" where each ring represents a solar year between the Ancient Games in the worship of Zeus. The five rings instead of "four," which were the cycle of the Games, were used because the Greeks reckoned inclu-

sively. It also referred to the eligibility of athletes to compete as boys (from ages seventeen to twenty) and then as men (four years later) (Robertson 1988, 22).

Public rituals in Athens conveyed the rich heritage of Greek life through the ages and demonstrated the interconnections of ancient rituals with myth, magic, and the supernatural. In such secret ceremonies, "ritual power" was evoked for divination, healing, protection, exorcism of evil, and love (Meyer and Mirecki 1995). These rituals can be viewed as coping mechanisms in which the actors' intention is to create order and seek assistance from a source beyond what is perceived to be humanly possible. Public rituals are more susceptible to social change than are secret ones—the latter are often based on faith because of the supernatural and sociopsychological implications for the participants (Akong'a 1987).

In defining the concept of ritual, Thompson (1992) refers to meaning and form by discussing rituals as static repetitions of the social order in southwestern Nigeria which is increasingly being transformed through play and improvisation. Such ritual behavior reflects the cultural, political, and religious context in which symbolic meanings and forms are acted out to express ritualistic and ceremonial behavior. Kertzer also stresses the concept of social order by defining ritual as "an analytical category that helps us deal with the chaos of human experience and put it into a coherent framework" (1988, 8). The culturally standardized, repetitive activity that conveys meaningful symbolic content may thus be performed to evoke ritual power.

Symbols and Symbolism

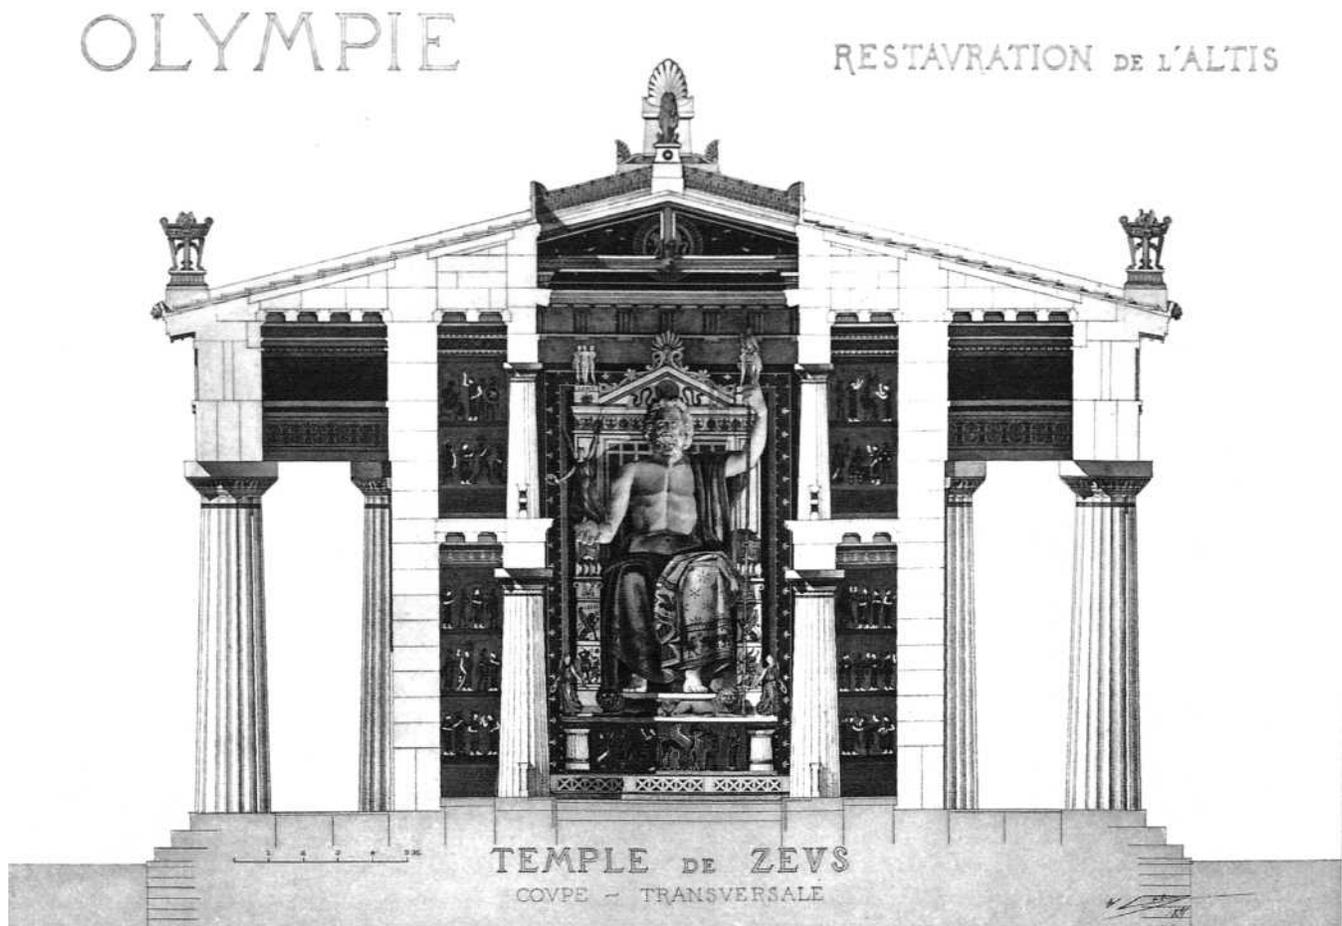

Kertzer described ritual behavior as "action wrapped in a web of symbolism" (1988, 9). The subjective world picture becomes a social reality through the meaningfulness of social symbols. The individuals' subjective experience is thus molded by the social meanings ascribed to the rituals that stem from the social matrix with meaningful psychological dimensions that reflect the understanding of reality and significance of the ritual. As symbols represent other meanings by association, resemblance,

or convention, according to Turner, they are “*multivocal*—speaking in many ways at once; *multivalent*, having various meanings or values, and *polysemous*, having or being open to several meanings” (1984, 16). The symbolic meanings are commonly understood and convey essential messages that may serve the strategic end or purpose of the ritual. Ritual celebrations provide the framework for identification, critique, and emotional involvement in which “meanings” are constructed (Platvoet 1995).

The transmission of messages through ritual dramatization is powerful and persuasive and is thus a significant vehicle political or religious leaders employ to legitimate their authority. Through ritual, followers are

guided, emotions are channeled, and loyalty and solidarity are created. “Insider–outsider” identities are established, such as is with the *Palio* celebration that is held in the central Italian city of Siena. In this celebration, different neighborhoods compete in various activities, building up to “a horse race through the centre of town.” In this competition, insider affiliations and bonds are strengthened as neighborhoods are ritually marked as people sharing the same social identity and who “express a sense of communion with others” (Kertzer 1988, 75).

Ritual behavior thus finds an expression in social life, and because competitive sport has become a highly contested terrain in which success, identity, and excellence

are celebrated and rewarded, rituals have found special meaning in local and global sporting events. The constructions of culturally meaningful symbols in and through sports and the symbolism of sport competitions are constructed and deconstructed by a variety of stakeholders in all spheres of society. Pregame rituals, rituals on the field of play, and the ritualistic nature of sport events draw on shared meanings and symbols and present unique dynamics as cultural and global products.

Constructing Ritual Pathways in and through Sport

The parallels between religious and sporting rituals and the ritualized practice of sports have attracted scholarly interest (Guttman 1978; Light 2000; Maguire 1992). From the early roots of ritualized contests to the global idiom of modern sport, inherent meanings of the ritual have survived. Interaction rituals that convey a shared reality and rituals as coping mechanisms in which individuals (in the case of sports, athletes) use rituals to manage moments of stress and anxiety, are transforming the perceived reality and competencies of athletes and role players in the sporting sphere (Firth 1996; Giddens 1995).

PREGAME RITUALS

Pregame rituals and ritualistic behaviors play an important role in the belief of creating a competitive edge. Such behaviors include the eating of specific foods, abstinence from alcohol and sex (Fischer, 1997), and superstitious rituals of athletes that are practiced in all sports and across all cultures (Bleak and Frederick 1998). Such rituals are perceived to be effective in ensuring success in sporting competitions, or serve as a catalyst in relieving anxiety or gaining an advantage over an opponent or opposing team. Such rituals may include not stepping on lines, wearing only certain colors, or executing pre-performance routines (Jackson and Baker 2001). Set patterns of pregame preparations may include traveling arrangements, specific meetings, motivational sessions, sharing hardships or excursions to

promote “mateship,” and battle cries as expression of unity and “group power” (Light 2000).

One of the most famous pregame rituals in the Rugby Union is undoubtedly the performance of the *haka* by the All Black (New Zealand’s national team) rugby players just before an international match. On the field, this ritual dance or routine symbolizes the “might” and “warrior tradition” of the indigenous Maori that are differently perceived by opponents (threat), supporters (affirm national identity and affirm group solidarity), and players (affirm identity as player and “warrior” in preparation of the contest) (Renner 1999).

The significance of fanatical sport fans’ sport rituals is invariably linked to the supporters’ sense of associating and building identity through perceived bonding and affiliation with specific players, athletes, or teams. Bonds and ties (*esprit de corps*) are strengthened by creating an “us” and “them” or insider–outsider affiliation (Van Beek 1998).

GLOBAL ENTERTAINMENT

The creation of global entertainment, as in the case of the European Superleague by the English Rugby Football league in association with media magnate Rupert Murdoch’s News Corporation in 1995, eroded the cultural attachments to the sport of rugby league (Falcous 1998). Global symbolism of sport consumerism and high entertainment are created through persuasive media images and messages. In this sense, sport events and competitions are symbols that carry multiple meanings and allow diverse association and identity formation of a broad spectrum of stakeholders.

Sport as Ritual

Modern sports rituals carry functions of integration and resistance locally, nationally, and globally. Kertzer (1988) believes that the multivocality of symbolic behavior in sports relative to personal interpretations is less important than are the public declarations of solidarity and identity that are conveyed symbolically. Stevenson and Alaug discuss sporting contests “as secular rituals that engender local and national identity” (1997, 251), in which

be as tedious as to work.* ■ WILLIAM SHAKESPEARE

case, social solidarity between players and supporters is expressed through shared symbols, ideology, and membership. Explicit or subconscious messages of insider's affiliation may find expression in sport as a national entity.

A national team symbolizes the aspired national identity of a nation, and team members are the bearers of national pride that is propagated by the playing of the national anthem and flag as significant national symbols if teams or athletes achieve success for their country in international competitions. High-profile male sports, which are most often considered the national sports, carry relatively more symbolic meaning of a nation's prestige in the global arena, where competition is fierce and victory a token of ideological and political superiority. The rituals and victory celebrations go beyond a sporting victory to serve as symbols of excellence, self-determination, and unification.

In many African countries, following independence from "foreign rule," sport has become a political tool to national unity and nation building.

- In Yemen, football rituals were used to promote national identity, and the selection of the national team with equal representation from clubs in the South and North was an incentive to cultivate such unity (Stevenson and Alaug 1997).
- Similar policy implementations found expression in South African sports in which racial quotas were enforced in the Rugby Union (rugby is regarded as a predominantly white Afrikaner sport).

In both cases, severe local resistance was experienced, and cultural symbols were endorsed by various groups in those societies.

More overt resistance is evident in the traditional sporting tradition of Ireland, known as the Gaelic Games, which predated the plantation and introduction of British colonial rule and British sports and pastimes (Sugden and Bairner 1993). These games became the symbol of sporting self-determination and an expression and ritual celebration of Irish culture as celebrated by the dominant Catholic inhabitants of Northern Ireland. The participants of such indigenous games and rit-

uals embrace the identity of local heroes and custodians of traditional body culture. They are often regarded as symbols of regional or nostalgic village identity and local resistance, for example, elderly, lower-class males participating in Belgium in traditional Flemish folk games such as Kaatsen (team handball), Struifvogel (bird darts), or Gansrijden (goose pulling) (Renson, De Cramer, and De Vroede 1997).

The Future

Scholarly work in the construction and deconstruction of rituals and ritual behavior in sport and other social contexts provides an understanding of the meaningful role of symbols in evoking and portraying strategic ends. Since ancient times, rituals have signified group identity and affirmed solidarity within insider-outsider affiliations. Secret and public rituals found their way into sports through meaningful social symbols. These social messages and dramatized patterned ritual behavior are employed to:

- Influence human affairs (religious content)
- Project communal identity
- Celebrate and propagate meaningful social, political, and cultural content

The symbolic transmission of messages through ritual dramatization is powerful and finds expression in pregame rituals and sporting practices for enhancing solidarity from the local to the international level or serves as symbols of resistance against hegemonic forces and practices embedded in commercialized modern sport forms.

Rodeo

Rodeo developed in the cattle country of the American West during the post–Civil War era. An Anglicized version of the Mexican equestrian event *charreada*, rodeo became a professional sport during the 1880s, and became a modern, centrally governed sport during the 1930s. Today more than sixty thousand men, women, and children compete in nearly three thousand amateur and professional rodeos in North America each year. Men outnumber women approximately 10 to 1 at the top professional level; equal numbers of girls and boys participate in high school rodeo. Although the sport is popular with spectators in most of the United States and western Canada, more than 90 percent of rodeo participants come from the western half of North America.

Rodeo events are classified as timed events, in which athletes try to beat the clock, and rough stock events, in which athletes attempt to ride a bucking animal for a specified time. The standard timed events are calf roping, steer roping, team roping, steer wrestling, and barrel racing. Rough stock events are bull riding, saddle bronc riding, and bareback bronc riding. In Professional Rodeo Cowboys Association (PRCA) rodeos, riders must stay on the animals for eight seconds. Different organizations have different rules, and several have additional timed events.

The most profitable rodeos are the more than seven hundred rodeos sanctioned by the PRCA, but part-time and amateur athletes far outnumber the full-time professionals. The richest rodeo in the United States is the PRCA’s National Finals Rodeo (NFR), held since 1984 at Las Vegas, Nevada. The nearly \$3 million purse is six times larger than that of its closest rival, the Houston

Livestock Show and Rodeo. Early stars competed for saddles and belt buckles, whereas today's stars earn more than \$100,000 annually. The PRCA, formed as the Cowboys Turtle Association (CTA) in 1936, is largely responsible for the professionalization and standardization of the sport and for the huge increases in prize money.

The biggest issue that rodeo has faced throughout its history is opposition from humane societies and animal rights groups. Despite almost a century of opposition, efforts to shut down rodeos have largely failed, and rodeo organizations have enacted strict rules to protect their stock. Athletes are much more likely to be injured or killed than are livestock. During the wide-open days before the PRCA, integrity problems dogged some rodeos, but those problems were solved by the 1950s.

U.S.-style rodeos also take place in Australia and New Zealand, and similar, related sports are popular in several Latin American countries. However, the sport thrives only in the cattle country where youngsters are born to the saddle. Elsewhere it remains largely a novelty or amateur hobby.

Origins

All rodeo events except women's barrel racing have counterparts in the *charreada*. U.S.-style steer wrestling, however, is radically different from the Mexican *cola* (bull tailing). Bull riding, an event whose origins have long baffled historians, was a central feature of the *charreada* and the Mexican bullfight. Those two sports had parallel and overlapping histories through the late nineteenth century. *Charro* contests came to the United States with the cattle business and were transmitted from Mexican vaqueros (cowboys) to Anglo and black cowboys along with the skills, terminology, and costumes of the range. Ranch-versus-ranch rodeos and informal contests among ranch hands helped spread the competition throughout the western United States and Canada.

Western fairs and holidays often featured rodeo and *charro* contests in which persons of diverse ethnicities competed for prizes. The major impetus for the com-

mercialization of rodeo came after the closing of the frontier when western communities began seeking ways to perpetuate their unique heritage. Historians credit Buffalo Bill Cody for staging both the first professional rodeo and the first Wild West show at North Platte, Nebraska, on 4 July 1882. Hoping to show spectators scenes from life in the "real West," Cody hired cowboys, Native Americans, and Mexican ropers and riders to reenact stagecoach robberies, war dances, a buffalo hunt, and Pony Express rides. Merchants donated prizes for the winners of contests in roping and animal riding. This successful "Old Glory Blowout" drew the largest crowd in the history of the Nebraska territory. Cody then became a Wild West show entrepreneur rather than a rodeo producer, while western communities followed his lead in developing contest rodeo into a viable sport. Rodeo and Wild West shows enjoyed a symbiotic relationship for the next thirty years, with a majority of professionals active in both. The international popularity of the Wild West shows did much to create the audience for professional rodeo and make the once-maligned cowboy into a national hero. The term *rodeo* did not become standard until after World War I; prior to that time the contests had various names, including *frontier days*, *stampedes*, *cowboy contests*, and *roundups*.

Early rodeos had much greater diversity than do their twenty-first-century counterparts. Women, Hispanics from both the United States and Mexico, Native Americans, and African-Americans participated. Because of similar rules, persons of all ethnicities and nationalities competed throughout North America during the pre-World War I era. Native Americans competed in events reserved only for those people who camped on the rodeo grounds and entertained the crowds but were also free to enter the other contests. Bill Pickett (1870–1932), an African-American cowboy from central Texas, gets credit for inventing bulldogging or steer wrestling. Rodeo and *charreada* were quite similar until after World War I, when the *charreada* was reorganized into an amateur team sport, while rodeo remained an individual, professional sport.

The only correct actions are those that demand no explanation and no apology. ■ RED AUERBACH

Development

When Wild West entertainment expanded during the late nineteenth century, local cowboy contests gradually got more publicity and bigger prizes all over the West. Ranch-versus-ranch rodeos grew into community celebrations. While these contests multiplied, a few major rodeos came into existence. The Cheyenne Frontier Days, introduced in 1897, became the most prestigious of the early contests, followed by the Pendleton, Oregon Roundup and the Calgary Stampede in Canada. Competition often lasted for days, with as many as twenty events in a single day. Besides the rough stock and timed events, early rodeos included races, trick and fancy roping and riding competitions, and novelty contests such as nightgown races and wild-cow milking. Races, the most popular, included chariot races, chuck wagon races, stage coach races, and relay races in which riders changed horses after each lap of the arena. In the dangerous Roman standing race, riders stood with one foot on the back of each of a pair of horses. During this era cowgirls often competed against cowboys, enjoying unprecedented success in Roman racing.

Trick and fancy roping contestants had to make figures and shapes with the lasso before unleashing it to capture one or several persons or animals. The most famous trick roper was unquestionably the humorist Will Rogers. The top rodeo trick ropers were Chester Byers (1892–1945) and Florence LaDue (1883–1951). Trick and fancy riders circled the arena on their speeding horses while performing a variety of gymnastic feats. Judging of both contests resembled that of contemporary figure skating or diving. Many call Leonard Stroud (1893–1961) the greatest trick rider among cowboys, while all-around cowgirl Tad Lucas (1902–1990) was the most successful woman in that event. Other stars of the pre–World War I era included Lucille Mulhall (1884–1940), a versatile athlete most famous for defeating cowboys at steer roping, Bill Pickett, Enos Edward “Yakima” Canutt (1895–1986), and Hoot Gibson (1892–1962).

Rodeo was a hand-to-mouth existence for most performers, although combined with Wild West entertain-

ing it could provide a few with full-time employment. Many early hands had unsavory reputations for drinking and carousing, which made rodeo unwelcome in some communities. The economic outlook improved with the introduction of the Madison Square Garden Rodeo in New York City in 1922. Its success spawned a series of lucrative eastern rodeos that capped off the season and provided top hands with large paydays. The Madison Square Garden Rodeo soon became the foremost contest, but eastern indoor rodeos required adjustments of time and space, leading to the gradual demise of races, novelties, and trick and fancy competitions. Tex Austin (1887–1941) introduced rodeo to Madison Square Garden, but the major producer of the 1930s was Col. W. T. Johnson of San Antonio, Texas. His eastern rodeos set records for attendance that stood for years and enabled the sport to survive the Great Depression. Among the dominant stars of the 1920s and 1930s were Lucas, roper Bob Crosby, and all-around hand Bob Askin.

Rodeo long defied modernization, lacking central governance, standard rules, or record-keeping. This situation led to a plethora of world champions and an environment in which fraud thrived. Of particular concern were unscrupulous promoters, who advertised staged events as legitimate contests, and “bloomers,” who collected entry fees, gate receipts, and services for their rodeos and then fled during the final go-round, leaving local businesses and contestants unpaid. These problems led western producers in 1929 to form the Rodeo Association of America. The RAA established regulations and official rules, devised the first official system for naming world champions, and published a blacklist of unscrupulous promoters. The RAA certified no contests for women, and Johnson and other big operators failed to join the organization, which was most influential in the West.

Johnson himself became the target of the biggest controversy in rodeo history—the 1936 strike of cowboys against his Boston (Massachusetts) Garden Rodeo. The cowboys refused to compete unless Johnson increased their take. Although initially resistant, Johnson faced an

ultimatum from the venue's management that produced a settlement—the first time in U.S. sports history that athletes staged a successful strike and wrested control from wealthy businessmen. The jubilant cowboys formed the Cowboys Turtle Association (CTA) but struggled for years. Last-minute strikes caused chaos, leaving Turtles banned from some major contests. Ultimately, the CTA forged an agreement with the RAA that enabled the cowboys to take control of the sport by 1955. With the ability to sanction rodeos and decertify contestants, they eliminated the corruption in the sport and ultimately became the PRCA.

By the end of World War II rodeo was a different sport, thanks to the influence of Gene Autry, the Hollywood singing cowboy who purchased most of the major rodeo companies during the 1940s. Stressing pride, patriotism, and masculinity, he produced elaborate rodeos with only six or seven contests. Autry played a key role in sustaining rodeo through World War II and establishing the tradition of headlining singing stars rather than athletes. His productions never included women's contests, and cowgirls vanished from the big-time circuit, where blacks, Hispanics, and Native Americans had already become almost nonexistent.

In 1948 a group of Texas women founded the Girls' Rodeo Association (GRA), later renamed the "Women's Professional Rodeo Association" (WPRA), and began working with both local rodeo committees and the PRCA to ensure cowgirls a place in the sport. In 1955 WPRA President Jackie Worthington and PRCA President Bill Linderman signed the agreement ensuring that all women's contests at PRCA rodeos would have the WPRA sanction. Cowgirl barrel racing quickly became a standard contest at most PRCA-sanctioned rodeos. In order to provide women with opportunities to compete in roping and rough stock events, the WPRA sanctioned all-women rodeos. Extremely popular during the late 1940s and 1950s, these rodeos today draw limited crowds, making prize money insufficient to meet expenses.

By the late 1950s the Madison Square Garden Rodeo had declined, and the PRCA decided to establish a le-

gitimate means of determining world champions. In 1959 the first National Finals Rodeo took place at Dallas, Texas. The NFR, run by the PRCA itself, is now the premier rodeo in the United States and certainly the richest. The top fifteen money winners in six cowboy events—bareback and saddle bronc riding, bull riding, calf and team roping, and steer wrestling—compete in the week-long rodeo. Women's barrel racing joined the program in 1967. The total purse for the first two NFRs was \$50,000. During the NFR's tenure in Oklahoma City (1965–1984), its purse rose from \$44,500 to \$901,000. In 1984 Las Vegas made the PRCA a better offer, and the NFR moved to Nevada. There the 1985 purse was \$1,790,000, reaching \$2,886,269 in 1994. During that same period the number of PRCA-sanctioned rodeos grew from 493 to more than 700,

while the total prize money increased sevenfold to more than \$23 million. Commercial sponsorship has become increasingly important since 1971, when the R. J. Reynolds Corporation contributed more than \$100,000 in cash prizes. Today numerous sponsors and television contracts enrich successful contestants.

Cowboy Jim Shoulders won his fourth all-around title in 1959, collecting a total of \$32,905. The top single-event winner, calf-roping champion Jim Bob Altizer, won \$24,728. Individual winnings rose along with purses and rodeos, and by 1995 fifteen athletes had reached the \$1 million mark in rodeo winnings. Charmayne James, who won ten consecutive barrel racing titles before relinquishing her crown in 1994, is the lone cowgirl in the fifteen. James' success is due in great part to the leadership of the WPRA, which in 1980 issued an ultimatum to more than six hundred rodeo committees that if women's purses did not equal men's by 1985, the women would not ride. The committees complied, and in 1985 James earned more than \$150,000, triple her 1984 winnings.

Tom Ferguson in 1976 became the first cowboy to surpass the \$100,000 mark in annual winnings. Roy Cooper, who competes in steer wrestling as well as all three roping events, has the highest total career winnings, followed by rough stock specialist Ty Murray, the youngest man ever to reach the \$1 million figure. In 1993 Murray set several records, including the most money ever won at the NFR (\$124,821) and the most in a single season (\$297,896). Murray, Ferguson, and Larry Mahan share the honor of having won the most all-around titles with six apiece, while Jim Shoulders' total of sixteen world titles remains unsurpassed.

Few African-Americans followed Bill Pickett into rodeo, perhaps because local committees and judges exhibited significant racism. Biographers suggest that Pickett would have been a major contestant had he been permitted to enter more often. Although PRCA records reveal no institutional racism, minority athletes, sometimes barred locally, often felt doomed, especially when events required subjective judging. Even today African-Americans make up less than 10 percent of

PRCA members and less than 1 percent of WPRA members. Only two black cowboys have ever won world championships—bull rider Charles Sampson in 1982 and calf roper Fred Whitfield, who won the title in 1991 and 1995, qualifying for every NFR since 1990. In an effort to help more African-American cowboys have successful PRCA careers, a series of Bill Pickett Rodeos takes place each year.

Hispanic and Native American athletes also felt unwelcome at many rodeos. Hispanics who joined the major circuit concentrated on their specialty, roping, which is scored by the clock, not by judges. From 1972 to 1986, Leo Camarillo won the PRCA team roping title five times, making the top fifteen every year. He finished in a tie for the 1975 all-around title, thus earning a place in the National Rodeo Hall of Fame at Oklahoma City. Hispanics elected to that hall include pioneer roper Vincente Oropeza (1858–1923) of Mexico and Texas roper Juan Salinas (1901–1995). Camarillo, team roper Jim Rodriguez (b. 1941), and bronc rider James Charles “J. C.” Trujillo (b. 1948) are honored by the Pro Rodeo Hall of Fame at Colorado Springs, Colorado. Both halls also honor Bill Pickett and cowgirl Tad Lucas, one of only two women honored at Colorado Springs. Lucas is also among the honorees at the National Cowgirl Hall of Fame at Fort Worth, Texas.

Organizations

Numerous rodeo governing bodies exist in North America, each with slightly different rules. However, the richest and most powerful is the Professional Rodeo Cowboys Association, which sanctions seven events and allows barrel races sanctioned by the Women's Professional Rodeo Association as the only women's contest at its rodeos. Other organizations include the American Junior Rodeo Association (AJRA) for contestants under twenty years of age, Canadian Professional Rodeo Association (CPRCA), National High School Rodeo Association (NHSRA), National Intercollegiate Rodeo Association (NIRA), National Little Britches Rodeo Association (NLBRA) for contestants eight to eighteen years old, Senior Pro Rodeo (SPR) for contestants forty

years old or more, International Rodeo Association (IRA), Indian Professional Rodeo Association (IPRA) for Canada only, and All Indian Rodeo Cowboys for the United States. Although women make up less than 20 percent of all rodeo contestants, girls outnumber boys in the eight- to twelve-year-old ranks, and their numbers equal those of boys in high school rodeo. Regardless of the association involved, athletes must have membership cards or permits in order to compete and must limit their participation to rodeos sanctioned by their governing body or one having an agreement with their governing body. Local rodeo committees are the lifeblood of the sport. They pay sanctioning fees to the appropriate governing bodies and hire approved stock contractors, judges, announcers, clowns, and barrel men. For many small western communities, the annual rodeo is the biggest event of the year, and the Fourth of July is the biggest rodeo day in the United States.

Events

The most popular timed events in rodeo are steer wrestling, calf roping, steer roping, team roping, and barrel racing. Barrel racers try to ride a cloverleaf path around three barrels placed at set distances around the arena without toppling them. Steer and calf ropers try to rope the animals, jump from their horses, and tie the animals so that they remain tied for a specified time. Team ropers work in pairs, the header roping the front of the animal, the heeler roping the rear. Steer wrestlers must jump from their horses, grab the steer's horns, and wrestle the steer to the ground. Animals get a head start, and contestants must stay behind a barrier until released or be penalized. Some rodeo organizations have additional events such as goat tying and breakaway calf roping, in which animals are not tied; many organizations omit steer roping, which is illegal in some states.

Rough stock events include bull riding, saddle bronc riding, and bareback bronc riding. In PRCA rodeos riders must stay on the animals for eight seconds. Those riders who succeed receive scores from the judges, who award scores of 0 to 50 points to both the animal and the rider, for a possible high score of 100 points. Dif-

ferent organizations have different minimum time limits, and some organizations omit some of these contests. Most organizations regulate attire, and many conduct drug tests.

World champions are typically decided at a finals rodeo. In the WPRA and PRCA the top fifteen money winners in each event participate in the finals, with money won there added to the year's total to determine the world champion. High school and college rodeos have different means of determining finalists. Amateur organizations often award scholarships rather than money. Usually the athlete with the most money or points acquired while competing in more than one event is named the all-around champion, the sport's highest honor.

The biggest issue facing rodeo is opposition from animal rights groups. Rodeo has faced the wrath of humane societies in North America and abroad since the late nineteenth century. Producer Tex Austin had to drop some events from his famous 1924 London rodeo for this reason. The tactics of opponents have changed recently. Besides picketing and demonstrating, opponents have successfully lobbied state legislatures to outlaw certain contests, as happened with steer roping years ago. The PRCA has responded with educational programs and legislation. The PRCA now has more than sixty rules, endorsed by the American Veterinary Medical Association, to protect livestock. Administrators are quick to note that rodeo is much more dangerous to humans than to animals. The injury rate for animals is a statistically negligible .00045 percent. Although no one has calculated the injury rate for cowboys and cowgirls, rodeo deaths continue to make headlines. Two top bull riders, Lane Frost (1963–1989) and Brent Thurman (1969–1994), suffered fatal injuries at major rodeos.

Rodeo outside the United States

U.S. rodeo is popular with international audiences. The 1887 European tour of Buffalo Bill's Wild West Show generated great enthusiasm. During the next forty years numerous Wild West shows and exhibition rodeos

traversed the globe, leaving behind pockets of interest on every continent except Antarctica. Ultimately, many equestrian, cattle-raising cultures devised their own similar sports rather than copy the U.S. model. Events that U.S. residents sometimes call “rodeos” take place in Chile, Argentina, and Brazil, but these events have different rules and contests in each country and owe more to local developments than to U.S. rodeo. Little effort has been made to record their history. Chile’s *la fiesta huaso* contains but two events, and neither is like any U.S. contest. The older Mexican *charreada* maintains its popularity in both Mexico and the United States, but it is a different sport from U.S. rodeo. U.S.-style rodeos do occur sporadically in disparate locations such as Japan and France, but like the South American events and *charreada*, they are amateur amusements. The International Rodeo Association turns down numerous invitations annually to exhibit rodeos abroad because of expenses and logistical problems.

U.S.-style rodeo is practiced primarily in the United States, Canada, Australia, and New Zealand. Inspired by the formation and success of the Cowboys Turtle Association, Australian hands formed the Australian Rough Riders Association (ARRA) in 1945 and have held national championships in the standard rodeo contests since that time. The ARRA changed its name to the “Australian Professional Rodeo Association” (APRA) in 1988. Also active is the Australian Bushmen’s Campcraft and Rodeo Association Ltd. Still, U.S. rodeo is the most lucrative in the world, and skilled athletes from other countries often relocate to the United States to compete on the PRCA, IRA, or WPRA circuits, hoping to become full-time professionals.

Rodeo Today

Today the PRCA sanctions rodeos in forty-six states and four Canadian provinces. Although recalling a simpler time, major contests are sophisticated productions featuring computerized entry systems and electronic timing. Rodeos have long drawn big crowds in the major eastern cities. During the heyday of the Madison Square Garden Rodeo, cowgirls found they could not

even shop in Manhattan in western attire without attracting crowds of curious onlookers. However, rodeo’s appeal to the eastern urban spectator is much the same as the appeal of western films: nostalgia for a mythical past and a chance to see “real cowboys” in action.

Rodeo is as much a part of life in the ranching West as skiing is in Norway. As they have done for more than 150 years, ranch children begin riding before they can walk, and many begin roping posts and household animals in early childhood. They are socialized into competitive rodeo at a young age through Little Britches and other youth rodeos with the enthusiastic support of their parents. They can progress to NHSRA and NIRA rodeo without moving far from home. Rodeo is also a family affair, with many current contestants representing the third or fourth generations of their families to be active in the sport. Most rodeos take place in rodeo country, where fans and contestants share a culture. Big-time U.S. rodeo does not flourish without community support, specially bred rodeo stock, and men and women born to the saddle.

Romania

Romania is located in southeastern Europe and its capital is Bucharest. It borders Russia on the north and east, Bulgaria on the south, Serbia in the southwest, and Hungary in the west. Although Romania is close to the Slavic region, the Romanian language belongs to the Romance family. In addition to the Romanians, there are Hungarian, German, and Ukrainian minorities among an estimated population of 22 million.

From Independence to World War II

Modern Romania was born in 1859, when the principalities of Moldavia and Wallachia merged into one state under Russian influence. In 1879 European powers recognized the independent Kingdom of Romania. The development of a state based on agriculture with little industrialization progressed with difficulty until World War I, with Romania having continuously to balance its interests between the Russian and Austro-Hungarian empires and their expansion.

The aristocrats loved horseracing, in particular flat racing and trotting, and Bucharest was a profitable venue for both. At the turn of the nineteenth century, cycling, football, and athletics were practiced in Bucharest, where

in 1904 a central sport club was established. In 1909 the Romanian Federation of Football was formed and a year later the first National Cup took place. In 1912, a national board assumed the control of all sports. In 1914 the first national championships for athletics took place. The Balkan Wars (1912–1914) and later World War I interfered with the development of sports.

The Treaty of Versailles (1919) changed the borders of Romania and the new kingdom, soon renamed Greater Romania, encompassed Transylvania, formerly part of Hungary, and Bessarabia. The larger nation absorbed the town of Arad, which had two important clubs, one for gymnastics and one for football, which later would have great impact. Romania signed the Petite Entente in 1922, a treaty that connected it with France. This choice also had an impact on sport; as some middle-class people went to study in French universities and learned the rudiments of rugby, which then became popular in Romania. Moreover, the football federation changed its name and its internal organization and controlled handball, another sport that grew in the coming years.

In 1924, Romania debuted in the Olympics. However, previously, in 1900, Georghe Plagino, one of Romania's International Olympic Committee members, competed in shooting's clay trap event. In the 1920s and 1930s, some Romanian professional boxers achieved success. On the occasion of the first World Cup of soccer in 1930, the best European teams refused to sail for the host country, Uruguay, but the Romanian football body accepted the warm invitation of the president of the International Federation, the Frenchman Jules Rimet, and took part to the finals. Romania also participated in the World Cups of 1934 and 1938. Romanian football became professional in 1933.

In 1940, with Nazi support, General Ion Antonescu took power. In 1944 King Michael recaptured the throne and joined the Allies against Germany. During the Nazi period, the rising star of women's table tennis, a Jewish player named Virgilia Rozeanu, was imprisoned. Later, she came back to reign in table tennis into the 1950s.

Key Events in Romania Sports History

- 1904** A central sports club is founded in Bucharest.
- 1909** The Romanian Federation of Football is founded.
- 1912** A national governing board assumes control of sports.
- 1914** The first national championship in athletics takes place.
- 1924** Romania competes in the Olympics for the first time.
- 1933** Football is professionalized.
- 1947** Romania comes under Soviet control and sports is reorganized following the Soviet centralization model.
- 1968** Romania wins its first European Cup in rugby.
- 1972** Tennis player Ilie Nastase wins the U.S. Open and then the French Open in 1973.
- 1976** Nadia Comaneci gains international attention for gymnastics performances at the Montreal Olympics.
- 1984** Romania breaks with other Soviet bloc nations and competes in the Olympics in Los Angeles.
- 1989** Nadia Comaneci defects to the United States.
- 2004** Romanian women win eight gold medals at the Athens Olympics.

Under Communist Rule

The Communist Party won the election of November 1946 and, under Soviet influence, forced King Michael to abdicate a year later. Sport was reorganized in accord with the Soviet Union model, with a large investment in facilities, compulsory youth participation, and more recruitment youth to sports. Women's sport was promoted, with particular attention to team sports like handball and volleyball, but also gymnastics and rowing.

Between 1950 and 1960, Romania industrialized. In 1965, Nicolae Ceausescu took power and, although maintaining the Warsaw Treaty, which connected Romania to other Eastern European Communist countries, he expressed disagreement on the occasion with Soviet policies such as the invasion of Czechoslovakia in 1968 and he also recognized West Germany. On the sport side, the boldest act of independence from Soviet influence was the decision to participate in the 1984 Olympics in Los Angeles.

Romania gained attention in rugby when, in 1968 and 1975, it won the European Cup, defeating previously unbeaten France. On the other hand, some Romanian athletes were involved in scandals. One was the two-time Olympic champion and record holder in the women's high jump Iolanda Balas who refused to take

a gender test before European Championships of Budapest in 1966. In 1969 and 1972 Romania reached the finals of the Davis Cup, both years against the United States. On the second occasion, the match took place in Bucharest and, according the unanimous judgment of international experts, the Americans were penalized by several unjustified decisions in favor of Romania. However, United States won the Cup. One of the Romanian players, Ilie Nastase, became an idol in Romania. Winner of the men's singles in the U.S. Open (1972) and the French Open (1973), he displayed a mix of talent and a theatrical style.

The greatest Romanian champion was the gymnast Nadia Comaneci. At the 1976 Montreal Olympics, she astonished the world with her skill and earned seven judges' scores of ten. In 1989 she defected to the United States and claimed to have been abused by the Ceausescu family. In 1986, the Steaua Bucharest club won the European Cup for National Champions, but some months later three players were injured and disabled by Ceausescu's sons. One of first signals of the end of Ceausescu's power was the unexpected protests of some Steaua players against the rigged refereeing of Romanian Cup 1989 in favor of Ceausescu's preferred team, the Dynamo Bucharest.

Hail Caesar, we who are about to die salute you. ■ GLADIATORS' SALUTE IN ANCIENT ROME.

Romania after 1989

When Ceausescu fell from power on 25 December 1989, Romania began a difficult transition to democracy and capitalism. Sports continued to be popular and organizations remained active. Women's victories, especially in gymnastics, rowing, athletics, and swimming, represent over the half of the honors won by this country in the Olympics. At the 2004 games in Athens women won all of the eight gold medals for Romania.

The Future

No longer under state control, sport still has some privileges because it brings prestige. Professionalism now faces fewer restrictions and the state gives only limited assistance to many Olympic sports, encouraging private sponsorship. Some athletes emigrate, and in some cases change their citizenship so as to compete in better-paying professional leagues and competitions.

Rome, Ancient

In contrast to physical education in ancient Greece, games and exercises in ancient Rome were intended only to make men strong and skillful warriors. The Romans of the republic and the early empire were selectively enthusiastic about Greek athletic contests. Emphasizing physical exercises for military preparedness, the Romans preferred boxing, wrestling, and javelin throwing to running foot races and throwing the discus.

Ball Games

Ball games were popular with the ancient Romans throughout their history. They used different types and sizes of balls, some being filled with hair, others with feathers or air. Throwing or catching formed the basis of most games. Playing, catching, and juggling two or more balls in the air and similar activities were popular as light exercises. More active games played by Roman youth included "handball," *trigon*, *sphaeromachia*, and *harpastum*. In "handball" the players attempted to hit a ball with their open hand so that it struck against a wall, then permitted it to bounce on the ground, and attempted to repeat the process as long as possible. Descriptions of *trigon* are confusing, but apparently three men stood at the corners of a triangle and played with two or more balls. Frequently they had to catch and toss simultaneously because the balls were not thrown in any definite order but rather at the caprice of the server. In *sphaeromachia* the ground was marked off somewhat as in lawn tennis, and the players took sides. *Harpastum* was played with a small ball filled with air. Two or more players threw the ball to one another in such a way as to avoid a player between them.

Games and Politics

Under the empire the Romans promoted games and festivals for political purposes rather than for athletic ideals. To win support, politicians vied with one another, attempting to produce the most ostentatious games to delight the thrill-hungry mobs. In later times noblemen maintained schools of gladiators, often with the idea that these men could be utilized as private armies. The state kept voting greater and greater sums to be spent on public games. To capture public favor, ambitious young politicians in charge of the holidays supplemented the government appropriations with funds from their own pockets and privately sponsored additional games. Frequently men incurred huge debts in this manner, but they hoped to recoup their losses by securing profitable political appointments to provinces as a result of their public popularity. With the increased

It is a rough road that leads to the heights of greatness. ■ SENECA

interest in such lavish entertainments, new facilities were provided for the comfort of the pampered patrons of sporting events.

Besides the Circus Maximus and Circus Flaminius, another racetrack was erected in Rome, and three others were constructed a short distance from the city. Usually these tracks consisted of tiers of seats built around three sides of a long, level track. At first they were built of wood, but after fire, decay, and accidents had wrought much damage, stone seats were provided. The Circus Maximus was about 600 meters long and 182 meters wide and in the times of the emperor Augustus could accommodate 150,000 spectators. The charioteers raced around a fence, or *spina*, that was built down the center of the arena.

Chariot Races

The state or private citizens financed the races at the circuses, but racing syndicates provided the entertainment. Their stables housed horses imported from every part of the empire and employed a huge staff of trainers, coaches, doctors, and attendants. Each syndicate was identified by the colors its drivers wore. In the early days anyone could race, but by the end of the republic men of repute did not race. The drivers in the races were usually slaves, although a few won their freedom through exhibitions of skill. The more successful charioteers were the pets of society and received extravagant gifts from wealthy gambling fans.

Gladiatorial Combats

The gladiatorial combats were more popular even than the chariot races because they provided the chief spectacles for the populace. Indeed, the *munera*, which pitted man against man, and the *venationes*, which pitted man against animals, became popular even in the Greek-speaking eastern empire, which historians once had thought immune to the lust for blood. The gladiatorial games, however, had a powerful religious dimension. The first Roman combats, in 264 BCE, were derived from Etruscan funeral games in which mortal combat

provided companions for the deceased. In the early days the gladiatorial combats were held at the graves, forums, or circuses, but none of these places offered the most convenient facilities. In about 50 BCE men began to experiment with building tiers of wooden seats around an oval arena in order to offer a better view of the hand-to-hand fighting and the gory exhibitions. Later these amphitheaters were constructed of stone and served as public recreation centers resembling modern football stadiums. The Colosseum amphitheater covered 2.4 hectares, had walls 48 meters high, and could accommodate ninety thousand spectators.

Its subterranean area contained chambers for gladiators, dens for animals, and labyrinths of pipes to flood and drain the arena for water battles. Its marble seats were covered with cushions, awnings protected the citizens from the sun and rain, the air was refreshed by perfumed fountains, and sixty-four exits minimized congestion as the crowd left at the conclusion of the combats. The *editor* who staged the games usually rented the gladiators from a *lanista* (the manager of a troupe of gladiators) and was required to reimburse him for losers executed in response to a “thumbs down” sign. The performers in the gladiatorial combats were slaves, criminals, or captives, but some voluntarily joined the schools of gladiators.

During the reign of the emperor Nero (54–68 CE), women gladiators were introduced to the arena. The professional gladiators, most of whom were owned by wealthy men or dealers, received their professional education in private schools. Several of these schools received some support from public funds during the empire. At least four schools were located in Rome, and some were maintained in other cities. The emperor Caligula had twenty thousand gladiators in his school. The dormitories were constructed around a square exercise field where the gladiators received their strict training under the master and special teachers. Originally the combatants, attired in armor and employing various types of weapons, customarily fought man against man, but afterward the more thrilling mass bat-

tles were fought. Usually the fighting continued until death decided the victor, unless the mob gave the “thumbs up” sign, which indicated a popular decision to spare a wounded man’s life. In addition to the combats of men against men, combats of men against beasts and beasts against beasts were added. Even mock naval battles were instituted: The floor of an amphitheater was flooded. In one event nineteen thousand men were forced to participate in a miniature war in which hundreds lost their lives.

Late Antiquity

The Roman circus and the Byzantine (relating to the ancient city of Byzantium, now Istanbul, Turkey) hippodrome (an oval stadium for horse and chariot races) continued to provide chariot racing long after Christian protests (and heavy economic costs) ended the gladiatorial games, probably early in the fifth century. The less obtrusive pagan religious associations of the chariot races helped them to survive centuries after the emperor Constantine’s conversion to Christianity in 337 CE.

Rope Jumping

Rope jumping has been popular, especially among children, in many areas of the world, from the Polynesian islands to Korea to Colombia. In Europe, too, rope jumping has a long history. In 1657 Jacob Catsen published a book about pastimes of children in Zurich, Switzerland, and this book included a picture of a boy rope jumping.

Rope jumping played an important role in the concepts of the so-called philanthropists who developed an educational program based on the ideas of the French philosopher and writer Jean-Jacques Rousseau at the end of the eighteenth century. One of the most famous philanthropists was Johann Friedrich GutsMuths, who published his book *Gymnastics for Youth* in 1793. This book was translated into numerous languages and influenced the development of physical education in many European countries. However, “youth” for GutsMuths meant “boys only”—girls were excluded from gymnastics. GutsMuths devoted a whole chapter to “the dance in the rope and in the hoop” (GutsMuths 1793, 455).

Rope jumping also had a place in the concept of German gymnastics (*turnen*), which was developed by Friedrich Ludwig Jahn and his adherents at the beginning of the nineteenth century. German gymnastics, which had educational and political aims, included a variety of physical activities. In 1816 Jahn and his co-author, Ernst Eiselen, published the “bible” of the German turners, *Deutsche Turnkunst* (Art of Gymnastics). This book contained many exercises, including short rope jumping with two swings of the rope, crossing the arms while swinging, running and jumping, and turning while jumping. Exercises with a long rope included running through or jumping above the rope. In the guidelines for the installation of gymnastic grounds, Jahn demanded specific places for rope jumping, and in his list of equipment he included long and short ropes.

During the first half of the nineteenth century in many Western countries educational programs began to

Each fresh peak ascended teaches something. ■ SIR MARTIN CONWAY

offer physical activities for girls to increase health and grace. Girls were to be “protected” from strenuous, dangerous, and immoral activities. Rope jumping did not offend propriety and femininity and thus was looked upon as especially suitable for the “weaker sex.”

During the second half of the nineteenth century physical education began to be integrated in schools in Europe as well as the United States. Rope jumping was a popular exercise in physical education because it does not require expensive equipment or facilities and because all pupils can exercise at the same time.

Rope jumping also was recommended in books about games published by the education, health, and lifestyle reformation movements at the end of the century. In Germany, for example, a games movement recommended games and other activities for young people in fresh air. One of the reformers was Adolf Netsch, who praised rope jumping in his book about games for girls. For him girls, ropes, and youthful joy were as closely connected as spring and flowers. However, he also warned against dangers if girls jump until they are exhausted or if “they stamp and throw their body from one leg to the other” (Netsch 1895, 49). Rope jumping was also recommended for boys. Bancroft, for example, wrote (1922, 117): “Jumping a rope is admirable for boys and girls, combining much skill with invigorating exercise.”

After the turn of the century people employed rope jumping in new areas. Gymnastics schools used the rope in rhythmic exercises. Rope jumping also was used in other sports, such as in boxing, to improve endurance and mobility.

During the 1970s rope jumping was rediscovered in the United States when people were

encouraged to rope jump to strengthen their hearts and to improve their blood circulation. In addition, police officers and social workers used rope jumping to engage children in minority areas of cities. Rope jumping was an excellent way to support cooperation, strengthen self-esteem, and contribute to the resocialization of troubled children. Antidrug campaigns recommended rope jumping with the motto, “Rope is better than dope.”

Benefits

Rope jumping is recommended for all age groups but attracts mainly young people, especially girls. Proponents say rope jumping benefits health and improves motor skills and coordination. Rope jumping not only increases gymnastic and acrobatic skills, but also supports strength and endurance. In addition, rope jumping allows people to be active with others. It also is inclusive: Anyone can participate and be part of a performance which is attractive to spectators. Last but not least, rope jumping does not require sports facilities or expensive equipment.

Rope Skipping

Such initiatives were successful: Young people participated in rope jumping with increasing enthusiasm. They invented variations of jumps and swings; they loved the rhythm. Rope jumping received a new image, and a new sport was created: rope skipping. The most important difference between rope jumping and rope skipping is the rope, which has handles that allow the rope to turn, allowing faster and more precise swings. A plastic rope for individual jumping is lightweight and can be moved using only the wrists.

Girls in Germany jumping rope.

Beaded ropes have been developed to allow people to jump in pairs. Beaded ropes have a slower and more regular swing. Cloth ropes are long and made of a heavier material; they are used for jumping in groups.

Rope skipping uses music—the faster the better. The beat increases with the skill of the skipper. Beginners start with a slow rhythm and in the training process they increase the speed gradually with the aim to skip as quickly as possible. Rope skippers might start with basic skips and graduate to skips with a partner or to complex exercises with a group (up to eight partners) who performs routines. In addition, skipping can be combined with performing tricks (forms of swinging the rope), gymnastic exercises, and even with playing with a ball or with break dancing.

The evolution of rope jumping to rope skipping was a sportification process. The process included the standardization of tricks, exercises, and routines; the development of systematic learning and teaching methods; the publication of teaching manuals; the education of trainers and teachers; and the organization of competitions. Clubs and federations were formed on the national level and the international level.

Competition at the Top

Rope skipping as a competitive and performance-oriented sport is new. In individual competitions the number of double or triple swings is counted. In speed competitions contestants skip as fast as possible in a given time. In other competitions the number and difficulty of tricks are judged. The most spectacular events are group competitions with up to eight athletes using the long rope. In 1991 the first European championship took place in Ghent, Belgium. Since then, the number of national and international events increased and even world championships were organized. The last world championship took place in 2004 in Australia.

Governing Bodies

The governing bodies of rope jumping and rope skipping are the International Rope Skipping Federation

(IRSF) (www.irsf.ca), with headquarters in Canada, and the European Rope Skipping Organization (ERSO) (www.erso.org).

Rounders and Stoolball

Rounders and stoolball are bat and ball games that, like many of today's sports, originated in Britain in the late eighteenth century. It has been claimed that rounders was the precursor of American baseball, and the games do have similar elements: a bowled (pitched) ball struck with a wooden stick (bat), a home base, four posts (bases) around which players run, and nine players. Rounders and stoolball were first played by men and women. They soon became primarily women's sports and are played predominantly by women or mixed teams on a recreational level, or by students in physical education programs. Young women who can now play soccer (association football), basketball, or cricket associate rounders with old-fashioned school games. Rounders is played mostly in primary or elementary schools, while stoolball is a traditional English summer game for women.

It is the greatest shot of adrenaline to be doing what you have wanted to do so badly. You almost feel like you could fly without the plane. ■ CHARLES LINDBERGH

History

Rounders and stoolball share a number of features in early history and styles of play, but diverge in the way their growth was stimulated in modern urban society. Both emerged as loosely structured spring and summer pastimes in rural England by the later eighteenth century. There have been several attempts at antiquarian reconstruction, as part of an attempt to locate them in broader national folk roots, but the earlier evidence is sparse and its terminology unreliable. One assertion that continues to provoke angry disagreement is that both contributed to the remarkably separate rise of cricket and baseball; it often seems to be the case that broadly similar activities are harnessed together to satisfy a hunger for origins. The use of wooden bats and wickets and thrown balls on grass fields may well be all these two games have in common with their supposed descendants. In England they often share the same grounds as cricket but are physically as well as symbolically marginalized because of their assumed feminine domination. When compared with cricket they fall into an uneasy divide between sport and pastime.

Both sports owe their modern followings to late Victorian attempts to reconstruct an imagined country past and, particularly, to improve the health and leisure activities of young girls and married women. Both owe a subsequent rise in popularity to a growing emphasis on physical recreation as an essential part of education in English state schools after World War I; their relative cheapness and team involvement made them particularly attractive, as did the fact that they could be played on asphalted urban yards if necessary. But they were never quite wholly gender-limited; at times there have been confusion and even conflict as to whom they were designed for and that is still far from resolved. The actual scale of participation, which is probably in thousands, is very difficult to reconstruct because relatively small national organizations exist alongside a wide range of informal participation.

Modern Play

Rounders is played on a five-sided pitch, three of whose sides are 12 meters long, whilst the other two are

8.5 meters. The bat holder stands in an approximately 2-meter square at the junction of one of the longer with one of the shorter sides, opposite a bowler in a central 2.5-meter square. Each team has nine players, and the various roles, bowling, batting, and fielding, are rotated so that all share as a team; whatever the individual skills, play does not generate specialties. A game consists of two innings, in which each side bats twice. A hard leather ball up to 19 centimeters in circumference and weighing up to 80 grams is bowled underarm to a round wooden bat or “stick” about 46 centimeters long.

After the strike, the bat holder runs, counterclockwise, round four posts 1.2 meters tall, hoping not to be caught or bowled out. Each successful run scores a “rounder” and the next team member steps forward until all have completed or been caught out. The team with most rounders wins. Two umpires watch for rule infringements. No special dress is required, although most players wear some version of decorous sporting wear and teams may wear sweatshirts. The rounders rules are reviewed every three years, with occasional minor revisions.

In stoolball, two teams, normally of eleven a side, play with two wickets (30-centimeter square boards) mounted on poles 1.37 meters tall and 5 meters apart. Soft balls, derived from tennis, are bowled underarm from one wicket to a bat holder standing at the other. The bat is normally wooden, shaped like a rather heavy table-tennis bat—it is often claimed that the game’s name derived from the fact that the first bats were three-legged milking stools, from which modern bats were developed. After striking the ball, the bat holder runs between the two wickets unless bowled or caught out. The winning team scores the highest number of runs, hence the claimed similarities with cricket. There are two umpires who are normally male, whatever the gender of the players, who are predominantly female. The rest of the bowler’s team are spread out as fielders.

Formalization, Eccentricity, and Gender Confusion

Rounders had a relatively quiet history until the later nineteenth century, when it was adopted loosely as a

useful game for younger boys and girls in some schools and as a team game for uniformed youth organizations. Some of the major new girls' private schools, such as Roedean in Sussex, adopted it, but often as a poor second to games such as hockey, which were regarded as more character-forming. Despite its reputation as a girls' game, it appeared in a number of contemporary texts as an option for "young sportsmen," a gentle preparation for more demanding and manly games. Rather grandiosely titled governing bodies appeared in 1889, when proper rules were drawn up. In that year, in Scotland and the urban north of England, two bodies appeared, the Scottish Rounders Association and the National Rounders Association of Liverpool. They were joined eventually by the more rural Gloucester Association and concocted the rules more or less as they still stand. It was 1943 before a proper National Rounders Association was formed, well away from London, as the country's governing body. It controls the rules and allows the formation of leagues for which a minimum of three local clubs is required; there are now forty leagues. The game also received a boost by being recognized as a useful way of keeping soldiers fit in both world wars, being cheap, easily organized, and requiring little specialized equipment. As such, it featured with stoolball in a number of military handbooks as a means of useful and impromptu morale building between bouts of fighting. There, an essentially female game was harnessed to become a lesser recreation for men when more complex sports were difficult to organize. Although it has had some success at national and even some international levels, particularly in Australia, where it proved popular in new private girls' schools for the socially ambitious around 1900, it remains essentially a localized game in which fun matters as much as seriousness. The National Rounders Association continues to promote it as ideal for all ages and both sexes, but especially as a family bonding activity. Its literature shows young men playing, but it is difficult to see it as other than a pastime for young women, away from its value in primary schools. It is essentially amateur.

Stoolball, by comparison, has a more checkered history. It was largely refounded in southeastern England in the 1840s by rural social matriarchs as a means of filling the little spare time of village girls with activities they could supervise. The daughters of the wealthy were also encouraged to play in teams, which were occasionally drawn from mixed social classes, using country house lawns as part of rural fetes. Some village clubs grew on the edge of cricket fields and men occasionally joined in, usually with one hand tied behind their backs. Small county organizations emerged, but most competitions took place between neighboring villages.

It would probably have remained very localized had it not attracted the attention of an eccentric lawyer, country landowner, and part-time soldier, William W. Grantham of Sussex, who saw in it both a means of reviving a local patriotism threatened by social and cultural changes and a means of helping wounded soldiers recuperate in preparation for returning to the trenches of World War I. He organized hospital teams between patients and nurses and used his aristocratic connections ruthlessly to develop it as a fund-raiser for veterans' charities. For some years it was even played in the grounds of Buckingham Palace, when the royal family was away. Grantham had it filmed and broadcasted, and took sets on his travels round the world. Reduced versions were played on ocean liners and scratch teams were formed wherever he turned up, in Geneva, Iceland, and the United States amongst others. He developed strong links with Japanese diplomats in 1930s London, who formed their own teams; and he made the mistake of seeing it as a means of generating international friendship to head off a Pacific war. Tireless as he was, Grantham made two serious mistakes in his attempts to revive stoolball as a national game. He used the game to promote a rather dotty revival of "Merrie England," in which male players such as he played wearing idealized peasant costumes, opening the game to ridicule. Much worse, he alienated the social matriarchs, who regarded it as essentially a women's game and found him autocratic.

The real popularity of stoolball after 1920 lay with local women's organizations, since it was offered as a game for virtually all ages and as a refuge from male interference. By the 1930s there were around one thousand clubs scattered throughout England, but the battle for control was fought out in the southeast of its roots. In 1923 Grantham formed a Stoolball Association of Great Britain, but it was male-dominated, and women in local federations fought shy of it, even pushing Grantham out of his own county federation. They did not, however, bother to found a rival national organization, leaving Grantham to flounder on; when he died in 1942 his creation died with him.

England's postwar revival saw stoolball reemerge rather more quietly. Most of the international dimension had gone but the game was still played occasionally in schools throughout the country as part of a diet of physical recreation. The main focus was in local clubs and leagues in southeastern England, some village-based, others attached to employers as distinctive as banks and food factories. At the end of the twentieth century mini stoolball was introduced for children and an indoor version was developed to allow year-round play.

The Future

In the late 1970s a new National Stoolball Association emerged, dealing largely with the southeast and some two hundred clubs—though many more clubs remained without affiliation, and do so to this day. One major difficulty continues; the new association recognizes the major changes that have taken place in both sporting practice and alternative attractions for young women, so it allows mixed teams. Some of the older members will not countenance this and insist on playing all-female teams, nor will they accept a change in catch rules. The memory of Grantham lives on as disagreement about gender-specific play thrives. Nonetheless, it remains as a much-loved amateur game primarily for women, as important a symbol of the English summer locally as cricket is for men.

Rowing

Rowing is the method of propelling a boat across water along a set course, involving the use of the whole body to work a pivoted oar, with various combinations of participants in the boat. Its geographical spread is only limited by access to suitable water and extends across the world, reflecting the sport's distant origins as a means of transport.

History

Much of the history of rowing is uncertain; there are next to no reliable written records before about 1800, and even after that date, professional secrecy meant that much information was never passed on. The activity of paddling a boat as a means of transportation reaches back to Egypt and must predate the appearance of the first sails, that is, around 3500 BCE. Boat construction, rowing instead of paddling, and different uses for rowing boats, such as troop, cargo, and passenger transport, developed in many ways in a wide variety of locations. Probably the most noteworthy contributors to the development of rowing were the Athenians of the fifth century BCE, and the Vikings between roughly 750 and 1150 CE. Both relied on ships, either rowing or sailing as conditions dictated. The Athenians developed the trireme, with three levels of oarsmen, which en-

abled the city-state to maintain its supremacy in the eastern Mediterranean from around 480 BCE. The technology was lost after the rise of Roman civilization, and only incomplete written records survived. The Vikings are notable for their wide-ranging expeditions to almost all the coasts of northern Europe, the inland seas of eastern Europe, parts of the Mediterranean, and even as far as the New World—to the popular and partially correct image of raiding parties associated with them should be added their contributions to trade and settlement. It is easy to conjecture about various informal competitions among those who made a living on a river or along a coast, but the first events on anything approaching a formal basis were Italian in the fourteenth century, hence the word *regatta*. The first recorded regatta to feature racing in England is believed to have been at Ranelagh (west of London) in 1775, although the term had for many years been used for a formal waterborne entertainment.

The Doggett's Coat and Badge was founded in 1715 by Thomas Doggett, an actor-manager, to be competed for by Thames ferrymen; still competed for annually, it is the oldest annual competition in the world.

Social Context

In many countries the first rowing was done by workmen as part of their livelihood and only “adopted” and reshaped comparatively recently. The first races were between professionals—people who made their living on the water—and once this practice died out toward the end of the nineteenth century, the sport remained amateur almost up to the present day.

COST OF EQUIPMENT

The origins of “modern” rowing in English public schools and universities immediately imparted a class bias to the sport in that country that took more than a century to recede to any great extent. Such was not the case in other nations. However, it has always been the case that the equipment to compete at the highest levels is expensive by any measure; currently, typical prices

for a top-quality eight are in the range \$20,000–\$25,000, for a single scull \$7,000–\$8,000, and a single oar approximately \$300.

The establishment of new clubs—calling for some kind of permanent structure and initial stock of boats—was and is expensive. It is therefore often the case that the most successful clubs are those with a long history that have managed to accumulate funds and boats sufficient to maintain stocks of equipment for top-class crews.

ADOPTION BY OTHER NATIONS

Although the earliest developments toward the modern version of the sport took place in England, the ideas were quickly adopted abroad; the first clubs in New York being formed in 1834, and the first college club at Yale in 1843.

The spread of the sport to other countries is a long and fascinating story. The first stimulus usually came from by rowing expatriates, mostly from England and usually involved in diplomacy, trade, or the Church. Among the countries so influenced were Germany, where the first club—the English Club—was founded in Hamburg in 1830, Australia (1835), France (1838), Russia (c. 1842), India (1845), Argentina (1857), South Africa and New Zealand (1861), and Japan (1866).

Evolution and Development of Construction and Materials

Although many types of boats have been and still are rowed on rivers, seas, and lakes, four specific developments produced what is now immediately recognizable as a racing boat. All four changes occurred during the nineteenth century and were the results of intense research and experiment.

BOAT DESIGN

Because the oar has to pivot about a fixed point, the most effective arrangement is for the portion of the oar on the rower's side of the pivot to be about 30 percent of the total length. It had always been the case that the

pivot (the fixed, rigid oarlock) was mounted on the side (thwart) of the boat, but the development of a metal arm fixed to the side of a boat to hold the pivot meant that the hull width could be reduced.

The next logical development was the sliding seat. With a fixed seat the stroke length is determined by the rower's ability to bend the upper body forward and backward while keeping the lower body fixed. It was obvious to the earliest rowers that the ability to somehow move the seat by flexing the legs would extend the length of the effective stroke in the water; the Athenians sat on fleeces that allowed a certain amount of sliding movement along their fixed seats. The first fully sliding seat was devised in Chicago in 1857—as now, it involved small wheels fixed to the underside of a seat, traveling in metal grooves.

These two changes naturally produced a longer and much narrower boat than previously, at the same time calling for a much-changed rowing technique to gain the maximum benefits. The least noticeable of the four developments (c. 1870) was to turn the fixed oarlock open at the top into a swiveling “gate,” with a lockable

mechanism to keep the oar in place; this gate is able to move around a vertical pin to allow maximum reach forward and backward.

Finally, the removal of the keel made for a much smoother hull shape at the cost of a loss of stability—the result being a gradual modification from a rounded to a V-shaped cross section.

These developments were specific to rowing; other general boat-building techniques were also adopted—smooth (carvel) replaced overlapping (clinker) construction, and internal load-bearing frameworks permitted thinner hulls. As with all waterborne craft, the precise design of any hull is a compromise between speed, weight distribution and stability, and manufacturers are continually seeking a “good” compromise for the mass market while being able to offer boats individually tailored to specific requirements.

The most recent stage of development has involved plastics and carbon fiber to provide—according to the specific use—greater strength and/or lower weight.

OARS

Oars underwent a later but equally remarkable series of changes. The traditional shape of the spoon (the part going through the water) had always been “pencil” or “barrel” shape—that is, long and thin. The oarloom (the long, thin section connecting handle and spoon) had to be comparatively thick to bear the stresses, but this implied extra weight and hindered boat speed by creating turbulence next to the spoon. Over the space of some twenty years beginning around 1950, spoons became broader and shorter, to reach the approximate proportions of a shield (Macon pattern) and then the wooden loom began to be reinforced with carbon fiber, until the wooden blade was finally abandoned. The next development in spoon shape, beginning during the 1980s, was the “meat cleaver”; approximately a broad rectangle, this specific, modern spoon shape is offset on the oarloom with the double result that only the effective part of the oar is in the water and greater effort can be applied at the start of the stroke.

The introduction of lightweight classifications to the Olympic program has provided a stimulus in many countries; the maximum weights permitted are men: 72.5 kilograms individual, 70 kilograms crew average; women: 59 and 57 kilograms, respectively.

Across the four groups of events raced at world championships, there are a total of twenty-four events; men race all eight boats, women and lightweight men do not race in coxed pairs or coxed fours, and lightweight women race the three sculling events and the coxless pair. From this list fourteen events are offered at Olympic regattas.

TECHNIQUE AND STEERING

In a sculling boat, each member of the crew has two oars, and each oar is pulled and controlled by a single hand and arm. In a rowing (sometimes called “sweep”) boat, one oar per crew member—with

both hands controlling—allows a greater pull but requires rather more concentration on the balance of the boat as the action is asymmetric.

The coxswain can sit either upright facing the rearmost rower (Stroke) or lie down in a small compartment between the bow of the boat and the leading rower (Bow). For the coxless boat, steering is achieved by the designated person looking over his or her shoulder at the end of the stroke and taking action by adjusting the amount of power delivered by the blade or blades; this action is generally preferred over the alternative of a movable footplate pulling rudder lines. On a straight course all that is necessary is to maintain a position midway between the two lines of buoys marking the lane.

Nature of the Sport

There are eight boat types in regular use, although pressure from Olympic authorities to reduce the size of the Olympic Regatta has resulted in a number falling-out of general favor since 1996: Single Scull (abbreviated 1x); Coxless Pair (2-); Coxed Pair (2+); Double Scull (2x); Coxless Four (4-); Coxed Four (4+); Quadruple Scull (4x); and Eight (8o).

EVENTS AND WEIGHT CLASSIFICATIONS

Events may be offered for men, women, and mixed crews, for age groups such as Juniors (under eighteen) and Veterans/Masters (over twenty-seven), which are further classified by age.

A boat without a coxswain will go faster than the equivalent with, but there is a benefit from the input of someone with a view of the course ahead and a prepared race plan, and steering in this situation—especially on a winding course—is much easier and more precise.

BOAT HANDLING

Each boat type has its handling characteristics due to the weight distribution of the crew, the point in the stroke cycle at which maximum power can be applied and buoyancy requirements. Handling characteristics can be further modified by the hull profile and—for the four- and eight-oar boats—the amount of torque generated at certain points in the cycle that gives a slight side-to-side “wobble.” To reduce the effects of torque, it is quite usual to see arrangements where two consecutive oars appear on the same side instead of in the more usual alternating scheme.

Racing

The first racing distances were by mutual agreement—between landmarks and for one race only. The usual distance appears to have been a number of miles (the distance for the Doggett’s, referred to earlier, is approximately 5 miles [8 kilometers], from “London Bridge to Chelsea”). The practicalities of a regatta, involving a number of races over the same course within a day or an afternoon, would have forced adoption of a much shorter distance. Local—river—regattas now typically vary between 500 meters and 1,500 meters and have two or three boats racing abreast. The increasing popularity and availability of the multilane, international-standard 2,000-meter course, with facilities for six abreast, has drawn top-level domestic competition away from the smaller venues.

Women compete over the same distances as men. Juniors are usually restricted to a maximum of 1,000 meters.

TACTICS AND PROBLEMS

At the highest levels of competition, over 2,000 meters, given that boats are so closely matched, racing tactics are

a trade-off between strength and stamina, coupled with a strong element of psychology. The classic race-winning strategy is to start strongly enough to take a lead well within the first thirty to forty-five seconds—certainly by the 250 meter mark—and stay sufficiently clear of the opposition to be able to match any increases in their speed all the way down the course. This requires a well-drilled crew with sufficient reserves of energy to last the full distance—it is far from unknown for a crew to lead to 1,500 meters or even 1,750 meters but be overhauled when their reserves prove to fall slightly short.

There are other complicating factors that may come into play. If conditions are windy, not only will the water surface be choppy, requiring concentration to be diverted to keeping the oarblade clear of the water on the return cycle, but the balance may well be affected as the boat is blown about. A headwind will slow forward progress and add a variable amount of extra time to a carefully planned expenditure of energy.

If there is one crew leading and a chasing group in close touch, members of the latter are often able to use each other as pacemakers and wear down the leading crew by a number of attacks at different points, usually leading to a blanket finish.

OTHER RACES

The other widespread type of event is the processional or “head of the river” format. This is a time trial, with competing crews given a rolling start, ten to thirty seconds apart, depending on the course, conditions, and skill levels involved. As “head” courses are significantly longer than those for regattas—typically being between 5–10 kilometers, but often much longer—overtaking will frequently occur, offering crews a chance to react to a challenge and raise the level of their performance.

In this type of race, a new set of abilities is called for, primarily stamina and sustained concentration. The concept was the brainchild of Steve Fairbairn, an Australian coaching in England, who wished to create an event to encourage winter training, against the pattern of training and racing between May and September only. Rowing

Rowing in the South Pacific

The rowing races are the most beautiful and exciting. What zeal among the rowers, as if it were the most important thing in the world. The canoes come rushing along in a line. Quick as lightning the oars dip into the water. From the mouth of the crew is heard incessantly the “iefot, iefot.” The spectators on the shore shriek, run up and down, and express their opinion about the individual canoes. When the first canoe has reached the goal, the people lift the oars, and the steersman cries “ieko,” which everybody answers with “o.” One day from the veranda of my house I watched a rowing race by my Christians. Two canoes tipped over, and the whole crew fell into the water; the third one went on calmly, without bothering about the victims. But the latter knew how to help themselves. They turned the canoes over and emptied them by pushing them back and forth; then they climbed in and came to the shore, greeted with howling laughter.

They also have many sayings which they shout at the opponent during the contest in order to provoke him. Thus, they say during a sailing race:

Wotama wotam
Sail only onward, only onward,
Wodedotok fan i ebäb.
Straight ahead under the canoe house.
Sön nan fan?
Who is there below?
Uan nimo[unknown]ö bi.
The canoe of the sand eater.

Here the opponent, whose canoe lags behind on account of his clumsiness, is mockingly called sand eater, because he scarcely seems to get away from the sand of the shore.

During a rowing race they call out:

Mei da äten, mei da sob.
Smashed is the decoration, smashed the beak,
Faben nigokop mei tere[unknown]ä[unknown]ä.
The canoe of the nigokop is roaring.

The canoe of the victor darts through the waves with such speed that it roars, and individual parts break due to the force of the pounding.

According to our views, the defeated canoe should pay something to the victor. But it is different on Truk. The victor has the honor and must pay an epilas (literally: spot) to the vanquished. That is a consolation prize for the defeat. Namely, a true Kanaka is seriously hurt if a kuf or a su is said of him, both of which means “vanquished.”

In former times women danced on the shore while the men rowed in races, in order to encourage them. Each woman naturally tried to show off in this and to impress her “lover,” which the latter’s wife did not want to permit. The jealous women insulted each other, tore each other’s hair, scratched and bit each other, until the men separated their darling wives.

Tideway, was the first to be held in 1926. The longest race in Europe is an annual 160-kilometer international “Tour du Lac à la Rame, a full clockwise circuit of Lake Geneva, which generally takes from twelve to seventeen hours.

CREW CONSIDERATIONS

A major factor in racing is crew selection. Not only must competitors possess both strength and stamina,

but they must also have sufficient psychological resilience to adapt to changing circumstances during a race. In larger boats, also, individual attributes come into play. With all boats it is always the case that the lighter crew members must be toward the bow for the optimum progress through the water. At the same time, the rower in the Stroke (sternmost) position must be technically outstanding and have a good “racing brain” to set the pace for the rest of the crew. The person

It is a sublime thing to suffer and be stronger. ■ HENRY WADSWORTH LONGFELLOW

behind the Stroke (usually designated “7” in an eight and “3” in a four), because his or her blade is on the opposite side, cannot see the Stroke’s blade action, so he or she must be able to pick up on body movement to transmit a reliable signal to the other rowers on that side. With this in mind, in an eight the next two to four places will be filled by the strongest individuals, and at the bow the requirement is for a “thinker” who can feed back useful criticism. Within the four the roles are less clearly defined, although the two central rowers are very much the powerhouse.

Social Rowing

While social (as opposed to competitive) rowing is a well-established feature in Europe, with annual rowing tours offered by FISA (Fédération Internationale des Sociétés d’Aviron), it should be noted that a great deal of rowing activity takes place in many other craft.

Craft embodying traditional seagoing designs can be found in regular use around almost all the coastline of Europe, and on both seaboard of the United States; although the building and rowing techniques rarely died out completely, regattas and rallies have staged a revival in the last fifteen to twenty years. Boat types tend to be restricted to a single country or region, although handicapping parameters exist to enable fair racing at large, international events.

At the same time, there has occurred a revival in old-style—sometimes rather obscure—racing craft such as the dongola (a wide, flat-bottomed rowing boat originally found in the Dongola province of the Sudan) and the randan—from the Far East—which requires two oarsmen to row with one oar each and a sculler with two blades in between them.

ERGOMETERS

There has been an explosive growth in recent years in ergometer competition. Despite a number of “rowing machines” achieving limited success over the years, the ergometer was devised in the early 1980’s as a rowing simulator for training, and thanks to its combination of a sliding seat with a heavy flywheel producing a good

approximation to a rowing action, it rapidly became very popular. Ergometers were also adopted by (non-rowing) health clubs and private individuals, and national and world championships are held annually. The machine has the obvious advantage of being usable almost anywhere, and various PC-based options permit the user to compete against others, with relative placings displayed to an audience as the “race” progresses.

Competition at the Top

The annual World Championships usually takes place in late August, although an Olympic regatta takes precedence over that year’s event, and a reduced program is offered a few weeks before the Olympics. Women’s events were introduced to the Olympics in 1976, when the standard distance for their races was 1,000 meters and moved up to the full 2,000 meters for the 1985 World Championships.

- The Olympic events are as follows:
- Men: 8o, 4-, 4x, 2-, 2x, 1x
- Women: 8o, 4x, 2-, 2x, 1x
- Lightweight Men: 4-, 2x
- Lightweight Women: 2x

There are no restrictions on the numbers of entries for the World Championships, but at the Olympics there are quotas of entries allowed for each of the fourteen events. For example, in Men’s 8o the total entry is nine crews—seven of which qualify by finishing 1 through 7 in the previous year’s World Championships, and a further two crews via a qualifying regatta some two months before the Games.

In Women’s 1x, nine qualify the previous year; a further twelve places are awarded via three continental qualification regattas for Asia, Africa, and Latin America; and the last three qualifiers come from the final qualifying event, making a total of twenty-four competitors.

REGATTA FORMAT

The typical World Championships or Olympic regatta will extend over eight days and may possibly add on a spare day to allow for poor conditions. This time frame

allows for two distinct groups of events to proceed in the sequence of heats, repechages, semifinals, and finals, with a day between each. FISA prescribes the number of races at each stage according to the total entry, and how winners are to progress to further rounds. Within the rules there is sufficient flexibility to cope with a number of days lost to the weather by, for example, rowing two days of events on the same day or arranging for an early start if the weather forecast is poor.

Team and Individual Successes

The sport has been almost completely free of cases of cheating, and although the remarkable success of Eastern Bloc crews—most notably those from East Germany—in the period 1945–1990 was undoubtedly partially due to the use of performance-enhancing drugs, it was also the result of a great deal of very thorough and imaginative research into what is now referred to as “sport science.”

The pattern of Olympic success over the years has followed three broad trends. These were echoed in the other annual competitions. The “old guard” countries—United States, Great Britain, France, Germany, Italy, the Netherlands—prevailed at first, although a significant factor for the first few Olympics was the difficulty of travel and so, for example, at the 1904 Olympic regatta at St. Louis, the United States and Canada were unchallenged, and in 1908 (Paris) there were no North American entries.

After the 1948 Olympics, the USSR and other Eastern Bloc countries generally prevailed, although their success tended to be in the smaller boats (the first East German success in Olympic eights was in 1976, the United States having won the event 1920–1956 and 1964).

Since the advent of doping controls and more recently the collapse of the USSR, success has been more evenly spread, with honors being shared widely, going to Australia and New Zealand as well as the European names from a century ago. A certain amount of this success is due to the diaspora of Eastern Bloc coaches who have found positions in other countries.

In women’s Olympic rowing, the first successes (1976–1988) went overwhelmingly to East Germany

and Romania; more recently other nations have come to prominence, although Romania continues to show strongly (three out of a possible six golds at Sydney 2000).

ROWING PERSONALITIES AND COMPETITORS

Famous names in other fields who enjoyed fame or success in rowing include the artists Thomas Eakins (United States) and Alfred Sisley (France), Dr. Benjamin Spock (Olympic gold in eights in 1924), and Jack and John Kelly (father and brother of Grace Kelly, competitors at Olympics 1920–1924 and 1956).

Given the extent to which each member is required to sacrifice some of their individuality to allow the crew to function as a single unit, it is perhaps not surprising that notable figures are few and far between, except in the area of single sculling—in this particular event the rivalry between Pertti Karppinen (Finland) and Peter-Michael Kolbe (Germany) in the 1970s and 1980s.

A small number of oarsmen and oarswomen have won gold at three different Olympics. Steven Redgrave (Great Britain) established a unique record by winning gold at five consecutive Games 1984–2000 (plus a bronze in 1988); his record is paralleled by Elisabeta Lipa (Romania) who over the same sequence of Games won 4 golds, 2 silvers, and 1 bronze.

Among coaches, the leading names have been Hiram Conibear (United States, from 1906), Karl Adam (East Germany, from 1952), and Thor Nilsen (Norway and Italy, from 1960).

Governing Body

Based in Lausanne, Switzerland, the international governing body FISA (Fédération Internationale des Sociétés d’Aviron), was founded by representatives from France, Switzerland, Belgium, Adriatica (now a part of Italy), and Italy in Turin, in June 1892; it is the oldest international sports federation in the Olympic movement.

Rugby

It is important to recognize the specific differences between Rugby Union and Rugby League. Rugby Union is a fifteen-a-side game played with an oval ball on a large rectangular pitch. It is a running, passing, tackling, and kicking game. Five points are awarded for a try (when a team manages to touch the ball to the ground across their opponents' goal line) and two points for the following conversion. Penalty kicks and drop goals carry a three-point tariff each. A match lasts for two halves of forty minutes, and is played between two teams comprising backs and forwards. Generally the larger and slower the player, the more likely they are to be a forward. A forward's job is to engage the opposition's forwards, win possession for the team, and provide a controlled mode of attack. The backs remain the main attacking force as they are usually the quicker runners. Backs attempt to exploit the spaces outside the forward clashes; consequently, the backs usually top the lists of try-scorers. A key rule of note in both forms of rugby is that the ball can be kicked forward but must be passed backward.

Rugby League has a similar look to Rugby Union, but there are number of significant differences between the two codes. Essentially the object of both codes is the same in terms of invasion of opposition territory; how-

ever, in Rugby League there are only thirteen men per side. There is also less distinction between forwards and backs. In terms of the practicalities of play, each team takes turns to complete a series of tackles. After each tackle, the player tackled "plays the ball" by tapping it back to a teammate. On the sixth tackle, possession reverts back to the opposition. Points are scored on a similar sliding scale to Rugby Union. Generally, Rugby League is faster than Rugby Union, with more open attacking and quick-break tactics. The use of a slightly smaller ball and the wearing of shoulder pads are a few of the more subtle differences between the codes.

Historical Development

Notably, there had been no attempt to codify generally accepted rules related to playing such games as rugby and other forms of football until the mid-nineteenth century. It was the English public schools that introduced formal practices and established codes of behavior and regulation for the form of games that they played. Initially, these rules differed from school to school, as they had been developed to suit the particular area on which the game itself was played. The codification of the sport into generally accepted norms of play was a key element in its development. More generally there was an ongoing process of the adaptation of traditional, folk modes of play into newer, more organized forms, as it was seen as a priority to attempt to regulate the increasingly violent behavior of players on the field-of play. As the game played at Rugby School grew in popularity throughout the second half of the nineteenth century, specific regional differences related to the interpretation of amateurism, although slight, began to develop. During this period, the Rugby Football Union (RFU, also referred to as Rugby Union) was formed in 1871 to act as the steward of the development of the sport in England. Initially, all of the rugby authorities in Britain sought to preserve the amateur ethos and its associated values of fraternity, innocence, fair play, and gentlemanly conduct as core values within the sport. However, to suggest that there was consistency or consensus in the stance taken by the governing

bodies related to amateurism and player eligibility would be incorrect.

Power Struggles

The RFU's fear of working-class domination of the game was heightened by the growing success of northern teams on the pitch in the 1880s and early 1890s. There was a general fear that if the southern amateurs at the RFU could not hold their own against the northern working-class players on the field of play, then southern control of the game would inevitably come into question. This would in turn have fundamental and possibly terminal implications for the amateur code. The constant RFU search for "veiled professionals" put pressure on many clubs. Indeed, the clubs that relied on regular matches and a high attendance for their income had difficulty in reconciling that dynamic with the policy of the governing authorities. Survival in such an unstable and uncertain environment was a pressing issue for many clubs. Broken time acted as "opportunity cost" payments and was seen by the northern clubs as a measure solely to benefit working-class players by ensuring that they would not suffer financially from their involvement in the game. Crucially, the northern clubs attempted to provide assurances that the nature of the game would remain true to the amateur principles.

Such notions, and the attendant uncertainty of the volatile industrial climate of the early 1890s, were viewed by some as inflammatory. The establishment of a governing body to act on behalf of the northern clubs began a process of differentiation and divergence that was to come to a head in 1895. The RFU clearly began to view the Northern Union (NU) as an extension of working-class unrest. The response of the RFU to the northern proposals was unambiguous. Arthur Budd, who was later to become the president of the RFU, stated, "If blind enthusiasts of working men's clubs insist on introducing professionalism, there can be but one result—disunion" (Delaney 1993).

It can be argued that the tensions giving rise to the subsequent split were directly related to the struggle for control of the sport, rather than the issue of pay-

ments to players. The RFU soon drew up a list of activities that they viewed as protecting the amateur ethos. Seventeen specific acts were listed, whereby any player contravening such regulations would have violated the amateur code and would be banned from the Union game. In doing so, the RFU had forced the issue with battle lines effectively being drawn between the two rugby codes. Whilst there has undoubtedly been a process of diffusion and democratization downward within society, Rugby Union (particularly in the United Kingdom) since 1895 has developed under predominantly middle-class control. This was especially the case regarding the majority of administrators and participants. However, the working-class players in the north of England happily left the southern administrators to their own devices amid bitterness and recrimination. The Northern Union developed separately in an openly professional manner and became known as the Rugby League in 1922. From this point on the positions of the two different codes became increasingly entrenched.

Transition and Structural Uncertainty

Immediately following the split of 1895, Rugby Union experienced a period of waning support and as spectator numbers declined so did the sport's finances. During the interwar years there was a general growth in interest, which was in no small part due to the application of the amateur ethos and its associated robust yet desirable principles. The first decades of the twentieth century saw Rugby Union—playing businessmen and empire-builders travel extensively throughout the world, introducing locals to the sport and forming clubs as they went. However, the international spread of Rugby Union was not mirrored in the fortunes of Rugby League. Indeed, Rugby League became confined to a small number of nations and enjoyed only minimal growth. Clearly the two codes were now developing in very different directions. The largely passive role of the governing bodies in developing Rugby Union since the latter half of the nineteenth century is an excellent example of what occurs when a largely amateur leisure pursuit with a robust

Trying to Understand Rugby

In his novel Very Good, Jeeves (1930), the British writer P.G. Wodehouse muses on the complexity of rugby:

Rugby football is a game I can't claim absolutely to understand in all its niceties, if you know what I mean. I can follow the broad, general principles, of course. I mean to say, I know that the main scheme is to work the ball down the field somehow and deposit it over the line at the other end and that, in order to squaleh this programme, each side is allowed to put in a certain amount of assault and battery and do things to its fellow man which, if done elsewhere, would result in 14 days without the option, coupled with some strong remarks from the Bench.

and worthy image grows into a far larger and more seriously organized concern.

The issue of gate money that accompanied the enclosure of Rugby Union grounds was something that fundamentally challenged the structure of the game as it had been originally constituted and codified. Throughout the 1980s, clubs and international unions began to benefit financially from the efforts of the players on the pitch and a distinct dynamic was in place. It would only be a matter of time before the players themselves sought some form of recompense for their efforts, which were providing profits for their clubs and Rugby Union's governing bodies. While this developmental process occurred slowly over a number of decades, the die was cast early on. Paradoxically, the hard-line attitude and approach to eligibility taken by the RFU seemed to strengthen the integrity of the amateur ethos. It became viewed as increasingly robust and worthy in part due to the associations with gentlemen amateurs well into the 1970s. Rugby Union authorities bowed to pressure from an increase in spectator numbers in the post-World War II period by

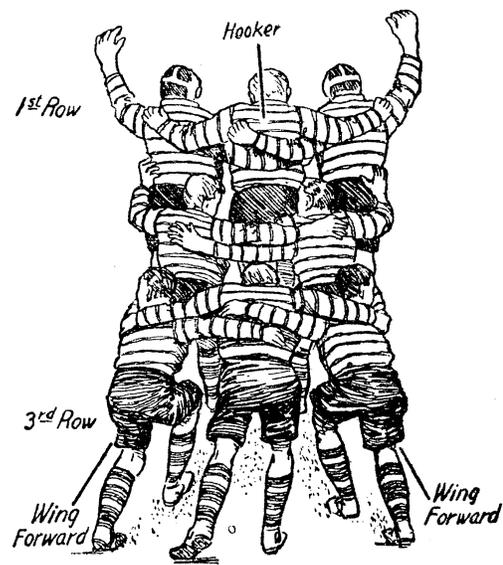

initiating rule changes that were designed to make the game more spectacular. This indicates the gradual movement away from the previously ubiquitous and all-pervasive amateur values.

These rule changes took the form of new offside laws that provided a clearer demarcation between the participating teams. Furthermore, there was greater opportunity for teams to introduce more expansive running plays and more attacking enterprise in general with penalties now having to travel ten yards, and the modification of the "knock-on" law, meaning when caught, the ball goes forward from a hand or arm and hits the ground or another player before it is regathered. Unless the defensive team gains an obvious advantage, a scrum is awarded in favor of the defensive team. Modifications to this law were particularly notable during the 1950s. In part they related to enforcing the laws more tightly. This was likely to open out the field of play for the backs, by involving the forwards in a scrum. It was hoped by governing bodies that this would in turn lead to more expansive and exciting tactical opportunities. When coupled with the added incentive of the try now being worth four points instead of three, tactics and strategic planning became increasingly important. These changes allowed the game to develop into a more dynamic sporting event throughout the 1950s, which was reflected in a growth in both spectatorship and participation. Despite the expansion of revenues resulting from the growth in spectacle and popularity, Rugby Union became relatively stagnant in terms of equality of competition. A number of meaningless fixtures and one-sided results led to calls from many players and the media for centrally organized, national leagues. Given the tensions related to the issue of professionalism and payments to players, it is ironic that Rugby Union's success as a spectator sport and the increasing importance of the Five Nations on television was to transform revenues. Notably, there had remained a close relationship between Rugby Union and the media throughout the late 1970s and into the 1980s. The Five Nations championship comprised the nations within the UK (England, Ireland, Scotland, and Wales)

who were joined by France. More recently this has become the Six Nations, with the inclusion of Italy. Alongside the southern hemisphere tri-nations series (involving Australia, New Zealand, South Africa), the Six Nations championship is the most popular annual event in world rugby.

The core amateur principles, upon which so much of this success was based, have come under increasing pressure since the mid-1980s as certain high-profile players began to benefit financially from opportunities outside of the game. As the public personas of many rugby stars had been developed following their rugby activities, the governing bodies believed that they should exert a degree of control over the earnings of top players. As the move toward open professionalism became a stampede, the governing bodies of the sport struggled to maintain control particularly in the southern hemisphere dominated by New Zealand, Australia, and South Africa. Concessions to the new financial pressures have slowly changed the whole structure and bargaining position of the governing bodies. Gradual pressure was forcing a policy shift in the form of a move from player-structured to spectator-oriented amateurism. The officially stated rationale for actions taken by the governing bodies was that they were acting to preserve the validity of the amateur ethos. This approach of the governing bodies did little to enhance their position or image as guardians of the sport.

For Rugby League, development was slow and largely confined to their traditional regions. Certainly, the fact that the majority of Rugby League players were working class hindered efforts at international diffusion. Whereas Rugby Union began to spread relatively quickly, Rugby League had neither the means nor the message to replicate such developments. Consequently, Rugby League has never attracted the same diversity and extent of funding as Rugby Union. Within Rugby Union, the almost constant pressures that were placed on the amateur philosophy were partly a result of the broad appeal that the amateur ideals had within the wider sporting society as well as society as a whole. Indeed, this appeal has allowed the governing bodies def-

inite, unique commercial opportunities as the game has grown in sophistication. Those authorities affiliated to the International Rugby Board (IRB) have slowly embraced expanding revenues and forms of financing, including significant television rights.

International Spread

Rugby Union's inherent popularity among the more privileged within society undoubtedly helped to diffuse the game abroad. The adherence to the philosophy of amateurism can be viewed as hindering the progress that the sport could have made whilst also maintaining its distinctiveness from Rugby League. We should remember that the sport was globally structured in commercial and professional terms at an early stage. Being able to draw upon the popularity of the sport in the former Commonwealth territories was vitally important in terms of such international growth. There are now over 120 nations affiliated to the IRB, with nations such as Argentina, Fiji, Ivory Coast, Georgia, and Samoa having recently participated in the finals of the Rugby World Cup.

During the 1980s the influence of sponsorship and the further promotion and selling of the sport was carried out in a more deliberate manner. Sponsorship of Rugby Union had only really become recognizable in a modern sense from the early 1970s. Initial deals were limited to

Rugby in Somaliland

A ball-game is the very last kind of game one would expect to find being played by a savage uncivilized race, and yet there is a game, which might be termed hand-ball in contradistinction to foot-ball, played by the Esa and Gadabursi tribesmen, which is quite as rough a game as our Rugby football.

The game is called "Gonso," and the ball used is very similar to the ball used for cricket on board an ocean liner. There are an equal number of men on each side, and the object of the game is for the third consecutive man of the same side who handles the ball, to bounce it on the ground, and catch it on the back of his hand; if the ball fails to pass through the hands of three members of the same side, the original thrower being one of them, it is handed over to one of the opposing team to throw to one of his friend; neither the original thrower nor the second is allowed to bounce the ball, nor is it allowed to touch the ground.

The game starts by the winner of the toss going to the centre of the group of players and carefully marked by one of the opposing side who has to try to prevent him throwing the ball in the direction of one of his own side; immediately the ball is thrown there is a dash made for it, and if one of the thrower's side gets it, he has to try to pass it to any one of his

own side, who has, in his turn, to try to get away and bounce it on the ground, catching it on the back of his hand. Each time it is successfully done, it counts one, ten being the winning total, and each failure lets the opposite side in. Once the man with the ball is collared fairly, the ball must be at once handed over to the other side.

The tackling is usually very good indeed, and at times gets exceedingly rough.

It is a common sight, when a man has succeeded in bouncing the ball, to see him throw it into the air, leaping up at the same time and coming down, giving his thighs a severe smack with the palms of his hands.

Not the least amusing part of the proceedings is the amusement and interest of the spectators who crowd round, gradually drawing, in their excitement, a regular cordon round the players, who have no compunction in running headlong through them, upsetting men and boys in their endeavour to either get away and pass the ball or bounce it.

The game, so as to prevent intertribal conflict, is usually played by sides composed of the sons by mothers of the Esa tribe and sons by Gadabursi mothers, so that Esa and Gadabursi are mixed up.

international or representative matches and key international tours. By the early 1980s, the main Rugby Union-playing nations in the southern hemisphere (South Africa, Australia, and New Zealand) had been operating a well-established system of illicit payments to international players, thereby circumventing the amateur ideals. The IRB unsuccessfully tried to discipline them for infractions of the amateur ethos on a number of occasions. Indeed, most Rugby Union authorities were finding ways of paying players "in kind," as nonexistent jobs and generous expenses were organized with friendly and accommodating companies. During this period there were also a number of instances of international rugby players

being employed by the game's sponsors. The sport star would be paid by the business for promotional work, while pursuing his rugby career full time. Indeed, other notable players were accepted into universities on rugby scholarships. What this period shows is the relatively ineffective position of the IRB, as they did little to halt such practices of creeping professionalism. International Rugby Board intransigence had allowed the sport to develop within its amateur parameters but the rate of change was still being stifled. What should be emphasized is that this was a relatively haphazard process with practices and structures that were pushing the limits of the amateur eligibility criteria.

It was in 1987 that the first Rugby Union World Cup was held in New Zealand. It proved so popular that there was simply no going back in terms of the open acceptance of financial structures within the sport. It is crucial to recognize that in the face of such expansion, the sport has managed to maintain its link to the image of amateurism relatively intact. Even when full professionalism was accepted by the IRB in 1995, the sport still benefited from the notion that many of the positive and desirable values associated with a century of the amateur philosophy still remained. In many ways the Rugby Union authorities seem to have enjoyed success because of their commitment to amateurism and the values associated with that philosophy. It is clear that with a degree of well-positioned marketing, the Rugby Union game and its administrators can also benefit from such associations in future. The increasingly precarious financial position of many top clubs raises concerns for Rugby Union in the medium term.

In Rugby League, the issue of cash flow was even more pronounced. Apart from Australia, where the league version of the sport remains more popular than Rugby Union, Rugby League has struggled to expand beyond its regional base. The limited success of the Rugby League World Cup series provides testament to some of the structural difficulties faced by the sport. When the Rugby League authorities in England moved the sport from winter to summer, partly to secure a lucrative television contract, this was accepted as a desperate and yet necessary measure. The additional rebranding of the sport as “Superleague” was far from universally popular and caused animosity among many in the Rugby League fraternity. However, this move has certainly secured the short-term future of the sport in the United Kingdom, especially when coupled with the growing popularity of the playoffs at the end of each Superleague season.

The Future

Despite a degree of structural uncertainty over the form that the new professional sport is likely to take, the general process of change occurring within Rugby

Union is best understood by considering the approach of the rugby authorities and the broader issues affecting the development of the sport. Even a cursory glance at the development of Rugby Union suggests that differing historical approaches by the sport’s governing bodies have clearly affected subsequent developments. While the situation in Rugby League is informative from a comparative point of view, it remains a less well-established or widely dispersed activity despite the undoubted strength and skills on display. Rugby League remains hugely popular in Australia but beyond that country and the United Kingdom, New Zealand, and France it is a largely peripheral pastime.

There is little doubt that it was necessary for Rugby Union to move on from amateurism as a core value in the development of the sport. However, future development and expansion within the Rugby Union is to some degree still dependent on the appeal of the values associated with the amateur philosophy. Rugby Union and Rugby League will enjoy closer links in future. The crossover of players, coaches, and trainers began before the acceptance of professionalism in Rugby Union, but it is only now that freedom of movement is widely accepted. How this process is managed and how the amateur ethos is applied to the playing and organization of the game at all levels remain crucial for the future of the sport.

Russia and USSR

For much of the twentieth century, the Soviet Union dominated Olympic sport; it also pioneered a new pattern of sport with its main function being part of a program of “nation-building” as set and controlled by the state.

Soviet sport had its roots deep in Russian history, in the people’s traditions, the climate, fears about internal and external foes, the organized sports pioneered largely by Britain, the gymnastics schools of Germany (founded by Jahn), Scandinavia (Ling and Nachtegall), and the Czech lands (Tyrs), and in Prussian military training. The pattern of Soviet sport was shaped as much by these factors as by political ideals.

As an industrial society developed in nineteenth-century Russia, liberal noblemen and native industrialists, with foreigners resident in Russia, began to set up private sports clubs in the major cities. They embraced sports such as yachting (the Imperial Yacht Club, dating from 1846), ice skating (the Amateur Skating Society, 1864), fencing (the Officers’ Fencing Gymnasium, 1857), gymnastics (the Palma Gymnastics Society, 1863), and even cricket (the St. Petersburg Tennis and Cricket Club, 1868). Commercial promoters were also providing, for spectators and gamblers, such professional sports as horse racing (the St. Petersburg Horse Racing Society, 1826), boxing (Baron Kister’s English Boxing Arena, 1895), cycling (the Tsarskoye Selo Cycling Circle, 1880), and soccer (the Victoria Football Club was the first established soccer club, founded by Germans, in 1894). Various displays of strength were popular in circuses, featuring such world-famous performers as the Estonian Georgi

Hakkenschmidt and the Russian Ivan Poddubny and his wrestling wife Masha Poddubnaya.

At the turn of the century, there were several Russian sports associations and, on the eve of World War I, as many as 1,266 Russian sports clubs existed, with an average membership of sixty persons. Although many of these clubs were located in the principal Russian cities (Moscow and St. Petersburg), the industrializing provinces also accounted for a growing number of them. For example, the Ukraine had 196 sports clubs with 8,000 members, and Belorussia had 1,000 members in Sanitas, Sokol, Bogatyr, and the Jewish Maccabee sports clubs (Jews being barred from membership of many Russian and Ukrainian clubs). In 1912 the government set up its quasi-military Physical Fitness Committee under General Voyeikov, which took control of all major sports clubs. The Bolsheviks therefore would inherit a developing sports movement that was already largely centrally controlled.

Sport in Revolution

The first steps to be taken after the Bolsheviks seized power in October 1917 were by no means clear, for there was no pattern to follow. The changeover from criticism of czarist sport to action in an 80 percent peasant, illiterate country in the throes of a world war and civil war presented considerable problems.

However, the crucial question being debated was not what form sport should take, but whether competitive sport should exist at all in the new workers’ state. After all, some revolutionaries argued, sports such as track and field, soccer, rowing, tennis, and gymnastics were invented by the industrial bourgeoisie for their own diversion and as character training for their careers as captains of industry and empire. It was thought natural by some after the Russian Revolution that a new pattern of recreation would emerge, reflecting the dominant values and needs of the new socialist state.

The two main groups that regarded competitive sport as debasing workers’ physical culture and inculcating nonsocialist habits were the Hygienists and the

Proletkultists (from "proletarian culture"). To the Hygienists, sport implied competition, games that were potentially injurious to mental and physical health. These included boxing, weightlifting, wrestling, and gymnastics, which were said to encourage individualist rather than collectivist attitudes. They condemned the emphasis on record breaking and the professionalism of Western sport, and they favored noncommercialized forms of recreation that dispensed with grandstands and spectators. To the Proletkultists sports that derived from bourgeois society were remnants of the decadent past and part of degenerate bourgeois culture. A fresh start had to be made through labor exercises and mass displays, pageants and folk games. In the decade after the revolution, many factory yards and farm meadows full of muscular men and women rhythmically swinging hammers and sickles, simulating work movements in time to music, could be seen.

Essentially, however, sport during the first few years came to be geared to war needs. All the old clubs and their equipment were commandeered for the Universal Military Training Board (Vsevoluch) whose main aim

was to supply the Red Army with contingents of trained conscripts as quickly as possible. Vsevoluch took over the czarist Physical Fitness Committee and coordinated its activities with those of the education and health commissariats. A second major consideration then was health. Regular participation in physical exercise was to be a means of improving health standards rapidly and of educating people in hygiene, nutrition, and exercise. This campaign could only succeed, in the opinion of the Vsevoluch chief, Nikolai Podvoisky, if the emotional attraction of competitive sport was fully exploited.

Competitive sports began to be organized from the lowest level upward, culminating in the All-Russia Pre-Olympiads and the First Central Asian Olympics of 1920. Sports were taken from town to country, from the European metropolis to the Asiatic interior, as an explicit means of involving as many people as possible in organized sport and exercise. A third function was integration. What was significant about the First Central Asian Olympics, held in Tashkent over ten days in early October 1920, was that for the first time Central Asian

peoples, as well as Russians and other Europeans, competed in sporting events together.

Sport against the Background of Forced Industrialization

The big sports contest of the 1920s was the First Workers' Spartakiad of 1928, with some 4,000 participants, including 600 foreign (Communist) athletes from twelve countries. In view of the fact that the USSR had few contacts with international sports federations and none with the Olympic movement, this Spartakiad was intended to be a universal workers' Olympics—in opposition to the “bourgeois” Olympics held that year in Amsterdam, with roughly the same program of events. Although Soviet sports performance was understandably below top world standards, in some events the USSR did have world-class athletes. Yakov Melnikov (1894–1960), for example, had won the 5000-meter speed-skating event at the Stockholm World Championships in 1923.

In 1925 the Communist Party made clear its views on “physical culture” and took it completely under party control. Physical culture was to be an inseparable part of political and cultural education and of public health. Sport was given the revolutionary role of being an agent of wide-ranging social change. Participation in sport was to develop healthy minds in healthy bodies; it stood for “clean living,” progress, good health, and rationality, and it was regarded by the party as one of the most effective instruments in implementing its social policies.

The implications for the sports movement of the economic and political processes (industrialization, collectivization of agriculture, and political dictatorship) of the late 1920s–1930s were extremely important, for it was then that the organizational pattern of Soviet sport was basically formed—with sports societies, sports schools, a national fitness program, and a uniform rankings system for individual sports. The new society of the 1930s saw the flourishing of all manner of competitive sports with spectator appeal, of leagues, cups, championships, popularity polls, and cults of sporting heroes. All were designed to provide recreation and diversion

for the fast-growing urban population. The big city and security forces (Dinamo) teams, with their considerable resources, dominated competition in all sports (for example, the Premier Division soccer league of 1938 contained six Dinamo teams).

The many sports parades and pageants that constituted a background to the sports contests were intended to create a “togetherness” and patriotic feeling (for the new unitary state, the USSR, overriding Russian/Armenian/Ukrainian allegiances). Significantly, sports rallies often began to accompany major political events and festivals (May Day, Anniversary of the Revolution, Constitution Day), thereby linking members of the public, through sport, with politics, the party and, of course, with their leader, Joseph Stalin.

A relatively close link was reestablished in the 1930s between sport and the military, stemming from the conviction that a state surrounded by unfriendly powers must be militarily strong. Sport openly became a means of providing premilitary training and achieving a relatively high standard of national fitness and defense. The two largest and most successful sports clubs were those run by the armed forces and the security forces: the Central House of the Red Army—later the Central Sports Club of the Army, CSKA—and Dinamo, respectively. After 1931, moreover, the national fitness program (based on Baden Powell's Boy Scout program) was expressly intended to train people, through sport, for military preparedness and work—the Russian abbreviation GTO (*Gotov k trudu i oborone*) standing for “Prepared for Work and Defense.”

Postwar Sports Competition

With the conclusion of the World War II and the setting of a new national target—to catch up and overtake the most advanced industrial powers, in sport as in all else—Soviet leaders felt it possible to demonstrate the pre-eminence of sport in Soviet socialist society. Given the limited opportunities elsewhere, sport seemed to offer a suitable medium for pursuing this goal as an area in which the USSR did not have to take second place. This aim presupposed a level of skill in a wide range of

sports superior to that existing in the leading Western states. Sport was seen as “one of the best and most comprehensible means of explaining to people throughout the world the advantages of the socialist system over capitalism.”

So, immediately after the war, Soviet sports associations established affiliations with nearly all the major international federations, and Soviet athletes competed regularly at home and abroad against foreign opposition. Soviet sport became an instrument of foreign policy, both to advertise the advantages of socialism among capitalist and the new socialist states in Eastern Europe and Asia and to influence Third World countries through the provision of assistance in building sports programs. Between 1946 and 1958, the USSR joined thirty international federations and, by 1975, as many as forty-eight. Further, 236 Soviet officials held posts in international sporting organizations in 1978.

Not only were affiliations established, but Soviet athletes also quickly achieved world dominance, often on their debut in world sport. In 1948 Botvinnik won the world chess title, and in 1949 Ludmilla Rudenko won the women’s world chess title. In 1945 the Moscow Dinamo soccer team came to Britain and played four matches without defeat against leading British clubs (Chelsea, Arsenal, Cardiff, and Glasgow Rangers). In weightlifting, wrestling, volleyball, and ice hockey, Soviet teams established a supremacy that they were to maintain.

Despite these initial successes, the USSR moved cautiously into Olympic competition. Only in April 1951 was a Soviet Olympic Committee

formed and, in May, accepted by the IOC. The USSR made its debut at the Fifteenth Summer Olympics, held in Helsinki in 1952. Soviet athletes contested all events with the exception of field hockey and, although they gained fewer gold medals than the United States (22 to 40), they gained more silver (30 to 19) and bronze (19 to 17), thereby tying with the United States in points allotted for the first six places (according to the system used in the Olympic Bulletin).

The USSR took no part in the 1952 Winter Olympics and made its winter debut in 1956 at Cortina d’Ampezzo in Italy. There it amassed most medals and points. From the debuts in 1952 and 1956, up to its final participation in Barcelona in 1991 as the Unified Team, the USSR “won” every Olympic Games with the sole exception of 1968 when it came second to Norway in the Winter Games and the United States in Summer. It also provided the most versatile performance in the Olympic Games.

The Twenty-second Olympic Games were held in Moscow from 19 July to 3 August 1980. Despite a partial boycott led by the United States over the USSR’s invasion of Afghanistan in December 1979, a total of sixty-eight nations attended the games; notable absentees with the United States were West Germany and Japan. A number of national teams participated against the advice of their governments.

Post-Communist Developments

With the demise of the Soviet Union in 1991, fifteen constituent union republics gained autonomy as independent nations, henceforth competing in sports competitions as

Folk Sport and Self-Determination in Tatarstan

In the extract below, the sports historian Henning Eichberg discusses the folk sports of the Tatars, an ethnic minority group in Russia:

We see a wrestler walking proudly around the arena, surrounded by thousands of spectators. He bears a sheep on his shoulders, the prize of his victory, he laughs and waves to the enthusiastic crowd. He has just won the final match in belt wrestling, the Tatar *korash*, where one puts one's girdle or towel around the waist of the opponent, tries to raise him from the ground and to throw him down on his back. After old Tatar tradition, the winner of the last fight has won the ram, which he is bearing triumphantly through the crowd, as well as an embroidered towel. And he obtains the title of a *batyr*, a Hercules, a strong man.

The triumph of the *batyr* is a central event in the springtime holiday which the Tatars call *Sabantuy*, the "ploughman's festivity." This ancient cultural event had been suppressed for generations as being "reactionary," "religious" or "separatist," anyway as "un-Sovietic." But the peoples' rising of 1989/91 brought it to life again. By the festivity, a people expressed its cultural survival. It showed that a new—and old—nation was striving for self-determination, Tatarstan. [...]

The Tatar springtime festivity includes besides *korash* wrestling: running competitions and horse races, performances of strength (as weight lifting),

jumping and several types of games. Many of the competitions have a humorous character, provoking laughter and enjoyment. They display the grotesque sides of the human body—by sack race, pole climbing, balancing on a swinging beam. These performances do not only put on stage the success, but also the failure, the stumbling, the comic and the ridiculous. Some of the dances, too, are part of the popular culture of laughter. We see a woman showing vements, which a man tries to imitate—and all burst into fun. By this sexual parody, the tensions and unbalances between the genders in Tatar patriarchy [are] displayed and exposed to common laughter.

Other dances have a more formalized and folkloristic character. This is reminiscent of the Soviet period when state ensembles demonstrated "living folk culture" by measured choreographies, theatrical pathos and reconstructed costumes. Again other performances are more sportive in character, such as parachute jump.

The Tatar *Sabantuy* festivity, as it reappeared after 1990, is, thus, compiled from many elements and different sources, often in a contradictory way. Features from modern sport and from traditional folk practice clashed and mingled—competition, dance and folkloric arrangement—national demonstration and popular joke.

independent teams. All the state and trade union subsidies for erstwhile Soviet sports clubs were discontinued, and the sports system began to take on the same shape as commercialized sport in other capitalist countries. In the initial transition period, several sports that were not commercially viable, like chess and volleyball, swiftly lost ground, the top sportsmen and sportswomen went overseas to compete for the best-paying clubs in the West, and the "New Russians" (often Mafia) invested in domestic clubs that exuded the healthy odor

of sport and fitness. It is too early to predict the final contours of the new Russian sport. It is highly likely, however, that it will become an appendage of wealthier and stronger sports systems in the West, as well as developing the characteristics of sport driven by the profit motive and globalized competition.

For the newly independent states (like the Ukraine, Belarus, Georgia, and Estonia), although they will not see so much success as they had when part of the mighty Soviet Union, at least they have the satisfaction of cheering

Origins

Samuel Ryder (1858–1936) was a wealthy seed merchant from St. Albans, England, who took up golf at the age of fifty and became fanatical about the game. In 1926 Ryder announced that he would present a trophy for annual competitions between Great Britain and the United States, and in June that year at Wentworth, England, a

match was held, taking advantage of the presence in England of many U.S. players who had come over to qualify for the British Open Championship. The British won the match by a margin of 9–3, but because not all members of the U.S. team were born in the United States, participants decided to view the match as “unofficial,” and no trophy was presented. After the match Ryder; the leading U.S. player, Walter Hagen (1892–1969); and the British players George Duncan and Abe Mitchell (1887–1947) decided to hold matches on a biennial basis, with the first match for the Ryder Cup taking place the next year in the United States. The famous gold trophy, which cost 250 British pounds, was produced in time for that match.

on their own teams under their own flags and national anthems. For the public at large, there is also the satisfaction of being able to pursue sports, whether as players or spectators, that are genuinely popular and not imposed by a bureaucracy in faraway Moscow.

Ryder Cup

The Ryder Cup is the trophy that professional golfers have played for since 1927 in a biennial competition between the United States and Europe.

Prewar Era

The playing format initially adopted was a two-day competition with four foursomes on the first day and eight singles on the second; all matches were over thirty-six holes. Some people have suggested that when the 1927 match was played, the British had not recovered their “land legs” after the Atlantic crossing, and the U.S. team won 9½–2½. The British captain, Ted Ray, made a comment that would be repeated many times through the years when he ascribed the British failure to the superior putting of the U.S. team. The first four matches were all won by the home team, but 1937 produced the first away victory when the U.S. team won at Southport and Ainsdale.

[Golf is] a sport for liars, drinkers and cussers who like to walk two or three miles belaboring an object 1/45th their size with a loaded cane. ■ VESTA M. KELLY

1947–1977: U.S. Dominance

With Britain still suffering economic hardship after World War II, the Ryder Cup matches were resumed in 1947 largely because of the generosity of an Oregon fruit grower and canner, Robert A. Hudson, who funded the British team. The match was played at Portland, Oregon, and the U.S. team won 11–1.

In 1947 U.S. golfers adopted a points system for selecting their team; the British followed suit in 1957. The selection methods have been revised frequently through the years; the basic aim has been to reward those players who have performed most consistently during the qualifying period while leaving scope to select a few players who are clearly among the best available but have not accumulated sufficient points.

The 1949 match was closer, but even without several leading players, the U.S. team had sufficient depth to win the singles 6–2 and secure a victory. Comfortable U.S. wins in 1951 and 1955 bracketed a tight match in England at Wentworth in 1953, but in 1957 at Lindrick under the captaincy of Dai Rees (1913–1983) the British finally gained their first win since 1933, taking 6½ points in the singles and winning 7½–4½. In 1959, however, the U.S. team regained the cup with an 8½–3½ victory.

Beginning in 1961 all the matches were played over eighteen holes instead of thirty-six; in that year two sets of foursomes and singles were played, making the number of points available twenty-four, and in 1963 the match was extended to three days with two sets of four-ball matches played on the middle day. The change to eighteen-hole matches was expected to help the weaker side, the British, but nevertheless the U.S. team won from 1961 to 1967 with some ease.

The 1969 match produced the first tie in the cup's history. Eventually, all depended on the last match between Tony Jacklin (b. 1944) and Jack Nicklaus (b. 1940). In a memorable act of sportsmanship, Nicklaus conceded a 60-centimeter putt to tie the match on the last green. After the excitement of the 1969 match, however, the old pattern was reestablished, and the United States won the next four matches by good margins.

1979–Present: Continental Europe Joins In

For some time people had suggested that little point existed in continuing with such a one-sided competition. During the 1977 match the Professional Golfers Associations of the two countries discussed the possibility of including golfers from continental Europe. This inclusion was approved, and in 1981 the present format of twenty-eight matches was adopted, with two sets of foursomes on the first day, two sets of fourballs on the second day, and one set of twelve singles on the final day.

The balance of power was not immediately altered; the U.S. team won comfortably in the United States in 1979; at Walton Heath in Surrey in 1981 the United States achieved its last overwhelming victory to date with what was perhaps the strongest team it had ever fielded: Among themselves these players had amassed forty-nine major championship wins.

From 1983 onward the matches were all closely fought and highly competitive; in that year Europe came closer than ever to winning on U.S. soil, losing by only one point. Finally in 1985 in England, at the Belfry, Europe achieved its first victory in twenty-eight years, and Europe followed this victory in 1987 with its first win in the United States. Since then the cup has changed hands four times, and on three occasions the winning margin in the match has been the narrowest possible: 14½–13½.

The strict biennial pattern of the matches was broken because of the September 11 terrorist attacks on the United States in 2001, after which the match was postponed for a year. In 2002 Europe won 15½–12½, and in 2004 18½–9½; those results mean that since continental Europe joined the fray, the United States has won six times, and Europe has won five times, with one match tied.

The Future

The Ryder Cup has become one of the most keenly anticipated and closely fought sporting competitions between the United States and Europe. Indeed, some controversy surrounds the degree of fervor generated

among the spectators and even the participants; in one or two recent matches some players have not been shown the courtesy normally associated with golf. However, players in both continents strive to be selected for the teams; whereas the U.S. team usually has on average higher world rankings and favorites “on paper,” the Europeans sometimes appear to combine more readily into a bonded team. The Ryder Cup, as a competition that is played for prestige rather than money and that uses the gladiatorial match-play format, will continue to provide golfing excitement.

Sail Sports

Sail sports involve a wind-propelled sail that is either attached to a yacht or held by the sailor on sand, ice, water, snow, or other land surfaces. The following sail sports proliferated in the twentieth century throughout North America, Europe, and Australia:

- *Sandyachting*, which uses wind power to propel wheeled yachts on sand
- *Iceboating*, also called ice yachting, a winter sport in which iceboats are sailed on frozen lakes, rivers, or bays
- *Sailboarding*, also called boardsailing and windsurfing, which involves attaching a mast and sail to a surfboard
- *Parawing* sailing, which takes place on diverse terrain while the sailor wears various sliding or rolling devices on his feet
- *Ice skate, icewing, roller skate, and ski sailing*, which all require hand-held sails propelled by wind, a standing sailor, and special footgear

Sandyachting—Origins

Sandyachting can be traced back to sixth-century China, where the first wind-driven carriages and sail-powered chariots were developed for battle. Competitively, sandyachting began in 1898 in Belgium. Sandyachts were popular at French and Belgian beach resorts during the 1930s. Employees of the *Detroit Evening News* introduced a light, efficient yacht in the early 1960s that

revolutionized the sport. In 1975, the Windskite, a tiny yacht of tubular construction, initiated a new phase of sandyacht design. Sandyachting competitions exist in most countries where there are suitable beaches for racing: the United Kingdom, the United States, France, Germany, Belgium, the Netherlands, New Zealand, and Australia.

Iceboating—Origins

Modern iceboating began in eighteenth century Holland, where people sailed wind-powered boats on the ice. In the nineteenth century, iceboating was practiced in the river regions of New York and New Jersey. The Poughkeepsie, New York, Ice Yacht Club, founded in 1869, was the first formal iceboating group in the United States. In the twentieth century, iceboating gained more widespread popularity with the development of small boats that were inexpensive and portable. Designs formulated in Milwaukee, Wisconsin, in the 1930s made it possible to build small iceboats that were both fast and stable, known as Sketers. Among the most popular modern iceboat designs was the DN, which was created at the *Detroit News* in 1937. Iceboats are now sailed primarily in the northern regions of Europe and North America.

Sailboarding—Origins

Sailboarding was invented in California, but it grew rapidly in Holland, Germany, and France during the 1970s. Adapting the sailboard to the big waves of Hawaii, Larry Stanley developed footstraps in 1977. Footstraps, along with shorter boards, made aerial maneuvers possible and changed the sport. Harnesses were

designed to fit around the chest or hips, thereby removing strain from the arms. Sails, wetsuits, and the variety of gear associated with the sport are often quite colorful. Popular places to sailboard include Oahu, Hawaii; the Columbia River Gorge in Oregon; Lake Garda and northeast Sardinia in Italy; Brittany and the Riviera in France; the Canary Islands; the west coast of Cornwall in Great Britain; and Perth, Australia.

Parawing Sailing—Origins

German sports enthusiast Wolf Beringer invented parawing sailing in the early 1980s, when he developed the unique control system that allowed changing the angle of attack of a parafoil wing. He became a European legend with his graceful and athletic stunts, including airborne lifts, jumps, and glides, and along with other early parawing sailors, developed competition events and rules. In 1992, kite designer and builder Hans Schepler and skier George Theriault designed and produced parawings in the United States.

Skate Sailing—Origins

Ice skate sailing is a Northern European and North American winter recreation exclusively practiced outdoors in the daytime. It began in the seventeenth century, when Dutch skaters began using sharp-edged iron blades, instead of broad bone blades. The Swedish botanist and explorer Carolus Linnaeus (1707–1778) sighted skaters “with sails like wings.” Skate sails in the mid-nineteenth century carried fowlers across the ice separating Denmark from Sweden, bearing the hunters to their prey. Organized races began near Stockholm in

1887. Wally van B. Claussen devised the popular Hopatcong skate sail, named for the largest lake in New Jersey, in 1917. Skate sailors on Lake George, New York, hurtled at more than 110 kilometers (70 miles) per hour in the 1930s.

Anders Ansar invented the icewing in Stockholm, Sweden, in 1973, which consists of two cloth sails, a solid top, and a rigid, curved leading edge. The icewing, a semi-rigid craft that is aerodynamically efficient, resembling the upturned tip of an airplane wing, encloses the sailor completely and represents the greatest twentieth century innovation in ice skate sailing.

Roller skate sailing dates from the 1930s in the United States but takes place internationally. The sport is versatile because many hard surfaces are suitable for roller skate sailing. Ski sailing began as early as 1917 in North America and northern Europe. A variety of sail types are used, including the kite-like American Hopatcong, the dihedral Finnish Skimbat, and the inflatable German parawing.

What Are Sail Sports?

Sandyachting uses the wind to propel a wheeled craft along a sandy surface at speeds of up to 130 kilometers (80 miles) per hour. The sail is mounted on a wheeled framework capable of carrying at least one person. Modern sandyachts are either small or large, with the same basic three-wheeled configuration. Sandyachts can sail three or four times the speed of the wind. Serious, competitive sandyacht racing occurs during the winter months in Europe, when the beaches are less crowded but invariably wet. A typical race is thirty minutes long.

Early iceboats were very basic, with crude skate-like runners, simple sails, and rigging. Some iceboats were merely conventional sailboats with runners attached. Larger and more complex boats were built in the mid-nineteenth century. Iceboats reach very high speeds, so their sailors wear helmets and other protective equipment. Iceboaters sit in a small cockpit in the hull or on a seat attached to its surface. Courses for iceboat racing are determined by the direction of the wind and are marked by buoys placed about a mile apart. Judging is

based on a combination of speed and the ability of the sailor to control the craft and follow the course as closely as possible.

Sailboarding, a mix of surfing and sailing, requires a board, rig (sail, mast, and boom), wetsuit, and wet suit booties. Some sailboards are designed for racing; competitors sail these around a series of buoys in a predetermined order and direction. Rules are similar to those of sailing. Other variations are the following:

- Speed sailing
- Freestyle sailing, in which performers attempt intricate maneuvers
- Sailboard jumping, which is another branch of freestyle and sometimes competitive
- Sailing indoors, using jet engines to provide wind
- Tandem sailboards, with two or three sails and sailors

Parawing sailing provides a highly maneuverable way for people to sail on land during all seasons. The sailor uses the parawing as a sail for propulsion, converting the pull and “lift” of the wing to forward motion. The parawing consists of a ram-air inflatable soft-fabric wing attached by multiple lines to a control bar held by the sailor and sometimes attached to the sailor by a quick-release snap swivel and body harness. Parawings are sailed:

- Over snow or ice with the sailor wearing skis or skates
- Over sand beaches or salt flats with the sailor wearing land or sand skis or foot-steered “buggies”
- Over paved surfaces with the sailor wearing in-line skates
- Over turf with the sailor using grass skis, buggies, or various roller devices

Parawing sailing appeals to many age groups and can be adapted to various skill levels.

Ice skate sailors stand erect, wear ice skates on their feet, and hold sails with their hands and shoulders. They sail round trips, reaching speeds than more double the true wind velocity. Ice skate sailing requires smooth, thick, snow-free ice occupying at least ten acres, and steady winds. Frozen lakes, ponds, and reservoirs lend themselves to the sport, as do icy estu-

aries and the Baltic Sea. Stiff, high boots provide warmth and ankle maneuverability. The sport appeals to male and female skaters of all ages, who must be capable of skating without extending their arms. Flat, sharp, long blades on the ice skates minimize sideslipping and lend stability over rough ice or at high speeds. The shapes of many contemporary skate sails resemble parallel trapeziums.

The icewing sailor also wears ice skates and sails on frozen lakes. Entering an icewing requires assistance because the craft lacks any opening except the bottom. Once a helper has placed the icewing over the squatting sailor, who faces into the wind, the sailor rises to his feet and steers by maneuvering a horizontal control bar located at waist height. Icewing sailors can move four times faster than the true wind speed.

Most roller-skate sailors wear in-line skates with plastic wheels, smooth bearings, and rigid boots, and usually sail on paved lots and rural roads. Hopalong skate sails, which are often homemade and are popular in the eastern United States, can be used with roller skates. Triangular roller-skate sails are popular in California.

Ski sailors wear downhill skis and Alpine boots. Ski sailing requires a faster wind and a larger sail than ice skate sailing. Wind-packed snow 5 centimeters (2 inches) thick offers an ideal surface for fast ski sailing. Loose, deep snow reduces speed, and a hard, icy surface affords too little traction. Snow-covered fields and golf courses offer large suitable areas for ski sailing. Some ski sailors combine high speeds with horizontal leaps from platforms made of snow.

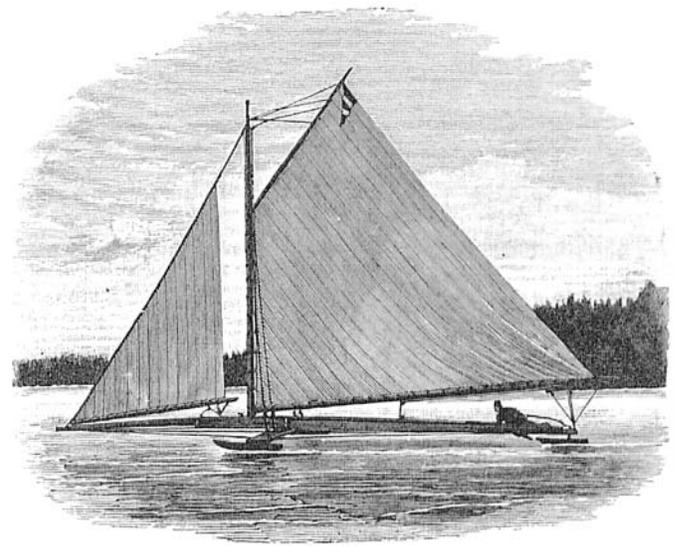

Competition at the Top

The International Land and Sandyachting Federation (FISLY) was formed in 1962 with representatives from France, Germany, Belgium, and Great Britain. The first official European sandyachting championships were held in 1963, with all yachts racing together in an open class. The fleet was subdivided in 1965 into three classes according to sail size. The speed record for a landyacht is 152.13 kilometers (94.55 miles) per hour, set by Frenchman Bertrand Lambert in May 1991.

Important iceboating championships include the Hearst Cup, the Ice Yacht Pennant, and the Ford Cup. Ice sailors compete in local and regional races and in national and international championships, called regattas. Some races are open to all boats with similar sail sizes. One-design events are limited to a specific type of boat. The National Iceboat Authority establishes basic racing guidelines in the United States.

Olympic sailboarding began in the Los Angeles Summer Games in 1984, with thirty-eight countries participating. The board chosen was the Windglider, and events were held for both women and men. Another major sailboarding competition is the Pan Am Cup, sailed off the Hawaiian island of Oahu. It has three competitions: races around triangle-shaped courses, a long distance race of 20 miles, and ins-and-outs (sailing back and forth through surf). Sailboards earned the world speed record for all forms of sailing craft when Eric Beale of Great Britain achieved a speed of 76 kilometers (47 miles) per hour in November 1988 at les Saintes Maries de la Mer.

The World Ice and Snow Sailing Association divides its ice sailing competitions into three classes: open class (sailboard class), hand-held sails (free-sail class), and

kites (such as parawings). In the world of icewing competitions, national icewing races take place annually, often near Stockholm on the Baltic Sea.

Sailing

Sailing is a way of moving across water by using wind to power sails on a boat. People likely invented sailing in a variety of forms across the world. Sailing first became a sport of the wealthy during the seventeenth and eighteenth centuries. It developed rapidly during the nineteenth and twentieth centuries, branching out into various forms. Some sailors choose the competitiveness of racing, and others choose the freedom of cruising.

Today larger sailing boats can remain at sea for months, but many people sail smaller day boats, or dinghies, on lakes or close to the seashore. Mass production and use of new materials, such as fiberglass, have brought the price of small boats within the range of many buyers. In the Olympic Games yachting has been present continuously since 1908. Sailing is a sport in which women can compete against men and in which young and old and people with disabilities can compete. On windy days sailing is a physical challenge, but on calmer days the sport is an excellent form of relaxation.

Sailboats come in a variety of sizes, rigs (mast and sail configurations), and prices. To people outside sailing, possibly the best-known aspect of the sport is the America's Cup series of races in which extremely costly, state-of-the-art boats are used. Most sailors, however, sail smaller, much less expensive dinghies or keelboats. Sailing as a sport, being based on an ancient form of transportation, has a rich vocabulary of its own. Although sailing is usually not physically difficult, it requires an understanding of the forces and effects of wind and water. Rules are designed to keep boats from colliding with each other. A more detailed set of rules for racing has been developed to cover the closer encounters of competition. An understanding of when a boat has the right-of-way and when it must yield is crucial to safe sailboat handling.

Origins

Possibly the first type of sailboat was a simple raftlike structure from which people raised a mast on which they hung a cloth sail. Many cultures developed their own kinds of sailing craft. People of the Middle East sailed boats made of reeds about 3500 BCE and today still sail the distinctive dhows; Greeks and Romans sailed galleys about 1000 BCE; the Chinese developed the distinctive junk about 300 CE; and the Vikings sailed longboats from 700 CE. The rig gave each type of sailing boat unique and recognizable characteristics. Each sailboat was designed to work well in the prevailing conditions of wind direction and strength, number of crew members available, and locally available construction materials.

Sailing as a sport, as distinct from a mode of transportation, possibly began in the Netherlands. Many words (including *yacht*) are derived from Dutch words. During the 1660s a race took place in London between King Charles II's boat (a gift from Holland) and a boat owned by the duke of York. The first regatta (a rowing, speedboat, or sailing race or a series of such races) was organized in 1720 at the Water Club of Cork, Ireland. Sailing as a sport remained the province of the wealthy, however, until the late nineteenth century, when smaller

dinghies were built and raced. Certainly the sport had, and continues to have, patronage from the royal families of Europe and the socially prominent and wealthy families of the United States, so that the sport has always had somewhat of an aura of wealth and exclusivity. The oldest sailing club in continuous existence was founded as simply "the Yacht Club" (the first to use such terminology) in London in 1815. It received royal patronage and became known as "the Royal Yacht Club" in 1820 and "the Royal Yacht Squadron" in 1830.

Before sailboats were mass produced, each was completely unique; consequently, people developed systems of handicapping (assessing the relative winning chances of contestants) to obtain some kind of meaningful racing. The first successful system was developed in 1886 by the yacht designer Dixon Kemp. A boat's waterline length in feet was multiplied by the sail area in square feet and divided by 6,000.

In 1907 handicapping by rating was replaced by handicapping by meters, in which the handicap was determined by boat length, sail area, and a variety of other measurements. Yachts were 6-, 8-, 12-, and 15-meters. The 12-meter yachts survived to become the prototype for much of the twentieth-century America's Cup boats, and various meter classes became early Olympic classes.

Boats

Boats are made in a variety of sizes, shapes, rigs, and costs, each designed for a different purpose. People have designed boats for children as young as six to sail and race alone; children's requirements are clearly different from those of a wealthy business owner taking out clients for a day's sailing. Sailors with disabilities include people who are blind, who often have a keen sense of wind direction (and who have a sighted crew member on board), and quadriplegics, who sail in a wheelchair on board boats designed for their needs.

Regardless of differences, however, certain principles apply to all types of sailing boats. One way to understand the principles of sailing is to first examine the earliest boats and then see how modifications during the

Rules for the N. Y. C. C. Challenge Cup of 1886

1. The canoes competing must come within the limits defined by the N.Y.C.C. rules.
2. The cup is to be held as a perpetual challenge trophy.
3. The competition is open to not more than three authorized representatives of any canoe club sailing under foreign colors, as many canoes representing the club holding the cup as the challenging club.
4. Two victories to be necessary to either win or hold the cup, the same canoes competing in each.
5. The races to be sailed on the waters of the club holding the cup.
6. Races sailed in the United States to be contested on waters in the vicinity of New York city under the auspices of the N.Y.C.C.
7. The distance sailed over in each race must not be less than eight nor more than ten miles, and within a time limit of three hours. The course to be mutually agreed upon.
8. The races must be sailed at a time mutually agreeable to the challengers and the holders of the cup; but one series of races to be sailed in any one year.
9. The N.Y.C.C. rules to govern the races.
10. The club holding the cup to be responsible to N.Y.C.C. for its safe keeping. Should it dissolve its organization, the cup will then revert to the N.Y.C.C.
11. The representatives of the holders of the cup must be selected after a series of trial races open to all members of canoe clubs in the United States. The regatta committee of the club holding the cup shall have the right to select the competitors for the international races irrespective of the result of the trial races.
12. Should the cup be won by the American contestants in the international race: First, an active member of the club holding the cup must score one victory to entitle that club to retain it. Second, if a member (or members) of any other club wins two races, his club will hold the cup. Third, should the two races be won by members of two clubs, neither being the holder of the cup, the tie will be sailed off subsequently to determine which club shall take the cup.

years have enabled sailboats to increase the range and efficiency of what can be achieved. Early boats were probably able to sail only in the direction that the wind was blowing. This direction, or point of sailing, relative to the wind is called “running.” The boat was merely blown along, and the direction of travel was wherever the wind blew. It is still a relatively slow direction to sail because although the sail is pushed along by the wind, the sail also encounters much resistance from the air in front of it. The sail works most efficiently when it is out at 90 degrees to the boat to catch maximum wind.

Through the years advances in rig design allowed sailors to sail perpendicularly across the wind. This point of sailing is called “reaching.” Although the sideways force on the boat is quite great, the boat’s hull

(body), plus the centerboard or keel (central underwater fin) and rudder (a pivoted underwater fin at the back that allows the boat to be steered) all help to redirect the sideways force of the wind into forward motion of the boat. The most efficient sail position is half out; any farther out, and the sail would luff, or flutter; any farther in, and the sail would not catch so much wind.

Eventually boats were designed to be capable of making forward progress in a direction 45 degrees to the wind. This forward progress is called “beating” or “sailing close hauled.” This term is used because the most efficient sail position is hauled in close to the boat; any farther out, and the sail would luff and lose power. Again, the boat’s resistance to going sideways enables the boat to make some forward progress and also to slip

slightly sideways (called “leeway”). No boat can sail directly into the wind because on that heading the sail would act like a flag, with wind on each side, and harness no power. Boats can, however, make indirect progress into the wind by zigzagging back and forth.

The principle of the Swiss physicist Daniel Bernoulli, which explains how airplanes are able to achieve lift, can also be used to explain how a sail works. If one imagines the sail to be like a wing, the curved surface makes air travel over it faster than over a flat surface, so that in front (or on top in an airplane) of the curved surface is fast-moving air at low pressure, whereas the other surface has slower-moving air and higher pressure. This situation gives an airplane lift and a sail forward motion.

In addition to knowing how to sail in the various directions of a run, reach, and beat (and all those in between) a sailor should know how to turn the boat around in two different ways that have crucially different components. The choice is to turn the bow (front) into the wind or to turn the stern (back) into the wind. The results may be the same, but the processes are different. When turning the bow into the wind (called “coming about” or “going about”), a time comes when the sail flutters like a flag, and only momentum allows the boat to complete its turn. In turning away from the wind (called “jibing” or “gybing”), the wind is always filling, thus propelling, the sail, first on one side and then, after the sail is forced by the wind to swing across, on the other side. Old sailing ships, such as square riggers, had to turn by this method (called “wearing ship”) because they were too heavy and slow to come about. Modern sailing boats can do either type of turn, and skippers usually choose whichever is the quicker or smaller rotation. To make the boat come about, the tiller (steering stick) is moved toward the sail side. The turn happens quite slowly, relying on the boat’s momentum. To make the jibe turn, the tiller is moved away from the sail side. The sail can swing across quickly, and unless the skipper knows what to do, jibing can put a lot of force on the boat, resulting in either damage or a capsize.

Unlike many other vehicles, a sailboat has no brake. As long as wind is in the sail, the boat will move. To slow or stop, one must angle the boat or sail so that wind power is no longer caught by the sail. This can be achieved by either turning the boat into the wind or by letting out the sail. Either way, the sail loses power as a driving force and begins to act like a flag, with the wind passing over both sides. Getting started again involves trapping wind in the sail by angling the sail more across the wind. This can be achieved by either using the tiller and rudder to turn the boat or by pushing the sail out by the boom (the pole along the foot of the sail) at an angle to the wind.

Sailing Categories

Sailing can be divided into several categories according to the type of boat and usage. All sizes of boat may be either raced or just sailed from place to place. Dinghies, considered to be day boats, usually stay close to shore. Larger boats, such as keelboats, cruisers, or ocean racers, may go far offshore.

Cruising is a nonracing branch of sailing in which larger boats, usually with sleeping accommodation, are sailed on voyages ranging from short distance to around the world. Some smaller cruisers can be trailered, but usually cruisers are kept moored at anchor or in a marina. Most cruisers have fixed keels rather than movable centerboards. Keels are heavy and give the boat much greater stability than a dinghy has. After a knockdown, or capsize, a keelboat should right itself. Cruising requires not only sailing skills, but also knowledge of navigation, anchoring, meteorology, or indeed any fixing skill needed when out of sight of land miles from outside assistance. Cruisers are usually equipped with a variety of instruments, ranging from a compass and depth sounder to sophisticated Global Positioning System (GPS) navigation aids. Because of their size and weight, cruisers have a range of devices to help the crew gain a mechanical advantage in their work. These devices include winches for hoisting sails or pulling them in and capstans or windlasses (both are types of winches) for hoisting the anchor and chain. Most cruisers also are outfitted with engines.

Cruisers usually carry a variety of sails. These sails are changed to suit the prevailing weather conditions. Generally, as the wind rises, smaller sails are used to keep the boat from being overpowered. Because cruising may include sailing at night, in fog, and on the open sea, the crew should know the International Regulations for Preventing Collisions at Sea (COLREGS). The first rules of sailing were probably developed by the ancient Romans, but the current rules were agreed to by international charter in 1972. These rules include the requirements to display and recognize appropriate lights at night, to make and understand relevant sound signals in fog or in close proximity to other boats, and to keep a good lookout at all times. Sailors must know when the burden is on them to take action to avoid other boats. Even though sailors generally understand that power gives way to sail, many situations exist where the sailboat must give way. Two examples are when the powerboat/tanker is dredging or in a narrow channel. In general, the boat with the greater maneuverability keeps out of the way of the boat with more restricted maneuverability.

Three basic right-of-way rules apply to sailboats meeting other sailboats. These rules are the opposite tack rule, the overtaking rule, and the windward rule. In order to understand these rules, one must appreciate that when a sailboat has the wind blowing over its starboard side (and thus its boom is on the port side) the

boat is said to be on “starboard tack.” A boat with the wind blowing over its port side (with its boom to starboard) is said to be on “port tack.” When boats on opposite tacks meet, the one on port tack is required to keep clear of the one on starboard tack. When one boat is overtaking another, and they are on the same tack, the overtaking boat must keep clear. When two boats meet on the same tack, the one to windward (closer to the wind, that is on the nonsail side of the other) must keep clear of the one to leeward (downwind).

Some of the most popular designs of keelboats, some for racing and some for cruising, are the Catalina 22, Contessa 32, J24, and 12 meter. Many America's Cup races of the mid- to late twentieth century were raced in the 12-meter class. The America's Cup is probably the most famous yacht race.

Ocean, or offshore, racing began in October 1866 as the result of a wager. Three boats raced across the Atlantic, from New York to the Isle of Wight, England. *Henrietta* (32.6 meters) beat *Vesta* (32 meters) and *Fleetwing* (32.3 meters) in a close race. Crews of early ocean racers were usually professional seamen, and sometimes the owner was not even on board. During the 1920s amateur sailors took over much of ocean racing, and the sport was not without controversy. Some sailors felt that racing in the open sea is too dangerous, and, as a result, ocean racing grew up as a sport somewhat removed from dinghy and inshore keelboat racing. The Offshore Racing Council (ORC), headquartered in England, organizes the sport. Ocean racers are divided into classes for racing purposes: Class I, 21–10 meters; Class II, 9.9–8.8 meters; Class III, 8.7–7.6 meters; Class IV, 7.5–7 meters; and Class V, 6.9–6.4 meters.

A 1,014-kilometer race from Newport, Rhode Island, to Bermuda was first held in 1906 and since 1924 has been held every two years (except during World War II). Since 1925 the Fastnet Race has been held on the other side of the Atlantic in years when the Bermuda Race is not held. This race starts at Cowes on the Isle of Wight, off England's south coast, goes west past Plymouth, Devon, and up to the southwest coast of Ireland. Boats there round the Fastnet Rock and lighthouse and return to finish in Plymouth for a distance of 973 kilometers. The Fastnet Race has long had a well-deserved reputation for encountering heavy weather, but during the 1970s a series of races took place in light wind. However, perhaps designers forgot too soon the potential power of the sea because in 1979, after a light-wind start, hurricane-force winds blew over the largest fleet ever assembled for the race: 303 boats. The boats were scattered all over the southern Irish Sea, and many broke apart or were dismasted

in the steep, breaking waves. Fifteen crew members lost their lives; only eighty-five boats finished. People learned many lessons about boat design, rescue operations, and life rafts from this notorious race. The Fastnet Race is one of a series of races in the Admiral's Cup, one of the premier trophies in offshore racing. The 1,013-kilometer Sydney-Hobart, Australia, race, first held in 1945, is the third major offshore race. It always starts on Boxing Day (26 December). Another major ocean race is the Transpac, or Transpacific (held every two years in the odd-numbered years), which starts in Los Angeles and finishes in Hawaii, 3,580 kilometers away. An unusual feature of this race is that the wind usually blows in the same direction as the race, making it a run across the ocean.

Sponsorship has become a major feature of offshore racing. The Volvo Ocean Race (first held in 1973 and 1974 when it was known as the Whitbread Round the World Race) is for fully crewed boats, whereas the Vendée Globe (begun in 1989) is for single-handed racing around the world. Single-handed sailing around the world began in 1895 when Joshua Slocum (1844–1909), a U.S. sea captain born in Nova Scotia, Canada, started his voyage aboard *Spray*, a 11.2-meter boat. He went counterclockwise around, making use of prevailing winds and currents, and took three years, with many stops. His book, *Sailing Alone around the World*, has become a classic in sailing literature.

Dinghies are the smallest, but most numerous, type of boats and are distinguished by having retractable centerboards. They are usually raced by one-design class, which means that all boats in the race fleet are of the same type and exactly alike. The oldest one-design centerboard dinghy class boat still raced is the 4-meter clinker-built (overlapping planks) Water Wag from Ireland. These boats date from 1887 but were redesigned in 1900 by Mamie Doyle, the daughter of the original designer. In 1897 the A Scow was designed and raced on the Great Lakes of North America, and several still race. The Seabird Half Rater, designed in 1898 but not raced until 1899, takes its name from the handicapping system then used. Continuously sailed, raced, and built

without major redesign, a fleet of more than thirty is raced at Trearddur Bay, Wales, and all bear the names of seabirds.

Some dinghies have a simple rig—one sail—but others have a mainsail (a jibsail), a spinnaker (a balloon-like sail used in front of the mast on downwind legs, often brightly colored), and even a trapeze (a device that allows crew members to hook on to a wire, stand on the edge of the boat, and lever their weight over the side to assist in keeping the boat upright in windy conditions). Some of the more modern and popular dinghies of the hundreds of classes worldwide are the Optimist, Mirror, Sunfish, 420, 5-0-5, Snipe (all one-hulled boats) and the Hobiecat 16 (a catamaran, or twin-hulled boat). Another branch of dinghy sailing is made up of restricted or development classes. Boats in these classes are definitely not like each other because, although certain restrictions apply to what may be changed, the whole point is to encourage change and development.

Racing

Several types of sailing races exist. In fleet races boats of the same type race against each other. In handicap races boats of different types race against each other. Boats may start together, have their finish times recorded, and then work out who won on handicap. Sailors may use a visible handicap in which the slower boats start first and the faster boats start last at time intervals based on their handicap; the first boat over the finish line wins. Racing may also be subdivided into fleet racing, match racing (one-on-one races, such as used in America's Cup races), and team racing (in which boats race as members of teams, instead of individually; tactics between and among teams add to the interest).

A sailboat race is overseen by a race committee who issues instructions about the start procedure, the course to be raced, the finish, and the scoring. A sailing race is unusual when compared with races in other sports because the start is with competitors (boats) in motion. The race begins with a countdown (of ten, five, or three minutes) to the start, which is signaled to the boats by flags and/or sound. During this time the boats time and

practice starts and jockey for position, each one trying to be in the most advantageous place exactly on the start line, going fast in the direction of the first buoy, when the starting signal is made. The course is predetermined and is most often triangular. It is between a series of buoys that must be rounded in an agreed-upon order and direction for a certain number of laps. The point of sailing that requires the most skill and that gives the most opportunity for individually different courses is a beat. The start line is thus usually set perpendicular to the wind, giving a beat to the first buoy. The next leg may be a reach or a run.

The rules for sailboat racing include the three basic right-of-way rules described earlier plus many others necessary for sailing at close quarters. Because the rules may seem complex and intimidating to beginning racers, officials have been attempting to simplify the rules since 1997. Rules are always revised in the year after the Olympic Games by the London-based International Yacht Racing Union (IYRU). The rules cover, for example, starting, handling an obstruction (such as a rock) and rounding buoys. Additionally, the rules include precise definitions, prohibitions on certain forms of propulsion (such as fanning or rocking), and details on penalties. For example, if a boat hits a buoy, the boat must execute a 360-degree turn (come about, then jibe or vice versa in the same direction) to give itself a time penalty before continuing. If a boat hits another boat and admits it was in the wrong, it may usually put itself right by completing a 720-degree-turn penalty.

Another unusual feature of sailing races is that usually no referee is present. In fact, a referee would not be able to see every situation anywhere on the course. Instead, all competitors are honor bound to try to sail by the rules to the best of their knowledge and ability, but if one sailor thinks another has wrongly interpreted a rule, the only remedy is to protest. This protest involves flying a small flag on board and telling the other boat of the intention to protest. Protesting is not unsportsmanlike behavior because it is the only way, after the race, to get a ruling on a situation. At the protest hearing, a committee establishes the facts from the evidence

of both parties and decides what action to take. This action can range from doing nothing to disqualifying a boat or boats.

People also sail on land and ice, but the rules for these forms of racing are completely different from those of water sailing. Speeds in land-based sailing are usually much higher than those in water-based sailing because of the lower resistance needed to go over a hard, flat surface. Top speeds for sailing on land approach 110 kilometers per hour, whereas the top speeds for sailing on water in time trials are around 70 kilometers per hour. The fastest sailing craft are sailboards and catamarans.

Women in Sailing

Superstition and folklore have long held that to have a woman on board a boat is to court disaster. In light of this and other arguments against women participating in sport of any type, perhaps one should not be surprised that women have faced difficulty gaining acceptance in some branches of sailing, notably among the larger racing yachts. Women have nevertheless long participated in sailing.

Among the first women known to have sailed were a few women pirates. Alvilda, a Goth pirate from southern Sweden, went to sea to escape an arranged marriage and took with her an all-woman crew. During the seventeenth century, because of the relative inefficiency of sailing rigs, boats of all sizes often had to be rowed, making the all-woman makeup of the crew all the more remarkable. Around the same time, off the southwest coast of England, when the men of the villages were forced into King Henry VIII's navy, women took over their fishing boats and continued to make a living for their families.

The women sailors who have received the greatest recent publicity were those assembled by the America³ Foundation to try out for an all-woman crew in the America's Cup of 1995. They were not the first women to participate in this event, however. In 1895 Hope Goddard Iselin participated in an America's Cup race. She acted as timekeeper then and also in 1899 and 1903, when the U.S. defender boat was successful every time.

Outlook

The construction of sailboats has changed greatly during the last fifty years. Before then, most boats were built of wood, and the two major methods of construction were carvel (in which planks were laid edge to edge) and clinker (in which planks were overlapped). Next came the use of marine ply, and with that, boat building began to be something that people without great woodworking skills could do. Most boats today are made of fiberglass; some are made of aluminum or cement, and a few from expensive new materials such as Kevlar. However, many people continue to think that wood looks the best. Sails, traditionally made from flax or cotton, both of which tend to rot if left wet, have also become dependent on technology. Today sails are made from Dacron or sometimes Kevlar; the lighter spinnaker sails are made from nylon or Mylar.

As a sport, sailing is enjoyed around the world, and 108 countries are affiliated with the IYRU. Until recently sailing has been a difficult sport to watch because the boats cover a wide area and sometimes take different paths to the next buoy, making it hard even for experts to know which boat is leading. As with so many other sports, television may hold the key to the sport's increased popularity. Use of microcameras mounted high in the rigging or at deck level may be part of the solution. Another solution, long fought by some people in sailing but now seemingly here to stay, may be the growth of professional sailing opportunities.

Salary Caps

A salary cap limits the compensation an employer may provide to its employees. In sports, a salary cap is designed to restrict salaries for teams across an entire league—ideally creating an economic environment in which every team can be assured of cost containment as well as an opportunity to compete for player services.

NBA Salary Cap

Although there had been unofficial and official salary caps in professional baseball before the 1930s, the first modern salary cap was implemented in the National Basketball Association (NBA) in 1983. Numerous NBA teams had been struggling financially in the late 1970s and early 1980s, and concern existed that teams in larger United States markets (Los Angeles, Boston, New York, Philadelphia) would be able to outspend teams in smaller markets (Utah, Indiana, Cleveland) to the point that smaller market teams would cease operations and declare bankruptcy. NBA owners and NBA players agreed to a salary system that established a team salary floor (minimum amount paid in salaries per team) and salary cap or ceiling (maximum amount paid in salaries per team). Each year the NBA owners and players determine the league salary cap based on overall league revenues.

The NBA salary cap was designed, in theory, to maintain a level salary field for every team in the league. However, given the nature of the sport of basketball, it quickly became apparent that the loss of one or two players from a twelve-player roster could radically alter the quality of a team's performance. For this reason the NBA instituted a variety of rules that allowed individual teams to circumvent the cap. Most notable of these rules was the "Larry Bird" exemption, so named because the Boston Celtics were concerned that the potential loss of Larry Bird to free agency would devastate their team. The NBA allows teams, in most cases, to resign their own potential free agents for salaries that

may exceed the designated yearly salary cap. This exception has created an environment in which teams drafting quality players typically have an advantage in future salary negotiations, as free agents can usually resign with their original team for greater compensation than they can receive from other franchises.

Under the salary cap system, NBA popularity and salaries grew tremendously in the late 1980s and early 1990s. In 1998, NBA owners, tired of rapidly escalating player salaries, locked out the players at the start of the season. The negotiations to end the lockout resulted in new components being added to the salary cap agreement. Not only would NBA teams have a salary cap, but also individual player salaries would be capped based on their service time in the league. Although a few prominent players such as Shaquille O'Neal and Kevin Garnett had salaries exceeding the newly established individual limits, the NBA elected to grandfather their contracts and those players can continue to exceed the maximum individual salary limits. However, for the vast majority of players individual salary ceilings cannot be exceeded.

NFL Salary Cap

The National Football League (NFL) implemented a salary cap system in 1993 in an effort to maintain competitive balance among its franchises. The NFL cap system, similar to the NBA's, has a minimum and maximum team salary and is based each year on the overall league revenues. Unlike the NBA salary system in which numerous loopholes exist to exceed the cap, the NFL cap has a "hard" ceiling that must be maintained each year.

The NFL cap can be circumvented with the use of signing bonuses. If an NFL player signs a five-year contract worth \$5 million, each year his salary will count \$1 million against the NFL team's salary cap, and the player will receive \$1 million dollars each season. Unfortunately, since NFL contracts are usually not guaranteed, the player risks not receiving all of the money if he is hurt or is terminated by the club before each year of the contract is fulfilled. For this reason players like bonuses that are paid immediately on signing the con-

tract. If the aforementioned example is augmented with a signing bonus of \$5 million on top of the \$5 million for the five year contract, the player receives \$6 million in the first year of the contract, and the team is able to allocate \$2 million a year to its salary cap total.

Since a signing bonus in the NFL must be allocated to each year's salary cap for the length of the player's contract, the use of signing bonuses to circumvent the NFL cap is not without long-term repercussions. When a player who received a signing bonus retires, is cut, or is traded, his initial signing bonus must continue to be applied to that team's yearly cap. In the 1990s the San Francisco 49ers and other teams utilized signing bonuses to pay numerous players large salaries in the hopes of winning championships. In the case of the 49ers, they were able to field successful teams in the short term, but as players retired, became injured, and so on, the team was unable to sign other players under the cap as they had "mortgaged" their future with signing bonuses in the present.

Future of Salary Caps

Although not a perfect mechanism for limiting salaries and creating competitive balance, salary caps in the NBA and NFL have helped to create an economic environment in which all teams in the league have an opportunity to compete for player services. Major League Baseball (MLB) and the National Hockey League (NHL) owners have attempted to create a salary cap system for each of their sports, but they have been rebuffed by their players associations. In 1994 MLB players went on strike to protest a potential salary cap, and in 2004 NHL owners locked out the players in the hopes of implementing one. In both instances a salary cap was not instituted. MLB owners have continued to insist that a salary cap is needed at some point in the future, despite the protests of the players. NHL owners have insisted that too many teams are losing money due to high player salaries, and in February 2005, the NHL cancelled its 2004–2005 season after the players' association failed to accept the NHL owners' final offer of a \$42.5 million salary cap per team. In addition nu-

merous NFL and NBA players have remarked that they do not like the current salary caps in their leagues. Given the financial climate in which owners want player cost certainty and players want to maximize their career earnings, salary caps and the fight to implement or maintain them are likely to remain important topics in sport business well into the twenty-first century.

Scholar-Baller

Historically the athletic talents of African-American male student-athletes were marketable as cultural capital only if they were founded on intellectual and academic achievement. Before formal integration, African-American male athletes were not driven by money and commercial values but used their participation in sport to gain access to educational training and earn personal recognition.

These early pioneers, who lived during a period of reconstruction and the legalized separation of human beings in society based on phenotype and skin color, have been called "scholar-baller." Scholar-baller were young men with long-term goals and pursuits beyond their

participation in athletics; they were known at their colleges for both academic and athletic achievements. William Henry Lewis (at Amherst College and Harvard University), Paul Robeson (at Rutgers University), and Ralph Bunche (at UCLA) are perfect embodiments of the African-American scholar-baller—student-athletes who successfully balance cultural elements such as family and community with athletic and academic excellence.

Despite racist attitudes during the early twentieth century, African-American college students such as Lewis, Robeson, and Bunche were heavily involved in extracurricular activities, including the student newspaper and debate teams, and became part of an in-crowd composed primarily of scholars who happened to be outstanding athletes. Though each of these men faced discrimination from his white teammates and opponents, each went on to become an accomplished athlete and the valedictorian of his class.

African-American male student-athletes are no longer expected to combine academic excellence with athletic prowess. Somewhere on the continuum between Lewis and contemporary athletes like LeBraun James and Emeka Okefor, the expectation for black male student-athletes to succeed academically gave way to today's dumb-jock stereotype.

From Scholar-Baller to Baller

There are at least three major reasons for the shift in identity from scholar-baller to baller. The first one arises from the social and historical context, the second one reflects shifts in the structural context of intercollegiate athletics and higher education's reward system, and the third reason concerns notions of occupational success for African-American males. A shift in structural and cultural factors may be signaling a return to the original scholar-baller identity for all student-athletes, particularly in higher education and revenue sports. This shift may also impact the retention and graduation rates that the NCAA Academic Reform Movement (ARM) and higher education seek to rectify.

SOCIAL AND HISTORICAL CONTEXT

First, what has been the historical paradigm of African-Americans in sports and higher education? Academic and athletic ideology shifted for African-Americans at the height of social integration in 1954. Previously only a selected few African-American male student-athletes—who were commonly referred to as “handpicked”—would grace the playing fields. By 1970, however, African-American athletes had power on the playing field. Their numbers were increasing at all levels in basketball, football, baseball, boxing, and track and field. As the mood of the country shifted slightly toward giving blacks access to educational opportunities, coaches with an eye toward the scoreboard took advantage of open admissions policies.

STRUCTURAL CONTEXT

This shift led some to argue that African-American athletes in revenue sports were afforded a great opportunity in higher education while other, more critical observers of graduation and retention rates insisted that exploitation was the pattern and the outcome of participation in football and basketball. Some scholars have used empirical evidence to show that student-athletes in revenue sports were not unmotivated and negligent about their academic priorities but that their poor performance was rather the result of extrinsic barriers based on the current intercollegiate athletics model. While universities continue to benefit from the talent of African-American male student-athletes, the integration-without-education paradigm remains a tremendous challenge for athletes who do not perform beyond athletics.

AFRICAN-AMERICAN VISUAL LITERACY

As one scholar described the phenomenon, “In the 1970s black players enabled college football players to field exciting teams that employed daring option and pitchout plays such as the ‘I’ and the ‘veer’ which often depended on the physical skills of African-American athletes. The freer and spontaneous celebration of black

players after they scored provided almost as much entertainment as the scores themselves. The ‘Hi-Mom’ and high-fives soon embedded themselves into American culture” (Watterson 2000, 326–327).

There is an important connection between the cultural production of black athletic talents for competitive teams, the commercial ideology of big-time college athletics (football and basketball), and the early failure of faculty interinstitutional control. Some researchers have argued that black athletes are more visible to black youths than, say, black doctors or black lawyers because racial discrimination has limited black access to the full spectrum of high-prestige occupational opportunities. What are the consequences of this media bombardment of blacks in sport and entertainment rather than in education, science, or business?

RETENTION AND GRADUATION RATES

Between 1990 and 1991 nearly twice as many white athletes as African-American athletes graduated from college (52.2 percent versus 26.6 percent). Was the disparity due to social class, race, gender, or all three?

A 1997 study of African-American male student-athletes found that 1 out of 9 African-American students at predominantly white four-year institutions was an athlete. It also found that half of football and basketball players came from the lowest socioeconomic quartile; most athletes came from homes headed by women and many were first-generation college students. These athletes had to face the negative stereotypes and expectations associated with both student-athletes and men of color.

A 2003 study of over five hundred intercollegiate student athletes revealed a trend for black student athletes to choose between a strong athletic identity with a weak racial identity and a weak athletic identity with a strong racial identity. Unlike African-American scholar-ballerers of the past who excelled in both sports and academics, the majority of modern black student-athletes choose between academia and athleticism and rarely focus on both.

African-American male student-athletes are showcased as commodities on college campuses. While the median enrollment of African-American students at Division I universities is approximately 4 percent, blacks represent 12 percent of the student-athlete population (the overall population of blacks in the United States is 13 percent). As one researcher put it, “The problem is not that Blacks are overrepresented in college athletics, the problem is that African-American students are underrepresented in college” (Sellers 2000). The NCAA reported in 1995 that roughly 1 out of 9 African-American males on Division I campuses were scholarship athletes, compared to a ratio of 1 out of 50 for white males.

A 2003 survey by the American Football Coaches Association (AFCA) found interesting differences based on race and ethnicity. The purpose of the survey was to provide information to college administrators and coaches to help them better understand college football players. Responses were received from 5,474 football players from sixty-six teams and represented a cross-section of the Division I-A membership. Here is a summary of some key findings:

- When asked who influenced them most in making their decision on which university to attend, 43 percent of white Americans said it was their father. Among African-American players, the mother had the greatest influence, 32 percent, with the father at 25 percent.
- Earning a degree is foremost on the minds of today’s college football players. When asked the importance of graduating from college, 95 percent, regardless of race or ethnicity, said it was very important.
- White American athletes earned higher GPAs than African-Americans. Forty-one percent of white American players and 14 percent of African-American players earned a GPA of 3.0 or better, while 25 percent of white American players and 53 percent of African-American players registered a GPA of 2.5 or less. The relationship was similar for high school GPAs. Respondents from a two-parent family registered higher

He who stops being better stops being good. ■ OLIVER CROMWELL

high school and college GPAs than those who lived with one parent or with others.

- When asked why they play college football, respondents reported the following:
 1. In 2002, 60 percent said enjoyment of the game, 15 percent necessity of aid for education, and 19 percent opportunity for a professional career;
 2. In 1996, 66 percent said enjoyment of the game, 15 percent necessity of aid for education, and 15 percent opportunity for a professional career;
 3. In 1991, 65 percent said enjoyment of the game, 20 percent necessity of aid for education, and 11 percent opportunity for professional career;
 4. In 1986, 72 percent said enjoyment of the game, 16 percent necessity of aid for education, and 9 percent opportunity for a professional career.

Recommendations for improving the future of African-American male student-athletes include eliminating athletic scholarships, removing athletics from the university structure, and paying student-athletes. However, this data suggests that these recommendations might exacerbate the situation of athletes who already suffer from disparities of income and social class, family support, and educational and racial perceptions, as well as from the impact of popular stereotypes.

An experiment at Arizona State University in Tempe, Arizona, is attempting to solve these problems by working within the system.

Scholar-Baller: ASU Case Study

Major Division I college football brings to mind sell-out crowds, great athletes, lots of money, and hard work in the weight room and on the football field. Competing in the classroom at the highest level is never part of the image. However, in classrooms at Arizona State University, the scholar-baller paradigm is challenging Sun Devil football student-athletes to tap into the same competitive fire that makes them great athletes.

In urban hip hop vernacular, a “baller” is someone who excels in a given activity (for example, sports or earning money). A baller competes for the highest prize

and wins. At ASU the academic support staff and football coaches work together to set high standards for the performance of football student-athletes in the classroom.

The term “scholar-baller” was coined in 1996 by C. Keith Harrison, director of the Paul Robeson Research Center for Leadership, Academic and Athletic Prowess at ASU, and the implementation of the scholar-baller program has been a collaborative effort of Harrison, Jean Boyd, assistant athletic director for student-athlete development, and Dirk Koetter, head football coach. The implementation involves rewarding ASU footballers in several ways for their academic success:

- The football team is divided into academic teams that compete against each other in the spring semester, with the winners earning scholar-baller sweat suits.
- Scholar-baller awards (such as T-shirts and backpacks) recognizing a GPA of 3.0 and above by student-athletes are given out every year at Camp Tontozona.
- Scholar-baller are invited to a special dinner with the director of athletics.
- This year ASU will become the first Division I school in the country to acknowledge football student-athlete academic success with a scholar-baller patch designed to be worn on the front of jerseys at every game.

This system of rewarding academic prowess counteracts the notion that participation in college football is primarily a training ground for a career in the NFL and that academics is only important to maintain a player’s eligibility. The reality is that most college football student-athletes will not play the sport after college. The scholar-baller paradigm teaches that performing well in school and earning a bachelor’s degree are victories that last a lifetime.

ASU’s scholar-baller paradigm serves as a model for what Myles Brand, president of NCAA, called a “landmark academic reform package aimed at dramatically strengthening the educational success of student-athletes and holding universities and teams accountable. This comprehensive, three-year effort to improve the academic progress, retention and graduation of

student-athletes is the most far-reaching effort of its kind in the history of the association” (NCAA 2004, 1).

Robert Hemenway, chair of the NCAA Division I board of directors and chancellor of the University of Kansas, summarized the synergy of the scholar-baller and the NCAA’s new academic policies in this way: “The reform package fulfills the NCAA’s mission of making the education of student-athletes paramount in collegiate sports. With these proposals, institutions, teams and coaches will know exactly what they need to accomplish to ensure their student-athletes are progressing in a timely fashion toward completing a degree. If they do not meet the requirements, they will suffer consequences” (NCAA 2004, 1).

Since implementation of the scholar-baller concept, ASU football has experienced significant improvement in the retention rate of football student-athletes and in the academic performance of the entire team:

- ASU football’s retention rates for the 2001, 2002, and 2003 recruiting classes are significantly above the PAC-10 average (85 percent to 75 percent as of spring 2004).
- Retention rates for the 2000, 2001, and 2002 recruiting classes are also above the national average according to the American Football Coaches Association survey (80 percent to 73 percent).
- The cumulative GPAs for ASU football teams rose substantially from 2000 to 2004.
- In 2001 there were nine football student-athletes with a GPA of 3.0 or better, and in 2004 thirty-seven football student-athletes achieved a B average or better.
- Only 1 out of 63 football student-athletes recruited between 2000 and 2004 has been declared academically ineligible.

While winning on the football field is an important aspect of becoming a competitive team in the PAC-10 conference, the definition of success for a Division I football program should include the preparation of young men for life. Promoting the scholar-baller image does just that—it prepares ASU football student-athletes for the greatest competition of all, life. The ex-

perience at ASU also suggests that the scholar-baller paradigm could bring similar benefits to young man on athletic teams in elementary and secondary schools.

The Future

The scholar-baller paradigm is designed to help athletes escape the stereotyping that confines their talents to athletics and hinders their personal, social, cultural, and educational development. The new paradigm retains the current visuals but includes academic excellence. This transformation could lead to a different type of interaction between the public and the student-athlete. When asked, “Hey, are you a scholar-baller?” student-athletes—black, white, and brown—would be proud to say, “Yes, I am.”

This reframing must be sensitive to the needs of the student-athletes themselves. Part of integrating them into the university community will involve fusing their desires, connections, technologies, and artifacts (including video games, language, and fashions) with academic reform initiatives and policies. A key component of the NCAA academic reform movement is the concept of contemporaneous penalties in which real-time evaluations will be made in order to improve the academic retention and matriculation rates of student-athletes in all sports. A contemporaneous reward system for academic achievement will also be established.

Urban culture and hip hop have moved into the center of American popular culture. This makes it possible to imagine a synergy of education, sports, and entertainment creating a new paradigm in which athletics, education, and popular culture are united into an indissoluble whole. This is the goal of the scholar-baller covenant with the NCAA.

School Performance

Participation in school-sponsored sports activities benefits students' academic and non-academic achievement, particularly in high school. But this view is recent, and theoretical models of the effects of participation in sports lead to conflicting predictions. The *zero-sum model* suggests that time spent on sports detracts from time that is available for schoolwork. Historically, based substantially on this rationale, many educators were critical of participation in all extracurricular activities—but particularly sports. Subsequently, educational practitioners and researchers have taken a more positive perspective, arguing that sports participation may have positive effects on life skills and the total development of students (*development perspective*) that are not at the expense of academic achievement. According to the *identification/commitment model*, athletic participation enhances identification, involvement, and commitment to a school's values and goals in a way that enhances both academic and nonacademic outcomes—a win-win situation. Following from this debate, research has evaluated the impact of high school athletic participation in relation to a wide variety of outcomes and policy implications. These results show that participation in sports has generally positive effects on a variety of academic, social, and psychological outcomes, whereas there is little or no evidence of negative effects.

Recent Studies

There has been, however, a valid concern that some of the benefits attributed to athletic participation might simply represent differences that already existed in students who chose to participate in sports rather than being effects because of participation in sports. Hence, stronger studies are based on large, representative samples of students; employ longitudinal designs in which the same outcomes are measured on multiple occasions; and control for the effects of preexisting differences on background variables such as socioeconomic

status (SES), ethnicity, gender, parental education, and type of schooling (e.g., private versus public, rural versus urban, large versus small school).

Recent studies consistently support the *identification/commitment* model. In particular, students who participated in athletics were less likely to drop out of school. Participation in sports also had positive effects on school attendance, being in the academic track, taking more demanding coursework, spending more time on homework, and having more positive general, academic, and especially social self-concepts. Further positive effects of sports included liking school more and having better than expected school grades, higher educational aspirations, greater parental involvement, and higher expectations from parents and teachers. The positive effects also extend beyond high school. Students who participated in sports applied to more universities and were more likely to attend a university. Fifteen years after graduation from high school, students who had participated in high school sports had higher occupational status and income levels. Furthermore, the post-secondary benefits remained even after factors such as ability and secondary educational attainment were controlled. There was, however, some indication that benefits were larger for males and for students from lower SES backgrounds. Overall, however, the effects of athletic participation generalize reasonably well across the different student characteristics.

An interesting pattern of results emerged when effects of sports participation were considered separately and in combinations for intramural, extramural, individual, and team sports activities:

- Participation in extramural sports was significantly more beneficial than that with intramural sports, particularly for more narrowly defined academic outcomes (e.g., grades, being enrolled in more demanding courses, time spend on homework, educational aspirations, and subsequent university attainments).
- Participation in extramural sports was also beneficial for internal locus of control, self-esteem, and parental expectations.

- To a lesser extent, there were more positive benefits associated with participation in team sports than in individual sports.
- Overall, there were more benefits associated with participation in extramural/team sport activities than in intramural/individual sports participation.
- The effects of in-school sports activities were more positive than were those of the out-of-school sports activities.

All these overwhelmingly positive effects appeared across different students' characteristics and remained even after accounting for background characteristics and parallel outcomes in grades 8 and 10.

Reasons

To understand these outcomes, it is important to consider the various influences of factors such as the following:

- Peer and social network and the culture it reflects
- Opportunity to develop identification and commitment to school values
- Interaction with nonparent, competent adults
- Promotion of developmental benefits

INTERACTIONS WITH PEERS

The interactions that students have with peers facilitate the development of self-identity, which in turn leads to adopting particular social roles and behaviors associated with a membership (or its absence) in a particular group. Not surprisingly, adolescents involved in delinquent social networks are more likely to drop out of school, have substance-abuse issues, and have disciplinary problems, and students without any group affiliation tend to suffer emotional problems and have a higher risk of suicide and dropping out. The identities that adolescents form have powerful effects on their behavior during high school and beyond. For instance, students were asked to describe their identities in terms of the characters of the popular movie, *The Breakfast Club*: the "Brain," the "Jock," the "Basket Case," and the "Criminal." Although the Jock and the Criminal groups

were similar in some ways (both consumed more alcohol than other students did), the two groups were radically different in their academic and future outcomes. The Jock type had the highest level of self-esteem and reported the lowest level of social isolation, whereas the Criminals were less likely to finish the school and had the highest level of depression. The two groups differed in the type of extracurricular activity they took part in—Jocks were predominately involved in sports, largely being engaged in a positive network and high status activities, whereas Criminals largely belonged to the groups that were engaged in some delinquent and low-status activities. In other words, Criminals did not belong to the school culture, were more likely to drop out of high school, and were less likely to attend college. Jocks were involved in a social network of peers who valued schooling and planned to go to college.

Importantly, however—addressing concerns of psychological and social consequences of sport participation, that is, impact on image and stereotypes of social behavior of athletes—many students who participated in sports did not identify themselves as being Jocks. Furthermore, with respect to educational and occupational success and subsequent college attendance, sports par-

ticipation itself predicted advantages better than the Jock identity did. Nevertheless, interaction with peers and values play an important role in students' adopted patterns of behaviors. Participation in sports activities

- Fulfills students' need for social relatedness
- Increases their social status
- Contributes to formation of their identities as valued members of the school community

Hence, sports participation generally, and participation in extramural team sports in particular, appears to provide an important positive network that reinforces school values and has positive effects on many academic and non-academic outcomes.

IDENTIFICATION AND COMMITMENT TO SCHOOL VALUES

Participation in extramural high school sports provides a social context, socialization experiences, and social networks that lead to the following:

- Stronger identification with the school
- Greater reinforcement of school values
- Stronger commitment to academic accomplishments

Participation in extramural sports is more intense—it requires higher levels of commitment and higher intensity of peer interactions—and may result in more support from teachers, peers, and coaches. Similarly, participation in team sports—through greater levels of shared interaction with school peers and emphasis on cooperation with the team and team leaders—should also result in more identification with and commitment to school than would participation in individual and, especially, out-of-school sports. Moreover, participants in team sports might be more willing to help each other and thus acquire different social skills than would participants in individual sports. All these factors should result in a greater identification with school and its values, providing mediative, positive effects on many non-academic outcomes but particularly on more narrowly defined, academic outcomes. Hence, representing one's school in extramural, team sporting events is

likely to engender a sense of commitment and identification with one's school, leading to more positive effects than are other types of sporting participation across a diverse range of academic and nonacademic outcomes.

INTERACTION WITH NONPARENT, COMPETENT ADULTS

Participation in extramural or structured sports is more intense, it requires higher levels of commitment, and its outcomes are perceived as more important for the status of the school than is participation in intramural and out-of-school sports. Many schools have adopted “no pass, no play” policies that limit participation in athletic activities if students fail courses or do not achieve sufficient academic standards. Such policies are designed to reinforce the connection between athletic participation and more narrowly defined academic values of schooling, particularly for disadvantaged students who might not otherwise value the maintenance of acceptable levels of academic achievement. This may result in more support from teachers, peers, and coaches. The interaction with competent adults—typically teachers and coaches who place a high value on education—who are outside of the student's immediate family is particularly important for educational motivation in general, and especially for educational aspirations.

Furthermore, extramural sports are typically coached and supervised by competent adults who are part of the school structure (e.g., teachers, coaches). This leads to a stronger identification with the school, greater reinforcement of school values, and a stronger commitment to academic accomplishments that may not be directly relevant to the specific goals of the particular sports activity. Participating in sporting activities outside of school, in contrast, may enhance many other values, but is less relevant to the commitment to school and the promotion of school values. Hence, in-school and out-of-school sports activities differ not only the setting in which these activities take place but also in the values and goals that they promote.

In addition, extramural sports participation increases student's social connections and opportunities to a larger degree than does participation in intramural or out-of-school sports. That is, often school coaches and school counselors act as advisors and referees for receiving scholarships and college admission. These social networks are more developed with the extramural and, arguably, team sports, hence enhancing postsecondary outcomes.

PROMOTION OF DEVELOPMENTAL BENEFITS

Participation in sports activities has positive effects on social self-concept, yet these effects are reasonably independent of the effects on other variables. In the studies, students perceived themselves to be more popular with peers, but these effects of participation in sports did not necessarily lead to more positive academic outcomes. The effects of participation in sports were actually smaller for academic self-concept and educational aspirations, but these effects appeared to be more important in mediating the effects of sports participation. Participation in sports led to higher levels of academic self-concept and educational aspirations, and these effects led to a variety of other positive academic outcomes (e.g., better school grades, greater likelihood of going to a university).

Too Much Participation and Potential Problem Behaviors

Researchers have also been concerned that too much participation in sports may have negative effects—that small to moderate amounts of participation in sports up to some optimal level may have benefits, but that participation beyond this optimal level has diminishing returns. However, there is little support for these predictions; positive effects of participation in sports are evident for the entire range of typical levels of sports participation, with no evidence of diminishing returns associated with very high levels of participation.

There are also concerns that participation in sports may be associated with problem behaviors such as eating disorders, drug use, and alcohol consumption. For

example, increased consumption of alcohol might be a result of peer pressure or a particular culture present in some sports. Sports participation has been linked to eating disorders and drug use when the athlete feels pressure to lose or gain weight, to maintain an “ideal” weight or shape, or to achieve some higher level of performance. These pressures may be self-imposed, or may come from coaches, parents, or peers. Indeed, intense exercising and dieting may be seen as appropriate behaviors associated with some sports. Although such reports are often anecdotal and may be limited to very small number of athletes, schools need to realize the importance of preventative education as well as providing timely, effective, and confidential treatment options available to affected athletes. Coaches, trainers, families, and peers need to be aware of symptoms of such problem behaviors and to be informed of appropriate procedures to help athletes if such symptoms do occur. There is also a need for further research to determine how widespread such problems are, particularly among high school athletes, and how best to deal with such problems that do exist.

The Future

A growing body of research shows that participation in athletics has many benefits in both academic and non-academic achievements, both in high school and beyond. These results are consistent for students from different sociocultural backgrounds, races, genders, and school characteristics. The results are also evident even after controlling background variables and prior levels of achievement on the same outcomes. Participation in school-sponsored sports activities was more beneficial for academic and non-academic achievements than was participation in out-of-school sports. Consistent with the identification/commitment model, extramural and particularly extramural/team participation had more positive effects than did other types of sporting participation for a wide range of academic and nonacademic outcomes. Implications of this model for educational practice are that strategies to foster identification with school and commitment to school-related values are likely to have benefits across a range of academic as well

as non-academic outcomes. Particularly in times of tight educational budgets and achievement-test-score rationalism, it is important that cost-cutting measures do not force schools to eliminate sporting activities, especially extramural and team sports. The development of an exciting program of athletic activities is likely to benefit all students.

Scotland

Scotland is the most northerly nation in Britain. It has a population of 5 million people. Its capital city is Edinburgh in the east of the country, though the most densely populated center is around the Glasgow area to the west. In sporting terms, Scotland views *shinty*, a fast-moving game similar to lacrosse, as a unique indigenous activity, generally sees itself as the home of golf, the originator of the sport of curling, and the provider of some of Europe's greatest footballers and highest-ever attendances at football matches. Partly through playing an integral role in the creation and sustenance of the British Empire, Scotland has acquired a significant place in the development of modern sports history and development.

History

According to available records, King James IV (1488–1513) is one of the first people associated with sport in Scotland. Around the time of his reign tennis became popular among the aristocracy. Hawking, hunting, horse racing, and shooting were fashionable, too. A game similar to modern putting was also played, though it remains debatable whether golf itself is Scot-

tish or Dutch in origin. Among the lower classes in pre-Reformation Scotland, a type of football was played, as were forms of handball. For many years, sports and games occupied religious and other holidays and celebrations. The distinctively Scottish activity of curling can be considered the first modern sport to be played widely there. It was the most popular sport in the country from about 1780 until late in the nineteenth century. One of the most important figures in curling history is John Cairnie (1769–1842); among his contributions to the sport was the introduction of the first artificial rink in 1827.

Sports Clubs and Spectators

In the past, the influence of the national Church of Scotland in relation to sport was important. The Church decreed that no such activities should take place on a Sunday; the influence of the Kirk also meant that sports betting took place to a far lesser degree in Scotland than in England. It wasn't until late in the twentieth century that sports became a part of regular Sunday activity in Scotland.

As sport began to develop as a substantial social activity, sports clubs were initiated. The first sporting club in Scotland was the Company of Archers founded in 1676. Another landmark was reached with the instigation of Edinburgh's gymnastic club in 1770. Activities such as these gradually took on a more regulated format, and playing codes and rules emerged to fit their growing popularity and importance. The activities of many sporting clubs increased and the size of crowds of spectators followed suit. A horse-racing meeting at Ayr in 1834 had twenty thousand people in attendance on one day. Highland Games, the origins of which are clouded in myth, expanded to the Lowlands of Scotland after 1820. Characterized by caber tossing, pipe playing, and other indigenous activities, Highland Games have come to symbolize images of sporting Scotland, especially among ex-patriot communities in North America.

The importance that Highland Games increasingly enjoyed in the rest of Scotland serves as an opposite

Scotland in New York City

The Scot sporting tradition remained an important link to Scot culture in overseas Scot communities. The following is an announcement of an annual Scot games festival placed by the New York Caledonian Club in the New York Clipper in 1858.

The second annual celebration of the games of the "New York Caledonian Club" came off on Thursday, the 23d., at Jones' Wood. This club was only organized last year, on which occasion the games were held in Hoboken. So rapid, however, has been the progress of the club, and the accession of members; (who must be natives of "stern Caledonia," and resident in New York,) so numerous, that this year it was determined to hold the festival on a larger scale, and more in accordance with the importance and high condition of the society. The grounds attached to Jones' Wood were engaged for the purpose, and the members of the club assembled at their head quarters at the Mercer House, and at 8 o'clock a.m. proceeded to the place appointed. The day was remarkably fine, and although in the early part of the day there was a slight tinge of frost in the air, yet the sun's rays soon dissipated it, leaving the weather all that could be desired for the enjoyment of the sports.

The proceedings commenced shortly after 10 o'clock, a portion of the level ground having been enclosed thus forming a ring for the performance of the exercises. The sports opened with a Highland fling, reel and strathspey, in which both members and guests joined with the greatest spirit. The programmed of the games, and the rules for the government of the competitors, were as follows:

1. The Heavy Hammer is to be thrown without turning; each competitor [makes] the throw once before any one makes a second throw. Three throws to each competitor.
2. Putting the Light Stone—same arrangement as above; toe the mark, without a race, neither foot

to cross the mark before the stone strikes. Three trials each.

3. Throwing the Light Hammer — same arrangements as heavy hammer—three throws to each competitor.
4. Putting the Heavy Stone—arrangement same as for light stone—three trials each.
5. Tossing the Caber, each competitor to make one trial after it is turned once.
6. The Standing Jump—without weights—three trials to each.
7. The Running Jump—without weights—three trials to each.
8. The Running High Leap—without weights—three trials to each.
9. The Short Race—100 yards.
10. The Highland Fling, one dance each.
11. The Scottish Song or Ballad, optional.
12. The Long Race, say 600 yards.
13. Ghillie Caltum, or Broad Sword Dance, over two broadswords, crossed—one dance each.
14. Running Hop. Step, and Jump (omitted).
15. Wheeling the Barrow Blindfolded. The competitors to be blindfolded with back to Barrow, then turned around and placed before it, starting at the third call.
16. The Scotch Reel, one dance each.
17. The Sack Race—the first at the winning post, by any means without assistance, to win the race.
18. The Shinty—omitted.

The rules provided that no one shall be eligible to a prize without being a member of the club in good standing at the time of competing.

The following are the results of the different sports, and the awards of the judges, Messrs. Gibson, Innes, Shillinglaw, Mason, and Lines, were in every sense most just and impartial.

example of how Highland culture was appropriated in the Lowlands and Borders to become a dominant part of Scottish national identity. The creation, sustenance, and expression of Scottishness and Scottish national identity have long been associated with sport. In the nineteenth century John Murdoch, a cultural and political activist, looked to sports like *shinty* as quintessentially Scottish and as the true expression of a Celtic past. In the twentieth century other sports were also given this role.

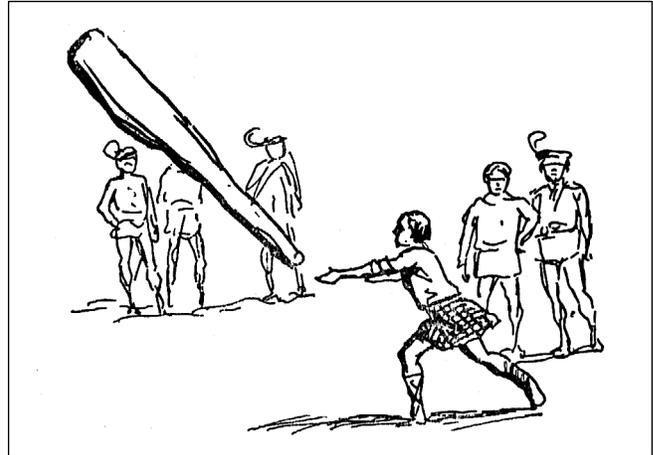

Women in Scottish Sports

Notably, it wasn't until the late twentieth century that women began to participate in sports; until then they were usually only spectators. A great Scottish sporting heroine in the mid-twentieth century was Nancy Riach from the Lanarkshire town of Motherwell. Riach won numerous Scottish and British titles and became a focus of Scottish national identity and pride until her untimely death from polio in 1947.

Policy, Young People, and Sport Today

The participation in sports and physical activity of children and young people is viewed by policy makers and politicians in Scotland as an opportunity for encouraging personal and social development. In the late twentieth and early twenty-first centuries, increasingly materialistic and sedentary lifestyles have led to a decrease in the physical-activity levels of children and young people. Scotland's health statistics are among the worst in Western Europe. A decline in the participant sports culture in Scotland, once characterized by mass activity in popular and accessible sports such as boxing, football, and swimming, has proved difficult to reverse. Numerous local and national programs have been created to reinvigorate sport in Scotland.

Also created was the Scottish Sports Council, a national body dedicated to increasing participation in sports by all citizens, from primary school children trying a sport for the first time to elite athletes seeking success on the world stage. The Council plays a leading

role in driving forward *Sport 21*, the national strategy for sport in Scotland, through partnerships with the public, private, and voluntary sectors. In this role, it has a relationship with the Scottish Executive, which provides exchequer funding. The Council combines resources to develop sports programs; for example, it advises Scottish ministers on how best to implement executive policy for sports and physical recreation; through consultation with partners, it provides an overview of sports development in the country; and it plays a major role in raising the profile of sports and highlighting their benefits to society.

Achievement and Change in Scottish Sports

In Paris in 1924, Eric Liddell became the first Scot to win a gold medal at the Olympics. Born in China of Scottish Presbyterian missionary parents, Liddell was immortalized in the 1980s Hollywood film *Chariots of Fire*. He also became famous for his refusal to run in the 100 meter Olympic final because he believed that Sunday was a day for rest and worship and not for sporting activities. He died in a Japanese concentration camp in 1945. In the twentieth and twenty-first centuries, sports stars such as Tommy Armour and Jessie Valentine (golf), Benny Lynch and Ken Buchanan (boxing), Jim Clark (racing), Bobby McGregor and David Wilkie (swimming), Finley Calder and Andy Irvine (rugby), and Helen Elliot Hamilton (table tennis) won national, European, or world titles in their respective sports.

Possibly the greatest change to modern Scottish sport took place with the advent of soccer. One of the world's first football clubs, Queen's Park in Glasgow, was founded in Scotland in 1867. More than any other sport, Scottish football reveals national attitudes toward identity, class, geography, nationhood, ethnic identity, racism, immigration, religious prejudice, and discrimination; it also reveals many of the differences and distinctions that exist within Scottish society. The high points of Scottish soccer were displayed in the winning of European trophies by Celtic (representatives of the Irish Catholic immigrant diaspora in the west of Scotland) and Glasgow Rangers and Aberdeen during the 1960s, 1970s, and 1980s. World-famous players and displays from Jim Baxter (Glasgow Rangers), Jimmy Johnstone (Celtic), and Kenny Dalglish (Celtic and Liverpool) have captivated millions, while European, national, and international record crowds at matches played in Glasgow reflect the traditional popularity of the sport within the country.

Challenges

Contemporary social and economic challenges presented by modern living patterns and lifestyles have had a detrimental effect on the capacity of communities and

individual people in Scotland to continue to participate in sports and enjoy watching them. Despite some successes, Scotland's performances on national and international stages have been in decline since the late twentieth century. Nonetheless, Scotland's sporting history can never be erased and serves as a template for a more positive sporting future.

Senegal

Senegal is located in West Africa and has a population of almost 8 million with its capital at Dakar. About 90 percent of the population is Muslim with the other 10 percent either followers of indigenous religions or Christianity. Senegal was a French colony from 1840 to 1960 and from 1895 it was the center of French West Africa. Senegal remains economically close to France, and many Senegalese citizens work there, including professional athletes.

French Dominance

At the time of French colonization, the native Senegalese participated in their own forms of running and wrestling competitions. In the early twentieth century the French established a few cycling, soccer, and athletics clubs in Senegal, but the indigenous population remained outside this formal sports structure.

In 1920, as French rule in the region intensified and became centered in Dakar, France sought to transmit French sports culture to West Africa. More sports clubs were founded as the French population in Dakar increased and also through physical education in the Senegalese schools, the French used physical education and sports to train good soldiers and good citizens. In 1927, Dakar became the center of the French West African Federal Committee for Sports.

Perhaps the most memorable event from this period for the Senegalese took place in 1922 when the Senegalese boxer Battling Siki defeated the celebrated French champion Georges Carpentier, and took the French, European, and world professional light-heavyweight boxing title. The victory also raised questions about the negative opinions that the French press had about him and about black people in general.

In the 1924 Olympics in Paris, Senegalese athlete Cire Samba represented France in the javelin throw. In boxing, another Senegalese athlete, Assani Diouf, won the French professional middleweight crown in 1939.

The aim of the French to host the African Games in Dakar, which would have been open to other countries under other European colonial regimes, failed to materialize in 1929.

The implementation of physical education and the related diffusion of sports facilities and the organization of competitions in football, gymnastics, basketball, swimming, and track and field was at first opposed but later accepted by Muslim leaders. In the 1930s, women were also allowed to participate in sports, especially in track, volleyball, and basketball. The first women's national basketball tournament took place in 1955. Senegal's first Olympic medal came in 1960, the year of its independence from France, when Abdouleye Seyé won the bronze medal in the 200-meter dash in Rome.

Independent Senegal

At the time of independence, athletes came almost exclusively from upper classes and proponents of sports faced a major challenge in getting more of the population involved. This was especially true for women as Muslim customs defined sports clothing as being degrading to women. The first president of Senegal, the poet and intellectual Leopold Senghor (1906–2001), strongly encouraged sports for men and women, as a means to improve one's health and physical appearance. The Senegalese Olympic Committee was formed in 1963 and since the Tokyo Olympics in 1964, Senegal has competed in the summer games and also in three Winter Olympics.

The International Association of Athletics Federations (IAAF) set up a center in Dakar, with track and field facilities and tuition-free training from instructors brought in from other nations in order to develop the most promising Senegalese youth. This process seemed to bear fruit in 1999 when Lamine Diack became chair of the IAAF. Diack was the first Senegalese person appointed as chief official in an international sport organization.

In athletics, Senegal achieved international honors. Amadou Dia Ba took the silver medal in the men's

Women excelled in continental basketball, winning the Pan African Games three times and the African championships six times, but never reaching the finals of the Olympic Games.

In 1987, commercial and economic interests opened the way for the inauguration of the Paris–Dakar motor rally. The short history of the rally was marred by several tragic accidents. Apart from ephemeral and superficial publicity during the rallies, Dakar did not benefit from the event.

Work opportunities for the Senegalese are still limited and many emigrate to France and Italy seeking better opportunities. In sport too, some talented athletes acquire French citizenship so they can train and compete in Europe. In the 1990s, Jean Baptiste Mendy won the supermiddleweight professional boxing title of France. In recent years, having understood the immense impact of sport, Senegalese government leaders repeatedly asked leading athletes to maintain their citizenship, even while their training abroad.

The Future

An impressive sign of Senegalese potential was seen the finals of the World Cup of football (soccer) in Japan and South Korea in 2002, when Senegal eliminated France in the first round and reached the quarterfinals. In a bow to Senegalese culture, the French coach of the Senegalese team, Bruno Metsu, in order to make the

game more appealing to his players, ended the practice of pregame seclusion, and allowed wives and fiancées to visit their men on the eve of the match.

Senior Sport

Sporting opportunities for seniors (ages fifty and older) are growing rapidly as the population of older adults increases globally. Large-scaled multisport events draw as many as 25,000 senior athletes who compete in alpine skiing, archery, badminton, basketball, bowling, cross country skiing, curling, cycling, golf, horseshoes, ice hockey, race walking, racquetball, road races, shuffleboard, snow-shoeing, softball, swimming, table tennis, tennis, track and field, triathlon, and volleyball. These events are held on international, national, regional, and local competitive and recreational levels for senior (also called golden age, masters, or veteran) men and women.

Aging and Exercise

As people age, many tend to view the process in negative terms. Physical fitness tends to decline as we become inactive. We think of getting older as losing our

attractiveness and good looks, gaining weight, becoming frail, suffering, and becoming dependent.

Substantial scientific research evidence substantiates daily physical activity in improving overall health and delaying illness and disease as we age. "The National Blueprint: Increasing Physical Activity Among Adults Aged 50 and Older" was published in May 2001 by a coalition of forty-six organizations with expertise in medical, health, social and behavioral sciences, epidemiology, gerontology/geriatric, public policy, marketing, community organization, and environmental issues. The Blueprint outlined the following action steps:

- Organizations should identify which strategies they are already addressing or will address and collaborate with other groups that share an interest in those strategies. Organizations should work with existing coalitions and coordinate with other groups and organizations. Participating organizations should also identify and involve other organizations that are not working on this issue but that can play a major supportive role.
- Organizations, associations, and agencies working collaboratively should focus on activities that they can reasonably expect to accomplish.
- Organizations need to undertake detailed tactical planning to delineate the specific actions necessary to achieve the strategies.
- Organizations need to allocate money and people to help support coalition and collaborative efforts.
- Health organizations and government agencies must encourage the exchange and dissemination of best practices. These groups must establish systems to enable this.
- Evaluation should be a key tool in all implementation steps. In some cases, evaluation can be objective, based on measurable objectives. In other cases, evaluation will be a process or formative. (The National Blueprint 2001, 35)

The Blueprint's major goal was to "identify the principal barriers to physical activity participation in older adults and to outline strategies for increasing physical

activity levels throughout the population" (Chodzko-Zajko, 2001).

According to the World Health Organization (WHO), the United Nations, and other prominent organizations that maintain statistics, seniors (ages fifty and over) are the fastest growing population in the world today. Studies show there will be a growth of 223 percent in the older population from 1970 to 2025. At the Second United Nations World Assembly on Aging held in Madrid, Spain, in April 2002, WHO (2002, 6) reported, "In 2025, there will be a total of 1.2 billion people over the age of 60. By 2050 there will be 2 billion with 80 percent of them living in developing countries."

Those eighty years and older are the fastest growing segment of the older population.

Effects of Aging

The effects of normal aging on physical fitness include changes in cardiovascular system, muscle mass, respiratory system, metabolism, and bone mass. Heart size decreases along with stroke volume and maximum heart rate. Heart valves and vessels become more rigid and thick with age. Normal aging also makes our hearts less responsive to the surge of adrenaline that occurs during exertion.

The aging process can cause an increase in cholesterol and blood pressure as well as decreases in oxygen consumption. The lungs decline in their ability to move oxygen to the bloodstream. This affects strength and endurance. By age sixty-five, our aerobic capacity is about 30 to 40 percent smaller than that of young adults.

Muscle mass declines between the ages of thirty and seventy by 22 percent for women and 23 percent for men (Knopf et. al. 1999). Type II muscle fibers that are responsible for high levels of strength decrease. Reduction in muscle mass results in the loss of strength, a decline in basal metabolic rate, muscle and joint flexibility and stability.

As we become older, our metabolism slows down. Older adults need to eat fewer calories (about 100 calories less each decade) to maintain status quo. If we do not, then we risk adding more body fat especially if we are sedentary and do not exercise.

If Jack Nicklaus can win the Masters at 46, I can win the Kentucky Derby at 54. ■ WILLIE SHOEMAKER

Bone mass declines as we age, more so in women than men:

- Women start to lose bone mineral mass during their thirties, and men start in their fifties.
- Women lose about 1 percent bone mass per year until menopause, and then lose 2 to 4 percent thereafter.
- Men lose about 0.5 percent bone mass per year.

Osteoporosis results in bones that have less density and tensile strength. Loss in bone mass leads to weakening of the musculoskeletal system, which in turn can lead to fractures and breaks.

Aging takes its toll on the human body. However, a sixty-year-old may function like a forty-year-old just as a twenty-year-old may function physically like a forty-year-old. The body is remarkable and responds positively to exercise. It is also very good at repairing itself despite the “wear and tear” of aging. A sedentary person will be more susceptible to health problems than will a physically active person.

- *Endurance activities* (such as cycling, walking, running, swimming) increase heart rate and breathing and strengthen the heart, lungs, and circulatory systems.
- *Strength exercises* (such as resistant bands, push ups, lifting light to heavy objects or dumbbells, barbells, or machine weights) strengthen the body overall and allow an older person to do daily tasks with less effort.
- *Balance exercises* (such as one leg stands, toe and heel stands, knee lifts,) help prevent falls that are common among seniors.
- *Flexibility exercises*, commonly known as stretching (with or without a partner), include various body parts that are stretched slowly without bouncing. These exercises improve the body’s overall flexibility and keep the body limber.

Benefits of Exercise on Aging

Exercise and sports for seniors offer a fun way to stay active, physically fit, and meet other older adults with the same interests. Participating in a daily regimen of exercise or sport enriches one’s life in many ways, in-

cluding relieving stress, helping one to relax, and enhancing self-esteem.

Research studies show that older people who are active physically tend to be healthier. Exercise can help prevent or delay some diseases and disabilities, improve one’s mood, enhance one’s lifestyle, and increase one’s life expectancy. With respect to the aging process, many benefits can be derived from participation in regular physical activities, including the following:

- *Cardiovascular System:* Increases the heart’s work capacity, increases aerobic capacity, decreases resting heart rate, decreases total cholesterol, increases HDL (good) cholesterol, and decreases blood pressure.
- *Musculoskeletal System:* Increases muscular strength, muscular endurance, metabolism, lean body mass, joint flexibility, and bone mineral content.
- *Nervous System:* Increases the speed of reaction and movement time; improves response time, visual organization, memory, and mental flexibility.
- *Pulmonary System:* Increases in respiratory function and vital capacity; decreases minute ventilation and respiratory ratio.

Interest in physical activity for older adults has grown tremendously during the past twenty years. Many gyms and rehabilitation and recreation centers have started to tailor their programs to meet the needs of the older population. Some of these programs offer discounts and other motivating factors to get seniors moving physically. Environmentally, governments at all levels are building new parks and trails near areas where there are large populations of seniors to provide opportunities for physical activities in their neighborhoods.

National Senior Games—Senior Olympics

Since the late twentieth century, there has been an explosion in competitive sports for seniors fifty and older. The earliest organized games were the Senior Olympics held in Southern California in 1969. Two hundred athletes over fifty-five years old competed in swimming, diving, and track and field events. This was followed by

pete against each other. More than 250,000 athletes now participate in the National Senior Games–Senior Olympics, which makes it the largest multisport event for seniors in the world.

The Senior Olympics are held every two years in host cities across the United States. The Summer National Senior Games are held in odd-

the National Senior Olympics Organization (NSOO), established in St. Louis, Missouri, in 1985 by a group of seven men and women. The NSOO promotes healthy lifestyles for seniors fifty and older through education, fitness, and sports participation. There is no upper age limit. The NSOO hosted the first national multisport competition in 1987 in St. Louis with 2,500 senior athletes competing in thirteen different sports.

As the organization grew, it became a member of the United States Olympic Committee (USOC) in 1989. Under an agreement with the USOC, the NSOO changed its corporate name to the United States National Senior Sports Organization doing business as the National Senior Games Association (NSGA). The USOC permitted the NSGA to continue to use the word *Olympic* in its signature event: the National Senior Games—Senior Olympics (NSG-SO). The NSGA serves forty-nine states and the District of Columbia. It is a nonprofit community organization staffed by twelve full-time employees and a volunteer board of directors. Originally headquartered in St. Louis, Missouri, the NSGA is currently located in Baton Rouge, Louisiana.

The NSGA sanctions senior games (more than 200) at the local, state, and regional levels. Senior athletes qualify for the national games at the state level in events that are organized in five-year age segments from 50 to 100-plus for men and women. Age-group records for both genders are kept by the NSGA. Rules for men and women are the same, although they do not com-

numbered years, and athletes compete in eighteen different sports. The NSGA anticipates approximately 12,000 senior competitors in the 2005 and 2007 NSG-SO to be held in Pittsburgh, Pennsylvania, and Louisville, Kentucky, respectively.

The Winter National Senior Games are held in even-numbered years, and athletes compete in Alpine skiing, cross country skiing, curling, ice hockey, snowshoeing, and speed skating. The inaugural Winter NSG-SO took place in Lake Placid, New York, in February–March 2000. A total of 239 athletes from twenty-two states competed in five winter sports.

Another first for the NSGA was the Senior Olympic Hockey Championships that took place in Lake Placid in 2002 between twenty-three teams representing nine states. Age divisions are 50+, 60+, and 70+ and are divided into elite- and recreational-skill divisions. The 2004 Senior Olympic Hockey Championships took place 1–4 October in Minneapolis, Minnesota.

The first-ever National Senior Games Championship Festival is slated for late October–early November 2005 in Mobile, Alabama. Approximately 2,250 senior athletes will compete in cycling, golf, sailing, and tennis. This is the first time the NSGA will offer sailing. This championship festival will be an annual event and is open to both men and women fifty years and older.

Successful senior athletes who are world or national record-holders are eligible for induction into the NSGA Senior Athlete Hall of Fame. Senior athletes have been

inducted in the Hall of Fame in several sports (adapted with permission from the NSGA):

- *Bowling*: Helen Duval, 79 (Berkeley, CA), the oldest woman to ever bowl a 300 game at age 65; and Joseph John Norris, 84 (San Diego, CA)
- *Pentathlon*: Melvin C. Bushman, 71 (Lansing, MI)
- *Swimming*: Dorothy Leonard Donnelly, 70 (Rutland, MA); Gustave Harold Langer, 88 (Milford, CT), who has been listed first among all-time best swimmers twenty-four times since 1988; Manuel Sanguily, 62 (Scarborough, NY); Aileen Riggan Soule, 89 (Honolulu, HI), who was the oldest living Olympic gold medalist for springboard diving when she was inducted; and Doris Cant Steadman, 71 (Monmouth Beach, NJ)
- *Tennis*: Dorothy “Dodo” Bundy Cheney, 79 (Santa Monica, CA)
- *Track and field*: Harold Chapson, 94; Helen Mary Darnall, 63 (Melbourne, AR); Clive Davies, 76 (Tillamook, OR); Frank Willard Furniss, 84 (Marion, OH); Sister Marion Irvine, 61 (Napa, CA), who is considered by the record-keepers to be the fastest female distance runner in the world; Payton Jordan, 74 (Los Altos, CA); and Shirley Matson, 55 (Moraga, CA)
- *Ultra-endurance triathlon*: Theodore “Ted” Epstein Jr., 55 (Denver, CO), who completed a grand slam of Ironman triathlons—a quintuple, a quadruple, a triple, and a double—within six months

Huntsman World Senior Games

John H. Morgan founded the World Senior Games (WSG) in 1987 in St. George, Utah, to provide competition for seniors fifty years and older from all over the world. The WSG became the Huntsman WSG (HWSG) in honor of its corporate sponsor, Huntsman Corporation, in 1989. In 2005, senior men and women athletes will compete in twenty-three sports: basketball, bowling, bridge, cowboy shoot, cycling, golf, horseshoes, lawn bowls, mountain biking, pickleball, race walking, racquetball, reining, road races, softball, square

dance, swimming, table tennis, tennis, track and field, triathlon, volleyball, and walking tours. The HWSG is governed by a board of directors, is run by a small staff led by an executive director, and includes a large number of volunteers. Since its inception, the HWSG has grown from 500 senior athletes to more than 7,000 in 2004 from all fifty states and forty-six countries. This annual event prides itself in fostering “health, friendship and world peace” by offering health screenings that include clinical breast exams for women; PSA testing for men; and blood sugar, bone density, cholesterol, glaucoma, hearing, blood pressure, and body compositions testing for men and women.

Alaska International Senior Games

The inaugural Alaska International Senior Games (AISG) took place in Fairbanks, Alaska, in 2003. Founded by Jim Madonna for seniors of all ages and abilities, the AISG differs from other senior games by dividing events into three different categories:

- Novelty games, including basketball toss, Frisbee throw, nail hammering, bean bag toss, miniature golf, softball throw, 100-yard walk, 440-yard walk, blanket toss, and high kick
- Leisure games, including bridge, checkers, chess, cribbage, dominoes, pinochle, and scrabble
- Sports, including archery, bowling, fly casting, racquetball, road races, softball, swimming, and track and field.

The first games had 150 participants, all from the United States. The oldest male was 104 years old, and the oldest female was 96 years old. The AISG’s goal is to establish a board of directors and make the event international.

Masters and Veterans Games

Many sports organizations have established masters and veterans games for senior men and women since the late 1960s. The games are competitive at the international level. Some of these athletes tend to be former Olympians who continue to compete as they grow older.

Senior Sport

A “Fifty-Seven Years New” Phenomenon

The *New York Times* has described Eileen-Philippa (“Phil”) Kersten Raschker (b. 1947) as “the most versatile track and field athlete in the world.” She has set more than two hundred U.S. and world track and field records, currently holds forty-four Masters records, named Outstanding Woman Masters Track and Field Athlete thirteen times, Outstanding Woman Masters Combined Event Athlete eight times (since the inception of this award in 1991), and Outstanding Masters Single Performance Athlete of the Year three times. This phenomenal athlete is only “fifty-seven years new” competes in 100m, 200m, 400m, 800m, high jump, pole vault, long jump, shot put, javelin, discus, triple jump, hurdles, decathlon, heptathlon and pentathlon events in the USA Track and Field and international meets and in the National Senior Games/Senior Olympics.

Born and raised in Hamburg, Germany, Phil competed in gymnastics, swimming and track and field during her youth but gave up sports when she moved to the United States in 1967 at the age of twenty. At thirty-three years old, she began competing again in the 100m, long jump and high jump. Never looking back, she has set world and national records in Masters Track and Field and Senior Olympics. Among her notable “firsts” are: first female masters athlete over 40 to compete in the U.S. Olympic trials, in the triple jump in 1988; first masters athlete to compete in the open women’s pole vault competition in 1995 at age forty-seven (Phil placed third and represented the United States at the world competition in England where she was the oldest female athlete to represent the United States in international open competition); she is also the oldest athlete to be recruited for a college track and field scholarship (at fifty years old). In 2004, Phil became the oldest athlete in the seventy-three-year history of the Amateur Athletic Union (AAU) Sullivan Award to be nominated for this prestigious award and one of five finalists that included

basketball standout LeBron James, Olympic speed-skater Apolo Anton Ohno, Olympic swimmer Michael Phelps, and college national basketball champion Diana Taurasi.

Phil, an accountant residing in Marietta, Georgia, is motivated by her intense competitive spirit and desire for fitness and health. A humble individual with a wonderful sense of humor, she enjoys being an ambassador for senior sport. In being named as one of the five finalists of the 2004 Sullivan Award, Phil shared the recognition with “all the aging athletes out there, the ones who dare to keep testing the limits of their abilities and who DARE to stop time from robbing them of the pure joy of competing. Dreams really do come true! Proof is that I am not just a masters athlete but an athlete regardless of age.”

During the 2003 competitive season, Phil set seven world and nine U.S. records in the pentathlon, heptathlon, 60m, 200m, 400m, high jump, pole vault and long jump. She won five gold medals at the World Masters Championships in Carolina, Puerto Rico; seven gold medals at the National Masters Outdoor Track and Field Championships in Eugene, Oregon and five gold medals at the Nationals Senior Olympics in Hampton Roads, Virginia. She stars in *Racing Against the Clock* (2004), a documentary film about five women track and field athletes, ages fifty to eighty-two, who compete in masters track and field meets around the world. The National Senior Games Association inducted her into its Senior Athlete Hall of Fame during the 2005 Senior Olympics.

Phil believes that by lacing up her shoes, competing and setting records, she is breaking barriers for masters and female athletes and encouraging participation in athletics by people of all ages. She provides inspiration just by toeing the starting line for master and senior athletes.

Growing numbers of baby boomers turning fifty years old are competing in these games in record numbers.

Track and field was one of the first sports to offer masters-level competition at the first National Track and Field Championship in San Diego, California, in 1968 and the inaugural World Masters Track and Field Championship in Toronto, Canada, in 1975. Other masters sporting organizations include the following:

- United States Masters Swimming (formed in 1971)
- Masters Diving
- Masters Skier
- World Masters Weightlifting
- World Masters Softball
- Masters Basketball
- Seniors Hockey
- USA Cycling
- US Tennis Association (USTA)
- International Volleyball
- Senior Golf

World Masters Games

The International Masters Games Association (IMGA) was established in 1995 from International Federations members to be the governing body of the World Masters Games (WMG). The IMGA mission is to “promote lifelong competition, friendship and understanding between mature sports people regardless of age, gender, race, religion or sport status” through the WMG. The minimum age to participate in these games is thirty but this is only a guideline. Different international sports governing bodies may permit participants as young as twenty-seven. There are no qualifying standards even though many of these masters’ events are very competitive. Mature athletes of all abilities participate in these games. Age group records are kept for each sport. All athletes participate for themselves because there are no national teams. For team sports, athletes are permitted to form multinational teams comprising several countries. Several teams from a single country are also permitted. The WMG began in 1985 in Toronto, Canada and are held every four years. After the 1989 WMG in

Denmark, the IMGA changed the event to be held in even-number years (1994 in Brisbane, Australia). The IMGA decided to return the WMG to its original odd-numbered year schedule in 2005 (Edmonton, Canada) to avoid conflicts with other major games.

The first WMG had 8,305 participants competing in twenty-two sports from sixty-one countries. The 2002 WMG in Melbourne, Australia, set a record of 24,886 participants competing in twenty-six sports from ninety-eight countries. Edmonton, Canada, will host the 2005 WMG, then the event will return to Australia for 2009 in Sydney. These games are the largest international multisport competition in the world.

National Veterans Golden Age Games

The National Veterans Golden Age Games (NVGAG) is a national multi-event sports recreational competition for military veterans fifty-five years and older who receive health care at Veterans Administration (VA) medical centers. The first NVGAG were held in Albany, Georgia, in 1985 with 115 participants. This annual event continues to grow as aging Vietnam veterans continue to enter the games. The Department of Veterans Affairs, Veterans of Foreign Wars, and Veterans of Cañteen Services sponsor this event to promote physical activity and support the VA’s rehabilitation programs. There are thirty-four competitive events and categories with six age categories (55–59, 60–64, 65–69, 70–74, 75–79, and 80+) in three different divisions (open, wheelchair, and visually impaired):

- The open division offers bowling, checkers, cycling, dominoes, golf, horseshoes, nine-ball, pentathlon, shuffleboard, swimming, and table tennis.
- The wheelchair division includes bowling, horseshoes, nine-ball, pentathlon, shuffleboard, swimming, and table tennis.
- The visually impaired division offers shuffleboard, horseshoes, and bowling.

The NVGAG is considered a model adaptive therapeutic sports competition.

Significance

As the world's population becomes older, seniors fifty and older are more health conscious and active than ever before. Masters and senior sporting events are growing in record numbers. Seniors are defying the stereotypes of aging and breaking records along the way. Exercise and sports for the mature population are prolonging life expectancy, decreasing disease and disability, relieving stress and anxiety, increasing functional ability, enhancing socialization, increasing and maintaining independence, and improving the overall quality of life.

Sepak Takraw

Some people have called *sepak takraw* “the international ball game of Southeast Asia.” *Sepak takraw* is a team sport that people play with a rattan or, increasingly, plastic ball. Players are prohibited from touching the ball with their hands.

History

The origins of *sepak takraw* are obscure. People played *kemari*, a sport similar to *sepak takraw*, in Japan from perhaps the seventh century. People also played a similar sport in southwest China in what is now Yunnan Province. However, the sport came into its own in Southeast Asia. All Southeast Asian countries where people play *sepak takraw* offer “national origin” myths for the creation of the sport, but none of them offers proof that *sepak takraw* had only one place of origin.

Evidence of sports similar to *sepak takraw* dates from the eleventh century, particularly in Malaysia and

Sumatra. These sports were apparently much like the sport of *sepak raga* (kickball) and were played in royal courts. Indeed, some connection between aristocracy and *sepak takraw* seems clear, but this fact could be only a reflection of the fact that only royal records provide surviving accounts of earlier times. However, if *sepak takraw* was not exclusively a sport of the royal classes, they at least played it seriously. For instance, a record of the Malay rajahs (princes) claimed that an heir to the sultanhip of Melaka was insulted when a player knocked off his royal headgear and that the hapless offender was executed. The same record described Sultan Mansur as kicking the ball more than one hundred times before passing it on to the young nobles with whom he played *sepak raga*, kicking the ball for as long as it would take to cook “many pots of rice.”

The ball that players use in *sepak takraw* and related sports is traditionally woven of rattan—a tough vegetable material from the climbing palm creeper of the genus *Calamus*. This fact, although it does not pinpoint any particular place of origin, may indicate that the sport is ancient. Rattan, used throughout the region to make everything from baskets to huts, was central to ancient Southeast Asian technology.

Although rattan generally disappears quickly from the archaeological record—as does all vegetable material—traces of woven hexagonal patterns in ceramics indicate that rattan was used from neolithic (relating to the latest period of the Stone Age) times. Thus, although no direct evidence for the deep antiquity of *sepak takraw* exists, the traditional rattan construction of the ball—in either hexagonal or pentagonal patterns—shows that the sport may be old indeed. Unfortunately, none of this evidence helps to pinpoint a specific place of origin for *sepak takraw*. *Sepak takraw*-like sports may have had a variety of origins, and certainly the several versions of *sepak takraw* may indicate multiple origins.

Versions

In hoop *takraw*, which is popular in Thailand, three large hoops are suspended over a circular court 16 meters in diameter, and players put the ball through the

hoops as many times as possible. The hoops, each with a radius of 20 centimeters, are made of wood, metal, or rattan and suspended from a high, tight rope so that the bottom of the hoops are 6 meters off the ground. Members of the team, usually seven, are cooperative, attempting to keep the ball “alive”—off the ground—and flying through the hoops as often as possible during a thirty-minute period.

Style counts in hoop *takraw*: Simple shots score lower, and difficult shots score higher. For example, a plain kick through a hoop is the most humble approach and thus a low scorer, whereas firing the ball off the elbow, knee, or shoulder scores higher. Naturally the fanciest shots score the most. The top-scoring shot is executed as a player stands facing away from a hoop, feet together, then jumps up, executing a tandem back-kick and directing the ball upward through a loop formed by his arms—joined at the fingers behind his back—and finally through the suspended hoop.

Hoop *takraw* was developed in Thailand during the late 1920s. People apparently played early versions with hoops of different sizes, with shots being scored differently depending on which hoop they went through.

Another Thai version is flag *takraw*, which requires a player to move as quickly as possible along a narrow track 50 meters in length while keeping the ball aloft through kicks of the foot and jerks of the head and elbows. The sport, often played at village festivals, is won by the player who reaches the end of the track without either dropping the ball or veering off the track.

People play *sepak raga*, the traditional Malay sport, on a six- or seven-man team. Men form a circle 15 meters in diameter and kick or head the ball to one another in a continuous round, the goal being to keep the ball from touching the ground. As in all versions of *sepak takraw*, elbows, feet, knees, shoulders, and head—all body parts except the hands and forearms—can be used. The winning team is the team that keeps the ball aloft for the required period of time—usually about thirty minutes—with the most kicks.

In-carrying *takraw* requires a single player to catch and carry as many balls as possible without using his hands.

This version, which seems more a form of juggling, requires the player to be ingenious about holding onto the caught balls: He may hold them with his teeth or under an arm. Twelve balls are the standard goal, but expert players have caught and held as many as seventeen.

Sepak takraw, one version of which is sometimes called “net *takraw*,” is the version that has achieved the highest international status, being played by amateur and semiprofessional teams throughout Southeast Asia. People play *sepak takraw* on a rectangular court that measures 13.4 by 6.1 meters. The court is divided by a centerline at either end of which is marked a half-circle with a radius of 0.9 meters. Across the centerline is stretched a net that is 1.52 meters from the ground. In each half-court a service circle is drawn, the center of which is 2.45 meters from the back line and 3.04 meters from either side.

Play

The most important physical skills in *sepak takraw* are used in the striking movements. Team skills, however, are also important. Players compare the required teamwork to that required of the best volleyball or soccer (association football) teams.

The sport is played between two teams—called “*regus*”—of three players each. Each team enters three *regus* during a formal competition, and the winning team is the one that hosts two out of three winning *regus*. A *regu* wins the set with fifteen points. As in volleyball, each team is entitled to hit the ball three times before sending it across the net, but the three hits can come from the same player. Points are won or lost when the ball touches the ground in or out of the court or does not cross the net after being played three times by the offensive *regu*.

A game of *sepak takraw* begins when the ball is thrown by either the left inside or right inside player, standing in one of the quarter-circles at either end of the service line, to the back player. The back player, who stands with one foot inside and one foot outside of the serving circle, must kick the ball across the net. As soon as this service has taken place and the ball has crossed

the net, all players are allowed to move about anywhere in their respective half-courts.

Faults during service can be called against the serving side for a number of reasons, including moving out of the quarter-circle or serving circle before play or delaying when throwing the ball to the back for service. During play faults include crossing either over or under the net with any part of the body, stepping on the center line, holding the ball in any way—under the arm, for example, or between the legs—and touching the ball with a hand. Faults committed during play result in a point being awarded to the opposing *regu*.

The net used in *sepak takraw* was introduced during the 1920s, and in general for many years the sport was played according to various local rules. In fact, some people for a time thought that no form of *sepak takraw* would survive to compete with the Western sports that were being exported to all parts of Asia. However, in Singapore before World War II, the main Malay form of *sepak takraw* was included in high school variety programs, and after the war the Singapore National Body of Sepak Takraw (PARSES) was formed. PARSES, with emerging *sepak takraw* organizations in Malaysia and Thailand, agreed in 1965 on a uniform set of regulations and on the term “*sepak takraw*.” These agreements were the result of negotiations that began in 1958 during the third Asian Games in Tokyo, where representatives from Thailand invited officials from Burma, Malaya (Malaysia), and Laos to consider the benefits of holding small regional events. These events, held more frequently than the Asian Games or the Olympics, would let athletes hone their skills for the more global competitions and would advance regional cultural interaction. They would also let interested countries pursue “traditional” sports—such as *sepak takraw*—that were virtually unknown in sports networks oriented to Western and Olympic standards.

The result of regional negotiations was the formation of the Southeast Asian Games Federation, which sponsors competitive events such as the Southeast Asian Games in Bangkok, Thailand, in 1965, the first to feature what one could call “world class” *sepak takraw*.

Since the mid-1960s *sepak takraw* has been a major competitive international sport in Southeast Asia.

Wider acceptance of *sepak takraw* outside of Southeast Asia has been slow but steady. The Asian Sepak Takraw Federation (ASTAF) proposed in 1967 that the sport be included in the Asian Games, and it was but only as an exhibition sport. In 1984 ASTAF proposed that *sepak takraw* be accepted as a regular competition but was rebuffed.

In 1988 ASTAF reorganized itself as the International Sepak-Takraw Federation (ISTAF) and began to campaign more vigorously for wider global acceptance of *sepak takraw*. This acceptance occurred in 1990 when *sepak takraw* was included in the eleventh Asian Games in Beijing, China. Clearly this inclusion was facilitated by the Asian Games' Chinese hosts, who displayed their confidence in the international future of *sepak takraw* by supporting nineteen teams of their own and sending Chinese *sepak takraw* players to train in Malaysia and Singapore.

In 2003 seventeen countries participated in the eighteenth King's Cup Sepak Takraw World Championship in Thailand. Thailand won the men's team event and the women's team event; Malaysia won the men's *regu* event, division 1; South Korea won division 2; Brazil won division 3. Thailand won the women's *regu* event, divisions 1 and 2. Thailand also won the men's and women's circle event.

The Future

Internationalization brings standardization, and, if *sepak takraw* continues to grow in popularity, the hand-woven rattan ball—one of the sport's most distinctive features—may become a relic. Unfortunately, the ball varies considerably in circumference and weight and is difficult to produce even within the flexible official guidelines—40 to 42.5 centimeters in circumference and 160 to 180 grams in weight. Trivial though such variations may seem, they are a challenge to the replicable criteria that increasingly govern modern sports. Not surprisingly, a company in Singapore now manufactures absolutely standard *sepak takraw* balls. They

are woven in the traditional pattern but of precisely milled plastic strips and not of rattan. The Thais are already playing competitively with such balls, and the acceptance of plastic seems inevitable.

With the traditional rattan ball on its way to the museum, with international rules and established venues, *sepak takraw* seems established as an international sport. Longtime popularity in Southeast Asia and more recently in China ensures its survival as a major competitive sport. Whether it can move beyond its present level of popularity will depend more on commercial considerations and communications than on purely sporting values.

Sex and Performance

People have debated the impact of sex (defined in published studies as heterosexual intercourse) on athletic performance for the past two thousand years. Writer Jeff Merron notes that the Roman historian Pliny the Elder tackled the issue in 77 CE. Pliny said, "Athletes when sluggish are revitalized by love-making, and the voice is restored from being gruff and husky." The late New York Yankees manager Casey Stengel reportedly said, "The trouble is not that players have sex the night before a game. It's that they stay out all night looking for it." Several famous athletes claimed to abstain from sex for days or weeks before a race or other athletic event. The great U.S. miler Marty Liquori thought abstinence the best policy. "Sex makes you happy," he said, "and happy people don't run a 3:47 mile." Lynn

Jennings, 1993 U.S. 10-kilometer title winner, said, “I found that sex the night before solidifies my core feeling of happiness” and helped her win.

Testimonials aside, does any scientific evidence support either side of this debate? Researchers Boone and Gilmore studied the impact of sexual intercourse twelve hours prior to a treadmill exercise test to measure physical performance with a group of eleven sedentary men. The results from the test indicated that sexual intercourse had no impact on test results: Sexual intercourse did not diminish performance.

Researchers Anderson, Wei, and Shyu studied the relationship between sexual activity and four other health measures on the marathon running performance of sixty-one men and fourteen women whose ages ranged from seventeen to sixty-five. On average the subjects were forty-one years old, had been running regularly for twelve years, and had run an average of fifteen previous events. Results showed that marathon runners’ sexual activity was not related to their relative running performance. Those who slept more and took in more calories, compared with the amount they slept and the calories they consumed in previous events, performed better in the marathon, compared with their performance in previous events. Drinking alcohol and smoking cigarettes were not related to self-reported running success.

Writing for the *Western Gazette*, David Lee noted that Dr. Earl Noble, a professor in the faculty of health sciences, believes no link exists between sex and decreased athletic performance. Although Noble stated that the research he was aware of was far from conclusive, he believes it points in the right direction. “Personally, I believe that anytime you start disrupting normal behavior, you’re going to start having negative effects in whatever you do, be it academics or athletics. Whatever you’re accustomed to is what you should do” (Lee 2004).

In 1999 Italian scientists found that testosterone levels in men increased as sexual activity increased. These data could suggest that a rendezvous in the bedroom might lead to higher rates of aggression the next day—and enhance athletic performance.

With little scientific evidence and conflicting opinions offered by coaches, pundits, and athletes themselves, how do athletes behave while competing? According to a report by Paul Hochman, at the 1992 winter Olympics at Albertville, France, condom machines in the athletes’ village had to be refilled every two hours. At the Olympics in Sydney, Australia, in 2000 the organizers’ original order of seventy thousand condoms went so fast that they had to order twenty thousand more. Even with the replenishment, the supply was exhausted three days before the end of the competition schedule. This anecdotal evidence does not mean that all the condoms were used for sex or that only athletes used them, but it may help us frame future research.

In conclusion, James stated that despite the fact that sexual abstinence before an athletic event has been advocated by crusty football coaches, Olympic athletes, and even U.S. boxer Muhammad Ali in his prime, no one really knows how the practice got started or whether it is in an athlete’s best interest. Depending on the athlete’s frame of mind, the little scientific evidence available supports the notion that it couldn’t hurt and it might help. In view of the lack of scientific evidence on the subject and the conflicting testimonials, athletes these days seem confused about having sex the night before an athletic contest. Although the commonly believed benefits of sexual abstinence have a long tradition, the little scientific evidence available and the majority opinion among athletes, coaches, and physicians now are that sex has little or no effect on athletic performance. The psychosocial reality is that every athlete should do what works for him or her. To discover what works may take some experimentation and a willing partner.

Sexual Harassment

Sport symbolizes courage, fairness, and morality, but coaches' sexual relations with their athletes diminish this image. Together, the existing literature on sexual harassment in sports; empirical data from studies of sports clubs, coaches, and athletes; and case material from court cases illustrate the complexities and controversies involved, the various stages of the boundary erosion process, and the relevant risk factors. There are, however, prevention strategies that can be adopted to help prevent sexual harassment and abuse of athletes by their peers, coaches, or other authorities.

Most athletes are able to pursue their sporting aspirations with the positive feedback and support in their sporting environment, but others may experience various forms of sexual harassment and abuse (also named *sexual exploitation* as a collective term) such as initiation rituals, sexist jokes, and sexualized language, or unwanted touching, groping, or intercourse—either from peer athletes, coaches, or other sports authorities. Besides devastating sport careers, coaches' sexual harassment and abuse is a degrading and painful reality in the lives of too many athletes—male and female, child and adolescents. The coach-athlete relationship is an asymmetric power relation based on trust that—if not carefully administered—may easily lead to emotional or physical exploitation. Research and clinical practice outside sports demonstrate that sexual abuse is neither accidental nor spontaneous, even though perpetrators often claim this to be the case. There are always precursors to the abuse, with distinct stages of

deliberate planning, grooming, and execution. Within sports, the scenario is often the same: a conscious grooming of the family and victim to gain their complete trust. The overlapping stages of selection, building confidence, seduction, and abuse are known as the boundary erosion process. Some of the most relevant and important questions about sexual harassment and abuse are the following:

- How and why do coaches do it, and why doesn't anyone see or do anything to prevent it from happening?
- What is the prevalence of sexual harassment and abuse in sports?
- Which risk factors predominate in detecting harassment and abuse?
- What choices and narrative components cause coaches to enter the path of deviant behavior?

What Is Sexual Coach Behavior?

When speaking of sexual relations between a coach and an athlete, some of the most commonly used terms are *sexual harassment*, *sexual abuse*, *sexual molestation*, *sexual misconduct*, and *abuse of trust*. Within this article, *sexual exploitation* is used as collective term for both sexual harassment and abuse. Though often used synonymously and closely related, *sexual harassment* and *sexual abuse* are two different things with separate definitions.

SEXUAL HARASSMENT

Sexual harassment is often referred to as forms of unwanted attention such as sexually oriented comments, jokes, or bullying based on sex, whereas *sexual abuse* is mainly associated with forced or coerced physical intimacy. The Australian Sports Commission (1988) defines sexual harassment as “behaviour that has a sexual element, that is unwelcome and that could reasonably be expected, in the circumstances in which it occurs, to offend, humiliate or intimidate the person or people at whom it is directed.”

According to the Women Sport International Task Force (1998), sexual harassment may include the following:

Written or verbal abuses or threats; sexually oriented comments; jokes, lewd comments or sexual innuendoes; taunts about body, dress, marital status or sexuality; shouting and/or bullying; ridiculing or undermining of performance or self-respect; sexual or homophobic graffiti; practical jokes based on sex; intimidating sexual remarks; invitations or familiarity; domination of meetings, training sessions or equipment; condescending or patronizing behaviour; physical contact, fondling, pinching or kissing; sex-related vandalism; offensive phone calls or photos; bullying on the basis of sex.

Sexual harassment is against the law, and it conflicts with the United Nations declaration on human rights and equal opportunity acts. In most countries, sexual harassment is criminalized by laws regarding sexual indecency or equal opportunity.

SEXUAL ABUSE

Sexual abuse may be defined as an exchange of rewards or privileges for sexual favors, groping, indecent exposure, rape, or anal or vaginal penetration by penis, fingers, or objects. Summarizing the literature on abuse definitions, Riley points out, "In sexual abuse, the abuser is an adult or adolescent who uses the child for a sexual act to satisfy his need for power, bravado, tenderness and contact as well as his erotic desires to the detriment of the child. The child victim is sexually aroused or drawn into a sexual act, the meaning of which she (/he) does not completely understand, and in which is inappropriate for her age, her emotional development and her role within the family" (1991, 17). Sexual abuse violates criminal laws universally.

Sexual Exploitation Continuum

The British sport sociologist Celia Brackenridge has placed the various forms of sexual coach behaviors—such as discrimination, harassment, assault, and rape—within a continuum of sexual exploitation, with mild and severe types of sexual exploitation at the ends of the continuum. The individual may experience the behavior as exploitative, though not criminalized by law.

Such behavior may be construed to belong to a grey zone area, where the experienced behavior is highly dependent on context and individual interpretation. According to these definitions of harassment and abuse, a single accidental touch of an athlete's arm, though unwanted, would not constitute sexual harassment. Many sport clubs do not have ethical guidelines or codes of conduct, so this may be considered as a grey area. Athlete-coach relations when athletes are older than the legal age of consent form another grey area.

The legal threshold, however, defines the boundary of the laws regarding anything from sexual indecency to forced genital acts and rape. Although some athletes may feel hurt, wounded, or even abused long before the legal threshold, the opposite may also be the case—some athletes either put up with or accept behavior that is far beyond the legal threshold. Empirical data from a case study of 189 police reports validates this notion by showing that most sport-related sexual abuse cases are only detected and unfold years after the actual abuse. The typical pattern shows that old cases are regularly identified in relation to more recent abuse allegations. Research shows that some athletes, though admitting being abused, do not file a police report and avoid the emotional turmoil of going through a court process. These results illustrate that only a fraction of cases may lead to court convictions and that the problem of sexual harassment and abuse may be heavily underreported.

Myths and Taboos

The phenomenon of sexual exploitation is shrouded in myths and taboos because it includes elements of private sexuality and types of perverse behavior. Sexual harassment and abuse is generally associated with physical force, threats, and the use of force, but the contradictory reality shows that most cases of sexual harassment and abuse happen after careful grooming, where the athlete is seduced or lured into believing that sexual involvement with the coach is acceptable, unavoidable, or a normal part of training or everyday behavior. When voluntary leaders or coaches who are thought to be

representing a morally strong activity are accused of “molesting” a child, the most common reaction is disbelief or denial. The reactions to sexual exploitation often vary between extreme disbelief and the urge to punish the abuser. We want to believe that we are able to read people around us; subsequently, people ignore the fact that the abuse can happen to their children and that the abuser can be someone they admire and trust. This has to do with the way we perceive our surroundings and the cultural status of coaches and sports more generally.

Response of Sports Organizations to Harassment and Abuse

During the past fifteen to twenty years, sports organizations around the world, including the International Olympic Committee, have gone through various stages of denial, subsequently causing sports to lag behind other public organizations in defining inappropriate behavior and developing child-protection policies. Initially, sports organizations have tried to deal with cases of sexual harassment and abuse as separate or “one-off cases,” rather than recognizing that sexual harassment and abuse arise from problematic power and gender relations. Why do some coaches make it their mandate to become *the* authority on everything for the athlete such as diet, weight, dress, and social behavior? In her book *Spoilsports*, Brackenridge points out, “In considering the social process by which athletes come to be exploited sexually, and how authority figures like coaches come to assume dominance and control over athletes, it is clear that these expressions of agency arise from long-term, collective, socio-cultural influences” (2001, 127). These collective, sociocultural influences are closely connected to the implicit values of sports, such as the following:

- Sports should be a carefree meeting place between adults and children with no or few restrictions.
- Being a volunteer in sports is a quality in itself, regardless of past qualifications.

- The fear of interfering with and regulating intimacy in sports is rooted in the understanding of sport as a morally sound and apolitical institution.

Previous Research

Intrafamilial sexual abuse was established as a social problem as early as 1962, and literature on sexual harassment in the workplace and in educational settings started appearing in the early 1970s, but sexual abuse in sports was not discovered and described by academia until 1986. Since then, sport researchers have documented the problem of sexual exploitation in Canada, the United States, Great Britain, Norway, Holland, Germany, and Denmark.

Currently, there are no reliable statistics or prevalence figures on sexual harassment and abuse cases, but apparently sexual harassment and abuse is a relevant issue in all sports disciplines—in individual as well as team sports, and from beginner’s level in recreational sports to the highest elite level. Based on the existing prevalence data, researchers are suggesting that between 2 and 22 percent of athletes experience severe forms of sexual abuse some time in their sporting careers. However, a Norwegian survey by Fasting, Brackenridge, and Sundgot-Borgen (2000) indicates that the risk of harassment and abuse in sports is not significantly higher than outside sports. In sports, bodily domain boundaries are often broken down, so it is likely that athletes become more tolerant toward intimate behavior than are people who are not involved in sports.

Empirical data about the incidence of sexual abuse are difficult to collect and, because of heavy reporting, mostly unreliable. Adding to the methodological complexity are issues such as securing confidentiality for all involved informants and dealing with the problems of revelation and fear of reprisal. Furthermore, reliability and validity are flawed by differences in definitions of abuse, the source of reports, the purpose of the studies, ethics, and consent and sampling techniques. Several qualitative approaches based on interviews and smaller case studies have tried to explore important aspects

*If you are prepared, you will be confident,
and will do the job.* ■ TOM LANDRY

such as risk factors, abuse dynamics, and the personal experiences of both coaches and athletes from being involved in sexual coach-athlete relationships.

What Triggers Sexual Harassment and Abuse in Sports?

In search of an explanatory model of what triggers sexual harassment and abuse in sport, Brackenridge has introduced the contingency theory. Adding to existing abuse theories by Finkelhor (1984), the contingency theory identifies three key factors of importance:

1. *Coach inclination:* The risk is related to the coach's motivation to engage in a sexual relationship based on emotional congruence, sexual arousal, blockage, and disinhibition.
2. *Sports opportunity:* The risk is related to the normative cultures of sports and to constitutive structures.
3. *Athlete vulnerability:* The risk is related to the susceptibility of the athlete and coping with emotional pressure or sexual advances.

Who's at Risk and Who Is the Abuser?

The existing literature on child abuse suggests that one in four girls and one in nine boys will experience sexual abuse before the age of eighteen. Much of the literature on harassment and abuse in sports also suggests that these figures could apply in sports, particularly with adolescent athletes. Most existing literature has focused on competitive sports and male coach-female athlete relationships, and very little attention has been granted to recreational sports and homosexual relations or to the relations between male coaches and male athletes.

Results from a recent case study of 189 police reports (Toftegaard Nielsen, 2004), however, show that 63 percent of the abused athletes were boys compared with 37 percent girls. The average age of the abused children was found to be twelve years with a low of six years and a high of seventeen years. Even though most perpetrators target lonely children with low self-esteem, weak social

contact, poor family bonding, or who generally seek physical or emotional attention, well functioning children and adolescents may also be drawn into a sexual relationship with the coach. These characteristics appear to be more outspoken for heterosexual relationships, where coaches typically claim that the relationship is equivalent to any other romantic love affair based on mutual respect and understanding. Furthermore, the rationale used by coaches under such circumstances could also include a strategy of blaming the athletes for being flirtatious, taking initiative, or appearing to be older or more mature than their peers. According to the Danish researchers, approximately 20 to 25 percent of cases fell into the category of hebephile relationships—where coaches were sexually intimate with athletes older than the age of puberty. Conversely, 75 to 80 percent can be defined as pedophilia—where the coaches had been sexually intimate with children under the stage of puberty.

In more than 99 percent of the existing abuse cases, perpetrators have been male. This does not mean that female coaches will not engage in forbidden zone intimacy, but there have been very few allegations and no convictions of female coaches. The existing case material indicates that 69 percent of the abusers are between twenty-five and thirty-seven years old. The average age is thirty-five, with a low of twenty and a high of seventy years. Drawing on the police interrogation material of the perpetrators, very little evidence indicates that these men have gone into sports solely to be sexually involved with children or adolescents. For some coaches, sexual misconduct may develop as the result of a reach and retreat process—in which the coach learns how to use power, position, trust, and persuasion as tools to overcome the athlete's resistance. Empirical knowledge about risk factors and developmental stages is still rather scarce and needs further validation.

Context: Grooming of Athletes and Their Environments

The relationship between a coach and an athlete may develop into an intimate relationship because of a

Table 1.

	Indirectly instruction-related	Training outside normal hours, at unfamiliar training settings, driving to and from training, competition, etc., injury treatment, massage.

common interest and the strong commitment of both coach and athlete. Within the first phase of the relationship, the building of confidence is founded on various forms of instruction-related behavior such as giving feedback on technique, tactics, assisting on landings (gymnastics), or getting seated (horse riding). While making the athlete feeling comfortable through games and having fun, the coach will have an opportunity to spot the athlete's level of self-esteem and his or her strengths and weaknesses. Whether at a conscious level or not, the perpetrator will chose his victim carefully, and within weeks, months, or years, subtly initiate more and more ambiguous behavior. The coach may start spending more time with a particular athlete, giving extra positive feedback, telling the athlete that he or she has special talents, and encouraging the athlete to consult the coach on personal matters. Because the sport is so important, the athlete may idolize the coach and present him in a very positive light, thereby legitimizing spending more and more time doing sports. For the coach, however, this may be the first stage in isolating the athlete by setting up difficult training regimes and demanding that the athlete put the sport before family and friends. If parents start complaining about this, the coach may tell the athlete that this is normal and that parents cannot understand what it takes to become a winner. The coach may also try to isolate the athlete from friends in or outside sports, by telling lies about teammate conspiracies or asking the athlete to keep their special friendship as a secret.

Once the coach has selected and isolated the athlete, the overlapping stages of seduction and abuse may

progress. Empirical data show that this boundary erosion process often follows the same pattern (see Table 1):

- From group-oriented to personal-focused behavior
- From verbal to physical behavior
- From instruction-related to non-instruction-related behavior

The climax stage of the relationship depends highly on the maturity and strength of the athlete and the persistence and sexual preferences of the coach. Most pedophiles prefer boys younger than eleven to twelve years old and may have several parallel relations at the same time, where most hebephile abusers seem to prefer girls older than twelve to thirteen years of age. Sexual abuse can happen in seconds or last for years. In 60 percent of cases, the athletes are subjected to the coach's sexual behavior for between three and six months, and in 13 percent of cases for four to five years or longer. Many athletes who have experienced the consequences of losing access to a sporting environment, losing privileges, or being socially isolated have also experienced the revictimization of the coach. In most cases, athletes have been able to terminate the sexual relations by moving, becoming injured or sick, or simply standing up to the coach.

Personal Experiences of Athletes and Coaches

The voices of both athletes and coaches are extremely important for understanding the complex structures of the coach-athlete relationship and for identifying effective prevention measures. Athletes who have not been in a sexual coach-athlete relationship generally

have a wide tolerance toward instruction-related intimacy, whereas athletes who have come out of abusive relationships show little tolerance toward physical intimacy in sports. The following quotation from an abused athlete sums up some of the consequences and contradictory emotions after an abusive relationship:

It strikes me how strange it is that one can look so good and feel so miserable inside. I was filled up with pain. It is only just now seeping out, sometimes while I'm lying down crying, quietly or hysterically, kicking into the wall or writing about how cruel he was to destroy me this way. Now I consult a psychologist. I feel pain in my stomach and a knot in my chest. I wonder why I time upon time went along with it and even begged for it, when so many resources inside of me were trying to fight it.

Generally, coaches seem to have more liberal attitudes toward non-instruction-related behavior such as touching and hugging an athlete, flirting, or being in an intimate coach-athlete relationship, particularly when athletes are older than the legal age of consent. The results of a questionnaire among 275 Danish elite youth coaches showed that 30 percent thought it was “yes—definitely acceptable,” 36 percent thought it was “yes—possibly acceptable” to engage in an intimate relationship with an athlete older than the age of consent, and 5 percent admitted doing so. Two percent admitted having an intimate relationship with an athlete less than fifteen years old (Toftgaard Nielsen 2001). Police records show that nine of ten convicted coaches initially denied the sexual abuse charges. It is difficult to obtain an objective version of what has happened if we only listen to one side of the story. Police interrogations with coaches do not represent an objective truth because stories and statements are collected for specific legal purposes. However, the inconsistencies between the statements made by coaches and those made by athletes illustrate that the perpetrating coaches seek instruction-related explanations for their criminal behavior and that coaches rarely feel responsible for the development of the case. Apparently, few coaches have entered sport for the reason of perpetrating; moreover, coaches likely

shape their narratives to fit as they continue inappropriate behavior.

Preventing Sexual Harassment and Abuse

Besides being fun, sports should provide important opportunities for personal achievement and development. Children and adolescents are often encouraged to join sports to improve their self-confidence and physical strength, and most athletes enjoy sports for their competitive, social, or physical aspects. Although not every intimate relationship between a coach and an athlete is based on an abuse of power by the coach, such relations are a danger area where consequences can be harmful to both the sport and themselves. From an ethical perspective, coaches should observe the professional responsibilities of being authority figures and act respectfully toward their athletes—regardless of age. However novel and obvious this may seem to most coaches, the problem of prevention work is how to direct information and secure compliance among those who become emotionally and sexually involved with their athletes. Several approaches with varying success have been used to prevent sexual abuse in sports:

- In general, those who are in favor of more regulation claim that requiring a coach's license or a compulsory criminal background check will send an important message and keep perpetrators out of sports.
- Another approach is to make information campaigns about the potential problem of harassment and simultaneously reward democratic leadership and safe sports environments. Even though very little is known about the effect of prevention campaigns, the lack of evidence about their effect cannot be used as an excuse for not doing anything.

At the organizational level, it is important to facilitate an antiharassment policy and develop a complaints procedure to deal with breaches of the policy. To be effective, these must be combined with an information and education campaign for all participants in the organization. An antiharassment policy should include a

statement declaring that the sports organization is committed to providing

- A work that effectively will deal with the problem
- An outline of the organization's objectives and strategies regarding harassment
- Clear definitions of to whom and under what circumstances the organization guidelines will apply

Individual athletes may find it difficult to talk about bullying, sexual harassment, or sexual abuse and even more difficult to stop the exploitation. Before the behavior gets too far, however, an athlete should tell the coach that he or she has crossed the athlete's boundaries and simply ask the coach to stop doing it. If athletes are not comfortable doing this in person, then they should write it down, send it, and keep a copy of the letter as documentation. Athletes must also be willing to let other people see that there is a problem. Athletes who feel insecure, or fear that they may be misinterpreting something, should seek information. The more an athlete knows, the better the athlete will be able to understand the experiences—whether they are harmless or cases of harassment or abuse. Other actions athletes can take to deal with possible abuse or harassment are the following:

- Talk to a trusted adult or call a telephone hotline. Athletes should be told to provide an example of the behavior that they find unpleasant and tell how they feel and think about it. This may help them listen to themselves—athletes should not ignore their physical or psychological reactions.
- Seek professional help if the athlete continues to feel anxious, is unable to sleep, has eating disorders, or feels depressed.
- File complaints with the board of the sports club. If any legal boundaries have been crossed, the athlete may want to report it to the police. A court case does not guarantee that the abuser will be convicted, but this will likely deter the coach from continuing approaches to the athlete or fellow athletes.

Sexual exploitation is not about sex; it is about dominant power and the abuse of that power. Child

protection and athletes' rights are relatively new issues on the sports agenda. To make sports safer and more enjoyable for everyone, more information, education, and dialogue is needed on critical issues such as coach-athlete intimacy, sexual harassment, and sexual abuse.

If the Bible has taught us nothing else, and it hasn't, it's that girls should stick to girls' sports, such as hot oil wrestling, foxy boxing, and such and such. ■ HOMER SIMPSON

Sexuality

As manifestations of human physical embodiment, sports and sexuality have always been intimately related. Depending on the historical era and the cultural context, this intimate relationship has been celebrated, acknowledged, condemned, or denied. These contradictory responses have often occurred simultaneously.

Greek and Roman Athletes

The Romans were less obsessed with the athletic body than were the Greeks, but they, too, understood—and for the most part accepted—the association of sports and sexuality. Odd as it may seem to us, the gladiator who entered the arena and risked his life in armed combat was a sexually charged figure whose physicality excited Roman women of every social class. The gladiator with his sword or trident—not the orator and certainly not the poet—was the embodiment of Roman masculinity. As upper-class brides were prepared for the initiation into womanhood, it was customary to part their hair with a spear that had been dipped in the blood of a slain gladiator. The word *gladius* (“sword”) was often used as a slang term for the penis.

Writing of sexuality and death in the Roman arena, the poet Ovid observed, in *The Art of Love*, “on that sorrowful sand Venus has often contested.” Gladiators were legally “infamous,” but Roman women responded nonetheless (and perhaps all the more) to their sexual attractiveness. Graffiti found in Pompeii proclaim that the gladiator Celadus was *suspirium puellarum* (freely translated: “the heart-throb of all the girls”). His colleague Crescens was the *puparum dominus* (“master of the girls”). Poets such as Juvenal were outraged when respectable women chose gladiators as their lovers: “The sword is what they dote on.” His anger was impotent. Propertius’ poems, which include rhapsodic references to athletic Spartan girls, testify that Roman men were also fascinated by the erotic dimension of women’s sports.

Christian Influences

Christianity ended the pagan adoration of the athletic body. References to the human body as a prison, a charnel house, a grave, or a sink of corruption were ubiquitous in the religious literature of late antiquity as ascetic men and women were inspired to join the ranks of “those who have made themselves eunuchs for the sake of the Kingdom of Heaven” (Matthew 19:2). Late in the fourth century or early in the fifth, Christian antipathy brought an end to the Olympic Games and to gladiatorial combats. Rather than looking to athletes and gladiators as icons of masculinity, devout Christians venerated saints like Simeon Stylites, who glorified God by spending thirty physically inactive years atop a sixty-foot-high Byzantine pillar.

THE IMPORTANCE OF TOURNAMENTS

The medieval tournament was a stage for the ostentatious demonstration of martial skill and valor. It was the preferred place for aristocratic men to vaunt—and for aristocratic women to admire—proud masculinity. Tournament lists may seem far removed from the domain of Eros, but the relationship between feats of arms and the code of courtly love was strikingly direct. The sexual aspects of the tournament were glaringly obvious when the victor’s prize was a *puellam decoram valde* (“nicely dressed young girl”), which was the case at a tournament in the German town of Merseburg in 1226. Sexuality also played a central—if more subtle—role in later tournaments, at which knights demonstrated their prowess as warriors and suggested their potential as lovers. In time, tournaments became less bellicose and more theatrical, but the erotic dimension continued to play a major role. Tournaments became allegories in which men and women masqueraded as Lancelot and Guinevere, as Tristan and Isolde, or as other suitably romantic Arthurian figures. In the typical sixteenth-century tournament, bold knights rescued distressed damsels, after which they retired to a “Temple of Love,” where the gallant men

doffed their battered helmets and received kisses of gratitude. Although the military functions of the tournament never wholly disappeared, the erotic function—properly conventionalized—became increasingly prominent.

Conventionalization of the erotic did not diminish the opposition of the Roman Catholic Church, which repeatedly—and vainly—condemned the medieval and the Renaissance tournament. Clerical hostility was aroused by the un-Christian bloodshed that characterized the earlier tournament, but sublimated sexuality was also an abomination in ascetic eyes. Illuminated manuscripts frequently depicted medieval women engaged in fabulous jousts. A marginal illustration to Pierart dou Tielt's *Saint Graal* shows a combat between two naked women armed with distaffs, one upon a goat, the other on a ram. The scene is imaginary, but it testifies to the association, in the minds of clerical misogynists, of Eros and sports.

Modern Reactions

In the modern era, as sports once again assumed the central role that they played in pagan antiquity, Christian ascetics—Protestant as well as Roman Catholic—were initially hostile. Clerical critics were not motivated to condemnation simply by profanation of the Sabbath (although that was a common theme from the seventeenth to the twentieth centuries). Sports were also deplored because of their sensuality and their ability to entice, excite, and sexually arouse participants and spectators alike.

- In the Victorian era, presidents of evangelical colleges warned ominously that football games were orgiastic affairs more fit for pagan thickets than for the groves of academe. In 1892, for instance, the *Wesleyan Christian Advocate* complained that the violent game unleashed “the lower impulses of the physical man” and allowed young males to “find their pleasure in mere sensual energy.”

- When Senda Berenson introduced basketball to the young women of Smith College, in Northampton, Massachusetts, the students were chastely clothed from neck to ankle and the only man allowed in the gymnasium was the president of the college, a man whose age and dignity were thought to immunize him from the danger of sexual arousal.
- When the Australian press reported positively, in October 1907, on “the brown skinned specimens of manhood” and the “bronze Venuses” that were to be seen on the beaches and in the surf, there were immediate protests against “heaps of sprawling men and lads, naked but for a nondescript rag around the middle.”
- In 1933, when Sunny Lowry swam the English Channel, she was berated as a “harlot” because she exposed her bare knees.
- In 1934, Cardinal Rodrigue Villeneuve of Quebec, condemning the “pagan” cult of the body as manifested in sports, bemoaned the rampant concern for “hysterical strength, sensual pleasure, and the development of the human animal.”
- Meanwhile, his European colleagues thundered Episcopal anathemas against female gymnasts who performed before mixed audiences. Their denunciations are repeated today, almost verbatim, by Islamic fundamentalists horrified by the public display of female limbs.

In response to the recurrent charge that sports are a sensual if not a satanic indulgence, most athletes and spectators have defended their passion for sports as if the pleasure they derived from them had no connection whatsoever with human sexuality. Whenever outraged religious traditionalists have called attention to the erotic appeal of the human body at play, high-minded progressive reformers have blandly expatiated on the benefits of sunlight, fresh air, and unencumbered movement. In 1921, for example, the German gymnastics journal, *Die Freie Turnerin*, showed off its new logo—a youthful nude. The edi-

tors distanced themselves from imputations of pornographic intent by claiming the logo represented “a free maiden, with a joyful sense of her strength and her trained body, whose nakedness is unashamed because it is natural.” This kind of wholesome nudity was not, they emphasized, sexual. Countering allegations of prurience, a contributor to *Sport im Bild* announced in 1928 that sports participation actually dissipated “the mists of the erotic” that had enveloped German women. Thanks to sports, women were “cleaner, more free, fresher.”

YMCA workers, physical educators, and coaches went beyond mere self-deceptive denial. In response to the critics’ exasperated insistence that sports can quite obviously be an occasion for erotic play, enthusiasts for sports have propagated the modern myth that a heated contest and a cold shower divert or diminish adolescent sexuality. With luck, they assert, sports may totally extinguish sexual impulses.

This was the conventional wisdom in the heyday of “muscular Christianity,” when nineteenth-century sports were instrumentalized in a misguided effort to dampen erotic ardor and to distract young people from sexual activity. Even as British games masters and American physical educators praised sports as a healthy alternative to fornication and “self-abuse,” the cult of athleticism that they encouraged actually contributed to the sexual activity that was rife in elite British and American boys’ schools such as Eton and Groton. Memoirs of English “public-school”

life, for instance, attest to the continued prevalence of homosexuality among healthy adolescent football players (soccer and rugby) tutored by naively moralistic mentors. The English critic and editor Cyril Connolly recalled his early twentieth-century schooldays at sports-mad Eton and added that homosexuality was “the Forbidden Tree around which our Eden dizzily revolved.” (Like a typical first-year student, Connolly fell in love with a boy who was “good at games and older than I.”) American physical educators seem never to have noticed that the high-school romance of popular fiction

pairs the most athletic of the boys (the star of the football team) with the most athletic of the girls (the captain of the cheerleading squad).

Sexualization of Sports

By the end of the nineteenth century, mainstream Protestants had altered their opposition to sports to the point where YMCA workers were leading the way in inventing new sports (such as basketball and volleyball) and in propagating sports—for girls as well as boys—throughout the United States and elsewhere. Similarly, in 1945, Pope Pius XII broke ranks with his predecessors and affirmed the positive value of modern sports. By the end of the twentieth century, religious opposition to sports had all but disappeared. There is continued opposition to the association of sports and sexuality, but the opposition is motivated less by a rejection of “pagan sexuality” than by distress at levels of promiscuity and outrage at the incidence of sexual predation. “Baseball Annies”

Success is not the result of spontaneous combustion; you must set yourself on fire first. ■ REGGIE LEACH

and other young women eager for sexual unions with their athletic idols have, almost literally, thrown themselves at the feet of collegiate and professional athletes. Basketball star Wilt Chamberlain, who boasted of having slept with 20,000 women, is a notorious example of the athlete willing to accept sexual favors from adoring admirers. Champion boxer Mike Tyson and a number of other high-profile athletes have stood trial for rape. That a number of collegiate and professional athletes have been found guilty of rape and other forms of sexual assault, including domestic violence, has caused understandable concern. Although most athletes are not sexual predators, empirical studies have found that varsity athletes are more likely than are other college students to be accused of sexual offenses.

The negative critique of sports and sexuality is no longer a prominent part of the Christian tradition. As mainstream churches took to celebrations of the joy of sports, to the construction of basketball courts, and to the establishment of church-related sports leagues, Marxist scholars began to deplore the “sexualization” of sports in capitalist society. Drawing from Sigmund Freud as well as from Karl Marx, these scholars blamed sports, which they defined as “the capitalistically deformed form of play,” for the psychological “castration” of the male athlete and for the deflection of male sexuality into sadism, masochism, narcissism, exhibitionism, and homosexuality. Radical feminists have also condemned sports because they enhance a female athlete’s heterosexual attractiveness and thus increase her “erotic exchange-value.” (The greater the value in the sexual marketplace, the more extreme the exploitation.) Although admitting that some women have benefited from sports and from the fitness boom, the sport sociologist Nancy Theberge (1987) nonetheless alleges that sports programs promising enhanced attractiveness represent “not the liberation of women . . . but their continued oppression through the sexualization of physical activity.” The assumption behind the charge of “sexualization” is that sports are not inherently sexual.

The reticulation of assertion and denial has recently become even more bizarrely tangled as Brian Pronger,

Birgit Palzkill, and a number of other homosexual writers have condemned sports for their complicity in the social construction of “hegemonic masculinity,” “compulsory heterosexuality,” and “heteronormativity.”

The Ideal Body

The discussion of sports and sexuality must include comments on the ideal body. Young men are judged not only by their sports prowess but also by the muscularity of their bodies (enhanced, in many cases, by anabolic steroids). Young women are exposed to daily exhortations to exercise and diet. Feminist critics believe these women are coerced into in a hopeless quest for an unattainably perfect body. Crippling injuries and eating disorders are said to be among the consequences of the overemphasis on sports and fitness.

There is some truth to the critics’ indictment. Although no cultural absolute defines the ideal masculine body, the muscularity of the Greek athlete, celebrated in antiquity by sculptors and vase painters, remains the ideal promoted by modern mass media. That body seems functionally related to what were, until recently, the taken-for-granted male roles of physically active protector and provider. Although there is considerable agreement about the desirability of what might be termed the standard mesomorphic male body, cultural ideals for women have varied across a much wider range—from the sinewy bodies of Spartan girls to the debility of foot-bound Chinese brides unable to walk, much less run, on their mutilated feet. Despite the range and variation in cultural ideals, some scholars see a pattern cut by the determined scissors of patriarchal power: In their book *Face Value: The Politics of Beauty* (1985) Robin Tolmach Lakoff and Raquel L. Scherr argue that female desirability over time has stressed “feminine helplessness and passivity” while male beauty in art is rarely depicted that way.

Other scholars see quite a different pattern. The anthropologist April Fallon suggests that focus on exotic extremes, like the Karen women of Burma, whose stretched and weakened necks require the support of

twenty-four brass rings, deflects attention from the nearly universal consensus that the ideal—at least for a young woman—is “roundness rather than angularity,” a firm rather than a flabby body, health rather than sickness. The athletic female body widely prized today in Europe and North America is quite similar to the women’s bodies valorized in ancient Sparta (if not in other Greek cities). This may or may not be the “natural” body, but it is, for the moment, the dominant ideal.

Global Views

Consideration of non-Western civilizations complicates speculations about physical ideals. In the Islamic cultures of West Asia, the Zurkhanah (“House of Strength”) attracts wrestlers and weightlifters whose powerful bodies are the cultural ideal. In East Asia, however, the ideal is very different. Mark Elvin, a scholar in Chinese history, notes that in traditional China the human body was not glorified, as was the case with the classical Greek culture with its statues of young unclothed male athletes. Images of the Buddha enthroned on a lotus leaf seem effeminate to European and American museumgoers. The gates to Japanese temples are often flanked by larger-than-life carved figures—the *nio*—whose hypermuscularity and weaponry symbolizes their role as threatening guardians, but these are lesser deities whose bulky bodies mark their inferior status in the heavenly order. Ordinary men and women may idolize sumo wrestlers, but the Japanese elite has long expressed a preference for unathletic elegance. The East Asian glorification of the cerebral scholar or the otherworldly mystic can best be understood as a futile attempt to transcend the physical, whose presence and power is acknowledged by the almost superhuman effort at its suppression. Asceticism is the bitter tribute that mind pays to body. Sports—and the sexuality that inheres in sports—are, in all likelihood, here to stay.

Shinty

Shinty is Scotland’s national sport. *Shinty* (from the Gaelic word *sinteag* meaning “leap”) is first mentioned toward the end of the eighteenth century in records of the Highlands and Inner and Outer Hebrides islands of Scotland. As with mob football, which was popular on the Scottish borders, *shinty* was a highly physical contact-and-collision sport played on a vast area with a minimum of rules or rest. Its primitive structure and its amalgam of unmasked violence and community festival are summarized in this description:

Games were contested between whole clans or parishes without limit as to numbers or time until darkness stopped play among the walking wounded. The field of play was undelineated except by the occasional pail of *visge-beatha* (whisky). In an interclan match, a combatant who had failed to disable at least one opponent within a reasonable time had his curved stick (*caman*) confiscated as a punishment by the chieftain so that he could only kick the ball (*cnaige*) or his opponents. (McWhirter and McWhirter 1975)

Origins

Historians do not agree on the origins of *shinty*. R. W. Henderson, a U.S. sports historian and expert on the evolution of ball games, wrote:

It has been claimed that *shinty* came to Scotland by way of Ireland, but so far evidence is not conclusive. In Irish mythology Cuchulain, Fionn, and Fingall play huge club and ball games over the land of the Gaels, and many are the mythological men who are proficient with ball and club. Allowing for the fact that these legends date back hundreds of years B.C., we must again remember that they were written A.D. The highly imaginative, romantic, legendary accounts should not be taken as historical sources. (Henderson 1974)

Hugh Dan MacIannan, a *shinty* expert, has a differing view. He played *shinty* at Lochaber High School in Fort William, Scotland, during the 1970s and then gained a Blue (the equivalent of an athletic letter in the United States) at Glasgow University. After playing for Fort William and then Inverness, he turned to broadcasting and journalism. In 1990 he received the first Shinty Reporter of the Year Award.

MacIannan underscores the fact that *shinty* (in Gaelic the word is *camanachd*) has a long history. In the United States baseball and football have histories of between 100 and 150 years. *Shinty*, by contrast, may have pagan roots and goes back thousands of years. *Shinty* was introduced to northwestern Scotland along with Christianity and the Gaelic language nearly two thousand years ago by Irish missionaries.

Development

However, *shinty* is not a major sport. Scotland's premier sport is soccer, followed by rugby. Many more Scottish children participate in golf, swimming, netball, track and field, basketball, and other sports than in *shinty*. *Shinty* players number only in the low thousands, but forty *shinty* clubs exist, and although the regional base continues to be in the Highlands and islands, that does not tell the whole story. For example, university clubs exist at Aberdeen, St. Andrews, and Edinburgh; Tayforth has a Lowland club; and emigre Scots can play for London Camanachd. MacIannan cautions that one should not see *shinty* as just a minor sport played regionally in Scotland. Wherever Scots

have gone, they have taken *shinty* with them as a part of their culture. For example, soldiers of the Lovat Scouts played *shinty* during the Boer War in South Africa at the beginning of the twentieth century.

Before World War I *shinty* developed rapidly, and rules that all players could agree to were needed. Codifying those rules helped in the sport's expansion. After World War I and up until the 1950s, however, socioeconomic factors led to the decline of *shinty*. Significant numbers of Scots moved away from the Highlands and islands and settled in industrialized Glasgow and the north of England. MacIannan quotes one *shinty* player, Roger Hutchinson, who says, "The game of *shinty* ceased to be played during the first four decades of the 20th century. It was an inexorable decline."

Originally *shinty* resembled hurling, which is Ireland's premier sport. Today the sports, as played at an elite level, have major differences in technique. In *shinty* each team has twelve players, and seven officials are required. Unlike in most field games, in *shinty* the pitch (field) size is not fixed and varies greatly from club to club. The recommended size of a pitch is 155 meters by 73 meters. This area is considerably larger than the area required for U.S. football, rugby, or soccer (association football). The goal posts may seem similar to those used in U.S. football or rugby union football, but they are actually much narrower: The cross bars are only 3.6 meters wide. The crooked, broad-bladed *shinty* stick bears some resemblance to a field hockey stick.

Practice

The twelve players on a *shinty* team are a hail-keeper (goalkeeper), a fullback, three halfbacks, a center back, a centerfield, a center forward, three half-forwards, and a full forward. A game lasts ninety minutes, with a half-time of five minutes. The game is essentially aerial, with the ball being tossed and flicked and passed. Only the goalkeeper may handle the ball. This rule is the major contrast to hurling, in which all players may catch and strike the ball. A goal is scored when the ball passes wholly over the goal line, between the goal posts, and under the cross bar, which is set at a height of 3 meters.

I think my favorite sport in the Olympics is the one in which you make your way through the snow, you stop, you shoot a gun, and then you continue on. In most of the world, it is known as the biathlon, except in New York City, where it is known as winter. ■ MICHAEL VENTRE

The ball is covered with leather and has a core of cork and worsted wool. The stick has a cylindrical shaft. The head must be able to pass through a ring 63 millimeters in diameter.

A game of *shinty* is tough. Fouls such as kicking, catching, or throwing the ball, obstructing, charging, hacking, pushing, and jumping at an opponent are penalized. *Shinty*, like hurling, is a game in which the level of ball flow, spatial movement, and player fluidity create spectator exhilaration.

Recently corporate sponsorship and segments of the tourist industry have helped to revitalize *shinty*. This revitalization has resulted in the United Kingdom's Prince Edward associating himself with the development of a youth *shinty* league, and Diana, the late princess of Wales, was given a *shinty* stick at a meeting of the Bute Highland Games during the early 1990s. English cricket star Ian Botham has played the game, and in 1991 two Scottish teams (Skye and Kinguissie) visited Cape Breton and reintroduced the sport to Canada's maritime region after an absence of 150 years.

The Future

What is *shinty*'s future? Is it to be a modern sport or a relic of Celtic culture? MacIennan (1993) makes this observation:

For life-force and continuing success, the game must continue to aspire to skill and spectacle at the highest level. If these remain the ideals of the greatest game in the world, and as long as the unique enduring comradeship "after battle" can be maintained, then *shinty* will maintain the traditions which were founded thousands of years ago and have stood the test of time. It will also remain one of Scotland's truly national assets.

Shooting

Modern shooting sports evolved from the use of arms for hunting and combat. Today, sport hunters lead conservation efforts and fuel a huge industry in shooting gear. A wide variety of competitions with rifles, shotguns, and pistols entertain shooters year-round. Some of the most skilled compete at the Olympic Games.

History

Shooting sports arose from the use of weapons and hunting implements. Long before gunpowder, hunters defended themselves and killed game from a distance. Rocks and spears gave way to boomerangs, arrows, darts, and bolts. "Chinese snow" appeared in fireworks a couple of centuries before English friar Roger Bacon described gunpowder in 1249. In 1327, England's Edward II used guns to invade Scotland, but their performance didn't match their novelty.

The first guns were heavy tubes that required two attendants. One held the tube while his partner lit a priming charge with a burning stick or rope. The first lock was a lever by which a smoldering wick was lowered to the touch-hole in the barrel. Such guns were called matchlocks. Sixteenth-century German gun designers replaced the wick with a spring-loaded jaw that held pyrite (flint) against a serrated bar. Pulling the bar across the pyrite showered sparks into a pan that held a trail of fine gunpowder leading to the touch-hole. Around 1515 in Nuremberg the bar was replaced by a spring-loaded sprocket wound with a spanner wrench. Pulling the trigger released the wheel to spin against a fixed shard of pyrite held against the wheel's teeth. The

subsequent flintlock featured a cock or hammer with a clamped flint that struck a steel plate above the pan. In 1806 Scotch clergyman Alexander John Forsythe became the first on record to ignite a spark inside the chamber of a gun. He used an explosive fulminate to generate sparks. In 1814, sea captain Joshua Shaw of Philadelphia upstaged a host of experimenters to produce a viable percussion cap.

Columbus reached the Americas while armed with a triggerless matchlock. Pilgrims carried long 75-caliber smoothbore flintlocks, although the superior accuracy of rifled bores had been proven as early as 1498 in Germany. Americans did come to favor the jaeger (hunter) rifle with a 61- to 76-centimeter barrel of 65 to 70 caliber. To conserve lead, frontier gunsmiths made jaegers with small bores. To shave weight, they trimmed the stock. The svelte “Kentucky rifle,” derived mostly from Pennsylvania-based German gunmakers, resulted. Under-size balls in greased patches speeded loading.

As the frontier edged west, the needs of hunters changed. Grizzly bears, bison, and elk were hard to kill with Kentucky rifles, whose barrels were also awkward in the saddle. Brothers Sam and Jake Hawken of St. Louis developed a shorter rifle with a half-stock and heavy 50-caliber soft-iron barrel with a slow rifling twist. Mid-nineteenth-century mountain men coveted their Hawkens.

In 1848, New York inventor Walter Hunt developed a repeating rifle with the charge in the base of his “rocket ball” bullets. Financier George Arrowsmith and mechanic Lewis Jennings made the rifle more reliable. In 1849 Arrowsmith sold this “Volitional” repeater for \$100,000 to railroad magnate Courtland Palmer. With Palmer’s backing, Horace Smith and Daniel Wesson developed a metallic cartridge for it. In 1855 a group of

forty New York and New Haven investors bought out Smith, Wesson, and Palmer to form the Volcanic Repeating Arms Company. Their first director, shirt salesman Oliver F. Winchester, hired B. Tyler Henry to reengineer both rifle and ammo. In 1860 Henry came up with a fifteen-shot repeater that would later impress Confederates as the “damned Yankee rifle you loaded on Sunday and fired all week.”

But the Henry lacked the punch needed by buffalo hunters, who favored Remington Rolling Block and Sharps 1874 dropping-block single-shots chambered for cigar-size cartridges. When the Sharps Rifle Company folded in 1880, the sustenance and market hunting was over. Human scavengers would glean more than *three million tons* of bison bones from the plains. The days of buffalo hunting were short and shameful.

By that time Winchester had discovered John Moses Browning, a frontier gun genius working from a crude shop in Ogden, Utah. Between 1883 and 1900, Browning would deliver forty-four designs to Winchester’s New Haven plant. The Model 1886 lever-action brought Browning \$50,000 in 1885. The first successful gas-operated guns came from Browning, whose machine gun cycled 1,800 rounds in Colt’s test lab without malfunction. It weighed half as much as a Gatling. A fearsome succession of weapons followed. Hermann Goering would remark that if Germany had had Browning .50s, it might have defeated Britain’s RAF.

By 1900 three of every four guns used by American sportsmen were Winchesters of Browning design. Only Peter Paul Mauser, who developed the bolt-action rifle in Germany during the 1880s, has had such lasting impact on the design of modern sporting guns. His rifles would allow twentieth-century designers like Roy Weatherby to extend the reach of hunters, target shooters, and tactical marksmen.

The period between 1820 and 1900 was the most active in the history of firearms design. From flintlock to caplock, muzzle-loader to breech-loader, single-shot to repeater, firearms became more effective and reliable. They also determined the games that would entertain sportsmen and women.

While hunters established the rifle market on the western frontier, target shooting became popular in the East. German- and Swiss-style *Schuetzenfests* included beer, sauerbraten, and beautiful single-shot rifles. The first recorded *Schuetzenfest* occurred in New York the year after the Civil War ended. Most shooting was done at 183 meters, offhand. The rifles weighed from 5.5 to 7.3 kilograms, with 32- to 45-caliber bores and sophisticated aperture sights. Shortly after 1900, scopes were permitted in some events.

By that time, riflemen were competing in long-range matches shot prone with rifles resembling those used by buffalo hunters. In fact, Lewis L. Hepburn modified the Rolling Block as he began work for Remington on a rifle that would help beat the Irish sharpshooters who had won at Wimbledon in 1873. The Irish had subsequently challenged “any American team” to another contest. The team would comprise six men who would fire three rounds of fifteen shots, one round each at 732, 823, and 914 meters, onto targets 3.7 meters high and 1.8 meters wide, with 91-centimeter-square bull’s-eyes. The Sharps and Remington companies soon came up with prize funds and promised rifles for the event. An Amateur Rifle Club was formed to conduct tryouts. A fledgling National Rifle Association and the cities of New York and Brooklyn put up \$5,000 each to build a rifle range on Long Island’s Creed’s Farm. Deeded to the NRA for \$26,250 in 1872, it would be called Creedmoor.

Remington’s new target rifle, a .44-90 shooting 550-grain conical bullets, came off the line in March 1874. On 26 September, a favored Irish team shooting muzzle-loaders bowed to the Americans and their new Remington and Sharps breech-loaders. The score was 934 to 931. Matches held in 1875 and 1876 were won more decisively by the U.S. team. Remington Creedmoor rifles posted the highest scores.

Experiments to test and improve the inherent accuracy of rifles led, in mid-nineteenth century, to a sport that has since grown. Benchrest shooting started as a noncompetitive diversion for hobbyists in the northeastern United States. After the 1930s, when benchrest competition blossomed, participants took the science of rifle accuracy more seriously. Women participated too. Sharpshooter Mary Louise DeVito fired ten shots into a group of less than 20 centimeters at 914 meters, a world record during the Vietnam era. Shooters and rifles kept improving. In August 2003, Kyle Brown put ten shots into a 10.7-centimeter group at 914 meters.

Laurels in benchrest shooting go to competitors with the most accurate rifles and ammunition, and to those who can best read wind and mirage. In the past, however, accolades went to the most flamboyant shooters, many of whom were employed by traveling shows and gun and ammunition firms for exhibitions during the late nineteenth and early twentieth centuries. Annie Oakley was one of these talents.

Phoebe Ann Moses was born in a log cabin in Darke County, Ohio, in 1860. She shot her first game, a squirrel, at age eight. Subsistence hunting refined her skills with a rifle. At a local rifle match, she beat visiting sharpshooter Frank Butler. She was only fifteen! A year later they married, and Annie joined his traveling show under the name of Annie Oakley. Later, she joined Buffalo Bill’s Wild West Show. Sweet-tempered and petite, Annie became an instant star. The German crown prince, later Kaiser Wilhelm II, once asked her to shoot a cigarette from his lips. She obliged, remarking after World War I that a miss might have changed history. Her sharpshooting

demonstrations included an exhibition in 1884 when she used a .22 rifle to shatter 943 glass balls out of 1,000 tossed.

If Annie had an equal, it was Ad Topperwein, born in 1869 near New Braunfels, Texas. With a .22 Winchester 1890 pump rifle, young Ad began shooting aerial targets and wound up shooting for a circus. In 1894, he used a rifle to break 955 of 1,000 clay 5.7-centimeter disks tossed in the air. Dissatisfied with the score, he repeated twice, shattering 987 and 989. Standard clay shotgun targets proved too easy; he broke 1,500 straight, the first 1,000 from 9.1 meters, the last 500 from 12.2 meters. Ad was also a showman. Holding a Model 63 with the ejection port up, he'd fire a cartridge, then shoot the ejected case in the air. He could riddle five tossed cans before any hit the ground. He drew Indian-head caricatures in tin with up to 450 bullets fired at a shot a second. After shooting at a washer tossed aloft, he'd tell onlookers the bullet went through the middle. Challenged by the audience, Ad would stick a postage stamp over the hole, toss the washer again and perforate the stamp. Topperwein began working for Winchester, where he met, wed, and teamed with Elizabeth Servaty. To audiences, she became "Plinky," a fine shot in her own right. In 1916 she blasted 1,952 of 2,000 clay targets with a Model 12 shotgun.

Topperwein's exploits drew exciting competition, culminating with the remarkable performance by Remington salesman Tom Frye when he shot 100,004 out of 100,010 5.7×5.7-centimeter airborne blocks with Nylon 66 autoloaders. Frye missed two of his first 43,725 targets.

Other exhibition shooters entertained American audiences during the first half of the twentieth century, but such events dwindled after World War II. Herb Parsons, the last gun wizard to shoot for Winchester, recorded his stunts on film during the 1950s. Tom Knapp, who now shoots for Benelli, upstaged Parsons's feat of hand-tossing seven clay targets at once and breaking them all with seven shots from a Winchester pump. Knapp emphasizes that the autoloading Benelli he used to hit nine clays might have helped Parsons too.

The fascination of shooting as a sport depends almost wholly on whether you are at the right or wrong end of the gun. ■ P. G. WODEHOUSE

What Is Competitive Shooting?

There are three main categories of target shooting: (1) rifle and (2) pistol shooting, and (3) shotgunning.

RIFLE AND PISTOL SHOOTING

The most common rifle competition now practiced in the United States is conducted by clubs affiliated with the National Rifle Association, which has published rulebooks governing all of its sanctioned shooting events. The "black bull's-eye" matches developed for riflemen accommodate a range of shooters and equipment. A BB gun match limits competitors to smoothbore air- or gas-powered guns firing .177 steel balls. Iron sights only are permitted. Firing distance: 5 meters. A three-position match comprises ten shots each in prone, kneeling, and offhand; four-position matches add ten shots in a sitting position. Precision air rifle competitions are three-position events using iron sights at 10 meters with air- or gas-powered rifles. Sporter air rifle events mandate lighter-weight rifles. They can include four-position matches and optical sights.

Several courses of fire exist for .22 rimfires, including three- and four-position matches, prone matches, and team events. Some are fired at 15 meters on indoor ranges, others outdoors at longer yardage. Some specify iron sights; others allow scopes. A two-day prone match comprises 160 record shots each day at 46 meters, 50 meters, and 92 meters. The first day is shot with iron sights, the second with a scope.

High-power (centerfire) rifle matches require longer ranges. The National Match Course includes 183-meter offhand and rapid-fire sitting stages, plus prone stages at 274 and 549 meters, all with iron sights. Service rifle and open categories level the playing field and encourage practice with military rifles. International rules for rifles, targets, and courses of fire are generally more stringent than NRA rules. One Olympic event is free rifle, consisting of 40 shots prone, 40 offhand, and 40 kneeling at 300 meters with an iron-sighted centerfire target rifle. All bull's-eye rifle competition (NRA and international) is by the clock, though the deadline for each shot comes much more quickly in timed and

rapid-fire events. At 105 minutes, the standing stage of free rifle gives marksmen more than 2½ minutes for each record round.

Bull's-eye shooting has little to offer spectators. But metallic silhouette matches entertain. In 1967 Roy Dunlap and fellow shooters at Nogales, Arizona, imported this sport from Mexico. Original course of fire: 10 shots each at steel *gallinas* (chickens) at 200 meters, *guajalotes* (turkeys), at 385 and *borregos* (sheep) at 500. Dunlap added a bank of *javelinas* (pigs), to be shot at 300 meters. On April 12, 1969, the first American metallic silhouette match unfolded at the Tucson rifle range. An entry fee of 30 pesos, or \$2.40, included all the pit-barbecued beef you could eat. Matches that followed were for centerfire rifles only, with an increased maximum weight of 4.6 kilograms to accommodate scope sights. Still, all shots had to be taken offhand (standing), without a sling or artificial support.

The National Rifle Association has developed metallic silhouette courses for black-powder cartridge rifle, long-range pistol, short-range pistol, small-bore (rimfire) rifle, even air rifle and air pistol. Target sizes and distances vary. In centerfire and rimfire rifle matches, competitors fire 40, 60, 80, or 120 shots in five-round strings, with no sighting shots.

Approximately 17,230,000 shooters fire at paper targets each year in the United States, including 10,966,000 handgunners. Traditional bull's-eye pistol matches call for one-handed shooting, typically with autoloading guns that can be reloaded easily for ten-shot strings. The National Match Course includes a ten-shot, slow-fire string at 46 meters, plus five-shot timed-fire (20-second) and five-shot rapid-fire (10-second) strings, both at 23 meters. There are gallery events for indoor shooting, and matches for certain types of handguns (rimfire or centerfire, pistol or revolver). Most but not all matches specify iron sights. International rules apply to additional courses: rapid fire, center fire, sport pistol match, standard pistol, air pistol, and free pistol. The latter, like the free rifle event, showcases superaccurate equipment fired very deliberately. The distance in this case is 50 meters.

A practical extension of bull's-eye shooting is police combat shooting. The target is black-on-white, as in bull's-eye shooting, but it is shaped like a human torso. Prone, sitting, kneeling, and standing positions are all included in police combat. Shooters hold guns with both hands, as they would in a real emergency. In some matches, shooters use small "backup" guns. In others, caliber designations apply.

A notch up in excitement from police combat is action pistol, another series of contests emphasizing speed and precision in real-world shooting scenarios. The Los Alamitos Pistol Match includes five stages, for a total of forty-two shots at 6, 9, and 23 meters. The same distances apply to moving target, twenty-four shots. During barricade events, shooters fire from behind simulated wall corners at 9, 14, 23, and 32 meters, six shots each in five, six, seven, and eight seconds. Shooters feel the same urgency in the falling plate event, as they fire at 20-centimeter round metal disks. In some courses, competitors must use their weak hand; in others, timing starts with a holstered gun. Action pistol events have spawned a cottage industry in "race guns" tuned and modified for superior speed and accuracy. The events are telegenic and carry substantial purses. Competitors earn national recognition and endorsement packages in high-profile championships like the Bianchi Cup.

Cowboy action shooting was developed in 1979 by Harper Criegh, Bill Hahn, and Gordon Davis, who formed the Single Action Shooting Society, the sport's organizing body. Matches feature various competitions using handguns, rifles and shotguns most typical of the American West from 1860 to 1900. The emphasis is on speed and accuracy. Shooting scenarios have a Wild West theme, born from actual incidents, movie scenes, or match designers' imaginations. Participants enjoy dressing up in clothing of the Old West era, and each must have a pseudonym or "handle," adding a historical and theatrical flavor to the sport.

SHOTGUNNING

Hitting targets in the air with a cloud of pellets from a smoothbore gun was recorded as early as 1793 in

England's *Sporting Magazine*. Live pigeons were placed in shallow cavities in the ground and "trapped" there with old hats. At the gunner's signal, a jerk on the line attached to a hat released the pigeon.

The first formal trap shoot in the United States occurred in Cincinnati in 1831. The passenger pigeon, a wild bird but then plentiful and easy to catch, was the target of choice. By 1850, live pigeon shooting had drawn lots of interest—but also complaints from people who objected to wholesale killing. Also, wild pigeons had become scarce. States began outlawing the sport. Then, in 1866, Charles Portlock of Boston improved on a sling device or trap used in England to throw glass balls. The balls flew and broke inconsistently; nonetheless, the sport grew. Captain Adam Borgardus, market hunter and exhibition shooter, devised a better trap. George Ligowsky of Cincinnati developed a clay disk that flew flatter and faster. In 1880 he demonstrated the target at a live bird shoot on Coney Island. A year later his improved trap gave the disks even more appeal. An Englishman named McCaskey soon made them easier to break by substituting river silt and pitch for the ground clay and water used by Ligowsky. Limestone later replaced the silt. "Clay pigeons" or "clay birds," as they're known today, are still made of limestone and pitch.

Initially, trap shooters using the new disks participated in teams of six, one man behind each of five trap houses and an "extra" that rotated out after position number five. In 1885, W. G. Sargent of Joplin, Missouri, changed the game to incorporate three traps. Two years later, five shooters were shooting from five stations behind one trap. So the game remains.

In American or ATA (Amateur Trapshooting Association) Trap, the clay bird leaves the trap at about 65 kilometers per hour, its direction determined by the trap arm, which pivots in a 44-degree arc. The target typically sails 46 meters if not hit; most hits occur at around 32. Regulations call for the shooting pad or line to be 15 meters behind the trap. In handicap events, the starting distance is 25 meters. A round of ATA Trap consists of twenty-five shots, five from each of five stations.

Birds visibly broken, even of only chipped, count as hits. Experts commonly break twenty-five.

Doubles trap challenges shooters by lofting two birds at once. However, unlike singles trap, the doubles routine puts targets on known paths. International double trap is different still: an Olympic sport that incorporates three traps with birds traveling 16 kilometers per hour faster than in ATA events. International trap for single targets, an Olympic event since 1900, places competitors 16 meters behind a row of fifteen traps in a bunker. Extreme angles and speeds of up to 177 kilometers per hour make these targets devilishly difficult.

Skeet, a game not invented until about 1920, uses the same disks, about 10 centimeters in diameter. They streak from two traps, one in a "high house," one in a "low house," at either end of an arc-shaped firing line comprising seven stations. A final station, number eight, lies between the houses. Targets emerge on fixed flight paths, but jet across the line of fire instead of away from it. Various angles are provided by the array of firing points. On four stations, shooters must also take doubles. As in trap, a round of skeet is twenty-five shots.

Charles Davies of Andover, Massachusetts, apparently came up with the first skeet field because trap shooting wasn't giving him practice for the steep angles he encountered when hunting birds. A young friend of Davies, Bill Foster, published an article on the novel game in the February 1926 issues of both *National Sportsman* and *Hunting and Fishing* magazines. He asked that readers name the event, offering a \$100 prize to the winning suggestion. Mrs. Gertrude Hurlbutt of Dayton, Montana, came up with skeet, an old Scandinavian word for "shoot."

Unlike trap targets that quickly test the reach of a shooter's gun, skeet targets fly close. Neither a heavy charge of shot nor a tight choke, the constriction at barrel's end that squeezes a shot column together as it exits is necessary. Skeet includes games for 12-, 20-, and 28-gauge guns, even .410s.

International skeet is more difficult than American skeet for several reasons. First, shooters must start with the gun-butt at hip level. Second, the targets zoom by at

89 kilometers per hour, not 65, and they go farther. Also, there can be up to three seconds' delay for target release after the shooter calls for the bird—an impediment to timing. Finally, the six easiest targets in American skeet do not appear at all on the International skeet card; they're replaced by doubles at the difficult middle stations.

A game of more value to hunters than trap or skeet is sporting clays. Originating in England, it came to the United States in the early twentieth century and has become exceedingly popular since 1989, when the National Sporting Clays Association (NSCA) was founded. Sporting clays courses are all unique, usually laid out to include field, woodland, and, where convenient, marsh. Traps are installed to throw targets at tough angles, into the sun and through thick vegetation where gunners get only a small window for the shot. "Rabbits" add variety. They're special clay disks made to launch on edge and

to scoot along the ground, bouncing unpredictably. Doubles are part of sporting clays. A "true pair" means a simultaneous toss. A "report pair" gives you the second bird at the sound of your first shot. A "following pair" puts one bird up at your call and the second target aloft at the pleasure of the trap operator. A round of sporting clays uses up fifty shot shells. Scores on most courses are much lower than on trap and skeet fields. About 5,393,000 shotgunners fired at clay targets in organized U.S. events during 2002.

Competition at the Top

The first World Shooting Championships occurred in Lyons, France, in 1897, when a local club organized a 300-meter rifle event on its twenty-fifth anniversary. Women began to compete formally in 1958. Now, world championships for men and women are held every four years.

Push yourself again and again. Don't give an inch until the final buzzer sounds. ■ LARRY BIRD

French nobleman Baron Pierre de Coubertin arranged the first modern Olympic Games in Athens in 1896, a year before the historic Lyons match. A former French pistol champion, de Coubertin urged the inclusion of shooting as one of the nine featured sports. In 1907, l'Union des Federations et Associations Nationales de Tir was established. Its successor, the UIT (Union Internationale de Tir or International Shooting Union), imposes competition rules. It is headquartered in Munich.

The number of Olympic shooting events has varied from two (in 1932) to twenty-one (in 1920). Individual and team events were slated until 1948, when UIT eliminated team matches. Women from the United States began winning in 1976, with Margaret Murdock's silver in three-position rifle. Eight years later in Los Angeles, the Olympic Games included three shooting events for women: air rifle, three-position rifle, and sport pistol. Since the first Olympics, men and women shooting for the United States have won ninety medals. Of the top U.S. Olympic performers of all time, three are shooters. Only track and field and swimming have garnered more medals for the United States than the shooting sports. In 2004, the Athens Olympics scheduled seventeen rifle, pistol, and shotgun events, in which 390 men and women competed. Ages ranged from fifteen to fifty.

The Grand American World Trapshooting Championships, hosted by the Amateur Trapshooting Association, is perhaps the premier shooting event in the world. Only the modern marathon has more participants in a single day of competition. It debuted at the Interstate Park in Queens, New York, in 1900, moved to Chicago, St. Louis, and Columbus before settling in Vandalia, Ohio, in 1923. In 2006, however, the Grand will once again move, this time to the World Shooting Complex in Sparta, Illinois. Among the tens of thousands of shooters who have participated have been celebrities such as John Philip Sousa and Roy Rogers. Annie Oakley competed only once, at age sixty-five, breaking ninety-seven of one hundred clays. She passed away the following year.

The Grand hosts seven thousand competitors annually. The facility at Vandalia features one hundred trap fields set side by side, where 5 million traps are thrown and more than a million dollars in prize money is awarded.

The National Sporting Clays Championship, hosted by the National Sporting Clays Association, attracts more than one thousand competitors annually to the San Antonio, Texas, event.

The National Skeet Shooting Association hosts the World Skeet Shooting Championship annually in San Antonio, at its National Shooting Complex, the world's largest skeet shooting facility.

The NRA National Outdoor Rifle and Pistol Championships is an annual event at Camp Perry, Ohio, during July and August. Here, the national championships in pistol, small-bore rifle three-position, small-bore rifle prone, high-power rifle, and high-power long range are established. Each of these categories encompasses a variety of individual and team championship events.

Governing Bodies

Olympic shooting in the United States got a boost in 1978 with passage of the Amateur Sports Act and establishment of national teams, national development teams, coaching staffs, and training sites and programs. In 1995 the United States Olympic Committee assembled USA Shooting, a nonprofit corporation, to be the national governing body for shooting events. Its mission: prepare athletes for the Olympic Games and promote the shooting sports at the local level. USA Shooting is headquartered at the Olympic Training Center, a sophisticated complex in Colorado Springs with 101 firing points and three 10-meter running-target ranges indoors. It is the largest indoor shooting facility in the western hemisphere. Outdoors are four trap and skeet fields. The 41-hectare Olympic Training Center hosts competitions as well as training camps, coaching seminars, and visiting athletes.

The Amateur Trapshooting Association, headquartered in Vandalia, Ohio, governs that sport's rules and regulations and seeks ways to further enhance the sport

and increase participation. It oversees more than six thousand registered shoots each year conducted by more than one thousand affiliated gun clubs.

The National Skeet Shooting Association, founded in the early 1930s, is headquartered in San Antonio, Texas. The nonprofit NSSA, owned and operated by its approximately twenty thousand members, is the largest organization in the world dedicated solely to the sport. It is dedicated to the development of the sport at all levels of competition and meaningful fellowship within its membership.

The National Sporting Clays Association was founded in March 1989 and serves as the official premier sporting clays association, dedicated to the development of the sport at all levels of participation. It, too, is based in San Antonio, Texas, a hotbed of competitive clay-bird shooting. With a total of seventeen thousand members, NSCA clubs host numerous tournaments for the serious competitor and the casual shooter.

Despite the importance of those governing bodies, the two most influential organizations in the shooting sports are the National Rifle Association and the National Shooting Sports Foundation.

A group of National Guard officers began the NRA in 1871 to emphasize better marksmanship in support of national defense. Civil War hero General Ambrose E. Burnside was chosen as the NRA's first president. Money from the NRA and the New York state government secured a 28-hectare tract on Long Island, New York, called Creed's Farm. Renamed Creedmoor, it was soon developed as a shooting facility. The first matches there commenced 21 July 1873. The NRA's first annual matches were held 8 October of that year. The 1874 contest between Ireland and the United States made Creedmoor a legendary place.

For financial reasons, the NRA deeded Creedmoor to New York state in 1890, and later moved the national matches to Sea Girt, New Jersey. In 1903 Congress approved a National Board for the Promotion of Rifle Practice. Subsequently, surplus arms were transferred to state militias to encourage shooting at the local level.

When Theodore Roosevelt, an ardent shooter, became U.S. president, the NRA had an ally in its drive to bridge state boundaries. By 1905, it had introduced a rifle shooting program to public schools. Meanwhile, crowding at Sea Girt forced construction of a new range near the shore of Lake Erie. Just before the 1907 matches were held there, the facility was dedicated as Camp Perry, after the commodore who triumphed over the British on Lake Erie in the War of 1812. In 1994 the NRA moved its headquarters to Fairfax, Virginia. By 2000, the NRA's membership had reached 4.3 million.

In 1961, the National Shooting Sports Foundation (NSSF) was established as a trade association for the hunting and recreational shooting sports industry. Now headquartered in Newtown, Connecticut, the NSSF promotes participation and safety in firearms use. Among the shooting sports it promotes are scholastic rifle and shotgun programs. The rifle program tests speed and accuracy. The shotgunning programs include trap, skeet, and sporting clays. These programs teach young people through high school age firearms safety and shooting fundamentals while bringing them through intrasquad practices leading to state and national competitions.

The NSSF has also embraced novice shooters through STEP OUTSIDE, a program that reaches out to experienced sportsmen to introduce and mentor newcomers to the sport. The foundation owns and sponsors the annual Shooting, Hunting, and Outdoor Trade Show (SHOT Show), which brings together all facets of the shooting sports industry. The NSSF has partnered with federal agencies and state and local law enforcement agencies to distribute free firearms safety kits, including gun locks, and to encourage safe firearms storage.

The foundation, through its range division, the National Association of Shooting Ranges, has helped upgrade and standardize environmental and professional practices to maintain the physical and fiscal health of the facilities that host the shooting sports in the United States.

Silat

Silat, or *pencak silat*, is the general term for a wide variety of indigenous martial arts traditions of the Malay-speaking world, encompassing the countries of Indonesia, Malaysia, Singapore, Brunei Darussalam, and to a lesser extent some parts of the Philippines and southern Thailand. Since the late twentieth century, it also has been practiced in Europe, America, and Australia. Silat is a mixture of self-defense, athletics, and dance, with strong spiritual, aesthetic, and ritual qualities. Performed in a wide variety of sociocultural circumstances, its practice settings range from small family groups to large international athletic championships. The official name currently in use is *pencak silat*. However, regional differences persist, with the term *pencak* and its dialectic variations often in use in Java and Madura, and *silat* predominantly used in other areas of Indonesia and Malaysia. Another application is to use the term *pencak* for the more artistic movements and *silat* for the actual self-defense applications.

Origins and Historical Context

Predecessors of what today is called *pencak* or *silat* were known under various names and go back hun-

dreds of years. Knowledge of martial arts traditions in the Malay world was predominantly passed on through oral tradition, hence there are very few reliable written sources about the early development presently available.

PRE-HINDU PERIOD

Reaching the furthest back in time into the pre-Hindu period are vivid origin myths and legends. One of the more colorful ones links Alexander the Great to the ur-ancestors of the Minangkabau ethnic group and to the emergence of *silat* in West Sumatra, at Pariangan near Mount Merapi. Many origin myths credit divine inspiration of a mythic or historic figure with the creation of *silat*; others weave tales of a legendary founder observing animals and nature and thereby learning the foundations of *silat* movement and spirit. One of the more widely accepted theories places the origin of *silat* in the Riau islands between Sumatra and the Malay Peninsula at around the sixth century. From there it probably spread first to Sumatra and then to Sunda and Java. Typical of cultural processes in the Malay world, these early indigenous self-defense techniques adapted various streams of influence from major high cultures of mainland Southeast Asia, China, India, and the Middle East that continuously flowed through the Malay world along ancient trading routes. This process eventually created distinct local Malay martial arts through long periods of acculturation and synthesis—a process that continues to this day.

HINDU-BUDDHIST PERIOD

Various historical and archeological sources indicate the presence of highly developed, distinct martial arts systems at the court of the Malay Srivijaya empire. From the seventh to thirteenth centuries, this Hindu-Buddhist empire, centered in Palembang on Sumatra, extended its dominion over large parts of the Malay area and controlled the strategic Straight of Malacca. It was eventually eclipsed by the mighty Hindu-Buddhist Majapahit empire on Java (thirteenth to fifteenth centuries). In both courts martial arts were practiced by the court elite, guards, and military forces. Both empires had a

prolonged interchange with major cultural centers in India and Indochina, which most likely led to influences from Hindu and Chinese martial arts styles in the further development of silat.

ISLAMIZATION

With the fall of the Hindu-Buddhist Majapahit empire and the ascent and spread of Islam throughout the Malay world, martial arts also underwent changes. Especially, elements of the early mystical Sufi Islam blended well with indigenous spiritual aspects of silat. Over the centuries many Islamic doctrines and teachings found their way into silat philosophy and practice. Silat training gradually began to emphasize the development of noble character and the pursuit of a righteous path, along with the mastery of effective self-defense techniques. The development of physical as well as mental strength, outer and inner control, became strongly connected to the practice of faith.

COLONIAL PERIOD

During the early periods of Dutch colonization of Java and the British colonization of the Malay Peninsula, silat continued largely unaffected by the Western powers. With expanding Dutch colonization of the wider Indonesian archipelago in the nineteenth century, however, the colonial government tightened its control over its subjects, and silat became a source of concern as a likely source of anticolonial sentiment. Many silat schools were banned, but practice often continued in secret. When the Indonesian independence movement emerged in force in the early twentieth century, many silat masters and students joined and were subject to intensifying harassment by the colonial police and military.

During the brief interlude of Japanese occupation of Indonesia toward the end of World War II (1942–1945), silat was initially encouraged by the Japanese as a means to strengthen a native fighting force within its scheme for the Greater East Asia Co-Prosperty Sphere; influences of Japanese martial arts in silat stem mostly from this brief period. However, as initial enthusiasm for the Japanese presence changed to widespread re-

sentment, silat practice in turn fell under a ban on public assembly issued by the Japanese authorities.

INDEPENDENCE AND BEYOND

After the end of World War II, the declaration of independence by Indonesia in 1945, and the eventual recognition of the Republic of Indonesia as an sovereign state in 1949, the new nation sought to shape a post-colonial national identity to unify the country's many ethnic, religious, and cultural groups. Along with national efforts of the administration addressing issues of education and language, leaders also looked to pencak silat's potential as a pan-Indonesian national art and sport. Efforts were undertaken to integrate silat education into the public school system. In the late twentieth century, silat also became a competitive sport in the international arena. The emphasis in silat was again shifted, this time onto the sport aspects. (see "Official Organizations" following). Malaysia reached independence from British colonial rule in 1957 and followed a similar path to make silat a national sport.

Social and Cultural Context

The practice of silat is intricately interwoven with the cultural fabric of the Malay world. Its principles embody and perpetuate central cultural values, and silat plays an important role in the cultural identity and education of the younger generation. Proper silat practice aims at the following goals: mastery of self-defense, strengthening of mind and character, development of aesthetic/artistic sensibility, and enhancement of general fitness and athletic ability. Depending on the style or circumstance, one aspect might be emphasized more than others, however, all four aspects are always present. A master of silat is highly respected in society and often referred to by the honorary title *pendekar*. This title is reserved for masters who epitomize the core values of silat specifically and of Malay culture generally. They are recognized as elders and spiritual leaders in the community; often they are healers or believed to possess supernatural powers. In the ideal of the *pendekar* one often finds an intriguing synthesis of old animistic, Hindu,

and Islamic beliefs. Frequently, silat is performed as an integral part of traditional celebrations such as harvests, weddings, circumcisions, and many other community and religious festivals. In these cultural contexts the performances focus on the artistic and aesthetic aspect and are often accompanied by traditional musical orchestras such as *gamelan*, *kendang*, or *talempong* ensembles. However, it is not only viewed as entertainment, but also believed to bestow protection over the participants and community. Due to its inherent aesthetic qualities, silat elements have also been integrated into dance and theater genres, for example *Randai* dance-drama of the Minangkabau, various Malay and Sundanese dances, and Javanese *Ketoprak* theater.

Techniques, Styles, and Schools

Traditional silat is practiced predominantly in rural areas all over the Malay Peninsula and Indonesian archipelago where many regional styles called *aliran* have developed. Hundreds of such regional *aliran* are still practiced today and their techniques and approaches differ greatly. These countless regional styles and variations have developed over the past hundreds of years, owing to different environmental conditions, varying exposure to other martial arts traditions, contact with multitudes of philosophies and religions, and support or suppression through political and social circumstances. Last but not least manifold styles resulted from the distinct skills, inventiveness, expertise, and genius of individual teachers and masters. Several basic characteristics however are shared among silat styles. Foremost among them is its general evasive or defensive quality, in which the aim is to unbalance opponents and diminish their advantage. All styles include basic postures, steps, and greeting etiquette that precede actual attack-defense exercises. Many styles favor circular ver-

sus linear approaches, and many feature positions low to the ground. Many styles or single techniques are inspired by animal movements or other elements in nature. The training is preferably held in a natural outdoor environment, often at night, in a practice area customarily called *gelanggang*. The foundation of all silat is specific footwork called *langkah*. Basic fighting techniques include kicks, punches, grabs, blocks, parries, locks, and throws, all with the aim to unbalance the opponent and bring him into a position from which he can no longer attack. More advanced training includes techniques aiming at vital points; on the next higher level special training for inner strength (*kebatinan*) is emphasized. True masters can eventually execute long-distance strikes without physically touching their opponent. The kind of approach used depends on the circumstance. Obviously, the techniques applied in a live-threatening self-defense situation are quite different from those used in a tournament situation with strict rules or in a public performance.

Among all the martial arts styles in the world, silat employs one of the largest arsenals of weapons. Foremost among them is the *keris*. Expertly crafted, this long, wave-bladed dagger is the most important weapon in Malay and Indonesian cultures. It possesses deep spiritual and ceremonial significance. Straight-bladed versions exist as well, along with multiple other variations of knives, daggers, machetes, halberds, and swords of variable length and shape, augmented by a dizzying array of spears, staffs, tridents, chains, discs, whips,

shields, and other handheld or throwing weapons. Quite a few of these were imported from mainland Southeast Asia, China, India, or the Middle East and then adapted, while many others are of indigenous origin, highly specialized and only used in a specific region. Costuming for silat practice, performance, and competition typically consists of a long-sleeve shirt and loose trousers, preferably of black or dark cloth, a bright colored sash, and a head cloth, wrapped in the various distinct local fashions. The various styles are taught in schools or clubs, called *perguruan*, ranging in size from very small groups with just a handful of select students to large organizations with memberships in the tens of thousands and branches all over Indonesia and abroad. Some schools teach only one style under one master, with the knowledge predominantly passed on through oral tradition. Others teach several styles separately or as a synthesis. The more modern types of schools have written rules and regulations. The master teacher of a school is referred to as *maha guru* (grand master) or *pendekar*. Silat students, called *pesilat*, owe loyalty and respect to their teachers and lifelong connections are typically formed between student and master.

Competitions

There are two types of competitions: traditional ones within an *aliran*, and modern ones in the context of sports tournaments. The traditional ones are part of the standard training process and give students within a school the opportunity to compete against fellow students according to the rules of the specific aliran.

Since the 1980s modern competitions are organized regularly by the national federations and every two years world championships are held by PERSILAT. Silat competitions have been included in the Southeast Asia Games. Efforts are underway as of 2004 to make silat part of the Olympic Games as well. World championships are attended by increasing numbers of member states and participants, as the worldwide appeal of this art and sport genre grows continuously. The Twelfth World Championship in Penang, Malaysia, in 2002, for instance, attracted over 150 participants from twenty nations.

The tournament rules are set by PERSILAT to include one category for the sports silat (*olahraga*) variant of full-contact fighting and three for the arts silat (*seni*) variant. The sports competition, called *tanding*, consists of three 2-minute rounds of one-on-one full-contact fighting. The combatants wear protective gear; permissible targets include the torso and limbs, hits to the head, groin, and spine are illegal. Combatants compete in standard weight divisions for men and women. A referee and judges use a point system to determine the winner. The seni category is subdivided into three competition types. The first, *tunggal*, consists of choreographed forms, preset by PERSILAT, in which a single competitor performs one part empty-handed and two parts with weapons, using the *golok* and *tongkat* (a type of machete and staff respectively). The second type is the *ganda*, in which a duo of performers presents their own choreography, using empty-handed techniques as well as weapons. The third is the *regu*, a standardized three-person sequence performing a set choreography. In all three seni categories the competitors are evaluated by a point system for accuracy of movement, level of skill, precision, and timing. In addition, the *ganda* category is also graded for creativity of the individual choreography showcasing beautiful and effective silat moves. All seni forms are three minutes long. Both arts and sports competitions are typically held concurrently at all major championships; male and female participants compete in both. Although silat was historically predominately a male activity, many notable female silat masters are known all over the Malay world. Since the 1970s girls and women also participate in increasing numbers in competitions on the regional level as well as in national and international tournaments. The vast majority of silat practitioners are amateurs. A small elite of professional athletes and trainers has developed along with efforts to make silat a national and international sport.

Governing Bodies

In 1948 the first national silat organization was founded in Indonesia by Mr. Wongsonegoro and other leaders in the silat community. Called Indonesian

Pencak Silat Federation or IPSI (Ikatan Pencak Silat Indonesia, www.pencaksilat.co.uk/psfIPSI.htm), its goals were the coordination and systematization of silat schools and practices within Indonesia, and the consolidation of silat as a national sport.

In 1980 the International Pencak Silat Federation or PERSILAT (Persekutuan Pencak Silat Antarbangsa, www.persilat.net/persilat) was established in Jakarta in order to coordinate silat in the international arena. For this IPSI was joined by the official silat federations in Malaysia (PESAKA), Singapore (PERSISI), and Brunei Darussalam (PESIB). In addition to the four founding member states, the PERSILAT federation includes more than twenty other official member organizations in other areas, such as Pentjak Silat USA (www.pentjaksilatusa.com), the European Pencak Silat Federation (www.pencaksilat.co.uk/epsfwlcm.htm), and groups in Asia, Africa, the Middle East, North and South America, and the Pacific region. The main goals of PERSILAT and its members are to promote, develop, and disseminate pencak silat worldwide. PERSILAT issues guidelines and rules for training, promotion, and competition; organizes regular tournaments and championships; and trains and licenses coaches and judges. It also holds regular seminars and sponsors publications on silat. In 1997 the organization also established an official silat training center in Jakarta, known as Padepokan. It has to be added that there are numerous silat schools throughout Indonesia and Malaysia who do not join PERSILAT or the national federations in order to retain their individual style and training philosophy.

Singapore

Singapore is an equatorial island city-state of four million people. Independent since 1965, it is a multicultural democracy, in which Chinese, Malays, and Indians are the dominant groups. Sport is seen as playing an ongoing role in nation building, with particular emphasis on sport for all, sports excellence, and sport as an industry. Most sports are of British origin with association football being accepted as the national game.

History

The indigenous sports that exist are Malay in origin. A game played with a rattan ball (*sepak takraw*) is still a popular three-person team game. Sailing and silat (a martial art) are the other traditional activities. Colonization by the British brought with it the range of team and individual sport associated with middle- and late-nineteenth-century diffusion. The games were fully adopted by the 1930s, by which time many sports had local administrative associations. A love of gambling, a trait shared by the colonial power and the migrant Chinese, has long been a complementary activity. The colonial government paid little attention to sport, considering it a fundamentally amateur activity. Funding for representative competitive sport was often the sole responsibility of the individual athlete. The system of subscription and donation did ease the burden of finance before independence.

Participant and Spectator Sports

Badminton and weightlifting were the most successful sports during the late colonial period, with Singapore sportsmen winning international honors in the Thomas Cup and Commonwealth Games respectively. Swimming, sailing, and, more recently, table tennis have been

the most productive sports in the South East Asian (SEA) Games and the Asian Games since independence. The state-operated system now recognizes the status of core and merit sports. Track and field, badminton, silat, sailing, soccer, swimming/water polo, table tennis, and bowling now receive the most emphasis within the sports excellence program. Soccer operates a professional league, which includes an additional team each from Japan and China. The major venue for international games and contests is the national stadium.

A wide range of sport is played at both competitive and recreational levels. Well-established team games (basketball, volleyball, rugby, hockey, and cricket) and individual games (golf, tennis, squash, and billiards) have been supplemented by martial arts (judo, taekwondo, and wushu). Outdoor adventure activities, water sports, and healthy lifestyle activities are available for all age groups. The most recent inclusion to the SEA games has been international chess, which has a wide following in schools. The quadrennial Asian Games and the biennial SEA Games are the most prominent regional competitions. Singapore has won only one medal in the Olympic games—a silver medal achieved in weightlifting by Tan Howe Liang in 1960.

National identity in relation to sport has become an increasingly important issue as calls for success are made. Achievement in international games is promoted through direct policies and growing expenditure. The sports excellence programs are supported by initiatives to nurture young athletes, for example in a new sports school. Talented athletes from countries like China are encouraged to develop their talent in Singaporean programs, with a view to adopting citizenship. The dilemma now exists that foreign talent is not always seen to reflect the national sporting profile.

Women and Sport

One concern has been the lack of Singaporean women's participation in sport at all forms. The Women and Sport Group, working under the auspices of the Singapore Sports Council (SSC), has become one of the foremost bodies promoting sport for women in Asia. The

pioneer female Olympian competed in Helsinki in 1952. Since then one in seven Singaporean Olympians have been women.

Youth Sports

Youth participation in sport exists within the school system and among the clubs and associations. The People's Association (a statutory body) provides extensive developmental programs at community clubs. Regional fitness and recreational centres provide a sophisticated range of facilities and amenities.

Organizations

The major national organization is the SSC, which is a statutory board of the Ministry of Community Development and Sports (www.ssc.gov.sg/SportsWeb/index.jsp).

The Vision of the SSC is to create "A Sporting Singapore! Our Way Of Life," and the mission statement elaborates the need to "develop sports champions and create enjoyable sporting experiences for Singapore." The individual National Sports Associations are affiliated to the SSC and to the Singapore National Olympic Council (SNOC, www.snoc.org.sg).

The educational arm of the SNOC is the Singapore Olympic Academy, which organizes an annual session for trainee teachers of physical education. The Academy also links the Olympic associations within the South East Asian region and Asia beyond by inviting delegates to its residential course.

Sports in Society

The general societal perception of sport is that as an institution it has to compete with the twin demands of education and employment. It has not been easy to provide a balance of emphasis. The local news media concentrate on international sporting events and leagues, while the homegrown professional scene enjoys only moderate support. Globalization has placed the English Premier League and the NBA into sharp relief for the local population.

There have been periodic examples of illegal performance enhancement, but not to a significant degree.

The most controversial issues in recent years concern the sports excellence program. Among these, the foremost has been the foreign-talent identification scheme, which is perceived by some observers to limit the potential of local-born athletes. Singaporeans do not find it easy to accept foreign talent as their own. The establishment of the new Sports School, which has a long-term plan to create champions, caused some concern about the policy to focus initially on potential entrants with above-average academic qualifications at primary-school level. The relatively low status of elite sport and the relatively high status of educational achievement in society as a whole means that the combination of sports and academic excellence is often viewed with some scepticism.

The Future

The most significant trend has been toward the creation of a sports hub as a component of a sports industry. Hosting major international sporting events has become an important item on the agenda. Sports for all remains an important pillar in the development of the culture of sport, but the perception is that excellence in competition, and the underlying commercial interest in sport, must generate gains that benefit the economy as a whole. Five hundred million dollars have been committed to the concept of “Team Singapore” over the next five years. The plan has been to steer the people toward accepting the concept of an identifiable culture known as Sporting Singapore.

Skateboarding

Skateboarding involves riding a wheeled board. The first skateboards were created by connecting roller skate wheels to a wooden plank. Thus, the terms “skate” and “board” were also connected to name the activity. Technology has dramatically improved from these first iterations. For example, the wheels have gone through numerous upgrades from clay wheels of roller skates initially used to polyurethane ones currently used. Even though skateboards are now mass produced, there is no “official” standard for the composition or shape of boards and wheels; instead, these vary according to techniques and styles within skateboarding. Part of this flexibility can be explained by skateboarding's historical appeal to those seeking alternatives to formalized sport and its association with antiestablishment youth culture.

Brief History

Skateboarding's history began in southern California, and much of the industry is still located there. The initial popularity occurred in the early 1960s when skateboards were first mass produced. Since then, skateboarding has gone through many “boom or bust” cycles. These cycles are often linked to the legal status of skateboarding as well as the general health of the economy. During the first cycle of popularity, the infrastructure to develop safe and secure places to skate was weak. Thus, skateboarders commonly used sidewalks, school playgrounds, and parking lots as their parks. This caused concern from store owners and public officials because

or bowl skating, but this occurred illegally in drained pools or at ramps located in private residences. Skateboarders embraced the punk rock movement as well. In a sense, skateboarding became more “underground” during the 1980s. In addition, the style became more airborne and was taking place primarily in urban settings. Christian Hosoi and Tony Hawk were considered the top ramp/bowl skaters because of their

many skaters were disrupting commercial transactions and were incurring injury. City officials were concerned, and many medical associations warned people of the inherent danger of the sport. These two widespread concerns led to waning support and participation in the late 1960s and early 1970s.

Skateboarding made a comeback in the 1970s primarily through groundbreaking technology that allowed smoother and safer rides: the creation of the polyurethane wheel. The boards were long and skinny and most people rode in slalom style or freestyle. Downhill rides were common as were tricks such as doing handstands while riding on the board. Skateboarding’s commercial appeal increased as other youth-oriented products, such as soda companies, began sponsoring competitions. During this cycle, privately owned skate parks started to spring up around the United States. These parks were a sea of cement, including toboggan like runs as well as pool-like “bowls.”

Through its first two decades, skateboarding was primarily associated with suburban middle classes and gradually gained mainstream appeal. During the late 1970s and the early 1980s, however, there were widespread closures of skateboard parks because of liability issues. These legal barriers encouraged skateboarding to change in style and location, which, in turn, severed ties to the mainstream. Skaters continued to practice ramp

ability to get height above and outside of the ramps (“to get air”) and because of their creativity.

The other significant style developed in the 1980s was “street.” The crucial innovation for this style was the “ollie”: a technique that enables the skater to propel the board completely off the ground. This skill is essential for other more elaborate tricks that allow a skateboarder to “jump” onto a variety of objects. Once the board lands on an object, the skater will generally ride the board over it by sliding along the object. This style commonly takes place in everyday city settings rather than in commercially produced skateboard parks. For example, skateboarders often jump their board onto handrails, then slide their boards down those rails. The variations skaters create involving this jumping and sliding are the basis for current “street style” of skateboarding.

Skateboarding’s association with legal problems, urban settings, and punk rock and grunge music effectively helped to distance itself from the mainstream. And this “edgy” connotation was used by the industry as commercial appeal to a worldwide youth market. One chief executor officer claimed that he was selling the “California lifestyle” abroad. In the late 1980s, skateboarding reached a peak in actual participation, but the economic recession of the late 1980s and early 1990s took a toll on skateboarding: the lowest participation rates were during the early 1990s.

Twenty years ago you could win a world title with a double axel. Now they need at least seven triples. ■ ELLEN BURKA

Renewed Popularity and Cultural Appeal

The advent of the X-games in the mid-1990s catapulted skateboarding back into mainstream consciousness. This made-for-television event was the idea of an ESPN (an all-sport network) executive. The goal was to reach a young audience by creating the “Olympics” of alternative sports. Ramp skateboarding became a central feature of these games. The X-games are now a global phenomenon with competitions held throughout the world. Another broadcast corporation created a similar event, the “Gravity Games,” to compete in that market. Skateboarding has evolved with many different styles, although ramp, pool, and street skating are still the most familiar forms. Even at its height of popularity, the underlying ethos of being alternative has fueled political struggles over whether a universal governing body for the sport should be formed.

The most famous participant, Tony Hawk, represents the newfound popularity of skateboarding. In a poll conducted by a teen marketing research firm in 2002, Tony Hawk was voted the “coolest big-time athlete” ahead of more traditional sport athletes such as Tiger Woods, Michael Jordan, and Derek Jeter. The number of participants was at an all-time high at the turn of the twenty-first century, reaching approximately 12 million. Females constituted approximately 10 percent of those participants, and skateboarders such as Cara Beth Burnside and Jen O’Brien made livings as professionals.

As the sport has become popular, the clothing and lifestyle have taken on greater cultural appeal to the youth market. Currently, more money is made from sales of shoes and specialty clothing to a general audience than from the sales of boards to core participants. Skateboarding and many other alternative sports became a symbol of the active, creative, independent, and ultimately, “cool” teenager in the later 1990s. The significance of skateboarding as a cultural marker of “cool” can be demonstrated by looking at the how many different corporations use the symbols of skateboarding to sell products not directly related, such as video games, music, fast food, and drinks.

The Future

Skateboarding has historically been associated with youth who wanted to practice an alternative to mainstream sport. This is represented in the lack of formal structures and continual changes in style and technology. This alternative ethos evolved in the 1980s and 1990s to represent antiauthoritarianism. The direction of skateboarding will be affected by this most recent commercialization and use of skateboarding as a symbol of “cool.” It will be interesting to see if there is a backlash to this mainstream appeal, or whether skateboarding becomes accepted as a conventional sport.

Skating, Ice Figure

Ice figure skating is a sport that combines athletic skills, musical interpretation, and choreography. Performances and competitions are organized in four categories: women’s singles, men’s singles, pairs, and ice dancing. A judged, aesthetic sport, ice figure skating spans the borders of art and entertainment. During the late eighteenth and early nineteenth centuries, ice figure skating was an elegant art practiced primarily by upper-

class men in cold climates. Today ice figure skating is a middle-class sport in which girls heavily outnumber boys at all but the highest levels. Clubs are as likely to be found in Australia or California as in Oslo, Norway, or Toronto, Canada, and spectators are as likely to watch skaters performing in competitions as in highly staged television specials.

Early History

Early skaters were sliders; they slid across frozen lakes and rivers on runners made from sharpened bone or wood, sometimes using poles or sticks to propel themselves and to maintain their balance. About the fourteenth century the Dutch replaced these runners with blades made of iron. Sharpened metal blades have distinct edges that grip the ice, allowing for stronger pushes and more speed. The edge of the blade cutting into the ice gives each stroke its distinctive sound and requires the curving step that is the basis of all modern skating.

In the Netherlands skating was both transportation and recreation. Sixteenth-century Dutch paintings show men, women, and children of all classes skating on the iced-over canals. The integration of skating into everyday life seems to have been unique to the Netherlands, as was the democracy of Dutch skating. Apart from a few attempts to use skates in the military, skating evolved throughout the rest of Europe and North America as a form of recreation that took different forms among people of different classes.

Until the late 1800s skaters were tied to the landscape in obvious ways. If no ice existed, no one skated. If the river was long, and the ice was solid, skaters might run races or use their skates to travel quickly and easily from village to village. On ponds where no distance captured their imaginations, skaters explored the technical possibilities of the blade on the ice. Different landscapes led to different forms of skating, and these different forms became associated with the people who practiced them. In the Fen District of England, for instance, where the still, flat water froze in great smooth stretches, farm laborers—mostly men—invented courses and formats for

racing on skates, a pastime that would eventually turn into the formal sport of speed skating. In London and other big cities skating was a pastime of young boys and well-to-do gentlemen. While the boys played games on frozen ditches or canals, the gentlemen practiced a sedate and dignified style of gliding on small ponds and lakes in urban parks and estates. This “gentle art” was the style of skating that would eventually turn into ice figure skating. The product of elegant and noble manners, it became a popular court entertainment, honed at ice balls and masquerades and at other aristocratic gatherings across the continent.

With few exceptions—Marie Antoinette (wife of King Louis XVI of France) being one—early practitioners of the gentle art were men. Women, bundled in fur robes, were more likely to be pushed about the ice in carved wooden sleighs. In Russia the first skating club, founded in 1865, had even a special department of “chaise” skating. Skating historians do not know why so few women outside of the Netherlands skated. Some historians suggest that feminine skating would have been considered too liberated or immoral. Others suggest that women were afraid of breaking through the ice or that women’s clothing made skating impractical.

The world’s first skating club was founded in Edinburgh, Scotland, during the mid-1700s. Until 1910 membership in the club was restricted to upper-class men. Potential members were vetted for social standing and given a test of their skating skills that required them to skate a circle on each foot and to jump over three hats stacked on the ice. Although later clubs in Europe and North America also catered exclusively to upper-class men, many began to offer memberships to women during the late 1800s. Women’s memberships, however, usually depended on the women’s ties to husbands, brothers, or fathers. In some clubs, if a woman ceased to live in the home of a male club member, her own membership would be terminated.

During the second half of the nineteenth century technical developments made skating easier, more comfortable, and more accessible. In many cities skating was moved from frozen lakes and rivers to flooded urban

fields to avoid the danger of drowning. Steel blades were developed in Philadelphia in 1848. The first covered rink (over natural ice) was built in Quebec City, Canada, in 1858, complete with gas lights to allow safe skating at night. Processes for making artificial ice were invented in London in 1876. With these improved conditions, the number of skating clubs increased dramatically, as did the numbers of women skaters.

Competing Skating Styles

During the late 1700s and early 1800s the art of skating involved little more than long rolling edges that were sometimes embellished with expressive head and arm movements. According to Robert Jones, author of the first skating textbook, published in England in 1772, the primary goal of the skater was easy movement and grace. For Jones technique was far less important than aesthetics. Skaters in France also emphasized artistic movement and expressive poses, whereas Canadian and U.S. skaters were more inclined to focus on tricky footwork combinations and spins. In England and elsewhere in Europe stunts such as jumps and spins were frowned upon and were considered by many not to be true skating.

By the mid-1800s British society was increasingly organized around industry and science. Skating reflected this organization. British skaters turned their primary interest from aesthetics toward technical innovation. What came to be called the “English style” emphasized long edges and turns, and this style is reflected in the English term *figure skating*. It demanded a stiff upright posture and tremendous control. Knees were not to bend. Arms were not to lift. Nothing fanciful was to interfere with precision. It could not have been more different from the flowing style of Robert Jones’s time nor the heavily choreographed performances of today.

While British skaters were practicing this exacting ice science, skaters on the continent were pushing their aesthetic limits. In other languages, including French, Spanish, Italian, and German, this style is known as “artistic skating”; it has evolved into the music-based ice figure skating with which we are familiar today. A U.S.

skater, Jackson Haines (1845–1879), is generally credited with creating this style. Trained as a dancer, Haines saw in skating tremendous theatrical and artistic possibilities. He fit his skating to music, developed new moves (including the sit spin, which for many years was called a “Jackson Haines spin”), and invented a one-piece skate. Although nonskating audiences found him thrilling to watch, few skaters adopted his radical style. In 1864 Haines left the United States and traveled to Europe to find a more receptive audience.

Evidence suggests that he skated to warm receptions in Norway, Sweden, and Russia and that his exhibitions in those countries prompted the founding of ice figure skating clubs and the building of ice rinks. However, in Vienna, Austria, Haines had his greatest success, and his performances changed the future development of skating. The book *Tracks on the Ice*, written in 1881 by Viennese skaters Demeter Diamantidi, Carl Von Korper, and Max Wirth, turned Haines’s technical accomplishments into a system that eventually served as the basis for international competition rules. The system provided the technical ground upon which skating could grow: edges, turns, and school figures. For the first time the turns were skated as part of large figure eights (school figures), a concept that revolutionized skating and remained fundamental to its practice until the late 1980s. *Tracks on the Ice* stressed the aesthetic component in both figures and free skating movements. The idea behind the system was that after skaters had mastered the basic techniques they could engage with ice figure skating as an art.

Institutionalization of the Sport

Eager to promote their style of skating, the Viennese organized some of the first international competitions during the 1870s and 1880s. Thus, their artistic style, which was known as the “international style,” and not the stiff English style, came to be institutionalized as a sport. English skaters were, however, the first to be governed by a national organization. The National Skating Association (NSA) was founded in England in 1879 to curb gambling and professionalism in speed skating,

but ice figure skaters joined the organization in 1880. The NSA became responsible for administering a series of graded tests to raise the level of skating skills. Such tests remain the foundation of instructional skating programs in many parts of the world today.

Outside of England most national skating organizations were founded to standardize the rules of competitions. On the encouragement of the Dutch federation, fifteen delegates from European federations came together in 1892 to found the International Skating Union (ISU). Although the ISU immediately implemented rules for speed skating, it did not implement rules for ice figure skating until 1897, a delay that signaled differences of opinion and tense relations between some of the members of the organization.

Before the founding of the ISU, competitions had been organized for women and men at both local and international levels in figure skating and free skating. In many competitions women and men competed against each other in the same events. Despite this tradition, ISU world championships, which began in 1896, were open only to men. In 1902 the English skater Madge Syers (1881–1917) challenged the ISU's restrictions and became the first woman to compete for an official world title. Unable to imagine that a woman would ever dare to skate against men, members of the ISU had no rule with which they could block Syers's participation. She went on to win the silver medal behind the great Swedish skater Ulrich Salchow (1877–1949). At the ISU Congress in 1903 members discussed (but never passed) a rule explicitly prohibiting women from competing. They argued that women's long skirts prevented judges from seeing their feet. Not until 1906 did the ISU approve a women's championship. Madge Syers took the first ISU women's championship. She won the ISU title again in 1907. She also won the first Olympic title in 1908 when ice figure skating made its Olympic debut at the Summer Games in London, one of the first sports to allow women to compete. Not until 1924 did the ISU permit women to compete for the title of world champion. Women were not permitted to judge international skating championships until 1947.

In the first ISU competitions school figures determined 67 percent of a skater's final score, whereas free skating determined just 33 percent. During that era free-skating programs included single rotation jumps and various spins that were connected with long edges, dance steps, and turns. Carriage and flow were emphasized more than athleticism. In 1882 Axel Paulsen (1855–1938) first performed the famous one-and-one-half rotation jump that would take his name. However, despite his spectacular jump and his ability to spin at blistering speed, he placed third. Dash and athleticism were not what counted most.

Until about the mid-twentieth century competitive skaters were adults. Although men and women were generally capable of the same feats, decorum and long skirts limited women's ability to practice jumps in public. The first jump by a woman in international competition was performed by bronze medalist Theresa Weld (1893–1978) of the United States during the 1920 Olympic Games. Weld was chastised by the judges for her unfeminine behavior. Some say her jump cost her the gold medal. However, her daring opened the door for further change.

At the 1924 Winter Olympics in Chamonix, France, an eleven-year-old girl from Norway stunned the crowd and the judges with her youth, her combination of athleticism and artistry, and the shortness of her skirt. Sonja Henie (1912–1969), who would become the most popular ice figure skater of all time, finished last in this first international appearance. She would eventually win ten world championships and three Olympic gold medals. To say that she changed the face of ice figure skating is an understatement. As a child participating in what had previously been an adult sport, Henie introduced an athleticism that had not been seen in women's skating. Because of her youth, she broke no rules of decorum by wearing the short skirts that allowed her to do jumps and innovative spins. She was also among the first skaters to choreograph a skating program as if it were a ballet solo. Prior to this innovation free-skating routines relied heavily on the turns and edges used in school figures, linked by a few special tricks. Henie's programs

The ten-step, showing the man's steps.

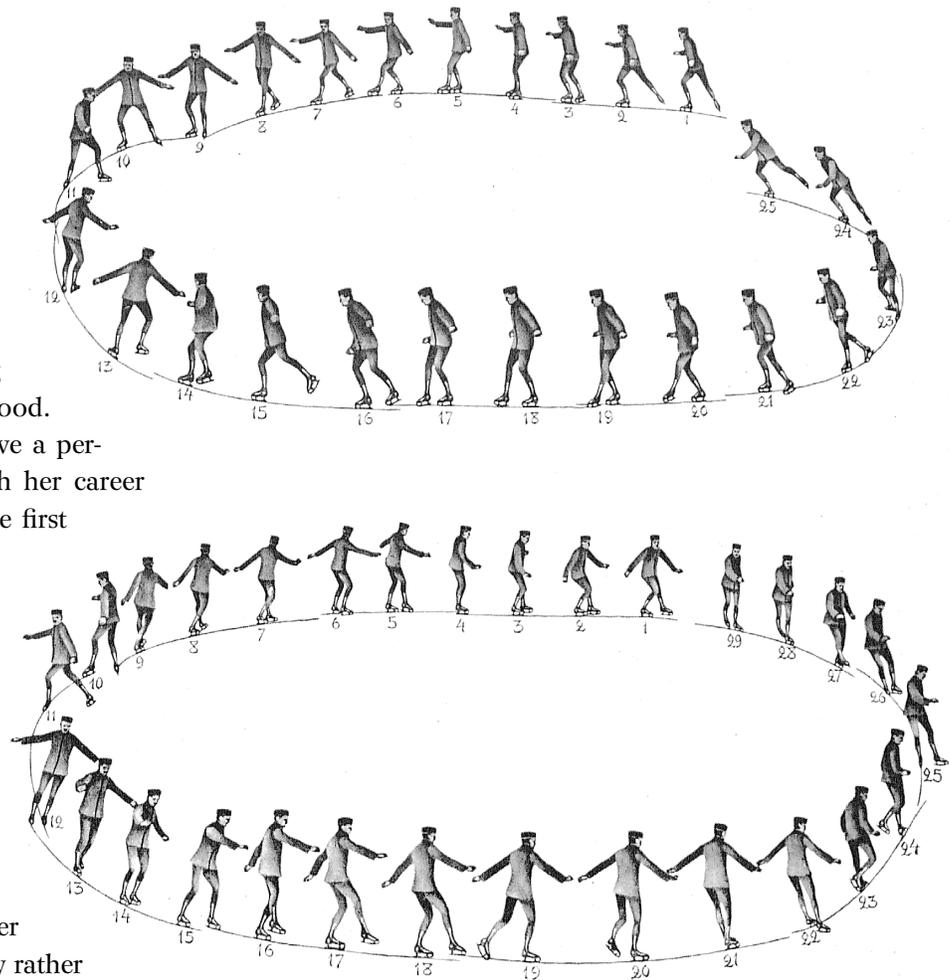

told a story with jumps and spins worked into a seamless whole.

Retiring from competition after the 1936 season, Henie toured with her own skating show before heading for Hollywood.

There she rented a rink and gave a performance that helped to launch her career with Twentieth Century-Fox. The first of Henie's eleven movies, *One in a Million*, was produced that same year. During the era before television, Henie's films brought ice figure skating to a huge public for the first time.

From its earliest days ice figure skating had been a pastime of the elite. Competitions took place in exclusive rinks and received only modest newspaper coverage—usually on the society rather than the sports pages. In such a context Henie *was* figure skating. Her sequined and bejeweled costumes, her use of toe-steps, and her often doll-like appearance led to popular understandings of figure skating as a feminine style of dancing on ice rather than a competitive sport. On the one hand, this shift led to a tremendous growth in the sport among young girls seeking to emulate their idol. On the other hand, this shift made skating seem too girlish for boys and men. Biographies of male skaters routinely speak of fathers being disappointed by their son's choice of sport. Even today, after decades of loosening gender expectations in the general culture, many people consider ice figure skating to be an effeminate sport.

In many ways women's ice figure skating has not broken the "ice princess" mold that Sonja Henie set before World War II. For the past seventy years the idealized woman skater has been conventionally pretty and feminine and, until the 1990s, invariably white. She has skated with a graceful lyricism that masks the

tremendous difficulty of what she does. Male skaters have not been similarly locked into a single mold. The two men who dominated skating during the 1920s and 1930s, Gillis Grafstrom (1893–1938) and Karl Schaefer of Austria (1909–1976), were lauded for creating poetry on ice. After World War II U.S. skater Dick Button (b. 1930), Olympic gold medalist in 1948 and 1952, was lauded for his athletic prowess, especially for being the first skater to land a double axel (1947) and a triple jump in competition (1952). In Button's wake some male skaters focused so much on the athletic content of their programs that they became wooden and uninspiring to watch. During this period jumps came to be the measure of a skater's technical achievement. Critics continue to lament this trend, arguing that skaters focus on jumps to the detriment of their other skills.

During the 1970s Canada's Toller Cranston (b. 1952) and Britain's John Curry (1949–1994) tried

to return men's skating to its more lyrical roots. Curry, 1976 Olympic champion, skated with an elegant and balletic style. His skating appeared effortless. By contrast, Toller Cranston, the 1976 Olympic bronze medalist, skated with fire and passion. His performances were full of odd angles and innovative moves. These two men were instrumental in expanding the range of acceptable styles in men's skating. Today male skaters span the gamut from the artistic Canadian Emanuel Sandhu (b. 1980), who is a classically trained ballet dancer, to the fist-pumping, Lycra-wearing U.S. skater, Michael Weiss (b. 1976), who recently performed to music by the 1970s rock group Santana. Women's skating can seem monochromatic by comparison.

Pairs

The first pairs skaters were men. They skated side-by-side, executing dance steps and gliding movements while holding hands. When the ISU established rules for pairs, pairs could be composed of two men, two women, or one woman and one man. However, by the time the ISU inaugurated the first pairs championship in 1908, mixed pairs were the only ones invited to compete. At that time pairs performances were much like dances. However, as accomplished singles skaters turned to pairs skating, the routines grew more complex. In 1923 British skaters Mildred and T. D. Richardson introduced shadow skating to world competition, performing free skating movements in close unison, an extremely difficult feat to accomplish while moving at high speed across the ice. Lifts, the moves that currently define pairs skating, were introduced to international competition in 1924 by the French skaters Andrée Joly (1901–1993) and Pierre Brunet (1902–1991), to the dismay of some judges who called the daring new moves “circus tricks.” Joly and Brunet married in 1925. They won the first of four world titles in 1926. They were also Olympic gold medalists in 1928 and 1932.

Ice figure skating is one of the few sports in which teams of men and women compete against other teams of men and women. However, unlike racquet sports, which also have mixed-gender teams, ice figure skating

pairs and ice dancing events are designed to highlight the social and physical differences between men and women—the man is required to lift the woman, he offers his partner up for display. In these events gender relations are a required part of the performance. Soviet skaters Ludmila (b. 1935) and Oleg (b. 1932) Protopopov were Olympic pairs champions in 1964 and 1968 and world champions from 1965 to 1968. They were known for extremely elegant programs that were reminiscent of ballet duets. The Protopopovs' success with judges and popular audiences ensured that of the many ways that men and women might choose to skate together, heterosexual conventions would dominate pairs competitions.

Ice Dancing

Although ice dancers were admitted to the world championships only in 1952 and to the Olympic Games in 1976, ice dancing has been important to the history of ice figure skating. People's fascination with waltzing on ice during the late nineteenth century led to the first significant increase in the number of skaters. Indeed, dancing was key to getting women onto the ice. The pleasure of dancing motivated many skaters to work hard to improve their technical skills. Their demands for reliable ice—for more than one or two months of the year—helped to prompt the invention of artificial ice.

At first skaters tried simply to transpose ballroom dance steps to the rink. Before long they began to invent dances to take advantage of the unique properties of skating. Skating clubs hired rinkside orchestras, and social dances and formal balls became regular events on the skating calendar. In England the NSA held competitions to inspire the creation of new dances. Today's skaters continue to learn the steps of some of the winning entries, in addition to those of more recent invention. These set pattern dances are called “compulsory dances.” They make up the first of the three components of contemporary ice dancing competitions.

Initially no difference existed between pairs skating and ice dancing. The two disciplines split when pairs skaters started to incorporate lifts, jumps, and throws

into their routines. Competitive ice dancers are not permitted to perform jumps or throws and may only perform small lifts. Although the specific rules of ice dancing have changed frequently through the years, the somewhat vaguely defined requirement to impart the feel of dance remains constant. Current competition involves three parts: the compulsory dances; the “original dance” which is a short program skated to prescribed rhythms (such as the rumba or the waltz or the foxtrot); and the long free program.

Judging

Like gymnastics and diving, skating is an aesthetic, judged sport. Unlike running or shot put, ice figure skating includes no single objective measure by which to determine a winner. Consequently, the sport has always been plagued by judging controversies. At the European championship of 1893 Swedish and Austrian judges could not agree on the means by which the winner would be declared and the results of the competition were annulled. In many early competitions skaters were awarded points for each aspect of the competition. The skater with the most points at the end was the winner. It seemed to be a clear and simple system. However, assigning points to something as complex as a skating performance, either in school figures or in free skating, is not easy. Which should count more—flow, speed, technique, or the overall impression left by a performance? In 1897 the ISU passed regulations that would be followed for more than a century: The winner of skating competitions would be determined not by the total marks a skater received but rather by the total of his or her placings. The skater with the lowest total—the lowest number of ordinals—would win. These regulations recognized that skaters were not being measured against an objective standard but rather against each other. The relationship between the skaters (their placings) would determine the outcome. In 1901 the ISU introduced the famous 0–6.0 judging scale, in which a mark of 6.0 represented a “faultless” performance. In the most recent version of this scale, skaters received two marks: one for technique and one for presentation. Through the years

these marks have been called different things. The former was once called “sporting merit,” whereas the latter has been called “general impression” and the better-known “artistic impression.”

Throughout its history ice figure skating has been rocked by all manner of judging scandals. At one time host countries would stack the judging panel with their own judges. During the Cold War countries on either side of the Iron Curtain commonly collaborated in vote-swapping schemes with their allies: “I’ll give your skater a good placing in dance, if you give mine a good placing in men’s.” At the 1998 Olympics in Nagano, Japan, a Canadian judge taped a phone conversation in which a Ukrainian judge asked her to agree in advance on the outcome of an event. For such a blatant breach of the rules, the Ukrainian judge received only a one-year suspension. Amazingly, the whistle-blowing judge was also suspended. The most recent scandal occurred during the 2002 Olympic Games in Salt Lake City, Utah, where a French judge admitted to marking the pairs competition according to a deal made by the French and Russian federations. After being pressured by the International Olympic Committee, the ISU eventually awarded two gold medals in the event: the first on the evening of the competition to Elena Berezhnaya and Anton Sikharulidze of Russia, the second a few days later to Jamie Salé and David Pelletier of Canada, who had originally been awarded the silver.

Notorious for ignoring the corruption in their midst, ISU officials could not ignore the public outcry that followed the events in Salt Lake City, especially the suggestion by the IOC that if ice figure skating were not cleaned up it could be pushed out of the “Olympic family.” As a response the ISU has approved a new scoring system to be implemented during the 2004–2005 season. Ironically, the new system returns to the points system rejected as unfair and unwieldy during the late nineteenth century. Judges will award points for each element of a skater’s program. The system leans heavily toward easily quantifiable technical skills rather than aesthetic achievements. Whereas some commentators believe the new system of scoring will make judging more objective and will

help clean up the sport, others worry that the system will rob the sport of its creativity. Some frustrated skaters and officials believe the problems in the ISU are greater than the scoring system alone and have given up on the ISU entirely. In 2003 they started a new governing body—the World Skating Federation.

Recent Developments

Skating continues to evolve technically and aesthetically. A slim technical gap remains between men skaters and women skaters, with women routinely performing the same jumps as men except the triple axel and quadruple jumps. If spins, for instance, were more valued than jumps, this gap would mean little. A handful of women have performed the triple axel in competition, and many more have performed it in practice. In December 2003 the first woman to perform a quadruple salchow (a jump with a takeoff from the back inside edge of one skate followed by one or more full turns in the air and a landing on the back outside edge of the opposite skate) in competition was fourteen-year-old Miki Ando of Japan at the Junior Grand Prix final in The Hague, Netherlands. For their part men at the highest levels are paying more attention to style and aesthetic concerns than they once did. Although stereotypes suggest that women are the more artistic skaters, in many instances men are pushing the bounds of the sport in artistry, for instance, by performing to a broader range of music and by designing more complex footwork.

The technical advances in ice figure skating are, in part, a result of improved coaching techniques and better facilities and equipment. They are also a result of the now-commonplace tendency of elite athletes to begin training at a young age and to train full-time. However, more importantly, free skating has benefited immensely from the elimination of school figures from competition. Where figures once counted for 60 percent of a skater's score, in 1968 they were reduced to 50 percent. In 1973 the ISU introduced the short program to singles and pairs events. The ISU was responding to public outcry after Austria's Beatrix Schuba (b. 1951) won the 1972 world championships. Schuba, unmatched in her

ability to trace school figures, placed ninth in the free skating portion of the competition—the only part of the competition seen by television viewers, who could not understand why such a lackluster skater was on the top of the podium. With the introduction of the short program, figures fell to 30 percent of the total mark. They were finally phased out altogether in 1990. Today's competitors in all events perform a short technical program that includes a series of required elements. Each missed element leads to a deduction of marks.

During the mid-1990s ice figure skating became tremendously popular as a consequence of the Kerrigan–Harding scandal. At the 1994 U.S. Nationals gold medal favorite Nancy Kerrigan (b. 1969) was hit on the knee by a pipe-wielding assailant hired by the husband of Kerrigan's main rival, Tonya Harding (b. 1970). Harding went on to win the nationals after Kerrigan was forced to withdraw. The scandal made public the cutthroat side of skating and led to massive media interest in the women's event at the 1994 Olympic Games. For competitive skaters the increase in media interest spawned an increase in the number of competitions and the amount of prize money offered. Professional skaters benefited from an increase in the number of tours, shows, and televised specials. More agents became involved in the sport, more promoters organized events, more sports journalists covered the skaters. This boom of interest lasted almost a decade. However, as television schedules became saturated with skating shows, audiences began to fall off. But while the traditional ice figure skating audience in North America and western Europe may have reached the limits of expansion, new audiences are growing in places such as Hong Kong and Brazil, where few people skate. Skating has become a global entertainment commodity, and the invention of materials that can substitute for ice now means that skating shows appear regularly in tropical environments without permanent ice rinks.

The Future

Since the days of Jackson Haines ice figure skating has spanned the boundaries of sport, art, and entertainment. Although the dictates of sport have had the greatest

impact on the structure of ice figure skating, the artistic and entertainment aspects of skating will ensure its future. They attract the imagination of skater and spectator alike; they set skating apart from other types of athletic contests. The future of ice figure skating will be determined not by the limits of the human body, but rather by the potential of the human imagination.

Skating, Ice Speed

Ice skating was born out of a need for rapid movement in the winter climates of the Northern Hemisphere. Scholars do not know the origins of ice skating. However, the oldest pair of skates found in Europe is thought to be more than four thousand years old; thus, we can trace skating to the pre-Christian era.

Modern ice skating originated in the Netherlands. During winters in Amsterdam, markets were supplied by goods that were moved along frozen canals, including eggs carried in baskets on women's heads. In the same way that cycling and running originated in practical usage, ice skating was often the only way for people to travel quickly and even to conduct business during the long winters. Most Dutch people learned to skate at an early age, holding themselves upright on the ice by pushing a chair in front of them.

Probably because of its usefulness, ice speed skating developed about one hundred years before figure skat-

ing. Whereas figure skating tended to be the domain of town dwellers and the wealthy during the sixteenth and seventeenth centuries, ice speed skating was the domain of the lower classes. Members of the lower classes competed in races in which the goal was to reach the next town before other skaters.

Britain Imports Skating

Ice skating was brought to Britain during the eighteenth century by people from the Dutch province of Friesland who came to build canals in the eastern part of England. Scholars think that the first ice speed skating competition was held on the Fens, a low-lying district in eastern England, in 1763. Skating was popular not only in England, but also in Scotland, where the first club was formed in 1742. Skaters held many competitions in Britain through the latter part of the nineteenth century, and almost every town in the north and the east of England had its own champion.

British races were largely the domain of men. However, in the Netherlands women participated in touring speed skating races. In 1805 in Leeuwarden 130 women took part in such a race. Town-to-town races and touring races were open to women as separate events; women did not compete against men. However, women's competitions became increasingly peripheral as the nineteenth century advanced, and speed skating became increasingly organized by men.

People considered ice speed skating to be unsuitable and immodest for women. However, women continued to participate, and the first official women's world record was set in Poland in 1929. Men had been setting world records since 1893 and competing internationally since 1885, but women had to wait until 1936 to have their own world championships recognized. Olympic recognition for women speed skaters came even later. Women's speed skating was a demonstration sport at the 1932 Olympics in Lake Placid, New York, but did not become a formal event until the games in 1960 at Squaw Valley, California. In contrast, men's ice speed skating had been part of the Winter Olympics since the 1924 Games in Chamonix, France.

Skating, Ice Speed

Speed in Boston in the Early 1800s

Several exciting races came off at the Skating Park, Boston, on Saturday, the 4th inst. The first was for ladies, with prizes of a silver goblet, valued at \$25, and a pair of skates valued at \$10, for the best time; distance, half-mile. The second race was for gentlemen, consisting of a goblet valued at \$35, and a pair of skates valued at \$10.

For the ladies' race there were entered, the Misses Lucy Crocker, Addis M. Fogg, Carrie St. Clair, M.B. Lunt, Eliza Yenehki, Alice Twombly, M.D. Lamb, and Mrs. John L. Brown and Mrs. Carrie Ashley of Boston; Mrs. Anna Walker, of Rosbury; Mrs. George Farnam, of Lowell; Miss W.A. Roberts, of Andover. These were Divided into two parties, Miss Alice Twombly, Miss M.D. Lamb, Miss Anna Walker, and Miss Addie M. Fogg first. After a pleasant contest, the latter won, making the half-mile in 3:11, and Miss Lamb in 3:35. The others were distanced. The

next party consisted of Mrs. George Farnum, Mrs. John L. Brown, and Mrs. Carrie Ashley. The former won in 2:59, her companions being distanced. The prize was awarded to Mrs. Farnum, and the second to Miss Fogg.

Next in order was the gentleman's race, a distance of five miles, for which appeared Wm. F. Smith, F.G. Lawrence, Emory Lawrence, Gabriel F. Worden, Edward Spencer, and George E. Lawrence. The first mile was made well together in 4:24. On the fifth mile an exciting contest took place between the two Lawrences, which was decided in favor of George. Time, 22:46; his brother was two seconds later. The prizes were presented to the winners by the judges, Messers. Wheildon, Fuller, and Cumston. The affair passed off pleasantly, and gave great satisfaction to the large crowd present.

Ice speed skating has lagged behind figure skating in recognition as an Olympic-level sport for women. Figure skating fulfills the norms of femininity and was therefore acceptable, whereas ice speed skating has elements of strength and endurance that were regarded as less suitable for women.

However, the participation of men and women in organized competition developed at the same pace in short-track speed skating. Although scholars have not documented the precise dates of short-track speed skating's origins, they think it began in indoor skating halls. Interest in indoor skating peaked during the 1920s and 1930s. Those early competitions were unorganized circuit races. The first official short-track competition was held in Ayr, Scotland, in 1948, but not until 1967 did the International Skating Union (ISU) recognize short-track speed skating. The first ISU-recognized competition in which men and women were almost equally represented was held in Solihull, England. Skaters from eight nations took part in that competition. Both men's short-track speed skating and women's short-track

speed skating debuted at the same Olympics, appearing as a demonstration sport at the 1988 Calgary Olympics in Canada and as part of the official program at the 1992 Albertville Olympics in France.

Rules and Play

The goal of ice speed skating is simple: to skate faster than competitors. All of the races in international competitions are spread over two days. Because most speed skaters compete in several races and because the sport requires high levels of speed and endurance, the number of races in which skaters compete during two days is remarkable. Their feat is comparable to runners competing in the 100-, 200-, 800-, and 1,500-meter races during two days.

Long-track speed skating consists of two skaters racing on a two-lane, 400-meter track, but they race against the clock, not each other. Racing pairs are drawn by ballot. During the race the skaters must skate in both lanes; otherwise, one racer would have an unfair advantage. Lanes are changed at a point of the track called the

“crossing line.” The rules for long-track speed skating were developed with the men’s competition in mind and were later adopted for the women’s competition. The only difference between the men’s races and the women’s races is the length. Women race in 500-, 1,000-, 3,000-, and 5,000-meter races, whereas men race in an additional distance of 10,000 meters but have no 3,000-meter race.

People sometimes assume that short-track speed skating and long-track speed skating differ only in that short-track skating takes place indoors and long-track skating takes place outdoors, but this assumption is wrong. Short-track skating takes place on a much smaller track—only 111 meters. Skaters wear more protective gear than do long-track skaters; because short-track races are peloton races (a pack of skaters racing on the same track), the chance of collision or injury is greater. The short-track races at the 1992 Olympics at Albertville included a 500-meter individual race and a 3,000-meter relay. A 1,000-meter race was added at Lillehammer, Norway, in 1994. Spectators find the pack start and the sharply angled turns of the short-track skaters more thrilling to watch than those of long-track skaters. Short-track skating is popular in countries whose climate would ordinarily not allow residents to participate in winter sports. For example, South Korea, a country not known for its success in long-track skating, won the gold medal in the women’s relay at Lillehammer in 1994 and the women’s 1,500-meter race and women’s 3,000-meter relay in Salt Lake City, Utah, in 2002.

Dutch Treat

Although people often associate ice speed skating with the Dutch, not until 1968 did Carolina Geijessen, a twenty-one-year-old Dutch secretary, win Olympic gold in the 1,000-meter race. During winters in Amsterdam Geijessen skated to work each day, a mirror of the seventeenth-century women carrying

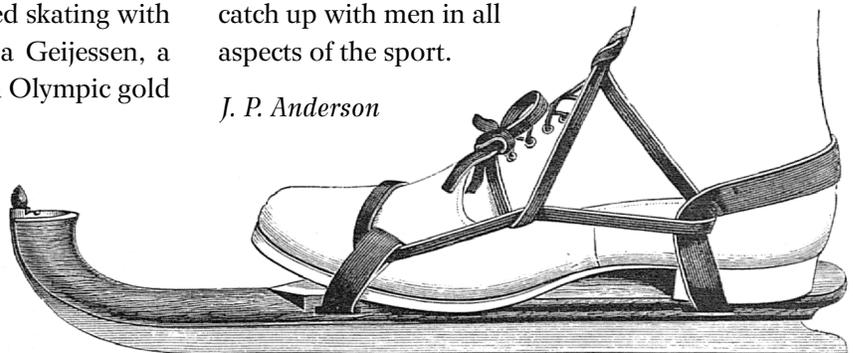

their eggs to market on the frozen canals. The Soviet Union, East Germany, and United States have dominated long-track skating. Lidia Skoblikova of the Soviet Union won two gold medals in the 1960 Squaw Valley Olympics and gold in all four events at the next Olympics in 1964 at Innsbruck, Austria. Like runners, ice speed skaters must concentrate on their particular talents, and multidistance champions such as Skoblikova are a rarity. Bonnie Blair is the most successful winter Olympian for the United States, having won six medals during four Olympics. Although Blair won the same number of medals as Skoblikova, Blair won her medals over a greater number of Olympics. Blair dominated the 500- and 1,000-meter races.

At the 2002 Winter Olympics at Salt Lake City, Utah, short-track speed skating gold medal winners were: men’s 500-meter, Marc Gagnon of Canada; men’s 1,000-meter, Steven Bradbury of Australia; men’s 1,500-meter, Apolo Anton Ohno of the United States; men’s 5,000-meter relay, Eric Bedard, Marc Gagnon, Jonathon Guilmette, Francois-Louis Tremblay, and Mathieu Turcotte of Canada; women’s 500-meter, Yang Yang of China; women’s 1,000-meter, Yang Yang of China; women’s 1,500-meter, Gi-Hyun Ko of South Korea; and women’s 3,000-meter relay, Min-Kyung Choi, Min-Jin Joo, Hye-Won Park, and Eun-Kyung Choi of South Korea.

The Future

Ice speed skating is a demanding and at times dangerous sport that is never likely to attract great numbers of participants of either gender. Women, however, after starting late, have begun to catch up with men in all aspects of the sport.

Skating, In-Line

In-line skating is a type of roller skating that uses skates that have wheels, generally four or five, that are set in a straight line, mimicking an ice skate. However, in-line skates are freed from the necessity of a frozen surface and sacrifice the precise control of dual-axle roller skates for superior adaptability to a variety of surfaces, greater speed, and easier mastery.

The popularity of in-line skating developed in the United States and has spread to Europe and parts of Asia. The most popular form is recreational outdoor skating. Roller hockey, speed skating, and stunt or “aggressive” skating are other forms. As in other skating sports, in-line skaters receive the benefits of low-impact cardiovascular exercise and toning of all major muscle groups. In-line skating is open to people of all ages; industry figures indicate an even split between male and female skaters; the average age is twenty-seven.

History

In-line skates are the oldest type of roller skate, although in-line skating did not have widespread popularity before the 1980s. The earliest recorded attempt to move skating from the winter ice was made by Joseph Merlin (1735–1803), a Belgian maker of musical instruments. He introduced roller skating to the public at a reception in London in 1760. As he played the violin and skated about for the crowd in front of a large mirror, Merlin discovered that he could not turn or brake on his new invention. Merlin survived the discovery. His violin and the mirror were not as fortunate.

During the late eighteenth and early nineteenth centuries in-line skates were used in theatrical productions as a substitute for ice skates. Experiments with different configurations eventually led to the cushioned dual-axle roller skate with its superior maneuverability. The in-line form survived into the 1970s largely as an off-season training tool for ice skaters and skiers. It also benefited from the introduction of polyurethane wheels and plastic components. Scott Olson, a nineteen-year-old U.S. semiprofessional hockey player, in 1979 discovered the in-line skate as an off-season training tool. He modified the design for use in hockey and in 1984 sold the patent rights to a private investor. Rollerblade, the resultant company, began a major marketing campaign that popularized in-line skating and made the company’s name synonymous with in-line skates.

Development

The modern in-line skate bears little resemblance to its nineteenth-century predecessor. Early in-line skates were wooden platforms mounting wooden wheels, attached to the skater’s feet with straps of leather or fabric. Modern in-line skates are made of space-age materials. The boot, or shell, encases the skater’s foot. Recreational in-line skates and their heavier stunt versions generally have a plastic outer shell and a removable lining for comfort, offering stability and support. Hockey skates and racing skates have leather or leather and nylon boots, which sacrifice some stability and support for decreased weight and increased flexibility. Beneath the boot is the frame, which mounts the wheels and can be constructed of metal, plastic, or nylon. The frame can incorporate a number of features depending on its purpose, including “rocker” features to enhance maneuverability, brake pads, and even active braking systems. A skater chooses wheels to suit the intended surface and activity, with variations in size and hardness.

During the late 1980s and early 1990s in-line skating had an explosive growth of popularity. In 1993 in the United States an estimated 12 million people tried the sport at least once. Now in-line skates are found around the world and are used for both practical and

recreational purposes. The U.S. Amish community, famous for its rejection of modern technology and recreational pursuits, has adopted in-line skates as a means of transportation. The Amish continue to shun the use of automobiles, electricity, and most modern conveniences, but they have accepted in-line skating because of its practicality and simplicity. However, the Amish still frown on use of the skates for pure entertainment.

In-line skaters are not limited to tamely rolling down sidewalks and around skating rinks. Those uses, although the most popular activity, often serve as merely the introduction to a number of organized forms of in-line skating. The least regulated form is “aggressive” skating—performing acrobatic stunts. Aggressive skating is similar to stunt skateboarding in its nature and its largely adolescent demographics. Aggressive skating also shares some of skateboarding’s negative reputation because of their close relationship and the damage each inflicts on public property through stunts and the often rebellious actions of youthful subcultures. In 1992 the in-line industry formed the Skatesmart program, which promotes skating safety, to improve the reputation of aggressive skating.

Competition

The Federation Internationale de Roller Skating (FIRS) governs organized competitive roller skating internationally. The FIRS accepts in-line skates in all categories and has established hockey and speed divisions for in-line skaters. The regimented and codified nature of these forms of in-line skating stands in sharp contrast to the more informal world of stunt skating, as does organized skating’s popularity among people in a broader range of age groups.

The introduction of in-line skates gave roller hockey a substantial boost in popularity. The 1992 Olympic Games in Barcelona, Spain, featured an exhibition of roller hockey, the first roller sport featured in the Olympics. The sport is based on ice hockey, with a few modifications pertaining to the different surfaces involved. In-line roller hockey, in keeping with its early ties to the ice hockey community, has

formed professional leagues and includes professional ice hockey players.

In-line skates quickly replaced traditional roller skates in speed competitions sanctioned by the FIRS and national governing organizations and in less formal competitions, which increased in number as the popularity of in-line skating increased. The configuration of in-line skates allows for larger wheels and a reduced area in contact with the skating surface, allowing greater efficiency and decreased drag in comparison with the configuration of traditional roller skates. In addition, larger wheels tolerate rough surfaces better, improving the appeal of outdoor and long-distance competitions.

Artistic roller skating is the only form of internationally organized skating that remains untouched by in-line skates. Artistic roller skating remains dominated by dual-axle skates because of their superior control and maneuverability. However, artistic skating events are open to in-line skates, and inventors continue to improve in-line designs. One European innovation demonstrated at the U.S. national championships in 1994 featured a modified four-wheel in-line configuration designed for artistic skating. Perhaps in time even the conservative world of figure skating will welcome in-line skaters.

The popularity of in-line skating may be attributed to its close relationship with the international ice skating and roller skating communities and to in-line skates’ outdoor adaptability. Beyond the appeal of exhilarating motion to young skaters, in-line skating offers a mode of transportation that is almost as efficient as bicycling but in a more compact form. That factor may help explain in-line skating’s urban popularity because it reduces the security and logistics concerns associated with bicycling.

The Future

In-line skating has not spread far into cultures that are not familiar with ice skating or roller skating and/or bicycling. However, the sport continues to grow in popularity, with participants and manufacturers in Europe, Asia, the Americas, and Australia.

Skating, Roller

Roller skating for sport developed from roller skating for transportation and recreation and is modeled on ice skating. In 1760 Joseph Merlin, a Belgian maker of musical instruments, created the first roller skates with metal wheels. He demonstrated his invention in London at a reception by skating across the floor while playing an expensive violin. Because his skates could not be turned or braked, he glided gracefully into a huge mirror and was seriously injured.

In 1849 roller skates were first successfully seen in public when Louis Legrange of France used them to simulate ice skating in the play *Le Prophete* (The Prophet). He devised his skates by mounting tiny rollers to the center of ice skates. During the mid-1800s a number of inventors produced several types of roller skates. All of these skates, however, suffered the problem of Merlin's skates—the inability to be effectively turned or braked.

Problem Solved

In 1863 James Plimpton of New York solved the problem of controlling roller skates. His skates had a rubber cushion to anchor the axles. This cushion compressed when a skater leaned, enabling the wheels of the skates to turn slightly as the skater shifted his or her weight. Plimpton's design is considered the basis of the modern roller skate.

Plimpton opened a number of skating rinks across the United States and Europe, envisioning roller skating

as a pastime of the rich. However, soon after his patents expired, cheap imitations of his skates were produced, and skating became popular with all classes.

Development

During the late nineteenth and early twentieth centuries organized roller skating sports developed as the popularity of roller skates increased. As early as 1901 roller hockey teams played throughout Europe. Although the popularity of roller hockey waned during World War I, it quickly regained its momentum, and in 1936 the first world championship of roller hockey was held in Stuttgart, Germany. A year later the first speed roller skating world championships were held in Monza, Italy. Although competitive artistic roller skating existed at the time, the first artistic roller skating world championships were not held until 1947 in Washington, DC.

World championship competitions in all three recognized disciplines of competitive roller skating—artistic, speed, and hockey—have been held annually (with a few exceptions) ever since. The first U.S. speed roller skating championships were held in 1937 in Detroit, and the first world dance and figures championships were held in 1947.

The United States Amateur Confederation of Roller Skating (USACRS) governs all three disciplines in the United States. USACRS is recognized by the United States Olympic Committee as the national governing body for all roller sports. The Federation Internationale de Roller Skating (FIRS) governs roller skating internationally.

Artistic roller skating is further broken down into dance, singles and pairs freestyle, and figures. Dance skating requires skaters to perform preannounced dance programs, which are detailed series of steps at various points around the floor. Each dance has its own steps, rhythm, tempo, and progression. Judges evaluate skaters on their performance of the steps and their adherence to the music. Artistic skating—both singles and pairs freestyle—is similar to ice figure skating: Skaters perform difficult routines set to music. Judges evaluate skaters on their maneuvers, such as jumps and spins, as well as

their use of music, appearance, flow of the program as a whole, and artistic impression. Figures skating stresses fundamentals and is the oldest of the artistic roller skating disciplines. Figures skating requires skaters to trace painted circles on the floor. Judges evaluate skaters on their carriage, their ability to stay on the lines, and the degree to which they make their program look effortless.

Speed skating is a noncontact sport that requires skaters to maneuver cleanly through a pack of other skaters and into winning position. Skaters are disqualified for engaging in unsportsmanlike conduct, such as forcing another skater out of position, blocking, or using their arms, legs, or hands to impede the progress of other skaters. Speed skating is one of the fastest sports in the world in which speed is generated by human energy.

Speed skating is broken down into indoor and outdoor varieties, with indoor speed skating being an almost exclusively U.S. pastime. Indoor speed skaters compete on a flat, 100-meter track in individual and relay races. Indoor speed skating is broken down even further by equipment (dual-axle skates or in-line skates), gender, and age divisions. In individual competition skaters compete in three distances, receiving thirty, twenty, or ten points for first through third places, respectively, in each distance. The winner is the skater who has the highest point total at the end of the competition. Relays are staged in combinations of same-sex or mixed groups. As skaters finish their leg of a relay, they tag the next team members with a push from behind to help accelerate the next skaters into the flow of traffic.

Outdoor speed skating is the internationally accepted form of speed skating. Skaters compete on both banked tracks and road courses. The banked track is usually about 200 meters long and

has parabolic curves. The U.S. home track is at the 7-Eleven Velodrome in Colorado Springs, Colorado. Road competitions are held on a flat course, which may be a closed course or an open stretch of road. Distances of 300, 500, 1,500, 3,000, 5,000, 10,000, and 20,000 meters are skated and include a relay. On the road the same distances are skated, but the relay is replaced by a marathon. Skaters may wear either dual-axle skates or in-line skates in outdoor speed skating, but in-line skates are the choice of most competitors.

Separate Divisions

In-line skates are popular among recreational skaters, and their dominance over dual-axle skates in speed skating competitions prompted USACRS to create separate divisions in indoor competitions. Recognizing the impact of in-line skates, USACRS also successfully lobbied FIRS to permit in-line skates in international competition. In 1992 in-line skates debuted at the world speed skating championships.

The popularity of in-line roller hockey has increased in the United States and the rest of the world. However, dual-axle roller hockey has been popular throughout the world for many years, most notably in Spain, Italy, Portugal, and South America. In fact, in many of those countries dual-axle roller hockey is second in popularity only to soccer.

Skaters play dual-axle roller hockey with a hard, black rubber ball and a short, curved wooden stick. Four players and a goalkeeper on each team try to place the ball into the net of the opposing team while attempting to prevent the opposing team from doing the same. Although the game is played with an essentially non-contact principle, players have to

protect themselves from injury by wearing padding, helmets, and reinforced skates. A well-hit shot can propel the ball off a stick at more than 128 kilometers per hour.

In-line roller hockey more closely resembles its ice hockey cousin in the equipment used, including the rubber puck, the amount of physical contact, and the high speeds. However, this form also is played with four players and a goalkeeper on each team. In-line roller hockey players also need to protect themselves because a puck can reach speeds of 160 kilometers per hour off a slapshot. Roller hockey accommodates young and old alike and both male and female players in co-ed and separate divisions.

The dual-axle form of roller hockey was a demonstration sport at the 1992 Olympic Games in Barcelona, Spain. However, the international popularity of the in-line form can be seen in the fact that the first world championship was held in Chicago in 1995.

Ski Jumping

To spectators, ski jumping represents the height of skiing prowess, and the sport holds a central role in the winter sports life of nations such as Finland, Austria, Germany, Norway, Slovenia, and the Czech Republic. In the sport of ski jumping, performers aim to float through the air on skis, as far as possible down a prepared, snow-covered hill, with both the flight and the landing in the performer's control.

Origins

Jumping on skis began as part of the Nordic (Norwegian, Swedish, and Finnish) skiing culture, from which it has spread over most of the world, wherever climate or technology allows. However, ski jumping as a sport seems to be a specifically Norwegian invention. Early skiing had several local strongholds in Norway: from the southeastern inland all the way to the Lappish Finnmark. The early sagas of the Norse Viking era describe dramatic skiing challenges. Versatile Sami (Lappish) skiing was described in the seventeenth century. There is evidence of ski jumping among the Norwegian military ski companies around the turn of the eighteenth century. The first formal competitions were most often combined events, either downhill with a terminating jump, or cross-country with one or more jumps included. A local race in Trysil in 1862 is the first known pure jumping competition. During that decade, attempts to formalize the activity into a sport also emerged in the cities. From 1879, the annual Huseby races in Kristiania (Oslo) strengthened the urban hegemony. In 1892, the organizers (Foreningen til Skiidrættens Fremme) moved the race to the larger Holmenkollen hill, which has housed one of the major events in the sport ever since.

Ski jumping spread from Norway to neighboring countries and to the countries to which Norwegians emigrated. Ski jumping came to Sweden through Norwegian soldiers posted in Stockholm as part of the union military system. Here the alleged first international ski jumping contest took place in 1886. The spread continued to Finland, where skiers rather hesitantly took up the "Norwegian habit" around the turn of the twentieth century. The original Finnish form of skiing at that time was cross-country. The Alps region also seems to have been introduced to ski jumping through Norwegian students and ski instructors, either directly or indirectly:

- In Austria, a Norwegian baker's apprentice impressed the locals with a jump of six meters in 1893.
- In Germany, three Norwegians were among the founders of the Schneeschuhverein (skiing club) München, which organized a jumping contest in 1894.

In Switzerland, France, and Italy, the first real contests did not occur until the turn of the twentieth century. Czechoslovakia, Poland, Yugoslavia, and Japan also embraced the sport after 1900. As early as the middle of the nineteenth century, however, Norwegian immigrants had brought jumping to North America. By the beginning of the twentieth century, ski jumps had been performed in such remote areas as Australia and South Africa as well. As skiing and ski jumping were transplanted to new settings, the sport experienced important cultural and ideological changes. In North America, for example, the interest in “world records” was a new element in ski jumping.

Competitions, Sites, and Personalities

Modern competitive ski jumping has been included in Olympic Games since the Winter Games in 1924. Today, these competitions comprise two individual (large and small hill) and one team competition. World championships were inaugurated in 1926 as parts of the championships in Nordic skiing. The German-Austrian “Springer-Tournee,” initiated during the winter 1952–1953 is a yearly big event that attracts hundreds of thousands of spectators. The New Year’s Day race in Garmisch-Partenkirchen has also become an international tradition on European television.

The World Cup of ski jumping has sought to integrate as many as possible of the sport’s traditional sites, of which there are many:

- Around 1900, the Holmenkollen races were the main event.
- Finland began its Finnish “Ski-games” in Lahti in 1922.
- Sweden initiated “Ski-games” in Falun in 1947.

- Central European events took place in Innsbruck, Oberstdorf, Bischofshofen, Zakopane, Harrachow, Kulm, and Engelberg, among others.
- Sapporo, Japan, and various hills in North America have also been traditional ski jumping sites.

From 1924 until 1952, Norwegian jumpers won all Olympic races as well as a substantial number of world championships. Thereafter, the geographical distribution of medals has been more even. In recent decades, world-class jumpers have come from nations as varied as Finland, Austria, Germany (both East and West), Slovenia, Czechoslovakia, Poland, Japan, Switzerland, and Italy as well as from ski-jumping strongholds in Canada and the United States.

Matti Nykanen of Finland has won the most championships after World War II. He collected nineteen medals from Olympic Games and world championships. Earlier jumpers had less chances of gaining gold medals. Three Ruud brothers, however, were highly successful at winning gold medals from world championships and Olympic Games:

- Every Olympic jumping contest between 1928 and 1948 had a Ruud on the winners’ podium.
- The brothers won seven of ten available international titles between 1928 and 1938.

Of the three brothers, Birger stood out—he won the last two Olympic gold medals before World War II

(1932 and 1936) and came back sixteen years after his first win to capture a silver medal in the 1948 Games at St. Moritz. His versatility is illustrated by his winning the downhill race—which counted as a part of the Alpine combination—in Garmisch-Partenkirchen in 1936. Another modern jumper who made a remarkable comeback was the German Jens Weissflog who won a gold and a silver medal in the 1984 Games (representing East Germany) and came back after a ten-year Olympic medal drought to garner a new gold medal at the 1994 Games at Lillehammer. The achievement was all the more impressive because ski jumping in the meantime had gone through a virtual revolution in the shift to V-style.

Jumping in very large hills, “ski-flying,” has in the last decades become a very popular sport. Planica in Slovenia recently holds the world record for the longest standing jump. In 2003, Matti Hautamaeki of Finland reached 231 meters.

Controversies

A competitive ski jump is evaluated through length and style points. The five referees assign style points from one to twenty. Norms and rules of evaluation have undergone dramatic changes. The historical tendency has been to diminish the importance of style. Modern equipment allows longer jumps and larger hills. As the hills grew, more aerodynamic styles forced their way in. The last big innovation was the V-style, introduced by the Swede Jan Boklov in 1986. His revolutionary idea was to jump with the skis spread in a V-shape (seen from behind), instead of jumping with parallel skis. This style today is the rule in competition. The telemark landing, with bent knees, one foot ahead of the other, has remained obligatory.

The tendency towards bigger hills, as well as more differentiated competitions, means that ski jumping has gone through the same processes of modernization as most other modern sports have, leading to a de-ideologization of what was originally considered a national Norwegian sport. The traditional ski ideologues

preferred to see ski jumping as a way of mastering natural challenges in the snow-covered mountain terrain, rather than as a competition in skiing acrobatics. Even though this ideology has been steadily eroded, some of its elements have survived. Ski jumping remains an aesthetic sport—the skier who has the longest jumps does not necessarily win the competition—even if the norms for evaluating what is considered a correct jump have changed tremendously over the years.

Ski jumping has been a male-dominated sport since its origins. Some girls and fewer women have tried to compete, but as a sport, ski jumping competition has been only for men until recently. Only in 2004 did the Federation Internationale de Ski (FIS) officially recognize ski jumping competitions for women.

Skiing, Alpine

Alpine skiing consists of two types of skiing on snow: slalom (skiing in a zigzag or wavy course between upright obstacles) and downhill. During the late nineteenth and early twentieth centuries Alpine skiing developed and spread, especially during the 1930s, to every part of the world that had enough snow cover to support the sport. Slalom and downhill

came to dominate recreational and competitive skiing on all levels.

History

The word *Alpine* refers to the Alps mountain range of central Europe, but long before people skied the Alps, Siberian tribes, nomadic Sami, and Norwegians had skied fast down their local hillsides when necessary. When Norwegians first visited the Alps at the beginning of the twentieth century, they told their hosts that the Alps, with their steep, wooded hillsides, were no place to ski and that everyone should stick to the undulations of the forelands.

Early skiers of Europe's heartland read the book by the Norwegian explorer Fridtjof Nansen (1861–1930) about his 1888 crossing of the Greenland ice cap. The book contained a long chapter on the history of skiing as well as on his use of skis. This utilitarian aspect of skis motivated outdoor enthusiasts to try skiing for sport. From the start skiing appealed to the middle and upper classes of the heartland, in contrast to Norway, where skis provided a way of getting about in winter country. The wealthy of Europe found a new preoccupation for their winter days that promised exercise, health, and amusement. Only in the military was skiing taken up by recruits from mountain villages; in France, for example, only with difficulty were the local lads persuaded to leave their animal-heated dens and odorous dwellings for a breath of high country air.

Until about 1900 skiers tended to slide around valley floors, occasionally making a trip to a pass or a col (a ridge connecting two higher elevations), and some of the more adventurous, often simulating their summer excursions, strove for a peak. On the return the exhilaration of the downhill rush was often commented upon. It was “the nearest approach to flying,” Arnold Lunn (1888–1974) confided to his diary in 1905.

Whereas a Norwegian country lad skied out of his back door, the wealthy of Europe had to travel from the cities to the ski fields. The development of transportation was vital for skiing to grow into a sport. Many out-of-the-way Alpine villages that happened to be on a rail

line experienced an economic upturn if they provided accommodation and guides. Mayors and innkeepers often promoted the development of skiing.

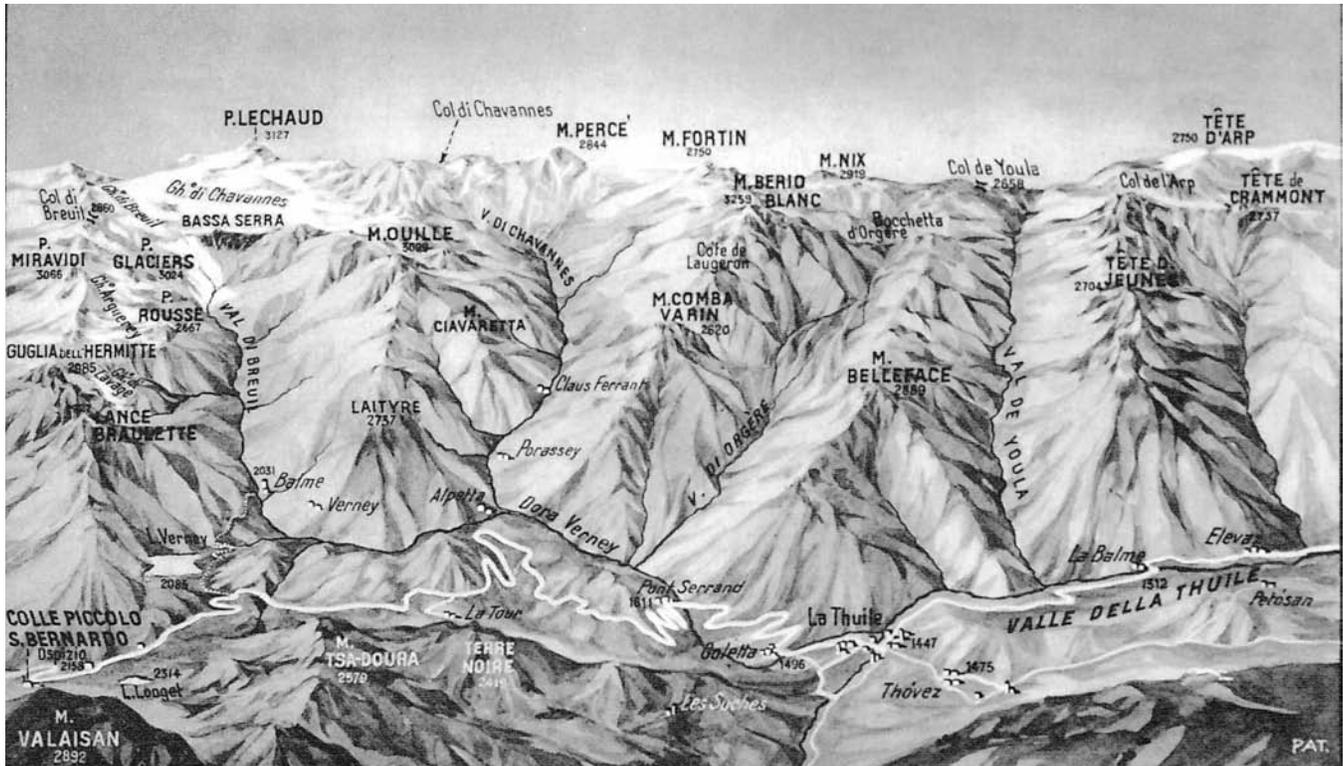

Switzerland's touristic infrastructure, already catering to an extended clientele with a large number of health stations, began to convert to winter use. In 1880 the bed count stood at 43,850. The number had doubled by 1894 and in 1912 reached 168,625, the year when 18,000 British visited for winter sporting. These Swiss stations were well served by the ease of railway connections in comparison with, say, Murzzuschlag, Austria, or Chamonix, France. The annual number of visitors to Davos in 1900 was thirteen thousand, almost exactly the number who visited the entire country of Norway.

Home Away from Home

British visitors—men and women—came from the top drawer of society to enjoy strenuous leisure in two select clubs, stayed in hotels reserved for themselves, and re-created an England of public school and officers mess among the stunning vistas of the Swiss Alps.

One of these clubs was the Ski Club of Great Britain, founded in 1903, which spent its time devising tests and running competitions. The key word is *tests*. These tests were supposed to produce an all-round skier. Arnold Lunn wrote about passing his third-class test in 1905: “Up and down 1,500 feet in two hours. Passed easily, though skis were coming off the whole way up. Came down with ski unfastened.” Style was important because skiing was perceived to be aesthetic: “He who habitually uses sticks [poles] to control ski is supposed to be disqualified.” Competent judges were hard to come by.

The British were by no means the only people to enjoy the new sport. In the years before 1914 the wealthy of Vienna, Berlin, Munich, Prague, Paris, Grenoble, and Turin also took to skiing and were tested by their own *Kunstlauf* (skill race), *Hindernislauf* (obstacle race), and *Stilgemssse Lauf* (style point race). Viennese high society had easy access to the slopes at Potzleinsdorf. Later they took the train to Semmering, Murzzuschlag, and particularly to Lilienfeld, where their instructor, Mathias Zdarsky

(1856–1940), demanded discipline and orthodoxy from his followers, drilling thousands during the years in a military manner while teaching them a technique that allowed for a descent on a steep slope even though he insisted on the use of only one pole.

On mountain ranges across Germany, in the Black Forest, Harz, and Riesengebirge, people who had read Nansen often inspired their friends to try skiing, and active clubs were formed. The same occurred in Austria. Such was the proliferation of skiing clubs that the Norwegians became concerned that the rest of Europe was corrupting what they considered to be their national sport. They organized the first international ski congress in 1910 to ensure that they controlled skiing. This congress was the forerunner of the Federation Internationale de Ski (FIS), which was founded in 1924 and was, in spite of its French name, dominated by Scandinavians until after World War II.

Test of Skill

Arnold Lunn, realizing that most Europeans were on skis only for short holiday periods and that the Alps required a different sort of skiing than the skiing that was

practiced in Norway, began proselytizing for a downhill race in 1913, claiming that it would be “the finest and most conclusive test of skiing.” The key word is—again—*test*. For Lunn the descent from the peak was as challenging as the climb up: The degree of slope, differing snow conditions, changing weather, and natural objects all tested the skier. Once in the trees, the skier had to negotiate the glades and run the curving paths and slippery logging roads while descending to the inn on the valley floor. In order to test a person’s ability to ski down from the high peaks, races down mountains were invented. Some races required elongated turns, others with sharper turns demanded more control of the skis. The downhill—often called the “down mountain race” or “straight race” (because the mark of an accomplished skier is a straight track)—was to simulate the speedy descent from peak or pass to tree line. The slalom tested the ability to take curves; it simulated tree running.

Early downhill races were uncontrolled descents. In 1910, while leading the unmarked course for the Roberts of Kandahar Cup (often seen as the first major downhill competition), the eventual winner met spectating Arnold Lunn halfway down the course. They

stopped for a chat and a drink. Then came 4.8 kilometers across a glacier, followed by 1.2 kilometers on windswept crust. The last 0.3 kilometer was “a test of tricky wood running.” This sort of amateur race has virtually no relationship to today’s downhill, where speeds can reach 112 kilometers an hour.

The word *slalom* is derived from the Norwegian *slalaam*, but the modern race owes little to Norwegian influence. Norwegians had a variety of Laam (tracks): Kneikelaam (run with bumps), Ufselaam (run off a cliff), Hoplaam (run with a jump or jumps), Svinglaam (run with turns), and a dare-devil run mixing all obstacles, the Uvyrdslaam or *ville lamir* (wild run). The *slalaam* was a descent around natural obstacles. Although included in a race meeting in Norway in 1879, it had not proved popular.

To define the course in early races, Lunn placed little branches, then flags, and, later, gates in the snow. He went on to publish debates, rules, and their changes during the years. Rules were first published for the 1922–1923 season, and further style regulations—such as ten-second penalties for sitting down at one flag before going on to the next—remained in force until the mid-1920s, by which time downhill and slalom were becoming events on the racing calendar. In 1930 they were finally accepted—with much Norwegian reservation—for inclusion in international competitions.

By then their popularity could be attributed to the thrill of speed. All of a sudden, it seemed, people had found a way to travel as fast as other animals and with as much grace. But people had to be taught how to do it. That was the great life work of the Austrian Hannes Schneider (1890–1955), whose Arlberg technique—a low crouch and a lift and swing into the turn—enabled skiers with much practice to swirl down the mountain sides in an exhilarating schuss (a descent directly down a slope at high speed) equaled only by the beauty of the motion. Lunn and Schneider combined to set up the Arlberg-Kandahar race in 1928, and it soon became the premier Alpine racing event in the world.

Norwegians Spread the Sport

Norwegian immigrants spread skiing in Canada and the United States; they joined the gold-fevered rush in Australia and New Zealand; they were in South America building railroads; and everywhere they went, when the snow came they made themselves skis and showed the natives how to enjoy themselves in winter. In these places a foundation of skiing was laid for the wave of Arlbergers who followed during the 1930s, some emigrating in search of work, others fleeing from fascist persecution. During this period non-Europeans, particularly people from the United States, journeyed to Europe to learn the Arlberg technique from the master himself. These wealthy people returned to their own countries and re-created the skiing style and technique back home. Some brought Arlberg experts back with them; thus, Schneider’s technique swept the Alpine skiing world during the 1930s. Otto Lang, one of Schneider’s leading instructors, found himself teaching in Spain and the United States; Ernst Skadarasy went to Australia and New Zealand. For the spring of 1930 Schneider traveled to Japan, where he taught hundreds via an interpreter.

The Norwegians, longtime masters of cross-country (Nordic) skiing, had difficulty accepting the new Alpine skiing. Not only was the graceful Telemark (relating to a region of Norway) turn eclipsed by the Arlberg crouch, but also the whole philosophy was undermined by Alpine “hotel sport.” One U.S. instruction book written in 1935 listed eight foreign words “necessary for understanding a ski lesson.” Seven were German. A Japanese tourist booklet in English extolling Hokaido skiing listed the available Hutte (huts) and took particular pride in the Okura Schantze (jump). Although people had complained about the canonization of Schneider during the 1920s, his popularity soared with the release of Dr. Arnold Fanck’s (1889–1974) ski films: *Wunder des Schneeschuhes* (The Wonders of Skiing) and *Der weisse Rausch* (White Ecstasy) made in 1931 with Leni Riefenstahl (1902–2003) dazzled the ski world with the poetry of motion. Schneider himself attributed his success on a worldwide scale to these films.

The best and fastest way to learn a sport is to watch and imitate a champion. ■ JEAN-CLAUDE KILLY

After World War I Alpine skiing became even more popular. Wartime experiments with over-the-snow vehicles, cable lift construction, and the use of strong and light metals and alloys were all adapted by the ski industry. Wooden skis gave way to more durable and faster metal skis, now designed specifically for downhill or slalom. Skiing also became easier with stiffer boots, release bindings, and lighter poles. Today's Alpine parabolic ski, narrowing in the middle and widening at tip and tail, is the ski of choice. Speed has increased for both racer and recreational skier. As early as 1935 a giant slalom (a longer and steeper course) was tried in Italy: It became the third of the Alpine competitions sanctioned by the FIS in 1972. The faster super giant slalom, known as the "super G," is run over a still longer course. It became part of the world racing circuit in 1987. In giant slalom the control gates are spaced farther apart than in a slalom. Both giant slalom and super G combine elements of downhill and slalom.

Snowboarding to the Rescue

The current estimate of skiers worldwide is 25 million, but many people ski only three or four times a season. Since the early 1970s the growth in the number of skiers has been negligible, and only the advent of snowboarding has kept much of what used to be called the "ski industry" afloat. Skiing has given way to "snow sports," which might include tubing, even riding bicycles down the slopes. Particularly in Europe people witnessing larger ski events can still number into the thousands, whereas in the United States, for example, ski areas hosting World Cup events sometimes have had to advertise cheap tickets just to get people to attend. Around the winner's podium might be fewer than fifty admirers. Even though dual racing—in which one competitor races against another, rather than a decision being based on time—was invented for the professional circuit, the numbers of spectators did not rise appreciably.

The Olympic Games are different because they go on for such a long time, are exactly organized, and have a following just because they are "Olympic." The television audience for the winter Olympics runs into the millions.

During the years four major controversies have arisen. The first arose during the early twentieth century when arguments between people who supported Mathias Zdarsky and those who supported Norwegian styles almost produced a diplomatic incident. The second was the introduction of skis to aid in mountaineering in winter. Old-guard mountaineers tended to see skiing as some sort of acrobatic nonsense: all right, perhaps, on the sloping forelands but certainly not something that should sully the purity of high mountain peaks. Making the rift worse, as more skiers enjoyed the rush down from the mountain, they called for the Alpine clubs to build huts. Diehard mountaineers saw their subscriptions going for the wrong purpose. The third and fourth controversies were connected: They had to do with what constitutes professionalism, and much of that controversy took place over the position of the ski instructor. Of course, prize money and, after World War II, endorsement of products also entered into the controversy. Under-the-counter payments to top skiers became common. At the 1972 Olympics in Nagano, Japan, long-time International Olympic Committee President Avery Brundage could have disqualified forty participants; the great Austrian Alpine skier Karl Schranz was sent home, providing a scapegoat.

Nature of the Sport

On a recreational level Alpine skiing has no rules except those enforced by the ski area, such as what constitutes dangerous skiing and what the penalty might be. Competitions, on the other hand, are rule-bound by national bodies and by the FIS for international meets. Specifications are provided for equipment, clothing, length of courses, number of gates in the slalom, and so on. Women's races are slightly shorter and less steep than the men's courses.

Facilities have kept pace with advancing technology. Before World War II, in the United States the rope tow was ubiquitous. After the war J-bars, T-bars, other up-ski devices, chairlifts, trams, and mountain railroads climbed what were once pristine snow fields to the peaks above. For example, skiers can make their way up

the Val Gardena, in Italy's south Tirol, by taking eighty-four lifts.

U.S. ski areas now vie with European Alpine resorts in popularity. The British often come to ski the slopes in the northeastern United States, and the trail signs at Snowbird, Utah, are written in Japanese. Western Canada is well known for its helicopter skiing, and Australia and New Zealand now promote their winter joys during the Northern Hemisphere's summer, as South America once did as well.

However, the ease of global travel also has had a negative effect on Alpine skiing. Although a skier of means can ski on three continents in one season, he or she may be disappointed to find that ski resorts everywhere are much the same—the lifts are all made by the same few manufacturers, the ski equipment made by the same companies, and the clothing, food, drink, and even ski techniques are the same around the world. A rented condominium in Albertville, France, or Zell am See, Austria, is indistinguishable from a condo in Stowe, Utah, or Sapporo, Japan. Only the accent of the skiers (who frequently speak English) varies. Alpine ski development has urbanized and standardized the ski environment around the globe, outdoors and in.

Competition at the Top

Alpine events became part of the winter Olympic Games only in 1936. The winter games have increased in size, spectator attendance, number of events, and geographical distribution. Eight of the first ten games were held in Europe. The United States and France have hosted the games three times, Japan twice.

Downhill and slalom were the only Alpine events in 1936, and gold, silver, and bronze medals were awarded for a combination of the two. The winner of the men's downhill was the Norwegian jumper Birger

Ruud, but he did poorly in the slalom, so the gold medal went to the German Franz Pfnur and the bronze to Guzzi Lantschner, who had switched allegiance from Austria to Germany. In the women's downhill race the surprise competitor was the young Norwegian Laila Schou Nilsen, whose slalom was good enough to bring her a bronze medal. The winner was the one woman who had proved her superiority before the Olympics: Christl Cranz of Germany. She had fallen in the downhill and actually placed sixth, but her slalom was so good, beating the competition by more than seven seconds, that she won the gold medal.

U.S. skier Gretchen Fraser's unexpected slalom win at St. Moritz, Switzerland, in the first post-World War II games put the Europeans on notice that U.S. women were up and coming. At Oslo, Norway, in 1952 Andrea Mead Lawrence showed gold form in both the slalom and in the giant slalom the first time this race was on the Olympic program.

The Olympics at Cortina, Italy, belonged to a triple gold medalist, Austrian Toni Sailer. He was superior to the runners-up by more than two seconds in the downhill, an extraordinary four seconds in the slalom, and more than six seconds in the giant slalom—something that Jean-Claude Killy of France repeated—albeit by small margins—on his home piste (downhill ski trail) of Grenoble in 1968. At Innsbruck, Austria, in 1976 Rosi Mittermaier of Germany won the downhill and slalom and missed first place in the giant slalom by .12 second.

Skiing combines outdoor fun with knocking down trees with your face. ■ DAVE BARRY

Sarajevo, Yugoslavia, in 1984 produced surprise winners in U.S. skiers Bill Johnson and Debbie Armstrong, who won the men's downhill and women's giant slalom. The Alpine ski powers of Europe—Austria, France, Germany, and Switzerland—in the years from 1936 to 1984 won 72 percent of all medals given for the Alpine disciplines. By comparison, the United States won 13 percent. Spain and Japan have one medal each. Overall the Austrians have proved the most successful medal winners with seventy-seven. The Swiss come next with fifty and the French with thirty-eight. Today's top athletes are comparable; .8 second separated the first eight racers in one downhill. At the Salt Lake City, Utah, men's downhill in 2002, .22 second separated first place from second place, and .06 second separated second place from third place. Such a difference is difficult to detect, and the audience has to wait for the official time to know for whom to cheer. The Olympic program now includes running moguls (bumps in a ski run), aerials, and snowboarding, providing instant gratification that can easily be exploited by television.

Downhill Hero

When Alpine skiing first took hold, the major figure on the slope was the instructor: Hannes Schneider was literally skimaster to the world. However, after World War II, partially because so many instructors were needed, and partially because so many people became adept at the sport, the racer became more of the hero. The first to turn his winning to major advantage was the Norwegian Stein Eriksen (b. 1927), whose spectacular downhill run at the Oslo Olympics added to his golden-boy image. He parlayed his victories into an economic gold mine and moved to the United States, where—in the manner of CEOs of large companies—he moved from Michigan's Boyne Mountain to Sugarbush in Vermont, then to Aspen Highlands, Colorado, and then to Park City, Utah.

Eriksen's 1952 Olympic victory run has not been the only spectacular run, of course. Austrians remember their Franz Klammer's (b. 1953) dare-devil downhill at Igls, Austria, in 1976. Skiers such as Sweden's Ingemar

Stenmark (b. 1956), France's Jean-Claude Killy (b. 1943), Austria's Toni Sailer (b. 1935), and Italy's Alberto Tomba (b. 1966) dominated Alpine competition and attracted large followings. No non-European has achieved this sort of hero status.

The World Cup was first suggested by Serge Lange and organized by *L'Equipe*, a major French sporting journal, but is now managed by the FIS with input from the national associations. This annual competition rates skiers in downhill, giant slalom, and slalom with a point system so that at the end of the season the best all-round skier is clear. In 1966–1967 seventeen races were held; now the number is up to thirty as resorts and national federations see economic advantage in hosting a World Cup event. During the years the point system has been changed, with the result that the winning records of, say, Ingemar Stenmark and Jean-Claude Killy can never be compared.

Governing Body

The Federation Internationale de Ski (www.fis-ski) via its many committees governs all facets of international ski competitions. The International Olympic Committee (www.olympic.org) has jurisdiction over the actual organization of the program for skiing, but the technicalities are left to the FIS. Every skiing nation has its national organizations, and local clubs belong to regional associations. Where club activities are strong, such as in Europe, the better skiers move from the club to regional championships and, if successful, to the national teams. In the United States university teams often produce the strongest skiers, and top skiers migrate to the national teams.

Skiing, Cross-Country

People have been skiing to get from point A to point B for more than five thousand years. Written records from ancient Scandinavia and China tell of informal skiing competition and the use of skis in warfare. Icelandic *eddas* (thirteenth-century collections of mythological, heroic, and aphoristic poetry) and Norse sagas also tell of early informal competition. However, not until the late eighteenth century were the first organized competitions held under the auspices of the Norwegian military, probably in 1767. Monetary prizes were awarded for shooting while skiing, for making the fastest downhill run, and for skiing in full equipment.

When the Norwegian ski troops disbanded in 1826, local civilian clubs took up the sport and organized competitions. The competition near Kristiania (which became the Holmenkollen ski competition at Oslo) was first staged in 1879. By then emigrating Norwegians had taken their skiing style with them throughout the world. In Australia and the Americas they introduced locals to the use of skis for travel and enjoyment. Gold fever also infected immigrants who knew how to ski, and in the deep mountain snows of Kiandra (Australia) and California (United States), skis became common in mining camps. Skiing mail carriers there were often hailed as heroes.

Thus, the Norwegian way of skiing and the concept of *idraet*—the belief that outdoor sports improve not

only individuals but also clubs and even nations—formed the foundation of cross-country skiing worldwide. The more optimistic proponents of *idraet* believed that cross-country skiing could regenerate a nation, an especially important notion to Norwegians, who had won their independence from Sweden in 1905. Until Alpine (relating to competitive ski events consisting of slalom and downhill racing) skiing became popular during the 1930s, Norwegian styles and attitudes remained dominant.

“Rich Man’s Passion”

The Norwegian explorer Fridtjof Nansen (1861–1930) crossed southern Greenland on skis in 1888. When his book about his expedition, *Paa Ski over Gronland* (Across Greenland on Skis) was translated into German, it sparked an interest in skiing among wealthy outdoorsmen of Europe. By 1900 cross-country skiing was “a rich man’s passion” throughout Europe, and skiing clubs were formed. Visiting Norwegians became club mentors and set up competitions with ski jumping as the centerpiece.

Organizations were founded on the local, regional, and national levels to organize competitions and establish rules as clubs were formed worldwide. Norwegians, to retain control of “their” sport, called for an international ski congress in 1910 and held the secretaryship until the Federation Internationale de Ski (FIS), the world governing body of ski competition, was founded in 1924. The FIS makes rules for competitions, approves courses for international competition, selects the sites for the biennial FIS world championships, determines eligibility, sanctions events eligible for FIS points, and approves the courses for Olympic competition.

Recreational Skiing

Until the 1920s and 1930s, when the Alpine skiing craze put a premium on speed when skiing down a hill, cross-country was the only form of skiing. The first major recreational use of skis was for winter trips into the mountains, and more adventurous people attempted even higher climbs on skis. That tradition continues today as experienced cross-country skiers traverse the

high mountains of the world from the Caucasus (Russia) to the Karakorams (Pakistan) and from the Wasatch range (United States) to the Atlas range (Algeria). The most committed cross-country skiers test their skill against the mountains of Patagonia, the rugged terrain of Greenland, the Haute Route of Switzerland, and even the North and South Poles.

However, the majority of cross-country skiers today are less interested in a survival adventure than a 1900-style ski outing: skiing through forests and across meadows. In 1900, though, such an outing would have been a club outing. Today a ski party is more likely to be made up of families or informal, small groups. Skiers today also enjoy amenities unavailable in 1900: machine-prepared *loipen* (trails) in the Alps, lighted pathways in Nordmarka near Oslo, and marked loops in North America. These amenities attest to the popularity of a winter sport that costs substantially less than a day's Alpine lift skiing.

Since World War II recreational cross-country skiing and skiing equipment have been aggressively marketed in the United States, possibly because the country's fitness craze began as Bill Koch (b. 1955) won an Olympic silver medal for the 30-kilometer race at Innsbruck, Austria, in 1976. Recreational skis were not developed specifically for cross-country skiing until a different sort of ski had been developed for Alpine skiing. Skis made of wood have yielded to skis made of synthetic materials that require no waxing. Click-in bindings that require special boots have replaced the three-pin binding designed to hold the front part of the boot firm while leaving the ankle and heel free. Poles made of steel and bamboo are now found only in museums, replaced by high-tech poles with small disks, alloy shafts, and pointed davits. Fashions, too, have changed with these developments.

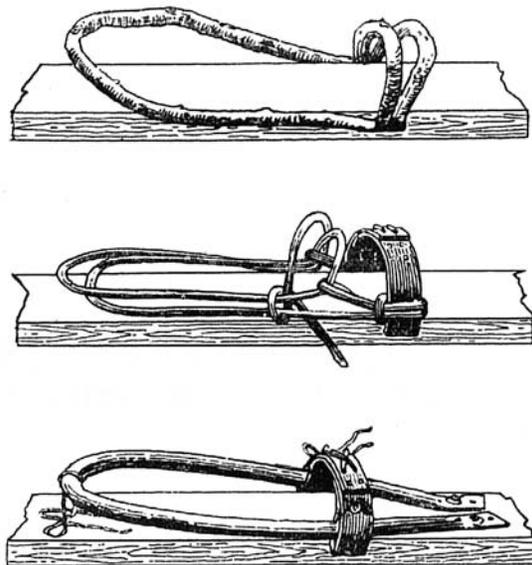

Jumping was the high point of any ski competition around the turn of the century. In Scandinavia and particularly in North America local communities prided themselves on their jumping. In Europe jumping declined in popularity as skiing became a social activity, and although jumping was still admired, most skiers no

longer attempted it. In Scandinavia many men continued jumping for recreation; in North America only the experts continued, and jumping became the great winter outdoor spectator sport.

Telemark is a style of ski turn that peasant skiers from Telemark, Norway, first used. During the late nineteenth century skiers used it to turn and stop in cross-country skiing and in jumping. Now the telemark turn is often used in Alpine skiing as well. Special boots, skis, and even competitions are designed for the "tele skier."

Competitive Skiing

Cross-country racing, first organized on national levels in the United States and Europe before World War I, observed Norwegian rules. The standard Norwegian races were 15 to 50 kilometers long, and the popular 50-kilometer race was called the "winter marathon." However, the true hero was not the winner of these races. The true hero was the man whose combined points for cross-country skiing and ski jumping showed him to be the best all-round skier. After World War II specialization became increasingly common as men and, from 1952 on, women trained for specific distances. Cross-country racing by the 1960s had become such a specialized sport

Skiing, Cross-Country

Cross Country Racing, 1907

The extract below from the National Ski Association Report (7 February 1907) describes the first extensive cross-country ski run in the United States:

It was a pretty sight to behold the uniformed members of Nor Ski Club, Chicago, starting from the headquarters with red, white and blue streamers to be posted along the nine mile course. A good natured and healthy looking lot of men, who would do honor to any regiment of infantry in Uncle Sam's army. The men were distributed along the course to watch at difficult passes, and report on any participant, who should in any way disobey the laws governing the contest. It is a very strict rule in Norway not to allow any participant in a cross country run to remove his skis during the contest, and this rule was adhered to in every detail. The skis could not be removed in jumping a fence or in clearing any other obstacle that might seem rather hard to overcome. The practical use of the ski is learned in runs of this nature, and it takes but a short time to get accustomed to handling the skis to advantage over obstacles of every description.

On a level surface, the Finns are the masters of the ski, while in a hilly and brushy country, the Norwegians cannot be beaten. The course of this run (the National Championship) was laid over a territory consisting of about four miles of hills and brush, three miles on the level and two miles on snow covered ice, thus giving the participating Finlanders a chance to gain on the level what their long skis naturally would lose through the brush, and the world famous Asarja Autio certainly knew how to avail himself of these level stretches as he practically flew over the snow as soon as the open availed itself, and he sustained his reputation by covering the distances two minutes ahead of the sturdy Norwegian runners, Elling Diesen and Gustav Bye, in the good time of 47 minutes and 30 seconds. The participants were in good condition, when they finished their hard run, and were well taken care of at headquarters. Warm milk was served as refreshments. It is of great importance, that the men posted along the course have a supply of bits of oranges or lemons to give the skiers as refreshments as they pass.

that recreational and club skiers no longer even considered entering competitions. However, in China and other countries where skiing did not become so specialized, cross-country racing continued as a club activity.

So-called citizen races (races open to all) are a recent development that benefits the better amateur cross-country skier. These races are best known from the thirteen marathons held around the world. The Norwegian Birkebeiner and the Swedish Vasaloppet, commemorating military and national events of the thirteenth and sixteenth centuries, hold pride of place among the venues: Europe, North America, Japan, and Australia.

The biathlon—a cross-country race that includes target shooting—is an offshoot of cross-country skiing. It is derived from the military ski patrol race. Before World War I Western and Westernized military leaders (in Norway, Finland, Sweden, Germany, Italy, France, Austria-

Hungary, Switzerland, Russia, Japan, and the United States) equipped a few military units as ski units. International military ski competitions were held. The Alpini (Italy) and the Chasseurs Alpains (France) were particular rivals. Patrols of four to six men in battle gear competed for the best time traveling between two points. During the war troops on skis saw some duty on the major fronts in the Dolomites, Vosges, and Carpathians.

After the war the Federation Internationale de Ski and the International Olympic Committee (IOC) considered adopting the biathlon. In 1909 proponents had called for its inclusion in the Olympic Games, but it remained only a demonstration event until it became part of the Olympic program at Squaw Valley (United States) in 1960.

Style Controversies

Arguments between proponents of the classical technique and proponents of the skating step are about twenty years old. The skating step—

about the ability of women's bodies to withstand such competition prevented women from receiving serious consideration, and ski jumping by women was even more out of the question. However, the two world wars opened opportunities for women. In 1952 competitive cross-country skiing for women became part of the Olympic program at Oslo with a 10-kilometer event. At Lillehammer, Norway, in 1994 women's events of 5, 15, and 30 kilometers, a 4 × 5-kilometer relay, 7.5- and 15-kilometer biathlons, and a 4 × 7.5-kilometer relay were held. The 5-kilometer and 30-kilometer events were skied in classical technique; the 15-kilometer event was skied in the free technique, better described as the "skating step."

At the 2002 Winter Olympics at Salt Lake City, Utah, cross-country skiing gold medal winners were: men's sprint, Tor Arne Hetland of Norway; men's 10-kilometer free pursuit, Johann Muehlepp of Spain; men's 15-kilometer classical, Andrus Veerpalu of Spain; men's 30-kilometer free mass start, Johann Muehlepp of Spain; men's 50-kilometer classical, Mikhail Ivanov of the Russian Federation; men's 4 × 10-kilometer relay, Thomas Alsgaard, Kristen Skjeldal, Frode Estil, and Anders Aukland of Norway; women's sprint, Julija Tjepalova of the Russian Federation; women's 5-kilometer free pursuit, Olga Danilova of the Russian Federation; women's 10-kilometer classical, Bente Skari of Norway; women's 15-kilometer free mass start, Stefania Belmondo of Italy; women's 30-kilometer classical,

one ski in a track and the other used like a skate to push off—was introduced at the Holmenkollen 50-kilometer race in 1971, and the Engadine, Switzerland, marathon in 1975 was won by a skier using the skating step. The step proved faster over flatter terrain, but it also cut up the prepared track, was derived from another sport, and seemed to emphasize winning by use of a modern technique over honoring the classical technique. By the late 1970s Finnish skaters used the skating step so effectively that it was called the "Finnstep" or "Siitonschritt" after Finland's Pauli Siitonen. Today the classical technique and skating step are separate cross-country disciplines.

During the past century ski jumping styles, too, have changed. At one time a squat position competed with the more upright position that is popular today. Skiers have become increasingly interested in aerodynamic styles since the mid-1920s. Ski jumping competitions are won or lost on the basis of two criteria: the distance traveled and the style of the jump based on positions at takeoff, flight, and landing. Rules for awarding points have changed. At one time points were awarded for the crouch and the leap, which ideally aesthetically stretched and poised the body in the air with arms forward, back, or at the side to allow flight guidance and balance on landing. The lift during the flight was achieved by parallel skis pointing straight out almost like the wing of a plane. However, during the late 1980s Jan Boklov of Sweden spread his skis in an outward "V"

on taking off, and a hundred-year-old tradition was broken. Initially perceived as unaesthetic and accordingly discounted by judges, the “V” style was given official sanction before the 1992 Olympics and has replaced the classical ski jumping style. In 1962 jumps were regulated at heights of 90 and 70 meters, and ski flying, in which skiers attain distances of more than 183 meters, was sanctioned by the FIS in 1972.

Skiing, Freestyle

Freestyle skiing goes back to the 1930s and is a form of Alpine skiing that is divided into three disciplines:

- Mogul
- Aerial
- Acro (short for acrobatic)

Each requires different athletic skills, terrain, and equipment.

Three Disciplines

The roots of freestyle skiing cannot be exactly determined; however, most sources mention Norway as the cradle of freestyle skiing. There, in the 1930s, competi-

tive skiers used ski acrobatics for training and discovered their entertaining effect.

Competitive freestyle skiing started in the United States in 1966. Beginning in the 1970s, other countries staged national championships and the sport was divided into the three disciplines with competitions for men and women. In 1973, the International Free Skiers Association (IFSA) was formed to protect athlete interests, develop judging and scoring rules, and help standardize events. In 1980, the Fédération Internationale de Ski (FIS) established the Freestyle World Cup, and the first World Championships took place in 1986 in Tignes, France. Competitions were held in all three disciplines, including a combined competition in mogul and aerial skiing. Two years later, freestyle skiing was included as a demonstration sport at the 1988 Calgary Olympic Winter Games. However, only mogul and aerial skiing gained Olympic status: mogul competitions were accepted for the 1992 Olympic Winter Games in Albertville (France), and aerials for the Lillehammer (Norway) Winter Games in 1994.

With the development of new gliding and skiing equipment, and the building of special snow parks for snowboarders that included various jumps and half-pipes, aerial skiing has become more common among recreational skiers, especially younger ones. Recreational skiers commonly try the “hot dogging” technique of the bump experts when skiing moguls. The least common, and popular, among recreational skiers is acro skiing mainly because special equipment and athletic skills are needed, whereas bumps and jumps can be done with normal skis and poles.

Many ski schools around the world have also taken advantage of this raising interest by offering clinics and classes in the three freestyle disciplines. Because of this popularity, many ski federations include freestyle elements in their ski instructor training programs.

For the entertainment business, freestyle skiing attracts spectators at snow festivals and ski school events. The film industry discovered the attractiveness of the sport as early as the 1930s when the first ski films were produced:

- *Der wesse Rausch* [*The White Frenzy*] (1931), a German silent film by Arnold Fanck, starring Hannes Schneider and Leni Riefenstahl, included many acrobatic and aerial skiing sequences that drew viewers into the movie theatres.
- Willy Bogner's movie *Fire and Ice* (1986), with a superficial storyline, focused on all three freestyle disciplines and has become an icon for many skiers.
- The American producer Warren Miller also frequently shows glimpses of mogul and aerial moves in his extreme skiing adventure movies.

What Is Freestyle Skiing?

The following sections will give a brief insight into the three unrelated freestyle skiing techniques.

MOGUL SKIING

Mogul skiing is also known as “hot dogging.” The athlete skis through bumps, or moguls, keeping to the fall line.

Skiers compensate for the moguls with their knees while their upper bodies stay motionless. The skis should not leave the snow surface. Competitions take place on steep runs of 28 to 35 degrees for about 250 meters. The moguls are often artificially constructed, with two jump areas for aerial maneuvers in the course. Performed jumps must include two or three techniques but inverted maneuvers are prohibited. Usually two skiers compete in a parallel run against each other in a round-robin event. Style, time, and the performance of the two jumps are important for winning the competition. The winner is determined by the score, which is awarded by seven judges. The total score is split into 25 percent for speed, 25 percent for the two aerial jumps, and 50 percent for the overall technique and control during the performance. The skiers often wear special colored kneepads to draw the judges' attention to their performance. The average ski length is 185 centimeters for men and 175 centimeters for women.

AERIAL SKIING

Aerial skiing is a form of ski jumping in which tricks are performed in the air. Aerial skiers use jumping areas, or kickers, of various sizes. Top competitors perform triple back somersaults with as many as four twists. These jumps are very similar to trampolines, which is used for training, moves. To perform these spectacular jumps, the skis should not be too long, usually only 160 centimeters long.

The competitors jump over a tabletop where they hit the “Big Air,” meaning they are several meters high in the air, which helps them perform. Half- and quarter-pipes are incorporated in aerial skiing. Here, the jumping and flipping occurs with less air.

There are also combined mogul and aerial competitions.

ACRO SKIING

Acro skiing is more commonly known as “ski ballet” because of its similarity to dancing. Acro is performed on groomed runs that are about 250 meters long and not steep. According to the FIS, acro competitions include jumps, spins, flips, rotations, and inverted movements. Moreover, linking maneuvers blend all these elements into “a well-balanced program, performed in harmony with music of the skiers’ choice,” as stated by the FIS. The performance is judged equally on technique and artistic impression.

This sport shares many similarities with figure skating on ice, and many acro participants originally competed in figure skating or gymnastics.

For these disciplines, the skis are about the length of 80 percent of the performer’s body; thus, they are easier to manage. Longer poles support jumping and lifting elements. Acro skiing has not yet become an Olympic event.

Competition at the Top

On the international level, the FIS is responsible for organizing the Freestyle FIS World Cup every winter and the Freestyle World Ski Championships held every other winter since 1986 for all three disciplines, as well as combined mogul and aerial competitions. Other than

these FIS events, the Olympic Games are the highest elite level competition for freestyle skiers.

The first Olympic mogul competitions were held 1992 in Albertville, France. The gold medalists were Edgar Grosperon of France in the men’s competition, and Donna Weinbracht of the United States in the women’s competition. Two years later at the Lillehammer Games, aerial events were officially included. Andreas Schönbächler of Switzerland won the men’s competition and Lina Cheryazova of Uzbekistan won the women’s.

Governing Body

In most countries, the national ski federation governs freestyle skiing. International competitions are conducted by the FIS (www.fis-ski.com).

Skiing, Water

Popular around the world, water skiing combines elements of several sports, including boating and snow skiing. Some 50 million people participate in water skiing internationally, most of whom are recreational skiers. The remainder are serious water skiers who compete in organized events.

In the sport, a water skier is pulled along the surface of the water by a motorboat. In the basic style of the sport, the water skier wears a ski on each foot and

holds a tow rope with both arms. As the boat moves forward, it pulls the skier at a speed that enables him or her to stand up on the skis and glide along the surface of the water. Variations include the use of only one ski, barefoot skiing, and jumping off ramps, among others.

Water skiing appeals to people on many levels. It offers the opportunity to experience being on the water in a more direct sense than is possible in a boat, combined with the excitement of skiing along its surface at high speeds. The basic skills of water skiing can be learned quickly, and people with a moderate degree of physical proficiency can enjoy the sport on its simpler levels. Water skiing at more advanced levels is a very challenging sport that requires a great deal of physical skill and courage. Those who pursue the sport more seriously enjoy the opportunity to develop their skills, test their courage, and compete against other water skiers.

Water skiing is also a popular spectator sport in competition as well as in noncompetitive entertainment shows. The skiers can accomplish physical feats that are quite impressive to watch, including intricate maneuvers on skis, high-speed runs, impressive leaps and flips in the air, and other demonstrations of prowess and courage.

The name can be spelled as two separate words (water skiing), as one word (waterskiing), or with a hyphen (water-skiing). The primary water skiing organization in the United States, the American Water Ski Association, spells it as two separate words.

Origins and Development

Water skiing is a twentieth-century sport, with origins in the ancient principle of using the power of one moving object to tow another. Throughout history people have used animals to pull wagons on land or sleds on snow and ice. On the water, people used one vessel to tow a raft or attached boat containing cargo. In addition to harnessing this concept to accomplish tasks, people have used it for recreational activities such as sledding.

Although it is believed that people attempted earlier forms of water skiing using sailboats, the sport originated in its modern form only after 1900, with the development of the motorboat, which provided sufficient

power and speed to reliably pull people along the water's surface. As motorboats began to proliferate in the decades after 1900, people in various locations began to develop separately activities that evolved into the sport of water skiing, including towing sleds and other flat objects that people either sat on or stood up in. These activities were popular on the French Riviera and other bodies of water in Europe; Count Maximilian Pulaski is believed to have devised an early pair of water skis in Europe in the early 1920s. In the United States, Ralph Samuelson invented and demonstrated a pair of water skis in 1922 on Lake Pepin, Minnesota. At approximately the same time, near New York City, Fred Waller invented and marketed a style of water ski and also invented the bridle at the end of the tow rope that water skiers hold.

By the 1930s efforts were being initiated to organize and promote the sport more widely. In the United States an enthusiast named Dan Haines formed the American Water Ski Association (AWSA) in 1939, and the organization held its first national championship at Jones Beach near New York City that year. Many of the pioneers of the sport came together under the umbrella of AWSA, and standardized rules and a structure of local clubs and competitions were established. Similar initiatives took place in other nations. In the late 1940s the World Water Ski Union (WWSU) was formed to coordinate the sport, sanction events and records, and formulate rules internationally. Tournaments and championship events were established throughout the world on regional, national, and international levels.

EMERGENCE AS A SPECTATOR SPORT

Water skiing also captured the public's attention as a spectator sport. Entertainment-oriented water shows became popular attractions that helped to boost the sport's visibility. These shows featured spectacular stunts, beautiful women performing choreographed dance routines, and other crowd-pleasing activities on water skis. One of the first of these water-sports shows was held in 1928 at the Atlantic City Steel Pier in New Jersey sponsored by entrepreneur Frank Sterling.

In Florida, Dick Pope featured a ski-jumping demonstration that same year. Pope and his family became leading promoters of water-skiing shows, especially after establishing a major ski show at Cypress Gardens, an aquatic theme park in Winter Haven, Florida. Similar attractions were established in many other locations.

World War II inhibited recreational activities like water skiing that used fuel needed for the war effort. After the war, however, water skiing experienced steady and continued growth. It remained primarily an amateur sport, with trophies awarded more often than prize money. Many expert water skiers made a living by teaching, participating in shows, or holding other jobs connected to the sport. Professional competitive water skiing tours and events were eventually established, but the amateur emphasis remained. The distinction between amateur and professional aspects of the sport has been an ongoing debate.

Water skiing continued to grow and become more diverse in the decades after 1970. In part this reflected the overall popularity of the sport of powerboating. Enthusiasts continued to accomplish new speed and distance records and to perform ever-more-spectacular stunts. New variations of water skiing were also devised. These included activities that combined water skiing with elements of other sports such as hang gliding and surfing. Both males and females participate in water skiing on a recreational and competitive level; tournaments and series often include categories for males, females, and mixed-gender events.

Practice

In the basic form of water skiing, the skier uses two skis and holds a horizontal bar connected to the end of the tow rope, which is attached to the motorboat. The tow rope is typically 23 meters (75 feet) long, although the ropes vary in length depending on the particular activity. There are several basic ways to start a run. In a basic beach start, the skier crouches in the water with arms forward and knees close to the chest, with the lower legs placed so the ski tips are raised out of the water. As the boat moves forward, the skis are pulled

and lifted straight onto the water's surface. The skier rises to a standing position and is pulled along. Variations include the dock start, in which the skier begins by sitting on a dock and is pulled into the water as the boat starts forward.

The minimum sustained speed for water skiing begins at around 24 kilometers per hour (15 miles per hour). As water skiers become more proficient and confident, they can be towed at increasing speeds. In 1983, Christopher Michael Massey, an Australian, established a water-ski speed record of more than 230 kilometers (144 miles) per hour.

Once beginning skiers are able to maintain balance while riding straight behind the boat, they can progress to turning independently of the boat and making other movements. Water skiers control their runs in various ways, including how they bend their legs; lean forward, backward, and from side to side; hold and tug the tow rope; and shift their weight and position in other ways. One basic move is crossing the wake, which is accomplished by attaining the momentum to swing beyond

the waves that fan out behind both sides of the boat. In a more exaggerated form, this is known as wake jumping. Water skiers may advance to using only one ski and to more difficult and specialized tricks, jumps, and other challenging activities.

Ski Design

The design of basic skis emphasizes stability and ease of handling. They are often between 1.5 and 1.8 meters (60 and 70 inches) long and come in pairs, with a binding that holds the foot securely but releases quickly to protect skiers if they fall or lose control. There are many other variations and types of water skis for specific purposes. Advanced slalom skiers use single skis with two sets of bindings, one for each foot. Skis designed for stunts and other purposes may be shorter or more rounded. Other types of skis include the kneeboard, which is ridden in a kneeling position, and boards that are ridden without bindings (similar to a surfboard).

Powerboat Concerns

Many types of powerboats are used to tow water skiers. On a purely recreational level, a variety of general-purpose motorboats are suitable. However, certain characteristics are important. Boats should have an appropriate size and body design and an engine that has enough power to tow a person but that does not create an excessive wake or overwhelm the skier in other ways. Certain powerboats are designed specifically for water skiing and are used by dedicated amateurs and in organized competitions and professional shows. The type of boat used is especially critical in competitions to ensure that the performances of individual skiers are based on their own abilities and are not the result of differences among towboats. The AWSA, for example, has very stringent criteria for boats that can be used in sanctioned events to ensure consistency, performance, and safety.

Safety is an important concern, especially in the more advanced aspects of the sport, in which skiers travel at high speeds and perform flips and other potentially

dangerous moves. Flotation vests are encouraged for all skiers, and helmets and other protective gear are often used in addition. Water-skiing clubs and events have strict guidelines for events to promote safety. Coordination between the driver and skier is crucial, and hand signals or verbal cues are often used to communicate. In many instances, a third person, or “spotter,” also rides in the boat to watch the skier and make sure the driver is aware of his or her status.

Most often, water skiing has one person being towed by an individual boat. However, a boat may tow two or more people simultaneously. In water shows, for example, a team of performers may form a line with a single boat towing them. In 1986, the cruising vessel Reef Cat towed 100 water skiers simultaneously for one nautical mile in Queensland, Australia.

Competitions

Individual competitions and overall rankings of competitive water skiers are based on age and gender, in addition to categories for specific events. Competitions are often organized by local clubs and are sanctioned and based on guidelines from national organizations and the International Water Ski Federation (the new name, as of 1993, for the WWSU). Traditionally, competitive water-skiing tournaments feature three main competitions: slalom, tricks, and jumping.

In the slalom event, skiers maneuver back and forth on a course marked with buoys (usually six), while the boat follows a straight line down the middle. During the event the boat speed is increased and the tow rope shortened, which makes runs successively difficult. The ability of the skier to get as close as possible to all of the buoys during the run without missing one or falling is scored.

In trick skiing, the competitors ski on a straight course and perform as many stunts as they can within their designated time (usually two 20-second passes). A panel of judges scores their performance based on the difficulty of their routines and their skill in executing them. Trick skiing can include a wide variety of moves,

such as twirling in the water, removing skis while in motion, and flipping out of the water.

In jumping, skiers go up an inclined ramp in the water, which launches them into the air. In addition to maintaining good form and control, skiers attempt to extend the length of the jump as far as possible before landing on the water. The standard ramp is approximately 1.8 meters (6 feet) high out of the water at its highest point for men's adult competition and 1.5 meters (5 feet) for others. During the history of jumping, the distance records have gotten progressively longer. In 1947, a distance-jumping record was set at 15 meters (49 feet). By the 1990s, skiers were achieving jumps of 60 meters (200 feet) and longer.

In 2004, competition reached a new level when the International Water Ski Federation began sponsoring a Water Ski World Cup event in 2004, with stops in Russia, England, China, and Qatar over a five-month period.

SPECIALIZED COMPETITIONS AND STUNTS

The sport also encompasses more specialized competitions. Freestyle jumping emerged in competition after the 1950s. In freestyle, jumpers add midair flips and other variations to the basic jump. Barefoot skiing was introduced publicly as a stunt at Cypress Gardens in 1947 and has since developed into a separate branch of the sport, with competitions and other events. In 1989, Scott M. Pellaton achieved a barefoot skiing speed record of almost 219 kilometers (136 miles) per hour. In 1978, Billy Nichols established a barefoot duration record by skiing for 2 hours, 42 minutes, and 39 seconds. In 1989, Steve Fontaine skied backward for just over 1 hour and 27 minutes. Barefoot skiing and jumping were combined into an event known as barefoot jumping, and competitors have made jumps of over 26 meters (86 feet).

In the 1950s water-skiing shows began to feature a stunt in which a water skier was connected to a large kite, which created air currents that carried him aloft as the boat gained speed. This facet of the sport gained popularity in the 1970s. A cousin of hang gliding and parachuting, it has been referred to by several names, in-

cluding parasailing, paragliding, and kite skiing. Although safety and insurance-liability concerns inhibited its acceptance in sanctioned water-skiing competitions in the 1980s, parasailing became popular among recreational water skiers. In the 1990s, a variation of this emerged in which water skiers attach tow lines to kites, which pull the skier along on the water.

Other Watercraft

In the 1980s and 1990s, a hybrid of powerboating and water skiing became popular that involved motorized craft known as personal watercraft, Jet Skis, and other names. These watercraft are very small and are driven in a manner somewhat similar to water skiing, but they are self-propelled. Jet Skis are fast and maneuverable. In some instances, when riders have acted irresponsibly, Jet Skis have prompted concern and criticism about noise and similar disruptions to other boats and the environments where they are used.

Sled Dog Racing

In sled dog racing a driver, known as a “musher,” controls a harnessed dog team that races to achieve speed or distance. Frequently the challenge is a combination of speed and distance that involves crossing hundreds of kilometers of ice and snow trails during a period of days.

Development

European sled dog racing originated in Scandinavia, where competitions can be traced back to the eighteenth century. In North America the development of sled dog racing was more recent, with the first races being held during the late nineteenth century. Early competition may have begun as rival groups of gold prospectors or fur trappers challenged one another to see who had the fastest sled and the best team of racing dogs.

Although the sport has appeal in polar and subpolar regions, it has always had limited international appeal. The first organized race was the 1908 All-Alaskan Sweepstake, a round-trip race between the townships of Nome and Candle. The distance crossed was 656 kilo-

meters. The Hudson Bay Derby was instituted in 1916, followed seven years later by the Banff Alberta Dog Derby. In 1936 the Laconia Sled Dog Club of New Hampshire organized the first World Championship Sled Dog Derby. In 1966 the International Sled Dog Racing Association was formed and led to the development of a racing circuit.

Sled dog teams also played a role in exploration, in particular in the exploration of the Antarctic. The progress of the Norwegian Roald Amundsen (1872–1928) and the Englishman Captain Robert Falcon Scott (1868–1912) toward the South Pole in late 1911 was seen by their respective nations and the world’s press as a race to be the first to reach the South Pole. Amundsen won, reaching the South Pole on 14 December 1911. Scott and his party died on the return journey, victims of starvation and the intense cold. Scott relied on ponies and primitive engines early during his trek, but at the end he and his exhausted team manhandled their own equipment. By contrast, Amundsen planned his trek around the use of dogs and sleds. In his party he had four companions and four light sleds, each pulled by thirteen dogs.

In North America, although Eskimos used dog sleds for hunting, travel, and recreation during the pre-colonial period, regulated sled dog races did not appear until the late nineteenth century. The U.S. writer Jack London (1876–1916) was a major figure in introducing these dogs, and indirectly their sleds, to the mainstream of U.S. life. By the age of twenty London had held a variety of jobs: sailor, tramp, Klondike adventurer.

His appreciation of the dramatic Alaskan gold rush area popularized the perception of the “man in the wild” constantly battling the elements and surviving in a tough world. With his novels *The Call of the Wild* and *White Fang* London described a wild dog (probably a composite of Siberian huskies or malamutes) and explored notions of a dog being tamed but never escaping its savage origins.

However, the event that catapulted sled dog racing onto the front pages of newspapers around the world was a 1925 diphtheria outbreak in Nome, Alaska. Hundreds of people were at risk and could not be reached by road or air because of ground conditions and severe weather. The only way to get serum to them was by dogsled. This outbreak received worldwide media coverage and stimulated sled dog racing in Canada and northern New England.

In 1928 the *New York Times* reported on events at the Saint-Moritz Olympics in Switzerland. Sandwiched between columns on skating and ice hockey was a report of a different contest, describing a three-day, 198-kilometer sled dog race in which Emile St. Goddard's of Manitoba, Canada, defeated Leonard Seppala of Nome, Alaska. The race consisted of three sections, one held each day. At the start of the final day, the lead of St. Goddard's over Seppala was only forty seconds. As the race ended the lead of St. Goddard's had increased to 3 minutes, 10 seconds. In light of the repeated successes by women mushers in Alaska's Iditarod race during the 1980s and 1990s, the newspaper report of the race is interesting. Its tenor is in keeping with the social climate of the time: a gentlemanly concern for the competitive woman, liberally sprinkled with admonitions about the overwhelming nature of such physical challenges:

Mrs. Edward P. Ricker Jr. of Poland Spring, Maine, did not start the last day. She is the only woman who ever had courage or skill to enter this race against the best men drivers of the continent. Two of her dogs tired last night and she dropped out to save them. (*New York Times*, 23 February 1928)

“Mush!”

The Iditarod, inaugurated in 1973, is the most famous dog sled race. It begins in Anchorage, Alaska, and crosses the Alaska Range, turns west along the Yukon River, and continues up the Bering Sea coast to Nome. The race takes approximately eleven days. One of the most exciting Iditarod races was run in 1978. After more than two weeks of racing Dick Macky won by less than a dog's length over Rick Swenson—one of the smallest gaps ever between winner and loser.

In 1985 Libby Riddles was the first woman to win the Iditarod.

Winner of the 2004 Iditarod was Mitch Seavey of Sterling, Alaska, with a time of 9 days, 12 hours, 20 minutes, and 22 seconds.

Winners of the 2004 World Championship Sled Dog Derby in Laconia, New Hampshire, were: one-dog junior class, Breana Martin with a time of 31 minutes; Dick Moulton three-dog junior class, Eddie Gast, with a total time of 41 minutes, 9 seconds; Lyn Newell memorial six-dog classic, Hank Plaisted, with a total time of 1 hour, 26 minutes, 25 seconds; and open class, Real Turmel with a total time of 2 hours, 44 minutes, 21 seconds.

Sled dog teams are traditionally composed of Siberian or Alaskan huskies. The number of dogs used varies, but seven or nine in a team is common. In the Iditarod as many as sixteen may be used. Although racing sleds are lightweight, they must be strongly constructed and able to carry equipment, provisions, or a sick or fatigued dog.

Sled dog race courses are marked by red and green. Red flags indicate a turn. Green flags indicate a straightaway. Dog teams are inspected approximately ten minutes before the start of a race to make certain that the dogs are neither sick nor injured and are “up to scratch” for the demands of the race. Many sled dog races count only periods of racing time and not rest intervals, so the mushers—and, more importantly, the dog teams—are provisioned and rested. The International Sled Dog Racing Association (www.isdra.org), which governs the sport, has acknowledged the metabolism of a racing

husky: “A sled dog at rest in the summer needs about 800 calories per day. In the middle of a cold winter’s long distance race the same dog may need up to 10,000 calories per day.”

Sledding—Skeleton

Skeleton is a winter sport in which an athlete lies face down and head first on a sled and races down a snow track.

Such forms of sledding (tobogganing) spread in North America, Russia, and middle Europe during the nineteenth century. In Switzerland natives and foreign residents—most of them citizens of England and the United States—raced toboggans on artificial and natural snow tracks. In 1884 some British residents of the Swiss city of Saint Moritz, led by Major W. H. Bulpetts, built an artificial track with curves and banks at Cresta at the outskirts of the city. There, on 18 February 1885, the first Grand National race took place with twenty contestants. Racers from the Swiss city of Davos won.

Head Start

In 1887 a Scot named McCornish raced head first in the Grand National. He did not win, but other racers began to imitate his head-first style because it allowed greater

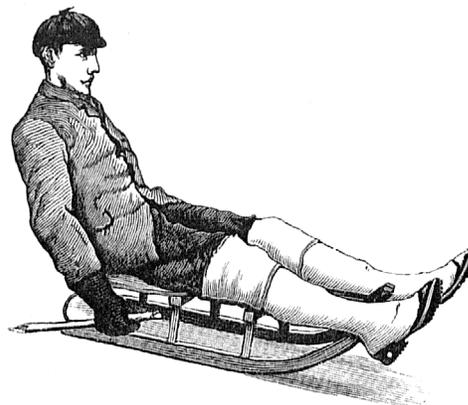

speed. By 1890 all racers of the Grand National raced head first, and skeleton distinguished itself from luge, in which athletes races downhill feet first. The head-first style also spread to the International Race of Davos. In Switzerland skeleton soon had more competitors than had luge, which remained quite diffused. In November 1887 the Saint Moritz Tobogganing Club was formed, and this body governed the competitions of both sports.

Eventually women were allowed to compete in the Grand National, and other races began to allow women and children as well. Ursula Weble, three-time winner of the Grand National in the traditional style, adopted the head-first style and added other six victories for a total of nine—a record.

The word *skeleton* refers to the fact that, in comparison with a luge sled, a skeleton sled was reduced to minimal elements. Four pillars connected the sled’s seat to the sled’s running blades. In 1901 John Bott of the United States introduced the sliding seat, which allowed better management of the sled.

In 1905 regional championships were begun in Austria and Germany, but luge and bobsleigh remained more popular in those countries. In 1910 at Cresta the Ashbourne Cup race, over a course of 887 meters, was begun. Women competed with men. Later the race was renamed the “Curzon Cup.”

In 1913 in Dresden, Germany, an international body was founded to control all tobogganing sports. In 1914

A Tribute to Hesta

This amusing poem pays tribute to “Hesta,” a folk heroine who is said to have tobogganed down the Cresta Valley in 1882, three years before official construction of the run:

Now Hesta rode the Cresta
Midst the snows of '82
Tho' her mother had impressed her
It was *not* the thing to do.
She said “It’s nice,
I like the ice,
It thrills me thru’ and thru’.”
In defiance of her mummy
She slid upon her tummy.

in Davos the first European championship was held. A man named “Bernhoff,” a German resident of the Russian town of Riga, was the winner. The Federation Internationale de Bobsleigh et Tobogganing (www.bobsleigh.com), with headquarters in Milan, Italy, is now the international governing body. It was founded in 1923.

Cresta Run Tobogganing

During the period between the two world wars, under the aegis of the Federation Internationale de Bobsleigh et Tobogganing, bobsleigh racing entered the Olympic program; skeleton racing appeared in the 1928 Olympics at Saint Moritz, where Jennison Heaton of the United States won. The Grand National and the Curzon Cup remained the two international races.

In 1926 a woman competed for the last time in Cresta Run. In 1929 women were excluded from the race because organizers feared that the face-down style might injure the breasts of women racers.

Skeleton came back to the Olympics in 1948 when the games returned to Saint Moritz. The winner was the Italian Nino Bibbia, a hero of the two big races at Engadin, Switzerland, where he won fifteen victories from 1948 to 1969. Jack Heaton was runner-up. In 1954 the International Olympic Committee decided to accept luge and to exclude skeleton.

In 2002 skeleton—open to men and women—was readmitted to the Olympics at Salt Lake City. The U.S. team won gold twice as John Shea won the men’s, and Tristan Gale won the women’s.

During the last half-century, unlike luge, the style of skeleton has not changed significantly. Fiberglass is the material used most often for the sled. Clothing has evolved from pullovers, trousers, and mountaineering shoes to more sporting styles.

Snowboarding

The picture of alpine slopes has greatly changed over the last decades. One of the most obvious changes is the appearance of persons gliding down the snow on boards: the snowboarders.

Male and female snowboarders can be found either on regular slopes, off the slopes in ungroomed and powder areas, and in boarder parks with various jumps and half pipes in which the boarders focus on airborne tricks and maneuvers. According to their preferred territory, the snowboarders are categorized as alpine or carving riders, freeriders, or freestylers, each equipped with specially designed boards, bindings, and boots.

Presently there are more than five million snowboarders worldwide. Predominantly children and adolescents are learning this relatively new winter sport.

For many snowboarders, snowboarding is more than a sport; it stands for a special philosophy and lifestyle, going back to the initial influence of surfing and skateboarding, and reflecting an easygoing youth culture

snurfer by taking advantage of their experience in the making of surfboards. Sims started—just like Burton—to build boards consisting of laminated wooden layers. Although none of these constructions had steel edges, they made it possible to glide down mountains. However, neither Milovich’s “Wintersticks” nor Sims’s boards were very prosperous in the long run.

that strives to neglect all kinds of conformity and searches for individuality and freedom. These snowboarders can be considered a subculture, distinguishing themselves from alpine skiers not only by their sporting equipment, but also by fashion, hairstyle, body piercing and tattooing, as well as language, music, and off-slope appearance and behavior.

History

Snowboarding has its roots in the United States. One of the early pioneers who greatly influenced the introduction of this winter sport was the American Sherman Poppen from Michigan. In the mid-1960s he developed a toy board consisting of two attached skis on which one had to stand sideways. He named his construction “snurfer,” a word mixture of the words “surfing” and “snow.” This board of about 1.20 meters in length had neither real steel edges nor bindings and was steered by a rope tied to its nose. Accordingly, it was difficult to handle on hard slopes. However, it was successful. At the end of the 1977, Jake Burton Carpenter modified the snurfer. He attached rubber straps to the board to facilitate standing, and founded his own company, Burton, for the production of snowboards, which has been successful until today. At about the same time the experienced surfers Dimitrije Milovich and Tom Sims, the latter world champion in skateboarding at the time, also started to improve the

Besides problems involving materials, this new sport had to face another difficulty: many ski areas did not allow snowboarding on their mountains. In the United States this was mostly due to security reasons, whereas in Europe the skiers were very reluctant to approve of this new winter sport. Meanwhile, the material dilemma was solved: snowboards began to be produced with steel edges; additionally, special bindings and special boots made it easier to control the boards.

As a result, by the end of the 1980s many ski areas throughout the world had opened their slopes to snowboarding. This was also an economic chance for tourism and the ski-equipment-producing industry; especially the latter had reached a growth plateau at the time. The sale of boards in the winter of 1994–1995 was 471,000 and rose in the following year to over 1,200,000. In the 1990s, the strongest market was in North America, followed by Europe and, finally, Asia.

Competitions and Federations

The acceptance of snowboarding as a sport can also be seen in the rise of the first competitions in the 1980s. During that decade, too, a number of snowboard federations in various European countries and North America were founded. The first governing body for competitive and grassroots snowboarding was the United States Snowboard Association (USASA), which goes back to 1988. On an international level the

International Snowboard Federation (ISF), which developed out of the International Snowboard Association (ISA) initiated in 1989, was organized in 1991. The ISF started to organize a World Pro Tour in 1987.

The Federation Internationale du Ski (FIS) introduced snowboarding as an FIS discipline in 1994. They hold the FIS Snowboard World Cup series and the FIS Snowboard World Championships, making snowboarding eligible for the Olympic Winter Games. At the Winter Olympics in 1998 in Nagano, Japan, both men and women participated as snowboarding competitions in giant slalom and half pipe were held for the first time. Presently there are six snowboard events on the program of the Olympic Winter Games: half pipe, parallel giant slalom, and snowboard cross, each held separately for men and women. Tension between the FIS and the ISF arose pertaining to the responsibility for this “new” sport, especially with regard to the Olympic Games.

Although the World Cup under the FIS’s authority was financially less attractive than the IFS’s World Pro

Tour, in the long run the FIS survived as the sport’s official governing body. It had more expertise in organizing events and attracting sponsors and TV contracts. As a result, the IFS, which claimed to be more than a sport federation, but also stood for a special lifestyle and philosophy, had to fold in 2002.

Snowshoe Racing

Snowshoe racing is of recent origin, although snowshoes themselves are ancient. Informal racing is probably as old as the snowshoe itself, but serious racing only emerged in North America in the 1970s, after major improvements in snowshoes were introduced.

New World Beginnings

Snowshoes have been used for the past 6,000 years, primarily by Amerindian peoples. Informal races have probably taken place for centuries, but for most of its historical career, the snowshoe had a primarily utilitarian life, enabling people to work and travel in snowy conditions. The trappers, hunters, and explorers of North America all used snowshoes.

As a form of recreation, snowshoeing in Canada came into its own with “snowshoe clubs.” These clubs, some of them two hundred years old, were popular among both French- and English-speaking populations, but more so among French Canadians. The clubs were originally tied to communities, churches, guilds, and military units. A small number of the Quebec clubs are still active.

In 1907, the Canadian Snowshoer’s Union was founded as a loose confederation of clubs. The union, though, never made a serious effort to transform snowshoeing from a recreation into a more competitive sport. Some snowshoe clubs, primarily among people of French ancestry, were formed in the United States and were found throughout New England and in New York. These, like the Canadian clubs, were mainly recreational, organizing only informal races.

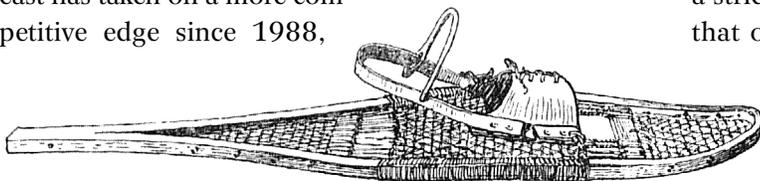

The long tradition of “social snowshoeing” continues in Quebec and New England. However, racing in the east has taken on a more competitive edge since 1988,

when the first “North American Snowshoe Classic” was run. The newest centers of snowshoe racing are in Wisconsin, Minnesota, Colorado, and the neighboring mountain states. The races are increasingly more organized and competitive, but they still have recreational qualities.

What Is Snowshoe Racing?

Snowshoe races are held either on groomed trails, as for most Nordic ski events, or on unbroken snow. When the “modern” phase of snowshoe racing first began, many races were run on groomed tracks. Some believed, however, that snowshoe racing might end up losing all its distinctiveness and become merely a sort of handicapped running activity. Races through unbroken snow were also problematic. When such races were staged, a typical strategy was simply to “hang back” while the leaders broke a more manageable path through the snow and then sprint at the end. In an attempt to do away with this “laggard’s advantage,” some recent races have featured a sequence of “primes,” rather like in cycling races, to improve the ambitions of the pack.

The chief innovation has involved changes in the design of the snowshoe itself. The traditional snowshoe was primarily a snow flotation device and, as such, not suited for high speed. Traditional snowshoes were large and heavy, crafted of wood, leather, and vegetable fibers. Beginning in the middle 1960s, when aluminum and other alloy frames were introduced, weight has been reduced greatly, and the size of the shoe has become smaller. The snowshoe went through a process of drastic redesign, which reduced size and weight and allowed for the use of a real racing stride. The newer snowshoes allow considerable flotation, yet they are small enough to accommodate a stride that is more like that of a modern runner than that of a heavily laden trapper. The new shoes have

Snowshoe Racing

Snowshoe Racing in Montreal in 1858

On Tuesday Afternoon, the annual races of the Montreal Snoe-Shoe Club took place at Ouimet's race course, near Mile End. The day was rather cold, yet notwithstanding this, at least a thousand persons were present, to witness the feats of speed in this manly and exhilarating exercise. The grand stand was filled with ladies, and on the Steward's stand we noticed Sir William Eyre, Commander of the Forces, with his staff. The first race was a distance of four miles, and nine Indians from Caughnawaga, entered it. The start was good, and for a considerable distance the same position was maintained. The first mile was accomplished in six minutes twenty seconds; the second in eight minutes twenty-two seconds; and the third in nine minutes thirty seconds; the fourth was exciting, the contest being very close. The Indian who came in victor during the three previous miles and for a long distance on the fourth, was the third; but when within half a mile of the stand, he made a dash and took the lead, which he kept and came in some ten yards ahead of the second Indian, and fifteen ahead of the third. The last mile occupied by seven minutes and ten seconds, and the four miles were ac-

complished in thirty-one minutes twenty-two seconds. The winner of this race seemed to feel himself a very important personage, for he immediately donned a fantastic head-dress, and strutted about his discomfited compeers with a very bombastic air. The prize for this race was forty dollars.

The next was a hurdle race over four three feet hurdles; the prize being ten dollars. Preparations for this race were made by six whites and three Indians; it was a most exciting struggle—the first hurdle was leapt almost simultaneously by all the competitors, but between the first hurdle and the second, distances were changed, Mr. Brown keeping first, followed closely by Mr. Murray, who fell while clearing the third hurdle, an Indian who was following having trodden on his snow-shoe. He was up in an instant, however, But Mr. Brown, first—Mr. Murray, second, and an Indian third.

completely replaced wooden snowshoes in the modern races.

The deck of the racing shoe has also changed. It is no longer webbed but solid, and generally made from rubberized or other treated nylon. The deck is no longer attached to the frame with rawhide lacing, but riveted or clipped to it. This preserves some of the flotation qualities of snowshoes but reduces overall size. Most modern shoes also feature a cleat at the toe or ball of the foot for traction, and some are cleated at the heel as well. The overall result is a much lighter and smaller shoe, with improved climbing ability, that still allows a certain amount of controlled sliding on down slopes. Binding, with the new shoes, seems to be still be evolving. Many of the best racers simply lace regular running shoes to the snowshoe.

Competition at the Top

Two prominent modern-style races are the John Beargrease in Duluth, Minnesota—a marathon of 25 kilometers run in conjunction with a dogsled race of the same name—and the Birkebeiner in Northern Wisconsin, associated with a prestigious cross-country ski event. There is also an annual event now being run on one of the original sections of the famous Alaskan Iditarod. The U.S. Snowshoe Association has been holding an annual National Snowshoe Championship (in a different location each year) since 2001. Snowshoe racing is not an Olympic sport, but proponents hope it will become one.

Soaring

Soaring is similar to gliding. Both sports are practiced by people who either fly for the sheer enjoyment of powerless flight (gliding) or compete as individuals or members of teams in glider competition (soaring). Many people do both.

To Air Is Human

The theory of soaring dates to the first time people saw birds flying without flapping their wings. Babylonian cave etchings and Greek mythology tell of people's dream to fly. The fifteenth-century Italian painter, sculptor, architect, and engineer Leonardo da Vinci reflected on various kinds of flying apparatus, including parachutes.

Balloons were the first devices that provided people with the means to fly. Then, in 1848, Sir George Cayley, a British scientist, built the first successful heavier-than-air device: a glider that was said to have carried a ten-year-old boy several yards after being launched from a hill. Although research continued during the interim, from the 1890s onward people in Germany, England, and the United States increasingly researched and developed gliders and flying techniques.

During the 1890s Otto Lilienthal of Germany is said to have made more than two thousand glider flights. In 1891 he was the first man to fly more than 100 meters. About that time Orville and Wilbur Wright in the United States and Percy Pilcher of England were working on similar glider developments. Near San Diego, California, John Montgomery also conducted experiments during that period and is said to have even flown before Lilienthal. Montgomery is credited with making a nine-minute unpowered flight that broke a record set by the Wright brothers. Montgomery, Lilienthal, and Pilcher all died in glider accidents.

Octave Chanute, at sixty years of age in 1896, took the first of a reported two thousand flights without an accident. During the autumn of 1902 alone, the Wright brothers made more than one thousand glider flights, many involving turns and distances of more than 183 meters, before their first powered flight in 1903.

World War I stalled glider development as the world went to war. After the war ended, however, the Treaty of Versailles prohibition on powered flight in Germany prompted great progress in the development of gliding. Three thousand German schoolboys enrolled in glider instruction during 1928 alone. Germans dominated world gliding throughout the 1920s and early 1930s. Wolfgang Klemperer was the first to fly more than 1,000 meters in 1920, and Robert Kronfeld set the world distance record of 100 kilometers in the late 1920s.

In 1934 Richard DuPont of the United States set the world distance record of 248 kilometers. By the late 1930s the record was 557 kilometers. Development continued but was slowed during World War II when military applications of gliding forced sport gliding into the background.

Since then gliding as a sport has flourished, and several countries have large soaring communities. More than 150 pilots have flown flights farther than 1,000 kilometers.

How Does a Glider Glide?

Understanding soaring requires understanding how a glider—an airplane without an engine—flies through

the atmosphere. Air flows over the wings of a glider in much the same way as it flows over the wings of a powered airplane, which is propelled through the air by the force of its engine. However, a glider has no engine. Gliding flight can be achieved only by descending the glider, speeding it up, and causing air to flow around its wings and tail surfaces. Therefore, a glider (or sailplane, as it is often called) is always descending, usually at a rate of between 45 and 90 meters per minute in still air.

The acceleration of air over the wings of the glider produces a lifting force that counterbalances the weight of the glider and slows its rate of descent. If not for the force of lift, gliders would fly straight down. They instead follow predictable glide ratios. A glide ratio is a measure of how far a glider will travel forward (horizontal distance) for each unit of altitude it loses (vertical distance). A 40 to 1 glide ratio, for example, means that a glider could travel (in still air, with no updrafts or downdrafts) 40 kilometers over the ground for each kilometer of altitude above the ground. Modern gliders have glide ratios of 20 to 1 to 60 to 1, or 20 to 60 meters forward for every 1 meter downward. Older gliders generally have steeper glide slopes.

Glider pilots fly at specific speeds to obtain the performance expected of their gliders. Flying at “best glide speed” allows a glider to go the greatest distance possible. Flying at “minimum sink speed,” usually *slower* than the best glide speed, allows a glider to stay in the air for the longest possible time—but not glide the farthest distance.

Although gliders are capable of rolls, loops, and other aerobatic maneuvers that enable them to climb for short periods, rather than to continually descend, a glider, in gliding flight, is always descending.

Airplanes and automobiles must stop periodically to refuel. What makes soaring a sport is the challenge of finding and using ascending air currents to keep the glider aloft—to cause it to climb faster than it descends (which it always is)—so that distance, height, or flight durations that are not possible in still air can be achieved. In a sense updrafts are the fuel of gliders. Pilots who excel at finding and using the invisible ascending air currents

better than other pilots are the champions and record holders.

Classes of Gliders

World competition generally recognizes three classes of gliders: 15-meter, open, and standard. A fourth class—the world class—has been approved, but it has yet to compete on any widespread basis.

15-METER CLASS

Fifteen-meter class gliders have a maximum wingspan of 15 meters and a maximum weight of 525 kilograms. These gliders have control devices called “flaps” that enable them to fly a more controlled approach for landing and that enhance performance in other ways. The maximum glide ratio of most 15-meter class gliders is 45 to 1.

OPEN CLASS

The only specification for open class gliders is that their maximum weight cannot exceed 750 kilograms. Open class gliders typically have wingspans of about 25 meters and a maximum glide ratio of 60 to 1.

STANDARD CLASS

Standard class gliders are similar to 15-meter class gliders except that their performance is more restricted. In particular, flaps are not permitted, and standard class gliders have a maximum glide ratio of 42 to 1.

WORLD CLASS

World gliding authorities recently approved the world class. Enthusiasts hope this class will result in a simple, cheap, easy-to-fly glider that can be economically produced in many countries.

Methods of Launching

Gliders cannot propel themselves through the air with sufficient force to attain flying speed, which is normally 48–64 kilometers per hour. Some outside initial force must be applied to get the glider moving fast enough that adequate airflow passes around the wings to overcome the force of gravity and cause the glider to fly.

Through the years people have used several methods to provide this speed, including dropping heavy weights on the ends of ropes to pull the glider into the air; pushing the glider down a hill until airflow over the wings is sufficient to produce flight; pulling the glider with elastic-like ropes and “slingshotting” it to flying speed; hooking it behind an airplane that takes off and pulls the glider to an altitude from which gliding flight can begin; pulling it into the air on long cables reeled in by engine-driven winches; and pulling it into the air on ropes behind automobiles.

The Wright brothers launched their early gliders by using the slopes of sand dunes near the Atlantic Ocean. Other people used “shoulder launches” in which assistants held the glider aloft and ran with it into the wind until it flew. Today a glider usually is towed aloft by a rope attached to a powered airplane. This technique is called “aerotow.” Glider pilots using this form of launch must be able to fly safely and smoothly behind the towplane as it ascends until the glider release altitude is reached.

Types of Gliding

After a glider reaches sufficient altitude and airspeed, the pilot pulls a release handle in the cockpit, the towing rope is released, and the glider is in free flight. If sufficient lift to sustain flight is not found rather quickly, the glider will usually be forced to land within a matter of minutes.

The goal is to soar rather than to glide. Several methods of remaining aloft are used. All rely on pilot skill and knowledge in finding air currents rising at a greater rate than the glider’s “built in” rate of descent—between 45 and 90 meters per minute. These methods are mountain wave flying, thermaling, land and sea breeze flying, and ridge flying. An additional source of lift can be obtained by flying under or near developing cumulus clouds that owe their formation and sustenance to the updrafts found directly underneath them. During the early days of soaring, when people did not understand much about hazardous weather, pilots also used areas near (or inside) thunderstorms to propel themselves

upward. That practice is recognized as very dangerous and little used in modern glider flying. The safe rule is to avoid thunderstorms.

MOUNTAIN WAVE FLYING

For mountain wave flying, gliders find strong lift produced downwind of mountains as the mountains are struck by strong winds at near-perpendicular angles. These winds can propel a glider thousands of meters above the altitudes where it first encountered the mountain wave lift. Many world records have been set, particularly in the United States, where mountain wave phenomena lend themselves to strong updrafts and great altitude gains. Soaring in a mountain wave usually requires special equipment such as heated clothing, supplementary oxygen, and other high-altitude precautions. Expert mountain wave soarers say nothing compares with the views of a High Sierra or Rocky Mountain wave flight or the views of the European Alps.

THERMALING

Thermals—rising columns of warmer-than-normal air—occur where the sun heats surface geographical features to temperatures hotter than the surrounding terrain. Such updrafts may rise hundreds of feet per minute faster than surrounding air. Gliders soaring in thermals are lifted, often thousands of feet. An instrument in a glider that shows the speed of rising air indicates entry into a thermal. The challenge of soaring in a thermal is to keep the glider in the narrow column of air by flying it in precise circles to maintain the greatest upward speed. The ability to find thermals, often extending thousands of feet up from the surface, allows pilots to move from one thermal to another, increasing altitude with each thermal, thus enabling great altitudes, distances, and durations.

LAND AND SEA BREEZE FLYING

Land and sea breezes are caused by wind changes near the shoreline that create differential temperatures of the land and sea at different times of the day. In land and sea breeze flying, glider pilots, like birds that gracefully

glide there, take advantage of these alternating breezes to soar into the headwinds they produce.

RIDGE FLYING

In ridge flying pilots find updrafts that are produced when wind strikes the side of a vertical terrain feature such as a hill, mountain, or ridge line at an angle of about 90 degrees, producing updrafts on the side of the feature from which the wind is blowing. Gliders in such updrafts have flown in ridge “lift” without descending for hundreds of miles at great speeds. Flights of more than 1,000 kilometers are not unusual in the strong ridge lift behind fast-moving weather fronts.

Birds of a Feather

The popularity of air sports generally, and soaring specifically, has increased significantly during the last several decades. Structure and uniformity in management were needed to develop the sport and devise accepted rules of competition among pilots and nations. As a result, most nations in which any organized air sport is conducted have formed National Aero Clubs to represent them to the world governing body for air sports, the Federation Aeronautique Internationale (FAI), headquartered in Paris. Each air sport is represented within the FAI by a group from member nations that participate in that sport. These groups make rules for their respective sports and administer their activities internationally. The representative group for soaring is the International Gliding Commission (IGC).

The IGC makes rules by which world soaring competitions are conducted, approves claims for glider world records, awards badges to recognize skill and accomplishment by pilots, and otherwise administers international conduct of soaring as a sport.

World Competition

Each country, through its National Aero Club, local glider clubs, and commercial soaring enterprises, conducts local, regional, and national competitions to reward skill and to select persons to represent it in various

levels of competition. Pilots who compete at the international level do so as representatives of their National Aero Club under the umbrella and sanction of the FAI.

The first world championship of soaring was held in 1937 at Wasserkuppe, Germany. No championships were held during World War II or shortly thereafter. Now, during every odd calendar year, the FAI sanctions a world gliding championship for each of the three classes (open, 15-meter, and standard). The world championship is usually held during a three-week period, with the first week devoted to practice and the last two weeks to competition.

At the twenty-sixth World Gliding Championship in Bayreuth, Germany, in 1999 Giorgio Galetto of Italy won the 15-meter class; Holger Karow of Germany won the open class; and Jean-Marc Caillard of France won the standard class. The Nation’s Cup Trophy went to the eight pilots of the German team.

Phases of soaring competition are called “tasks.” Each day at the world championship, for example, pilots fly around a specifically assigned course comprised of clearly defined turn points on the ground. These turn points are prominent road intersections, the ends of airfield runways, or other distinctly identifiable geographical landmarks over which pilots must fly.

During world championships before 1995 pilots were required to photograph turn points to prove they had flown the prescribed course. However, beginning in 1995, pilots carried a “data-logger” that electronically records time, position, and altitude using signals received from satellites of the Global Positioning System (GPS).

When pilots are ready to begin the day’s task, they fly over the landmark that defines the starting point. Then they fly each turn point, in order, until returning to the finish point. After the flight GPS data are downloaded into a computer for display, analysis, and scoring. The pilot with the fastest speed around the course is the daily winner. Other pilots are awarded points based on the ratio of their speeds to that of the winner’s. Points are accumulated during the competition to determine the champion in each class.

Some people think football is a matter of life and death. I don't like that attitude. I can assure them it is much more serious than that. ■ BILL SHANKLY

Levels of Accomplishment

The FAI awards badges to recognize milestones in soaring: The Silver, Gold, and Diamond badges signify accomplishment for height attained, distance flown, and duration achieved. The Silver badge is the first level of international soaring recognition, intended to foster self-reliance in a new pilot. The requirements for this badge are completion of a flight of at least 50 kilometers over a straight course, an altitude gain of at least 1,000 meters, and a flight duration of at least five hours. The Gold badge requires a distance flight of at least 300 kilometers, an altitude gain of at least 3,000 meters, and a flight duration of at least five hours. The Diamond badge is awarded for completion of three separate tasks: a flight, flown in designated turn point sequence, of at least 300 kilometers over an out-and-return course; a flight of at least 500 kilometers; and an altitude gain of more than 5,000 meters.

Soccer

Soccer—known as “football” in most of the world—is the world’s most popular sport. It involves two teams of eleven members trying to kick a ball into a goal, although it is often played in less organized ways. The modern sport was developed in England during the nineteenth century, evolving from older ball games that were played across the globe, with perhaps the oldest forms existing in China.

Origins

Modern soccer evolved from games played in England’s elite “public” education system. Here ball games, usually known as football, were used to discipline boys and to build their character both as individual leaders and as socially useful team players. Underpinning the values that football was thought to cultivate were ideas of masculinity and Christian conviction. The notion of “muscular Christianity” deemed that men should be chivalrous and champions of the weak but also physically strong and robust. The belief that such qualities would create the right sort of men to lead the British empire led to a cult of athleticism within English public schools. Football thus came to be a prominent feature of life for these schoolboys, as evoked in Thomas Hughes’s 1857 novel *Tom Brown’s Schooldays*.

Schools developed their own rules for football, which made interschool matches and games in the universities problematic. Thus, people attempted to draw up common rules; this attempt culminated in the formation of the Football Association (FA) at a meeting at a London inn in 1863. The FA drew up a set of rules that was to

**“The Association Game”

become the basis of modern soccer. However, disagreements emerged at the meeting over the legitimacy of hacking (kicking an opponent in the shins) and the extent to which handling the ball should be allowed. These disagreements meant that the FA’s new rules did not find universal acceptance in all schools, and proponents of handling the ball and hacking, which were

deemed more manly, formed the Rugby Football Union in 1871. Football was thus divided into soccer (alternatively known as “association football”) and rugby football. The term *soccer* evolved as public-school boys corrupted the word *association* into slang.

As boys left school, they wanted to continue playing and thus formed clubs with their friends, either at college or in the wider world. Because these young men went into positions of influence in industry, teaching, the military, the church, and professions such as the law or colonial service, they had not only the resources to form such clubs but also the social influence to get other people, including workers, involved. Many former public and grammar school students continued to be driven by the values of the cult of athleticism that they had learned at school. They thus saw moral benefits to teaching the masses to play. In this way soccer quickly spread both geographically and socially. In the English provinces many of the early promoters of organized soccer were from the lower middle classes and even the skilled workforce. Soccer probably was taken up by the lower classes with such speed because of surviving traditions of ball games. Thus, the organized version of soccer that emerged from the public schools was not a completely alien cultural phenomenon to the lower classes.

Integral to the sport’s development during the late nineteenth century was the development of cup competitions. The first such competition was the FA Cup, founded in 1871 and still the oldest soccer competition

in the world. It involved teams being randomly paired in rounds, with each winner progressing to the next round. This progression continued until just two teams were left to meet in the “cup final.” The FA Cup added some purpose and excitement to the emerging sport of soccer. At a time of growing urbanization, it drew on and fed rivalries between towns and was instrumental in turning soccer into something that people watched rather than just played. Cup competitions were also an opportunity for gambling and attracted upbeat newspaper coverage. Ireland, Scotland, and Wales, as well as most of the English counties, soon followed the example of the FA Cup and established their own competitions, thus further cementing the sport’s popularity across Britain. Underpinned by the popularity of cup soccer, soccer emerged during the 1880s and 1890s as something resembling the modern sport, although the rules were subject to constant refinement. In the industrial north of England the growing crowds began to be charged for the privilege of watching and were hosted in purpose-built grounds. The first men to be paid to play were industrial workers who were offered jobs in return for playing for a club that sought to raise its reputation in the burgeoning sport. Other players were offered specific fees for matches. The response to such practices, particularly among the middle classes of the south of England, was not always favorable. Many people felt that playing for money undermined the sporting and manly characteristics of soccer. Such tensions were

fed as the FA Cup showed that the northern professionalized teams were more effective and successful. Arguments over professionalism were thus tinged with class and regional prejudices and were essentially about the meaning and future of the sport. After northern teams threatened to break away and form their own association, the southern-dominated FA reluctantly legalized professionalism in 1885 in order to retain control of the sport.

With clubs now committed to paying players and charging spectators, they sought new ways to raise their income. In 1888 the Football League was founded with twelve teams from the Midlands and northern England who played each other on a home and away basis. This arrangement ensured regular competitive soccer beyond the world of cup competitions and did much to raise the profile and popularity of soccer. Like the FA Cup, the Football League was also to become a model for national soccer competitions in every country of the world.

By the end of the 1890s the leading Football League clubs could attract crowds of more than twenty thousand. Like the professional teams they watched and cheered, working-class men dominated these crowds, although small numbers of middle-class men and women supporters attended, too. Soccer thus came to be regarded as a “people’s game,” but the reality was more complex. The cost of attending matches put soccer beyond the reach of much of the unskilled and semiskilled workforce. The clubs and competitions were governed and administered by the middle classes, who kept a tight control over the contractual freedom and pay of their players. Thus, although soccer gave many working men much pleasure, the sport remained within the confines of wider material and political conditions.

Beyond Britain

The foundations of modern soccer were firmly established in Britain by the end of the nineteenth century. While its popularity and gradual acceptance as part of national culture continued in Britain during the first half of the twentieth century, the sport also began to spread

beyond British shores. There the role of British trade and the British Empire was key. Britain was the globe’s most powerful economic and political force during the nineteenth century. British men thus traveled the world and took their favorite sports with them, setting up clubs and teaching others to play. Similarly, many people from elsewhere in Europe came to learn or work in Britain, discovered soccer, and took the sport home with them. This popularity was not rooted just in the simplicity and excitement of soccer; it also owed something to the fashionability and prestige that British culture enjoyed overseas. As soccer established itself in urbanized western and northern Europe at the end of the nineteenth century, its new continental proponents began to play a role in its diffusion. The famous team FC Barcelona, for example, was set up in 1899 by a mixture of Swiss, German, and British young men who had learned soccer at college.

The spread of soccer across the rest of Europe was, of course, uneven, even within individual nations. In France, a country that pioneered the international administration of the sport, not until after World War I did soccer establish itself fully in the south of the country. In Germany and France soccer was often viewed as foreign and inferior to gymnastics. Some people saw the spread of soccer as a threat to established national, regional, and local traditions of play. In Bavaria soccer was actually banned until 1913. However, during the interwar years soccer became firmly established as the leading spectator sport across most of industrial Europe. The use of soccer as a means of entertaining troops during World War I was one important cause of soccer’s success. The development of international matches was another. The first international match took place between England and Scotland in 1872, but between the two world wars such matches became quite common on the continent and were used as a source of national pride and prestige, most obviously in the fascist dictatorships of Italy and Germany. As soccer’s popularity was cemented during the 1920s in continental Europe, the sport also became professionalized there. Again, this professionalization was neither universal

Anyone can cook aloo gobi, but who can bend a ball like Beckham? ■ PARMINDER NAGRA AS JESS IN "BEND IT LIKE BECKHAM"

nor even. West German soccer did not become professional on a full-time basis until 1963.

South America was the first continent beyond Europe where soccer took a grip. Again, the influence of the British was key. British emigres, brought to Argentina, Brazil, and Uruguay by trade opportunities and links, set up teams, sometimes inviting the local population to play with them, sometimes seeing their efforts imitated by local elites. Other clubs owed their origins to members of the South American social elite who were educated in Europe. Traces of the British influence are still visible today, with some leading clubs, such as River Plate and Boca Juniors, having English names. Not until 1903 were the sport's rules translated into Spanish and the Argentine Football Association began holding meetings in Spanish. As the sport shifted from its British origins, it became less socially exclusive, spreading to the urban masses and becoming an integral part of their popular culture. In 1916 a South American soccer association (CONMEBOL) was formed and the first South American championship, now known as the "Copa America," competed for.

Soccer also spread to other continents, but it did not attain the huge popularity that it achieved in Europe and South America. A short-lived professional league was formed in the United States in 1894, but its popularity was patchy and largely rooted in urban European immigrant communities. The sport's diffusion in colonial Asia and Africa was hindered by local political and ethnic tensions, whereas in Australasia and North America soccer was overshadowed by already developed local versions of football.

Television Era

In the post-1945 world the mass media drove soccer to new heights of popularity across the globe. Newspaper and magazine coverage continued to foster an interest in the sport, while radio coverage allowed those fans unable to attend matches to share in its excitement. Television took this immediacy even further, particularly from the mid-1960s when technical developments in close-ups and replays meant that watching a match on

television allowed a spectator to both see more of the action and not suffer the discomfort of being in a stadium that often was cold, dated, and uncomfortable. A realization of this fact made soccer's authorities often distrustful of television's interest in broadcasting matches. They feared that attendances would fall as people stayed home to watch rather than pay to attend a match. Such fears underestimated the appeal of the atmosphere and communal experience of a live match. The potential that television held for boosting rather than undermining the general popularity of soccer became apparent with the success of broadcasts of the World Cup and, to a lesser extent, European club competitions. Technical developments during the 1960s and 1970s allowed such matches to be watched live across the globe, turning the global sport into a shared global experience.

Television also extended the potential for the commercial exploitation of soccer. Since the advent of professionalism, soccer had been run on business lines in capitalist countries, but rarely was profit a key motive for club owners. Instead, most financial surpluses tended to be used to improve the team or its ground. With television the potential for sponsorship and advertising increased significantly. Most obviously, during the 1980s sponsors' names began to appear on team shirts, and competitions were renamed after sponsors. The large audiences that televised soccer attracted appealed to advertisers, pushing up the fees that broadcasters were willing to pay for the rights to matches. During the 1990s these broadcasting fees spiraled as the decline of hooliganism improved soccer's image and as its owners and administrators developed more commercial mind-sets. Instead of using this increased income to secure their financial futures, clubs splurged the income on players' wages, turning the sport's stars into multimillionaires. Across the globe, apart from the most popular clubs such as Real Madrid or Manchester United, soccer's financial base remains unstable. Accompanying such developments has been an increasingly fluid and globalized labor market for players. Leading clubs across the developed world hire the best

players they can attract, regardless of their origin, turning their teams into multilingual symbols of globalization. Such cosmopolitan teams have furthered the trend that television began, as fans often support teams from places with which they have no personal connection.

Although the fame and fortunes of players have risen, the social structure of supporters has remained more static. Soccer remains a sport of the masses across the globe, although it has also always drawn significant support from the middle class. In Europe during the 1990s clubs sought to pay for players' wages and the modernization of their stadiums by increasing ticket prices. This practice priced live soccer beyond the means of some of its supporters, but the reach of the mass media meant that the sport's emotional pull remains strong for such fans. Indeed, with increased television coverage, the age and gender boundaries of soccer fans perhaps expanded. An estimated 1.3 billion people watched the 1998 World Cup final on television. The level of commitment to soccer amongst members of this vast audience obviously varied significantly. However, for many people across the globe, soccer remains an integral part of life, a sport that, via the loyalty felt toward individual clubs, adds structure and meaning to life.

Such loyalty has not always been for the good. Racism, crowd disorder, and violence have been a problem throughout soccer's history. Before the 1960s soccer hooliganism was associated with continental Europe, but then people began to view it as the "English disease." Hooliganism's form varied across different cultures and periods, but it usually was characterized by fighting between opposing fans. Although occasionally resulting in deaths, hooliganism was more typically based on show and scuffles than serious violence. In 1980s Europe many hooligan groups developed fashionable dress codes and became clearly identifiable subcultures of their own. Sociologists have debated soccer hooliganism's causes, with explanations varying from economically and politically oppressed young men venting their frustrations to people simply enjoying fighting. In Europe the growth of all-seater stadiums and close-circuit television has led to a decline in the overt hooli-

ganism of previous decades, although it continues to take place on a reduced scale away from soccer grounds and at some international tournaments.

For many men soccer has been a key part of their masculinity, something they were socialized into at young age, a sport that allowed them to gain the respect of their peers and display their emotions and a sense of communal identity in an uninhibited fashion. Yet, for all its association with maleness, soccer is also played and watched by women. The earliest women's matches were played in England during the 1890s, but women players struggled against the characterization of soccer as something inherently manly. The disruption of social norms during World War I led to a temporary upsurge in women's soccer in parts of western Europe, but not until the wider movement for the social liberation of women during the 1960s and 1970s did women's soccer gradually, and often grudgingly, begin to win acceptance from soccer's male authorities and supporters. Although a women's World Cup began in 1991 and was included in the Olympics from 1996, across most of the world women's soccer continues to struggle to escape the shadow of the men's sport.

North America is the one part of the globe where soccer has not dominated spectator sports. In North America soccer has struggled against the popularity of baseball, U.S. football, and basketball, all of which claim to be more authentically American. However, the fortunes of soccer in the United States seemed to increase during the late 1970s. Some clubs in the North American Soccer League (NASL), most notably the New York Cosmos, brought in great foreign talents such as Pelé and Franz Beckenbauer and attracted crowds comparable with those of the largest European clubs. However, the NASL failed to become financially sustainable and closed in 1985. The desire of the Fédération Internationale de Football Association (FIFA), soccer's world governing body, to break into the North American market led it to hold the 1994 World Cup in the United States—a decision treated with some skepticism around the rest of the globe. The tournament was a success and led to the reintroduction of a national professional

league in the United States but it did not lead to a major breakthrough in soccer's overall popularity there. However, soccer's North American profile (together with women's soccer in general) was boosted in 1999 when the United States hosted and won the Women's World Cup, with 40 million people watching the final in the United States alone. Today soccer remains overshadowed in U.S. culture by other sports, but its popularity as a participatory sport continues to grow steadily, especially among girls and middle-class children.

Nature of the Sport

Soccer can be reduced to two teams trying to place the ball into a recognizable goal and outfield players being prohibited from touching the ball or wrestling or hacking each other. The field of play, numbers of players, and duration of a match can all be changed without destroying the sport's essence. Furthermore, the basic skills of kicking and controlling the ball are not difficult to master. This simplicity and adaptability have underpinned the sport's popularity and diffusion, allowing it to be played everywhere from the beach to the street.

Even in its organized form, soccer has only seventeen rules. These rules have been subject to ongoing refinement, and their simplicity belies the intricacy of the skills, tactics, and ebb and flow of the sport. The adult-organized form requires eleven players on a team, with one player nominated as goalkeeper and able to handle the ball in the defined penalty area. It is played on a marked grass pitch (playing field) that is a maximum of 110 meters long and 69–91 meters wide, with goals 7.3 meters wide and 2.5 meters high and constructed of metal posts with nets. Matches last for ninety minutes, with the winner being the team who scores the most goals, although ties are permissible in league competitions. The settling of tied matches in tournaments and cup competitions has been a controversial issue. Replays, extra time, and penalty shootouts all are used. Yet, ties remain a normal part of soccer and separate it from many other sports.

Of course, the tactics of soccer have evolved during its history. During its public school infancy soccer

was based around each player dribbling the ball toward the goal and then shooting or seeking to regain possession if tackled. As soccer took off with the British working class, it evolved into a more fluid passing game with the emphasis on team play. This led to a clear demarcation of different roles for players within teams and the gradual establishment of essentially attacking and defending roles. During the interwar years defensive positions began to take on more importance in tactics, despite a change in the offside rules in 1925 intended to create a more attacking game that would be more attractive to paying spectators. Stopping goals increasingly became easier than scoring them, putting creative players—those who were routinely able to pass the ball to a teammate in a goal-scoring position or dribble past defenders with a mixture of skill and speed—at a premium. Yet, not until the 1960s did teams begin to assign more players to primarily defensive duties than to attacking ones. Defensive play and the tight marking of opponents became particularly common in Italian soccer. A brief and entertaining departure from the emphasis on not conceding goals came from the Dutch national teams of the 1970s. Playing a system christened “total football,” all players were supposed to be able to both attack and defend, thus breaking down the rigidity of positional play. Today the 4-4-2 system (four defenders, four midfielders, and two attackers) dominates the professional sport across the globe.

The nature of soccer fandom, like the sport itself, is based around oppositions: To support a team is also to have a rival. This dyadic role explains why soccer is such a powerful source of both individual and collective identities. Across the globe some of the strongest team rivalries are infused by wider ethnic, economic, religious, or political tensions. Fandom can take on religion-like qualities for many supporters, most of whom have an unrivaled passion for a single team. A team's ground holds a deep emotional significance, players are worshipped (both as individuals and as team members), and rituals surround the match-day experience. The rituals of match day vary across cultures,

but demonstrative show is central, with fans wearing team colors and singing or chanting to declare their support.

Competition at the Top

Soccer's most important competition is the World Cup, staged every four years and comparable to—maybe superior to—the Olympics in prestige. The first World Cup tournament was held in Uruguay in 1930 and was won by the host country, competing against just twelve other countries. The World Cup's popularity grew quickly, and a qualifying competition was used for the next tournament in Italy in 1934. The extensive global television coverage that the tournament received from 1970 onward made it worthy of its title. By 1982 the final tournament was expanded to twenty-four teams, and, although still dominated by Europe, the allocation of places became somewhat more representative of the global spread of the sport's popularity. The final tournament was expanded to thirty-two teams in France in 1998, when its sixty-four matches were watched by 2.7 million in the stadiums and a total of 37 billion people on television. For participating nations the competition often creates a temporary but strong sense of unity that cuts across class and regional divisions as people join to support their nation's team.

Brazil has been the outstanding nation in the tournament's history, winning the cup five times. International competitions are also held by every continental soccer

confederation, although none matches the prestige or popularity of the World Cup. In Asia, and particularly Africa, these competitions are rooted in the spirit of the postcolonial era, as soccer began to flourish and to be used by newly independent countries as a symbol of national pride and of a

wider sense of unity among such countries. In 2002 the World Cup was jointly hosted by South Korea and Japan—the first time it had been held outside Europe and the Americas. The 2010 World Cup will be held in South Africa—the first time either it or the Olympics have been held on that continent.

Soccer was introduced to the Olympics in 1900. Olympic soccer enjoyed some prestige during the 1920s but was quickly superseded by the World Cup and suffered from the problem that the best players were increasingly professionals. Even after the Olympics were professionalized, FIFA has remained largely un-supportive of the Olympic game, fearing a rival for its World Cup. Since 1992 Olympics soccer has taken the form of an under-twenty-three competition.

In club soccer the European Cup, now known as the "Champions League," is the most prestigious event. It was begun in 1955 as a competition for winners of the various European leagues. European club games, played on midweek evenings and made possible by the growth of air travel and the development of floodlights, created a meaningful European soccer community. The lure of television money led to the competition expanding during the early 1990s, changing from a knockout competition to a mini-league format in its early rounds. The most successful European countries (where the television market was also the greatest) were awarded extra places, and England, Italy, and Spain now provide four teams each to the competition. The monetary rewards of qualifying for the Champions League have become

so great that for most clubs it now takes precedence over domestic trophies.

Like the history of all sports, soccer's history is filled with stars who have excited crowds. The most famous player in history is Pelé (b. 1940). Raised in Brazilian slums, he embodied that country's obsession with artistic soccer but he was also subjected to attempts by Brazil's dictatorship to exploit his status to promote its own standing. Other stars who have influenced how people thought and played the sport include Stanley Matthews (1915–2000, England), Franz Beckenbauer (b. 1945, Germany), and Johan Cruyff (b. 1947, Netherlands).

Governing Body

Soccer is governed by FIFA, formed in 1904 by a group of European nations. Its initial membership of 7 had reached 73 by 1950 and 204 by 2004. FIFA is responsible for organizing the World Cup, but responsibility for the rules of soccer lies with the International Football Association Board, consisting of four voting representatives from FIFA and one each from the soccer associations of England, Ireland, Scotland, and Wales, a legacy of the early respect for Britain's pioneering role. FIFA's governance has not been uncontroversial. In particular, it has faced tensions over the relative power and influence of the different continental associations. The Union des Associations Européennes de Football has remained particularly influential, mostly because of the greater television money available in Europe. At the 2006 World Cup fourteen of the thirty-two places will be awarded to European teams. In contrast, Africa—which, like Europe, entered fifty-two teams into the qualifying competition—will receive only five places.

Soccer is organized into continental confederations: the Asian Football Confederation (formed 1954), Confédération Africaine de Football (formed 1957), Confederation of North, Central American and Caribbean Association Football (formed 1961), Confederación Sudamericana de Fútbol (formed 1916), Oceania Football Confederation (formed 1966), and Union des Associations Européennes de Football (formed 1954). FIFA

has more members than the United Nations—a clear indication of the popularity of soccer.

Social Class and Sport

Sports are activities often based on the physical capacity and strategy of participants involved and are intended to allow for competition among others that showcases talent and effort. Sport is an aspect of virtually all contemporary societies and is often viewed as an institution in modern countries. From a sociological viewpoint, sport as an institution in society serves as a system that often reflects broader issues by mirroring both the best and worst of human characteristics.

Sporting competitions balance social inequalities because social injustices are rarely, if ever, displayed on the fields of play. Sport is also thought by many to even transcend societal boundary issues. However, while the pristine nature of competition exists on the field, extraneous factors affecting sport are nonetheless omnipresent.

One sociological factor intersecting with sport is the stratification of social class.

A social class refers to a category of people based upon a common economic and social position. Social class intersects with various aspects of sport including sport participation and social mobility through sport, which will further be discussed.

Two important aspects should be noted concerning the intersection of social class and sport. First, there are sports that are popular and supposedly transcend class structure. Sports such as football and baseball are two examples of spectator sports that minimize class distinctions. These sports are enjoyed across social classes and participation restrictions are often minimal. However, spectators of these sports are separated by social class in terms of economics through quality of seats and number of attended games.

Second, social class is difficult to define in terms of categorizing groups of people. Most people in the United States, for example, would classify themselves as middle class or belonging to a subtier of the middle class (upper, middle, lower). Therefore, this article will discuss more extreme levels of social class as a means of articulating specific differences.

Sport Participation

Pierre Bourdieu, a social theorist who devoted his study to sport and leisure issues, observed that “sport, like any other practice, is an object of struggles between the fractions of the dominant class and also between social classes” (Bourdieu 1986, cited in Jarvie & Maquire 1994, 193). In essence, sport is an arena of society where struggles exist between social groups and it often perpetuates the status quo of class structure.

Research on sport participation has revealed a relationship between social class and participation in sport. For instance, members of upper and upper middle classes are more likely to participate in sports than members of working classes. However, participants of the upper middle classes are limited to specific activities. These activities are usually individually based as op-

posed to team sports and are consistent with general preferences and tastes of upper-class groups. These sports emphasize “highbrow” activities that are considered to distinguish the elite class from the rest of society. Examples of sports preferred by the upper middle class include golf, tennis, and skiing. These sports emphasize aesthetics and individualism and deemphasize team play and physical toughness.

Research has also revealed that members of the working class are less likely overall to participate in sports than higher classes. When they do participate in sports, members of the working class are more active in team sports, often sponsored by local businesses, employers, churches, and recreation departments. In addition, members of lower social groups are more likely to participate in sports that emphasize utilizing the body as an instrument, in terms of strength and physical toughness. Examples of sports favored by the working class include basketball, auto racing, and boxing. These types of sports have previously been labeled as “prole” sports, after the term “proletariat.”

There are various reasons for these differences in amount and choice of sport participation reflected in the different social classes. Two main concepts in social research literature that are important to examine are social exclusion and social capital. These concepts are not independent of one another but rather often intersect. This article examines factors that affect sport participation within the realm of social class.

Economics

Social exclusion refers to “encompassing not only low material means but the inability to participate effectively in social, political, and cultural life” (Walker & Walker 1997, 8). Social exclusion or restriction in sport is caused by intervening constraints that reduce a social class’s participation in some sporting activities. Intervening constraints refer to obvious barriers to participation such as facility dues, transportation, and equipment expenses. These intervening constraints are reflected through differences in economic means. Higher economic means afford some groups the luxury of bypassing these barriers

Althea Gibson—A Lady and a Tiger

Those days, I probably would have been more at home training in Stillman's Gym than at the Cosmopolitan Club. I really wasn't the tennis type. But the polite manners of the game, that seemed so silly to me at first, gradually began to appeal to me. So did the pretty white clothes. I had trouble as a competitor because I kept wanting to fight the other player every time I started to lose a match After a while I began to understand that you could walk out on the court like a lady, all dressed up in immaculate white, be polite to everybody, and still play like a tiger and beat the liver and lights out of the ball. I remember thinking to myself that it was kind of like a matador going into the bull ring, beautifully dressed, bowing in all directions, following the fancy rules to the letter, and all the time having nothing in mind except sticking that sword into the bull's guts and killing him as dead as hell. I probably picked up that notion from some movie I saw

The Cosmopolitan members were the highest class of Harlem people and they had rigid ideas about what was socially acceptable behavior. They were undoubtedly more strict than white people of similar position, for the obvious reason that they felt they had to be doubly careful in order to overcome the prejudiced attitude that all Negroes lived eight to a room in dirty houses and drank gin all day and settled all their arguments with knives. I'm ashamed to say I was

still living pretty wild. I was supposed to be looking for a job but. . . the hardest work I did, aside from practicing tennis, was to report to the Welfare ladies once a week, tell them how I was getting along, and pick up my allowance. . . . I guess it would have been too much to expect me to change completely right away. Actually, I realize now that every day I played tennis and got more interested in the game, I was changing a little bit. I just wasn't aware of it One of the days I remember best at the Cosmopolitan Club was the day Alice Marble played an exhibition match there. I can still remember saying to myself, boy, would I like to be able to play tennis like that! She was the only woman tennis player I'd ever seen that I felt exactly that way about. Until I saw her, I'd always had eyes only for the good men players. But her effectiveness of strike, and the power that she had, impressed me terrifically. Basically, or course, it was the aggressiveness behind her game that I liked. Watching her smack that effortless serve, and then follow it into the net and put the ball away with an overhead as good as any man's, I saw possibilities in the game of tennis that I had never seen before. . . . I had no way of knowing then that when the time came for me to be up for an invitation to play at Forest Hills, my biggest supporter aside from a handful of my own people would be this same Alice Marble. . . .

and grant freedom to participate in any given sport. However, lower-income groups must confront and overcome these intervening constraints in order to participate.

An example of intervening constraints that affect sport participation can be witnessed in public school athletic programs. An increasingly widespread strategy adopted by public schools is the "pay for play" approach. This philosophy requires all participants to pay specific athletic fees for each sport, which have sharply increased in previous years. According to records of two public schools in Ohio, fees range from \$425 to

\$630 per sport. Imposing these fees reduces the involvement in sport of students from the working class. Thus, the possibility arises that teams could be mostly comprised of children from affluent families. These fees provide an example of an economic (intervening) constraint that reduces lower-income people's opportunities to participate in sport and in many cases excludes working classes altogether.

Social marginalization of the working classes in sport also occurs through economic constraints imposed upon them by higher-income groups. Higher-income

groups perpetuate the status quo of class distinction in certain sports. Upper-middle-class sports including golf, tennis, rowing, and swimming are essentially “adopted” and promoted as select sports by the upper middle class. This restriction of sports by upper classes occurs because economic (intervening) conditions essentially bar participation from lower-income groups. Affluent groups often participate in these aforementioned sports through expensive private clubs in fashionable neighborhoods and the cost of participating in these sports through this avenue is high. Consequently, youth involved in these sports encounter equipment fees, travel expenses, and coaching costs. Youth from lower-income classes are often relegated to insufficient public facilities, lack of quality instruction, and poor equipment. Hence, the quality experience of youth in different social classes within the same sport helps perpetuate the status quo of participation in these types of sports.

Social Capital

Social capital within the context of sport represents preferences, skills, and knowledge collectively possessed by a specific social class. Social capital is mostly derived from one’s education, upbringing, and lifestyle and these factors affect sport participation. The concept of social capital in many ways is a more powerful factor of participation in sport across social classes. While economic means allow members from the upper classes to indulge in various sporting activities, the concept of social capital confines sport participation within respective social classes. These limits of sport participation not only occur from a top-down perspective, but also occur across social classes.

Antecedent constraints are a social class’s access to “economic, social, cultural, and symbolic forms of capital” (Bourdieu 1986, cited in Collins & Buller 2003, 423). Antecedent constraints differ from intervening constraints because most are obscure social differences that lead to specific sporting opportunities. Plainly stated, numerous antecedent constraints, in the form of lifestyle and upbringing, restrict access to other class values, thus denying involvement in certain sports.

According to social learning theory, people acquire these preferences of sport through reference groups within their respective social classes. Reference groups (e.g., family, peers, coaches, teachers, etc.) serve as socializing agents, which establish a social class’s group norms and values. It is suggested that lifestyle differences among social classes affect the preferences and tastes of certain sports over others. Sports that are supported and encouraged by one’s immediate reference group are also reflective of the preferences and tastes of the overall social class.

An example of the influence of social capital on sport consumption involves “prole” sports. Working classes are more likely to be involved with “prole” sports and are reflective of social class on the basis of access to social capital. Working class values and lifestyle choices emphasize sports that contain physical toughness, speed, and physical pose. These characteristics suggest that the preferences and tastes of working classes highlight and reward sports with excitement, aggression, and violent performances. The use of the body in sport also exemplifies working classes’ access to social capital. Working classes support prole sports that often view the body as a means to experience excitement. In this sense, the body is viewed as a tool to accentuate working class values of aggression and physical prowess in sport. Prime examples of sports that emphasize these characteristics include basketball and boxing. These physical sports emphasize the social capital of the working class consistent with rewarding excitement and aggression.

Upper middle classes avoid prole sports because the preferences and tastes associated with these sports are not consistent with upper-middle-class values. High-income groups favor sports that stress aesthetic performances and devalue sports of toughness and hard labor. Upper-middle-class values also assert that sports are viewed as an end in themselves, enjoyed for the sake of enjoyment, and are consistent with activities that highlight high culture. The social capital of upper middle classes is consistent with displaying one’s status and wealth. These acts of showcasing wealth on sport

consumption involve the avoidance of certain sports associated with working classes. Thus, this avoidance of certain sports is an example of the upper-class snobbery exhibited toward “lower” sports classes.

Social class participation in certain sports enforces the existing structure of society. In terms of access to social capital, this perpetuation of preferences and values of sport occurs through interactions with people similar to themselves. This direct link of social support and networking is one signifier of maintaining the social class’s ideals. This reinforcement of social capital occurs within working-class and upper-middle-class sports.

The existing structure of sport in society is also reinforced through direct descendants. Within any social class, children are direct beneficiaries of the available reference groups of their parents. Children from lower-income classes may gain entrance into sports that do not require extensive parental involvement, whereas children from upper-middle-class families have access to certain sports as a direct result of their parents’ involvement. Thus, children’s involvement with certain sports may be predisposed by the available access and involvement of their parents.

It is interesting to examine how sports participation can in fact symbolically determine one’s social class. America’s large middle class has various tiers and sport as an institution may serve as a distinguisher of social class. In essence, participation in sports associated with specific economic and social capital access can be an indicator of a specific social class. The consumption of sports associated with a particular social class may redefine the boundaries of what is essentially defined as social class.

Basketball

While traditional basketball often transcends societal boundaries, a form that is represented by lower-income classes is “streetball.” Streetball restricts participation from other social classes mostly through access to social capital. Streetball is essentially basketball, but maintains working-class preferences and values through the style, physicality, and location of the sport. The nature

of streetball stems from the way one wins as opposed to whether one wins. Style and originality are of utmost importance and are considered a barrier to entry if one does not have the physical “moves” required to participate. Creativity and expressiveness on the court, in the form of language, is also an important aspect of the sport. The language of streetball is synonymous with having a verbal repartee that enables players to articulate putdowns and demonstrate toughness. These traits are reflective of lower-income classes because of the appreciation of aggressive and physical play.

The location of streetball is also a factor toward the exclusion of other social classes’ involvement. Inner-city parks and playgrounds—havens for streetball—are often located in unsafe neighborhoods. Nonetheless, these courts provide a sense of community derived through people’s involvement. The court is seen as a place where respect is important and is earned through continuous play. Outsiders or people from other areas must play “hard” in order to be accepted. A court such as Rucker Park in New York City is an example of a court where legends of the street game were made and professionals still visit to showcase their talent.

Golf

Upper-class involvement within golf is perpetuated by both economic means and access to social capital. Rich white males often construct the rules of exclusionary policies within the golfing community. These policies are designed to maintain the “grass ceiling” against people on the basis of race, gender, and socioeconomic status. These practices are commonplace in many golf clubs, which are able to do so under the moniker of “private.” This section will highlight the issue of social class, although there is an intersection of exclusion among these groups.

From an economic standpoint, typical costs of participating in golf include clubs, bags, balls, and shoes. Even practicing golf costs money with the inclusion of range balls. These participatory costs of golf are severely opposed to other sports that require minimal space and supply costs. The median cost for a round of

The Well-Dressed Hunter

The following list of the clothing and equipment needed for a two-month-long expedition in a temperate climate illustrates the relative luxury that an upper-class hunter deemed “essential” in 1895.

Two tweed suits

One buckskin shirt

Two tweed caps

Four flannel shirts

Four pairs of flannel drawers

Six pairs of woolen socks or stockings

Moccasins: the number of these depends entirely upon the nature of the shooting. After ibex, I have worn out a pair in a morning, but for ordinary work a pair of good thick moccasins should last four or five days

Eight handkerchiefs: not white, but some dull colour which will not attract attention from afar, if inadvertently pulled out in sight of game.

One pair of short waterproof boots (gum boots)

One waterproof cape, such as is made by Cording; an armless contrivance, very light and portable, used I think by cyclists

Three pairs of blankets, one waterproof sheet, one air-cushion

One belt of webbing for cartridges

One pair of loose buckskin gloves, one pair of woolen mitts

One boating sweater

golf in the United States is around \$40, while a round of golf at a premier public course can cost upwards to \$110. By comparison, the first-year cost of membership at a private course (including initiation, ownership, and yearly dues) can exceed \$30,000. In addition, advancing to higher levels in golf requires sufficient economic means for facilities, private instruction, and quality equipment. The high economic requirements of golf enable only those without economic restrictions to participate.

Beyond economic means, upper middle classes also have access to the social capital surrounding golf, and these preferences, tastes, and practices are used to legitimize their position and restrict outside participation. These practices of the structure of golf include specific rules and etiquette, which are deemed essential to playing the game. In order to participate, one must therefore assimilate a role of supporting the existing structure. These specific practices of desirable behavior maintain influence over who participates. Lower-income groups often lack the network support needed to gain entry into golf's culture. Without this direct link to a social support system, participating in golf is still viewed

as a luxury often incongruent with the lifestyle of working classes.

Social Mobility

Social mobility can occur in conjunction with sport and is defined as changes in social class through improved economic situations, education, and vocational advances. In view of this, does sport as an institution in society serve as a vehicle for upward social mobility? In this context, sport is examined as an institution for social mobility, and not viewed as a developmental, social, or character-building agent often common with sport participation.

Professional Sports

Obvious financial rewards are present for athletes who “make it” to the professional level of the National Basketball Association, National Football League, National Hockey League, or Major League Baseball. However, the odds of becoming a professional in any of these sports is approximately 20,000 to 1. In addition, professional athletic careers are often short-lived, averaging between four and seven years. This is significant because

The English country gentleman galloping after a fox—the unspeakable in full pursuit of the uneatable. ■ OSCAR WILDE

after retirement from playing a professional sport, many years still remain in a person's work life. Thus, while the dream exists for a professional career, the odds of upward social mobility through this avenue are slim.

Interestingly, belief in the possibility of becoming a professional athlete mostly exists in the youth of the working class. Research supports that almost two-thirds of male urban youth assume this belief in the possibility of becoming a professional athlete. On the other hand, upper-income parents do not support such beliefs and are one-fourth as likely as lower-income parents to feel their child will become a professional athlete. These beliefs by parents and youth of working classes translate into focusing on achieving opportunities through sport, by developing the necessary skills needed for certain sports. On the other hand, upper-middle-class families concentrate on developing life and educational skills, which translates into better chances of upward social mobility.

Education

College can serve as a link to upward social mobility. College graduates are more likely to earn more financially than non-college graduates and have more networking opportunities. Sports can provide a means for attending college by lower-income groups through athletic scholarships. Unfortunately, the majority of student-athletes are left without financial assistance through participation in sport. Only 15–20 percent of student-athletes achieve a full scholarship, and another 20 percent achieve a partial remittance. These statistics are worse for females, who comprise only 35 percent of student-athletes. Thus while these scholarships are achieved through sport, they are limited in number.

The attainment of a college degree for student-athletes is an important factor for social mobility. Graduation rates for Division I student-athletes have increased in recent years to a national average of 60 percent. However, graduation rates remain low (42 percent for male basketball) for revenue-producing sports.

Barriers to graduation for student-athletes also exist that are often not present for non-student ath-

letes. The demand and time required by one's sport are not conducive to progressing toward one's degree. Also, lower-income student-athletes may have to work separate jobs in the off-season, which adds to current demands. Another barrier to college graduation is the academic preparation required to complete college. Student-athletes who are less prepared academically are more likely to take classes that suffice academic requirements, but do not matriculate toward graduation. These barriers to graduating do not support sport as an institution for upward social mobility.

The Future

There are relationships between sport as an institution and social class. However, most people do not constructively examine the role of social class and sport participation. Nonetheless, these differences of social class and sport are caused by access to both economic means and social capital. While we can easily view the way economic constraints can severely limit choices of sport participation, it is difficult to observe how access to social capital, in the form of preferences, values, and tastes, directs participation in certain sports. Social capital influences which sports are played by certain classes because these sports often reflect the values and preferences of a particular class in society. Streetball provides an example of how the lower-income class's preferences of aggression, excitement, and pose are reflected in the enjoyment of the sport, whereas golf is an example of upper-middle-class preferences of an aesthetic sport that also helps display one's status in society.

Participation in sport may also serve as a distinguisher of the type of social class that one associates with. Since the United States has a large middle class, sports may be a factor in deciphering social stratification.

Striving for upward social mobility is often a common goal in the United States. Sport is also seen by many as an avenue of improving economic and social conditions.

High salaries of professional athletes can serve as a way of reaching financial and social success, although odds are against such a venture and careers are often short-lived. Earning a college diploma is another means of achieving upward social mobility through sport. Yet educational skills are still required to achieve this goal and student-athletes often face tougher roads due to their various commitments.

Social Constructivism

Social constructivism—a research paradigm (framework) and set of assumptions basic to much of the social sciences and the humanities for at least the last forty years—in general argues that humans and human culture are made, not born, that is, that human institutions such as language and the political and ideological assumptions that inform these institutions shape everything around people.

To a social constructivist, “nature” does not exist. Only culture exists in that human ideas about “nature” and what is “natural” are themselves the product of ideological cultural assumptions. Often seen as the diametric opposite of biological determinism, which argues that human behaviors and institutions are predetermined by genetics, social constructivism set the stage for poststructuralist theory of all kinds, allowing for an investigation into every conceivable subject, including sports. Because sports are so closely linked with the body, and the body is so often linked with “nature” and genetics, for many years sports research did not examine the political and ideological assumptions that necessarily inform research paradigms, seeing those paradigms as an “objective,” neutral, and transparent tool for knowledge production. Particularly with the rise of feminist theory since the 1970s and the attention devoted to race and postcolonial studies since the late 1980s, social constructivist paradigms provide a necessarily self-reflexive, critical inquiry into the institutions of sports and research methodologies used to study sports.

For the social constructivist reality is not predetermined, a fixed form that is universal and never changes. Rather, for the social constructivist human agents construct and reproduce reality through their daily practices, the way they think about things, the ways they live their lives. One can say, then, that reality is in this sense based on a social ontology (a branch of metaphysics concerned with the nature and relations of being)

Football brings out the sociologist that lurks in some otherwise respectable citizens. They say football is a metaphor for America's sinfulness. ■ GEORGE F. WILL

wherein human agents do not exist independently from their social environment or context. This idea is in contrast to the idea of rational choice individualism, in which the individual makes choices independently of the context in which he or she is embedded. In the structure/agency or nature/nurture debates, social constructivism insists that social structures and agents are mutually constitutive. While the social environment defines people, simultaneously human agency creates, reproduces, and changes that environment through people's daily practices. Social constructivism marks a midway point between individualism and structuralism by claiming that the two are mutually constitutive. An athlete may choose to participate in the dominant corporate model of sports, for instance, using her celebrity and achievements to gain endorsements, but she may also be critical of that model and work to change it.

Social constructivism became mainstreamed as a sociological paradigm with Peter L. Berger and Thomas Luckmann's 1966 book *The Social Construction of Reality*. The book argued that the purpose of this paradigm is to discover the ways social reality and social phenomena are constructed, naturalized, and institutionalized so that social phenomena *appear* to have some fundamental biological basis but don't. Therefore, constructivist researchers focused on a description and analysis of institutions rather than on the individual. In this view reality itself becomes a social construction, an ongoing multidimensional process that is always historical and subject to change. Particular human subjectivities inform those "facts" that people take to be objective.

Social constructivism describes subjective, rather than objective, reality and argues that the idea of objectivity is itself a construction often used to discredit other forms of research because for the social constructivist, objectivity is not possible because each researcher comes at his or her subjects from a particular, situated standpoint.

Standpoint Theory Evolves

Standpoint theory evolved from this paradigm. For standpoint theorists such as Sandra Harding, the human

race, class, gender, religion, and other variables inform the standpoint or position from which people view the world, a position that determines what people focus on as well as what people don't see. The social groups of which people are members and the identities to which people subscribe shape what and how people know, as well as how people communicate what they know. In this view societal inequalities such as those based on race, gender, and so forth produce a particular standpoint or perspective in the marginalized group that can provide a more rather than less objective view than the perspective from the lives of the more powerful because those people in power have a vested interest in the preservation of the status quo, and knowledge produced by those people will always be in service of that interest. Feminist standpoint theorists were influenced by the idea of German political philosopher Karl Marx and the German socialist Friedrich Engels that those people not in power can be society's "ideal knowers."

Social constructivism is a central tenet of poststructuralism and has therefore been influential in the field of cultural studies, which breaks down traditional disciplinary barriers to combine sociology, literary theory, film/video studies, and anthropology to examine cultural institutions. Scholars working in cultural studies often emphasize how the structures of a given institution are informed by ideologies related to race, class, gender, and other variables. As such, it concerns itself with the meaning and practices of everyday life in addition to forms of "high culture" such as literature or painting (cultural studies—through a social constructivist lens—break down the distinctions between "high" and "low" culture). Cultural studies attempt to explain why people do particular things (such as participate in sports) in a given culture and under what sets of assumptions they do so.

Social constructivism as it has been applied through poststructuralism has therefore opened the door to a cultural analysis of sports and the particular meanings people give sports. It has made sports a legitimate subject of analysis in departments where they previously weren't (such as English or history) and has vastly

expanded the range of approaches to sports studies. Key to these forms of inquiry is a focus on language/knowledge and power, which often in sports studies is influenced by the work of the French philosopher Michel Foucault, who asked the following questions about knowledge production and how people come to “know” what they know: What counts as “knowledge”? Who decides? Who is authorized to speak? Many sports researchers working from a constructivist set of assumptions have found Foucault’s work useful for conceptualizing how knowledge about athletes and various aspects of the institutions related to sports is produced.

Gender, Race, and Postcolonial Studies of Sports

Feminist pioneers such as Helen Lenskji, Carole Oglesby, M. Ann Hall, Susan Birrell, Nancy Theberge, Mary Boutilier, Cindy SanGiovanni, and Lois Bryson began to look at gender as a socially constructed category that, rather than being a variable of the standard, can be conceptualized as a set of relationships that is constructed and maintained through human agency and cultural practices. Whereas perspectives based in biological determinism might argue that a fixed, given, biologically based reason exists for the social construction of women athletes, say, as weaker, a constructivist perspective would point to all the ideological assumptions that go into this perspective. In this view gender is formulated as a cultural construction, not just “nature” or biology. This is not to say that constructivists claim that biology does not exist or that genetics, hormones, endocrine systems, and basic physiological processes have no effect on human behavior. Rather, the idea is that biology is mediated, shaped, and given meaning by language and culture (a “constructionist” view). Whereas some earlier feminist views tended to fall into “essentialism”—the view that women are essentially different from men—gender studies are more common in the academy today.

For gender critics gender difference is a symbol of oppression, a set of culturally constructed stereotypes that works to maintain and justify power imbalances be-

tween genders. Gender criticism asserts that sexuality, which had previously been represented as a “natural,” private matter, is, in fact, constructed in, through, and by culture according to the political aims of the dominant culture. Gender criticism sees both gender and sexuality as existing on a continuum (some women are more “masculine” than some men, and some men are more “feminine” than some women).

Gender criticism sees gender as a performance that people put on, as roles that they play rather than as something fixed, set, given, or natural. Gender critics would question the stereotype that women, for instance, are any more “naturally” nurturing than men or less competitive than men. In the jargon of the field, this idea is called “gender performativity”—gender is performed, not given. If, for instance, a girl chooses to participate in gymnastics because gymnastics is seen as a more acceptable sport for girls than is rugby, she is performing gender.

Everyone Has a Gender

Like the emphasis on the fact that everyone, not just whites, has an ethnicity in postcolonial theory, gender studies would say that everyone has a gender. Therefore, discussions about gender should focus not only on women and “femininity” but also on men and “masculinity.” Particularly in sports studies in the pioneering work of, among others, Don Sabo and Michael Messner, masculinity has been formulated as a complex construct producing and reproducing a constellation of behaviors and goals, many of them destructive.

Recently researchers have conducted a great deal of work from a constructivist perspective that focuses on culturally constructed assumptions about gender, race, ethnicity, religion, and other identity variables as these interact with each other to affect how particular athletes are represented, who occupies leadership positions, and how sports function as a cultural institution. These researchers ask how dominant cultural assumptions about race, class, gender, and sexuality intersect to produce social relations and to what extent people accept and/or resist these. For these researchers people’s beliefs

about race or sexuality are not given “facts” or “truths” but rather cultural constructions that support inequitable power relations between groups. In *Masculinities*, for instance, R. W. Connell argues that race relations are central to the formation of dominant and subordinate masculinities, and sports are for him a highly visible site where this formation happens. Although the U.S. basketball star Michael Jordan was continually represented as having “no color,” David Andrews reads U.S. racial politics as determining, for instance, the representation of Jordan as a “natural” athlete, which reinforces historical racist linkages between blackness, masculinity, and the body. Pat Griffin and others have shown how negative social constructions of the woman athlete as lesbian and masculine have served to discourage homosexual and heterosexual women from sports participation and how sexuality remains a site for repression in the sports world. Postcolonial critics focused on women’s world sports, and scholars of globalization investigate how all the different axes of identity determine sports paradigms worldwide. Analyses of the global sports process examine the gendered, racialized, and ethnicity- and class-based nature of these processes and try to arrive at multidimensional models to accommodate these complexities.

Increasingly focused on the global stage, social constructivism informs a wide range of theoretical approaches to sports that analyzes relationships of hegemony (influence) and representation and that looks at the intersecting variables of identity as these affect the construction of knowledge and social relations in sports as an increasingly powerful institution.

Social Identity

Since their humble beginnings as folk games, most sports have developed into formats that are almost unrecognizable in comparison with their ancestral forms. However, a theme that we can identify throughout the evolution of sport is its role in the expression of social identity.

From the intense regional rivalries that characterized medieval ball games to the national, religious, ethnic, class, and political antagonisms that are present in modern sports, we can highlight the continued role of sport in processes of identity construction and maintenance. Although we should acknowledge that for some people—both participants and spectators—sport is sought purely for its intrinsic value, for many other people sport plays a far more significant role in their lives. For example, as the sociologist Joao Nuno Coelho states with regard to soccer, “it is fascinating, even though sometimes frightening, how a [soccer] team gains vast and complex social signification and symbolism which overtake the simple outcome of a sporting competition” (1998, 159). Furthermore, the social anthropologist Jeremy

MacClancy says “sports . . . are vehicles of identity, providing people with a sense of difference and a way of classifying themselves and others, whether latitudinally or hierarchically” (1996, 2). As this statement highlights, sport-based social identities operate in a variety of ways, differing in content, function, and complexity. Fundamentally, possessing a particular social identity not only facilitates a feeling of shared identity with fellow members, but also acts as a means of differentiating oneself from other groups. In other words, identification with a particular sport-based social identity indicates what or who one *is* and, equally importantly, what or who one is *not*.

Social Identity Theory: A Summary

The most substantial contributions to the study of identity have grown out of social identity theory, which was pioneered by the social psychologists Henri Tajfel and John Turner during the 1970s. Tajfel defines social identity as “the individual’s knowledge that he/she belongs to certain social groups together with some emotional and value significance to him/her of the group membership” (1972, 31). The theory posits that a specific self-inclusive social category—for example, a sports team—furnishes a category-congruent self-definition that forms part of the self-concept. A person perceives this category as a social identity that not only describes but also prescribes his or her attributes as part of that group. The theory is based around two fundamental processes: categorization and self-enhancement. The former process elucidates group boundaries by manufacturing group normative and stereotypical actions and perceptions and allocates people to the contextually relevant group. The latter process ensures that in-group stereotypes and norms favor, in the main, that group. Thus, ultimately, as the social anthropologist Richard Jenkins states, “social identity is our understanding of who we are and of who other people are, and, reciprocally, other people’s understanding of themselves and others (which includes us)” (1996, 5). In this regard, as the social behaviorist George Herbert Mead suggests,

people cannot see themselves without seeing themselves as others see them. Simply asserting an identity is insufficient; significant others must recognize—or validate—it within any interaction.

By the end of the twentieth century sociologists increasingly recognized that social identities are multiple and that people possess many identities. As Stuart Hall, cultural theorist, argues, “if we feel we have a unified identity . . . it is only because we construct a comforting story or ‘narrative of the self’ about ourselves . . . the fully unified, completed, secure and coherent identity is a fantasy. Instead, as the systems of meaning and cultural representation multiply, we are confronted by a bewildering, fleeting multiplicity of possible identities, any one of which we could identify with—at least temporarily” (1992, 277). The anthropologist Cris Shore, for example, proposes that we can view the components of a person’s identity as concentric rings, with each ring defining a separate identity. As a person undertakes various roles in life, different aspects of his or her identity will become more prominent depending on the situation and his or her position in relation to others. For example, a person from Northern Ireland might define herself in different contexts as Protestant, Unionist, or Loyalist, and “each apparently minor shift from one label to another in fact conveys messages of considerable magnitude and political complexity” (Shore 1993, 37). Social identities thus fluctuate depending on the context and are relative to the position of the observer. Indeed, as Hall reminds us, identities are never complete but rather are necessarily always in process—they are often fragmented and, at times, can appear seemingly contradictory.

Sports Teams as “Imagined Communities”

Participation in sport can represent an important component of a person’s social identity. An oft-cited example is the high school football player whose sporting expertise is reflected in high social status within the school and local community. However, the concept of a sport-based social identity is arguably more applicable to

the collective identities shared by particular groups than to those of individuals.

This fact is reflected in the academic study of sport, where an increasingly sizeable body of sociological inquiry has sought to establish how support for various sports teams acts as a significant source of social identity through the creation of a shared fan consciousness. We should not be surprised that soccer, as the most popular and played team sport in the world, is probably the primary sport in which certain teams are perceived to represent specific social identities. In the vast majority of soccer-playing countries the national team makes a considerable contribution to the construction and maintenance of national identity. Nevertheless, in other countries the relationship between soccer and national identity is more contested. For example, in Spain strong regional identifications and interteam conflict among supporters mean that the national team is a relatively ineffective vehicle for the expression of nationalist sentiments. Instead, soccer acts as a vehicle for social identity in the historic nationalities, where Barcelona represents Catalans and Athletic Bilbao symbolizes Basque identity. In Germany the successes of teams such as Schalke 04 and Borussia Dortmund have played a crucial role in constructing a positive regional identity for inhabitants of the industrial Ruhr Valley area, whereas in the city of Hamburg supporters of FC St. Pauli celebrate their perceived collective intellectual, antiestablishment identity. In Scotland and Northern Ireland the supporters of many sports teams reflect inveterate religious divisions and are strongly associated with either Catholicism or Protestantism. In Africa, the Middle East, and Australia large numbers of sports teams are associated with ethnic groups, whether they be indigenous or migrant. The preceding examples demonstrate the manner in which sports teams operate

globally as vehicles through which individuals and groups can strengthen their attachment to, and identification with, a particular community.

A key contribution to the study of social identity has been professor of government Benedict Anderson's work on nationalism. He refers to nations as "imagined communities," a concept that can also be applied to supporter groups of sports teams. As John Sugden and Alan Tomlinson, sport sociologists, highlight, "sport in many cases informs and refuels the popular memory of communities, and offers a collective source of identification and community expression for those who follow teams and individuals" (1994, 3). In this sense the term *community* implies that the members of a group possess common features that significantly distinguish them from members of other groups. Membership of a community may be determined by a variety of criteria: People may be required to possess particular ethnic, social, religious, political, or national characteristics. Fans of sports teams can be similarly conceived of as comprising distinct communities that revolve around identification with a particular team. Central to Anderson's argument is the notion that although a person may share elements of his or her identity with many other members of a particular social grouping, he or she likely will have had direct personal contact with only a small percentage of them. This fact is why the community is perceived as inherently imagined. In most cases one could not conceive of supporters of a particular professional team

being aware of the existence of all others who share this element of their social identity, yet for the majority this fact is irrelevant. For them the knowledge that they form part of the vast interdependency networks that constitute membership of a social group is sufficient to procure feelings of pride and involvement, despite the absence of close personal relationships with other people in this group.

Sport, Postcolonialism, and Social Identity

Sport also plays a significant role in the expression of social identity in relation to postcolonial populations. During the eighteenth and nineteenth centuries the colonization of Africa and the Indian subcontinent was unequivocally connected to dominant European theories of racial and cultural difference. Colonialism enabled the European powers to contrast themselves with those populations that they perceived to be backward and inferior. One of the central tenets of this ideology was physicality, and whereas the British categorized themselves as a “healthy race”—that is, possessing strength, vigor, and bravery—the British categorized the Indian population, for example, as bereft of such qualities. The importance attached to the “games ethic”—that is, the role of sport and physical education—in colonialism led to the development of a mutually reinforcing cycle that maintained that the less civilized “races” lacked the characteristics needed to compete in sporting endeavors and that the sporting (non)performances of Indians were symptomatic of deficiencies in their all-round character. As the medical anthropologist Joseph Alter points out, sporting images are not just allegories of wider racial ideologies because the sporting body “may be seen, not simply as a signifier of meaning, but as a subject actor in a larger drama of culture and power” (1994, 24). Sport was thus a barometer by which the differing social statuses and identities of colonizer and colonized were measured.

After the middle of the twentieth century many colonies began to achieve independence, and large numbers of people began to migrate from former

colonies to western Europe and North America. Since this period sport has played a major role in the construction and articulation of postcolonial social identities for former colonial populations and members of their respective diasporas (scatterings).

This development is particularly the case with cricket and former British colonies. Because of the relatively small number of nations that participate in first-class world test cricket, former British territories regularly play against and, with increasing frequency, defeat England. Despite, or perhaps because of, the fact that cricket was a key instrument in British imperialism and colonialism, for the duration of a match or series former colonial peoples are afforded the opportunity to compete on equal terms with England and to literally “beat the masters at their own game.” Consequently, in international cricket the inherent ideological capabilities of sport are accentuated, and the game continues to operate as an arena where significant political and postcolonial symbolism can be achieved. This situation is apparent with both those people who remain in the former colonies and those who have migrated to England. By the end of the twentieth century people widely acknowledged that, in international cricket, a substantial number of British Caribbeans and south Asians support their country of ancestry, particularly when they are playing against England. Such patterns of fandom enable people to celebrate tradition and feelings of continuity with the nation from which they or their forebears migrated, together with an opportunity to distance themselves from those elements of British life with which they are uncomfortable. For example, as the anthropologist Pnina Werbner points out, “it is in the field of sport, through support of the [Pakistan] national team, that young British Pakistanis express their love of both cricket and the home country, along with their sense of alienation and disaffection from British society” (1996, 101).

We find similar trends in other sports, such as soccer, where postcolonial populations have used the game to make symbolic gestures toward their former colonizers. For example, in 2001, nearly forty years after Algeria

The medals don't mean anything and the glory doesn't last. It's all about your happiness. The rewards are going to come, but my happiness is just loving the sport and having fun performing. ■ JACKIE JOYNER KERSEE

had gained its independence from France, a soccer match between the two countries in Paris was abandoned after second- and third-generation north African migrants invaded the pitch (playing field) to protest their alienation from contemporary French society. Furthermore, during the 1998 and 2002 soccer World Cup events, large numbers of supporters in Cameroon developed an “anyone but France” mentality during matches involving their former colonizers.

The Future

We should not assume that particular sport-related social identities are, or will be, necessarily bound to the locations where they developed. Certainly during the majority of the twentieth century social identities based on an affiliation to specific sports teams tended to be the preserve of those people living in the immediate location where the teams were based. Then, as a result of mass global migrations, by the end of the century allegiances to Glasgow Celtic or AC Milan, for example, formed part of the social identities of second- and third-generation migrants in the Scottish and Italian diasporas.

However, the twenty-first century has brought new forms of sport-based social identities. The construction of these identities is a consequence not only of population migration, but also of the global interchange of ideologies, technologies, economies, and media. Rapid advances in global media have contributed to what many globalization theorists label a “time-space compression,” that is, literally a decrease in the time required for people to link distinct locations. Through cable and satellite television and the Internet people have access to “live” sporting events wherever and whenever they take place. Consequently—although this notion may be contested by those people who are more “traditional” in their fandom—one can be a fan of a particular team without ever seeing it play or even visiting the city or country where the team is based. For example, as a result of the team’s promotional tours, satellite TV, and marketing of merchandise in the Far East, the profile of the Manchester United team is as large in Malaysia as it is in England. Therefore, we must recog-

nize that being a Manchester United fan may be as important an aspect of social identity for a citizen of Kuala Lumpur as it is for a season ticket holder in Manchester itself. Furthermore, a cursory glance at the clothing of African migrants in European cities, such as Lisbon or Barcelona, reveals not only elements of traditional African dress but also important sporting markers, such as Chicago Bulls basketball vests or Auxerre soccer jerseys. These cultural attributes represent both an increasing access to modern consumer marketplaces and the significance of globally recognizable sport symbols in expressions of social identity. In such instances the referent still possesses its specific local roots, but the identities involved become based around a wider “imagined community.” The huge popularity of sport also means that, in the early twenty-first century, social identities are being created that are purely contiguous to the actual sporting experience. For example, the United States is witnessing the dawn of the “soccer mom” who derives status from, and structures parts of her identity around, the participation of her children in soccer.

We should recognize that for different people association with a particular sports team is likely to represent different levels of significance in terms of the composition of their overall social identity. Whereas one person may perceive that his or her most prominent characteristic is “New York Yankees fan,” another person may rank this characteristic lower, in terms of perceived importance, than his or her role as a “citizen of New York.” Nevertheless, regardless of the degree to which it does so, support of a sports team clearly acts as a vehicle through which the other elements of a person’s social identity can be affirmed and articulated.

Softball

Each year, Thanksgiving marks an anniversary of one of the most popular team sports in the United States—softball. On that day in 1887, alumni of Yale and Harvard waited inside the Farragut Boat Club in Chicago, Illinois, for the outcome of the Harvard–Yale football game. When the alumni heard that Yale had defeated Harvard, one of the Yale rooters, so excited by the good news, took an old boxing glove and tossed it toward one of the Harvard alumni, who tried to hit the boxing glove back with a stick—thus giving George Hancock, a reporter for the Chicago Board of Trade, the idea for an indoor game of baseball. Hancock’s friends

thought he was suggesting a game outdoors. But Hancock was serious about an indoor game and, using available materials, he tied together the laces of the boxing glove to make a ball. He marked off a diamond inside the boat club and divided the alumni into two teams.

The game ended 17–8, but the final score was insignificant. What was important was that Hancock and his friends had played the first game of softball, which has become one of the most popular team sports in the United States.

Hancock’s game eventually became popular in Chicago, with Farragut teams playing games against teams from other gyms. In the spring, Hancock took his game outdoors where it was played on fields smaller than baseball diamonds. His game was called indoor-outdoor, and Hancock was the recognized expert on the game.

Over time, Hancock changed 19 special rules from his original set of indoor-outdoor baseball rules for his indoor game, which the Mid Winter Indoor Baseball League of Chicago adopted in 1889. Hancock’s game became popular throughout the Midwest, especially in Minneapolis, Minnesota, where Lewis Rober, a Minneapolis Fire Department lieutenant needed a game to occupy the idle time of his firemen. Using the vacant lot near the firehouse, Rober placed bases 10.6 meters (35 feet) apart and used a scaled-down medicine ball for a ball. The players hit the ball with a bat 5 meters (2 inches) in diameter. Other fire companies began to play Rober’s game, and by 1895, he had transferred to another fire company where he organized a team called the Kittens.

In the summer of 1900, the captain of Truck Company No.1, George Kehoe, named Rober’s version of softball, “Kitten League Ball,” which was shortened to “Kitten Ball.” Rober’s game remained Kitten Ball until the Minneapolis Park Board changed it to Diamond Ball in 1925—one of at least a half a dozen names the sport had before 1926.

Amateur Softball Association

Leo Fischer and Michael J. Pauley established the Amateur Softball Association (ASA) in 1933, following a

tournament that the two held in conjunction with the 1933 world's fair in Chicago. Fischer was sports editor of the *Chicago American*, which supported the event with fifty-five teams invited to participate in three classes—fastballers, slow pitch, and women, with a 14-inch (circumference) ball used in the single elimination or single knockout event.

Fischer and Pauley played their tournament inside the fair grounds with the Century of Progress Exposition (1933 World's Fair in Chicago) sponsoring the event, which had free admission. Seventy-thousand people viewed the first round and watched Harry (Coon) Rosen (inducted into the ASA National Softball Hall of Fame in 1990) lead the J. L. Friedman Boosters to the men's championship, one-hitting the famed Briggs Beautyware of Detroit, Michigan—the only loss suffered that season by Beautyware in forty-two games.

Pauley and Fischer's efforts paid off, and by 1935, the *Playground Association Softball Guide* wrote, "The

years of persistent effort, constant promotion and unchanging faith of believers in softball proved to have not been in vain, for in 1934 softball came into its own. All over America, hundreds of leagues and thousands of players enthusiastically accepted this major team game. The promotional activities of the ASA played an important part in stimulating the interest that has been developing (in the sport) for many years. The battle for recognition for this splendid sport is over. Softball has won a place among America's foremost sports."

NAME CHANGES

In 1926, Walter Hakanson, the Denver YMCA director, suggested the name softball. The name was accepted by the JRCOS (Joint Rules Committee on Softball), which was expanded in 1934 to add the Amateur Softball Association (ASA) as a member. Hakanson would later serve as president of the Amateur Softball Association (1948). Today, the ASA has its national headquarters in Oklahoma City with a full-time staff of twenty-eight under the leadership of Ron Radigonda, the former commissioner of the Sacramento, California division of the ASA. The ASA National Softball Hall of Fame and the Don E. Porter Hall of Fame Stadium also are located on the twenty-six acres in northeast Oklahoma City.

ASA's formation couldn't have come at a better time because teams played under different rules that left more than one manager confused and wondering where this sport was going. Teams had played the game at different base distances, and pitchers had delivered the ball from a different distance just about every time a game was played.

The JRCOS started in 1934 and provided consistency to the sport's rules as softball continued to grow in popularity nationwide. Since 1980, the ASA has had the responsibility for the official rules of softball, which are submitted and voted on by the almost 300 members of the ASA National Council.

As many as 105 ASA local associations were established throughout the United States, but by 2004, that number had dropped to 91, with smaller associations (metros) being absorbed by the larger (state) associations.

A highly romanticized image of ancient women playing a ball game.

*Power is not revealed by striking hard or often,
but by striking true.* ■ HONORE DE BALZAC

Through its network of commissioners, many of whom were employed by parks and recreation departments, ASA expanded its program to include different classifications (Class A, Class B, Class C, and Class D) and divisions for national championship play.

CHAMPIONSHIPS

Originally, the ASA had four national championships. By 2004, ASA had thirty-four divisions of championship play and seventy-eight classifications, amounting to more than eighty national championships. In 1974, the ASA added a youth program as the popularity of girls' softball increased in U.S. high schools and colleges. Between 1963 and 1991, the number of ASA youth teams increased more than 750 percent and the number of adult teams increased 250 percent.

With more female sports opportunities, and the popularity of the U.S. Olympic team, the number of female fast-pitch players increased 62 percent from 1990–1991 to 2001–2002, according to the SGMA's U.S. Trends Team Sports Report. National Collegiate Athletic Association (NCAA) fast-pitch softball grew 59 percent during the same period, making softball the fourth most popular team sport. More than 357,912 girls play fast pitch at 14,007 U.S. high schools (2002–2003), making it the fourth most popular female high school sport. Slow pitch is also offered in U.S. high schools, with 15,057 girls playing at 791 schools.

PAN AMERICAN AND OLYMPIC GAMES

The ASA, which is recognized by the United States Olympic Committee as the national governing body (NGB) of softball in the United States, selects and trains the athletes who will represent the United States in the Pan American Games and Olympics and other international softball events through the International Softball Federation (ISF), the governing body of softball internationally. Softball is played throughout the world in 124 countries with the ISF located in Plant City, Florida, since 2000. ISF President Don E. Porter, former ASA executive director (1963–1998), was the driving force behind softball officially being accepted

into the Pan American Games (San Juan, Puerto Rico, 1979) and the Olympics (Atlanta, 1996). The International Olympic Committee (IOC) approved the recommendations of the IOC Program Commission and its Executive Board during its general session in Birmingham, England, on 13 June 1991, to add softball to the Olympic program. Softball (women's fast pitch) was highly successful in the 1996 and 2000 (Sydney) Olympics, with attendance of 135,564 people in 1996 and 197,139 in 2000. In 2004, women's softball was again on the Olympic program with eight countries competing in Athens, Greece, with the heavily favored USA women's team winning a third gold medal. The softball competition drew attendance of 54,616 in 32 games or an average of 1,706 people per game. Since women's softball made its Olympic debut in 1996, 387,319 people have attended the competition. There is, however, no men's softball in the Olympic Games.

Pitcher Jennie Finch, former University of Arizona standout and a member of the U.S. Olympic team, brought the sport tremendous publicity in 2004, combining her glamorous looks with her unquestioned ability. She made *People* magazine's "50 Most Beautiful People" list in 2004, which marked softball's third—and most important—appearance in the Olympics.

Softball will remain on the Olympic program through 2008, with a decision expected in July 2005 at the IOC meeting in Singapore to determine if softball will be on the Olympic program for 2012. To keep the softball games in the Olympics moving, the ISF will use a 20-second clock that will provide a countdown visible to the pitcher, umpires, and the fans. If the pitcher doesn't release the ball within 20 seconds, the umpire will call a ball on the batter.

According to the SGMA's Team Sport Report, softball ranked thirtieth out of the top fifty sports activities in 2004 with 17.9 million participants, including 14.4 million in slow pitch and 3.5 million in fast pitch. Softball participation was as high as 22.1 million in 1989 and ranked seventeenth with 18.1 million participants in 1994.

What Is Softball?

Softball is a well-established bat-and-ball game played by two teams of nine or ten players each on a diamond-shaped field. Games generally are seven innings in length or until a winner is determined. All you need is the desire and the equipment to play softball. Like baseball, the objective of the sport is simple: The team that scores the most runs in the number of innings wins the game. An inning lasts until the team on defense records three outs against the team that is batting or is on offense. Each team alternates each inning between offense and defense, with the visiting team batting first and the home team batting last. A turn at bat or on defense completes the inning, with nine players in the starting lineup for fast pitch and ten in the starting lineup for slow pitch. A putout is recorded by the defensive team's pitcher striking out one or all of the players on offense, an infielder fielding the ball and throwing the ball to first base or another base to retire the offensive player before he or she reaches the base, an infielder or outfielder catching a pop fly or line drive before the ball touches the ground, and a player being tagged out by the defense before reaching first base, second base, third base, or home plate.

Softball's identity is diverse because of the two different disciplines: fast pitch and slow pitch. Fast pitch also has a variation called modified pitch, which was added to the ASA program in 1975. Very popular in Chicago and other Midwest cities is 16-inch softball, which is played with a softball 16 inches (40.6 centimeters) in circumference; the distance between bases was changed from 55 feet to 60 feet (18.3 meters) in 2002 after softball was added to the national championship program in 1964.

From the 1930s through the 1970s, fast pitch was the most popular discipline of softball played. In time, however, men's fast pitch became games of double-digit strikeout totals. To give fast pitch a balance between offense and defense, the JRCOS changed the men's pitching distance from the mound to home plate from 11.5 meters to 14 meters (46 feet) in 1950. The women's pitching distance was changed from 12.2 meters to

13.11 meters (43 feet) in 2002. This distance is also used throughout U.S. colleges and ISF events, including the Olympic Games.

SLOW PITCH

Slow pitch, which was part of the Chicago world's fair tournament conducted by Pauley and Fischer, started to become popular after it was added to the ASA's national championship program in 1953. In 1935, Lakewood, Ohio, formed a slow pitch league with four teams composed of city employees. Once slow pitch was added to the ASA program, ASA team registrations soared and different classifications and divisions of play were added.

Coed slow pitch was added in 1982 and represents about 10 percent of the ASA's membership of more than 230,000 teams. Classifications now exist for people from 45- and-over to 75-and-over. Each discipline is played on a diamond with different distances between the bases and from the pitcher's mound depending on whether adult fast or slow pitch or youth fast pitch or slow pitch is being played.

Slow pitch continued to gain in popularity and manufacturers were quick to take advantage of the large market share; more than 80 percent of all softball played was slow pitch at one time. But, because of advances in equipment, ASA, as well as other softball organizations, changed distances between bases, and from the pitching mound for men's slow pitch, to strike a balance between offense and defense. By 2002, the men's pitching distance was changed to 53 feet (16.15 meters) and the distance between bases was increased to 80 feet (24.34 meters) in 2004. The ASA Super Division, which was started in 1981, was eliminated in 2004 because of a lack of parity of the teams playing in that division. With the Super Division gone, the ASA focused its efforts on improving its Major Division of slow pitch in 2004 through a series of qualifiers nationwide and prize money of \$25,000.

EXPANDING ORGANIZATIONS

Although the United States Olympic Committee recognizes ASA as the national governing body for softball,

more than a dozen other organizations have been formed during the past thirty years to register adult and youth teams and umpires and to conduct tournaments. Some of these organizations are either regional or national in scope and concentrate on either slow pitch or fast pitch or both disciplines of the sport. Even traditional baseball organizations (Babe Ruth, Pony, Little League) have turned their attention to softball, especially girls' softball, during the past twenty-five years to register teams and umpires as well as to conduct tournaments for different age groups. Ironically, there are more softball organizations than ever, but the overall market share of softball is smaller than it was a decade ago.

In 1965, the ISF held its first Women's World Championship in Australia; the host country defeated the United States for the gold medal. The first Men's World Championship was held in 1966 in Mexico City. The U.S. men won outright or shared (in 1976) five of the first seven championships. New Zealand is currently the dominant country in men's fast pitch internationally, having won three consecutive world championships (1996, 2000, and 2004), the first time that this has been accomplished. New Zealand also shared the 1976 World title with the United States and Canada and won another world title in 1984.

In Women's World Championship competition, the United States is the undisputed leader with seven gold medals, including five in a row (1986, 1990, 1994, 1998, and 2002). The U.S. women's team also has dominated in the Pan American Games, winning the gold medal all but once (1983) in seven Games. The U.S. men, however, have never won a gold medal in Pan American softball, instead taking seven silver medals behind gold medalist Canada.

Besides these competitions, softball is on the program of more than a dozen multisport games, including the following:

- All-Africa Games (women)
- Arafura Games (men and women)
- Asian Games (women)
- Bolivarian Games (men and women)
- Central American Games (men and women)
- Central American and Caribbean Games (men and women)

PROFESSIONAL LEVEL

Although softball is an amateur sport, attempts have been made to take the sport to the professional level, especially for female fast pitch. In 2004, the National Pro Fastpitch League was started with teams in six cities featuring top collegiate stars and past Olympians, including two-time U.S. gold medalist Michele Smith. The International Pro Softball Association operated between 1976 and 1979, then took a year off in 1980 and never returned. Another attempt at professional women's softball was made from 1997 to 1998 with the league suspending play until the National Pro Fastpitch League (NPF) launched the NPF All-Star Tour in 2003, which was hosted by twelve major league baseball clubs that summer and gave people the chance to see women's fast pitch in action through NPF exhibition games, clinics, and in-game promotions.

In 2004, the league's teams included the Akron Racers, NY/NJ Juggernaut, the New England Riptide, Texas Thunder, the Arizona Heat, and the California Sunbirds. The league is an official development partner of major league baseball for women's fast pitch softball and signed a contract with ESPN to televise eleven games nationally in the 2005 season.

In 2005, another pro league is scheduled to begin, headed by Dr. Dot Richardson, two-time U.S. Olympic gold medalist, and Lisa Fernandez, a member of the 2004 U.S. Olympic team.

The Future

Softball will likely remain as one of the most popular summer sports. Future participation is expected to increase in girls, masters', and seniors' competition as the U.S. society gets older and people have the time and money to play softball. According to Senior Softball-USA in Sacramento, California, an estimated two million people (men over 50 and women over 45) play senior softball in the United States. The average age of

the top 30,000 tournament players is sixty-four years old. These people have an average disposal income of \$35,000 and play an average of seven tournaments each summer.

Whether or not softball remains on the Olympic program beyond 2008 will certainly affect the continued growth of girls' fast pitch in U.S. high schools, colleges, and universities. One professional league might eventually succeed, but with two leagues expected to operate in 2005, one or both could fail.

Softball is a lifetime sport that people can play on a highly competitive level or for recreation and fun based on their abilities and, depending on where they live, almost year around. Because of this, softball "is the sport for everyone." People make lifelong friends. Softball players spend an estimated \$4.3 billion annually to compete, and people from all socioeconomic and ethnic groups play softball.

Softball is the "ultimate class equalizer," said ASA Commissioner Dan Saylor, "You can be a nobody and a star in softball or be a Ph.D. and go 0-for-4. No matter how good or bad you are, there's a league for you."

South Africa

South Africa is a large nation of varied geological regions and climates at the southern tip of Africa. In mid-2004 the population was estimated at 46.6 million people, 79 percent of whom classified themselves as African, 9.6 percent as white, 8.9 percent as colored (mixed), and 2.5 percent as Indian or Asian. South Africa's history has been riddled with ethnic conflict, institutional and political racism, and unequal gender relations of power. However, after the demise of the political system of apartheid (established in 1948 and characterized by white supremacy and the oppression of black people) and the establishment of a democratically elected government in 1994, the new country was characterized as the "nonracial, nonsexist Rainbow Republic of South Africa."

Sports have held a significant place in South Africa's stormy history, shaped by its people's diversities and by social and political struggles. During colonial times sports were racialized and gendered: The powerful white male minority wielded the greatest power over the development of sports and had access to the best resources. The fact that South African sports have been the "national religion" enabled sports to be used to help

overthrow apartheid, and sports' continuing grip on the nation's psyche has provided impetus for their use in nation building in recent years. Writing in 2004 about developing nonracial sports in his country, President Thabo Mbeki pointed out the importance of "ensuring that the addiction to competitive sport serves to unite our people in a spirit of national reconciliation, rather than racial division and conflict."

Sports before Apartheid

Africans migrated south into present-day South Africa two thousand years ago, and the Dutch began to settle around Cape Town in 1652, but the British heralded the introduction of "modern sports" to the region. With their ethos (distinguishing character, sentiment, moral nature, or guiding beliefs) of fair play, self-discipline, and collective identity, the organized sports that emerged in Britain during the nineteenth century were brought to South Africa by immigrants who had annexed and settled in the country since the beginning of the century. Sports and British cultural values, especially those of the boys' public schools, were thereafter inseparably linked and produced a colonial sporting system from which today's sports have evolved.

The British model of sports was exclusive and alienated the majority of Africans as well as the Boer settlers (white farmers of mostly Dutch descent). Nineteenth-century Boers were men of the veld (a grassland, especially of southern Africa, usually with scattered shrubs or trees), their sporting activities confined largely to riding and shooting, whereas English-descended South Africans tended to organize themselves in clubs, a habit given impetus by the soldiers who came to fight Queen Victoria's wars in South Africa. Some clubs were single-sport clubs for cricket, rugby, soccer, tennis, or cycling, and so forth. Other clubs, such as the Wanderers in Johannesburg and the Collegians in Pietermaritzburg, were multipurpose, with vastly superior facilities.

Until rugby and soccer arrived during the early 1860s, hunting, horse racing (introduced in 1797), and cricket (introduced in 1808) remained the three principal sports, played essentially by British immigrants and

the military. Other sports followed rapidly, their arrival coinciding with the discovery of diamonds at Kimberley (1867), the discovery of gold at Rand (1886), and imperial expansion.

Colonial sports lent themselves to the racial segregation that characterized South African society. Most sports were exclusively white, but the civilizing mission of sports to build the empire was influential in the schools, colleges, and clubs for educated nonwhites and in missionary schools for poor black children. Games such as cricket and especially soccer were adopted within South Africa's black communities; in comparison, the traditional skills of hunting, archery, spear throwing, wrestling, and dance were losing their appeal. From the start colonial sports were heavily gendered, emphasizing aggressive and chauvinist images of sporting manliness.

Although the Boers eventually adopted British forms of sports—and in the case of rugby attached their own identity and meaning to it—they had practiced various folk sports prior to the nineteenth century. Many of these were nostalgically revived during the latter years of apartheid. *Jukskei* (a throwing game using the wooden pin from an ox yoke) was still being played in more than seven hundred clubs during the late 1970s, with the South African *Jukskei* Board boasting more than twenty thousand members. *Vingertrek* (a form of hand wrestling), now played by children, once was played by burly adults at the religious festival of *Nachtmaal*. The horse also played a crucial role in Boer social and working life, featuring in many recreational activities. Increasingly, though, through rapid urbanization and exposure in schools—the two most powerful forces in the propagation of “British” sports in South Africa— young Boers also chose to take up team sports such as cricket and rugby.

Before World War II people played a smattering of racially mixed sports, but most sports were segregated. However, no sports infrastructure existed for the majority of the population, which was black, and because of grinding poverty few blacks had money for education, recreation, or sports. In rural areas no facilities and

opportunities existed. During the 1930s and 1940s the neglect of sports provision for nonwhites coexisted with racial practices that denied mixed-race social interaction and set the scene for the systematic political institutionalization of apartheid sports.

Sports during Apartheid

Henrik Verwoerd, prime minister of South Africa in 1948 when the Afrikaner Nationalist Party took power, is known as the “architect of apartheid” with its mandatory division of the nation into four racial categories: African (pejoratively labeled “native”), colored, Asian or Indian, and white. The nonracial term *black* was used by antiapartheid activists to describe all those groups characterized by the government as “nonwhite.” Apartheid was a violent form of racist repression enforced by the white minority so that the rights and opportunities of African, colored, and Indian people were reduced in all areas of life and culture, including sports. Although no official prohibition of mixed-race sports existed, little need existed to impose apartheid on the already established model of segregated sports. Nevertheless, the government passed laws that, among other taboos, prevented nonwhites from traveling freely and using white facilities. Although class differences existed, and poor whites had limited opportunities, the resourcing of middle-class white-male sports was superlative, and middle-class white women had access to excellent facilities as well. In Indian and colored areas far fewer fa-

cilities existed, and African areas were devoid of anything but the most basic facilities.

Bureaucratic responsibility for sports was also assigned on a racial basis. During the early days of apartheid white sports federations were founded, increasingly patronized by the government, reflecting white

South Africa’s prosperity and obsession with sports. Until 1979 African sports were administered by the Bantu Affairs Department (thereafter the Department of Sport and Recreation assumed partial responsibility); colored sports were administered by the Colored Affairs Department; and Indian sports were administered by local authorities and the Department of Indian Affairs.

A surprisingly active sports movement in nonwhite communities existed throughout the apartheid period, and sports became a focus for cultural resistance and antiapartheid politics. During the 1950s nonracial national federations were founded for sports, including soccer, cricket, weight lifting, table tennis, and athletics. The South African Sports Association (SASA) was established in 1959. The establishment in 1963 of the South African Non-Racial Olympic Committee (SAN-ROC) and in the early 1970s of the South African Non-Racial Sports Organization (SASPO) and the South African Council on Sport (SACOS) were significant developments in the eventual desegregation of sports. SAN-ROC, which relocated to England, was the leading organization in the international campaign against apartheid sports. Sam Ramsamy, in exile in London, became its president. Using the unifying slogan, “No normal sport in an abnormal society,” these organizations worked alongside the African National Congress (ANC) political party and with the support of international antiapartheid initiatives to oppose apartheid sports. The major method of opposition was

to encourage and support a total boycott of South African sports.

Also in the 1970s Prime Minister Vorster unveiled a “multinational” sports policy to persuade the international community to reverse the boycott decision. However, multinational sports clearly did nothing to dismantle the separate and unequal development intrinsic to political apartheid. In 1977 the commonwealth heads of government made public their condemnation of apartheid sports by signing the Gleneagles Agreement, and in the 1980s a militant organization, the National Sports Congress (NSC), was established. With the exception of rebel tours, South Africa was now totally isolated from international sports, including the Olympic Games.

Although the International Olympic Committee (IOC) claimed to have a nonracial policy, it did nothing to oppose all-white South African participation in the Olympic Games from 1908 until 1960. However, united pressure from the new independent African nations—with the backing of the Soviet Union and other Communist bloc countries, the Supreme Council for Sports in Africa (SCSA), SAN-ROC, and other anti-apartheid organizations—resulted in South Africa being banned from the 1964 and 1968 Olympic Games and, in 1970, to the complete expulsion of South Africa from the Olympic movement. South Africa was banned from the Commonwealth Games at the same time. One of the aims of the African Games, the first of which took place in 1965, was to unite the countries of the continent against apartheid in South Africa. Another key event took place in 1976 when seventeen African countries boycotted the Olympic Games in Montreal, Canada (because the IOC had refused to ban New Zealand after its national all-black rugby team had played against South Africa).

Responding to such international pressure, by the mid-1980s some public sports facilities became desegregated. However, white racism, black poverty, and gross inequalities of sports resourcing remained. For these reasons, and in parallel with an economic crisis and uprisings in the black townships, the sports boycott

tightened. Thus, in 1985, when the white South African Cricket Union (SACU) arranged a rebel Australian tour, it was strongly opposed by the nonracial South African Cricket Board (SACB) and all the opponents of apartheid in countries throughout the cricketing world. Nevertheless, in January 1990 another cricket rebel tour captained by Mike Gatting (former England captain) took place. This last-ever rebel tour attracted aggressive demonstrations and was cut short, reflecting the growing confidence that the anti-apartheid fight was being won and coinciding with another watershed in South Africa’s history.

President F. W. de Klerk announced in Parliament a reform program of deracialization, and the ANC leader, Nelson Mandela, was freed from prison. The international sports boycott was lifted, and negotiations between the white sports bodies and the nonracial sports bodies took place to establish single national sports organizations—a prerequisite for the reentry of South Africa into international competition. In 1992 the IOC invited South Africa to take part in the Olympic Games in Barcelona, Spain.

Sports after Apartheid

In 1994 apartheid officially ended, South Africa achieved majority rule, the ANC was voted into power, a multiracial democracy was established under the Government of National Unity, and Nelson Mandela was its president. In 2004 the ANC was returned to power for the third time with President Mbeki winning his second term. The new constitution has been described as one of the most radical in the world, providing scope for ending discrimination and inequalities between races, classes, and genders. The Reconstruction and Development Program (RDP) of the new government set out immediately to work toward this end. The government recognized the potential of sports to break down barriers between races, to foster national reconciliation throughout the country, and to work for international recognition.

The anti-apartheid National Sports Council (NSC) was the main facilitator of new democratic sports

Ball Dances of the Bushmen of South Africa

The 1905 ethnographic account below by George Stow describes two kinds of ball games as "ball dances."

Some of their dances required considerable skill, such as that which may be called the ball dance. In this a number of women from five to ten would form a line and face an equal number in another row, leaving a space of thirty or forty feet between them. A woman at the end of one of these lines would commence by throwing a round ball, about the size of an orange, and made of a root, under her right leg, and across to the woman opposite to her, who in turn would catch the ball and throw it back in a similar manner to the second woman in the first row; she would return it again in the same way to the second in the second, and thus it continued until all had taken their turn. Then the women would shift their positions, crossing over to opposite sides, and again continue in the same manner as before; and so on until the game was over, when they would rest for a short time and begin again.

Another ball dance was played merely by the men. A ball was made expressly for this game out of the thickest portion of a hippopotamus' hide, cut from the back of the neck; this was hammered when it was perfectly fresh until it was quite round; when finished it

was elastic, and would quickly rebound when thrown upon a hard surface. In this performance a flat stone was placed in the center upon the ground, the players or dancers standing around. One of them commenced by throwing the ball on the stone, when it rebounded; the next to him caught it, and immediately it was thrown again by him upon the stone in the same manner as by the leader, when it was caught by the next in succession, and so on, one after the other passing rapidly round the ring, until the leader or one of the others would throw it with such force as to send it flying high and straight up into the air, when during its ascent they commenced a series of antics, throwing themselves into all kinds of positions, imitating wild dogs, and like them making a noise "che! che! che!" but in the meantime watching the ball, which was caught by one of them, when he took the place of leader, and the game was again renewed.

The play was sometimes varied by two players being matched against each other, each throwing and catching the ball alternately, until one of them missed it, when it was immediately caught by one of those in the outer ring, who at once took the place of the one who had made the slip, and thus the play continued.

structures, and the first minister of sports, Steve Tshwete, was appointed. The provision of sports facilities and opportunities in severely deprived areas was a priority of the RDP, and girls were regarded as an especially needy group. In 1997 Women and Sport South Africa (WASSA) initiatives were established in each of the nine provinces. The importance placed on sports as a symbol of national unity was exemplified during the 1995 rugby World Cup final when Nelson Mandela wore the springbok (a southern African gazelle) kit, instantly transforming it from a symbol of white (Afrikaner) superiority to one of national unity. The NSC was dissolved in 2001 and replaced by the South African Sports Commission (SASC), and

Ngconde Balfour was appointed the minister of sports and recreation.

Today the overall responsibility for sports and recreation policy, provision, and delivery resides with Sport and Recreation South Africa (SRSA) and the SASC. The key objectives are to increase participation, raise the profile of sports, increase the probability of South African success in major competitions, and place sports and recreation at the forefront of efforts to address national issues of unemployment, poverty, economic development, and health.

In addition, the SRSA coordinates and monitors the creation and upgrading of sports and recreation infrastructures through the Building for Sport and

Zola Budd on “Running Barefoot”

South African distance runner Zola Budd achieved a certain notoriety in the 1980s for more than her record-breaking runs. Many in the international athletic community were outraged when she acquired British citizenship, a way to get into the Olympics when South African athletes were banned due to the apartheid policies of their government. Budd was also noted for running barefoot, which she describes in the extract below.

Coming from a farming background, I saw nothing out of the ordinary in running barefoot, although it seemed to startle the rest of the athletics world. I have always enjoyed going barefoot and when I was growing up I seldom wore shoes, even when I went into town. The exceptions were when I went to school, or church or on special occasions, and it was natural when I started running that I should do it barefoot.

I received my first pair of running spikes when I was thirteen and used them in a big inter-school athletics meeting. I found them uncomfortable and after that I decided to continue running barefoot because I found it more comfortable.

Recreation Project (BSRP). The new theme of sports and recreation in South Africa, namely, “getting the nation to play,” places the major responsibility on stakeholders (including all spheres of government and all sports-specific and recreation-specific organizations, including sports federations such as Disability Sport South Africa) to raise the levels of participation in sports and recreation, currently estimated at 7–20 percent in historically disadvantaged groups, including black South Africans, women, youth, people in rural communities, and people with disabilities.

Sports and recreation are central features of the regeneration program funded by proceeds of the national

lottery and corporate sponsors. The contribution of sports and recreation to the gross domestic product (GDP) in 2000 was around 2 percent, providing employment for 34,325 full-time and 6,140 part-time workers and 8,000 volunteers. South Africa also benefits from the national Sports Tourism Project, which estimated that the economic impact of the 2003 cricket World Cup attracted twenty thousand foreign spectators and generated thirty-five hundred jobs. Experts predict that when the 2010 soccer World Cup comes to South Africa in 2010, 2.72 million tickets will be sold.

Competition at the Top

Another goal of the South Africa sports initiative is to promote the country to the rest of the world by hosting big events and to achieve success in elite competitions such as World Cups and the Olympic Games. Linked to the growing significance of commercialization, international sports receive support from both public and private sectors.

A ministerial task team was appointed in 2000 to study high-performance sports, followed by the establishment of talent identification programs and the securing of corporate sponsorship. Immediately after the 2000 Olympics in Sydney, Australia, the National Olympic Committee of South Africa (NOCSA) inaugurated Operation Excellence, an initiative whereby elite athletes, in particular potential Olympic finalists and medalists, went to specialized training camps and were given financial assistance, medical care, and in some cases employment to improve their chances at the 2004 Olympics in Athens, Greece. In November 2002 Olympic House was officially opened in Johannesburg and described by Sam Ramsamy, president of NOCSA, as “the doorway to the hopes and dreams of all South Africans. . . . It is here where we will continue to hold a place for all races, age groups, income levels and genders” (Ramsamy and Griffiths 2004).

The emphasis on the internationalization of South African sports is reflected in the country’s participation in the Barcelona, Atlanta, Sydney, and Athens Olympics; the promotion of the 1995 rugby World Cup; hosting of

the 2003 cricket World Cup; Cape Town's bid to host the 2004 Olympics; and plans to host the 2010 football World Cup finals.

However, some people oppose public spending on elite athletes and showcase sports events and are angered that elite sports in South Africa show signs of manipulation and corruption typical of elite sports in countries in the West. In spite of the focus on unification and equity, stark inequalities remain, and race, class, and gender discrimination is still evident. Radical critics continue to argue that sports cannot be developed democratically until more money has been spent on the general social fabric of South African society.

The Future

With the approval of the cabinet, South African sports in the future will be governed by a two-tier system, comprising a fully fledged government department and a nongovernmental sports confederation. These two structures will take full responsibility for all levels of sports, including mass participation and high performance. The new system is expected to be implemented by April 2005. The goal will continue to be "unity out of diversity." Representing members of the nonracial sports movement during the apartheid regime who worked to sustain the sports boycott and the isolation of South Africa, Cheryl Roberts (who was a member of the South African team at the 1992 Barcelona Olympics) celebrated ten years of South Africa's return to world sports when she wrote, "The sacrifices made were not in vain for today we are a non-racial, democratic South Africa and participate in world sport as a legitimate country." Roberts went on to speak for many when she stated how eagerly South Africa waited hosting the 2010 Soccer World Cup Finals and someday the Olympic Games.

South East Asian Games

The South East Asian Games idea began with informal meetings in May of 1958 during the Asian Games in Tokyo. Led by a proposal from Thailand, sports officials from Burma, Laos, Malaysia, and Thailand met to discuss creating a competition that would strengthen ties between nations of the South East Asian Peninsula and give athletes an opportunity to prepare for Asian Games and Olympic competitions. Originally known as the South East Asian Peninsular Games, the first games were held in Bangkok, Thailand, in 1959 with Burma, Cambodia, Laos, Malaysia, Thailand, and Vietnam participating. The games have been held on a biennial basis, with the exception of 1963, since that time.

The original intent was to rotate the games alphabetically by nation, thus removing any doubt over which nation was to be the next host. This would also eliminate complex bidding processes and allow nations to plan well in advance, as they knew when it would be their turn to host the games. This plan quickly fell apart at the third games when Cambodia was involved in a dispute over eligibility with the International Association of Athletics Federations (IAAF) over Cambodia's participation in the GANEFO (Games of the New Emerging Forces) Games and Cambodia was not able to host the games.

Laos was scheduled to host the next games in 1965 but was not prepared and had to decline. Malaysia moved up in the rotation and Kuala Lumpur hosted the games. Singapore was accepted into the federation in 1965 and all seven South East Asian Peninsular (SEAP) Federation members participated in the 1965 games.

Alphabetic rotation was to be abandoned in 1967 when Cambodia was once again asked to host the games. Cambodia pulled out in February of 1967, withdrawing completely from the SEAP Games Federation, telling the other nations that they had other games to prepare for and did not have time to get ready for the fourth SEAP Games. This was met with skepticism and frustration by the other members, who pointed out that

Cambodia had just hosted the Asian GANEFO Games 25 November to 6 December 1966, with fifteen nations present.

The SEAP Federation met in May of 1967 and reawarded the 1967 games to Bangkok, to be held in December of that same year. Fortunately Bangkok had held the Asian Games just twelve months before in December 1966 and had a short list of tasks to finish to be ready for the games.

Organizers Change the Name

The name South East Asian Peninsular Games was used up until 1975, when the SEAP Games Federation accepted Indonesia and the Philippines as members and the name was changed to South East Asian Games. Lord Killanin, then president of the International Olympic Committee, showed his support for the South East Asian Games movement when he was present at the 1977 games in Kuala Lumpur, Malaysia.

The huge 100,000-seat Gelora Senayan stadium, originally built for the 1962 Asian Games, was host to the 1979 South East Asian Games held in Jakarta, Indonesia.

The 1989 games in Kuala Lumpur saw the return of teams from Vietnam and Laos, who had last been at the games in 1973.

Chiang Mai, Thailand, in 1995 was the first non-capital city to host the games. The games were part of the seven-hundredth-anniversary celebration of the city.

The 1997 games in Jakarta were contentious. Disagreements over judging in gymnastics, boxing, and taekwondo and hostility to visiting athletes by spectators disrupted the friendly spirit of the games. During soccer games fans smashed and burned the wooden seats inside the stadium and overturned cars outside. The Asian Football Confederation threatened to cancel the football final if organizers could not control the crowds. The final was held, but was interrupted by violence and fans starting fires in the stands and throwing stones onto the field. The game was stopped for forty-five minutes at halftime in an attempt to calm the crowds. After the games fans destroyed property and overturned cars in the streets.

The 1999 games were held in the tiny oil-rich kingdom of Brunei in Bandar Seri Begawan. Organizers expected little trouble with crowd control due to the strict Islamic laws enforced in Brunei and the Sultan of Brunei also declared that his subjects could watch the games for free.

The 2001 games were held in Kuala Lumpur, Penang, and Johor in Malaysia, making both Thailand and Malaysia five-time hosts of the South East Asian Games.

In 2003 at the games in Vietnam, East Timor participated for the first time, bringing to eleven the number of participating nations. Several Vietnamese citizens were arrested at the games for passing out religious materials, because they were not part of an organization that was sanctioned by the government. Several other countries complained when Vietnam added sports to the schedule that were considered minor and not well known outside Vietnam, such as *capteh* or shuttlecock kicking, the circle event in *sepak takraw*, and underwater fin swimming. The accusation was that Vietnam was simply trying to win the most medals with obscure sports, and Vietnam did in fact pick up an overwhelming majority of the medals in those events. The following year the South East Asian Games Federation passed new rules so that future hosts would not have as much freedom with the sports, and said that nations had to focus on sports practiced at the Asian and Olympic Games.

The Future

The 2005 games are scheduled to be held in the Philippines, the 2007 games in Thailand, and the 2009 games in Laos.

Spain

Situated in southwestern Europe, Spain is surrounded by the Mediterranean Sea, the Cantabrian Sea, and the Atlantic Ocean. It has a population of 40.3 million people. It is a nation of contrasts with a rainy north and a sunny south and cultural variations that are reflected in differences in economic systems and political organization. Spain is divided into nineteen autonomous regions, including the Balearic Islands, the Canaries and three small possessions off the Moroccan coast. Each unit has an autonomous government and its own sports structure. Madrid, the capital, is located in the country's geographical center. Soccer is the "king of sport" as it attracts an enormous percentage of the population to its teams.

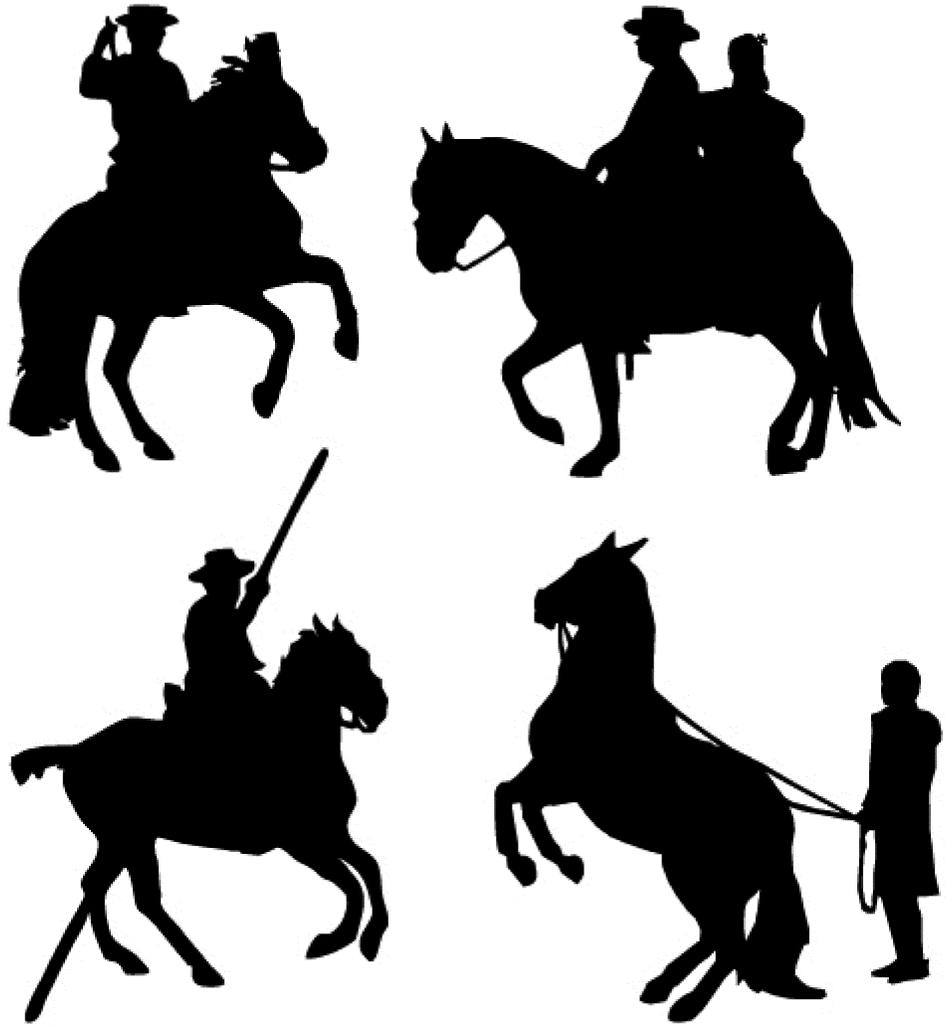

History

Spain has a long tradition of indigenous sports. A ball game whose origins go back to the Middle Ages was played by hitting a ball with the hand, a stick, or a bat. The game is noted in the Songs of Alfonso X the Wise One, in the thirteenth century and is considered to be a precursor of modern ball games. Bowling is a sport popular across the north. Water sports like the *traineras*, trainerillas of the Cantabrian cornice, the *falucho* of Valencia and *lagut* in Catalonia, are of popular origin, since it was fishermen who initiated these competitions by competing to return to port with their catch.

Horse sports, probably of Arab origin, developed in the south and featured two teams on horseback who hurled *bohordos* (spears of wood) at one another and protected themselves with shields. Bullfighting, either on horse or on foot, survive today, although the latter is far more important. Bullfighting is seen as an art form

and is called the “National Festival,” although it is not immune to impassioned debates between adherents and critics. The aristocracy practiced horseback riding, shooting, and fencing, sports associated with the military.

Modern sports were introduced by the 1870s by the many British residents in cities such as Huelva and Bilbao. They formed sports club to support such activities as tennis and soccer. It took until the first three decades of the twentieth century for these sports to spread from the British and a few Spanish aristocrats to the middle class. In 1902 the first National Championship of Soccer was contested. The event was covered by the press, which helped make it more popular across Spain.

In 1936 the Spanish Civil War began, and a dictatorship was established by Francisco Franco (1892–1875) that remained in power until his death in 1975. Under Franco’s rule sport was politicized and placed under centralized control. The role of sport was to bring national pride to Spain. Soccer was supported by the state and became the major sport, with one team, Real Madrid, associated with the state. After Franco’s death democracy was established, and the control of sport shifted to the regions. Each autonomous region has its

own sports council while a central agency, the Upper Counsel of Sports, is in charge of coordination.

Participants and Spectators

Soccer is the premier sport. A national league encourages regional rivalries with the strongest teams being Barcelona and Real Madrid. The contests between these two teams accentuate regional rivalries. The basketball league runs in the same way, but without the same high level of fan intensity as soccer. Out of these sports emerge sports celebrities. Many are wealthy, foreign soccer players who draw adoring fans because of the Spanish team they play for.

The other sport event that draws much attention is the Olympics, especially popular since the games were held in Barcelona in 1992.

To succeed . . . You need to find something to hold on to, something to motivate you, something to inspire you. ■ TONY DORSETT

Women and Sports

In the early twentieth century beliefs about the body and health changed, creating a climate more open to women's participation in sports. But, during the first years of the century, participation by women remained limited. Lili Alvarez was the first Spanish athlete to participate in European and world competitions. During the Franco period, female participation was limited, as a woman was allowed to be only a mother and wife. Democracy brought change, but today only 19 percent of women mention sport as preferred leisure, although many mention a desire to participate.

Youth Sports

Physical education is compulsory in the schools. Nevertheless, only 50 percent show an interest in participating. Youth championships at the national level exist, and youth compete in international championships through the International Confederacy of School Sport (ISF), of which Spain is member.

Organizations

The Upper Counsel of Sports (www.csd.mec.es) is an agency of the Department of Education and Culture, and the central organization for administering sport at all levels—associations, universities, and schools, Olympic Games, world championships, etc. The Association of Olympic Sports (ADO) was created to support Olympic athletes.

Sports in Society

Sport as a leisure activity has become more popular over the last three decades. Involvement in sports is most common among young men, single and students, who reside in cities of less than 500,000 inhabitants. Some 27 percent of men consider sport their preferred leisure activity. Housewives and retired women, especially in the rural center of the nation show the least interest in sports.

Swimming is the most popular participatory sport, followed by soccer (the most popular spectator sport)

then basketball, and much less popular are tennis, cycling, jogging and fitness exercise.

The Future

Soccer is likely to remain a sport and a spectacle. Sports participation is expected to increase in the cities among men and women, although it is declining in the schools as less time is being given to physical education. There remains an interest in staying in shape and in pursuing in a greater variety of sports. Nevertheless, the overall growth of organized sport may well be hampered by remaining prejudices—passed on from the not very distant past—that favor intellectual supremacy.

Special Olympics

Special Olympics is an international nonprofit organization serving 1.4 million children (over eight years old) and adults with intellectual disabilities. It is the largest sports training and competition program in the world for this population. It provides year-round sports training and athletic competition in twenty-six

different sports and other opportunities for athletes of all abilities in more than 200 programs in over 150 countries. These programs are divided into seven regions: Africa, Asia Pacific, East Asia, Europe/Eurasia, Latin America, Middle East/North Africa, and North America. Athletes compete at the local, state, regional, national, and international levels. Special Olympics athletes compete in Alpine skiing, aquatics, athletics, badminton, basketball, bocce, bowling, cross-country skiing, cycling, equestrian, figure skating, floor hockey, football (soccer), golf, gymnastics, powerlifting, roller skating, sailing, snowboarding, snowshoeing, softball, speed skating, table tennis, team handball, tennis and volleyball. Special Olympics is governed by a board of directors and led by Timothy Shriver, chairman and chief executive officer, and 500,000 volunteers. Athletes serve on boards of directors of all Special Olympics programs, including the International Board. Special Olympics headquarters is located in Washington, D.C.

History

Eunice Kennedy Shriver believed that persons with intellectual disabilities were far more capable than others believed. Mrs. Shriver invited thirty-five boys and girls to her home in Maryland to participate in sports and physical activities at Camp Shriver in 1962. Camp Shriver grew into an annual event sponsored by the Joseph P. Kennedy Foundation, for which Mrs. Shriver served as executive vice president. It expanded into more than 300 camps throughout the United States and served thousands of children with intellectual disabilities.

From its humble beginnings as a day camp, the first Special Olympics Games, planned and underwritten by the Kennedy Foundation, together with the Chicago Park District, was held in Chicago, Illinois in the summer of 1968. Over 1,000 athletes from twenty-six states and Canada competed in athletics, floor hockey, and aquatics during this historic events. At those Games, Shriver announced a new program—Special Olympics

—to offer people with intellectual disabilities everywhere “the chance to play, the chance to compete, and the chance to grow.” The first International Winter Special Olympics Games were held in 1977 at Steamboat Springs, Colorado with more than 500 athletes competing in skiing and skating events.

Special Olympics World Games are held every four years, with Summer and Winter World Games alternating every two years in countries around the world. Nineteen different Olympic-type sports are offered in the World Summer Games: aquatics, athletics, badminton, basketball, bocce, bowling, cycling, equestrian, football (soccer), golf, gymnastics, handball, powerlifting, roller skating, sailing, softball, table tennis, tennis, and volleyball. In the World Winter Games, Special Olympics athletes compete in Alpine skiing, cross-country skiing, snowboarding, figure skating, speed skating, snowshoeing, and floor hockey.

Special Olympics mission is “to provide year-round sports training and athletic competition in a variety of Olympic-type sports for children and adults with intellectual disabilities by giving them continuing opportunities to develop physical fitness, demonstrate courage, experience joy and participate in the sharing of gifts, skills and friendship with their families, other Special Olympic athletes and the community” (Special Olympics website: www.specialolympics.org).

Special Olympics celebrated its thirty-fifth anniversary in 2003, holding its World Summer Games in Dublin, Ireland. It was the largest sporting event of the year, with 7,000 athletes from 150 countries competing in eighteen competitive and three demonstration sports. Athletes with severe disabilities or limitations who were not yet able to compete in official Special Olympics sports participated in the Motor Activities Training Program (MATP) at the World Games in Dublin. These individuals participated in the bean bag lift, ball kick, wide beam and bench, ball lift (small), ball lift (large), ball push, and log roll. Training and participation are the focus of MATP. These participants can transition into the introductory level of competitive sports as they reach the appropriate skill levels.

The 2001 Special Olympics World Winter Games in Anchorage, Alaska, proved to be the largest sporting event ever held in the history of the state. Over 1,800 athletes representing seventy countries competed in seven Olympic-type sports: Alpine skiing, cross-country skiing, snowboarding, figure skating, speed skating, snowshoeing, and floor hockey.

Special Olympics Sports Rules were created based on the rules of the International Sports Federations (ISF) and National Governing Bodies (NGB). Special Olympics uses ISF and NGB rules except when in conflict with Special Olympics rules, then the Special Olympics Rules are applied. A level playing field is ensured among competitors by placing athletes in divisions based on their age, gender, and ability. Every Special Olympics athlete, regardless of ability, is recognized for his or her performance.

The International Olympic Committee (IOC) formally recognized Special Olympics in February 1988 and authorized the use of the prestigious word *Olympics* in its name. Special Olympics is the only organization approved by the IOC to use the word *Olympics* worldwide.

Eligibility requirements to participate in Special Olympics are as follows: Athletes must be eight years old or older and have one of the following conditions: intellectual disability, cognitive delay as determined by

standardized measures (i.e. intelligence quotient), or a development disability as identified by an agency or professional. All athletes must register to participate in Special Olympics. There is no cost for participation. All persons with intellectual disabilities, regardless of the degree of disability, are eligible to participate.

Significance

Historically, society believed that individuals with intellectual disabilities were incapable of developing and functioning in any area of life. People avoided them out of ignorance and fear. Mrs. Shriver, who believed this population was capable of far more, including participation in sports and physical education, rejected this stigma and exclusion by society. Mrs. Shriver and her husband, Sargent Shriver, developed the Special Olympics into the largest amateur athletic organization in the world for people with intellectual disabilities. Under the Shriver's leadership, the organization grew from serving 1,000 to 1.4 million athletes since its inception in 1968. In 1996 their son, Timothy Shriver, was named president and CEO of Special Olympics; in

2003 he assumed the additional responsibility of chairman. Sargent Shriver, who was elected president of Special Olympics in 1984 and appointed chairman in 1990, stepped down as chairman in 2003 and was appointed chairman emeritus in recognition of his long service and dedication to the movement, which he continues to serve as an ambassador of optimism and goodwill. Mrs. Shriver remains a member of the Special Olympics Board of Directors and continues to lend her well-earned reputation as a visionary leader in improving the lives of people with intellectual disabilities to furthering the mission and expansion of the movement.

Special Olympics Initiatives, such as the Athletic Leadership Programs, Family Leadership and Support, Healthy Athletes® and Special Olympics Get Into It™, enhance the mission of Special Olympics. The Special Olympics "Flame of Hope" is never extinguished, as Special Olympics athletes compete in 20,000 competitions around the world annually. The 2005 World Winter Games in Nagano, Japan, will be the first Special Olympics World Games held in Asia. The first-ever Special Olympics U.S. National Games are slated for July 2006 at Iowa State University in Ames, Iowa. The 2007 Special Olympics World Summer Games will mark the first time the World Summer Games will be held in Asia and only the second time the event will be held outside of the United States.

The Future

In June 2004 a bipartisan group of senators and congressmen announced the introduction of the Special Olympics Sport Empowerment Act of 2004, a first-ever bill of its kind that will authorize \$15 million for 2005 and "such sums" over the next four years to fund the Special Olympics movement. From its beginning with thirty-five athletes at Camp Shriver in Rockville, Maryland, to 1.4 million athletes in 150 countries around the world, Special Olympics continues to break down barriers by increasing public awareness, conducting research, increasing and expanding competitive and recreational opportunities, building family support, and promoting the phenomenal gifts of people

Spectator Consumption Behavior

Sport consumption behavior includes such actions as purchasing, attending, spectating, or wearing products or using services associated with spectator sport. Consumption also includes reading about sports or teams in newspapers or magazines, watching sports events on television, buying clothing representing a specific team or sport, going to a game, or searching websites for sport statistics for a fantasy league. In 2001, the U.S. Census Bureau estimated that individuals in the United States spent \$10.1 billion attending spectator sports events and spent another \$24.8 billion on athletic and sport apparel. Although there is a plethora of

actual sport consumption behaviors, managers and marketers of sport organizations, media professionals, and business managers of sport merchandise organizations are very interested in *why* people consume sport and the associated products.

The aspects that influence people to consume sport products and services can be divided into four categories: demographic aspects, psychographic aspects, environmental aspects, and past behavior. If we think of sport products and services as the total pie, demographic variables would take up about 5–10 percent of the total pie, psychographic aspects about 40–45 percent, environmental aspects about 15–20 percent, and past behavior about 15–20 percent. There remains a small part of the pie that is unknown.

Demographic Aspects

Numerous demographic variables have been studied. These include age, race, family size, gender, household income, level of education, and participation in sport. Although differences have been found on some of these variables associated with sport consumption, typically the differences are not meaningful. For example, although females have been shown to purchase more team merchandise than males, the difference in the amount spent on the clothing by women over men is small when compared with the overall amount spent on team clothing in general. Furthermore, in this case even though women purchase more merchandise, it is more often for their children, husbands, or boyfriends rather than for themselves. Similarly, although there are racial differences in sport consumption by sport, overall there is not a large difference in the total consumption of sport products by race. There have been conflicting results as to differences in household income and sport consumption. Although those with higher income levels have the ability to purchase high-priced tickets for some sports, such as professional basketball or professional football, when evaluating those who come to the games across all sports, there are few differences relative to number of games attended or watched on television between those with high incomes and those with

low incomes. These are just a few examples of the lack of meaningful differences in demographic variables. This lack of differences is evident in the small percentage of the total that demographic aspects contribute to explaining sport spectator consumption.

Psychographic Aspects

Psychographic aspects are made up of cognitive aspects (motives, points of attachment, and expectancies), affective aspects (mood and satisfaction), and conative aspects (intentions to consume sport products or services).

COGNITIVE ASPECTS

Individuals are motivated to consume sport because of the reinforcing pleasures therein. Most of these pleasurable behaviors fulfill social or psychological needs.

Motives

A number of motives that theoretically explain consumption behavior have been identified by previous researchers: acquisition of knowledge, aesthetics, catharsis/aggression, drama/excitement, entertainment, escape (relaxing), family, physical attractiveness of participants, quality of physical skill of the participant, social interaction, supporting opportunities in sports, and vicarious achievement. Many of these motives are interrelated, but we will explain each separately.

Many people read about, watch, or attend sport events because by doing so they learn about the sport or gain information about the team. This information may be used to interact socially, bet on a team in the future, or play in fantasy leagues. Some people may watch sport for the aesthetic qualities inherent in the game or event; for example, a beautiful pass in basketball, a triple jump in ice skating, or a spectacular dismount in gymnastics. On the other hand, some research has suggested that individuals may also watch sports because of the violence (e.g., boxing, hockey, or football). Another motive is the drama or excitement that may be present when a game comes down to the final seconds and either team could win or when the upset of a favored team is taking place (e.g., when the U.S. hockey

team beat the USSR in the 1980 Winter Olympic Games). The motive of entertainment may be an umbrella motive that includes many of the other motives. Some people are motivated by the potential to escape from the daily grind of work or home and just get a chance to relax by watching or listening to a game. Some research has shown that the motive of taking the family to a game is important to some people. In some instances the physical attractiveness of the participants may be a motive for spectating (e.g., beach volleyball or swimming and diving). As a motive the quality of the physical skills of the athletes is somewhat similar to aesthetics. Many people can appreciate the skill it takes to chip a golf ball out of a sand trap or hit a curve ball in baseball. The opportunity to interact socially is also a prime motive for people attending sporting events. Tailgating in football and socializing in in-arena restaurants (especially in professional basketball) are good examples of this, although many people just like interacting with others while sitting next to them in the stands. Another motive is the opportunity to support a certain segment of the population in their participation in sport (e.g., the Special Olympics or the professional women's soccer league). Finally, probably one of the most important motives for sport consumption is vicarious achievement. Many people feel that the connection with a successful team allows them to achieve vicariously. Although some of these motives do impact sport consumption behavior directly, research has shown that motives in combination with various points of attachment are better predictors than motives alone.

Points of Attachment

Sports teams can provide people with a sense of belonging to a specific community and thus people may identify with or become attached to the team. However, the team may be only one of several possible points of attachment. Individuals may be oriented to other parts of the whole sport consumption experience, not necessarily just a team. Some people may be fans of a specific coach regardless of what team he or she coaches. Others may be fans of a specific player even if that player is

traded or switches teams. For example, when Michael Jordan went from the Chicago Bulls to the Washington Wizards, many people bought tickets to the Wizards games because of Michael Jordan. On the other hand, sometimes people will watch games or events even though they don't necessarily like either team or any of the athletes, but instead because they just like the sport. However, sometimes the level of sport makes a difference as to whether an individual will watch it. Some people are only fans of college basketball and will not watch professional basketball, while others are just the opposite. Finally, sometimes people may not even necessarily like the sport that much, but because the team represents the community, home, country, or the alma mater, they will watch the event because of one or more of those points of attachment. Specifically, team identification/attachment has been found to be a very strong indicator of sport spectator consumption behavior.

Expectancies

When going into events, fans and spectators often have expectations about the outcome of the event, individual performances, the competitiveness of the teams, their own level of enjoyment of the event, and so on. These expectations are either confirmed or disconfirmed by the event experience, and they can be either positive or negative. Thus, there is a continuum with negative disconfirmation on one end, followed by negative confirmation, then positive confirmation, and anchored on the other end by positive disconfirmation. For example, if an individual expects the team to win and it does not, then the expectation is disconfirmed in a negative way. If the individual expects the team to lose and it does, then the expectation is confirmed, but the outcome is still negative. On the other hand, if the individual expects the team to win and it does, the confirmation is positive. Finally, if the individual expects the team to lose, but instead the team wins, the expectation is disconfirmed, but in a positive way. Typically, the reaction of the individual is more acute when the expectation is *disconfirmed*, whether negatively or positively. For example, if a fan expected the team to lose and the team

won, the fan would experience more enjoyment than if expecting the team to win. Thus, the motives, points of attachment, and the confirmation/disconfirmation of expectations are cognitive aspects that influence sport consumption either directly or indirectly. However, there are also affective aspects that are part of the psychographic content.

AFFECTIVE ASPECTS

Much of the research on sport consumption behavior has shown that fans have an affective reaction to the advertising or promotion of a product and also to the consumption of a product or service. Positive mood items such as pleased, happy, energetic, satisfied, and confident, or negative mood items such as discouraged, frustrated, upset, angry, irritated, sad, and hostile have typically represented the affective reaction. Research has shown that people who are in a positive mood will more likely purchase a product than those who are in a negative mood, especially if they have never purchased the specific product before. Furthermore, and perhaps more obviously, consumers who are happy with their previous consumption experiences typically will repurchase the same product or service.

Sometimes researchers have not made a distinction between satisfaction and the affective response to consumption. Although they are significantly correlated, satisfaction is distinct from the affective response because satisfaction typically has a cognitive component. For example, satisfaction typically has a point of reference, whereas mood is usually a more general indicator of affect. That is, I was satisfied with my venue experience because the beer was cold and the popcorn was hot, my site lines were good, and the rest room lines were short. An affective response, on the other hand, would be as follows: someone is asked directly after the game how he or she felt and replies, "I feel good." Although there could be a point of reference (i.e., I feel good about the game), mood states are defined as not having cognitive evaluations, whereas satisfaction is usually a combination of both. In both cases, though, when individuals feel good and when they are satisfied,

they typically intend to repurchase the product or service that made them happy and satisfied.

CONATIVE ASPECTS

Conation is the intent to do something. In terms of sport consumption behavior, it is the intent to purchase a sport product or service in the future. The combination of the cognitive aspects of motives, points of attachment, expectancy confirmation, and the affective aspects of mood and satisfaction influence the individual's intentions to repurchase. However, even though an individual may indicate that he or she will repurchase, it does not necessarily always happen. Sometimes a better indicator of sport consumption behavior is the actual past behavior of the individual.

Past Behavior

Previous consumption behavior has been shown to be a good predictor of future consumption behavior; that is, those who bought season tickets last year will typically buy season tickets this year at a much higher rate than those who didn't buy season's tickets for the previous season. However, there are other past behaviors that are also good predictors of whether people will repurchase merchandise or tickets or will consume media again.

People react to event outcomes in different ways. Oftentimes individuals are motivated to create and maintain a positive self-concept through the strategic attachment or detachment to certain teams with which they identify. As we noted earlier, individuals may watch sports to fulfill achievement needs and hope to bask in the reflected glory (BIRG) of successful others. Being "a part of the team" when the team is successful allows them to glean status and self-esteem through their identification and association. The tendency to BIRG is an attempt to secure esteem from those who can perceive the connection.

People will also distance themselves away from unsuccessful others in order to maintain self-esteem. That is, if a team loses or does not play as well as expected, many spectators will cut off reflected failure (CORF). Not all spectators BIRG only after victory or automat-

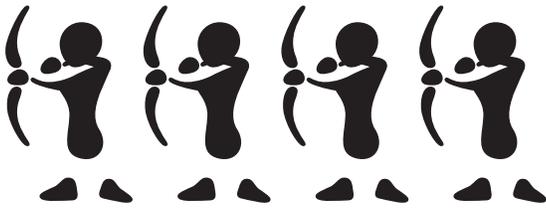

ically CORF in defeat, though. Highly team-identified people often resist the temptation to CORF. The level of fan identification typically influences an individual's reactions to event outcomes; that is, individuals high in team identification are much more likely to engage in BIRGing behavior after a victory and less likely to CORF after a defeat when compared with fans low in team identification. It may be that highly identified fans cannot bring themselves to CORF.

For those individuals who cannot CORF and cannot BIRG because there is no successful other, they may have to engage in other coping mechanisms such as out-group derogation and/or aggression (i.e., blasting). Thus, individuals, in trying to maintain their own levels of self-esteem in the eyes of others when faced with a potentially negative association, would often derogate or blast the negatively associated group.

Environmental Aspects

Environmental aspects have been segmented into three areas: game attractiveness (e.g., athlete skills, team records, league standing, record-breaking performance, closeness of competition, team history in a community, schedule, convenience, and stadium quality), marketing promotions (e.g., publicity, special events, entertainment programs, and giveaways), and economic considerations (e.g., ticket price, substitute forms of entertainment, income, and competition of other sport events (Zhang, Lam, and Connaughton 2003, 33)). The team's record typically has an impact on both ticket sales and on merchandise sales, although there are enough exceptions that this is not a given. For example, the Chicago Cubs have had many seasons in which they have not won a lot of games, and they have not been to the World Series since 1945, yet they typically have one of the best attendance records in Major League Baseball. On the other hand, the Atlanta Braves won thirteen straight division titles through 2004 and have had difficulty selling out home playoff games.

There has been conflicting research about the effects of promotions and advertising on increasing attendance. Although marketers and managers of professional franchises

tend to believe that advertising is useful when the team is not winning, most spectators and fans have indicated that advertising has little if any impact on their ticket purchasing or attendance behavior. Research has also been contradictory about the impact of price on sports products and services. Typically, if prices are too high, then various market segments are priced out of the market. However, as the Cincinnati Reds found out in the 1990s, if ticket prices are too low, people won't buy them either. The Reds priced the outfield bleacher seats at \$1.00 and very few people bought them because they felt that anything that cheap must not be any good.

Aspects of the venue also can influence attendance slightly. When a new stadium is built, there is often a novelty factor. People will go to a game just to see the new stadium, even if they have little interest in the game or sport itself. This factor tends to last a year or two at most, and then attendance returns to previous levels. Probably the largest venue effect is a negative one. When spectators are dissatisfied with the venue or levels of service at the venue, they tend to decrease their attendance. The opposite is typically not true. If the spectators are satisfied with venue aspects, it doesn't mean that they will attend more games, just the same number they originally intended on going to. However, all of these environmental aspects have, as a whole, had little impact on sport spectator consumer behavior compared with psychographic aspects.

Implications for the Future

Many working in the sport entertainment area in the late 1990s believed that the rapid expansion in sport spectator consumption would continue well into the new century. Unfortunately, economic factors in the early twenty-first century do not clearly point in this direction. Attendance figures for several professional sports leagues have plateaued or even shown a decrease between 2000 and 2004. The purchase of licensed sports merchandise has followed a similar trend. Consequently, as competition for the consumer increases, the need for a clearer understanding of sport spectator consumer behavior is great. Because team identifica-

tion is a strong predictor of sport spectator consumer behavior, understanding the social psychological mechanisms that foster sentiments of collective identification and feelings of attachment appear to be more crucial to marketing success than either demographic or environmental aspects.

Spectators

“And the crowd goes wild!” This oft-repeated phrase represents the reality of twenty-first-century spectator sports, which are routinely watched by millions of people across a nation or across the world. It also represents a wide range of spectator behavior, ranging from rooting for the home team to rioting in the streets. The words *rooter*, *booster*, *adoring multitude*, *football hooligan*, *soccer mom*, *hockey dad*, and *the viewers at home* conjure images of fans watching sports with various levels of intensity. Some of these words have positive connotations and some negative, but they all describe a similar experience that touches the lives of a large segment of the world’s population.

During the past millennium the number of people who watch sporting events has grown from a few in-person spectators to enormous television and live audiences, and as the audiences have grown, the pressure of fan (short for *fanatic*) expectations has modified sports and society, often eclipsing the action on the

field and distorting the purpose of sports. With the advent of mass communication mediums such as radio and television during the twentieth century, the base population that could experience sporting events in real time expanded exponentially.

Ancient Fans

Fans have existed as long as sports. Sports require specialized skill, so not all people can participate. The unskilled have had to be content to watch. The ancient Olympic Games of Greece provided spectacle as well as a way of determining the best athletes and honoring the gods. The ultimate venue for sports fans in the ancient world was undoubtedly the Roman Colosseum, where sixty thousand spectators could watch gladiators battle to the death. Medieval jousting tournaments provided mass entertainment as well as military training and display. Large crowds also watched blood sports such as bear baiting or bullfighting, and these sports continued to be popular into the modern age. The crowds always went wild for those sports, but relatively few people actually witnessed them.

Stadiums

During the late nineteenth century entrepreneurs built larger venues for spectator sports as leisure time and incomes grew for the middle classes, and by the 1920s seating capacity at some exceeded that of the Colosseum. These secular cathedrals to sports allowed thousands to watch their favorite teams at one time. Civic pride became invested in a city’s ability to provide venues for their citizens, and construction of these facilities outstripped that of other entertainment venues such as opera houses or theaters as the middle class absorbed working-class sports into their dominant culture.

As the popularity of sports spread, fans in cities distant from the action could follow the fortunes of their favorites in newspapers and in periodicals such as the *Police Gazette* in the United States and the *Sporting Life* in Great Britain. Young boys were regaled with stories such as *Tom Brown’s School Days* in Britain or the popular *Frank Merriwell* series in the United States,

which blended sports with morality tales to nurture manly virtue in readers. The wealthy abandoned popular sports, withdrawing behind the walls of golf, yacht, and tennis clubs, and held events with fewer, but presumably, more refined fans.

Radio

When radio began to broadcast major sporting events such as the World Series and championship prize fights, the number of sports fans exploded. Prior to radio, fans clustered about businesses with telephone or telegraph connections where scores or updates were posted as an inducement to shoppers or as a public service. By the 1920s major sporting events such as boxing title matches, college bowl games, and the World Series could be enjoyed by fans a continent away from the action. The expansion of team loyalties meant that a fan of the Chicago Cubs might find a kindred soul in Florida or California, and the new medium also helped widen the appeal of sports within U.S. culture.

Radio, people have argued, was the media that best suited baseball. The slow pace of the game allowed a sportscaster such as Graham MacNamee, who was at the microphone for the first broadcast of a World Series game in 1923, or Ronald Reagan, whose first job in the entertainment industry was as a baseball announcer, to fill the time between pitches with biographical and statistical information on the players or to discuss the finer points of baseball strategy. The lack of a visual image allowed creative radio personalities to embellish routine plays, which made the games more exciting for fans, who were compelled to imagine visual images to supplement the narrative coming over the radio waves.

Television

After World War II television eroded radio's dominance in sports broadcasting. In the United States sporting preferences shifted toward football, which was better suited to television as a spectacle. College football, formerly the province of the educated classes, reached out to new fans as first radio and then television began to broadcast the games to an often-nationwide audience.

The pool of fans grew to include those fans who never actually attended a school but who formed an emotional attachment to a school through the media. This attachment was especially powerful when the school embodied a particular cultural trait or existed in a region with little competition from other sporting activities. The Fighting Irish of Notre Dame University reached across geographic borders to win fans among U.S. Catholics. The team's popularity among even non-Catholics also helped ease its full assimilation into the mainstream of U.S. culture. The University of Nebraska Cornhuskers provided a unifying symbol for an entire state whose residents had little in else in common.

The National Collegiate Athletic Association (NCAA) approached television gingerly, fearing that it would decrease gate receipts, but professional football embraced the new medium of television and in the process won a central place in the hearts of U.S. fans. The popularity of the National Football League and other broadcast sports in the United States began to draw enormous sums of money to the sporting world through television revenue, and television and sports formed a symbiotic relationship that created an upward spiral of popularity among fans.

PROLIFERATION OF CHOICES

Television expanded the popularity of sports within U.S. culture, and programs such as the American Broadcasting Company's *Wide World of Sports* introduced new sports that appealed to people who traditionally ignored sports. Members of the two-television family could now separate by viewing choices, with the males watching football while females watched figure skating. During the late 1980s the proliferation of cable television channels further diversified fan opportunities, with channels or pay-per-view packages devoted to major sports, as fans of poker, billiards, bass fishing, and a dizzying array of other sports enjoyed their own niche programs. The cable sports channel ESPN offered fans the chance to catch up on news from their favorite sports twenty-four hours a day, and ESPN Classic allowed young and old enthusiasts to watch the best

were young. The former athletes can remember, often with advantage, the exploits of their youth and recapture some small part of the joy they felt while competing. Such fan groups are often quite exclusive, being open only to the initiated, and members share the common language of the sport, which is typically incomprehensible to those who did not play.

games and matches from past years. For those fans who would rather argue than watch, or argue after watching, radio regained popularity by offering sports talk shows on which fans could comment on their favorite teams or sports, and television followed suit with celebrity argument and/or interview programs.

Outside the United States football (soccer) reigns supreme, and the quadrennial World Cup matches are watched by a large percentage of the world's population. Each nation has other folk sports, such as cricket in the United Kingdom, that have gained a wider following within and without its borders through television. Rugby, horseracing, and other sports are also popular among fans worldwide and have likewise benefited from television's constant courtship of people eighteen to forty-nine years old, who spend the most money and therefore are coveted by advertisers.

FAN MOTIVATION

Today even fans in remote areas can follow their favorite sports. However, why would they want to? Fans watch sports, whether on television or in person, because it fulfills a need.

Some fans watch a sport because they played the sport in their youth, and watching it allows them to relive past thrills and agonies. Young fans can sit at the feet of their elders and absorb the lore of the sport from men and women who played the sport when they

For some, spectator sports are social events and an excuse to hold gatherings of friends. The sports party has become a hallowed ritual for millions who gather with their friends to discuss the team's chances before, during, and after the game while consuming elaborate feasts, which are no less impressive because of the simplicity of the fare. These parties may occur in a residence, at a tailgate party in the parking lot outside the stadium or field, or in a business constructed for such celebrations: the sports bar. Sports enthusiasts across the world charter buses, planes, or trains to carry them to contests. These groupings usually are less exclusive and attract a wide cross-section of fans, from the ex-athlete to the casual fan.

Young fans can dream of one day taking their place on the field, and many visualize themselves making the moves of their heroes while playing in the backyard or on the street. A time-honored tradition is the crowd of young fans who surrounds athletes for autographs, although the value of memorabilia in the latter decades of the twentieth century gave rise to a more mercenary class of athlete and fan. When a fan party includes the initiated, it often serves as a rite of passage for young enthusiasts as they learn the folkways involved in spending a lifetime enamored with a sport.

Following a team or sport also provides a venue for consumption, and the sports-memorabilia and licensed-product markets bring in millions annually. During the 1990s economic boom, baseball cards and other

memorabilia prices set record highs and spawned their own subculture. Every professional team, college team, and many high school teams offer a wide array of product choices from current uniforms to classic replicas and the hats, clocks, and other bric-a-brac to complement them.

Finally, many fans use sports to escape from the drudgeries of everyday life. Following a team or a sport provides the opportunity to connect to something larger than the individual and to transcend everyday cares. When a player such as the U.S. basketball star Michael Jordan or the British soccer star David Beckham does the impossible, the escapist fan can forget for the moment his or her own powerlessness and the futility of a humdrum existence.

International Consequences

Sports offer a thrilling way for teams or individuals to compete for dominance, but the result rarely carries permanent consequences for real life. Many people would dispute the latter point, and often civic, regional, or even national pride becomes intertwined in the action, which adds to the vicarious thrill gained from rooting for the home team. During the Cold War the quadrennial Olympic Games became a venue for competition that often served as an alternative to more serious conflict. Tremendous controversies surrounded how Olympic team points should be awarded or whether men's and women's results should be kept separate. The lofty goals of the Olympic movement descended to the level of a playground argument in the competition for allegiance among nonaligned nations in the global struggle, and fans from the opposing sides gleefully joined in the fray, questioning the amateur standing, the drug use, or even the biological sex of the athletes from the other side.

Fan Behavior

By participating in sports as spectators, fans gain a feeling of belonging to something larger than themselves, and often times this feeling leads to extreme or bizarre behavior. During the 1996 World Cup finals, in a game

SPORTS FAN IS NOW A KING

Sit down, Sports Fan! Your day is here. A ticket to the ASTRODOME makes you a king.

Since the dawn of history, sports fans have watched events on stone blocks in the Roman Colosseum, hard wooden planks in most football stadiums, and slatted wooden chairs in most baseball parks. In some giant stadia in England and Europe the fans attending soccer games sit on the bare grounds in the curved end zones.

But all that is now ended for the patron who attends an event in the ASTRODOME. For the first time in sports history, you can watch a baseball game from deep-cushioned, foam-padded nylon upholstered chairs. You will be able to sit in a chair as comfortable as any found in the world's finest theatres and opera houses.

Equipping the ASTRODOME with cushioned, upholstered chairs was so revolutionary that the DuPont Company, which supplied the fabric, called attention to this drastic upgrading of customer's seats thusly:

"Is the new Houston Stadium run by nuts? Upholstered seats for sports fans . . . rodeo followers . . . boxing buffs! Are they crazy?"

"No, they're canny! This superdome they're building is blazing new trails in comfort and pleasure. So naturally, for those 45,054 comfortable, theatre-type chairs the architects specified DuPont ANTRON nylon coverings. They look so luxurious, will take the toughest treatment any audience can give them! Nine lively colors help spectators locate their seats quickly."

The American Seating Company, which manufactured the upholstered chairs, is proud of being a part of this revolutionary development in the sports world.

"In all the world, wherever people sit in large groups," states the American Seating Company, "even in theatres, music halls, churches, government buildings, auditoriums, or sports arenas, no more comfortable chairs have been provided. Every person who goes to an event in the Domed Stadium can be assured that he is sitting in one of the finest chairs ever built for use in a public place."

The luxurious chairs for the Domed Stadium was the largest single public seating in history—45,054 upholstered chairs.

The foam-covered spring type seats and the foam-padded backs required over 45,000 square yards of upholstery material. This is a strip of material 35" wide and over 25 miles long. To transport the chairs required enough freight cars to make a train slightly less than one mile long. To install the chairs on the face of the concrete risers over 100,000 holes had to be drilled into the concrete.

The cost of the seats was \$929,815.00 and the stadium planners and builders had you in mind when they set out to make the patrons of the ASTRODOME the world's most pampered customers.

pitting the United States against Colombia, a Colombian defenseman inadvertently kicked the ball into his own goal, which counted as a score for the United States and led to his team's defeat. A week later, the player was dead, gunned down in the street by an irate fan. Some British soccer fans are notorious for their violence, and these soccer hooligans, along with similar fans from other nations, often eclipse the headlines earned by the teams they root for. When a team wins or loses a championship or sometimes a regular season game, police often face a night of rioting. Parents watching their children's games have often become irate and even violent when the breaks go against their children. In Chicago a man watching his son's hockey game became so enraged by the decisions made by the team's coach that he beat the coach to death.

Even when fan behavior is not violent, it is often still bizarre, especially when television is present. Even

Spectators

A Women-Only Crowd, 1896

In the 1896 extract below, from a newspaper article about a game played between female athletes from Stanford and Berkeley, it's clear that women hold their own as spectators—and players:

In this connection it should be set on record that there appeared to be no predominant type of woman among the spectators. There were old women, and young women, and short-haired women, and long-haired women, and pretty women, and plain women, and new women and—well, there may have been middle-aged women. But the really remarkable thing about them was the immense volume of noise they managed to create. It did one good to hear their cheers, and “bravos,” and excited comments on the play. And as for the players themselves, they were simply vociferous. Their animal spirits would have been an object lesson to half the young men in San Francisco. Why, when the Stanford girls retired to their dressing-room after winning the game, nothing would content them but to turn handsprings on the floor—and fine, workmanlike handsprings they were.

casual National Football League viewers have seen fans in northern cities standing bare-chested in subzero weather, and during the 1970s one fan with a multi-colored Afro wig seemed to attend every televised game. The early years of *Monday Night Football* were marked by a carnival atmosphere in the stands as women, often exotic dancers in search of publicity, performed suggestively for the cameras. One fan has made a career of impersonating players or referees to gain access to the field at important sporting matches. Games in various sports have been interrupted by streakers running naked across the field while officials give chase, and Morgana the Kissing Bandit, a well-endowed woman, made a career of turning up at sporting events to interrupt the action by kissing players.

Brazilian soccer games often resemble giant parties, with drums being pounded throughout, the fans singing, and flags waving. Beach balls are bounced around stadiums by fans who, when not so engaged, often take time out to do the wave, a synchronized movement of fans standing up in sequence so that it resembles an ocean wave. At basketball games fans behind the backboard often have balloons or towels that are waved in an attempt to distract opposing players when they shoot foul shots. In the television age the fan has often become an integral part of the action, rather than a passive spectator, and the notion that their actions matter has spurred fans to ever-greater exertions.

Sometimes fans suffer for their few seconds of fame. During a football game between the Baltimore Colts and the Miami Dolphins in 1971, an exuberant fan ran onto the field and passed close to the Colts defensive huddle. Mike Curtis, the middle linebacker for the Colts, proved his reputation for hitting by viciously knocking the fan to the ground. The man later lost his job and had to spend considerable time in the hospital because of the injuries he received. In a soccer game in Belgium in 1985, fans attacking the opposition crowd were held up at a barrier fence. When those behind continued to push, the fence collapsed, and thirty-nine were killed and hundreds injured. During the 2003 National League Championship Series between the Florida Marlins and the Chicago Cubs in Chicago's Wrigley Field, a young fan named “Bartman,” hoping to take a souvenir home from the game, tipped a foul ball out of the Cub leftfielder's glove, giving the Marlins another chance, which they exploited to win the game and the series. Bartman received tremendous attention from the media, and when his name became public, he received hate mail and death threats from other fans who were livid that the young man had helped extend the Cubs' absence from the World Series.

Such actions, and the emotions caused by them, have become part of the spectacle of modern sports, inseparable from the behavior of the true enthusiast.

Sports provide a way for fans who are so inclined to act out their personal dramas. This behavior is not a modern phenomenon, however, and from the beginning of sports as a spectacle, fan behavior has often bordered on the psychotic. At the ancient Roman gladiatorial matches, when given the chance, fans screamed for the life or death of the unlucky loser of a match. Bullfight fans have attempted or succeeded in crippling the animal adversary of their favorites, and horseracing fans have likewise interfered with the performance of horses or jockeys. These actions most often occur in the context of gambling on sports, another area of participation enjoyed by fans. Early baseball games were often marred by the sound of gunfire as fans (known then as “cranks”) in the stadium attempted to distract players on the field, and in one case a war broke out between El Salvador and Honduras after a soccer game.

The Future

Whether merely enjoying the action or reveling in the spectacle, fans transformed the act of watching games and in some cases threatened the meaning of sports. In the early twenty-first century the Internet has opened whole new vistas for fan participation. Fantasy sports are a multimillion-dollar business in the United States, and some people argue that fantasy sports hold the potential to alter the bond between fan and team that has been a mark of the sports fan in the past because lineups are assembled from players of various teams, weakening the traditional ties. Television’s need for new programming has also made sports of pastimes and will continue to influence the evolution of what it means to be a fan.

Whatever the result, the fan occupies a central place within the world of competitive sports at all levels and in nearly all areas of the planet. With television few people cannot be a fan of some sport, and the growth of the fan base, along with the idea that the spectator is part of the action, has altered both sports and culture.

Speedball

Speedball was a popular recreational and intramural game for girls and women in the United States until the 1960s. This recreational team sport combines kicking elements of soccer and football with passing elements of basketball.

History

Speedball originated in 1921 when E. D. Mitchell, the director of intramural sports at the University of Michigan, decided to fill the need for a fall sport that was not as dangerous as football and that would interest students of average athletic ability. Basketball in

the winter and baseball in the spring were games suitable for average players, but the fall lacked a game in which everyone could safely participate.

Speedball was an ideal intramural game because it was safe and inexpensive, did not take a great deal of training or skill, was excellent exercise for the entire body, and was interesting because of the different ways to score points. The facilities were also simple because a soccer (association football), hockey, or football field could be used if goalposts were added.

Speedball was successful from its inception. It had widespread use in the intramural departments of colleges and universities throughout the country but primarily in the Midwest. It was a popular physical education activity in secondary schools and even found its way into industrial recreation programs sponsored by city recreation departments in the 1930s. However, speedball lost favor with men's recreational programs by the end of the 1930s and was no longer included in the intramural college men's programs by the 1950s. Speedball also died in men's high school programs by the end of World War II. More schools started to play flag football or soccer, and speedball became a forgotten sport.

Meanwhile, by the 1930s, the game had proved itself to be particularly suitable for girls and had a larger following among women players than among men. By the 1950s, it had become a very popular sport for girls and women in colleges and high schools throughout the Midwest. California used speedball in many of its high school programs. In the East, however, private high schools and colleges played field hockey in the fall and moved directly to soccer later. Speedball remained an important game for girls and women only until the 1960s, when soccer took over.

Nature of the Sport

The game combines soccer, basketball, and football skills, using the catching and passing skills of basketball along with the kicking and punting tactics of soccer and football. The new skill needed is kicking a grounded ball up into the air. The player can kick the ball either to him- or herself or to another player.

During the game, played with seven to eleven players, touchdowns are scored by catching forward passes in the end zone. Players can't run with the ball. A player is not permitted to touch a ground ball with his or her hands. A fly ball, defined as one that has risen into the air directly from the foot of a player, may be caught with the hands, provided the catch is made before the ball strikes the ground again. In advancing the ball, the player may use one overhead dribble—that is, he or she may throw the ball in the air ahead and run forward and catch it before it strikes the ground.

The rules vary for high school versus college and intramural versus varsity competitions. Since the beginning, there have also been different rules for men's and women's games. Regardless of specific rules, however, the game is played in four periods of eight or ten minutes each, with the object being to score points by kicking the ball into the goal or through the goalposts, catching it in the end zone, or kicking out of the end zone. The standard field for men is 110 meters (360 feet) long by 49 meters (160 feet) wide; for women the field length is cut to 91 meters (300 feet). Players on each team are aligned across the field as forwards, backs, guards, and a goalkeeper. Free substitution of as many as five players is allowed. A soccer ball is usually used, although a basketball is sometimes used on smaller fields. Play involves moving the ball toward the other team's end zone and scoring points by kicking and hand passing. Running with the ball is not permitted. Contact between the players is not allowed, although players may guard each other and try to kick the ball away from the offensive player.

There is a key distinction between ground balls and aerial or fly balls:

- A ground ball is one that has touched the ground and is stationary, rolling, or bouncing. It may be played by kicking, heading, or playing off the body. A ground ball may be made an aerial ball by passing to oneself. This play is unique to speedball, and swift, smooth conversion of a ground ball to an aerial ball is a skill that distinguishes the best speedball players.

- An aerial ball is one that is in the air, and it may be played by catching it and by then drop kicking, punting, or dribbling it in the air.

The three types of kicks allowed are punting (kicking the ball while it is in the air), drop kicking (kicking the ball after one bounce), and place kicking (kicking the ball while it is stationary). Scoring differs slightly for men and women.

Today, speedball as a sport for women has largely disappeared, replaced by soccer, basketball, softball, and hockey.

Sponsorship

Sponsorship has become commonplace in sports. Most definitions incorporate the concept of an exchange of value between the sponsor and the sport property. Commonly, sponsors are referred to as “partners.” In each case, the nature of the relationship is one in which a company with assets valuable to the sport property contracts to provide monetary support, equipment, technology, or a host of services in exchange for a commercial advantage. By marketing through sport, many nonsport-related companies have realized a significant return on investment (ROI). This contrasts with the early days of sponsorship, in which the gesture of financial support by a company for a sports event was most often philanthropic. In 1984, however, the Olympic games hosted by Los Angeles created the template for corporate sponsorship as it is known today.

Rationale for Sponsorship

Sport today could not exist without sponsorship. For professional sports, being competitive requires high salaries, premium facilities, media coverage, and corporate sponsorship to offset the expenses. In return, sponsors expect to accomplish any number of market-

ing objectives. Examples include hospitality, image enhancement, exposure to potential consumers, product sampling, increased sales, and market share. The most successful sport-sponsorship relationships are the result of a blending between the corporate partners’ marketing objectives and the attributes offered by affiliation or association with the sport property. The least successful relationships result when a gap exists between the objectives the corporate sponsor had when agreeing to engage in a sport sponsorship and the benefits resulting from the partnership. Similarly, a lack of affinity or image fit between the message of the corporate sponsor and the sport property sponsored often leads to sponsor defection. A strong image link can relaunch or establish a brand via the sport association. For example, Mountain Dew created an image as a beverage that appeals to young, hip, extreme, or action-sport enthusiasts through its strong affiliation with ESPN’s X Games. As a result, Mountain Dew also experienced a commensurate increase in global market share.

Trends in Sports Sponsorship

In 1976, the Montreal Olympic games created enormous debt for Canadian taxpayers. The 1984 Los Angeles Olympic Organizing Committee (LAOOC) understood the potential that reaching a global audience would have to companies who operated beyond the borders of a single country. The LAOOC plan called for only thirty-two sponsors that would each pay between \$4 million and \$13 million in cash, goods, and services to be affiliated with this one-of-a-kind global sporting event. The LAOOC produced a net profit of \$222 million, which had never happened in the history of the Olympic games. Before the success of the 1984 games spurred corporate interest, the Olympics were feared to be heading to extinction. Instead, companies that became involved with the LAOOC—such as Coca Cola, IBM, Visa, and Xerox—expanded into new markets, improved revenue, and maximized their transnational reach via the Olympic sponsorship platform. The Olympic Partners (TOP), worldwide sponsors that contracted with the International Olympic Committee

(IOC), numbered only eleven for the 2000 Sydney Olympic games, but this highest level of Olympic sponsorship required a minimum \$50 million commitment for the rights to be an official Olympic partner. The TOP sponsorship fee will increase to \$70 million for rights to the Beijing Olympic Games in 2008. Yet, with an emerging market of 1.3 billion people, companies are expected to sign up without hesitation. In fact, most TOP companies have been involved with the Olympic games for years, even decades.

One women's sport property was initially launched because of the financial support provided by a company that saw the potential value in sponsorship. The Women's Tennis Association (WTA) began as a result of disgruntled women athletes who believed their performances on the tennis court were worthy of tournament prize money similar to that offered the men's tournaments. Virginia Slims, a cigarette brand created for women, became the WTA title sponsor in the 1970s, and a new sport property was formed. Early on, tobacco and alcohol sponsorship of sports was common because of advertising restrictions limiting their direct use of television or radio broadcasts. By sponsoring sports events, these companies gained tremendous exposure without violating the advertising bans.

In the United States, intercollegiate athletics have become big business. National Collegiate Athletic Association (NCAA) Division I colleges generate an average of \$1.4 million in total revenue from corporate sponsorships. The average value of a typical corporate sponsorship deal for a Division I athletic program is currently \$26,613, with the average value for highest-level sponsors at \$198,437 compared with the average of \$4,755 for the lowest-level sponsorships. Division I schools also collaborate with an average of sixty companies. In 2004, the top ten schools secured \$3 million in corporate sponsorships, the average value of the sponsorships among these schools was \$90,500, and value of the largest sponsorship was more than \$350,000 annually for each school. Nevertheless, typical sponsorship contracts in collegiate sports often in-

clude women's sports and Olympic sports only as afterthoughts. Traditional thinking has placed football and men's basketball as the revenue-generating sports. Increasingly, however, women's college sports have generated strong followings and audiences. The College Sport Network has helped create value for these traditionally nonrevenue-generating sports. With television coverage for sports such as soccer, volleyball, and softball, a completely new area for potential corporate sponsorship has been created.

Marketing Through Sport Sponsorship

Meeting a company's marketing objectives remains the primary reason sponsors are attracted to sport sponsorship. Organizations selling a sports product are in the business of trying to attract a large audience of fans who typically represent a diverse consumer base. Attracting more fans through major events has been an important goal of professional and collegiate sport teams. As a result, companies have become involved in sport and event marketing because they expect their message to reach their desired audience through the sport fan base.

Traditionally, children were introduced to sports by their parents. Marketers have acknowledged that children who watch and take part in sports often grow up to become sport spectators. For this reason, Major League Baseball (MLB) has focused significant attention on building ballparks with family-friendly areas and engaging opportunities for kids. MLB recognizes that its future fan base comprises many of the children parents bring to games. Parents play a key role in children's interest in sports. As a result, companies have become more interested in addressing mothers through marketing efforts. Women have been acknowledged as key decision makers in numerous household purchases. Women are also known to be more loyal consumers than men are. These phenomena explain the use of sport-specific advertisements in women's magazines. By communicating with women, companies hope to influence a family outing to a major sporting event. Once

families are at events, the sponsorship mechanisms can be employed on kids as well as adults.

Target Marketing Through Sport Sponsorship

Since the early 1980s, the number of knowledgeable female sport fans has increased significantly, partly because of improved opportunities for women in competitive sports. Today, roughly 45 percent of the National Basketball Association's (NBA) and National Football League's (NFL) audiences are women. MLB has had a similar gender representation for decades. The National Hockey League (NHL) and National Association for Stock Car Auto Racing (NASCAR) have fewer female fans (41 percent), yet this represents a significant increase for NASCAR from 36 percent in 1995. The WNBA (women's version of the NBA) maintains an audience of roughly 60 percent female. These numbers suggest that corporate sponsors of various sport properties can reach women, if they find the right communication strategy. Increasingly, reaching women has become important to marketers. Women today are responsible for 80 percent of all consumer goods purchases in the United States.

Still, one of the difficulties corporations face in trying to communicate with a target audience is that no audience is homogeneous. Age, education, and income are just three characteristics by which fans vary. Typically, advertising and promotions have treated women as part of the family demographic. Thus, compa-

nies that sell grocery products and children's clothing, as well as car companies looking to promote their minivans, have used sponsorship of women's basketball to reach the women who make such major decisions as what car to buy. In contrast, companies that want to sell products exclusively for men have been more interested in sports such as football, car racing, and hockey, whose audiences are almost 60 percent male. The NBA was reported to be the favorite sport among children ages seven to eleven, but teens preferred the NFL. Increasingly, marketers have targeted kids, often trying to bypass parental decision making. This can be challenging, given that sponsorship by beer companies has become pervasive in sport. The demographic most often sought through sport sponsorship is that of the eighteen- to thirty-five-year-old male. Affluent, white males control sport and are most often the target demographic. Nonetheless, recent attention has been placed on the Hispanic market with many professional sport teams in the United States employing staffs designated for this purpose. In MLB, Hispanic fans by percentage have equaled African-American fans at roughly 10 percent, whereas in both major league soccer and the NHL,

Hispanic fans actually outnumber African-American fans. As sport marketing grows in sophistication, corporate sponsors are looking for avenues to relate to diverse market segments often found in sport.

Corporate Sponsorship and Media

The Olympic games are the platform of choice when it comes to reaching a global audience. Media rights for the Olympic games have escalated at an astronomical rate:

- In 1960, CBS televised the winter Olympics from Squaw Valley, California. The fee was \$50,000, approximately equal to \$310,000 today. CBS also purchased the 1960 Rome summer games rights for \$390,000, approximately \$2.4 million in today's economy.
- In 1984, ABC paid \$225 million (\$398 million in today's money) for television rights to the summer Olympic games in Los Angeles.

Media companies that purchase the rights to broadcast the Olympic games believe that the inventory of advertising time will offset the expense and that the network will ultimately achieve a profit. In corporate sponsorship, companies commonly spend twice the amount paid for rights fees and often more than five times the amount paid for rights fees in promoting their sponsorship of the sporting event or property. Given this understanding, the details of the latest Olympic television-rights deal are noteworthy.

General Electric (GE) maintains ownership of several television networks, including NBC, MSNBC, and CNBC. In 2003, GE captured the U.S. rights to the Olympic games with an unprecedented \$2.2 billion bid that included broadcast rights and a new global sponsorship category. Companies such as Disney (ABC/ESPN), News Corp. (Fox), and Viacom (CBS) had all bid for the contract. However, the winning bid made by GE/NBC agreed to pay the IOC \$820 million for the rights to the 2010 Olympic winter games and \$1.18 billion for the rights to the 2012 summer games,

plus an additional \$160 million to \$200 million during an eight-year period to secure GE a place as one of the eleven existing members of TOP. With this deal, NBC has secured the Olympic broadcast rights continuously for more than a decade, 2000 to 2012.

The NFL's Super Bowl also commands a high price, second only to the Olympic games. There, however, the advertising rate has gained the corporate attention. With an American audience that reportedly tunes in as much to see the advertising as to watch the football game, the Super Bowl has become an event for thirty-second message competition:

- In the Super Bowl's inaugural year, a thirty-second advertisement cost \$42,500; this 1967 rate equates to \$230,700 in today's terms.
- In 2003, the average paid for a thirty-second advertisement was \$2.2 million.

In 1967, the television rating was 17.8 or a 34 percent share. By 2003, the rating was 40.7 or a 61 percent share. Figures such as these dictate the value and equivalent price. Many companies believe they simply cannot afford to miss the opportunity to communicate with this dense an audience. The story of Master Lock illustrates the value of the Super Bowl for advertisements. In the mid 1990s when a thirty-second commercial cost roughly \$1 million, Master Lock reportedly spent its entire advertising budget on this one opportunity. Nonetheless, that one thirty-second commercial remains memorable to consumers as long as ten years later.

The World Series baseball broadcasts have gone from being shown in 20 countries in the late 1980s to more than 200 countries since the mid 1990s. In 2002, 224 countries received the World Series television broadcast. For corporate sponsors of MLB, this adds tremendous value. In Great Britain, the top televised sport broadcasts in 2001 were all soccer World Cup qualifiers. Only the broadcast of Britain's top tennis athlete, Tim Henman, in the semi-final of Wimbledon rated competitively.

Unique Attributes of Sport Sponsorship

Sport marketing has two primary aspects:

1. The marketing of sports
2. Marketing through sports

Sponsorship most often involves nonsport products or services that use images of sports to market to consumers. The primary industries involved in sport sponsorship include the automobile, credit card, beer, airline, soda, telecommunications, and fast food industries, but new industry categories are continuously emerging. The most lucrative sponsorship deals for teams today involve naming-rights deals for stadiums and arenas. Facilities that once were named after influential figures or historic community affiliations now bear the names of companies who were willing to pay a multimillion-dollar fee. Deals such as this often create controversy and can lead to resentment among fans. Nonetheless, the sponsorship pendulum has continued to swing in the same direction for many years. As endorsement commitments by companies such as Nike increase with the latest athletic achievements, and as the appetite for sports continues to grow, there appear to be no limits to using sport as a desirable marketing vehicle. Sponsorship allows companies to create a template of benefits that integrate communication strategies like no other medium. Still, the most attractive aspect of sponsorship to companies is often the price. When the cost of advertising time during major sporting events is compared with the array of benefits built into a sponsorship package, the decision is rarely a difficult one. Add in the opportunity to enhance a brand image, link with a beloved entity such as an athlete or sport, and potentially reach a global audience, and you can see why sponsorship of sport will be around for many years to come.

Sport and National Identity

Understanding sport's cultural significance in society requires considering how sports are tied to ideas about national identity.

In the media, the link is most apparent during large sporting events such as the Olympic Games, where a country's sporting successes (or failures) are visibly tied with nationalistic sentiment. Likewise, rugby in Wales, New Zealand, and South Africa, cricket in the West Indies, soccer in Brazil and Italy, and baseball in the United States are just a few examples of sports that are frequently constructed as constituting the character of a nation. Moreover, it is difficult, if not impossible, to imagine major professional or international sporting events without the presence of national anthems, national flags, and medal standings. Indeed, sport, and in particular televised sport, is often described as a "uniquely effective medium for inculcating national feelings" (Jarvie 1993, 74) because it provides a symbolic site for historical or current struggles and conflicts (Gruneau & Whitson 1993).

Sport's role in nation building is important to consider, but the reverse relationship is equally significant. Indeed, our collective understandings of national identity contribute to shaping sporting practices and, by extension, broader institutions. Thus, the imperative of fostering a national identity is often used as the justifi-

A baseball cap with flag during the national anthem at the 2001 World Series held in the wake of the 9/11 terrorist attacks.

Generally speaking, national identity is expressed out of both similarity and difference with respect to such dimensions. For example, although Canadians define themselves according to their wintry climate and bilingual histories, they also distinguish themselves more simply as “non-Americans.” National identity is in effect a social construction constituted by historical processes and symbolic practices including the creation (and transmission) of myths, stories, images, and rituals to produce shared meanings and understandings of nationhood. Such narratives of the nation are told and retold to represent and differentiate a collective and unified “us” from a generic and often stereotypical “them” (De Cillia, Reisigl, & Wodak 1999). Anderson believes the nation is a distinctly cultural artifact and socially constructed representation that needs to be “imagined because the members of even the smallest nation will never know most of their fellow-members, meet them, or even hear of them, yet in the minds of each lives the image of their communion” (1991, 6).

Undoubtedly, sport plays a significant role in the social construction of distinct national identities and invented national traditions around the world (Hobsbawm and Ranger, 1983). International sporting competitions have been particularly useful for promoting national unity and international standing because they are competitive and have the potential to effectively and popularly mobilize “us” versus “them.” Moreover, collective national sporting identities or national sporting mythologies typically have deep popular roots that have been molded in relation to historically significant moments of national sporting prowess. For example, the United States’ 1980 Olympic win over the Soviets in ice hockey has been mythologized as a “miracle on ice” and a defining moment in U.S. sporting imagination and, by extension, a triumph of American values and capitalist democracy. Meanwhile, in New Zealand, the nation’s iconic rugby team, the All Blacks, has historically idealized the relatively small and isolated nation as a classless, egalitarian, and racially harmonious society. In other words, because of the visibility and popularity

cation for redesigning sporting relations, physical education in schools, and public policy. For example, had it not been for Australia’s poor performance at the 1976 Olympic Games (and the public perception of a tarnished national image), the Australian Institute of Sport might never have been established. Similarly, sport gained ascendancy in Canada’s federal policies because of its promise to promote national unity and a pan-Canadian identity amid an increasing divide between English-speaking and French-speaking territories.

What Is National Identity?

The concept of national identity is notably difficult to define and its precise character has been widely interpreted in relation to a number of issues including geography, ethnicity, religion, language, and shared experience.

of sport it is frequently promoted as embodying the naturalized and taken-for-granted values of the nation.

Why Study Sport and National Identity?

The connections between sport and national identity deserve careful examination because of the sociocultural and ideological tensions they reveal. Indeed, a nation's identity is never universally apparent, shared, or accepted but, rather, continuously is given meaning through cultural practices like sport. Sport can tell us who we are, where we came from, and what we collectively stand for. But the link between sport and national identity is ultimately contentious because it also suggests who we *ought* to be and what we *should* stand for. As Coakley writes, "It is important to ask critical questions about the long-term consequences of this emotional unity and about whose interests are being served by the images, traditions, and memories around which identities are expressed" (2001, 390). As a result, any consideration of national identity and sport involves addressing *how* these identities are constructed (e.g., through the media) and *who* has the power to influence their conceptualizations and understandings (e.g., corporate elites, the state).

Likewise, to examine sport's role in constructing or maintaining a nation's identity reveals the contested nature of sport itself. For example, some have argued that the primacy given to creating national identity tends to favor elite sports over recreational forms because of elite sports' affinity with notions of a competitive society. Thus, if nation building is an important goal, it follows that this is more apt to occur through sporting forms that support "we/they" identifications along national lines. Such arguments are ultimately important to us because they are often presented as common-sense interpretations of how sport, and by extension society, is (or should be) structured. In other words, examining sport and national identity helps reveal the inevitable tensions and divisions of our collective identities as well as the political nature of sport itself.

Issues Related to Sports and National Identity

An extensive body of research compares and contrasts cases in sovereign countries and in other nations that, although not recognized by the United Nations, gain a sense of nationhood through sport events such as the soccer and rugby World Cups (e.g., Scotland). A second level of enquiry focuses on the cultural significance of sport in shaping national identities and how the media contribute to naturalizing particular interpretations of the "nation." Given the breadth of these perspectives (and their considerable theoretical and empirical depth), we synthesize two broad, recurring themes underpinning the analysis of national identity and sport.

ONE NATIONAL IDENTITY?

One of them most common themes from these scholarly works concerns the political implications surrounding the expression of a singular national identity. Within any country, there are multiple identities, drawn along lines of race, language, or religion, so the idea that sport can legitimately represent (or promote) a universal set of attributes is invariably problematic. Two closely related critiques emanate from this point.

The first is that sport contributes to an overly narrow version of national identity that tends to privilege particular values over others. Specifically, these criticisms are aimed at the connections often made between a country's "national sport" and the character of its citizens. Some have argued, for instance, that promoting the idea of a national sport often implies virtuous attributes such as manliness or respect for authority, thereby rendering alternate expressions (such as individuality) untenable. The idea that ice hockey is inherently "Canadian" or that rugby mirrors New Zealand culture represents a romanticized frame of reference that tends to ignore competing representations of what it is to be a citizen of these countries. Indeed, Bairner points out, "the concept of 'the national sport' is a slippery one," as it may either "confirm the exclusive character of the nation or, more commonly, reflect a contest between ethnic and civic representations of the nation"

Extract from *Little Women* (1868)

The excerpt below from Chapter 12 of the classic novel by Louisa May Alcott describes a heated croquet match with teams composed of both Americans and English visitors.

It was not far to Longmeadow, but the tent was pitched and the wickets down by the time they arrived. A pleasant green field, with three wide-spreading oaks in the middle and a smooth strip of turf for croquet.

“Welcome to Camp Laurence!” said the young host, as they landed with exclamations of delight.

“Brooke is commander in chief, I am commissary general, the other fellows are staff officers, and you, ladies, are company. The tent is for your especial benefit and that oak is your drawing room, this is the messroom and third is the camp kitchen. Now, let’s have a game before it gets hot, and then we’ll see about dinner.”

Frank, Beth, Amy, and Grace sat down to watch the game played by the other eight. Mr. Brooke chose Meg, Kate, and Fred; Laurie took Sallie, Jo, and Ned. The English played well, but the Americans played better, and contested every inch of the ground as strongly as if the spirit of ‘76 inspired them. Jo and Fred had several skirmishes and once narrowly escaped high words. Jo was through the last wicket and had missed the stroke, which failure ruffled her a good deal. Fred was close behind her and his turn came before hers, he gave a stroke, his ball hit the wicket, and stopped an inch on the wrong side. No one was very near, and running up to examine, he gave it a sly nudge with his toe, which put it just an inch on the right side.

“I’m through! Now, Miss Jo, I’ll settle you, and get in first,” cried the young gentleman, swinging his mallet for another blow.

“You pushed it; I saw you; it’s my turn now,” said Jo sharply.

“Upon my word, I didn’t move it; it rolled a bit, perhaps, but that is allowed; so stand off, please, and let me have a go at the stake.”

“We don’t cheat in America, but you can, if you choose,” said Jo angrily.

“Yankees are a deal the most tricky, everybody knows. There you go!” returned Fred, croqueting her ball far away.

Jo opened her lips to say something rude, but checked herself in time, colored up to her forehead and stood a minute, hammering down a wicket with all her might, while Fred hit the stake and declared himself out with much exultation. She went off to get her ball, and was a long time finding it among the bushes, but she came back, looking cool and quiet, and waited her turn patiently. It took several strokes to regain the place she had lost, and when she got there, the other side had nearly won, for Kate’s ball was the last but one and lay near the stake.

“By George, it’s all up with us! Good-by Kate, Miss Jo owes me one, so you are finished,” cried Fred excitedly, as they all drew near the finish.

“Yankees have a trick of being generous to their enemies,” said Joe, with a look that made the lad redder, “especially when they beat them,” she added, as, leaving Kate’s ball untouched, she won the game by a clever stroke.

(2001, 167). Furthermore, given that such national sports have traditionally been the preserve of men, scholars argue that these reproduce powerful messages about “appropriate” conceptions of masculinity and femininity. Although women are clearly involved in national sports and compete internationally, discourses of national sporting identities are often unfavorable to

them and exclusionary. As Rowe, McKay, and Miller note, “The individual achievements of women athletes (such as Chris Evert and Billie Jean King) may be of great significance, but at the level of team sports, where the source of pride is collectivized, women are denied the status of bearers of national qualities that the media and the apparatus of the state conventionally accord to

Presentation of the flag and the national anthem before a baseball game.

men” (1998, 126). In this view, therefore, the definition of national identity through sport is never a neutral or benign statement of fact; rather, it has very real implications because it *identifies* particular characteristics or values and *typifies* them.

The second broad critique relative to national identity and sport regards the claim that sport helps *unite* citizens and that it can effectively transcend other identities. Although most agree that on some level, sport has the potential to build a sense of national unity, the main point of contention is how this claim is ultimately taken for granted. In response, critics point to an inherent contradiction: that national identity represents similarity (through expressions such as “we” or “us”), but it paradoxically tends to be defined through “difference” by using stereotypes and myths to distinguish it from the “other.” In sporting lore, heroes are infused into a nation’s identity as much by their personal achievements as by *whom* they conquered and how. In referring to the particularities of a United Kingdom identity, where Scotland, Wales, and Northern Ireland contribute to blurred distinctions, Whannel points out, “the production [of natural belongingness] is not a neat unifying performance, but rather a process in which moments of apparent national unity have to be set against the divisions and tensions that may operate between national and local identities” (1998, 26). Beyond these divisions, conceptions of “otherness” also include those who might question the ideological foundations on which expressions of national identity are constructed. Indeed, the capacity for sporting stories, memories, and myths to unite is tempered by the very way in which they sometimes gloss over inequities and le-

gitimate dominant notions of a meritocratic or egalitarian society. Ultimately, the idea of national unity (through a common identity) is contradictory because national sporting identities can obscure internal (and very real) cultural and social divisions and the economic inequalities present in democratic societies.

SPORTS, NATIONAL IDENTITY, AND GLOBALIZATION

A second level of analysis revolves around the visible challenges to national identity and the nation-state triggered by particular political, economic, and cultural social processes of globalization and an intensified sense of interconnectivity. Although scholars widely use the concept of globalization as a lens through which to analyze sport and national identity, they reach considerably different conclusions. The effects of globalization and the apparent declining importance of the nation-state feature prominently in recent analyses of national identity and sport.

Some have argued, for example, that globalization has increasingly rendered the nation-state obsolete, particularly because of the heightened power of transnational corporations. Indeed, though nationalism clearly exists in conjunction with international sports, the boundaries and differences between national identities and corporate interests are becoming increasingly

blurred. For example, transnational corporations are increasingly sponsoring national sporting teams and appropriating national sporting identities in their global promotional campaigns: Nike sponsors the Brazilian soccer team, whereas Adidas sponsors the New Zealand All Blacks rugby team. In this sense, national identity is being increasingly aligned with the interests of global corporations and consumption, such that sponsors often herald victories by “national” teams as conquests over rival transnational corporations. Such issues raise important questions about who “owns” and “controls” national identity.

The notion of athletes as global migrant workers is another contemporary global political issue that indicates the permeation of national boundaries. In conjunction with the new international division of labor, the diversity and frequency of sporting labor migration patterns of athletes has increased substantially. Although high-profile athletes such as Michael Jordan, Tiger Woods, and Martina Hingis are marketed to audiences around the world and have transnational celebrity appeal, borderless athletes routinely move between states, regions, and continents, raising important questions about the relevancy of national identity and national borders in the global sports arena. The degree to which their “host” countries embrace athletes varies substantially and can be closely tied to their sporting successes. In Canada, for example, European and Russian hockey players are still frequent targets of xenophobic and disparaging stereotypes by some cultural commentators who argue that skilled foreign players are incompatible with “Canadian values” of rugged toughness.

In their totality, the impacts of globalization have often triggered identity crises within particular nations. This is particularly evident, for example, when a country loses in its “national game” in major international competitions, which effectively sets the stage for periods of national self-examination. In such instances, fans and citizens alike commonly retreat to the mists of nostalgic recollections of past sporting and national “victories.” Indeed, as Jackson and Ponik note, sporting crises serve “as a key site for the confirmation of a particular set of im-

ages, narratives, and social bodies upon which a selective social memory can be constructed” (2001, 59). Britain’s national identity, for example, is often argued to be “languishing” amid “dreams of an imperial past” because of processes of migration and competing nationalist claims from its “Celtic Fringe” (Tuck 2003). Meanwhile, in New Zealand, any loss by the All Blacks is regarded as a national crisis and greeted with intense anger, mourning, and nostalgic recollections of the rugged sporting legacy of the nation’s rugby team. In Canada, key sporting figures such as “The Great One” (Wayne Gretzky) have become standard bearers of “Canadianness” (Jackson 2001).

Sport and Popular Culture

As an important part of popular culture, sport powerfully links “national symbols and myths of national character with the ordinary lives of people and with widely shared popular experiences” (Gruneau and Whitson 1993, 251). In this light, sport can advance feelings of national unity while paradoxically dismissing societal divisions along lines of class, race, language, religion, and gender. Consequently, the meanings of, and claims to expressions of sporting national identities are very much implicated in sustaining power and privilege within specific nations. Indeed, examining sport and national identity helps reveal the inevitable tensions and divisions of our collective identities as well as the contested nature of sport itself.

Sport as Religion

Is it possible to regard sport as a religion? Based on similar yet different definitions of religion, the answer is yes. The institution of sport is more than humans interacting in a playful manner; rather it is a civic religion, a social institution. According to French sociologist Emile Durkheim “religion is the tie that binds a collectivity together—it transforms the objects and activities of everyday life into the sacred. Planned gatherings paradoxically generate spontaneous expressions of group enthusiasm, even hysteria that bind the individual with the assembly” (cited in Mazur & McCarthy 2001, 124). Applying this theory to football, fan participation becomes a religious experience as denominations or team

supporters unite in chants and cheers, expressing their group enthusiasm. Using Durkheim’s definition, sport is, indeed, a religion. Sporting events unite athletes and spectators in a unique community in which sacred rituals and morals are reinforced. During sporting events congregational members are encouraged to express emotions through chants and songs. Clifford Geertz states that religion’s role is to shape the social order, to guide and shape behaviors (1973, 119). Again using football, athletes and fans learn favorable social behavior through rules and regulations. The structure of football demands dedication, with players executing their individual roles within the collective. A football team’s success depends on individuals working together to achieve a common goal. If each member acted independently chaos would arise. Sport congregations apply the social behavior of teamwork to everyday situations.

The concept of sport as a religion is not new. In fact, the Olympics were originally portrayed as a religious event, a sacred festival of games and sport. Flags, drums, dances, songs/chants, and feasts all accompanied ancient religious/sport rituals. During these religious events, “the drummers beat their drums like those possessed and this it was believed signified the presence of the spirits who were the determinants in the results of the contest” (Obare 2003, 1). These same ancient rituals are present in modern sporting events, especially football tailgating. At weekend football services, college bands are entrusted to ignite the congregation and raise spirits through the beating of drums and blowing of horns. Charles Prebish (1993) likens the ritual of tailgating to that of eighteenth-century evangelical tent revivals, in which followers temporarily congregated and formed “pop-up” communities. Every college football weekend fans congregate in mobile homes and recreational vehicles and form these quasi minicommunities. The congregation reminisces over past glories and looks forward to future triumphs. Each new generation learns traditions of breaking bread as well as kinship/fellowship from the previous generation.

Researcher Ruphine Obare (2003, 1) defines religion as “human beings relation to that which they re-

gard as holy, sacred, spiritual, divine . . . worship is probably the most basic element of religion.” Obare regards sport as a natural religion because it reflects rituals, symbols, and a desire for perfection. Concurring with Obare, Coakley believes “sports are natural religions. All things human are proper to them—in sports, we meet our humanity. Assuming one begins with limited hopes, there is more to admire in sports—and in our humanity, and in our nation than to despise” (2001, 314).

Sport as Alternative Civil Religion

There are two main reasons the religion of sport is significant to American culture. The first is simply offering an alternative civil religion, while the second consists of palpable implications within American society. Bellah classifies civil religion as a set of beliefs, symbols, and rituals: “certain common elements of religious orientation that the great majority of Americans share. These . . . provide a religious dimension for the whole fabric of American life, including the political sphere” (Bellah et al. 1987, 3). Despite making distinction between civil religion and denominational religions, Bellah’s civil religion is closely linked to Protestantism throughout the nineteenth century. Some researchers argue that certain aspects of sport actually reflect the Protestant ethic of building strong moral worth through sacrifice and pain, one of the basic foundations of sport religion.

To Geertz, religion (even a civil religion) provides meaning to an objective reality, which produces generational worldview or culture. Religious beliefs and practices, Geertz said, “represent a way of life ideally adapted to the actual state of affairs” (1966, 3). This theory is applicable to sport. For example, business ideology as portrayed through rhetoric involving individuals working together as a “team” to achieve a “common goal” exemplifies this theory.

Although Bellah’s civil religion refers to America’s devotion to itself, his ideology can be applied to America’s love of sports. The functions of this civil religion include instilling proper respect for authority, stressing moral values, and the hard-work ethic.

Milton Yinger (1963) suggests that these quasi religions are formed to compensate for traditional churches’ inability to achieve unity among groups with different values.

Peter Berger suggests that a socially constructed world (a religion) “directs, sanctions, controls, and punishes individual conduct” (1967, 11). Rules and regulations within sports resemble this very same theology/ideology. Sport teaches a “respect for limits and laws and rules—and the lust to develop the art of doing things perfectly” (Prebish 1993, 163). In other words, sport builds a fundamentally strong character base that is applicable to everyday life. The search for perfection becomes a self-transcendental journey. Berger refers to this journey as a religious phenomenon, one that is socially self-transcendent. In addition, Berger believes that religion “is a humanly constructed universe of meaning, and this construction is undertaken by linguistic means” (1967, 175). The nature of sport generates and constructs communities in which a unique language (or sports lingo) is used to both define and explain its society as well as the outside world. Expressions originating within sports such as “hitting below the belt,” “taking one for the team,” “spoilsport,” and “team player” translate to everyday life and help define certain actions and behaviors. Common use of football terminologies such as “offside,” “fumble,” or “time out” demonstrates the practical application of this religious theory. Members interweave these expressions and apply them to everyday life. Football creates a unique terminology that combines sign language with oral communication. Sport impacts our understanding of fair play and integrity, thus helping to shape the social order. Through rules and regulations, sport reinforces a reliance on a higher authority and a type of submission to a controlled social order. Again, using football as an example, the referee has ultimate say in determining fair play or settling disputes, thus reiterating this civil religion’s goal of instilling proper respect for authority.

Sport resembles religion in the sense that both are organized institutions with disciplines and liturgies, stressing moral values of heart and soul. Sport as a social

Sport as Religion

Worshipping at the “Church of Sports”

If there is a universal popular religion in America, it is to be found within the institution of sports. . . . Many Americans worship at the church of sports. Services are held for each personal belief, whether it be football, racing, golf, or driving.

Prebish, C. S. (1993). *Religion and sport: The meeting of sacred and profane* (p. 57). Westport, CT: Greenwood.

institution, like religion, uses codes to guide moral conduct, which ultimately results in a deeper respect for authority. The religion of sport transcends the individual, thus molding and impacting personalities. Individuals or members identify themselves with certain characteristics or traits belonging to their beloved sport/team. This identification is especially true when devotion begins as a child. “By being born into the clan or raised a fan of a particular team, the individual is constituted by identification with the totemic symbol of the group” (Mazur & McCarthy 2001, 127). For example, Chicago Cub fans have endured years of disappointment resulting in a sense of hopefulness, a belief that this could be the year, which sets them apart from other team supporters (with the exception of Boston Red Sox fans before October 2004). In other words, one could argue that Cub fans are bred to endure pain and disappointment, making them more forgiving and more optimistic. Teaching endurance from generation to generation complies with Geertz’s traditional aspect of what constitutes a religion.

Religion and Sport Reflect Society

Religion functions as a reflection of society, defining rules and explaining norms. Geertz argued that anywhere norms or models of society and/or models for behaving in society exist there is religion. If Geertz is right and religious motives are “liabilities to perform particular classes of act or have particular classes of feelings” (1973, 97), then emotional sporting rituals

such as chanting and festive tailgating classify sport as religion. According to Geertz, religious motives stimulate moods, which trigger certain behaviors. Sacred symbols then ignite moods ranging from “exultation to melancholy, from self-confidence to self-pity” (1973, 97). Depending on loyalty or devotion to a particular team or sport, symbols like the Stanley Cup, the Lombardi Trophy, or a World Series ring can either exhilarate or depress individuals. In addition, the playing of sporting anthems rekindles deep emotional ties, further uniting the individual with the sport community. This rekindling of emotions is especially true in regard to collegiate football anthems. Whether it’s the sound of “The Victory March” or the “Texas Fight” song, either the Notre Dame Stadium or Darrell K. Royal Stadium ignites in unified exuberance with fans rejoicing while partaking in the festivities.

One consciously chooses a set of beliefs and attitudes that affect one’s behavior, or one’s spirituality. Eric Mazur and Kate McCarthy (2001) believe that a spiritual person seeks these beliefs, values, and practices to enhance their life and provide a sense of responsibility and orientation. According to researchers James Frey and D. Stanley Eitzen (1991) religion has several roles including emphasizing asceticism, repetition, and developing character. Institutional sports, especially American football, American baseball, and hockey possess these very qualities. Through self-denial and self-discipline, athletes learn to endure pain and to place the team above all. Common male expressions like “buck up” or “no pain, no gain” demonstrate the infiltration of this sport ideology into everyday life. Athletes seeking perfection through repetition set an example of good character for the rest of the congregation (or fans). According to Putney, and Frey and Eitzen, these same positive values of self-discipline, sportsmanship, a hard work ethic, and goal attainment through competition help qualify sport as religion.

As found in traditional religions, sport relies on symbols, language, and rituals to both maintain order and help explain events of everyday life. According to Coakley, “the rituals of sport engage more people in a shared

The ruins of ancient Olympia in 2003, a site associated with both sport and religion.

experience than any other institution or cultural activity today” (2001, 1). As early as the late 1800s Americans relied on sporting rituals to help promote moral values. In 1887, based on sports rituals, Luther Gulick transformed the YMCA’s goal of saving souls to building character. As a YMCA philosopher and director of physical training, Gulick believed that sport taught moral values of body, mind, and spirit, and through sport, people could tone and perfect their human character. Today’s Fellowship of Christian Athletes’ mission of using athletics to “impact the world for Jesus Christ” through values of integrity, service, teamwork, and excellence is based on this same principle. Routines and disciplines found in sport strengthen personal character. A stronger moral foundation/character better prepares an individual to combat everyday trials. When combating an aggressive opponent, football conditions defensive players to dig in, to remain tough and hold the line. In everyday situations, this conditioning translates to determination and perseverance both in the work force and within personal relationships.

Through sport, children learn basic skills such as cooperation, self-esteem, altruism, loyalty, self-control, and obedience. Researchers Margaret Gatz, Michael Messner, and Sandra Rokeach argue that values and skills learned through sport help children develop so-

cially and emotionally, and further serve to prepare an individual for the rest of life. Sport teaches acceptance of authority and initiates youth in routines. In this manner, sport becomes a transmitter, translating societal goals or meanings from one generation to the next. Sport becomes a “symbolic liaison” that Berger refers to as an “ancient lineage [that is] grounded in the very antiquity of kinship institutions”

(1967, 132). Sport, like religion, binds communities together. Sport educates society in responsibility and self-control through its “demands for fairness and chivalry which must be respected even in the face of the strongest aggression” (Guttmann 1978, 130).

According to Edwards and Coakley, sport shares numerous essential features of religion including formal statement of beliefs, testimonies that bring fullness and satisfaction to life, saints (or idolized people), ruling patriarchs (coaches), hierarchal/high council (NCAA or referees), reliance on scribes (records and journalists), seekers of the kingdom (fans), shrines and/or cathedrals, and symbols of the faith (trophies/souvenirs). Like traditional religions, sport provides structure and an opportunity for religious expression. This religious expression provides a chance to step outside of one’s daily routine and become part of the collective, especially through chants. Durkheim refers to this impetuous passionate release as “corrobbori” (as cited in Mazur & McCarthy 2001, 125). Sport is catharsis in that it “allows the release of emotions in a range of behavior including pre-game levity, frenzied cheering during the game, and post-game carousing” (Guttmann 1978, 134).

In this community, “post modern religious expression is once removed, vicariously experienced by those who observe the ‘religious’ ritual. Spectating, therefore,

*Baseball is like church. Many attend,
few understand.* ■ LEO DUROCHER

replaces participating” (Mazur & McCarthy 2001, 129). Fans, however, individually symbolize their faith through pennants, emblems, flags, hats, and whatever best characterizes the glory of their team (Prebish 1993, 67). During the sporting event (or service) members restate their belief by submitting to the hierarchal codes and rules. The sport congregation participates with both rookies (novices) and veterans (ordained clergy) as “pilgrims travel hundred of miles to witness a game [and invoke] traditional hallowed chants. Instead of salvation and redemption, the goal is now collective victory” (Rudin 1972, 384). Sports pages become sacred scrolls, read in daily devotions along with viewing ESPN.

Applying researcher Catherine Abanese’s four components of religion adds validity to the claim that sport is, indeed, a religion (as cited in Prebish 1993). Abanese’s first component, creed, is defined as the shared viewpoints of a group. To some extent athletes, coaches, and supporters/fans define sport through their belief or viewpoint of its existence and/or meaning. Abanese bases her second component, code, on rules and regulations, which guide or govern this belief. Strictly enforced guidelines and rules define sport. Whether you are an athlete or a spectator, either ignoring or blatantly disrespecting rules will result in your expulsion or denial from participating in the game (or service). For example, hockey penalizes breaking the rule of high sticking with time in the penalty box, denying the “sinner” the glory of joining in the service. Third, Abanese gauges religion by cultus—or its ceremonies/rituals and tradition. Whether it is the singing of the national anthem, the traditional seventh-inning rendition of “Take Me Out to the Ballgame” at Wrigley Field, or the official tossing of a coin at the beginning of a football game, ceremonies and traditions are mainstays in modern sport. Last, Abanese defines religion through community. Again, sport fits this criterion through its creation of unique communities that exist solely through sports and sporting events. Through hope and anticipation in their quest for victory/perfection, fans and athletes become emotionally united. According to Prebish (1993, 65), sport is a festive communion creating solidarity between players and fans.

Sport creates a second type of family or community, a support system, in which meaning and morals are shared and learned. Researcher Michael Novak believes football is such a community. “The liturgy of a football game is, indeed, a communal and statewide worship service, with a unitary cosmic scheme” (1988, 235). Mazur and McCarthy liken the passions of football to religious ritual. “Football doesn’t have just a incidental kinship of faith. On the contrary, football is fundamentally connected to religion” (Mazur & McCarthy 2001, 124). As in football, the community of baseball poses religious qualities, which include the American principles of merit and fair play. “The national game promotes respect for proper authority, self-confidence, fairmindedness, quick judgment and self-control” (Guttman 1978, 96). In addition, sport possesses a messianic-millenarian ideology. Berger defines messianic-millenarian theodicy by “relativizing the suffering or injustice of the present in terms of their being overcome in a glorious future” (1967, 69). In this sense, players and fans look for redemption in the upcoming season. Again, Chicago Cub fans’ infamous expression “Wait till next year” exemplifies this type of “hopeful” redemption ideology. Sport religion maintains a type of optimistic ideology in which hope springs eternal. The ending of each sport season wipes the slate clean and provides a chance to start anew, rekindling hope for a better season, a better tomorrow.

What Does It Mean?

So, what does this all mean? This form of civil religion has far-reaching implications. According to Barna Research, 66 percent of Americans polled contend that traditional religion is losing its influence in society. Supporting this theory, research also indicates a decrease in traditional church attendance. In fact, researchers Kirk Hadaway, Penny Long Marler, and Mark Chaves believe the “church attendance rate is one-half what everyone thinks it is” (1993, 750). And according to a study by the University of Michigan, the percentage rate of Americans who attend a weekly church service is forty-four. In some instances, devotion to sport has replaced or overpowered devotion to traditional religion. For example, the Dallas

Sport as Religion

Racing and the Supernatural

This description of a racing ritual of the Dogon people of Mali points to the often close association between sports and religion.

In the Ogols, a race was arranged between the Anakyê sanctuary and a point on the border of Lower Ogol. The route thus ran through the field between the two villages in the hollow where the baobabs were.

The man with the torch started from the sanctuary, and ran down the slope through the stubble-fields, shaking his brand and scattering a shower of sparks and embers. For the smith in heaven dropped some of his fire as he ran, picked it up with his crook, and continued to run, losing it and picking it up again.

On reaching the border of Lower Ogol the runner turned and ran back to the sanctuary, from which he at once started out again. This performance was repeated three times, and all the time the two masks pursued the fugitive brandishing a knife. They sym-

bolized the two thunderbolts launched by the Nummo against the guilty smith, and they never caught up with the torch-bearer till, at the end of the third course, he regained the sanctuary. He had by then made the complete circuit three times brandishing his torch all the while.

‘These three courses,’ said Ogotemméli, ‘recall the flight of the smith and his search for a way into the celestial granary, where he could hide the embers.’ For in this ritual the circular Anakyê sanctuary represented the celestial granary.

The pursuit ended when a smith scanned the rock and beat upon it with the iron of his anvil. And the live fire, pursued by the two dead fires, gave life again to the hearths of this world as well as to the blackened logs which protect the crops and the fruit of the trees.

Cowboy legendary coach Tom Landry confessed late in his career, “football had been my religion for decades” (Mattingly 1996). Whether this devotion is made consciously or unconsciously depends on the individual. Bellah argues that people “are coming to depend less on established social sources of denominationalism and more on binding ties between the moral outlook and way of life to which persons actually hold” (Bellah et al. 1987, 326). As early as 1961, researcher Bernard Lazerwitz investigated the impact of societal forces on variations in church attendance. Recent community trends of holding children’s sporting events such as soccer on Sunday leads one to believe that sport is having an impact on church attendance. Unlike strict past guidelines, which discouraged the scheduling of youth sporting events on Sundays, modern trends appear to place sporting events above traditional religious events. Just a short time ago, professional players like Sandy Koufax honored blue laws by refusing to pitch on the Sabbath, an ideology that today’s societal standard would consider ridiculous. Blue laws are state or local ordinances that prohibit certain activi-

ties, like sports or drinking, on Sunday. Economics played a key role in overturning blue laws regarding professional sports. For instance, in 1933, after much heated debate, Philadelphia overturned its blue law regarding professional baseball to help promote the local economy. Social rather than economic desires guide today’s Sunday scheduling of youth sporting events.

As mentioned earlier, sport’s influence among society includes several aspects of traditional religion. To offset growing social desires to partake in sporting events, churches have altered the timing of religious events. Numerous traditional denominations have altered Sunday services to accommodate sport congregations’ need to witness the kickoff. In addition to impacting religious schedules, sport has infiltrated religious architecture. For instance, a stained-glass window at the Cathedral of St. John the Divine in New York is devoted to sports. According to the then-reigning bishop, “A well played game is as pleasing to God as a beautiful service of worship” (Farrelly 1997). Another main area of sport permeation is religious sermons. Perhaps the

best example of this is Father Edward Rupp's prayer before an all-star hockey game:

Heavenly Father, Divine Goalie, we come before You this evening to seek Your blessing. We are, thanks to You, All-Stars. We pray tonight for Your guidance. Keep us free from actions that would put us in the Sin Bin of Hell. Inspire us to avoid the pitfalls of our profession. Help us to stay within the blue line of Your commandments and the red line of Your grace. Protect us from being injured by the puck of pride. May we be ever delivered from the high stick of dishonesty. May the wings of your angels play at the right and left of our teammates. May You always be the Divine Center of our team, and when our summons comes for eternal retirement to the heavenly grandstand, may we find you ready to give us the everlasting bonus of a permanent seat in your coliseum. Finally, grant us the courage to skate without tripping, to run without icing, and to score the goal that really counts—the one that makes us a winner, a champion, an All-Star in the hectic Hockey Game of Life. *Amen!!* (Sammons 2002, 2)

The Future

Sport is not a religion in the traditional theological sense, but rather civilly. As stated earlier, sport is a social institution that not only educates, but also provides structure and moral support for its members. This research indicates, therefore, that sport does, indeed, possess qualities and characteristics that coincide with religious ideology. Whether one is participating as an athlete or as a fan/spectator, sport has the ability to transcend an individual to a supernatural level of existence. As Charles Prebish notes (1993, 210): "What it all boils down to is this: if sports can bring its advocates to an experience of the ultimate, and this experience is expressed through a formal series of public and private rituals requiring a symbolic language and space deemed sacred by its worshipers then it is both proper and necessary to call sport itself a religion."

Sport in the sense of a mass-spectacle, with death to add to the underlying excitement, comes into existence when a population has been drilled and regimented and depressed to such an extent that it needs at least a vicarious participation in difficult feats of strength or skill or heroism in order to sustain its waning life-sense. ■ LEWIS MUMFORD

Sport as Spectacle

The world of sport in the age of mass media has been transformed from amateur recreational participation to spectator-centered business. The commercial incentives for sport to cooperate with television, film, radio, newspaper, and magazine to consistently expand the “spectacle” aspects of the event are ever increasing. Much more is at stake than material gain, however; the players and fans depend on sport as spectacle for esteem, honor, dignity, identity, and status.

Today’s sporting spectacle presents an encompassing drama: actors, ritual, plot, production, masculinity, rage, pride, chance, and social message are all brilliantly choreographed in the sport spectacular. For the committed fan (derived, indeed, from the word “fanatic”) winning produces overwhelming exhilaration, defeat, deep depression. Yet even in defeat there is always hope for the next game or season. Fans and players become inseparable actors in the same drama.

Early Spectator Entertainment

Evidence for organized sporting events can be traced to Egyptian culture as far back as 5200 BCE; however, evidence for sport spectatorship is extant only from the first century BCE. The Grecian Olympic Games were the first to offer dimensions of spectator entertainment as well as opportunities for civic and religious ceremonies. Grecian appreciation of athletic grace was soon to be usurped by the spread of the Roman Empire and the accompanying appetite for sport spectacles laden with violence, such as gladiator matches

and chariot races. The attendance records for Roman sporting events remained unchallenged until the period of the industrial revolution. As families moved into the cities, leisure time increased, and this, combined with concomitant developments in transportation and communication technology, allowed spectators to bond as a community and develop regional rivalries while regularly visiting distant stadiums and keeping track of “their” teams.

Impact of Technology on Spectator Sport

In the mid-1800s, the steamboat and railway networks, soon followed by the electric streetcar, opened up the city to suburban areas, carrying sport crowds (and players) to horse races, baseball games, football matches, and intercollegiate rowing events. When Thomas A. Edison developed the incandescent bulb in 1879, he inaugurated a new era in the social nightlife of the metropolis. Within a few years sport arenas with electric lighting were hosting night games. The advent and expansion of use of the telegraph, newspapers, and radio during this same period fostered, for the first time, sport reporting and spectator following of distant, even international sport. As technology advanced, pictures of sporting events were added to newspaper articles; the still camera, a precursor to the video camera and televised sport, was first to provide visual information to millions of remote fans.

With the broad democratization of television and televised sports in the 1960s, thousands of enthusiasts never had to leave their homes to take in a sporting event. The Internet, of course, has further complicated and fragmented the sport spectator experience. Beginning with the 2001 Major League Baseball (MLB) World Series, audiences could express their approval or disapproval of team managers’ decisions during the game via the Internet. Today every MLB game can be downloaded upon its completion, so fans are able to relive new and classic ballgames at any time. Sport spectatorship is inextricably linked to technology development.

In contemporary Western society, sport is a spectacle in three noteworthy ways. Sport is (1) a public performance of a large scale or impressive nature, such as the grand exhibitions of the Olympic Games; (2) a regrettable public display, as in the deplorable behavior of destructive international soccer fans; and (3) a commodity, a tool of pacification, depoliticization, and “massification,” exemplified by professional football’s commercially exploitative Super Bowl.

SPORT AS AN IMPRESSIVE TELEVISED PERFORMANCE

The transition to large-scale, extraordinary sport spectacles is directly connected to the widespread popularity of televised sport, which got underway in the United States the afternoon of 17 May 1939, when the first televised baseball game was put on the air by NBC. The picture impulses of a game between Princeton and Columbia University from Columbia’s Baker Field marked the beginning of a romance between the new medium and sport.

Until the perfection of color television, slow motion, and replay shots in the 1960s, team sports could not easily be conveyed on the small screen and therefore constituted a small portion of network budgets and program time. When ABC decided to

make sport a centerpiece of its programming, other corporations had no choice but to follow, and an all-out war between networks for supremacy in sport television ensued. In the 1980s “superstations” employing transmission satellites also joined in the fray. The moguls of sport quickly began to package their games as even greater spectacles so they would be more appealing to television audiences. The National Basketball Association (NBA) and the National Hockey League (NHL) expanded their playoff formats so that sixteen teams (more than two-thirds) reach the championship tournaments. Halftime periods have been shortened so that television audiences will be more likely to stay tuned, and pre-arranged schedules of time-outs have been added to football, basketball, and hockey games to make time for commercials.

The Good and the Bad

Even in the televised sport age, the anticipation of actually attending a sport stadium adds immeasurably to the excitement, evidenced by continued sellout crowds at Pakistan’s Rawalpindi Cricket Stadium, the Dallas Mavericks American Airlines Center, or Manchester United’s

During the Greek period, the Olympics were organized in honor of the Greek god Zeus, with a major temple on the site built in his honor.

Old Trafford. Once at the stadium, the sharing of emotions with other fans heightens the intensity of the experience.

On one hand television cheapened and trivialized the spectator experience. Too many seasons, games, teams, and “big plays” have diluted the poignancy and potency of the sporting experience and have diminished the capacity of sport to furnish heroes, release people from the ennui of daily life, and bind communities. Television contributed to the rise of a new set of sporting ideals: nationalism, sportsmanship, and civility were replaced by self-indulgence, win-at-all-costs attitudes, and supremacy of commercial interests.

On the other hand, television broadened and deepened the drama of the spectacle by stimulating an even broader audience, offering an exciting narrative text that begins long before the game, framing meaning, and setting a tone that hypes the contests and specifies the conflicts worthy of conjecture. Close-up, slow-motion, and replay shots add to the appreciation of beautifully executed plays, and many fans now prefer to watch sport on television instead of being in the stands because, ironically, they feel closer to their heroes. For instance, in the sport of soccer, the Premier League’s David Beckham not only scores goals and brings fame to his team, but televised sport has also helped him branch out into films (*Bend It like Beckham*) and product endorsements (Adidas, Marks and Spencer, and Gillette), bringing him into contact with his devoted fans more and more often. Made-for-media grand-scale spectacles, such as the opening ceremonies of the Olympic Games or the National Football League’s (NFL) Super Bowl halftime show, have large television audiences and are only indirectly related to sport.

OLYMPIC GAMES

Pageantry, political rhetoric, and showbiz extravaganzas now characterize today’s grand-scale sporting events. In September 2000 Australian Olympian Cathy Freeman, an Aborigine, carried the Olympic torch for its last leg up toward a vast waterfall before she ignited the cauldron. In an extraordinarily intricate and dangerous

spectacle, flames surrounded her as a choir sang and deafening orange fireworks illuminated Sydney’s sky. The spectacle was the grandest of opening ceremonies to that date and had significant political implications given the Australian government’s political relationship with the Aboriginal people.

SUPERBOWL

No one at first expected the Super Bowl to far exceed all other sport spectacles in the size of its domestic audience (140 million people). In the twenty-first century nearly one billion people worldwide are routinely expected to view the exhibitions that the NFL and its advertisers have in mind. Advertisers use the broadcast as a way to roll out new products and pay over \$2 million for a thirty-second commercial spot. The highlight is always the halftime show, and the 2004 version was the most spectacular and controversial yet. The finale was a duet with American celebrity recording artists Janet Jackson and Justin Timberlake, during which Jackson’s breast was (un)intentionally exposed. The sensationalism and shock value achieved was directly in line with the goals of the sport/media complex.

Sport as a Violent, Sexist Spectacle

Sport is also a spectacle in the sense of being a regrettable display. As the task of attracting a sufficiently large audience to satisfy advertisers becomes more and more challenging, “mediatized” sport has wrought two negative features: (1) increased violence associated with (male) professional sport on the field, court, and rink; in the stands; and at home, and (2) the entrenchment of the trivialization of women’s sporting accomplishments, sexualization of women’s bodies, and overall subordination of women’s roles.

INCREASING VIOLENCE

In the game, brutal tactics have led to an epidemic injury rate in football, and similar license in other sports (hockey and basketball) has been well documented. More often, activities that lead to the temporary incapacitation, knockout, or injury of competitors are the norm.

Sport as Spectacle

An Ethiopian Horse Sport

“The game of gugs is based on warfare, but where a cavalryman carried two spears, a light one for throwing, and a heavier job for infighting, the gouks [gugs] player uses only light wood wands. The object is for members of one team to gallop off followed by the others who are supposed to hit them with their wands, either by hurling at them or by catching up and hitting them. Those being pursued are protected with traditional circular shields in hippo or rhinoceros hide, some covered with coloured velvet and decorated with gold and silver. As they tear away across the plain, they may dodge, hang off the horse or ward off with the shield. The riders are often in traditional costume, or at any rate the cloak and gold-fringed lion or baboon headdress!!”

Mindless acts of violence intricately tied to win-at-any-cost ethics and retribution have led to player indictments. For instance, in 2004 National Hockey League play, the Vancouver Canucks’ Todd Bertuzzi attacked the Colorado Avalanche’s Steve Moore from behind. Moore suffered a concussion and a fractured neck. Bertuzzi was indicted for assault causing bodily harm and plead guilty.

In the stands, fan violence can be deadly. For at least two decades there has been a widespread tendency for English fans to be castigated for aggressive behavior, drunkenness, and open displays of xenophobia and racism. Spectators have cursed, yelled racial slurs, given death threats, and thrown objects onto the field. During Euro 2000, disappointment turned to violence in Charleroi, France, as supporters of the English team brought terror to the streets following a loss, resulting in 850 arrests. And in one of the most grotesque displays of human belligerence, over three hundred people were killed and one thousand injured in a Lima, Peru, soccer riot in 1964. Fans may feel so invested in the drama of sport and nationalism that losses become too painful to bear.

Empirical evidence supports the appeal of sport violence. One recent study found that more (perceived) violence in football matches led to greater enjoyment, so in addition to actual hostility between players, emphasis by commentators on athletes’ antagonisms augments audience enjoyment. Another study discovered that watching televised sport at home was connected to seemingly senseless and brutal attacks on the female partners of fans.

SEXISM

Feminist sport critics who study the portrayal of female athletes in the mass media reveal the degree to which the sport media contribute to the oppression of marginalized groups, particularly women, by reinforcing “natural” sex differences through representations of sports that privilege and empower men over women. Female athletes are more often celebrated if they play “feminine” sports, those that depict females in aesthetically pleasing motions and poses, often emphasizing the erotic physicality of the female body with tight bodices and short skirts (e.g., gymnastics, tennis, and figure skating).

Skating emphasizes artistry over athleticism, and its use of grace, music, and costume have a culturally influenced gender appeal designed to attract and sustain female viewers and titillate male viewers. International tennis sensation Anna Kournikova is one of many female athletes better known for her modeling career than on-court achievement. The spectacle of sport allows her to earn more in endorsements than any other female player, despite her indifferent performances, while women who have won recognized tennis tournaments on the international circuit gain much less income and attention. In mainstream sports women also play passive, supporting roles and conform to patriarchal standards of sport and femininity. Scantly clad female models (car racing), cheerleaders (gridiron football), or half-time dancers (basketball) secure a large audience of men by creating an atmosphere of hegemonic masculinity.

Many more women are absent from televised sport because they are prevented from participating or because

their sports are not considered sufficient audience draws and are therefore not promoted through mainstream media. Despite the fact that women's athletic participation in modern-day Olympic Games exceeds their participation in any other major sporting event, a sexist ideology persists in the media which highlights and reinforces the supposedly *natural* differences between males and females and overwhelmingly favors men's participation as they compete separately in the same sport (e.g., downhill skiing) or in sex-exclusive sports, such as synchronized swimming and softball (women) or boxing (men). Professional female athletes receive disproportionately less television, radio, and magazine coverage than their male counterparts. The sport spectacle in the twentieth century has given men an arena in which to create and reinforce an ideology of male superiority.

The quintessential example of a violent, sexist, "mediatized" sporting spectacle is the pseudosport of professional wrestling. While discounted as a genuine sport by most, professional wrestling has evolved into a culturally powerful multimedia complex. Specifically, professional wrestling's mandate is to excite audiences via contrived and hyperviolent athletic competition and to portray "hot babes of wrestling" as sexy props on the margins of the men's matches or against each other in titillating showcases of "raw feminine energy." It teaches lessons about masculinity and femininity to massive audiences who tune in for both sport and theater. The World Wrestling Federation, New Japan Pro Wrestling and Australian Wrestling Federation have prospered because they offer entertainment consistent with the entrenched interests of the sport/media/commercial complex.

Sport as a Commercially Exploitative Spectacle

Finally, as a tool of "massification" and pacification, spectator sports appear to provide escape from the pressures or banality of the work world; however, patrons are subsequently trapped by corporations, which use sports as commodities to fuel desires, stimulate de-

mands, and create new needs, essentially creating more work. Despite the fact that athletes' performances can be breathtaking, a race won or a ninth-inning base hit hair-raising, these aspects of the spectacle are considered a "free lunch" or bonus of the commodity spectacle, which is one created purely for its market value; sport serves the purpose of providing audiences for advertisers. The strategic vision of using sport programming (produced cheaply and transferred easily across cultural and linguistic borders) to reach new international audiences is being aggressively shared by a growing number of media organizations: Eurosport, Sky, ESPN, Fox, and Japan Sports Channel, to name a few. The competition to secure the rights for seasons and finales has intensified to unprecedented levels of financial investment on the part of media outlets. For instance, BBC pays £105 million for the rights to Saturday and Sunday night Premier league highlights; Fox acquired the rights to MLB baseball's playoffs, World Series, and All-Star Game for \$417 million per year; and NBC pays \$2.2 billion for rights to broadcast the Olympics.

RACISM

Creating a "big-time sport" spectacle has led to big drug abuse, big recruiting bribes, and big academic cheating among major American colleges. Along this loathsome byway, the black athlete has been especially misused. The belief that people with dark skin are driven by brawn rather than brains was used to justify colonization and exploitation during slavery and continues today to justify manipulation and exploitation in "mediatized" sport. In the NFL and NBA the majority of the workers are black; yet the majority of the owners, administrators, league presidents, and network executives are white and make millions of dollars more than the average player. Many black athletes, although recognizing that pro sports are akin to slavery, refuse to let go of their share of the pie. Inflated contracts are confused with achievement and the end of racism, and audiences and athletes alike have been pacified and depoliticized. Some argue that greed has changed the spectacle into a circus. On the other hand, without

Serious sport has nothing to do with fair play. It is bound up with hatred, jealousy, boastfulness, disregard of all rules and sadistic pleasure in witnessing violence: in other words it is war minus the shooting. ■ GEORGE ORWELL

media coverage and the considerable amounts of money paid by advertisers and corporations, the popularity and revenue-generating potential of commercial spectator sports would be seriously limited. Even without ever visiting a stadium, dedicated fanatics can experience the unpredictable drama, human transcendence, and joys of performance through newspapers' daily sports pages, television and radio broadcasts, and Internet updates.

The Future

Communication technologies have raised sport spectatorship more than a thousand-fold. Multichannel direct-satellite services, and Internet sports give fanatics the ability to choose from numerous live sporting events any time games are being played, anywhere in the world. With increased awareness of sport-related violence and discrimination against women and black athletes, sporting spectacles will become increasingly more humane and fair, but the almighty dollar still reigns, and the media will continue to provide the type of spectacle that will maintain the biggest audience. The Western sport spectacle has been completely revolutionized in under a century and is now transmitted to and imitated by nations worldwide.

Sport Politics

The late Avery Brundage of the United States, International Olympic Committee (IOC) president, argued that sports and politics are and should always be separate. Yet, clearly even a cursory look below the surface indicates how sports are a heady mix of inspiration and representation, with the latter related to obvious forms of identification within the social context.

When we consider politics in sports we must examine the internal, external, and peripheral influences on sports. Internally, the authorities and organizations that determine the development of their particular sport can be viewed as inherently political. The fact that key policy decisions are made by governing bodies and sports authorities makes this a political process. The issue of politics affecting the sporting environment from outside is more obviously dependent on the use of examples. The issue is particularly related to how during the twentieth century sports became increasingly affected by the political undercurrents within society. The interaction between sports and politics has also been partly a result of increasing international exchange at a diplomatic and sporting level. However, another key agent in this developing dynamic since the mid-nineteenth century has been peripheral influences such as the growth of the media. The provision of television as a mode of information transfer, since the mid-1960s, has further solidified the link between political processes and the sporting context.

History

Sports and broader expressions of physical culture have played a role throughout history as a means of achieving political capital and increased popularity for

political figures. The centrality of the ancient Roman coliseum to successive emperors is a good example of this fact. Throughout the latter part of the nineteenth century the organization and development of sports were firmly in the hands of elite social groups. This fact suggests that the structure of the sociopolitical environment played a key role in popularizing the pastimes and activities that have since spread throughout society and across the world. More recently, the German chancellor Adolf Hitler's use of the 1936 Olympic Games in Berlin cast a shadow over those particular Olympics as much for the political management of the event as for the subsequent horrors of that regime.

Sports and physical culture were also significant in the former Communist countries. Indeed, significant political figures in Communist nations began to develop a highly utilitarian physical culture to support the needs of their society. Communist societies in particular needed fit and strong people to work to support the development of their society and also to defend the state if necessary. In China a long history of traditional pastimes and court games informs China's more recent utilitarian system of physical culture. In command economies psychic income is received by the state and society from having an international champion. Cuba's history of boxing success at the Olympics is a good example of the political importance of sporting success to Communist states. It provides vigor to their self-image and raises their standing in the eyes of the world. Although these examples illustrate the extent of state manipulation of sports for political ends, this issue is not limited to Communism.

Internal Politics of Sports

We should examine the full extent of political processes involved in sports. They can operate at the international level, as detailed in the examples related to the Olympics. In the former USSR sports were little more than a tool of the state. They provided a focus for their achievements on an international stage, and the governing bodies operated under direct governmental control to further this goal. Certainly the full glare of the

global media provides its own form of accountability for those people making political decisions at the level of international sports.

At the national level more complex models exist for providing sports. The models can be affected by the national culture, climate, religion, economics, and, of course, society in general. Perhaps most difficult to distinguish is the often informal and occasional type of provision at a local level. What is not always clear is how different national political processes are supposed to act in the best interests of sports. In many respects the governmental policy toward sports (even the lack of a distinct policy) can inform our analysis of the provision of sports. Clearly the introduction of greater degrees of planning and organization related to school sports and physical education can affect notions of health and illness within society as well as have potentially positive effects on rates of crime and recidivism. The importance of such sports development initiatives will only increase in the future. At both the national and local levels accountability is provided by the democratic process; yet, perhaps the most powerful policy makers are not actually politicians. The role of the national governing bodies provides further information about how the national government interacts with its national sporting authorities. The role of the governing bodies can also be viewed as central to the character and nature of sports. An excellent example of this fact has been the stewardship of the Olympic Games by the International Olympic Committee.

The application of political theories to sports can also provide a useful analytical lens. Pluralism and the traditional Western model of sports remain the consensus position for most developed countries. This position recognizes the fact that numerous agencies have a bearing on the practical aspects of sports. The provision of a consensus can also be relevant to the notion of hegemony (influence) within sports. A more controversial political ideology that has had a crucial influence on the way that sports are viewed within their socio-economic context relates to traditional Marxism. Although the German political philosopher Karl Marx did not actually

focus on sports, an analysis of the sociopolitical context can be directly applied to the sporting context. Marx's focus on the inequalities inherent within the structure of many societies is a perspective that continues to influence the growing study of how best to provide practical forms of sports development.

Sports remain part of a policy-making process, and by definition politics and political structures are a central part of any policy-making process. Sports, by definition, have to be organized by decisions made within a particular nation's politicoeconomic structure. Consequently, sports would not enjoy the popularity that they have if not for the influence and control provided by the varied efforts of political associations and organizations as well as politicians and policies throughout history. Indeed, Bruce Kidd, an expert on international sport, put it rather eloquently in the British series about the history of the Olympics, *The Games in Question* (1988):

Politics have always been part of international sport and to suggest otherwise is ludicrous. Training and competition . . . everything connected with an international sports event are provided by a decision-making process that I would call political. They involve the allocation of resources towards sport and away from something else and that is a political process.

External Politics Affecting Sports

After World War II the Cold War provided a backdrop to world sports between 1950 and 1990 and added a significant political aspect to the practice of international relations, including sports. However, not all instances of political intrusion at the Olympic Games were related to Cold War tensions. The black power salute of Tommy Smith and John Carlos at Mexico City in 1968 remains an enduring example of the use of the sporting arena for the expression of diverse political agendas, in this case regarding the issue of civil rights within the United States. An unintended consequence of the protest at Mexico City was to highlight to others with diverse and often radical political agendas how sports can be used as a vehicle to communicate a mes-

sage. This incident was to have terrible and far-reaching consequences after the massacre of Israeli athletes at the 1972 Olympic Games in Munich. The Palestinian terrorist group Black September used that global sports festival as a means to disseminate its message related to the prevailing political situation in the Middle East. Four years later the boycott of the Montreal Olympic Games by the Organization of African Unity (OAU)—after protests against sporting links with apartheid (racial segregation) South Africa—provided a global focus for examining and hardening attitudes toward that pariah state. Again the role of the media in providing a vehicle for disseminating such messages is significant.

Clearly sports have the ability to act as a metaphorical background or a pressure-relief valve for both nations and individuals. On a number of occasions the sporting arena in general and the Olympic Games in particular have provided a stage where the two superpowers could compete in a sporting environment in front of the eyes of the world. In a number of instances politics has adversely affected the proceedings. Indeed, one can argue that without politics a broad interest in international sports would not exist today. The use of the Olympic Games as a tool in boycott politics during the 1970s and 1980s was possible only because of the influence of the mass media on global society during the latter half of the twentieth century.

The Olympic Games during the Cold War provide examples of this inherent tension within the developing sporting exchange. The Moscow Olympic Games of 1980 and the Los Angeles Olympic Games of 1984 were tarnished by boycotts related to ongoing fractious superpower relations. Yet, in 1976 in Montreal the Olympic Games were boycotted by the Organization of African Unity in protest of South Africa's apartheid regime. Although the 1976 boycott was clearly political, perhaps the best examples of Cold War tensions in sports were the boycotts of the early 1980s. At both Moscow and Los Angeles the Olympic Games acted as a showcase for the political ideologies of Communism and capitalism, respectively. Too often in the history of

the Olympic Games opportunities to learn about people in other countries and to develop a sense of social responsibility have been undermined by the subordination of sports and recreation to political and commercial goals.

Some academics subsequently have argued that the huge success of the Los Angeles Olympic Games after the spectacular overspending at Moscow showed which political system worked better. Although this argument may be a bit simplistic to take at face value, we should realize the power of the media in providing a sufficient vehicle for the dissemination of political messages, whether positive or negative. Undoubtedly the media can operate more effectively in a market rather than a centralized command economy. In that sense it can directly affect not only the type of message disseminated, but also how that message is received. Indeed, we should remember that the media provide a means of data and information transfer for sports. In this respect we can view sports as a victim of their own success. The relationship between sports and the media is vital to this process. Sports are a uniquely cheap and effective programming resource, in relative terms, for different forms of media. In fact, this axis with the media must continue to provide a major revenue stream in support of both the organization and development of sports.

Sports as Representation

Indeed, the influence of politics on sports, coupled with the development of media coverage, was one of the defining features of the development of international sports during the latter part of the twentieth century. The late U.S. President Richard Nixon used the pretext of a sporting exchange to nurture closer relations with hard-line Communist China. A table tennis match was scheduled between the two nations. This match led to a short period of high-level exchange, which became known as "Ping-Pong diplomacy." The role that sports have played in the hardening of attitudes in tense situations should not be underestimated. In the former Yugoslavia prior to the war in the Balkans, soccer teams provided a focus for demonstration and even violent

conflict that served to challenge interethnic relations. Illustrative examples during the early 1990s were matches between the Red Star Belgrade (Serbia) and Dynamo Zagreb (Croatia), which took on a significant political element. These often violent, highly charged matches mirrored the tensions related to the slow, inexorable collapse of the Yugoslav state.

As sports provide a focus for social interaction they inevitably come under pressure from those people seeking to use sports events (or success in an event) to highlight a particular political agenda. In many cases the attempt to control the political environment through sports results in a spectacular and contentious sporting outcome. Sports are undoubtedly a political endeavor when they involve national rivalries, and politics likely will continue to be central for sports on many fronts, both in a theoretical sense and in a practical sense. The strong representational element within sports (which in turn are supported by the political system) elevates sports within our social psyche and so makes them more important to our societies. Sports provide everyone from a head of state to a fringe ideologue with the ability to present his or her message to millions across the globe.

Separation of Power

In most nations a separation exists between those people in charge of developing sports and those people in charge of funding sports. Even this separation of power on sound organizational principles is an example of politics affecting sports. Such separation fundamentally affects the interaction between groups related to the funding and organization of sports. Often as a result of the organizing and planning process, sports tend to exhibit characteristics related to a particular national identity and its perceived uniqueness. During this nonlinear process sports become increasingly relevant to societies in a representational sense. We should not underestimate the importance of the representational element of sports to policy and political groups. Politicians and political structures usually act to channel national resources toward certain sporting goals, particularly when

a sport has enjoyed success on the world stage. The potential of a feel-good factor provided by sporting success to sustain the popularity of politicians has been recognized since ancient Roman times. Despite the protestations of many administrators and sportspeople, the link between sports and politics was firmly established before sports became the all-pervasive element of popular culture that they are today.

Sport Science

Sport science can be traced back to the ancient Greek physicians and philosophers, such as Herodicus and Hippocrates, who advocated following a proper diet and physical training to prevent disease. One of the first known definitions of *exercise* was written by the Greek physician Galen (131–201 CE): “To me it does not seem that all movement is exercise, but only when it is vigorous . . . The criterion of vigorousness is change of respiration.”

Through the Renaissance and into the twentieth century European and later U.S. doctors of physiology continued to expound on exercise physiology, focusing on exercise metabolism and physiology, environmental physiology, clinical pathophysiology, exercise and aging, nutrition, and assessment of physical fitness. In 1891 Harvard University founded the first exercise laboratory. Led by George Wells Fitz (1860–1934) and named the “Department of Anatomy, Physiology, and Physical Training,” it soon matured into the Harvard Fatigue Laboratory (1927–1946). Under the direction of David Bruce Dill (1891–1986), the Harvard Fatigue Laboratory was the source of groundbreaking research in exercise physiology and fitness assessment testing.

Classical Issues in Sport Science Research

Sport science began as an observational science as researchers made careful notes of heart-rate changes, body-composition changes, work capacity adaptations, and oxygen consumption during exercise. It soon branched into the experimental realm as sport scientists began to ask questions on how to optimize performance and increase the quality of life for the general population. The early investigators were also noted inventors as they designed tools to better observe exercise physiology. Tools such as the calorimeter, a device to measure the body’s heat production, and closed-circuit spirometry, which accurately quantifies energy expenditure, are still used in exercise science laboratories.

Sport-science technology is also used in medicine. The graded-exercise treadmill test is used to assess the ability to transport and use oxygen during exercise, called “maximal oxygen uptake.” Most physicians and exercise physiologists consider this test to be the most valid measurement of cardiovascular fitness.

Physical Fitness Assessment

During the mid-1950s the U.S. government began to take a proactive (acting in anticipation of future problems, needs, or changes) stance in the prevention of sedentary and obesity-related diseases. In 1955 U.S.

President Dwight D. Eisenhower established the President's Council on Youth Fitness, later renamed the "President's Council on Physical Fitness and Sports," to highlight the need for increased physical activity in schools, business, and industry. Along with the new council, the American Association for Health, Physical Education, and Recreation (AAHPER) developed fitness assessment tests with national standards and norms that could easily be used in physical education classes throughout the country.

Fitness testing for adults became commonplace during the 1970s. Along with the graded-exercise treadmill test, other specialized tests began to be used to assess cardiovascular health and to develop exercise programs. Cardiorespiratory fitness can be estimated using cycle ergometers or step tests in addition to treadmills.

Heart-Healthy Lifestyle

Aside from the finding of a decline in physical fitness of youth in the United States, another finding stimulated the government's interest in promoting physical activity during the middle of the twentieth century. Autopsy reports of young soldiers killed during the Korean War showed significant coronary artery disease. This finding coupled with the increasing death rate from coronary artery disease among middle-aged men spurred exercise scientists to determine the cause. Large epidemiological studies showed that the triad of a high-fat diet, cigarette smoking, and inactivity was the major risk factor in preventable coronary artery disease, prompting government-sponsored programs to promote early initiation of healthy behavior, including diet and exercise, as the best defense against coronary artery disease.

Braving the Elements: Environmental Physiology

Environmental physiology studies not only the obvious adaptations to hot-humid and cold weather, but also the effects of dehydration on performance, training at altitude, and the effects of gravity during space travel.

The topics of hydration and exercise during extreme weather conditions have been in the news recently be-

cause of deaths of professional and collegiate athletes attributed to heat stress, although research in these topics has been a staple of exercise physiology for some time. Much research in these topics comes from the military. The U.S. Army Research Institute of Environmental Medicine and the Institute of Military Physiology at the Heller Institute in Israel are major contributors to research in these topics as they strive to keep their military personnel healthy and safe when traveling to different parts of the world. The Harvard Fatigue Laboratory was home to much of the early research in environmental and altitude exercise physiology.

Landmark studies of acclimatization to hot and cold climates have given us a greater understanding of the adaptability of humans to survive. For instance, within fourteen days of exposure to a hot environment, physiological adaptations occur, via an improved control of cardiovascular function, to reduce cardiac strain. More recent research involves central nervous system adaptations, cell pathology of heatstroke, and even the role of clothing on the body's ability to thermoregulate (regulate temperature). Likewise, in the study of hydration status and exercise, sport science research has clarified the profound physiological effects that dehydration has on physiological functions.

The physiological effects of high altitudes are not often considered until people travel from sea level to a mountainous area and find themselves host to numerous physiological adaptations. Sport-science literature reports numerous short-term and long-term adaptations to altitude, including hematological (relating to blood), cardiovascular, and hormonal changes. This literature has helped to identify and alleviate several altitude-related illnesses, such as acute mountain sickness, through changes in physical activity and diet.

In nearly all realms of science space is considered the last frontier. Sport science is no different. Early observation of space flight showed remarkable physiological changes in humans, including changes in posture, body composition, the musculoskeleton, and fluid shifts. To simulate a microgravity environment, researchers have used strategies such as head-down bed rest, cast

immobilization confinement, limb suspension, and water immersion to study physiological effects. To combat the numerous effects of space flight, exercise, particularly resistance training, is now a standard activity during all flights.

Strength and Resistance Training

Although sport science has a history as old as that of sport itself, the main focus of research was usually on disease prevention, physical activity of the general and clinical populations, and scientific observation of physiological mechanisms. Recently the progression of training programs and nutritional design came from anecdotal evidence, passed from coaches to athletes in their quest to make and become champions. However, as the sports industry becomes more lucrative and as more emphasis is placed on people in the general population starting an active lifestyle, more research is focused on optimizing performance.

During the early twentieth century strength and resistance training began to emerge from basement gyms and circus side-show exhibitions into the realm of science. In 1945 Thomas DeLorme introduced the concept of progressive resistance exercise. Three years later he teamed with A. L. Watkins and published a paper on long-term resistance training for rehabilitative purposes.

Although research scientists were just beginning to recognize the importance of strength and resistance training, the popularity of lay publications dedicated to this new form of exercise was rising. In 1932 Bob Hoffman, founder of the York Barbell Company, published *Strength and Health*, a landmark magazine dedicated to weightlifting. In 1964 Hoffman published *Muscular*

Development, the first magazine dedicated to the sport of bodybuilding. Other magazines soon hit the newsstands, including *Ironman* and the modern Joe Weider publications such as *Muscle and Fitness*. These publications were instrumental in the popularization of resistance training.

Despite the popularity of such magazines, resistance-training research was uncommon until the 1970s. During the 1980s more research on strength and resistance training was published, and the focus shifted from athletes to women and men in the general population. Leading this new trend in science was the National Strength and Conditioning Association, which in 1987 began publishing the first journal dedicated to strength and conditioning research, *The Journal of Strength and Conditioning Research*. During the past twenty years tremendous advancements have been made in physiological adaptations and mechanisms, gender differences in training, and specificity of training. Most importantly, resistance training research has highlighted the importance of regular strength and resistance training to two important sections of our population: youth and the elderly.

Future Athletes and Weekend Warriors

The U.S. Centers for Disease Control report that 24 percent of high school boys do not engage in the recommended amount of daily physical activity. For high school girls the number is 38 percent. An average of 15 percent of children between the ages of six and nine are overweight. This number increases to 64 percent among adults, with those adults engaging in the recommended amount of physical activity at only 26 percent. The decline in physical-activity rates and the increase in obesity rates have prompted government-sponsored programs to promote youth fitness and sport scientists to publish research devoted to improving the fitness levels of children to prevent obesity and inactivity-related diseases later in life.

Organized sport and physical activity aren't the only recommendations for youth anymore; for many, strength and resistance training for children is an area of growing interest. Studies show that a moderate-intensity strength-training program can help increase strength, decrease the risks of injury while playing other sports, increase motor performance skills and increase bone density, and enhance growth and development in children. As a result of research that dispels old myths that children should not lift weights, the American Academy of Pediatrics has issued a statement advocating strength training for children.

Golden Years

The average life expectancy is 77.2 years, and life expectancy increases even more if a person reaches age fifty-five. Thus, much of the research in sport science is focused on improving the quality of life in the elderly.

A major health concern for the elderly is osteoporosis, a disease characterized by low bone mass and structural deterioration of bone tissue, leading to bone fragility and an increased susceptibility to fractures, especially of the hip, spine, and wrist. The U.S. National Institutes of Health estimate that one in two women and one in four men will develop the disease.

Researchers in several areas of the sport sciences, including nutrition, epidemiology, and strength resistance training, have published articles about this costly disease. Early research focused on increased calcium intake, hormone therapy, and daily exercise to prevent osteoporosis. However, strength and resistance training has come to the forefront as not only a preventive measure, but also as a possible treatment. Studies show that high-intensity resistance training not only can prevent osteoporosis when started at a young age, but also can increase bone density later in life.

Resistance training can have several other health benefits in the elderly. Sarcopenia, the progressive reduction of muscle mass, is another health concern for the elderly. Resistance training can ameliorate and even reverse physical frailty in the elderly. When resistance training is combined with daily physical activity and aerobic exercise, the risk of developing sarcopenia and osteoporosis can be drastically reduced.

Putting It All Together

The pioneers of exercise physiology built a solid foundation for modern theories based on a few principles. Arguably the most important principle is specificity, developed by DeLorme. Specificity of exercise is targeted adaptations of muscles, hormones, energy metabolism, and the cardiovascular system. For example, aerobic training increases aerobic capacity, whereas heavy resistance training increases muscular strength. Although seemingly simple, this principle serves as a basis for almost every sport-specific training program.

Overload is another important principle. *Overload* refers to the fact that a system or tissue must be exercised at a level beyond which it is accustomed for a training effect to occur. The principle of progressive overload is equally important, especially in resistance training. Introduced by DeLorme, it is the principle of gradually increasing the amount of weight lifted over time to increase muscular strength.

In addition to these two principles, one should consider several other variables when designing an exercise routine. These variables include frequency, intensity,

duration, and volume. Frequency (how often one performs a specific type of training) and duration (the length of time the exercise is performed) have a direct impact on intensity.

Intensity is defined in many ways and is different for different types of exercise. In aerobic exercise *intensity* often is defined as “a percentage of maximal heart rate.” Commonly the age-predicted maximal heart rate equation is used:

$$220 - \text{person's age} = \text{maximal heart rate}$$

The resulting maximal heart rate can then be multiplied by a desired percentage to get a target heart rate or the optimal heart rate a person should achieve for a given intensity. For instance, if a forty-year-old person wishes to exercise at 80 percent (a relatively high-intensity workout), the calculation would be as follows:

$$220 - 40 = 180 \times 0.80 = 144$$

Thus, the heart rate that this person would want to achieve and maintain for a given workout would be 144 beats per minute. The duration of this exercise bout would also affect the overall intensity.

In resistance training intensity is a function of duration, frequency, volume, order of exercise, and rest time between exercise sets. Volume is a product of the number of repetitions performed and the amount of resistance used. The order of exercise in a bout of resistance training is equally important. As a general rule, exercises that utilize larger and more numerous muscle groups should be done in the beginning of the workout. Also, these exercises require more work and increase the intensity of the workout. The amount of rest taken between sets can also affect the intensity of a workout. In addition, individual differences and training states may affect intensity. For instance, an elite marathon runner may find a bout of heavy resistance training to be high intensity, whereas an Olympic weight lifter may consider the same bout to be low intensity.

In all types of training staleness and overtraining can occur. Overtraining is a potentially serious and debilitating physical and emotional condition that can lead to

performance decrements and injury. To lower this risk, variations in training are essential.

Periodization

During the past three decades a method of training called “periodization” has evolved to ensure progressive gains and to minimize overtraining. Periodization is the changing of program variables to continually elicit performance gains. Strength athletes initially relied on the classical periodization model, also called “linear periodization.” The concept of linear periodization is attributed to the work of Eastern Bloc sports programs during the early 1950s. It came about by trial and error as coaches tried to optimize sports performance. They noticed that decreasing the volume and increasing the intensity (in this case defined as “a percentage of near-maximal effort”) during the weeks leading to a competition elevated performance.

Early periodization models were built around four phases: (1) preparation, (2) first transition (end of the preseason), (3) competition, and (4) second transition (off season). The preparation phase involved increasing strength and muscle mass. Volume was high, and intensity was low in this phase. In the first transition phase volume decreased as intensity increased, with optimizing muscular power and skill-proficiency training being the goals. The competition phase is also referred to as “peaking,” leading to the second transition or off season. The off season was spent performing activities that would aid in recovery and rehabilitation but not lead to complete detraining.

The terms *mesocycle*, *microcycle*, and *macrocycle* fit into these phases. A mesocycle is a small number of training sessions in which the goal (i.e., power) is the same. One or two weeks in any one phase would be a mesocycle. A microcycle is a run of mesocycles and is analogous with an individual phase. A macrocycle is a whole competitive season; all four phases are included in this cycle.

Linear periodization also often utilizes progressive overload within its phases. This utilization calls for gradual and linear increases in weights lifted from week

The New Value of Play

Dr. Russell H. Conwell tells a beautiful story which illustrates this close connection between play and work. A pious old Arab, who lived to the age of a hundred years, made it his duty to go to the temple every day to pray. He got there safely each morning, for, as he came out into the city, a beautiful angel took him and led him by the hand. He went forth happy each day, but always returned home sad, for every night as he left the temple there came behind him a terrible form that followed him to his house, and filled him with fear and trembling. On one certain day,—the day before his death,—as he was making his last journey from the temple, the shadow-form came up behind him, put her hand upon his shoulder, and spoke to him. The old Arab said, “I seem to recognize that voice. Yes, it is the voice of the lovely angel who guides me in the morning to prayer.” The form answered, “I am that angel who guides you every morning to prayer, and I would have guided you home every night, but you were afraid. You saw me in the morning in the light, but when you returned from the temple I was in the shadow.”

The impulses that lead men to labor are the same that must lead them to play,—a vital interest in the personal well-being, and a desire for the best rounded life, of the social organism of which they are a part.

to week. Although the basic idea that a person wants to lift more weights from week to week seems inherently correct, progressive overload, in its simple form, is not the most effective method of enhancing performance over a long period of time. Its most notable downfall is the tendency to plateau in various phases of the cycles after a few macrocycles. Periodization has evolved beyond this downfall, and more modern forms can be manipulated to meet the special needs of athletes.

During the past decade undulating periodization has replaced classical periodization. Rather than sequentially increasing or decreasing volume and intensity, undulating periodization calls for more frequent changes—on a weekly and sometimes daily basis. Recent research comparing undulating periodization to linear periodization has shown that making more frequent variations to a program elicits greater gains. Another important aspect of undulating periodization is the volume and intensity of the assistance work that a person does. Individual differences are also of consideration when designing this type of program.

Exercise Prescription

Guidelines of the American College of Sports Medicine call for twenty to sixty minutes of intermittent or continuous aerobic activity three to five times a week. Activities can include biking, running, aerobic dancing, and swimming. Intensity should reach at least 55 percent of maximal heart rate.

According to the American College of Sports Medicine, healthy adults should incorporate resistance training in their physical fitness routine at least two to three times per week. More advanced lifters should train with weights three to four times per week. A full body routine with progressive overload should be used by novices, leading to a periodized, split body (working different body parts on different days) routine as they become more advanced.

The Human Genome Project (an international research project to determine the complete sequence of the 3 billion deoxyribonucleic acid subunits, identify all human genes, and make them accessible for biological study) has led to medical and scientific advancements that were unheard of even a decade ago. Some experts speculate that the knowledge gained from this project will lead to the ability to control human physiology. This speculation has led to the possibility of genetic-engineered athletes in the future. In an effort to remain proactive, the World Anti-Doping Agency has already hosted a conference to stay abreast of potential problems that genetic engineering poses to drug-tested sports.

Careers

Sport scientists have a broad range of professional possibilities—from physical education teacher to professor and from research scientist to personal trainer. Many graduates further their education and become cardiac rehabilitation specialists, physical therapists, and physician assistants. In addition, well-trained sport nutritionists and strength and conditioning coaches are in demand.

The founders of sport science could not have comprehended the impact that their research would have on society. Although sport science as we know it today emerged within only the past sixty years, the discoveries and technological advances have been integrated into the medical community and have affected children and adults alike.

Sport Tourism

Increasingly people travel—as individuals, as families, as organizations—to watch or participate in sports. Such sport tourists may travel for holiday or business (nonholiday) reasons.

Sport tourists also may be active or passive. Active sport tourists may engage in “sports activity holidays,” during which sports are a main purpose of their trip, or

Sport-Event Tourism

In the listing below, sports marketing expert Donald Getz notes the potential benefits and goals of sport-event tourism:

- Attract high-yield visitors, especially repeaters
- Generate a favorable image for the destination
- Develop new infrastructure
- Use the media to extend the normal communications reach
- Generate increased rate of tourism growth or a higher demand plateau
- Improve the organizational, marketing, and bidding capability of the community
- Secure a financial legacy for management of new sport facilities
- Maximize the use of, and revenue for, existing facilities
- Increase community support for sport and sport-events

in “holiday sports activities,” during which sports are incidental and not the main purpose. People take two types of sports activity holidays: (1) the single-sport holiday during which people enjoy a specific sport and (2) the multiple-sport holiday during which people enjoy several sports. The two types of holiday sports activities are (1) incidental participation in organized sports (usually in groups, as in competitive beach games) and (2) private or independent sports activities (e.g., walking or playing golf).

We may further classify passive sport tourists according to how important sports are to the purpose of their trip. Connoisseur observers are extensively passively involved and discriminating in the sports they watch as spectators or officiators. Casual observers enjoy watching a sporting event and usually happen across it rather than plan their holiday around it.

Impact of Tourism on Sports

Probably as many people have learned to swim on holiday as have learned to swim in their local swimming pool. Likewise, skiing prowess (except in Alpine countries) is virtually wholly attributable to holiday experiences. Skiing, the most popular of all winter sports, is the classic example of a sport-tourism sport. Every year skiing introduces 40–50 million visitors to the European Alps, with forty thousand ski runs and twelve thousand cable ways and lifts capable of handling 1.5 million

skiers an hour. The ski market accounts for 20 percent of the total European holiday market. Tourism influences sports participation, and sports infrastructures have followed the example set by the tourism industry. For example, to complement the beach and to provide an attraction during inclement weather to extend the length of the holiday season, resorts have constructed indoor swimming pool complexes.

Impact of Sports on Tourism

The Tour de France, France’s three-week bicycle race, claims to be the world’s largest annual sports spectator event, attracting several million spectators along its 4,000-kilometer route. In Britain 2.5 million people watch outdoor sports, and another 1 million watch indoor sports while on holiday in the United Kingdom.

Research indicates that 88 percent of the 110,000 international visitors who traveled to Australia for the Sydney Olympics in 2000 returned to Sydney as tourists. Furthermore, the games were responsible for attracting an additional 1.7 million visitors, generating a \$6.1 billion economic boost, between 1997 and 2004. The Olympics advanced Australia ten years in the awareness of people in other parts of the world, meaning that the world wouldn’t have “known about” Australia until 2010 had Sydney not hosted the games.

The British Tourist Authority (BTA) reported in 1992 that 26 percent of its respondents cited sports as the

main purpose of their trip. Gibson and Yiannakis found that 22 percent of respondents considered opportunities to participate in sports important when planning a holiday.

In Belgium 27 percent of residents participate in sports during domestic holiday trips; this percentage increases to 30.4 percent for holidays abroad. Similar statistics are found elsewhere, namely in New Zealand and France. If we consider holidays in which sports are an incidental aspect instead of holidays in which sports are the main aspect, the participation rate rises to between 25 and 80 percent.

The Future

Changes in the international travel market are leading to an increasing variety of tourist types, needs, and patterns. Adventure and activity holidays are a growing segment of the tourist industry, and sports training is an important process for which tourism can be the catalyst.

Health care and body training also have created an important industry. Since the beginning tourism was promoted for its health-improving aspects. People went to seaside resorts because of the “presumed health-giving properties of sea bathing” (Urry 1990, 37). Sea bathing led to sunbathing, but the risk of skin cancer has shifted the emphasis toward a fit body that is trained through exercise and sports. Sports as therapy are another growing segment of the tourism industry, with an estimated 15 million annual visits to spas in

Europe alone, a figure that compares well with that of similar markets in the United States and Asia.

Sports as part of business hospitality are also profitable and growing, with most clients watching sports events miles from their place of work. Active sports associated with business tours are also becoming more popular.

Professional sportspeople increasingly must travel to pursue their careers. Team tours are also popular with amateur clubs who engage agents to find events and arrange accommodations and transport.

Travel agents are looking at new markets to broaden their base. At the American Society of Travel Agents World Travel Congress in Portugal in 1994, the sports sector of niche travel was recognized as a major growth market. Whatever the special interest, a company will organize a vacation around it.

Sporting Goods Industry

Cultural, political, and, especially, economic forces operating increasingly on a global scale have shaped the sporting goods industry. As sport sociologist George H. Sage (1998, 131) notes, however, contemporary sport “needs to be understood as a historical moment: today’s highly commercialised sport industry is not a cultural universal.”

The sporting goods industry encompasses sports equipment, sports apparel, and sports footwear. The United Nations Statistics Division Classifications Registry using the Standard International Trade Classification (SITC) Revision 3 (code number 894.7) defines “sports goods” mainly as equipment. This includes such articles as fishing rods and tackle, ice and roller skates, snow and water skis, surfboards and sail boards, golf equipment, tennis and badminton rackets, gloves and mitts, as well as other equipment used for physical exercise. Arguably, however, sporting goods should also include clothes and footwear designed for or that could be used in sports.

Global Sporting Goods Market

The sportswear goods industry has been especially profitable during the past twenty years because of the rise of sportswear as fashion wear. Much of the athletic wear purchased—some estimates put it at more than 50 percent—is not actually used during active sports performance.

These are my new shoes. They're good shoes. They won't make you rich like me, they won't make you rebound like me, they definitely won't make you handsome like me. They'll only make you have shoes like me. That's it. ■ CHARLES BARKLEY

Sports clothing and equipment each account for about 40 percent of the total sales of sporting goods and services. Footwear sales account for the other 20 percent. In 1999, the U.S. market for sports clothing alone was worth an estimated \$32 billion, ten times the U.K. market and nearly half of the entire worldwide market of \$70 billion (Buckley, 2000). Within the European Union in 2001, the leading countries by economic turnover of sporting goods and equipment were Germany, France, the United Kingdom, Italy, and Spain. Together, these countries represented 35 percent of global sales of sports clothing and shoes, whereas the United States had 42 percent, Asia 16 percent, and the rest of the world 7 percent (Ohl and Tribou 2004, 142). The Sporting Goods Manufacturers Association of the United States (www.sgma.com) reported that the U.S. market for sports clothing and footwear in 2003 reached \$50 billion and that in Canada, it was worth \$6.86 billion. In Canada, the largest category of sports equipment sold in 2003 was bicycles (\$780 million).

Sporting Goods Industry Organizations and Associations

Alongside national organizations such as the SGMA, the sporting goods industry has organized international trade fairs and had international organizations representing it since the late 1970s. The World Federation of the Sporting Goods Industry (WFSGI), for example, was founded in 1976 following the first World Congress of the sporting goods industry. The WFSGI is an independent association of industry suppliers, national organizations, and sporting goods industry-related businesses. The membership has reflected many of the leading brands in the sporting goods world and has included industry leaders such as Armin Dassler, Kihachiro Onitsuka, and Masato Mizuno. The International Trade Fair for Sports Equipment and Fashion, which takes place in Frankfurt, Germany, is one of the largest annual trade fairs.

Sport and the Circulation of Goods

According to historical and contemporary studies of consumption trends, the four major social influences

that have segmented the market for sporting goods are the following:

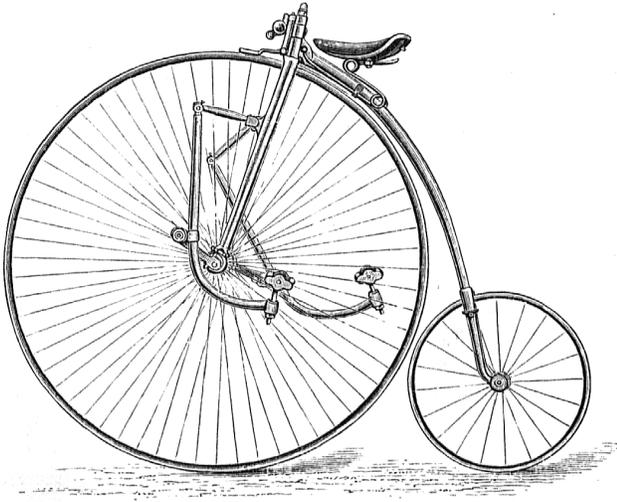

- Age
- Gender
- Place
- Social class

In the United States in 2003, for example, men spent twice as much as women did on sports footwear, and 40 percent of purchases of sports clothing were for children aged seventeen and younger.

Modern sports developed at the same time as modern consumption practices and the mass market emerged (Fraser 1981). Developments in retailing, department stores, and chains of shops were accompanied by the growth of mass circulation newspapers and magazines. Sport offered one means of stimulating consumption and offered a means of stimulating and promoting the general consumption of other goods and services. Sport became part of the “magic system” that helped promote, market, and circulate goods in capitalist economies (Williams 1980). Participants in sports have increasingly lent themselves to becoming agents of the promotion of goods and services (“endorsees”) and “media sport stars” (Whannel 2002). Sport as a mass-mediated spectacle helps sell newspapers and other channels of communication while encouraging sports enthusiasm. This in turn creates a market for the products endorsed and sometimes worn by the athletes—for example, the Michael Jordan phenomenon (LaFeber 1999).

Emergence of the Sporting Goods Industry

Where did this market come from? How did it emerge? Who buys sporting goods? The sporting goods industry arguably was “born in the USA.” The U.S. sporting economy overall was worth US\$194 billion in 2001—ahead of chemicals, electronics, and food—amounting to more than 1 percent of the value of all goods and services produced in the United States, where there are 150 major sports franchises, a dozen professional

sports tours (such as the PGA), and hundreds of other commercial sports events.

Sport can be seen as an industry with all the problems of conventional industrial relations—involving employers, workers, and consumers. Modern sport has been associated with business for a long time although the relationship has not always been a straightforward commercial one. In Britain, one hundred years ago, for example, the “entrepreneur was not attracted to sport for the profit that could be made out of it” (Mason 1988, 115). Hence, in England, (association) football clubs were limited liability companies with boards of directors and shareholders, but dividends were limited to 5 percent and directors were not paid.

- By 1895, one estimate suggests that British expenditure on sport reached £47 million per year and that investment in sports represented 3 percent of gross national product (GNP) (Mitchell & Deane 1988, 828).
- By 1912, expenditure on golf alone was £7 million, with £600,000 being spent on 7.2 million golf balls annually.
- Growth of manufacturing in golf and cycling was also partly responsible for economic recovery in areas affected by economic depression.
- In 1892, 915,856 cycles were exported, but at “the height of the cycling boom, in 1896, the figure had increased to 1,855,604” (Lowerson 1995, 226).

Other sports required imported equipment, but many middle-class people seized the new investment opportunities offered by sport: “They generated not only in-

The “Xtradordinary” bicycle.

come and capital formation but also social prestige and opportunities for local influence, so that expected gains were not always expressed in economic terms” (Lowerson 1995, 226).

Agreeing that many sport promoters in Britain were not directly in pursuit of profit, Vamplew (1988, 281–283) notes, nonetheless, that the “industrialisation of British sport can be charted as the working out of supply and demand in the market place.” In the United States, by comparison, the profit maximizers won the battle between those “who saw sport as something separate from business and those who saw no reason not to make profit from sport” (Mason 1988, 115).

Contemporary Economic Significance of Sport

One measure of the contemporary economic significance of sport is retail sporting goods sales figures. Table 1 illustrates that the consumption of sport is a preserve of the advanced capitalist countries.

Sport Market Forecasts, an annually revised publication based on research conducted at the Universities of Sheffield and Sheffield Hallam in England, draws on relevant official and independent research sources to compile a snapshot picture of sport-related consumer expenditure in Britain. Table 2 details the latest of these reviews.

The following features are most noteworthy. Spending on sporting goods in Britain amounted to £5.706 billion in 2002—more than one-third (34.6 percent) of the total spent on sport in the United Kingdom. Of this:

- Clothing and footwear amounted to almost 20 percent.
- Equipment and boats accounted for 11.5 percent.
- Walking and hiking clothing and trainers and running shoes accounted for the biggest share of sales of sports apparel and footwear.
- Golf and fitness equipment accounted for the largest share of sales of sports equipment.

Books, magazines, and newspapers are included in the category “publications,” and the SIRC report attributes a specific share of total expenditure on newspapers

to the sport market “based on the average share of sport in the total content of newspapers” (SIRC 2003, 4).

The largest sector of the sport services market was gambling, which accounted for 15.8 percent. Of this, horseracing accounts for 70 percent of all sports-related gambling. Participation sports included admission fees and subscriptions to voluntary sports clubs and public-sector sports centers and swimming pools. Health and fitness includes fees for private health and fitness clubs and has been the second most rapid growth area since the late 1990s. Together, membership fees and subscriptions accounted for 24.3 percent of service expenditure. Sports-related TV and video expenditure—including subscriptions to satellite, digital and cable TV channels—included an estimate for the sports component of the TV license fee. This has been the most rapid growth area since the late 1990s. The other category included food, drink, and accommodation associated with participation, spectating, and other forms of involvement at sport events.

The total figure of £16.488 billion was equivalent to approximately 2 percent of gross domestic product (GDP) and 2.5 percent of total consumer expenditure in the U.K.

The SIRC report noted, “Although the media has emphasised the strong growth over the recent past in professional sport, and in particular football, consumer expenditure in the sport market consists in the main of expenditures related to the consumer’s own participation in sport rather than to sport spectating” (SIRC,

2003, 4). One indicator of this is the increase in gym membership.

- During the past ten years, private companies such as Cannons, David Lloyd, Fitness First, Holmes Place, LA Fitness, and Next Generation have developed their market.
- There are now about 2,600 private clubs in addition to the public-sector leisure centers.
- Despite warnings that some health and fitness clubs were locking their members into long contracts with large cancellation penalties, 18.6 percent of the U.K. population (8.6 million people) has joined.
- Turnover for private health clubs reached £1.85 billion in 2003, an increase from £1.23 billion in 1999.

Issues and Controversies

Most sales of sporting goods occur in the developed world, yet the bulk of their manufacture is carried out in the poorer, less-developed countries for companies such as Nike, Reebok International, Adidas-Salomon, K-Swiss, and the Pentland Group. Perhaps the best way to understand the growth of the sports industry is by focusing on its global political economy (Miller et al. 2001). Sporting goods manufacturers and businesses

are increasingly transnational corporations (TNCs) based in advanced capitalist countries. They have undergone consolidation through mergers and acquisitions. Global horizontal and vertical integration has occurred. The network approach to production and subcontracting has led to several “flexible business networks” (Dicken 2003, 262–265) in the sporting goods industry. There has been a transfer of labor-intensive production to the less developed “South” or Third World. In some of these, “export-oriented industrialization” has created a New International Division of Labour (NIDL). Miller et al. (2001) suggest that in sport there is a New International Division of Cultural Labour (NICL), which occurs because developing countries provide the following:

- Lower wages and fewer worker benefits
- Fewer organized (unionized) workforces, resulting in greater management control over the labor process
- Less stringent or poorly enforced health and safety regulations
- Less stringent environmental and community health and safety regulations

Other researchers have drawn attention to the existence of “global commodity chains” in sporting goods manufacturing (Gereffi 1994). Hence, businesses such as Nike do not own production facilities, so strictly speaking, they are not manufacturers because they have no factories. Instead, they design and market the branded products they sell. The firm relies on a complex tiered network of contractors that perform all its specialized tasks. The commodity circuitry of the Nike shoe has been illustrated by Goldman and Papson (1998, 8). Many companies with well-known global brands have their headquarters in the United States, but a brief profile of the brands produced by the Pentland Group, which has its headquarters in the United Kingdom, is illustrative. The information is based on the company’s and its subsidiaries’ websites and material available from Mintel Research and *Who Owns Whom* in 2002.

Pentland is an international brand management group involved in the sports, outdoors, and fashion

markets. Founded in Liverpool in the early 1930s as the Liverpool Shoe Company, the company was floated on the London Stock exchange in 1964. It remained a public company for thirty-five years until November 1999 when it was taken back into private hands. As this is now a private company there is a paucity of information in the public domain. Although Pentland’s global headquarters are in the U.K., the group has offices in Australia, France, Germany, Hong Kong, Indonesia, Italy, Korea, the Netherlands, Taiwan, Thailand, the United States, and Vietnam. The total number of employees was 2000.

Robert Stephen Holdings Ltd., the Rubin family’s investment firm, owns Pentland. The chair of the company is R. Stephen Rubin, the CEO is his son Andrew K. Rubin, and the other director is R. S. Rubin’s wife, Angela. R. S. Rubin has been president of the WFSGI. In 1998, the last year before it went private, the company reported group turnover in excess of £500 million. The Pentland group owns several international sports, outdoor, and fashion brands, including Speedo, Mitre, Ellesse, Kickers (a 50 percent joint venture), Berghaus, Brasher, Kangaroos, Ted Baker, Grazia, and Red or Dead. Pentland also holds licenses from other brand owners, including a worldwide license for Lacoste footwear. In the late 1980s, Pentland also owned a 37 percent stake in Reebok. Pentland supplies private label footwear and clothing to well-known national and international retailers. Speedo is the clear market leader in branded swimwear with a 10 percent share of the market and a 75 percent share of performance swimwear. The group’s brands are sold directly by companies or licensees and distributors in more than 120 countries.

Corporate Social Responsibility

Sports participants in the richer countries rely on the manufacturing, distribution, and circulation of goods from a global sports industry whose key characteristics, researchers suggest, are sweatshops, high profit margins, and the exploitation of vulnerable groups of workers. Researchers argue that the great excesses of

capitalist commodification are just as likely to be found in sporting goods manufacture as anywhere else.

The following illustrations show the circumstances and practices that lead to calls for greater corporate social responsibility among sporting goods industry firms:

- Rawlings Sporting Goods Co. of St. Louis, Missouri, produces baseballs for the Major League Baseball. In 1953, Rawlings has moved manufacturing from St. Louis to Licking, Missouri (a non-union plant). In 1964, it moved to Puerto Rico (exploiting a tax “holiday” for inward investment). In 1969, it moved to Haiti (the poorest country in the Western hemisphere, where strikes were illegal). In 1990, it moved to Costa Rica where the factory sewers stitched 30–35 balls a day for US\$5–6 and pieceworkers at home earned 15 cents a ball (Sage 1998, 272).
- In 1995, research conducted for Christian Aid found the following in Nike and Reebok factories in Asia:
 - Two-thirds were women under the age of 25.
 - Typical workers in Indonesian plants were paid 19 cents an hour for 10-and-a-half-hour days, six days a week, and forced overtime.
 - The monthly wage was 30 percent less than that required to meet “minimum physical needs.” Hence, a pair of trainers that sold for £50 in the U.K. was made in a production process involving 40 workers who were paid a total of £1 between them. The Nike Air Pegasus, which sold for \$70 in the United States, incurred labor costs of \$1.66.
- In 2000, the India Committee of the Netherlands (ICN) published *The Dark Side of Football—Child and Adult Labour in India’s Football Industry and the Role of FIFA*. The report showed that agreements about labor rights reached between Fédération Internationale de Football (FIFA), the world governing body for association football, and the football manufacturing companies who placed FIFA logos on their balls, were often violated.
- In 2004, an Oxfam report, *Play Fair at the Olympics*, also revealed details of poor working conditions in

factories run by the U.K.-based company Umbro producing sportswear, including excessive working hours and poor wages.

Hence, concerns including child and labor rights, gender divisions, freedom of association, health and safety, the monitoring of conditions, and rehabilitation of those affected by the practices of some of the manufacturers has led to a backlash against some of the best-known sports brands.

Sports Medicine

Today most elite athletes are provided with the assistance of physicians, physiologists, nutritionists, biomechanists, psychologists, and other medical and scientific experts in order to improve their performance. Athletes, physicians, and scientists have worked with one another both formally and informally for more than a century, and the history of sports medicine goes back even farther.

The medical aspects of sport are founded on scientific research. One of the critical concerns in sports medicine, however, is how quickly new scientific results reach the practitioner. In fact, an even greater worry is whether or not the practitioner is utilizing newer results at all. Early trainers in sport often based their methods and practices on traditions passed down from trainers before them. However, over the past several decades, sports medicine has become increasingly tied to its scientific foundations. This should ensure that the latest research findings quickly reach the coach and athlete.

History

The history of sports medicine goes back at least as far as the ancient Greeks; many would argue that it goes back even farther to ideas passed down from the Ayurveda in India on exercise and massage between 1000 and 800 BCE. In China ideas about the “Five Elements [Wuxing],” from approximately the second and third century CE, were connected with many phases of life, including the organs of the human body. Acupuncture was practiced as early as the Han Dynasty (202 BCE–220 CE) to treat symptoms of disease.

A traditional starting point in the Western world is Hippocrates of Cos (c. 460–370 BCE), who is often called the “father of scientific medicine.” Hippocrates’s work focused on the four humors—blood, yellow bile, black bile, phlegm—and the necessity of creating balance among the four in order to achieve health. There were few drugs during this era, and treatments typically consisted of massage, bloodletting, or hydrotherapy.

INFLUENCE OF GALEN

The next great figure in the history of sports medicine is Galen of Pergamon (c. 129–210 CE), who became a physician to emperors and gladiators. His important work, *De Sanitate Tuenda* [*On Hygiene*], analyzed the notion of the naturals versus the nonnaturals (he also discussed the contranaturals). The naturals were “of nature” while the nonnaturals were those things that were not innate and thus could be manipulated in order to create health. These nonnaturals included air, food/drink, motion/rest, sleep/wake, excretion/retention, and the passions of the mind. Galenic theories borrowed heavily from Hippocrates, especially the notion that there was a need for balance in the bodily system. Exercise was a way of creating this balance.

Galenic theory continued to influence thought on health and hygiene well into the medieval and Renaissance period. The early Renaissance (twelfth century) focused on the recovery of the writings and knowledge of the ancients. This included both literary and scientific work. The later Renaissance (fifteenth and sixteenth centuries) was not only the rebirth of ancient knowledge but also an examination of ancient knowledge in a new context.

A variety of scholars began to investigate the concept of hygiene in the mid-sixteenth century. Thomas Elyot’s (1490–1546) *The Castel of Healthe* (c. 1539), Cristobal Mendez’s (1500–1561) *Libro del Exercicio Corporal* [*Book of Bodily Exercise*] (1553), Girolamo Cardano’s (1501–1576) *De Sanitate Tuenda* [*Care of Health*] (1560), and Hieronymus Mercurialis’s (1530–1606) *De Arte Gymnastica Aput Ancients* [*The Art of Gymnastics Among the Ancients*] (1569) all set forth Galenic theories as the foundation for their ideas about exercise and health.

MOVEMENT AWAY FROM GALENIC THEORY

Vesalius’s (1514–1564) *De Humani Corpori Fabrica* [*On the Fabric of the Human Body*] (1543) created a fundamentally new way of teaching anatomy. For Vesalius, the cadaver was a source of information about the body. Despite the fact that he found several hundred

A leg in a brace shortly after knee surgery, a very common sports medicine procedure.

Source: istockphoto/kcopperhead.

inconsistencies with Galenic theory, he was not interested in setting aside Galenic notions; in particular he continued to support Galenic physiology.

William Harvey (1575–1657), however, brought about a revolution. Although he did not make many discoveries, he did serve as a catalyst

for change in the overall view of Galenic theory. The significance of Harvey's *De Moto Cordis* [*The Motion of the Heart*] (1628) is that it substituted one way of thinking for another. These were not Harvey's ideas; many were from his precursors. However, the entire nature of physiological research after Harvey was transformed. Harvey moved the focus in physiology from the liver, which had been the central organ for Galen, to a new focus on the circulatory system.

HYGIENIC AND MEDICAL ASPECTS

The 1700s and 1800s saw an increase in awareness in the hygienic and medical aspects of sport through two basic avenues. First there was rising interest in somewhat more formalized sport and thus some concern about the training of athletes. In addition there was growing interest in the use of gymnastic exercise for therapeutic reasons. John Sinclair's *Code of Health and Longevity* (1807), which was based substantially on the work of the ancients, provided information about training regimens during this time, particularly for boxing and pedestrianism. A diet heavy in red meat, which most resembled the muscle that it was supposed to build, and other training ideas based substantially on creating a balance in Galenic humoral theory through sweating, purging, and vomiting were the centerpiece of this work.

The gymnastics systems emerging in Europe, in particular the Swedish system of Per Henrik Ling, had a

great deal of influence on medical and therapeutic attitudes toward exercise. Swedish medical gymnastics would serve as the foundation for a great deal of sports medicine, including physical and occupational therapy and athletic training.

It appears that George Taylor was among the first to bring Per Henrik Ling's system to America in the 1850s. Hartvig Nissen published his work in *Practical Massage and Corrective Exercises with Applied Anatomy* (1889). Other important texts on Swedish gymnastics included Baron Nils Posse's *Handbook of School Gymnastics and the Swedish System* (1891), Anders Wide's *Handbook of Medical Gymnastics* (1899), and William Skarstrom's *Gymnastic Kinesiology* (1909), which first appeared as a series in the *American Physical Education Review* in 1908–1909. Widely practiced in physical education in Europe and America in the late nineteenth and early twentieth centuries, Swedish gymnastics clearly is the basis for many of the allied health fields.

BRINGING TOGETHER SCIENCE, MEDICINE, AND ATHLETICS

By the middle decades of the 1800s a number of works emerged that attempted to look at the connections among science, medicine, and athletics. Scotsman Archibald McClaren published *Training in Theory and Practice* in 1866. In this work he applied his medical training and his knowledge of gymnastics and exercise to the emerging field of athletic training. By the early

1900s training manuals appeared, including those from Michael C. Murphy and S. E. Bilik, whose *Trainer's Bible*, first published in 1917, went through numerous editions. R. Tait McKenzie brought together medical and athletic knowledge in his 1909 work *Exercise in Education and Medicine*.

Sports medicine in Germany was more organized than in many places including the first official sport Physician Congress in 1912. The interest of German physicians in sports medicine set the groundwork for the first meeting of FIMS (Federation Internationale de Médecine Sportive) at the II Olympic Winter Games held in St. Moritz [it was at first called Association Internationale Medico-Sportive (AIMS); the name was changed to FIMS in 1934]. A number of similar organizations were formed throughout the world in the twentieth century that focused on the topic of sports medicine, including the American College of Sports Medicine, founded in 1954.

The connection between the International Olympic Committee (IOC) and FIMS continued to grow, and FIMS was “officially recognized” by the IOC at its meeting in Oslo in 1952. The 1960 Olympic Games in Rome had a Medical and Scientific Committee that established a complete scientific study of the athletes taking part in the Games, and the Tokyo Games of 1964 included an International Congress of Sport Sciences. Doping was one of the major scientific/medical problems that confronted the IOC in the early 1960s. The suspicious death of a Danish cyclist during the 1960 Rome Olympics led the IOC to take action, and they created a Medical Commission that by 1968 would begin drug testing of Olympic competitors.

Sex testing (or gender verification) was another scientific/medical problem that emerged in the 1960s. Although it took nearly 30 years, scientists and physicians who had protested the testing since its inception finally made inroads with the major sport organizations. By 1992, the International Association of Athletics Federations (IAAF) had dropped genetic testing for female athletes. The IOC, however, moved at a much more deliberate pace. In 1992 they dropped the “buc-

cal smear” chromosome test in favor of polymerase chain reaction (PCR) testing. In 1999 the IOC provisionally withdrew all sex testing beginning with the 2000 Games in Sydney. However, the IOC has not ended sex testing, because if anyone questions a competitor, tests will be conducted by what the IOC calls “appropriate medical personnel.” It is important to note that not one male posing as a female competitor has been detected since sex testing began in 1968.

Contemporary Issues in Sports Medicine

Athletes in Galen's time could never have predicted the issues on which sports medicine needs to focus in the twenty-first century. Injury prevention, environmental factors such as heat stroke and so-called “oxygen debt,” and new and increasingly difficult-to-detect performance-enhancing drugs are just a few of the thorny problems that sports medicine will be grappling with in the future.

SPORTS INJURIES

Injury prevention, as a topic of inquiry, is slowly beginning to come to the forefront. Athletes, coaches, and researchers understand the potential benefit of preventing injury rather than rehabilitating it; however, little research has been conducted up to now in this area. Recent studies have looked at the beneficial impact of equipment such as facial protection in hockey and helmet use in pole vaulting and cycling.

Although all injury in sport is potentially serious, injuries to the head, neck, and spine are considered to be the most significant. Thus, a great deal of research is concerned with preventing such injuries and treating and rehabilitating athletes with head, neck, and spine injuries. Recently, such research has focused on the issue of concussions in sport. This includes work on prevention of concussion via specialized equipment, the need for better diagnosis following injury, the impact of multiple concussions on an athlete, and the legal implications of allowing an athlete to return to competition following the concussion. Low back pain is another issue that is common to a variety of sports. Managing

low back pain has become another topic of research interest. Topics studied in this subfield include warmup exercises, joint manipulation, and dynamic stability exercises.

Treatment for sports injury no longer is isolated to full open surgery. Increasingly, athletes opt for arthroscopic surgery when possible and thus are able to begin rehabilitation much more quickly and return to competition much faster than ever before. Thus injuries to shoulders, elbows, knees, and other joints do not necessarily end an athlete's season.

After joint injuries, muscle and tendon injuries are the next critical issue in sports medicine. Sudden tears and, increasingly, overuse injuries are commonplace. Magnetic resonance imaging (MRI) has become a useful tool in evaluating musculoskeletal injuries. A better understanding of biomechanical and mechanical principles is giving us an enhanced understanding of how to better evaluate and improve performance. In addition, mechanics are contributing to the understanding of injury rehabilitation. Rehabilitation from injury increasingly includes active exercise.

ENVIRONMENTAL FACTORS

Altitude, heat, and pollution are all potential threats to athletes. The problems of altitude were exposed to the public as a result of the selection of Mexico City as the site of the XIX Olympiad. The greatest concern expressed by distance runners was that their bodies would not be able to overcome what they called the "oxygen debt" imposed by running at such a high altitude. The term *oxygen debt* was introduced in 1925 by the distinguished British Nobel Prize-winning physiologist A. V. Hill. As with many scientific and medical terms, use of the term oxygen debt has had a long duration, even as research has provided more appropriate terms.

Altitude continues to be a topic of interest in sports medicine. Today, scientists believe that high altitude has a definite impact on performance, particularly on events after the return to sea level by altitude-trained athletes. When an athlete lives and trains at high altitude for an extended period of time, the body adapts in a number

of ways; most importantly for the elite athlete is the increased production of red blood cells. This allows the blood to carry oxygen more effectively, and it should lead to an improvement in performance. Technological sophistication entered the equation many years ago with the practice of blood doping and the production of drugs such as erythropoietin that increase the red-blood-cell count. In addition, as the latest theories now argue that the athlete should perhaps "live high and train low," there have been a number of products developed that allow competitors to simulate different altitudes via breathing apparatus or in specially constructed tents and chambers.

Heat-related illness, particularly sudden onset, is a serious problem in sport. Concerns have also developed that an individual who has had one occurrence of a heat-related illness is more likely to have successive episodes. There have, unfortunately, been numerous examples of athletes dying suddenly during a variety of sports, particularly in American football, but also in wrestling and soccer. Keeping athletes adequately hydrated and having them avoid dietary supplements that may exacerbate dehydration is of key importance. An additional environmental factor that impacts performance is pollution, although limited research is conducted in this area compared to the other two factors.

DRUGS AND SPORT

There is no foreseeable end in sight to the use of performance-enhancing drugs in sport. Doping continues despite the increasingly sophisticated detection techniques created by physicians and scientists. The Worldwide Anti-Doping Agency (WADA) attempts to control the doping problem within sport, but despite the support of most of the elite sport world is successful in only a limited way. New drugs are developed and are virtually impossible to detect. These new drugs are added to the list of banned substances as quickly as possible, but the rapidity with which they are created and distributed makes drug testing a seemingly Sisyphean task. The favorite doping methods of only a few years ago, such as nandrolone and EPO, are

Naming Sports Injuries

As sports increased in popularity during the late nineteenth century, critics began to question the effects of sports on participants. The following account reveals the concerns of doctors regarding this new class of injuries.

Mr. Charles Richards Dodge, in the February *Outing*, refers to the subject of the “pathology of Recreative Sports,” . . . based evidently upon articles which I contributed to the *Medical Record* and to *Science* of November last, . . .

The “lawn-tennis arm” and “lawn-tennis leg” are accidents peculiar to tennis, and having a special train of symptoms. Therefore, we give them special names for purposes of convenience. We physicians do not create the disease, but simply name it, in which there certainly can be no harm. I must add, that, since my articles have been written, another tennis injury has been noted. It is called “lawn-tennis back.” In boys who begin to play tennis early, and keep up the

game continuously, there is sometimes observed a peculiar overgrowth of the muscles of the back on the right side. This causes loss of straightness and symmetry to the spinal column, amounting almost to deformity. It is, I believe, a rare condition. Mr. Dodge suggests a medical nomenclature with which to portray the injuries and idiosyncrasies of bicycle riders. There has already been one cycle-disease noted. In boys who ride much upon bicycles the continual pressure of the saddle upon the perinaeum sometimes causes irritation of the urinary passage and neighboring organs. Even a stricture may be developed, in this way, it is alleged. I believe this injury to be extremely rare, and am so far from being an alarmist, that I would freely permit young patients to ride bicycles as much, perhaps, as they wished. But it is always wise to know about possible dangers. . . .

quickly replaced by designer steroids like THG. Concern is also raised because not only does doping create an uneven playing field in the world of sport, but it can potentially create and exacerbate health problems in training and competition.

Women, Children, Older Adults

The basic research in sports medicine continues to focus on the elite male athlete, while women are categorized as different—as are children, older adults, people with disabilities, and people of color. As all of these groups are treated as special, there appears to be less research conducted on these groups and their medical issues within the world of sport. However, women do receive considerably more attention than all of the others and far more than they did only two to three decades ago. A variety of recent studies have looked at the decline in the level of physical activity among girls as they enter adolescence. In addition, researchers are also looking at the issue of bone loss in young girls in an effort to bet-

ter understand the effect of exercise on bone mass in females throughout their lifespan.

A series of studies have focused on the fact that females in some sport activities are three to four times more likely to have an ACL (anterior cruciate ligament) injury than male athletes. Much of the research on this topic has examined the differences in the “Q-angle” (the direction of the quadriceps muscle force during a concentric contraction) between males and females. A number of researchers argue that ensuring the development of safer movement patterns among female athletes will potentially lead to a reduction in these types of injuries.

Of particular concern among young children is the effect of activities such as weight training, competition-modified diets, and certain types of physical activities such as pitching mechanics or high-impact training. Although some forms of impact training are crucial in the development of optimal bone density, caution must be exercised to not cause injury. There is still a great deal of research that supports the contention that children between the ages of nine and fourteen should not be

taught certain sport activities such as how to throw a curveball or a slider in baseball.

Over the past four decades, exercise has been utilized increasingly as a mode of recovery from coronary heart disease (CHD). Research is ongoing into the type and amount of aerobic exercise needed to be effective in cardiac rehabilitation. Additionally, there have been an increasing number of studies on the effect of training on the cardiovascular health of older women. Recent studies in older adults have focused particularly on the issue of gait function, a key issue in helping to keep the elderly active, mobile, and injury free. A number of researchers have concluded that strength and endurance training do have beneficial effects on older adults.

Encouraging Physically Inactive People to Exercise

The vast majority of work in sports medicine has been devoted to elite athletes. However, today there is greater interest in the experiences of everyday people; in particular, there are grave concerns about the high levels of sedentary behavior among the general public. Thus, a number of researchers are trying to better understand the type, amount, duration, and intensity of aerobic exercise that the public needs in order to not only reduce weight but also to improve cardiovascular functioning. A variety of researchers are struggling with the issue of how to get the public to adhere to some sort of exercise program. This is not only a sport-medicine issue but a public-health issue as well. In addition, increased physical activity will lead to a potential reduction in the incidence of cardiovascular disease and adult-onset diabetes.

Sportsmanship

Fair play in sport, more commonly referred to as sportsmanship, is demonstrated through ethical conduct by athletes during competition and a positive attitude toward the game by players, officials, and

Pro football is like nuclear warfare. There are no winners, only survivors. ■ FRANK GIFFORD

spectators. Advocates of sportsmanship consider the game worth playing only if all athletes have equal opportunity to win, if they use only their physical or strategic prowess to overcome their opponents, if they treat others as they would like to be treated, and if they refuse to accept a tainted victory. Many sportsmanlike behaviors have been abandoned of late, including congratulating opponents after defeat, personally checking on injured players, thanking referees for a job well done, refraining from use of profanity, and shaking hands, smiling, and moving on when the game is over, regardless of the score.

Sportsmanship ideals can be extended from individual in-game behaviors to the behaviors of sports organizations. Are uniforms made in compliance with labor and human rights standards? Is the game available for all people to play regardless of classes, gender, age, sexual orientation, or race? Does the organization respond to the personal needs of the athletes and fans and reward or promote respect for self, others, and the game? All of these aspects of sportsmanship should be taken into consideration.

Sports Construct Ethical Character

A broadly held assumption is that participation in competitive games prepares athletes for success in a cutthroat society. Athletes may learn to strive for excellence, persevere, sacrifice, follow orders, be selfless, work with others, and to be fair. With this assumption sports have gained a prominent place in school and community programs, and both amateur and professional sports are usually well supported by the media. D. Stanley Eitzen (1999) recounts many examples of outstanding ethical behavior on the part of coaches and athletes. For instance, a month or so after Rockdale County (Georgia) won the state basketball championship in 1987, the coach, Cleveland Stroud, found that he had unknowingly used an ineligible player in a game. Although the player in question was in the game only a minute or two and had not scored, Stroud notified the authorities of the infraction. As a result, the school forfeited the only state championship it had ever won. In a similar vein Andy Herr of Bloomington, In-

diana, chose to hold up and finish second in a 10-kilometer race in Toledo (Ohio), because the leader had accidentally taken a wrong turn. In these examples sports competitors showed respect for each other and for the game when they strictly adhered to rules set out by governing bodies, no matter how minor, in an attempt to maintain a "level playing field." They acted as role models for many, teaching that a tainted victory is no victory at all.

The essence of sports is competition governed by specific rules that structure and define the practice. Rules are designed to place constraints and conditions upon the competition in order to make success more difficult to achieve. Therefore, in order to "win" in a sport, a competitor must adhere to an illogical framework. In European handball players are restricted to carrying the ball a maximum of three steps before they must bounce or pass it. Slalom skiers are required to cross with both skis the imaginary line between the two poles of every gate of the slalom course. These strict rules demarcate sports from other activities and present a challenge to competitors.

Historically, in sports that have maintained much of their amateur credo (i.e., golf, baseball, tennis, and cricket) an emphasis on fairness, recreation, and personal challenge has prevailed. Although these sports can be played at a highly competitive level and for considerably large purses at the professional level, scandals involving unethical behavior by athletes in these sports are rare in comparison with scandals in sports that are driven by the tenets of professionalism, and in particular those sports that highlight physical strength and physical domination over opponents. In sports such as association football and gridiron football, ice hockey, rugby, and basketball, the goal of gaining an advantage over rivals has prevailed, and in many cases a spirit of fair play and a respect for rules and personal well-being have been forsaken.

Sports Deconstruct Ethical Character

According to Beller and Stoll (1993), although sports do build character if *character* is defined as "loyalty, dedication, sacrifice, and teamwork," they do not build

Hunting is not a sport. In a sport, both sides should know they're in the game. ■ PAUL RODRIGUEZ

character if *character* is defined as “honesty, responsibility, and justice.” All levels of all sports, from youth leagues to professional ranks, are becoming more and more “professional,” with children as young as six years old adopting a “no place for second place” attitude. As the salaries and status associated with winning have increased, some athletes, coaches, and even spectators have accepted a “winning-at-all-costs” philosophy, which has led to the dehumanization of athletes and their alienation from their bodies and competitors. Under these conditions we should not be surprised that research reveals consistently that sports stifle moral reasoning and moral development.

When coaches, athletes, and fans corrupt the ideals of sportsmanship in their zeal to succeed, they are likely to employ or condone similar tactics outside sports. They might accept the necessity of dirty tricks in politics or misleading advertising in business because the overall goal is to win even if winning requires moving outside the established rules. Rule violations that serve efficiency and team interests are widely accepted in many sports; however, problems arise when both teams have not consented to certain “interpretations” of the rules. The negative values learned in sports may include selfishness, envy, conceit, greed, hostility, and brutality. Athletes cheat, use profanity, performance-enhancing drugs, and violence to gain a competitive edge and see these unfair tactics as “strategy” rather than cheating.

Cheating in Sports

Some illegal acts have become so commonplace that they are now accepted as part of the game. In basketball, hockey, and association football, for example, a player commonly pretends to be fouled or injured in order to receive an unmerited free throw, power play, or penalty kick with a relatively high certainty of scoring. In fact, these “penalties” are built into the structure of the game, and the concept of no contact, which is in fact, written into the rules, is completely ignored. Pitchers in baseball sometimes achieve an illegal advantage by scuffing the ball or by putting a foreign substance (i.e., saliva or Vaseline) on it so that it drops suddenly when pitched.

Batters, such as Billy Hatcher of the Houston Astros in 1987, Wilton Guerrero of the Los Angeles Dodgers in 1997, and Sammy Sosa of the Chicago Cubs in 2003, countered by illegally corking their bats in order to hit the ball farther. On 3 June 2003, Sosa, known for hitting explosive home runs, grounded out but knocked in a run, breaking his bat on impact. The home plate umpire discovered the cork in Sosa’s bat, and Sosa was subsequently ejected from the game. Although Sosa denied the intentional use of an illegal bat, he and all players caught cheating instantly cast doubt on their entire prior sporting success.

Profanity in Sports

Profanity is creeping into youth sports as a result of the antics of professional athletes in televised sports. The media continue to show adults out of control because to do so increases ratings. Television close-ups display college athletes and coaches mouthing obscenities in reaction to an official’s call. Cameras zoom in on athletes who lose their cool and provide intense interviews liberally interspersed with “bleeps.” Coaches who release streams of four-letter words to anyone within earshot are guaranteed to be featured in prime time. Bobby Knight, formerly of Indiana University, is the most infamous coach known for verbally abusing officials and his own players, throwing chairs, and even kicking his own son. Equally loved and hated by many, Knight was known for his vulgarities and his winning record. He acted as a role model to athletes and other coaches alike. Unbridled profanity can also be found in car racing. In 2004, National Association for Stock Car Auto Racing (NASCAR) president Mike Helton threatened to fine drivers and crewmen for “inappropriate” language and issued stern warnings for drivers to watch their mouths.

Performance-Enhancing Drugs in Sports

The history of athletes using drugs to enhance their endurance, power, or strength is a long one, dating back to the Greek athletes who raised their testosterone levels

by eating sheep testicles during the ancient Olympic Games. British cyclist Tommy Simpson died on a hill climb of Mont Ventoux during the 1967 Tour de France. A vial containing an amphetamine was found on his body. In 1988 Canadian sprinter Ben Johnson tested positive for anabolic steroid use after winning the Seoul, South Korea Olympics men's 100-meter race. His medal was revoked, and subsequently the International Amateur Athletics Federation banned him from competition for life. Despite the fact that drugs are illegal and cause harmful side effects, elite athletes in many sports, in particular sprinting, weightlifting, bodybuilding, and weight throwing (shot put, discus, hammer, javelin), are almost required to take steroids if they want to be successful and meet international standards.

Violence in Sports

Violence has become a prevalent feature of contemporary sports, both in its instrumental and hostile forms. Instrumental violence helps an athlete to achieve the goal of winning a competition. Sports are one of the few settings in which acts of aggression are not only tolerated, but also enthusiastically applauded and even required from athletes. Hostile violence is intentionally harming another person, whether that person is a player, referee, or spectator, and its incidence is on the rise. In the past National Football League coaches (contrary to league rules) gave monetary awards each week to players who hit their opponents the hardest, and at least one, Kansas City Chiefs coach Marty Schottenheimer, offered to pay off any fines his team incurred for breaking the jaws of opponents or knocking down adversaries. This emphasis on intimidating violence is almost universal among gridiron football, rugby, and hockey coaches, players, and fans. The objective is not just to hit but to punish and even to injure. Sociologist Michael Smith has argued that violence in hockey, as in war, is a socially rewarded behavior. The players (and fans) are convinced that aggression (body checking, intimidation, and the like) is vital to winning.

Spectators have been known to assault opposing spectators and players. In 2000 Los Angeles Dodger

backup catcher Chad Kreuter was sitting in the bullpen when a fan hit him in the head and stole his cap. Kreuter and several other Dodgers went into the stands, and a mob scene ensued. Sixteen players and three coaches were given suspensions. The most notorious cases of fan violence have occurred in European football. In 1909 a riot that even today would warrant headlines internationally broke out in Scotland after officials declined the fans' demand for extra-play time to settle a draw between Glasgow and Celtic. The riot involved six thousand spectators and resulted in injury to fifty-four policemen, serious damage to the grounds and emergency equipment, and the destruction of virtually every street lamp in the area. At Euro 2000 Brussels police arrested 850 fans during a street riot that erupted before a match between England and Germany. Fans of both nations began with chanting and taunting before throwing chairs and beer bottles at each other in the city's main square. Riot police armed with a water canon eventually quelled the violence; however, European fans continue to bring the sport of association football into disrepute.

Lacking Ethics at the Organizational Level

Immorality is not a matter of just breaking or bending the rules—the rules themselves may be unfair or even immoral. Powerful organizations such as the National Collegiate Athletic Association (NCAA) and the International Olympic Committee (IOC) have denied equality to women and have exploited athletes. During the 1960s the National Organization for Women (NOW) gathered data at the national and local levels on discrimination against girls and women in neighborhood and school sports. Armed with this data, the organization lobbied Congress, which ultimately passed Title IX, the 1972 education amendment that prohibits discrimination against women in U.S. federally funded education programs. Until that time, compared with men's sports, women's sports received less funding, fewer scholarships were awarded to women athletes, women had fewer opportunities to play, and coaches of

Some critics of hunting do not consider it very sportsmanlike because the animals do not know they are part of the competition.

women's teams received lower salaries. Although much progress has been made, more than thirty years later gender equity has not been reached. The NCAA has not effectively implemented the law and continues to uphold rules that exploit athletes.

NCAA regulations require that athletes commit to a four-year agreement with a school, yet schools make only a year-by-year commitment to athletes. This fact means that athletes can lose scholarships at the whim of their coaches, yet they cannot move to another school without sitting out a year. Meanwhile, coaches who break their contracts can coach immediately at another school. Coaches have physically assaulted and publicly belittled their players, but if their teams win, they are rewarded handsomely. "Big-time" college sports in the United States have corrupted academe by engaging in recruiting violations, waiving academic requirements, and actually preventing student-athletes from studying and attending classes. As more schools are seduced by the potential profits (several million dollars in revenue) from successful intercollegiate competition, they are treating athletes more and more as investment capital; many have forgotten that college athletes have been promised an education in exchange for their sports participation. Intercollegiate sports have become big business; athletic programs seek to remain competitive to maximize profits

and not only deny athletes access to an education, but also increasingly pervert the educational value of sports.

The emphasis on sportsmanship by the leaders of the IOC tends to be nullified by questionable practices condoned by administrators. During the 1990s eleven International Olympic Committee members resigned or were expelled as a result of scandals over vote buying. IOC members demanded bribes of up to one million dollars from cities bidding to host the games. Marc Hodler, a member of the International Olympic Committee executive board at the time, claimed abuses in voting occurred for the 1996 Atlanta games and the 2000 Sydney games before unscrupulous IOC mem-

bers were caught taking cash bribes, medical expenses, travel expenses, gifts, entertainment, and college tuition payments for their children during Salt Lake City's successful 2002 Winter Olympics bid. During this same era, while other international sports organizations such as the International Amateur Athletics Federation were eliminating gender testing, the IOC continued to require all women competitors to "prove" their femininity, much to the chagrin of many women Olympians.

Returning to Ethical Sports Behavior

The Federation Internationale de Football Association (FIFA), the world governing body for soccer, has recognized that the world's top teams and players have a responsibility as role models for young people taking up the game and fans in the stands. FIFA now obliges all players in the World Cup finals and other FIFA events to sign a "fair play declaration." The number of occurrences bringing football into disrepute in European countries has been reduced as a result of close cooperation with the respective authorities and strict guidelines for match organization and "no standing room" stadium design. As well as rewarding its various world champion teams with cups and diplomas, FIFA also recognizes special acts of fair play by presenting individual and team FIFA Fair Play Trophies.

The Citizenship Through Sports Alliance (CTSA) is the largest coalition of professional and amateur athletics organizations in the United States concerned with character in sports. CTSA promotes sportsmanship at all levels of sports to reinforce the positive values that sports can teach. Since 1997 CTSA has been building a sports culture that encourages respect for self, others, and the game. Fair Play for Children (FPC), an international organization based in the United Kingdom, promotes every child's right to play with fair attitudes and activities worldwide. The United Nations has declared that every child has a right to engage in age-appropriate play and recreational activities, and FPC works to ensure that each child has equal opportunity for full participation, free

from discrimination, brutal training tactics, and cut-throat competition.

The Future of Fair Play

It has been said that unless we remind ourselves of the essentials of sportsmanship it will gradually fade, as have other traditional societal values. To return to a more ethical sporting ethos (distinguishing character, moral nature, or principled guiding beliefs), what is most important is the change that fans can bring about. Sports fans pay the costs of big-time college and professional sports, spending \$100 billion a year on sports equipment, memorabilia, tickets, and the like. If enough fans withdrew their financial support of professional sports in protest, refusing to forgive and forget the irresponsible behavior of players, coaches, and owners, meaningful improvements might occur. Sports enthusiasts may also work within the system, volunteering to coach youth sports teams or serve on the board of directors of a sports league. Teachers and professors can become coaches, move into athletic administration, or serve on athletic committees. As people become insiders and move into positions of increasing power, they must fight against the status quo.

Thousands of games are played worldwide every day without incident. Players and fans act appropriately, coaches and referees behave beyond reproach. Unfortunately, incidents of immoral behavior are more likely to make headlines, and professional athletes are always on display. The problems in sports are not solely the result of "a few bad apples." Society demands that athletes remain drug free and, at the same time, honors only those athletes who win and break records. For those who triumph, the rewards for them (and perhaps their families and their coaches) are substantial, so instead of privileging sportsmanship, winning at any price has become the prevailing code of conduct. Sports psychologist Charles Banham put it simply: "Good sportsmanship may be a product of sport, but so is bad sportsmanship." Examining issues such as trash talking, cheating, flagrant fouls, doping and athletes as role

models will provide coaches and educators with effective tools for promoting sportsmanship.

Sportswriting and Reporting

In the worldwide development and acceptance of sports, few institutions have played a more important role than the sporting press. In fact, the growth of newspapers in the nineteenth century coincided with the growth of modern sports, and although until the last decade of that century the sporting press existed and flourished somewhere beyond the pale of standard journalism, the traditional functions of the press applied to sportswriting and continue to do so. Journalism supplies information to the reading public and builds community; journalism sets an agenda for public discourse; and journalism serves as a social watchdog. These basic functions, some more powerful than others at different historical periods, shaped the development of sportswriting. As Stanley Walker of the *New York Herald Tribune* noted about sportswriters in *City Editor*: “[T]he best ones know that the test of good sports reporting is not substantially different from that of all other good reporting” (1934, 133). Walker and others agree that the history of

sportswriting is a record of sports reporters sometimes failing and sometimes passing the test of good journalism.

The Father of All Sportswriters

Beginning in 1787 and continuing until 1824, England became enamored of sports, especially bare-knuckle prize fighting. In 1810 and again in 1811, the British champion Tom Cribb fought and defeated a freed American slave named Tom Molineaux, and although the fights were illegal and had to be held in the country to evade the authorities, crowds of approximately five thousand attended the fights and countless others awaited news of the outcomes in London and other cities. The followers of sports, all sports, were known as “The Fancy,” a subculture of males from all walks of society who gathered in taverns and who were enthusiastic about athletic contests. The man who supplied this subculture with information and thereby established a sense of a sporting community was Pierce Egan. Egan was born in Ireland in 1772, and he died in England in 1849. During the course of his journalism career, Egan became “the greatest writer about the ring who ever lived,” according to A. J. Liebling, who considered his collection of boxing stories, *The Sweet Science*, to be an extension of Egan’s work (Liebling 1956, 8, 12). In 1813 Egan published *Boxiana*, a book that can be regarded as a guide for both the novice and more experienced member of the Fancy who sought to learn more about the history and current state of the prize ring. Egan educated the public on the slang of the ring and other sports, but his particular genius and his claim to an influential role in the popularization of sports are based on the fact he was the first to recognize that an audience that craved information existed.

Egan worked as a compositor for the *London Weekly Dispatch*, and in 1816 he joined the staff as a sportswriter. In 1820 he went on his own and began to publish and edit *Bell’s Life in London*, an all-sports weekly that virtually served as a template for other sports weeklies published in England and the United States until 1860. Egan covered sports and the social scene

surrounding sports, and in doing so he provided a public record in print of a spirit of freedom and adventure that young men were beginning to experience.

American Sportswriting Pioneers

Egan sold *Bell's Life in London* in 1824, but its influence extended beyond that time and across the Atlantic. The first successful attempt to sustain a sporting publication in the United States was the work of John Stuart Skinner, who published the *American Farmer* in 1819 and the more sports-oriented *American Turf Register and Sporting Magazine* in 1829. Skinner included some articles on sports, recreation, and exercise in *American Farmer*, but for the most part he covered events that fell under the headings "Rural Sports" and "Sports of the Plough" (Berryman 1979, 46). As its title suggests, *American Turf Register* focused on horses and field sports.

The initial issue of the first true sports weekly in America, William Trotter Porter's *Spirit of the Times*, appeared on 10 December 1831. While covering a multitude of sports, Porter aimed his publication at an audience of America's sporting gentry. He favored horse racing and field sports, and his most famous contributor was William Henry Herbert, who wrote outdoors sketches under the pen name Frank Forester. Forester's work gained great popularity, but Herbert, who harbored loftier literary ambitions, was ashamed of what he considered his hack writing. Despite becoming, in the estimation of John Rickards Betts, "the first nationally famous sportswriter," Herbert committed suicide in 1858 (1953, 42).

George Wilkes launched the *National Police Gazette* in New York City in 1845, and in 1856 he bought the *Spirit of the Times*, which for a while was published simultaneously under slightly different names and with different owners. The more famous version of the *National Police Gazette*, the notorious "barbershop Bible" printed on pink paper, began in 1876 when Irish immigrant Richard Kyle Fox bought the weekly and turned it into the sporting paper with the greatest influence and largest circulation in the United States in the last decades of the nineteenth century.

In 1853 Frank Queen began publishing and editing the weekly *New York Clipper*, the paper that inaugurated the baseball box score, an invention of the game's first great chronicler, Henry Chadwick. More so than other publications of the period, Queen's *Clipper* functioned as a booster, an educator, and a builder of an emerging American sports culture. The paper flourished until Queen's death in 1882, and it continued to publish, although dealing primarily with theater news, until 1923 when it was bought by *Variety*.

With the reading audience for sports news increasing annually, Francis C. Richter responded in 1882 by issuing *Sporting Life*, a weekly published in Philadelphia that included regular reports on baseball, track and field, cycling, yachting, tennis, and prize fighting. Devoted to the increasingly popular sport of baseball, Al and Charlie Spink's *Sporting News* first appeared in 1886 in St. Louis, and by 1900 it usurped the *Clipper's* title as the "Bible of baseball." Richard Harding Davis became editor of *Harper's Weekly* in 1890, and he retooled the magazine in an effort to attract an audience of young, primarily well-to-do men. Davis hired Casper Whitney to write a weekly column on "Amateur Sports," and between them they introduced and helped popularize the "school sports hero" (Messenger 1981, 151–153).

James Gordon Bennett Jr. Promotes Sports

Editors of daily newspapers were slow to acknowledge the surging importance of sports as news, but James Gordon Bennett Jr., whose father started the *New York Herald* in 1835, proved an exception. In the 1860s, after taking the reins of the paper from his father, Bennett consistently devoted space, if not specifically devoted pages, to sports news, covering baseball, prize fighting, and horse racing in particular. Bennett was also a self-promoter. In 1866 he used the newly laid underwater cable to wire back reports of the victory of his yacht in a transatlantic race in which each participant put up \$30,000 in a winner-take-all challenge.

Bennett's win led to the reinstatement of the America's Cup challenge in 1870, and his coverage led other

newspaper editors to increase their attention to sports. In 1878 Charles Wright was named sports editor of the *Syracuse Courier*, and he is believed to be the first American journalist to hold such a position. In the same year Francis Richter, who four years later launched *Sporting Life*, directed other reporters in a full-fledged sports department at the *Philadelphia Public Ledger*.

The Birth of Daily Sports Pages

It was not until the 1880s, when professional baseball earned a spot in the national consciousness and heavyweight champion John L. Sullivan was becoming enormously popular, that daily newspapers began to experiment with the radical idea of including regular sports pages. In New York, Charles A. Dana of the *Sun* and Joseph Pulitzer of the *World* featured regular sports pages. In Chicago, a fiercely competitive newspaper town whose papers reflected the boisterous, bustling nature of the city, a crime reporter for the *Inter-Ocean*, Leonard Washburn, accepted an assignment to cover a Chicago White Stockings game. Washburn's story, according to Hugh Fullerton, revolutionized the genre because he produced a story "interesting and entertaining enough to be read by all the patrons of the paper" (1928, 18). Washburn's efforts in sports coverage were soon to be followed by another Chicago stylist, Finley Peter Dunne, and the sportswriter as storyteller, as opposed to a compiler of facts and statistics, was born. Sometimes the results of this style proved less than informative. Noting that the objective of the first American sports pages was to tell a reader who won and who lost, Randall Poe observed in his essay "The Writing of Sports" that "the scores often got in the way of roco description and were lost" (1974, 173–174).

Grantland Rice and the Golden Age of Sportswriting

Grantland Rice joined the sports staff of the *New York Evening Mail* in December 1910, and it could be argued that modern sportswriting reached an age of robust adolescence at the same time. Up to the day of his death on

13 July 1954, Rice continued to cover sports in daily newspapers, in his syndicated column, in film shorts, and in magazines. Rice was, in the estimation of Robert Lipsyte, "the prototype superstar sportswriter of the Golden Age" (1975, 170). For better or for worse, Rice spawned generations of journalistic imitators, prompting Lipsyte to claim that Rice's influence was "the most liberating and the most destructive" in sportswriting history (1975, 170). Early in his career, Rice formulated his philosophy of sportswriting: "[G]ood sportsmanship should apply not only to playing sport but to writing about it as well. No cheap shots" (Harper 1999, 122). Rice never took a journalistic cheap shot at anybody. If an athlete or coach did something worthy of criticism, Rice's approach was to ignore that person and event and devote his column inches to the more smiling aspects of the game.

Stanley Walker determined that "two fairly definite schools" of sportswriting existed in Rice's time, the "Gee Whiz!" and "Aw Nuts!" schools (1934, 123). Rice was the premier practitioner of the Gee Whiz style, writing that used classical metaphors and often used verse to mythologize an athlete or team. Ironically, W. O. McGeehan, who for a time in the 1920s was Rice's sports editor at the *New York Herald Tribune*, was, along with Westbrook Pegler and Heywood Broun, the foremost practitioner of the Aw Nuts School, which sought to treat athletes as real people with human failings and games as business enterprises. McGeehan, for example, refused to refer to the people attending a sporting event as "fans," preferring instead to label them the "customers."

Rice's most famous story was his Four Horsemen report on the 1924 Army–Notre Dame football game. "Outlined against a blue-gray October sky," he wrote, "the Four Horsemen rode again." His story ran not only in the Sunday editions of the *Herald Tribune*, but because of syndication, in numerous papers around the country. With one deftly chosen sports-page trope, Rice romanticized and made immortal a Notre Dame backfield that was only a bit above average. More significantly, though, he romanticized and helped popularize

The Rise of Sportswriting

Fred Lieb, a man who spent more than seventy years writing sports, recounts the tale of covering a mid-winter baseball meeting in 1915 when the Federal League was challenging the established National and American leagues for economic supremacy. Lieb left the Manhattan meeting site with Heywood Broun, then the sports editor of the *New York Tribune*. Broun had been raised in a wealthy New York family and went to Harvard. Lieb grew up in decidedly more modest circumstances in Philadelphia and graduated from Central Manual High School. What drew these two men together was a mutual love for sports and sportswriting.

Upon leaving the meeting, Lieb accepted Broun's invitation to dine with him at the Harvard Club. "One of his old Harvard professors stopped at our table and chatted familiarly for several minutes," Lieb writes in his 1977 book *Baseball as I Have Known It*. "As the professor started to move away, he stopped and said, 'I forgot to ask, what are you doing now, Broun?' Heywood replied, 'I'm writing baseball for the *Tribune*.' The professor's face dropped. 'Bah! Have you fallen to that?'"

The professor's reaction to Broun's chosen profession in 1915 was not surprising. Sports reporting had a deserved reputation as a "backdoor trade" pop-

ulated by naive kids or "free loaders who long ago gave up their dreams and a healthy part of their morals," as Seymour Krim observes in his essay "Sportswriting: Square and Avantgarde." Too often, sportswriters were propagandists, mere shills for a promoter who could buy their coverage with a few dollars or a bottle of whisky. And sometimes both.

While that may have been the case at the beginning of the twentieth century, the situation in the sportswriting business at the beginning of the twenty-first century has changed completely. In his "Foreword" to the collection titled *The Best American Sports Writing of the Century*, Glenn Stout notes that in the past three decades "sports writing has become something of a respected genre of American literature." Indeed, sprinkled throughout virtually all of the anthologies of literary journalism are stories written by sportswriters. What used to be a "backdoor trade" has emerged as an admired genre of nonfiction literature.

Significantly, it is worth noting that Heywood Broun's son, Heywood Hale Broun, followed his father into sportswriting and became one of the most respected writers and sports commentators of the latter half of the century.

intercollegiate football, as well as other sports to which he turned his attention, most notably golf.

Ring, Runyon, and Other Luminaries

American press boxes in the first three decades of the twentieth century were filled with some of the greats of the profession. Ring Lardner, Damon Runyon, Hugh Fullerton, Paul Gallico, Fred Lieb, John Kieran, Charles E. Van Loan, and John R. Tunis all were covering sports on a regular basis. Of that group, Lardner, Runyon, and Gallico are noted for their work as sports reporters and for the fiction, sports-related and otherwise, they

produced. Lardner was born on 6 March 1885 in Niles, Michigan, and he initially built his reputation as an astute writer covering major league baseball, especially his beloved Chicago White Sox. Lardner earned a lofty place in American literature when his biting humorous *You Know Me Al* stories were published in book form in 1916. Written in dialect and from the point of view of White Sox rookie pitcher Jack Keefe, the stories were originally published in *The Saturday Evening Post*.

Runyon, who grew up in Pueblo, Colorado, covered sports and wrote a column for the *New York American* from 1911 to 1946, but it was in 1931 when *Guys and Dolls* was published that he achieved literary

The Big Game

Sportswriter Grantland Rice penned sonnets about a variety of sports. Here he captures the mood of a football game in 1924.

You take the color and flash of the game,
 And the human gardens of rose-lip girls,
 And all the pageant that waits the call
 As the toe drives into the waiting ball
 But leave me the halfback's driving might,
 The surging lines in a bitter fight,
 The sweat and smear of the warring soul
 As the tackle opens a two-foot hole;
 The roar of the crowds, with their beasts aflame,
 The ringing cheers, with their eddying swirls,
 The interference, the deadly pass,
 The grip and crash of the swirling mass.
 For the crowd fades out and the cheers dip low
 When the fourth down comes, with a yard to go,
 And in the struggle along the field
 The battle changes to sword and shield
 And the knightly tourneys that used to be
 In the golden era of chivalry.
 The world soft as the years advance
 Further and further from sword and lance,
 When the caveman, after his morning's fun,
 Slew the mammoth and mastodon;
 But his ghost at the gridiron calls through space:
 "These, too, are worthy to build a race."

immortality. Runyon's stories introduced readers to the characters, language, and the values of New York City's underworld and sports culture, earning him the title "The Chronicler of Broadway."

Gallico was born in New York City on 26 July 1897, and he served as sports reporter and sports editor of the *New York Daily News* from 1923 to 1936. Gallico was a Gee Whiz writer who came to regret his journalistic style, as he notes in his 1938 book *Farewell to Sport*.

Gallico, McGeehan, and Tunis, who wrote eighteen sports-based novels for juvenile readers from 1938 to 1973, filled the role of journalistic watchdogs of sport.

The Fresh Eye of Red Smith

Red Smith, a writer once observed, "has given sports what Monet gave sunrises—a pure and constantly fresh eye" (Poe 1974, 176). Smith began covering sports for the *Milwaukee Sentinel* in 1927 and was still writing a column for the *New York Times* when he died on 15 January 1982. He won the Pulitzer Prize for distinguished commentary in 1976, becoming just the third sportswriter to achieve journalism's highest honor. *New York Times* columnist Arthur Daley won in 1956, beating out Smith and Jimmy Cannon of the *New York Post*, and in 1951 Max Kase of the *New York Journal-American* won for his story exposing the college basketball point-shaving scandal.

Like Grantland Rice, Smith spent his career in sports journalism, but unlike Rice and Rice's many imitators, Smith never shied away from critiquing sports. When the Soviet Union invaded Afghanistan in 1980, Smith was the first sports columnist to advocate a United States boycott of the Summer Olympic Games in Moscow. Ironically, the *New York Times* chose not to run the column because the editors felt it was politically inappropriate. However, the column ran in 350 papers that subscribed to the *Times* news service, and it helped draw national attention to the boycott issue. In 1968 he supported Tommy Smith's and John Carlos's right to make the black-glove protest on the medals podium at the Mexico City Olympics, and as early as 1957 he called baseball's reserve clause a version of the "slave trade."

Sports Illustrated and the Texas Sportswriters

Sports Illustrated debuted with the issue of 16 August 1954. The brainchild of Time Inc. founder and publisher Henry Luce, the magazine at first fell considerably short of being a blockbuster success, an outcome that many in the Time Inc. business office ominously predicted. "Only males read sports magazines," a prepublication business

office assessment read, and “most of the males are either juveniles or ne'er-do-wells . . . and that even having the word Sport in a magazine title may be financial folly” (MacCambridge 1997, 22). To offset that perception, one that could be traced to the beginnings of sport and sports journalism in the nineteenth century, the magazine's editors made their product high-toned, aiming at a well-heeled, socially elite audience. Still, the magazine languished and seemed doomed for extinction.

The turnaround of the floundering magazine began in April 1955 when Roy Terrell, an ex-Marine from Texas, was hired as a writer, and salvation was realized when on 19 March 1956 Time Inc.'s senior European correspondent Andre Laguerre was hired as the assistant managing editor and, shortly thereafter, the managing editor. Laguerre revamped *Sports Illustrated*, transforming it from a curious mix of high-society sports and cookbook recipes to a publication that showed a genuine affection for sports. Moreover, Laguerre hired more writers like Terrell—Texans, for the most part, “whose prose was lucid, irreverent, and unapologetic about the central role of sports in modern society” (MacCambridge 1997, 4). At the forefront of the infusion of Texas-trained sportswriters were Dan Jenkins and Bud Shrake, both of whom began their sportswriting careers at the *Fort Worth Press* under legendary sports editor Blackie Sherrod. Jenkins and Shrake led the way in making the magazine more mainstream in terms of sports coverage and cutting edge in terms of writing style. The *Sports Illustrated* style forged “the blueprint for modern American sports journalism” (MacCambridge 1997, 4).

Women Sportswriters

As opportunities for women athletes increased in the final three decades of the twentieth century, so, too, did opportunities for women sportswriters, who, increasingly, have not been limited to covering just women's sports. A survey of fifty American sports departments conducted by the Women's Sports Foundation revealed that from 1991 to 2001 the number of women covering sports rose from 6 percent of staff to 13 percent. Mary Garber of the *Winston-Salem* (North Carolina)

Journal was a pioneering woman sportswriter. Garber began writing all sports in 1944 and retired in 1986.

A short list of top women sportswriters would include Sally Jenkins, whose work has appeared in *Sports Illustrated*, *Women's Sport & Fitness*, and the *Washington Post*; Diane K. Shah, a former sports columnist for the *Los Angeles Herald Examiner* and a contributing writer for *ESPN: The Magazine*; Jackie MacMullan of the *Boston Globe*; and Joan Ryan, who covered sports for the *Orlando Sentinel* and the *San Francisco Examiner*, as well as writing the highly acclaimed book about young gymnasts, *Little Girls in Pretty Boxes*.

Murray and Liebling: The Past as Prologue

While women continue to take their rightful place in the press boxes in the twenty-first century, sportswriters in general will continue to do what sportswriters have done since the days of Pierce Egan—work hard to get a complete story and write it as compellingly as possible. The instantaneous and virtually universal coverage of television and online reporting has liberated print journalists from being just reporters of fact and freed them to be writers who produce more personalized, atmospheric, and analytical pieces. A canon of contemporary writers of sport would include names such as Frank Deford, David Halberstam, Mike Lupica, Jon Krakauer, Roger Angell, Dave Anderson, William Nack, Sally Jenkins, and the late Dick Schaap, all of whom use or used the techniques of literary journalism—genuine storytelling. In that respect, they are like the best of their immediate predecessors, stylists such as Jim Murray and A. J. Liebling.

Murray, who, as the West Coast correspondent, was one of the few bright lights on the beginning *Sports Illustrated* staff, wrote a nationally syndicated column for the *Los Angeles Times* from 1961 until his death in 1998. Murray won the Pulitzer Prize in 1990. Liebling, a reporter for *The New Yorker* for almost thirty years until his death in 1963, graced the pages of the magazine with his essays on boxing. Noting that editor Harold Ross tried to discourage him from covering

such “low-life” events, Liebling persevered, insisting that, “Low-life was Ross’s word for the kind of subject that I did best” (1956, 6). Liebling’s pieces combined literary metaphors with blow-by-blow detail to lift a bout from the low-life to a genuinely courageous and heroic display. Liebling’s words did what good sportswriting should always strive to do—inform, entertain, and even inspire.

Squash

Squash is an indoor racket sport, probably the fastest sport inside four walls. Fifteen million people play squash on fifty thousand courts in 130 countries.

Origins

Squash was invented at the Harrow school in England in about 1830 and spread to British colonies such as Pakistan, Egypt, India, Australia, South Africa, New Zealand, and Canada and during the 1880s to the United States. The U.S. version differed from the international version in that the squash court was narrower and the ball harder. During the 1980s squash was standardized in accord with the international version. The British Open Championship, which served as the world championship until 1967, was first played in 1920. The Women’s British Open was first played in 1922

and was dominated by British women until 1960, with Janet Morgan (1921–1990) winning the title ten times. Even more successful was Heather McKay of Australia, who won seventeen championships in a row, the last three from 1975 to 1977 after squash entered the open era, with amateurs and professionals competing in the same tournament. In the United States the first national championships were played in 1907, and the event was dominated by men and women from Philadelphia, Boston, and Wilmington, Delaware.

Rules and Play

People play squash on a court measuring 9.7 meters long by 6.4 meters wide. Two players, each using a racket approximately half the size of a tennis racket, strike a small black ball alternately against the front wall of the court. The ball is soft and “squashes” on impact, causing it to bounce slowly and causing the players to work hard, both mentally and physically, to keep it in play. Squash has been judged to be the toughest cardiovascular sport played with a ball, ahead of water polo and soccer (association football).

Women Take the Court

From the beginning squash was a men’s sport, and men players outnumbered women by more than ten to one, with some nations such as Egypt having no women players at all. Squash was run internationally by separate men’s and women’s associations. In 1985 the men’s and women’s associations merged under the banner of the International Squash Rackets Federation (ISRF), with the name changed in 1992 to the “World Squash Federation” (WSF). Despite predictions that involvement by women would disappear under male leadership, the opposite has

occurred, and women and men now share leadership of the sport. A “women’s committee” was given responsibility for organizing the world championships for women and junior women, as well as advancing opportunities for women and girls in squash generally. This responsibility included encouraging women to join ISRF committees such as coaching, competitions, rules and referees, medical, and technical.

In 1989 a ISRF survey identified the factors limiting women’s participation in squash. Member nations (almost exclusively administered by men at the time) funded men’s and boys’ championships but had no funds for women and girl players, who were less of a priority. Few women served in administrative roles or on governing committees. Professional women’s events made up only 18 percent of the international tournaments and paid out just 8 percent of the prize money. In a number of nations separate men’s and women’s associations managed the sport, with the inevitable duplication of resources. The women’s associations had significantly smaller player bases and limited capacity to generate financial support and development.

When the International Squash Rackets Federation became known as the “World Squash Federation” the new constitution provided for three vice presidents, one of whom was required to be of the “other sex,” rather than specifying a woman as before—a subtle but important change. Member nations also were required to have a single governing body, which meant that men’s associations and women’s associations had to merge.

The World Squash Federation took other steps to end male control. Athletes were now referred to as “he” or “she” as appropriate, not as simply “he,” as had been the practice. The rules of squash were revised to make them

gender neutral, and the content of federation publications was made gender neutral and gender balanced.

During the late 1990s squash became more open to women around the world. For example, in 1997 Egypt hosted a women's grand prix final in a court situated outdoors on a resort island—a spectacular event that would have been unthinkable just a few years earlier in that Muslim nation. Another example is Malaysia, which initially supported women's squash because people there recognized that a woman might be able to achieve international recognition more easily than a man. In 1998 Malaysia had two girls in the top eight world junior rankings, one of them just fourteen years old.

In late 2004 Lee Beachill of England was first in the Professional Squash Association men's world rankings. Australia's Rachael Grinham was first in the women's world rankings by the Women's International Squash Players' Association (WISPA).

St. Andrews

St. Andrews golf club—officially called the “Royal & Ancient Golf Club of St. Andrews”—is located in the city of St. Andrews, Scotland. It is the governing body of golf throughout the world except for the United States, Canada, and Mexico. The Old Course at St. Andrews is the most famous golf course in the world and has been the venue for twenty-six Open Championships.

Early History

Golf has almost certainly been played at St. Andrews on the links fringing the North Sea since the first half of the fifteenth century, but the first definite mention of golf at St. Andrews dates to 1552. After the Reformation (a sixteenth-century religious movement marked ultimately by rejection or modification of some Roman Catholic doctrine and practice and establishment of the Protestant churches), the ancient cathedral city of St. Andrews lost much of its importance, and after a period of decline, in 1754 twenty-two “Noblemen and Gentlemen of the Kingdom of Fife” founded the Society of St. Andrews Golfers and contributed to a silver club that would be played for annually over the St. Andrews links. These men were both founding a private golf society to enjoy the sport and good company and intending, by holding an annual competition for a valuable trophy, to restore the reputation of St. Andrews as the home of golf.

This golf society was not the world's oldest golf club; that distinction belongs to the Gentlemen Golfers of Leith, who later became the Honourable Company of Edinburgh Golfers, but the latter had difficulty establishing itself at a satisfactory course and moved three times during the period when the prestige of St. Andrews was becoming firmly reestablished. By 1834 the leading position of St. Andrews was confirmed by the granting of royal patronage.

The Royal & Ancient Golf Club

The title “Royal & Ancient Golf Club” was given to the club by King William IV in 1834, and agreement was later reached with the nearby Union Club to make use of its premises, which overlooked the course. In 1854 the original part of the present clubhouse was built, and by the end of the nineteenth century golf clubs throughout Great Britain looked to St. Andrews as the game's leading authority. This role was officially recognized in 1897 when the growth of the game led to a demand for a standard set of rules as opposed to a variety of local regulations; the members of the Royal & Ancient Golf Club agreed, with perhaps some reluctance, to take

control of the rules of the game, and the first Rules of Golf Committee was appointed.

The role of the Royal & Ancient Golf Club steadily became more wide ranging and international, until today it has four main areas of responsibility. It administers the rules of golf, in conjunction with the United States Golf Association; it runs the Open Championship (generally known as the “British Open” outside the United Kingdom) and other key events; it fosters the development of golf throughout the world, using the profits from the Open Championship to do so; and it continues to operate as a private golf club with more than two thousand members.

The Old Course

The well-drained soils, short grass, natural humps and hollows, and banks of whin (a European shrub) made St. Andrews’s links land next to the sea a natural ground for golf. Although many changes, both natural and human-made, have been made through the centuries, the basic qualities of the Old Course are the same as they were when golf was first played there.

In the early days golfers played twenty-two holes, although only eleven existed, and they were played twice: first out toward the River Eden and then back into the city. Homeward players had priority, but after holing out they had to tee off within one club’s length of the hole. This practice created both a terrible surface for putting and considerable delays and confusion. In 1764 the first four holes were made into two, thus reducing

the course to eighteen holes as they were played twice, and it was this change that led to the worldwide adoption of the eighteen-hole standard. In 1856–1857 separate holes were cut for those golfers playing the outward and inward holes, and soon afterward tees were introduced to replace the practice of starting each hole from the preceding green. The original clockwise route that players took around the course was eventually changed to counterclockwise, new bunkers were added periodically, and more recently six new championship tees were created to cope with the power of modern professionals. Although the Old Course is not the most difficult championship course in the world, it remains a unique and timeless challenge.

The Open Championship

The Open Championship was begun by Prestwick Golf Club, and although the Royal & Ancient Golf Club and the Honourable Company of Edinburgh Golfers soon became involved and contributed to the purchase of the famous Claret Jug first awarded in 1872, not until 1920 did the Royal & Ancient Golf Club take over sole management of the event and the first championship committee was appointed.

The first Open Championship was held at St. Andrews in 1873, and hence the Old Course has been on the list of venues currently used for the championship longer than any other. In all, twenty-six Opens have been played there to date, and winners have included some of the greatest names in golf. J. H. Taylor (1871–1963) and James Braid (1870–1950) each won twice at St. Andrews before World War I; the U.S. amateur Bobby Jones (1902–1971) won in 1927; Sam Snead (1912–2002) won the first post-World War II Open in 1946; the Australian Peter Thomson (b. 1929) won the second of his four Opens in 1955; Jack Nicklaus (b. 1940) won consecutive St. Andrews Opens in 1970 and 1978; and in the Millennium Open of 2000 Tiger Woods (b. 1975) was the winner with the lowest winning score yet recorded at St. Andrews (269) and with one of the largest margins (eight strokes).

The Future

The unique roles of the Royal & Ancient Golf Club and of the Old Course in the history and development of golf, combined with some willingness to adapt to changing times and requirements, are likely to ensure that St. Andrews will maintain its position of importance in the game and will continue to be regarded as “the home of golf,” where both playing and winning will have special significance for golfers from all over the world.

St. Moritz

St. Moritz—named for a martyred saint—has built its reputation on attracting wealth and international high society, so much so that other like-minded resorts are now measured against St. Moritz. When Godfrey Dewey made successful efforts to obtain the Winter Olympic Games of 1932 for Lake Placid, New York, he did so to make his Lake Placid Club and surrounds into America’s St. Moritz. Averell Harriman used the same formula when building America’s own St. Moritz, which he called Sun Valley, in the wilds of the cowboy town Ketchum, Idaho.

Health Haven

St. Moritz, initially one of many places known for its waters’ curative qualities, became an aristocrat’s haven. St. Moritz’s winter season started with the tale of Johannes Badrutt’s bet to a group of well-to-do Englishmen that the winter was as sunny as the summer. The village became a particularly English place with a resident parson and Anglican church to minister to the English colony. Summer guests could play tennis (the Palace hotel had one of the first indoor courts), golf, and croquet and could putt, bowl, sail, try their expertise on the archery range and badminton court, and keep in form in the cricket net. In winter, they could skate, toboggan, and ski. The village’s cachet was sufficient for it to host the II Winter Olympic Games in 1928 and the first post–World War II Games in 1948.

As a health resort, St. Moritz was not the easiest place to reach. The journey from London to Chur, Switzerland, took two days, then came the exhausting stagecoach ride over the Julier Pass to arrive in time for a late dinner. The Abula tunnel provided the railroad connection from 1904 on, cutting the journey time to less than two days.

The locals built hotel after hotel to cater to the increasing numbers of royalty, aristocracy, and wealth. The Kurhaus opened in 1865, and in quick succession, the Beau Rivage, Bellevue, Victoria, Du Lac and, finally, in 1896, the Palace opened. With its vast and lavish appointments, and irreproachable service, the Palace set the standard and gave St. Moritz its mystique. The clientele came for the air, for skating, tobogganing and, in the years before World War I, for skiing.

St. Moritz Athletic Clubs and Events

The St. Moritz Skating Club, founded in 1880, practiced a disciplined style—as stiff, precise, and proper as the English colony itself—that became known as the *English style*. However, many Europeans had been much impressed by Jackson Haines, an American who toured Europe giving exciting exhibitions in which

his arms and legs appeared to be utterly free. He settled in Vienna, and the Viennese and other Europeans emulated his style, which became known as the *Continental style*. As early as 1872, Viennese skaters came to St. Moritz for a contest. The two styles skated side by side on the hotel rinks in uneasy fashion until well after World War I. On the rink, too, curlers from Scotland could be found and a St. Moritz Curling Club came into being.

Meanwhile, in the neighboring valley, a tobogganing club had been formed in Davos with members from many countries; the first international match took place in St. Moritz in 1883. Johannes Badrutt had laid out a toboggan run from St. Moritz to the village of Cresta, just above Celerina. The Cresta Run gave St. Moritz the first of its sporting cachets. At first, men and woman rode the Cresta on their small toboggans, then a Mr. Cornish lay on his sled, chin inches from the ice, and this Cresta style became de

rigueur. Longer and lower sleds were built to accommodate the lying position.

Skiing of a rough country sort by Engadine farmers in 1860 gave way to sporting activities in the late nineteenth century. These became formalized in 1904 in the Ski Club Alpina. Generally, high society found skiing uncongenial, but little by little as the Ski Club of Great Britain and the Public Schools Alpine Sports Club organized their wealthy members into winter sporting, St. Moritz became one of the venues where even women could find pleasure and where, as the *Times* of London explained, “Practise can be had with a *minimum* of fatigue.” The Engadine’s two main ski villages were Davos, home to the first English ski club in 1903, and St. Moritz. They vied with Mürren and Montana in the Bernese Oberland.

Olympic Games in St. Moritz

Until 1936, it was never certain that Winter Olympic Games would be a viable counterpart of the modern festival created by Pierre de Coubertin and first held in 1896. The Winter Games—retrospectively officially called Olympic—were held at Chamonix, France, in 1924. The Scandinavians—who felt they were supreme in Nordic sports—came only after assurances were given that the games were not called “Olympic.” Norwegians garnered half of the skating medals and all but one of those given for skiing. After such overwhelming success, there were calls in Norway to join in Winter Olympics. In the Norwegian Ski Association a vote was taken to see if a team should be sent to the 1928 Winter Olympics to be held at St. Moritz: 29 voted for, 27 against.

The weather for these games was awful; one whole day’s events had to be cancelled. Still, the Norwegians won eight of twelve medals awarded for skiing and six of nine for skating. The star of the St. Moritz Olympics was the young Norwegian skater, Sonja Henie, who dazzled both the judges and crowds.

Unbombed St. Moritz played host to the Winter Olympics again in 1948. Europe was still recovering

from World War II, and the Cold War continued to make life uncertain. Germans and Japanese were banned from the games and the Russians were not present. The poor weather and outworn facilities did not give the Winter Olympic postwar era a particularly good start. Scandinavians dominated the Nordic events, and French and Swiss skiers gained medals in the Alpine skiing competitions. One American woman, Gretchen Fraser, put the Europeans on notice that the United States was an up and coming “Alpine” nation with a win in the slalom. American Dick Button revolutionized men’s skating with his acrobatic jumps, which gained him a gold medal.

Constantly Re-Inventing

St. Moritz became known for its skijoring—being pulled by a horse. Its ski school started in 1929, and the following year the Kilomètre lance, from which modern speed skiing is derived, was developed. In 1969, St. Moritz hosted the now-annual Engadine marathon and in 1987 held the first Snowboard World Championship.

The village—now town—has found a way to keep up culturally with modernization yet it retains its old-money style and remains one of the great playgrounds of the rich.

Stanley Cup

The Stanley Cup is awarded each year to the champions of the National Hockey League (NHL) of the United States and Canada. It is the oldest trophy in professional sports in North America and is widely considered to be the most coveted prize in ice hockey. Each year NHL teams play an arduous regular season schedule to qualify for the Stanley Cup playoffs. Only sixteen of thirty teams qualify. After they make the playoffs they must win four best-of-seven series to win the Stanley Cup.

The Stanley Cup is unique in that the names of each winning team and all of its members are inscribed on it. A series of bands was added to the cup to allow space for the names of new champions to be inscribed each year. Each band has the capacity for thirteen winning teams, and so every thirteen years the oldest completed band is removed, and a blank band is added. The original Stanley Cup was officially retired in 1969 and is now located in the Hockey Hall of Fame in Toronto, Canada.

History

Sir Frederick Arthur Stanley of Preston, Canada, was appointed the sixth governor general of Canada in 1888 and quickly became an avid supporter of ice hockey. Three of his sons played on the Government House Rideau Hall Rebels hockey team, and his oldest son, Arthur, is credited with organizing one of the first ice hockey associations in Canada, the Hockey Association of Ontario. Stanley recognized the need for a challenge cup that would be won and held each year by the leading hockey team in Canada. He resigned his post as governor general early because of the death of his brother and returned to England in July of 1893, but he remained an ardent supporter of ice hockey. Shortly after returning to England he sent a letter to his successor, Lord Kilcourseie, suggesting the development of a challenge cup. He wrote in this letter that “there does not appear to be an outward or visible sign of the cham-

pionship at present. Considering the interest that hockey matches now elicit and the importance of having the games fairly played under generally recognized rules, I am willing to give a cup that shall be annually held by the winning club” (McFarlane 1978, 17–18).

Lord Stanley’s offer was accepted, and the Stanley Cup was born. Stanley arranged for the purchase of a gold-lined silver cup that was worth approximately \$50 and would be awarded each year to the leading hockey team in Canada. The administration and awarding of the cup would be controlled by two trustees. These trustees, P. D. Ross and John Sweetland, played a pivotal role in deciding who would compete for the Stanley Cup during the challenge era.

The Stanley Cup was originally an amateur trophy, and the winner was determined through a challenge system. Any team that was willing to travel could challenge the holders of the cup. The first winner of the Stanley Cup was the Montreal Amateur Athletic Association hockey team in 1893. Between 1893 and 1910 the Stanley Cup was awarded to both amateur and professional teams, but in 1910 it became an exclusively professional trophy. An agreement that one team from the East and one team from the West would compete to determine the winner of the cup went into effect in 1915. This agreement signaled the beginning of the end of the challenge era. In the spring of 1917 the Seattle Millionaires became the first non-Canadian team to win the Stanley Cup.

In 1917 the National Hockey League was formed. Between 1917 and 1926 the Stanley Cup was awarded to the winner of a playoff series between a team from the NHL and a team from the Pacific Coast Hockey Association (PCHA). With the demise of the PCHA in 1926 the Stanley Cup became the sole property of the NHL. This event marked the beginning of the Stanley Cup playoffs as we know them today. Then ten teams played in the NHL, and six of them would compete in the Stanley Cup playoffs. However, the Great Depression of the 1930s eventually claimed four of these teams and left only six teams—the Toronto Maple Leafs, the Montreal Canadiens, the Boston Bruins, the

Detroit Red Wings, the Chicago Blackhawks, and the New York Rangers—to compete for Stanley Cup supremacy. The next major expansion of the NHL occurred in 1967 with the addition of six teams. In 1979 the NHL added four teams from the rival World Hockey Association, including the Edmonton Oilers and a player who would go on to become one of the greatest players in the history of Stanley Cup competition—Wayne Gretzky.

The Montreal Canadiens won twenty-four Stanley Cup championships between 1916 and 2004. They won five straight Stanley Cups between 1956 and 1960 and six between 1965 and 1973. The Toronto Maple Leafs won five Stanley Cup championships in the 1940s and four in the 1960s. The New York Islanders became the first expansion dynasty when they won four straight Stanley Cups between 1980 and 1983. The Edmonton Oilers were the last dynasty in Stanley Cup history when they won five championships between 1984 and 1990.

Significance

The Stanley Cup is one of the most enduring trophies in sports. It has been awarded every year since an influenza epidemic caused the 1919 series to be cancelled—until 2005 when the Stanley Cup was not awarded because of labor problems in the National Hockey league. The hockey players competing for the cup have become increasingly international. Players from all over the world now compete to have their names engraved on the most cherished trophy in ice hockey, the Stanley Cup.

Strength

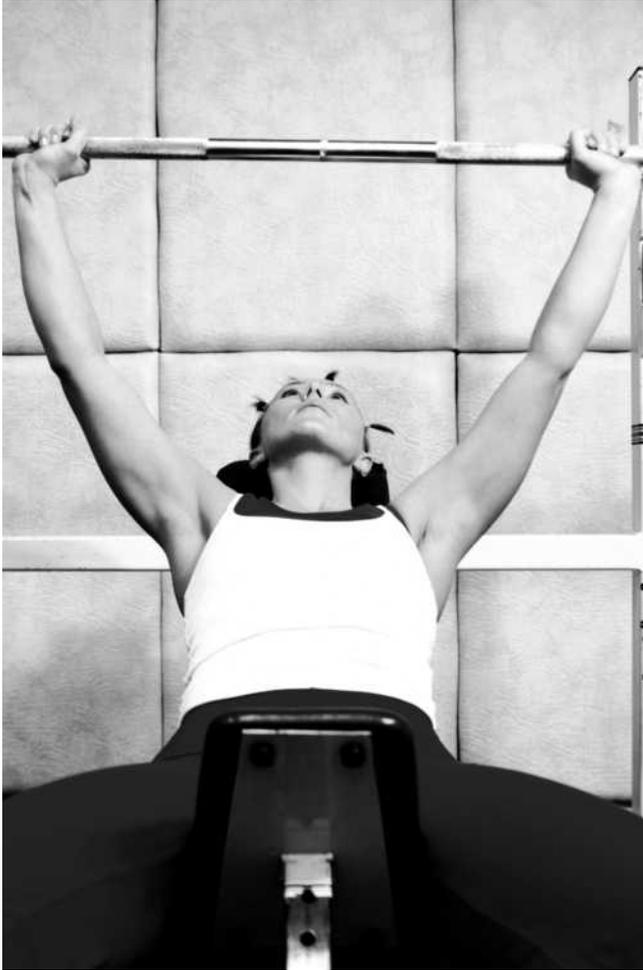

Strength is the capacity to move a load. Many sports require a high level of strength for peak performance. Strength is a function of the musculoskeletal system. The larger a muscle, the heavier the load it can move. A muscle's size depends on the number of its fibers and their thickness. Heredity determines the number of fibers. Age, diet, and exercise determine thickness.

A muscle does not directly move a load but rather moves a bone to which it attaches. Every muscle has two attachments: origin and insertion. In the parlance of physiology, the point where a muscle does not move a bone is the point of origin, and the point where a muscle does move a bone is the point of insertion. The point of insertion is the second factor, along with mus-

cle size, that determines capacity to move a load. The biceps, for example, anchors to the scapula and insert at the radius. At one end of the radius and ulna, the two bones of the forearm, is the elbow, the joint about which they move, and at the other end is the load. The higher up the radius the biceps attaches, the greater its capacity to move a load, a fact that becomes obvious if one imagines the forearm as a lever. To take an example of a lever, one might imagine the ulna and radius as a door, the elbow the hinge and the knob the point of insertion. The door will be difficult to open with the knob at the hinge, the point of insertion on the human forearm, but easy to open with the knob at the end, its customary place on a door. A chimpanzee derives strength in part from the biceps' comparatively high attachment on the radius. As with the number of muscle fibers, heredity determines a muscle's point of origin and insertion.

A muscle moves a load by contracting or shortening its fibers. The body does not recruit every fiber to move a light load, but only by contracting them all can it move the maximum load. During the eighteenth century the Italian physician Luigi Galvani demonstrated that electricity stimulates a muscle to contract. A nerve carries electricity in the form of ions—molecules with a chemical charge. The charge is an electrochemical signal that has a cascade, rippling down the length of a muscle fiber and causing its filaments to slide past each other as the fingers of two hands slide past each other in interlocking. This sliding of filaments bunches a fiber together and is by definition the contraction of a muscle.

The Russian fitness instructor Pavel Tsatsouline describes three types of strength. Maximum strength is the capacity to move the maximum load in a single effort. An athlete who lifts the bumper of a car displays maximum strength. Explosive strength is the capacity to unleash force in a burst. A basketball player who leaps for a rebound displays this type of strength. Strength endurance is the capacity to move a load over time. A cyclist who climbs a mountain or an athlete who performs

one hundred push-ups displays this coupling of strength and endurance.

Differences in Strength

Long before humans understood how muscles work they mythologized men of strength. Whether literary creations or historical figures Hercules and Samson rose above the common man through their strength. The ancients equated strength with virility, which itself implied virtue. Strength was thus an ethical quality as well as a physical fact. However, strength can be an ambiguous quality. The author of the biblical book of Ecclesiastes said that chance more than strength determines the outcome of events. The English writer Mary Shelley's Frankenstein monster had prodigious strength but used it for evil. The same is true of the English writer Bram Stoker's Count Dracula. The character Abraham Van Helsing estimated the count's strength as that of twenty

men. In the end brain trumped brawn: Van Helsing's vampire hunters killed the undead. Yet, people continue to have a quasi-Darwinian admiration of strength, a conviction that the stronger vanquish the weaker in the struggle for survival.

Despite the belief that evolution has blessed humans with innumerable advantages, we cannot boast exceptional strength. A 54-kilogram chimpanzee is on average three to five times stronger than a man. An ant can drag 5,000 percent of its weight, whereas a human can drag only 60 percent of his or her weight. Even among hominids (erect bipedal primate mammals comprising recent humans and extinct ancestral and related forms) humans rate poorly. The skeletons of *Homo erectus* and *Homo neanderthals* are robust and their slots for the origin and insertion of tendons wide compared with these traits in humans. Even Cro-Magnon, the earliest anatomically modern people of Europe, were more robust than we are. In the parlance of paleoanthropology we are the gracile (slender) hominid. Simply put, we have less muscle and are surely weaker than were our closest hominid kin.

Women have on average two-thirds the strength of men because they have less muscle. The disparity is greater in the upper body, where women have 40–60 percent the strength of men, and less in the lower body, where the percentage rises to 75. The notion that women are the weaker sex is a holdover from the Victorian era. Where muscle mass is equal, women are as strong as men. To put the matter another way, a muscle fiber has the same strength in women as in men. At the level of the muscle fiber the distinction between female and male vanishes.

Strength Exercises

By one estimate women and men can increase strength 30–60 percent through exercise. Coaches and athletes distinguish between two types of strength exercises. Isometric exercise causes muscles to tense but not contract. An athlete who pushes against a wall performs isometric exercise because his or her muscles do not

Testing Strength in Siberia

The boys know many games for testing strength. A boy lies down flat on the ground with his arms out-stretched. Three others grab him, one by each arm and one by the legs, and carry him along, and it is up to him to hold himself stiff as a rod as long as possible. Or one boy holds a wooden stick in his elbow joints while two others take hold of the ends of the stick and lift their legs from the ground. The boy then tries to carry these two a few steps ahead. Or two men sit down on the ground facing one another, legs straight and feet against feet. They both hold on to a leather strap or belt and each tries to pull the other boy over to him. Or a boy lies on the ground and another, kneeling in front of him, grabs him under the knees and tries to pull him into an upright position, or sitting down they pull each other by the middle finger. They make stilts in a jiffy from suitable trees, but they are very clumsy in using them. They also have lots of fun racing on their knees.

shorten despite the greatest exertion so long as the wall holds firm. Isotonic exercise requires muscles to contract. An athlete who curls a dumbbell from waist to chin performs isotonic exercise because he or she contracts the biceps in moving a load.

Weight training is a form of isotonic exercise. An athlete may use free weights: dumbbells and barbells that are not attached to a supporting structure. The absence of support requires an athlete to balance as well as lift a free weight. Alternatively an athlete may use a machine that supports weight through its range of motion, obviating the need to balance the weight while lifting it. Controversy rages over the number of repetitions of an exercise that an athlete should perform. Proponents of low-repetition exercise assert that only exertion for a single repetition pits an athlete's strength against the maximum load. Critics counter that such exercise does

not mirror the reality of competition. A basketball player, for example, must leap for several rebounds rather than merely one during a game. Better, they assert, to build strength through multiple repetitions of an exercise. Rather than free weights or machines an athlete may use the body, as in a push-up or pull-up, as the load.

An undercurrent of sexism still circulates in some circles of strength training. Women, critics contend, sacrifice femininity in attempting to build strength; if women must train, critics argue, women's delicate physique confines them to light weights. The issue of gender and strength pivots as much on the definition of femininity as on innate ability to increase strength. Men would do well to define femininity broadly enough to acknowledge muscle mass and strength as female attributes as much as male attributes.

A second type of error confuses weight lifting with strength training. Whereas many athletes lift weights to increase strength, bodybuilders lift weights solely to sculpt their physique. The prospect that a bodybuilder will grow stronger is incidental to the purpose of enlarging muscle and reducing fat to the point that he becomes "ripped," the lexicon for extreme muscle definition. Bodybuilding underscores the fact that most athletes do not toil to increase strength as an end in itself. The discus thrower wishes to increase the length of his toss and the tennis player the speed of her serve. In short, athletes want to grow stronger in order to improve performance in a sport.

Strength Competitions

A small group of sports demands strength more than other attributes. The Scottish Highland Games bill themselves as the oldest strength competition at one thousand years. The seven events include the familiar hammer throw and shot put, but others are unique. The caber throw requires participants to hoist a 68-kilogram tree trunk, balance it during an 18-meter run, and toss it for distance and accuracy: The trunk must align parallel to the participant's line of approach for full points. The event that makes explicit the competition's ethos (distinguishing character, sentiment, moral nature, or

Strength does not come from physical capacity. It comes from an indomitable will. ■ MAHATMA GANDHI

guiding beliefs) is the lifting of massive stones. Participants call them the “manhood stones,” affirming the old prejudice that strength is solely a masculine attribute.

The Basque people have their own stone-lifting contest in Ustaritz, France. Contestants hoist a stone around which the tribal elders once met. Basques believe that the stone lift, more than a strength contest, commemorates their Druid origins. The Basque stone is a religious symbol, and the men who hoist it demonstrate through their strength that the gods favor them. The stone lift affirms strength as a divine attribute.

Since 1977 Universal Studios in the United States has hosted the World’s Strongest Man competition. It draws inspiration from the contests in Scotland and France but belongs to the machine era of Henry Ford and the Wright brothers. Stones and tree trunks give way to the Boeing 747, which contestants must pull along a runway. Another event requires contestants to lift a tire from a semitrailer. The competition pits man against machine in the tradition of John Henry. In this respect it is less a world event than a U.S. one in its ethos.

Diet and Drugs

Weight lifters and their ilk center their diet on protein in hopes of growing strong. The body synthesizes protein into muscle. Most protein replaces muscle that the body has metabolized, although when diet and exercise are ideal a fraction may build new tissue that increases the muscle mass of an athlete. The body adds muscle by thickening muscle fibers, not by creating new fibers. The novice may believe the fallacy that if the consumption of 100 grams of protein a day will add 1 gram of muscle, then 200 grams of protein will add 2 grams. Testimonials in muscle magazines promote this fallacy in an effort to sell protein powder for mixing with milk. Some athletes consume 400 grams of protein a day, oblivious to the fact that they will excrete three-quarters of it. An athlete needs roughly 1 gram of protein per kilogram of body mass per day. A 100-kilogram athlete therefore needs not 400 grams of protein a day but rather 100 grams, the amount of protein in 481 grams of salmon or 396 grams of cheese.

The quest for strength leads some athletes to supplement their diet with anabolic steroids, a class of chemicals that mimics the male hormone testosterone in building muscle mass and strength. One researcher estimates that 1 million athletes in the United States use steroids, generating \$10 million in annual sales on the black market. Studies document that athletes on steroids may increase strength 5–10 percent in six weeks. Once off steroids, however, athletes return to their original strength within six weeks. The fact that strength gains are temporary may goad athletes to take steroids for months or even years. Long use increases the risk of liver

damage, heart disease, and cancer. The U.S. football player Lyle Alzado's admission that he used steroids throughout his career and his death from cancer at age forty-three caused a furor over the abuse of steroids. Even if athletes remain healthy they risk detection. Numerous associations, including the International Olympic Committee and the National Collegiate Athletic Association, ban the use of steroids. Public exposure of steroid use tarnishes athletes, prompting the charge that they do not play fairly. The U.S. baseball player Barry Bonds is the latest of many athletes to lose respect for having used steroids.

Toward Maximum Strength

Humans cannot increase strength ad infinitum. Even now we may be near the maximum. Since 1976 the International Olympic Committee has awarded medals

for the total weight lifted in two events: the snatch and the clean and jerk. In 1976 385 kilograms, the sum of both events, won the gold medal. In 1980 the winning sum leaped to 422.5 kilograms but has since held nearly steady, registering 425 kilograms at both the 2000 and 2004 games.

Counterintuitive as it may seem, the nearer athletes approach maximum strength the less decisive strength will be in separating winners from losers. Near the maximum athletes will have little room to improve and thereby distinguish themselves from rivals, who will be only infinitesimally less strong. At the maximum all elite athletes will be identical in strength, nullifying it as an advantage. To put the matter another way, when all athletes are at the maximum they will all bump up against the same strength ceiling.

Near the maximum athletes may work less to build that last iota of strength and more to maintain strength throughout their career. A baseball player who can hit the ball 137 meters at age forty may extend his career and the earnings from it a decade beyond those of players whose strength deteriorates with age. Whether athletes will covet such longevity remains open to question. Multimillion-dollar contracts make athletes financially secure after only a few years, obviating the need to play longer than they desire. Yet, athletes need a long career if they are to set records and secure their place in the history of sports. If for no other reason people remember the U.S. baseball players Lou Gehrig and Cal Ripken for longevity. For the same reason Italians revere cyclist Gino Bartali, who in 1948 won the Tour de France ten years after his first victory, a feat no other cyclist has matched. His success was possible only because Bartali remained strong throughout his career: He was the best mountain climber among cyclists of his generation. Others were faster on level ground, but none had his strength and the discipline to maintain it during two decades as a climber. The future may belong to athletes such as Bartali who make strength the foundation of their durability.

Stress

Stress has been identified as a critical facet in sport, influencing individual and team performance as well as social functioning. The inability to manage stress in sport is strongly associated with increased anxiety and burnout, increased aggression and violence, decreased self-esteem and enjoyment, decreased performance expectancies, and performance difficulties. Nevertheless, one of the primary challenges in understanding and controlling stress revolves around conceptualizing it. This dilemma is revealed in the following definition of stress:

1. Generally, any force that, when applied to a system causes some significant modification of its form usually with the connotation that the modification is a deformation or a distortion. The term is used with respect to physical, psychological and social forces and pressures. Note that stress in this sense is a cause; it is the antecedent of some effect.
2. A state of psychological tension produced by the kinds of forces or pressures alluded to in 1. Note that stress in this sense is an effect; it is the result of other pressures. When meaning 2 is intended, the term stressor is typically used to refer to the causal agent." (Reber and Reber 2001, 716)

The first part of the definition identifies stress as a stimulus. Research based on this approach emphasized how social-cultural factors (social class, age, gender,

racism, life changes, etc.) produce stress reactions. A popular investigation of psychological stress focused on identifying common life changes or events ranging from holidays, to sexual difficulties, to death of a spouse. Sport research tended to concentrate on factors such as the pressure of important sporting events, expectations of significant others, coaching and playing demands, financial difficulties, and the like. This point of reference also leads to the use of such terms as good stress (*eustress*) and bad stress (*distress*).

The second part of the definition focuses more on the stress response. This orientation emphasizes the physiological and emotional responses (such as arousal and anxiety) or the consequences of being placed in demanding sporting situations. Stress as a response was popular because scientists could study the relationship between particular biological-physiological reactions and further consequences such as illness or performance breakdowns. Physiological effects included activation of the adrenal glands, producing stress hormones (cortisol, aldosterone, and epinephrine). The stress response included increased neural excitability, cardiovascular changes, increased metabolic activity, neurological sweating, and changes in gastrointestinal functioning. Thus, a stress response to sport stressors could include increased heart rate and heart stroke volume, sweating palms (and other body parts), muscular tension or control problems, butterflies in the stomach, feelings of nausea, diarrhea, and need to urinate. Psychological responses such as emotional reactions (fear and anxiety) and changes in cognitive information processing are also important.

Both the stimulus and response conceptualizations are limiting. Researchers have found large individual differences in how athletes (and nonathletes) react to the same objective stimulus. Because of these difficulties, the general consensus in the research field is that stress is best conceptualized *as a process* involving a dynamic interaction between the person and the environment (Lazarus 1999). This viewpoint recognizes that an athlete's physiological, emotional, and cognitive responses to sporting stressors will be heavily determined

by the athlete's motives, beliefs, goals, cognitive and coping abilities, physical conditioning, and other internal factors.

The Stress Process

To better understand the stress process in sport performers, it is best to identify the critical components of the process. These components are environmental demands, cognitive appraisal, physiological arousal, action tendencies or impulses, coping strategies, and emotions. A comprehensive discussion of these components and their role in the stress process is beyond the scope of this article (see, instead, Further Reading). Nevertheless, a succinct discussion will help the reader understand the role of these components in sport stress.

Environmental demands create the initial stressor conditions. Common sport stressors include opponent and teammate abilities and actions, match importance, referee decisions, playing conditions, sport crowd or audience behavior, coach's actions, equipment, financial pressures, and the support and expectations of significant others. None of these stressors, however, are sufficient in themselves to produce stress responses. Research has indicated that in the majority of cases it is how the athlete evaluates the meaning of the stressors that produces stress responses.

The late Richard Lazarus suggested that psychological stress requires a judgment that the person-environment interactions involve one of the three stress relationships: harm-loss, threat, challenge. Harm-loss and threat are negative interpretations, whereas challenge involves the person perceiving possible benefits but requiring high cognitive and physical effort. The type of stress relationship is dependent on the individual's internal characteristics, the cognitive appraisal of the environmental demands and one's ability to manage these demands (their coping ability). There are two interrelated types of appraisal. Primary appraisal involves determining "what is at stake?" The athlete must quickly evaluate, much of which is done automatically, if the sporting situation is important to one's goals (motivation aspect) and whether the situation threatens, harms, or benefits these goals. An

important aspect of this process is determining the potential consequences of succeeding or failing to meet the stressor demands. Secondary appraisal involves determining "what can be done." This evaluation involves determining who is or was responsible, future expectancies, perceived control, and coping options.

The appraisal of environmental demands and perceived consequences will produce discrete emotions (i.e. anxiety, anger, fear, happiness) and associated physiological states such as arousal and action impulses. For example, anxiety occurs if in the athlete's judgment, he or she is likely to fail to achieve success in a very important event. This emotion is usually associated with high arousal and an action impulse to escape or withdraw. Coping is a critical process that can moderate this emotional experience. Sport researchers have recognized that coping strategies play an important role in the ways in which athletes of various ages manage and change stress and emotion. Coping refers to cognitive and behavioral actions used to manage the external and internal demands of a stressful situation. Most conceptual models of coping feature at least two broad coping dimensions. Problem-focused coping refers to efforts that attempt to change the situational demands. Common problem-focused strategies in sport include increasing effort, planning, and information seeking. Emotion-focused coping are efforts to manage emotions. This type of coping includes strategies like seeking emotional support, acceptance, relaxation, and positive reappraisal. Many researchers propose a third category, avoidance coping, which includes individuals' efforts to remove themselves either physically or mentally from the stressful situation. The strategies selected by an athlete are contingent on (a) the appraisal that the strategy will help manage the situation, and (b) the confidence the athlete has in using the strategy in that situation.

Coping strategies can impact the stress process both in the competition preparation stage and when the athlete actually confronts a stressor. For example, an athlete can plan a course of strategic action to neutralize an opponent's strengths. Other preparation strategies

might include positive imagery, suppressing competing activities (e.g., partying with friends), and fine tuning physical and technical training. Successful confrontation coping strategies might include utilizing coaching assistance and the competition plan, positive self-talk, arousal control, and increasing effort.

How Stress Impacts Performance

We can understand how stress can affect sporting performance by examining how emotional experience can potentially disrupt underlying performance mechanisms. Stress can exert an influence on the physiological components of performance via an increase in arousal. Increased heart rate, sweaty hands, and mus-

cular tension can influence fine motor control and dexterity. For example, research with elite rifle and pistol shooters show that the ability to control heart rate and muscular tension is critical for top performance. Top golf professionals have reported being unable to feel their arms and hands when faced with putts that are worth hundreds of thousands of dollars.

Stress can also influence cognitive information processing such as perception, decision making, memory, and response selection. Anxiety states can impair the ability to identify important information. The combination of anxiety and arousal can produce two performance-impairing states: (a) narrowing of attention such that critical information needed for optimal

performance is missed or (b) hyperdistractibility such that the athlete is again unable to focus on the important information. Examples from sport include mistakenly passing a ball to the wrong team, forgetting part of a sequence in a play, being unable to think, and not recognizing the position of athletes in either defensive or offensive formations.

Emotional control problems associated with stress can also cause problems such as violence or withdraw from the sporting situation. Action impulses associated with strong emotions such as anger may result in one athlete striking another. There have been numerous cases in the media in which athletes have loss control in highly stressful situations and have attacked other

athletes, coaches, referees, or spectators. These are clearly cases where athletes have lacked or chosen not to use coping strategies to manage their action impulses.

Prolonged experience of stress-related anxiety and sadness may contribute to athletes withdrawing from sport, disrupting everyday social functioning, experiencing illness, and in extreme cases, committing suicide. Burnout in sport is becoming an increasing concern in organized sport at both the youth and adult level. Burnout is associated with emotional exhaustion, feelings of isolation, low motivation, negative feelings, and concentration problems. Burnout results from overtraining, combined with prolonged exposure to high pressure to perform. Some sport research indicates that athletes who have a tendency to have very high, self-imposed standards and have an inability to accept flaws or failures within themselves are at greater risk for burnout.

Managing Stress

Given that sporting demands can produce undesirable consequences, it is important to identify ways to either reduce the stressor demands or help athletes manage stress more effectively. There are several key areas of stress management interventions including environmental management; the athlete's physical, technical, and strategic preparation; and the athlete's psychological skills and coping strategies. Since stress involves an interaction between the environment and the person, interventions should target both aspects of this relationship. Environmental management can include providing supportive coaching and parental feedback, placing athletes in training and competitive conditions that promote challenge rather than threat, developing training programs that allow for proper physical and psychological adaptation and allow sufficient rest for recovery, and modifying sporting equipment and rules to promote the development of skills, greater success, and enjoyment.

Since stress occurs when athletes perceive an imbalance between situational demands and their resources, one means to reduce stress is to improve physical, technical, and tactical expertise. As athletes become stronger,

faster, more skillful, and more strategically adept, they will be better able to handle more demanding sport situations. However, increased ability often results in the athlete entering a higher level of competition with increased demands. Psychological-skills and coping-skills training can help athletes manage stress. There are a number of effective skills such as relaxation, energizing, biofeedback, goal setting, imagery, self-talk, cognitive restructuring, problem solving, time management, refocusing, and attention control that could help manage stress. Some intervention strategies may affect only one component of stress (i.e., progressive relaxation targets muscular and arousal activation), whereas other strategies may directly or indirectly affect several components (i.e., goal setting can impact the adoption of specific motivational goals and motivate changes in physical and psychological training).

Sport research has found that coping-skills training can help athletes learn a number of coping skills to effectively manage stress and emotion. Stress Inoculation Training, developed by Dr. Donald Meichenbaum, is a coping-skills training intervention in which athletes learn a variety of coping responses. Athletes practice individually relevant coping skills, starting with small manageable doses of stress and progressing to more stress-inducing settings. A second program, developed by Dr. Ronald Smith, called Stress Management Training, involves having athletes develop an "integrated coping response" that enables them to better manage stressful situations. The integrated coping response combines both a breathing-relaxation component and self-talk. Athletes practice this integrated response to control high levels of arousal generated through a technique called "induced affect."

This article has emphasized that stress is a complex process that results from a dynamic transaction between the environment and the person. The sporting environment places numerous demands on the athlete, the athlete evaluates the meaning of these demands and responds, and the environment counters with new demands. It is difficult to determine what types of situations and sports are inherently more stressful than

others since so much depends on what the athlete brings to the situation in terms of goals, motives, and physical and psychological skills. The ability to cope with the competitive pressure is critical in all levels of sport to ensure positive psychological growth.

Sumo

Sumo wrestling is a Japanese sport in which a contestant loses if he is forced out of the ring or if any part of his body except the soles of his feet touches the ground. A sumo match usually lasts a few seconds and only in rare cases a minute or more.

History

Some historians have used archaeological evidence, such as the terra-cotta figures known as “haniwa,” to claim that sumo had prehistoric origins. Others have claimed the origins of sumo in the mythic hand-to-hand combats recorded in the *Kojiki* (Record of Ancient Matters) of the eighth century. However, we can reliably trace sumo no further back than 821, when sumo tournaments, along with archery and equestrian archery tournaments, were among the three great annual tournaments of the imperial court.

Sumo tournaments were staged on the grounds of the imperial palace. An area behind the Shishinden (Hall for State Ceremonies) was strewn with white sand for the event. Thirty-four wrestlers, drawn from the “right” and “left” imperial bodyguards, entered a garden to the accompaniment of two drums and two gongs. After the wrestlers came musicians, dancers, and officials, then the emperor and his courtiers. Members of the “left” team wore paper hollyhocks in their hair, the “right” team wore calabash blossoms. Matches were decided when a wrestler fell or was dragged by his opponent to his team’s tent. After each match the musicians beat their drums, banged their gongs, and performed a ritual dance.

These tournaments were suspended from 1120 to 1156, revived intermittently until 1185, and then discontinued. However, sumo survived in other forms—as *no sumo* (field wrestling) and *kusa sumo* (grass wrestling) or as *shinji-zumo* (wrestling in the service of the gods). The most famous version of the latter form was *karasu-zumo* (crow wrestling). It was staged at the Kamo Shrine in Kyoto, where boys who represented the

god Takemikazuchi wrestled boys who represented the secular world. *Onna-zumo* (women's wrestling) seems to have been staged for the titillation of men.

During the early eighteenth century Yoshida Oikaze and other *toshiyori* (elders) codified sumo wrestling and introduced some of the rituals that make sumo distinctively Japanese. Matches were staged to entertain the shoguns (military governors) who, until the Meiji Restoration of 1868, exerted greater political power than did the emperors. According to writer P. L. Cuyler (1979), "Shogunal sumo lifted the sport out of the vulgar world of entertainment and imparted to it a sense of ritual that later became its major characteristic."

Practice

Even today the administration of sumo wrestling is a complex mixture of traditional and modern elements. All sumo wrestlers are members of a *heya* (room), the equivalent of a stable in horse racing. The most famous of these *heya* were established in Edo (modern Tokyo) between 1751 and 1781. The elders who ran the *heya* received official recognition by the shogun in 1773 and by the emperor in 1885. At that time 105 elders existed. In 1926 the organization was restructured when *heya* from Tokyo joined those from Osaka to form a more nearly national organization. In 1958 this organization became the Nihon Sumo Kaikyo (Japanese Sumo Association). In 1989 forty-one *heya* were informally organized into five great families. The Yoshida family, which claims to have been involved with sumo wrestling since the thirteenth century, was so dominant that not until 1951, after a teenager became the official

head of the family, did the Yoshida family agree to let the sumo organization decide which wrestlers should be elevated to the top rank.

The hierarchy of ranks is complicated. Beginners enter as *maezumo* (before sumo). They receive room, board, and a small allowance. They also receive new names, which are written in kanji (Chinese characters). By contrast, not only do Japanese baseball players keep their own names, but also, on their uniforms, these names are spelled in the Latin alphabet. If the *maezumo* are successful in the six annual fifteen-day tournaments, they rise to become *jonokuchi*, who are given individual rankings. Further successes mean promotion to the ranks of *jonidan*, *sandamme*, *makushita*, and *juryo*. Only about

one in sixty wrestlers rises to *juryo* rank. If he reaches this rank, he is classified as *sekitori* and allowed to change from a black or dark blue loincloth to a white one and to participate in the ring-entering ceremony. Members of the *juryo* rank wrestle daily during tournaments, receive a salary in addition to their winnings, and have apprentice wrestlers to assist them. When they are not engaged in wrestling, they are also allowed to wear a kimono and *haori* (a man's light coat).

The five ranks higher than *juryo*—*maegashira*, *komusubi*, *sekiwake*, *ozeki*, and *yokozuna*—comprise the *makuuchi* division. Members of this division are allowed four minutes for *shikiri*, the crouching, stamping, and glaring that precede wrestling. *Juryo* are allowed only three minutes of *shikiri*; *makushita* are allowed only two. Members of the lesser ranks must enter the ring and move directly into competition.

Election to the highest rank—*yokozuna*—is an honor that is bestowed on few wrestlers. In all other ranks a wrestler can be demoted after a number of losses. A *yokozuna* cannot be demoted. If his powers begin to diminish, he is expected to retire. A series of successful tournaments will elevate a wrestler to the *ozeki* rank, but only wrestlers whom the elders deem to have *seishin* (spirit) are elevated to *yokozuna*. Although a few foreigners have become *ozeki*, they rarely become *yokozuna*. When Hawaii-born Jesse Kuhaulua retired in 1976, the elders decreed that foreign-born wrestlers should not be allowed to achieve elder status.

Westerners who watch sumo wrestling are struck not only by the size of the participants—some of whom weigh more than 182 kilograms—but also by sumo's many rituals. Among the ritual elements is the design of the *doyo* (ring), which consists of a circle inscribed in a square. The *doyo*, which dates from the seventeenth century, is flanked by four pillars at the four corners of the rectangular "ring." These pillars are painted blue for the god of spring, white for the god of autumn, red for the god of summer, and black for the god of winter. During the eighteenth century four elders would lean against these four pillars to assist the referee in his decisions. They were known as the "*naka aratame*" (mid-

dle determiners). The circle is formed by twenty bags of rice straw stuffed with earth. The ring is about 50 centimeters high with a diameter of 4.5 meters. Before each match the *doyo* is purified by handfuls of salt. The *shimenawa*—the ropes that the *yokozuna* wear around their waists—represent the ropes that adorn Shinto shrines and date from the sixteenth century.

Some of sumo's traditions are ancient, but others can be traced back only to the eighteenth century. Yoshida Oikaze, for example, introduced the ring-entering ceremony in 1791 when sumo was staged for the shogun Ienari, and something suitably ceremonial was called for. Today all *sekitori* participate in the ceremony, which includes an entrance by means of the *hanamichi* (path of flowers). The wrestlers circle the ring, face inward, clap their hands, raise their arms, lift their aprons slightly, and file out. The ceremony is slightly different for a *yokozuna*. He appears with a *tsuyu harai* (dew sweeper) and a *tachi mochi* (sword bearer). He wears a thick white rope over his apron. After his hand movements, he goes to the center of the ring, stamps his feet, lies down, rises, stamps again, and repeats his hand movements. The stamping is intended to drive away demons. The salt that the wrestlers strew upon the *doyo* serves the same function. The *yumitorishiki* (bow dance) was first performed when the shogun expressed his pleasure by handing one of the wrestlers, the great Tanikaze Kajinosuke, a bow. Tanikaze's dance was an expression of his gratitude.

"Traditionalization"

Sumo wrestling, unlike most other sports, has not undergone modernization to rid it of its religious elements. On the contrary, sumo has been characterized more by "traditionalization"—an effort to introduce religious elements into a previously secular sport and to link it more closely to the culture of medieval Japan. The hat worn by the referee, which looks like the headgear of a Shinto priest from the Heian period (794–1185), was adopted in 1909. His colorful kimono, which imitates Heian courtly attire, also dates from that nationalistic period. The roof above the *doyo* was originally

shaped like the roof of a traditional Japanese farmhouse. In 1931, during another nationalistic period, the roof was redesigned to resemble the roof of the Ise Shrine, the most sacred Japanese religious site. In other words, much of the religious symbolism that an observer might assume to date to the Heian period is actually what the British historian Eric Hobsbawm has called “invented tradition.”

The elders who “traditionalized” sumo were successful: Sumo is baseball’s only serious rival among spectator sports in Japan. Together the two sports symbolize Japan’s desire to be both a traditional and a modern society.

Sumo Grand Tournament Series

Although sumo enthusiasts claim that their sport is thousands of years old, this uniquely Japanese form of wrestling can be reliably traced no farther back than 734 CE, when sumo matches were performed at the imperial court in Nara. When the court was moved to Heian-Kyo (modern Kyoto), at the end of the century, tournaments were held on the grounds of the imperial palace. From 837, the site was an area behind the Shishinden (“Hall for State Ceremonies”). It was strewn with white sand for the occasion. Thirty-four wrestlers, drawn from the “right” and “left” imperial bodyguards, entered to the sound of drums and gongs. They were followed by officials, musicians, and dancers, then by the emperor and his court. The teams were distinguished by decorations in their hair, paper hollyhocks for the left,

and calabash blossoms for the right. Matches were decided by falls or when a wrestler was dragged to his own team’s tent by his opponent. After each match, the musicians beat their drums, struck their gongs, and performed a ritual dance. There was no independent referee, so the emperor decided close matches. Arrows thrust into the sand recorded the results.

The annual tournaments at court lasted only until 1185, but sumo survived in several other forms, the most important of which was probably *shinjizumo* (“wrestling in service of the gods”). A less exalted form was *onnazumo* (women’s wrestling).

Modern sumo can be traced to the early eighteenth century, when *zujizumo* (street-corner sumo) entertained the urban population of Osaka, Kyoto, and Edo (modern Tokyo). Yoshida Oikaze and a number of other *toshiyori* (elders) codified and regulated the sport and introduced a number of distinctive rituals. Between 1751 and 1781, the elders, who gratefully received the shogun’s official recognition in 1773, gathered the wrestlers into a number of *heya* (“rooms”) where they lived and trained. By 1885, when the emperor gave his approval to the system, there were 105 *heya*, each presided over by an elder. The entire organization was restructured in 1926 when Tokyo’s *heya* joined those from Osaka to form a national organization. In 1958, this organization, frequently reformed and renamed, became Nihon Sumo Kaikyo (Japanese Sumo Association). In 1989, forty-one *heya* were informally organized into five great “families.” In 1965, the rule that prohibited matches between wrestlers of the same “family” was dropped, but matches between members of the same *heya* are still banned.

Complicated Rankings

The wrestlers themselves are divided into an extremely complicated pyramid of ranks. Beginners enter as *maezumo* (“before sumo”). They receive room, board, and small allowance. They are also given new names, which are invariably written in Chinese characters. If the novices are successful in the six annual fifteen-day tournaments held in Tokyo, Nagoya, and Osaka, they

become *jonokuchi*. Continued success means promotion to the *jonidan*, *sandamme*, *makushita*, and *juryo*. Only about one in sixty wrestlers rises to *juryo* status. If they reach this rank, they are classified as *sekitori* and allowed to change from black or dark blue loin-cloths to white ones. They wrestle daily during the tournaments, and they receive a regular salary in addition to their winnings. When they are out in public, they are allowed to wear a kimono and *haori* (a man's light coat).

The *makuuchi* division comprises the five top ranks—*maegashira*, *komusubi*, *sekiwake*, *ozeki*, and *yokozuna*. Among the privileges enjoyed by the *makuuchi* is *shikiri*, time set aside for crouching, stamping, and glaring. Election to the eleventh and highest rank—the *yokozuna*—is a great honor bestowed on very few wrestlers. The *yokozuna* must satisfy the elders that he has *seishin* (spirit), that he is an exemplary representative of the Japanese people. Once promoted, he cannot be reduced in rank. (If a *yokozuna* loses two or three matches in a row, he goes into retirement.) Not until 1993, after Hawaii-born Akebono had won two consecutive championships, did the Sumo Association reluctantly elevate a non-Japanese to *yokozuna* rank.

The rules that prohibit matches between *heya*-mates and allow matches between wrestlers of different ranks makes the selection of a tournament champion extremely complicated. Calculations made on the basis of wins and losses must take into account that a *sekiwake* who unexpectedly humbles a *yokozuna* has achieved a spectacular upset (as if a middleweight boxer defeated the reigning heavyweight champion).

Size, Ritual, and Traditions

Westerners who attend a sumo tournament are surprised by the huge size of the wrestlers, some of whom weigh 400 pounds or more, and by the many rituals that characterize the sport. The *doyo* (ring), which dates from the middle of the seventeenth century, is a circle inscribed in a square flanked by four pillars painted blue, red, white, and black (for the gods of spring, summer, autumn, and winter). The circle within which the

wrestlers compete is formed by twenty bags of rice straw stuffed with earth. The *doyo*'s rim is approximately 20 inches high and its diameter is slightly less than 15 feet. Before each bout, the ring is purified by handfuls of salt. The *shimenawa* that the *yokozuna* wear wound about their waists represent the ropes that adorn Shinto shrines.

Some of sumo's traditions are very old, some date from the eighteenth or nineteenth centuries, and some are surprisingly recent. The strewing of salt dates from the end of the seventeenth century. Yoshida Zenzaemon introduced the ring-entering ceremony in 1791. Today, all *sekitori* participate in the ceremony, which includes an entrance down the *hanamichi* (path of flowers). The wrestlers circle the ring, face inward, clap their hands, raise their arms, lift their aprons slightly and file out again. The *yokozuna* is privileged to enter with a *tsuyuharai* (dew-sweeper) and a *tachimochi* (sword-bearer). He wears a thick white rope over his apron. After his hand movements, he goes to the center of the ring and stamps to drive away demons. The *yumitorishiki* (bow-dance) also dates from the eighteenth century, when the shogun expressed his appreciation by presenting a bow to the great Tanikaze Kajinosuke, who promptly danced his gratitude. Some of sumo's most distinctive symbolism dates from the early twentieth century, when the sport underwent a period of intense "retraditionalization." The referee's tall black hat, which resembles the headgear of a medieval sumo priest, was adopted in 1909. His colorful kimono dates from the same period of nationalistic fervor. The roof that is suspended over the *doyo*, even when sumo tournaments are held indoors, was originally shaped like an ordinary Japanese farmhouse, but it was redesigned in 1931, in another highly nationalistic period, to resemble the roof of the Ise Shrine, Japan's most sacred Shinto site.

The elders who retraditionalized sumo were quite successful. In the very center of high-tech global modernity, sumo reassures the Japanese that they still have a distinctive culture.

Super Bowl

The Super Bowl, the championship game of American football, is the most watched, written about, and talked about single sports event in the United States today. It has become a national ritual, and Super Bowl Sunday is akin to a national holiday—marked by gatherings of family and friends, food, drink, and betting on the outcome. The competitors are the winners of the National Football and American Football conferences of the National Football League playoffs.

An American Institution

First played in 1967, the Super Bowl is traditionally staged on a Sunday evening, and is seen by more than 130 million television viewers alone in the United States. Advertisers, who paid as little as \$75,000 for a thirty-second commercial for the telecast of Super Bowl I, now pay \$2.5 million for the same thirty second commercial. Apple Computers introduced its first ever line of Macintosh computers with a Super Bowl television advertisement in 1984.

The NFL estimates that in 2004 almost one billion people viewed part of Super Bowl XXXVIII in 229 different countries, and the game was broadcast in twenty-one different languages. Some 3,000 media credentials are typically assigned for a Super Bowl, including 400 to international journalists. The game's number is traditionally referred to in roman numerals, although that practice did not start until the fifth Super Bowl.

The game is played at a stadium site that is picked years in advance of the actual game date. No team has ever played a Super Bowl in its home stadium. Super Bowl games are usually awarded to stadiums in the southern part of the United States, to help ensure good weather since the game is played in either late January or early February, although on a few occasions the game has been played in northern locations that have a domed stadium. In all, eleven different cities in the United States have hosted a Super Bowl, with New Orleans hosting the most with nine. Cities are competitive in bidding to host the game, since the economic impact from just one Super Bowl can be as high as \$250 million.

The day has become so popular—more pizzas are sold on Super Bowl Sunday than any other day of the year in the United States—that some consider it a

When you lose a game, you have to learn.* ■ TOM LANDRY

de facto holiday. In 2004, more than \$81 million in bets were placed on the Super Bowl in the state of Nevada, where gambling on professional sports is legal. Privately, it is estimated that several billion dollars is actually wagered on the game illegally. Part of the Super Bowl tradition is the elaborate halftime show featuring top entertainers. The 2004 show was controversial when singer Janet Jackson's breast was bared; the 2005 show featured former Beatle Paul McCartney and was much tamer. Commercials have become an integral part of the television broadcast as well, with major corporations vying to produce the most creative, innovative, or amusing commercials—which are then widely critiqued in the media on the day after the game.

History

The game was originally known as AFL-NFL World Championship Game, and came about because of competition between the two competing professional football leagues—the American Football League founded in 1960 and the National Football League founded in 1920 as the American Professional Football Association. It took the NFL name in 1922. The game didn't actually become the "Super Bowl" until 1968, before the third championship game. Legend has it that the owner of the Kansas City Chiefs, Lamar Hunt, whose team played in the first ever Super Bowl, came up with the event's name after coming across one of his daughter's favorite toys, a super ball. The game's number is traditionally referred to in roman numerals, although that practice did not start until the fifth Super Bowl.

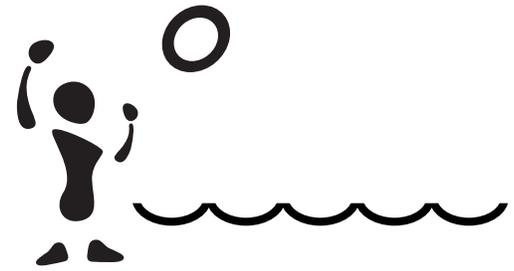

The Chiefs played the Green Bay Packers, coached by Vince Lombardi (considered one of the league's most legendary coaches), in Super Bowl I, played 15 January 1967. Today, the trophy given out to winning team is called the Vince Lombardi trophy. The Pete Rozelle Trophy—named after the man who served as league commissioner for almost thirty years and is largely credited with spurring the growth and popularity of the National Football League—is given out to the most valuable player in the Super Bowl.

Far from the popular event it is today the first Super Bowl only attracted 61,946 fans, almost 40,000 short of capacity at the Los Angeles' Memorial Coliseum, although every game since has been a sell out. Green Bay won the first game, 35–10, led by quarterback Bart Starr and receiver Max McGee—who only saw action in the game because of an injury to starting wide receiver Boyd Dowler. For the entire season, McGee had caught only four passes for 91 yards, but in the newly created title game, he hauled in seven passes for 138 yards and two touchdowns. Each Packer received a "winner's share"—a monetary reward for being on the victorious team—of \$15,000 each, while each Chief earned \$7,500. By comparison, the 2004 winning share for each member of the New England Patriots was \$68,000, while the members of the losing Carolina Panthers each earned \$36,500. The most inexpensive ticket to the first-ever Super Bowl was \$6; the most inexpensive ticket price for the 2004 game was \$350.

Seventeen teams have won the Super Bowl:

Dallas Cowboys	5
San Francisco 49ers	5
Pittsburgh Steelers	4
Green Bay Packers	3
New England Patriots	3
Oakland/LA Raiders	3
Washington Redskins	3
Denver Broncos	2
Miami Dolphins	2
New York Giants	2
Baltimore Colts	1
Baltimore Ravens	1
Chicago Bears	1
Kansas City Chiefs	1
New York Jets	1
St. Louis/LA Rams	1
Tampa Bay Buccaneers	1

The New England Patriots have won three of the last four Super Bowls. This is considered a near-amazing achievement given efforts by the league to develop parity among teams. The most significant Super Bowl was

the third when the New York Jets of the AFL beat the heavily favored Baltimore Colts of the NFL by the score of 16–7. The victory had been publicly guaranteed by Jet’s quarterback Joe Namath three days before the game. The victory made the AFL the equal of the NFL, and the next year the leagues merged.

Surf Lifesaving

A combination of water safety educational programs and practices and ocean and beach sports, surf lifesaving first developed on Australian, New Zealand, and South African foreshores in the early twentieth century. Many of the early clubs began as affiliates of the Royal Life Saving Society (founded by William Henry in 1891), a volunteer rescue society based in England. But the dynamic ocean environment encouraged the clubs to progressively affiliate with specialist surf-based lifesaving organizations. Indeed, in 1924 the Surf Life Saving Association of Australia (SLSAA) and the Royal Life Saving Society (RLSS) in Australia signed an agreement that allocated responsibility for the safety of harbors, bays, and rivers to the latter. The RLSS also assumed responsibility for teaching lifesaving procedures to schoolchildren and public agencies. However, the social environment played a more decisive role than the physical environment in shaping the Australian movement that has achieved hegemony on the international stage via the International Council of Surf Life Saving (formed

in 1956), World Life Saving (1971), and the International Life Saving Federation (1993).

To qualify as a patrolling surf lifesaver, an individual must gain the bronze medallion, which tests fitness (beach running, swimming in the surf, and resuscitation methods). Clubs conduct the test on an annual basis, but only a minority of members has current medallions.

History

Alerted by medical practitioners to the health-giving and therapeutic properties of cold-water bathing, the English middle classes adopted bathing as a pastime and sport (i.e., swimming) in the eighteenth century. But in the nineteenth century, bathers who pursued their pleasures in public faced opposition from evangelically inspired factions, who campaigned against what they deemed morally offensive and socially subversive behaviors, including exposed displays of the body. In this social climate bathing and swimming largely developed in enclosed baths (both seawater and freshwater) where moral guardians could monitor and control public displays of the human body.

In the antipodes official ordinances regulated bathing in public (for example, prohibiting the activity during daylight hours), fueling conflict between moralists and those who deemed bathing in open waters a natural pleasure and of high social and economic benefit. The factions in favor of public bathing challenged repressive beach-bathing laws. In the early 1900s, devotees won the right to bathe in daylight hours, but the struggle to control the beach was far from resolved.

Determined to protect “the common standards of propriety that prevail among civilized nations,” moralists directed attention to bathers’ costumes, sunbathing (which they described as a practice suitable only for dogs), and mixed bathing. Surf bathers responded by forming lifesaving patrols to demonstrate their respectable intentions, and in October 1907 a dozen clubs in Sydney united under the umbrella of the Surf Bathing Association of New South Wales (SBANSW). Its objectives were to provide better

facilities for surf bathers, institute improved lifesaving methods and aids, and provide rules for the proper conduct of surf bathers.

The class structure and aims of SBANSW quickly ensured official sanction for the activity. In 1911 John Lord, the association's first president, chaired a four-man committee appointed by the NSW government to inquire into surf bathing. The government adopted virtually all the committee's recommendations, including structuring volunteer lifesaving clubs around rational military organization, discipline, and drills.

Surf Life Saving Association of Australia

SBANSW survived by assuming "duty-of-care" for surf bathers. The association defined itself as a humanitarian and volunteer safety service and, consistent with this image, changed its name in 1920 to the Surf Life Saving Association of Australia. The SLSAA reinforced its self-imposed responsibility by adopting the motto "Vigilance and Service" and by highlighting its annual and cumulative tallies of rescues. (The SLSAA claims that its members have performed over 484,000 rescues since 1907.) But if its assumption of "duty-of-care" increased SLSAA's standing in the eyes of governments and helped secure more financial assistance from local councils who understand only too well that volunteer organizations can provide highly effective cost-effective services, it also exposed the association to risks of public liability. Indeed, the expense of insuring against public liability has steadily grown to the point where it currently threatens the financial viability of many clubs.

The SLSAA has also failed to reconcile the place of sport in the movement. The association nurtures the sporting image of the lifesaver that it uses to raise public monies and entice commercial sponsorship. Competition at regional, state, national, and international levels officially provides members with the means to practice and develop lifesaving skills; in reality many members and clubs regard lifesaving sport as the end rather than the means.

"IRONMAN"

The development of the Ironman Grand Prix circuit in the 1980s exacerbated the lifesaver-athlete contradiction. Introduced to Australia by touring lifeguards from the United States in 1965, corporate sponsors and the media soon recognized the economic and sporting potential for an endurance event involving lifesavers running, swimming, and paddling boards and surf skis. After outside commercial interests threatened to organize an independent event, the SLSAA introduced its own circuit in 1986. But lifesavers quickly grew dissatisfied with the management and administration of the official circuit. In 1989 a small group formed the Ironman Super Series as a "rebel" competition and secured their own sponsors. Assisted by corporate rivalry between the sponsors and those televising the two circuits, prize money for the two competitions ballooned to \$1.5 million; many leading lifesavers also secured lucrative personal sponsorships.

In 2001, after twelve years, breakfast food manufacturer Uncle Tobys withdrew its financial support and the "rebel" Ironman Super Series collapsed. Kellogg immediately slashed its contribution to the official circuit by more than 50 percent. Ill at ease with the hype and attention afforded to its lifesavers and seeking to balance the sporting and lifesaving aspects of the movement, the SLSAA restructured and downsized the elite ironman competition.

During the course of the twentieth century, the Australian surf lifesaver became a national and international icon propelled by both lifesaving and sporting heroics on the beach. Unfortunately, successive generations of officials responsible for organizing and administering surf lifesaving have failed to reconcile the long-standing tension between the ideals and realities of what it means to be a lifesaver.

Surfing

Surfing is the water sport of riding waves; the ancient Hawaiians referred to surfing as Heʻenalu. The peoples of greater Oceania are credited with developing surfing as we know it, especially those in the islands of Hawaii where the sport became an integral part of the culture sometime around 1000 CE, centuries before Columbus sought the New World.

Origins of Surfing

Although most scholars agree that the sport of surfing traces its origins more specifically to Polynesia, where and when the activity was first practiced remains a mystery. Hawaii holds a clue. History there was not preserved via the written word; rather, it was passed on from one generation to the next via stories and chants. Countless narratives, generations deep, recalled how deeply imbued surfing played into the culture. One such accounting was transcribed by A. S. Twombly in his book *Kelea: The Surf-Rider, A Romance of Pagan Hawaii* in the late 1800s and published in 1900.

The western world first learned of surfing through the recorded observations of the Hawaiian explorer Captain James Cook and his ship’s illustrator, John Webber. Cook’s explorations more than once brought him and his crew to Kealahou Bay, Hawaii (Hawaii was then named the Sandwich Islands), where he and the crew first witnessed men and women surfing on boards and canoes.

By the 1860s, author Mark Twain penned his account of surfing while traveling on the Big Island of

Hawaii. There, he noted how the “naked natives of both sexes and all ages, were amusing themselves with the national pastime of surf-bathing.” Twain later described his first personal and futile attempts at “surf-riding” in his book *Roughing It*.

After more than five centuries, the sport of surfing has developed and evolved into a well-established activity, although not before the decline of the Hawaiian culture, which began during the 1800s. An inevitable clash of cultures occurred when the missionaries and Europeans traveled to the islands with differing ways and customs. Surfing nearly ceased to exist by the end of the nineteenth century for many reasons, including the missionaries’ disdain for such a nonproductive activity and disease brought to Hawaii by outsiders. A mere 10 percent of the Hawaiian population is estimated to have survived between the first outside contacts with Hawaii and the end of the 1800s.

The revival of surfing in Hawaii and the consequent global spread of the sport thereafter was largely because of Duke Paoa Kahanamoku, a full-blood Hawaiian who is the revered and acknowledged father of modern surfing. Kahanamoku is credited with spearheading the return of surf-riding and its mainstream acceptance in Hawaii by 1910 and, shortly thereafter, with introducing the longer ten- to eleven-foot Waikiki-style surfboard.

In 1912, he went on to win gold and silver medals for swimming at the Stockholm Olympics. The same year, he introduced surfing to the U.S. East Coast, and by 1915, he brought surfing to New Zealand and Australia. During a visit to California that year, Duke advanced the sports of both surfing and swimming with displays of his water skills and because of his celebrity status.

George Freeth, Hawaiian born of mixed Irish and Hawaiian ancestry, was likewise instrumental in the spread of surfing to California, far from the sport’s firmly established epicenter in Hawaii. Employed as a Los Angeles county lifeguard, Freeth was often seen riding his surfboard or using the board assisting swimmers in danger during beach rescues. Surfing in Hawaii

In this report by a group of missionaries in 1823, they describe surfing as practiced by indigenous Hawaiians.

On these occasions they use a board, which they call *papa he naru*, (wave sliding-board,) generally five or six feet long, and rather more than a foot wide, sometimes flat, but more frequently slightly convex on both sides. It is usually made of the wood of the *erythrina*, stained quite black, and preserved with great care. After using, it is placed in the sun till perfectly dry, when it is rubbed over with cocoa-nut oil, frequently wrapped in cloth, and suspended in some part of their dwelling house.

Sometimes they choose a place where the deep water reaches to the beach, but generally prefer a part where the rocks are ten or twenty feet under water, and extend to a distance from the shore, as the surf breaks more violently over these. When playing in these places, each individual takes his board, and, pushing it before him, swims perhaps a quarter of a mile or more out to sea. They do not attempt to go over the billows which roll towards the shore, but watch their approach, and dive under water, allowing the billow to pass over their heads.

1900s, did much to reinstate surfing in Hawaii. By 1908, Ford founded the Outrigger Canoe Club predicated upon a group of enthusiasts devoted to preserving and developing surf-riding on both surfboards and canoes.

Surfing Innovations

Key surfboard designers and revolutionary design developments emerged during and after World War II, especially in the then-developing surfing mecca of Southern California. There, differing wave fields often broke close to the shoreline so rides were shorter in both distance and duration compared with those of the deep water, offshore reef venues of the islands. Until this point, the equipment used was heavy and crude by contemporary standards, with surfboards often weighing more than 100 lbs. Constructed from a variety of woods, the heavy boards precluded all but the strongest from participating in the sport. Surfboard designers in California devised lightweight surfboards that would react more spontaneously to the rider's whims in waves, which afforded a surf-rider less time to set up for the ride. Maneuverability was the outcome, and these same surfboards soon thereafter became mainstays in Hawaiian surfing equipment.

Period design and material innovators were Matt Kivlin, Joe Quigg, Bob Simmons, Dave Sweet, Dale

Velzy, and Hobie Alter, among others. Technologies and materials developed during the war years were put to use by the private sector; chief among the materials was an assortment of plastics that revolutionized the equipment and the act of wave-riding itself.

The advent of fiberglass allowed surfboard builders to seal the surfboard's soft South American balsa wood core. The sealed lightweight balsa soon made all the heavy materials preceding its use obsolete and allowed surfing to reach more people.

Social Acceptance

In a social context, the surfers of the late 1940s and 1950s were initially too few to be recognized by general society. California pioneers of the sport can recall when almost everyone who surfed the coast knew one another. By the early 1960s, further refinements in equipment delivered the sport to the mainstream status that surf riding currently holds. Today, surfers constitute a subculture whose lifestyle intrigues society at large. A multimillion-dollar fashion industry has developed around the sport that finds origins dating back to the early 1960s. Multiple media venues, including advertising, documentaries, television, print, and news, all find markets and an increasing audience share

among the public at large, not just sports fans. Surf riding clearly holds a worldwide mystique.

Acclaimed *Surf* journalist Matt Warshaw reports an estimated 2.5 million active surfers in the United States. At last count, however, Warshaw documented less than 9,000 active competitors participating in contest circuits within the United States today. This stark accounting provides insights that the real competition in surfing is perhaps surfer vs. nature rather than surfer vs. surfer. What so many surfing participants find most alluring is the sport's lack of basic rules, strategies, and tactics outside the formal competition venues. Conversely, formal surfing competition holds a key position in the sport and provides the pathway for professional surfing. Strong and consistent contest ratings on the pro circuit are vital elements toward endorsements and sponsorship for aspiring professionals within the peripheral billion-dollar surfing industry.

Competitive Surfing

Surfing competitions traces its origins back to Ancient Hawaiian folklore, the way in which the indigenous people of Hawaii preserved their history. It is said that chiefs competed against each other, often for a bounty of materials, livestock, or goods. Criteria for victory consisted of the longest ride or perhaps the first surfer to reach a designated point in the water or on the beach. A contest might very well comprise a series of rides and wins to declare a final victor.

The earliest known surfboards used in the competition were the *olo* and *kiko'o*, used in the precontact days of Hawaii. The ancient boards were long and heavy

(measuring 12–16 feet [3.7–4.8 meters], some examples reportedly reached up to 18 feet [5.7 meters]) and were reserved for use exclusively by Hawaiian chiefs and royalty. The commoners used shorter *alaia* boards (6–10 feet or more [1.9–3.2 meters]), also referred to as *omo*. The longer *olo* boards more effectively caught the fast-moving ocean waves, aided by additional buoyancy and paddling speed afforded by length.

Formal competition resumed during the sport's revival in the 1900s. A 1918 competition held in Hawaii was among the first to judge a winning performance on style and mastery in the surf. A backlash of discontent quickly diminished any plans to continue measuring performance by what was then perceived as vague and obscure standards. For the short term thereafter, the objectives dating as far back as the Ancient Hawaiians remained the predominant measure of competitive aptitude (that is, distance covered, first to the beach or marker, and so on).

In Australia, beginning in 1919, a string of surfing competitions soon came to be known as surf carnivals. The competitions became mainstream by the 1930s, often incorporating matches between lifeguards assessing

their prowess implementing lifesaving devices that included an assortment of equipment used within coastal surf zones.

In California, the Pacific Coast Surf Riding Championships began in 1928 and continued into the 1940s.

Competitive surfing found genuine validity and acceptance in 1953–1954. The Makaha International Surfing Championships changed how surfers' wave-riding skills were evaluated. Although somewhat flawed in hindsight, the judging parameters set a new standard and became a blueprint from which to fabricate today's refined appraisals. The brainchild of California transplant and former lifeguard John Lind, the contest is now acknowledged as the beginning of modern surfing competition and the prototype that fostered the sport of surfing's passage into the competitive arena.

Lind's competitive background as a lifeguard and surfer, replete with established competition experiences and organizational skills combined the ingredients necessary to create such a forum within a near-perfect contest venue. In all but the first year of the event, the

fabled surf break at Makaha produced dependable and quality surfing conditions.

Enlisting the aid of the Waikiki Surf Club (founded by Lind) and the local Lions Club, Lind found a strong workforce of volunteers and sponsorship to help finance the event. The inaugural event in 1953 was well planned and well attended but relegated only to paddle board races. The surfing competition was cancelled that first year due to a lack of surf—the only time in the two-decade run of the event that this happened. Undeterred, Lind brought the event to fruition the following year and set the stage for the future of surfing competition.

The event was open to anyone who wanted to enter, including women's and tandem surfing divisions. The final heats of top contenders were carried annually on the ABC-TV *Wide World of Sports* program during the early 1960s. Disputes over royalties are said to be the only reason why the TV coverage was dropped in subsequent years.

Competitive surfing gained further recognition through the United States Surfing Association (USSA), founded in California in 1961. The organization spear-

headed a drive to improve the public image of surfing and surfers. Soon thereafter, the USSA became a governing faction for surfing competition. Seven districts including Hawaii, California, and the East Coast had prescribed universal rules and the requisite membership. Points could be accumulated from different contests with annual standings developed. The USSA eventually gave way to four separate zones with common interests and competition standards

because groups in California, Hawaii, and the East and Gulf Coasts were better equipped to govern surfing in their own locales.

The United States Surfing Championships (USSC) sprang from the West Coast Surfing Championships that began in 1959 in Huntington Beach, California. Contrived by the Chamber of Commerce and Huntington Beach Recreation Department, the championships continue drawing contestants from amateur circuits nationwide. In 1973, the event moved from its exclusive Huntington Beach, California, location to different venues annually throughout the country. For more than four decades, the USSC has been the springboard that allows U.S. surfers to move into the highest competitive ranks.

Numerous other competitive organizations exist worldwide. Of note is the United States Surfing Federation (USSF). The union of six existing surfing organizations was founded by the late Colin Couture to establish and choose an amateur surfing team to attend the World Surfing Championships. The International Olympic Committee (IOC) acknowledged the USSF despite the sport's continuously failed bids to gain Olympic recognition. Many believe the inability of the sport of surfing to gain Olympic status lies within the playing field. A consistent, measurable, and dependable venue is not to be afforded by the ocean.

In the 1970s, Fred Hemmings and Randy Rarick started the world pro surf tour. The International Professional Surfers (IPS) held professional events initially in Hawaii, South Africa, and Australia. Shortly after the tour's inception, a women's division was added. A modest purse was offered during the inaugural years, although the first-season winner Peter Townend nearly broke even in prize monies against his traveling expenses. Approximately five years later amidst turbulent

differences with the Australian contingent, the IPS was superseded by the Association of Surfing Professionals (ASP). Founded in 1982, the organization built on what the IPS had begun, unifying isolated and discordant events into one assembly maintaining a pro circuit.

By 1983, the contest circuit and attending special events offered a purse totaling just under \$500,000. Prize money has grown steadily over the years but remains paltry when compared with mainstream sports such as baseball, football, basketball, and tennis. As a result, career surfers with strong competitive backgrounds often gain lucrative sponsorships and endorsements to augment their incomes, allowing a career to be had riding waves.

Although competition does indeed play a pivotal role in surfing, defining the leaders, trends, and hierarchy, it is the mainstream participants that are at the core of the

sport. The very essence of surf riding remains as true today, as it did centuries ago: the elemental, almost primal, pleasures found within the simple yet thrilling act of successfully riding upon a wave.

Sweden

Sweden covers 411,000 square kilometers in Scandinavia, a peninsula of northern Europe. The country spreads north through the Arctic Circle and south to the Baltic Sea and is bounded on the west by Norway

and on the east by the Baltic. More than 9 million people inhabit Sweden, the majority of them in the cities of the central and southern regions. Stockholm, the capital and largest city, is home to 1.2 million people. Sports have helped forge Sweden's identity as a land of vigorous people. Cross-country skiing is the national passion, although many other sports claim the allegiance of Swedes, including football (soccer), cross-country and road running, orienteering, cycling, ice hockey, bandy (a game similar to hockey), golf, rugby, handball, tennis, and wrestling.

History

Sports in Sweden grew out of the turmoil of history. The political and economic instability of the Middle Ages persisted in Sweden into the sixteenth century, devolving into near anarchy in 1520 when Danish King Christian II ordered his army to massacre Swedish aristocrats in a bid to conquer Sweden. Nobleman Gustav Ericsson Vasa escaped the massacre in Mora, Sweden, on skis, fleeing 90 kilometers to Salen, where a band of townsmen from Dahrna, themselves on skis, overtook Vasa and pledged their loyalty to him. Their support helped make Vasa king and created cross-country skiing as Sweden's oldest sport, although only in 1922 did King Gustav V establish the Vasaloppet, a cross-country ski race between Mora and Salen, to commemorate Vasa's flight from Christian II's army.

By 1922 sports were prevalent in Sweden. During the 1880s Swedes had begun importing a variety of sports from other European nations. More than did U.S. sports fans, Swedish sports fans adopted a less formal attitude toward sports in which clubs of amateurs rather than government shaped the development of sports. Sweden entered the international arena in 1912, hosting the Olympic Games in Stockholm.

Participant and Spectator Sports

Despite its northern latitude Sweden has a temperate climate that encourages participation in both winter and summer sports. Among winter sports cross-country skiing, ice hockey, and bandy have more than 4 million

enthusiasts, with cross-country skiers accounting for nearly half that total. The jewel of winter sports is the Vasaloppet, which the Swedish Skiing Association caps at twelve thousand entrants, turning away as many as twenty thousand applicants.

Among summer sports football rivals cross-country skiing's winter popularity, attracting more than 1 million participants. Sweden has fielded teams for the Olympic Games since 1908 and the World Cup since 1934. Matches draw as many as fifty thousand spectators.

Running is likewise popular. Swedes pride themselves on competition amid the rustic splendor of nature, a sentiment that suits cross-country running. Since

1965 the Lidingo-loppet has been the preeminent competition, hosting as many as thirty thousand runners per year. Men run 30 kilometers, and women run 10 kilometers. A derivative of cross-country running is orienteering, in which more than 100,000 Swedes participate annually. The five-day O-Ringen since 1965 has been the jewel of orienteering. A third event is the Stockholm Marathon, which journalist and Hasselby Athletic Club member Anders Olsson in 1979 patterned after the New York City Marathon. In 2004 the Stockholm Marathon fielded 16,221 runners from fifty-five countries.

Swedes embrace sports as validation of their identity as hardy people. This validation encourages Swedes of all abilities and backgrounds to participate in sports, a democratic vision that diminishes the importance of elite competition.

Women and Sports

Women benefit from this democratic vision, participating in the same sports that men participate in. The Swedish Football Association has thirteen hundred women's clubs and eighty-five thousand girls under age fifteen as members. The Lidingo-loppet hosts a 10-kilometer race for women. Cross-country skiing, orienteering, ice hockey, bandy, and many other sports have women's clubs. Every June the Swedish Cycling Federation hosts the Tjej-Vattern, a 150-kilometer bicycle race open only to women, and one week later hosts the Vattern-Rudan, a 300-kilometer race for women and men. Both races circuit Lake Vattern, Sweden's second-largest lake.

Youth Sports

Swedish youth flock to sports. The Swedish Football Association has 250,000 members under age fifteen. The Federation Internationale de Football Association hosts the Gothia Cup, the world's largest junior tournament. Some 600,000 boys and girls between ages twelve and seventeen from 120 countries participate. The federation recruits youth from disparate economic, ethnic, and religious backgrounds in hopes of promoting tolerance. The Gothia Cup is as much a youth peace move-

ment as a sports competition. The Swedish Orienteering Federation sponsors the Silva Junior Cup for boys and girls under age eighteen. The Lidingo-loppet has divisions for boys and girls ages seven to fifteen.

Organizations

Sweden has sixty-five national sports organizations. Since 1903 the Swedish National Sports Federation (www.svenskdoviddrott.nu/t2.asp?p=80185) has organized Swedish sports in twenty-two federations. The largest is the Swedish Football Association (www.svenskfotboll.se), with more than 1 million members and three thousand clubs. Unique among Swedish organizations is the Swedish Athletic Federation for the Deaf (www.svenskdoviddrott.nu). At its inception in 1906 the federation fostered athletic competitions among the deaf, notably the International Deaf Games in Gothenburg, and has since grown to sponsor events for Swedes with disabilities of all types.

Sports in Society

Sports are a progressive influence on Swedish society. They promote health and the virtues of the well-rounded athlete. Swedes encourage participation in a range of sports rather than specialization in a single sport and prize equal access to sports above elitism. Swedish competitions welcome women, men, youth, the disabled, and people of all classes, ethnicities, and religions in an effort to promote national unity rather than a win-at-all-costs mentality. Swedes do not venerate star athletes as much as U.S. popular culture does.

However, in 2002 Swedish biologist Anna Kindlundh challenged this pristine image of sports, documenting the use of anabolic steroids and other performance-enhancing drugs among Swedes as young as seven. Approximately 3 percent of boys and 0.5 percent of girls in the high schools of Uppsala, Sweden, had used steroids, she found, in their desire to enhance performance, increase muscle mass and tone, and improve their appearance. Fifteen percent of boys and 9 percent of girls had used some type of illicit drug to enhance performance. The pressure to succeed,

Kindlundh concluded, was undermining the purity of Swedish sports.

The Future

Kindlundh's research suggests that sports in Sweden may come to resemble sports in the United States and the former USSR in the drive to win at any price. This attitude may weaken the traditions of universal access to sports, the ordinary Swede as athlete, and the well-rounded amateur. However, counter to this attitude is the example of Dahrna's townsmen—ordinary citizens rather than extraordinary athletes—who skied across the country to aid a future king.

Swimming

References to swimming practices have been found in hieroglyphics, drawings and paintings, legends, and books dating back to ancient times. It was not until the sixteenth century, however, that specialized books on the subject of swimming appeared—first with a book by Nicolas Wynman in 1538, and half a century later with a book by Everard Digby that described and illustrated about forty different utilitarian or recreational techniques. An athletic form of swimming appeared in England during the first third of the

nineteenth century, and since then, swimming has become a major international sport and one of the most widely practiced sports in the world.

History

In England during the 1830s and 1840s, swimming grew away from its utilitarian origins to become a competitive practice. There were enough professional swimmers at the time to justify the creation of the National Swimming Society and a national championship in 1837. A concern for the health of society led to the building of an increasing number of indoor pools, which smoothed the way for professional competitions, popular events to which admission was charged. At about the same time, a number of public schools and universities began to encourage swimming by organizing meets between teams, whose members later started the first amateur clubs during the 1860s. In January 1869, London’s main swimming clubs united to form the Associated Metropolitan Swimming Club (AMSC), a precursor of the Amateur Swimming Association (ASA). The AMSC drafted a regulatory code for all issues relating to amateur races.

In spite of the friction that existed between amateurs and professionals at the time, a definition of athletic swimming was finally established during the 1880s in the form of fifty-nine articles. These were ultimately

used as a basis for international regulations when the Fédération Internationale de Natation Amateur (FINA) was created in London in 1908. In these early stages, the choice of the different events was a compromise that took into account demands emanating from clubs, trade journals, and ASA directors. The demands concerned issues such as swimmers’ rights and obligations, the powers granted to officials, the distances to be covered in events, and environmental characteristics (seas, rivers, and pools were all accepted).

FINE-TUNING

A differentiation among techniques was not initially taken into consideration, but was specified in 1903 when breaststroke and backstroke championships were added to the freestyle events. The butterfly stroke officially appeared as an event in 1953, although it had already been used in 1926 by the German Erich Rademacher in a breaststroke event, and during the 1933 New York winter championships by the American Henry Meyers in the 150-yard individual medley event. For a time it even appeared as though the butterfly might supplant the breaststroke. In 1946, FINA prohibited changing techniques during any one race, and seven years later it made the distinction between breaststroke and butterfly events official. FINA continued to fine-tune the details of competitive swimming, including material

factors such as the size and height of the starting block, approved pool length, and the modesty of bathing suits; human factors, such as how to keep contestants from getting in each other's way, the proper starter order, and the rights and powers granted to officials; and technical factors.

Over time there has been a gradual shift to a much larger number of events with shorter distances. In 1949, records for distances over 200 meters disappeared from the books in the backstroke and breaststroke categories. In 1968, a 100-meter event was added for the breaststroke, which previously had been held only for 200-meter distances (except for the period from 1912 to 1920, with 400 meters). Fifty-meter events were gradually added to international programs, first in freestyle during the 1980s (the 1988 Olympic Games) and then in medley events. More recently, however, sport authorities have reinstated long-distance swimming in open water to satisfy the dictates of entertainment: The 1991 World Championships included a 25-kilometer marathon river race for the first time.

THE CRAWL

In freestyle events—by definition the least rule-bound—the front crawl has become established as the most efficient technique. The crawl was perfected around 1893 in Sydney by professional Australian swimmers Percy and Arthur Cavill and was exported to the rest of the world in the early twentieth century. At first their “Australian crawl,” as it was called, involved a “pedaling” of the water with bent knees, but by 1903 a straight-leg flutter kick was being initiated at the hip, and this provided more powerful propulsion. Before World War I, the stroke was optimized with a more vertical position of the body; some swimmers also sought to develop the upward kick (the Europeans and Americans around 1928) and others, the downward kick (the Japanese around 1932).

THE BREASTSTROKE AND BACKSTROKE

Rooted in tradition, the breaststroke and the backstroke changed very little until the 1920s. However, after the

butterfly was separated from the breaststroke to become another style in the 1950s, the rules for the breaststroke became stricter, in particular in 1957 with the obligation to break the surface of the water with the head; this was instated to reduce the longer periods contestants managed to stay underwater by pulling their arms all the way down to their thighs and pulling their heads out of the water to breathe only on turns (the Japanese were notable for using this method). The backstroke changed considerably when the Americans introduced leg kicks before World War I; the Japanese then transformed the leg kicks in the early 1930s by eliminating the “pedaling” characteristic. American swimmer A. Kiefer introduced a straighter position of the body in the water and after 1967, East German swimmer Roland Mattes revolutionized the back crawl.

STRENGTH OR GLIDE?

During the 1920s and 1930s, swimmers generally took inspiration from boats, seeking very vertical positions with the head lifted, in postures illustrated perfectly by Johnny Weissmuller. During the 1960s, the focus was more on reducing resistance to forward movement, resulting in longer periods underwater during races; during the 1970s, it was more on striking a balance between powerful movements and glide. Swim training was subjected to a lot of scientific research—for example, with famous American trainer James Counsilman—but was also negatively affected by doping practices in countries that were experimenting with techniques on a large scale, like the GDR. Since the 1980s, the search for a balance between the two principles is still manifest in the systematic use of physical work to gain power and the shaving of body hair or wearing of wetsuits to lower water resistance. In some countries, however, the emphasis is more on one (Germany for strength) or the other (China for glide).

After 1950, professional swimming increased in popularity, in particular long-distance swimming. A number of international federations were created. One example is the World Professional Marathon Swimming Federation (WPMSF) in the United States. In 1963, the WPMSF set

up a world championship circuit that included a number of events. The races took place all over the world in the form of marathons and raids up to 60 kilometers long on rivers and in lakes, performed in difficult temperature and water conditions. In 1991 FINA took over the initiative, organizing world open-water championships and later starting a professional circuit in 1998 as a way to compete with the International Marathon Swimming Association.

WOMEN AT THE OLYMPICS

Ever since swimming in Great Britain was organized professionally, it has been open to women. By the end of the nineteenth century and the beginning of the twentieth, women had their own amateur clubs in several countries (the United States, Australia, and France, among others) where sport in general was not particularly favorable to women. This precedent opened the door to the Olympics for women: Even before they were officially admitted to the program in 1928, women were allowed to participate in the 1912 Stockholm Games (as well as the following Games) in the 100-meter freestyle and the 4×100 relay swim events. The women's Olympic program (as well as events giving rise to World Record claims) slowly became established alongside the men's program. By the end of the twentieth century, it was the same as the men's.

The recreational form of swimming is present everywhere in the world, but competitive swimming has developed more in the regions where economic and sanitary conditions have been favorable to the existence of a network of swimming pools (North America, Asia, Europe, and Australia). Competitive swimming is organized in the form of championships for all age categories. In some countries, junior categories have existed since the 1920s, and for swimmers over 25, FINA's Masters Events have provided a system of categories by a five-year age band since the 1980s.

Competitive Swimming

Competitive swimming basically consists of traveling a certain distance at the water's surface without material

aids and in a more or less stabilized environment, in accordance with specified technical conditions and in the shortest time possible. FINA further specifies that its Masters Program pursues other objectives, such as "fitness, friendship and understanding."

The principle of sprint swimming is to compare performance among swimmers in material conditions that are as neutral as possible. Some examples of such standardization are an absence of currents, a predetermined water temperature, and since 1924, delineated lanes to separate swimmers.

In 1908, there were six different official swimming events; these were the 100-, 400-, and 1500-meter freestyle, the 100- and 200-meter breaststroke, and the 4×200 freestyle relay. As of 2004, FINA now recognizes seventeen different individual events for men and as many for women (the 50-, 100-, 200-, 400-, 800-, and 1500-meter freestyle; the 50-, 100- and 200-meter backstroke; the 50-, 100- and 200-meter breaststroke; the 50-, 100- and 200-meter butterfly; and the 200- and 400-meter medley), plus three relay events both for men and for women: the 4×100 and 4×200-meter freestyle, and the 4×100 medley.

Since 1969, world records are accepted only if they are achieved in approved 50-meter swimming pools; 33-meter and 25-meter pools are prohibited. Open-water events are defined as "any competition in rivers, lakes or ocean." For these events, there are long-distance swimming races for distances under 10 kilometers and marathon swimming for distances over that. World championships and FINA competitions propose 5-, 10-, and 15-kilometer events.

CODIFYING STROKES

The breaststroke is the most codified swim technique, with seven rule points (compared to five for the butterfly or the backstroke). All arm and leg movements must be done in the water simultaneously and symmetrically (that is, "without alternating movement"). The hands must be pulled down laterally with the arms extended to form a T. The feet must be brought toward the body with bent knees apart, and the movement continued by

The Importance of Learning to Swim

Robert J. H. Kiphuth, is remembered as Yale's most successful swimming coach (from 1918 to 1959) and coach of six U.S. Olympic teams. In the extract below, Kiphuth discusses why it is important to learn how to swim.

When you go to a big bathing beach on a hot summer day, or to the "old swimmin' hole," or to a swimming pool in a college of Y.M.C.A. gymnasium, and see the thousands of men and women, boys and girls—particularly boys—splashing and shouting and paddling and cutting through the water, you're likely to think that just about everybody there knows how to swim.

And yet there are hundreds who are frightened into shivers at the thought of plunging into a river or lake, simply because they haven't given it the right kind of try; there are as many more who are able to paddle around and keep themselves afloat and do half a dozen strokes, after a fashion, but who will never become real swimmers because they don't take the trouble to learn properly.

All of these people are missing a lot. Swimming is a thing that everybody can do, and do right. More than that—it's a thing that supplies an amazing lot of fun, that frequently means the difference between life and death and that is an excellent body builder. It's for all these reasons that a number of colleges and universities have made it compulsory for a student to pass a swimming test before he can get his diploma.

extending the legs laterally and pulling them back along an elliptical path in a frog kick. All vertical movement of the legs is prohibited, and all motion along the course is at the water's surface. The only exceptions to the above are when executing turns and at the start, when the arms and legs can complete the strokes. It was

only in 1987 that the head was allowed to break the surface at each full arm cycle, allowing a longer period underwater as the body straightens. By 1991, given that the butterfly was a separate event from the breaststroke, it became possible in the breaststroke to bring the arms forward at the surface instead of underwater. On the backward pull, however, the hands were not allowed to extend past the hip line.

The butterfly was also relatively strictly codified, the main difference with the breaststroke being that the arms were to be "brought forward together over the water." As for the backstroke, the main rule remained keeping the body on the back throughout the swimming phases of a race. The only real change was in the turns, where the underwater course after push-off from the wall gradually became longer with the aid of "dolphin fishtail" movements (sometimes more than 35 meters), for example at the Seoul Games in 1988. FINA later limited this underwater distance to 10 meters in 1989 and then 15 meters in 1991. The "back only" principle was also modified; during turns, swimmers could touch the wall with any part of the body and were authorized to rotate onto their stomachs just before the somersault, as long as no propulsive movements of arms or legs were added.

CHAMPIONS

Swimming was considered by Pierre de Coubertin as a fundamentally utilitarian sport. It is the oldest Olympic sport, appearing on the Games program without interruption since 1896. The other major swim competition is the World Championship, which has been organized every four years (in between Olympic Games) since 1978 by FINA.

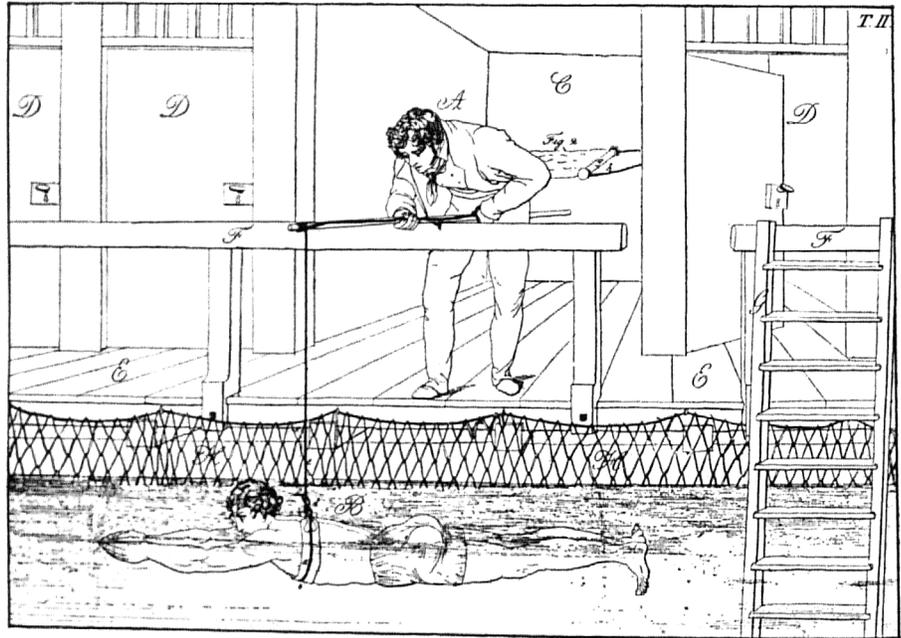

During the three swimming events at the first Olympic Games in 1896, which were held in Athens, there were thirteen participants in the 100-meter event, including eight Greeks, two Hungarians, one American, one Swede, and one Dane; three participants in the 500-meter event (two Greeks and one Austrian); and nine in the 1200-meter event, which replaced the 1000-meter race at the last minute. The same swimmers participated

in several events, of course. No special installation was built for the swimming events, which took place in the open waters of the Bay of Zea. Contestants swam approximate distances, surrounded by waves. Closed swimming pools became the norm only in 1908.

When Athens hosted the Games again in 2004, 158 national delegations participated in a program of 38 different swimming events. Eight new world records, 43 continental records, and 26 Olympic records came out of these Games, evidence of how far training patterns and techniques had progressed. Many swimmers wore wetsuits, which have been authorized since 1999. Swimmer performance was registered using electronic timing devices in each lane. Each of these electronic touch pads (2.4-meters long, 90-centimeters wide, and 1-centimeter thick) is sensitive to any pressure from 1.5 to 3 kilograms exerted on it by the swimmer at the finish. The American Michael Phelps flew through these Olympic Games, winning a total of eight medals—six of them gold—to add his name to the list of great Olympic swimmers.

Many of these champions are American: Charles Daniel (four gold medals in 1904, 1906, and 1908); Duke Kahanamoku (two gold medals in 1912 and 1920); Norman Ross (two gold medals in 1920); Johnny Weissmuller (three gold medals in 1924 and 1928), who is just a famous for swimming the first 100-meter race in under a minute as he is for becoming Tarzan in the movies; Michael Burton (three gold medals in 1968 and 1972); Mark Spitz (seven gold medals in 1972); and Jim Montgomery (three gold medals in 1972 and 1976). The Australian Murray Rose (three gold medals in 1956 and 1960), German backstroke swimmer Roland Matthes (six gold medals from 1968 to 1975), and Russian Alexander Popov, a gold medal for the 100-meter event in 1992 and in 1996, have also earned their place in history's Hall of Fame for great

swimmers. Other exceptional champions have followed in their footsteps—for example, the three prodigies of the 2004 Athens Games: Australian Ian Thorp, Dutchman Pieter van den Hoogenband (record holder for the 100 meter), and American Michael Phelps.

In women's swimming, much of the twentieth century was dominated by the Americans, the Germans, and the Australians, with increasing participation from the Dutch. The most famous swimmers in the early 1900s were the Australians Annette Kellerman and Fanny Durack, but the Americans made a name for themselves in the 1920s, led by Estheda Bleibtrey, who broke record after record, and Gertrude Ederle, who successfully swam across the English Channel. Dutch sprint swimmer Willie den Ouden and the Dane Ragnhild Hveger reigned during the 1930s. Some of the swimming celebrities after World War II were Australian Dawn Fraser, who swam the 100-meter freestyle in under a minute in 1962; the American Debbie Meyer and Germans Kornelia Ender and Ulrika Richter during the 1970s; and American Janet Evans and German Kristin Otto during the 1980s. The Australian Jodie Henry holds the world's record in the 100-meter freestyle.

Governing Body

By the end of the nineteenth century, swimming was already subject to national regulations through specific or

multisports associations in a number of countries where it was practiced. The first really international organization dates back to 1908, when J. de Courcy-Laffan, secretary general of the organizing committee of the London Games, proposed that a set of international rules modeled on the English federations be adopted for each sport discipline. For swimming regulations, he appointed ASA President George Hearn, who worked with fellow Englishman William Henry (the founder of the Life Saving Society), German-born Olympic swimmer Max Ritter, and Swedish swimmer Hjalmar Johansson to accomplish the task. Hearn took advantage of the occasion to call delegates from ten countries to a meeting on 19 July 1908, for the purpose of founding the Fédération Internationale de Natation Amateur (FINA). FINA's objectives were to establish rules for international swimming events, keep a list of official world records, and organize swimming events at the Olympic Games.

FINA, headquartered in Lausanne, Switzerland, has been the highest authority for international swimming ever since. In 2004 it included 223 national federations, which represented 42 African, 48 American, 44 Asian, 68 European, and 21 Oceanic countries. FINA also recognizes five continental organizations. These are the Confédération Africaine de Natation Amateur, the Amateur Swimming Union of the Americas, the Asian Amateur Swimming Federation, the Oceania Swimming Association, and the Ligue Européenne de Natation (the oldest one, founded in 1926).

Each continental organization coordinates its own championships. The European championships, which have been held since 1926, are the oldest. Since 1976, these have taken place each year as a function of the organization of the Summer Olympic Games. The Pan-American Games have been taking place every four years (during the year that precedes the Olympic Games) since 1951. A Latin Cup was added in 1977, and in Europe, a European Cup has been pitting national teams against one another since 1969.

Swimming, Synchronized

From the interwar period on, the main vehicles for synchronized swimming were shows and musicals. The activity only began to acquire status as a genuine sport during the 1950s, when it was included as an official event by the Fédération Internationale de Natation Amateur (FINA). It began to spread internationally during the second half of the twentieth century, finally gaining Olympic recognition in 1984, although even then it was not considered a major sport. Synchronized swimming is essentially a feminine sport, and one in which North Americans have traditionally excelled.

History

Aquatic practices called "fancy swimming" or "ornamental swimming" developed in England during the mid-nineteenth century. Swimmers assumed unusual positions and performed unusual figures in the water, either during utilitarian swimming or as a feature of professional swimming exhibitions. Around the turn of the century, swimmers competed in "tricks and stunts"

in England and Canada, and both men and women participated in displays of aquatic gymnastics in Germany, Belgium, France, and the Netherlands.

In 1907, Australian swimming champion Annette Kellerman (1887–1975), who was celebrated as “the most beautiful woman in the world,” took aquatic practices down an even more aesthetically pleasing and spectacular route. She went on tour after tour in Europe and North America, where her aquatic exhibitions drew in tens of thousands of spectators. Her success inspired the development of water pageants in a number of North American colleges, universities, and associations during and following World War I.

University of Wisconsin student Katharine Curtis was the first to combine aquatic figures and music. Curtis created the first synchronized swimming club (the Tarpon Club) in 1923 in Chicago, where she developed what was called rhythmic swimming. This used combinations that were synchronized with the beat of the music. Her students, the “Modern Mermaids,” were invited to Chicago’s 1933–1934 Century of Progress Fair to give demonstrations. It was to describe their exhibition that the term “synchronized swimming” was first used.

Katharine Curtis’ initiatives led to two different orientations. The first one showcased the spectacular aspect. In 1939, commercial performances called “aquacades” started to develop in the United States. Aquacades featured former swimming champions starring in extravagant productions; among these, Esther Williams played a considerable role in making synchronized swimming popular. She became a star in aqua movie musicals such as *Bathing Beauty* and *Neptune’s Daughter*. The second orientation developed when some of Curtis’ students decided to organize a competition between two of Chicago’s colleges. This took place on 27 May 1939; the following year, the swimming committee of the Amateur Athletic Union officially accepted the new activity. The first national championship took place in 1946, just after World War II, and Canada followed suit five years later. During the 1950s, championships included events in the

solo, duet, and team categories. These were performed in costume and to music.

Thanks to the spread of competition in North America and the popularity of the musicals featuring Esther Williams, synchronized swimming began to spread to the rest of the world. It was displayed at the Helsinki Olympic Games in 1952 and recognized officially by FINA that same year. Two years later, inspired by the Canadian and American experiences, FINA codified the discipline and included it in major international competitions.

Due to its hybrid entertainment-sport origins, however, the International Olympic Committee was much more reticent about admitting it into Olympic circles. The rebuff led synchronized swimming to shift during the 1970s from its choreographic and theatrical orientation to a practice that promoted a combination of endurance (long periods under water), strength (lifts), and even acrobatics, but also great virtuosity, charm, and poise. Finally recognized as a full-fledged sport, it was included in the Olympic program for the Los Angeles Games in 1984.

Although it is spectacular and garners a lot of media attention, synchronized swimming has a relatively limited audience and is practiced mostly in North America, Europe, and Japan. It is open to men in the United States; however, there are no mixed teams. In spite of a few attempts in Europe during the 1990s to include men, the international FINA and IOC regulations—along with most national federations—restrict the events to women only. Champions in synchronized swimming often use their sport skills to launch a career in aquatic shows—for example, Linda Shelley (American) and Murielle Hermine (French).

Nature of Synchronized Swimming

FINA regulations provide for solo, duet, team (from four to eight swimmers), and free routine combination events in synchronized swimming competitions. Each of the first three events contains figure competition, technical

routine, and free routine elements. In figure competition, the swimmer must perform four figures chosen from a list of required elements. The choice must be made known eighteen to forty-eight hours before the meet. For the technical routine, required elements are also chosen from a list, but may be performed to any music chosen by the swimmer. Time limits are specified for all parts of the routine, including the deck work that precedes immersion. In the free-routine event, swimmers are allowed to choose their own choreography.

Five to seven judges score each performance on a scale of 0 to 10 (in tenths of a point). A routine is judged on both technical merit components (execution, synchronization, and difficulty of strokes) and artistic components (musical interpretation and manner of presentation). FINA regulations provide for senior (ages 18 and over) and junior (ages 15 to 18) categories, as well as for three different age groups (ages 12 and under, ages 13 to 15, and ages 16 to 18). In practice, elite swimmers are usually under 23, but there are master competitions for swimmers over 25.

Competition at the Top

The major synchronized swimming competitions are the Olympic Games (since 1984), the World Championships (since 1973), the Goodwill Games (since 1990), and the Continental Championships. There are also a number of open international meetings with more flexible rules. These often take place at the same time as the national championships in the organizing country (for example, the Swiss Open, the Roma Sincro, and the French Open). The United States and Canada have historically been the leaders in competitive synchronized swimming. However, since the 1980s the North American dominance has been challenged by Japan, which places third in major championships on a regular basis; by Russia; and to a lesser extent, by France. The undisputed stars of Olympic synchronized swimming are the American Tracie Ruiz, with two gold medals at the 1984 Los Angeles Games, and the Russian Anna Kozlova,

with three gold medals at the 1992 Barcelona Games. The Russian swimmers were the big winners at the 2004 Athens Games.

Switzerland

Switzerland occupies 41,290 square kilometers in central Europe; the Alps is its defining feature. Bern is the capital and Zurich is the largest city, with 971,800 of Switzerland's 7.5 million inhabitants. Sports mirror class divisions and the tension between tradition and modernism. Football (soccer), downhill skiing, curling, gymnastics, ice hockey, cycling, *schwingen* (a kind of wrestling), and *hornussen* (a team game) remain popular even as beach volleyball attracts a new generation of Swiss athletes.

History

Switzerland's indigenous sports developed from pagan religious rituals. A seventeenth-century letter describes how peasants in Schwarzenburg would gather on Christmas night to seek justice and the favor of the gods. Rivals wrestled one another and the man who threw his opponent to the ground was considered chosen by the gods. From this event evolved *schwingen*, a variant of wrestling in which a match ends when a wrestler loses hold of his opponent or is pinned to the ground. Every August men and women still gather at the Swiss Alpine Herdsmen's Festival in Interlaken to wrestle and also to see who can throw an 83-kilogram

granite block the farthest. According to folklore, *hornussen*, another indigenous sport, developed from the practice of using a long stick to rid malevolent spirits from one's property. *Hornussen* pits teams of sixteen to eighteen players against one another. A member of the offense strikes a disk toward the defense with his stick. The offense scores a point when the disk soars past the defenders, whereas the defense tallies a point when a defender knocks the disk to the ground with his shield.

In the 1840s Swiss teacher Adolph Spiess integrated gymnastics into the curriculum, a movement that led schools, and by extension the government, to sponsor sports. Swiss schools resemble American precollegiate schools in mandating sports as part of the curriculum and they resemble American high schools and colleges in fielding teams for competition.

I have resolved for the future, so long as God grants me life, to ascend divers mountains every year, or at least one, in the season when vegetation is at its height, partly for botanical observation, partly for the worthy exercise of the body and recreation of the mind. What must be the pleasure, think you, what the delight of a mind rightly touched, to gaze upon the huge mountain masses for one's show, and, as it were, lift one's head into the clouds? The soul is strangely rapt with these astonishing heights, and carried off to the contemplation of the one supreme Architect Philosophers will always feast the eyes of body and mind on the goodly things of this earthly paradise; and by no means least among these are the abruptly soaring summits, the trackless steeps, the vast slopes rising to the sky, the rugged rocks, the shady woods.

Since 1911 the Tour de France has included the Swiss Alps among its stages, and seldom has any cyclist captured the Tour without triumphing in the Alps, making them the arbiter of victory. In 1936 the Swiss Cycling Federation modeled the Tour de Suisse after the Tour de France. The nine-stage race every June is the final European stage race before the Tour de France. Between 23 and 25 July 1999 Switzerland hosted 737 couriers from the United States and Europe in the Cycle Messenger World Championships.

Hedy Schlanegger signaled the ascent of Swiss women to elite status in 1948 when she became the first Swiss woman to win an Olympic gold medal in downhill skiing. In 1980 a school in Fribourg started the first women’s ice hockey team in Switzerland. Swiss Folk Wrestling, 1611

The letter below, from a Swiss court to the government in 1611, condemns a traditional folk ritual wrestling match.

We have heard that the common people (*das gemeine Volk*), as peasants and farm-servants, here in Schwarzenburg for a long time have been meeting on Christmas night at the place where the religious and secular justice is administered, and hold there a wrestling match (*Schwinget*) until midnight. They challenge and try their strength against each other, and who throws the other on the ground becomes famous hereby. They also believe that who trains that night will be vigorous and healthy the coming year. They do not only put faith into this superstition, but they also, as it has often happened, damage their limbs, shed their blood, and this leads to loud crying, cursing, swearing and other frivolous manners. Some come even from Freiburg to participate. Some have already been punished and this event has been forbidden and condemned by our decree.

Sports in Society

The most notable social phenomenon may be the rise of beach volleyball, a sport that combines athleticism and sex appeal with women in two-piece outfits and men in shorts, attire that reveals muscle tone and suntan. Beach volleyball advertises itself as a free-spirited alternative to traditional sports, whereas Swiss conservatives lament it as hedonistic and sensual. hockey, tennis, downhill skiing, and swimming, and the less affluent in unihockey, football, and *hornussen*. Sports also underscore cultural attitudes, with traditionalists extolling *hornussen* and *schwingen* as symbols of national pride and modernists anticipating beach volleyball as a movement that will open Switzerland to American popular culture and fashion.

Traditionalists and modernists alike suffered a setback when the International Olympic Committee (IOC) awarded the 2006 Winter Games to Turin, Italy, rather than to Sion, Switzerland. Swiss athletes and officials condemned the decision as retaliation against Swiss attorney and IOC official Marc Hedler for alleging that since 1996 countries have bought the right to host the Games.

The Future

The IOC decision to award the 2006 Winter Games to Turin may exacerbate the rivalry between Switzerland and Italy. However, the future of sports in Switzerland may lie less with Europe than with the United States as American popular culture permeates Switzerland. Such a future may not imperil football and *hornussen*, but downhill skiing may lose ground if beach volleyball lures athletes and spectators to sun and sand. Much depends on the balance young Swiss athletes strike between tradition and modernism.

Football Fans Tackle Heidi

Once upon a time, a Swiss heroine named Heidi changed how football was broadcast by U.S. television networks. On 17 November 1968, NBC aired a matchup between the New York Jets and Oakland Raiders that football historians call the “Heidi Game.” A made-for-TV movie of the classic children’s novel *Heidi* was set to premiere at 7 p.m. The game had just a little more than a minute to go when the network went to a commercial and then right to the airing of *Heidi*. NBC lived to regret that decision because in the last minute of play, the balance shifted dramatically. The score had been 32–29, with the Jets leading. Here’s how sportswriter Phil Barber describes the scene as football fans saw their game replaced by Heidi frolicking in the Swiss Alps:

What happened was a torrent of angry calls from East Coast couch potatoes, who asked, in colorful terms, why a spunky little girl had replaced their football game. They flooded the switchboard at

Manhattan’s Rockefeller Plaza and crashed the phone exchange.

As it happened, they missed a fairly exciting 65 seconds. Lamonica threw a 43-yard touchdown pass to halfback Charlie Smith with 42 seconds to play, giving Oakland a 36–32 lead. The ensuing kickoff sputtered free and Riddlehuber, the Raiders’ reserve fullback, picked it up and ran into the end zone. The Raiders had scored 14 points in a shorter time than it took Heidi to yodel.

To make sure that there would never be another “Heidi Game,” TV networks adopted a policy of staying with a sporting event until it was over—letting the programming schedule “slide”—which is why American viewers now sometimes find themselves waiting an extra 60 minutes for *60 Minutes* to begin.

Table Tennis

Table tennis—also known by the trademark name “Ping-Pong”—began to find mass acceptance at the beginning of the twentieth century after people had looked upon it during the late nineteenth century as an extension of an entertaining board game, an after-dinner social diversion among the English upper classes.

In 1926 table tennis became a competitive sport under the auspices of the newly established International Table Tennis Federation (ITTF). By then the sport had spread deep into the masses, even in Asia. In the May–June 1992 issue of the United States Table Tennis Association’s publication *Table Tennis Topics*, Edward Bilinski wrote of his interview with a seventy-one-year-old man who won a small tournament in 1932 in Xizhou, China. The conditions had been primitive: just one table with a net but without a white center line for doubles play; a single forty-watt bulb; a poorly glued celluloid ball, wobbly because of the grit lodged in its seams; and nailed boards shaped into rackets. This account hinted that players in China might eventually take the sport seriously.

However, the dominance of Japan and then China did not become manifest to the West until the 1950s, when Asian players, using the supposedly outdated pen-hold grip (European players used the shake-hand grip), began winning ITTF world championships.

World championships began in 1926, and the ITTF, composed of associations from more than 170 countries, continues to supervise these and other world title

events, including a biennial world veterans event (for those forty to eighty years of age). Beginning in 1988 table tennis became part of the Olympic Games.

Since tournament play began, controversies have arisen, such as over the use of illegal serves (still an issue today) and over nonattacking, interminably slow play. Consequently, rules have been changed. For example, in 1936–1937 U.S. tournaments the net was lowered from 17.1 to 15.3 centimeters. However, nothing has been more controversial than the advent of rackets with sponge rubber-based surfaces during the 1950s. With these rackets the Japanese began to win world championships, and the rackets have proliferated since.

Players may use various grips, but with regard to the sport's essential characteristics of spin and speed and the athleticism that championship play requires, the technological changes in the racket surfaces during the last fifty years have brought about great changes. Indeed, one can speak of table tennis before sponge and table tennis after sponge as virtually two different games.

Meanwhile, the best players—the Chinese and Swedish men and the Chinese and South Korean women—continue to excel, as do their lesser counterparts, in leagues and tournaments in East and West.

The ITTF continues to serve as a miniature United Nations, and in 1991 it enabled a combined North and South Korean team to participate in the world championships. The year 2001 marked the thirtieth anniversary of the “Ping-Pong diplomacy” visit of the U.S. table tennis team to a China that would forever be changed.

Origins

Table tennis is generally considered to be of English origin. People—mostly formally dressed gentlefolk—played miniature “tennis” indoors in England during the 1880s and 1890s. The table usually was set up in a dining room or parlor. Players sometimes improvised nets of woven fabric, taut towels, stringed bottles, or books. Long-handled, hollow, vellum rackets eventually were replaced by short-handled wooden rackets covered with cork, sandpaper, and, as the sport grew during the first years of the 1900s, pimped rubber. The pips-out rubber offered better spin and control. In progressing from swatting at crude balls carved from champagne corks, players came to prefer celluloid balls.

Development

By the beginning of the twentieth century table tennis had outgrown the drawing rooms of the British upper classes. People from every walk of life were playing the sport. Indeed, from 1900 to 1902 a table tennis craze swept Britain and the United States. The sport was athletic and inexpensive and provided families with wholesome entertainment. Table tennis postcards, party invitations, and even musical pieces were popular. A great demand existed for equipment, and boxed sets sold well. In England many table tennis clubs were formed, and tournaments, some offering prizes, were held.

Arnold “Ping-Pong” Parker of England (no relation to Parker Brothers, the game manufacturers who in 1928 patented the trade name “Ping-Pong” in the United States) was a turn-of-the-century star player and

authority. He devised some much needed rules, one of which championed the double-bounce serve. The double-bounce serve is now the standard, but, despite Parker's influence, it wasn't always so. Although table tennis was in some ways similar to lawn tennis, players realized that some modification had to be made to the single-bounce tennis serve (in which the server's ball cannot bounce until it is on the opponent's side). Because serving overhand would be viciously absurd, an early rule required an underhand, one-bounce serve. As the server hit the ball from behind and within the end lengths of the table, perhaps even from a line drawn behind the table, only the handle of the racket could be above the waist. Thus, by the late 1920s in the United States many players used the forehand-favoring, blade-down penholder grip instead of the double-winged, shake-hands tennis grip.

In 1922 a Cambridge University student, Ivor Montagu of England, began to codify the rules of the sport, including the retention of the double-bounce serve. In January 1926 Montagu, with representatives from Austria, Germany, Hungary, and Sweden, met in Berlin. With Dr. Georg Lehmann, president of the Deutscher Tischtennis-Bund, taking the initiative, the ITTF was organized. Montagu was its first and longest-serving president (1926–1967).

The ITTF held its first world championship in 1926 in London. Lady Swaythling, Montagu's mother, donated a trophy cup for the men's team matches, and six European countries and India competed for it. A men's singles (with fifty-one players) championship and a men's doubles championship were decided. Women's doubles were not introduced until 1928, and women's team matches for the Marcel Corbillon Cup were not introduced until 1933 in Paris. However, in 1926 the women had their own singles championship (fourteen players) and also mixed doubles.

During the early 1920s Montagu and his Cambridge friends, with the help of a leading English manufacturer, Jaques, had reestablished the English Ping-Pong Association, but when Jaques insisted that players use Jaques equipment, Montagu's group changed its name to the

"Table Tennis Association." A similar event occurred almost a decade later in the United States when players balked at using only Parker Brothers equipment in American Ping-Pong Association (APPA) tournaments sponsored by Parker Brothers. Although the 1930 Metro and the 1931 First National APPA Championships, both held in New York City, were successful, New York area players, wanting to preserve their independence, broke away from the APPA to form the New York Table Tennis Association (NYTTA) and to hold their own national championships. By 1935 APPA players had joined, as the NYTTA players had earlier, the United States Table Tennis Association (USTTA). Upon its formation in 1933, this association (in 1993 renamed "USA Table Tennis" or "USATT" at its Colorado Springs Olympic Headquarters) affiliated with the ITTF.

At the first APPA tournaments (men only; women were soon to follow), one could see that table tennis is a great social leveler and that the immigrant influx was strong. Evelyn Seeley, writing in 1930 in the *New York World-Telegram*, spoke of "an amazing miscellaneous group" of participants. "Bankers and brokers . . . office boys and clerks, yachtsmen and Y.M.C.A. boys." A number of players, she said, "spoke in Continental accents."

Hungary at the Top

In the beginning Hungarian players dominated the world championships—particularly five-time world champion Maria Mednyanszky, two-time world champion Anna Sipos, and the "Three Musketeers," Victor Barna, Miklos "Mike" Szabados, and Laszlo "Laci" Bellak. Among other European world champions before the Asian ascendancy during the 1950s were Czechoslovakia's Bohumil Vana and Marie Kettnerova, Hungary's Gizella "Gizi" Farkas and Ferenc Sido, Romania's Angelica Rozeanu, and England's Johnny Leach.

The most famous person in table tennis perhaps is Victor Barna (born Berna). Known for his signature stroke, the backhand flick, he won twenty of his twenty-two world titles before he broke his playing arm in a car accident at age twenty-three. That arm was said to be insured for \$10,000, but, as Barna said, "with that crash

Chinese children learning table tennis.

During the 1940s, after such U.S. stars as Lou Pagliaro, Marty Reisman, Leah Neuberger, Thelma Thall, and Dick Miles had been more or less just putting the ball into play, Asian players, about to become the world's best, would aim to win the point as quickly as possible. Ichiro Ogimura of Japan, the 1954 and 1956 world champion, although using open-palm serves, nonetheless was able to get an immediate advantage by squatting and, with a swipe of the racket, spinning (or deceptively not spinning) the ball; he would then look to sock away the return (in what is called a "third-ball attack") or maneuver to sock away the next return (in what is called a "fifth-ball attack").

went a part of my game never to return." After his first exhibition tour of the United States in 1934–1935, Barna was the first player to warn the ITTF of the havoc that fingerspin serves could cause. As practiced by the 1930s U.S. singles and world doubles champions Sol Schiff and Jimmy McClure and to a lesser degree by Europeans, these serves eventually forced a service rule stating that the ball must initially rest on the flat open palm and be thrown up without any fingerspin. Otherwise, players frustrated their opponents in various ways: They would rub the ball against the racket and let it fly, with index and middle finger throw the ball in a wheel-like motion at different positions on the racket to make it bounce crazily, shoot the ball off like a wobbly marble, snapped from a thumb, or even nick the celluloid ball with a fingernail to cause it to hop like a Mexican jumping bean. Often, if the opponent was lucky enough to return the ball, it would present a set-up, an easy point-winning follow for the server.

By the mid-1970s, after three-time world champion Zhuang Zedong, his perennial runner-up Li Furong, and long-pips initiator Zhang Xielin had established the supremacy of China, other players establishing themselves after China's Cultural Revolution (1966–1976) showed further inventiveness: By tossing the ball up 6 meters, then pivoting into the drop, Hsu Shao-fa found new spins and new deceptions, and Huang Liang, taking advantage of technology, used still-unfamiliar long pips-out rubber to defeat opponents with unreadable spins.

Into the 1980s and 1990s players and officials had to cope with behind-the-back illegal serves and players who legally "hid the ball" on service. Deception remains an integral part of table tennis. Players must learn how to "read" not only the spin on the ball but also the movements of the opponent and to anticipate how best to react to them.

Another problem of the 1930s was the interminably long play that would occur when two inveterate

sportsmanship is far better than
fifty preaching it.* ■ KNUTE ROCKNE

defenders played a match in which both simply “chiseled,” that is, pushed the ball passively back and forth, waiting for the other to miss. One point scored at the world championships in 1936 lasted more than two hours! Naturally, a rule to expedite play had to be devised, and variations were not always to a player’s liking.

The U.S. team was displeased when defending world women’s singles champion Ruth Aarons was disqualified from defending her title in the 1937 final, along with her Austrian opponent Gertrude “Trude” Pritzi, for not finishing their match in the allotted time. Not long after, the four-time world champion, Richard Bergmann of England, reportedly put three alarm clocks under the playing table because a new rule mandated that if a game wasn’t finished in twenty minutes, whoever was ahead would be awarded the game. Thus, iconoclastic Bergmann set his clocks to go off at intervals to warn him of his lapsed playing time. Predictably the clocks were soon banned.

Today the “expedite rule” stresses a fifteen-minute time period for any one game. Then, if the game isn’t finished, players must alternate services for the rest of the match, with the stipulation that if the server’s opponent returns a thirteenth ball he automatically wins the point.

Spin Doctors

However, by the 1970s the likelihood of slow, boring play was slight with the super topspin game of the Hungarians Tibor Klampar, Istvan Jonyer, and Gabor Gergely, who, if forced to their far forehand side, could loop the ball around the table net posts with the precision of a bowler spinning strikes into a pocket. The same applies to the attack of not only the Chinese stars but also the Swedish world champions of the 1970s, led by Kjell Johansson, Hans Alser, and Stellan Bengtsson.

Japanese women won six out of seven world women’s singles titles from 1956 through 1969, with two-time winner Kimiyo Matsuzaki leading the way. Japanese men were also successful after Hiroji Satoh’s world championship win in Mumbai (Bombay), India, in 1952. Since then, however, the Japanese have been un-

able to match their Chinese and Korean neighbors. In his book *Songs of International Friendship*, Hikosuke Tamasu, the “Butterfly” table tennis manufacturer, says that at a Japanese training camp during the 1960s players were not permitted to go to bed until they had hit one thousand forehands in a row without a miss. Thirty years later he said players lack not only what technology has made ever more indispensable—paid professional coaching—but also dedication and love of the game.

After emerging from their Cultural Revolution, the Chinese coined the diplomacy slogan, “Friendship first, competition second,” and reacquainted the world, especially the so-called Third World of Asian, African, and Latin American countries, with their table tennis expertise—and their friendly propaganda. Only once during the 1970s did China have a world men’s singles champion: Hsi En-ting. The table tennis historian Zdenko Uzorinac said Hsi “tattooed” his nonplaying hand “with thoughts of great thinkers.” Hsi said, “I played with both hands, the one in which I held the racket and the other which inspired me with wise sayings that led me to victory.”

China’s diplomacy went so far as to occasionally allow Chinese players to take it easy on their opponents, even, some thought, in major championships. Could this fact account for a number of European teams winning world doubles titles? Perhaps. However, given the opportunity, stars such as Russia’s Stanislav Gomozkov, Romania’s Maria Alexandru, Yugoslavia’s Dragutin Surbek, France’s Jacques Secretin, and Germany’s Jorg Roszkopf were capable of rising to the occasion.

During the 1980s and early 1990s, a new wave of Swedish athletes—Jorgen Persson, Erik Lindh, Jan-Ove Waldner, Mikael Appelgren, and Peter Karlsson—won championships. These victories showed what a country—with a total population less than any one of China’s three largest cities—could do with an excellent table tennis development program, a unifying team spirit, and a will to win.

However, the Chinese have come back. At the 2004 Summer Olympics in Athens, Greece, 172 athletes

competed in table tennis. China won three gold medals, one silver, and two bronze: In men's singles Hao Wang won silver, and Liqin Wang won bronze; in women's singles Yining Zhang won gold; in men's doubles Qi Chen and Lin Ma won gold; in women's doubles Nan Wang and Yining Zhang won gold, and Yue Guo and Niu Jianfeng won bronze. China's closest competition, South Korea, won one gold, one silver, and one bronze.

In late 2004 the ITTF ranked four Chinese players among the top six players in the world: Hao Wang, Liqin Wang, Lin Ma, and Qi Chen.

At the 2004 ITTF Men's and Women's World Cup in Xiaoshang, China, defending champion Lin Ma of China retained his title when he beat Kalinikos Kreanga of Greece in six games to win the event for the third time in his career.

The Future

Perhaps their old problem faces the Chinese anew: With their strong sense of national pride, their large pool of top players and coaches, and their professional approach to table tennis, who can beat them? Are China's table tennis players perhaps too good for the sport's advancement?

Taekwondo

Taekwondo is a Korean martial art that utilizes kicks, hand strikes, and blocks for self-defense, sport, and artistic expression. Taekwondo tournaments may include competition in sparring, prearranged patterns, or “forms,” and board breaking. In English translation *tae* means foot, *kwon* means hand or fist, and *do* means way—the way of hand and foot. Alternative spellings for taekwondo include tae kwon do, taekwon-do, and t'aegwondo. Taekwondo was developed in Korea, but in the past few decades it has become the most widely practiced martial art in the world. The basic techniques of taekwondo have been practiced for the past two thousand years, but the sport as practiced today was developed during the 1940s.

History

The history of taekwondo is interwoven with martial arts that have been developing since first practiced in primitive cultures throughout the Far East. Many martial arts historians trace the origins of Eastern martial arts to India, and particularly to the Buddhist monk Bodhidharma, who taught martial arts exercises to monks in the Shaolin temple in China. From there kung fu was developed and then spread throughout China. Monks, warlords, and merchants traveling to other countries brought their martial arts practices with them and transmitted them to other cultures. Korea was an intermediary for the passage of new techniques and ideas from China to Japan and Okinawa.

According to the World Taekwondo Federation (WTF), the roots and development of the art lie solely within the

Korean peninsula, and techniques were originally developed from fighting against beasts and other humans. Taekwondo was part of the physical training for young warriors dating back to the Silla Kingdom in 57 BC. Subak and taekkyon were early names for taekwondo.

During the Japanese occupation of Korea, the practice of Korean martial arts was forbidden for nationalistic reasons. Taekkyon training went underground during that time, and was only practiced again openly after 1945. It was during the Japanese occupation that the father of modern taekwondo, General Hong Hi Choi, began his martial arts training. As a boy he learned taekkyon, a Korean kicking art, and in 1937 he was sent to Japan where he attained a first degree black belt in karate, an art that relies more on hand techniques. Choi was forced to enlist in the Japanese army when World War II broke out, but eventually he was implicated as a planner of the Korean Independence Movement and was imprisoned in Japan. It was during this time in prison that Choi developed modern taekwondo from his training in taekkyon and karate.

Choi continued to develop taekwondo, and in 1953 he spearheaded the introduction of taekwondo training for the Korean military. During the same period other martial arts schools, or *kwans*, were spreading throughout Korea, many using similar techniques derived from taekkyon, karate, and other martial arts. In 1955 the kwans combined together to form one art that was recognized as a Korean martial art, and it was formally named “taekwondo.” General Choi and other taekwondo masters then began touring the world and spread the practice of taekwondo to many countries. In 1960 General Choi visited the United States and persuaded Jhoon Rhee, a karate instructor, to rename his school Taekwon-Do. Jhoon Rhee is recognized as the father of taekwondo in the United States, and he was instrumental in spreading the art throughout the country. Taekwondo was accepted into the Amateur Athletic Union (AAU) in 1974, and the United States Taekwondo Union (USTU) was formed.

In 1966 General Choi made a goodwill visit to North Korea, which caused him to fall into disgrace with the

South Koreans. To this day General Choi is not mentioned in the history of taekwondo on the official WTF website. That year General Choi left the Korea Taekwondo Association (KTA) and created the International Taekwon-Do Federation (ITF), with nine charter member countries. Until his death in 2002, General Choi continued to visit other countries and work to spread taekwondo throughout the world.

In 1973 the KTA became the WTF. The ITF remained under the control of General Choi, and its practitioners were thought to be more traditional. The WTF began to place more emphasis on sparring and became more sport-oriented. There have been attempts to bring the two federations together, so far without success. The political fallout from General Choi’s visit to North Korea, and his belief that taekwondo should be taught there, created a rift that has yet to be bridged. Currently the ITF style of taekwondo is thought to be more traditional than the WTF style, tournaments are not full-contact, students practice forms developed by General Choi, and the ITF style of taekwondo is still considered to be a “martial art.” The WTF created its own forms, uses full-contact sparring, and their style of taekwondo is now considered to be more of a “martial sport.”

The International Olympic Committee (IOC) recognized taekwondo as an amateur sport in 1980. Under the sparring rules for Olympic taekwondo, kicks and punches were allowed to the body, but only kicks were allowed to the head. The reason for disallowing punches to the head was that taekwondo is an art that is famous for kicking, and allowing punches to the head would lead to more of a boxing style competition. For children, however, kicks to the head were against the rules for safety reasons. Recently the United States Olympic Committee changed the rule to allow children to score points with kicks to the head, a ruling that caused controversy because of the perceived danger.

The social context of taekwondo is an important part of the art and sport. For many practitioners of taekwondo, the art is a way of life. Taekwondo students learn the Five Tenets of Taekwondo, which are courtesy, integrity, self-control, perseverance, and indom-

itable spirit. There are strict rules for etiquette, and breaching these rules may lead to expulsion from one's school. Etiquette rules include addressing superiors properly, bowing when entering and leaving the practice hall (*dojang*), bowing to instructors, black belts, flags, practice partners, and, at the beginning and end of class, wearing the uniform properly, facing away from others when straightening the uniform, and other rules. In some systems there are rules of etiquette that apply to social situations, such as order of seating at the table, how to make proper introductions, and showing respect for one's elders. Rules of etiquette also apply to tournaments, and even at the Olympic level a competitor may be penalized for showing disrespect.

According to the Kukkiwon, which is the World Taekwondo Headquarters in Korea, taekwondo now has 50 million participants in 175 countries. One of the people taught by General Choi who went on to start a major taekwondo association was Haeng Ung Lee. Eternal Grandmaster Haeng Ung Lee founded the American Taekwondo Association in 1969, and there are now 300,000 members. The WTF is currently the largest taekwondo governing body in the world, followed by the ITF.

A major scandal occurred in the world of taekwondo when Kim Un-yong, president of the WTF and IOC member, was arrested in 2003. He was accused of embezzling over three million dollars from the WTF, and taking bribes. Kim was a longtime member of the IOC and had run for president of the organization. His IOC membership was suspended when he was indicted on charges of embezzlement and bribery, and he stepped down from his positions as a national legislator and as president of the WTF. Kim was sentenced to jail and fined \$680,000 in September 2004.

What Is Taekwondo?

Currently all Olympic competitors must be black belts, but in other tournaments there are divisions for competitors based on rank. Ranking in taekwondo is indicated by belt color. Taekwondo students start at the white belt level and then progress through color belt

levels until they reach first degree black belt. At each level students learn new forms and one-step sparring techniques, and are expected to demonstrate increasingly difficult board-breaking techniques. Testing may also include a written knowledge test of history, philosophy, and Korean terminology. It takes approximately three months to progress between ranks at the lower levels, and a longer amount of time the higher one progresses. In general it takes two to three years to progress from white belt to black belt. At the black belt level students are often expected to help teach, referee at tournaments, and take on other responsibilities. Progressing from one degree of black belt to the next can take several years. The highest rank in taekwondo is tenth degree, but generally ninth degree is the highest one may advance, and tenth degree may be granted as an honorary rank.

The WTF is the ruling body for Olympic-level taekwondo, and participants must have Kukkiwon certification of *dan* (degree of black belt). In sparring there are eight weight divisions for men and women, ten for boys and girls 14–17 years old in the World Junior Championships, and four for men and women in the Olympics. Men fight three rounds lasting three minutes each with one minute rest between rounds, and women and juniors fight three rounds lasting two minutes each with one minute of rest between rounds. The size of the sparring ring and the placement of judges and the contestants are specified in the rules. In the early years of taekwondo tournaments there was no safety equipment, but now equipment has been developed and refined for maximum safety. All contestants must wear the WTF-approved V-neck uniform, shin and forearm guards, mouthpiece, headgear, chest protector, and men must wear a groin guard. Headgear and chest protectors with electronic devices to score points are available in some tournaments. Commands to bow, begin, stop, and end are given in the Korean language. Fist strikes and kicks are allowed to the body on the chest protector, and kicks are allowed to the face. Kicking or punching to the spine, back of the head, or below the belt are against the rules, and attacking these areas results in

point deductions. One point is given for forceful attacks to the body, two points for attacks to the head, and one extra point if the opponent is knocked down and the referee counts. Matches are full-contact, continuous, and the winner is the contestant with the most points at the end of the three rounds. Below the Olympic level, WTF-sanctioned tournaments may also hold competition in forms.

Rules for “point tournaments” vary, and are often quite different from official WTF tournaments. In a point tournament there may be fewer or no weight classes. Divisions are based on belt rank, age, and gender. Full contact may be prohibited, and in some tournaments a competitor may be disqualified for “excessive contact.” Bouts are not continuous—judges stop the action to declare points. The winner is the contestant with the most points at the end of the match, or the one who reaches the designated number of points first. Hand techniques may be allowed to the head, and varying numbers of points may be awarded for specific techniques delivered to specific areas. Rules for youth may be different from adult rules, such as requiring less contact for a point to be scored, and in some tournaments boys and girls may spar against each other. The protective equipment required varies according to individual tournament rules, and may include hand and footgear in addition to the type of equipment required by the WTF. Point tournaments also generally include competition in forms and board breaking. Forms competitors are divided into divisions based on age and rank, and they may or may not be divided by gender.

The characteristics of taekwondo practitioners are varied. There are programs for children as young as three, and people are able to practice throughout their lives. Men and women, boys and girls, of all ages, throughout the world practice taekwondo. Studies concerning the personality traits of taekwondo practitioners have shown that it improves self-esteem and reduces aggression in children, and students holding higher belt ranks tend to be more demanding, enthusiastic and optimistic, self-reliant, and socially perceptive.

Competition at the Top

There are numerous national, regional, and international taekwondo tournaments. The World Taekwondo League holds competitions in four regional areas: Pan America, Europe, Africa, and Asia. Competitors must have Kukkiwon certification of *dan*, and competition rules are similar to WTF (Olympic) rules. Taekwondo competitions are also held in the Asian Games, South Pacific Games, Pan American Games, World Games, All-Africa Games, Southeast Asian Games, South American Games, Bolivarian Games, and Olympics.

The history of taekwondo in the Olympics starts prior to 1980. The WTF created standardized competition rules and forms as they began to bid for recognition by the IOC as the governing body for taekwondo in the world, and they gained that recognition in 1980. In 1985 taekwondo was accepted as a demonstration sport for the 1988 Olympics. Taekwondo was a demonstration sport in the 1988, 1992, and 1996 Olympics, and was accepted as a full Olympic sport for the 2000 games in Sydney.

Arlene Limas stands out as one of the major athletes in taekwondo. She competed in the Olympic games in Seoul, Korea, and was the first taekwondo athlete to ever win an Olympic gold medal. Ms. Limas retired in 2000 but has remained prominent in the Olympic movement in the United States, and she is an activist for athletes’ rights. Another athlete from the 1988 games, Jimmy Kim, was the first gold medalist in the men’s heavyweight division, and he was *Blackbelt Magazine*’s 1988 Male Competitor of the Year. Herb Perez was another gold medalist in the 1988 games who went on to achieve fame. He played Olympus on the television show *WMAC Masters*, and he has appeared in several books and videos. A more recent Olympic champion of note is American Steven Lopez, who won gold medals in both the 2000 Olympics in Sydney and the 2004 Olympics in Athens.

Ernie Reyes has not only won many taekwondo championships himself, but he set a record for training the most black-belt champions in one year with seven of his students from his West Coast team winning

national championships. He has been inducted into the Black Belt Hall of Fame, has appeared on the cover of every major martial arts magazine, and in 2003 was awarded a lifetime achievement award for twenty-five years of excellence.

Tai Chi

Tai chi is a Chinese martial art that is linked to the Daoist meditative, philosophical, and medical tradition. In China invalids and the elderly often perform the soft, slow movements of the popular Yang style of tai chi to strengthen the constitution and to promote

longevity. Advocates say that disciplined daily practice enhances the quality and circulation of *chi* (vital energy) within the body, improves bodily functions, tones muscles, and engenders a relaxed mental attitude. The majority of the millions of people who practice tai chi in China and elsewhere do so for these benefits, but tai chi also is a premier martial art that can be practiced even late in life.

Origins

Chinese legendary history attributes tai chi's origin to Zhang Sanfeng, a Daoist expert who was canonized in 1459, but tai chi entered recorded history centuries later as a martial art practiced esoterically by the people of Chenjiagou in Henan Province. A form of the art was first demonstrated and taught in public in Beijing by Yang Luchan (1799–1872), who had learned it in Chenjiagou. Scholars say Yang accepted all challenges from the many Beijing martial arts masters, never to be defeated and never to seriously injure an opponent. He became known as “Yang the Invincible” and was appointed martial arts instructor to the imperial court. Yang Luchan publicly taught the slow and soft performance of a lengthy sequence of patterns, but he transmitted a much larger and more varied body of lore to his private students, a practice in keeping with martial arts tradition. Popular conceptions of tai chi as an only vaguely martial exercise, although beneficial to health and longevity, are drawn from Yang's and his successors' publicly taught form. This process of simplifying and softening has made tai chi accessible to many more people than would otherwise be the case. However, the more obviously martial and physically strenuous Chen style continues to be practiced, as do the derivative Sun, Wu, and Hao styles.

Practice

As a martial art tai chi employs a subtlety of touch to sense an opponent's strength in order to redirect his or her motion so that one's defensive movement neutralizes it and becomes a counterattack as well. In describing this capacity practitioners use such phrases as “when the

opponent is still, be still; when the opponent moves, move first,” and “use four ounces to deflect a thousand pounds.” The technique depends upon the ability to maintain gentle physical contact with the opponent without resisting, that is, to never meet force with force. The tai chi player’s counter to the aggressive move, after the instant has been seized and the movement’s force captured, can be any of several techniques. Most benignly and simply, the tai chi player can accelerate or redirect the opponent’s motion, sending him or her many feet away. Alternatively, a player can use any of several in-fighting techniques, ranging from low kicks to punches to open-hand strikes and grappling techniques, singly or in combination, practically simultaneously with blending with the opponent’s force. The initial contact is said to be as soft as cotton; the counter that it becomes is said to be as springy as steel.

The strength, sensitivity, skill, and mental attitude required to perform such feats spontaneously and without effort are cultivated partly by the practice of solo forms (sequences of patterns) and partly by other means. Forms vary in length and in their composition and sequence of techniques; players can practice them at different speeds with larger or smaller patterns and in higher or lower stances. In some forms the tempo is even; in others it varies. Instructors say a player should practice forms with the continuity of one “reeling silk from a cocoon.” In appearance form practice should resemble an eagle in flight; the attitude should be that of a cat when about to pounce on a mouse. Form practice is a kind of meditation in motion and requires concentration without tension. Paired practice routines, in which one works with a partner to simu-

late martial encounters, have degrees of formality ranging from duo form sequences to freestyle sparring. The full range of tai chi skills includes the use of weapons as well; the sword, broadsword, staff, and spear are used. In some schools students practice auxiliary exercises to facilitate the development of the physical conditioning, skills, and mind-set appropriate to tai chi; in others schools tai chi itself is considered the only necessary exercise. In either case the expectation is that players will learn to direct and augment the flow of vital energy within the body with their mind in harmony with the breath and that bodily functions will be enhanced as the body is renewed by improved circulation of chi. Through this internal aspect of tai chi the body is expected to become supple and limber; both traits are essential to good health and to proper performance of tai chi.

Tai chi’s mechanical principles involve erect stances that combine stability with nimbleness of foot. Movement begins at the *dantian*, an anatomical point at the body’s center of gravity just below the navel. With no tensing of muscles and with mechanical efficiency and relaxed precision, the weight is shifted and energy is transmitted via the waist to the hands. In effect the legs, spine, and arms become like five bows, resulting in

A tai chi movement.

Life is about timing. ■ CARL LEWIS

springy whole-body strength to be applied at the optimum instant. Footwork should be like the tread of a cat. Tai chi sport competition involves solo form performance and sometimes *tuishou* or push-hands, a demonstration of mastery of the principles of tai chi.

From a Chinese cultural perspective the psychological and medical value of the art and its martial potential are reasonable expectations. Both are in harmony with Daoist philosophical principles that are believed to be universally valid. The Daoist classics *Daodejing* and *Yijing* promulgate these principles, the interplay and balance of opposites that tai chi embodies. Thus, one can see tai chi as an art of harmonization with nature that includes the ability to harmonize with an opponent's attack and the nurturance of *chi* that animates every living thing in the universe: Tai chi is considered to be a spiritual discipline as well.

The Future

During China's Cultural Revolution (1966–1976) tai chi was under political attack in China, but the situation has changed. Tai chi has been reinstated as a national treasure and a uniquely Chinese form of art and sport. Basic tai chi is taught publicly in parks and other suitable places, as it is in other parts of the Chinese world. Advanced instruction is available, and form competitions are held. Lacking knowledge of Chinese philosophy and its implications for self-defense and medicine, Westerners have generally been drawn to flashier martial arts. However, that situation is changing, too; gradually tai chi is becoming better known in the West. It is of growing interest to the international medical research community and to martial arts scholarship, but tai chi is still best known in the West as a health and longevity exercise of particular benefit to seniors.

Technology

Technology has become pervasive in society as innovations promise to make our lives better. We accept most innovations that make our lives easier as long as they are safe and efficient. Sport, however, is different. Challenge and tradition are central to the essence of sport, so technology presents a more complex dynamic in the sports arena.

New Materials, New Opportunities, and New Challenges

Changes in materials and designs have provided opportunities for countless athletes to develop their athletic potential. Innovations can make sports less expensive, can provide flexibility in design so athletes can select the equipment best suited to their individual skills, and can reduce risk by making sports safer:

- Composite bats have allowed younger baseball players to develop their athletic skills without having to wield heavy wooden bats.
- In boating, composite materials have enabled kayakers to select the hull shape best suited to their individual skills.
- Mass manufacturing of equipment has reduced the cost of golf balls, which were once hand stuffed and sewn.

- Design, materials, and testing have produced safety pads and helmets that minimize severe injuries in many sports.

Innovation also improves performance, opportunity, and interest:

- The fastskin swimsuits, which ignited controversy at the 2000 Olympic games in Sydney, Australia, significantly reduce drag in the water and, thus, the swimmer's time.
- Composite skis transformed skiing into a popular recreational activity and encouraged innovative designs, which led, decades later, to shape skis that allow previously intermediate skiers to quest the advanced black diamond trails.
- In the 1980s, after the javelin's center of gravity was moved forward, athletes with precise technique were able to achieve victories that previously went to physically stronger athletes.

Not all technological innovations improve sport, however. Some new technologies can usurp the challenge or tradition of the sport. If a golf ball had a guidance system that guaranteed a hole-in-one every shot, it would certainly compromise the test of driving distance, accuracy, and putting precision that golf provides. These artificial challenges are the core of sports. Sport provides physical challenges that exist purely for the sake of the activity it makes possible:

- In track, the athletes get from the starting line to the finish line by running around the track rather than across the infield. Rowers move from the starting line to the finish line without the aid of a motor. Football players have challenges including a defensive line, to transfer the walk into the endzone into a sport. By contrast, dance, while a physical activity, is not a sport. Dance does not have artificial challenges set up purely for the sake of the activity. These physical challenges are essential to sport.
- Chess has challenges and artificial inefficiencies in the design of how the pieces are allowed to move but these challenges are mental and not physical, thus

chess does not meet the requirements necessary for sport.

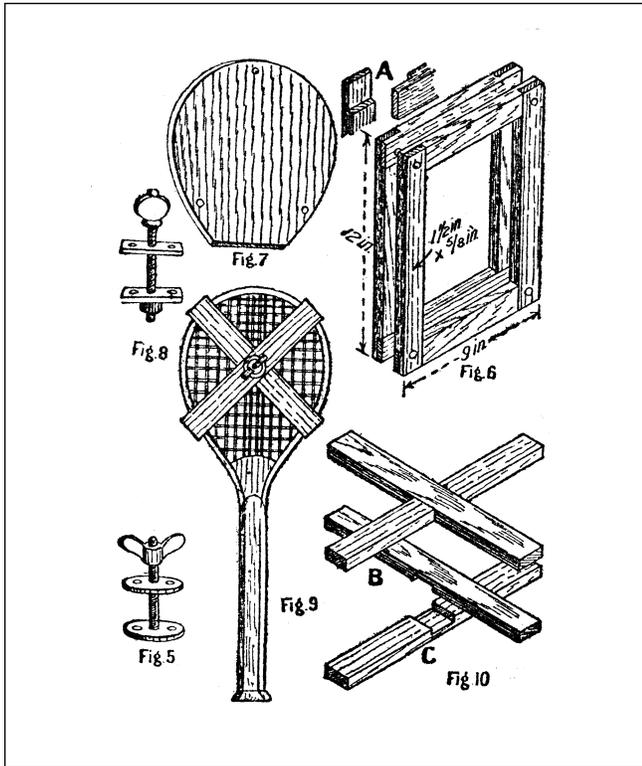

Before World War II, the available materials limited the design of sports equipment. For years, the tennis racket design remained stable. Tennis rackets with wood heads could not withstand the stringing tension necessary for a successful large-head racket. Thus, the nature of the materials provided design constraints and few innovations had a revolutionary affect on sports. Once new materials that emerged out of military research entered the industrial sphere, ingenious inventors increased flexibility to design new technologies that would revolutionize sport. Howard Head, for example, used such military materials and knowledge to design composite skis based on airplane wings. With the increased money entering the sports arena because of television fame, inventors had the incentive to be creative and develop new technology that would yield victories.

Victories were profitable because of the increased revenue generated through television, and because the newly suburban families flocked to sports activities and purchased the latest equipment—equipment that enabled mass participation. New designs continued as these athletes, new to the sport, brought their own creativity into the design process unencumbered by years of sports tradition indoctrination. For example, rules governing golf balls were based on the size and weight as well as overall distance the ball could be hit. No rules governed dimple patterns until two non-golfers redesigned the dimples to reduce hooks and slices and improve the accuracy of golf ball flight.

With new materials enabling creative technological design, money from television, money from the newly created recreational market, and people unencumbered by years of enculturation, the timing was right for technological innovations to revolutionize sport and to force governing bodies to address technological issues.

Controlling Innovations in Sport

If innovations can increase opportunities of participation, providing athletes the chance to express their own

Press for an old-style wooden tennis racket.

With a few exceptions, sport governing bodies that had been adept at developing playing and eligibility rules failed to address these technological revolutions until a crisis occurred. In tennis, for example, a new stringing system enabled players with an average topspin stroke to produce a shot with championship caliber spin. Balls hit effectively with this stringing system were unreturnable, so low-ranked players produced upsets throughout Europe. The International Tennis Federation (ITF) had no rule prohibiting the different stringing systems, so the new and revolutionary system was legal. In desperation, the ITF banned the new design after a number of players had already relied on the technology and the manufacturers and distributors invested in the product. The rule the ITF developed to ban the “spaghetti strung” racket focused specifically on that stringing design without providing standards to govern future technological innovations.

In contrast, when the United States Golf Association (USGA) wanted to protect the sport from golf ball designs that were yielding longer drives, it developed a performance standard. No golf ball, regardless of material, manufacture, or production could fly longer than a specified distance when hit with a specified force. This performance standard proactively protected the skills the USGA defined as essential to the sport while giving manufacturers maximum flexibility in design. In addition, with this performance standard, those with a stake in golf technology knew the rules in advance.

individual excellence, but can compromise the challenge or tradition of sports, how can sports organizations make comprehensive technology policy decisions? How do sports organizations determine what technologies to allow and which ones would be detrimental to the core challenge or tradition of the sport?

Sports organizations have banned gels on the bottom of rowing shells that minimize drag, dimple patterns on golf balls that reduce hooks and slices, stringing systems on tennis racquets that increase topspin, recumbent bicycles, and more. These regulations protect the core challenge of the sport.

The International Olympic Committee (IOC) is dedicated to protecting the integrity of its games by ensuring that victories go to athletes and not engineers. The IOC allows each sport to write its own rules for technology policy but requires that innovations be available to all the athletes to make sure no one athlete has an unfair advantage. The individual sports are thus charged with determining which innovations will be permitted on the field of play during sanctioned competition. After the 1960s, the policy of ignoring technological innovation, as many organizations did (cycling and golf are notable exceptions), created crises for many sports governing bodies.

TEAM VERSUS INDIVIDUAL SPORTS TECHNOLOGY

Although coherent sport-technology policy is ideal, there are significant differences in team versus individual sports, in recreational versus elite athletes, in male versus female athletes, in adult versus youth athletes, and in on-field versus off-field sports. Technological innovations tend to have much less impact on team sports than on individual sports because the team dynamic influences results more than an individual’s technologically improved performance. In team sports, much of the technology is shared—a ball for example—and

Equipment Innovations

While not always greeted with enthusiasm, change is often for the better. The following extract describes the practical innovations that have guided the evolution of baseball equipment over time.

With the steady improvement in the playing of baseball we have had an improvement in the appliances of the game. It doesn't take a very old enthusiast to remember when the catcher had no protection at all from the cannon-shot delivery of the pitcher. First came the glove for the left hand, without fingers, but slightly padded; this was first used by Douglas Allison in the old Cincinnati Reds of 1869. It came into general use slowly, many catchers disdaining to use it. The glove protection gradually found favor and improvement until now we have almost every player in the team using a glove on his non-throwing hand, and as for the catchers, they have a heavily padded mitten with a steel guard around the outer edge which effectually prevents broken and stoved up fingers, and on his throwing hand a lightly padded glove with short fingers. The first protection for the face was a large piece of rubber held in the mouth, which, if the ball hit, it bounded off and saved the

teeth and nose; this came in vogue about 1875. In 1876 a catcher by the name of Thayer, of Harvard College, invented the mask, which is now so universally used; the professionals didn't take to it at all kindly at first and refused to use it. A few years ago the rubber body protector was brought into use. There has been as much improvement in baseball shoes as in any one appliance; they have now almost reached the perfection of lightness and durability and constructed with special view to the requirements of the player. The ball is greatly improved over those of ten or twenty years ago, in fact it seems to have reached the acme of perfection. There is apparently no hope for an improvement in the bat, except that better material is generally used now in the manufacture of first-class bats than formerly. A great deal more attention is paid to the grounds than formerly, and many of them are as nearly perfect as it is possible to make them. These items enter not a little into the almost perfect playing with which we are entertained nowadays.

thus, the advantage of technological innovations geared for the athletes' individual skill has no impact. With shared technology, any advantage an innovation provides is also shared.

Often an innovation will dramatically affect the recreation market before the elite athlete reaps any rewards. The large-head tennis racket provides a prime example of an innovation the governing body ignored because it had no initial impact on the professional tour. This new racket dominated the tennis club scene and all weekend players wielded the new weapon, but its stringing tension was insufficient for professional athletes. Because the new technology did not dramatically affect the elite athletes, the ITF allowed the innovation, but once the large-head rackets began to affect the professional tour, its prominence made it difficult to ban.

Having different rules for different athletes creates both philosophical and practical challenges. Recreational and elite athletes have different skills and frequently use different technology. Manufacturers, however, leverage the visibility of the professionals to market their products and highlight their technologies. Recreational athletes frequently strive to emulate the professionals and purchase the "same" equipment that they witnessed leading to such success on the professional circuit. Different regulations make manufacturing and testing different technologies more complex and leave opportunities for nonapproved equipment to abound. In addition, although sport governing bodies do regulate championships, no one really regulates those weekend warriors, leaving the definition of the sport and success in the sport dubious—do victories belong to the athlete or to the engineer?

Technological innovation has also increased opportunities for female athletes to excel but has raised the question of whether rules should be identical for male and female athletes. Some vocal tennis commentators criticize composite rackets as destroying the men's game. This same technology has enabled female tennis players, however, to thrive and produce television ratings that exceed those of their male counterparts.

OFF THE FIELD TECHNOLOGY

Often the greatest impact on sport comes from those technologies used in training. Rehabilitation technology, weightlifting technology, simulation machines, high-altitude training chambers, and even performance-enhancing substances all have significantly shaped our games. These technologies are all used off the field of play and outside the view of the fans, challengers, and regulatory bodies. Governing bodies define the rules of engagement on the field of play, but they have little or no authority outside the competition arena. The IOC

governs the activities for the two weeks of Olympic competition but not during the years of training that lead to that competition. The ITF governs the rules on the court of play, and the Professional Golfers' Association (PGA) Tour governs activity on the green during their competitions. These organizations, however, have not historically had any control or authority over the training of athletes and, thus, all the technologies used to prepare an athlete for competition have remained outside the rules established by governing bodies.

CHEMICAL ENHANCEMENTS

One notable exception to the governing bodies writing technology rules outside the competitive arena is in the rules of performance-enhancing substances such as steroids. Governing bodies have recognized that chemical enhancements compromise the integrity of their sports and transform the challenge from one between athletes into one between pharmacologists. Governing bodies have, however, struggled to govern these new technologies for a number of reasons:

1. The governing bodies had to define specifically what was not allowed. This is not as simple as it might sound because different athletes have different levels of chemicals, and athletes take different medications for medical reasons.
2. Accurate tests need to withstand the legal scrutiny that would result from a monopoly inhibiting an athlete from earning a living.
3. Even when sports governing bodies created a list of "banned substances" and developed tests to be used on the day of competition, the regulations were vacuous because many athletes used the banned substances to train and build muscle, strength, and endurance but allowed the substances to leave their bodies in time

Waxing Poetic about Sports Equipment

An excerpt from the poem "The Outfit and the Spirit" by Ray Hoffman (1923):

"Phillup" Peters had a wonder bat of willow,
Must have cost him eighteen bucks or so at
that;
But as was to be expected.
"Phillup" never once connected,
While Fred Ferkins knocked the homers with a
slat.
Did you ever know this truthful fact to fail
you?
It's the gospel truth, I'll say so, every time—
Get this sentence, sport fans, hear it,
'Taint the outfit, it's the spirit,
Thought the tools you have to use cost but a
dime.

Source: Hoffman, R. (1923, January). The outfit and the spirit. *Sporting Life*, p. 35.

for the competition and the testing. Other athletes took other substances that masked their use of the performance-enhancing substances.

Thus, actually protecting the integrity of the sport means developing sport-technology policy that can be enforced off the field of play—a significant shift for sports organizations whose sovereignty has historically extended only as long as the competition.

The Future

While sports organizations have focused much of their attention on athlete eligibility and game rules, technology has dramatically affected many sports. Often, the policies governing bodies write to protect their sports from new technologies are reactive ad hoc policies implemented following a crisis. With this reactive policy approach, manufacturers invest research and development dollars in creating and marketing a new technology. In some cases, this technology becomes accepted and used—as were square groove golf clubs

and the large-head tennis racket—so that governing bodies find it impossible to ban the innovation regardless of how it affects the sport. In other cases, governing bodies succeed in banning the new technology, such as the "spaghetti strung" tennis racket or the "Polara" golf ball, and the manufacture seeks to recoup the costs through legal battles that challenge the right of the governing bodies to implement these ad hoc policies

Anticipating innovations is impossible, so sports governing bodies have historically waited and ruled on innovations as they arrived or created policies so vague they had no practical meaning. The debate about the fastskin swimsuit continues, for example. The suit was allowed in the 2000 Olympic games and has since appeared on swimmers at all levels. Arm-bands that increase buoyancy and reduce drag were banned, however. This type of ambiguity in sport technology policy could be avoided with proactive performance standards.

Shifting from design standards to performance standards, such as the overall distance standard in golf, would effectively enable sports organizations to protect the core challenge of their games without having to anticipate future innovations. These proactive standards would provide foreknowledge to the manufacturers and provide protection in the legal battles that ensue from retroactively regulating technology. In addition, proactive performance standards would more effectively protect the core challenge and tradition of sport while providing manufacturers maximum flexibility to innovate.

Tennis

The word *tennis* is thought to have evolved from the Greek word *phennis* or the German word *tanz*. Others have speculated that the word evolved from the French word *tenez* meaning “to play.” However the name came to be, the sport has evolved from a game enjoyed only by the upper classes to one that is played and watched by people of every social strata.

History

The origins of tennis are much debated. The earliest reports date back to ancient Greece. Information from the fourth century CE specifies that the Persians enjoyed a game called *tchigan* that was played in an enclosed space with rackets that were approximately four feet long. Despite these records of early games that were similar to tennis, most historians feel that tennis originated in thirteenth-century France. The game, known as *jeu de paume* (or game of the palm) evolved from handball. Balls made of cloth sewn into a hard round shape were hit with a bare hand or a hand in a glove. Nets were made of wooden obstacles or mounds of dirt, and participants volleyed against a wall or with each other. The scoring system probably originated from the Old French word *une journee* meaning a “sport match” or “a day.” The word *love*, meaning “no points,” is thought to come from the French word for egg, *l’oeuf*, which sounds like “love.”

Growth of the Sport Worldwide

In 1873 Major Walter Clapton Wingfield, a British Army officer, in an effort to liven up a lawn party invented lawn tennis, a combination of badminton and court tennis that was played on an hourglass-shaped court. Major

Wingfield patented the game in 1874 and sold equipment for the sport. Tennis balls were made of uncovered hollow rubber, and the net was 4 feet high in the center and 5 feet at the posts. Rackets were spoon shaped with long handles. In 1877 when Wingfield’s patent ran out, the game was further modified: the hourglass shape of the court was changed to a rectangle.

Most historians speculate that the game of tennis was brought to America by Mary Ewing Outerbridge of New York. Outerbridge, nicknamed the “mother of tennis,” learned the game from British officers while visiting her brother stationed at a British garrison in Bermuda. Consequently, she brought the equipment back to America. By late 1874 she had helped establish the first lawn court on American soil, in Staten Island, New York. Initially, the sport grew mostly in the eastern United States—especially at the women’s colleges in the region. The game was introduced at Smith College in Northampton, Massachusetts, in 1881. In 1892 Bryn Mawr College in Pennsylvania held the first intercollegiate tennis contest, an event that may have been the first intercollegiate contest for women in any sport.

After the 1920s the game was no longer assumed to be restricted to those from the upper class. Tennis is now played among all social classes, having moved “from the classes to the masses—from an informal lawn party to a lavish spectator show” (Bartlett and Gillen 1981, 11). Much of the increased participation in tennis was due to the availability of public tennis courts.

Worldwide Participation

Tennis was one of the first sports to be enjoyed by women. The leisurely and social nature of the game appealed to the “less athletically inclined” female. Despite the growth of women’s participation in tennis in the late nineteenth and early twentieth centuries, men still had more competition opportunities than women. For example, in 1884 England started the “All England Lawn Tennis Club” women’s singles championships—now known as Wimbledon—seven years after the start of the

same event for men. Perhaps more profoundly for the women, the early success of female tennis players and the growth of the sport among virtually all social classes paved the way for women to play other sports, such as basketball and field hockey.

International tennis competition for men started with the Davis Cup in 1900 and for the women with the Wightman Cup in 1923 (only the United States and England participated). The Wightman Cup was discontinued near the end of the 1980s in favor of the more popular Federation Cup—initiated in 1963 as an equivalent to the men’s Davis Cup. Tennis was first added as an Olympic event in 1900. Then, in 1924 the sport was eliminated because of disputes over the distinction between amateur and professional athletes. Finally, at the Seoul Olympics in 1988, tennis returned as an Olympic sport. With the beginning of the “open era” of tennis in the late 1960s (a limited number of tournaments were opened to amateur and professional players), the Olympics became a showcase for many of the top professional players. Presently, television ratings for tennis are high, and tournament attendance records are broken regularly. Tennis is recognized as a multimillion dollar sport. This revenue has been generated from corporate support, player endorsements, and tournament proceedings. Mercedes-Benz’s current multiyear deal with the Association of Tennis Professionals (ATP) is worth close to \$50 million. Sanex’s sponsorship, although terminated in 2002, generated over \$40 million in sports revenue for the Women’s Tennis Association (WTA). IBM and Rolex corporations alone have multimillion sponsorship deals with the Grand Slam tournament Wimbledon (amounting to nearly \$14 million each year). With \$52 million at stake at the sixty tournaments worldwide on the women’s professional circuit, it is not surprising that Venus Williams was the highest paid female athlete in 2001–2002 along with her tournament winnings, having signed \$20 million in endorsement contracts with companies including Reebok and Wrigley.

The popularity of the International Tennis Federation (ITF) Veterans Circuit is also growing. It currently offers

186 tournaments worldwide, with players over thirty-five eligible to compete in a variety of age-category events. Tennis remains, however, the most visible sport in which men and women of different nationalities, ethnicities, and backgrounds can compete, succeed, and dominate the center stage.

Rules, Equipment, and Training: Recent Changes

Since the open era of tennis began in the late 1960s, notable changes have occurred in areas such as scoring, pre- and postmatch mandatory interviews, establishment of the Code of Conduct (1975), and match protocol. The most recent additions include player hindrance guidelines, particularly regarding excessive player “grunting” during play; removal of the rest break after the first game of every set; and the use of the tiebreaker. (A full description of the current rules and regulations for professional conduct and play can be found at www.itftennis.com.) With regards to training and coaching, the most recognized professional coaching certifications are generally obtained through the national governing body for tennis in each respective country. (Many resources exist concerning tennis-related and tennis-specific training practices and programs, such as www.tennislovers.com and www.tennisonline.com.)

The changes in scoring and protocol concurrent with the onset of the open era of tennis have been accompanied by changes in racket technology and the quality and type of clothing (especially for females). Rackets are now made of titanium, graphite, or hypercarbon (or a combination of these materials), as opposed to wood (the predominant racket type until the 1970s) or aluminum. The price of a racket can vary significantly depending on the quality and manufacturer. Player clothing has also been transformed to provide greater comfort for the players (e.g., quicker sweating capacity, ease of movement) and provide more commercial appeal. Consequently, player clothing today consists of many bright and unconventional colors and styles. Few individuals now wear traditional “all white” outfits—except at Wimbledon where it is mandatory.

The Tennis-Court

When as the hand at Tennis plays,
And Men to gaming fall;
Love is the court, Hope is the house,
And favour serves the Ball.

This Ball itself is due desert,
The Line that measure shows
Is Reason, whereon judgement looks
Where Players win and lose.

The Tutties are deceitful shifts;
The Stoppers, jealousy,
Which hath, Sire Argus' hundred eyes,
Wherewith to watch and pry.

The Fault, whereon fifteen is lost,
Is want of Wit and Sense;

And he that brings the Racket in
Is Double Dilligence.

But now the Racket is Free-will,
Which makes the Ball rebound;
And noble beauty is the choice,
And of each Game the ground.

The Racket strikes the Ball away,
And there is oversight;
A bandy, ho! The people cry,
And so the Ball takes flight.

Now at the length good liking proves
Content to be their gain;
Thus, in the Tennis-Court, Love is
A Pleasure mixed with Pain.

Recently, there have been calls for more drastic rule changes to make the game more viewer friendly and to reduce the dominance of the serve (especially in the men's game). Suggested changes include the "no let" rule (if the serve hits the net and falls in, it counts), no second serves, no ad-scoring, reducing the size of the service box, use of wooden rackets, and on-court coaching. These alterations have gained support from prominent individuals in the tennis world, such as John McEnroe and Stan Smith (associate director of the USTA Player Development Program, 1988–1995).

Important People

The history of tennis contains many memorable personalities, notable players, and ambassadors for the sport. A brief summary of these men and women follows.

The first gentlemen characters in tennis were two sets of British brothers, Ernie and William Renshaw, followed by the Doherty boys, Reggie and Laurence, who won numerous Wimbledon Singles and Doubles titles during the 1880s through the early 1900s. In 1938 American Don Budge became the first male to achieve

the "Grand Slam," which consists of winning all four major Grand Slam events in the same calendar year. In 1962 and 1969, Australian Rod Laver became the second man to achieve this feat (twice nonetheless). In 1968 Arthur Ashe became the first African-American to play on the U.S. Davis Cup team and the first to win a major singles title, the U.S. Open, the first of his three (Australian Open, 1970; Wimbledon, 1975, being the others). In doing so he established a legacy that remains today. Swedish player Björn Borg won an unprecedented fifth consecutive Wimbledon Singles title in 1980 (he would win a total of twelve Grand Slam majors by 1981). In the 1970s and 1980s, the fiery tempers of players such as John McEnroe, Ilie Nastase, and Jimmy Connors, often directed at their opponents, umpires, and even the crowd, were more than matched by their genius as players. McEnroe won seventeen major titles (singles and doubles), and Connors, as well as winning eight major singles titles, is the only male to win the U.S. Open on three different surfaces. The Spread of Tennis

Our popular athletic games are not really modern, but inheritances from people and times of old. Tennis is probably the oldest of all the ball-games. Its origin is uncertain, but it first appeared in Europe during the Middle Ages. It was popular among the French nobility, who are said to have borrowed it from the Italians. The English in turn adopted it from the French. The name of the game is said to be French in origin being derived from the expression “Tenez!” which was used by early French players in serving the ball. The antiquity of the game is testified to by Horace, the Roman bard, who tells of Maecenas playing tennis while on the journey to Brundisium.

(Czechoslovakian, American after 1992) also have honorable places in tennis history, having captured between four and eight Grand Slam titles each. Pete Sampras, an American, holds the record for men’s Grand Slam singles titles at fourteen, having been ranked number one for most of the 1990s. Today’s game is blessed with a wide variety of personalities and playing styles, from the composed persona of Roger Federer to the charismatic play and experience of Andre Agassi and the fiery passion of Lleyton Hewitt.

In the 1920s, Mary Kendell Browne, an American, became one of the first female professional tennis players, along with the glamorous Frenchwomen, Suzanne Lenglen. In 1950 Althea Gibson became the first African-American woman to participate in the U.S. Championships, which she later became the first African-American to win in 1957 (having won Wimbledon in 1956). In the 1970s Evonne Goolagong Cawley became the first and only Aborigine (Native Australian) to win a Grand Slam event (two Wimbledon titles, one French, and four Australian Open Championships). In 1953 Maureen Catherine Connolly became the first female to achieve the Grand Slam. This feat has been equaled by only two other women: Margaret Court Smith in 1970 and Steffi Graf in 1988. Graf won

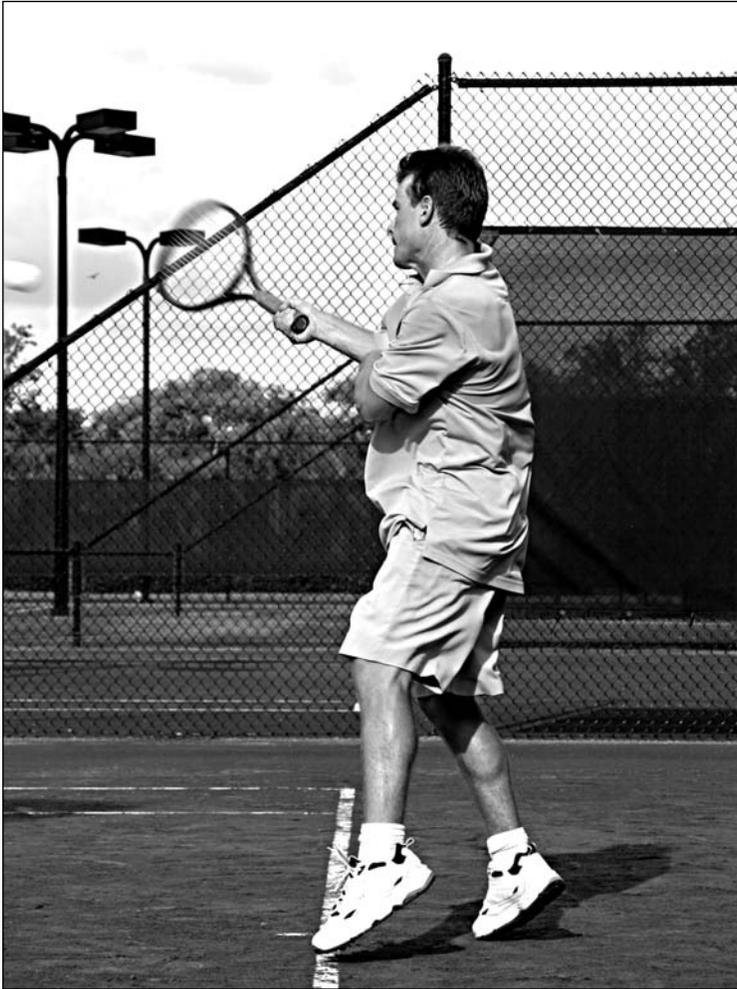

twenty-two Grand Slam titles in a highly successful career that finished with a sentimental French Open Singles victory in 1998. Martina Navratilova, who won a record high of 170 singles and 129 doubles titles, recently equaled Billie Jean King’s record of twenty Wimbledon tournament wins, with a victory in the 2003 Mixed Doubles event at Wimbledon alongside partner Leander Paes. Despite retiring in 1995, Navratilova has recently been active on the tour once again at the age of forty-seven, competing in the singles and doubles events at the 2004 French Open, Wimbledon, U.S. Open, and the 2004 Olympics, but is now contemplating retirement for the second time.

It is largely agreed that Helen Wills and Suzanne Lenglen were considered the greatest female players of all time for over fifty years, Pauline May Betz Addie was possibly the best post–World War II player, and Martina Navratilova and Steffi Graf were possibly the greatest female players of the open era. Women’s tennis has also seen a variety of successful playing styles. Strength and power were demonstrated in the game of Alice Mable, Suzanne Lenglen, and Helen Wills in the 1920s and 1930s; Eleonara Sears and May Sutton Bundy in the early 1900s; Margaret Court Smith in the 1960s and 1970s; and Martina Navratilova from the 1970s to present. Finesse accompanied by dominating ground-stroke games were demonstrated by Maureen Connolly in the 1950s and Evonne Cawley and Chris Evert in the 1970s and 1980s. Presently, a diversity of playing styles and strokes is evident in the women’s game. This has undoubtedly contributed to the immense popularity of the women’s tour.

Significant Events

The emergence of open tennis, the “Battle of the Sexes,” and the development of a women’s professional league, the Association of Tennis Professionals (ATP), and Women’s Tennis Association (WTA) are arguably the most important events in tennis history.

In response to growing concern that the most popular tennis players of the era would continue to join players already turned professional (e.g., Roy Emerson, John

A young man playing tennis.

Newcombe, Cliff Drysdale, Rod Laver, Ken Rosewell), the International Tennis Federation (ITF) approved twelve tournaments (including Wimbledon) for both amateur and professional players in 1968, signaling the beginning of the open era of tennis.

The women's liberation movement and other social justice movements of the early 1970s prompted female tennis players to rectify the significant gender differences in prize money, travel allowances, and sponsorship. As a result of the 1970 Pacific Southwest Tournament organizers refusal to equalize the disparity in prize money (the men's singles champion was set to receive \$12,500 compared to the women's champion receiving only \$1,500), a women-only tournament was established in Houston, Texas. The prize money was set at \$5,000, plus \$2,500 in additional monies (pledged by Joe Cullman of Philip Morris tobacco) for the winner of the tournament in exchange for naming it the "Virginia Slims Tournament." Led by tennis entrepreneur Gladys Held-

man, nine women (two Australians—Kerr Melville and Judy Dalton—and seven Americans—Peaches Bartkowicz, Val Ziegenfuss, Kristy Pigeon, Nancy Richey, Billie Jean King, Rosie Casals, and Julie Heldman) agreed to play despite threats of suspension from the USLTA. By 1971 Billie Jean King became the first female athlete to earn \$100,000 in a year. Overall, the Virginia Slims tour was developed, worth \$250,000, and twenty-four tournaments were planned for the near future (as opposed to only two tournaments that were guaranteed following Houston). Billie Jean King continued to act as a prominent advocate of women's tennis and promote equality for women in sport by defeating Bobby Riggs in the 1973 "Battle of the Sexes." The match, which was worth \$100,000 (plus bonuses and endorsements) to the winner, was watched by 30,472 people in the Houston Astrodome and over 50 million on television. Billie Jean King has since occupied major roles as the first president of the Women's Tennis Association (WTA) and coach of the U.S. Federation Cup Team. Although im-

mense progress has been made, inequality still exists within professional tennis. Only seventeen female players have earned more than \$300,000, compared with fifty professional male players. Furthermore, only the Australian and U.S. Open tournaments (both Grand Slam competitions) award equal prize money to males and females.

In 1972 the ATP, a male players' union, was formed. The ATP has been instrumental in governing prize money, tournament conditions, conduct, and organization of tournaments (except the Grand Slams) on the men's professional circuit (ATP Tour). The WTA is a comparable organization established in 1974 for professional female players and works in a similar manner to the ATP.

The New Millennium: Issues and Challenges

The arrival of the new millennium brought both developments and opportunities to tennis. It also highlighted

Tennis

International Tennis Federation

In 1911 the International Lawn Tennis Federation (ILTF) was formed. This organization integrated national tennis associations worldwide and helped bring a uniform structure to international tennis. The ILTF was officially recognized as the governing body for international tennis in 1924, and in 1977 it became the International Tennis Federation (ITF). Since the ITF was founded, it has been involved in and helped resolve disputes within the tennis arena. The ITF took over organization of the Davis Cup in 1979 and established the Women's International Professional Tennis Council (WIPTC) in 1975 to monitor and promote women's professional tennis worldwide. It also founded the Wheelchair Tennis Players Association (WTPA) in 1981. Overall, the ITF (www.itftennis.org) has helped secure the continued success and growth of professional tennis.

Katie Sell, Maria Newton, and Lynda Ransdell

challenges that the sport had been facing for some time. It remains difficult to “grow the game” (as the United States Tennis Association would say) partly because sport in today's society is driven by its entertainment value. The future of every sport is tied to its ability to secure TV time and advertising dollars. The international flavor of professional tennis tends to decrease the lure of tennis to the American consumer because the presence of an American in the final of a tournament cannot be guaranteed. For example, the 2004 U.S. Open was the first American Grand Slam event, since 1988, to lack an American male finalist. Justine Henin-Hardenne and fellow Belgian Kim Clijsters met in the final of the 2003 U.S. Open. They had a national TV rating of 2.5 million. That was a 52 percent drop from 2002, when Serena Williams beat older sister Venus Williams. Fewer viewers mean less exposure, revenue, and, ultimately, interest in the game.

To generate more “team” interest and promote a regional association for these teams, Billie Jean King formed World Team Tennis. Developed nearly thirty years ago, ten teams competed in 2004 season. The franchises include Delaware, Hartford, Kansas City, New York (Buzz and Sportimes), Newport Beach, Philadelphia, Sacramento, St. Louis, and Springfield. Unlike traditional tennis tournaments, coaching is allowed, music is played, and men and women compose teams.

Tennis has provided an avenue for college scholarships, although opportunities to receive financial aid (i.e., scholarships) to play collegiate-level tennis are primarily restricted to American institutions. The number of NCAA Division I, II, and III female college players has increased from 6,599 in 1981–1982 to 8,420 in 2002–2003, whereas the number of male collegiate players has declined slightly from 7,340 to 7,312 during the same period. With the exception of Stan Smith (University of Southern California), Arthur Ashe (ULCA), Bob and Mike Bryan (two years at Stanford University), and Laura Granville (Stanford University), few collegiate players succeed in making the jump from college to the professional circuit. Controversy regarding the large number of foreign players recruited to play at American colleges is growing, with an estimated forty-eight out of the top one hundred females ranked by the Intercollegiate Tennis Association in 2000 hailing from countries other than the United States.

The considerable success of both current and former tennis players off court symbolizes many of the changes and issues that tennis is currently facing. Players have given back to the sport by supporting charity events (notably Andre Agassi's Charitable Foundation), coaching, commentating, and even hosting chat shows. The phenomenal off-court success of current players, such as Venus and Serena Williams, reflects the increasingly changing attitudes and interests of female players away from the courts. The manner in which they have successfully parlayed their tennis success and notoriety into other ventures (e.g., modeling, acting, and interior designing) deserves honorable mention. The continual interaction between professional sports

and entertainment, and whether it will interfere with players “giving back to the game,” will be interesting to observe in the future.

With an increase in the popularity of the sport, we have also seen an increase in injuries in the men’s and the women’s games. Undoubtedly, the pace and power of the game are contributing to the rise in injuries. Overuse injuries are also prevalent due to the early age at which players begin training and the number of hours spent doing so. Additionally, the increasing length of the season and pressure to play tournaments undeniably has an impact on injury rates. In order to preserve the players and the game, steps must be taken to prevent injuries.

In the 1990s much was made of how teenagers were dominating the women’s game. In 1998 six of the top sixteen players in the world were under twenty years of age, and three of those were ranked in the top ten. In May of 2004, there were no players under twenty in the top ten and only two players under twenty in the top twenty in the world. Tennis insiders would suggest that it is no coincidence that the two teenagers (Svetlana Kuznetsova, nineteen, and Maria Sharapova, seventeen) in the top-twenty rankings are from Russia. Tennis was introduced to an entirely new generation of young girls from Russia following the unprecedented success (albeit not entirely tennis related) of Anna Kournikova. Olympic success is still also a very powerful political tool. As evidence of the success of the Russian program, seven of the top twenty females in the world (December 2004) are Russian, and the winners of the 2004 Ladies French Open, Wimbledon, and U.S. Open (Singles) were Russian (Anastasia Myskina, Maria Sharapova, and Elena Kuznetsova, respectively). Interestingly, the men’s game currently boasts players from seven different nationalities in the top ten alone.

Sexual orientation remains a taboo subject in men’s and women’s professional sport, but with the growth and development of the game, tennis has come to play a powerful role. Three world-ranked players have come out as lesbians, including two former world number one players, Billie Jean King and Martina Navratilova. Homo-

phobia still exists in tennis and on the tour, but tennis has become the “heroine” because no other sport nor as many fans have openly embraced lesbian athletes.

Drug abuse in the form of an anabolic steroid, nandrolone, has become an issue over recent years, particularly in the men’s game. In 1998 the Czechoslovakian Petr Korda tested positive for the steroid, as did seven professional players between 2002 and 2003. Interestingly, all of these players went unpunished because intentional use of the supplement could not be proven. Greg Rudeski is one of twenty-two players who have since tested positive for the steroid (and been excused) despite the ATP’s, one of the governing bodies for men’s professional tennis, instructing trainers not to distribute electrolyte tablets containing the drug. Players are tested throughout the competitive year, as well as three times out of competition (Andre Agassi, Roger Federer, and Andy Roddick were all tested at least twenty times in 2003). However, the ATP is being criticized considerably for allowing unexplainable drug use to run rife in today’s game.

PROMOTING GROWTH OF THE GAME

While spectatorship is growing, both the men’s and women’s games continue to struggle to increase participation numbers. From 1988 to 1995, the number of people playing tennis dropped from 20.4 million to 17.8 million. During that same time frame, the number of women participating dropped from 9.1 million to 7.3 million. Since 1995, however, participation has started to escalate. In 2003, 24 million people played tennis in the United States.

To foster growth in the game, the U.S. Tennis Association (USTA, www.usta.com), along with national governing bodies in Australia, Canada, and the United Kingdom, have developed programs such as Tennis Welcome Centers, Growing Tennis 50/50, and the Cartoon Network Tennis Club. The USTA has made efforts to diversify participation through grassroots tennis programs that attempt to introduce the game to kids in the inner cities. Worldwide (Belgium, Canada, Denmark, Israel, the Netherlands, Norway, Germany, United Kingdom,

Events such as “Tennis for Africa Day,” hosted annually in Rome, Italy, and Dublin, Ireland, have attracted top professional players, all participating to raise money and offer assistance to less-affluent countries on the African continent. The goal of such events is to disseminate the game of tennis to all and provide opportunities for nationwide involvement, especially among young people.

Title IX

On June 23, 1972, President Richard M. Nixon signed into law Title IX of the Educational Amendments. Title IX states: “No person in the United States shall, on the basis of sex, be excluded from participation in, be denied the benefits of, or be subjected to discrimination under any education program or activity receiving Federal financial assistance” (20 U.S.C. § 1681(a) [2000]). On that day the landscape of college athletics was forever changed as collegiate institutions were required under federal law to provide equitable opportunities, funding, and benefits to female student-athletes.

History of Title IX

Although Title IX was passed into law in 1972, the enforcement of and compliance with this legislation within college athletics has followed many paths. With passage in 1972, there was much debate as to whether Title IX applied to college athletic departments. Language within the legislation was not specific, only referring to education programs or activities receiving federal financial assistance. As a result numerous athletic directors and college presidents did not feel athletics was included within the scope of Title IX.

In July 1975 the Department of Health, Education, and Welfare (HEW) issued Title IX regulations to clarify how Title IX should be implemented. These regulations were criticized as being too vague and not providing adequate instruction on Title IX implementation. HEW followed up with policy interpretations in December 1978, but confusion still existed as to the application of Title IX to athletics, considering that athletic language or application was not included in these policy interpretations. Finally, in December 1979 the Office of Civil Rights (OCR) in the Department of Education, the successor to HEW charged with the administration and enforcement of Title IX, released policy interpretations that specifically included interscholastic and intercollegiate athletics.

The next hurdle regarding enforcement of Title IX involved the federal financial-assistance component of the statute. The major point of contention was whether the legislation applied only to specific departments that received direct federal funding or to any department within a school or institution that received federal funding. This issue would be decided in 1984 with the *Grove City College v. Bell* case. Grove City College is a private college in Pennsylvania that was asked by the Department of Education in 1977 to execute an Assurance of Compliance, meaning that the school would comply with Title IX standards. The department felt that Grove City was a recipient of federal funding through the admittance of students who received Basic Educational Opportunity Grants (BEOGs). The school refused, taking the position that it was a private institution and therefore did not need to comply with the government's request. The U.S. Supreme Court ruled in 1984 that only programs receiving direct federal funding needed to comply with Title IX (often referred to as a "programmatic approach"). Therefore, at Grove City College only the financial aid program needed to comply with Title IX. This ruling caused the OCR to drop numerous Title IX cases against athletic departments if it could not be established that the athletic department received direct federal funding.

In 1987 the Civil Rights Restoration Act (CRRA) was proposed to restore the broad scope of coverage and to clarify the application of Title IX, as well as the Rehabilitation Act of 1973, the Age Discrimination Act of 1975, and Title VI of the Civil Rights Act of 1964. Congress felt that the application of these acts had been unduly narrowed and that legislative action was required to restore the broad institution-wide application of these laws. In 1988 the Civil Rights Restoration Act was passed when Congress voted to override President Ronald Reagan's veto. The passage of the CRRA restored the enforcement muscle of Title IX as now an "institutional approach" would be followed. This meant that if any department or program within an institution received federal funds, then all programs (including athletics) at the institution needed to comply with Title IX.

Application and Enforcement of Title IX

In 1990 the OCR published the *Title IX Athletics Investigator's Manual* that sets forth the requirements and standards of Title IX for interscholastic and intercollegiate athletic departments. There are thirteen major factors, or program components, listed in the Title IX Regulation and Policy Interpretations that may be investigated by the OCR. These thirteen component areas may be grouped under three primary headings: financial assistance (athletic scholarships), accommodation of athletic interests and abilities, and benefits and opportunities.

The financial assistance component investigates whether the athletic scholarships for male and female student-athletes are awarded on a substantially proportional basis. In determining compliance the OCR will look at the proportion of athletic scholarship dollars provided to male and female student-athletes and compare this with the proportion of athletes who are male and female. In July 1998 the OCR issued a policy interpretation stating this proportional analysis should be within one percentage point. In other words, if the percentage of female student-athletes within the athletic department is 45 percent, the percentage of athletic scholarship aid provided to these female student-athletes should be within 1 percent, or not less than 44 percent.

A difference beyond the one-percentage-point allowable discrepancy should not automatically be viewed as a Title IX violation. Within an investigation of Title IX component areas, including financial assistance, the OCR has identified certain "nondiscriminatory factors." These are factors that have caused the discrepancy to occur, but in themselves are not discriminatory. For example, when analyzing the financial assistance or distribution of athletic-scholarships component area, allowable nondiscriminatory factors include higher costs of tuition for students from out of state that may in some years be unevenly distributed between men's and women's sport programs, and a disproportional allocation of scholarship aid in a particular year due to a sport program's development.

Pierre de Coubertin on Female Athletes (1910)

Can one permit women . . . to appear as female jockeys? Could one look calmly on from the stands while they broke their skulls? Should female teams be allowed to compete in polo and soccer matches? By no means!

Respect for individual liberty requires that one should not interfere in private acts. If a woman wishes to pilot an airplane, no policeman has a right to stop her. . . . But, when it comes to public sports competitions, women's participation should be absolutely prohibited. It is indecent that the spectators

should be exposed to the risk of seeing the body of a woman smashed before their eyes. Besides, no matter how toughened a sportswoman may be, her organism is not formed to sustain certain shocks. Her nerves dominate her muscles, this is nature's will. Finally, the . . . discipline that is brought to bear on male competitors in order to establish the good order and decorum of a contest is jeopardized by female participation.

Source: de Coubertin, P. (1910). *Chronique du mois: Défense aux femmes. Revue Olympique*, 109–110.

The second primary area of Title IX compliance is the accommodation of student interests and abilities. This component area addresses the extent to which the institution has met the interests and abilities of male and female students. A three-prong test is used to determine compliance with the accommodation component area. The three-prong test involves the following: (1) whether intercollegiate participation opportunities for male and female students are provided in numbers substantially proportionate to their respective enrollment; (2) where members of one sex are underrepresented (failure to meet prong 1), whether the institution can show a history and continuing practice of program expansion that is responsive to the developing interests and abilities of the underrepresented sex; and (3) where the members of one sex are underrepresented and the institution cannot show a continuing practice of program expansion (failure to meet prong 1 or prong 2), whether the institution can demonstrate that the interests and abilities of the members of the underrepresented sex have been fully and effectively accommodated by the present program.

When investigating the accommodation component area at an institution, the OCR will first compare the ratio of male and female athletes with the ratio of male and female undergraduate full-time students (prong 1). The OCR has no set statistical requirement for allowable discrepancy between these percentages, but certain courts in their decisions as well as institutions have used

a 5 percent benchmark. If a school fails to meet prong 1, they can still be found in compliance with the accommodation Title IX component area if they meet one of the remaining two tests. The second prong looks at the history of the athletic department. An institution must show that although their participation ratio is not substantially proportional to the student body ratio by sex as required under prong 1, the institution has made progress and shows continued progress toward compliance with steps being taken at the institution. In January 1996 the OCR provided a clarification letter that identified three factors that determine whether an institution has established a history of program expansion: (1) an institution's record of adding intercollegiate teams or upgrading teams to intercollegiate status, (2) an institution's record of increasing the number of participants in intercollegiate athletics who are members of the underrepresented sex, and (3) an institution's affirmative response to requests by students or others for addition or elevation. In evaluating whether a continuing practice of program expansion is taking place, the court looks for any formal policies in place that might indicate that the institution is monitoring the pulse of the interest of its students in anticipation of expansion. Syracuse University was one of the first institutions that met Title IX compliance in the accommodation component area by satisfying prong 2 (see *Boucher v. Syracuse University*, 164 F.3d 113 [1999]).

Whatever women do they must do twice as well as men to be thought half as good. Luckily, this is not difficult. ■ CHARLOTTE WHITTON

The third component area involves benefits and opportunities provided to male and female student-athletes. Within this component area is a laundry list of areas investigated by the OCR including provision of equipment and supplies; scheduling of games and practice time; travel and per diem allowances; opportunity to receive academic tutoring; opportunity to receive coaching; provision of locker room, practice, and competitive facilities; provision of medical and training facilities and services; provision of housing and dining facilities and services; publicity; provision of support services; and recruiting. The 1990 *Title IX Athletics Investigator's Manual* contains instructions on each, including tables for the collection of information and for comparison purposes. Basically, it is the goal of Title IX to see that the benefits and opportunities provided to the male student-athletes are comparable with the benefits and opportunities received by the female student-athletes. Once again, nondiscriminatory factors may be involved justifying any discrepancy that may exist. For example, the equipment budget of the male student-athletes overall may be substantially more than that provided to the female student-athletes. This discrepancy is allowable if it can be attributable to certain sport programs primarily on the men's side that require equipment that costs more or if more equipment is needed due to roster sizes. No violation of Title IX occurs as long as the male and female student-athletes receive comparable treatment.

Key Title IX Lawsuits

Since the passage of Title IX in 1972, there have been numerous Title IX lawsuits involving athletic departments at the high school and college levels. Some of these lawsuits have had a major impact on the interpretation and enforcement of Title IX. For example, *Grove City College v. Bell*, although not involving an athletic department and sport programs specifically, diminished the enforcement application of Title IX to athletic departments due to the "programmatic" approach employed by the U.S. Supreme Court. Another such

court case of importance to Title IX is *Cohen v. Brown University* (101 F.3d 155 [1996]).

In 1991, due to financial constraints within the athletic department, Brown University demoted the women's gymnastics and volleyball as well as men's water polo and golf teams from varsity to club status. Female student-athletes brought a class action lawsuit against Brown, claiming that the university discriminated against women in the operation of the athletic program. At issue was the effective accommodation of student interests and abilities component area of Title IX. In 1993–1994, the Brown University athletic department was made up of 38 percent female student-athletes, while the undergraduate enrollment at Brown was 51 percent female. Brown's defense relied on arguments questioning the application of the "proportionality test," comparison of the student-athlete by sex ratio to the student body by sex ratio. In 1995 the district court ruled that Brown was in violation of Title IX and ordered Brown to submit to the court within 120 days a comprehensive plan for complying with Title IX. Brown University appealed to the First Circuit Court of Appeals. The key argument in the appeals case, and one used often by opponents of Title IX, was the "relative interest" argument. Basically, this argument states that there is a difference in the level of interest in sports among the sexes in general, and, therefore, significant disparities in athletic opportunities should be allowed. In 1996 the First Circuit Court of Appeals upheld the district court's decision, ruling that Brown had discriminated against female student-athletes. In the decision the First Circuit Court responded to the "relative interest" argument by stating that interest and ability rarely develop in a vacuum, but rather they evolve as a function of opportunity and experience. Women's lower rate of participation in athletics within colleges and high schools is merely a reflection of the historical discrimination the women have been experiencing, the exact reason for which Title IX was enacted. Brown University appealed the case to the U.S. Supreme Court, which refused to hear it.

One additional Title IX case of note is *Mercer v. Duke University* (190 F.3d 643 [1999]). This case is noteworthy in that it involves a woman participating in a men's contact sport, football. Title IX exempts contact sports from its protection, meaning that Title IX does not mandate equal opportunity in contact sports. Title IX defines a "contact sport" as one in which the purpose or major activity involves bodily contact, such as football, wrestling, boxing, basketball, rugby, and ice hockey. Heather Sue Mercer, an all-state kicker during high school, served as manager for the Duke football team during the 1994 season. During the spring 1995 semester, Mercer participated in conditioning drills with the team and played in an intrasquad scrimmage that April. In that game Mercer kicked the winning 28-yard field goal, with the head coach afterward telling the news media that Mercer was on the team. By the fall 1995 season, Mercer was officially listed by the university on the team roster and regularly attended practices although not playing in any games. During the spring 1996 semester, Mercer participated in conditioning drills with the team. During the 1995–1996 school year, Mercer alleges she was the subject of discriminatory treatment by the university and the football coach, with the coach informing her that she was off the team at the start of the 1996 football season. In September 1997 Mercer filed suit against Duke and the head football coach alleging sex discrimination in violation of Title IX.

Duke University argued that Title IX did not apply in this case because football is a contact sport, and, therefore, they were under no obligation to allow Mercer, or any female, to be a member of the men's football team. The district court agreed and granted Duke University's motion to dismiss the case. Mercer appealed, with the Fourth Circuit Court of Appeals ruling in 1999 that Mercer had stated a valid claim under Title IX regulations. By initially allowing Mercer to try out for the football team (contact sport), the university voluntarily opened the team to members of both sexes. Therefore, Title IX and its regulations regarding discrimination based on gender were applicable. Duke University was found to have violated Title IX by discriminating against

Mercer in cutting her from the football team because she was a woman.

Commission on Opportunity in Athletics Debate

In June 2002, Secretary of Education Rod Paige formed the Commission on Opportunity in Athletics, a federal advisory panel created to study Title IX. This commission was made up of members from Division I athletic programs, women's groups, and former or current athletes. It was charged with studying Title IX, including the collecting information, analyzing issues, and obtaining public input, with the goal of improving the application of current federal standards for measuring equal opportunity under Title IX.

Over the next eight months, the commission held six public meetings across the United States, hearing testimony and gathering information and data from various constituency groups representing a variety of viewpoints on Title IX and the enforcement standards. On February 28, 2003, the commission released its report, *Open to All: Title IX at Thirty*. In this report the commission developed twenty-three key recommendations, fifteen of which were approved unanimously. Overall, the commission found strong and broad support for the original intent of Title IX, while also hearing a great deal of confusion and debate over how the law should be enforced. Many of the recommendations put forth by the commission were met with opposition, with two members of the commission, Donna de Varona and Julie Foudy, submitting a minority views report. Their report summarized the concern that a majority of the recommendations put forth by the commission would weaken Title IX's protections leading to reduced opportunities for women and girls in sport. In July 2003 the Bush Administration endorsed Title IX as is, with no significant changes made to the enforcement methods used for compliance.

The political debate surrounding Title IX continues, as organizations such as the National Women's Law Center, Women's Sports Foundation, and National Organization for Women, among others, argue the merits of

- 2004** A suit by the National Wrestling Coaches Association arguing that the male student-athletes were being discriminated against due to the enforcement standards directly causing a reduction in men’s sports is dismissed.

Title IX and the appropriate enforcement methods being used. In contrast the National Wrestling Coaches Association has questioned the appropriateness of certain compliance standards, in particular the proportionality test measuring athletic participation opportunity by sex in comparison with undergraduate student body enrollment by sex. The primary concern of this association, as well as the men’s gymnastics group, is that men’s teams, and thus male opportunities to participate in sport, are being dropped as schools attempt to comply with Title IX. About 400 men’s college teams were eliminated during the 1990s, with wrestling being hit particularly hard. The National Wrestling Coaches Association filed a lawsuit against the Department of Education, arguing that the male student-athletes were being discriminated against due to the enforcement standards directly causing a reduction in men’s sports. This lawsuit was dismissed in May 2004 as an appeals court panel ruled that the parties lacked standing to file the lawsuit, which instead should be litigated against the individual colleges that eliminated men’s sports.

Current Status of Title IX

The formation of the secretary’s commission to study Title IX in 2003 caused athletic administrators to be attentive to these discussions, with speculation occurring as to whether the compliance standards would be altered. The Bush Administration’s endorsement of Title IX, with no changes being made to the enforcement standards used for compliance, has tempered, for the time being, this concern and debate surrounding Title IX.

As federal legislation Title IX is enforced by the Office for Civil Rights of the Department of Education. The NCAA, as governing body of collegiate athletics, has not actively involved itself with this enforcement, but instead through the Principle of Gender Equity directs their member institutions to comply with federal and state laws regarding gender equity. The federal requirements for Title IX have been endorsed recently by the president of the NCAA, Myles Brand, who, while speaking at a meeting of the National Wrestling

*As long as I breathe,
I attack.* ■ BERNARD HINAULT

Coaches Association in May 2004, told the group that Title IX has been used as an excuse to eliminate sport programs. Title IX should not be seen, though, as the cause. Instead, these decisions are made at the institutional level, and while the number of wrestling programs at NCAA schools over the past two decades has dropped from 363 to 222, the number of football teams has increased from 497 to 619.

As part of the Education Amendments of 1972, Title IX was enacted to eliminate discrimination in educational programs or activities. The positive impact of this law is evident as many new doors of opportunity have been opened for women and girls in educational areas, bachelor and advanced degree programs, medical degrees, and athletics. In 1971, 294,015 girls participated in high school athletics. Today, over 2.7 million girls are participating. From 1981 to 1999, the total number of college women's teams increased by 66 percent. Although these improvements are impressive, there is still more work to be done, as girls and women continue to experience the benefits that participation in sport can bring.

Tour de France

The Tour de France is an annual international bicycling event in which riders who represent different brands compete. It has taken place every year since 1903, except during the two world wars. The race, which is usually during July, lasts a month, and each year the circuit is different. There are twenty race stages on average, each one ranging from 50 to 350 kilometers in length, and together they constitute a more or less regular race route around the country. Since 1977, the race has traditionally finished in Paris on the Champs-Élysées. The yellow jersey designates an individual time classification, which is calculated by adding up the overall time of each individual rider for all stages. There is also a team classification, a best climber classification (polka-dot jersey), and a best sprinter classification (green jersey). The greatest champion of the twenty-first century so far is the American Lance Armstrong, who won the race six times in a row from 1999 to 2004. The Tour has a number of other legendary riders as well. The best-known are the Spaniard Miguel Indurain, the Italian Fausto Coppi, the Belgian Eddy Merckx, the American Greg Lemond, and Frenchmen Louison Bobet, Bernard Hinault, Jacques Anquetil, and Raymond Poulidor.

History

The Tour de France was created in 1903 by Henri Desgrange, editor of the sports newspaper *L'Auto*, as a way to compete with his main rival, *Le Vélo* editor Pierre Griffard, as working-class sports entertainment began to emerge and as bicycling became more widespread. In

Belle Époque France, the stage race concept was immediately a success, helping *L'Auto* to make a name for itself as France's leading sports newspaper. The newspaper continued to lead even after it became *L'Équipe* in 1945, and it still does.

Desgrange remained the main organizer of the Tour through the interwar period and initiated major innovations designed to spark the interest of spectators and *L'Auto* readers. He set up the Tour "caravan," a collection of team sponsors who follow the pack throughout the race and take care of coordinating each stage. In 1919 he introduced the yellow jersey (yellow for the colors of the newspaper), which was awarded to the temporary leader in the overall individual time category. He chose the mountain stages that were most likely to add zest to the journalistic accounts of sweat and tears. During the 1930s, when Europe went through a period of rising nationalism, he replaced individual riders with national teams.

After World War II, the Tour no longer simply outlined the borders of France. As its audience became more international, it crossed over into Italy, Belgium, Switzerland, Spain, or Germany for certain stages. After 1948, when press coverage and radio broadcasts were joined by television, the event became even more popular. During the 1960s the Tour enjoyed one of the largest audiences in the world. As it became more of a media event, the economic stakes started to rise and, as a result, national teams were replaced by brand-sponsored teams. Municipalities hoping to enhance their prestige were more and more eager to host a stage start or finish. Since 2000, the Tour has become the world's most widely followed annual sports event. Fifteen million people take to the roads in France to see the riders pass by. Each year a total of more than 2000 television programming hours are devoted to the race, reaching 2 billion people in 175 countries.

Significance

At least four aspects of the Tour de France contribute to its special character and significance. These are

identity, gender, economics, and ethics. From its very start, under the revanchist influence of the early 1900s, the race put on a show that featured the national territory and gave the working-class French the image of France they yearned for. The "Great Loop" went on to become one of the testimonials of the French collective conscience. Historian Georges Vigarello describes the symbolic power of the race as a repository of French culture.

The popular success of the Tour has also been due to its ability to create a setting for, and elevate a masculine ideal that conformed to, the standards of the working and middle classes during several different periods. Both the total exclusion of women in the event (or their relegation to roles as foils) and the intense media promotion of the physical effort, technical skills, and ever-widening territory make the Tour de France a model of hegemonic masculinity.

The economic stakes were present from the very beginning, given that the participants were already professional riders. Since then, the stakes have continued to rise, making the Tour one of the annual sporting events that generates the most income. The press has always maintained a close relationship with the event: Only five race directors have reigned from 1903 to 1998, for example, and they have all been journalists. A hundred years after it was created, the Tour (which is under the responsibility of the Amaury Sport Organisation group) has an annual budget of 60 million euros and generates more than 15 million euros per year in profits.

The ethical issues are becoming increasingly important. Since Tom Simson died in 1967 during one of the mountain stages, a cloud of suspicion has hung over the Tour. A scandal finally broke in 1998 with what was called the "Festina Affair," where it was revealed that EPO (erythropoietin) doping was a common practice within the pack. This temporarily shook up the Tour and its image has been tarnished by cases of doping ever since.

Track and Field— Jumping and Throwing

Track and field events are ancient sports. The men's javelin, discus, and long jump date back to the first Olympics of the Greeks in 708 BCE, whereas the triple jump, pole vault, and high jump originated with the Celts. The hammer also is an ancient tradition, and the shot put dates back to the seventeenth century when the English army held cannon-ball-throwing competitions.

Track and field has progressed from those humble beginnings. The first college meet occurred in 1864 between Oxford and Cambridge Universities. The International Amateur Athletic Federation (IAAF), the world governing body, began with only seventeen federations but today has more than two hundred. Since the revival of the Olympics in 1896 track and field remains one of the premier Olympic attractions. In the United States and Canada track and field events are the most popular high school sports, with more than 950,000 students participating each year. The achievements of track-and-field athletes have ensured that track-and-field events also remain popular internationally.

Jumping

Jumping events in track and field are the long jump, triple jump, high jump, and pole vault. The long jump

and triple jump are measures of how far a competitor can jump horizontally after a running start. The high jump and pole vault test a competitor's ability to clear a bar at various heights.

LONG JUMP

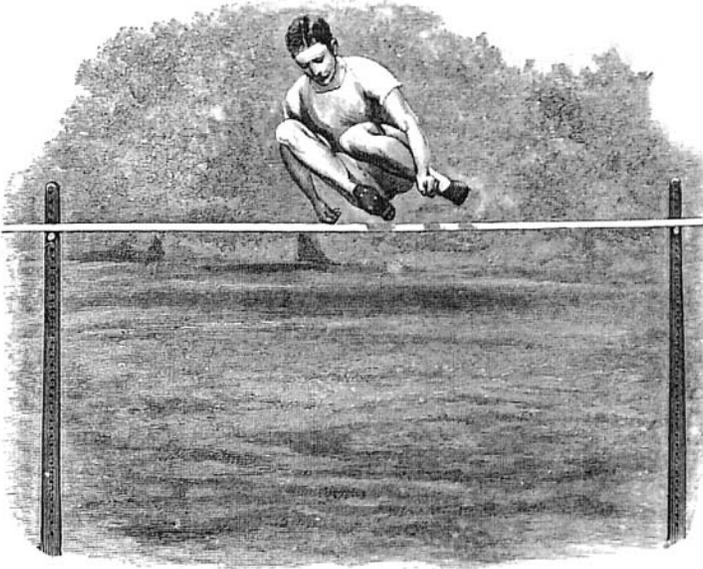

In 1922 William Dehart Hubbard and Robert Legendre introduced the hitch kick technique to the long jump. Between 1935 and 1968 the long jump world record increased a total of 8 feet, 6 inches (259 centimeters). The world record was 27 feet, 4.75 inches (8.37 meters) until one of the most amazing feats in Olympic history took place. Bob Beamon of the United States became the first person to jump more than 28 (8.5 meters) and 29 feet (8.8 meters) with a leap of 29 feet, 2.5 inches (8.90 meters) at the 1968 Olympics at Mexico City. His jump was not exceeded until Mike Powell and Carl Lewis of the United States jumped 29 feet, 3.25 inches (8.92 meters) in 1991.

The long jump is one of the simplest events in track and field. An athlete sprints down a runway (coated with the same surface as the running track), jumps from a takeoff board, glides through the air, and lands in a sand pit. The takeoff board is usually 10 feet (3.05 meters) from the sand but can be closer for less experienced or younger athletes. The athlete throws both feet forward and lands feet first, pivoting the body forward. The measurement is taken from the footprints in the sand. If the athlete steps beyond the takeoff board during the run-up to the pit a foul is called, and the jump is not measured.

The format of competition varies, but generally athletes are allowed three attempts to jump, and then all but eight competitors are eliminated. The eight who are not eliminated are allowed three more jumps. Only an athlete's longest legal jump counts toward the results, and the athlete with the longest jump then wins the competition. Athletes who are successful in the long jump tend to have strong leg and abdominal muscles and superior sprinting speed.

TRIPLE JUMP

The triple jump entails sprinting down a runway and jumping to reach a maximum horizontal distance. The

triple jump is similar to the long jump. Often athletes use the facilities of the long jump, although the takeoff board is usually 40–45 feet (12.19–13.71 meters) for men and 32–36 feet (9.76–10.97 meters) for women. Successful long jumpers are often successful triple jumpers; however, having sprinting speed is not as important as mastering the timing and technique of the three jumps.

The form of the triple jump has evolved from the form of three consecutive long jumps by the ancient Greeks to the form of hop, hop, and jump to the modern form of hop, step, and jump. Russian and Polish athletes have had the greatest influence on triple jump technique in modern times. The Polish technique emphasizes the hop phase, whereas the Russian technique emphasizes the step phase.

In the hop phase the athlete sprints along a running path, then hops into the air on the takeoff foot and comes down on the opposite foot. The athlete then immediately moves into the step phase, during which the athlete springs or bounds forward and lands on the takeoff foot again. To complete the sequence the athlete goes into the jump phase, during which the athlete jumps into the air once more and lands in the sand. As with the long jump, if the athlete steps beyond the takeoff board during the run-up to the pit, a foul is called, and the jump is not marked.

HIGH JUMP

In 1874 Europeans invented the Eastern cut-off technique of the high jump. The Celts then invented the scis-

or kick in 1876. M. F. Horine of the United States developed a more efficient technique, the Western roll, during which the athlete approaches the bar on a diagonal with the inner leg being used for the takeoff and the outer leg being thrust up to lead the body sideways over the bar. Horine set the world record at 6 feet, 7 inches (2 meters) in 1912. His technique dominated through the Berlin Olympics of 1936. The Western roll led to the straddle technique, which was widely used until Dick Fosbury of the United States unveiled his new technique, the Fosbury flop, during the 1968 Olympics (he won a gold medal). The flop technique required the athlete to jump over the bar head first and land on the shoulders. This advancement in technique was made possible in part by the addition of soft landing material.

The high jump differs from the other jumping events in that athletes jump vertical distances. Athletes are allowed three attempts to clear a crossbar that is set between two upright poles 13 feet (4 meters) apart. The crossbar is usually made of fiberglass, and the athlete lands on a cushioned mat called a “pit.” The cross-section of the crossbar can be round, triangular, or square, with the ends being square to rest on the uprights.

Athletes run up to the crossbar and must jump off on one foot and clear the crossbar; they may touch the crossbar, but if it falls because they touched it the jump becomes a miss. Athletes can use a variety of techniques to clear the crossbar; however, the Fosbury flop is the most popular. Using this technique an athlete sprints at a perpendicular angle toward the crossbar, then curves and leaps backward over the crossbar, forming a J. The athlete pivots the head, facing upward so that the head clears the crossbar first, and then arches the back over the crossbar as the rest of the body follows, finishing with a leg extension to clear the crossbar. The athlete should land on the shoulders first. An athlete could also use the straddle or dive techniques; however, they are not as successful, and elite competitors almost always choose the Fosbury flop.

Usually the crossbar is set at a low height and is raised in set increments. The increments can be anywhere the

meet host wants them to be, but they are usually set at 3–5 centimeters. Athletes choose their starting height and are allowed three attempts at each height. If they fail in all three attempts at any given height, they are out of the competition. If they clear a height, they move on to the next increment. If athletes do not want to jump at a certain height they can elect to pass that height and move on to the next height. The athlete who clears the highest height with the fewest misses wins the competition. In the event of a tie a jump-off is performed between the tied athletes.

POLE VAULT

The pole vault originated in Europe, where men used the pole to jump across canals. The goal was to cover horizontal distance rather than vertical distance. The goal became covering vertical distance in Germany in 1875. In 1900 the bamboo pole and vault box were introduced. The aluminum pole was introduced in 1957, followed by the steel pole in 1960. In 1956 the fiberglass pole was invented; modern poles are made of composite materials such as carbon fiber.

In the pole vault, like the high jump, the athlete attempts to clear a crossbar at varied heights, but the heights are much higher. The athlete uses a flexible pole to propel his or her body over the crossbar into the air and onto a pit. The pole is typically 12 to 16 feet long (4–5 meters). The vaulter usually grasps the pole 6 inches (15 centimeters) from the top, one hand placed with an under grip and the other hand with an over grip. The vaulter then sprints down a runway and plants the tip of the pole in the vault box. The vaulter then swings the feet upward toward the crossbar and, as the feet near the crossbar, executes a handstand on the pole, pushing the body feet first and facedown over the crossbar. The athlete pushes the pole away from the body, releases it, and drops onto the pit. Athletes are allowed three attempts at each height; if they miss all three attempts they are out of the competition. A miss is charged if the athlete displaces the crossbar or passes underneath it. The crossbar's height is typically increased by 3–6 inches (8–15 centimeters) at a time.

During the 1990s women began competing in the pole vault, and many states added the women's pole vault to their high school programs. The women's pole vault became an Olympic event in the 2000 games.

Throwing

Throwing events include the shot put, javelin, discus, and hammer. An athlete wins a throwing event by throwing an object the farthest.

The ancient Greek poet Homer recorded one of the first instances of competitive throwing, an account of a rock-throwing competition during the siege of Troy. England's King Henry the VIII was a noted throwing competitor, and the English army held cannon ball-throwing competitions that evolved into the shot put.

SHOT PUT

The word *put* is derived from an old Scottish word meaning "to thrust," and the word *shot* comes from the occasional substitution of a cannon ball for a stone from the Middle Ages onward. The shot put event involves an athlete propelling a heavy metal ball as far as possible. The athlete competes inside a circle. The event began in a 7-foot (2.1 meters) square; in 1860 the starting point was changed to circle 7 feet (2.1 meters) in diameter. The athlete cannot leave the circle until the shot lands on the ground. If the athlete does not leave the circle from the back half a foul is called. The distance of the put is measured from the center of the circle to where the shot put landed. An athlete can use only one arm, and thus strength is essential, but an athlete also needs speed and coordination to create the momentum and maximum force during the propelling motion. In most competitions athletes are allowed three attempts, and the eight best performers are allowed three more attempts. The competitor with the farthest distance wins the competition.

Athletes use two techniques to propel the shot put. In both techniques an athlete faces the back of the circle, holds the shot against the shoulder and under the chin, and launches the shot by pushing the arm forward, putting the shot, not throwing it. The first technique in-

volves sidestepping to the front of the circle and releasing the shot put; this technique is called the “glide.” The second—and newer—technique involves rotating like a discus thrower and is called the “spin.” In both techniques the key is to gain maximum forward velocity to help speed the shot on its way. Most elite shot putters use the spin technique; however, the glide is still popular, especially at the amateur level, because it is easier to master. In modern times Parry O’Brien of the United States pioneered the spin technique, and Alexander Baryshnikov of the USSR further advanced it.

In 1906 16 pounds (7.26 kilograms) become the standard weight of the shot put, although the weight varies depending on the level of competition and the gender of the competitor. Men put a 16-pound (7.26-kilogram) shot for international and collegiate competition and a 12-pound (5.44-kilogram) shot for high school competition. Women’s shot puts weigh 8 pounds, 13 ounces (4 kilograms) for high school, collegiate, and international competitions.

JAVELIN

The javelin is a steel-tipped metal spear that athletes throw as far as possible. A javelin measures 8 feet, 6.25 inches (2.6 meters) long and weighs 1.75 pounds (800 grams) for men and measures 7 feet, 2.5 inches (2.2 meters) long and 1.5 pounds (600 grams) for women. The rules for javelin throwing are similar to the rules for other throwing events. The athlete is allowed three attempts, and then the top eight competitors are given three more throws, with the athlete throwing the farthest winning the competition. The most noticeable difference between the javelin throw and other events is that instead of throwing from a circle, the javelin thrower throws from a run-up area that is coated with a rubberized surface. The athlete sprints down a runway toward a scratch line and near the end twists to one side and draws back the javelin; to maintain running speed while leaning back for the throw, the athlete performs a hop or a fast cross step before throwing the javelin. The throw is ruled a foul if the athlete crosses the

scratch line, if the tip of the javelin doesn't land first, or if the javelin lands outside of the fan-shaped in-bounds area. Javelin throwers gain considerable forward speed in the run-up to the throw, making their athleticism more similar to that of athletes in running and jumping events than that of strength throwers.

Franklin Herd invented the hollow javelin, allowing a javelin to be thrown farther. Felix Erausquarin devised the rotational javelin-throwing technique in 1966 and threw the javelin more than 100 meters. The International Amateur Athletic Federation soon banned that technique, and no competitor threw farther than 100 meters again until 1984.

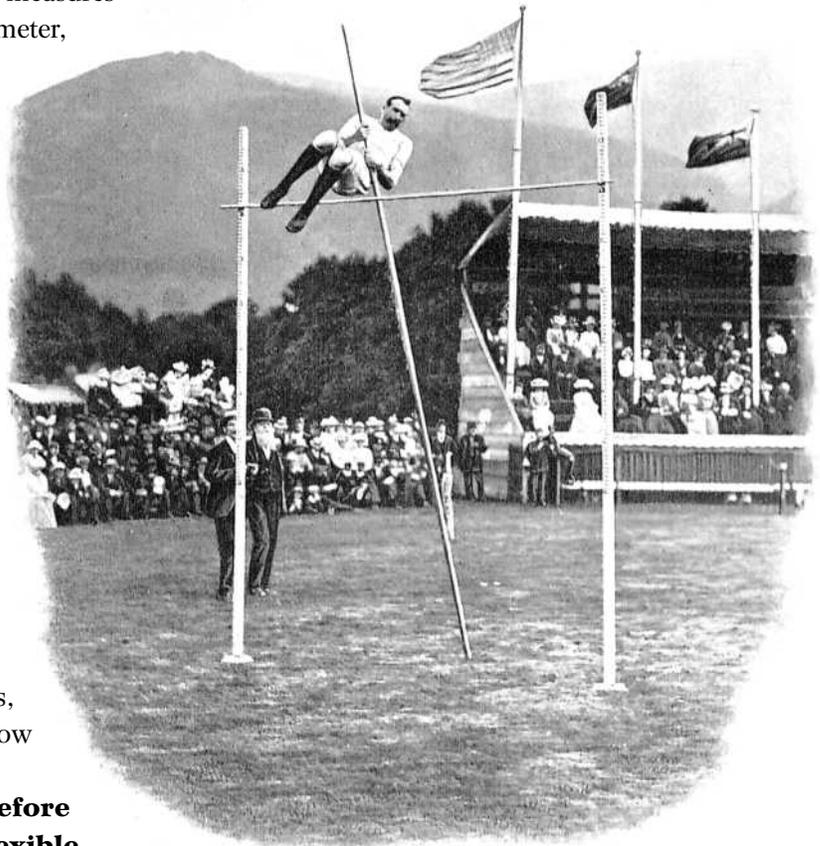

HAMMER

The hammer used in the hammer throw is a metal ball attached to a handle. The handle is 4.3 inches (11 centimeters) wide and is attached to a wire that is attached to a metal ball called the "head." The head measures 4.3–5.1 inches (11–13 centimeters) in diameter, and the hammer must have a total length between 4.6 and 4.7 inches (11.75 and 12 centimeters) and weigh 16 pounds (7.26 kilograms). The athlete throws the hammer with a spinning motion similar to that used to throw the discus. The athlete stands in a throwing circle, grips the handle with both hands and, while keeping the feet stationary, rotates the head of the hammer above his or her head. The hammer gains momentum as the athlete spins the body around three times and releases the hammer at the front of the circle. If the hammer lands outside the fan-shaped in-bounds area, the throw is ruled a foul. As in the other throwing events athletes are given three attempts, and then the top eight competitors are given three more attempts, and the competitor with the farthest throw

wins the competition. If an athlete steps out of the circle before the hammer lands, a foul is called, and the throw is not measured. The women's hammer throw was first included in the Olympics in 2000 in Sydney, Australia.

DISCUS

The discus throw uses a steel-rimmed hardwood or metal circular platter with a diameter of 8.75 inches (22 centimeters) and a weight of 4 pounds, 6.5 ounces (2 kilograms) for men and a diameter of 7.25 inches (18 centimeters) and a weight of 2 pounds, 3.25 ounces (1 kilogram) for women. An athlete stands in a throwing circle and holds the discus in one hand, with the palm facing down and the arm outstretched. He or she then spins one and a half times toward the front of the circle and releases the discus. After the athlete enters the circle and begins a throw he or she must not touch

the ground outside the circle until the discus has landed. A throw must land in the fan-shaped in-bounds area, which is a 60-degree arc. The athlete is allowed three throws, and then the eight competitors with the farthest throws are allowed three more attempts. The athlete with the farthest throw wins the competition.

In 1954 the concrete circle was introduced, allowing competitors to move much faster. The circle is 8 feet, 2.5 inches (2.5 meters) in diameter. The standard weight of the discus became 2 kilograms in 1907.

Amateurism and Controversy

As track-and-field events have developed into modern sports, issues have arisen. One major issue was the status of amateur athletes. For many years track-and-field events were considered purely amateur sports, and athletes could not accept training money or cash prizes. If charged with professionalism, athletes could be banned from competition for life. In 1913 Jim Thorpe of the United States was stripped of his 1912 Olympic victories in the decathlon and pentathlon and banned from further completion after authorities learned he had played semi-professional baseball. By the end of the decade track-and-field events at their highest levels had become full-fledged professional sports. During the 1980s many countries allowed athletes to receive appearance payments through trust fund accounts.

Performance-enhancing drugs have long been a source of controversy in sports. Sports governing bodies as well as countries have implemented testing to control the use of such drugs. Athletes caught using such drugs are banned from competition. Repeat offenders are banned for life, whereas first offenders are often offered a lesser sentence and banned for only one to two years. They are also required to forfeit all records, prize money, and medals.

Competition at the Top

Track and field has several major competitions, most notably the World Championships, the Grand Prix, the Golden League, and the Olympics. The World Champi-

onships, the largest competition outside of the Olympics, were first held in 1983 in Helsinki, Finland. The World Championships are held every two years in varying locations across the world. In 1985 the IAAF created the Grand Prix, which was the first meet to award official prize money. In 1998 the IAAF awarded more than \$2.5 million in prize money. In 1998 the IAAF created the Golden League to unify the elite individual meetings held in Europe. The Golden League is comprised of seven meetings rich in track-and-field tradition. It is held during the height of the track-and-field season, which is approximately July and August. For competing athletes the strategy is simple: Win the IAAF Golden League discipline at each Golden League meeting for a share of the Golden League jackpot of 100 kilograms of gold ingots, worth approximately \$1 million.

The Olympics are the last big track-and-field competition. In 1894 French educator Baron Pierre de Coubertin, speaking in Paris to a gathering of international sports leaders, proposed that the ancient games be revived on an international scale. The idea was enthusiastically received, and the modern Olympics were born. The first Olympics were held two years later in Athens and are currently held every four years.

All of track and field's jumping and throwing events have been included in the modern Olympic Games since 1896, although women were not allowed to participate until 1928. In jumping and throwing women competed in only two events: high jump and the discus throw. In 1932 the javelin was added to the list of women's events, followed by the long jump and shot put in 1948. In 1996 women were given the triple jump, and in 2000 women were given the pole vault and the hammer throw.

The jumping and throwing events have had many notable athletes. In the long jump Bob Beamon was the first person to jump more than 29 feet (8.8 meters). Carl Lewis is the only person to win four Olympic gold medals in the long jump. In the triple jump Victor Sayenev won three Olympic gold medals in 1968, 1972, and 1976 and is a former world-record holder. Jonathon Edwards of Great Britain, the current world-record holder, was the first person to jump more than

60 feet (18.2 meters) in the triple jump. Al Oerter of the United States in the discus was the first person to win four Olympic gold medals in the same event. Sergey Bubka of Ukraine was the first person to surpass 20 feet (6 meters) in the pole vault.

The International Amateur Athletic Federation must certify all world records. An athlete may set a world record at any IAAF-sanctioned meet.

Track and Field— Running and Hurdling

Track and field is not a single sport but rather a collection of sports. Track and field dates back more than four thousand years and originated through a natural course of events. People of that time did not have sports in mind when they perfected their abilities to run, jump, and throw. These are natural activities of the body and are essential to the development of muscles groups.

These activities also were imperative for survival. In pre-historic times humans had to intuitively find means to survive. Many times their only defense was to run away, jump over, and/or throw objects. These abilities were defense mechanisms as well as aids in the acquisition of food. People had to throw objects to knock fruit from trees and throw weapons to kill animals for meat.

Historians argue about the beginnings of organized track and field. Recorded history shows that various civilizations competed in some aspects of track and field. The competitions of the ancient Greeks, Romans, and Germanic tribes are well known; however, records show that similar events occurred in early civilizations of India, Egypt, the Americas, and Ireland. The ancient Greeks held gatherings for social amusement and in the process displayed some tests of bodily strength. The Greeks sometimes held such gatherings at funerals of distinguished men. Bodily strength was tested through wrestling or a half-mile foot race.

The ancient Olympic Games of the Greeks were the start of track and field events as we know them today. The ancient Olympic Games were based with three central events: the *stade*, *diaulos*, and *dolichos*. The *stade* was a race of 192 meters, and the *diaulos* was an out-and-back race of double that distance. In the fifteenth Olympiad the *dolichos*, a long-distance race of about 5,000 meters, was added. In the beginning the Olympic Games featured a limited amount of events and participants. Competition was restricted to men and boys.

People began recording accounts of track and field competition during the nineteenth century. During the early 1820s men held running matches, running more than a mile on turnpike roads or race courses. People set aside open grass fields to allow athletes to practice running, jumping, and throwing. Such fields were also used for informal competitions. By the mid-nineteenth century separate athletic cultures emerged. People staged rural sports meetings, two-man races between professional athletes, open professional athletics meetings consisting entirely of running events, open athletic meetings for the middle class (excluding the working class), and intersquad competitions between universities

and public schools. In 1896 Baron Pierre de Coubertin of France revived the modern Olympics Games. The games were held in Athens, Greece, on a cramped, crumbling track of Averoff Stadium.

By the twentieth century the Olympic movement was firmly established; however, many countries were not involved in track and field. In the major nations, such as the United States and Great Britain, opportunities to compete were directly related to social class. Therefore, a significant percentage of the national teams were college athletes, who tend to be middle to upper class.

Today athletes hold track and field events in every country in the world. Events are easy to stage, which is a major reason for their popularity. The International Amateur Athletics Federation (IAAF), which governs international track and field meets, has more than two hundred member nations. In the United States and Canada track and field events are the most popular sports among high school athletes.

Athletes compete in track and field events throughout the year. During the winter athletes participate in indoor events. During the spring and summer they participate in outdoor events. Some outdoor events are converted to indoor events during the winter. These events are the 100 meters, which is run indoors as the 55–60 meters; the 100–110-meter high hurdles, which is run indoors as the 55–60-meter hurdles; and the 1,500 meters, which is run indoors as the 1,600 meters

(metric mile). The summer Olympics usually follows the outdoor events program.

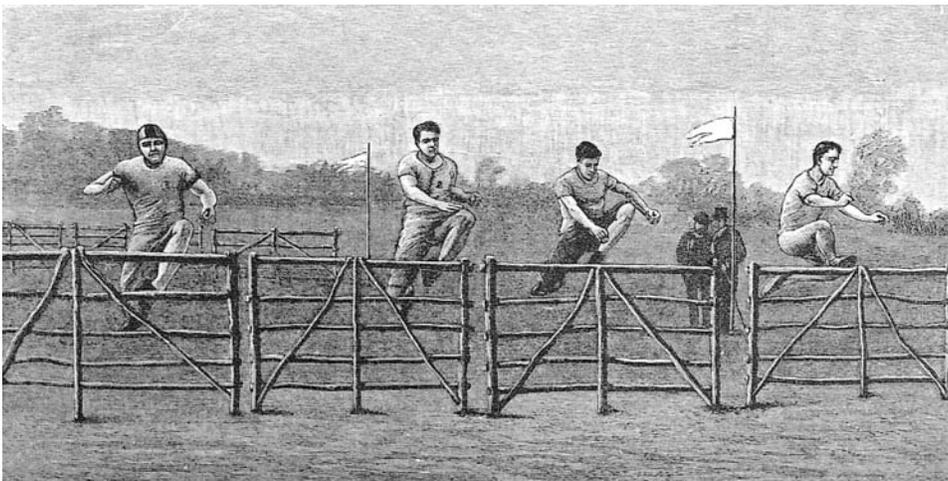

Women in Track and Field

Although the ancient Olympic Games were limited to male participants, women took part in their own festivals in honor of Hera, the patron saint of women runners. At such festivals women competed in running. However, after the fall of the Roman Empire until the beginning of the nineteenth century women were discouraged from participating in physical activity. During the Victorian era women competed in races at fairs and festivals. The first modern meeting in which women competed was held in 1904 in Germany.

Women were excluded from the modern Olympic Games because many members of the male-dominated governing bodies felt that women were at physical risk if they competed in track and field events. Baron de Coubertin felt that women had only one task in the Olympic Games: to crown the winners. However, in 1928 women were admitted to the Olympic Games at Amsterdam, Netherlands. They were allowed to compete in only five events: 100 meters, 800 meters, 4×100-meter relay, high jump, and discus throw. At the end of the 800-meter race the women runners collapsed from exhaustion because they were relatively untrained. Their collapse reinforced antifeminist beliefs that women should not participate in competitive sports. People protested women's participa-

tion in track and field events. However, despite protests, the hurdles and javelin events for women were added to the next Olympics.

Because of the women's collapse in 1928, not until 1960 were Olympic women athletes

Men clearing field hurdles that are much less forgiving than those used today.

Track and Field

The Running Jumps

Careful attention to the proper ratio of rest to exercise was the concern of athletes in the past as it is today. This 1914 account describes the necessary method of training young men for common track and field events.

For high school boys, training is a different matter than for college fellows, especially in the common lack of a really reliable coach. At this age exercise and not training is to be sought. Three days a week is the maximum limit for practice, of which only one may be used for competition of any kind. For college men, four days is the most to be desired. No broad-jumper should jump more than twice a week, although at this event as at the others there should be a liberal

mixture of various exercise for its own sake. Sprinting, hurdling, and long jogs after practice should be a regular part of the early season work, but as the meets come along, absolutely all exercise beyond the limited practice of one's special event should gradually be abandoned for absolute rest. Before and after a meet as well there ought to be a rest of two days at least. This is because the field events exhaust little muscular energy but a great deal of nervous force, which can be replaced and accumulated only by inaction.

For the same reason strict training beyond enough sleep and decent care of the diet is inadvisable.

allowed to compete in any distance of more than 800 meters. Women had to prove that they have strength and endurance. Many members of the male-dominated society held women to an image of gentility and helplessness and preferred not to see them engage in strenuous activity. As the times changed and women received more rights in society, their opportunities in track and field increased as well. The 1960 Olympics added the 800 meters, and the 1972 Olympics added the 1,500 meters.

Drug Use

The use of performance-enhancing drugs has been an eminent problem in track and field as athletes have tried to gain an edge. The best-known drugs used to enhance performance are steroids. Steroids reduce nitrogen loss and increase protein synthesis, enlarging the muscular contracting force. Steroids give greater strength because of increased muscle bulk and improve work rate, which lead to better training. Steroids are now banned, as are certain cold medicines and the dietary supplement creatine. Recently many elite professional track and field athletes have been banned because of positive drug tests.

Sprints

Sprints—short-distance races—have been a part of the competitive play of every civilization. Sprints were run

in the ancient Greek Olympics. However, the Greeks made no time comparisons because they had no accurate way to keep time. The prime means of comparison was the order in which the runners completed a race.

In ancient times runners used starting blocks. Races were started by a herald's call of "go" or the blare of a trumpet. If a runner started too early he was beaten to death with rods.

Athletes developed sprint techniques by trial and error. Ancient sprint techniques were similar to those of modern sprinters. Images on Greek vases show sprinters running on their toes with knees lifted high, bodies erect, arms moving rapidly.

When sprint races were held during the seventeenth and eighteenth centuries, most runners were members of nobility, servants of nobility, or the representatives of nobility. In 1850 the stopwatch was invented, allowing accurate timing of sprint races. In the mid-1850s spiked running shoes were invented, giving sprinters traction on cinder tracks.

The way in which races start and the techniques used at the start of races have evolved through the centuries and continue to be refined. Until the last half of the nineteenth century, many sprint competitions used "start by consent": Runners had to agree among themselves on the fairness of the start. A problem of the start by

consent is that each runner had the right to appeal before the race, which often took a long time and caused delays in the race. To reduce this problem a clause was added to athletes' contracts stipulating that the race would begin by "start by consent" and that if the runners could not reach an agreement in one hour the race would start by gun. Soon all races started by a gun.

The dab start was one of the first start techniques that athletes used. It was used until the end of the nineteenth century. In this standing start the front foot hit the ground first. Another technique was a conventional standing start from starting holes. Toward the end of the nineteenth century Michael Murphy, a Yale University track coach, developed a crouch start from starting holes. This start technique provided the runner better stability in the "set" position and greater velocity from the gun. Through the years athletes have used many variations of this start technique.

Sprint races include the 55–60 meters (indoors), 100 meters (outdoors), 200 meters (indoors and outdoors), and the 400 meters (indoors-outdoors). Two early sprint stars were Jesse Owens and Wilma Rudolph. Recent sprint stars include Carl Lewis, Florence Griffith Joyner, Michael Johnson, Gail Devers, Maurice Greene, and Marion Jones.

Hurdles

Hurdles as a competitive event began during the early nineteenth century in England. The standard distance and height for hurdles were set in the beginning: The hurdle race was 110 meters with ten 3-foot, 6-inch (106 centimeters) hurdles spaced about 9 meters apart. At that time athletes hurdled over sheep hurdles that were fixed to the ground. Sometimes hurdlers had to jump over a rope or cross bar that stretched across the track.

Hurdles tended to be run in public schools and the universities of Oxford and Cambridge until the end of the nineteenth century. Alvin Kraenzlein has been called the "father of modern hurdling." Kraenzlein, a hurdler for the University of Pennsylvania, was known for his sprint action and a straight first (lead) leg over the hur-

dle. He executed running "through" the hurdles as opposed to jumping over the hurdles and spending more time in the air.

In addition to moving hurdles from grass to cinder tracks, U.S. athletes modified the structure of the hurdles. During the late 1890s U.S. athletes introduced a loose hurdle top. Soon after 1900 a hurdle in the shape of an inverted T was designed to swing down in the middle when struck by a hurdler. In 1935 Dartmouth coach Harry Hillman invented the modern weighted L-shaped hurdle because of concern that the inverted-T hurdle would rise up when knocked down and clip the hurdler. The new L shape allowed for more fluid sprinting by hurdlers. The L-shaped hurdle increased the confidence and speed of hurdlers by removing the fear instilled by the inverted-T hurdle. The L-shaped hurdle is used today in competition.

Some differences exist between men's and women's hurdles. Men have been running 110-meter hurdles at their standard height of 3 feet, 6 inches (106 centimeters) for many years. When women became involved in hurdling they ran 80-meter hurdle races over 2-foot, 6-inch hurdles (76 centimeters) until 1969, when the hurdles were changed to 100-meter races over 2-foot, 9-inch (83 centimeters) hurdles.

At the 1900 Paris Olympic Games the 400-meter hurdles were added. In this race thirteen hurdles are placed around the track in 35-meter intervals. The men's hurdle height is set at 3 feet (1 meter). The 400-meter hurdles for women was introduced in 1974.

Well-known 100-meter and 110-meter hurdlers include Roger Kingdom, Renaldo Nehemiah, Gail Devers, Allen Johnson, and Terrence Trammell. Noted 400-meter hurdlers include Edwin Moses, Tonja Buford-Bailey, Kim Batten, Felix Sanchez, Sheena Johnson, and Marie Jose-Perec.

Middle-Distance and Long-Distance Races

The only long-distance race in the ancient Greek Olympics was the *dolichos*, which was about 5,000 meters long. Depictions of *dolichos* runners show low, economical action of energy, even though the athletes

A challenge for many sprinters is developing the most efficient way to leave the starting blocks.

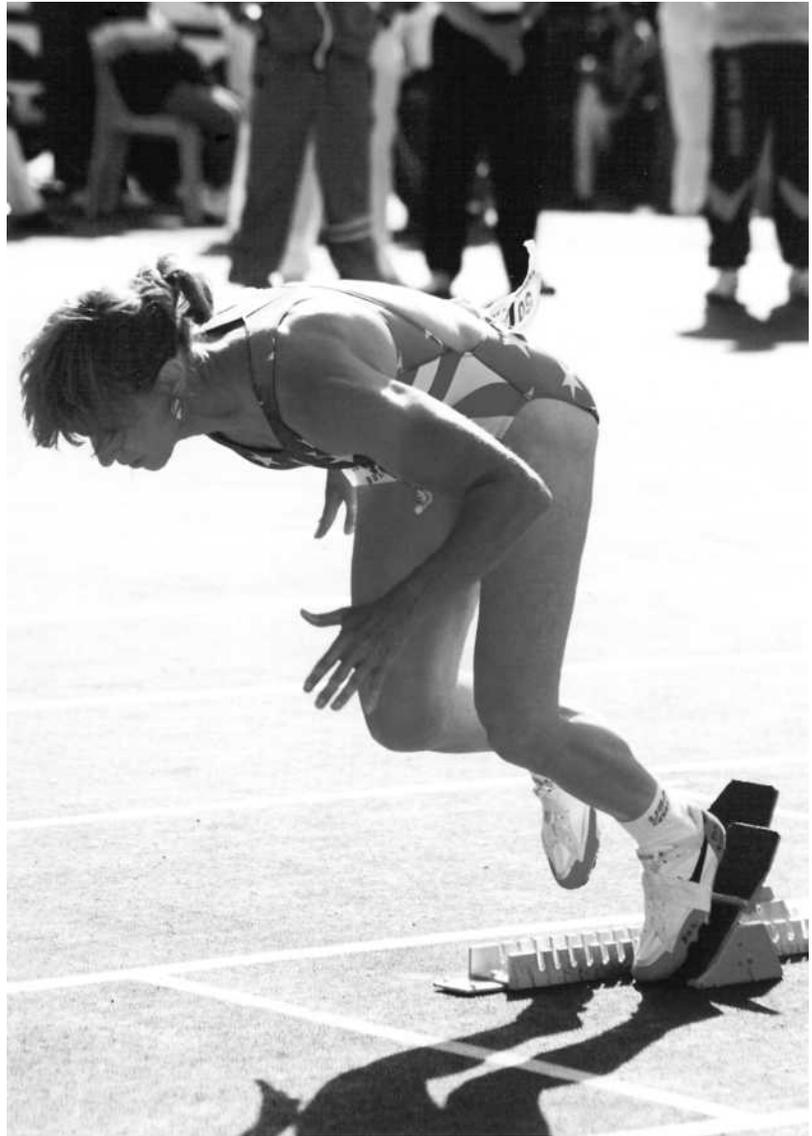

seemed to be more muscular than distance runners of today. After the ancient Olympics the next record of competitive distance running occurs during the eighteenth century in England. Most races at that time took place on heaths or race courses at fairs or at running competitions between villages. No standard distances existed for runners by the middle of the nineteenth century; however, the mile was as popular then as it is now. Today middle-distance and long-distance running events range from 800 meters to 10,000 meters. The 800-meter race is a balance between endurance and speed. It has evolved into a sprinter race because of faster times by modern athletes.

Because of the collapse of the women runners in the 800 meters at the 1928 Olympics, women were not allowed to compete in middle-distance or long-distance races. The 800 meters for women did not reappear on the Olympic program until 1964. Now women participate in all distances and have attained some outstanding performances.

Well-known distance runners have included Jim Ryun and Mary Decker. More recently Maria Mutola, Suzy Favor Hamilton, Marla Runyan, and Alan Webb are known for their distance running.

Steeplechase

Historians have many theories about the origins of the steeplechase race. One theory is that the steeplechase is a version of the nineteenth-century cross-country race between church steeples. Another theory is that the steeplechase was taken from the horse-racing world in Oxford, England, where people discussed a horse race over obstacles, which led to the race being run on foot. In the steeplechase race athletes jump over oversized hurdles and over water. The first 2-mile (3.21 kilometer) steeplechase race took place in 1864 in a

meet between Oxford University and Cambridge University. The 3,000-meter steeplechase became a formal part of the Olympic program in 1920. Steeplechase races of varying distances had been held at the 1900, 1904, and 1908 Olympics. When the steeplechase first appeared in the 1900 Olympics, runners had to clear stone fences, water, hurdles, and other obstacles. The steeplechase is similar to the 400-meter hurdles. The main difference is that steeplechase racers have freedom on the track and are not restricted to a single lane. Another difference is that the distances between the hurdles and the water jump are not equal. The steeplechase race is run in many meets by men but is gradually becoming popular among women. However, it is not yet an Olympic event for women runners.

Relays

The modern relays were created in 1893 by F. B. Ellis and H. L. Geyelin of the United States. The standard relays are the 4×100 meters and the 4×400 meters. Early relay events did not require the use of batons. Instead, the outgoing runner had to wait until he or she was touched by the incoming runner. Now all relays (except the shuttle hurdle relay) require runners to exchange a 28–30-centimeter-long baton within an exchange zone. Until the Munich Olympics of 1972 the outgoing runner had to work within a 20-meter exchange zone. A 10-meter acceleration zone was added to allow the runner time to develop speed. The acceleration zone gave the runner more running space, but the exchange of the baton still had to take place in the 20-meter exchange zone.

Nature of the Sport

In all track and field distance events the main objective is the same: to be the first competitor to cross the finish line. A bonus is to finish in record time, with a personal record (PR), championship record, national record, Olympic record, or world record.

To officially win a competitor must follow the basic rules of track and field. Some rules apply to all events, and some rules apply to a specific event. A general rule

for all events is that all runners must start a race at the same time. A good start occurs when all runners take off after the starter fires the gun. Many runners try to anticipate the starter and get an early edge on the field. When a runner takes off before the starter fires the gun a false start is declared. Each runner is allowed two false starts. When a runner false starts twice, he or she is disqualified. In the United States this rule applies to all meets that are governed by United States Track and Field (USATF). The false-start rule in meets governed by the IAAF has changed. Now the entire field of competitors is given one opportunity to false start. If a runner false starts the entire field is charged with the false start, as if all runners had made the false start themselves. The next false start will be charged to the runner who jumped the gun, and that runner will be disqualified from the race whether or not he or she committed the first false start. The rule was changed because losing time to false starts made maintaining a meet schedule difficult. This rule encourages runners not to anticipate the starter and to wait for the gun.

Other general rules involve good sportsmanship: Do not cheat (i.e., use drugs), use deceptive tactics, or inflict intentional harm. Cheating is acting outside of the rules. Using deceptive tactics—such as using illegal

The Art of Hurdling

Now a hurdler must have a long, easy stride and plenty of snap and spring in his legs and body. Obviously he must be a good sprinter to begin with, especially to run the low obstacles. The high hurdles are placed ten yards apart and there are ten of them to be safely cleared, and there lies one of the most exciting elements in the race, for there are ten chances for a man to strike a hurdle and lose his stride or tumble, either one of which will put him hopelessly out of the race. For one's stride is an all-important thing. It

must be so regulated as to bring the same foot forward each time a hurdle is to be cleared, and mind you, the high hurdles are three feet, six inches high and the low just a foot shorter. In order to do this, the ten yards must be covered comfortably in three strides. In the low hurdles, which are twenty yards apart, the distance ought to be covered in seven strides. Some short-legged men use nine strides, but they are obviously at a disadvantage.

equipment—is a form of cheating. Forms of inflicting intentional harm include pushing, tripping, or cutting off competitors. Any infraction on these rules results in disqualification.

Specific running events have specific rules. In the 100 meters, 200 meters, 400 meters, 400 intermediate hurdles, 100-meter and 110-meter high hurdles, and 4×100 meters runners must stay in their designated lane. Running out of the designated lane results in disqualification. When a runner takes three consecutive steps on the line separating the lanes, the runner is disqualified. In the 800-meter, 1,500-meter, 3,000-meter, and steeplechase events runners are allowed to break from their designated lane after a certain distance.

The 4×400-meter relay has variations to the lane rules. The 4×400-meter relay can be run with a waterfall start, two-turn stagger, or three-turn stagger. In the waterfall start the first leg (runner) of each team starts at the starting line without a stagger (offset). When the gun is fired the runners must fight for position to get ahead of the field. This start is rarely used because the congestion causes some runners to fall or batons to be dropped. The 4×400-meter event can also be run with a two-turn stagger in which the first leg is required to stay in lanes for two curves, and then the second leg is allowed to break as soon as runners get the baton. The most common start for the 4×400 meters is the three-turn stagger, in which the first-leg runners are required

to stay in lanes for the entire lap. When the second-leg runners get the baton they must stay in that same lane for 100 meters or the first curve. After the first 100 meters the second-leg runners are allowed to break their lane and run on any lane on the track (although most runners select lane 1). The runners of the third and fourth legs are also allowed to run in any lane they choose.

Although the objective in track and field distance events is to be the first competitor to cross the finish line, no single strategy exists for any event. Sprinters and hurdlers run their races differently than do distance runners. Each athlete adopts a strategy that works best for her or him. However, in most races athletes want to efficiently use their energy. To efficiently use their energy, most athletes rely on technique and form. Runners focus on staying relaxed, keeping their shoulders square, pumping their arms, and maintaining good knee lift.

Ideally sprinters want to be explosive and to cover the track rapidly with the minimum loss of speed after peak velocity is reached. A sprint race can be divided into three stages: start, pickup, and finish. At the start, in the sprinting blocks sprinters focus on their reaction time, which is the first muscular response to the gun. After sprinters have reacted to the gun they must apply force backward against the ground. This applied force is important to velocity during acceleration. During the pickup stage acceleration is governed by the power and range of the muscles of the legs during sustained

A lifetime of training for just ten seconds. ■ JESSE OWENS

ground contact. At the beginning of the pickup stage a runner's body is low to the ground; by the end of the stage a runner's body is erect. During the finish stage sprinters decelerate toward the tape at the finish line. At the finish line sprinters tend to lean toward the tape because the winner is determined by which torso crosses the tape first.

Technique also is important in hurdles. Hurdlers should fluidly sprint over the hurdles, making only slight modifications to sprint technique in order to clear the hurdles. When approaching a hurdle, hurdlers sprint tall toward the hurdle, raise a bent lead leg to clear the hurdle, and snap the lead leg down to the ground. When they snap the lead leg down to the ground, the trail leg circles around the hurdle in a parallel manner. In the short hurdles (100–110 meters) a runner ideally takes three steps between each hurdle. In the long hurdles (400 meters), the runner, depending on stride pattern, tends to run thirteen to seventeen strides between hurdles. Men tend to take thirteen to fourteen strides per hurdle, and women tend to take fifteen to seventeen. Some 400-meter hurdlers alternate from their normal hurdle form and use their normal trail leg as their lead leg when going over a hurdle. Hurdlers tend to alternate legs when fatigue sets in. Some 400-meter hurdlers also use the alternate leg technique to remain consistent over the hurdles. Thus, instead of alternating when fatigue sets in, they train themselves to alternate legs throughout the race.

A distance runner should concentrate on increasing her or his capacity to supply the muscles with oxygen. For the 800 meters runners ideally get out hard and run the first lap fast. The second lap is usually strategic, and most runners try to keep the same pace or to not break down too much from the first lap. In the final stretch runners want to come in strong. The times in the 800 meters have decreased so much that some people now look at it as a sprint. In the longer races runners try to run a consistent race pattern or pace throughout the entire race. Some even try to run each lap faster than the previous one.

Facilities and Equipment

Although some track and field equipment is specific to some events, the track is used in all running events. The standard shape of the track is oval, containing two curves and two straightaways surfaced with an all-weather material (i.e., a rubberized compound). All races are run counterclockwise. The lengths of the sections of a track are usually distributed evenly between the curves and the straightaways. The standard length of an indoor track is 200 meters. Undersized tracks are less than 200 meters. Some indoor tracks are more than 200 meters but less than 400 meters. Indoor tracks can be flat or banked. A banked track has sloped curves, allowing runners to reach top speed without running off the track. Indoor tracks tend to have six lanes. Most outdoor tracks have eight or nine lanes. Most outdoor track competitions are held on an Olympic standard track. The length of an Olympic standard track is 400 meters. Straightaways and curves are 100 meters long.

In sprint races runners usually use starting blocks. Starting blocks are designed to give runners traction and power. At the start of a race runners crouch and place their feet on the blocks and their hands on the starting line. At the starter's command runners come to the set position by raising their hips. When the gun fires runners drive out of the blocks by pushing against the blocks with both feet.

Competition at the Top

Track and field meets are held at the league, high school, collegiate, and professional levels. At the league level youths ages five to eighteen participate in club summer track programs. Summer track meets in the United States are hosted by United States Track and Field and American Athletic Union (AAU). High school track meets usually consist of dual meets, relay meets, and open meets. At the end of each season county, district, regional, state, and national track meets are held. In track meets held at the high school level, athletes are allowed to compete against only other high school athletes. Most collegiate track and field athletes are recruited from the high school

level. At the collegiate level runners compete in many meets. At the end of each season they compete in meets against runners from other schools in their conference. After the conference meets, athletes participate in the National Collegiate Athletic Association (NCAA) national track meet. This meet includes the best collegiate track and field athletes in the United States and lets athletes compete for a national title. Some athletes at the collegiate level are considered to have elite status and thus are able to compete with professional athletes. Many Olympic teams are comprised of college athletes. Athletes who have completed or withdrawn from their collegiate career compete at the professional level, where they receive product endorsements and monetary compensation. When professional athletes win races at certain meets they also receive prize money.

Tug of War

Tug of war is a contest of strength and skill that pits two teams against each other as they pull on opposite ends of a thick rope. Contests like tug of war were long practiced informally in the English countryside. The event is now played as an amateur sport, mainly in Europe and the United States.

History

Tug of war is said to have originated in the harvest-gathering of ancient China; to have been used to train slaves to haul stones up the Sphinx; or to have developed from the routines used by sailors in hoisting sails and by soldiers in hauling guns up the mountains of India's north-west frontier.

The *Dictionary of British Folk-Lore* (Gomme 1898) described the evolution of this ludic activity out of a basic catching- and-rhyming game. Two people stood facing one another and held their linked arms in the air. The game continued until there were two teams of linked people. The climax of the activity was a competitive tugging event, which went on until one of the teams broke down or was pulled over the halfway mark.

As early as the 1840s, tug of war appeared on the programs of various Scottish Highland Games. By 1880, the Amateur Athletic Association recognized tug of war, and it became part of track and field meetings. In 1958, a Tug-of-War Association was formed in Great Britain; by then, there were nearly 1,000 clubs. The sport is coeducational and draws competitors of all ages from around the world.

In the United States, tug of war retains a niche in agricultural and county fairs, circuses, carnivals, cel-

Tug of War

Tug of War in Korea

My favorite of all the activities of this busy month (but one not done in Yean), the tug-of-war (*chuldarigi*), originated in China but seems to have flourished in Korea. It occurred, and in some places still occurs, on the day of the full moon. The exact procedure for this widespread activity varies. In some villages the two sides are all the adult males against all the women and children. Regardless of age, unmarried people are on the women and children's side. The women and children are on the west (*yin*) side, of course, and the adult males on the east (*yang*). If the women and children win, there is supposed to be a good harvest. As in the ritual I observed, this is a time for recognition of the (*char*)um side (women, the young, low status, the west, the earth). The rope is ac-

tually two ropes bent double and connected by a linchpin in a way that resembles the symbol of the cosmic interplay of *yin* and *yang*.

Sometimes the hamlets (often named *yin* and *yang*) or the east (*yang*) and the west (*yin*) compete with each other. In these cases the two ropes are called male and female ropes, and the two sides place themselves in east and west directions and think of themselves as male-*yang* and female-*yin* sides. In Ch(char)olla Province, Koch'ang Township, Tongbu village, "the male rope is made to go through the loop of the female rope, then a large wooden linchpin is stuck through from the male rope side."

ebations, and picnics. It has also found a regular place in what has come to be known as corporate challenge "character building" workshops that strive to develop teamwork. Tug of war also continues to be a popular recreational pastime of fraternities and sororities on U.S. college campuses.

What Is Tug of War?

Tug of war as a competitive sport is practiced by teams that are members of national tug of war associations, which are affiliated with the Tug of War International Federation. The participants, who must be amateurs, are divided by gender, age, and weight class. Competitions are either indoors or outdoors, and each venue requires specific shoes. Teams must wear normal sports clothing but may also wear protective clothing underneath. Every pulling member holds the rope with both bare hands. Each team attempts to pull the opposing team over a center line on a surface that is approximately 36 meters long. Rules designate the rope dimensions, team substitutions, pulling area, rope grip, pulling position, and position of the anchor (the person who stands at the end of a line of pullers).

Olympic Competition

From 1900 to 1920, the event was featured at the Olympics. The rules were simple, with two teams and no weight restriction. The winning team was the one to pull the opposition six feet. The time allowed was five minutes and, in the event that no winner emerged after five minutes, victory went to the team that had pulled its opponents the farthest distance. Regulations changed at each Olympics. In 1900, team size was six; in 1904, there were five to a team; and in 1908, teams comprised eight athletes.

At the 1900 Paris Olympics, victory went to the Sweden-Denmark combined team. Four years later at the St. Louis Olympics, when very few Europeans had either the time or money to travel to the United States, the gold medal went to the United States. The four top-placing teams at the St. Louis Olympics were composed of members of track and field teams or gymnastic clubs. At the 1906 Athens Olympics, Germany was the champion.

In 1908 at the London Olympics, there were accusations of chicanery. Although the Liverpool police (representing Great Britain) quickly yanked the Americans over the line, the cry went up that the British were cheats. The debate went back and forth. The British

policemen claimed that their heavy boots with steel cleats were standard everyday wear. The Americans saw it differently. They felt the Liverpool team was unfairly shod in "special illegal boots." The Americans were unsuccessful, and British law and order prevailed with gold, silver, and bronze medals going to three teams of constabulary.

At the 1912 Stockholm Olympics, Sweden won the gold medal, and at the 1920 Antwerp Olympics, Great Britain triumphed. The record for the longest pull according to Amateur Athletic Association rules (where lying on the ground or "burying" feet are prohibited) is one of 8 minutes, 18.2 seconds, between the Royal Army Service Corps (Feltham) and the Royal Marines (Portsmouth Division) at the Royal Tournament, England, in June 1938. Since 1958, there have been national outdoor championships, and European championships were inaugurated in 1965.

Turkey

Turkey, founded in 1923, is located between southeastern Europe and southwestern Asia and has a population of 69 million people. Turkey's history of sports and other physical activities has been influenced by culture, social structure, living environment, and time period.

History During the Early Period

Throughout history, from central Asia to Europe and Africa, Turks established a number of states and encountered different cultures. Turks are descended from nomads who roamed central Asia between the Altai Mountains,

*Turkey Olympics Results**2004 Summer Olympics: 3 Gold, 3 Silver, 4 Bronze*

the Eurasian steppes (vast, usually level and treeless tracts in southeastern Europe or Asia), the Yenisei River, and Lake Baikal. These nomads had a mobile civilization based on tribal organization and shamanistic beliefs that involved worship of nature. Life on the harsh steppes required people to be physically fit. The equestrian tradition was strong: Turkish tribesmen lived on horseback.

Physical activities were part of everyday life and primarily were associated with survival, warfare, religious festivals, and celebrations. Turks celebrated the beginning of spring and conducted rituals to mark births, deaths, and marriages that included equestrian games, archery, wrestling, dance, and singing and hunting competitions. Women joined men in these activities.

Turks began accepting Islam during the tenth century as a result of close trade relations, migration to Islamic countries, and missionary activities. Conversion brought the abandonment of shamanism and replaced the nomadic warrior life with a settled existence. In the long term Islamic and Turkish traditions dominated the new civilization that emerged in Turkish Anatolia. However, increasing religious constraints and laws restricted Turkish women from public life and consequently from sports and other physical activities.

Festivals—organized under the patronage of Ottoman sultans to commemorate the circumcision of sons, births, weddings, war victories, and religion—became popular. They featured activities such as equestrian games, archery, wrestling, horse races, races, weight lifting and stone lifting, and sword competitions. Sports and other physical activities also were used in military schools to improve physical skills.

Fields for sports events, training, celebrations, and ceremonies were built as early as the fourteenth century. The most famous archery field (Ok Meydan in Istanbul) had special rules, including rules for training, participation criteria, referees, awards, and behavior. *Tekkes*, supported by the sultans and the ruling class, were popular sports clubs, especially for Turkish wrestlers and archers. Growing religious influence and the decline of the Ottoman Empire caused traditional sports to lose their popularity and support.

Physical Education and Modern Sports

During the nineteenth century reforms were initiated to modernize and Westernize the Ottoman Empire, beginning with Tanzimat (reform and reorganization). Educational reforms created secular schools. Gymnastics (later called “physical education”) courses and fencing were introduced in secular military schools in 1862 as a result of European influences. In 1868 Galatasaray High School became the first school to offer regular physical education classes, introduce modern sports, and organize sports festivals.

Even though the Regulation for Public Education program, enacted in 1869, required physical education to be included in Rusdiye (adolescence) schools for boys, only a limited number of schools practiced it. Books on physical education and modern sports, influenced by Europe, were translated to use as educational tools at schools, and articles were published in newspapers and magazines.

The first sports clubs were formed by foreign and non-Muslim minorities at the end of the nineteenth century. The Ottoman ruling class prohibited Turkish youngsters from forming or joining sports clubs. The first Turkish sports clubs (for football) were the Black Stockings (1899), Besiktas (1903), Galatasaray (1905), and Fenerbahce (1907). After creation of a constitutional monarchy in 1908 Turks were given more freedom and formed sports clubs and played modern sports.

The Ottoman National Olympic Committee was founded in 1908 through the efforts of Selim Sırrı Tarcan, an important role model in the development of Turkish sports and physical education. The Ottoman state was represented by one gymnast at the 1908 Olympic Games in London.

Despite the lack of schools, teachers, and gymnasiums, the Ministry of Education issued a physical education course curriculum for teacher-training schools for men in 1911 and for women in 1912. The first sports festival for Turkish schools was organized in 1916 through the efforts of European-educated Turkish teachers and sportsmen.

The Turkish Sport Associations Union (Türkiye İdman Cemiyetleri İttifakı [TİCI]), considered to be the first national sports institution, was formed in 1922 to develop Turkish sports, establish national sports federations, and represent Turkey at international sports competitions. The first national sports federations of athletics, football, and wrestling were founded in 1922, followed by federations of cycling, fencing, and weight lifting in 1923 and federations of boxing, rowing, swimming, and sailing in 1924.

Development during the Turkish Republic

The Republic of Turkey, founded in 1923 after the War of Independence, rose from the ruins of the Ottoman Empire under the leadership of Mustafa Kemal Atatürk. The Turkish Republic has undergone an intense period of secularization and modernization with a new constitution and a reform movement.

Reforms have led to an increase in sports participation and an increase in the number of clubs and school sports activities. Women were given equal rights, and secular laws enhanced women's role in society. This enhancement was reflected in sports: Turkish women began participating in modern sports such as athletics, tennis, rowing, volleyball, swimming, and equestrianism.

Even though decades of war, revolution, and occupation created a disastrous economy, the government, aware of the importance of sports, provided financial assistance, and Turkey participated with forty athletes in the 1924 Paris Olympic Games in athletics, cycling, fencing, football, wrestling, and weightlifting.

Under increasing pressure from the government for involvement in sports as part of a federal ideology, the TICI was abolished, and the semifederal Turkish Sport Association (Türk Spor Kurumu [TSK]) was established in 1936 and followed by a general directorate of sports in 1938 as an umbrella organization.

Not until the 1936 Olympic Games in Berlin, Germany, did the first Turkish women athletes—Suat Fetgeri Aseni and Halet Cambel—take part (in fencing) and

Turkey won its first Olympic medals in men's wrestling with Yasar Erkan's gold medal and Mersinli Ahmet's silver medal. At later Olympic Games and world championships, Turkish wrestlers were successful, and in the 1948 London Games Turkey won twelve medals, all in wrestling.

Within the Turkish school system participation in sports and other physical activities increased slowly, hampered by limited hours of physical education classes, limited content, and limited sports facilities and financing.

However, during the last decade the success of Turkish national teams and individual athletes at international competitions has increased rapidly. Football continues to be the most popular sport and dominates Turkish sports life. In recent years women's volleyball teams, men's basketball teams, athletics teams, and weight lifting teams developed and gained popularity by winning medals at world and European championships and Olympic Games. This success has created new sports role models in Turkey. However, the growing success of Turkish sports is yet to be reflected in the number of participants in recreational and elite-level sports.

Turner Festivals

Turner festivals (*Turnfeste*) are gatherings at which turners (members of a gymnasts movement) compete in gymnastics and related sports. These festivals also have social and cultural components. Turner festivals are held in all countries where the system and culture of German *turnen* (gymnastics) were introduced, especially Austria, Switzerland, and eastern European nations such as Poland, Hungary, and the Czech Republic.

Historical Overview

Turner festivals of the nineteenth century helped turners unify and build identity. They contributed to the establishment of a national culture and the formation of a body-and-movement culture. They also demonstrated the manners and practices of the turner movement and the ideological, mental, and political values that turners supported. Festivals were associated with national rituals and symbols, reflected most of all in the turners' language, songs, poetry, flags, clothing, and physical culture.

Turner festivals developed out of the Turntage (Turner Days). The most important turner festival before the German Revolution of 1848–1849 took place in 1846 in Heilbronn. It stood for the prerevolutionary culture of

turnen. There the foundation of a German turner union was supposed to be laid, but the effort failed. National turner festivals have been held since 1860 in Coburg. From 1880 on, with the exception of the period from World War I until 1933, they were held every five years.

The Arbeiter-Turn-und-Sportbund (ATSB), which dissociated from the national turner festivals, organized its own national festivals in 1922 in Leipzig and in 1929 in Nuremberg.

In 1948, two years before the foundation of today's Deutsche Turner-Bund (DTB), the first West German turner festival took place in Frankfurt. In East Germany during the Cold War eight turner and sports festivals were held by the Deutsche Turn- und Sportbund (DTSB) in the former sports capital of Leipzig. Besides being athletic festivals they were misused by the totalitarian socialist government for political purposes.

U.S. Turner Festivals

For turners in the United States, who founded their first societies in 1848, the festivals were of great significance from the beginning. The American Turner Union organized its first national festival in Philadelphia in 1851. The U.S. turner festivals fostered a feeling of solidarity among turners and German immigrants and provided an important element in the expansion of the ideas and

culture of *turnen*, not only among the immigrant Germans and German-Americans of later generations, but also among U.S. residents who visited the festivals. A climax was reached at the beginning of the twentieth century, when the 1905 turner festival in Indianapolis, Indiana, attracted three thousand participants and more than ten thousand spectators. Since 1881 turner festivals ("Turn-fests") have been held every four years.

Turner Festivals

The 1909 Cincinnati Turnfest

One of the most memorable of the American “Turnfests” occurred in June of 1909 in Cincinnati, Ohio, drawing “turners” from all over the United States. Judging by photos of the scene, it seemed as if the entire city either marched in or watched the parade in honor of the festival—especially since all the factories and stores were closed that day. A proclamation declared: “Cincinnati, famed the world over for the successes of her expositions and dramatic and musical

festivals, has had no opportunity to see so magnificent a festival as that which has been prepared under the popular title of the North American Turnfest.” Considering that 13,000 people participated in the events and another 50,000 attended, the proclamation wasn’t much of an overstatement.

Women

Until World War I the question of whether and how women should participate at the German turner festivals provoked fierce discussions within the movement, generated by a concern for morality and the fear of an emancipation that would destroy German family life and German peoplehood (*volkstum*). National turner festival officials and many women turners as well were concerned about the women’s reputation. In 1894 fifty women turners from Breslau dared to perform at the eighth German turner festival in that city. Four years later one thousand women turners from Hamburg supposedly performed improper exercises at the ninth turner festival in their home city. Before World War I nonlocal women turners were not allowed to participate at festivals. After the war, when women were able to participate in the national turner festivals, the number of women participants rose. Today about 70 percent of turner festival visitors are girls and women.

In the United States women have participated in line formations or mass exercises since the 1870s. Not until 1921 were they allowed to show their skills in competitive events.

In the past practical *turnen* with free and apparatus exercises, turner games, and competition in running, throwing, and wrestling, as well as hikes, trips, and the recitation of poetry, constituted the program of festivals. Today the program of German turner festivals is gymnastics and sports in individual, team, and combined

categories, as well as many gymnastic, dancing, and artistic displays.

The Future

German turner festivals are held every four to five years in a different city. They still can be characterized as a festivity for the people, as can be seen by their popularity. The thirty-first German turner festival in 2002 in Leipzig was organized by the DTB, with more than 5 million members in more than twenty thousand clubs. About 100,000 people—mostly women—participated before 1 million spectators. Traditions and symbols—among them parading through the hosting city at the beginning of the festival and carrying turner flags—have survived and show a strong connection to the turners’ past.

In the United States the importance of turner festivals has declined. In 2003 the number of participants at the fifty-first national festival had declined to a few hundred. These festivals no longer present German-American culture, nor do they attract the public as much. They are mainly attended by turners and their families.

Ultimate

Ultimate is a fast-paced sport that combines elements of soccer, basketball, and football. Opposing teams throw a plastic disk and transition quickly from offense to defense on a large field. Players attempt to score by catching an aerial pass in the opponent's end zone. Since its invention in 1967 Ultimate—sometimes referred to as “Ultimate Frisbee”—has been one of the fastest-growing sports in the world.

History

Ultimate was invented by a group of high school students in Maplewood, New Jersey, who wanted to create a countercultural sport. The students designed what they regarded as the “ultimate sport.” The Frisbee flying disk, a product of the Wham-O Manufacturing Company, was used originally, although Ultimate now officially uses a sturdy 175-gram disk instead of a Frisbee. Ultimate spread by word of mouth and demonstration as people learned to play on college greens and city parks. Before long Ultimate was being played around the world, although it has remained at an amateur level of competition as it has moved from obscurity into the realm of popular culture. However, Ultimate players often refer to themselves as a subculture within the larger athletic world. Approximately 100,000 people in more than forty-two countries play Ultimate, and about half of those players are from the United States. Ultimate is also popular among students at universities in Canada, Germany, Japan, and the United Kingdom.

Ultimate purports to celebrate sportsmanship and fair play by a principle called the “spirit of the game.” Competitive play is acceptable but never at the expense of respect between players, adherence to the rules, and the basic joy of play. Through this spirit of the game, the sport teaches social values and reproaches unacceptable behavior. Ultimate players are responsible for making their own foul and line calls and must resolve any disputes that arise among themselves. Poor sportsmanship is discouraged and creates negative social repercussions. Players say that Ultimate was, from the beginning, a grassroots sport without referees or playbooks. It was created as an alternative to ultracompetitive, professionalized sports. Ultimate also was a response to the rise of violence in sports, the corrupting influence of million-dollar contracts, and the unsportsmanlike behavior of many athletes. The self-image of early Ultimate players emphasized this countercultural identity. Part of the allure for many players was the notion that they were engaging in a unique activity, a sport removed from the mainstream.

Ultimate players share a sense of camaraderie that is augmented by the sport’s jargon, which sets social boundaries. People who do not play Ultimate are often confounded by the terms that players yell to one another, such as “force home,” “hammer,” and “lay out for that.” Spectators, who are usually players themselves, also heckle and encourage the teams with Ultimate jargon. To feel that they belong, newcomers must learn Ultimate jargon and culture.

Informal pickup games are the most common manifestation of Ultimate. The skills, rules, and culture of the

sport are transmitted through face-to-face contact with other Ultimate players. Players insist that anyone is welcome to participate in pickup Ultimate. However, although nobody is ever turned away from a game, players who feel awkward or clumsy tend not to return after their first attempt. The Ultimate community includes players with various levels of involvement, but those who play most frequently tend to identify most strongly with the community. Games in recreational leagues are more organized than pickup games, but the leagues welcome newcomers and recruit players. Leagues have been established in Australia, Brazil, Canada, China, Japan, Korea, Mexico, New Zealand, Peru, Portugal, Switzerland, Taiwan, Thailand, the United Kingdom, and the United States.

People who want to play more strenuous Ultimate can join regional club teams, which hold tryouts. Club teams travel to tournaments and compete against other club teams in games in which the intensity level is higher than in pickup games. When taken seriously, Ultimate is a grueling sport that requires endurance, speed, and agility. The spirit of the game usually prevails on the field, but plenty of arguments develop. Still, a few players on each team often wear colorful costumes, encouraging lightheartedness in the midst of competition. When the games are over, members of opposing teams are expected to socialize with one another, sharing the esprit de corps of Ultimate.

As Ultimate becomes more mainstream each year, veteran players strive to preserve the purity of the sport by highlighting the unique social benefits of Ultimate. However, a growing number of players who come from

A young woman playing Ultimate.

traditional athletic backgrounds have brought with them the cutthroat mentality that Ultimate was meant to avoid. A boom in popularity and a spike in aggressiveness among players have increased the level of competitiveness. Some Ultimate players lament increasing disputes over calls and less evidence of the spirit of the game. High-level tournaments have begun using controversial “observers”: nonplayers who can assist in resolving player disputes. Many Ultimate purists insist that observers are antithetical to the spirit of self-governing cooperation that is meant to guide Ultimate.

Nature of the Sport

The Ultimate Players Association (UPA), the governing body of the sport in the United States, was founded in 1979. The UPA continues to modify the rules as Ultimate has evolved, but it has essentially kept the sport intact. Teams of seven players face off on a rectangular field. A regulation field is 64 meters long and 36 meters wide, with 22-meter end zones. Ultimate is a noncontact sport that requires no special equipment aside from a disk and field. Most players wear cleats and use cones to mark the field boundaries. Players run and cut to receive a pass but must stop and pivot when holding the disk. The team who possesses the disk is on offense and scores when one of its players catches a pass in the defense’s end zone. If a pass is not completed, the defensive team takes possession of the disk and transitions into the offense. Teams may play either person-to-person or zone defense. A typical game is played to fifteen points and lasts approximately one and one-half hours. Player substitutions are allowed after a score. Players from both teams commonly exchange songs and cheers after the game and convene at a local bar or restaurant for social time.

Aside from their love of the sport, many Ultimate players feel that they share values and have more in common with other Ultimate players than with nonplayers. The self-image of Ultimate players models itself on the ideal of being laidback, sociable, fun, athletic, passionate about the sport, and always ready for a party. Of course, Ultimate players are not all alike. How-

ever, Ultimate aficionados claim that the sport is open to anyone, regardless of ability, race, or class. In fact, Ultimate is primarily a sport for young, white, middle-class men and women who are both athletic and fond of socializing. According to demographic information compiled by the UPA, which has 15,600 members, the Ultimate membership base in 2004 was 65 percent male. Members tend to be young (71 percent are between the ages of nineteen and thirty-four), educated (93 percent have completed a bachelor’s degree), technologically savvy (87 percent own a computer), and middle class (54 percent report household income of more than \$50,000). The UPA does not publicize racial statistics, but the sport has made few inroads among nonwhites, especially compared with other sports such as football, baseball, and basketball.

Competition at the Top

Elite competition in Ultimate takes the form of local, regional, national, and international tournaments. Among men’s club teams, New York dominated men’s Ultimate during the early 1990s. Boston’s Death or Glory won numerous national and world championships during the late 1990s. In California, Santa Barbara’s Lady Condors reigned among women’s club teams during the 1980s, and Boston’s Lady Godiva captured a series of national and world titles between 1995 and 2002. Separate tournaments are held for mixed (co-ed) and master’s teams. The first World Championships for Ultimate took place in 1983 with teams from Europe and the United States. Japan joined the tournament the following year. U.S. and Canadian teams have prevailed in recent World Championships, whereas Sweden and

Finland have repeatedly won the European National Championships.

Rutgers and Princeton played the first college game in 1972. College national championships have been held annually for men since 1984, and a division for women began three years later. The most successful women's college teams have been from California, with multiple titles going to Stanford University, University of California at Santa Barbara, and University of California at San Diego. Several men's collegiate championship teams have also hailed from Stanford and University of California at Santa Barbara. The Junior National tournament for both boys and girls has been dominated by Amherst (Massachusetts) Regional High School, and Canada won the 2002 World Junior Ultimate Championship in Latvia.

The Future

Ultimate is not an Olympic sport. Given its self-officiated nature and the relative lack of sponsorship compared to conventional sports, its potential for professionalization is limited. However, in 2001 Ultimate was included in the World Games (held in Akita, Japan) for the first time as a full medal sport.

Governing Bodies

Governing bodies of Ultimate include Asociacion Mexicana de Disco Volador, Australian Flying Disc Association, Canadian Ultimate Players Association, European Flying Disc Federation, Frisbee Brasil (Federacao Paulista de Disco), Hong Kong Ultimate, Korea Ultimate, New Zealand Flying Disc Association, Singapore Ultimate, South African Flying Disc Association, UK Ultimate Association, Ultimate Players Association, and the World Flying Disc Federation (WFDF).

Underwater Sports

The wide variety of sporting or athletic activities that may be pursued underwater are always dominated by an environment that cannot sustain human life. Underwater sports therefore can be classified by the means that participants use to overcome that environmental challenge and fall into three broad categories. *Snorkeling*, the use of a hollow tube to breathe surface air while the face remains submerged, allows the shallowest penetration of the underwater world and is distinguished from swimming only by the use of that piece of equipment to facilitate breathing. When a swimmer or snorkeler abandons ready access to air by descending beneath the water, that person is engaged in *breath-hold*, or *free diving*. When the diver uses life-support equipment to continue breathing without direct access to surface air, he or she is participating in what is generally termed *scuba diving*.

Numerous activities may be pursued underwater, beginning with the simple exploration of an alien environment. Such activities may be enjoyed anywhere from a backyard swimming pool to depths beyond the sun's reach. The only constraints on sporting activities beneath the water's surface are those imposed by the challenges of the environment, the means chosen to overcome them, and the ingenuity of participants.

Origins of Underwater Sports

Although the widespread pursuit of recreational activities beneath the water's surface is relatively new, humanity has explored and exploited the sea since the dawn of recorded history. Ancient free divers held their breath to collect foodstuffs, hunt, or obtain materials from shallow depths. The snorkel undoubtedly appeared

soon after, with the introduction of a hollow reed or similar device that allowed the swimmer or diver to breathe with the face submerged. A person using a snorkel can remain focused on the underwater world indefinitely, but the mechanical effort required to breathe air through a tube while submerged restricts snorkeling depths to only a few centimeters. Unaided free divers can reach significant depths, but they can do so for only short periods. Expanding the limits of depth and time required more sophisticated technology.

The Greek philosopher Aristotle reported the use of a diving bell in the fourth century BCE, and Leonardo da Vinci envisioned a submersible life-support system in the sixteenth century. But truly effective systems for preserving human life underwater for extended periods were not developed until the nineteenth century. Even then, the cost, discomfort, and cumbersome nature of the required equipment restricted it to commercial and military applications. Underwater sports did not begin to emerge until the middle of the twentieth century, when the technology required to expand the human reach underwater became widely available.

In the 1869 novel *20,000 Leagues Under the Sea*, French science fiction author Jules Verne hypothesized that a recently introduced French commercial diving system that pumped air from the surface into a tank carried by a diver and then used a demand valve to supply the diver from the tank could be further modified. By eliminating the first link to the surface and personally carrying all of the required air in a self-contained system, a diver could freely interact with the marine environment. A series of experiments over the ensuing decades produced successful rebreathers, devices that filtered carbon dioxide from a diver's exhalations and replenished their oxygen levels in a continuous breathing loop. Although useful in military and commercial applications, this technology remained too complex and hazardous for recreational use.

Two French inventors, engineer Emile Gagnan and free diver Jacques-Yves Cousteau (1910–1997), resolved that difficulty in 1943 with a mechanism similar to the one described by Jules Verne. A demand valve at-

tached to a tank of compressed air provided the diver with a breath of air at the same pressure as the surrounding water. In combination with the snorkel and the recent development of fins worn on the feet to aid propulsion and goggles to allow the eye to focus underwater, would-be adventurers now had access to simple technologies that made submerged recreational pursuits possible.

Dangers Underwater

The dangers involved in underwater activities had already been identified when Cousteau and Gagnan began to develop their apparatus. While the risks represented by sea creatures themselves are often ridiculously exaggerated, the laws of physics and human physiology represent significant barriers to underwater sports of all types. The most obvious of those barriers is the simple fact that humans require oxygen to stay alive. Snorkelers have found a solution to that problem, but it presents more substantial difficulties for free divers.

At sea level, water pressure increases by one atmosphere for every 10 meters (33 feet) of descent; that is, a person 10 meters below the surface of the ocean is exposed to the normal pressure of the surface atmosphere and an additional atmosphere of pressure from the surrounding water. Descending to 20 meters subjects the diver to three atmospheres of total pressure. Being subject to such pressure has several immediate results. Anyone who has attempted to free dive in even a shallow pool will be aware that the air spaces within the human ear must be equalized with the surrounding water pressure to avoid pain or injury. If the diver is wearing goggles, which provide an air space to allow the eyes to focus underwater, the air within them must also be equalized. Most divers wear masks that enclose the nose as well as the eyes rather than simple goggles so that a gentle exhalation can increase the pressure in the mask to match external pressure and so avoid painful injury. But another consequence of increasing pressure on descent is less obvious.

All air spaces in the human body are subjected to changes in external pressure, including the lungs.

You have to perform at a consistently higher level than others. That's the mark of a true professional. ■ JOE PATERNO

Increasing the pressure of the air within the lungs also increases the pressure exerted by the oxygen contained within that air, the oxygen partial pressure. As a result of that increased partial pressure, a submerged free diver may unknowingly metabolize a higher percentage of the total oxygen available in his or her lungs than would be possible at the surface. When the diver ascends, the decreasing external pressure may reduce the remaining partial pressure of oxygen below the level required to sustain consciousness. The resulting phenomena is called shallow-water blackout, and it can prove fatal. Because of this potential, free divers are well advised to pursue the sport in pairs and exercise caution in increasing both the depth and duration of their dives.

Perhaps the greatest danger of shallow-water blackout is its counterintuitive nature. Like most dangers in underwater sports, it is associated with shallow water rather than great depth. A moment's consideration will reveal the cause: If the pressure on a diver goes from 1 atmosphere at the surface to 2 atmospheres at 10 meters, then to 3 atmospheres at 20 meters and so on, it follows that the increase in pressure is 100 percent in the first 10 meters of descent, 50 percent in the second 10 meters, and continues to decrease as the total depth increases. Pressure changes most rapidly near the water's surface, and it is that rapid pressure change that subjects the human body to the greatest physiological hazards in underwater sports.

Breathing compressed gasses underwater further complicates those hazards. The breathing apparatus that Cousteau and Gagnan developed, the Aqua-Lung, provides the diver with air at the pressure of the surrounding water. While the air in a free diver's lungs is similarly pressurized, it achieves that pressure through physical compression and a reduction in total lung volume. The lungs and the air within them return to surface pressure and capacity as the diver ascends, and the ratio between the amount of air the lungs can hold and the amount that they actually do hold remains relatively constant throughout. A diver on compressed air fills the lungs to their normal surface volume regardless

of depth. Thus ascending without exhaling would force the lungs to expand beyond their normal volume as the depressurizing air expands, leading to rupture of the lungs and a condition known as arterial gas embolism. The mantra of divers using such equipment therefore became "never hold your breath," marking a complete break with the habit of free diving.

Other complications delve even deeper into physics and physiology. Air is composed of approximately 21 percent oxygen and 79 percent nitrogen, plus various trace gasses. That is, at the surface humans breathe oxygen at a partial pressure of .21 atmospheres and nitrogen at .79 atmospheres. As those pressures increase with depth, the increasing partial pressure of nitrogen soon begins to exert a narcotic effect. This nitrogen narcosis, or rapture of the deep, impairs higher brain functions and may produce a sense of well-being that increases to euphoria or a sense of unease that increases to terror. As with alcohol and other intoxicants, individual susceptibility varies on a daily basis, but all divers are affected. Memory and reasoning power are often affected first and without the diver's awareness. This condition may lead the diver to forget that he or she ever experienced any impairment and is often revealed in vague memories of a dive immediately after its completion. The gradual erosion of reasoning power is a more serious danger, for the diver may unknowingly become unable to analyze and respond to an unexpected event.

In addition to its narcotic effect, nitrogen is an inert gas that the body does not metabolize. Increasing partial pressures force nitrogen from the lungs into the bloodstream and tissues, where it accumulates. The problem this produces is still referred to as "the bends" because a rapid return to normal atmospheric pressure allows the stored nitrogen to form bubbles that tend to accumulate in joints and the central nervous system. Victims may contort their bodies to relieve joint pain and can experience permanent nerve damage, paralysis, or death. This malady first struck men working in pressurized caissons during bridge construction and was therefore properly known as caisson disease. In 1880 French physiologist Paul Bert suggested that the disease,

also a problem for commercial divers, was associated with exposure to pressurized nitrogen. In 1910 British physiologist John Haldane confirmed this suspicion and generated a set of tables for staged decompression, gradual ascent from beneath the water or any other pressurized environment, to allow for the release of accumulated nitrogen. The use of such tables allows divers to significantly reduce the incidence of decompression sickness, as caisson disease is now more widely known.

Scuba

The fundamental dangers of using an Aqua-Lung could therefore be addressed by the knowledge of physics and physiology available to Cousteau, Gagnan, and their contemporaries. In the wake of World War II, diving with the Aqua-Lung and free diving both became increasingly popular. Continued use of the brand name AquaLung, under which Cousteau and Gagnan first marketed their device, to designate all such devices posed obvious difficulties, and the generic designation of self-contained underwater breathing apparatus, or simply “scuba,” began to emerge as the sport developed in the 1950s.

Underwater sports enthusiasts around the world banded together in a steadily growing number of clubs during that decade, aided by a number of best-selling books, popular motion pictures, and television shows that popularized diving. Manuals and standards began to emerge as the number of equipment manufacturers and retail shops increased, but training for scuba diving still reflected its origins in military and commercial instruction. The heavy emphasis on physical fitness, emergency techniques, and performance under stress in an adversarial environment that characterized most training programs limited participation in scuba diving, particularly among women.

Resorts dedicated to scuba diving and other underwater activities began to appear in the late 1950s and 1960s as participation increased. Divers benefited from the increased thermal insulation provided by the appearance of commercially available wet suits and the introduction of the buoyancy compensator, a device that allows the scuba diver to float on the surface and adjust

buoyancy throughout the dive. Such equipment was normally designed for male anatomy, making it ill-suited or uncomfortable for female divers.

Steady growth in tropical tourism and cruise ship vacations in the 1970s introduced thousands of people to snorkeling, free diving, and scuba as the popularity of all three modes of underwater exploration continued to increase. But female participation in underwater sports, particularly in scuba diving, remained relatively limited through the mid-1980s. The steady increase in the number of female divers since that time can be attributed to a number of social and economic factors: the development of less adversarial and physically demanding training standards, the appearance of equipment designed for female use, and wider acceptance of underwater sports as safe activities.

Underwater Activities

A number of recreational activities are commonly pursued beneath the water’s surface. Vacationers may be introduced to underwater sports, snorkeling, or free diving to explore the beauty of tropical reefs, but that level of participation is just the beginning of the informal possibilities and the activities formally organized under the Confédération Mondiale des Activités Subaquatiques (CMAS), the international organization that governs training and competition in underwater sports. At the informal level, snorkeling and free diving allow the participant to reach beyond exploration into activities such as photography and videography, hunting, and improvised games. CMAS takes the possibilities a little further.

Under the auspices of CMAS, free divers can participate in Apnea, competitive breath-hold diving, in a number of categories. The goal of such competitions is to attain the maximum possible depth and safely return to the surface. But that is only one of the internationally organized competitive events CMAS offers. Octopush, an underwater variant of hockey, remains little known despite steady growth since the late 1990s. The sport features biannual world championships and national, regional, and local competitions. In those competitions single- or mixed-gender teams of ten contend to move a small metal disk

across the bottom of a 2-meter- (6-foot-) deep swimming pool and into a goal, using 30-centimeter (12-inch) bats resembling small hockey sticks. Team members employ snorkeling equipment and free dive to the pool bottom to advance the disk or defend their goal.

CMAS also establishes international standards for scuba instruction. As in snorkeling or free diving, simply enjoying the underwater environment is only the first level of participation in scuba diving. But competitions in the actual use of scuba equipment are rare and are actively discouraged by much of the international diving community due to safety concerns. Scuba diving is not a competitive sport. Instead, scuba divers participate in a wide range of specialized activities.

Underwater hunting and artifact collecting enjoyed widespread popularity as the sport of scuba diving matured, but growing environmental concerns have placed a number of restrictions on those activities. Scuba divers were among the pioneers of the global environmental movement, and the diving community has proven very effective in establishing legal protections and enforcing self-imposed restrictions. As a result of the efforts of divers, in conjunction with other interested parties, underwater parks and marine sanctuaries began to appear in the 1960s and continue to proliferate.

Many scuba divers enjoy underwater photography and videography. Some indulge in exploration of underwater shipwrecks and caves, activities that carry added risk and require very specialized training and equipment. With proper gear, scuba divers can pursue such activities from tropical seas to mountain lakes, and even in winter or beneath arctic ice. In one variant of scuba, divers breath air supplied through a hose from a compressor on the surface rather than a true self-contained system. Often marketed as little more than a powered snorkel, this form of diving subjects participants to many of the hazards found in scuba and should be approached with proper caution.

Technical Diving

A number of innovations in scuba equipment and techniques began to emerge in the 1990s, at the same time

that the growing popularity and safety record of scuba began driving some divers to extend the range of the sport. Many were content to seek new locations, fueling the expansion of diving resorts and underwater sports in some of the world's most remote aquatic locations. Others sought to expand diving's horizons by going deeper and further than was previously possible.

The later group are identified as technical divers, because their activities depend on an expanded array of equipment, specialized techniques, and complete technical mastery of both for safety as they surpass the expected limits of recreational scuba diving. One of the defining elements of technical diving is abandoning the use of simple compressed air in favor of more exotic gas mixtures. Expert alteration of the ratio of oxygen to nitrogen or addition of inert gases such as helium into the breathing mix and the use of multiple optimized breathing mixes on a single dive can allow a diver to go deeper and stay longer than is advisable when using normal air. Safely using the full range of such mixtures remains too complicated for the average recreational diver, but during the 1990s oxygen-enriched air, or nitrox, gained wide acceptance in the general diving community, and additional breathing gasses and advanced techniques have continued to migrate from the technical diving community into more general use since that time.

The Future

Underwater sports remain in their infancy despite their ancient origins. The recreational use of life-support equipment to explore and enjoy the underwater world—scuba diving—is less than a century old. The technologies involved continue to change rapidly, including the widespread adoption of computers to manage the complexities of dive tables, the growing use of breathing mixtures other than air, and even the introduction of rebreather technologies long restricted to military and commercial applications. Such technologies and advances in understanding of the physics and physiological impact of diving continue to make diving safer and more accessible as they expand the possibilities for human recreation in the underwater world.

I'm rich. What am I supposed to do, hide it? ■ LOU WHITAKER

Demographics indicate that female participation in most aspects of the sport is growing toward parity, and training agencies are developing standards and protocols to introduce scuba to preteens. The medical aspects of diving are complex, but specialized training and equipment allows many physically challenged individuals to participate in underwater sports, and some studies suggest that such participation may have therapeutic value. Participation in underwater sports is likely to become more widespread and diversified as the sports continue to mature.

Unionism

Not surprisingly, the Major League Baseball Players Association (MLBPA) is often referred to as the most successful and most powerful union in the United States. This is the union that brought unrestricted free agency into the world of team sports, and in 2003 the average major league player earned \$2.4 million in salary. Yet if we judge by average salary, then the basketball players union (the NBPA) would win the prize: The average player salary in 2003–2004 was \$4.4 million.

Team sports unions are like no others. First, there is the obvious difference that the membership would hardly qualify as proletarian. Rather, virtually all members reside in the top 1 percent of income earners in the country.

Second, unlike traditional unions, team sports unions do not bargain over specific wages; instead, they bargain over the framework within which wages are determined. Sports collective bargaining agreements (CBAs)

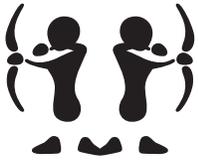

also stipulate minimum salaries, benefits, and grievance procedures as well as other general employment provisions. Once the framework is set, individual players and their agents bargain with their teams for salaries above the minimum and other benefits through the addition of special covenants to the uniform players contract.

Third, sports unions bargain within a multiemployer bargaining unit. That is, each of the four major team sports leagues, Major League Baseball (MLB), the National Basketball Association (NBA), the National Football League (NFL), and the National Hockey League (NHL), has thirty or more teams, each of which is separately owned. There is also a wide disparity in revenue across the teams in any given league. The widest disparities are in baseball, where the top team earns over \$300 million in revenue and the bottom team earns around \$40 million (before revenue sharing). The smallest disparities are in football, a league within which over 70 percent of the revenues are equally shared, where the top team earns approximately \$240 million and the bottom team around \$140 million.

These disparities are important for a variety of reasons. For collective bargaining purposes their largest significance is that team owners have very different economic experiences from each other. These differences, in turn, lead to rather distinct views about what the collective bargaining agreement should accomplish.

MLBPA and Collective Bargaining

As the earlier revenue figures suggest, the disagreements among owners tend to be sharpest in baseball, where the problems that ensue from this disunity are at least three-fold. First, the owners cannot agree on a common vision for the game, let alone a cohesive plan for its future. Their inability to agree on basic demands inevitably leads to long delays before collective bargaining is initiated. For instance, shortly after the baseball owners reopened the 1990 collective bargaining agreement in December 1992, the owners' chief negotiator Richard Ravitch told Don Fehr, who represents the players union, that he wanted to start negotiating right away.

Actual bargaining did not begin until March 1994, sixteen months later.

Well in advance of the 2002 CBA, Commissioner Bud Selig formed a unilateral Blue Ribbon Panel in 1998 to study the economics of baseball and make recommendations for reform. The panel produced its report in July 2000. Then, nearly a year passed before Selig authorized Paul Beeston, then MLB's chief operating officer, to commence discussions with the MLBPA. According to Steve Fehr, a union negotiator, the two sides had twenty-three meetings between 28 February 2001 and 20 June 2001. When the June 20 meeting adjourned, the MLBPA thought they had an agreement. Beeston had responded favorably to the players' last proposal and said he would get back to them in short order. But the players never heard back. Selig had abruptly terminated the discussions without explanation. The owners did not put their substantive demands on the bargaining table until December 2001—a month after the expiration of the old agreement and eighteen months after the Blue Ribbon Panel's report was issued.

A likely explanation for these delays is the disunity among owners. Since they cannot agree what demands to put on the table, bargaining is pushed back. Then, when they start preliminary bargaining, a previously dormant ownership clique gets wind of the talks, objects, and the talks are terminated. The end result is that bargaining goes down to the wire and either does not get resolved in time (as in 1994) or is resolved in haste (as in 2002) with a flawed structure resting on compromise.

Second, when the owners finally are ready to come to the bargaining table, it is usually based on the lowest common denominator among them—they would like salaries to be lower. Accordingly, rather than producing a coherent, balanced plan for the game's future, the tendency of the owners has been to come to the bargaining table with a demand for unilateral sacrifice by the players that restricts free agency rights in one way or another. This sets an adversarial tone to the bargaining process and reinforces the deep-seated distrust that the players have felt toward the owners.

Third, the MLBPA confronts formal ownership demands, but in practice it is bargaining with different groups of owners that must be reconciled. It is put in the strange position of triangulating an agreement. This too is conducive to inefficient outcomes. For instance, a few owners may find themselves aligning more closely with the players on the issues of revenue sharing and luxury taxes. We know this to be the case at least with the New York Yankees owner George Steinbrenner. This phenomenon leads the majority of owners to seek to penalize the owners who break ranks, even if it means deviating from a rational design of its collective bargaining institutions.

Similar, though generally less acute, dynamics are at play in the NHL, NBA, and NFL. Strong leadership from the commissioner's office can help to alleviate some of the centrifugal forces.

Defining Labor Issues

While the foregoing may help to explain the difficulty in reaching a collective bargaining agreement, most sports fans cannot understand or accept the inability of millionaire (or billionaire) owners and millionaire players to find common ground. If the issue is cast as a greedy \$10 million player who wants to earn \$10.5 million, then there is little question that the players do not merit a great deal of sympathy from the fans.

Players associations, however, do not see their struggles in those terms. Rather, they want to be sure that the players are getting their fair share of the billions of dollars of revenue generated by the monopoly sports leagues. Owners repeatedly claim to be losing money, yet the value of their franchises keeps rising, and owners have been found to hide revenue from each other as well as from the players associations.

Players, thus, tend to resist compensation systems that place restrictions on a free market determination of their value. The players' struggle for free markets originated in their battle against the reserve clause that prevailed in all the team sports prior to the 1970s. The reserve clause basically allowed teams to retain their players as long as they wanted. Reserved players could

receive no competitive bids for their services from other teams and, hence, they received artificially depressed salaries.

Free Agency

Between 1964 and 1970, the players in each of the four major team sports formed collective bargaining units. Unrestricted free agency, however, was not gained until 1976, when the MLBPA won the Messersmith-McNally arbitration case. Thereafter, players with six years of major league experience (whose existing contracts had expired) qualified to enter the open market and receive competitive bids from other teams.

Unrestricted free agency followed begrudgingly in other sports. In the NBA a settlement was reached in 1976 allowing the ABA (American Basketball Association) and NBA to merge, but also creating a form of restricted free agency. The restriction was that a team losing a free agent would be compensated significantly by the team signing the player. This restriction first was replaced by a clause giving each team the right of first refusal before a new team signed one of its players and then, in 1984–1985, by unrestricted free agency along with a salary cap. The cap at the time was set at 53 percent of “defined gross revenues” or DGR.

The NBA cap was introduced with one very significant loophole, known as the “Larry Bird Exception.” A team could re-sign one of its own players and pay him as much as they wanted (without regard to the cap). This exception reduced player mobility and made it more likely that a small market team could retain its best players, rather than seeing them flee to a large market club as is the pattern in baseball and hockey. The Bird Exception is still in place.

Another interesting development in the NBA points at one of the difficulties of a salary cap system. The amount a team can pay its players (payroll) is set as a percent of some definition of league revenues. But league revenues are based on team revenues, and teams have various ways to legally underreport their revenues. This opens the door for disputes between the league and the union

and this is precisely what happened in 1991. The players brought a proceeding that charged the owners with hiding revenues. In July 1992 a settlement was signed that awarded \$62 million to the players.

With the 1999 collective bargaining agreement, the NBA introduced an escrow system along with a very stiff luxury tax (over 100 percent) for payrolls that rose above 61 percent of defined revenue. NBA player payrolls have stabilized around 60 percent of defined league-wide revenues.

The NFL took a more tortuous route to free agency. The National Football League Players Association (NFLPA) became the collective bargaining unit for the players in 1970. The owners refused to yield on any of the players’ key demands, which included unrestricted free agency and impartial arbitration of all disputes. In 1974 the players brought suit against the NFL, and in 1976 the courts declared the NFL in violation of the nation’s antitrust laws. Fewer than half the players, however, were paying dues to the union, leaving the union in a weak bargaining position.

In this context the union and the NFL reached agreement on a new CBA in March 1977. Player benefits were increased significantly and impartial arbitration was introduced for most issues, but the new free agency system was still highly restrictive. It stipulated that a team losing a player would have a right of first refusal and then be compensated for the lost player with a first-round draft pick. Moreover, with the NFL’s extensive revenue sharing, owners had little financial incentive to invest in free agents. The result was that very few “free agents” moved to new teams.

Ironically, in retrospect, in 1982 the players asked for a salary cap, set at 55 percent of league-wide revenues. When the owners refused, the players began a two-month strike. The strike was settled when the owners agreed to a considerably larger benefit-compensation package, but the issue of free agency remained unresolved.

When negotiations for the next CBA opened in 1987, the owners were feeling their oats because their would-be competitive league, the United States Football

Unionism

Resistance to a Baseball Union in the 1920s

The ball players seem determined to have another union. As in the case of the old Players' Fraternity, which collapsed soon after America's entry into the World War, the present union is being organized from the outside. The strike of the Detroit players in 1911 in protest against Cobb's indefinite suspension for punching an abusive fan in New York gave Dave Fultz, a retired ball player, the idea for a union of ball players. Unquestionably Ray Cannon, a young Milwaukee attorney, got considerable encouragement when he broached the subject of a union to prominent ball players.

It seems largely up to organizer Cannon whether his union shall make itself a nuisance or an organization for the good of the game. Fultz's Fraternity accomplished some needed reforms, but Fultz then began looking for trouble. In the winter of 1916–1917, with the war right around the corner, Fultz called upon all fraternity members, major and minor, to sign pledges not to enter into contracts with their clubs until certain grievances of minor league players were met.

Knowing as he did the slender thread which bound the majors and minors together, it was a suicidal policy to try to keep players like Speaker, Sisler

and Johnson from signing big league contracts until Kalamazoo paid \$50 back pay to pitcher Schmeltz and Muskogee reinstated catcher Schmitz.

The new Players' Union should profit by the mistakes of its predecessor. No one has any objection to the players forming an organization, especially one which gives some thought to the old down-and-out player. If instead of searching for grievance with a microscope, the new union seeks to do all it can to help the game, it can make of itself a praiseworthy institution.

The new union may act as a clearing house for rumors of the diamond in the event that any set of players again attempt to undermine the game. Honest players, with the welfare of the game at heart, have made the mistake in the past of being too clannish. They saw things that they knew did not look right; especially was this true of the honest Chicago American League players in 1919 and 1920, but they whispered it among themselves and never went to the constituted baseball authorities with their suspicions.

As far as we recall, Les Mann, who took Phil Douglas' incriminating letter to Branch Rickey, is the only player who has lent much of a hand in cleaning up the game in recent years.

League (USFL), had gone out of business the year before. The players had less leverage, but the union was no less determined to gain true free agency. The intransigence on each side led to a three-week strike, which ended when the ranks of the players became divided, and the union leader decided that the players had a better chance with an antitrust action than a job action.

After an initial victory, the union was told that it would have to decertify itself as a collective bargaining unit to proceed with its antitrust claims. The union did this and in 1990 filed its *McNeil v. NFL* case against the league. The jury found in favor of the union, and the owners were forced to negotiate a more open system.

In January 1993 the two sides reached agreement. Owners agreed to free agency, but only if there was a salary cap. Players agreed to the cap, but only if player costs first exceeded 67 percent of league defined revenues. Even then, the cap would have to be relatively high—63 percent of defined revenues—and the clubs would have to guarantee that at least 58 percent of defined revenues would be spent on players. Further, the agreement permits teams to exceed the cap by counting only a portion of up-front signing bonuses. (Historically, until then, the players' share of revenues had averaged less than 50 percent.) Importantly, the owners agreed that there would be no cap in the last year of the deal—1999. Finally, \$195 million in damages would

have to be paid to the players in settlement of various court actions. This same cap system, with small modifications, has been extended four times and has been the basis for uninterrupted labor peace in the NFL since 1993. Labor relations in hockey were at a crossroads in 2004. Although the league did not adopt unrestricted free agency until the mid-1990s, and even then allowed it to only apply to players with at least ten years in the league or thirty-one years of age, the player payroll share in revenue was considerably higher in the NHL (at around 70 percent) than in the other team sports. In part this is because of hockey's system of salary arbitration, and in part this is because of unrestrained signing bonuses offered to first-year players.

The 1995 CBA expired after the 2004 season (as did the league's television contract with ABC/ESPN). In October 2004 the owners locked out the players. The owners maintained that they would not sign a new CBA unless it included "cost certainty." The union interpreted this to mean a salary cap and has maintained that a cap is unacceptable. Many observers predicted a long work stoppage and a further weakening of the league's fan base.

Perspectives

Whatever the outcome of the NHL's labor negotiations, the 2004 dispute once again raises the issue of why labor markets in sports should be different from elsewhere in the economy. Sports unions (the NFLPA excepted) have argued that the free market is the fairest way to value player talent. Don Fehr at the MLBPA and Bob Goodenow at the NHLPA (National Hockey League Players Association) have maintained it would be unconscionable for their unions to accept a set of rules that would prevent team owners from paying players as much as they wanted to pay them.

The owners, in contrast, have said that sports are different from other industries because of their popularity. Owners, they argue, come under enormous public pressure to build winning teams, and responding to this pressure leads to intense competition and excessive compensation.

One of the interesting features of the sports industry is precisely its degree of public exposure. Team owners benefit from this because it makes them prominent in the community. This prominence, in turn, yields new contacts and influence in business and political circles. Thus, owning a sports team usually helps to promote an owner's other businesses.

Some owners own one or more businesses significantly related to the sports team (such as a local sports channel or radio station, the arena or stadium, a concessions company, surrounding real estate, etc.). The more important these related businesses, generally, the more valuable a player is to the owner. The player contributes to the value of the team, but also to the other businesses. This effect can produce very large disparities in team payrolls, but it can also create payrolls that are disproportionate to the revenues generated in the sport.

Hence, there appears to be a reasonable argument for sports labor markets to be restrained. The MLBPA has accepted implicitly this argument by agreeing to a luxury tax and revenue sharing system. The NHLPA has also stated that it is willing to accept tax-related restraints on payrolls. The question remains whether hard salary caps or incentive systems are the best and fairest way to modify free labor markets in the team sports industry. As long as this issue remains unresolved, collective bargaining in sports promises to continue to be both contentious and interesting.

United Kingdom

The United Kingdom was the birthplace of modern sport. From the drawing up of rules to the development of sporting philosophies, Britons have played a major role in shaping sport as the world knows it today. This role meant that British sport was overly insular and confident in its early days, while its post-1945 history was marked by doubts and crises as the nation realized that the rest of the world had moved on, a situation that mirrored the U.K.'s wider crisis of confidence in a postimperial world.

Preindustrial Sports

Preindustrial sport in Britain resembled sport in much of Europe. It was not a clearly demarcated activity but rather part of a communal festive culture that saw people congregate to celebrate high days and eat, drink, gamble, and play. The sports of the people reflected their lives: They were rough, proud, and highly localized. Rules were unwritten and based on customs and informal agreements that varied from place to place according to local oral traditions. "Folk" football was one of the most common and popular sports. It had existed in different forms across England and Wales since at least medieval times, but it resembled a melee more than it resembled its modern descendant. Traditional boundaries within rural society were celebrated in such games, with contests between parishes, young and old, and married and unmarried. Other sports played at communal festivals included running races and traditional feats of strength such as lifting or throwing rocks.

The physicality of pre- and early-industrial Britain was also reflected and celebrated in bare-knuckle prizefighting, although this widespread sport could not always be clearly distinguished from public drunken brawls. The brutality of life was further evident in the popularity of animal sports. Bear or bull baiting and cockfighting were among the most popular, but such recreations increasingly came under attack in the middle of the nineteenth century from middle-class moral-

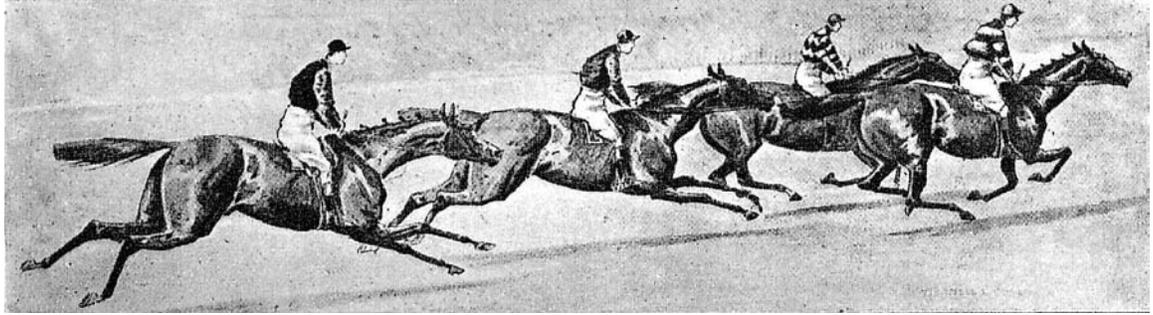

ists. The foxhunting of the upper class was not attacked, suggesting that the crusades owed something to concerns about the turbulent behavior of the workers and not only to the suffering of animals.

The attacks on animal sports were part of a wider process of modernization that saw Britain transformed into the industrial workshop of the world. Urbanization, railways, factories, mills, and mines saw Britain transformed, economically, environmentally, and psychologically. Modern sport was forged within this heady mix of breakneck change; new ways of working and living brought new ways of playing. Along with the assaults on animal sports, folk football was attacked in towns because it disrupted trade and the general orderliness of the increasingly regimented world that industry was creating. Bare-knuckle fighting, too, was attacked as a threatening symbol of a violent working class that unsettled an establishment already worried by the rise of political demands from the workers.

There was, of course, much continuity between preindustrial sport and the commercialized and codified games that emerged toward the end of the nineteenth century. Cockfighting and prizefighting, for example, survived the attempts to outlaw them, but they left the centers of towns for quiet rural spots or pubs and back streets that were away from the surveillance of middle-class authorities. Folk football too lived on, although apparently on a smaller scale that was less oriented around traditional holidays and community celebrations. Its survival in this form surely underpinned the speed with which the codified form that emerged from the public schools was taken up by the masses across Britain.

Emergence of Modern Sport

While forms of football were on the decline in mid-nineteenth-century Britain, they were actually being adopted by the country's public schools as a means of controlling the boys and building their character, both as individual leaders and as socially useful team players. Underpinning the values that football was thought to cultivate were ideas of masculinity and religious conviction. Muscular Christianity deemed that men should

**First time past the stands in the Gold Cup in 1825.

be chivalrous and champions of the weak but also physically strong and robust. The belief that such qualities would create the right sort of men to lead the British Empire meant that a cult of athleticism, whose importance ran far deeper than mere play, developed within the English public schools.

CODIFICATION

Such traditions found a natural extension in the universities. It was here, particularly at Cambridge, that much of the impetus for common sets of rules developed in order to allow boys from different public schools to play together. It was from such beginnings that the moves toward the codification of rules and the establishment of governing bodies mostly sprang. Most famously, representatives of leading London football clubs, including former public schoolboys, met in London in 1863 to establish a common code of rules for football and form the Football Association to govern the game.

With rules and a governing body behind them, former public schoolboys went out into the world, taking their games with them. Not only did this encourage the diffusion of sport outside British shores but it also led to modern sport being taken to the masses by a paternal elite who sought to better the health and morals of the masses, not least because of fears of national decline. Games like soccer and rugby were well suited to urban, industrial communities, requiring only limited time and space, and they very quickly developed in popularity among the working classes across Britain during the late nineteenth century. Such developments created an apparent homogenization of sport culture across Britain, but there were distinct local variations.

Knurr-and-spell and hurling, for example, enjoyed some popularity in the north of England and the Scottish highlands, respectively. Such traditional games furthered the continuity between preindustrial and industrial sport, but to survive, even they had to develop modern organizations and sets of rules.

Modern British sport was not entirely rooted in the public schools and their spheres of influence. In Sheffield, for example, there were independent attempts to draw up sets of rules for football. Even among the southern middle classes, there developed popular sports, such as tennis, whose origins lay elsewhere. Golf could trace its written rules back into eighteenth-century Scotland, but it was not until the wider sporting revolution and mania of the late nineteenth century that the sport's popularity exploded among the British middle classes. Cricket was another sport whose written rules were drawn up in the eighteenth century and thus predate the public-school cult of athleticism.

AMATEURISM

Professionalism in cricket also dated back to the eighteenth century, but as the phenomena developed in other sports in the late nineteenth century, cricket too developed an obsession with amateurism that was closely allied to the public-school ethos of fair play and playing for the sake of the game. Above all, amateurism was about projecting social position in a period of social change and mobility. To be an amateur in late Victorian and Edwardian Britain was to not need to be paid to play. Thus in cricket, where amateurs and professionals often played on the same team, social distinctions were preserved through the use of different changing rooms, different ways of writing names, and

Cards are war, in disguise of a sport. ■ CHARLES LAMB

initially requiring professionals to labor with bowling and even menial tasks such as cleaning the kit.

Yet, despite the snobbery that underpinned amateurism, there was a general reluctance in most sports to impose explicit class-based restrictions on participation, though the Amateur Rowing Association was a notable exception. Furthermore, the reality of amateurism did not always match the rhetoric. Nowhere was this clearer than in the case of cricketer W. G. Grace (1848–1915). Undoubtedly the most famous sportsman of the Victorian era, Grace was a doctor and a gentleman but he was also supremely competitive and certainly not above gamesmanship and demanding excessively generous expenses.

RUGBY AND SOCCER

It was in rugby and soccer that the issue of professionalism became most controversial. The growth of socially mixed northern teams led to broken-time payments, where working men were compensated for missing work in order to play. Such payments, however, not only offended the amateur principles of some of the elite, but they also threatened to take power away from the middle classes, both on and off the playing field. In soccer, professionalism was sanctioned in 1885 in order to ensure that the middle-class Football Association retained control of the game, but it was soon tempered with severe controls on players' freedom to move clubs and be paid what a free market might allow. Such tensions, fueled by north-south rivalries, led rugby to split into two codes (which became known as league and union) in 1895. Rugby league became a sport whose whole existence and identity was closely interwoven with ideas of working-class identity in northern England.

Watching and Playing

Clubs could afford to pay players because soccer and rugby had become something that people watched as well as played. This owed much to the establishment of cup competitions, which, fed by civic and regional rivalries, gave some purpose and excitement to matches. In the industrial north of England, the growing crowds

began to be charged for the privilege of watching and were hosted in purpose-built grounds. Such crowds worried the class prejudices of social onlookers, who complained about the drinking, gambling, and partisanship of supporters, as well as about the impact on the nation's health of a population that spent its free time watching rather than playing.

When soccer continued to be played after the outbreak of war in 1914, the reputation of professional sport plummeted among the middle classes. Nonetheless, sport was to play an important role in maintaining troop morale at the front, and in the aftermath of the Great War, spectator sport reached new heights of popularity. The largest league games in soccer could attract as many as sixty thousand spectators, yet beyond drinking and gambling disorder was rare. This led the sport to be celebrated as a symbol of the general orderliness and good nature of the British working class at a time of political and social unrest at home and abroad.

MASCULINE ENCLAVES

For spectators, professional sport offered an exciting communal experience, where the spheres of home and work could be forgotten in the company of one's peers. As such, crowds at professional soccer and rugby league games became overwhelmingly masculine enclaves that fed a shared sense of community, and perhaps even class identities. Sport's ability to promote civic identity was underpinned not by the players, who being professional were transient, but by the supporters and the club sharing the name of their town or city.

Yet these crowds were not actually representative of such civic communities. Professional sport was mostly watched by skilled male workers, with only a sprinkling of women and the middle classes. Unemployed and unskilled workers were, by and large, excluded by their own poverty and the relative expense of entry prices. Consequently, as unemployment rocketed in parts of Britain during the interwar depression, professional sport suffered. Some clubs in the hardest-hit industrial regions actually went bankrupt. Working-class women were excluded from professional sport by the

A wrestling match at a fair during the Elizabethan era.

constraints of both time and money. Even the skilled workers did not show an uncritical loyalty to their local teams. Professional sport was ultimately entertainment, and people exercised judgment over what was worth spending their limited wages on.

Men played as well as watched, and the towns of Britain boasted a plethora of different sports, from water polo in the public baths to pigeon races from allotments and quoits in fields behind pubs. Darts, dominoes, and billiards flourished inside pubs and clubs. Space was, of course, a key requirement of sport but it was at a premium and the land that was available was heavily used. For all the excitement that sport enabled men and women to add to their lives, they were still constrained by the wider structures of economic power.

Working-class sport could not be divorced from the character of working-class culture. Local sport was thus intensely competitive and often very physical. In both football codes, bodies and fists were hurled through the mud, cinders, and sawdust of the rough pitches that were built on parks, farmland, and even mountainsides. But, win or lose, for many men and boys, playing sport was a source of considerable physical and emotional rewards. For many youths, giving and taking such knocks was part of a wider process of socialization: Playing sport was an experience that helped teach them what it meant to be a man. Similarly, working-class sporting heroes reflected the values and interests of the audience; they were tough, skilled, and attached to their working-class roots.

CRICKET

Cricket was the national sport of late nineteenth- and early twentieth-century England, in that its following was not limited to one class or region. Matches in urban working-class districts may have lacked the pressed white flannels and neat green wickets of a test match at Lord's, but they shared the same intricacy and subtlety of play. The contest between the skill and speed of the bowler and the technique and bravery of the batsmen was familiar to both working-class boys and upper-class gentlemen. Cricket's popularity also owed something to the

rural image of England that it encapsulated. Cricket on the village green was an evocative and emotive image, employed even by a prime minister at the end of the twentieth century. Yet, from the English elite cricket spread not only to the masses of the cities but also to the four corners of the vast British Empire, where it enabled the colonies both to celebrate imperial links and to take considerable pride in putting the English in their place.

HORSE RACING

Like cricket, horse racing had been organized since the eighteenth century and was followed by all classes, from lords to commoners. Gambling was at the core of its attraction, and a flutter on the horses was extremely popular, despite its illegality (until 1963) when the bet was placed in cash and outside the race course. As with soccer, the sporting press offered form guides and was studied closely, and elaborate schemes were developed to predict a winner. The race course itself was often rather disreputable, with the sporting entertainment on offer to its large crowds supplemented by beer, sideshows, and in the nineteenth century, prostitutes. It provided the middle classes with an opportunity to (mis)behave in a manner that would be impossible in the wider respectable society.

THE MIDDLE CLASS

Respectability did matter on the golf course and in the clubhouse. Although it had a limited working-class following, especially in Scotland, golf was a sport of the middle class and its clubs were important social and business networks that conferred privilege and status within the local community upon their mostly male membership. Tennis too had both a middle-class profile

Sports during the Boer War in South Africa

On Christmas Day, a year ago, General Buller's army was encamped at Chriveley Hill; and because it was an army of Britishers, the day was given chiefly to sports.

Only ten days before this the broken regiments had come crawling back to the camp from the disaster of that mad attack on the Boer position at Colenso. Even now the tents of the foremost brigade were almost within range of the enemy's big guns. It was a time of strange uncertainty—a time of many rumors.

[. . .]

Of course, both the variety of the sports and the extent to which they could be carried out depended upon the material for such to be found with an army in the field. The men of the naval brigade, as always, were most ingenious. They decided to have what they called "a bit of fun" at the beginning of the festivities. Their officers gave permission. They borrowed a gun carriage from a neighboring field battery and arranged long ropes to drag it by. Then they dressed one of their number as Oom Paul Kruger and an-

other as John Bull, placed them on the seats, and started to drag the carriage through the camps.

[. . .]

In the afternoon all the kinds of sports which were possible under the circumstances were held in the open space about the camp. To the different arms of the service different sports were naturally allotted. The infantry had running races, potato races and the like; the cavalry men engaged each other in wrestling bouts on horseback and tent-pegging competitions; the Royal Army Medical Corps organized a race of ambulance wagons—and these same ambulances which now went tearing wildly over the rough ground of the veldt in order to be first across the finish line, to-morrow or the next day would crawl out cautiously behind the advancing battle front to bring back the wounded from the field; but the most important of all were the horse-races of the mounted infantry brigade.

and a social importance that often marginalized actually playing the game. Like archery and croquet before it, for the urban middle class of the early twentieth century, the tennis club was an opportunity to meet and flirt with members of the opposite sex of the "right sort." In such ways, sport became an important part of the lives of a middle class that was increasingly socially isolated in the new suburbs.

INTERWAR AND POST-WAR SPORT

Like the rest of Europe, the shadow of war was hanging over the suburbs by the 1930s. In such an atmosphere, sport itself became increasingly political. The England soccer team were even told by the appeasing Foreign Office to give the Nazi salute when playing an international game in Berlin in 1938. The threat from Germany also led to renewed investment in playing fields, as concerns resurfaced about the fitness of a nation on the brink of war. Unlike in World War I, sport was fully pro-

moted during the 1939–1945 conflict, as an improver of spirits and bodies for civilians and troops alike.

Britain finished World War II victorious but physically and economically exhausted. In the austerity that marked the late 1940s, sport was one readily obtainable relief and, encouraged by growing radio coverage, soccer, rugby, cricket, and boxing enjoyed huge crowds. There were also large crowds at the 1948 Olympics, which London hosted in the hope that the games would rejuvenate tourism and help put some color into the postwar austerity. The games were an organizational success and even made a profit—the last Olympics to do so until 1984. After leaning toward isolationism in both politics and sport during the interwar years, the postwar period saw a new awareness in Britain of its relationship with the rest of the world. With the Empire being dissolved, international competitions like the Olympics began to matter more as indicators of national vitality. The conquest of Everest in 1953 offered

The fact that most members played games and participated in sports gave them a similarity of outlook which was clearly reflected in their handling of administrative matters. some optimism and confidence for the future, but soccer, Britain and the world's most popular game, was not reassuring for its inventors. England's first forays into the World Cup were far from successful and indicated that the country's loss of global power was not confined to the political sphere.

The Television Era

As economic prosperity returned in the 1950s, spectator sport suffered a downturn in popularity because it now had to compete against the lure of shopping, cars, and increased domestic comforts, of which television was one of the most alluring. Such alternatives were particularly appealing to older men, and thus the 1960s seemed to witness crowds, in soccer at least, become younger. One consequence was the rise of a youthful football-fan culture that utilized humorous but obscene and aggressive chants and promoted fighting between rival supporters. The media spotlight, increasingly looking for sensational stories from across sport, amplified the hooligan problem, but from the late 1960s to the 1980s football fans created a genuine and widespread subculture that drew more upon the thrill of limited violence than upon any sense of a disempowered youth rebelling against the world.

Initially, there was only limited sport shown on television, and many sporting authorities, not least soccer authorities, feared that coverage would kill live audiences. Yet others, like golf and horse racing authorities, saw television as an opportunity to develop their popularity and thus they courted its coverage. The growth of televised sport was therefore sporadic; in the 1950s and 1960s it was often limited to edited highlights or live coverage of only the biggest events on the sporting calendar.

Yet televised sport was to become hugely popular and influential. In the 1960s, coverage of the Olympics and the 1966 World Cup won mass audiences and turned the events into shared celebrations of a global sporting culture. Wimbledon became, for most people, a television event rather than a live tennis championship, while rugby league became inextricably linked to the northern tones of commentator Eddie Waring. By the 1970s, television coverage had also helped turn rugby union's Five Nations Championship into a very popular competition that transcended the sport's middle-class English foundations.

COMMERCIAL OPPORTUNITIES

Television also opened up opportunities to utilize sport commercially, not least through sponsorship. Athletics was one sport where television and sponsorship increased its profile and popularity, but this also created tensions between the amateur traditions of the administrators and the commercial demands of the stars. Other sports suffered similar tensions and responded by either slowly becoming explicitly commercial, as in the case of professional golf, or turning a blind eye to transgressions of amateur code, as in parts of rugby union. Yet ultimately money talked and amateurism gave way to commercial pressures across senior sport.

The changes television was bringing about could be radical. Cricket proved surprisingly willing to embrace change and even introduced a one-day Sunday League as early as 1967, as it searched for a more accessible and exciting one-day format to supplement the waning four-day county game. After the invention of color television,

snooker was televised from the late 1960s, and the sport was transformed from the realm of smoky pubs to something resembling a national craze. The relatively static nature of the game meant that it was cheap to broadcast and conducive to dramatic close-ups. Snooker also had the characters and personalities that the media was increasingly seeking in its coverage of sport.

SATELLITE TV

The real commercial boost from television came in the 1990s with the development of satellite television. Soccer was seen as the key to securing an audience for the new medium. Rupert Murdoch's Sky Global Network spent enormous sums on securing and then keeping the rights to televise the game's senior division. After the 1980s—when hooliganism and the fatal horrors of disasters at Bradford, Heysel, and Hillsborough had seen English football sink to its lowest ebb of popularity and standing—Sky's millions enabled the game's upper echelon to reinvent itself in the 1990s. New all-seater stadiums (enforced by the government to avoid a repeat

of the ninety-six deaths at Hillsborough in 1989) made watching soccer both safer and more sanitized, and an influx of talented foreign players raised standards of play, while a more cynical and overtly commercial edge developed among the game's owners and administrators. Players were the main beneficiaries as their profile, wages, and sponsorship opportunities rapidly escalated in the now hugely fashionable and celebrity-conscious game. David Beckham epitomized this transition, with his pop-star wife, countless sponsorship deals, and media-frenzied private life.

Fans meanwhile could watch more soccer than ever on television but actually attending matches had become extortionately expensive. Other sports were keen to follow soccer's example. Rugby league became Super League, its teams gained American-style epithets, and the sport moved from winter to the less-crowded television schedules of summer. Rugby union, fearing being left behind, suddenly abandoned its amateur heritage and turned professional in 1995, a move that was to bring it as many financial headaches as rewards.

Identities and Inequalities

In the second half of the twentieth century, spectator sport and television may have become interwoven in a relationship built on money, but participatory sport did not die out. However, it too became part of a leisure industry that sold everything from training shoes to personal gyms, and

you should occasionally look at

participation remained skewed by class. The wealthier appeared not only more able to afford to play sport but also more interested in doing so. The foundations and boundaries of the British class system were becoming increasingly blurred, and the diminishing class associations of the most popular sports reflected that. Yet historical legacies and financial requirements meant that equestrian sport still remained beyond the reach and often the tastes of the masses, while activities such as boxing and darts remained closely allied to working-class culture. Success at such sports could take performers out of their working-class origins, but this did not end the cultural resonances that had been built up over a century.

Nor were the gender biases of sport ended by the equal opportunity ethos of the late twentieth century. Playing and watching sport remained far more popular among men, despite the significant advances made in female participation rates and the profile of some leading sportswomen. Olympic athletes like Denise Lewis and Kelly Holmes may have ventured into the celebrity world of sports stardom, but at the start of the twenty-first century, women are still on the margins of sport in terms of numbers, profile, and culture.

Athletes from Britain's ethnic minorities have, however, broken through into the mainstream of nearly all the country's most popular sports. In the early twentieth century, there had been occasional black athletes, in boxing and soccer in particular, but it was the 1970s, when the sons of the first generation of large-scale immigration reached adulthood, that saw British sport become genuinely ethnically mixed. By the twenty-first century, England's national teams had even had black and Asian captains in soccer and cricket, respectively. Such achievements were not simply symbolic but also encouraged a degree of wider racial integration in national culture. Yet sport has also been, and continues to be, the site of explicit racism (notably in the form of soccer chants) and more subtle prejudices about the playing abilities of different ethnic groups. Such prejudices must surely explain why a pro-

fessional soccer player of note has yet to emerge from the U.K.'s large Asian population.

While little sustained media attention was ever devoted to sporting inequalities based on class, gender, or ethnicity, nationhood was a topic of widespread popular interest. When in 1999 the Chelsea Football Club fielded a team that did not include a single British player, there were debates about globalization's potential impact on the future success of British international sides. Sport had always played an important role in shaping national identity within the United Kingdom. For the Welsh, Scottish, and Irish, it had had an important symbolic role in affirming their nationhood and equality with England. While the Scots and Welsh enjoyed cutting the English down to size at football and rugby, the Irish increasingly rejected these sports in favor of their own indigenous games, such as Gaelic football and hurling, which could be used to symbolize a separate, and non-British, cultural heritage.

Values and Ethics

Ethics generally refers to the question of what is right or correct from a moral standpoint. The study of ethics necessitates the critical examination of beliefs. This process involves clarifying the principles that undergird beliefs and subjecting them to rigorous interrogation (Simon 2004). The conundrum for sport scholars is to understand the field of sport as one in which competing and sometimes contradictory values and ethics are debated and idealized (Eitzen 1999). Understanding this complex situation requires defining an approach to the subject, rather than providing clear-cut answers. Ethical inquiry into sport forms a broad field, often with very different areas of investigation and conclusions. A variety of theories and models have been employed and can be applied to the example of sports.

Simon (2004) argues that what these models and theories share is an approach that combines three common features: (1) impartial moral reasoning: one must consider multiple perspectives and points of view, giving no special consideration to his/her position or group; (2) systematic consistency: regardless of characteristics, people should receive comparable responses to similar actions; and (3) reflective judgments: one must consider actual and hypothetical examples from a critical perspective. By approaching ethical dilemmas from a perspective that employs these three features, a reasoned consideration may be made. Sport mirrors the human experience and society in ways that make inquiry illuminating (Eitzen 1999).

Debates over Ethics and Values

Since the inception of modern sport with the advent of industrialization, a host of issues have been debated. Many debates perceived as current also plagued early modern sport and often ancient sport as well. Such debates focus on questions of inclusion/exclusion, the nature of competition, acceptable methods by which to pursue excellence, sportsmanship, and responsibilities toward bodies at risk.

THE NATURE OF COMPETITION

Since the inception of modern sport with the rise of industrialization in the nineteenth century, the nature and value of competition has been considered from an ethical standpoint. Is “winning the only thing,” or is it immaterial compared to “how one plays the game”? In the first case, competition itself must be critically considered. Some scholars contend that competition may be inherently immoral or may reinforce undesirable social values. Others note that competition promotes many positive traits such as loyalty, character, and perseverance (Simon 2004). While some argue that participation in sport builds character, teamwork, and a host of other positive virtues, Shulman and Bowen (2001) report that these traits are already present in athletes. In other words, perhaps those who already possess the traits thought to be taught by sport self-select into them.

Further, many question the benefit of some of the values imparted in competitive sport. Feezell (1987) argues that victory at all costs is by necessity ethically problematic, while others contend that being able to eschew

victory reflects a privileged position that not all athletes (whether recreational or professional) occupy. The enormous amount of debate over this subject reflects a wide range of cultural beliefs and differing social experiences.

WHAT IS A GOOD COMPETITOR?

How one evaluates what a good competitor is depends on one’s views of competition. Is the best competitor the one who plays with honor and dignity or the one who may use anything to win, including intimidation and psychological warfare? Additionally, who one is affects how the larger culture has viewed competition. Early women’s sport had to contend with the idea that competition would make women “manly,” and therefore, competition was considered inappropriate for women. This view carried the weight of institutional verification as medical professionals counseled that the exertion and excitement of competition endangered the reproductive viability and even life of women (Cahn 1994). While many female educators decried the negative consequences of competition, others lauded the positive virtues and saw it as a vehicle to achieve equal rights. Such beliefs still surface in charges that women aren’t interested in competition or that women’s sports are secondary to men’s because they represent a less competitive version of games.

APPROACHES TO COMPETITION

Simon (2004) notes there are several different philosophical approaches to competition in sports. In the first case, one could adopt a utilitarian perspective and focus on competition in terms of the consequences. If

Animal Baiting Criticized

Animal baiting, whether involving dogs, bulls, badgers, or bears, has always been controversial. This extract published in The New York Spectator on 7 September 1827 takes the critical view.

Bull Baiting.—The following is the note of “Humanitas,” to which we referred yesterday. The author is a gentleman of respectability, and we therefore call upon the police to interpose and prevent the barbarous spectacle proposed by Mr. Armstrong on Thursday next. One of our friends, in passing Harlem, at the time, accidentally saw the cruel scene.

Mr. Editor—As a friend of “humanity and correct morals,” will you give a hint to the guardians of our city, of a most bloody and cruel Bull Bait, which took place at Armstrong’s tavern, at Harlem yesterday afternoon—and also, that notice was given that another “Piece of Sport” of the same kind, would take place next Thursday, at the same place. These exhibitions are scandalous, and with all the vices attending in their train, tend much to paralyze every effort that can be made for the increase of morality, and virtue among us.

so, one must determine how consequences will be evaluated. In the second case, one could evaluate competition in terms of its operating as a “mutual quest for excellence.” In this view the ways in which competition may or may not impede this quest are considered. While some contend that competition has simply been redefined as a quest for excellence, others point to how competitive spirits may elevate the play of all involved. For example, being in a competitive situation may lead to an athlete’s setting a new record. Third, competition as competition with the self must be considered. Does competing with one’s earlier performances serve as a positive motivating force? Certainly, many athletes

strive to improve in ways that seem to be beneficial and positive. Fourth, is winning central to competition? While some argue that winning is at the heart of competition, others contend improvement, the elevation of the game, and how one plays the game are central.

What becomes clear is that there is no simple answer to these questions. If one considers that each athlete may take away different lessons from the same sporting situation, the picture becomes even more complicated. What follows from debates surrounding the nature of competition is the behavior of those competing. Sportsmanship and cheating require closer investigation.

Sportsmanship and Cheating

The code of “sportsmanship” is often cited as an example of ethical beliefs, but a great deal of confusion exists as to what the term explicitly means. The slogan adopted by the Sportsmanship Brotherhood in 1926, “not that you won or lost but how you played the game” seems to embody popular sentiment on sportsmanship (Keating 1964). Keating also suggests that what makes sportsmanship so hard to define is that individuals engage in sport at a wide range of levels and with very different goals. He notes that for the recreational setting sportsmanship is an injunction that one should conduct oneself in a manner such that the pleasure found in the activity is not detracted from for oneself or one’s fellow participants. The difficulty in this, as Keating points out, is that it asks those engaged in emotionally charged and sometimes high-stakes competition to act as if they were merely engaged in a diversion. Keating suggests a concept of fair play, in which opponents mutually demonstrate similar expectations to define competitive sportsmanship, while Feezell (1987) suggests that an even more fluid definition that takes specific situations into account be employed to address each situation uniquely.

CHEATING

Cheating seems a clear-cut issue, but what exactly constitutes “cheating”? The controversial ending to the 1999 Women’s World Cup, in which the American

One man practicing sportsmanship is far better than fifty preaching it. ■ KNUTE ROCKNE

team beat the Chinese team in overtime penalty kicks provides an often cited example. Following the match, American goalkeeper Briana Scurry admitted that she had consciously violated the rules. She took two steps toward shooter Liu Ying and successfully blocked the shot. But is this cheating? Or is it a calculated risk, for which she was willing to incur possible penalty? Is a strategic decision to violate the rules and run the risk of “getting caught” cheating?

While some argue that attempting to gain an unfair advantage by breaking a rule deliberately exemplifies poor sportsmanship and qualifies as cheating (Feezell 1987), others contend that it is the responsibility of officials to prevent such infractions (Simon 2004). Pearson (1973) argues that there are two types of deception possible in sport—strategic and definitional deception. *Strategic deception* involves an athlete’s tricking an opponent within the rules of the game. *Definitional deception* involves an athlete’s deliberately breaking the rules of the game. In this view, while strategic deception is acceptable, definitional deception, as committed by Scurry, is not.

Debates over the intentional foul in basketball reveal the complexity of the situation. While some argue the intentional foul is unsportsmanlike, others argue that the very fact players are given a limited number of fouls to “use” implies that they may be strategically deployed. Still others note that it’s not a foul unless the referee calls it. Therefore, nothing the player does is relevant; rather, it’s how the referee interprets actions.

Role of Performance-Enhancing Drugs

The question of cheating becomes more involved when one considers the role of performance-enhancing drugs in sports. The Bay Area Laboratory Co-Operative (BALCO) scandal that broke in 2003 (in which four men employed by BALCO were charged with distributing steroids and other illegal performance-enhancing substances to top athletes) demonstrated that the use of such illegal drugs is endemic in amateur and professional sports. Part of the problem involves what defines a performance-enhancing substance. Certainly, legal painkillers, caffeine, and other

commonly used products enhance performance. But at what point does a substance become illegal? One would think this is an easy definition; but not all leagues have banned some substances. While some argue that athletes have a legitimate right to use performance-enhancing substances, others maintain the risk to athletes outweighs the benefits to performance. Still others contend that the use of performance-enhancing drugs detracts from the sanctity of the game. Some note the coercive pressure to use such drugs is problematic and that athletes may feel they must consume potentially harmful substances to remain competitive.

Sport and Socialization

Similar to arguments centering around competition, the role of sport in socialization generates a great deal of ethical debate. Mirroring traditional divides between functionalist and conflict theorists, debates focus on the integrative function of sport. Some note that sport socializes children by extolling positive virtues like loyalty, courage, and perseverance. Further, participation in sport teaches teamwork, the value of hard work, and responsibility. While many presume these to be positive values, other scholars note that some of what is taught is problematic. While Marxist scholars are critical of the ways in which sport mirrors the logic of capitalist production, inculcating athletes with specific traits that prepare them to be compliant workers (Rigauer 1981), post-structuralists expand on these ideas to note the disciplinary aspects of sport participation. Moreover, sport, in its role of defining masculinity, has long been seen by some as socializing men into a form of masculinity that is violent and misogynist.

Inclusion/Exclusion

When considering ethical issues in sport, one must consider debates over access and control. Who can play in which venues? For whom is sport appropriate? What type of sport? There has long been a schism between idealized, legitimated venues and popular amusements. Modern sport has featured a number of venerated forums—for example, college sports and the

Olympics—that have been viewed as displaying the “best” features and traits held by the Western world and specifically the male world. Hardworking, persevering, loyal, and successful, the idealized athlete embodied hegemonic (the most powerful form of) masculinity (Connel 1987, 1995).

Because these positive virtues were linked exclusively to privileged bodies, subordinated men and women were excluded from the venerated venues of early modern sports. For example, the first modern Olympic Games held in Athens, Greece, in 1896 excluded women and those who worked for a living. Though women were admitted to the second games in 1900, it was in a limited capacity, and even today fewer events are offered to women than men. The exclusion of women, people of color, and the working class from legitimated sporting venues was the subject of great debate and to some degree continues to plague the world of sport.

While marginalized men and women did participate in local games and events, serious concern was expressed regarding the exploitation of athletes, alcohol use, gambling, and other social ills, despite the prevalence of these problems in legitimate venues. In this way, ethical debate actually emerged as a means for disciplining and controlling “other bodies, while privileged bodies were presumed to be above needing such controls. Current debates consider limiting participation in risk sports or sports known to have a high risk

of injury. While some focus on the possibilities of exploitation, particularly of the economically disadvantaged, others see attempts to limit participation as paternalism (Simon 2004).

Sport and Corruption

The problem of corruption at all levels continues to plague the world of sport. Many believe that the unresolved issues surrounding the concepts of amateurism versus professionalism contribute to rampant corruption. These issues center around who can be paid to participate, the implications of payment, legal age restrictions, and the rights of players.

College sports provide an example. Accounts of college sports in the 1800s reveal the existence of “ringers” who spent far more time on athletics than academics. Some traveled from region to region, playing at different colleges and being paid by alumni and local gambling interests. Today, the question of what to do about amateurism remains problematic. While some advocate eliminating the requirements of amateurism from high-level college sports and certain other venues, others contend that this would hardly solve the problem. Investigation into an academic-fraud accusation at the University of Minnesota in 1999 revealed that with the coaches’ knowledge, an academic counselor had written hundreds of papers for players. In addition, the case uncovered improper payments, sexual impropriety, and a host of recruiting violations. Wetzels and Yaeger

In the field of sports you are more or less accepted for what you do rather than what you are. ■ ALTHEA GIBSON

(2000), in their exploration of youth basketball leagues, found that corruption and unethical practices are endemic even to youth sports. The continued exploitation of young athletes by their legal custodians, coaches, leagues, and multinational corporations is a key problem facing the world of sports today.

Bodies at Risk

Concerns of exploitation must include the issue of bodies at risk—athletes in many sports subject their bodies to the possibility of injury. The question of who has the right to control this risk (the athlete, the coach, the team owner?) must be balanced against considerations of what risks are worth accepting. Scholars are critical of the ways in which the type of masculinity venerated in sports encourages athletes to ignore pain and injury. Such practices risk further injury, shorten careers, and can lead to long-term physical disability (Messner 1992).

Moreover, social stratification means that the riskiest sports are largely practiced by those with few other viable options for economic stability and success. As Messner argues, men with options are often able to disengage from sport voluntarily to pursue more stable and less risky careers, while their working-class counterparts more often have fewer options when no longer able to compete. What obligation do sporting bodies have to reduce risk, and what levels of risk are acceptable? For example, despite incontrovertible medical evidence that links blows to the head with the risk of death or long-term debilitation due to head injuries, head gear for boxers is not imposed at the professional level (Jackson 1999). Further, the risk of performance-enhancing drugs cannot be underestimated.

HIV/AIDS AND THE RISK OF INFECTION

In recent years, concerns centering around the transmission of HIV/AIDS and the rights of infected and uninfected athletes have risen to the forefront. Debates over athletes' rights to privacy, risk of transmission, and the role of athletes as public figures remain unresolved. However, most leagues have adopted universal precautions, protecting the rights of athletes to participate,

while minimizing risk. The public and mass media have largely come to support the rights of HIV-positive athletes to participate; however, the public and legislative bodies remain undecided on rules of disclosure. Rather than adopting a single universal principle, Jackson (1999) suggests that any ethical inquiry into HIV/AIDS and sport should adhere to four rules: (1) specific details of any recommendations made must be given; (2) the goals of the recommendation must be stated clearly and honestly; (3) ethical and factual justification for the recommendation must be given; and (4) possible objections to the recommendation must be given.

Imagery

Finally, how should the imagery promoted in sport venues be considered with regard to values and ethics? The team-mascot debate provides an excellent example. Eitzen and Baca Zinn (2001) discuss what they call “the dark side of sports symbols.” Many contend that the use of Native American mascots and symbols is offensive. While some fans assert that these images are not taken seriously or are meant to honor, not offend, many Native American groups have expressed serious objections to mascots such as Chief Wahoo of the Cleveland Indians or gestures such as the tomahawk chop of the Atlanta Braves. Some Native groups have supported specific schools—usually local schools with names that represent the specific nation—in their use of the name, citing few other public forums in which the name of their group is cheered. However, there seems little support or excuse for teams whose mascot, team name, or chant is essentially an ethnic slur.

The Future

The arena of sports remains a site of ethical contention. While sports is an arena in which positive values can be exhibited and taught, it is also an arena in which negative values may be imparted as well. Indeed, debates over the meaning and efficacy of competition reflect disparities in the wider culture as to what values and ethics should be promoted. While barriers to access for women and people of color have been significantly

reduced, the exploitation of athletes, acceptable means to ends practices (performance enhancing substances, deliberate rules violations, and so forth), and the role of business remain areas of considerable debate.

Venice Beach

“Venice Beach” is an expression used to describe the physical culture phenomenon that emerged in the Santa Monica Bay region of southern California during the 1930s. Centered in the seaside communities of Santa

Monica and Venice, the phenomenon helped shape the image of southern California as a land of sun, fun, health, and fitness and as a mecca for bodybuilders.

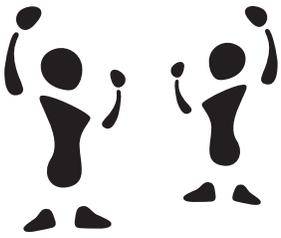

Early History

Because of its congenial climate and abundant natural resources, California attracted many enterprising free spirits from the eastern United States during the late nineteenth century. New York businessman and visionary Abbott Kinney founded Venice in 1900 as an upper-middle-brow Italianate resort, replete with a 25-kilometer network of canals, gondoliers, and a twenty-five-hundred-seat auditorium for lectures, recitals, opera, and plays. When Los Angeles citizens did not respond to such haute (fashionable) culture, Kinney turned his creation into a Coney Island of the Pacific where the masses could enjoy a Ferris wheel, shoot-the-chutes ride, skating rink, dance pavilion, bowling alley, shooting gallery, aquacade, and other amusements. This paradise by the sea declined into speakeasies and gambling halls during the 1920s, but Venice was destined to remain a center for leisure, recreation, and sport—a precursor of Disneyland.

Original Muscle Beach

During the 1930s attention shifted to Santa Monica, where, beside a pier with a roller coaster and merry-go-round, fitness enthusiasts gathered on the beach to engage in volleyball, acrobatics, and gymnastics and to enjoy the sun and fresh air. Known as the “Santa Monica Beach Playground,” it also attracted weightlifters and bodybuilders who found the milieu conducive to training, getting tanned, showing their bodies, and possibly even landing a movie role in nearby Hollywood. The city government encouraged these activities by improving the facilities for acrobats and installing a weight pit for the musclemen. Even before World War II this physical culture hotbed attracted thousands of spectators and participants, especially on weekends and holidays.

During the postwar years the playground entered its golden age and became nationally renowned as “Muscle Beach.” It featured such notables as Abbye (Pudgy) Stockton, the first woman bodybuilder, who with her

husband, Les, operated a gym on Sunset Boulevard. Jack LaLanne brought physical fitness (and the California beach culture) to a new level through his television show that aired from 1951 to 1984 on approximately two hundred stations to millions of viewers. Harold Zinkin, an acrobat and bodybuilder, helped devise the Universal Gym in 1957. Screen star Mae West recruited her celebrated troupe of musclemen from Muscle Beach for nightclub appearances in major cities during the 1950s. Muscle Beach was also a magnet for prominent weightlifters, including Olympic champions John Davis, Paul Anderson, and Isaac Berger, and such bodybuilding greats as John Grimek, George Eiferman, and Dick Dubois. However, the most famous Muscle Beach trainee was the 1947 Mr. America, Steve Reeves, who starred in various sword-and-sandal epics, including *Hercules*, the highest grossing film of 1959.

Closely associated with the beach culture was Vic Tanny's Gym, opened in the late 1930s in a loft above an auto repair shop on Second Street in Santa Monica. Assisted by his brother Armand, a physique star and Muscle Beach regular, Tanny expanded his operation into the first major chain, eventually resulting in eighty-four gyms nationwide, grossing \$15 million a year by the 1960s. Annual Mr. and Miss Muscle Beach contests, combining brawn and beauty, added luster to Santa Monica's image and contributed to the popularity of the growing sport of bodybuilding. However, the intrusion of unsavory elements and some unfortunate incidents prompted city leaders to close Muscle Beach in 1958.

Muscle Beach Moves to Venice

The weightlifters and bodybuilders retreated temporarily to the "Dungeon," a workout facility operated by Vic Tanny in the basement of a nearby commercial building. Then they convinced the city of Venice to set up a weight pen on the beach, about two miles south of the old location. This new Muscle Beach soon attracted a regular clientele and spectators, but without the acrobatic-gymnastics component. It was complemented in 1965 when Joe Gold opened his first gym on Pacific

Avenue. His gym eventually spread to more than five hundred locations in twenty-six countries and became the most famous fitness franchise in the world. These neighboring outdoor-indoor facilities created the arresting image and expression of "Venice Beach" during the 1970s.

When leading fitness promoter Joe Weider moved his operations from New Jersey to Los Angeles in 1972, the reputation of this new Muscle Beach was enhanced by photographs in his magazine of such physique stars as Arnold Schwarzenegger, Franco Columbu, and Lou Ferrigno training there. The most notable icon, however, was Dave Draper, the "Blond Bomber," who co-starred (with Tony Curtis, Claudia Cardinale, and Sharon Tate) in the 1967 film *Don't Make Waves*, based on Ira Wiallach's novel *Muscle Beach*. Muscle magazine photos of Draper and others frolicking in the sun, sand, and surf and surrounded by beves of beautiful women inspired a generation of bodybuilders, many of whom moved to Venice to take part in the California dream.

Bodybuilding's Mecca

This phenomenon had a direct impact on the fitness boom that swept the United States during the late 1970s. Despite the growth of many other bodybuilding centers during the next two decades, attention remained focused on Venice. After selling his original franchise, Joe Gold established his first World Gym International in 1987 on Main Street between Santa Monica and Venice. It eventually blossomed into 280 gyms worldwide with headquarters in the adjacent community of Marina del Rey. The most important center for bodybuilders, however, remains at the Gold's Gym located at Hampton and Sunset in Venice, where the champions train and pose for photographers.

Venice Beach also remains a sentimental source of inspiration. True to its origins, a carnival-like atmosphere prevails on the mile-long Ocean Front Walk where cyclists, joggers, and in-line skaters mingle with jugglers, acrobats, tarot card readers, musicians, bikini-clad women, and gawking tourists—a kaleidoscope of humanity that one would expect to find in southern California. The

weight pen, too, is still there, reconstructed in 1986 with a stage to conduct bodybuilding and powerlifting competitions. At the same time, in recognition of a tradition stretching back a half-century, the city formally designated the venue “Muscle Beach Venice.”

Violence

Violence in sport is not a new area of study. What is new is the systemization of the research being conducted on violence, both on and off the field of play.

Sport used to be about games; not any more. These days no sport is immune from the effects of violent behavior, even those we refer to as “country-club” sports (e.g., tennis, golf, and figure skating). Violence now extends beyond the playing field or the court into real life. Baylor men's basketball player Carlton Dotson has been accused of killing Patrick Dennehy, his teammate and roommate. And NHL hockey player Mike Danton was involved in a failed murder-for-hire plot. These scenarios are real, and they and many other events have begun to impact the institution of sport in ways that no athlete, professional or amateur, who played in the 1940s, 1950s, or even as late as the 1970s could have imagined.

Violence, Sport, and a Critical Understanding

The list of athletes involved in some form of violence or another is long and growing longer. Nor is violence in sport limited to current and former professional athletes; in fact, violence perpetrated by athletes begins early on, often in high school. Coaches and fans, as well, have been a factor in recent years, so that violence is certainly not limited to the court or playing field.

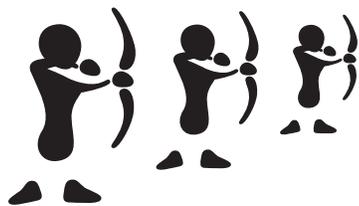

CONTRIBUTIONS OF ATHLETES TO SOCIETY

No one could deny that many athletes do good works. In college, some volunteer at local human-resource agencies or work with troubled kids, and as professionals, many donate food to homeless shelters or money to charities. Some speak out on the travails of smoking, drinking, and drug use as an underage problem in America. A few athletes are also socially conscious and will address issues of poverty and inadequate healthcare for the elderly.

Jeanette Lee, a professional pool player, more commonly known as the “Black Widow,” is currently the national spokeswoman for the Scoliosis Association. In addition, the Jeanette Lee Foundation raises money to help create more public awareness about this disease and the need for more physical therapy programs and scoliosis research.

Emmitt Smith, a professional athlete well known for his football achievements, is becoming equally recognized for his contributions to community services. To date Smith has raised over \$350,000 for charity by auctioning game-worn items and artifacts from his football career. He put it thus: “Football has given me an extraordinary opportunity. This is just one way that I can continue to give back. I have always believed that I have a responsibility to make an impact beyond the football field.” Troy Aikman, former Dallas Cowboys football star, started the Starbright Foundation, which establishes Troy Aikman End Zone playrooms in children's hospitals around the country.

These accomplishments are admirable and should always be recognized as athletes giving back to their re-

spective communities. However, increasingly, some athletes are bringing violence into the very communities they inhabit and sometimes into the communities they visit in sport competitions.

Violence in High School Sport

When most adults today were growing up, violence associated with high school sport involved fistfights between local rivals after a football game or the occasional scuffle between players.

GLEN RIDGE RAPE

Today, however, violence in high school sport involves assault and even rape. Incidents can take place both on and off the field and can sometimes affect nonathletes as well. One incident that received national and international media attention took place in the middle-class suburb of Glen Ridge, New Jersey. In 1989 three high school athletes, all white males, gang raped a mentally retarded seventeen-year-old white female in front of a group of their friends, using a baseball bat and a broom handle. Much of the media attention at the time focused on the culture in the school's athletic program, one which was said not to have valued or required decent character and behavior on the part of its male athletes.

This incident is one of many that detail how young males sometimes assault and commit sexual violence against females (Hattery 2001) with few consequences. The Glen Ridge perpetrators, when convicted, appealed and were out on bail for four years until they were finally sent to prison in 1997. Another aspect of this horrific crime that is in some ways even more disturbing is that there were some ten others who witnessed the crime and did nothing to stop it.

The high school athletes in Glen Ridge that day were participating in what is for some young men a sort of ritual, a twisted rite of passage into what they see as adulthood. The culture of their high school athletic program gave the impression that such behaviors as talking about and carrying out sexually violent acts against women, if not acceptable, were at the very least looked

upon as something that carried no responsibility and had no consequences.

SPUR POSSE

Another incident similar to the Glen Ridge case took place in 1993 in Lakewood, California, a town where the Youth Sports Hall of Fame is not at the high school, not at City Hall, but in the local McDonald's.

In the Lakewood case, teenage male athletes from a street sex gang that went by the name of "Spur Posse" made use of their athletic popularity in high school to seduce female classmates. When done, they passed these girls around for sex and then publicly bragged about their conquests. The news of their exploits sent shock waves across the community and the nation. In a misguided show of support, family members, mothers, girlfriends, and supporters from the community came forth to defend these young males. Dottie Belman, mother of Kristopher Belman, a member of the Spur Posse, together with her husband Donald, served the Lakewood community as coaches of Little League and Pop Warner football, and Dottie herself was a "team mother." She says:

They would make a home run or a touchdown and I held my head high. We were reliving our past. We'd walk into Little League and we were hot stuff. I'd go to Von's and people would come up to me and say, "Your kids are great." I was so proud. Now I go to Von's at 5 a.m. in disguise. I've been Mother of the Year. I've sacrificed everything for my kids. Now I feel like I have to defend my honor (Didion 1993, 55).

Dottie and Donald Belman and a host of other Lakewood parents and residents blamed the girls who were involved for the boys' troubles. It was argued that the girls were "loose"—as Donald Belman said on national television, they had to be, for these girls even had various body parts tattooed. And it was even suggested that perhaps the girls tricked the boys into the sexually aggressive behavior that had transpired. Accepted behavior? Socially approved behavior? The message is yes. The fact that much of the outcry in Lakewood was

against the girls who stepped forward to complain about this behavior speaks volumes about how Americans still view male/female relationships and roles in this country. The messages sent to young males are quite clear: predatory sexual behavior carries with it no responsibility and no consequences. Sometimes it can even bestow bragging rights. The escalation in irrational violent behavior among young males is a symptom of the growing tendency in sport programs to condone violence, or at least to “look the other way.”

Violence in Intercollegiate Sport

When the essence of life is to “keep up with the Joneses,” social problems inevitably arise as a result of this chase. Repercussions of this uniquely American rat race are manifest from the available data on individuals and families living beyond their means to the numbers on home foreclosures and bankruptcy.

With the need to win becoming the driving force in athletics, we are seeing the recruitment of student athletes from places as diverse as Riker’s Island (the world’s most populous penal colony) and so-called prep schools that have no academic standing whatsoever.

UNIVERSITY OF ALABAMA INCIDENT

In a college version of the Glen Ridge and Lakewood crimes, a 14-year-old female child prodigy who was attending the University of Alabama, Birmingham, was kidnapped and held as the sex slave of the basketball and football teams for close to a full semester. This was a crime involving 25 student athletes. Not only was the young girl used as a sex slave while living in the college dormitory, but she was turned into a drug addict as well.

BAYLOR MURDER

One case that stands out as a prime example of college athletic programs out of control—crossing the line into lawbreaking behavior—is the 2003 murder of Baylor basketball player Patrick Dennehy, the arrest of his former roommate and teammate, and the allegation that head basketball coach Dave Bliss told his players to lie to the FBI agents investigating the homicide.

SPORT–SELF-PROMOTIONAL SHOWMANSHIP SYNDROME

One factor in the emergence of lawbreaking behavior in athletes is the system of privilege that the institutions, the student athletes, and the coaches have created that takes them away from the concept of “team” and moves them deeper into what the French sociologist Emile Durkheim describes in his research as “individualism.” Individualism can be defined as the Sport–Self-Promotional Showmanship Syndrome (S–SPSS).

S–SPSS also applies to the institutions that allow academic fraud and those that let faculty salaries lag and building maintenance deteriorate to the lowest levels, then use the funds to enter into the Division 1A athletic category. In other words, these institutions self-promote athletics above and beyond academics.

S–SPSS applies to coaches in the greed attached to their endorsement contracts, the television and radio shows, the automobiles for private use, game and even airline tickets for family and friends, and the use of institutional facilities for private gain (for example, summer camps).

Violence

William Hazlitt's "The Fight" (1822)

The extract below from this famous essay by English writer William Hazlitt graphically depicts the violence of a boxing match.

To see two men smashed to the ground, smeared with gore, stunned, senseless, the breath beaten out of their bodies; and then, before you recover from the shock, to see them rise up with new strength and courage, stand ready to inflict or receive mortal offense, and rush upon each other "like two clouds over the Caspian":—this is the high and heroic state of man! About the twelfth round it seemed as if it must have been over. Neate just then made a tremendous lunge, and hit Hickman full in the face. He hung suspended for a second or two, and then fell back, throwing his hands in the air, and with his face lifted up to the sky. All traces of life, of natural expression, were gone from him. His face was like a human skull, a death's head, spouting blood. The eyes were filled with blood, the nose streamed with blood, the mouth gaped blood. He was like a preternatural, spectral appearance, or like one of the figures in Dante's *Inferno*.

Yet he fought on after this for several rounds, still striking the first desperate blow, and Neate standing on the defensive, and using the same cautious guard to the last, as if he had still all his work to do; and it was not until the Gas-man was so stunned in the seventeenth or eighteenth round that his sense forsook him and he could not come to time, that the battle was declared over. When the Gas-man came to himself the first words he uttered were, "Where am I? What is the matter?" "Nothing is the matter, Tom,—you have lost the battle, but you are the bravest man alive." Neate instantly went up and shook him cordially by the hand, and seeing some old acquaintance, began to flourish with his fists, "Ah, you always said I couldn't fight—What do you think now?" But all in good humor, and without any appearance of arrogance; only it was evident that Bill Neate was pleased that he had won the fight. The carrier-pigeons now mounted into the air, and one of them flew with the news of her husband's victory to the bosom of Mrs. Neate. Alas for Mrs. Hickman!

For the student athlete, it's about trying to get as much playing time as possible, hogging the ball in games, victory celebrations that come with every score, the end-zone dances, and drawing attention to oneself. Even the venerable Florida Seminoles coach Bobby Bowden feels that because, "We give them this, we give them that," it is no wonder they focus on themselves.

This system of privilege for some athletes over others often leads to jealousies on teams and in the end can result in a loss of focus on the overall success of the team. Because this syndrome involves giving one athlete something that another doesn't have, all for the purpose of winning games, sometimes it's hard for student athletes and their coaches to discern right from wrong.

Violence in Professional Sport

In recent years, violence has been on the rise in professional sport; athletes engage in violence both on and off the field of competition.

KERMIT WASHINGTON

On the evening of Friday, 9 December 1977, the Los Angeles Lakers played the Houston Rockets in Houston. Few remember who even won the game, but the events that occurred in the third quarter are forever etched in professional basketball history (Goldpaper 1977).

Laker forward Kermit Washington was struggling for a loose ball while running up court when Houston player Kevin Kunnert got into a shoving match with Washington. Washington (six foot eight and 230 pounds), seeing from the corner of his eye a Houston Rockets player heading in his direction, turned and landed a right cross to the jaw of Houston player Rudy Tomjanovich. The rest is history. NBA Commissioner Larry O'Brien suspended Washington for 60 days (at a cost of \$50,000) and fined him an unprecedented amount of money for the time, \$10,000.

Tomjanovich, a forward for the Rockets, was sent to the hospital for 15 days with a broken jaw, fractured skull,

broken nose, cracked eye socket, and a ruined career. Lisa Olson, writing for the New York *Daily News* says:

Tomjanovich was felled in one punch, his skull and cheekbone fractured, his jaw and nose sinking back into his head like bloody pulps. Abdul-Jabbar said it sounded like a watermelon being dropped on cement.

According to sport writer John Feinstein (2002), the punch thrown by Washington changed the way the National Basketball Association handled on-court violence. Fights did break out prior to the Tomjanovich-Washington fight. Because Washington's punch to the face of Tomjanovich was so violent, the NBA took much more severe measures in punishing out-of-control players. Washington's fine and suspension, for example, was unheard of prior to the fight.

LATRELL SPREWELL

The job of a coach is to make sure that the athletes on his team train hard and win games. Unfortunately, the stresses of such an environment combined with personality clashes or harassing behavior can lead to violence.

Professional basketball player Latrell Sprewell (of the Golden State Warriors) crossed the line and is now paying the price. In a fit of anger because his coach, P. J. Carlesimo, was "in his face," Sprewell choked Carlesimo in front of other players during a practice session on 1 December 1997. Phil Taylor of *Sports Illustrated* put it thus:

When he assaulted and threatened to kill his coach, P. J. Carlesimo, . . . he committed one of the most outrageous acts on the court or field of play that American professional sports in the modern era has known, and that act will surely follow him for the rest of his life.

Almost anywhere except in the NBA, says *New York Times* columnist Ira Berkow, such an act would have meant immediate dismissal. Soon after the incident Sprewell was stripped of his four-year \$32 million contract (and a loss of all endorsement revenues estimated at \$500,000 with Converse). Furthermore, Commis-

sioner David Stern originally suspended Sprewell for a year from the NBA. But on 3 March, 1998, Sprewell was reinstated to the Warriors after lodging a grievance against the team and the league that was favorably heard by arbitrator John Feerick, dean of the Fordham University Law School.

MIKE TYSON

On Saturday, 28 June 1997, in a much-anticipated and -touted World Boxing Association heavyweight title fight, "Iron" Mike Tyson twice bit the ear of his opponent, the then heavyweight champion, Evander Holyfield. This behavior was an all-time low even for professional boxing, inflicted before an international audience on pay-per-view television.

VIOLENCE OUTSIDE THE PLAYING FIELD

Uncivil and violent behavior is not confined to the playing field or court, of course. The behavior of athletes and fans can be just as brutal outside the arena as it is inside.

On 30 April 1993, Monica Seles, one of the world's top female tennis players, was stabbed while playing in a tournament in Hamburg, Germany. Gunther Parche, the assailant, was apparently a fanatic fan of Stephanie Graf and wanted Seles out of the competition. For his crime, Parche was given a two-year suspended sentence. At the 1994 winter Olympic trials, Nancy Kerrigan, the top contender on the U.S. team, was attacked, clubbed in the leg just weeks before the Olympics. Tonya Harding, who was the closest contender to Kerrigan, was later convicted of hiring her ex-boyfriend to club Kerrigan at the trials, allegedly to eliminate her from the competition and ensure Harding's win. Kerrigan was able to recover in time for the Olympics and took a silver medal. Harding finished in eighth place and eventually served time in jail for her involvement in the crime.

TRADITION OF CIVILITY BEING REPLACED

There has always existed a tradition of *civility* in sport: it manifests itself in the form of fair play—by strict

Violence

Mud Battles among the Blackfoot of Canada

The most primitive sport was a mud battle fought by young tribesmen. Sides were picked, and the two bands of Indian boys would repair to a large flat under their respective leaders, each boy armed with a long pliable switch about six feet long and a big ball of mud weighing about 20 pounds. Here the opposing leaders would take up their positions, a distance of about 75 yards separating them. Each fighter would then take a small piece of mud weighing about four ounces and press it hard on the tip of his switch. The flexibility of a switch would send these mud pellets flying with terrific force and they would burn and leave bruises on the body of anyone unfortunate enough to be struck by them. A battle of this kind would rage sometimes for hours, mud whistling through the air accompanied by loud yells from those in the casualty list. After the cessation of hostilities everyone was happy, despite the sore spots and numerous bruises discernable on the bodies of the combatants.

definition, conformity to established rules. But fair play also involves such ideals as treating others with respect and courtesy, being a good loser, accepting responsibility for one's own mistakes in a mature way.

There is another tradition establishing itself in the arena of modern sport—openly avowed, assiduously cultivated, and zealously carried out—that was succinctly defined in the statement of Coach Woody Hayes that, “I’d rather die a winner than a loser,” and was nicely demonstrated in the testimony of ex-professional lineman Alex Karras that, “I hated everyone on the football field, and my personality would change drastically when I got out there . . . I had a license to kill for sixty minutes a week. My opponents were all fair game, and when I got off the field I had no regrets. It was like going totally insane.”

What happened to the tradition of civility and fair play, on the field and off? Latrell Sprewell in a fit of anger placed his hands around the neck of his coach and choked him. What does an act like this symbolize, even if the coach went beyond the normal boundaries in imposing stricter practice requirements? In many office environments, employers overload workers all the time. Yet most employees know that an action such as strangling their supervisors would result in at the very least termination, if not criminal prosecution.

Should we assume that courtesy among fans, getting an autograph from a professional athlete without having to pay for it, or attending a game without having beer dumped down your shirt only remain as figments of the sport sociological imagination? In answering this question we ultimately bump up against the larger one of what we stand for as a society and as athletes entering the twenty-first century.

Francis Fukuyama in his immensely important book *Trust* (1995) demonstrates that when the community ethos dissolves and folkways disappear, citizens are no longer trustful of each other. As this is happening in American society, says Fukuyama, we begin to see the rise of violent crime and civil litigation; the breakdown of family structure; the decline of a wide range of intermediate social structures such as neighborhoods, churches, unions, clubs, and charities; and the general sense among Americans of a lack of shared values and community with those around them.

ROLE OF MALE DOMINANCE

In her book *The Stronger Women Get, the More Men Love Football*, Mariah Burton Nelson explores the connection between the growing power and strength of women and male resistance to participation by women in athletics. The furor over Title IX is a case in point. As Burton demonstrates, male resistance to female athletic participation can be empirically validated simply looking at the slow pace of compliance with Title IX. This resistance can sometimes take the form of violence.

Volleyball

Outlook

The violent, hyperaggressive, uncivil behavior we see in sport today is an issue that involves society at large. What we tolerate in the sports arena reflects what we as a society find acceptable. And because of the high status and prestige placed upon athletes at all levels but especially in professional sport, we can expect that the huge sums of money that go to the owners of franchises, to the equipment outfitters, to the moguls who own and control the media, to the concessionaires, to the elected officials who run cities where teams play, and to the players themselves will drive individualism and greed to the extreme, and violence will continue.

The media have come to play an enormously important role in sports. By bringing evidence of the growing lack of civility in sport and the attendant rise in violence into our living rooms and by seeming to glorify such behavior, the media not only report the stories, they are a contributing factor in the perpetuation of violence.

Only when we—the athletes, the fans, the media, the coaches, everyone involved in sport—decide that the escalating violence must come to an end will civility again return to sport.

Volleyball is a close cousin of basketball: Both sports were created in Massachusetts, and both were created by men who worked for the Young Men's Christian Association (YMCA). Although at the recreational level volleyball maintains a universal appeal and an intuitive structure of play, at its most competitive level it has increasingly emphasized ball handling and specialization of players. The sport was introduced into the Pan American Games in 1955 at Mexico City and into the Olympic Games in 1964 at Tokyo.

Origins

William G. Morgan invented volleyball in 1895. He was physical education director of the YMCA in Holyoke, Massachusetts, and a former student of James Naismith of Springfield, Massachusetts, who invented basketball. Basketball and volleyball were, in fact, invented to be simple, diverting indoor winter sports that could augment the austere regimen of gymnastic exercises that made up the greater part of physical education in the United States during the late nineteenth century. Neither man anticipated the popularity and competitiveness of his creation.

Morgan invented volleyball for his clients at the YMCA: businessmen who were, for the most part, middle-aged, unathletic, and not up to the challenges of basketball. The original version of volleyball was played by two teams who pushed a slow, oversized ball back and forth over a net that was only a few inches higher than some of the players.

Because Morgan had originally used a badminton (or lawn tennis) net for his new sport, he at first called it *mintonette*, but its rules were derived mainly from handball and baseball. The influence of the latter is seen in early volleyball rules, which stipulated that the sport be played in nine "innings," with "three outs" allowed before a team lost the serve. In 1896, while watching a demonstration of the sport, Dr. Alfred Halstead of

An indoor volleyball match at the Pan American Games.

F. H. Brown, yet another YMCA organizer, introduced volleyball in Japan in 1913. Volleyball quickly became popular, and in 1921 the Japanese Imperial Volleyball Association was formed. The YMCA was active in other areas of Asia as well, notably India and China. Volleyball also became popular in the Philippines for a while, and it was played in Manila at the Far Eastern Games organized by the international YMCA in 1913.

During and after World War I many U.S. soldiers played volleyball in Europe, partly because many YMCA instructors had been inducted into the Army as physical education instructors. Many YMCA and YWCA organizers stayed on in Europe after the war, and volleyball grew in popularity through the 1920s, particularly in France, where many volleyball clubs were formed. The Soviets, too, became interested in volleyball, and the Soviets and their client states were to become, with Japan, major competitive players.

In 1931 the first international volleyball tournament in Europe was held in Paris. The Soviets won first place against their most serious opponents, the Estonian team, whose country at that time had only nine years of independence left before it was annexed by the Soviet Union.

Volleyball had become popular by 1920 in Central and South America, particularly in Peru and Brazil. Both countries would become top volleyball competitors.

Although the French had attempted to establish an international volleyball organization in 1936, only in 1946 was the International Volleyball Federation formed. The federation's most active original members were France on the one hand and the Soviet Union, Yugoslavia, Poland, and Czechoslovakia—all Communist nations—on the other. The United States showed no interest in elite volleyball, and the predominance of Communist nations in elite play ensured that the sport would be played in a highly politicized atmosphere during the next two decades. For example, during the 1949 world championships in Prague, Czechoslovakia, eleven countries competed, and the Soviets won both men's and women's titles. The United States did not bother to

Springfield College—a YMCA colleague of Morgan—suggested that the word *volleyball* better suits the sport's nature of pushing the ball back and forth over the net. The new word was quickly accepted.

Development

Volleyball, like basketball, spread quickly and for similar reasons: Both sports were simple in design and featured clear and intuitively appealing goals. Moreover, the YMCA and the Young Women's Christian Association (YWCA), both of which had chapters throughout the world, promoted both sports. Thus, volleyball, like basketball, initially moved across the globe in aid of a pragmatic and "muscular" Christianity.

The first national championship in the United States was played in 1922 in New York City. Twenty-three teams—most from no farther west than Chicago—competed at the Brooklyn Central YMCA gymnasium. The Pittsburgh team won. The Volleyball Rules Committee of the YMCA officiated this championship and subsequent championships until 1928, when the United States Volleyball Association (USVBA) was formed.

send a team. Yugoslavia did not send a team, either, although this fact had nothing to do with athletic ability or interest. Indeed, the Yugoslavians had developed considerable volleyball talent, but the Soviets wanted to send the Yugoslavians a political message via the Soviets' Czechoslovakian clients. In the end the "renegade" Yugoslavians—whose maverick leader Marshal Tito had offended socialist orthodoxy—were denied

visas to travel to the championships. Sending another such message in 1963, the Soviet bloc boycotted an international volleyball event in Albania—another "unorthodox" state. At the Albanian event the only teams were from Albania, China, North Korea, and Romania—all socialist countries that had either broken with the Soviets ideologically or were considering doing so.

During this period the only international volleyball played by the United States was a "match" in 1955 between the staffs of the U.S. and Soviet embassies in the Hague in the Netherlands. According to the *New York Times*, the Soviets—who had proposed the match—"beat the United States on the volleyball court this afternoon in a setting redolent of the spirit of coexistence, cooperation and goodwill." Perhaps one can explain the U.S. loss by the fact that volleyball had been intended as a recreation and not as a seriously competitive sport.

In 1961 the International Olympic Committee voted volleyball into the Olympic Games. The Soviets and their clients and the Japanese supported this vote, and, at the 1964 games in Tokyo the Japanese, Soviet, Polish, and Czech teams were the main players. The Soviets edged out the Czechs for the gold medal in the men's competition; the Czech men won silver, and the Japanese men won bronze. However, the Japanese

women's team played the most exciting volleyball. In fact, one can fairly argue that the Japanese women's team revolutionized volleyball. As one observer wrote, the Japanese women played "with a ferocity and precision that have made almost a new game of a familiar playground pastime." They were never in any danger, losing only one set (to the Polish team), and losing that only because the coach, Daimatsu Hirofumi, had taken some of his better players out of the game when he felt that the Soviet team was learning too much about his team's tactics.

The Japanese women's team was formed in 1953 and sponsored by the Nichibo Spinning Mills near Osaka. Hirofumi, who was the mills' manager in charge of office supplies procurement, drove his team hard: The team practiced six hours a day seven days a week all year. He had a hot temper, and insults and occasional kicks were part of his training. Although some people criticized such training, Hirofumi's 1964 team performed splendidly. One headline captures the surprise that attended the Japanese victory, at least in the United States, as well as a lingering Cold War atmosphere: "Celebrated Team of Office Girls Subdues Russians."

Of special interest to other teams was the Japanese version of the rolling retrieve, which required a player to fall with gymnastic precision and power to save an

incoming ball that could be up to 3 meters away. The player then recovered with grace and speed to rejoin the ongoing play. Since the 1964 Tokyo games, volleyball has been a hard-driving “power” sport in the international arena.

At the first Olympic Games to feature volleyball, the United States finished ninth. At the 1968 Olympic Games at Mexico City, neither the men’s team nor the women’s team of the United States made a very good showing—the Soviets, Japanese, Poles, and Czechs dominated—and U.S. teams did not even qualify for the Olympics again until 1984. The first U.S. national training center for volleyball, near Houston, Texas, was dedicated to women’s volleyball—a rare case of a sport being led, in development and elite participation, by women. However, the U.S. men’s team won the gold medal at the 1984 Olympics; the women’s team won the silver; and the United States has since been a world power.

However, at the 2004 Olympics in Athens, Greece, Brazil and China tied for first place. Brazil won gold in men’s, China won gold in women’s. Russia, Italy, and Cuba finished in third place through fifth place, respectively.

Practice

Originally teams played volleyball over a net that was just 2 meters high, but that height has been raised several times. Now the height is 2.43 meters for men and 2.25 meters for women. The net is 1 meter deep and is stretched across the center of a court that measures 9.14 meters by 18.29 meters. The minimum ceiling height is 7 meters. The ball—first manufactured by Spaulding, the company that originally manufactured basketballs—weighs 250 to 280 grams and measures 38 to 69 centimeters in circumference.

Standard teams have six players (Morgan’s original rules allowed nine players). Each team is arrayed in two rows of three players: left, center, and right forwards and left, center, and right backs. Play begins after first serve is determined by the toss of a coin, and the right

back of one team serves the ball. The serve may be overhanded or underhanded; the player must serve within five seconds of assuming the serving stance, and the served ball must not touch the net. The goal of the receiving team is to return the ball to the opposite side of the net. Team members may handle the ball three times before the ball is returned, and, indeed, game strategy depends on such ball handling.

In the basic volleying process players must master a number of skills. The front line handles blocking. Players in the front line move to the place where they think the ball will be coming into their court and jump with hands outspread and arms overhead to block the ball. Timing is crucial, and often a beginner is coming back down to the ground just as the opponent’s ball flies over the net. Players must avoid body contact with the net, adding another level of challenge to mastering the block.

Should the block fail, receiving players, generally in the back court, use an underhanded stroke played close to the ground. This stroke is designed to “dig” the ball up and into play. The stroke may be two-handed or, if quick lateral movement toward the ball is required, one-handed. The goal is to save the ball and to put it into play for another team member, who may choose to “set” (pass) the ball toward a third team member. The third team member then attempts to “spike” the ball into the opposing team’s court. The set can be toward the forward ranks or toward the back, or even lateral. Much of the skill in setting consists of holding a posture that conceals the direction of the intended pass until the last possible moment.

The spike—one of the more dramatic offensive maneuvers—can be sent into the opposing court at speeds of more than 100 kilometers per hour, leaving opponents with little reaction time. The spike involves a jumping attack and an overhead smash down toward the opposite court. Quick reaction time is essential to execute a good spike: Should a player aim the spike down into the opponent’s front court area, thus risking a successful block, or spike it toward the back to defeat the “diggers”?

The team who is serving wins a point if the other team is unable to return the ball; if the serving team loses, a “side-out” occurs, and the other team takes the serve. The players on the team that scores a side-out rotate clockwise so that each player begins the new set playing from a new position. Players must be in their positions when the ball is served. However, after the serve they may move to any position on the court, introducing the possibility of specialization into a sport that was designed to be universal in terms of the skills required. Of course, the postserve movement of players is also a key factor in overall strategy.

The first team to score fifteen points wins, as long as the other team trails by at least two points. If the trailing team is within one point, the game continues until the two-point spread is reached. A match consists of five games and is won with three games; three-game matches are sometimes played. Teams change sides after each game.

Beach volleyball—although played by many people purely as a form of recreation and by elite volleyball players as a form of training—has developed its own rules, teams, and a professional tour with corporate sponsorship. Teams may be of two or four players, male or female. The cushioning effect of beach sand encourages players to attempt saving dives that would be impossible on a hard gymnasium floor, and jumping for blocks and spiking are more difficult than in standard volleyball.

Volleyball, Beach

Beach volleyball is similar to indoor volleyball in its structure and rules of play. However, unlike indoor volleyball, beach volleyball has no coaches to facilitate play, and a player has only one teammate to rely on.

Beach volleyball began during the 1920s on the beaches of southern California and Europe. By the 1950s and 1960s tournaments were held in the United States, Brazil, Canada, and France, and in other parts of Europe. During the 1960s President John F. Kennedy attended the first official beach volleyball event at Sorrento Beach in Los Angeles. During the 1990s the Federation Internationale de Volleyball (FIVB), with 214 national federations, began to govern international beach volleyball and volleyball. The FIVB World Tour, formerly known as the “World Championship Series,” is the official international tour. The World Tour grew quickly since it began in 1992, and the groundwork for this growth was laid in the sands of sunny southern California.

Rules and Play

A distinct feature of beach volleyball is the formation of teams. Unlike other sports teams, beach volleyball teams are not contracted for a specified length of time. Players can switch teams as often as they like. Many times these switches are because of injuries, other times because of differences between teammates. Players can compete with one teammate one week and another teammate the next. Playing on any team of only two people is challenging, and beach volleyball is no exception. Maintaining partnerships is not easy. The relationship between the two players can become complicated and can interfere with the ability of the players to communicate and work together. This arrangement makes beach volleyball an interesting combination of a team sport and an individual sport.

awarded a point; if the receiving team wins the rally, a “side-out” is called, and the receiving team wins the right to serve. When a team “regains” service, the serve alternates between players from that team.

Players are allowed to move freely within their court area; no distinction is made between the front court and back court. Because no center line exists under the net, players can go under the net as long as they do not interfere with their opponents. Players

do not “rotate” from one position to the other as in indoor volleyball. During a rally the ball can be contacted by any part of the body. Three is the maximum number of contacts allowed on each side. A block counts as a contact. The usual sequence of contacts is pass (forearm pass or dig), set (volley or overhand pass), and attack (hit or spike) over the net. The attack cannot be completed with the use of an open-handed tip. If the ball is set, or volleyed over the net to the opponents, it must be set perpendicular to the shoulders of the player setting the ball. No substitution of players is allowed. During each match each team is allowed two timeouts of thirty seconds. Teams also switch sides every multiple of five points (4–1, 6–4, etc.) with a thirty-second rest between side changes.

A variety of scoring systems is used. The standard scoring system on the FIVB World Tour is a one-set match played to fifteen points, with at least a two-point lead required for victory, to a maximum of seventeen points (victory by one point is possible at 17–16). Teams can score points only when they are serving.

Play is between two teams of two players. A rally is initiated by a serve from anywhere in the area bounded by the 9-meter end of a team’s playing court (the team’s baseline) and the extensions of the two 18-meter sidelines of the court. Each player gets only one attempt to serve the ball, and a “net” serve is a fault. Common types of serves are spike serves, overhand float serves, underhand sky serves, and standing topspin serves. The server continues to serve until the opponent wins the rally. If the serving team wins the rally, that team is

Net Gains for Women

Women first appeared at beach volleyball competitions as “beauty contestants,” not as competitors. However, by the 1970s women’s beach volleyball competitions

began to become popular. By the 1980s the United States and Australia began holding national tournaments for women; after beach volleyball became an Olympic sport in 1996, many countries provided competitive opportunities for women.

Women had played organized beach volleyball in southern California since the 1950s. In fact, the United States was one of the first countries to develop a women's professional tour and a women's players association—the Women's Professional Volleyball Association (WPVA).

In 1987 the WPVA tour began with ten events and \$48,900 in total prize money; the top player earned more than eight thousand dollars. Because of such minimal earning potential, many athletes maintained a regular job while participating in weekend tournaments. By 1996 the WPVA tour had grown to fifteen events with more than \$900,000 in prize money; the top player earned more than \$88,000. However, in 1998 the WPVA and its tour began to struggle, and for the first time in more than ten years no tour was sanctioned by the WPVA. The WPVA was dissolved in 1998.

The formation of the WPVA and its tour and the popularity of the sport in the United States played a major role in the development of beach volleyball worldwide. Organizers in the United States also developed a national tour devoted to four-player team volleyball. Four-versus-four events were nationally televised and were sponsored by large corporations, helping to increase the exposure of beach volleyball. Because of the increased media exposure, some athletes who competed on this tour grew in popularity and began to promote beach volleyball outside of competitions. For example, Gabrielle Reese not only began writing magazine articles, but also hosted television shows for the MTV (Music Television) cable channel.

The WPVA competitions in the United States drew many international players who came to develop their skills. For example, Jackie Silva, an Olympic gold medalist in Atlanta, Georgia, in 1996, played on the WPVA tour from 1987 to 1991.

In 1992 the FIVB realized that providing opportunities for women as well as men was essential for global devel-

opment of beach volleyball and its acceptance by the Olympic community. Thus, 1992–1993 was the inaugural season for international women's beach volleyball. The World Tour had two stops, a purse of \$100,000, and more than thirty athletes representing eight countries. By 1998 the World Tour had nine stops, more than \$1.4 million in prize money—with women and men receiving equal prize money in each event, and more than three hundred athletes representing more than thirty countries.

Beach volleyball players, like so many other athletes, were now earning money from advertising. Players could advertise their own sponsors on their competition suits, hats or visors, and washable tattoos. Players could make a career out of playing beach volleyball. In 2002 Karch Kiraly of the United States became the first beach volleyball player to earn \$3 million in prize money. In 2002 he also became the oldest player to win a professional domestic beach volleyball tournament at the age of forty-one.

Considering the importance of the WPVA World Tour in the development of women's beach volleyball, one should not be surprised that U.S. women set the standards during the early years of the FIVB World Tour. The first beach volleyball event for women sanctioned by the FIVB was played in 1992 at the Olympic Year Tournament in Almeira, Spain. The winners were Karolyn Kirby and Nancy Reno of the United States. This team went on to win the second FIVB women's event held in Rio de Janeiro, Brazil, in 1993, and each player has won numerous events since then.

Since the beginning of the FIVB World Tour, Brazilian women have competed almost as well as U.S. women. From the first event in 1992 to the end of the 1998 season the FIVB had sanctioned fifty World Tour events. The United States won fifteen of the first twenty-five events (1992–1996), and Brazil won ten. Australia was the first country to consistently join Brazil and United States at the top of the sport.

Other nations began to challenge Brazil and the United States by breaking into the top four places at an FIVB World Tour event during the 1994–1995 season. The Japanese team of Sachiko Fujita and Yukiko Taka-

hashi finished fourth at Osaka, Japan. Takahashi has finished in the top four places at an FIVB World Tour event three times, including one silver medal. Beate Buhler and Danja Musch of Germany won the bronze medal at the Brisbane, Australia, event in 1995. Thereafter, Musch finished in the top four at an FIVB World Tour event seven times, with three silver medals and one bronze.

Beach volleyball made its first appearance in multi-sport international games at the 1994 Goodwill Games in St. Petersburg, Russia. Karolyn Kirby and Liz Masakayan of the United States won the gold medal by defeating Monica Rodrigues and Adriana Samuel of Brazil.

At the first Olympic beach volleyball match at the 1996 Olympics in Atlanta, Georgia, Brigitte Lesage and Anabelle Prawerman of France played Mayra Huerta Hernandez and Velia Eguiluz Soto of Mexico before more than nine thousand spectators. In July, Jackie Silva and Sandra Pires of Brazil made history by winning the first-ever Olympic gold medal in beach volleyball, defeating fellow Brazilians Monica Rodrigues and Adriana Samuel. The gold medal won by Silva and Pires was also Brazil's first Olympic gold medal in a women's sport. Natalie Cook and Kerri-Ann Pottharst of Australia won the bronze medal by defeating Linda Hanley and Barbra Fontana from the United States.

At the 2001 Goodwill Games in Brisbane, Australia, featuring the world's sixteen best men's and women's teams, the men's medalists were Jose Loiola and Ricardo Santos (Brazil), gold; Martin Conde and Eduardo Martinez (Argentina), silver; and Stein Metzger and Kevin Wong (United States), bronze. The women's medalists were Sandra Pires and Tatiana Minello (Brazil), gold; Adriana Behar and Shelda Bede (Brazil), silver; and Pauline Manser and Kerri-Ann Pottharst (Australia) and Elaine Youngs and Barbra Fontana (United States), bronze.

At the 2004 Summer Olympics in Athens, Greece, the Ricardo-Emanuel team of Brazil won a gold medal for men's beach volleyball; the Walsh-May team of the United States won a gold medal for women's beach volleyball.

Wakeboarding

Wakeboarding—a sport that combines surfing, water skiing, skateboarding, and snowboarding—began in 1985 when California surfer Tony Finn created a board called a “Skurfer” by combining a water ski and a short surfboard.

Finn’s creation allowed a wakeboarder—or “rider”—to “freeboard” or “skurf,” performing surfing-like moves on the board while being towed in the wave—or wake—behind a boat. Two of Finn’s friends suggested that he add foot straps to the board to allow riders more freedom of movement. Water ski company owner Herb O’Brien eventually joined with surfboard shapers to create a wakeboard that was more like a surfboard.

The “modern” wakeboard has a symmetrical front-to-back shape and a “twin tail” design—one each in the front and back underneath the board—to allow a more balanced position whether the wakeboarder is riding forward or backward.

Rules and Play

Wakeboarders can perform a variety of flips, turns, and spins called “tricks,” with some riders going as high as 7 meters into the air. Wakeboarding competitions began to develop in 1990 when Jimmy Redmon founded the World Wakeboard Association (WWA), the sport’s world governing body. World Sports & Marketing, a sports promotion and event organizer company, began to sponsor professional wakeboarding events in 1992. Professional wakeboarders can compete in numerous

events today, including the World Wakeboard Championships, the Pro Wakeboard Series, and the X Games (which consist of various so-called extreme sports). Amateur riders can participate in pro-am and other local events at which clinics are sometimes offered in conjunction with competitions.

Women and Wakeboarding

Although men and women compete in the same competitions, they are scored and ranked separately. The professional women's wakeboarding field includes competitors ranging from teenagers to riders in their mid-twenties. Tara Hamilton, a Florida high school student, competed in gymnastics for eight years before she took up wakeboarding. Training with male wakeboarder

Darin Shapiro, Hamilton was ranked among the top women wakeboarders in the world just a few months after she began the sport.

During the 1998 X Games in San Diego, California, silver medalist and first-time participant Dana Preble performed the first Air Raley by a woman. The Air Raley is a trick that consists of a rider hitting the wake, swinging the wakeboard and body head over heels to cross the wake in the air, and landing on the opposite side of the wake.

Competition at the Top

The World Wakeboard Association in 2004 ranked Andrew Adkison of the United States first in the world among men, Dallas Friday of the United States first in the world among women.

Weightlifting

Weightlifting is a sport in which heavy objects, usually barbells, are lifted in competition. It is also an exercise format designed to promote health, fitness, and proficiency in other sports. Since the late nineteenth century, weightlifting has achieved worldwide participation.

Early History

Competitive weightlifting can be traced to prehistoric times when ancient tribes used lifting heavy stones as a test of manhood, and stone-lifting is still done in strongman and strongwoman contests in Europe and America. Sustained interest in weightlifting activities dates from the Greeks, who not only hoisted stones and tossed the discus but also employed iron objects called halteres that resembled modern dumbbells in their games and training. By far the most famous Greek athlete was Milo of Crotona, a weightlifter and wrestler. Milo, a six-time Olympic champion, originated the idea of progressive resistance training by carrying a calf daily until it became a bull, thereby steadily increasing his strength.

Little weightlifting activity transpired during the Middle Ages, and not until the eighteenth century do records show iron weights (dumbbells) being used for light exercise. George Barker Windship, a Harvard-trained physician living in Boston in the 1850s, introduced heavy lifting. Windship incorporated various lifting devices to develop the lower torso and promote his philosophy, "Strength is Health." By the end of the century, strongmen such as Eugen Sandow (England and America), Arthur Saxon (Germany), George Hackenschmidt (Russia), Louis Uni (France), and Louis Cyr (Canada), were performing competitive feats of strength.

Weightlifting Becomes a Sport

The first official international weightlifting competition was held in London in 1891. Inspired by the Greek tradition, Pierre de Coubertin included weightlifting events in his 1896 revival of the Olympic games. The first

champions were Launceston Elliot (Great Britain) who did a one-hand jerk with 156 pounds (70.74 kg) and Viggo Jensen (Denmark) who did a two-hand jerk with 245 pounds (111.16 kg). Weightlifting was also included in the 1904 Olympics in St. Louis and in the 1906 intercalary games in Athens. Although world championships, largely made up of Europeans, occurred from 1903 to 1913, the sport was pursued in a haphazard manner, with relatively few competitions and no firm set of international rules and records. The outbreak of World War I stifled any further progress.

Then in 1920, Jules Rosset, president of the French federation, instigated the International Weightlifting Federation (Federation Haltérophile Internationale) to regulate and administer international competitions. This also was the occasion for weightlifting's return to the Olympics, which were staged in Antwerp. During the 1920s, the French, led by light-heavyweights Ernest Cadine and Charles Rigoulot, set the pace in international competition. The 1924 Paris Olympics marked the last time globe barbells were used. Plate-loading barbells then became standard, soon followed by bars with revolving (ball-bearing) sleeves to minimize friction as the athlete turned the bar while hoisting it. In 1928, the Germans returned to Olympic competition for the first time since the war, and the international federation adopted the press, snatch, and clean and jerk for use in all sanctioned competitions. These two-hand lifts (the Olympic lifts) remained the standard for the next forty-four years and essentially defined the sport.

The 1932 Los Angeles Olympics attracted relatively few weightlifting competitors, but it brought the first appearance by the United States in Olympic or world championships since 1904. Because of America's lackluster (third place) performance, Bob Hoffman of York, Pennsylvania, started recruiting and training young weightlifters and published *Strength & Health* magazine to promote Olympic lifting. Hoffman's lifters steadily improved during the 1930s with one of them, Tony Terlazzo, winning America's first gold medal at the 1936 (Berlin) Olympics. But the Germans, led by

Josef Manger and Rudolf Ismayr, and the Egyptians, under the great Khadar el Sayed Touni, dominated the decade. By the outbreak of World War II, weightlifting was recognized widely as a sport on the international, national, regional, and local levels, but it received far less acceptance as a means for developing health and fitness.

American Golden Age

Given the widespread devastation of European countries from the war, the United States emerged as the dominant weightlifting power, scoring a decisive victory over the Soviet Union at the 1946 world championships in Paris. Led by Hoffman and such great champions as John Davis, Tommy Kono, Pete George, and Norbert Schemansky, American lifters mounted a successful Cold War challenge to the Soviets and brought about a “golden age” of American weightlifting that lasted into the early 1960s. A climax occurred at the 1956 Olympics in Melbourne where Georgia heavyweight Paul Anderson again led the American team to victory over the Russians. So prodigious were Anderson’s feats of strength that he set a new standard for big men (being the first weightlifter to press 400 pounds (181.44 kg)). By universal consensus, the greatest weightlifter of all time was Kono, who won eleven national titles, six world championships, and one silver and two Olympic gold medals and set thirty-seven American, eight Pan American, seven Olympic, and twenty-six world records in three weight classes during his seventeen-year career (1948–1965).

Eventually, however, the Soviets, led by such standouts as Arcady Vorobiev, Yuri Vlasov, Leonid Zhabotinsky, and David Rigert, were beating Hoffman’s men with regularity, and such countries as Poland, Hungary, Japan, Cuba, and Bulgaria were coming to the fore. Most of the countries became competitive on the international level because of the introduction of vigorous (state-funded) nationalization programs. The greatest Asian lifter during the 1960s was Miyake Yoshinobu of Japan, who won three Olympic medals and six world titles and set twenty-five world records.

Agents of Change

By the 1960s, the sport was being affected by several ancillary developments. Because of the persistence of Hoffman and other promoters such as Peary Rader and Joe and Ben Weider, weightlifting was gaining a wider acceptance and was increasingly being employed to improve proficiency in other sports, particularly football, basketball, and baseball, but eventually even swimming, golf, tennis, and distance running, where flexibility and endurance were critical to success. On the other hand, the increased popularity of bodybuilding (physique) and powerlifting competitions during the 1960s seriously detracted from participation in Olympic weightlifting meets on all levels.

Another important change during this era was the internalization of the sport from simply training with barbells to the use of dietary supplements. Developed in the early 1950s by Irvin Johnson, a Chicago dietician and bodybuilding enthusiast, these products, often with a soy base, were designed to make more protein available for muscle growth and improve the weightlifter’s health and functioning of internal organs. Strength athletes started getting bigger and lifting more weight. Even more critical to performance was the introduction of anabolic steroids. First isolated in 1935 by Charles Kochakian, a University of Rochester graduate student, this drug was used on a limited basis in the 1940s to help wounded soldiers recuperate and in the 1950s by Russian weightlifters to fuel their victories in international competition. In the early 1960s, John Ziegler, an Olney, Maryland, physician, introduced steroids to American (York, Pennsylvania) lifters. During the next decade, their use spread to virtually all sports, and in all countries weightlifting totals and records soared. At the 1970 world championships in Columbus, Ohio, Russian superheavyweight Vasily Alexeev became the first man in history to clean and jerk more than 500 pounds (226.8 kg). From 1970 to 1977, the Russian giant broke eighty world records and eventually moved the clean and jerk mark up to 563 pounds (255.38 kg). Controversies surrounding steroids eventually led to their ban and the institution of drug testing by the International Olympic

Committee (IOC) at the 1976 Montreal Olympics. Weightlifters were stigmatized for steroid use in ensuing decades, but ergogenic drug abuse (from lack of testing) was far more prevalent in the sister sports of powerlifting and bodybuilding.

What contributed most to the relative decline of Olympic weightlifting, however, was a controversy over the execution of the overhead press, once the most popular of lifts and a legitimate test of upper body strength. Quite contrary to the rules, lifters were increasingly allowed to employ the legs and hips and an exaggerated backbend. Officiating became heavily mired in international politics, and the whole movement became a farce. At the 1972 Munich Olympics, the International Weightlifting Federation (IWF) made the momentous decision to eliminate the press as a competitive lift. Almost immediately Olympic weightlifting, despite its status as an Olympic sport and the growing public acceptance of weight training, began to decline in popularity, especially in the United States and Western Europe.

East European Dominance

In Eastern Europe and Cuba, however, the weightlifting tradition remained strong, and Bulgaria, a country of only about nine million people, began to replace Russia as the world's greatest lifting power. In the 1970s, Russia won 255 Olympic and world championship medals to Bulgaria's 150, but in the 1980s these totals were just 226 to 210 respectively. By 1989, Bulgaria held 14 of the world records to just 11 for Russia, and with the break-up of the Soviet Union in the early 1990s, Bulgaria became the dominant weightlifting power. Bulgaria's greatest weightlifter was Naim Suleimanov ("Pocket Hercules") who set his first world record at age fifteen but was prevented from entering the 1984 Los Angeles Olympics by Bulgaria's boycott. After defecting to Turkey at the 1986 World Cup Tournament in Australia, he became Naim Suleymanoglu and went on to win Olympic gold medals at Seoul, Barcelona, and Atlanta, the first weightlifter to win three in a row.

During this time, despite a windfall of \$656,000, surplus from the 1984 Olympics, and the establish-

ment of a first-rate national training facility in Colorado Springs, Colorado, American weightlifting continued its relative decline. At the 1995 world championships in Ghangzhou, China, for instance, the American team placed thirty-first, behind even Nauru, a Pacific island of only 10,000 people. So proficient did Bulgaria become at producing top-flight weightlifters that some of them were hired to become naturalized citizens and compete for other nations, such as Australia and Qatar, in international competition. The continued popularity of powerlifting and bodybuilding, lack of grassroots coaching and training facilities, and meager opportunities for commercial gain relative to other sports contributed to weightlifting's declining status in North America.

Reconstructing an International Order

That Olympic weightlifting retained a high degree of recognition elsewhere may be attributed partly to the stalwart leadership of Gottfried Schodl (Austria) and Tamás Aján (Hungary) in positions of IWF president and general secretary since the 1970s. Among their achievements was a substantial increase in the number of countries and athletes participating on all levels. The 1996 centennial Olympics in Atlanta attracted 100,000 spectators, the largest number in the history of the sport, each paying \$34. In 2003, 1,269 male weightlifters from 127 countries participated in IWF calendar events. Women's competitions, conducted on a regular basis since the late 1970s, also gained international status in 1987 with the first women's world championships in Daytona Beach, Florida. When women's weightlifting became an Olympic event for the first time at Sydney in 2000, Tara Nott, in the 48 kg class, became the first American to win an Olympic gold medal in weightlifting since bantamweight Chuck Vinci's victory at Rome in 1960. In 2003, a record 721 women from 95 countries participated in sanctioned international competitions.

Another leadership initiative has been an increased standardization of rules, officiating practices, and equipment. In 1993, the IWF implemented a more

rigorous drug-testing program that was complemented by a restructuring of weight classes and an abolition of all previous (presumably drug-induced) records. Not surprisingly, contest totals and world records dropped dramatically. In 2003, the IWF conducted 1,351 tests, with only 28 (2 percent) being positive for drugs. Especially with the inclusion of national spot-testing in some countries, weightlifting has become cleaner than its sister sports of powerlifting and bodybuilding.

Entering the Twenty-first Century

With the onset of the twenty-first century, Bulgaria remained a leading lifting power, but other countries including Turkey, China, Russia, Greece, Iran, Poland,

Rumania, and Qatar were producing world-class weightlifters in the men's ranks. In a poll conducted on the IWF Internet site, Hossein Reza Zadeh (105+ class) from Iran and Halil Mutlu (56 kg class) from Turkey received the most votes for world's best lifter in 2003. As of March 2004, Reza Zadeh held all the records in his class. Still his 578-pound (262.15 kg) world-record clean and jerk was only 15 pounds (6.8 kg) higher than Alexeev's 563 (255.42 kg) in 1977, a likely testimony to the effectiveness of drug testing.

In the women's ranks, China has utterly dominated competition, holding eighteen of the twenty-one senior world records and thirteen of the junior records in March 2004. By far the best female lifter, and recipient of the most Internet votes, was Liu Chunhong of China. Though still only a junior level lifter (at age 19), her 270 kg total in 2003 in the 69 kg class was 7.5 kg higher than the 262.5 kg total registered by Nahla Ramadan of Egypt in the 75 kg class. For men and women, especially in capitalist societies, the greatest challenge remains the relative lack of remuneration in Olympic weightlifting.

Weightlifting Basics

The objective of Olympic weightlifting is to register the highest two-lift total in the snatch and the clean and jerk. Each lifter gets three attempts in each lift, with the highest weights in each category being added to his or her total. If a lifter misses all three attempts in either lift, he or she is eliminated from the competition. In the event of a tie, the lighter lifter receives the higher placement. The lifter has two minutes from the time his or her name is called to start the lift. A head referee and two side judges officiate. At least two of three white lights are required for a passing lift. Strategy in weightlifting normally comes into play toward the end of the competition where each athlete will choose a final clean and jerk that will yield a total that other lifters will not be able to surpass.

In the first competitive lift, the snatch, the bar is pulled from the floor to an overhead position at arms length in one continuous movement. The lifter is allowed to move his feet into either a squatting or splitting position, essentially dipping under the bar while it is momentarily suspended in mid-air. In the recovery portion of the lift, the athlete raises his or her body to an erect position. The clean and jerk is a two-part lift. The athlete first, in the clean, lifts the barbell from the floor to the shoulders, again (as in the snatch) squatting or splitting under the suspended bar. The lifter then recovers into a standing position with the weight resting on the shoulders. After lowering the weight with the knees, the lifter then thrusts it overhead with his or her legs and again dips under the suspended bar by assuming either a split or squat position. In the recovery portion, the athlete again raises his or her body erect.

From 1928 to 1972, the press was also contested. As in the clean and jerk, the barbell was first brought to the lifter's shoulders, using the same foot motion options. The athlete would then stand erect until the head referee signaled the execution of the lift, which was done by pressing the barbell overhead with the arms and shoulders and with no assistance from the legs or lower torso.

In each lift, the athlete must finish with feet in line, body erect, arms and legs fully extended, and the barbell under control overhead. The lifter must hold the weight overhead until receiving the head referee's signal to replace it to the floor.

WEIGHT CLASSES AND EQUIPMENT

Men's competitions consist of eight bodyweight classifications, the upper limits being: 56 kg (123 pounds), 62 kg (137 pounds), 69 kg (152 pounds), 77 kg (170 pounds), 85 kg (187 pounds), 94 kg (207 pounds), 105 kg (231 pounds), and more than 105 kg. For women, there are seven weight classes: 48 kg (106 pounds), 53 kg (117 pounds), 58 kg (128 pounds), 63 kg (139 pounds), 69 kg (152 pounds), 75 kg (165 pounds), and more than 75 kg.

The equipment employed in competitive weightlifting consists of the barbell, a steel bar or rod to which cast-iron or steel disk weights (encased in hard rubber) are attached at each end on a revolving sleeve. The men's competition bar weighs 20 kg (44 pounds). For women, the bar weighs 15 kg (33 pounds). The range of weights added is 25, 20, 15, 10, 5, 2.5, and 1.25 kg (55, 44, 33, 22, 11, 5.5, and 2.75 pounds). All lifts are performed on a square platform that measures four meters on each side.

GOVERNANCE

Five organizations administer the sport of weightlifting, consisting of (in descending order of influence) the International Weightlifting Federation, National Weightlifting Federations, the International Olympic Committee, Olympic committees for individual nations, and the organizing committees for specific competitions. Olympic weightlifting in the United States is governed by USA Weightlifting in Colorado Springs.

Final Reflections

Weightlifting has always been a highly individual sporting endeavor. Although it is possible to compete on a team basis, particularly on the national and international levels, many weightlifters prefer no affiliation. Unlike many sports, there is no possibility for direct interaction with opponents or even members of one's own team. This lack of physical contact and team strategy encourages individuality, yet a strong spirit of camaraderie has always existed among participants.

Historically, weightlifting has attracted ethnic and racial minorities, those seeking greater self-esteem, or individuals not able to participate in team sports. Contrary to popular belief, the best weightlifters (pound-for-pound) are found in the lighter classes, often among individuals who appear quite normal and do not fit the stereotype (bulky, oversized). Speed (from fast-twitch muscles) and flexibility are as important as strength to an Olympic weightlifter's success. Exercise scientists, in fact, have identified the snatch, where great explosive

power and quickness are required, as the fastest movement in all of sport. Through its association as a training aid for other sports during the past half century, weightlifting has gained increased respect for its health and athletic qualities.

Wembley Stadium

Wembley Stadium is a sports stadium in Wembley, London, England. At the time of this writing, the original Wembley Stadium had been torn down and a new one, scheduled to open in 2006, is being built on the site. Wembley stadium was and is expected to continue to be Britain's leading soccer stadium and also a major venue for world soccer competitions.

In the late 1800s the ground that later became the stadium was Wembley Park Leisure Grounds and had facilities for soccer and cricket, gardens, and fountains. After a failed attempt to build a huge tower as a tourist attraction it became a golf course. In the 1920s the government developed the park into a venue for a British Empire Exhibition, with the new stadium, then called Empire Stadium, as the centerpiece. The new stadium was marked by its distinctive twin towers and by its royal box, thirty-nine steps above the field. The first event was the “White Horse Cup Final,” the Football Association (FA) final between the Bolton Wanderers and West Ham. It is believed that some 200,000 people attended with a seating capacity of only 100,000. The game got under way only when Police Constable George Scorey rode up and down the sidelines on his white horse, Billie, pushing the crowds back off the field. Hence, the names, “White Horse Cup Final.” The FA Cup was contested at Wembley every year (except when suspended due to war) until 2000, when the stadium was closed for rebuilding. It is also the home of the National Team and hosted the final game of the 1966 World Cup. It has also hosted five European Cup championships and numerous lower-level British championships. Brazilian soccer immortal Pele noted that “Wembley is the church of football. It is the capital of football and it is the heart of football.”

In addition to soccer, Wembley hosted the track and field events at the 1948 Olympics, Rugby League and Rugby Union matches, motorcycle racing, and several preseason National Football League games. In 1972 it

began hosting concerts. Notable ones have been those by Bruce Springsteen, Queen, the Spice Girls, and the Live Aid concert in 1985.

In 2000 the stadium was closed, and events shifted elsewhere until it was rebuilt. The rebuilding initiative was controversial and faced numerous financial and political hurdles including concerns about the overall cost, the source of funds, the effect on the surrounding community, and transportation issues. One major controversy has been over the plan to set aside 18,800 seats (of 90,000) for corporations that will pay between 30,000 and 50,000 British pounds to use the seats for a wide range of events for ten years. These subscriptions will provide 70 percent of the stadium's revenues. Some sports fans are concerned that the corporate presence will damage the sports experience for other fans. Manchester United's captain Roy Keane has referred to them as the "prawn sandwich brigade." Supporters of the plan argue that it will help keep the cost down for other fans.

The final plans were not agreed upon until 2002. The 90,000 seats in the new stadium will all have unobstructed views of the field. There will be a retractable roof that will close in inclement weather but remain open at other times to allow the sun to reach the grass field. The most visible feature will be an arch 315 meters long and 133 meters high above the north end. It supports the north stands and part of the south stands as well and replaces internal pillars. The royal box will be in its usual position in the middle of the north stand. The project is budgeted at 757 million pounds. Despite the series of false starts, Wembley Stadium seems on schedule for completion in 2006 and for the FA Cup in May.

Wimbledon

The All England Lawn Tennis Championships, known as "Wimbledon" (after the locale where they are played), is the most prestigious professional tennis tournament in the world. The championships are staged at the All England Lawn Tennis Club (AELTC), a private club founded in 1868.

Attended by more than 500,000 people each year, Wimbledon has grown tremendously from the gathering of two hundred spectators who attended the first championships in 1877. Only the men's singles event, won by Spencer Gore, was played originally. The women's singles event was not introduced until 1884 (the same year the men's doubles event was introduced). From an entry pool of thirteen women, Maud Watson became the first women's champion. The trophies presented to the initial winners are still presented today: a silver gilt cup (inscribed with "The All England Lawn Tennis Club Single Handed Champion of the World") for men and a silver salver named the "Rosewater Dish" for women. The number of players included in the main draw of the singles events has increased (to 128), as has the prize money. In 1968 the women's and men's singles champions received \$1,313 and \$3,500, respectively, which increased to \$980,875 and \$1,054,375, respectively, by

Tennis is a young man's game. Until you're 25, you can play singles. From 25 to 35, you should play doubles. I won't tell you exactly how old I am, but when I played, there were 28 men on the court—just on my side of the net. ■ GEORGE BURNS

2004. Permanent stands replaced temporary bleachers by the mid-1880s, and by 1922 a fourteen-thousand-seat stadium was built, one of the most prominent additions to date. Presently the Wimbledon championships utilize all nineteen grass courts of the AELTC, including the center court (originally the court around which all others were arranged) with a capacity of 13,810 and the number one court with a capacity of 11,429.

Players

In the beginning the championships were dominated by British players. Ernest and William Renshaw won thirteen singles and doubles championships from 1881 to 1889, followed by Reggie and Laurence Doherty, who won the doubles title eight times from 1896 to 1906. Since 1907 only two Britons, Arthur Gore (in 1901, 1908, and 1909) and Fred Perry (in 1934, 1935, and 1936) have won the men's singles title, and after 1922 only five British women have become singles champions (Kitty McKane Godfree in 1926, Dorothy Round in 1934 and 1937, Angela Mortimer in 1961, Ann Jones in 1969, and Virginia Wade in 1977).

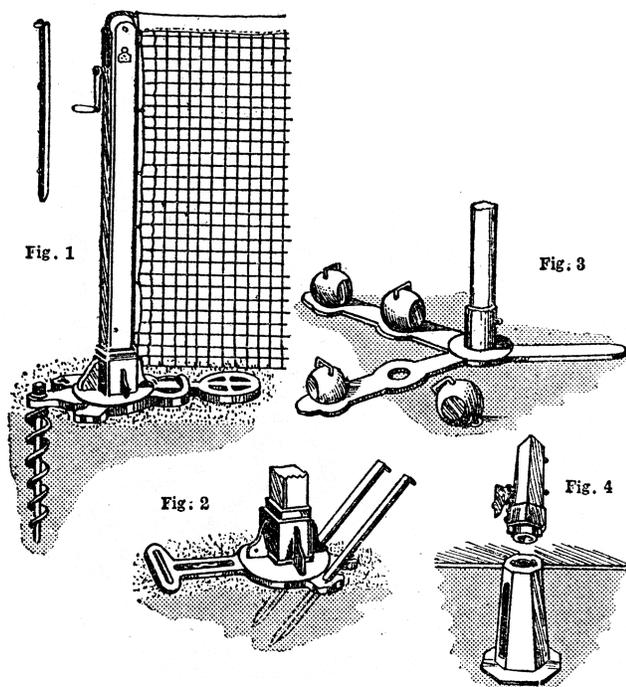

Regardless of the nationality of its players, Wimbledon has become a showcase for the greatest players on the professional women's tour. The participation of overseas players at Wimbledon was initiated by May Sutton in 1905 and by Norman Brookes of Australia in 1907. During the early 1920s Suzanne Lenglen of France dominated Wimbledon by winning six titles before turning professional. Her countrymen, Jean Borota, Jacques Brugnon, Rene Lacoste, and Henri Cochet (the "Four Musketeers"), continued to dominate during the late 1920s. U.S. men (e.g., Jack Kramer and Anthony Talbert) dominated the championships during the late 1940s and early 1950s before handing the mantle to the Australians (e.g., Rod Laver, Roy Emerson, and John Newcombe) until the 1970s. In 1956 Althea Gibson became the first African-American woman to win a title at Wimbledon before Margaret Court Smith captured the singles title three times (1963, 1965, and 1970). Wimbledon joined the "open era" by allowing both amateur and professional players in 1968, the year when Billy Jean King and Rod Laver became the women's and men's champions, respectively.

In 1971 Evonne Fay Goolagong became the first Aborigine (native Australian) to win Wimbledon. In 1980 the Swede Bjorn Borg became the first player to win five consecutive men's singles titles. Boris Becker became the youngest player (at seventeen), the first German, and the first unseeded player to win the same event in 1985. In 1987 the U.S. player Martina Navratilova became the first woman to win six women's singles championships in succession (nine in total by 1990). However, during the late 1980s and 1990s Steffi Graf (Germany) dominated Wimbledon, winning the title seven times. On the men's side the U.S. player Pete Sampras had also recorded seven men's singles wins by 2000.

Traditional Wimbledon

The plethora of Wimbledon traditions has helped maintain the unique character of the championships.

Bill Tilden at Wimbledon

In 1920 Bill Tilden became the first American to win at Wimbledon. The extract below captures his thoughts as he came to Centre Court at Wimbledon.

Here am I, America's representative, given the opportunity, the fates being kind, to do what no other American has yet done. Under my feet is the turf which the giants of all lawn tennis time have trod. Looking on are the shades of the Renshaws, the Baddelys, the Dohertys, and scores of others almost equally great, watching my strokes, noting my strategy and tactics, nodding, approvingly or the reverse, as they envision my bearing and take cognizance of my every action. Around me, filling every available bit of space, are the men and women who compose the most distinguished and critical gallery in all the lawn tennis world; even royalty has come to view the scene and add luster and *éclat* to it. 'Twould ill become me to do aught but acquit myself well, to justify my selection as one of the representatives of my country. I must act worthily, as beseems the game and its followers. And may the best man win.

Tilden II, W. T., & Merrihew, S. W. (1925). *Match play and the spin of the ball*. New York: American Lawn Tennis.

These traditions include the serving of strawberries and cream, champagne, and Pimms (an alcoholic cocktail supplemented with fruit), along with the presentation of trophies by members of the royal family (e.g., Queen Elizabeth II in 1977, Prince Philip in 2004) and, of course, the ivy-covered walls and timepieces throughout the grounds.

Wimbledon mandates completely white tennis attire for both men and women. Initially white clothing was popular because it masks perspiration. Clothing fashions, the prerogative of women players, have always been a major focus at Wimbledon, from the headband and silk chiffon that Lenglen added to her already delicate calf-length dress in 1919 to the form-fitting all-in-one white body stocking worn by Anne White in 1986.

I'll let the racket do the talking. ■ JOHN MCENROE

With increases in the popularity of professional tennis and player involvement in the fashion industry, the variety in tennis clothing will continue to flourish as it has done in recent years.

The Future

Wimbledon has changed through the years to accommodate the growth in popularity of tennis and the need for improved facilities. During the past twenty-five years the members enclosure was introduced, the center court roof was raised for more seating, and Aorangi Park (a large grassed area that allows televised coverage) was added. Currently the major project is the construction of a retractable roof for center court that will allow play to continue during rain. The projected completion date is 2009.

Since 2003 drug-testing policies at Wimbledon have also been increased in accordance with the Tennis Anti-Doping Program operated by the International Tennis Federation, the Association of Tennis Professionals, and the Women's Tennis Association.

Windsurfing

Windsurfing (also called "sailboarding") combines surfing and sailing on what is basically a large surfboard with a sail operated by one person.

History

Windsurfing originated during the late 1960s and, like surfing, developed a distinct culture. The windsurf board was based on designs and technologies adapted from boat sailing and surfing. By the mid-1970s

Culture

Windsurfing, along with other new sports such as snowboarding, surfing, and skateboarding (also called “lifestyle sports” or “whiz sports”), developed along with counter-culture social movements in North America. These activities evolved in opposition to mainstream sports and in opposition to the institutionalization of sports in recent

companies were producing windsurf boards around the developed world, particularly in Australia, Europe, Canada, and Japan. Windsurfing expanded rapidly during the 1980s as more than a half-million boards were sold worldwide. This expansion was largely because of advances in technology, particularly the development of materials with higher strength-to-weight ratios, which allowed lighter, more efficient, and more durable boards and rigs (the mast, sail, and boom) that were easier to use. The so-called fun board, which is shorter and lighter, contributed to the popularity during the mid-1980s, a period when windsurfing was the fastest growing sport in Europe.

Windsurfing had matured somewhat by the early 1990s; equipment sales in Europe—home of the sport’s largest consumer base and biggest producers—peaked during the late 1980s. However, windsurfing has progressed from being a fad and has established itself as a genuine sport that encompasses several forms, ranging from long-board racing and speed sailing to freestyle and wave sailing. Venues range from inland waters, such as lakes and reservoirs, to the open sea. People in many developing nations, including in Africa, South America, the Caribbean, and the Pacific islands, also windsurf. However, because the equipment is expensive and often unavailable in some of these areas, tourists (rather than

Only a few windsurfers belong to sports organizations. Windsurfing’s “grass roots” are casual weekend sailors.

Competition at the Top

In 1984 the Olympic Games accepted windsurfing as a class in the yachting events. Initially women and men competed together, but by 1994 separate women’s and men’s classes were established. Nevertheless, windsurfing competition takes many forms, and for many people the pinnacle is the professional funboard racing circuit, which operates under the auspices of the Professional Windsurfers Association (PWA).

Recreational windsurfers tend not to engage in formal competitions. For many windsurfers organized competition is contrary to the freedom of the windsurfing lifestyle.

In late 2004 the Professional Windsurfers Association ranked these athletes first: Scott McKercher of Australia, men’s wave; Daida Ruano Moreno of Spain, women’s

wave; Antoine Albeau of France, men's racing; Allison Shreeve of Australia, women's racing; Ricardo Campello of Brazil, men's freestyle; Daida Ruano Moreno, women's freestyle; and Matt Pritchard of the United States, Super X.

Culture and Gender

Women windsurf, but their numbers are disproportionately low, and the sport and its culture remain dominated by men. Research in Germany and Australia suggests that women constitute between 25 and 33 percent of windsurfers, although 40 percent of the windsurfers classified as beginners are women.

Demographic data from the United Kingdom also suggest class differences. This data showed that British women who windsurf regularly tend to be able-bodied, white, and middle class. Windsurfing is an expensive sport, although less expensive than other water sports such as sailing. Data showed that women participants in particular have disposable incomes that enable them to purchase the windsurfing board and sail. If participants lack the money to buy the equipment, they will have only a limited interest in participating. Windsurfing is a time-consuming sport; often several hours (at least) are needed to reach the location (often inaccessible by public transport), assemble the equipment, and then spend time out on the water. Women windsurfers interviewed in the United Kingdom suggested that, even for professional women whose income did not limit their ability to participate, finding time to windsurf was difficult; this was especially problematic for women who lived a considerable distance from the water and for women who had family commitments. As a woman instructor explained, "Windsurfing takes up half a day, or a day. Aerobics you can go down to the gym—fit it in—hubby or partner will baby-sit, so windsurfing is a problem. . . . I mean they haven't got time to fit it in, it's not a sport that is accessible to them."

Although improvements in both teaching equipment and methods have made windsurfing more accessible to women, the perception remains that windsurfing is dif-

ficult to learn and requires considerable power and strength. The media (especially videos and magazines) perpetuate this perception by focusing on advanced windsurfing action, with men dominating both photographs and text. Thus, windsurfing is represented as a male domain, with women often the ornamental observers. This emphasis on the hard-core element of the culture excludes outsiders, especially women. As Jessica Crisp, an elite Australian windsurfer, said, "I taught a girl the other day who felt she couldn't even paddle a surfboard because she had no muscles. But right away she was beach-starting, uphauling the sail and sailing around. . . . There is some myth that you have to be huge and strong, but just look at us—we aren't exactly giants. The equipment is so light and easy to learn on now. It's a technique thing in the end" (Crisp 1996, 14–20).

However, as more women participate, elite women are pushing the limits. Women windsurfers of all levels have described the confidence and independence they experience while windsurfing. Although the sport itself is individual, women have gained a sense of community from it.

Women's Sports, Media Coverage of

The feminist critique of sport that has existed for over three decades concludes that the marginalization and trivialization of female athletes only serves to reproduce the domination of men over women. Writers tend to agree that the media play a central ideological role not only in “reflecting” but also in reinforcing existing ideas about gender—there is a large body of work focused around the study of the media coverage of women's sports and female athletes. These studies tend to follow two main issues: the amount of coverage and the portrayal of women's sports and female athletes by the media. Many of these studies conclude that despite all the changes that have taken place over the last decades, women's sport is still underrepresented in the media, and when female athletes are covered, it is still in ways that are different from coverage given their male counterparts.

Women and Sport

The notion that in sports physical and biological differences interface with social and cultural interpretations of gender role expectations has been central to much of what has been published in the sociology of sport. Indeed, studies published during the 1970s and 1980s explored remarkable gender differences in patterns of athletic socialization and examined whether sport as an institution neutralizes men's power and privilege over women. They concluded that the marginalization and trivialization of female athletes only serves to reproduce the domination of men over women. In the decades that followed, some scholars continued to claim that sport, perhaps more than any other institution, perpetuates the myth of man's superiority and woman's inferiority, ap-

parently based on masculine biological and physiological supremacy. It is however clear that over the years, and particularly during the 1990s, women have made many advances in organized, competitive, high-performance spectator sports. Overall, figures do suggest a rise in women's participation in sports, particularly in Western societies and most clearly in the United States (following Title IX—an amendment to the Civil Rights Act of 1964 guaranteeing equal funding for girls and boys sports that became law in 1972).

Women, Media, and Sport

Why should the media be discussed in relation to women and sport? The main reason is that the mass media—which are an essential feature of modern social life—preserve, transmit, and create important cultural information. Indeed, one central assumption within media studies is that how members of society see themselves, how they are viewed and even treated by others is determined to a great extent by their media representation. It can be argued that when it comes to sport the mass media assume an even greater importance since the overwhelming majority of spectators experience sporting events in their mediated version.

To date a substantial body of work examining the role of the media in relation to women and sport does exist and, very broadly speaking, it tends to focus on two main issues: the amount of coverage and the portrayal of women's sports and female athletes by the media.

AMOUNT OF COVERAGE

Studies published throughout the 1980s, most of the 1990s, and onward have continued to reveal that the lion's share of sports coverage by the media is still dedicated to men's activity. Indeed, a consistent finding is the underreporting of female athletes and their sporting events throughout all mass media; for example, in 1994 men were found to receive 93.8 percent of coverage on U.S. television (Duncan and Messner 1998). Since the media is seen as reflecting what is important and has prestige, this severe underrepresentation is thought to

create the impression that women athletes are nonexistent in the sporting world or of little value when they do exist. Moreover, this “creates a false impression of women’s athleticism by denying the reality of the modern female athlete” (Kane and Greendorfer 1994, 35). This underrepresentation, in turn, is also viewed as creating a vicious circle since the growth of women’s sport is hindered by the lack of funds that nowadays come primarily from sponsorship. Sponsors are interested in investing in sports and teams that are featured regularly on television, and since women’s sports do not qualify as such, they do not get the big cash injections associated with sponsorship.

It is important to point out that the most substantial body of work in this field originates primarily from the United States; however, according to studies from other (Western) countries, the coverage of women’s sport routinely occupies no more than 5 percent of total sport airtime in nations like Italy (Capranica and Aversa 2002), the Netherlands (Knoppers and Elling 2001), Sweden (Koivula 1999), and Britain (Harris 1999). Studies also consistently show that along with significantly less coverage, there are fewer representations of those team or individual women’s sports generally conceived of as “masculine.”

And yet, some changes in the amount of coverage of women’s sport have been traced in major sporting events, like the extensive and successful coverage of the 1999 Women’s World Cup—in ratings terms—especially in the United States, the nation that hosted the games and eventually won the event. This case in fact showed television organizations that there is profit to be made in women’s sport. The 2001 UEFA European Women’s Championship also attracted a high level of sponsorship, live TV screening of the semifinals in all four countries concerned, and ratings that revealed that every fourth television set in Germany was tuned into the opening game (Germany versus Sweden). These could seem like major shifts, and yet, the examples mentioned are of major international sporting events in which it is safe to assume any successful athlete would get extensive media attention in his or her

home country regardless of the athlete’s gender. The Olympic Games are another revealing example in this context; studies by Eastman and Billings (1999) and Tuggle and Owen (1999), analyzing coverage of the 1996 Atlanta Olympics by the American network NBC found an almost equal coverage of men’s and women’s events as determined by parameters like proportions of clock time and numbers of covered medal events. Still, in these studies many reservations emerge in regard to the focusing of women’s sport coverage on those that are considered to be “feminine sports” (for a study of the Sydney Games, see Higgs, Weiller, and Scott 2003).

To date, women’s tennis may be the only clear example of a sport to which the media routinely dedicate much airtime. Thus, for example, in 1999 the American cable channel HBO devoted an unprecedented 70 percent of its tennis coverage to women (Mackay 1999). The intensive coverage of women’s tennis is even more extensive during major events like the Wimbledon tournament. This may be, however, not only because women’s tennis appears to elicit interest in sporting terms but also, as many have noticed, due to the physical appearance of some of the young female players—an argument that links into the qualitative aspect of the research of women, media, and sport.

MEDIA PORTRAYAL OF FEMALE ATHLETES

Beyond the quantitative questions of media coverage, studies also deal with differences in the type of coverage women’s and men’s sports get. Over the years various studies have focused on different practices by which the media construct female athleticism not only as “other than” but also as “lesser than” that of the male. Don Sabo and Curry Jansen (1992), for instance, argue that the skills and strengths of women athletes are often devalued since the dominant standards of excellence are masculine, emphasizing cultural equivalents of hegemonic masculinity: power, self-control, success, agency, and aggression. Furthermore, whereas male athletes are valorized, lionized, and put on cultural pedestals, female athletes are infantilized by sports commentators

who refer to them as “girls” or “young ladies.” Messner, Duncan, and Jensen (1990) found that while male athletes tended to be described in terms of strength and success, the physical strength of female athletes tended to be neutralized by ambivalent language. Another—much referred to in the literature—practice used by the media is the use of names in commentary. Indeed, Messner, Duncan, and Jensen (1990) found that commentators referred to female tennis players by their first names 52.7 percent of the time and to men only 7.8 percent of the time. Pfister’s (1989) study of the coverage of the Olympics by German newspapers also showed that while men were often addressed by their surnames, women were introduced by their first name, a nickname, or a fantasy name. According to her findings, these diminutive, especially intimate, or overly polite forms of address were among the strategies that were almost exclusively applied to women. This phenomenon is perceived by the various writers as displaying a hierarchy of naming, that is, a linguistic practice that reinforces the existing gender-based status differences. Moreover, while the male performance is often linked to power metaphors (like war), the coverage of female athletes is often framed within stereotypes that emphasize their aesthetic appeal rather than athletic skill.

However, in this respect too some changes have been taking place in recent years; thus, for example, in their aforementioned study of the 1996 Olympic Games, Eastman and Billings (1999) found that although the presence of gender stereotyping was not as overwhelming as had been expected, nonetheless “as traditional gender stereotyping suggests, the descriptors applied to women athletes contained more commentary about physical appearance than the descriptors applied to men athletes” (Eastman and Billings 1999, 163). Moreover, the scholars claim that one could also find—mainly in preproduced profile reports—what can be only labeled as “unfortunate stereotyping” (1999, 165). Eastman and Billings note, however, that NBC’s host and on-site reporters were careful to attribute women’s success and failure to the same characteristics as men’s

success and failure. Jones, Murrell, and Jackson (1999) in their study of the 1996 Olympics also found that for female athletes playing “female appropriate” sports, there was a trend toward print media accounts, which focused more on describing their performance than personality or appearance. Other findings by these scholars, however, indicate that the “beauty” and “grace” of the female gymnasts were still the main points of emphasis, despite their having taken U.S. gold in the event. Thus, it can be argued that the “buts” in this case outweigh the positive findings by far. Indeed, in her study Koivula (1999) found, for example, that infantilism (“girl,” “young lady/woman”) was still very much part of the language used by commentators for referring to women athletes, while the language used to describe men (“man” and even “old fellow/man”) linguistically acknowledged their status as adults—this although the athletes were generally of similar age. Moreover, in his study of the representation of woman in football-related stories in the British popular press during the course of the 1996 European Championship, Harris (1999) argues that the message still being portrayed is that sport is an essentially male activity in which women are afforded only subordinate and/or highly sexualized roles.

Appearance and Attractiveness

In fact, among various other findings, researchers analyzing the portrayal of female athletes from different perspectives found the coverage to be often framed within stereotypes that emphasize appearance and attractiveness rather than athletic skill. According to this argument, the sexualization of female athletes trivializes them and robs female athletes of athletic legitimacy, thus preserving hegemonic masculinity.

THE ANNA KOURNIKOVA PHENOMENON

The media coverage of women’s tennis over recent years is highly representative in this context, the most prominent example being Anna Kournikova. Although Kournikova, prior to her early retirement, was for several years one of the top players in the world—in the season of 2000, for instance, she was ranked eighth in the

*Set your goals high, and don't stop
till you get there.* ■ BO JACKSON

world—the amount and type of coverage she gained (and still does) did not correlate with her tennis ranking. To illustrate, during Wimbledon 2000 for every picture of the single's finalist Lindsay Davenport there were twenty of Kournikova in the British newspapers (Mackay 1999). The extensive media attention to the blonde, model-looking Kournikova—also dubbed “tennis's pinup girl”—clearly shows the importance certain branches of the media ascribe to looks and image over tennis skills. Indeed, as one Web-based writer put it, “the Anna Kournikova phenomenon proves you don't need to win tournaments to get your name—and photo—in the media” (Thomas 2001).

Some believe that there is an up side to this phenomena—Chris Evert, three-time Wimbledon champion and later a commentator for NBC, said in an interview: “Girls now want to grow up and be athletes [...] there are attractive, appealing girls out there and now they realize that's it is okay to run around and sweat and be tough. Twenty years ago it was frowned upon and wasn't feminine” (Mackay 1999). Furthermore, according to the Sports Sponsorship Advisory Service, women should “play the sex appeal card to attract more media coverage and therefore more sponsorship” (Gillan 1999). This suggestion infuriated Yvonne Barker, director of Women in Sport, who said: “We believe that women's sport should be sponsored for exactly the same reason as men—because they appeal to their audience for their achievement and intrinsic value. We certainly don't feel that they should be sponsored for sex and sex appeal” (Gillan 1999).

Generally speaking, a certain ambivalence emerges every time a female athlete is framed as a sexual being or is covered by the media not for her sport performance but because she is attractive and conveys sex appeal. Kournikova is but one example: During the 2003 Wimbledon tournament, Maria Sharapova—who one year later would go on to win the Wimbledon crown—drew much of the media's attention for her physical appearance. The dramatic decline in Anna Kournikova's tennis performance (she failed even to qualify) resulted in the media's “eagerness” to crown an appropriate substitute.

Sharapova was one option; Yelena Dukic was another, which was illustrated by the British newspaper headline prior to the match between the two being described as “Battle of the Babes” (*Daily Mirror*, June 28, 2003). However, it is important to emphasize that the current discussion of women's image is more complex than this. In addition to the wide variety of female images currently being presented by the media, tennis (and other sports) also offers an image of powerful sportswomen, manifested by stars like Venus and Serena Williams.

The Future

Over recent years women have certainly advanced in organized competitive sport, and women's sport has also gained considerable ground as far as media visibility is concerned, particularly in major sporting events. A certain shift also occurred in the type of coverage of women's sports and female athletes, and yet recent research findings show that practices used to undermine women's sporting achievements—and identified in the past—are still very much in evidence. All of which continues to send a message that sport is in essence a male activity, in which women play only a subordinate and/or sexualized role. Although it can be argued that the media cannot change the world, it can certainly help—alongside other societal forces—change attitudes about women in sports, but for now—with all the improvements that have been made—one can only hope they will do so more in the future.

Women's World Cup

Began in 1991, the Women's World Cup, the premier women's international soccer competition, is held every four years and involves female athletes from around the world. Sponsored by Fédération Internationale de Football Association (FIFA), this event involves a series of elimination games that begin with twelve to sixteen teams and culminate in a championship game between the top two teams. The Women's World Cup, which has received a great deal of media coverage, has brought issues concerning gender roles in international sports to the forefront in both academic and popular writings.

History

The People's Republic of China hosted twelve teams during the inaugural year, and the United States national team defeated Norway 2–1 for the championship in front of a crowd of sixty-five thousand in Guangzhou's Tianhe Stadium. Chinese media dubbed the front line of the American team—made up of Michelle Akers, Carin Jennings, and April Heinrichs, who combined to score twenty of the twenty-five total goals for the United States—the “Triple-Edged Sword.” The referee for the third-place match, Claudia de Vasconcelos of Brazil, became the first woman to officiate at this level for FIFA.

According to a note made in June 1995 on the FIFA website, “If China in 1991 was the innovation, Sweden in 1995 was the consecration of women's football at the highest level.” In the second Women's World Cup, Sweden hosted twelve teams and held the matches in medium-sized venues that held fewer than twenty thousand fans at a time. While the U.S. team was favored, Norway defeated the American team 2–0 in the semi-

finals and went on to victory in the finals against Germany. Sweden's Ingrid Jonsson became the first woman to referee a FIFA final.

In 1999, the number of participating teams rose from twelve to sixteen. The United States hosted the World Cup and defeated China 5–4 in penalty kicks at the Rose Bowl in Pasadena, California. This championship game had over ninety thousand fans in attendance—the largest audience at a female sporting event to date. Almost as many fans attended this final match as had attended the entire series of matches in the 1995 Women's World Cup in Sweden. It was at this event that American Brandi Chastain removed her shirt to reveal a sports

bra underneath after the winning kick—an image that remains one of the most famous of all sports images.

In 2003, the Women's World Cup was scheduled to take place in China, but due to the SARS outbreak, the venue was switched to the United States. This World Cup took place in six cities in the United States. Numerous North American journalists dubbed the event “World Cup Lite,” because it was put together quickly and was held in venues that hosted crowds of twenty or thirty thousand, rather than eighty or ninety thousand, as was the case in 1999. Taking place in Portland, Oregon, the final match of 2003 was between Germany and Sweden, with Germany winning 2–1 in overtime. In 2007, China will host the event as compensation for the changed venue in 2003 due to the SARS outbreak.

Significance

Women's sports changed dramatically in the last century. With the creation of Title IX in the United States, for example, young girls have more athletic opportunities at the high school and collegiate level than ever before, even if the opportunity for professional play is limited. Nonetheless, the highly publicized photo of U.S. national team player Brandi Chastain in her sports bra after the 1999 win against China in overtime suggests that even if women's sports were increasing in popularity, they were still qualitatively different from men's sports. Female athletes still face challenges with regard to being seen as serious and strong athletes in a world dominated by men's sports.

Internationally, women have increased their participation in sports such as soccer even in countries where women's roles are more traditional than in the United States. During each World Cup, journalists frequently comment on the status of women in the participating countries, noting that in countries such as Brazil and Mexico, where men's soccer is dominant, it is more difficult for female players to feel accepted than it is in the United States and some European nations. However, since the inception of the Women's World Cup, women's participation and status in international sporting events has increased, both as participants and as spectators.

Although the number of teams, players, and fans remains far below the equivalent in men's events, after several more Women's World Cup championships, this gap may narrow.

As journalists and academics reflect on the status of women's sports, the Women's World Cup can be seen as either a watershed in the fight for women's equality in international sports or as a blip in the slow but relatively stagnant growth of women's participation in professional sports. Undoubtedly the 1999 championship game was unique in its popularity, and it created a buzz about women's professional soccer leagues and prompted girls and boys to look up to increasing numbers of female athletes such as Mia Hamm and Julie Foudy as sports idols.

However, with the folding of the American professional soccer league for women—the Women's United Soccer Association (FIFA)—just five days before the start of the 2003 Women's World Cup, it is difficult to argue that that buzz has remained as strong as it was in 1999. Either way, the Women's World Cup remains the most visible venue in which professional female athletes from around the world compete for the most coveted championship in soccer. And the event itself signifies a milestone for women's sports that did not exist before 1991.

Worker Sport

In 1925, a year after the Paris Olympic Games, as many as 150,000 workers attended the first Worker Olympics at Frankfurt am Main, Germany. In 1931, one year before the Los Angeles “official” Olympic Games at which 1,408 athletes competed, over 100,000 workers from twenty-six countries took part in the second Worker Olympics in Vienna, Austria. More than a quarter of a million spectators attended the Vienna Games. Five years later, in opposition to the 1936 “Nazi Olympics” in Berlin, Germany, an even grander Worker Olympics was planned for Barcelona, Spain. However, it never took place, since the Spanish Civil War erupted on the day scheduled for the opening ceremony (and its organizers were later shot by Franco's fascists).

The Worker Olympics easily surpassed their rival, the “bourgeois” Olympic Games, in number of competitors and spectators, and in pageant, culture, and even sporting records. Yet today, it is only the official Olympic Games that are commemorated in books, television, and films. The Worker Olympics and the worker sport movement are all but forgotten. However, for millions of workers between World War I and World War II, sport was an integral part of the labor movement, and worker sport clubs or associations existed in almost every country of Europe, in the United States and Canada, and in South America and Asia (e.g., Japan

and India). By 1930 worker sport united well over 4 million people, making it by far the largest working-class cultural movement. At the zenith of its existence, worker “oppositional” sport combined sporting activities with socialist fellowship, solidarity, and working-class culture.

Aims of Worker Sport

The aims of the worker sport movement differed from country to country. All countries agreed, however, that worker sport should give working people the chance to take part in healthy recreation and to do so in a socialist atmosphere. Worker sport differed from bourgeois sport in that the former was open to all workers, women as well as men, and black as well as white (this at a time when many workers, women, and blacks were excluded from bourgeois clubs). It provided a socialist alternative to bourgeois competitive sport, to commercialism, chauvinism, and the obsession with stars and records. It replaced capitalist with socialist values and set the foundation for true working-class culture. Worker sport, therefore, initially emphasized less competitive physical activities, such as gymnastics, acrobatics, tumbling, pyramid forming, mass artistic displays, hiking, cycling, and swimming.

The founders of the worker sport movement believed that sport could be revolutionary, that the movement was no less significant to workers than their political, trade union, and cooperative movements. Sport played a paramount role in the struggle against capitalist nationalism and militarism that pervaded the so-called politically neutral bourgeois sport organizations and, through them, corrupted young working people. The formation of separate worker sport organizations shielded youths from bourgeois values. While capitalism fostered mistrust among workers of different nations, the worker sport organizations banded together internationally to create peace and international solidarity. They turned physical culture into a new international language capable of breaking down all barriers.

In Germany, for example, a worker sport organization, the Worker Gymnastics Association (WGA),

emerged in the 1890s in conscious opposition to the nationalistic German Gymnastics Society (Turnen) that was to spread its considerable influence to North America with the migration of entire German communities. The WGA was followed by the Solidarity Worker Cycling Club and the Friends of Nature Rambling Association in 1895, the Worker Swimming Association in 1897, the Free Sailing Association in 1901, the Worker Athletics Association in 1906, the Worker Chess Association in 1912, and the Free Shooting Association in 1926. With over 350,000 worker-athletes in various clubs even before World War I, Germany became the hub of the worker sport movement.

Olympic Games

While the worker sport movement did not take issue with much of the Baron de Coubertin idealism concerning the modern Olympic Games, it did oppose the games themselves and counterposed them with its own Olympiads, on the following grounds:

- The bourgeois Olympics encouraged competition along national lines, whereas the Worker Olympics stressed internationalism, worker solidarity, and peace. While the International Olympic Committee (IOC) barred German and Austrian athletes from the 1920 Games, and German athletes from the 1924 Games, the 1925 Worker Olympics were held in Germany under the slogan “No More War.”
- While the IOC Games restricted entry on the grounds of sporting ability, the worker games invited all athletes, stressing mass participation as well as expanding events to include poetry and song, plays, artistic displays, political lectures, and pageantry.
- The IOC Games were criticized for being confined chiefly to the sons of the rich and privileged because of their “amateur” rules and aristocratic, bourgeois-dominated Olympic committees. Coubertin himself always opposed women’s participation and readily accepted the cultural superiority of whites over blacks; the longest serving IOC presidents, Baillet-Latour and Avery Brundage, both collaborated with

Hitler's Nazi regime and were unabashedly anti-Semitic. By contrast, the Worker Olympics were explicitly against all chauvinism, racism, sexism, and social exclusivity. They were truly amateur, organized for the edification and enjoyment of workingwomen and workingmen, and they illustrated the fundamental unity of all working people irrespective of color, creed, sex, or national origin.

- The labor movement did not believe that the Olympic spirit of true amateurism and international understanding could be attained in a movement dominated by an aristocratic, bourgeois leadership. It was, therefore, determined that the labor movement should retain its cultural and political integrity within the workers' Olympic movement.

Problems of Worker Sport

Bourgeois society excluded workers from public life as well as from amateur sports clubs and competitions. Consequently, if workers were to compete locally, nationally, or internationally, they had to establish their own sports associations and contests. Such organizations were part of a far-reaching political, trade union, and cultural movement; they formed a network of worker-based organizations that could represent workers throughout their lives. The bourgeois state did all it could to obstruct this movement by introducing new laws, constantly moving the bureaucratic and administrative "goalposts," and at times resorting to brute force. The state, however, could not destroy the rapidly growing worker movement until Mussolini came to power in Italy in 1922 and Adolf Hitler rose to power in Germany after 1933.

Worker sport did not take place in a vacuum. The problems that other branches of the labor movement faced (especially the party struggle—social democratic versus communist—struggle for influence) also affected worker sport. And like these other branches of the labor movement—including trade unions, socialist or labor parties, the cooperative movement, and youth organizations like the Woodcraft Folk, Young Pioneers, and Young Communist League—worker sport rose and fell

everywhere almost simultaneously, reaching a peak in the 1920s and a trough in the late 1930s, and nearly fading away after World War II. National peculiarities invariably added brakes and accelerators, as the German and Austrian tragedies under Hitler; the peaceful demise of worker sport in the United Kingdom, North America, and Scandinavia; and the persistence of worker sport in Israel and Finland all illustrate.

Worker Sport after World War II

World War II weakened, but did not defeat, the worker sport movement. It continues today, although the radically changed circumstances of the postwar world inevitably transformed the movement. In contrast with its prewar development, the movement's new role called upon its member organizations to cooperate selectively with national sports federations and clubs.

A number of factors caused this new situation. First, the Soviet Union had broken its isolation. It emerged from the war a victor, and the Soviet Union's military and political power penetrated into Central and Eastern Europe. With the resulting international friction—Cold War—in which two rival blocs confronted one another in a divided Europe, sport became an obvious arena for international (peaceful) competition. In the Soviet Union, domestic sport was now thought potent enough to take on the world, and victories over bourgeois states, especially the United States, would evidently demonstrate the Soviet system's vitality (apart from space pioneering, sport was the only area in which the USSR could demonstrate superiority).

Second, worker sport encouraged both the Olympic movement and bourgeois sport in general to democratize their memberships. Fewer sports and clubs were confined to middle-class white males, and the belief grew that international sport, particularly the Olympic Games, could be used for peace, democracy, and the isolation of racist regimes, such as South Africa and Rhodesia.

Third, worker sport switched its emphasis to campaigning within bourgeois organizations against commercialism and chauvinism to sport for all—funds,

**Chinese workers

playgrounds, open spaces, and facilities; for working people; for promoting a sport that was profoundly humanistic and free; and for women's sport. As the development of worker sport in France showed, the new goal was no longer to replace bourgeois sport but, instead, to take part in building a national sports system founded on the needs of all.

A separate worker sport movement, however, managed to survive. In 1946, immediately after the war, the Socialist Worker sport association in Western Europe set up the International worker sport Committee (IWSC) in London. Despite a peak of 2.2 million members in fourteen countries, the IWSC never attained the importance of its prewar counterpart—the committee of the same name—because, with the exception of Finland, France, Austria, and Israel, individual member associations were weak. For example, the Finnish Gymnastics and Sports Federation (TUL), while cooperating with the national sports association (SVUL), retained its own identity; it had a membership of 450,000 (one-half the SVUL membership) in 1990; and it promoted mass gymnastics and artistic displays, family exercise programs, cultural events, and, particularly, women's sporting activities. Its worker sport festivals held in Helsinki's Olympic Stadium attracted as many as 50,000 spectators. The French Worker Sport and Gymnastics Federation (FSGT) had over 100,000 members at the end of the 1990s, coordinated the activities of worker sport clubs throughout the country, organized conferences, and sponsored worker sport events, such as the annual cross-country and cycling contests associated with the Communist newspaper *L'Humanite*, as well as the annual Fete de l'Humanite in which 6,000 people par-

ticipated in the 1980s. The Austrian worker sport Association (ASKO) similarly retained its identity and played an important part in Austrian sport. In Israel, *Hapoel* ("The Worker") is still Israel's largest and strongest sports organization. It is one of the few exceptions where a worker sport organization controls its country's sport.

Reasons for Today's Weakness

There are several reasons why the worker sport movement is relatively weak today (or has faded away completely) and why it never captured the majority of the working class within its membership. Worker sport almost always duplicated bourgeois sports, clubs, federations, and Olympics. This was not significant as long as the older organizations remained socially exclusive preserves of the bourgeoisie. But once the workers succeeded in democratizing sport and once industrial firms, the church, and governments came to realize the potential of sport for social control, the duplication became problematic. Worker sport societies rarely had the prestige, facilities, or funds to compete with bourgeois teams, and they were often denied access to public funds and amenities. Similarly, media coverage of worker sport was

usually confined to the socialist-communist press and was ignored by the bourgeois media. Insofar as only a minority of workers read the socialist-communist party press, it is not surprising that only a minority of workers joined the worker sport movement or were prepared to turn their backs on the glamorous bourgeois clubs for the low-status worker sport organizations. It was common for bourgeois clubs to recruit the best worker athletes—just as they recruited the best athletes from Africa, Asia, and Latin America—by offering athletes attractive financial inducements.

A number of problems hampered efforts to enhance the attractiveness of worker sport. These problems included the explicitly political nature of worker sport, the uncertain—and at times insensitive—attitudes of labor leaders toward organized sport and competition, and the tactical differences over the role of sport in society—not to mention the socialist versus communist wrangling. Apparently, many worker sport leaders failed to understand that a sports organization might be more politically effective by being less explicitly political.

The theoretical argument over the role of sport in society presented an obstacle to the development of worker sport. At one extreme were the proletarian culture advocates (and their supporters in the Soviet Union in the 1920s, and parts of Scandinavia) who saw bourgeois sport as a reflection of a degenerate bourgeois culture that had to be thrown out because it was permeated by chauvinism, exploitation, and militarism. What was needed, they asserted, was a new proletarian system of physical culture based on personal fulfillment, mutual respect, and solidarity. At the other extreme were those, like many North American and British socialists, who regarded sport as one's personal affair, on the periphery of superstructural phenomena and therefore relatively apolitical—not something on which the labor movement should waste its scarce resources. Typically, both extremes resulted in the feeblest of all the worker sport movements in the industrial world.

Where the worker sport movement did flourish, it often suffered from internal problems. In the early years, it emphasized noncompetitive participation, but as the

1920s and 1930s wore on, the bourgeois obsession with records, spectators, and victory infiltrated worker sport and caused the activities to adopt the elements of more organized competitions. It was not uncommon for socialist and communist newspapers, for example, to devote the bulk of their sports coverage to horse racing and winning forecasts.

What Did Worker Sport Accomplish?

Developments in the latter part of the twentieth century opened up a number of possibilities for certain sports. There were far more opportunities for organized sports participation than before the Second World War; the best athletes were more highly skilled and had a better chance to nurture their talent to the fullest for the benefit of the individual and the community. Gifted working-class, nonwhite, and women athletes could, with dedication, reach the top of their sport. There were now sporting spectacles of unprecedented scale, grandeur, and public exposure from which working people could gain considerable enjoyment—even if they were subjected to society's dominant sports values and presented a sport that workers themselves could not control.

The worker sport movement needed to expand if it was to fulfill its cultural and political mission, but this growth presented complex problems. Organized sport, like the working class itself, is a product of modern industrial society, and in a bourgeois world, a large proportion of workingmen and workingwomen are steeped in society's dominant values. Nonetheless, the worker sport movement did try to provide an alternative experience based on workers' own culture, and it did inspire visions of a new socialist culture. To this end, it organized the best sporting programs it could for all athletes, whether a Sunday bike ride or a Worker Olympic festival founded on genuinely socialist values.

Its story is as much a part of the history of sport and the labor movement as Coubertin's Olympics or trade unionism.

World Cup

By far the most popular single sporting event of the modern world is the World Cup, officially known as the FIFA World Cup, which is the quadrennial international championship for association football (soccer). Established by the Fédération Internationale de Football Association (FIFA) in 1928, the first World Cup was held in Uruguay in 1930. Since then, the world has celebrated the event seventeen times; it was cancelled because of World War II in 1942 and 1946. The FIFA Women's World Cup was launched in China in 1991. Although still in its infancy, the event has enjoyed significant growth and success in its first decade.

Humble Beginning

FIFA was founded in Paris, France, in May 1904, to represent seven European nations: Belgium, Denmark, France, Spain, Sweden, Switzerland, and the Netherlands. FIFA became truly international a decade later with membership including Argentina, Chile, the United States, and South Africa. For nearly a quarter century, the Olympic Games soccer tournaments were regarded as the world's championship games. Countries tried to use the Olympics to establish their own football supremacy in the world, but the strict amateur code of the Games banned "paid" athletes, often the best, from Olympic competition. Consequently, FIFA established its own international championship and awarded the honor of hosting the first World Cup to Uruguay, a small South

American country that had captured both the 1924 and 1928 Olympic titles. To ensure success of the championship, Uruguay built a brand new 100,000-seat stadium in the capital, Montevideo, and promised compensation for traveling and accommodation expenses for all participating teams. The host's effort, however, was not enough to entice most European teams to make the weeks-long ocean voyage to South America. Only thirteen teams, instead of the anticipated sixteen, competed for championship and its gold trophy (named the Jules Rimet Cup in 1950 for the Frenchman who conceived the World Cup event). Uruguay defeated Argentina in the final and became the first World Cup champion.

The 1934 World Cup in Italy was essentially a European affair with all eight quarter-finalists coming from the continent.

- Uruguay declined to defend its title in retaliation for the widespread European absenteeism in Montevideo.
- Argentina deliberately sent a weakened team to Rome as revenge for losing its best players to Italy after the 1930 World Cup.
- The British teams from England, Scotland, Wales, and Northern Ireland remained outside the event since their withdrawal from FIFA in 1928.

In the final, host Italy defeated Czechoslovakia 2–1 in extra-time play. Italy also captured its second World Cup four years later with a more convincing 4–2 victory over Hungary in Paris, France.

Postwar Era

The first postwar World Cup was held in Brazil in 1950. By then, the British football associations had rejoined FIFA. Fourteen teams competed in the three-week long finals. The United States, against all odds, defeated England 1–0 and virtually sent the "masters" of soccer packing. In the championship match, Uruguay defeated host Brazil in front of nearly 200,000 spectators in the brand-new Maracana Stadium, the largest crowd in soccer history.

The 1954 World Cup in Switzerland included the superb performance of a Hungarian team that demol-

ished its opponents with a total score of 25–7, including a 8–3 thumping of West Germany in the first round. The Germans, however, got their revenge in the final with a 3–2 victory over Hungary, becoming only the third country to capture a World Cup.

Pelé and Brazilian Dominance

A record fifty-five countries participated in the 1958 World Cup in Sweden. For the first time, the event received international television coverage, so much of the world witnessed the Brazilian dominance and the rise of Pelé (b. 1940), the king of soccer. Between 1958 and 1970, Brazil won three of four World Cups, losing only the one held in England. The English team, energized by an enthusiastic home crowd, took every advantage on

its own soil, defeated West Germany 4–2 in the final, and won the 1966 World Cup. Yet, the 1966 championship was not spectacular football—physical and defense-oriented play overshadowed the artistry and spontaneity of individual talents. That defensive style of football, however, was short-lived. The era belonged to Pelé and his brilliant Brazilian squad. Their magnificent offense-oriented attacking football mesmerized millions of spectators as well as many of their opponents. By the time Brazil captured its third World Cup—after defeating Italy 4–1 in front of 100,000 fans in Mexico City’s Aztec Stadium in 1970—soccer, with its incomparable popularity, had established itself as the king of sports.

Total Football

Pelé retired from the World Cup after 1970, as did the Jules Rimet trophy, retained by Brazil after winning it three times. But the impact of Brazilian football was profound. The last quarter of the twentieth century saw the rise and

dominance of “total football,” in which the traditional distinction between offense and defense blurred and players became more versatile and involved in the total operation of the team. The Dutch team at the 1974 World Cup epitomized the quality of total football. Although the Dutch lost to West Germany in the final, the team’s dazzling performance with superstar Johan Cruyff (b. 1947) won millions of fans around the world.

By the 1982 World Cup in Spain, FIFA had increased the number of qualifiers from sixteen to twenty-four. In 1986, Mexico became the first country to host two World Cups. Argentina, led by the masterful and unstoppable Diego Maradona (b. 1960), defeated West Germany 3–2 in the final and captured its second World Cup in eight years. The French team, with its near flawless

midfield trio of Michel Platini, Alain Giresse, and Jean Tigana, fascinated the world with its artistry.

Soccer's popularity surged in the 1990s:

- A record 147 countries competed for the twenty-four final seats in the 1994 World Cup held in the United States.
- By the 1998 World Cup in France, FIFA had increased the number of qualifiers to thirty-two to accommodate a more diverse representation of non-European countries.

In 1998, the French team defeated the 1994-champion Brazilians in the final to finally win the event that was conceived on French soil seven decades earlier.

The Future

The first World Cup in the twenty-first century was co-hosted by Korea and Japan in 2002. When the month-long event concluded, it became clear that a new era of soccer had arrived. Teams from Asia, Africa, and North America had successfully challenged the traditional powers from Europe and South America. Korea and Turkey fought all the way into the semi-finals, only to lose to Brazil and Germany, two teams with combined wins of eight World Cups. Nevertheless, as the game's popularity continues to grow and the structure of the World Cup becomes more diverse, soccer's traditional dominance by Europe and South America will soon become the past.

World Series

Each October, American attention focuses on the championship of Major League Baseball, the World Series. The phrase itself conjures images: Babe Ruth “calling his shot” in 1932; Willie Mays in 1954, racing to the outfield wall and making a breathtaking over-the-shoulder catch, then hurling the ball back toward the infield, his hat flying off in the effort; Carlton Fisk in 1975, skipping toward first base, willing the ball out of Fenway Park to force game seven against Cincinnati’s “Big Red Machine”; a hobbled Dodger, Kirk Gibson, bravely circling the bases after his game-winning home run against Oakland in 1988. It causes fans, both young and old, to remember the Sultan of Swat, Mr. October, and even poor Billy Buckner, who booted an easy ground ball and cost the Boston Red Sox a Series victory, forcing a Game 7, which the Red Sox lost, in 1986. For the baseball historian, it brings to mind Tinker to Evers to Chance, the Black Sox, or “Wait ‘til next year!” Such moments and heroes are a part of the shared culture of the United States, the Western Hemisphere, and beyond.

The Early Years

The Fall Classic began when the National League champion, the Pittsburgh Pirates, challenged the American Association champion Boston Pilgrims to a best-of-nine series to determine baseball's world champion in 1903. The series was due in part to a new “National Agreement” that settled the dispute between the established National League and the upstart American Association, ending cutthroat competition for players and fans at the turn of the century. The Pilgrim's victory five games to

Boston Red Sox defeated the St. Louis Cardinals four games to none, only one other series has been called off, that being in 1994 when the Major League Baseball Players Association strike against the owners canceled the autumnal rite.

War, Scandal, and Natural Disaster

During World War I, Major League Baseball shortened the regular season, played the World Series in September, and entertained the thought of canceling the 1919 season altogether. During the war service teams held their own service World Series, with teams gleaned from drafted professionals. The scandal that erupted after the Chicago White Sox conspired with gamblers to throw the first postwar series in 1919 also threatened its continuation, but firm action by newly installed commissioner Judge Kennesaw Mountain Landis saved the day. In the midst of the Great Depression, popular heroes such as Ruth, DiMaggio, and St. Louis's Gas House Gang provided some comfort in the midst of economic chaos. During World War II, the championship continued, minus most of the able-bodied players, as an important factor in boosting morale on the home front. In 1989, just before players from San Francisco and Oakland were to be introduced, an earthquake shook San Francisco's Candlestick Park. The disaster killed sixty-seven people in the Bay Area and forced postponement of Game 3. Some called for the cancellation of the series, but the games went on, providing normalcy and offering Bay Area residents a chance to heal. The 2001 Series, between the Yankees and Arizona Diamondbacks, was played while rubble was being removed from the site where the World Trade Center once stood, for the same reasons.

Technology and the World Series

Over the course of the century of World Series history, technology transformed it from an event that relatively few fans witnessed to a worldwide spectacle beamed globally via television. In the early decades, urban fans

Sandy Koufax and Yom Kippur

Sandy Koufax's decision not to pitch the opening game of the 1965 World Series had a strong impact on Jews in the United States. In the extract below, Rabbi Lee Bycel recalls that memorable day.

I remember it as if it were yesterday.

It was Oct. 6—the opening day of the 1965 World Series. The Dodgers, behind the great pitching of Sandy Koufax, had won the National League pennant and advanced to the Series. But Koufax, who was slated to start the first game, was not on the mound. He was not even in the stadium.

He was not there because it was Yom Kippur, the Day of Atonement, the holiest day of the Jewish year. [...]

As a Jewish boy and an ardent baseball fan, I had a great need for Jewish heroes — especially on the

playing field. Koufax's refusal to play on Yom Kippur filled me with pride. I realized that day that no one should ever be embarrassed when practicing one's religion or identifying with one's ancestral culture. Ethnic and religious identity should engender fulfillment and hope.

It was a courageous act for Koufax to abstain from playing in an era that preferred to sanitize difference. His decision not to pitch that Yom Kippur served as an important reminder that America shelters many different faiths and religious practices. Koufax taught me that I could hope to take an active part in American life without compromising my religious convictions. This lesson has remained, and has solidified my commitment to make it accessible to all people.

congregated around telegraph offices to follow the game, and when radio became widespread, businesses used displays, some featuring model fields and movable players, to attract trade. Graham McNamee became a household name when he became the first play-by-play announcer to describe the action of a baseball game live during the 1923 World Series between the Yankees and New York Giants. In modern times the Series reaches a worldwide audience boosted by the increasing presence of international players.

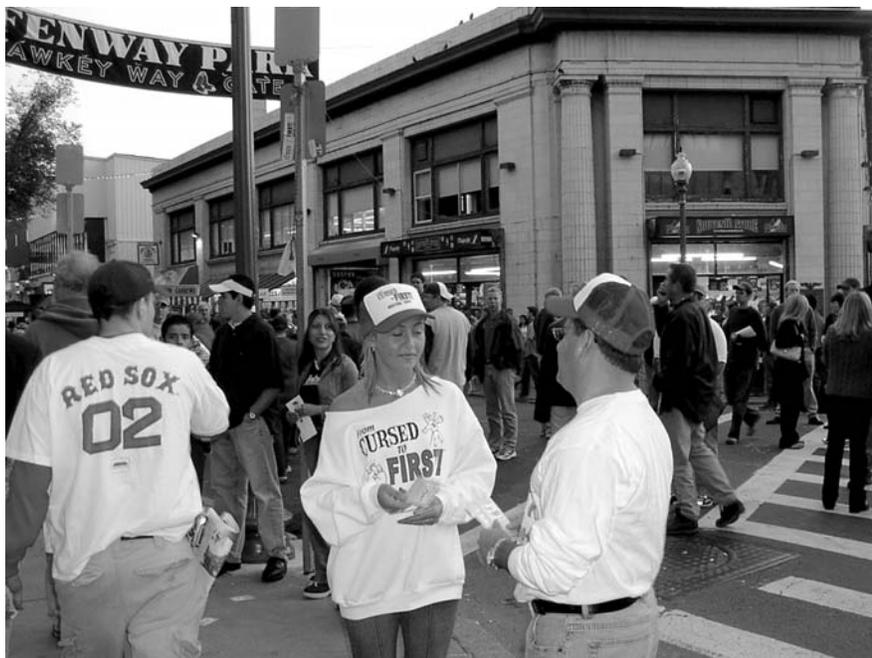

New York Domination

In 1992 the World Series became a “world” series in more than name only when the Toronto Blue Jays won the first of two consecutive championships, and in 1997, the Florida Marlins became the first “Wild Card” (nondivision champion) team to win it all. Despite new faces in the nineties, New York teams have dominated the World Series. The Yankees have won twenty-six; the Giants, before moving to San Francisco in 1958, won five; and “next year” finally came for the Brooklyn Dodgers in 1955, when they defeated the Yankees for their only championship in Brooklyn. The Mets finished

their miracle season with a championship in 1969, and they won again in 1986. In total New York teams have won thirty-three of ninety-eight World Series. New York teams have appeared in 66 percent of the series played, and there have been fourteen “subway series” between New York teams, the last in 2000, between the Yankees and Mets.

Series Mythology

The World Series has such importance in American culture that a mythology has formed around it. According to legend, both the Red Sox and the Chicago Cubs suffer from curses that doom them to postseason futility. The Sox were cursed when the team sold Ruth to the New York Yankees in 1919, but finally disposed of the “Curse of the Bambino” in 2004, beating the St. Louis Cardinals handily. In 1945 Sam “Billy Goat” Sianis, a local tavern owner, and his pet goat were denied entrance into Wrigley Field for Game 4 of the Series against the Detroit Tigers, causing him to curse the Cubs, and his “curse” has kept the team out of the series ever since. (The Cubs have not won a World Series since 1908!)

Fans outside Fenway Park in September 2004, the year the Boston Red Sox won the World Series.

Although some will argue that baseball is no longer the most popular sport in the United States, each October the World Series occupies a significant place in the American psyche and continues to provide cherished moments and heroes for a worldwide audience.

World University Games

The history of university sport can be visualized as three consecutive waves. The first wave originated with universities in the thirteenth century; the second wave coincided with the rise of the games ethic in pub-

lic schools in Great Britain in the nineteenth century and spread to the universities. This was the heyday of elite athleticism and amateurism, which inspired Pierre de Coubertin to found the modern Olympic games. The third wave started after World War I and led university sports into the turmoil of international sport contests and international politics. The University Games of 1959 in Turin, Italy, marked the beginning of yet another wave. From then on

there has been a gradual evolution of “amateur” student sportsmen and women competing with “professional” athletes in games with sometimes dubious university affiliations.

Founding Fathers of the Games

The first person to think of organizing international student sports was the English peace activist Hodgson Pratt (1824–1907), who founded the International Arbitration and Peace Association (IAPA) and chaired the Universal Peace Congress of 1890 in London. When Pierre de Coubertin (1863–1937) organized the 1894 congress in Paris that led to the founding of the International Olympic Committee, he invited Pratt to attend as an honorary member. Unable to be there, Pratt wrote to Coubertin and reminded him that he had proposed the idea of international student festivals, combining both sport and arts, at the Rome Peace Congress in 1891. The minutes of this congress describe Pratt’s proposal in this way: “That an annual conference and university fete of international fraternity be held successively at the seats of the great universities, including an international contest via gymnastics and similar exercises, and in contests of merit in poetry and prose on subjects relating to international concord and cooperation” (Anthony 1998).

In his educational zeal, Pierre de Coubertin tried to convince the leading circles of the European universities

to promote sport and physical education among their students as American universities were doing. During the IOC international congress on Sport and Physical Education in 1905 in Brussels, the following was proposed as recommendation 14: "The university should urge the students to join physical education societies and encourage such associations" (Comité International Olympique 1905, 187). However, a completely diluted version of the original recommendation was finally adopted: "The University should not ignore the physical activity of its students; but on the other hand it should not make it obligatory for them to frequent the gymnasium or the playing field" (Comite 1905, 233).

This weak statement might have been thought up by the university rectors of Brussels, Ghent, Liège, and Louvain, members of the honorary committee of the congress who probably did not want to be forced to change by congress recommendations. Before World War I, the majority of Louvain students preferred the playful atmosphere of traditional folk games such as popinjay shooting, curl bowls, jay bowls, or nine pins to more athletic efforts.

"Then came Jean Petitjean" is the opening line of Claude-Louis Gallien's 1999 biographical contribution to the history of university sport, and Jean Petitjean (1889–1969), a French chemist, is generally considered the father of the world university sports movement. At the first Student Congress of the postwar period, in 1921 in Strasbourg, he proposed the creation of a General Committee for Sports within the National Union of General Students Associations of France. It was under the aegis of this National Union that he organized the first International University Games in Paris in 1923. (See table 1 for a list of Summer and Winter World University Games from 1923 to 2005.) Petitjean wanted to call the first games "University Olympic Games," but Coubertin convinced him to change the name in order to reserve the term "olympic" for "his" Olympic Games.

Ten countries participated in the competitions, which included only track and field events, and Petitjean also invited "the world's fastest human," the American star

athlete Charlie Paddock. During these 1923 Games, an International Congress of University Sports was organized, which recommended the creation of an International University Sports Federation. The next year, the International Students Confederation (CIE) backed this idea and several important sport meets were organized between 1924 and 1939. After the competition in Paris in 1923, International University Games were staged in Warsaw in 1924, in Rome in 1927, in Paris in 1928, in Darmstadt in 1930, in Turin in 1933, in Budapest in 1935, in Paris in 1937, and in Monaco in 1939.

The first University Winter Games were organized in 1928 in Cortina d'Ampezzo, Italy. The three sports on the program were speed skating, figure skating, and cross country skiing. The 8th International University Games of 1939 in Monaco were interrupted by the start of the World War II. The participating students headed back home, where many of them became involved in the cruel war game.

The Cold War Split 1945–1959

One year after the end of the war, the International Union of Students (IUS) was founded in Prague to restore the tradition of the former International Students Confederation (CIE). Although during its very first meeting in 1946, some fundamental differences of opinion appeared among student leaders, particularly between the Marxist and the free unionist factions, the Physical Education and Sports Department of the IUS managed to organize the 9th World University Games in 1947 in Paris. Jean Petitjean was one of the initiators of these "reconciliation games," which were attended by about eight hundred students from seventeen countries.

However, in January of the same year, during the 7th University Winter Games in Davos, political incidents between students from both sides of the Iron Curtain disturbed the festive atmosphere. The increasingly overt leftist orientation of the IUS eventually evoked a reaction from the West and a dissident preparatory committee was created in Zurich. In December of 1948 in Luxemburg, seven Western countries (Belgium, France, Italy, Luxemburg, Monaco, The Netherlands, and

Switzerland) decided that they would create an independent Fédération Internationale du Sport Universitaire (FISU) if IUS would not change its Marxist course.

The situation worsened, and only one Western block country, France, participated in the 1949 Winter Games in Splinderuv Mlyn, Czechoslovakia. And when the 10th World University Games were held in Budapest in connection with the Youth Congress for Peace of the communist World Federation of Democratic Youth, only Belgium and France attended. However, because the IUS did not react to the 1948 Luxemburg motion, FISU considered itself legitimately established and organized rival Games in 1949 in Merano, Italy, the “International University Sports Week.”

After this, the split between East and West was considered a fact and FISU and the Physical Education and Sports Department of IUS organized their Summer and Winter University Games and Sport Weeks separately. Yugoslavia was expelled from the Kominform in 1948, and the IUS did the same with the Yugoslavian students in 1949. FISU was of course more than ready to offer the Yugoslavian sporting students a warm welcome: In the middle of the Cold War, FISU organized its 1955 Winter Sport Week in Jahorina, Yugoslavia, while the Summer Sport Week took place in San Sebastian, Spain.

At last, in 1957, on the 50th anniversary of the “neutral” French University Students Federation (UNEF), both FISU and IUS were invited to participate in the World University Games in Paris. Jean Petitjean was the travelling diplomat who man-

aged to bring both sides back together. Except for the virulent Asiatic flu epidemic, which scourged the Cité Universitaire, Petitjean’s reconciliation campaign was a success and the foundations were laid for the reunification of student sport

The Universiades and Primo Nebiolo, 1959–1999

“And then came Primo Nebiolo” could be the opening words of this section. During the first Universiade of the reunited FISU, Primo Nebiolo (1923–1999) from Turin had already revealed himself as the dynamic thriving force behind the local organizing committee. A few

months before the Turin Universiade, the former member countries of the IUS joined the FISU after several secret meetings, which had been planned by Jacques Flouret of France and Georges Oosterlynck of Belgium. It was the first time that the term *Universiade* was used, that the “starred U” flag was introduced, and that national anthems were replaced by the medieval student song *Gaudeamus igitur* during award ceremonies.

Although the new FISU was characterized by the peaceful co-existence of the former rival blocks, new difficulties loomed at the horizon. There were the “nostalgics,” who wanted to keep university sport small and cozy and far from the Olympic circuit and its ever-increasing professionalism. Flouret, for instance, organized the 1960 Winter Universiade in Chamonix at the very same time as the Winter Olympics were being held in

Poster of the 8th International University Games of Monaco in 1939. The events were interrupted by the beginning of World War I and the participants had to return home.

Squaw Valley, California. Other leaders wanted the Universiades to become as grandiose and philistine as the Olympic Games. During the Universiade in Sofia, Bulgaria, in 1961, FISU's founding president Paul Schleimer was replaced by the flamboyant and autocratic Primo Nebiolo. A comparative analysis of the Universiades and the Olympic Games between 1959

(Universiade of Turin) and 1996 (Atlanta Olympics) shows that the Universiades have gradually become "interolympics" in which top athletes meet and test each other in student camouflage. This analysis matched the names of the student athletes who were among the five best in their discipline at the Universiades against the names of the three medal winners in consecutive

Olympics. For instance, when the 1959 Turin Universiade was compared with the 1960 Olympic Games for track and field events, eight names reappeared: three men and five women. From 1959 to 1996, Eastern block countries outdid Western block countries with a success rate of, respectively, 241 versus 172 two-time-winners. The Eastern block countries dominated in track and field, gymnastics, fencing, and wrestling, whereas the Western countries were more successful in fancy diving, judo, and swimming.

When the number of two-time-winners was weighed in relation to the number of participants in the Universiades, the success rate varied between 0.65 (Sheffield 1991–Barcelona 1992) and 3.20 (Tokyo 1967–Mexico 1968). After Kobe 1985–Seoul 1988, the relative success rate of Universiade athletes in the Olympics dropped, probably due to the overt acceptance of professional athletes after the 1988 Olympics.

George E. Killian and International University Sports 1999–2005

When Primo Nebiolo died in 1999, he was succeeded by George E. Killian, an American who had served as president of the International Basketball Federation (FIBA) from 1990 to 1998 and who had been FISU First Vice President since 1995 and Vice President since 1987. Some old-timers thought that under the new leadership university sport would opt for less grandiosity and switch back to its origins in which there were real university games for real students. However, the new scenario turned out to be one of further differentiation, magnification, and professionalization.

Apart from the biannual Winter and Summer Universiades, more and more emphasis was now laid on the so-called World University Championships (WUCs). Student athletes met for the first time in a single World University Championship in 1962, and since then there have been 173 WUCs. These events are organized to ensure “continuity in our competition programme, since the Universiades take place in odd years” (New Identity 2004, 6). In 2002 eighty-three countries sent delegations and 4,228 students participated in 24 different WUC

competitions. The following new sports were introduced: shooting, floorball, matchracing (sailing), beach volleyball, and bridge.

For the Summer Universiade in Daegu, South Korea, in 2003, it was decided to include judo, archery, and taekwondo, three disciplines that were already regularly organized as WUCs. In 2004 twenty-seven World University Championships were scheduled in all parts of the world. The program now also included woodball (a kind of pall-mall), softball, rugby sevens, and water skiing. At the 22nd Winter Universiade in Innsbruck/Seefeld, Austria, in 2005, medals were for the first time awarded in ski cross. The Summer Universiade of 2005 in Izmir, Turkey, is proposing sailing, wrestling, taekwondo, and archery as optional sports. In 2007, the 23rd Winter Universiade will be hosted by Torino, Italy, and the 24th Summer Universiade by Bangkok, Thailand.

During a press conference in Zakopane at the 20th Winter Universiade in 2001, FISU President Killian said, “We can’t try to copy the Olympic Games programmes.

The most important factor for us is if students really practise a particular sport. Because Universiades are for students-sportsmen, not for professionals” (FISU 2001). This sounds anachronistic, since today most top athletes at the Universiades or World University Championships are professional athletes who happen to study or who are registered as students, and not university students who happen to practise a sport. At the 2003 Tarvisio Winter Universiade, a female Russian cross-country skier was disqualified because she had a positive drug test for norandrosterone.

In imitation of the IOC, FISU President Killian now also speaks of the FISU “family,” whereas the term “enterprise” might be more accurate. All in all, because of the democratization of higher education on the one hand and the increasing professionalization and internationalization (globalization) of sport on the other hand, more and more Universiade athletes and their coaches have not the slightest idea what the Latin medieval song *Gaudeamus igitur*, which replaces the national anthems at the Universiades, might mean.

Wrestling

Wrestling is a contact sport in which the objective of participants is to take down their opponent by using holds that involve placing both of the opponent's shoulders in contact with the mat (called a “pin” or “fall”). Although the objective may seem simple, accomplishing it requires effort and skill.

Origins

Wrestling is one of the world's oldest sports. Its history extends back thousands of years to the development of the first great empires around the Mediterranean Sea, in the valleys of the Nile and Euphrates Rivers, and in India and China. Scholars believe paintings from Egypt from about 3000 BCE to be the oldest evidence of the sport. Stories and legends handed down by the early poets and storytellers tell of wrestling in ancient Greece. In the *Odyssey* the ancient Greek poet Homer gives accounts of wrestling matches back to the eighth century BCE, including a story of a wrestling combat between Odysseus and Ajax with Achilles as referee. From the Roman empire the oldest evidence of wrestling is found in wall paintings that date from the fifth century BCE.

Rules and Play

Wrestlers are divided into classes based on gender, age, and weight. Wrestlers weigh in the day before a competition. Three referees are needed, each having their

“Wrestling Holds” By Grantland Rice

The Headlock is no way I'd choose
To try to chase away the blues;
If I was quite depressed and flat
I hardly think I'd seek a mat
And hire some human bracing-bit
To squeeze my skull until it split.

The Toehold, with its warping trend,
Is not the way I'd pick to spend
A happy, cheerful afternoon
In January or in June.
While twisted toes may cop the pelf,
I'd rather wiggle mine myself.

The Scissors may be worth a run,
But I can think of better fun
Than letting Stecher play the snake
Unto my abdominal ache,
The while he wraps his legs around
My cracking ribs on mat or ground.

Though here and there I strike a scale,
I do not get the wrestler's kale;
But I had rather keep instead
My uncracked toes and ribs and head;
For when through working I prefer
To have my bones just where they were.

own tasks. According to the standardized value system, wrestlers are rewarded for the holds they use to take down their opponent. The holds are rated as more or less difficult and also are rewarded differently. Points are awarded for each rewarded hold. A match is terminated when one wrestler is ten points ahead or when time runs out. The wrestler with the most points wins and must have at least three points to win a match. The International Federation of Associated Wrestling Styles (FILA, www.fila-wrestling.com), the governing body, continually revises the rules.

A wrestler needs minimal equipment: light, soft-soled boots and a wrestling costume, generally a singlet.

Some wrestlers also use a mouth guard, knee pads, or headgear.

About two hundred forms of wrestling exist. The freestyle and Greco-Roman forms have been dominant in Europe, and freestyle is the most common in the United States. Greco-Roman and freestyle dominate amateur competition.

Freestyle

In freestyle wrestling competitors use a wide variety of holds on the upper body and legs; competitors cannot grasp the opponent's clothing to secure a hold. The modern sport, which is practiced in the Olympic Games, the World Games, and competitions of the National Collegiate Athletic Association (NCAA) and Amateur Athletic Union (AAU), represents a tradition thousands of years old and manifested worldwide. The tactics, heroes, and lore of freestyle wrestling have had considerable impact on literature, art, and history.

Some types of freestyle wrestling practiced today appear to be descendants of ancient forms. The Nuba of the lower Sudan have held wrestling festivals for centuries, if not for millennia, and continuity seems to exist between the costumes of the Nubian wrestlers seen in Egyptian sculpture and the gourd-strung skirts that Nuba wrestlers still wear. A popular folk wrestling of India performed on a mud surface also continues an ancient tradition. Freestyle wrestling has been popular in Great Britain for centuries, and the Lancashire style in particular has had a great influence on modern wrestling. In this style, often called “catch as catch can,” contestants begin standing and continue the bout on the ground if neither contestant scores a fall from standing.

In the United States after the Civil War freestyle wrestling spread quickly, and by the 1880s its tournaments drew hundreds of contestants. Urbanization, industrialization, and the closing of the Western frontier formed the context in which this combat sport—along with boxing—became popular. A professional circuit, not corrupted by the theatrics of later years, emerged during this era, as did amateur organizations: About the time of the first New York Athletic Club wrestling

A wrestling match at the Pan American Games.

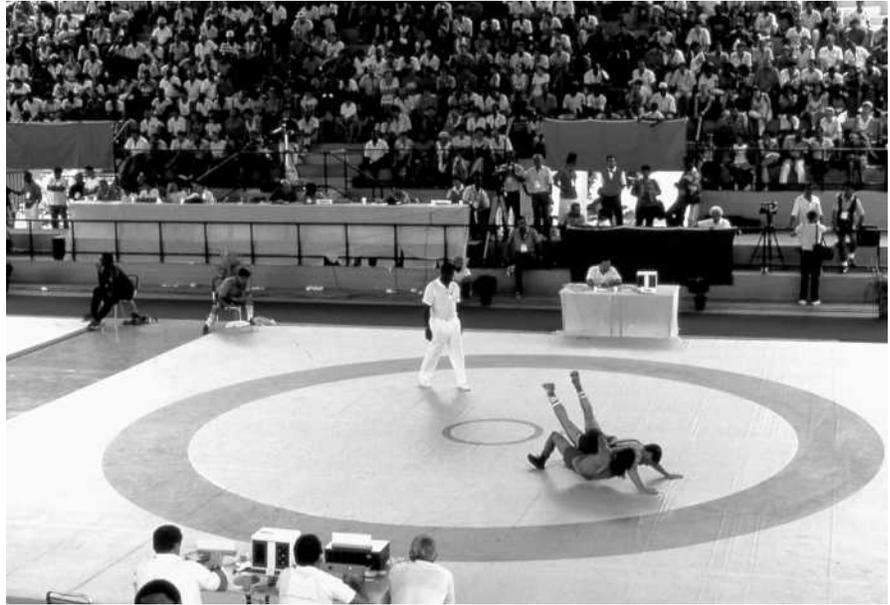

tournament in 1878, professional championship bouts offered purses of up to \$1,000.

From the earliest years FILA and intercollegiate rules stressed the safety of competitors. Tactics and holds that jeopardize life or limb or that punish the opponent, rather than gain leverage, have been consistently illegal. These tactics and holds include strangleholds, the full nelson, twisting hammerlocks, the flying mare with the opponent's arm locked, and slamming the opponent to the mat. Modern rules have gone further in banning virtually any hold that pressures a joint in a direction contrary to its natural movement.

Greco-Roman

Greco-Roman wrestling is governed by all the rules and procedures of freestyle wrestling, but contestants may not take holds below the waist or even use their legs actively in holds; thus, the leg takedowns and trips fundamental to freestyle wrestling are prohibited. The arm drags, bear hugs, and headlocks of freestyle wrestling, on the other hand, are a central part of Greco-Roman wrestling. Far from creating a dull contest, the restriction of holds to the upper body has encouraged the use of a spectacular series of throws called "souples," in which the offensive wrestler lifts the opponent in a high arch while falling backward to a bridge on his or her own neck and bringing the opponent's shoulders into contact with the mat. Even in wrestling on the mat (*par terre*), the Greco-Roman wrestler must seek body-lock and gut-wrench holds to turn the opponent for a fall. The ability to arch backward from a standing position onto one's own neck confidently and safely while lifting and turning the opponent to the mat is crucial. Rules prohibit stalling, and after fifteen seconds of inconclusive action, a bout must resume with both wrestlers standing in a neutral position and working toward a throw.

Despite its name, Greco-Roman is not an ancient form of wrestling but rather is mainly a development of

nineteenth-century Europe, where it achieved popularity as an amateur and professional sport and appeared in the first modern Olympics in 1896 in Athens, Greece. It maintains its popularity today, especially among wrestlers in Europe and the Far East.

The formalization of the elements of Greco-Roman wrestling into today's sport is a recent phenomenon. Sixteenth-century drawings of wrestling ascribed to Albrecht Durer and Fabian von Auerswald's *Wrestler's Art* depict leg holds inadmissible in Greco-Roman wrestling today, suggesting that freestyle, rather than Greco-Roman, was the main form of wrestling of that era.

Despite the similarities of Greco-Roman to several British forms of wrestling and its promotion by William Muldoon in the United States after the Civil War, the sport never achieved lasting popularity in the English-speaking world, yielding to the more unstructured freestyle form. Greco-Roman wrestling appeared at the first modern Olympics, where three contestants competed in the heavyweight class, with Karl Schuhman of Germany winning first place over Georgios Tsitas of Greece. Freestyle wrestling, by comparison, did not appear in the Olympics until the 1904 games in St. Louis, Missouri.

Wrestling in an Asian Indian Folktale

In an ancient village by the Simsang River Chela Asanpa came across a very strong man who was sitting in an open courtyard of his house making bamboo-threads out of big wahnok bamboos by splitting open the thick stiff nodes with his mere hands. The strong man welcomed Chela Asanpa cordially, killed a fatling bull for him and entertained him with food and drink. After he had dined Chela Asanpa said to his host:

I have heard much about you and so have come to wrestle with you. If you defeat me in a wrestling bout, you will have to come over to my village with your milam and spi for a duel. First, I shall entertain you with a grand feast in my house. Then we shall go to the village proper where we shall fight our duel with our milams and spis. If you are defeated you must leave your head with me. If I lose, you shall have my head to bring home here as a trophy. However, if you are defeated in our wrestling bout tomorrow, I shall leave you in peace as a man of no account to me. Do you agree?

The strong burly man of the ancient village readily agreed. The next day the two contestants cleared a site on the plain, loamy soil near the bank of the Simsang River. They together bathed and ate their meal. Then they began their wrestling contest in the clearing which they had earlier prepared. It was a titanic struggle, each holding the other in deadly grips, and trying his utmost to hurl the other down. What a spectacle they presented, these two enormously strong men clenched in each other's ironlike arms, straining their immense muscles, bending their huge bodies in an effort to fling and floor each other! At times they appeared like lifeless statues on pedestal,

so immovable they stood, though at such moments they were utilizing their full physical capacity to cause each other to give way. They sank deep into the loamy soil in the midst of their tremendous struggle. All about the ground was drenched with their perspiration. Hour followed hour. The sun stood on the western horizon, and the two mighty giants wrestled on continuously without one being able to floor the other. Both were by now almost utterly exhausted. Finally, exerting all his strength Chela Asanpa made one last vigorously desperate attempt to hurl his opponent down on the ground and succeeded. The colossal contest was over.

The victor and the vanquished praised each other's performance. Hand in hand they went down to the river to bathe. After that the strong man of the ancient village killed a seven-year old castrated pig for Chela Asanpa, procured a good deal of rice-beer, and dined with his conqueror until late at night. In the morning the host killed thirty-two cocks and twelve hens in the name of Chela Asanpa for the purpose of divining the future of his guest. After examining the entrails of the cocks and hens he said to Chela Asanpa:

My divination indicates that you will go on vanquishing all whom you encounter and that you will never allow your head to fall into the hands of an enemy. However, you will die a natural death at a ripe age, full of honour and fame. Your name and fame will remain in the mouths of our descendants for generations to come. Now, friend, take your full share of our customary Achik hospitality.

recently have women been welcomed by the international wrestling community and by the sport in general but still not on equal terms with men. That competitions are being organized for women and men together is a sign of progress in women's wrestling.

The history of women's wrestling in ancient times is largely unrecorded, but some documentation exists. This documentation suggests that wrestling between virgins of noble heritage was related to religious ceremonies. From Greek myths the legend of Atalanta is the best known through a vase painting from the

Wrestling in Hawaii

Wrestling was also practised by the more athletic youth, as a preparation to the single combats usual in almost every battle. Sometimes they had sham fights, when large numbers engaged, and each party advanced and retreated, attacked and defended, and exercised all the manoeuvres employed in actual engagement. Admirably constituted by nature with fine-formed bodies, supple joints, strong and active limbs, accustomed also to a light and cumbersome dress, they took great delight in these gymnastic and warlike exercises, and in the practice of them spent no inconsiderable portion of their time.

fifth or sixth century BCE, illustrating her grappling with Peleus.

As wrestling developed during the twentieth century, contests were organized professionally and held in circuses or in traveling booths, both in the United States and Europe. Most participants were men, but women were also allowed to perform. Between World War I and World War II women wrestlers became popular in several countries, but most women wrestlers were aware that the crowds came for the novelty: to see women wrestle. The matches, including mud wrestling, were mostly gimmicks.

Although participation by women has increased, women's wrestling remains controversial. The sport's physical requirements and great degree of body contact link it with masculinity; thus, many people still consider wrestling to be inappropriate for women. Therefore, as women's wrestling developed during the 1970s, 1980s, and 1990s, the athletes experienced barriers both in the sport and in daily life.

During the 1970s women's wrestling was largely practiced in European countries such as Belgium, France, and Norway. However, during the 1980s the sport began to

develop on other continents. FILA established the first commission for women's wrestling in 1983.

Effects

Advocates of wrestling emphasize that it offers wholesome physical and mental exercise and is one of the best sports for developing physical fitness: It improves balance, builds muscle tone, and develops agility, quickness, flexibility, and power. It also may develop positive personality characteristics such as determination, courage, self-confidence, and self-reliance.

Injuries are common, but they are seldom serious. Use of protective equipment can reduce some injuries; for example, head gear protects against cauliflower ear, which is an ear that, after many falls, becomes deformed by fluid accumulation under the skin that has calcified.

Competition at the Top

In the 2004 Olympics at Athens, women gold medal winners were: freestyle, 48 kilograms, Irim Merleni, Ukraine; 55 kilograms, Saori Yoshida, Japan; 63 kilograms, Kaori Icho, Japan; and 72 kilograms, Xu Wang, China. Men gold medal winners were: men's freestyle, 55 kilograms, Mavlet Batirov, Russia; 60 kilograms, Yandro Miguel Quintana, Cuba; 66 kilograms, Elbrus Tedeyev, Ukraine; 74 kilograms, Buvaysa Saytieyev, Russia; 84 kilograms, Cael Sanderson, United States; 96 kilograms, Khadjimourat Gatsalov, Russia; 120 kilograms, Artur Taymazov, Uzbekistan; men's Greco-Roman, 55 kilograms, Istvan Majoros, Hungary; 60 kilograms, Ji Hyun Jung, South Korea; 66 kilograms, Farid Mansurov, Azerbaijan; 74 kilograms, Alexandr Doktorishvili, Uzbekistan; 84 kilograms, Alexei Michine, Russia; 96 kilograms, Karam Ibrahim, Egypt; and 120 kilograms, Khasan Baroev, Russia.

Wrigley Field

Wrigley Field is the home of the Chicago Cubs baseball team and is the second-oldest ballpark in the majors. Only Boston's Fenway Park, opened in 1912, is older. It was built as the home of the Chicago Federals, later Whales, of the just-established Federal League by team owner Charlie Weeghman, at the cost of an estimated \$250,000. It opened on April 23, 1914, as Weeghman Park and was also known as the North Side Ball Park, as the first ball park built on Chicago's North Side. When the Federal League folded two years later, Weeghman and his ten partners bought the Chicago Cubs of the National League and moved them to Weeghman Park. One of Weeghman's partners was the chewing gum king, William Wrigley Jr., and by 1919 Wrigley had bought out the other partners, including Weeghman. In 1920 the field was renamed Cubs Park and then in 1926 renamed Wrigley Field in honor of the owner. In 1914 the park had a capacity of 14,000 that was expanded over the years to its current

capacity of 38,902 in 1998, small by current stadium standards. The field is also relatively small and play is affected by onshore or offshore Lake Michigan winds, favoring either the hitter or pitcher, respectively.

In 1937 outfield bleachers were added as was the scoreboard, which continues to be manually operated and has yet to be hit by batted ball. Both were added by baseball executive and innovator Bill Veeck. He also had Japanese and Boston ivy planted along the centerfield wall. The ivy thrived, giving the wall a unique appearance among major league stadiums. Among other Wrigley Field firsts were the first permanent concession in a baseball stadium (1914), allowing fans to keep foul balls, and throwing opposing team home run balls back on to the field. At the end of each game, a flag signifying a win or lose is flown from a center field flag pole—either a white flag with a blue W or a blue flag with a white L. Another feature is the custom of fans watching the game from the rooftops of houses on Waveland and Sheffield avenues.

Let There Be Lights

Until August 8 1988, Wrigley Field did not have lights and 5,687 consecutive day games had been played there. Wrigley had planned to install lights for the 1941 season but instead donated them to the government for use during World War II. Lights were finally installed over the objection of some residents in the Wrigleyville neighborhood under pressure from Major League Baseball and the Cubs management, who threatened to leave the stadium. The Cubs have played in six World Series at the field, but lost all six. The most famous event associated with Wrigley Field is Babe Ruth's "called shot" home run off of Charlie Root in the 1932 World Series. Ruth did make a hand gesture to the outfield before hitting Root's pitch into the bleachers, although it is not clear what he meant by the gesture. Among the great players who performed at Wrigley Field are Cubs shortstop Ernie Banks, third baseman Ron Santo, and outfielder Billy Williams. All three are honored by flags that hang from the foul poles displaying their uniform numbers, 14, 10, and 26.

Wrigley is also associated with a unique cast of off-the-field characters, including a group of regulars in the

bleachers about whose antics the play *Bleacher Bums* was written; William “Billy Goat” Sianis, a Chicago restaurant owner who put a “curse” on the Cubs when he and his goat were asked to leave a 1945 World Series game; and popular play-by-play announcer Harry Carey.

The Future

Like the other old ballpark, Fenway Park in Boston, Wrigley Field retains its appeal as a stadium that reflects an earlier era of baseball that has resisted destruction and desertion. Cubs fans are hopeful that the Red Sox’ winning the World Series in 2004 is a sign that their long World Series drought—dating back to 1908—will end soon as well.

Wushu

Wushu is the Chinese martial arts, ranging from their origins in early Stone Age cultures to the martially inspired arts practiced today. The word *wushu* is composed of two characters: *Wu* is associated with

military and warfare; *shu* with the skill or methods of performing an activity.

The word *gongfu*, or *kung-fu*, often used in the West to refer to Chinese martial arts, is actually composed of two Chinese characters that refer to the time and effort required to accomplish any human activity.

Development

Chinese martial traditions evolved with social and technological changes during China's history. Martial arts required a variety of defensive and offensive specializations, from basic hand-to-hand combat to complex techniques of large-scale warfare. Although composed primarily of martial arts, wushu has long been associated with meditative exercise, physical conditioning, dance, drama, and competitive exhibition. Wushu developed as an important element of China's culture and influenced the martial traditions of neighboring countries and eventually the rest of the world.

The Chinese martial arts grew out of people's need for protection against other people and dangerous animals. As Chinese society became more complex, so did its martial systems. The first martial systems used the body parts most appropriate for the task: feet, hands, knees, elbows, and head. Rudimentary skills were supplemented by the use of farming and hunting tools made of wood and stone, including the spear, club, and knife. As people developed the basic technology and began to use metals, a range of weaponry became available. Chinese society came to place more emphasis on warfare, and the martial arts became a specialized profession for many people. However, with the advent of modern firearms in China, people began to practice traditional martial arts more as forms of sport and exercise.

Today such martial arts enjoy a growing popularity throughout the world. Although people practice them in all cultures, martial arts of Asian origin are the better known because of their sophisticated repertoire of techniques coupled with philosophies of self-cultivation. The histories of the most popular Asian martial arts in-

dicating a strong Chinese influence. For example, Okinawan karate developed from China's Fujian Province, and the founder of Korean taekwondo studied wushu while serving in the military in Manchuria. The martial arts in Japan, Korea, and Indonesia were influenced by encounters with Chinese people during trade, immigration, and war. Knowledge of Asian martial arts likewise spread to the rest of the world, the movie industry being the most significant popularizer.

Basic forms of Chinese martial arts developed during early Neolithic (relating to the latest period of the Stone Age characterized by polished stone implements) times as products of a survival instinct. They also provided entertainment, as in games of "head butting" in which contestants wore animal horns. By the Zhou dynasty (1045–256 BCE), wushu had reached an advanced level. Excavations of the period have uncovered arms and armor, including halberds, spears, chariots, bows, arrows, swords, helmets, and knives. Other artifacts indicate not only sophisticated military organization, but also a culture in which martial arts were valued for their role in securing or maintaining political stability. The crossbow and iron weapons came into use during the fifth century BCE, ushering in new forms of martial arts. Military treatises, such as Sun Tsu's *The Art of War*, detailed military tactics and maneuvers that people still study today.

During later centuries China remained the apex of refined culture, and surrounding countries looked to it for inspiration and knowledge. However, with China's cultural advances came threats of invasion by people seeking its riches. Likewise, internal conflicts erupted because of inevitable social inequities that developed among economic groups. China's history flows through dynastic cycles during which imperial armies fought invading barbarians and/or native rebels. Such turmoil taught the Chinese to rely on martial arts as a security measure. Those people who possessed the most advanced systems felt that they had an advantage in protecting their empire, clan, or family. Therefore, martial arts systems were highly secretive and taught only to selected people.

*Winners never quit and
quitters never win.* ■ UNKNOWN

Effective Systems

The martial arts systems reflected the social positions and concerns of their creators. For instance, the imperial army developed martial arts for large-scale military engagements. Such arts often focused on long-range weapons, such as the crossbow. Their maneuvers usually required a fast cavalry to execute their objectives. However, sometimes the imperial political-military structure collapsed, leaving the commoners to fend for themselves. Other groups developed their own martial arts systems, often organizing themselves around a common bond, be it social, linguistic, or philosophical.

Because talented people were credited with creating specific martial arts systems, their families often retained control of such knowledge by passing it down from generation to generation. Their concerns were primarily for the security of family and clan. Their limited resources kept their focus on developing skills that a fighter could use, including in the use of weapons such as spear, sword, and knife. They often fought against individuals or small groups, so open-hand boxing skills were also important.

Martial arts styles were usually named for the people, places, or philosophical ideas associated with them. A few hundred Chinese styles exist, but many more styles and substyles have yet to be categorized. For the sake of simplicity, experts sometimes place martial arts styles into general categories, such as northern-southern, internal-external, or Taoist-Buddhist, and sometimes according to their place of origin.

The association of some Chinese martial arts with temples is of special importance. During times of turmoil, people often used temples as places of refuge. Such temples attracted people from all segments of Chinese society, including martial arts experts who came to live together, often comparing their knowledge. Some temples, such as Shaolin, became “universities” where experts contributed to the evolution and preservation of martial arts.

The rise of modern weaponry has led to the extinction of some martial arts traditions. Nonetheless, many

martial arts remain popular in China because, in part, of their pervasive presence in Chinese culture. Their historical importance has been the subject of many literary endeavors, including a martial arts genre. As moving art forms, the martial arts are living expressions of their developers’ creativity. People also value martial arts forms for their therapeutic benefits. In China the majority of people who practice martial arts do so primarily for such benefits. However, people also practice martial arts in theatrical productions, self-defense classes, entertainment industries, meditative practices, military training programs, and sporting events.

In China today modern forms of entertainment are relatively limited. Computers, televisions, and electronic games, for instance, are luxuries that relatively few people can afford. Modern health care is also limited because of high costs. Wushu, as a form of sport and exercise, is an attractive alternative. Martial arts exhibitions have a long tradition in China. Competitions are featured at the national level. International teams also have been formed. Routines standardized by government regulations are taught in martial arts schools and in colleges that have wushu departments.

Competitive martial arts exhibitions have transformed traditional solo routines by incorporating gymnastic elements to achieve greater visual effects. Matches between individuals, usually judged on a point system, limit the type of techniques used. Overall, martial arts sports have adapted elements from traditional systems, thus presenting only one aspect of what martial arts entail. Financial and political concerns increasingly play a role in martial arts as world participation in Asian martial arts increases.

The Future

Today people practice wushu for a variety of reasons in all parts of the world. Some people see wushu as a violent activity and thus are either attracted to it or seek to suppress it. Martial arts sports are popular with people who enjoy competition. Such competition ranges from full-contact bouts with no rules to no-contact tournaments with rules to prevent injuries and ensure fair-

ness in judging. However, problems continue to plague martial arts sports because no one internationally recognized system for teaching, ranking, or judging exists.

Still other people desire to learn martial arts for the physical and psychological benefits. More than ever people are attracted to wushu not simply as a physical activity but as a way of self-discovery. Therefore, despite its organizational disarray as a sport, wushu will increase in popularity.

X Games

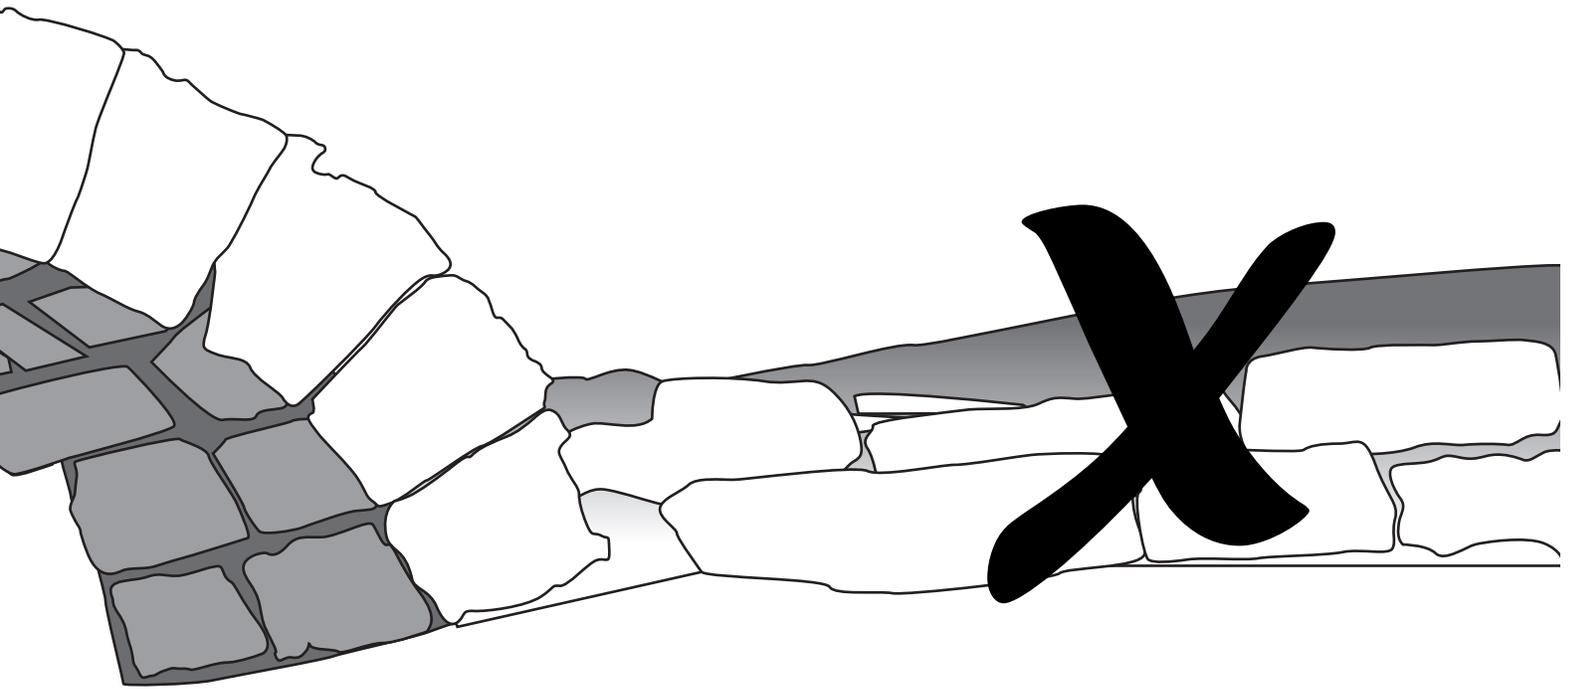

X Games

The concept of competition, whether athletic or otherwise, is universal; it crosses all language and cultural boundaries and can serve to unite an entire country, as it often does with the Olympic games. There exists, however, an even greater desire to test the human spirit, to push farther and expand the boundaries of athletics. Conventional sports are giving way to a new breed where adrenaline runs freely and the more extreme athlete goes home with the gold medal. The venue for this risk-taking, thrill-seeking, extreme athlete is the X Games.

History of the X Games

In 1993, Entertainment Sports Network Programming Director Ron Semiao envisioned a competition for extreme-sports athletes. Prior to this, organized athletic events were limited to traditional sports. With the growth of extreme sports in the last two decades of the twentieth century, the opportunity existed to create an outlet for the extreme and alternative athlete. After two years of preparation, ESPN successfully staged the first Extreme Games in Newport, Providence, and Middletown, Rhode Island, and in Mount Snow, Vermont, from 24 June through 1 July of 1995; 198,000 spectators attended. Nine sport categories were included, with such events as BMX/stunt bike, barefoot water-ski jumping, bungee jumping, in-line skating, kite skiing, mountain biking, skateboarding, sky surfing, sport climbing, street luge, windsurfing, and X Venture Race.

The success of the first Extreme Games and an enthusiastic response by the athletes, sponsors, and spectators encouraged ESPN to organize a second Extreme Games in 1996.

In January of 1996, the name Extreme Games was officially changed to X Games. Altering the name gave ESPN the ability to more easily market the games to international viewers and allowed for better branding opportunities. In April of 1996, the first X Games Road Show traveled throughout the United States, bringing a two-day interactive expo to twelve cities, including Boston, San Francisco, and Miami. In June of the same year, beneath the shadows of ancient temples, the first international exhibit took place in Shanghai. Spectators were treated to demonstrations of bicycle stunts, in-line skating and skateboarding. These demonstrations shadowed X Games II, held in late June before 200,000 spectators.

Winter X Games

The growing popularity of the X Games encouraged ESPN to organize the first Winter X Games. From 30 January through 2 February 1997, at the Snow Summit Mountain Resort in Big Bear Lake, California, spectators had the opportunity to watch extreme athletes compete in ice climbing, shovel racing, snowboarding, snow mountain bike racing, and a multisport crossover event.

Growing Popularity

Since the inception of the X Games in 1995, both men and women have had the opportunity to compete, and

1996 saw the beginning of international exposure and eventual participation in the X Games themselves. In 1997 the annual tradition of both winter and summer X Games began. In April of 1998, the first international X Games, the Asian X Games, were held in Phuket, Thailand, and featured two hundred athletes competing for spots in X Games IV in San Diego. X Games IV attracted 233,000 spectators, and there were nearly 275,000 spectators at X Games V.

The popularity of the games continued to increase, both within the United States and across the globe. In November of 1999, the first Junior X Games were held in Phuket, Thailand, attracting action-sports athletes between the ages of eight and fourteen. Within four years, the Asian X Games led to the development of the Junior X Games and, in March of 2002, the beginning of the Latin X Games. In July of 2002, the European X Games were held.

The global expansion of the X Games continued in May of 2002 with a new event, the X Games Global Championship. The premise of the Global Championship is that six world teams will compete against each other in a four-day competition, with both winter and summer X Games events. The events included are skateboard, bicycle stunt, Moto X, aggressive in-line skate, snowboard, and ski. Team USA edged out Team Europe to win the inaugural X Games Global Championship. Since 2002, the X Games have continued to grow in popularity. These extreme sports, once on the fringe, are finding their way into mainstream sport entertainment and international competition.

X Games Journalism

Just like the Games themselves, X Games journalism is breathless, exciting, and over the top. The extract below is part of an EXPN.com recap of the top ten moments of the 10th X Games, held in Los Angeles from 5–8 August 2004.

The first stop on the X Games X recap tour is the mammoth, monster, mother-of-all, behemoth drop-in, take your pick, shoot the gap, then trick-it-up-on-the-pipe mega ramp. The X gods pulled out all the stops for the 10th-anniversary edition and constructed the ultimate playground for six skateboard crazies.

The big lady featured a choose-your-own-adventure: a 50- or 70-foot roll-in that launched you over either a 50-foot gap or a 70-foot gap for he with stones. If you landed it, you were launched NOT-ever-so-gently into the 27-foot quarterpipe.

This is NOT for the faint of heart. Although the master of this monster—Mr. Danny Way—has a serious heart condition . . . an abnormal excess of heart. The 30-year-old vet from Encinitas, CA, was the only guy who dared drop in from the tipity top and he landed it Christ-air style.

Significance of the X Games

Extreme sports were neither developed for the purpose of entertainment nor for competition. The athletes that chose to participate in extreme sports did so for their own pleasure. Competition was not a prime motivator. Individual style was encouraged. Setting personal records was desired. These athletes were thrill seekers looking to push the limits of their own bodies and the boundaries of their sports.

The athletes who pursue extreme sports are men and women, adults and youth, who live in different countries throughout the world. The adrenaline rush and high risk of their event is what brings these athletes together. The development of the X Games gives these athletes a stage and a greater chance to improve themselves and push these extreme sports further than ever imagined. The X Games are the showcase for broken records and sometimes broken bones but also for never-

before-seen tricks such as Tony Hawk's "900 degree turn" in skateboarding or for the "Body Varial" in Moto X. The X Games encourage the development of and increased participation in extreme sports.

In August of 2001, ESPN helped to create skate parks designed to give an authentic X Games experience to anyone using it. Designed by the industry's top course designers, these public facilities offer skateboarding, bike stunt riding (BMX), and in-line skating ramps and props. These parks are currently located in five major metropolitan markets: Atlanta, Dallas, Denver, Philadelphia, and St. Louis.

The Future

Since the X Games were first introduced in 1995, the growth of extreme sports has been incredible. Athletes across the United States, Asia, South America, and beyond have taken sports originally considered to be too

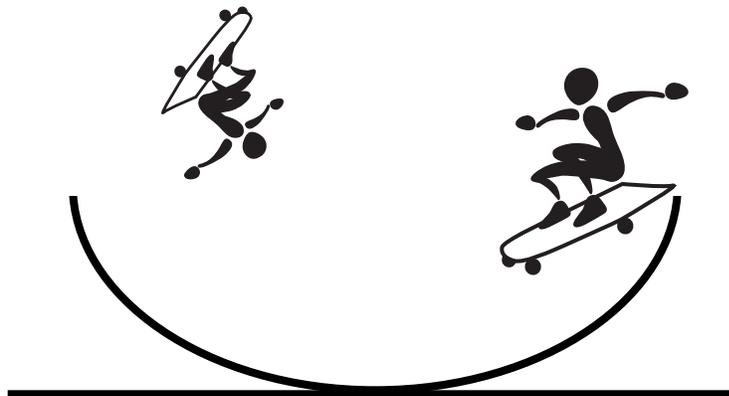

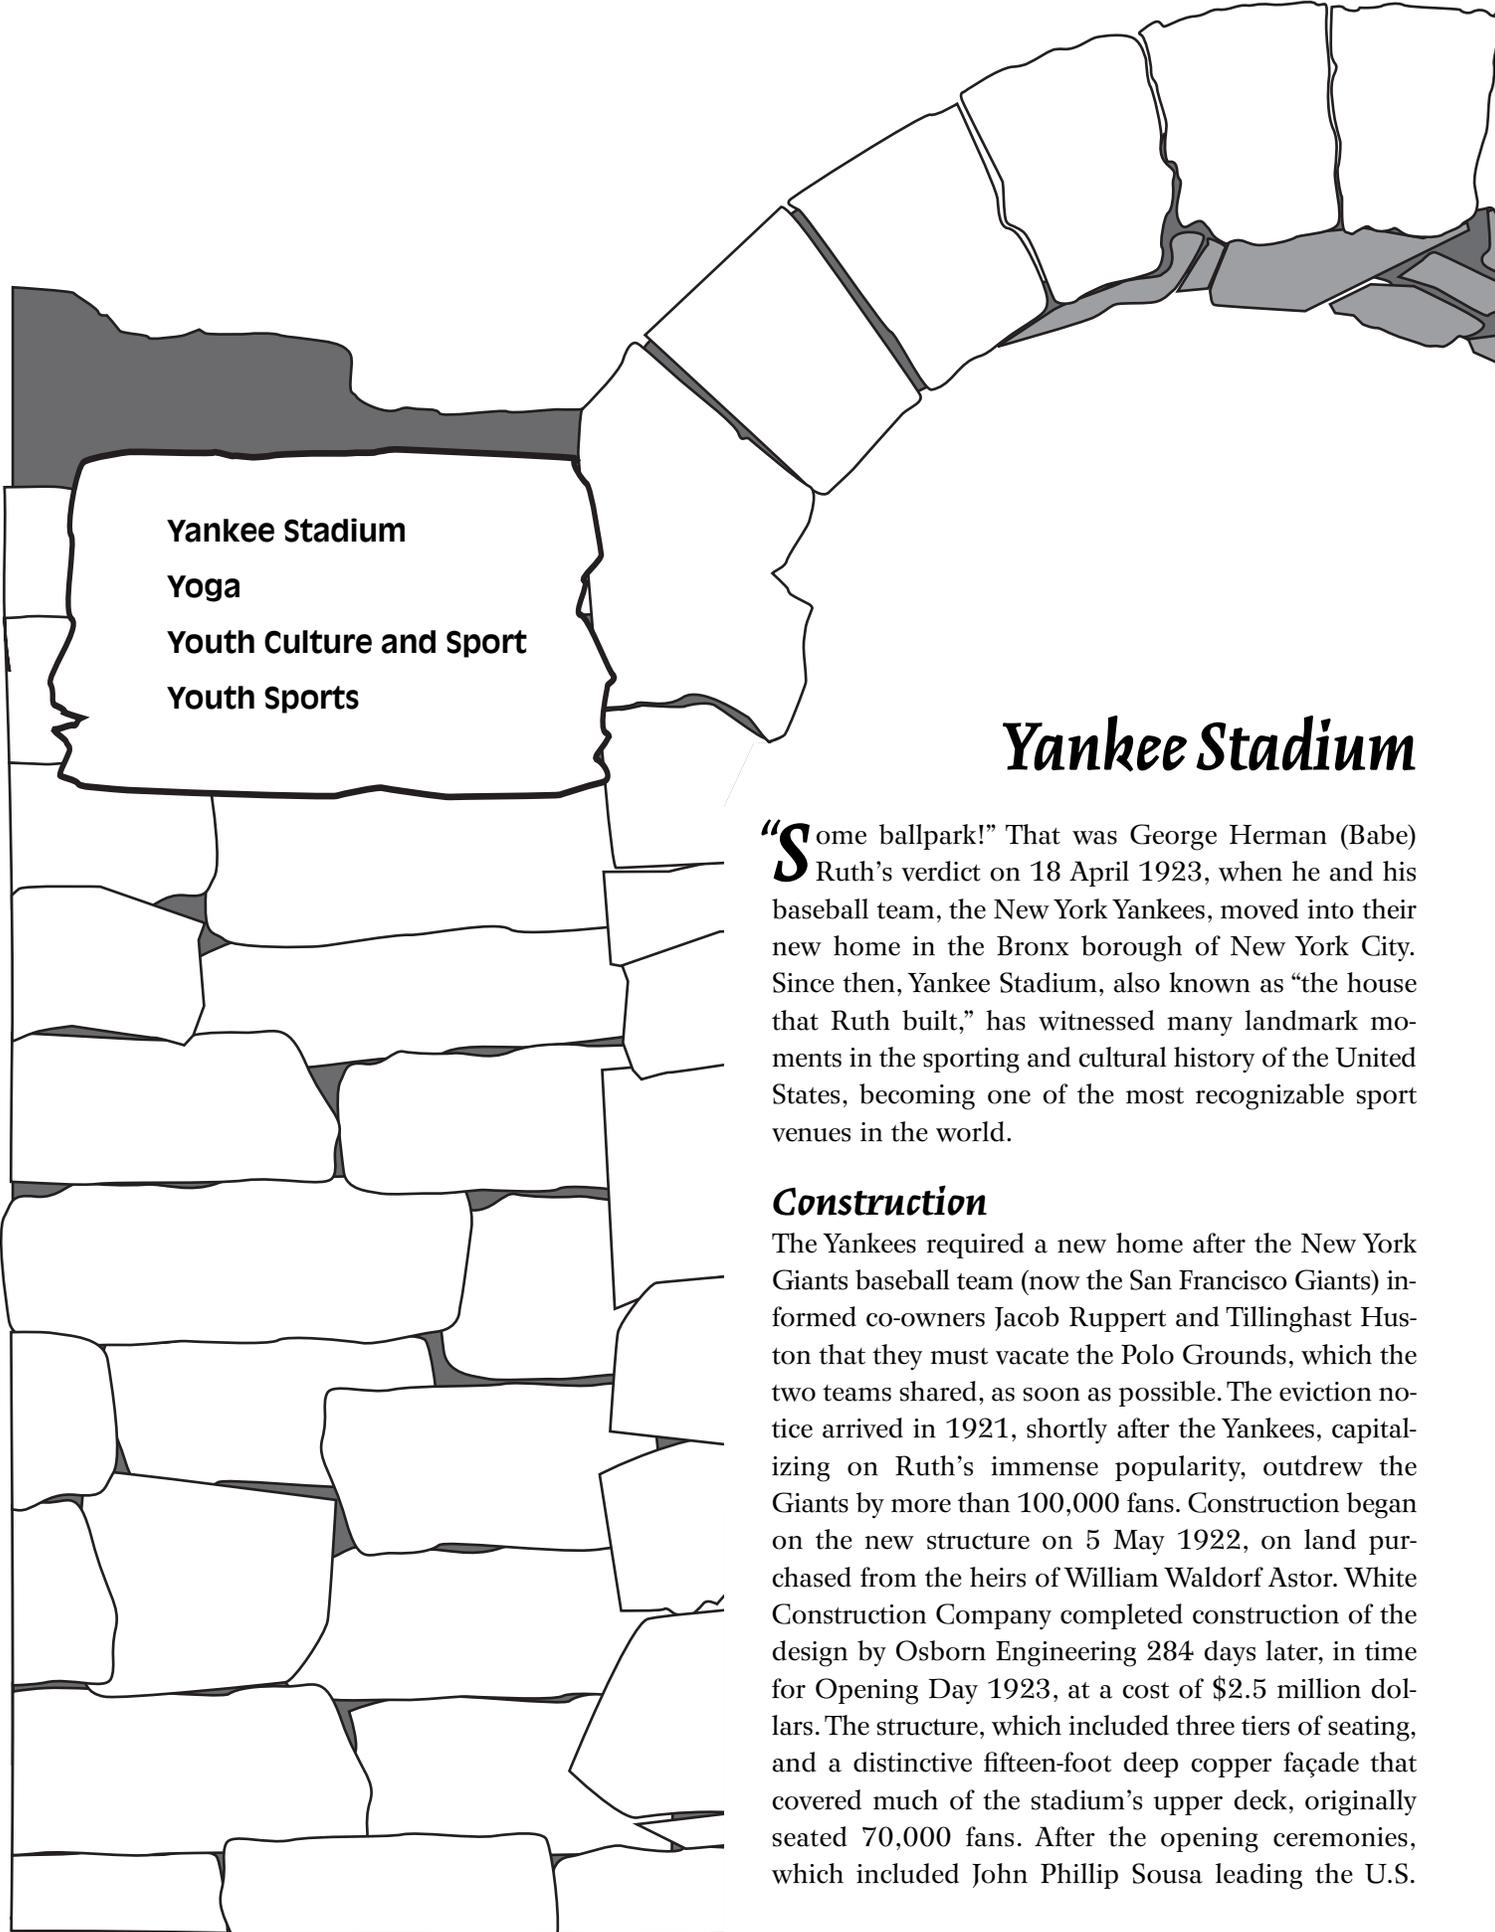

dangerous and helped them to become a source of entertainment and an important part of the sport culture of the late twentieth and early twenty-first centuries. With the help of its athletes and its fans, the X Games will continue to grow and expand as the sports become more extreme and as its athletes remain determined to push their limits.

Yankee Stadium

“Some ballpark!” That was George Herman (Babe) Ruth’s verdict on 18 April 1923, when he and his baseball team, the New York Yankees, moved into their new home in the Bronx borough of New York City. Since then, Yankee Stadium, also known as “the house that Ruth built,” has witnessed many landmark moments in the sporting and cultural history of the United States, becoming one of the most recognizable sport venues in the world.

Construction

The Yankees required a new home after the New York Giants baseball team (now the San Francisco Giants) informed co-owners Jacob Ruppert and Tillinghast Huston that they must vacate the Polo Grounds, which the two teams shared, as soon as possible. The eviction notice arrived in 1921, shortly after the Yankees, capitalizing on Ruth’s immense popularity, outdrew the Giants by more than 100,000 fans. Construction began on the new structure on 5 May 1922, on land purchased from the heirs of William Waldorf Astor. White Construction Company completed construction of the design by Osborn Engineering 284 days later, in time for Opening Day 1923, at a cost of \$2.5 million dollars. The structure, which included three tiers of seating, and a distinctive fifteen-foot deep copper façade that covered much of the stadium’s upper deck, originally seated 70,000 fans. After the opening ceremonies, which included John Phillip Sousa leading the U.S.

Army's Seventh Regiment band, 74,200 fans watched Ruth hit a three-run homer to defeat his old team, the Boston Red Sox, 4–1.

Innovation and Renovation

Many innovations baseball fans take for granted originated at Yankee Stadium:

- Yankee business manager Edward Barrow marked the distances from home plate on the outfield walls, which under the original design measured 281 feet in left, 295 feet in right, and 487 feet in center field.
- In 1946, Yankees president Larry McPhail installed lights so the Yankees began playing night baseball.
- The first electronic message board was installed in 1959.
- In 1976, after a complete renovation, the scoreboard featured baseball's first telescreen, which displayed slow-motion replays.

The renovation carried out by new owner New York City during the 1974 and 1975 seasons totally remodeled the aging structure. The new stadium had a capacity of 57,145 fans, fewer than the original design, but eliminated seats with obstructed views from the old stadium. The new dimensions included 318 feet to left, 314 to right, and 408 to the center field wall. Estimated at \$24 million, the actual cost to the city was nearly \$100 million during a time when the city defaulted on loans and faced bankruptcy. Despite the city's financial difficulties, its purchase of the stadium saved the Yankees for New York after the two parties signed a thirty-year lease in 1972.

Sports Milestones and Other Events

No other venue has been the scene for as many World Series (thirty-nine) as Yankee Stadium, which has been the site of many other memorable moments in baseball history:

- Babe Ruth hit his sixtieth homerun during the 1927 season, the Major League Baseball record until Roger Maris broke it there with his sixty-first homer in 1961.
- The Yankee's dominance of professional baseball that began with Ruth's acquisition included a World Series victory in their first season in their new home, a feat repeated twenty-five times since.
- Don Larsen pitched the only perfect game in World Series history there in 1956.
- Yankee Reggie Jackson added to the lore that joins Yankee Stadium and the World Series by hitting three consecutive pitches for homeruns in 1977.

Yankee Stadium has also served as the venue for numerous other sporting spectacles, including some legendary contests in American sports history:

- Thirty championship-boxing matches took place there, including the 1936 and 1938 fights between the German Max Schmeling and American Joe Lewis. Lewis gained revenge and salvaged American pride in the rematch when he knocked out the German in the first round.
- "The Greatest," Muhammad Ali, defeated Ken Norton in 1976 in a championship boxing match.
- On 12 November 1928, one of the most storied college football games of all time took place in Yankee

Stadium when the Fighting Irish of Notre Dame faced the Golden Knights of Army. At halftime of a scoreless tie, Notre Dame coach Knute Rockne made his legendary plea to “win one for the Gipper,” and Notre Dame responded by winning 12–6.

- On 28 December 1958, the National Football League’s New York Giants and the Baltimore Colts played to a 17–17 tie at the end of regulation in the NFL Championship Game, and in the first “sudden death” overtime game, Alan Ameche scored the winning touchdown, giving Baltimore the win. The game, still considered one of the greatest in NFL history, helped cement professional football’s popularity with the American public.

Yankee Stadium has also been the site for historic non-sporting events, with the largest crowd of 123,707 gathering for a Jehovah’s Witnesses convention. On 4 October 1965, in the first visit of a pontiff to North America, Pope Paul VI celebrated mass before 80,000 fans, and Pope John Paul II did the same in 1979. In commemoration, plaques of the two popes were added to the monuments that adorn the area behind the centerfield wall, joining such Yankee legends as Babe Ruth, Lou Gehrig, Joe DiMaggio, and Mickey Mantle. The area, which includes a memorial to the victims of the September 11, 2001, terrorist attacks, is open to fans before and after games.

The Future

One of the most recognizable landmarks in professional sports, and the first structure to be titled “stadium,” Yankee Stadium joins Chicago’s Wrigley Field and Boston’s Fenway Park as the oldest and most venerated baseball stadiums; collectively, they served as models for retro-style baseball stadiums constructed in the 1990s. The future remains uncertain for the only stadium used as a regular backdrop for an American television situation comedy (*Seinfeld*), and the scene for so many memorable moments, but tentative plans call for a new Yankee Stadium to be constructed across the street from the old site.

Yoga

Yoga is an ancient Indian spiritual philosophy that focuses on achieving deeper awareness of the body and mind through disciplined, dedicated practice. Yogic practice usually involves asanas, which are postures or sequences of postures; pranayama, or breathing modification and exercises; and meditation and sometimes chanting. Yoga is not a religion. To practice it, one need not sacrifice one’s own faith or beliefs.

Types of Yoga

Yoga is divided into six main types or branches:

- Raja yoga follows the strict form outlined by Patanjali in the *Yoga Sutras*, with emphasis on meditation, and is the preferred type of yoga for monastic practitioners, although monastic life is not required to practice it.
- Karma yoga, an ancient Vedic type of yoga, applies to a more spiritual practice of yoga and is focused on the yogic principle of ahimsa, that is, the avoidance of accumulating karma.
- Bhakti yoga is a devotional type of yoga. Within the *Mahabharata*, which is one of the most important

Indian religious epics, is the critical text, the *Bhagavad Gita*, which contains the seed teachings of the *Mahabharata*, particularly the devotional bhakti yoga. Bhakti yoga was first presented in the *Bhagavad Gita* through a conversation between the epic's hero Arjuna and the deity Krishna, who describes bhakti as full devotion of the practitioner to the deity. Thus, this type of yoga is more emotionally centered than are the older types of Vedic yogas.

- Jnana yoga, an older, more scholarly type of yoga than bhakti yoga, focuses on the yogic texts and scriptures, following a more direct path to realization. Realization, in this sense, is an extension of a person's consciousness that remains constant in all life activities—a state akin to the deep, peaceful awareness achieved through meditation.
- Tantra yoga, perhaps the most misunderstood form of yoga, and the most esoteric, is associated with finding the sacred in the mundane, and is closely linked with rituals. Interestingly, most Tantra yogis are celibate, contrary to popular Western ideas about Tantric sexual rituals. A yogi is an advanced practitioner of yoga. Often such a practitioner is able to use yoga to achieve a deep meditative state and perform

the more advanced postures easily, and may serve as a teacher of yoga.

- Hatha yoga, which first appeared in the ninth or tenth century CE, uses asanas, postures, or sequences of postures to purify the body and eventually the mind. Hatha yoga's focus, therefore, is more on the physical body than are some of the more cerebral yogas.

STYLES OF HATHA YOGA

Hatha is the most widely practiced form of yoga in the West. Within hatha yoga, several styles exist that include, but are not limited to, *ashtanga*, *iyengar*, *bikram*, *kundalini*, *Kripalu*, and *Tibetan*. These styles represent different schools of thought, or emphasize the ideas of specific masters, and are likely to be present in either full form or in varying degrees or combinations in a yoga class, as decided by the individual instructor.

- Ashtanga yoga was popularized by K. Pattabhi Jois, from Mysore, India, and is based on six series of asanas that increase in difficulty as the yoga student acquires more skill. During a yoga session, each set of asanas flows into the next. Ashtanga yoga allows students to use the asanas best suited to their own abilities and encourages students to increase difficulty only when they feel ready to do so.

- Iyengar yoga, which was founded by B. K. S. Iyengar in Pune, India, focuses on proper muscular and skeletal alignment, and the asanas are held much longer than in other styles.

- Bikram yoga, founded by Bikram Choudhury in the latter part of the twentieth century, is practiced in a very hot room, often exceeding 100° F (38° C). Bikram yoga is a

favorite style of Hollywood stars because it induces a high degree of perspiration, promoting both physical fitness and cleansing the body of toxins.

- Kundalini yoga, founded by Yogi Bhajan in the late 1960s, focuses on a Tantric path, using the kundalini energy that is centered at the base of the spine.
- Kripalu yoga was developed in the 1970s by Amrit Desai, who founded the Kripalu Center in the Berkshires of Massachusetts. Kripalu yoga uses three major stages: willful practice, willful surrender, and meditation in motion. Practice of the Kripalu style leads to a personal sense of harmony and trust in the body's own wisdom.
- Tibetan yoga, practiced in Tibet but virtually unknown outside Tibet until the twentieth century, combines asanas, Tantric meditation, and pranayama. Five continuous asanas are repeated and increased until practitioners can perform the twenty-one repetitions of the full practice.

Ancient Practices Continue

The history of yoga begins in the Vedic period, approximately 3,500 years ago. The origins of yogic practice were brought to India with invading Aryans' Brahmanism. The Aryans, from west of India, had a sacred language called Sanskrit, from which the term "yoga" originates. Yoga means "to yoke." As oxen are yoked to haul a heavy load, a yogi is yoked to self-discipline. Yoga was mentioned in the Vedas, which were memorized during the Vedic period because the Aryans did not yet have a written language. A good deal of evidence suggests that yoga was already present in the Vedic practice of the Aryans, so yoga may be 5,000 years old.

During the Preclassical period at the end of the Brahmanical era or Vedic period, texts called the Upanishads became prevalent. Although the Upanishads do not specifically target yogic asana practice, they stress the importance of a sincere commitment to the practice of yoga and meditation. Patanjali composed the 195 *Yoga Sutras* during the Classical period, which began about 1800 years ago. The *Yoga Sutras* and the eight-limbed path they delineate are important because these are the

first texts to systematically present yogic practice. Differing styles, including Hatha, developed during the subsequent Postclassical period, which began about 1600 years ago and continues. The Yoga Upanishads, written during this time by the unknown authors, provide clear instruction in pranayama, chanting, and the use of inner sound.

Around 1785, fifty years before yoga was introduced in the United States, English scholars began to study a variety of yogic texts. They, and later American scholars such as Henry David Thoreau (1817–1862) and Ralph Waldo Emerson (1803–1882), drew from these texts to produce philosophical writings. Yoga was not publicly discussed or practiced until Swami Vivekananda (1863–1902) arrived in the United States in 1893. In 1899, Vivekananda established the New York Vedanta Society, the first yoga school in the United States, which still exists. The Vedanta Society remains focused on four of the yoga branches: raja, karma, jnana, and bhakti.

Thereafter, many yogis traveled to the United States until the 1920s, when the United States government placed a quota on Indian immigration. This led many people, such as Paul Brunton (1898–1991), to travel to India in search of yogic instruction. Later Brunton established a yoga center in the United States, which is named for him. In 1934, Brunton authored *A Search in Secret India* after meeting Ramana Maharishi (1879–1950), one of yoga's greatest teachers. Brunton's foundation remains devoted to transmitting ideas between Eastern and Western philosophies. Richard Hittleman (1927–1991), another spiritual disciple of Maharishi, began teaching only the physical benefits of yoga to his students in New York City, later had a television program with the same approach, and founded the Yoga Universal Foundation, which educates its students on yogic philosophy.

Western Yoga in the Twenty-first Century

Presently, yoga is experiencing a revival in the United States; it seems to be everywhere. From pop music "gurus" to classes offered at corporately owned health

The forward bend is a classic yoga asana, practiced here by a class at the Berkshire Mountain Yoga studio.

HOLISTIC YOGIC HEALTH

Yogis believe health is a balanced state of the anatomical and physiological bodily functioning united with mental and emotional stability. Yoga emphasizes mind-body unity, focusing on a person as a whole being. In yoga, asana practice includes both physical and psychological processes. Asanas lengthen and strengthen the muscles and joints, improve balance,

and affect mental states. Another aspect of yoga that has impressive effects on health is pranayama, the art of breath control. Essentially, yogis believe that the body itself is a powerful remedy for health problems.

- *From books or videotapes.* Although books and videos are excellent teaching aids, they can hardly substitute for the benefit of having the experience and guidance of a trained yoga teacher.
- *In a basic class at a fitness center.* Although beginners will have the benefit of a yoga teacher, a growing trend among gyms is to hire yoga teachers who have undergone rapid training that does not allow them time to become familiar with the deep history and Sanskrit origin of yoga, nor with the deepened awareness of meditation. This rapid process does little to honor the rich tradition of yoga, and problems may arise if the teacher lacks enough experience to handle more nuanced aspects of yoga practice, such as a person's emotional response to an asana.
- *From a teacher trained in one of the formal traditions of yoga.* Trying a couple of classes in different styles to find one that feels right is a good idea. The benefit of taking a class in a yoga center is twofold: having the dedicated but gentle guidance of the instructor and having a caring, supportive class environment. Yoga students should feel safe to share the experiences they have during a session with one another. This is especially important for beginners, who may experience emotional or physical discomfort and find it helpful to speak with others who may be experiencing similar feelings.

WESTERN HEALTH AND YOGA

Medical research suggests that conditions such as asthma, back pain, carpal tunnel syndrome, cardiovascular diseases, epileptic seizure, obsessive compulsive disorder, and depression can be alleviated with a doctor-supervised regimen of yoga. For example, *Journal of Asthma* has reported that 74 percent of 255 asthma patients who participated in a 1986 medical study sustained significant improvement. The *New England Journal of Medicine* has further discussed the effects of yoga on carpal tunnel syndrome indicating that an eleven-asana-series that focuses on a full range of motion for most joints in the upper body is more effective than conventional treatments, including drugs and surgery, for sufferers of carpal tunnel.

Dr. Dean Ornish is a well-known medical doctor who has incorporated yoga in his therapy to reverse various heart diseases. Regular asana practice and meditation improve circulation of the blood to the heart and increases oxygen levels, so Dr. Ornish uses yoga to help his patients reduce low-density lipoprotein levels (LDL cholesterol) and blood pressure. The pranayama exercises calm the central nervous system, which frequently becomes overtaxed in "Type A" individuals prone to cardiovascular diseases. Dr. Ornish's

therapy is widely commended and used by doctors around the world.

Yoga and Sport

Yoga is now becoming a more important component of training for athletes. One pioneer, Kareem Abdul-Jabbar, began to practice yoga early in his basketball career, in high school. The aspects of limberness, concentration, and breath control drew him to yoga. By 1984, Abdul-Jabbar was studying with Bikram Choudhury. Abdul-Jabbar believes that yoga was instrumental to the longevity of his career, which spanned more than two decades. He avoided injuries that his fellow players endured and feels that he gained a deeper understanding of his body that allowed him to remain strong and healthy.

Phil Jackson, a leading basketball coach formerly with the Chicago Bulls and Los Angeles Lakers, has routinely employed contemplative practices and meditation to help his players succeed on the court. Jackson advocates that his players create a calm, serene place within themselves, even amidst the chaos of the game and the fans, to facilitate deeper concentration. He also feels that this contemplation helps him to feel more balanced, regardless of the outcome of the game.

Many other professional athletes use yoga to help them train. They come from the full spectrum of sports, including Evander Holyfield, Pete Sampras, Venus and Serena Williams, and Dan Marino. Judging by the success of these athletes, yoga has a potential to tap into the hidden body resources and enhance athletic performance.

The Future of Yoga in the West

Yoga has potential to aid healing in a variety of health conditions. As with any form of physical activity, however, practitioners should consult a physician before beginning a yoga regimen, particularly if they suffer from health problems. Western doctors who want to employ yoga already have a model for the fusion of yoga with Western medicine. In India, during the past forty years, yoga has been increasingly included in Western medi-

cine with great success, specifically for preventing illness. Illness prevention, which is more cost effective, has been important to achieving the health standards of the World Health Organization. This is especially true for impoverished areas, where physicians often combine preventative medicine with the limited Western medicine available. Although preventative medicine has not been as widely accepted in the United States as it has even in Europe, the Caribbean, and Asia, various academic disciplines have held discourses about the efficacy of preventative medicine. Yoga, with asanas that stimulate immune and healthy organ function, is particularly well suited for such a practice and is becoming employed in Western nations outside the United States for preventing disease. U.S. doctors are now beginning to look at the numerous studies from these countries for ways to incorporate yoga into Western medical treatments.

Despite yoga's great antiquity, it is proving to be beneficial for diverse populations. Its holistic, harmonizing approach to whole body health and vitality often succeeds where other methods fail. Yoga's versatility, wide scope, and focus on healthy living ensure its vitality and continued practice in the West. Yoga just may be one of the East's greatest contributions to the West.

Youth Culture and Sport

The term *youth* has historically been used to identify people in the transitional period between early childhood and adulthood, including puberty and adolescence. The role of sport in the values, beliefs, and ways of life of young people has long been researched and publicly debated. Indeed, few issues provoke sharper disagreements than whether sports provide constructive experiences and contribute positively to young people's development. Complicating these discussions is the changing nature of sport itself. Sport is now experienced by many youth within a web of both live and virtual media experiences, including television and computer games, rather than simply as participating in actual organized programs. For some youth, sports options have expanded to include *alternative* as well as *traditional* sports. Traditional youth sport involves adult leadership, structured competition, and sponsorship by public or nonprofit agencies. Alternative sports more resemble informal play and feature less adult involvement, less structure, deemphasized competition, and privatization.

Organized youth sports programs developed in Europe and North America in the late 1800s attempted to prepare children, mostly boys, for industrialization and an increasingly competitive society. Boys were targeted to counteract what were seen as "feminizing" forces in their social environments. The few programs developed for girls were much less vigorous and competitive because of beliefs that girls were frail and needed to prepare for child rearing and domestic lives. Sports sponsored by

schools, clubs, private organizations, and governmental agencies grew rapidly during the twentieth century to the point where, in some societies, participation is now an assumed rite of childhood. Around the world, organized sports continue to be used to target social problems of youth, including crime, violence, drug use, racial and ethnic tension, the loss of cultural heritage, child labor, and AIDS awareness. Many youth sports programs around the world are also linked to, if not integral parts of, elite sport systems and the production of professional athletes.

Growing Popularity of Sports

The tremendous variety of sports among cultures around the world, in addition to varying ways of collecting information about them, make comparisons of various countries difficult. Unfortunately, little systematic information exists about sport for youth in developing countries; most research focuses on Europe, North America, and Oceania. In these regions of the world, sports participation and interest among youth increased substantially through the last quarter of the twentieth century. In the United States, the overwhelming majority of American youth, both boys and girls, now spend time with sports via television, movies, video games, magazines, books, newspapers, the Internet, and radio. U.S. boys and girls differ significantly, however, in the sports they follow most closely, with boys preferring, in order, National Football League (NFL) football, National Basketball Association (NBA) basketball, and the Olympics and baseball (tied for third). Among girls, most popular are the Olympics, gymnastics, and figure skating, followed by NBA basketball. Boys are also twice as likely as girls to watch extreme sports, motor sports, National Hockey League (NHL) hockey, and boxing. Nearly equal percentages of girls and boys watch the most popular sports among boys, but boys are half as likely to watch the most popular sports among girls. This reflects a pattern in which women's sports receive a small fraction of the media coverage of men's sports.

Figures for actual sports participation around the world suggest strongly that sports participation is the

most popular leisure time activity of youth. In the United States, 74 percent of youth ages six to seventeen, or about 26 million youth, participate in one of eighteen sports offered by clubs, leagues, or schools. Of these, 11 million are girls and 15 million are boys. The team sports with the overall highest rate of participation for both boys and girls in the United States are basketball, followed closely by soccer. From there, participation figures among U.S youth show boys preferring, in order, baseball and tackle football, and girls choosing softball, volleyball, and cheerleading. On a worldwide basis, soccer is the number one participation sport among boys, and among both boys and girls in Canada. Among all team sports in the United States, soccer has grown the fastest in recent years and is the only sport where numbers of girls and boys participating is nearly equal.

Outcomes of Participation

There is plenty of debate about the relative merits of organized youth sports programs, but little evidence supports the many platitudes about them. Adult-led, community-sponsored sports may create occasions for youth and families to join forces; establish achievement arenas for children; provide early experiences of leadership, discipline, and competition; and enhance health and fitness. Those same programs can also create tensions, conflict, and hostility among adults; create work-like pressures on youth to please their parents and coaches; foster inappropriate expectations about their performances; and actually do more harm than good to their health and well-being. Under the right conditions, youth who participate in school-sponsored sports may have higher academic performance, educational aspirations, and enhanced career options than do those who do not, but ample evidence indicates that sports programs may subvert the educational mission of their sponsoring schools, sidetrack students into focusing exclusively on sports, and bestow disproportionate and inappropriate privileges to young, usually male, athletes. In general, organized youth sports are successful and constructive to the degree that they place the in-

terests of youth above those of the adults who lead them and the organizations that sponsor them. They also benefit from adults who are educated about the developmental characteristics of youth, effective at instruction in the skills of their sports, and genuinely concerned about the welfare of their athletes.

Current Issues

The composition, incomes, and other circumstances of the households and larger societies in which youth live are changing rapidly, and the role of sports in their lives is changing accordingly:

1. Among the most important demographic changes of the last twenty years have been the increase of single parent households, the need for both parents to work outside the home, and the “aging” of populations, particularly in North America and Europe. Youth now compose smaller percentages of their societies than in past years, and the cultures in which they live are increasingly focused on accommodating the needs and interests of adults.
2. Migration patterns from lesser- to more-developed countries have changed the composition and economic circumstances of youth, exacerbating differences between the rich and poor.
3. The expansion of global media, as parts of larger globalization patterns, has significantly influenced how youth spend their time and how they include sports in their lives.
4. There is an increasing shift in sponsorship and provision of youth sports away from the public and non-profit sectors to the private and corporate sectors.

These four factors working together, in addition to the sex-segregated history of youth sport, are essential in understanding the role of sport in contemporary youth culture.

GLOBAL BUT NOT UNIVERSAL

Although we know that youth sports are a growing world phenomenon, a number of youth in the world have little or no access to them. Organized sports in-

Youth Sports in Korea

The smallest schoolboys began the wrestling—little fellows of six and seven stepping forth into the arena and wrestling away until one of them threw the other amid universal applause. Older boys then had their turn and when one or other of them distinguished himself by defeating several competitors in succession the applause became wild and he had to go up and receive a prize, which consisted generally of a lead-pencil, a block of writing-paper, a couple of spools of cotton or some other useful object. Then came wrestlers of still larger size and finally fully grown men. Now the contests became more exciting than ever, the spectators shouting and yelling for all they were worth.

After the wrestling came the swinging. A big swing had been erected. Whoever swung highest won the prize. The heights attained were marked by a string which had to be touched. Swinging would seem to be the favourite exercise for girls in Korea. I have seen very large swings of this kind in many Korean villages and they are used by girls only. All the girls on this

occasion wore handsome national costumes. The women spectators secured places for themselves quite near the swings at the start of the competition but all drew close while it was in progress.

The competition seemed to be restricted to girls of marriageable age. I expected that they would sit on the seat but they all stood on it. The first competitor was a really handsome girl and in due course we were to see what Engan could show in the matter of female charms. Some of the competitors swung up to an astonishing height, winning loud applause as well as the allotted prizes. To prevent their skirts from flying up into their faces they all made a kind of jerk with their knees at the right moment. A great number of the women looking on carried babies on their backs and these babies were duly fed in the course of the festival. Many of the intending competitors were still a-waiting their turn when the rain began to pelt down on us once more, dispersing the whole joyous crowd in their brightly-coloured clothes.

involvement for children requires time, resources, facilities, and at least some adult and social support. Accordingly, youth living in conditions where any of these things are lacking may have diminished chances of accessing the array of well-organized and high-quality sports programs available to more fortunate children. Research in Canada strongly suggests that household income levels have a dramatic impact on youth involvement in sports. Three-quarters of children from households earning \$80,000 (Canadian) per year are active in sports, but less than 50 percent of children whose parents earn less than \$40,000 were active in sports. Data on changes to families and levels of poverty in the United States show that minority children are more likely to live in these diminished conditions. Before they reach age six, more than a quarter of U.S. children will already have lived with only one parent, including two-thirds of African-American children. More than 12 million children

in the United States were living below the poverty line in 2002, with the number of African-American children living in *extreme* poverty increasing by 1 million in 2003. Seventy-five percent of the children of migrant farm workers in the United States live below the national poverty line. About 5 million children in the United States spend time outside of school with no adult supervision.

SEDENTARY LIVES AND OBESITY

A study of youth sports across twenty different countries in the mid-1990s revealed a worldwide trend toward the formation of two groups of youth: one intensely involved in organized sports, the other quite inactive. In the United States, 20 percent of children ages eight to sixteen engage in two or fewer stints of activity per week, and 25 percent watch four or more hours of television per day. Evidence also suggests that school-based

Youth with a skateboard depicted in an urban grunge area. *Source: istockphoto/lovleah.*

physical education programs are not providing an adequate amount of time for children to be active. One study found third-grade children were involved an average of twenty-five minutes *per week* in moderate to vigorous activity, despite recommendations that children participate in thirty to sixty minutes *per day*.

Not surprisingly, inactivity is related to the increasing numbers of youth who are obese. The World Health Organization (WHO) lists obesity as among the ten most significant health problems in the world, although obesity is a problem characteristic of a few wealthy countries. Indeed, the WHO lists the number one health problem in the world as child and maternal *underweight*. On the other hand, young teens in the United States are heavier than those of fourteen other industrialized countries. For African-American and Latino children, particularly girls, these figures are higher, including

27 percent of African American teen girls. These figures represent a fourfold increase since the early 1970s.

The involvement of parents has been shown to be a key factor in their children's activities. A Canadian study found that interest and participation among youth increases if their parents are physically active and if they volunteer to be part of their children's programs. However, two-thirds of U.S. parents surveyed about the problem of inactivity among their children state that, although they realize participation in activity with their children is important, they have little time to do so. Forty percent of these surveyed parents also said they have little or no access to community playgrounds, parks, or other facilities in which to play with their children, with this barrier being more difficult for African-Americans and Latinos. Illustrative of the worldwide pattern, however, evidence shows that parents of children with the time and wherewithal have increasingly chosen structured, rather than "free time," activities for their children. In general, when left on their own, youth appear to be increasingly more interested in sedentary pursuits than active ones.

GENDER, RACE, AND CLASS CONTINUE TO DIVIDE

The high participation rate for boys in sports reflects a worldwide pattern in which boys remain more active in sports than girls. In the United States, even though participation numbers for youth reflect considerable increases among girls during the past thirty years, some studies show that boys spend twice as much time involved in sports as girls do. The increasing numbers of girls participating also needs to be qualified by race and class differences. Nearly 90 percent of U.S. girl participants are those who live in suburban areas, compared with only 15 percent of urban girls. African-American girls have one-third as many participation opportunities as their white counterparts do.

The differences between boys and girls reflect the sex-segregated and mostly unequal sports programs of the past. Girls also continue to receive mixed messages from the culture at large about their places in the sport

Youths playing a variety of games and sports.

world. Although they are often encouraged and welcomed into sports at early ages, girls continue to see an overwhelming emphasis on male sports in the media and learn that participation in traditionally masculine sports may entail risks to their gender and sexual identities. Predictably, even though both boys and girls have historically shown decreases in participation in sports during early adolescence, these figures are consistently higher for girls than for boys. In general, the most popular sports in the world have been built on male values and interests, and girls have simply been asked to fit into those programs.

An Alternative Future?

Traditional team sports participation appears to be on the decline in the United States, with just over half of all youth participating in these activities. On the other hand, the popularity of extreme or alternative sports has increased dramatically. Indeed, the fastest growing sport in the United States is in-line skating, with 29 million participants, nearly double the number of soccer participants. Other alternative sports, including skateboarding, mountain biking, snowboarding, bungee

jumping, rock or artificial wall climbing, paintball, and whitewater kayaking or canoeing, have all increased in popularity.

The implications of these changes are noteworthy:

1. Far fewer alternative sports are sponsored by public institutions, such as schools, recreation departments, and nonprofit leagues; instead, alternative sports tend to be offered by commercial, for-profit firms or corporations. Consequently, participation in alternative sports depends more heavily than traditional sports on the resources of youth and their families. As with traditional sports, such costs present considerable obstacles for youth from poor families, given the often expensive and specialized equipment, facilities, and instruction some alternative sports require.
2. The commercial status of providers of these activities means that, as youth participate, they are now also cultivated as potential consumers of products, both related and unrelated to participation in sports.
3. Although there are competitions in alternative sports such as skateboarding, bicycle motocross (BMX), and

mountain biking, unlike traditional sports, most participants focus on their own enjoyment rather than on a team or school's tradition or won/lost record.

4. Although specialized training may be involved in learning the skills of these sports, the traditional roles of adult figures, including coaches and parents, is significantly altered or absent altogether in alternative sports. The diminished adult involvement may foster creativity and increased enjoyment, but it may also mean activities that are less safe and mostly guided by values fostered in media.
5. To the degree that alternative sports are built on the values and interests of males, and male participants in them are the primary focus of alternative sport media coverage, they will attract more boys than girls.

Youth Sports

Children around the world play a wide range of physical activities and informal games native to their cultures. *Youth sports*, or *formally organized games and physical challenges designed for children and adolescents*, are relatively new activities in human history, because they depend on human and material resources and the existence of particular ideas about childhood and adolescence.

Youth sports require resources in the form of adults who have the time, money, and skills needed to organize and manage programs. They also require a critical mass of children with discretionary time and access to facilities and spaces designed for their organized games or physical challenges. In nations and regions where family income is very low, there are few, if any, youth sports. Adults in these settings lack resources to initiate and manage formally organized games and challenges, children lack free time to play in scheduled activities, and there are no playing fields and facilities to accommodate youth sports. In a material sense, youth sports are a luxury that many people in the world cannot afford.

Youth sports also require particular cultural ideas. People organize youth sports when they define childhood and adolescence as identifiable periods of the life course during which social, psychological, and cognitive development occurs in connection with personal experiences. This definition provides an incentive for organizing games and challenges designed specifically for children. Family and community resources are dedicated

to youth sports only when there are widespread beliefs that childhood and adolescence are times during which fun and developmental experiences are important.

The Emergence of Youth Sports

Playing youth sports is a taken-for-granted experience among many young people in wealthy, postindustrial societies. This is especially true when families have enough money to pay for equipment, program fees, and transportation to practices, games, and events. However, youth sports are a creation of the twentieth century, and they have become widely popular only since the 1950s.

It was not until the early 1900s that many people in England and North America began to realize that the behavior and character of children were strongly influenced by their social environment and everyday experiences. This belief that the environment influenced a person's overall development was encouraging to people interested in progress and reform. It caused them to think about how they might control the experiences of children so that they would grow up to be responsible and productive adults in societies where citizenship and work were highly valued. They knew that democracy depended on responsibility, and a growing capitalist economy depended on productivity.

Progressive reformers in the United States during the early twentieth century were influenced by educators in England who saw sports as ideal activities for molding the characters of young boys. In fact the very first youth sports were developed in exclusive private schools in

England. Playing sports, thought the headmasters at these schools, would help the sons of wealthy and powerful people in British society become future leaders in business, government, and the military.

Reform-oriented adults in the United States took the notion that sports built character and used it as a basis for organizing youth sports, especially team sports for boys, in schools, on playgrounds, and in church groups. The hope was that team sports would teach boys from working-class and immigrant families values about work, cooperation, productivity, and obedience to authority in the pursuit of competitive success. It was also hoped that sports would help boys from middle- and upper-class families become strong, assertive, competitive men who would eventually become the captains of industry, government, and the military. Teaching privileged boys to be tough, competitive men was important to many reformers because they worried that these boys were learning too many feminine values because they were raised exclusively by their mothers. Fathers worked long hours and were seldom at home, so there was a fear that boys had few chances to learn about manhood. Sports were seen as activities that would turn boys into men.

At the same time that youth sports were organized for boys, other activities were organized to help girls learn about motherhood and homemaking. Most people during the early twentieth century, even progressive reformers, believed that it was more important for girls to learn domestic skills than sport skills. School curriculum and playground activities were organized to

reflect this belief. According to ideas held by most people through the 1950s, girls were naturally suited to be wives and mothers, not athletes or leaders in society. Many physicians promoted the idea that playing vigorous physical activities were dangerous to the overall health and well-being of girls and women. Therefore, girls only needed to know about sports so they could raise their sons properly.

Until the 1970s there were few youth sports for girls apart from those that occurred in connection with the lifestyles of relatively wealthy families. When girls did participate, their sports were designed to enhance physical poise, coordination, and general health. Gender-mixed participation in youth sports was rare; if girls played sports and games with boys, it was done informally by girls who were identified as “tomboys.”

Although there were exceptions to these patterns, organized youth sports through most of the twentieth century were developed around prevailing cultural ideas about how boys and girls should grow up and what they were supposed to learn in the process of becoming productive adults.

Organized Youth Sports Since the 1950s

As the first wave of the Baby Boom generation (that is, children born between 1946 and 1964) moved through childhood during the 1950s and 1960s, youth sports became increasingly popular in Europe and North America. Growth was especially dramatic in the United States, where youth sports were funded by a combination of

public, private, and commercial sponsors. Local park and recreation departments sponsored programs. The YMCA, YWCA, Boys and Girls Clubs, and many religious organizations and churches added programs of their own. Entrepreneurs developed commercial clubs for children whose parents could afford to pay for private lessons and exclusive sport participation opportunities.

Parents also entered the scene as active promoters of youth sports. They were eager to have the characters of their sons built through organized, competitive sports. Fathers became coaches, managers, and league administrators. Mothers did laundry and became chauffeurs and short-order cooks so their sons were always ready and properly suited up for practices and games.

Most organized youth sports through the mid-1970s were for boys eight to fourteen years old. The programs usually emphasized a combination of fun and competition as preparation for future occupational success. Girls' interests in sports were largely ignored, and few girls had opportunities to play on organized youth teams or varsity sports in schools.

It was not until the mid-1970s that the women's movement, the health and fitness movement, and government legislation (Title IX in the United States) prohibiting sex discrimination in public school programs all came together to stimulate the development of sport

Ritual Fighting among Dogon Boys in West Africa

During the four months following the harvests, the boys of the two Ogols [villages] meet on prepared ground, as soon as the night falls and when the moon lights the countryside sufficiently. They place themselves in a circle *unu gonawe*; literally children in a circle; those of Ogolda occupy the half circle on the side of their village; those of Ogoldognou face them. A boy steps out from one of the sides, places himself in the middle of the circle and makes a defiant gesture towards the adversary side: he raises to his side his bent right leg, extends his right arm while holding his forearm vertically. A boy of the other side comes and places himself before him and the two seize each other by the waist, passing their right arm under the left arm of the other. The hands are crossed behind the back, without gripping each other. They try to unbalance each other by side to side twisting of the trunk, or by taking hold of the adversary's thigh. Each one tries equally to turn the other upside down while pressing the upper part of their body against the chest of the adversary and by seizing him by the loins. In order to avoid being taken by these different methods, the two fighters, at the beginning, stoop toward one another, with their feet very far apart.

He who falls under the other is beaten and hooted at by the opposing side. The vanquished is seized by one of his comrades and carried to the place where he was before the challenge took place. Two other boys take their turn in the contest.

When a child refuses to come and prepare the space on which one fights, his comrades insult him and forbid him to enter the circle on the first day of the competitions, but on that day only: *u y minne buburu üw bunno beg wr ngalu*. One said to you yesterday: "come and beat the earth into dust!" You responded: "I will not come."

When a boy refuses to take part in the fights, he is mocked and accused of cowardice or weakness: *u y a[caron] jjori üw amuga omuode wrngalu*.

One said to you yesterday: "Come to the fight." You, weak child, you have answered: "I am not coming!"

One can, without ridicule, refuse to fight with a comrade wearing a bracelet of iron *señe*. In effect, while holding upon the loins with the iron, one causes such a pain to the adversary that he immediately falls on his back.

These fights are organized generally between quarters or between villages. For the region of Sanga, Ogolda fights against Ogoldognou, Sangui against Enguel, Bongo against Gogoli: the two Diaméni like the Dini, both fight against Tabda; Doziou and Tabda unite against Guinna, etc. If a quarter finds itself alone, it divides into two sides.

Formerly, before the arrival of the French, all of the boys of the region of Upper Sanga would gather together in order to witness the fights between the two Ogols. Nowadays the nocturnal games are forbidden on the grounds that they are too noisy.

programs for girls. These programs grew rapidly during the 1970s and early 1980s, and now most girls in North America have opportunities to participate in youth sports. However, participation rates among girls remain lower than rates among boys because playing sports continues to be connected more strongly with masculinity than femininity. Furthermore, some girls continue to be discouraged by beliefs that "girls are not

as good as boys" in sports and that being successful as an athlete in certain sports will cause others to question their femininity.

Even though traditional ideas about masculinity and femininity still influence participation in youth sports, playing sports is now an accepted part of the process of growing up in most postindustrial nations. Parents encourage sons and daughters to play youth sports. Some

parents wonder if their children should play in programs where winning is emphasized more than overall child development, but many parents seek out the win-oriented programs, hoping their children will become the winners.

Current Trends in Youth Sports

In addition to increased popularity, recent trends in youth sports include the following:

1. Youth sports have become increasingly privatized in that they are more often sponsored by private and commercial organizations and less often sponsored by public, tax-supported organizations.
2. Youth sports increasingly emphasize a “performance ethic” in that participants, even in recreational programs, are encouraged to evaluate their experiences in terms of developing technical skills and progressing to higher levels of achievement.
3. There is an increase in elite sport training facilities dedicated to producing highly skilled, specialized athletes who progress through increasingly difficult levels of competition.
4. Parents have become more involved in and concerned about the participation and success of their children in youth sports because they see sports as socially and developmentally important activities for young people.
5. Participation in alternative or “action” sports has increased because some young people prefer unstructured, participant-controlled physical challenges such as those encountered in BMX biking, skateboarding, in-line skating, and snowboarding, among others.

These five trends have an impact on who participates in organized youth sports, the conditions of their participation, the types of experiences they have, and the meanings that they give to those experiences.

The Effects of Participation in Youth Sport

Youth sports provide a dynamic context in which young people can experience many positive outcomes. These outcomes include becoming more physically fit, learn-

ing about one’s body, and developing physical competence, self-esteem, social skills, and the ability to make moral decisions (Ewing et al. 2002). However, studies of the effects of participating in youth sports have produced mixed findings because the experiences of young people vary across programs, teams, and situations. Furthermore, the meanings given to sport experiences and the ways that they are integrated into the lives of young people vary from one participant to the next.

A review of the research indicates that positive developmental outcomes are most likely when youth sports provide young people with opportunities to expand their identities, experiences, and relationships under the guidance of adults concerned with and knowledgeable about developmental issues. Negative outcomes are most likely when participation constrains identity development, limits the diversity of a young person’s experiences and relationships, and occurs under the guidance of adults who focus on competitive success without explicit strategies for fostering general development (Coakley 2004).

Research also indicates that young people are most likely to have fun in youth sports when programs are organized to maximize action, personal involvement in the action, and the formation and reaffirmation of friendships among participants (Coakley 2004). However, definitions of fun change as children develop, as their goals related to sports change, and as they see their connections with the rest of the world in new ways. Although most young people define fun in terms of opportunities to develop and display physical competence across a range of activities and challenges, competitive success becomes a requirement for fun among many young people who participate in programs that have a strong emphasis on winning and moving up to higher levels of competition. A sense of fun is generally related to perceived competence, but ideas about competence vary with young people’s ideas about what is important in their lives. When success in a single sport becomes a primary focus, satisfaction and self-esteem among young people are likely to swing back and forth from one extreme to another depending on recent and anticipated competitive outcomes.

Problems in Youth Sports

Youth sports are not without problems. Some programs have become so costly that many young people are excluded. At the same time, many communities have cut publicly funded programs due to budget crises. Instead of sponsoring programs as they have done in the past, many publicly funded park and recreation programs now issue permits to club-based youth sport organizations that use fields and facilities. The cost of club-based programs often discourages participation by children from low-income families, which intensifies existing forms of socioeconomic segregation in many communities. Furthermore, the widespread notion that sports exemplify ideals of bodily perfection has limited the provision of youth sports for young people with disabilities.

Some youth sports programs are now organized so that young people are expected or required to participate year-round. In the case of children younger than fourteen years old, this specialization often restricts overall physical and social development, undermines motivation, and creates burnout. Burnout occurs primarily during early adolescence when young people feel that they have lost personal control over the conditions of their sport participation. This causes stress, and when stress becomes excessive, burnout becomes common.

The seriousness and demands of youth sports have also created problems for parents and problem parents. Many parents today feel it is their moral obligation to find the best programs for their children and ensure that their children experience success in those programs. These parents often believe that if they do things correctly their children will reap rewards such as college scholarships and even professional contracts and prize money in their sports. Under these conditions their children's accomplishments become evidence for their own moral worth as parents. These expectations put significant pressure on children to perform well and to continue playing a sport even when they would like to expand their interests and participate in other activities. It also creates pressure for coaches who may not always do what parents expect of them or think is appropriate.

As the stakes associated with youth sports have increased, so have the numbers of problem parents. At the same time, media accounts have publicized the actions of obnoxious and sometimes violent parents to the point that such characters have become the stuff of urban legends. Problem parents not only create challenges for coaches and program administrators, they also create challenges for young athletes who seek control of their sport experiences.

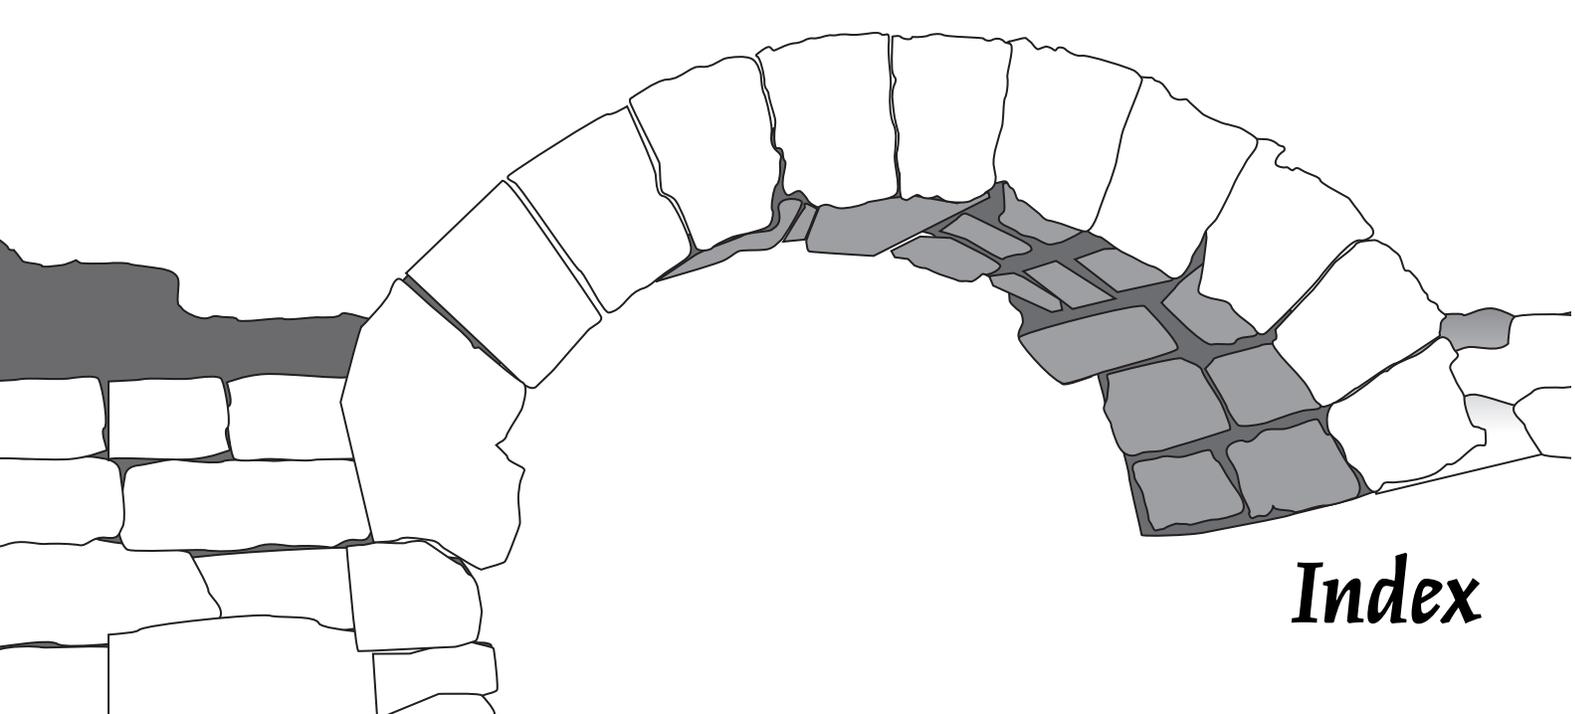

These and other problems have created challenges related to youth sports. Although the goal of many people is to ensure that all children have opportunities to play sports and develop and display physical skills in contexts that are safe and fun, there are others who have a goal of producing elite sport performers. Achieving both of these goals simultaneously is difficult when resources are limited. In the meantime increasing rates of childhood obesity in many postindustrial societies have raised questions about how to organize youth sports in ways that maximize health through the life course.
