As a member of the European Union (EU) since 1 May 2004, Hungary's migration and illegal migration border controls have tightened. According to *Migration Information Source*, as of 2002 some 115,000 foreign citizens with a valid long-term permit (i.e., good for at least one year) or permanent residence permit resided in Hungary; 43% were Romanian citizens, 11% Yugoslavians, 8% Ukrainians, and most of these were ethnic Hungarians, and 6% were Chinese. This population amounted to 1.13% of Hungary's total population. These changing waves of labor migration are also characterized by a new form of labor migration within the EU, termed "walk-over-the-border for employment," where workers seeking higher wages travel from one country to a neighboring one, such as from Slovakia to Hungary.

In 2005, the net migration rate was estimated as 0.86 migrants per 1,000 population.

## 8 ETHNIC GROUPS

Ethnically, Hungary is essentially a homogeneous state of Magyar extraction. The 2001 census indicates that Hungarians constitute about 92.3% of the total population. Roma account for about 1.9%. Ethnic Germans make up about 0.7% of the population. There are also small groups of Croats, Poles, Ukrainians, Greeks, Serbs, Slovenes, Armenians, Ruthenians, Bulgarians, Slovaks, and Romanians.

## 9 LANGUAGES

Hungarian, also known as Magyar, is the universal language. In addition to the letters of the English alphabet, it has the following letters and combinations: *á, é, í, ó, ö, ő, ú, ú, cs, dz, dzs, gy, ly, ny, sz, ty, zs*. Written in Latin characters, Hungarian (Magyar) belongs to the Finno-Ugric family, a branch of the Ural-Altai language group. Hungarian (Magyar) is also characterized by an admixture of Turkish, Slavic, German, Latin, and French words. In addition to their native language, many Hungarians speak English, German, French, or (since World War II) Russian. In 2002, 98.2% of the population spoke Hungarian; 1.8% spoke various other languages.

## 10 RELIGIONS

According to a 2001 census, approximately 55% of the people are nominally Roman Catholic, 15% are members of the Reformed Church, 3% of the population are Lutheran, and less than 1% are Jewish. About 3% of the population describe themselves as

LOCATION: 45°48' to 48°35' N; 16°5' to 22°58' E. BOUNDARY LENGTHS: Slovakia, 515 kilometers (320 miles); Ukraine, 103 kilometers (64 miles); Romania, 443 kilometers (275 miles); Serbia, 151 kilometers (94 miles); Croatia, 329 kilometers (204 miles); Slovenia, 102 kilometers (63 miles); Austria, 366 kilometers (227 miles).

Greek Catholics. About 15% of the population claim no religious affiliation.

About one million Jews lived in Hungary before World War II and an estimated 600,000 were deported in 1944 to concentration camps. According to estimates from the World Jewish Restitution Organization, there are between 70,000 and 110,000 Jews currently residing in Hungary. There are also seven Buddhist and five Orthodox denominations. There are three Islamic communities.

A 1990 Law on the Freedom of Conscience provides for separation of church and state and safeguards the liberty of conscience of all citizens and the freedom of religious worship. However, the state does grant financial support to religious denominations for religious practice, educational work, and maintenance of public collections. To promote further support of religious institutions, between 1997–99 the government signed separate agreements with the country's four largest churches (the Roman Catholic, Jewish, Lutheran, and Calvinist churches) and two smaller groups (Hungarian Baptist and Budai Serb Orthodox). The government also provides funds each year for the revitalization of churches based on annual negotiations between the Ministry of Cultural Heritage and the Ministry of Finance.

## 11 TRANSPORTATION

Transportation facilities have improved steadily since the 1960s. Budapest is the transportation center. In 2002, roads totaled 159,568 km (99,251 mi), of which some 70,050 km (43,571 mi) were paved, including 527 km (328 mi) of expressways. In 2003, Hungary had 2,777,219 passenger cars and 394,988 commercial vehicles registered for use.

As of 2004, Hungary had 7,937 km (4,937 mi) of broad, standard and narrow gauge railroad lines. Of that total, standard gauge lines accounted for the largest portion at 7,682 km (4,778 mi), followed by narrow gauge lines at 219 km (136 mi) and broad gauge lines at 36 km (22 mi). Most freight is carried by trucks; railway transport is of lesser importance. The railroad and bus networks are state owned.

Permanently navigable waterways totaled 1,622 km (1,009 mi) in 2004, of which most were on the Danube and Tisza rivers. In addition to the government shipping enterprises—which operate the best and largest ships and handle the bulk of water traffic—the Shipping Cooperative, an association of small operators, continues to function. In 1999, the latest year for which data was avail-

able), the merchant marine fleet consisted of 2 cargo ships with a total capacity of 12,949 GRT.

Hungary had an estimated 44 airports in 2004. As of 2005 a total of 19 had paved runways, and there were also five heliports. Ferihegy Airport in Budapest is the most important center for domestic and international flights. All domestic traffic is handled by the Hungarian Air Transportation Enterprise (Magyar Légiközlekedési Vállalat—MALEV). In 2003, about 2.369 million passengers were carried on scheduled domestic and international airline flights.

## 12 HISTORY

Ancient human footprints, tools, and a skull found at Vértesszőlős date the earliest occupants of present Hungary at a period from 250,000 to 500,000 years ago. Close to that site, at Tata, objects used for aesthetic or ceremonial purposes have been discovered, among the earliest such finds made anywhere in the world.

Celtic tribes settled in Hungary before the Romans came to occupy the western part of the country, which they called Pannonia and which the Roman Emperor Augustus conquered in 9 BC. Invasions by the Huns, the Goths, and later the Langobards had little lasting effect, but the two subsequent migrations of the Avars (who ruled for 250 years and, like the Huns, established a khanate in the Hungarian plain) left a more lasting impression.

The Magyars (Hungarians) migrated from the plains south and west of the Ural Mountains and invaded the Carpathian Basin under the leadership of Árpád in AD 896. For half a century they ranged far and wide, until their defeat by Otto the Great, king of Germany and Holy Roman emperor, near Augsburg in 955. They were converted to Christianity under King Stephen I (r.1001–1038), who was canonized in 1083. The Holy Crown of St. Stephen became the national symbol, and a constitution was gradually developed. The Magna Carta of Hungary, known as the Golden Bull of 1222, gave the nation a basic framework of national liberties to which every subsequent Hungarian monarch had to swear fidelity. Hungary was invaded at various times during the medieval period; the Mongols succeeded in devastating the country in 1241–42.

Medieval Hungary achieved its greatest heights under the Angevin rulers Charles Robert and Louis the Great (r.1342–82), when Hungarian mines yielded five times as much gold as those of any other European state. Sigismund of Luxembourg, king of Hungary, became Holy Roman emperor in 1410, largely on the strength of this national treasure. During the 15th century, however, Turkish armies began to threaten Hungary. The Balkan principalities to the south and southeast of Hungary developed as buffer states, but they did not long delay the advance of the Turks; nor could the victories of János Hunyadi, brilliant as they were, ultimately stem the Turkish tide. With the Turks temporarily at bay, the Hungarian renaissance flourished during the reign of Hunyadi's son, Matthias Corvinus (1458–90), but his successors in the 16th century overexploited the gold mines, brutally suppressed a peasant revolt, and allowed the Magyar army to deteriorate. Hungary's golden age ended with the rout by the Turks at Mohács in 1526.

Thereafter, warring factions split Hungary, but power was gradually consolidated by the Habsburg kings of Austria. With the defeat of the Turks at Vienna in 1683, Turkish power waned and that of the Habsburgs became stronger. The Hungarians mounted many

unsuccessful uprisings against the Habsburgs, the most important insurrectionist leaders being the Báthorys, Bocskai, Bethlen, and the Rákóczys. In 1713, however, the Hungarian Diet accepted the Pragmatic Sanction, which in guaranteeing the continuing integrity of Habsburg territories, bound Hungary to Austria.

During the first half of the 19th century, in the aftermath of the French Revolution and the Napoleonic wars, Hungary experienced an upsurge of Magyar nationalism, accompanied by a burst of literary creativity. The inability of a liberal reform movement to establish a constitutional monarchy led to the revolt of 1848, directed by Lajos Kossuth and Ferenc Deák, which established a short-lived Hungarian republic. Although Hungarian autonomy was abolished as a result of intervention by Austrian and Russian armies, Austria, weakened by its war with Prussia, was obliged to give in to Magyar national aspirations. The Compromise (Ausgleich) of 1867 established a dual monarchy of Austria and Hungary and permitted a degree of self-government for the Magyars.

After World War I, in which Austria-Hungary was defeated, the dual monarchy collapsed, and a democratic republic was established under Count Mihály Károlyi. This was supplanted in March 1919 by a Communist regime led by Béla Kun, but Romanian troops invaded Hungary and helped suppress it. In 1920, Hungary became a kingdom without a king; for the next 25 years, Adm. Miklós von Nagybánya Horthy served as regent. The Treaty of Trianon in 1920 formally freed the non-Magyar nationalities from Hungarian rule but also left significant numbers of Magyars in Romania and elsewhere beyond Hungary's borders. The fundamental policy of interwar Hungary was to recover the "lost" territories, and in the hope of achieving that end, Hungary formed alliances with the Axis powers and sided with them during World War II. Hungary temporarily regained territories from Czechoslovakia, Romania, and Yugoslavia. In March 1944, the German army occupied Hungary, but Soviet troops invaded the country later that year and liberated it by April 1945.

In 1946, a republican constitution was promulgated, and a coalition government (with Communist participation) was established. Under the terms of the peace treaty of 1947, Hungary was forced to give up all territories acquired after 1937. The Hungarian Workers (Communist) Party seized power in 1948 and adopted a constitution (on the Soviet model) in 1949. Hungarian foreign trade was oriented toward the Soviet bloc, industry was nationalized and greatly expanded, and collectivization of land was pressed. Resentment of continued Soviet influence over Hungarian affairs was one element in the popular uprising of October 1956, which after a few days' success—during which Hungary briefly withdrew from the Warsaw Treaty Organization—was summarily put down by Soviet military force. Many people fled the country, and many others were executed. From that time on, Hungary was a firm ally of the USSR. In 1968, the New Economic Mechanism was introduced in order to make the economy more competitive and open to market forces; reform measures beginning in 1979 further encouraged private enterprise. The movement toward relaxation of tensions in Europe in the 1970s was reflected in the improvement of Hungary's relations with Western countries, including the reestablishment of diplomatic relations with the FRG in 1973. A US-Hungarian war-claims agreement was signed that year, and on 6 January 1978 the United States returned the Hungarian coronation regalia.

The New Economic Mechanism that had been instituted in 1968 was largely abandoned, at Soviet and Comecon insistence, a decade later. This compounded the blows suffered by Hungary's economy during the energy crisis of the late 1970s, leading to a ballooning of the country's foreign indebtedness. By the late 1980s the country owed \$18 billion, the highest per capita indebtedness in Europe.

This indebtedness was the primary engine of political change. The necessity of introducing fiscal austerity was "sweetened" by the appointment of reform-minded Karóly Grosz as prime minister in 1987. Faced with continued high inflation, the government took the step the following year of forcing János Kádár out entirely, giving control of the party to Grosz. In 1989 Grosz and his supporters went even further, changing the party's name to Hungarian Socialist Party, and dismantling their nation's section of the Iron Curtain. The action that had the most far-reaching consequences, however, came in October 1989 when the state constitution was amended so as to create a multiparty political system.

Although Hungarians had been able to choose among multiple candidates for some legislative seats since as early as 1983, the foundations of a true multiparty system had been laid in 1987–88, when large numbers of discussion groups and special interest associations began to flourish. Many of these, such as the Network of Free Initiatives, the Bajscy-Zsilinszky Society, the Hungarian Democratic Forum, and the Alliance of Free Democrats, soon became true political parties. In addition, parties that had existed before the 1949 imposition of Communist rule, such as the People's Party, the Hungarian Independence Party, and the Social Democrats, began to reactivate themselves.

All of these groups, or the parties they had spawned, competed in the 1990 general election, the first major free election to be held in more than four decades. No party gained an absolute majority of seats, so a coalition government was formed, composed of the Democratic Forum, Smallholders' Party, and Christian Democrats, with Forum leader József Antall as prime minister. Árpád Göncz, of the Free Democrats, was selected as president. An important indicator of Hungary's intentions came in June 1989, when the remains of Imre Nagy, hanged for his part in the events of 1956, were reentered with public honors; politicians and other public figures used the occasion to press further distance from Communism and the removal of Soviet troops. Another sign of public sentiment was the first commemoration in 40 years of the anniversary of the Revolution of 1848.

Under Antall Hungary pursued a vigorous program of economic transformation, with the goal of transferring 30–35% of state assets to private control by the end of 1993. Hungary's liberal investment laws and comparatively well-developed industrial infrastructure permitted the nation to become an early leader in attracting Western investors. However, there were large blocs in society, and within the Democratic Forum itself, that found the pace of transition too slow, particularly since the government did not keep to its own time schedule.

In addition to its economic demands, this radical-right contingent also has a strongly nationalist, or even xenophobic, agenda, which has tended to polarize Hungarian national politics. Approximately 10% of the Hungarian population is non-Hungarian, including large populations of Jews and Roma (Gypsies). There are also large Hungarian populations in neighboring states, par-

ticularly in Romania, all of whom had been declared dual citizens of Hungary in 1988. The appeal to "Hungarian-ness" has been touted fairly frequently, widening preexisting tensions within the dominant Democratic Forum party, and weakening their coalition in parliament. The Smallholders Party withdrew from the coalition in 1992, and in 1993 other elements were threatening to do the same.

The Democratic Forum's loss of popularity was vividly exposed in the parliamentary elections of May 1994, when the party, led by acting head Sándor Leszák, lost almost one-third of the seats it had controlled. In that election voters turned overwhelmingly to the Hungarian Socialist Party, giving the former Communist party an absolute majority of 54%. Voter turnout in the two-tier election was as high as 70%, leaving little doubt that Hungarian voters had repudiated the Democratic Forum and its programs of forced transition to a market economy.

Hungary's international indebtedness remained very high—the country ran a \$936 million trade deficit for the first two months of 1994 alone—obligating new prime minister Gyula Horn to continue most of the same economic reform programs which the Socialists' predecessors had begun. There was concern, however, that the Socialists' absolute majority could lead to a reversal of some of the important democratic gains of the recent past. Those concerns sharpened in July 1994, when Prime Minister Horn unilaterally appointed new heads for the state-owned radio and television, who immediately dismissed or suspended a number of conservative journalists.

On 8 January 1994 Hungary formally accepted the offer of a compromise on NATO membership. The offer involved a new defense partnership between Eastern Europe and NATO. By July 1997, NATO agreed to grant Hungary full membership (along with Poland and the Czech Republic) in the organization in 1999. In order to help them qualify to join NATO and the EU, Hungary and Romania signed a treaty on 16 September 1996 ending a centuries-old dispute between the two neighbors. The agreement ended five years of negotiations over the status of Romania's 1.6 million ethnic Hungarians. On 12 March 1999, Hungary, Poland, and the Czech Republic were formally admitted to NATO, becoming the first former Warsaw Pact nations to join the alliance.

Despite improvements in the economy, the position of the Socialists was undermined by dissatisfaction among those negatively affected by privatization and austerity measures, as well as by financial scandals in 1997. The Socialist government was toppled in national elections held in May 1998, and a new center-right coalition government was formed in July by Viktor Orbán, leader of the victorious Federation of Young Democrats-Hungarian Civic Party (Fidesz).

In 1997 Hungary was invited to begin negotiations leading to membership in the European Union. It was formally invited to join the body in 2002 at the EU summit in Copenhagen. It was accepted as a full member on 1 January 2004. In 2000, parliament elected Ferenc Madl as president.

Under Viktor Orbán, Hungary experienced increasing prosperity, but also increasing social division. Fidesz is a strong supporter of ethnic Hungarians in neighboring countries. Indeed, parliament in June 2001 passed a controversial law entitling Hungarians living in Romania, Slovakia, Ukraine, Serbia, Croatia, and Slovenia to a special identity document allowing them to temporarily

work, study, and claim health care in Hungary. In June 2003 the law was amended by the parliament, with a majority of the Hungarian population agreeing with it. However, the referendum held in December 2004, in conjunction with this law, was invalidated due to low turnout.

Orbán's party was challenged in the April 2002 general elections by the Socialist Party, which chose Péter Medgyessy as its candidate for prime minister. Although Medgyessy characterized his party as patriotic, he stressed it was less extreme than Fidesz, and supported diversity as well as traditional values of fairness and social justice.

The 2002 campaign was divisive, and saw nationalists come out in force in favor of Fidesz. Although it won the largest bloc of seats in the National Assembly in the second round of voting (aligned with the Hungarian Democratic Forum), it was the Socialists in concert with the Alliance of Free Democrats that formed a coalition government with Medgyessy as prime minister.

In June 2002, allegations surfaced that Medgyessy had worked as a counterintelligence officer in the secret service under the Communist regime in the late 1970s and early 1980s. Medgyessy claimed he never collaborated with Moscow's KGB, but instead sought out Soviet spies attempting to disrupt Hungary's efforts to join the IMF. Upon his admission, his popularity soared.

In the summer of 2004, internal problems within his own party, as well as growing opposition from the coalition partners—the Alliance of Free Democrats, led Medgyessy to resign. He was replaced with Ferenc Gyurcsany, the former sports minister and one of the government's most popular figures. Gyurcsany received 453 votes, while his main contender—Peter Kiss—got 166.

The new prime minister promised to strengthen the coalition, boost economic growth, and improve living conditions for Hungarians. However, strict budget controls (many imposed by the EU), and unfulfilled election promises dramatically decreased the popular support for his government, and party. In the 2004 European Parliament elections, the Young Democrats (the main opposition party) led the pack, and predictions for the 2006 national parliamentary elections showed Socialists as garnering only 20% of the votes.

In June 2005, opposition-backed Laszlo Solyom was elected as the new president of Hungary. He garnered 185 votes, in the third round of elections, followed closely by the Socialist's nominee—Katalin Szili—with 182 votes.

### **13 GOVERNMENT**

Hungary's present constitution remains based upon the 1949 Soviet-style constitution, with major revisions made in 1972 and 1988. The 1988 revisions mandated the end of the Communist Party's monopoly on power, removed the word People's from the name of the state, and created the post of president to replace the earlier Presidential Council.

The present system is a unitary multiparty republic, with a parliamentary government. There is one legislative house (the National Assembly), with 386 members who are elected to four-year terms. The head of state is the president, who is elected by the parliament, for a five-year term. In 2005, Laszlo Solyom—a university professor and former president of the Constitutional Court—was elected president by a simple majority of the legislative vote. The next presidential elections were scheduled for June 2010.

The head of the government is the prime minister, leader of the largest party seated in the parliament. The prime minister is elected by the National Assembly on the recommendation of the president. In the Antall government important ministerial and other posts were split among representatives of various parties. As of 2005, the prime minister was Ferenc Gyurcsany, a wealthy businessman and popular political figure. Gyurcsany replaced Péter Medgyessy in 2004, following dissensions within the ruling coalition.

### **14 POLITICAL PARTIES**

Following the general elections of April 2002, four political parties were represented in the 386-member National Assembly, split into two coalitions. This situation raised fears that Hungary was drifting into a two-party state, divided by ideology and personalities, instead of reflecting other interests not represented in government.

The predominant party is the Hungarian Socialist Party (MSZP), whose government was toppled in 1998, but returned to power in 2002, receiving 42.05% of the popular vote and garnering 178 seats in the National Assembly. The MSZP is the Hungarian Communist Party renamed and, to a certain extent, reoriented. The party's platform indicates strong support for the market economy system, albeit with a wide net of social services. It supports diversity in Hungarian society, as opposed to the center-right's more populist, nationalistic party Fidesz.

The leading opposition party was the Federation of Young Democrats-Hungarian Civic Party (also known as Fidesz), which held 164 seats. The party's leader, Viktor Orbán, was named prime minister in 1998; he was out of office in 2002 when the Socialists came to power. Originally known as the Federation of Young Democrats, the party was formed on an anti-Communist platform by student activists and young professionals in 1988. During the 1990s, it evolved into a mainstream center-right party and was renamed in 1995.

The Alliance of Free Democrats (SzDSz), which holds 20 seats, is the coalition partner of the MSZP. This party was a liberal opposition party during the Antall government, with positions strongly in favor of closer integration with Europe, cooperation with Hungary's neighbors, and support for alien Hungarians. In economic terms their platform is very similar to that of the MSZP, which was the basis of their agreement to enter into a coalition. However, their alliance had frequent disputes that in result undermined their political strength.

The Hungarian Democratic Forum (MDF), which has been reduced to 24 seats, is a party of strong support for the ethnic minorities within Hungary. It is currently aligned with Fidesz. The Hungarian Justice and Life Party (MIEP) first gained parliamentary representation in 1998, winning 14 seats, and was founded by Istvan Csurka, who was expelled from the MDF for his nationalist and anti-Semitic sentiments. The party is populist in orientation, seeking to elevate "Hungarian values." It won 4.4% of the vote in 2002 but held no seats. The next legislative elections were scheduled for April 2006.

The Independent Smallholders' Party (FKgP), which held 48 seats in the 1998 government but no seats in the government formed in 2002, is a center-right party that seeks to ensure Hun-

garian interests in the context of European integration. It draws particular support from rural districts and among farmers.

Other parties include the centrist Center Party and the communist Worker's Party. Hungary also has a noticeable "skinhead" movement, which has provoked fights and other disturbances, especially with Gypsies.

## 15 LOCAL GOVERNMENT

Hungary is divided administratively into 19 counties, 20 urban counties, and the capital city of Budapest also has county status. At the local and regional level, legislative authority is vested in county, town, borough, and town precinct councils whose members are directly elected for four-year terms. Members of the county councils are elected by members of the lower-level councils. Hungary also has provisions for minority self-government, which is not based territorially, because minorities live dispersed throughout the country. Municipality councils must seek the approval of minority self-governments for matters affecting minority education and culture, among others.

## 16 JUDICIAL SYSTEM

Cases in the first instance usually come before provincial city courts or Budapest district courts. Appeals can be submitted to county courts or the Budapest Metropolitan Court. The Supreme Court is basically a court of appeal, although it may also hear important cases in the first instance. As of 2003, a new intermediate court of appeal was to be established between county courts and the Supreme Court, designed to alleviate the backlog of court cases.

The president of the Supreme Court is elected by the National Assembly. A National Judicial Council nominates judicial appointees other than those of the Constitutional Court. The state's punitive power is represented by the public prosecutor. Peter Polt was appointed as prosecutor general in 2000.

The Constitutional Court reviews the constitutionality of laws and statutes as well as compliance of these laws with international treaties the government has ratified. The 11 members of the Constitutional Court are elected by parliament for nine-year terms with a two-thirds majority; their mandates may be renewed in theory, but as of 2002, this had not happened in practice.

## 17 ARMED FORCES

In 2005, Hungary had a total of 32,300 active personnel in its armed forces, including an army of 23,950 and an air force of 7,500 personnel. The Hungarian Army operates 238 main battle tanks, 178 armored infantry fighting vehicles, 458 armored personnel carriers, and over 573 artillery pieces. The Air Force operates 14 combat capable aircraft, as well as 12 attack helicopters and 17 support aircraft. All major equipment is of Soviet design. There is a small Army maritime wing with 60 personnel operating three river craft to patrol the Danube River. Paramilitary forces, consisting of frontier and border guards, under the direction of the Ministry of the Interior, number about 12,000. There are about 44,000 military reservists. The defense budget was estimated at \$1.43 bil-

lion in 2005. Hungary provides UN observers and peacekeepers to eight regions or countries.

## 18 INTERNATIONAL COOPERATION

Hungary has been a member of the United Nations since 14 December 1955 and participates in ECE and most of the nonregional specialized agencies except the IFAD. Hungary became a member of the OECD in 1996, a NATO member in 1999, and a member of the European Union in 2004. Hungary is also a member of the WTO, the Council of Europe, G-9, and the OSCE. The nation has observer status in the OAS and is a member affiliate of the Western European Union.

Hungary is part of the Australia Group, the Zangger Committee, the Nuclear Suppliers Group, the Organization for the Prohibition of Chemical Weapons, the European Organization for Nuclear Research (CERN), and the Nuclear Energy Agency. In environmental cooperation, Hungary is part of the Antarctic Treaty, the Basel Convention, Conventions on Biological Diversity and Air Pollution, Ramsar, CITES, the London Convention, International Tropical Timber Agreements, the Kyoto Protocol, the Montréal Protocol, MARPOL, the Nuclear Test Ban Treaty, and the UN Conventions on the Law of the Sea, Climate Change, and Desertification.

## 19 ECONOMY

Before World War II, industrial growth was slow because adequate capital was lacking. Since 1949, however, industry has expanded rapidly, and it now contributes a larger share than agriculture to the national income. The government has no capital investments abroad, but it participates in limited economic activities in developing countries. Substantial industrial growth continued through the 1960s and mid-1970s, but output in the socialized sector declined during 1979–80, and growth was sluggish in the 1980s.

After the fall of Communism in 1989, Hungary began a painful transition to a market economy. Between 1990 and 1992, GDP dropped by about 20%. Freed to reach their own level, consumer prices rose 162% between 1989 and 1993. The rate of unemployment was 12.2% at the end of 1992. By late 1998, private-sector output was over 85% of the GDP.

By 1994, Hungary was in an economic slump unknown since the reforms toward capitalism began. Export earnings were down, inflation was on the rise, and Hungary's gross debt rose to about \$31.6 billion in mid-1995 (the highest per capita foreign debt in Europe). The IMF directed the government to curb social spending, but restricting social welfare during a period of high unemployment was unpopular with voters. The government began a stabilization plan in March 1995 designed to decrease the budget deficit by Ft170 billion (3–4% of the GDP) and to decrease the current account deficit to \$2.5 billion from the record high of \$4 billion in 1994. The government cut expenditures, increased its revenues, devalued the forint by 9%, introduced a crawling peg exchange rate policy, added an 8% surcharge on imports, and called for wage controls at state-owned companies. As a result of the program, inflation and GDP growth rose. In addition, the black market economy was estimated to be as much as 30% of GDP.

In the years since its implementation, the stabilization program has borne fruit. By 1999, the IMF assistance had been repaid. The Hungarian economy exhibited strong growth rates with

GDP increases of 4.6% and 5.1% in 1997 and 1998, respectively. Although a hard winter and the Kosovo conflict appeared to hamper Hungarian efforts to match the prior years' growth rate levels, the economy performed well in 2000, led by an increase in foreign direct investment. Since then, manufacturing output and productivity increased, and export industries did well, although increases in wages and a rapid appreciation of the forint in 2002 moderated export growth. The global economic downturn that began in 2001 had an impact on the Hungarian economy, as GDP rose by 3.3% in the first half of 2002, down from 6.6% in the first half of 2000. Although this growth rate was higher than most European nations in 2002, it was below the rate needed for Hungary to reach the wealth levels of EU countries.

Due to government efforts at privatization, over 80% of the economy was privately owned by 2001, and Hungary stands as a model for countries undergoing market reforms. In December 2002, Hungary was formally invited to join the EU; it was accepted as a full member in May 2004 as one of the most advanced of the 10 candidate countries slated for accession.

As an EU member, Hungary maintained its position as one of the most dynamic and strong economies in Central and Eastern Europe. Its position within the European Union, and the fact that it is still comparatively cheaper to do business there than in other Western European countries, makes Hungary a prime target for investments. However, Hungary is being challenged by some of its neighbors that have managed to maintain lower labor costs, and a more attractive tax system. Already some of the investments in the country have moved further east, to countries like Romania and Ukraine, and some of the bids for new investments have been lost for the same reasons.

Although the GDP growth was slower in 2002 and 2003 (3.3% and 2.9% respectively), it recuperated lost ground in 2004, with a 4% increase, and is expected to exceed 4% in 2005. Inflation decreased to 7% in 2004, and unemployment was only 5.9% in the same time period. However, in order to catch up with the developed economies in the EU, Hungary should register (according to the IMF specialists) annual growth rates of 5–5.25%. This means that further investments have to be attracted to generate funds for the state. Consequently, the governments planned to sell Budapest Airport and Antenna Hungaria in 2005. Attracting additional foreign investments is increasingly difficult though, as the country has to fight with rather high budget deficits (5.9% in 2004), and with increased competition from its neighbors.

## 20 INCOME

The US Central Intelligence Agency (CIA) reports that in 2005 Hungary's gross domestic product (GDP) was estimated at \$159.0 billion. The CIA defines GDP as the value of all final goods and services produced within a nation in a given year and computed on the basis of purchasing power parity (PPP) rather than value as measured on the basis of the rate of exchange based on current dollars. The per capita GDP was estimated at \$15,900. The annual growth rate of GDP was estimated at 3.7%. The average inflation rate in 2005 was 3.7%. It was estimated that agriculture accounted for 3.9% of GDP, industry 30.9%, and services 65.3%.

According to the World Bank, in 2003 remittances from citizens working abroad totaled \$295 million or about \$29 per capita and accounted for approximately 0.4% of GDP. Foreign aid receipts

amounted to \$248 million or about \$25 per capita and accounted for approximately 0.3% of the gross national income (GNI).

The World Bank reports that in 2003 household consumption in Hungary totaled \$56.30 billion or about \$5,574 per capita based on a GDP of \$82.8 billion, measured in current dollars rather than PPP. Household consumption includes expenditures of individuals, households, and nongovernmental organizations on goods and services, excluding purchases of dwellings. It was estimated that for the period 1990 to 2003 household consumption grew at an average annual rate of 1.6%. In 2001 it was estimated that approximately 25% of household consumption was spent on food, 17% on fuel, 6% on health care, and 20% on education. It was estimated that in 1997 about 17.3% of the population had incomes below the poverty line.

## 21 LABOR

Hungary's workforce in 2005 was estimated at 4.18 million. In 2003, agriculture accounted for 5.5% of the labor force, with 33.7% in manufacturing, and 60.7% in the services sector. In 2005, the estimated unemployment rate stood at 7.1%.

Before World War II, trade unions had not developed substantially; their combined membership was only about 100,000, principally craftsmen. After the war, the government reduced the number of the traditional craft unions, organized them along industrial lines, and placed them under Communist Party control. The Central Council of Hungarian Trade Unions (SZOT) held a monopoly over labor interests for over 40 years. Since wages, benefits, and other aspects of employment were state-controlled, the SZOT acted as a social service agency, but was dissolved in 1990 with the shift away from centralization to democracy. The National Federation of Trade Unions is its successor, with 735,000 members in 1999. There are now several other large labor organizations in Hungary, including the Democratic League of Independent Trade Unions, with some 100,000 members, and the Federation of Workers' Councils, with 56,000 members. Labor disputes are usually resolved by conciliation boards; appeal may be made to courts. Since 1991, most unions have been hesitant to strike, preferring instead to act as a buffer between workers and the negative side effects of economic reform. Collective bargaining is permitted but is not widespread.

The eight-hour day, adopted in several industries before World War II, is now widespread. The five-day week is typical, but many Hungarians have second or third jobs. The law prohibits employment for children under the age of 15 and closely regulates child labor. The minimum wage in 2002 was \$140 per month which was not sufficient to provide a decent lifestyle for a family. Most workers earn more than this amount. Health and safety conditions in the workplace do not meet international standards, and regulations are not enforced due to limited resources.

## 22 AGRICULTURE

In 2003, 52% of the land (4,820,000 hectares/11,910,000 acres) was arable. More than half of Hungary's area lies in the Great Plain; although the soil is fertile, most of the region lacks adequate rainfall and is prone to droughts, requiring extensive irrigation. In 2003,

some 230,000 hectares (568,000 acres) of land were irrigated. In 2003, agriculture contributed 4% to GDP.

Before World War II (1939–45), Hungary was a country of large landed estates and landless and land-poor peasants. In the land reform of 1945, about 35% of the land area was distributed, 1.9 million hectares (4.7 million acres) among 640,000 families and 1.3 million hectares (3.2 million acres) in state farms. In 1949, the government adopted a policy of collectivization based on the Soviet kolkhoz, and by the end of 1952, 5,110 collectives, many forcibly organized, controlled 22.6% of total arable land. Peasant resentment led to a policy change in 1953, and many collectives were dissolved, but the regime returned to its previous policy in 1955. As a result of the 1956 uprising, collectives were again dissolved; but a new collectivization drive begun in 1959 was essentially completed by 1961. Meanwhile, the proportion of the economically active population employed in agriculture decreased steadily. In 1949, agricultural employees accounted for 55.1% of the total labor force; in 2003, agriculture accounted for 10.7% of the engaged labor force and gross agricultural output was valued at over €1.95 billion. In 2004, Hungary had an agricultural trade surplus of \$1.3 billion.

Hungary has achieved self-sufficiency in temperate zone crops, and exports about one-third of all produce, especially fruit and preserved vegetables. The traditional agricultural crops have been cereals, with wheat, corn (maize), and rye grown on more than half the total sown area. In recent years, considerable progress has been made in industrial crops, especially oilseeds and sugar beets. Fruit production (especially for preserves) and viticulture are also significant; the wine output in 2004 was estimated at 48 million liters. That year, over 650,000 tons of grapes were produced on 93,000 hectares (230,000 acres).

The principal field crops harvested in 2004 included (in tons): corn, 8,317,000; wheat, 6,020,000; sugar beets, 3,130,000; potatoes, 767,000; rye, 125,000.

### 23 ANIMAL HUSBANDRY

Although animal husbandry is second only to cereal cultivation in agricultural production, the number and quality of animals are much lower than in neighboring countries. An inadequate supply of fodder is one of the chief deficiencies. In 2005 there were 4,059,000 hogs, 1,397,000 sheep, 723,000 head of cattle, and 68,000 horses; poultry numbered 32,800,000. The 2005 output of livestock products was 1,034,000 tons (live weight) of meat, 2,043,000 tons of milk, and 5,000 tons of wool; egg production was 180,200 tons.

### 24 FISHING

Fishing was unimportant before World War II (1939–45), but production has increased in recent years. The best fishing areas are the Danube and Tisza rivers, Lake Balaton, and various artificial ponds. The catch is composed mainly of carp, catfish, eel, and perch. The 2003 catch was 18,406 tons, 64% from aquaculture. Hungary imports around \$15–20 million in seafood annually to meet demand.

### 25 FORESTRY

Forests totaled 1,840,000 hectares (4,547,000 acres), or 19.9% of Hungary's total land area, in 2000. The forest consists of the fol-

lowing main species: oak, 23%; black locust, 20%; pine and fir, 15%; Austrian and turkey oak, 11%; poplars, 9%; beech, 6%; hornbeam (blue beech), 6%; and others, 10%. Because of the relatively small forest area and the high rate of exploitation, Hungary traditionally has had to import timber. During the 1960s, a systematic reforestation program began. Reforestation affected about 440,000 hectares (1,087,000 acres) during 1960–68 but only about 65,000 hectares (161,000 acres) in 1970–74 and 64,322 hectares (158,942 acres) during 1975–81. From 1990–2000, some 136,000 hectares (336,000 acres) were annually reforested.

Roundwood production has remained stagnant in recent years, at 5,660,000 cu m (200 million cu ft) in 2004. Less than 12% of the production is softwood; Hungary's wood imports consist mostly of softwood, while exports are based on hardwood products. Production of wood products in 2004 (in thousands of cu m) included: sawn wood, 204; wood-based panels, 638; paper and paperboard, 579; and pulpwood, 653.

Privatization of agricultural land, including forests, finished in 1996. According to estimates from the Ministry of Agriculture's Forestry Office, 55% of forests were under state control, 44.5% were owned by private individuals, and 0.5% belonged to municipalities.

### 26 MINING

In 2002, Hungary produced modest amounts of fossil fuels and industrial minerals, cement and coal being the dominant components of industrial minerals and metals. Although the country had significant output of alumina and bauxite, the output of primary aluminum was modest, due to limited domestic energy sources. Construction aggregates and cement continued to play an important role in Hungary's economy, especially in view of the modernization process necessary for the country's infrastructure, for which planned highway construction through 2008 would be an important element. Mineral reserves were small and generally inadequate.

Bauxite mining and refining to alumina, as well as manganese mining, remained the only metal mining and processing operations in Hungary in 2002. Production of bauxite, found in various parts of western Hungary, was 720,000 tons in 2002, compared with 1 million tons in 2001. Total resources of bauxite were estimated to be 23 million metric tons, with commercial reserves at 16 million metric tons. Bakony Bauxitbány Kft. constituted Hungary's bauxite mining industry in 2002. Hungary also produced 40,000 metric tons of manganese ore concentrate (gross weight) in 2002, up from 338,000 metric tons in 2001, and 250,000 tons of gypsum and anhydrite in 2002. A total of 500,000 tons of calcined lime were also produced that same year. In addition, Hungary produced alumina (calcined basis), bentonite, common clays, diatomite, kaolin, nitrogen, perlite, sand (common, foundry, and glass) and gravel, dimension stone, dolomite, limestone, sulfuric acid, and talc. Although Hungary no longer mined copper, past surveys of the deep-lying Recsk copper ore body, in the Matra mountains, discovered 172–175 million tons of copper ore at a grade of 1.12% copper and about 20 million tons of polymetallic ore at a grade of 4.22% lead and 0.92% zinc as well as smaller quantities of gold, molybdenum, and silver. After failing to attract foreign investment, the exploration shaft and adit at Recsk was closed, the equipment removed, and the facilities flooded in 1999.

Exploration for gold in the Recsk region continued in 2000, as 35 million tons of gold-bearing enargite copper ore was delineated with a grade of 1.47 grams per ton of gold.

## 27 ENERGY AND POWER

Hungary has modest reserves of oil, natural gas, and coal. In addition, the country's electric power sector relies upon nuclear power to provide a sizable portion of its electric power needs.

In 2002, Hungary's electric power generating capacity stood at 8.393 million kW, of which conventional thermal plants accounted for: 6.478 million kW; nuclear 1.866 million kW; hydropower 0.048 million kW; and geothermal/other 0.001 million kW. Electric output in 2002 came to 34.061 billion kWh, of which: conventional thermal sources accounted for 20.548 billion kWh; nuclear 13.255 billion kWh; hydropower 0.192 billion kWh; and geothermal/other 0.066 billion kWh. Electric power consumption in 2002 totaled 35.977 billion kWh. Imports and exports of electric power that year came to 12.6 billion kWh and 8.3 billion kWh, respectively. By the end of 1963, all villages were connected with electric power. Hungary's sole nuclear power plant, at Pécs, consists of four second-generation, Soviet-designed, VVER-440/213 reactors, which began production in 1982. As of 2002, modernization was planned to extend the operating life of the reactors by 20 years. The normal lifespan of the four units would end between 2012 and 2017. However, if the continuous operation of the power plant is to be maintained, the needed modernization would have to start in 2007.

Hungary's reserves of crude oil and natural gas are estimated, as of 1 January 2004, at 102.5 million barrels and 1.2 trillion cu ft, respectively. Refining capacity for that same date is estimated at 161,000 barrels per day. Coal reserves in 2001, were estimated at 1,209 million short tons. In 2003, Hungary's total oil production was estimated at 45,700 barrels per day, with natural gas and coal output estimated in 2002 at 110 billion cu ft and 14.2 million short tons, respectively. Consumption of oil, natural gas and coal outstrips domestic production. Demand for oil in 2003 was estimated at 137,000 barrels per day, while natural gas and coal consumption in 2002 were estimated at 473 billion cu ft and 15 million short tons, respectively. However, the consumption of coal has declined. Between 1993 and 2003, Hungary's demand for coal fell 21%. Brown coal, or lignite, accounted for all domestic coal output in 2002. Uranium, discovered in 1953 near Pécs, is expected to supply its nuclear station until 2020.

## 28 INDUSTRY

Hungary is poor in the natural resources essential for heavy industry and relies strongly on imported raw materials. Industry, only partially developed before World War II, has expanded rapidly since 1948 and provides the bulk of exports. Industrial plants were nationalized by 1949, and the socialized sector accounted for about 98.5% of gross production in 1985.

Hungary has concentrated on developing steel, machine tools, buses, diesel engines and locomotives, television sets, radios, electric light bulbs and fluorescent lamps, telecommunications equipment, refrigerators, washing machines, medical apparatus and other precision engineering equipment, pharmaceuticals, and petrochemical products. Textile and leather production has decreased in relative importance since World War II, while chemi-

icals grew to become the leading industry in the early 1990s. Food processing, formerly the leading industry, provides a significant portion of exports; meat, poultry, grain, and wine are common export items.

In 1993, industrial production was only two-thirds of the 1985 level. In 1997, industrial output increased in the manufacture of road vehicles, consumer electronics, insulated cables, office equipment and computers, steel products, aluminum metallurgy, household chemical products and cosmetics, rubber and plastic products, and paper and pulp production. In 1992, Suzuki and Opel began producing automobiles in Hungary, the first produced there since before World War II. Suzuki increased annual output at the Magyar Suzuki Corporation from 29,000 to 50,000 units starting in the 1995 fiscal year. Since 1990, Hungary has developed industrial strength in the automotive field as well as an expanding automotive sourcing industry in plastics and electronics. In 2001, Hungary produced 144,313 automobiles, a 5% increase over 2000. In 2000, it produced 1,621 heavy trucks, a 24% increase over 1999. In 2000, close to 14% of total Hungarian industrial output was accounted for by the vehicle manufacturing industry.

The growth in manufacturing output and productivity in the early 2000s has been supported by a considerable amount of foreign investment. Successive Hungarian governments have pursued privatization policies and policies to restructure industry, so that by 2002, 80% of the economy was privately owned. High-tech equipment (computers, telecommunication equipment, and household appliances) showed the strongest industrial growth in 2001. Industries targeted for growth in 2003 were the automotive industry, the general industrial and machine tool industry, and the information technology industry. Housing construction was another growth sector in 2002.

In 2004, the share of the industrial output in the GDP was 31.4%, while its representation in the labor force was 27.1%. Agriculture contributed 3.3% to the GDP, while occupying 6.2% of the labor force; services came in first with a 65.3% share in the economy, and a 66.7% representation in the labor force. The industrial production growth rate was 9.6% in 2004, and most of this growth occurred in industries like motor vehicles, chemicals (especially pharmaceuticals), textiles, processed foods, construction materials, metallurgy and mining.

## 29 SCIENCE AND TECHNOLOGY

In 2002, there were 486 technicians and 1,473 researchers per million people that were actively engaged in research and development (R&D). Total expenditures on R&D during that year amounted to \$1.374 million, or 1.01% of GDP. Of that total, the government sector accounted for the majority of spending at 58.6%, followed by business at 29.7%, foreign investors at 10.4%, and higher education at 0.3%. Undistributed funds accounted for the remainder. High-tech exports in 2002 were valued at \$7.364 billion and accounted for 25% of manufactured exports.

Among major scientific organizations are the Hungarian Academy of Sciences (founded in 1825), the Association for Dissemination of Sciences (founded in 1841), and the Federation of Technical and Scientific Societies (founded in 1948), with 32 agricultural, medical, scientific, and technical member societies. In 1996, Hungary had 45 research institutes concerned with agriculture and

veterinary science, medicine, natural sciences, and technology. There are 25 universities and colleges offering courses in basic and applied science. In 1987–97, science and engineering students accounted for 32% of university enrollment. In 2002, science degrees (natural sciences, mathematics and computers, and engineering) accounted for 11.9% of all bachelor's degrees awarded.

In addition to the National Museum of Science and Technology, Budapest has museums devoted to transport, electrical engineering, agriculture, natural history, and foundries.

### 30 DOMESTIC TRADE

Budapest is the business and trade center of the country, though most production facilities lie elsewhere. Over the past few years, the retail and wholesale sector has grown along Western standards. Throughout most of the country, small, family-owned and operated retail establishments predominate. However, in Budapest supermarkets, department stores, and indoor shopping malls have grown rapidly.

The Polus Center, the first American-style shopping mall in Central Europe, opened on the outskirts of Budapest in November 1996. West End City Center, the largest mall complex in Central Europe, was opened in Budapest in 1999. As of 2002, there were about 400 franchise operations nationwide. Several foreign chains are present. Retail purchases are still primarily cash based, though some banks are beginning to issue credit cards. A 12% value-added tax (VAT) applies to food, books, hotel accommodations and utilities. A 25% VAT applies to most other goods and services. Additional excise taxes (ranging from 10–35%) apply to some products, such as gold, coffee, wine, and automobiles.

New regulations passed in January 1997 concerning trade in food products and the operation of retail outlets focus on the reduction of black market activity, consumer protection, and harmonization with EU law. Nevertheless, the underground economy remained at around 30% in 1999.

Business hours extend from 9 or 10 AM to 4 or 5 PM for offices and general stores and to 3 or 4 PM for banks. Early closing (between noon and 1 PM) on Saturdays is widespread; Sunday closing is general. Food stores open between 6 and 8 AM and close between 7 and 9 PM weekdays; a few remain open on Sundays.

Newspapers and general, trade, and technical magazines are used for advertising; there is also broadcast and outdoor advertising. A major industrial fair, held since 1906, takes place every spring and autumn in Budapest.

### 31 FOREIGN TRADE

Hungary imports raw materials and semifinished products and exports finished products. Within that general framework, however, the structure, volume, and direction of Hungarian foreign trade have changed perceptibly in recent years. The total trade volume expanded from HUF18,344 million (foreign exchange) in 1959 to HUF2,657 billion in 1994. In 2000, exports were estimated at \$28.1 billion (up from \$12.9 billion in 1995), while imports were estimated to be \$32.1 billion (up from \$15.4 billion in 1995).

The majority of Hungary's export market is concentrated in the manufacturing industry, including electrical machinery, motor vehicle parts, polymers, petroleum refining, telecommunications equipment, and aluminum. Manufactured goods make up 82% of all exports. Other important exports include apparel (4.4%), polymers (2.2%), and meat (2.1%).

In 2004, Hungary's exports reached \$54.6 billion (FOB—Free on Board), while its imports (FOB) grew to \$58.7 billion; the trade deficit was \$4.1 billion. The most important export partners were Germany (where 31.4% of Hungary's exports went), Austria (6.8%), France (5.7%), Italy (5.6%), and the United Kingdom (5.1%). The bulk of exports were made up of machinery and equipment (61.1%), and other manufactures (28.7%); other export commodities included food products (6.5%), raw materials (2%), fuels and electricity (1.6%). Imports came mainly from Germany (29.2%), Austria (8.3%), Russia (5.7%), Italy (5.5%), the Netherlands (4.9%), China (4.8%), and France (4.7%). The main import commodities included machinery and equipment (51.6%), other manufactures (35.7%), fuels and electricity (7.7%), food products (3.1%), and raw materials (2.0%).

### 32 BALANCE OF PAYMENTS

Having scrapped central planning, the Hungarian government is engaged in stabilizing the economy and taming inflation. In 1992, exports had grown by 7.4%, but recession in export markets, western European protectionism, an appreciating forint, bankruptcies of firms producing one-third of exports, and drought caused Hungarian trade to slow down. In 1994, Hungary had a current account deficit of \$4 billion, but it shrank to \$2.5 billion in 1995, and to a further \$1 billion in 2001. Export markets were weak in 2003, and were not expected to rebound until mid-2004. Strong private consumption growth was sustaining the growth of the economy in 2003, but the current account deficit was forecast at 5.4% of GDP in 2003/04.

The US Central Intelligence Agency (CIA) reported that in 2002 the purchasing power parity of Hungary's exports was \$31.4 billion while imports totaled \$33.9 billion resulting in a trade deficit of \$2.5 billion.

The International Monetary Fund (IMF) reported that in 2001 Hungary had exports of goods totaling \$28.1 billion and imports totaling \$30.1 billion. The services credit totaled \$7.71 billion and debit \$5.55 billion.

By 2004, the exports of goods and services expanded to \$65.3 billion, while imports reached \$68.3 billion; this resulted in a

negative resource balance of \$3 billion. Also, the current account deficit worsened, growing from -\$7.2 billion in 2003, to -\$8.8 billion in 2004. The reserves of foreign exchange and gold grew from \$11.5 in 2003 to \$14.8 in 2004, covering less than four months of imports. Hungary is a major recipient of aid from the EU—for 2004–06 it had \$4.2 billion available in structural adjustment and cohesion funds. The external aid is dwarfed however by the external debt, which grew from \$47.4 billion in 2003 to \$61.3 billion in 2004.

**33 BANKING AND SECURITIES**

Banking was nationalized in 1948, when the National Bank of Hungary was installed as the bank of issue, with a monopoly on credit and foreign exchange operations.

Following the 1987 reform of the banking system, the National Bank retained its central position as a bank of issue and its foreign exchange monopoly, but its credit functions were transferred to commercial banks. Three new commercial banks were established: the Hungarian Credit Bank, the Commercial and Credit Bank, and the Budapest Bank. Two other commercial banks, both founded in the 1950s, are the Hungarian Foreign Trade Bank and the General Banking and Trust Co. These six banks serve the financial needs of enterprises and government operations. The main bank for the general public is the National Savings Bank; in 1987 there were also 262 savings cooperatives. The Central Corporation of Banking Companies handles state property, performs international property transactions for individuals, and deals with the liquidation of bankrupt companies. The State Development Institution manages and controls development projects. In 1987 there were also three banks with foreign participation: the Central European International Bank (66% of shares held by six foreign companies), Citibank Budapest (80% owned by Citibank New York), and Unibank (45% owned by three foreign companies). In 1991 there were 10 government owned commercial banks, 16 joint-

stock owned commercial banks, 5 government owned specialized financial institutions, one offshore bank, and 260 savings cooperatives. By 1997, Hungary had over 30 commercial banks, about 10 specialized financial institutions, and 260 savings cooperatives. By 1998, around 75% of all banks had been privatized and 70% of these shares had foreign owners. Upon joining the OECD in 1996, Hungary ceased its ban on the establishment of foreign branches, effective January 1998.

The International Monetary Fund reports that in 2001, currency and demand deposits—an aggregate commonly known as M1—were equal to \$9.7 billion. In that same year, M2—an aggregate equal to M1 plus savings deposits, small time deposits, and money market mutual funds—was \$24.3 billion. The discount rate, the interest rate at which the central bank lends to financial institutions in the short term, was 9.8%.

In Budapest, an authentic commodity and stock exchange functioned from 1867 until 1948, when it was closed down as the country transformed into a centralized socialist economy. The reorganization of the Hungarian securities market, after a pause of some 40 years, started at the beginning of the 1980s. The Exchange was founded eventually on 21 June 1990. The bull market on the Budapest Stock Exchange (BUX) continued during the final quarter of 1996. The BUX index closed 1996 at 4,125, up 170% compared with end-1995. The increase was the second strongest in the world, following the Venezuela market. By 7 February 1997, the BUX index had reached 5,657. By mid-2000, the index stood at over 8,800, but as of mid-2003, it had dropped to just over 8,000 amid the global recession. However, by the end of 2004, the BUX had recovered, rising 57.2% that year to close at 14,742.6. In 2004, a total of 47 companies were listed on the BUX, which had a market capitalization of \$28.711 billion.

**34 INSURANCE**

Before World War II, 49 private insurance companies—25 domestic and 24 foreign—conducted business activities in Hungary. All insurance was nationalized in 1949 and placed under the State Insurance Institute, a government monopoly. A new institution, Hungária Insurance Co., was founded in 1986. As of 1997, the regulatory authority was the Insurance Supervisor (allami Biztosításfelügyelet). Compulsory insurance in Hungary includes third-party auto liability, workers' compensation, and liability for aircraft, watercraft, and several professions. In 2003, the value of direct premiums written totaled \$2.454 billion, of which nonlife premiums made up the largest portion at \$1.473 billion. Allianz Hungaria was the country's leading nonlife insurer, with gross written nonlife premiums of \$621.8 million for 2003. ING was Hungary's top life insurer in 2003, with gross written life premiums totaling \$280.1 million.

**35 PUBLIC FINANCE**

In recent years, the government has presented its budget bill to the National Assembly sometime during the first several months of the year, but the budget itself becomes effective on 1 January, when the fiscal year begins. It is prepared by the Ministry of Finance. Although Hungary had one of the most liberal economic regimes of the former Eastern bloc countries, its economy still suffered the growing pains of any country trying to come out of com-

**Public Finance – Hungary (2002)**

(In billions of forint, central government figures)

<b>Revenue and Grants</b>	<b>6,338.1</b>	<b>100.0%</b>

munism and privatize its industries. The last few years, however, Hungary has enjoyed a remarkable expansion, averaging annual GDP growth of 4.5% between 1996 and 2002. Inflation in that period dropped from 28% to 7%, and unemployment fell to 6%, less than most EU countries. Eighty percent of GDP is now produced by privately owned companies. Still, Hungary's foreign debts remain large, putting a damper on the economy's otherwise spectacular performance.

The US Central Intelligence Agency (CIA) estimated that in 2005 Hungary's central government took in revenues of approximately \$51.4 billion and had expenditures of \$58.3 billion. Revenues minus expenditures totaled approximately -\$6.9 billion. Public debt in 2005 amounted to 60.9% of GDP. Total external debt was \$76.23 billion.

The International Monetary Fund (IMF) reported that in 2002, the most recent year for which it had data, central government revenues were Ft6,338.1 billion and expenditures were Ft7,781.6 billion. The value of revenues was us\$25 million and expenditures us\$30 million, based on an exchange rate for 2002 of us\$1 = Ft257.887 as reported by the IMF. Government outlays by function were as follows: general public services, 28.1%; defense, 3.0%; public order and safety, 4.3%; economic affairs, 20.6%; environmental protection, 0.5%; housing and community amenities, 0.4%; health, 5.8%; recreation, culture, and religion, 1.8%; education, 5.2%; and social protection, 30.2%.

**36 TAXATION**

As of 2006, Hungary's corporate tax rate is 16%. Capital gains are also taxed at the 16% rate. However, only 50% of capital gains generated from stock transactions are subject to the tax. Capital gains from the sale of business assets are treated as business income. The withholding tax on dividends paid to foreign companies is 20% unless recipients reinvest them in Hungarian companies. Dividends paid to individuals are subject to a 25% withholding tax, and dividends that are in excess of 30% of the return on equity are

subject to a 35% rate. However, most tax treaties with Hungary reduce the withholding tax to between 5% and 15%.

The progressive personal income tax schedule in Hungary has a top rate of 38%. Individuals receiving capital gains on immovable property or the sale of securities are subject to a 25% tax. Individuals also can take allowances against the taxes they owe in the form of tax deductions or tax credits. The main deduction from taxable income is 20% of annual income up to a certain maximum. The disabled are given an extra deduction. There are also partial deductions allowed for school fees, interest paid for the purchase of a house, and for donations to charity. Inheritance and gift taxes range from 11–15%. There is a 2–6% tax on the transfer of housing, and a 10% tax on the transfer of large estates. Local authorities may levy individual income and corporate taxes.

The major indirect tax in Hungary is the value-added tax (VAT). The normal VAT rate is 25%, with a reduced rate of 15% for items of social value, food and other staple items. A 5% VAT applies to certain medical materials and supplies, and to textbooks. Housing leases, health and education services, and financial services are exempt from the VAT. Other taxes include a stamp tax and a consumption tax imposed on cars, jewelry, gasoline, alcohol, cigarettes, and cosmetics at rates between 10% and 200%.

**37 CUSTOMS AND DUTIES**

Under Hungary's liberalized import policies, 93% of all imports do not require licenses. Under World Trade Organization (WTO) rules, import licenses on certain products from WTO states are no longer required. Under the same regulations, duties for countries with most-favored-nation status stood at around 8% in 2002, but could be over 100% for selected commodities.

**38 FOREIGN INVESTMENT**

Even before the repudiation of communism, Hungary sought to enter joint ventures with Western countries. By the end of 1996, Hungary had attracted \$15 billion in foreign direct investment. Since 1989, Hungary has attracted nearly one-third of all foreign direct investment in Central Europe and Eastern Europe. In 1995–96, the government adopted a stringent economic reform program of liberalization and privatization, and by 2002, the private sector, which had been 20% of the economy in 1989, was about 80%. Hungary has five free trade zones in which corporations are treated as foreign and are exempt from custom duties and taxes.

In the period 1988 to 1990, Hungary's share of world FDI inward flows was five and a half times its share in world GDP, the sixth-largest ratio in the world. Annual foreign direct investment (FDI) inflows into Hungary reached a peak in 1995 at about \$4.5 billion, from which point they declined steadily until 2001, when there was an upswing to \$2.4 billion from \$1.6 billion in 2000. In 2002, FDI inflow fell to less than \$1.5 billion. The average FDI inflow from 1998 to 2001 was about \$2 billion a year. For the period 1998 to 2000, Hungary's share of FDI inflows was about equal to its share of world GDP. Total FDI stock, from 1989 to 2002, is estimated at about \$34 billion.

The largest single source of foreign investment has been the United States, followed by Germany, the Netherlands, Austria, the United Kingdom, and France.

Of foreign capital invested in Hungary through 2000, 50% has been in manufacturing, 15% in telecommunications, 13% in en-

ergy, 6% in banking and finance, and 10% in other areas. FDI outflows from Hungary have averaged about \$400,000 per year and as of 2001, foreign stock held by Hungarians totaled \$2.2 billion.

The flow of foreign investment reached peak levels in 2003 and 2004, with €2.3 billion and €2.5 billion respectively. The Hungarian Ministry of Economics and Transportation estimated that by 2004 the total stock of FDI exceeded €42 billion, with the United States and Germany taking the lion's share of this total. The same agency expects the flow of FDI to grow to €3–3.5 billion in 2005. Most of the investments went to manufacturing (46%); real estate (12%); trade and repair (11%); finance (10%); transport, telecommunications, storage and post (10%); and the energy sector (5%). By 2003, the biggest investors in Hungary were: Deutsche Telekom A.G., Germany (with cumulative investments exceeding \$1.7 billion); Audi A.G., Germany (\$1.4 billion); General Electric, US (\$1.1 billion); Telenor ASA, Norway (\$1 billion); and, Vodafone, Netherlands (\$850 million).

### **3<sup>9</sup> ECONOMIC DEVELOPMENT**

During the first 20 years after World War II, Hungary had the following economic plans: the three-year plan (1947–49) for economic reconstruction; the first five-year plan (1950–54) which aimed at rapid and forced industrialization and which was slightly modified in 1951 and by the “new course” policy of 1953; the one-year plan of 1955; the second five-year plan (1956–60), designed to further industrialization but discarded as a result of the October 1956 uprising; the three-year plan (1958–60), which also emphasized industrialization, although it allocated greater investment for housing and certain consumer goods; and the new second five-year plan (1961–65), which provided for a 50% increase in industrial production. These were followed by the third five-year plan (1966–70); the fourth five-year plan (1971–75), with greater emphasis on modernization of industrial plants producing for export and housing construction; the fifth five-year plan (1976–80), which called for amelioration of the gap in living standards between the peasantry and the working class; the sixth five-year plan (1981–85), emphasizing investment in export industries and energy conservation and seeking to curb domestic demand; and the seventh five-year plan (1986–90), which projected growth of 15–17% in NMP, 13–16% in industrial production, and 12–14% in agriculture.

Far-reaching economic reforms, called the New Economic Mechanism (NEM), were introduced on 1 January 1968. In order to create a competitive consumers' market, some prices were no longer fixed administratively, but were to be determined by market forces. Central planning was restricted to essential materials, and managers of state enterprises were expected to plan and carry out all the tasks necessary to ensure profitable production. In the early years of the NEM, the growth rate of industrial output surpassed target figures; national income rose substantially, surpassing any previous planning periods; and productivity increased significantly in all sectors of the national economy. However, following the huge oil price increases of 1973–74, the government returned to more interventionist policies in an attempt to protect Hungary's economy from external forces. Beginning in 1979, the government introduced a program of price reform, aimed at aligning domestic with world prices; changes in wage setting, intended to encourage productivity; and decentralization of industry, in-

cluding the breakup of certain large enterprises and the creation of small-scale private ones, especially in services. New measures introduced in 1985 and 1986 included the lifting of government subsidies for retail prices (which led to sharp price increases) and the imposition of management reform, including the election of managers in 80% of all enterprises. The 1991–95 economic program aimed to fully integrate Hungary into the world economy on a competitive basis. The program's main features were to accelerate privatization, control inflation, and institute measures to prepare the way for the convertibility of the forint.

Reforms slowed in 1993 and 1994, and the privatization of state firms stopped. However, privatization accelerated in 1995 as the result of new laws passed in May of that year, which made the process simpler and allowed for the rapid privatization of small firms. Some large utilities were privatized in 1995; the first wave of the electricity and gas company privatization totaled \$3.2 billion, primarily from German, Italian, and French interests. Budapest Bank, one of the country's largest banks, was sold to GE Capital Services. Hungary is now one of the few countries in Eastern Europe to have privatized major portions of its telecommunications and energy sectors. In 1995, the government received \$4.5 billion in privatization proceeds. From the mid-1990s, a massive amount of foreign investment flowed into the country. (It stood at just under \$23.5 billion by the end of 2001, which was equivalent to about 46% of GDP.)

In 1994, the Development Assistance Committee of the OECD distributed \$68.3 million in aid to Hungary. Net concession flows from multilateral institutions that year amounted to \$132 million. With the adoption of an International Monetary Fund (IMF)-backed stabilization program in 1995, Hungary exhibited consistent GDP annual growth of 4% in the late 1990s. Moreover, Hungary has repaid its entire debt to the IMF, and was formally invited to join the EU in 2002, and finally accepted in 2004, together with nine other countries.

The private sector now produces 80% of GDP. The economy was suffering from the effects of currency appreciation in 2003, and from rises in wages in 2001–02. Hungary's markets in 2003 were weak, given the dismal state of the global economy. (Exports in 2001 reached the equivalent of some 60% of GDP, up from 30.6% in 1991.) The current account deficit reached 5.9% of GDP for in 2004.

The Hungarian economy improved as it joined the EU, but the rate of improvement was deemed unsatisfactory. The GDP growth rate was 4% in 2004, but IMF specialists consider that the economy needs to grow by 5–5.25% annually if Hungary is to catch up with Western Europe in the timeline that it set for itself. The Hungarian policy makers are trying to attract additional investments in the country as a way of fostering additional growth. This task is made difficult however by increasing competition from neighboring countries, and the need to implement a leaner and more flexible tax system.

### **4<sup>0</sup> SOCIAL DEVELOPMENT**

A national social insurance system was relatively well advanced before World War II for the nonagricultural population. A 1972 decree of the Council of Ministers extended this system to cover virtually the entire population, including craftsmen; by 1974, 99% of the population enjoyed the benefits of social insurance. Cover-

age includes relief for sickness, accidents, unemployment, and old age and incapacity, and provides maternity allowances for working women, allowances for children, and payment of funeral expenses. Men can collect old age pensions at the age of 62 after 20 years of employment. As of 2005, women collect at age 60, and will meet the same standards as men by 2009. The social insurance system also provides for disability and survivorship benefits. Medical care is provided directly to the insured through the public health service.

Women have the same legal rights as men, including inheritance and property rights. They hold a large number of the positions in teaching, medicine, and the judiciary, but generally earn less than men. Women are underrepresented in senior positions in both the private and public sectors. Sexual harassment in the workplace is commonplace, and it is not prohibited by law. Spousal abuse is a huge problem; approximately 20% of women were victimized in 2004. Sexual abuse, rape, and domestic violence are underreported due to cultural prejudice.

Minority rights are protected by law, allowing for the creation of minority local government bodies for limited self-rule. The law also preserves ethnic language rights and encourages minorities to preserve their cultural traditions. Despite these efforts, the Roma minority continues to face discrimination and prejudice. There were also reports of excessive police force in certain cases, as well as pretrial detention.

#### 41 HEALTH

The Ministry of Health administers the state health service, with the counties and districts forming hospital regions. By the end of 1974, 99% of the population was covered by social insurance and enjoyed free medical services; those few not insured pay for medical and hospital care. Limited private medical practice is permitted. In 1992, the Ministry of Welfare proposed a compulsory health care scheme based on the German system, to be administered by the National Health Security Directorate. After the termination of socialism in 1989, the Hungarian health system was largely unchanged. About 5% of clinics were privatized and health care was available to nearly all of Hungary's people. Health expenditures comprised an estimated 6.8% of the gross domestic product.

As of 2004, there were an estimated 316 physicians, 852 nurses, and 46 dentists per 100,000 people. Hungary's birthrate was estimated at 9 per 1,000 people. Contraceptives were used by an estimated 73% of married women. Average life expectancy was 72.40 years in 2005. Free professional assistance given to insured pregnant women and to the mothers of newborn children, maternity leave and grants, and improved hygienic conditions helped lower the infant mortality rate to 8.57 per 1,000 live births in 2005. As of 2000, the total fertility rate was 1.3 per woman during her child-bearing years.

The country faces severe problems in maintaining an acceptable level of health care for its population. The UN considers its death rate unacceptable (13 per 1,000 in 1999). The heart disease occurrence is below the average for wealthier countries. The likelihood of death after age 65 from heart disease was 283 (male) and 283 (female) per 1,000 people during 1990–1993. The number of cardiovascular deaths in 1994 was 74,182 people. Arteriosclerosis is a major cause of death (100 per 100,000 people). Contribut-

ing factors include the incidence of cardiovascular disease, which is directly related to stress through pressures of work, together with smoking and dietary factors. Hungary has one of the highest smoking rates in Europe. In 1990, there were 40 reported cases of tuberculosis per 100,000 people. Virtually all children up to one year old were vaccinated against tuberculosis, diphtheria, pertussis, and tetanus, polio and measles.

Compulsory testing for HIV has been widespread since 1988 in Hungary's attempt to stop the spread of AIDS. Hungary has resisted pressure from international agencies to switch from compulsory to voluntary testing. The HIV/AIDS prevalence was 0.10 per 100 adults in 2003. As of 2004, there were approximately 2,800 people living with HIV/AIDS in the country. There were an estimated 100 deaths from AIDS in 2003.

#### 42 HOUSING

The construction rate for new dwellings has been greater in smaller cities and towns than in Budapest, where as of 1980, 17.3% of all housing units were built before 1900 and 56.3% before 1945. About 20,320 new dwellings were completed in 2000; about 31,511 dwellings were completed or under construction in 2001. According to national statistics, in 2005 there were about 4,127,743 dwelling units nationwide. About 84% were owner occupied. Only about 130,208 units were owned by municipal governments. Most homes have an average of four rooms. It has been estimated that about 1.2 million people are affected by overcrowding.

Low-income residents and other private builders generally rely on the labor of family and friends, buying the essential materials little by little; they may apply for loans if necessary to complete the dwelling.

#### 43 EDUCATION

Before education was nationalized in 1948, most schools were operated by religious bodies, especially the Roman Catholic Church. The educational system is under the control of the Ministry of Education and is supervised by the local councils, which receive financial assistance from the central government. As of 2003, public expenditure on education was estimated at 5.5% of GDP, or 14.1% of total government expenditures.

Education is free for 12 years of study and compulsory for 10 years. The state also pays the bulk of costs for higher education. Primary school covers eight years of study. Secondary schools are divided into academic schools (*gimnázium*) and vocational schools (*szakközépiskola*). Programs at academic schools run from four to six years. Vocational school programs generally cover four years of study. In addition to its regular primary education, Hungary has over 100 primary schools with special music programs based on the pedagogy of the 20th-century composer Zoltan Kodály; at these "music primary schools," music receives as much emphasis as all other subjects. The academic year runs from September to June.

In 2001, about 80% of children between the ages of three and six were enrolled in some type of preschool program. Primary school enrollment in 2003 was estimated at about 91% of age-eligible students. The same year, secondary school enrollment was about 94% of age-eligible students. Most students complete their primary education. The student-to-teacher ratio for primary school was

at about 9.6:1 in 2003; the ratio for secondary school was about 11:1.

Hungary has about 77 institutions of higher education, including 25 universities and 47 colleges. Adult education expanded after World War II, especially through workers' schools and correspondence courses. Although there are university fees, many students are exempt from payment or pay reduced fees. In 2003, about 51% of the tertiary age population were enrolled in some type of higher education program. The adult literacy rate for 2004 was estimated at about 99%.

#### 44 LIBRARIES AND MUSEUMS

Hungary's National Archives were established in 1756; among its treasures are some 100,000 items from the period prior to the Turkish occupation (1526). Hungary's National Széchenyi Library is the largest and most significant in the country. Founded in Budapest in 1802, it has more than 2.5 million books and periodicals and more than 4.5 million manuscripts, maps, prints, and microfilms. Other important libraries are the Lóránd Eötvös University Library (1.5 million volumes) and the Library of the Hungarian Academy of Sciences (2.1 million volumes), both in Budapest; and the Central Library of the Lajos Kossuth University in Debrecen (1.27 million volumes). There are numerous local and regional public libraries.

There were over 500 museums (about 70 in Budapest) and many zoological and botanical gardens. One of the largest institutions is the Hungarian National Museum, which displays relics of prehistoric times as well as artifacts reflecting the history of Hungary from the Magyar conquest through 1849, including the Hungarian coronation regalia. A branch of the National Museum is the Hungarian Natural History Museum. Other museums, all in Budapest, include the Ethnographical Museum, the Museum of History, the Hungarian National Gallery, and the Museum of Fine Arts. Many castles and monasteries throughout the country have been converted to museums. There is also a Bela Bartok Museum, a Chinese Museum, a House of Terror museum (2002), and a Franz Liszt Memorial Museum and Research Center, all in Budapest.

#### 45 MEDIA

Budapest is the principal communications center. Although telecommunication services in Hungary were long underdeveloped, services improved significantly during the 1990s, and investment in value-added services, such as the Internet and VSAT, grew. In 2003, there were an estimated 349 mainline telephones for every 1,000 people; about 28,000 people were on a waiting list for telephone service installation. The same year, there were approximately 769 mobile phones in use for every 1,000 people.

In 2004, there were two state-owned public service television stations and two national commercial television stations. The same year, there were one public service radio and two national commercial radio stations. There are some smaller regional stations. In 2003, there were an estimated 690 radios and 475 television sets for every 1,000 people. About 190.7 of every 1,000 people were cable subscribers. Also in 2003, there were 108.4 personal computers for every 1,000 people and 232 of every 1,000 people had access to the Internet. There were 210 secure Internet servers in the country in 2004.

Budapest has always been Hungary's publishing center. The largest dailies (with affiliations and 2002 circulation rates as available) are *Népszabadság* (Hungarian Socialist Workers' Party, 316,000), *Népszava* (Hungarian Trade Unions, 120,000), *Mai Nap* (100,000), *Kurir* (80,000), *Magyar Hírlap* (Budapest Party Committee and Metropolitan Council, 75,000), *Expressz* (75,000), and *Magyar Nemzet* (Patriotic People's Front, 70,000).

The constitution of Hungary provides for free speech and a free press, and the government is said generally to respect these rights. Although previously all means of communication had been government property, 1995 saw the beginning of the privatization process, with aims to put most print and broadcast media in private hands.

#### 46 ORGANIZATIONS

There is a Chamber of Commerce in Budapest. The International Labour Organization has a subregional office in Budapest. Hungary is a member of the International Chamber of Commerce. Trade and professional associations exist representing a variety of occupations, including the steel and automotive workers, journalists, teachers, librarians, engineers, architects, and various medical professionals. There is a Confederation of Professional Unions based in Budapest.

Organizations promoting research and study of various medical and scientific fields also exist. Some of these are member organizations of the Federation of Hungarian Medical Societies and/or the Hungarian Academy of Sciences. A cultural organization particular to Hungary is the International Kodaly Society; named for the music composer, scholar, and teacher, this organization promotes appreciate and study of music, particularly for youth. The multinational scientific organization of the International Measurement Confederation is based in Budapest.

Notable national youth organizations include the Federation of Young Democrats of Hungary, the Goncol Environmental Youth Alliance, the National Union of Hungarian Students, and Young Musicians of Hungary. The Hungarian Scout Association is also active, as are various chapters of the YMCA/YWCA. There are several sports associations promoting amateur competition in such pastimes as tennis, badminton, skating, and baseball. There is a national chapter of the Paralympic Committee. National women's organizations include the Association of Hungarian Women and the National Council of Hungarian Women.

Volunteer service organizations, such as the Lions Clubs and International, are also present. The Red Cross, Caritas, and Amnesty International have active chapters in the country.

#### 47 TOURISM, TRAVEL, AND RECREATION

Among Hungary's diverse tourist attractions are Turkish and Roman ruins, medieval towns and castles, more than 500 thermal springs (some with resort facilities), and Lake Balaton, the largest freshwater lake in Europe. Budapest is a major tourist attraction and cultural capital, with 2 opera houses, over 200 monuments and museums, and several annual arts festivals.

Popular sports include handball, football (soccer), tennis, and volleyball. The Budapest Grand Prix, the only Formula-1 motor race in Eastern Europe, was inaugurated in August 1986. A valid passport is required of all foreign visitors. Citizens of the United

States and Canada are not required to have a visa for stays of up to 90 days.

Hungary had 31,412,483 visitors in 2003, about 48% of whom came from Central and Eastern Europe. There were 64,091 hotel rooms with 158,634 beds and an occupancy rate of 38%. The average length of stay was three nights. Tourist expenditure receipts totaled \$3.4 billion.

In 2004, the US Department of State estimated the daily expenses for staying in Budapest at \$218. Other areas were much lower at \$93 per day.

#### 48 FAMOUS HUNGARIANS

The foundations for modern Hungarian literature begin with the movement known as the Period of Linguistic Reform, whose leaders were the versatile writer Ferenc Kazinczy (1759–1831) and Ferencz Kölcsey (1790–1838), lyric poet and literary critic. Among the outstanding literary figures was Dániel Berzsenyi (1772–1836) of the Latin School. Károly Kisfaludy (1788–1830) founded the Hungarian national drama. Mihaly Vörösmarty (1800–55), a fine poet, related the Magyar victories under Árpád in his *Flight of Zalán*. He was followed by Hungary's greatest lyric poet, Sándor Petöfi (1823–49), a national hero who stirred the Magyars in their struggle against the Habsburgs in 1848 with his *Arise Hungarians*. Another revolutionary hero was Lajos Kossuth (1802–94), orator and political author. János Arany (1817–82), epic poet and translator, influenced future generations, as did Mór Jókai (1825–1904), Hungary's greatest novelist. The outstanding dramatist Imre Madách (1823–64) is known for his *Tragedy of Man*. Endre Ady (1877–1919) was a harbinger of modern poetry and Western ideas; Attila József (1905–1937) is another well-known poet. Lyric poets of the contemporary era include László Nagy (1925–78), János Pilinszky (1921–81), and Ferenc Juhász (b.1928). Gyula Illyés (1902–83), a poet, novelist, and dramatist, was one of the outstanding figures of 20th-century Hungarian literature. Ferenc Molnár (1878–1952) is known for his plays *Liliom*, *The Swan*, and *The Guardsman*. György Lukács (1885–1971) was an outstanding Marxist writer and literary critic. Hungarian-born Arthur Koestler (1905–83), a former radical, was a well-known anti-Communist novelist and writer. Imre Kertész (b.1929) is a Jewish-Hungarian author, Holocaust concentration camp survivor, and winner of the Nobel Prize in literature in 2002.

János Fadrusz (1858–1903) and József Somogyi (1916–93) are among Hungary's best-known sculptors. The outstanding Hungarian painter Mihály Munkácsy (1844–1900) is best known for his *Christ before Pilate*. Victor Vasarely (1908–97), a world-famous painter of "op art," was born in Budapest and settled in France in 1930. Miklós Ybl (1814–91) was a leading architect; and Gyula Halasz (1899–1984), better known as Brassai, was a well-known photographer. The Hungarian-born Joseph Pulitzer (1847–1911) was a noted journalist and publisher in the United States. Hungarian musicians include the composers Franz (Ferenc) Liszt (1811–86), Ernst (Ernö) von Dohnányi (1877–1960), Béla Bartók (1881–1945), Zoltán Kodály (1882–1967), and György Ligeti (b.1923); violinists Jenő Hubay (1858–1937) and Joseph Szigeti (1892–1973); cellist János Starker (b.1924); and pianists Lili Kraus (1903–86) and Erwin Nyiregyhazi (1903–87). Renowned Hungarian-born conductors who became famous abroad include Fritz Reiner (1888–1963), George Széll (1897–1970), Eugene Ormándy

(1899–1985), Antal Doráti (1906–88), and Ferenc Fricsay (1914–63). Miklós Jancsó (b.1921) is a distinguished film director, and Vilmos Zsigmond (b.1930) a noted cinematographer; Béla Lugosi (Blasko, 1882–1956) and Peter Lorre (Laszlo Loewenstein, 1904–64) were famous actors.

Notable scientists include Lóránd Eötvös (1848–1919), inventor of torsion balance; Ányos Jedlik (1800–95), known for his research on dynamos; and the psychoanalyst Sándor Ferenczi (1873–1933). Ignaz Philipp Semmelweis (1818–65) pioneered in the use of antiseptic methods in obstetrics. Béla Schick (1877–1967) invented the skin test to determine susceptibility to diphtheria.

Hungarian-born Nobel Prize winners are Róbert Bárány (1876–1936) in 1914, Albert Szent-Györgyi (1893–1986) in 1937, and Georg von Békésy (1899–1972) in 1961 in physiology or medicine, Georg de Hevesy (1885–1966) in 1944 in chemistry, and Dénes Gábor (1900–79) in 1971 for physics. Budapest-born scientists who contributed to atomic research in the United States were Leó Szilárd (1898–1964), Eugene Paul Wigner (1902–95), John von Neumann (1903–57), and Edward Teller (1908–2003). Theodore van Kármán (Todor Kármán, 1881–1963) is the father of aerodynamics. Paul Erdős (1913–1996) was an important mathematician, as was John von Neumann (Neumann János, 1903–1957). Eugene Paul Wigner (1902–1995), physicist and mathematician, received the 1963 Nobel Prize in physics. George Andrew Olah (b.1927 as György Oláh), a Hungarian-American chemist, won the Nobel Prize in chemistry in 1994.

Imre Nagy (1895?–1958) served as prime minister from 1953 to 1955, but was removed from office because of his criticism of Soviet policy; the uprising of October 1956 briefly brought Nagy back to the premiership. Arrested after the Soviet military intervention, Nagy was tried and executed in 1958. János Kádár (1912–89), first secretary of the HSWP since 1956, initially aligned himself with Nagy but subsequently headed the government established after Soviet troops rolled in. Kádár, who held the premiership from late 1956 to 1958 and again from 1961 to 1965, was the preeminent political leader in Hungary until his removal in May 1988. Gyula Horn (b.1932), a former communist, was named prime minister in 1994. He served in that post until 1998, when he was succeeded by Viktor Orbán (b.1963), who was prime minister between 1998 and 2002. Péter Medgyessy (b.1942) served as prime minister from 2002 until 2004, not completing his term. Ferenc Gyurcsány (b.1961) succeeded him.

George Soros (b.1930), philanthropist, was born in Budapest.

#### 49 DEPENDENCIES

Hungary has no territories or colonies.

# ICELAND

Republic of Iceland

*Lveldi Ísland*

**CAPITAL:** Reykjavík

**FLAG:** The national flag, introduced in 1916, consists of a red cross (with an extended right horizontal), bordered in white, on a blue field.

**ANTHEM:** *O Guð; vors lands (O God of Our Land)*.

**MONETARY UNIT:** The new króna (κ), introduced 1 January 1981 and equivalent to 100 old krónur, is a paper currency of 100 aurar. There are coins of 5, 10, and 50 aurar and 1, 10 and 50 krónur, and notes of 10, 50, 100, 500, 1,000 and 5,000 krónur. κ1 = \$0.01571 (or \$1 = κ63.65) as of 2005.

**WEIGHTS AND MEASURES:** The metric system is used.

**HOLIDAYS:** New Year's Day, 1 January; Labor Day, 1 May; National Holiday, 17 June; Bank Holiday, August; Christmas, 25–26 December. Movable religious holidays include Holy Thursday, Good Friday, Easter Monday, Ascension, and Whitmonday. Half-holidays are observed on Christmas Eve, 24 December, and New Year's Eve, 31 December.

**TIME:** GMT.

## <sup>1</sup>LOCATION, SIZE, AND EXTENT

Iceland, the westernmost country of Europe, is an island in the North Atlantic Ocean, just below the Arctic Circle and a little more than 322 km (200 mi) E of Greenland, 1,038 km (645 mi) W of Norway, and 837 km (520 mi) NW of Scotland. It has an area of 103,000 sq km (39,769 sq mi), extending 490 km (304 mi) E–W and 312 km (194 mi) N–S. Comparatively, the area occupied by Iceland is slightly smaller than the state of Kentucky. The total length of coastline is about 4,988 km (3,099 mi). The republic includes many smaller islands, of which the chief are the Westman Islands (Vestmannaeyjar) off the southern coast.

Iceland's capital city, Reykjavík, is located on the country's southwest coast.

## <sup>2</sup>TOPOGRAPHY

Iceland consists mainly of a central volcanic plateau, with elevations from about 700 to 800 m (2,297–2,625 ft), ringed by mountains, the highest of which is Hvannadalshnúkur (2,119 m/6,952 ft), in the Örfajökull glacier. Lava fields cover almost 11% of the country, and glaciers almost 12%. Among the many active volcanoes there is an average of about one eruption every five years. The largest glacier in Europe, Vatnajökull (about 8,400 sq km/3,200 sq mi), is in southeast Iceland. There are also many lakes, snowfields, hot springs, and geysers (the word “geyser” itself is of Icelandic origin).

The longest river is the Thjórsá (about 230 km/143 mi) in southern Iceland. Most rivers are short and none are navigable, but because of swift currents and waterfalls, Iceland's rivers have important waterpower potential. There are strips of low arable land along the southwest coast and in the valleys. Good natural harbors are provided by fjords on the north, east, and west coasts.

## <sup>3</sup>CLIMATE

Despite Iceland's northern latitude, its climate is fairly mild because of the Gulf Stream, part of which almost encircles the island. There are no extreme temperature variations between seasons, but frequent weather changes are usual, particularly in the south, which experiences many storms and heavy precipitation. Temperatures at Reykjavík range from an average of 11°C (52°F) in July to -1°C (30°F) in January, with an annual mean of about 5°C (41°F). Humidity is high, and there is much fog in the east. Annual rainfall in the north ranges from 30 to 70 cm (12–28 in); in the south, 127–203 cm (50–80 in); and in the mountains, up to 457 cm (180 in). Winters are long and fairly mild, summers short and cool. Summer days are long and nights short; in winter, days are short and nights long.

## <sup>4</sup>FLORA AND FAUNA

Although there are a few small trees (ash, aspen, birch, and willow), the chief forms of vegetation are grass, mosses, and small shrubs (heather, willow, dwarf birch). Some 340 different species of flowers have been listed, but most of these are sparse.

The fox, the chief indigenous animal, is common. Wild reindeer, introduced in the 18th century and once abundant, were almost exterminated and therefore have been protected in recent years; they are found chiefly in the northeastern highlands. The waters around Iceland abound in whales, many types of seals, and many kinds of fish. Dolphin, grampus, porpoise, and rorqual are numerous. Cod, haddock, and herring are particularly abundant, but there are also sole, shark, halibut, redfish, saithe, and other fish. Salmon abound in many rivers and trout in rivers and lakes. There are about 88 species of breeding birds; most are aquatic. The chief resident birds are eiderduck (raised commercially for their down) and ptarmigan. Other characteristic indigenous birds are

swan, eagle, falcon, and gannet, all rare now and protected. Iceland has no reptiles or frogs and very little insect life.

## 5 ENVIRONMENT

Because of Iceland's sparing use of hydrocarbon fuels, its air is cleaner than that of most industrialized nations. However, its water supply is polluted by excessive use of fertilizers (current estimates put Iceland's yearly usage of fertilizers at 2,500 lbs per acre). Population increases in the cities also contribute to water pollution. Iceland has 170 cu km of renewable water resources with 6% used for industrial purposes. Industrial carbon dioxide emissions totaled 2.1 million metric tons per year in 1996. Protected lands, which account for 9.5% of Iceland's total land area, include four national parks, with a total area of 619,300 hectares (1,530,315 acres) and 27 nature reserves, covering 256,861 hectares (634,714 acres). Principal environmental responsibility is vested in the Ministry of Social Affairs.

According to a 2006 report issued by the International Union for Conservation of Nature and Natural Resources (IUCN), threatened species included 7 types of mammals and 8 species of fish. Endangered species include the leatherback turtle and four species of whales. The great auk has become extinct.

## 6 POPULATION

The population of Iceland in 2005 was estimated by the United Nations (UN) at 295,000, which placed it at number 168 in population among the 193 nations of the world. In 2005, approximately 12% of the population was over 65 years of age, with another 23% of the population under 15 years of age. There were 100 males for every 100 females in the country. According to the UN, the annual population rate of change for 2005–10 was expected to be 0.8%, a rate the government viewed as satisfactory. The projected population for the year 2025 was 335,000. Iceland is one of the least densely populated countries in the world, with an overall population density of 3 per sq km (7 per sq mi). The interior of the country is largely uninhabited.

The UN estimated that 94% of the population lived in urban areas in 2005, and that urban areas were growing at an annual rate of 0.71%. The capital city, Reykjavík, had a population of 184,000 (more than half the nation's population) in that year. The next largest towns and their estimated populations are Kópavogur (25,291), south of Reykjavík; Hafnarfjörður (21,300), about 10 km (6 mi) from Reykjavík; and Akureyri (16,475), on the north coast.

## 7 MIGRATION

Little immigration has occurred since the original settlement in the 9th and 10th centuries. In the last quarter of the 19th century, because of unfavorable economic conditions, about 12,000 residents of Iceland emigrated to Canada and the United States. After 1900, net emigration decreased substantially.

As of 1997, just 375 refugees had arrived in Iceland since 1956. During the Kosovo crisis, Iceland offered to take up to 100 refugees under the UNHCR/IOM Humanitarian Evacuation Programme. A total of 70 people were actually evacuated to Iceland, 16 of whom returned to Kosovo by 1999. There were 16,000 migrants living in Iceland in 2000. In 2004 Iceland had 239 refugees, and 19 asylum seekers. In 2005 the net migration rate was estimat-

ed as 2.06 migrants per 1,000 population. The government views the migration levels as satisfactory.

## 8 ETHNIC GROUPS

The population is almost entirely Icelandic, many of whom descended from the Norse and Celtic settlers who came in the late 9th and early 10th centuries.

## 9 LANGUAGES

Icelandic, the national language, derives from the Old Norse language that was spoken throughout Scandinavia at the time of settlement. It has changed little through the centuries, partly because of the country's isolation and partly because of the people's familiarity with the classical language, as preserved in early historical and literary writings. There is comparatively little difference between the old language and the modern, or between the written language and the spoken. To this day, Icelanders are able to read the great 13th-century sagas without special study.

## 10 RELIGIONS

The Church, the national church, is endowed by the state, but there is complete freedom for all faiths, without discrimination. All of Iceland constitutes a single diocese of the national church, headed by a bishop with his seat at Reykjavík; there are 281 parishes. As of 2004, about 86% of the population were nominally members of this established church, though it is believed that most do not practice actively. A 2003 Gallup poll indicated that 43% of Lutherans did not attend church at all and only 10% said that they attend church one or more times a month. About 4.3% of the population belong to one of three Lutheran Free Churches: the Reykjavík Free Church, the Hafnarfjörður Free Church, or the Reykjavík Independent Church. Another 4.4% (about 13,025 people) belong to one of 21 different denominations that are registered and recognized by the state. The largest of these groups is the Roman Catholic Church (5,582 members); the smallest is the First Baptist Church (10 members). Seventh-Day Adventists, Jehovah's Witnesses, Buddhists, Baha'is, Muslims, and Jews are also represented by small congregations.

## 11 TRANSPORTATION

There are no railways or navigable inland waters. All important towns and districts can be reached by bus and truck via interurban roads. In 2004, Iceland's roadway system totaled 13,004 km (8,088 mi), of which only 4,331 km (2,694 mi) were paved or were surfaced with oiled gravel. Registered passenger cars in 2003 numbered 161,721 and there were 27,977 commercial vehicles.

In 2005, Iceland's merchant marine fleet consisted of three ships of 1,000 GRT or more, with a total capacity of 4,341 GRT. In addition, there are about 1,000 civilian vessels, mostly small fishing craft. Most of the import and export trade is handled in Reykjavík. Akureyri, on the north coast, is the largest port serving the outlying areas.

Iceland had an estimated 98 airports in 2004, of which 5 had paved runways as of 2005. The principal airport is Keflavik at Reykjavík. In the 1950s, Icelandic Airlines was the first transatlantic airline to offer fares drastically lower than those of the major carriers. Icelandair, formed by a merger of Icelandic Airlines and Iceland Air in the early 1970s, operates domestic routes as well

LOCATION: 63°19' to 67°7'5" N; 13°16'7" to 24°32'3" W. BOUNDARY LENGTHS: Total coastline, 4,970 kilometers (3,090 miles). TERRITORIAL SEA LIMIT: 12 miles.

as international flights to the United Kingdom, Scandinavia, and Germany, and transatlantic flights with stopovers at Reykjavík. In 2001 (the latest year for which data was available), 1,357,900 passengers were carried on scheduled domestic and international flights.

## 12 HISTORY

Iceland's first known settler, Ingólfur Arnarson, sailed from his native Norway to Iceland and settled at what is now Reykjavík in 874. During the late 9th and early 10th centuries, the island was settled by other Norwegians fleeing the oppressive rule of their king and by smaller groups of Scottish and Irish emigrants. In 930, a central legislative and judicial assembly, the Althing, was established, and a uniform code of laws for the entire country was compiled. Christianity was introduced in 1000, but the memory of the old pagan religion was preserved in 12th and 13th-century Icelandic literature. Many of the early settlers were great seafarers and continued their westward voyages of discovery and exploration from Iceland. Most famous of these were Eric the Red (Eiríkur

Thorvaldsson), who discovered and settled in Greenland in 982, and his son Leif Ericsson (Leifur Eiríksson), who around the year 1000 discovered the North American continent, which he called Vinland ("wineland") because of the grapes he found there. Icelanders acknowledged the sovereignty of Haakon IV of Norway in a treaty of 1262, which established a purely personal union, ending the independent republic or commonwealth in Iceland. When all the Scandinavian countries came under the rule of Denmark at the end of the 14th century, Iceland became a Danish dominion. Lutheranism was introduced in the 1540s. Exclusive trading rights with Iceland were given in 1602 to a private Danish trading company. Danes had a complete monopoly of trade with Iceland until 1786, when trade was opened to all subjects of the kings of Denmark, including Icelanders.

The last decades of the 18th century were a period of economic ruin for Iceland, compounded by poor harvests, epidemics, and volcanic eruptions (notably that of 1783, the worst in Iceland's history); the population dwindled to 38,000 by 1800, less than half the number in the period of independence. In that year, the king

abolished the Althing, long since reduced in power. Within a few decades, however, a nationalist movement had attained considerable strength, winning the reestablishment of the Althing (but only as an advisory body) in 1843, followed by the opening of trade with all countries in 1854. After a long constitutional struggle—led by a national hero, Jón Sigurðsson, who was both statesman and scholar—limited home rule was granted in 1874, and almost complete home rule in 1903. By agreement with Denmark in 1918, Iceland was declared a free and independent state, but personal union with the Danish crown was retained. The Danish king continued to function as king of Iceland, and Denmark conducted Iceland's foreign affairs; but Iceland had the right to terminate this union after 25 years.

Cut off from Denmark during World War II by the German occupation of that country, Iceland established diplomatic relations with the United Kingdom and the United States. British forces took over the protection of the island in 1940 and were replaced the following year by US troops that remained in Iceland until early 1947. In a referendum held in May 1944, more than 97% of those participating voted to end the union with the king of Denmark and, on 17 June 1944, Iceland became an independent republic. In 1946, it was admitted to UN membership. Three years later, Iceland became a party to the Atlantic Pact (NATO), and a bilateral defense agreement was signed in 1951 providing for a US military presence. In March 1970, Iceland joined EFTA, and a tariff agreement was ratified with the EC in February 1973. To protect its fishing industry, Iceland unilaterally extended its fishing zone in 1958, and again in 1972 and 1975, provoking conflict with the United Kingdom and other countries. Casualties resulted from the most serious outbreak of the "cod war" with the United Kingdom in late 1975 and in February 1976. An agreement ended the conflict in June 1976 and relations with the United Kingdom improved. Disputes over fisheries resources have also arisen with the Norwegians periodically, though both Norway and Iceland are united in their opposition to the international ban on whaling.

In 1985, the parliament unanimously voted to declare Iceland a nuclear-free zone, banning any deployment of nuclear weapons. Reykjavík was the scene of the October 1986 summit meeting between US president Ronald Reagan and Soviet leader Mikhail Gorbachev on arms control and nuclear disarmament.

Depressed world fish prices weakened the economy in the early 1990s, resulting in a no-growth GDP and higher unemployment. A number of factors have combined to reinvigorate the Icelandic economy. The government launched an austerity program to trim the Icelandic welfare state which included measures such as increasing the retirement age from 65 to 67 years of age (with future increases to age 70 envisioned). Icelanders are also being asked to pay for a greater portion of social services out of their own pockets. Demand in Europe and the United States for Icelandic fish has rebounded and fish exports account for 70% of exports and 50% of foreign earnings. Liberalization of many sectors of the economy such as telecoms and banking, required under the EEA (European Economic Area) agreement with the European Union in exchange for greater access to the EU market, has reduced public expenditures and positively affected governmental finances. By 1999, Iceland had experienced four years of more than 5% GDP growth, and purchasing power was increasing at four times the OECD average. Unemployment had dropped to 2%, and Iceland has dealt

with its labor shortage by initiating labor immigration from the Philippines. The economic boom years from 1996–2001 slowed in 2002, and Iceland experienced a mild recession with a GDP growth rate of -0.5%. Growth of GDP increased from 2003–05, however, nearing 6% by 2005.

Iceland was in the international headlines at the end of 1998 for altogether different reasons. In December 1998, the Icelandic parliament agreed after two full revisions of the legislation to create a health database of medical records of all Icelanders for use by a private company seeking to decode the human genome. Iceland's isolated, homogeneous population is a boon to medical researchers seeking to decode the genetic sequences of many hereditary diseases, but the lack of informed consent by individuals in the legislation became a heated political issue.

A public opinion poll taken in June 2002 indicated a 50–50 split between supporters and opponents of EU membership. However, conservative Independence Party leader and Prime Minister Davíð Oddsson remained resolutely opposed to EU membership, stating in 2002 that Iceland's affairs should not be dictated by conditions in "Paris or Berlin." Oddsson in 2005, however, indicated in a speech that a policy change was not ruled out depending upon how the EU evolved.

Iceland rejoined the International Whaling Commission in 2002 with reservations. It declared it would engage in whaling for scientific purposes, and resume commercial whaling of Minke and Fin whales after 2006.

President Ólafur Ragnar Grímsson was reelected president in June 2004. In September of that year, Prime Minister Davíð Oddsson switched positions with Foreign Minister Halldór Ásgrímsson. Oddsson had held the position of prime minister for a record 13 years.

### 13 GOVERNMENT

Iceland is an independent republic. Executive power is vested in the president and the government, legislative power in the president and the legislative assembly (Althing). The president is elected by universal suffrage for a four-year term. Effective executive power is exercised by a prime minister enjoying the confidence of the Althing; the prime minister is appointed by the president, and the prime minister in turn selects a cabinet composed of ministers responsible to the Althing for their acts. The president must sign all legislation before it becomes law.

All citizens who have reached the age of 18 may vote, provided they have resided in Iceland for the five years immediately preceding an election. In 2003, 87.5% of Icelanders eligible to vote in the parliamentary elections did so. By a system of proportional representation, voters elect the 63 members of the unicameral (since 1991) Althing from eight constituencies at a general election held every four years, but sooner if the governing coalition loses its ability to command a legislative majority. Because of the widely varying populations of the constituencies (Reykjavík constitutes one-third of the nation's population), each constituency has a minimum of five seats, and more populous regions have more. Three-quarters of the seats in any constituency are divided by the parties according to proportional representation of that region, while the final quarter of the seats in each constituency are apportioned according to the national vote tally to ensure national proportional representation. Any citizen qualified to vote is eligi-

ble to run for a seat in the Althing. When any amendment to the constitution is voted, the Althing is dissolved and new elections are held; if the new Althing accepts the proposed amendment, it becomes law when ratified by the president.

The institution of the Althing has parliamentary immunity and its members swear allegiance to the constitution. Government ministers are normally members of the Althing and enjoy full parliamentary privileges. The constitution and the rules of procedure of the Althing specify the rights and duties of parliamentarians, and the legislative year of the Althing begins on 1 October. The legislative agenda of the Althing is divided among 12 standing committees. At the first meeting following the inauguration ceremony, the president of the Althing is elected. In addition to acting as the chief executive of Althing, the president sits on the five-person presidium along with the four vice presidents. The presidium is responsible for the organization of parliamentary activities. Sessions of the Althing are normally held four days a week.

## 14 POLITICAL PARTIES

No one major party in recent years has been able to command a majority of the electorate, and coalition governments have been the rule. Principal parties include the Independence Party (Sjálfstoeðisflokkurinn) (IP), a conservative grouping; the Progressive Party (Framsóknarflokkurinn) (PP), an agrarian, left-center party; the Progressive Alliance (Althýðubandalag) (PA), a formerly Communist-oriented party, now a far-left party; and the Social Democratic People's Party (Althýðuflokkurinn) (SDP), a center-left group. An Independence Party splinter group, the Citizens' Party (CP), lost its parliamentary representation by securing no seats. Iceland is unique among the Nordic states (which lead the OECD countries on all indicators of gender equality) in that it is the only one to have a women's party, which has gained a foothold in parliament. In 1995, the Icelandic Women's Alliance, a political party devoted to feminist issues, gained three seats in the Althing.

Of these parties, the Independence Party dates back to 1929, and the Progressive and Social Democratic People's (formerly Labor) parties to 1916; all three have been the source of various splinter groups. The People's Alliance became a distinct political party in 1970; it grew out of an alliance among Communist-oriented elements in the Social Democratic People's Party and other groups, and in effect replaced the earlier People's Union–Socialist Party (Sameiningarflokkur althýðu-Sósíalístaflókkurinn).

It was the issue of NATO and the US military presence that in March 1956 broke up an early alliance between Progressives and Independents, and the elections that year led to a new coalition of the Progressive, Labor, and People's Union–Socialist parties, all of which opposed the US military base on Iceland. (After the Hungarian uprising of October 1956, however, the Progressive and Labor parties reversed their stand.) That government fell because of Communist opposition to a proposed wage freeze, and after elections in October 1959, a government formed by the Independence and Labor parties came into office. This coalition endured for some time. But after the loss of four seats in the June 1971 general elections, a new government, composed of the Progressive Party, the People's Alliance, and the Liberal and Left Alliance (a party established in 1969 on a platform opposing Iceland's participation in NATO and its defense agreement with the United States) came

into power under Prime Minister Olafur Jóhannesson. Then, on 29 August 1974, after gains by the Independence Party in June elections, a coalition of Independents and Progressives was sworn in under Geir Hallgrímsson of the Independence Party.

Two short-lived coalition governments followed. The first, a leftist coalition including the Social Democrats, People's Alliance, and Progressive Party, led by Olafur Jóhannesson, was dissolved when the Social Democrats left the coalition in October 1979. Following an election that December, a second coalition was eventually formed from members of the Independence Party, the People's Alliance, and the Progressives, with Gunnar Thoroddsen, deputy chairman of the Independence Party, as prime minister. After three unsuccessful attempts by party leaders to form a governing coalition following the April 1983 elections, Vigdís Finnbogadóttir—who in August 1981 had been elected president, becoming the first woman to become democratically elected head of state—threatened to request the formation of a government of civil servants. Eventually, Progressive leader Steingrímur Hermannsson formed and headed a coalition of the Independence and Progressive parties. Following the 1987 elections, Thorsteinn Pálsson of the Independence Party replaced Hermannsson as prime minister.

The general election of April 1991 resulted in a new center-right coalition led by Davíð Oddsson of the Independence Party and members of the Social Democratic People's Party. Vigdís Finnbogadóttir was reelected unopposed for a fourth four-year term in June 1992. The left-right coalition of the IP and SDP was dissolved after the elections of April 1995 when Oddsson formed a new coalition government composed of the Independence Party and the Progressive Party, chaired by Halldór Ásgrímsson, minister for foreign affairs and external trade. This coalition remained in power after the 1999 elections in which the Independence Party increased its share of the popular vote while the Progressives polled more poorly. Two new parties gained representation in the Althing in 1999, the environmental Left-Green Party (Vinstrihreyfing-Grnt framboð) and the Liberal Party (Frjálslyndi Flokkurinn). Of all 63 parliamentarians, 41 were men and 22 were women. In the presidential elections of 29 June 1996, Vigdís Finnbogadóttir chose not to run and Dr. Ólafur Ragnar Grímsson won with 41.4% of the vote. In 2000, Grímsson was reappointed president, unopposed, to a second four-year term. Grímsson faced two opponents in the 2004 presidential election, but beat them soundly (with 85.6% of the vote).

In the 10 May 2003 elections for the Althing, the Independence Party secured 33.7% of the vote and 22 seats in parliament. The opposition Social Democratic Alliance (which now includes the People's Alliance, Social Democratic Party, and Women's List) won 31% of the vote and took 20 seats. The Progressive Party won 17.7% of the vote and 12 seats, and entered into a coalition with the Independence Party. Therefore, the Independence/Progressive coalition held a slim majority of 34 seats in parliament, compared with the 43 it held after the 1999 elections. The Left-Green Alliance secured 8.8% of the vote and 5 seats, and the Liberal Party won 7.4% and held 4 seats. Following the election, Prime Minister Oddsson stated that in 2004, Minister of Foreign Affairs Halldór Ásgrímsson would become prime minister in a new government. He held true to his pledge, and Ásgrímsson became prime minister on 15 September 2004.

## 15 LOCAL GOVERNMENT

Iceland is divided into eight regions (*landshluta*), 23 counties (*sýslur*), and 23 independent towns (*kaupstaðir*). A magistrate or sheriff (*sýslumaður*) administers each county. Within the counties are 101 municipalities (as of 2004), each governed by a council: town councils are elected by proportional representation, rural councils by simple majority. The local government units supervise tax collections, police administration, local finances, employment, and other local affairs.

## 16 JUDICIAL SYSTEM

District courts are courts of first instance. There are eight district courts in Iceland, which have jurisdiction in both civil and criminal cases. Appeals are heard by the Supreme Court, consisting of nine justices (all appointed for life by the president), who elect one of their number as chief justice for a two-year term. There are special courts for maritime cases, labor disputes, and other types of cases.

The courts are free from political control. Although the Ministry of Justice administers the lower courts, the Supreme Court oversees independent and fair application of the law.

A recent reform project transferred all judicial authority for criminal and civil cases from local officials (chiefs of police) to newly established district courts. This complete separation of judicial and executive power in regional jurisdictions was completed in 1992. Iceland did not accept compulsory ICJ jurisdiction.

## 17 ARMED FORCES

Iceland is the only NATO member with no military force of its own, although the government does maintain a 130-member coast guard with three patrol and one logistical/support vessels. US forces (1,658 personnel), along with Dutch forces, are stationed in Iceland.

## 18 INTERNATIONAL COOPERATION

Iceland became a member of the United Nations on 19 November 1946 and belongs to ECE and most of the nonregional specialized agencies, such as FAO, UNESCO, ILO, IFC, IFAD, the World Bank, and WHO. It belongs to the Council of Europe, the WTO, European Bank for Reconstruction and Development, the Euro-Atlantic Partnership Council, EFTA, NATO, the OECD, and the OSCE. The country is an associate member of the Western European Union. Iceland hold membership in the Council of the Baltic Sea States, the Nordic Council, the Nordic Investment Bank, the Arctic Council, and Barents Euro-Arctic Council. In 2001, the government established the Icelandic Crisis Response Unit (ICRU), which is designed to expand national support for cooperation in peacekeeping initiatives through the United Nations.

Iceland belongs to the Australia Group, the Nuclear Energy Agency, and the Organization for the Prohibition of Chemical Weapons. In environmental cooperation, Iceland is part of the Basel Convention, Conventions on Biological Diversity and Air Pollution, Ramsar, CITES, the London Convention, the Kyoto Protocol, the Montréal Protocol, MARPOL, the Nuclear Test Ban Treaty, and the UN Conventions on the Law of the Sea, Climate Change and Desertification.

## 19 ECONOMY

Iceland's economy, once primarily agricultural, is now based overwhelmingly on fishing. Crop raising plays a small role, since most of the land is unsuitable for cultivation and the growing season is short. Sheep raising and dairying are the chief agricultural activities, with horse breeding also substantial. Iceland is generally self-sufficient in meat, eggs, and dairy products, but sugar and cereal products must be imported. Since Iceland has almost no known mineral resources and has had no concentrations of population until recent decades, industry is small-scale and local, depends heavily on imported raw and semi-manufactured materials, and cannot compete favorably with foreign industry, especially with imports from low-income countries.

Although the economy is based on private ownership and operates mainly on a free-enterprise basis, public enterprises account for a sizable share of GDP (about 30% in the mid-1990s). The cooperative movement is important in rural trade, and the national and local governments own some productive facilities in certain fields requiring large amounts of capital not available from private sources. The economy developed rapidly after World War II, with a rate of capital investment so high at times as to strain available resources. GNP growth fell from 9% in 1977 to -3% in 1983 but recovered to 9% in 1987. After that, it averaged -0.4% through 1993. From 1992–2001 the economy grew impressively. GDP per capita reached one of the highest levels among OECD countries. This performance was largely due to market liberalization, privatization, and other factors that spurred entrepreneurship and investment.

For a time, inflation ran rampant, rising from 30 to 45% in the late 1970s to nearly 50% annually during 1981–85. It then moderated, dropping to only 3.7% in 1991 and 1.7% in 1998; it rose again to 9.4% at the beginning of 2002. Unemployment, traditionally low, was 2% in 1999 and 3.2% in 2002.

After 2001, the overheated economy slowed. The government tightened monetary policy and exercised fiscal restraint to reduce domestic demand. The króna went through a period of devaluation and inflation rose. However, the weak currency resulted in a surge in exports, which was also helped by increased production. Aluminum exports were up 22% in 2002. Iceland is in the process of reducing its dependence upon fishing, and the aluminum industry is one sector that is contributing to the diversification of the economy; in addition, the government is taking advantage of Iceland's inexpensive and abundant supply of geothermal energy. Iceland was in a mild recession in 2002, but the economy was expected to recover by 2003 or 2004.

The GDP growth in 2004 was 5.2%, up from 4.2% in 2003; in 2005, the economy was expected to expand by 5.9%. The inflation rate has been fluctuating, but at 3.2% in 2004, it was well under control and did not pose any problems to the economy. A similar trend was registered by the unemployment rate, which reached 3.2% in 2004, and was expected to decrease to 2.1% in 2005. The government of Iceland continues to oppose EU membership for fear of losing control of the fishing industry, which is one of the country's main economic engines.

## 20 INCOME

The US Central Intelligence Agency (CIA) reports that in 2005 Iceland's gross domestic product (GDP) was estimated at \$10.3 billion. The CIA defines GDP as the value of all final goods and services produced within a nation in a given year and computed on the basis of purchasing power parity (PPP) rather than value as measured on the basis of the rate of exchange based on current dollars. The per capita GDP was estimated at \$34,600. The annual growth rate of GDP was estimated at 5.9%. The average inflation rate in 2005 was 4.1%. It was estimated that agriculture accounted for 11.8% of GDP, industry 22.3%, and services 65.9%.

Approximately 16% of household consumption was spent on food, 8% on fuel, 3% on health care, and 10% on education.

## 21 LABOR

The labor force was estimated at 160,000 in 2005. In 2003, agriculture, fishing or fish processing accounted for 10.3% of the workforce, with 18.3% in manufacturing, and 71.4% in the services sector. In 2005 the estimated unemployment rate was 2.1%.

As of 2002, about 85% of workers are union members. Principal unions are the Icelandic Federation of Labor (associated with the ICFTU) and the Municipal and Government Employees' Association. Labor disputes are settled by direct negotiations or by special courts, however strikes are permitted. Collective bargaining is used to negotiate pay, hours, and other conditions.

The customary workweek is 40 hours. Workers are entitled to overtime pay in excess of eight hours per day. There is no legal minimum wage, but wages are negotiated through collective bargaining. Even the lowest paid workers earn sufficient wages to provide a decent standard of living. Child labor standards are stringent and strictly enforced.

## 22 AGRICULTURE

About 78% of Iceland is agriculturally unproductive, and only about 1% of the land area is actually used for cultivation. Of this amount, 99% is used to cultivate hay and other fodder crops, with the remaining 1% used for potato and fodder root production. There were about 4,000 full-time farmers in the 1990s, with about 75% living on their own land; some holdings have been in the same family for centuries. In the 19th century and earlier, agriculture was the chief occupation, but by 1930, fewer than 36% of the people devoted their energies to farming, and the proportion has continued to fall. Hay is the principal crop; other crops are potatoes, turnips, oats, and garden vegetables. In hot-spring areas, vegetables, flowers and even tropical fruits are cultivated for domestic consumption in greenhouses heated with hot water from the springs. Besides hay and other fodder crops, about 7,500 tons of potatoes were produced in 2004. There are agricultural institutions in Borgarfjörður, Hjaltadalur, Hvanneyri, and Reykir; between 15–20% of all farmers have finished an agricultural degree program.

## 23 ANIMAL HUSBANDRY

Sheep raising is extensive, and mutton and lamb are primary meat products. Sheep are permitted to find their own grazing pasture during the warmer months and are rounded up toward the mid-

dle of September and put in shed for the winter. Cattle are raised mainly for dairying, and their number has been rising steadily; beef production is negligible. Sheep in 2005 numbered an estimated 454,000; cattle, 64,000 head; horses, 72,000; and poultry, 190,000. Estimated livestock production in 2005 included milk, 112,000 tons; mutton and lamb, 8,500 tons; and eggs, 2,600 tons. Iceland is self-sufficient in meat, dairy products, and eggs.

Icelandic farm animals are directly descended from the sheep, cattle, goats, pigs, poultry, dogs, cats, and especially horses (which were an invaluable means of travel) brought by 10th century Scandinavian settlers. In sparsely populated areas, such as the western fjords and on the east coast, farming is chiefly limited to raising sheep, although sheep farming exists in all areas of the country. Milk is produced mostly in the south and north. Except for poultry, egg, and pig production, farms are small in acreage and usually family-run. About 2,000 farmers are engaged in full-time sheep farming, and 1,000 more in mixed farming. There also are about 1,800 dairy farms in operation; Icelanders consume on average 175 liters (46.2 gal) of milk per capita per year, one of the highest amounts in the world. Cheese consumption is fourth highest, after France, Germany, and Italy. Horse-breeding is also a growing branch of animal husbandry in Iceland, as the popularity of the Iceland horse (which has five gaits) grows at home and abroad.

Animal farming is a highly mechanized industry carried out by well-educated farmers; nearly one fifth of all farmers matriculate at one of three agricultural colleges in Iceland.

## 24 FISHING

Accounting for about 9% of Iceland's employment, fishing and fish processing provide the primary source of foreign exchange. Exports of fish products were valued at \$1.5 billion in 2003. Icelanders consume more fish per capita annually (over 91.5 kg/201 lb live weight equivalent) than any other people in Europe. Cod is caught during the first five months of the year off the southwest coast. Herring are taken off the north and northeast coasts from June to September and off the southwest from September to December. In 2005, the fish catch was 1,984,349 tons (12th in the world), up from 1,502,445 tons in 1990. The 2003 catch included 680,291 tons of capelin, 501,494 tons of blue whiting, 250,039 tons of Atlantic herring, 206,670 tons of Atlantic cod, 60,402 tons of haddock, and 57,940 tons of pollock.

The fishing fleet as of 2004 consisted of 70 stern trawlers totaling 86,048 GRT and 869 other decked fishing vessels of 101,031 GRT. Most fishing vessels are now equipped with telecommunications devices, computers, and automated equipment. Through the early 1980s, about 250 whales a year were caught off the coast, providing lucrative export products. Although Iceland had agreed to phase out whaling in order to comply with the 1982 ban by the International Whaling Commission, in 1987 it announced its intention to take 100 whales a year for scientific purposes. The FAO reported that Iceland took 39 whales in 2003.

Abundant quantities of pure water and geothermal heat give Iceland an advantage over other nations in fish farming. Aquaculture is being developed to offset lean years in the natural fish catch, and to produce more expensive and profitable species of fish.

## 25 FORESTRY

There are no forests of commercial value, and the existing trees (ash, birch, aspen, and willow) are small; only about 1% of the total land area is considered forested. The originally extensive birch forests were cut down for firewood and to clear land for grazing sheep. In recent years, the remaining woods have been protected and reforestation has begun. Imports of forestry products amounted to about \$76.4 million in 2004.

## 26 MINING

Diatomite was a leading export commodity in 2004, and ferrosilicon production and geothermal power were Iceland's major mineral industries. Diatomite production, from Lake Myvatn, was estimated at 28,000 metric tons in 2004. Iceland also produced hydraulic cement, nitrogen, pumice, salt, scoria, sand (basaltic, calcareous, and shell), sand and gravel, and crushed stone (basaltic and rhyolite); these minerals were used by local industries. Among Iceland's other mineral resources, spar and sulfur deposits, once mined, were no longer worked extensively. Peat was common, but little used and sulfur and lignite were being processed experimentally, the former with the use of subterranean steam. The country's aluminum plant and ferrosilicon plant relied on imported raw materials and inexpensive hydroelectric and geothermal energy. Ferrosilicon production in 2004 totaled an estimated 118,000 metric tons in 2004.

## 27 ENERGY AND POWER

Iceland has no known reserves of oil, natural gas or coal. Thus, the country is entirely reliant upon imports to meet its demand for fossil fuels. However, the country does rely upon hydroelectric power and geothermal/other sources to generate electric power and to provide heat.

In 2002, refined oil imports were reported at 15,760 barrels per day, while demand was reported at 18,050 barrels per day. Coal imports and consumption for 2002, were each placed at 161,000 short tons. There were no imports of natural gas in 2002.

Hydroelectric power is the main source of electric power for Iceland, followed by geothermal and conventional thermal sources, respectively. In 2002, electric power generating capacity totaled 1.460 million kW, with hydropower accounting for 1.109 million kW, geothermal at 0.202 million kW, and conventional thermal at 0.149 million kW. Electric energy output in 2002 was 8.277 billion kWh, with hydroelectric output accounting for 83%, alternative sources for 16%, and conventional thermal fuels at less than 1%. Electric power demand in 2002 totaled 7.698 billion kWh. Peat, formerly an important source of heat on the farms, has been virtually abandoned.

Hot springs are used for heating greenhouses in which vegetables, fruit, and flowers are raised, and for heating public buildings. Since 1943, most of Reykjavík has been heated by water from hot springs at Reykir, some 160 km (100 mi) from the city. About 85% of the population lives in homes heated with geothermal power. In recent years, however, a significant decline in flow from geothermal drill holes has raised concern that this energy resource may not be so boundless as was once thought.

## 28 INDUSTRY

Fish processing is the most important industry. Facilities for freezing, salting, sun-curing, and reducing to oil or fish meal are flexible enough to allow shifting from one process to another in accordance with demand. By-products include fish meal and cod-liver oil.

Although Iceland's industry is focused on fish processing, the country in the 21st century needs to diversify its economy, as fish stocks are declining. (Nevertheless, fishing accounted for 12% of GDP in 2001 and 40% of total exports.) The manufacturing of energy-intensive industries, particularly aluminum, are rising. The ISAL aluminum smelter has expanded its capacity, and in 2002, construction of another aluminum smelter was underway. Production exports rose 22% in 2001. Other projects included the construction of a magnesium plant and the enlargement of the ferro alloy plant. Other industry is small-scale and designed to meet local needs. Chief manufactures include fishing equipment, electric stoves and cookers, paints, clothing, soaps, candles, cosmetics, dairy products, confectionery, and beer. Clothing factories are situated in Reykjavík and Akureyri. Icelandic ammonium nitrate needs are more than met by a fertilizer plant at Gufunes with an annual production capacity of 60,000 tons. A cement factory in Akranes with a capacity of 115,000 tons per year supplies most domestic cement requirements; total production in the mid-1990s amounted to 83,100 tons per year. Production of aluminum rose from 40,000 tons in 1970 to 99,300 tons per year in the same period. A ferro-silicon smelter, which began production in 1979, produced some 66,000 tons per year and a diatomite processing plant produced 25,000 tons.

In 2004, the industry had a 9.6% share in the GDP and employed 18.3% of the labor force; agriculture made up 11.2% of the economy, and together with fishing and fish processing employed 10.3% of the work force; services was by far the largest economic sector, with a 79.2% share in the GDP, and a 71.4% representation in the work force. The industrial production growth rate was 8.8% in 2004, higher than the GDP growth rate, which indicates that industry is currently a growth engine in Iceland.

## 29 SCIENCE AND TECHNOLOGY

The Icelandic Research Council coordinates science policy and advises the government on scientific matters. It has five research institutes devoted to marine science, technology, agriculture, the fish industry, and the construction and building industries. Other research institutes and learned societies include the Surtsey Research Society, the Icelandic Meteorological Office, the Association of Chartered Engineers in Iceland, the Agricultural Society of Iceland, the Iceland Glaciological Society, the Icelandic Natural History Society, and the Icelandic Society of Sciences, all located at Reykjavík.

The Icelandic Council of Science, an independent agency under the Ministry of Culture and Education, aims to stimulate and encourage scientific research. The University of Iceland has faculties of medicine, engineering, dentistry, and science. Two agricultural colleges are located in Hólum i Hjaltadal and Hvanneyri. The Icelandic College of Engineering and Technology is located at Reykjavík. In 1987–97, science and engineering students accounted for 41% of university enrollment. In 2002, of all bachelor's degrees

awarded, 17.2% were in the sciences (natural, mathematics and computers, and engineering).

In 2001, there were 6,592 researchers and 2,082 technicians per million people that were actively engaged in research and development (R&D). For that same year, R&D expenditures totaled \$262.371 million, or 3.08% of GDP. Of that amount, business accounted for the largest slice at 46.2%, followed by the government sector at 34%, with foreign sources and higher education accounting for 18.3% and 1.6%, respectively.

### 30 DOMESTIC TRADE

Foreign firms do not have branches in Iceland. Their business is conducted by Icelandic agents. Imports are handled by these agents, by wholesale or retail importers, or by the Federation of Iceland Cooperative Societies, and distribution is through private channels. Most advertising is translated and disseminated directly by agents. Foreign trade fairs are held from time to time.

Of the wholesale enterprises, 80–90% are concentrated in Reykjavík; more than half the retail establishments are likewise in the capital. Much trade is handled by cooperative societies, most of which are joined in the Federation of Iceland Cooperative Societies. A sales tax of 14% applies to most food items and books. A 24.5% tax applies to most other goods and services.

Business hours are from 9 AM to 6 PM on weekdays, and from 9 or 10 AM to noon on Saturdays. Banking hours are from 9:15 AM to 4 PM, Monday–Friday, with an additional hour from 5 to 6 PM on Thursday.

### 31 FOREIGN TRADE

The fishing industry of Iceland supports most of its commodity export market (60%). It supplies the world export market with 10.5% of its salted, dried, or smoked fish, second only to Norway in volume. Other important exports include aluminum (19%), animal feed (6.3%), iron (2.6%), diatomite, and ferrosilicon.

In 2004, exports reached \$2.9 billion (FOB—Free on Board), while imports grew to \$3.3 billion (FOB). The bulk of exports went to the United Kingdom (19.1%), Germany (17.2%), the Netherlands (11.5%), the United States (9.8%), Spain (6.8%), and Den-

mark (4.6%). Imports included machinery and equipment, petroleum products, foodstuffs, and textiles, and mainly came from Germany (12.3%), the United States (9.9%), Norway (9.7%), Denmark (7.9%), the United Kingdom (7.2%), Sweden (6.7%), and the Netherlands (6%).

### 32 BALANCE OF PAYMENTS

The difference between imports and exports since World War II has been met by drawing from large wartime reserves, by Marshall Plan aid, and, since 1953, by income from US defense spending at Keflavík, the NATO airbase. Widely fluctuating current account deficits, attributable mainly to the trade imbalance, averaged more than 6.5% of GNP during 1971–75. During the next four years, although still largely negative, the current account balance improved; from 1980 through 1985, however, Iceland's current accounts position again deteriorated, this time because of large deficits in services.

Iceland suffered a prolonged recession during 1987–93 due to cuts in fish catch quotas necessitated in part by overfishing. Again, there was a significant deterioration in the balance of payments, especially on the current account and merchandise trade balances. In 1994 the economy recovered with the help of a 6.3% growth in exports, due to a better than expected performance in the fishing sector. The external current account balance was positive for the first time since 1986. Iceland experienced successful economic performance in the 1990s but fell into recession in 2001, which negatively impacted the current account deficit.

The US Central Intelligence Agency (CIA) reported that in 2002 the purchasing power parity of Iceland's exports was \$2 billion while imports also totaled \$2 billion.

The International Monetary Fund (IMF) reported that in 2000 Iceland had exports of goods totaling \$1.9 billion and imports totaling \$2.38 billion. The services credit totaled \$1.05 billion and debit \$1.16 billion.

(...) data not available or not significant.

SOURCE: *2003 International Trade Statistics Yearbook*, New York: United Nations, 2004.

Exports of goods reached \$2.9 billion in 2004, and were expected to grow to \$3.2 billion in 2005. Imports were expected to reach \$4.6 billion in 2005, up from \$3.4 billion in 2004. The resource balance was consequently negative, reaching -\$0.4 billion in 2004, and -\$0.6 billion in 2005. The current account balance was also negative, at -\$1.0 billion in 2004, and an expected -\$2.1 billion in 2005. Foreign exchange reserves (including gold) grew to \$935 million in 2004, covering less than four months of imports.

### 3<sup>3</sup> BANKING AND SECURITIES

In March 1961, the Central Bank of Iceland was founded to issue notes and assume other central bank functions previously exercised by the National Bank of Iceland, a wholly state-owned bank established in 1885. Other banks are the Agricultural Bank, a state bank founded in 1929; the Fisheries Bank, a private joint-stock bank founded in 1930, with most of its shares held by the government; the Industrial Bank, a joint-stock bank established in 1953, with part of the shares owned by the government; the Iceland Bank of Commerce, founded in 1961; the Cooperative Bank of Iceland, founded in 1963; and the People's Bank, founded in 1971. All banks have main offices in Reykjavík, and some have branches in other towns. Savings banks are distributed throughout the country.

In 1955, Iceland took the first step toward indexation of financial assets. The Economic Management Act of 1979 established a system of full indexation of savings and credit, most provisions of which were gradually implemented over the next two years. Most deposits are now indexed, and legislation that took effect in November 1986 gave banks increased power to determine their interest rate.

In 1990 the number of commercial banks in Iceland were reduced from seven to four. A number of banks were forced to merge into the Islandbanki because of financial trouble. In 1997 there were four commercial banks, two of which, the Landsbanki and Bunadar banki, are still state-owned. The country's two other banks, Islandsbanki and Sparisjodabanki, are privately-owned.

The whole basis on which the financial system is supervised and regulated, however, has been transformed by Iceland's accession to the European Economic Area (EEA) in 1994. Under the agreement, Iceland has been required to implement into national law the common minimum standards for the supervision of financial institutions—banks, insurance companies, and securities firms—developed at EU level.

Since 15 June 1973, the market rate of the Icelandic króna has been floating vis-à-vis other currencies. A currency reform that took effect on 1 January 1981 introduced a new króna equivalent to 100 old krónur. The money supply, as measured by M2, totaled κ135,353 million in 1995. The International Monetary Fund reports that in 1998, currency and demand deposits—an aggregate commonly known as M1—were equal to \$820.5 million. In that same year, M2—an aggregate equal to M1 plus savings deposits, small time deposits, and money market mutual funds—was \$3.2 billion. The money market rate, the rate at which financial institutions lend to one another in the short term, was 8.12%. The discount rate, the interest rate at which the central bank lends to financial institutions in the short term, was 8.5%.

The Securities Exchange of Iceland (SEI) was established in 1985 on the basis of rules set by the Central Bank. A new Act on

the Icelandic Stock Exchange was passed in February 1993, granting a monopoly to the exchange. As of 2004, a total of 34 companies were listed on the stock exchange, which had a market capitalization that year of \$17.629 billion. In 2004, the ICEX-15 rose 58.9% from the previous year to 3,359.6.

### 3<sup>4</sup> INSURANCE

There are many mutual insurance societies in addition to the national health and social insurance scheme. Almost all direct insurance is written by domestic companies that conduct business in the various kinds of property and life insurance. Automobile liability insurance and homeowners' coverage against fire, floods, earthquakes, and volcanic eruptions are compulsory. The Ministry of Insurance Affairs is the principal supervisory body. In 2003, direct premiums written totaled \$345 million, of which nonlife premiums accounted for \$314 million. In 2002, Sjova Almennar was Iceland's top nonlife and life insurer, with gross written non-life premiums (for nonlife and life insurers) and life premiums of \$112.7 million and \$14.4 million, respectively.

### 3<sup>5</sup> PUBLIC FINANCE

Since 1984, Iceland's budget has shown a deficit averaging nearly 2% of GDP, raising its net indebtedness relative to GDP to almost 30% in 1994. Government attempts to balance the budget were frustrated by the economic downturn during 1987–93 and by fiscal concessions to expedite wage settlements. Consequently, the deficit has been larger than expected, reaching 34% of GDP in 1999.

The US Central Intelligence Agency (CIA) estimated that in 2005 Iceland's central government took in revenues of approximately \$6.9 billion and had expenditures of \$6.7 billion. Revenues minus expenditures totaled approximately \$234 million. Public debt in 2005 amounted to 34% of GDP. Total external debt was \$3.073 billion.

#### Public Finance – Iceland (2002)

(In millions of kronur, central government figures)

<b>Revenue and Grants</b>	<b>259,012</b>	<b>100.0%</b>
Tax revenue	197,026	76.1%
Social contributions	23,904	9.2%

Social protection	54,190	20.7%

(...) data not available or not significant.

SOURCE: *Government Finance Statistics Yearbook 2004*, Washington, DC: International Monetary Fund, 2004.

The International Monetary Fund (IMF) reported that in 2002, the most recent year for which it had data, central government revenues were κ259,012 million and expenditures were κ262,231 million. The value of revenues was us\$2,826 million and expenditures us\$2,861 million, based on an exchange rate for 2002 of us\$1 = κ91.662 as reported by the IMF. Government outlays by function were as follows: general public services, 18.5%; public order and safety, 4.9%; economic affairs, 15.7%; housing and community amenities, 0.9%; health, 26.2%; recreation, culture, and religion, 3.1%; education, 10.0%; and social protection, 20.7%.

### 3<sup>6</sup>TAXATION

Recent tax reforms in Iceland have produced a steady drop in corporate income tax rates throughout the 1990s and, since 1995, decreased marginal rates and increased thresholds for personal income tax. The corporate income tax rate, at 50% in 1989, was decreased from 30% in 2001 to 18% in 2002. The income tax on partnerships, was decreased from 38% in 2001 to 26% in 2002. Since March 1999, Iceland has also offered an offshore corporate tax rate of 5% to international trading companies (ITCs) that exclusively trade in goods and services outside of Iceland. Capital gains are taxed as ordinary income at 18%, although gains may be offset by extraordinary depreciation. Dividends paid to nonresident companies are subject to a 15% tax rate, while dividends paid to nonresident persons are subject to a 10% tax rate.

The personal income tax schedule in Iceland consists of a tax free allowance (about \$10,457 in 2002 increased to \$10,785 in 2003); a total tax rate that is the sum of the central government's general rate (25.75% in 2002 and 2003) and the municipal tax rate (12.8% in 2002 and 2003) giving a total tax rate of 38.55%; and a central government surtax (7% in 2002 reduced to 5% in 2003) which is applied to income above a certain threshold (\$51,404 in 2002 and \$52,818 in 2003) creating a three-bracket structure with maximum tax rate of 45.54% in 2002 decreased to 43.54% in 2003. Seamen are allowed special a special tax reduction amounting to about \$9.40 a day in 2003. The social security tax, paid by the employer, is 5.73%. Since 1999, reductions in social security taxes (0.2% in 1999 and 0.4% as of May 2000) have been offered to employers in exchange for their contribution to supplementary employee pension premiums. In 2003 the wealth tax rate, applied to assets above about \$61,000, was halved from 1.2% to 0.6% and a 0.25% surtax on net wealth above approximately \$81,800 was abolished largely because of increases in real property values following an assessment review by the Valuation Office in 2002. Inheritance and gift taxes range from 11–15%. There is a 2–6% tax on the transfer of housing, and a 10% tax on the transfer of large estates. Local authorities may levy individual income and corporate taxes.

The major indirect tax is Iceland's value-added tax (VAT) with a normal rate of 24.5% on domestic goods and services. There is a reduced rate of 14% applied to most foodstuffs, books, newspapers and periodicals, subscriptions to radio and the TV, hotels, electricity, geothermal heating. Exempted from VAT are exports of goods and services, as well as services connected with imports and exports. Other categories for exemption include health services, social services, education, libraries, the arts, sports, passenger transport, postal services, rental of property, insurance, and banking.

### 3<sup>7</sup>CUSTOMS AND DUTIES

Over 90% of imports are not subject to import restrictions or duties other than the same value-added tax applied to domestically produced goods. Special excise taxes are levied on sugar and some sugar products, potatoes, and motor vehicles. Agricultural products remain the most heavily taxed. In March 1970, Iceland acquired full membership in EFTA. On 28 February 1973, Iceland ratified a trade agreement with the European Community (later named the European Union) leading to the elimination of tariffs on industrial goods. A law authorizing the establishment of free trade zones went into effect in 1992. Iceland's trade regime underwent considerable liberalization in the 1990s with accession to the European Economic Area (EEA) in 1993, and the Uruguay Round in 1994.

Current duty rates generally range from 0–30% ad valorem and the average weighted tariff is 3.6%. Some goods enter duty-free, such as meat, fish, and dairy products.

### 3<sup>8</sup>FOREIGN INVESTMENT

Icelanders have been reluctant to permit substantial foreign investment; nearly all such investment is limited to participation in joint ventures in which Icelandic interests hold a majority share. There is only one wholly foreign-owned industrial facility in the country, a Swiss aluminum-processing facility. Two others, a ferro-silicon and a diatomite plant, have foreign equity participation. From the beginning of 1993, Icelanders have been free to invest abroad.

For the period 1988 to 1990, Iceland's share in world foreign direct investment (FDI) inflow was only 30% of its share in world GDP. For the period 1998 to 2000, its share of world FDI inflows was 40% of its share of world GDP, a marginal improvement. Except for a fall to \$66 million in 1998, yearly FDI inflows to Iceland have in the range of \$146 million (2001) to \$158 million (2000).

Energy-intensive industrial activities is one of the main areas for foreign investments, due to the inexpensive energy resources available in Iceland. The national telephone company was expected to be privatized by the end of 2005, and the government has started discussing about opening part of the fishing industry to limited foreign investment. Biomedical and genetic research are two areas with future potential for investments.

### 3<sup>9</sup>ECONOMIC DEVELOPMENT

The national government and some local governments are involved in trawler fishing, herring processing, merchant shipping, electric power facilities, and certain other industries. To a considerable degree, the central government supervises the export-import trade and the fishing and fish-processing industries. It may set uniform prices of export commodities and may shift export and import trade to specific countries as balance-of-payments considerations require. It channels investment funds into fields it considers desirable.

The government supports farmers in the rebuilding or enlarging of their homes, livestock sheds, and barns, and assists them in the purchase of machinery. Equipped with crawler tractors and excavators, a government agency helps farmers enlarge cultivated areas and break, drain, and level new lands for the establishment

of homesteads. Thousands of new acres have thus been brought under cultivation.

The government fixes prices of essential foods and other basic consumption items and subsidizes them, both to limit prices for the consumer and to maintain farm incomes. It also fixes mark-ups that manufacturers, wholesalers, retailers, and importers may place on a wide variety of products.

In the early 1990s, the government concentrated on maintaining the value of the króna by bringing down inflation, even at the cost of economic growth. Wage gains were restricted. In late 1992, plans were made public for a Fisheries Development Fund that would buy and scrap unneeded vessels and thereby promote efficiency. The Fund would also be used to help firms establish joint ventures abroad and buy fishing rights. Plans were also under way to sell several state-owned companies, with the money used for research and development and reducing the deficit. Entry into the European Economic Area (EEA) in 1994 and the Uruguay Round brought increased trade liberalization and foreign investment. The country experienced rapid economic growth during the late 1990s, but high domestic spending led to a widening current account deficit that peaked at 10% of GDP in 2000.

The economy went into recession in 2001, and inflation rose. The government tightened monetary and fiscal policy that brought inflation down, but GDP growth remained negative in 2002. The government adopted a floating exchange rate for the króna in March 2001. Gross external debt amounted to 130% of GDP at the end of 2002. The government is looking to diversify exports, which is expected to stabilize the economy.

More than 70% of export revenues are contributed by the fishing industry, which makes the Icelandic economy susceptible to declining fish stocks and fluctuations in world prices for fish and fish products. To better equip for the future, Iceland has started diversifying its economic base, and branched out into software production, biotechnology, and financial services. At the same time, it has started expanding its manufacturing and tourism sectors. The current economic growth is expected to be sustained until 2007, and will have private consumption as its prime engine.

#### **40 SOCIAL DEVELOPMENT**

There is a universal pension covering all residents and a mandatory occupational pension covering all employees and self-employed persons. Universal pensions covering all residents are paid by employer and government contributions, while the cost of employment pensions is shared by employees and employers. Benefits include old age, disability, and survivorship pensions. Sickness and maternity benefits are available to all residents. The first laws covering sickness and maternity were instituted in 1936. Medical benefits cover all residents.

The number of women in the work force is high, partially due to a comprehensive subsidized day care program. In 2004 more than 75% of women were actively engaged in the work force. Equal pay for equal work is required by law although men continue to earn more than women. The government takes serious measures to protect women against violence and sexual abuse, though many cases remain unreported.

The constitution provides for the freedom of speech and press, assembly and association, and religion. These rights are generally respected by the government. There is very little discrimina-

tion based on race, gender, religion, disability, language, or social status.

#### **41 HEALTH**

The Director of Public Health is responsible for all health matters. Iceland had an estimated 347 physicians, 893 nurses, 77 midwives, 120 dentists, and 85 pharmacists per 100,000 people in 2004. In the 1990s there were an estimated 53 hospitals, with 3,985 beds. Two-thirds of the beds were in nursing and senior living homes, with the remaining one-third in hospitals. Public expenditures on health were among the highest in industrialized countries at 19.3% of the gross domestic product.

As of 2002, Iceland had estimated birth and death rates of, respectively, 14.4 and 6.9 per 1,000 people. Life expectancy was estimated at 80.19 years, among the highest in the world. Infant mortality in 2005 was estimated at 3.31 per 1,000 live births, one of the lowest in the world. The total fertility rate was two children per woman during her childbearing years. The incidence of tuberculosis, once widespread, has been greatly reduced. Leprosy, also common in earlier times, has been virtually eliminated, with no new cases reported in recent decades. Approximately 99% of Iceland's children were immunized against measles. The HIV/AIDS prevalence was 0.20 per 100 adults in 2003. As of 2004, there were approximately 220 people living with HIV/AIDS in the country. There were an estimated 100 deaths from AIDS in 2003.

The major causes of death were circulatory system diseases, cerebrovascular disease, malignant neoplasms (cancers), and diseases of the respiratory system.

#### **42 HOUSING**

In 2003, there were about 111,157 dwellings in the nation; about 383 dwellings for every 1,000 inhabitants. About 53% of all dwellings were one- or two-family houses; 45% were apartments. About 37% of all dwellings had five or more rooms and a kitchen. Most rural buildings were at one time made of turf, then of wood, and most recently of stone and concrete. In the towns, turf houses long ago gave way to wooden ones, but for some decades most new housing has been concrete. Virtually all dwellings have electricity, piped water, and central heating.

#### **43 EDUCATION**

Education is compulsory for 10 years of basic education (ages 6 to 16). Students may then choose to attend a general or technical secondary school, each offering four-year programs. Specialized vocational schools are also available to secondary students, including a commercial high school, a school of navigation, two schools of agriculture, and a health professions school. In some remote rural areas, a system of "alternate teaching" is in effect. This allows children to study intensively for a week or two at a boarding school, then return home for the same period of time. The academic year runs from September to May.

Most children between the ages of three and five are enrolled in some type of preschool program. Primary school enrollment in 2003 was estimated at about 100% of age-eligible students. The same year, secondary school enrollment was about 86% of age-eligible students. Nearly all students complete their primary education. The student-to-teacher ratio for primary school was at about 11:1 in 2003; the ratio for secondary school was about 13:1.

There are at least eight *háskóli*; a term that refers to both traditional universities and other institutions of higher education that do not have research programs. The University of Iceland in Reykjavík, founded in 1911, has faculties of law and economics, theology, medicine and dentistry, philosophy (art and humanities), and engineering. Tuition is free; only nominal registration and examination fees must be paid. In 2003, about 63% of the tertiary age population were enrolled in some type of higher education program; with 45% for men and 81% for women. The adult literacy rate has been estimated at about 99.9%.

As of 2003, public expenditure on education was estimated at 7.6% of GDP.

#### 44 LIBRARIES AND MUSEUMS

The National and University Library in Reykjavík (founded in 1818; 900,000 items) serves as a national library as well as a public lending library. Other leading libraries, in the Reykjavík include the City Library of Reykjavík, which sponsors seven branch location and bookmobile, and the National Archives, which contains a collection of documents covering 800 years of Icelandic history. In 2000, there were about 106 public libraries in the country.

The important museums, also all in Reykjavík, are the Icelandic National Museum (founded in 1863), the Natural History Museum (1889), and a museum devoted to the sculptures and paintings of Einar Jónsson. The Arni Magnusson Institute contains Iceland literature and documents that were somewhat recently returned to the Icelandic government after being held by Denmark for centuries. Also in the capital are the National Gallery of Iceland, the Living Art Museum, and the Sigurjón Ólaffson Museum, among others. The Kopavogur Art Museum contains exhibits primarily on modern and contemporary art. A Salt Fish Museum opened in Grindavík in 2002 to commemorate the country's fishing industry.

#### 45 MEDIA

Radio and radiotelephone communications are maintained with Europe and America and an underwater telegraph cable connects Iceland with Europe. The telephone, telegraph, and radio systems are publicly owned and administered. In 2003, there were 190,700 mainline phones and 279,100 mobile phones in use throughout the country.

The government-owned Icelandic National Broadcasting Service (RUV) provides the primary national radio and television broadcasts. There are, however, several smaller private stations. As of 1999 there were 5 AM and 147 FM radio stations and 14 television stations. In 1997 there were 260,000 radios and 98,000 television sets throughout the country. In 2003, there were about 195,000 Internet subscribers nationwide served by about 122,175 Internet hosts.

There are five daily newspapers, four of which are published in Reykjavík. With their political orientation and average daily circulation in 2002, they were: *Morgunblað*, Independence Party, 53,000; *DV Dagblað*, 44,000; *Tíminn*, Progressive Party, 14,000; *Althyðublað*, 4,000; and *Dagur-Tíminn* (Akureyri), Progressive Party. Icelandreview.com is an English-language news site. Nondaily newspapers are published in Reykjavík and other towns. Various popular and scholarly periodicals are published in Reykjavík.

The law prohibits the production, showing, distribution, and/or sale of violent movies, which are defined as containing scenes depicting the mistreatment or the brutal killing of men or animals. The Motion Picture Review Committee, which includes six members, is appointed by the Minister of Education and Culture to review all movies before they are shown. The committee also rates the films based on their suitability for children. By their evaluation, the committee may ban a film or require edits before its release.

The constitution provides for freedom of speech and press, and the government is said to respect these rights in practice.

#### 46 ORGANIZATIONS

The Iceland Chamber of Commerce and the Confederation of Icelandic Employers are based in Reykjavík. Organizations representing laborers, businesses, and industries include the Farmers Association of Iceland, the Federation of Icelandic Industries, and the Federation of Icelandic Trade.

There are professional associations representing a wide variety of fields, such as the Icelandic Teachers Union and the Icelandic Nurses' Association. Many of these promote research and education in particular fields, such as the Icelandic Medical Association. There are several other associations dedicated to research and education for specific fields of medicine and particular diseases and conditions, such as the Icelandic Heart Association.

Notable national youth organizations include the Federation of Young Progressives, Independence Party Youth Organization, National Council of Icelandic Youth, National Union of Icelandic Students, Social Democratic Youth Federation, Youth Movement of the People's Alliance, YMCA/YWCA, and The Icelandic Boy and Girl Scouts Association. There are several sports associations in the country representing such pastimes as football (soccer), badminton, squash, mountain biking, skiing, skating, and track and field.

Learned societies include the Icelandic Archaeological Society, the Icelandic Historical Society, the Icelandic Literary Society, the Music Society, the Icelandic Natural History Society, and the Agricultural Association. There are also the Icelandic Artists' Association, the Iceland Association of Pictorial Artists, the Icelandic Actors' Association, the Icelandic Musicians' Association, the Icelandic Composers' Society, the Icelandic Architects' Association, and the Icelandic Writers' Association. Among other cultural organizations are the Icelandic-American Society, the Danish Society, the Danish-Icelandic Society, the Anglo-Icelandic Society, the Alliance Française, the Nordic Society, and the Union of Women's Societies.

The Salvation Army, Caritas, Amnesty International, and the Red Cross all have active chapters within the country. Volunteer service organizations, such as the Lions Clubs and Kiwanis International, are also present.

#### 47 TOURISM, TRAVEL, AND RECREATION

Iceland offers such diverse and unusual natural attractions as active volcanoes, glaciers, and hot springs. Among popular participatory sports are swimming (possible year-round in geothermal pools), salmon fishing, pony trekking, bird-watching, skiing, river

rafting, and golf. Tourists may arrange to stay in modern hotels, guest houses, on farms, or in youth hostels.

Citizens of the Scandinavian countries do not require a passport when visiting Iceland. All other visitors need valid passports and visas, except residents of some 60 countries (including the United States, Australia, and Canada). Visas are good for up to three months. A certificate of vaccination against yellow fever is required if traveling from an infected country.

In 2003, there were 569,194 tourist arrivals, almost an 11% increase from 2002. There were 7,330 hotel rooms with 14,948 beds and an occupancy rate of 42%.

In 2005, the US Department of State estimated the daily cost of traveling in Reykjavik from May through September at \$442, and \$352 the rest of the year. The cost of a stay in Keflavik-Grindavik was estimated at \$367 per day.

#### 48 FAMOUS ICELANDERS

Famous early Icelanders were Eric the Red (Eiríkur Thorvaldsson), who discovered and colonized Greenland in 982, and his son Leif Ericsson (Leifur Eiríksson, b.970), who introduced Christianity to Greenland and discovered the North American continent (c.1000). Two famous patriots and statesmen were Bishop Jón Arason (1484–1550), who led the fight for liberty against the power of the Danish king, and Jón Sigurðsson (1811–79), Iceland's national hero, champion of the fight for independence. Vigdís Finnbogadóttir (b.1930) served four consecutive terms as president from 1980 to 1996, becoming the first female elected to the presidency of any republic.

Prominent writers were Ari Thorgilsson (1067–1148), father of Icelandic historical writing; Snorri Sturluson (1178–1241), author of the famous *Prose Edda*, a collection of Norse myths; and Hallgrímur Pétursson (1614–74), author of Iceland's beloved Passion Hymns. Leading poets include Bjarni Thorarensen (1786–1841) and Jónas Hallgrímsson (1807–45), pioneers of the Romantic movement in Iceland; Matthías Jochumsson (1835–1920), author of Iceland's national anthem; Thorsteinn Erlingsson (1858–1914), lyricist; Einar Hjörleifsson Kvaran (1859–1939), a pioneer of realism in Icelandic literature and an outstanding short-story writer; Einar Benediktsson (1864–1940), ranked as one of the greatest modern Icelandic poets; Jóhann Sigurjónsson (1880–1919), who lived much of his life in Denmark and wrote many plays based on Icelandic history and legend, as well as poetry; and the novelist

Halldór Kiljan Laxness (1902–98), who received the Nobel Prize for literature in 1955.

Niels Ryberg Finsen (1860–1904), a physician who pioneered in the field of light (ray) therapy, received the Nobel Prize for medicine in 1903. Stefán Stefánsson (1863–1921) was the pioneer Icelandic botanist. Helgi Pjeturss (1872–1949), geologist and philosopher, was an authority on the Ice Age and the geology of Iceland. Einar Jónsson (1874–1954), Iceland's greatest sculptor, is represented in European and American museums.

Singer, songwriter, and composer Björk (b.1965), formerly the lead singer of the Icelandic band The Sugarcubes, works in a variety of musical genres. The former world chess champion Bobby Fischer (b.1943) became an Icelandic citizen in 2005. Russian pianist and composer Vladimir Ashkenazy (b.1937) has been a citizen since 1972.

#### 49 DEPENDENCIES

Iceland has no territories or colonies.

# IRELAND

Éire

**CAPITAL:** Dublin (Baile Átha Cliath)

**FLAG:** The national flag is a tricolor of green, white, and orange vertical stripes.

**ANTHEM:** *Amhrán na bhFiann (The Soldier's Song)*.

**MONETARY UNIT:** The euro replaced the Irish punt as the official currency in 2002. The euro is divided into 100 cents. There are coins in denominations of 1, 2, 5, 10, 20, and 50 cents and 1 euro and 2 euros. There are notes of 5, 10, 20, 50, 100, 200, and 500 euros. €1 = \$1.25475 (or \$1 = €0.79697) as of 2005.

**WEIGHTS AND MEASURES:** Since 1988, Ireland has largely converted from the British system of weights and measures to the metric system.

**HOLIDAYS:** New Year's Day, 1 January; St. Patrick's Day, 17 March; Bank Holidays, 1st Monday in June, 1st Monday in August, and last Monday in October; Christmas Day, 25 December; St. Stephen's Day, 26 December. Movable religious holidays include Good Friday and Easter Monday.

**TIME:** GMT.

## <sup>1</sup> LOCATION, SIZE, AND EXTENT

An island in the eastern part of the North Atlantic directly west of the United Kingdom, on the continental shelf of Europe, Ireland covers an area of 70,280 sq km (27,135 sq mi). Comparatively, the area occupied by Ireland is slightly larger than the state of West Virginia. The island's length is 486 km (302 mi) N–S, and its width is 275 km (171 mi) E–W. The Irish Republic is bounded on the N by the North Channel, which separates it from Scotland; on the NE by Northern Ireland; and on the E and SE by the Irish Sea and St. George's Channel, which separate it from England and Wales. To the W, from north to south, the coast is washed by the Atlantic Ocean.

Ireland's capital city, Dublin, is located on the Irish Sea coast.

## <sup>2</sup> TOPOGRAPHY

Ireland is a limestone plateau rimmed by coastal highlands of varying geological structure. The central plain area, characterized by many lakes, bogs, and scattered low ridges, averages about 90 m (300 ft) above sea level. Principal mountain ranges include the Wicklow Mountains in the east and Macgillicuddy's Reeks in the southwest. The highest peaks are Carrantuohill (1,041 m/3,414 ft) and Mt. Brandon (953 m/3,127 ft), near Killarney, and, 64 km (40 mi) south of Dublin, Lugnaquilla (926 m/3,039 ft).

The coastline, 1,448 km (900 mi) long, is heavily indented along the south and west coasts where the ranges of Donegal, Mayo, and Munster end in bold headlands and rocky islands, forming long, narrow fjordlike inlets or wide-mouthed bays. On the southern coast, drowned river channels have created deep natural harbors. The east coast has few good harbors.

Most important of the many rivers is the Shannon, which rises in the mountains along the Ulster border and drains the central plain as it flows 370 km (230 mi) to the Atlantic, into which it

empties through a wide estuary nearly 110 km (70 mi) long. Other important rivers are the Boyne, Suir, Liffey, Slaney, Barrow, Blackwater, Lee, and Nore.

## <sup>3</sup> CLIMATE

Ireland has an equable climate, because the prevailing west and southwest winds have crossed long stretches of the North Atlantic Ocean, which is warmer in winter and cooler in summer than the continental land masses. The mean annual temperature is 10°C (50°F), and average monthly temperatures range from a mild 4°C (39°F) in January to 16°C (61°F) in July. Average yearly rainfall ranges from less than 76 cm (30 in) in places near Dublin to more than 254 cm (100 in) in some mountainous regions. The sunniest area is the extreme southeast, with an annual average of 1,700 hours of bright sunshine. Winds are strongest near the west coast, where the average speed is about 26 km/hr (16 mph).

## <sup>4</sup> FLORA AND FAUNA

Since Ireland was completely covered by ice sheets during the most recent Ice Age, all existing native plant and animal life originated from the natural migration of species, chiefly from other parts of Europe and especially from Britain. Early sea inundation of the land bridge connecting Ireland and Britain prevented further migration after 6000 BC. Although many species have subsequently been introduced, Ireland has a much narrower range of flora and fauna than Britain. Forest is the natural dominant vegetation, but the total forest area is now only 9.6% of the total area, and most of that remains because of the state afforestation program. The natural forest cover was chiefly mixed sessile oak woodland with ash, wych elm, birch, and yew. Pine was dominant on poorer soils,

with rowan and birch. Beech and lime are notable natural absentees that thrive when introduced.

The fauna of Ireland is basically similar to that of Britain, but there are some notable gaps. Among those absent are weasel, polecat, wildcat, most shrews, moles, water voles, roe deer, snakes, and common toads. There are also fewer bird and insect species. Some introduced animals, such as the rabbit and brown rat, have been very successful. Ireland has some species not native to Britain, such as the spotted slug and certain species of wood lice. Ireland's isolation has made it notably free from plant and animal diseases. Among the common domestic animals, Ireland is particularly noted for its fine horses, dogs, and cattle. The Connemara pony, Irish wolfhound, Kerry blue terrier, and several types of cattle and sheep are recognized as distinct breeds.

As of 2002, there were at least 25 species of mammals, 143 species of birds, and over 900 species of plants throughout the country.

## 5 ENVIRONMENT

Ireland enjoys the benefits of a climate in which calms are rare and the winds are sufficiently strong to disperse atmospheric pollution. Nevertheless, industry is a significant source of pollution. In 1996, carbon dioxide emissions from industrial sources totaled 34.9 million metric tons. In 2002, the total of carbon dioxide emissions was at 42.2 million metric tons. Water pollution is also a problem, especially pollution of lakes from agricultural runoff. The nation has 49 cu km of renewable water resources.

Principal responsibility for environmental protection is vested in the Department of the Environment. The Department of Fisheries and Forestry, the Department of Agriculture, and the Office of Public Works also deal with environmental affairs. Local authorities, acting under the supervision of the Department of the Environment, are responsible for water supply, sewage disposal, and other environmental matters.

In 2003, about 1.7% of the total land area was protected, including 45 Ramsar wetland sites. According to a 2006 report issued by the International Union for Conservation of Nature and Natural Resources (IUCN), threatened species included four types of mammals, eight species of birds, six species of fish, one type of mollusk, two species of other invertebrates, and one species of plant. Threatened species include the Baltic sturgeon, Kerry slug, and Marsh snail. The great auk has become extinct.

## 6 POPULATION

The population of Ireland in 2005 was estimated by the United Nations (UN) at 4,125,000, which placed it at number 122 in population among the 193 nations of the world. In 2005, approximately 11% of the population was over 65 years of age, with another 21% of the population under 15 years of age. There were 99 males for every 100 females in the country. According to the UN, the annual population rate of change for 2005–10 was expected to be 0.8%, a rate the government viewed as satisfactory. The projected population for the year 2025 was 4,530,000. The population density was 59 per sq km (152 per sq mi).

The UN estimated that 60% of the population lived in urban areas in 2005, and that urban areas were growing at an annual rate of 1.37%. The capital city, Dublin (Baile Átha Cliath), had a popu-

lation of 1,015,000 in that year. The other largest urban centers (and their estimated populations) were Cork (193,400), Limerick (84,900), Galway (65,832), and Waterford (44,594).

## 7 MIGRATION

The great famine in the late 1840s inaugurated the wave of Irish emigrants to the United States, Canada, Argentina, and other countries: 100,000 in 1846, 200,000 per year from 1847 to 1850, and 250,000 in 1851. Since then, emigration has been a traditional feature of Irish life, although it has been considerably reduced since World War II. The net emigration figure decreased from 212,000 for 1956–61 to 80,605 for 1961–66 and 53,906 for 1966–71. During 1971–81, Ireland recorded a net gain from immigration of 103,889. As of November 1995, more than 150,000 people had left Ireland in the previous 10 years, unemployment being the main reason. The top two destinations were the United Kingdom and the United States.

During the 1990s there was a considerable rise in the number of asylum seekers, from 39 applications in 1992 to 4,630 in 1998. The main countries of origin were Nigeria, Romania, the Democratic Republic of the Congo, Libya, and Algeria. Also, during the Kosovo crisis in 1999, Ireland took in 1,033 Kosovar Albanians who were evacuated from Macedonia under the UNHCR/IOM Humanitarian Evacuation Programme. In 2004 Ireland had 7,201 refugees and 3,696 asylum seekers. Asylum seekers are primarily from Nigeria and the Democratic Republic of the Congo and six other countries.

In 2005, the net migration rate was estimated as 4.93 migrants per 1,000 population, up from -1.31 in 1999.

## 8 ETHNIC GROUPS

Within historic times, Ireland has been inhabited by Celts, Norsemen, French Normans, and English. Through the centuries, the racial strains represented by these groups have been so intermingled that no purely ethnic divisions remain. The Travellers are group of about 25,000 indigenous nomadic people who consider themselves to be a distinct ethnic minority.

## 9 LANGUAGES

Two languages are spoken, English and Irish (Gaelic). During the long centuries of British control, Irish fell into disuse except in parts of western Ireland. Since the establishment of the Irish Free State in 1922, the government has sought to reestablish Irish as a spoken language throughout the country. It is taught as a compulsory subject in schools and all government publications, street signs, and post office notices are printed in both Irish and English. English, however, remains the language in common use. Only in a few areas (the Gaeltacht), mostly along the western seaboard, is Irish in everyday use. In 1995, a national survey found that only 5% of Irish people frequently used the Irish language and only 2% considered it their native tongue. About 30% of the population, however, claims some proficiency in Gaelic.

## 10 RELIGIONS

According to the 2002 census, about 88.4% of the population were nominally Roman Catholic. The next largest organization was the Church of Ireland (Anglican), with a membership of about 2.9%

of the population. About 0.52% of the population were Presbyterian, 0.25% were Methodist, 0.49 were Muslim, and less than 0.1% were Jewish. There are small communities Jehovah's Witnesses. For ecclesiastical purposes, the Republic of Ireland and Northern Ireland (UK) constitute a single entity. Both Roman Catholics and Episcopalian churches have administrative seats at Armagh in Northern Ireland. The Presbyterian Church has its headquarters in Belfast. The constitutional right to freedom of religion is generally respected in practice.

## 11 TRANSPORTATION

The Irish Transport System (C oras Iompair  ireann-CIE), a state-sponsored entity, provides a nationwide coordinated road and rail system of public transport for goods and passengers. It is also responsible for maintaining the canals, although they are no longer used for commercial transport. Ireland's railroads, like those of many other European countries, have become increasingly unprofitable because of competition from road transport facilities. There were 3,312 km (2,056 mi) of track in 2004, all of it broad gauge. CIE receives an annual government subsidy.

A network of good main roads extends throughout the country, and improved country roads lead to smaller towns and villages. Ninety-six percent of all inland passenger transport and 90% of inland freight are conveyed by road. Bus routes connect all the major population centers and numerous moderate-sized towns. In 2002, there were 95,736 km (59,548 mi) of roads, of which all were surfaced. In 2003 there were 1,520,000 passenger cars and 272,000 commercial vehicles in use.

In 2005, Ireland's merchant fleet consisted of 39 vessels of 1,000 GRT or more. The state-supported shipping firm, the British and Irish Steam Packet Co. (the B and I Line), is largely engaged in cross-channel travel between Ireland and the United Kingdom, providing passenger and car ferry services as well as containerized freight services, both port to port and door to door. The Irish Continental Line operates services to France, linking Rosslare with Le Havre and Cherbourg; it also runs a summer service between Cork and Le Havre. Brittany Ferries operates a weekly service between Cork and Roscoff. Other shipping concerns operate regular passenger and freight services to the United Kingdom and freight services to the Continent. There are deepwater ports at Cork and Dublin and 10 secondary ports. Dublin is the main port. As of 2004, Ireland had 753 km (468 mi) of navigable inland waterways, but which were accessible only by pleasure craft.

In 2004 there were an estimated 36 airports, of which 15 had paved runways as of 2005. Aer Lingus (Irish International Airlines), the Irish national airline, operates services between Ireland, the United Kingdom, and continental Europe as well as transatlantic flights. Many foreign airlines operate scheduled transatlantic passenger and air freight services through the duty-free port at Shannon, and most transatlantic airlines make nonscheduled stops there; foreign airlines also operate services between Ireland, the United Kingdom, and continental Europe. The three state airports at Dublin, Shannon, and Cork are managed by Aer Rianta on behalf of the Ministry for Transport and Power. A domestic airline, Aer Arann Teo, connects Galway with the Aran Islands

LOCATION: 63°19' to 67°7'5" N; 13°16'7" to 24°32'3" W. BOUNDARY LENGTHS: total coastline, 4,970 kilometers (3,090 miles). TERRITORIAL SEA LIMIT: 12 miles.

and Dublin. In 2003, about 28.864 million passengers were carried on scheduled domestic and international airline flights.

## 12 HISTORY

The pre-Christian era in Ireland is known chiefly through legend, although there is archaeological evidence of habitation during the Stone and Bronze ages. In about the 4th century BC, the tall, red-haired Celts from Gaul or Galicia arrived, bringing with them the Iron Age. They subdued the Picts in the north and the  rainn tribe in the south, then settled down to establish a Gaelic civilization, absorbing many of the traditions of the previous inhabitants. By the 3rd century AD, the Gaels had established five permanent

kingdoms—Ulster, Connacht, Leinster, Meath (North Leinster), and Munster—with a high king, whose title was often little more than honorary, at Tara. After St. Patrick's arrival in AD 432, Christian Ireland rapidly became a center of Latin and Gaelic learning. Irish monasteries drew not only the pious but also the intellectuals of the day, and sent out missionaries to many parts of Europe.

Toward the end of the 8th century, the Vikings began their invasions, destroying monasteries and wreaking havoc on the land, but also intermarrying, adopting Irish customs, and establishing coastal settlements from which have grown Ireland's chief cities. Viking power was finally broken at the Battle of Clontarf in 1014. About 150 years later, the Anglo-Norman invasions began. Gradually, the invaders gained control of the whole country. Many of them intermarried, adopted the Irish language, customs, and traditions, and became more Irish than the Gaels. But the political attachment to the English crown instituted by the Norman invasion caused almost 800 years of strife, as successive English monarchs sought to subdue Gaels and Norman-Irish alike. Wholesale confiscations of land and large plantations of English colonists began under Mary I (Mary Tudor) and continued under Elizabeth I, Cromwell, and William III. Treatment of the Irish reached a brutal climax in the 18th century with the Penal Laws, which deprived Catholics and Dissenters (the majority of the population) of all legal rights.

By the end of the 18th century, many of the English colonists had come to regard themselves as Irish and, like the English colonists in America, resented the domination of London and their own lack of power to rule themselves. In 1783, they forced the establishment of an independent Irish parliament, but it was abolished by the Act of Union (1800), which gave Ireland direct representation in Westminster. Catholic emancipation was finally achieved in 1829 through the efforts of Daniel O'Connell, but the great famine of the 1840s, when millions died or emigrated for lack of potatoes while landlords continued to export other crops to England, emphasized the tragic condition of the Irish peasant and the great need for land reform.

A series of uprisings and the growth of various movements aimed at home rule or outright independence led gradually to many reforms, but the desire for complete independence continued to grow. After the bloodshed and political maneuvers that followed the Easter Uprising of 1916 and the proclamation of an Irish Republic by Irish members of Parliament in 1919, the Anglo-Irish Treaty was signed in 1921, establishing an Irish Free State with dominion status in the British Commonwealth. Violent opposition to dominion status and to a separate government in Protestant-dominated Northern Ireland precipitated a civil war lasting almost a year. The Free State was officially proclaimed and a new constitution adopted in 1922, but sentiment in favor of a reunified Irish Republic remained strong, represented at its extreme by the terrorist activities of the Irish Republican Army (IRA). Powerful at first, the IRA lost much of its popularity after Éamon de Valera, a disillusioned supporter, took over the government in 1932. During the civil violence that disrupted Northern Ireland from the late 1960s on, the Irish government attempted to curb the "provisional wing" of the IRA, a terrorist organization that used Ireland as a base for attacks in the north. Beginning in 1976, the government assumed emergency powers to cope with IRA activities, but the

terrorist acts continued, most notably the assassination on 27 August 1979 of the British Earl Mountbatten.

The Irish government continued to favor union with Northern Ireland, but only by peaceful means. In November 1985, with the aim of promoting peace in Northern Ireland, Ireland and the United Kingdom ratified a treaty enabling Ireland to play a role in various aspects of Northern Ireland's affairs. On 10 April 1998 the Irish Republic jointly signed a peace agreement with the United Kingdom to resolve the Northern Ireland crisis. Ireland pledged to amend articles 2 and 3 of the Irish Constitution, which lay claim to the territory of the North, in return for the United Kingdom promising to amend the Government of Ireland Act. On 22 May 1998, 94.4% of the electorate voted in a referendum to drop Ireland's claim to Northern Ireland. A year after the agreement, several key provisions of the Good Friday Agreement had been implemented. The peace process has since then witnessed long moments of gloom in spite of the ongoing involvements of the British and Irish prime ministers to resolve the situation in Northern Ireland. One of the largest obstacles was the disarmament of the IRA and the reservations on the part of the Ulster Unionists to share power with Sinn Féin, the political arm of the IRA. Finally, in May 2000, the IRA proposed that outside observers be shown the contents of arms dumps and reinspect them at regular intervals to ensure that weaponry had not been removed and was back in circulation. The Ulster Unionists agreed to power-sharing arrangements and to endorse devolution of Northern Ireland. Decommissioning of the IRA did not progress in early 2001, however, and David Trimble, the first minister of the power-sharing government, resigned in July 2001. Sinn Féin's offices at Stormont, the Northern Ireland Assembly, were raided by the police in October 2002, due to spying allegations. On 14 October 2002, devolution was suspended and direct rule from London returned to Northern Ireland. Elections planned for the assembly in May 2003 were indefinitely postponed by British Prime Minister Tony Blair, due to a lack of evidence of peaceful intentions on the part of the IRA. Talks aimed at restoring devolved government in 2004 failed due to the continued IRA possession of illegal arms and its refusal to disband and pull out of illegal activities. Progress did not look eminent as of January 2005, when some IRA members were brutally murdered and the provisional government seemed to make attempts to protect those responsible for the murders from prosecution.

The years since the proclamation of the Irish Free State have witnessed important changes in governmental structure and international relations. In 1937, under a new constitution, the governor-general was replaced by an elected president, and the name of the country was officially changed to Ireland (Éire in Irish). In 1948, Ireland voted itself out of the Commonwealth of Nations, and on 18 April 1949, it declared itself a republic. Ireland was admitted to the UN in 1955 and became a member of the EC in 1973. Ireland, unlike the United Kingdom, joined the European economic and monetary union in 1999 without problem, and adopted the euro as its currency. However, Irish voters in June 2001 rejected the Treaty of Nice, which allowed for the enlargement of the EU. The other 14 members of the EU all approved the treaty by parliamentary vote, but Ireland's adoption required amending the constitution, which stipulated a popular vote. Voter turnout was low (34.8%), and when the treaty was put to Irish voters once again in October 2002, the government conducted a massive edu-

cation campaign to bring voters to the polls. This time, voter turnout was 48.5%, and 63% of voters in the October referendum approved the Nice Treaty. Ten new EU candidate countries joined the body on 1 May 2004.

Ireland has also benefited from progressive leadership. Mary Robinson, an international lawyer, activist, and Catholic, was elected president in November 1990. She became the first woman to hold that office. In 1974, while serving in the Irish legislature, she shocked her fellow country people by calling for legal sale of contraceptives. Her victory came at a period in Irish history dominated by controversy over the major issues of the first half of the 1990s: unemployment, women's rights, abortion, divorce, and homosexuality. Robinson promoted legislation that enabled women to serve on juries and gave 18-year-olds the right to vote. In 1997, Mary McAleese, who lived in Northern Ireland, became the first British subject to be elected president of the Irish Republic until 2004. In March 2002, Irish voters rejected a referendum proposal that would further restrict abortion laws. The vote was 50.4% against the proposal and 49.6% in favor. The vote was a setback to Prime Minister Bertie Ahern. However, Ahern's Fianna Fáil party overwhelmingly defeated the opposition Fine Gael party in the May 2002 elections.

In June 2004, local and European elections were held. In October 2004, McAleese won a second seven-year term as President; however, this was in light of the fact that opposing parties didn't nominate alternative candidates. She will not be eligible for another reelection in the October 2011 elections. Senate elections were scheduled to occur in July 2007, and the House of Representatives were scheduled to be held one month prior, in May 2007.

### 13 GOVERNMENT

Constitutionally, Ireland is a parliamentary democracy. Under the constitution of 1937, as amended, legislative power is vested in the Oireachtas (national parliament), which consists of the president and two houses—Dáil Éireann (house of representatives) and Seanad Éireann (senate)—and sits in Dublin, the capital city. The president is elected by popular vote for seven years. Members of the Dáil, who are also elected by popular suffrage, using the single transferable vote, represent constituencies determined by law and serve five-year terms. These constituencies, none of which may return fewer than three members, must be revised at least once every 12 years, and the ratio between the number of members to be elected for each constituency and its population as ascertained at the last census must be the same, as far as practicable, throughout the country. Since 1981, there have been 166 seats in the Dáil.

The Seanad consists of 60 members: 49 elected from five panels of candidates representing (a) industry and commerce, (b) agricultural and allied interests and fisheries, (c) labor, (d) cultural and educational interests, and (e) public administration and social services; 6 elected by the universities; and 11 nominated by the taoiseach (prime minister). Elections for the Seanad must be held within 90 days of the dissolution of the Dáil; the electorate consists of members of the outgoing Seanad, members of the incoming Dáil, members of county councils, and county borough authorities. The taoiseach is assisted by a *tánaiste* (deputy prime minister) and at least six but not more than 14 other ministers. The constitution provides for popular referendums on certain bills

of national importance passed by the Oireachtas. Suffrage is universal at age 18.

The chief of state is the president, who is elected by universal suffrage to serve a seven-year term and may be reelected only once. The presidency is traditionally a figurehead role with limited powers. The president appoints a cabinet based upon a nomination from the prime minister and approval from the house of representatives. As of 2005, Mary McAleese held the presidential office. The head of government is the prime minister, who is nominated by the house of representatives and appointed by the president. As of 2005 Bertie Ahern was prime minister and had occupied the position since 26 June 1997.

A number of amendments having to do with European integration, Northern Ireland, abortion, and divorce have been added to the 1937 constitution, which may only be altered by referendum. A recent referendum in 2004 ended in a 4-to-1 vote that native-born children could not be granted automatic citizenship.

### 14 POLITICAL PARTIES

The major political parties are the Fianna Fáil, the Fine Gael, Labour, and the Progressive Democrats. Because the members of the Dáil are elected by a proportional representation system, smaller parties have also at times won representation in the Oireachtas. In 1986, Sinn Féin, the political arm of the Provisional IRA, ended its 65-year boycott of the Dáil and registered as a political party winning one seat in the Dáil in the 6 June 1997 elections.

Fianna Fáil, the Republican Party, was founded by Éamon de Valera. It is the largest party since 1932 and has participated in government during 55 of the past 73 years, as of 2004. When the Anglo-Irish Treaty of 1921 was signed, de Valera violently opposed the dominion status accepted by a close vote of the Dáil. Until 1927, when the government threatened to annul their election if they did not fulfill their mandates, de Valera and his followers boycotted the Dáil and refused to take an oath of allegiance to the English crown. In 1932, however, de Valera became prime minister, a position he held continuously until 1947 and intermittently until 1959, when he became president for the first of two terms. From 1932 to 1973, when it lost its majority to a Fine Gael-Labour coalition, Fianna Fáil was in power for all but six years.

Fine Gael is the present name for the traditionally center-right party (of the Christian democratic type) and is second-largest party in Ireland. It grew out of the policies of Arthur Griffith, first president of the Irish Free State, and Michael Collins, first minister for finance and commander-in-chief of the army. W. T. Cosgrave, their successor, accepted the conditions of the 1921 treaty as the best then obtainable and worked out the details of the partition boundary and dominion status. This party held power from the first general election of 1922 until 1932. Since 1948, as the principal opponent of Fianna Fáil, it has provided leadership for several coalition governments. The policies of Fine Gael traditionally have been far more moderate than those of Fianna Fáil, although it was an interparty coalition government dominated by Fine Gael and Labour that voted Ireland out of the Commonwealth in 1948.

The Labour party incorporated the Democratic Left into its party in 1998, but still failed to increase its seats in the 2002 election (it is much smaller than Fine Gael). The party moved toward the center under the leadership of Pat Rabbitte.

In 1985, a group of parliamentarians broke away from Fianna Fáil because of the autocratic leadership of Charles Haughey. They formed the Progressive Democrats (PDs) party, which supported liberal economic orthodoxy in the 1980s. It joined in a coalition with Fianna Fáil in 1997 and has been influential in economic policy making.

In the 2002 elections, two smaller parties increased their seat holdings. Sinn Féin, the political wing of the IRA, added four seats to the one it had won in the Dáil in 1997. The Green Party increased its holdings from two to six seats. It opposed European integration and participation in European security structures.

In the general elections of 24 November 1982 (the third general election to be held within a year and a half), Fianna Fáil won 75 seats, Fine Gael 70, and the Labour Party 16. Two members of the Workers' Party and three independents were also elected. Garret FitzGerald was elected *taoiseach* (1983-1987), heading a Fine Gael-Labour coalition. It was the second time in a year that he had replaced Charles J. Haughey of the Fianna Fáil in that office. In December 1979, Haughey had replaced Jack Lynch as head of his party and become prime minister. The 1987 elections saw Fianna Fáil raise its representation, despite a drop in its proportion of the vote compared to the 1982 elections. Fine Gael and Labour lost seats, while the Progressive Democrats and Workers' Party (which increased its representation from two to four seats) increased their seat holding. In a bitter contest, Charles Haughey was elected *taoiseach* (1987-1991) and formed a minority Fianna Fáil government. Albert Reynolds was *taoiseach* (prime minister) from 1991 to 1994.

An early general election in 1992 saw the two largest parties—Fianna Fáil and Fine Gael—lose seats to the Labour Party. Albert Reynolds of Fianna Fáil was reelected *taoiseach* of the Fianna Fáil-Labour Coalition. From 1994 to 1997, John Bruton, of the Fianna Gael-Labour-Democratic Left was prime minister. However, a center-right alliance led by Bertie Ahern of Fianna Fáil defeated Prime Minister Bruton's three-party left-of-center coalition in the 6 June 1997 general election. Although Bruton's own party, Fine Gael, increased its share of the vote, its coalition partners, the Labour Party and the Democratic Left, both lost seats. Fianna Fáil won 77 seats outright, 6 shy of the 83 required for a majority. Other parties winning seats were Labor (17), Democratic Left (4), Progressive Democrats (4), Greens (2), Sinn Féin (1), Socialists (1), and Independents (6).

Fianna Fáil joined with the Progressive Democrats and Independents to form a new government with Bertie Ahern as *taoiseach* (prime minister). In 1999, the Labour Party and the Democratic Left merged and the new party is called the Labour Party. The electoral significance of this realignment of the left is not yet clear, but the merger provides the Irish electorate with a more viable social democratic alternative to the governing coalition.

Bertie Ahern remained prime minister after Fianna Fáil won 41.5% of the vote on 16 May 2002, capturing 81 seats in the Dáil. Fine Gael won 22.5% of the vote and 31 seats, its worst defeat in 70 years. The Labour Party took 10.8% of the vote and 21 seats. Other parties winning seats were the Progressive Democrats (8), the Greens (6), Sinn Féin (5), the Socialist Party (1), and Independents (13). The next presidential election was scheduled for October 2011 and the next legislative elections were scheduled for 2007.

## 15 LOCAL GOVERNMENT

The provinces of Ulster, Munster, Leinster, and Connacht no longer serve as political divisions, but each is divided into a number of counties that do. Prior to the passage of the new Local Government Act of 2001 and its implementation in 2002, Ireland was divided into 29 county councils, 5 boroughs, 5 boroughs governed by municipal corporations, 49 urban district councils, and 26 boards of town commissioners. Under the new system, the county councils remain the same, but the corporations no longer exist. The cities of Dublin, Cork, Limerick, Waterford, and Galway are city councils, while Drogheda, Wexford, Kilkenny, Sligo, and Clonmel are the five borough councils. The urban district councils and town commissions are now one and the same and known as town councils, of which there are 75.

Local authorities' principal functions include planning and development, housing, roads, and sanitary and environmental services. Health services, which were administered by local authorities up to 1971, are now administered by regional health boards, although the local authorities still continue to pay part of the cost. Expenditures are financed by a local tax on the occupation of property (rates), by grants and subsidies from the central government, and by charges made for certain services. Capital expenditure is financed mainly by borrowing from the Local Loans Fund, operated by the central government, and from banking and insurance institutions.

## 16 JUDICIAL SYSTEM

Responsibility for law enforcement is in the hands of a commissioner, responsible to the Department of Justice, who controls an unarmed police force known as the civil guard (Garda Síochána). Justice is administered by a Supreme Court, a High Court with full original jurisdiction, eight circuit courts, and 23 district courts with local and limited jurisdiction. Judges are appointed by the president, on the advice of the prime minister and cabinet.

Individual liberties are protected by the 1937 constitution and by Supreme Court decisions. The constitution provides for the creation of "special courts" to handle cases which cannot be adequately managed by the ordinary court system. The Offenses Against the State Act formally established a special court to hear cases involving political violence by terrorist groups. In such cases, in order to prevent intimidation, the panel of judges sits in place of a jury.

The judiciary is independent and provides a fair, efficient judicial process based upon the English common law system. Judicial precedent makes it a vital check on the power of the executive in Ireland. It can declare laws unconstitutional before and after they have been enacted, as well. Typically, however, the relationship between the judiciary and the other two branches of government has been untroubled by conflict.

The Supreme Court has affirmed that the inviolability of personal privacy and home must be respected in law and practice. This is fully respected by the government. Revelations about corruption by leading politicians forced the government to set up an independent tribunal. It investigated payments to politicians, especially to the former prime minister Charles Haughey, who was a recipient of large sums of money from businessmen for his personal use.

A former judge, Hugh O'Flaherty, was forced to resign from the Supreme Court over his handling of a dangerous driving case in 1999. His case provoked much public outrage after it was discovered that the government quickly boosted his annual pension prior to his resignation.

## 17 ARMED FORCES

The Irish army and its reserves, along with the country's air corps, and navy, constitute a small but well-trained nucleus that can be enlarged in a time of emergency. In 2005, the active defense force numbered 10,460, with reserves numbering 14,875. The army had 8,500 active personnel equipped with 14 Scorpion light tanks, 33 reconnaissance vehicles, 42 armored personnel carriers, and 537 artillery pieces. Navy personnel totaled 1,100 in 2005. Major naval units included eight patrol/coastal vessels. The air corps consisted of 860 personnel, outfitted with two maritime patrol and three transport aircraft. The navy also operated two assault and 11 utility helicopters. Ireland provided support to UN, NATO and European Union peacekeeping or military operations in 10 countries or regions. The defense budget in 2005 was \$959 million.

## 18 INTERNATIONAL COOPERATION

Ireland, which became a member of the United Nations on 14 December 1955, belongs to ECE and several nonregional specialized agencies, such as the FAO, UNESCO, UNHCR, IFC, the World Bank, and WHO. On 1 January 1973, Ireland became a member of the European Union. The country is also a member of the WTO, the European Bank for Reconstruction and Development, the Paris Club, the Euro-Atlantic Partnership Council, and the OSCE. Ireland is a founding member of OECD and the Council of Europe. The country also participates as an observer in the OAS and the Western European Union.

Irish troops have served in UN operations and missions in the Congo (est. 1999), Cyprus (est. 1964), Kosovo (est. 1999), Lebanon (est. 1978), Liberia (est. 2003), and Côte d'Ivoire (est. 2004), among others. Ireland is a guest of the Nonaligned Movement. It is also a part of the Australia Group, the Zangger Committee, the Nuclear Suppliers Group (London Group), the Organization for the Prohibition of Chemical Weapons, and the Nuclear Energy Agency. In environmental cooperation, Ireland is part of the Basel Convention; Conventions on Biological Diversity, Whaling, and Air Pollution; Ramsar; the London Convention; International Tropical Timber Agreements; the Kyoto Protocol; the Montréal Protocol; MARPOL; the Nuclear Test Ban Treaty; and the UN Conventions on the Law of the Sea, Climate Change and Desertification.

## 19 ECONOMY

Until the 1950s, Ireland had a predominantly agricultural economy, with agriculture making the largest contribution to the GNP. However, liberal trade policies and the drive for industrialization stimulated economic expansion. In 1958, agriculture accounted for 21% of the GNP, industry 23.5%, and other sectors 55.5%. By 2002, however, agriculture accounted for only 5% of the total, industry 46%, and services 49%.

Ireland's economy was initially slower in developing than the economies of other West European countries. The government carried on a comprehensive public investment program, partic-

ularly in housing, public welfare, communications, transportation, new industries, and electric power. Growth rose quickly in the 1960s and, since then, the government has tried to stimulate output, particularly of goods for the export market. Thus, manufactured exports grew from £78.4 million in 1967 to £11,510 million in 1992.

In the 1970s Ireland began to approach the income of the rest of Western Europe until it lost fiscal control in the latter part of the 1970s due to the oil crisis. During the early 1980s, Ireland suffered considerably from the worldwide recession, experiencing double-digit inflation and high unemployment. The economy continued to lag through 1986, but the GNP grew 30% between 1987 and 1992, and continued at a yearly pace of about 7.5% until 1996 when it was expected to slow to about 5.25%. However, the Irish economy grew faster than any other in the European Union during the so-called "Celtic Tiger" years of the second half of the 1990s, when growth rates were in double digits. The good economic performance was mainly due to strong consumer and investor confidence and strong export opportunities.

Ireland suffered from the global economic slowdown that began in 2001, however, and the average annual growth 2000–04 was 6.1%. Though Ireland started out the decade with a growth rate of 6.2%, it dropped to 4.4% in 2003 and had not regained even a percentage point as of 2005.

Although substantially lower than in 1986 when it topped 18%, unemployment remained high until 1998, when it dropped to 7.7%. The estimated unemployment rate in 2005 was 4.2%. The inflation rate stood at 2.4% in 1998 and was 2% in 2003 and 3% in 2004. Inflation was steadily falling, from a rate of 4.9% in 2000 to 2.2% in 2004.

Ireland has depended on substantial financial assistance from the European Union designed to raise the per capita gross national product to the EU average. Almost \$11 billion was allocated for the period 1993–99 from the EU's Structural and Cohesion Funds. During the 1990s, living standards rose from 56% to 87% of the EU average.

In the latter half of the 1990s, the economic situation greatly improved and Ireland recorded growth rates of 7% 1996–2000. Unemployment fell from 16% in 1993 to 5% in 2000. Due to the global economic downturn that began in 2001, however, even Ireland's booming economy slowed. Services, pharmaceuticals, and information technology are important sectors of the economy in the 21st century.

## 20 INCOME

The US Central Intelligence Agency (CIA) reports that in 2005 Ireland's gross domestic product (GDP) was estimated at \$136.9 billion. The CIA defines GDP as the value of all final goods and services produced within a nation in a given year and computed on the basis of purchasing power parity (PPP) rather than value as measured on the basis of the rate of exchange based on current dollars. The per capita GDP was estimated at \$34,100. The annual growth rate of GDP was estimated at 4.9%. The average inflation rate in 2005 was 2.7%. It was estimated that agriculture accounted for 5% of GDP, industry 46%, and services 49%.

According to the World Bank, in 2003 remittances from citizens working abroad totaled \$337 million or about \$84 per capita and accounted for approximately 0.2% of GDP.

The World Bank reports that in 2003 household consumption in Ireland totaled \$54.84 billion or about \$13,730 per capita based on a GDP of \$153.7 billion, measured in current dollars rather than PPP. Household consumption includes expenditures of individuals, households, and nongovernmental organizations on goods and services, excluding purchases of dwellings. It was estimated that for the period 1990 to 2003 household consumption grew at an average annual rate of 5.6%. In 2001 it was estimated that approximately 21% of household consumption was spent on food, 10% on fuel, 4% on health care, and 7% on education. It was estimated that in 1997 about 10% of the population had incomes below the poverty line.

## 2<sup>1</sup> LABOR

In 2005, Ireland's workforce was estimated at 2.03 million. Of those employed in 2003, an estimated 6.4% were in agriculture, 27.8% in industry, and 65.4% in services. The estimated unemployment rate in 2005 was 4.2%.

The right to join a union is protected by law, and as of 2002, about 31% of the labor force were union members. The Irish Congress of Trade Unions (ICTU) represents 64 unions and is independent of political parties and the government. The right to strike, except for police and military personnel, is exercised in both the public and private sectors. Employers are legally prohibited from discriminating against those who participate in union activity. Collective bargaining is used to determine wages and other conditions of employment.

Children under age 16 are legally prohibited from engaging in regular, full-time work. Under certain restrictions, some part-time or educational work may be given to 14- and 15-year-olds. Violations of child labor laws are not common. The standard workweek is 39 hours, and the legal limit on industrial work is nine hours per day and 48 hours per week. A national minimum wage of \$5.45 went into effect in 2001.

## 2<sup>2</sup> AGRICULTURE

About 1,184,000 hectares (2,926,000 acres), or 17.2% of the total area, were devoted to growing crops in 2003. About 6% of the agricultural acreage is used for growing cereals, 1.5% for growing root and green crops, and the balance for pasture and hay. Thus most of the farmland is used to support livestock, the leading source of Ireland's exports. Most farms are small, although there has been a trend toward consolidation. Agriculture accounts for about 10% of Irish employment. In 2003, there were 135,250 agricultural holdings, with a farm labor force of 104,540 full-time and 140,980 part-time workers. Principal crops (with their estimated 2004 production) include barley, 1,159,000 tons; sugar beets, 1,500,000 tons; wheat, 849,000 tons; potatoes, 500,000 tons; and oats, 134,000 tons.

Over half of agricultural production, by value, is exported. The benefits of the EU's Common Agricultural Policy, which provides secure markets and improved prices for most major agricultural products, account in part for the increase of Ireland's agricultural income from £314 million in 1972 (before Ireland's accession) to £1,919.9 million in 1995. The estimated value of crop output was €1.3 billion in 2005.

The government operates a comprehensive network of services within the framework of the Common Agricultural Policy, includ-

ing educational and advisory services to farmers. Under a farm modernization scheme, capital assistance is provided to farmers for land development, improvement of farm buildings, and other projects, with part of the cost borne by the EU. In 1974, pursuant to an European Community directive, incentives were made available to farmers wishing to retire and make their lands available, by lease or sale, for the land reform program.

## 2<sup>3</sup> ANIMAL HUSBANDRY

With some 90% of Ireland's agricultural land devoted to pasture and hay, the main activity of the farming community is the production of grazing animals and other livestock, which account for about 53% of agricultural exports. In 2005, total livestock output was valued at €2.17 billion, with cattle and milk each accounting for around 40%. During 2002–04, livestock output was down 4.5% from 1999–2001.

The estimated livestock population in 2005 was 7,000,000 head of cattle (including 1.1 million dairy cows), 1,757,000 pigs, and 12,700,000 poultry. In 2005, butter production was estimated at 142,000 tons, cheese 118,750 tons, and wool (greasy) 12,000 tons. Milk production in 2005 was 5,500,000 tons.

Since livestock is a major element in the country's economy, the government is particularly concerned with improving methods of operation and increasing output. A campaign for eradication of bovine tuberculosis was completed in 1965, and programs are under way for eradication of bovine brucellosis, warble fly, and sheep scab.

## 2<sup>4</sup> FISHING

Salmon, eels, trout, pike, perch, and other freshwater fish are found in the rivers and lakes; sea angling is good along the entire coast; and deep-sea fishing is done from the south and west coasts. The fishing industry has made considerable progress as a result of government measures to improve credit facilities for the purchase of fishing boats and the development of harbors; establishment of training programs for fishermen; increased emphasis on market development and research; establishment of hatcheries; and promotion of sport fishing as an attraction for tourists. The Irish fishing fleet consisted of 1,376 vessels with a capacity of 77,888 gross tons in 2002.

Leading varieties of saltwater fish are mackerel, herring, cod, whiting, plaice, ray, skate, and haddock. Lobsters, crawfish, and Dublin Bay prawns are also important. In 2003, the value of fish exports was \$453.5 million, up 32% from 2000. Aquaculture accounted for 19% of the volume. The total fish production in 2003 was 364,861 tons. Mackerel, herring, and blue whiting accounted for 24% of the volume that year.

## 2<sup>5</sup> FORESTRY

Once well forested, Ireland was stripped of timber in the 17th and 18th centuries by absentee landlords, who made no attempt to reforest the denuded land, and later by the steady conversion of natural forest into farms and grazing lands. In an effort to restore part of the woodland areas, a state forestry program was inaugurated in 1903; since then, over 350,000 hectares (865,000 acres) have been planted. More than half the planting is carried out in the western counties. In 2000, about 9.6% of Ireland was forested; about 95% of the trees planted are coniferous. The aim of the for-

estry program is to eliminate a large part of timber imports—a major drain on the balance of payments—and to produce a surplus of natural and processed timber for export. Roundwood removals totaled 2.5 million cu m (88 million cu ft) in 2004.

## 26 MINING

Ireland was a leading European Union (EU) producer of lead and zinc in 2003, and an important producer of lead, alumina, and peat. Mineral production in 2003 included zinc, 419,014 kg, compared to 252,700 kg in 2002; mined lead, 50,339,000 tons, compared to 32,486,000 tons in 2002; and an estimated 1.2 million metric tons of alumina. Other commercially exploited minerals were silver, hydraulic cement, clays for cement production, fire clay, granite, slate, marble, rock sand, silica rock, gypsum, lime, limestone, sand and gravel, shales, dolomite, diatomite, building stone, and aggregate building materials.

Zinc production centered on three zinc-lead mines, the Lisheen (a joint venture of Anglo American PLC and Ivernia West PLC), the Galmoy (Arcon International Resources PLC), and the Tara (Outokumpu Oyj), three of Europe's most modern mines. Outokumpu announced that because of low zinc prices, it was closing the Tara Mine (at Navan, County Meath), the largest lead-zinc field in Europe, and putting it on care and maintenance; the Tara came into production in the late 1970s. The Galmoy Mine was producing 650,000 tons per year of ore at target grades of 11.3% zinc and 1% lead, and the Lisheen Mine, which mined its first ore in 1999 and began commercial production in 2001, initially planned to produce 160,000 tons per year of zinc concentrate, to be increased to 330,000 tons per year of zinc concentrate and 40,000 tons per year of lead in concentrate at full production; both were on the Rathdowney Trend mineralized belt, southwest of Dublin. Cambridge Mineral Resources PLC continued diamond and sapphire exploration work, identifying numerous diamond indicator minerals and recovering significant quantities of ruby and sapphire. Gold was discovered in County Mayo in 1989, with an estimated 498,000 tons of ore at 1.5 grams per ton of gold. There was a marked increase in mining exploration beginning in the early 1960s, resulting in Ireland becoming a significant source of base metals.

## 27 ENERGY AND POWER

Ireland's energy and power sector is marked by a lack of any oil reserves, thus making it totally dependent upon imports. However, the country has modest natural gas reserves, and a small refining capacity.

In 2002, Ireland's imports of crude and refined petroleum products averaged 211,230 barrels per day. Domestic refinery production for that year averaged 65,230 barrels per day. Demand for refined oil products averaged 180,440 barrels per day.

Ireland's proven reserves of natural gas were estimated as of 1 January 2002 at 9.911 billion cu m. Output in 2001 was estimated at 815 million cu m, with demand and imports estimated at 4.199 billion cu m and 3.384 billion cu m, respectively, for that year.

Ireland's electric power generating sector is primarily based upon the use of conventional fossil fuels to provide electric power. Total generating capacity in 2002 stood at 4.435 million kW, of which conventional thermal capacity accounted for 4.049 million kW, followed by hydropower at 0.236 million kW and geothermal/

other at 0.150 million kW. Total power production in 2002 was 22.876 billion kWh, of which 94% was from fossil fuels, mostly thermal coal and oil stations, 3.9% from hydropower, and the rest from geothermal/other sources.

Ireland's Coal production consists of high-ash semibituminous from the Connaught Field, and is used for electricity production. In 2002, Ireland imported 3,148,000 short tons of coal, of which 3,090,000 short tons consisted of hard coal, and 58,000 short tons of lignite.

## 28 INDUSTRY

Since the establishment of the Irish Free State, successive governments encouraged industrialization by granting tariff protection and promoting diversification. Following the launching of the First Program for Economic Expansion by the government in 1958, considerable progress was made in developing this sector of the economy, in which foreign industrialists played a significant role. The Industrial Development Authority (IDA) administers a scheme of incentives to attract foreign investment. In addition, several government agencies offer facilities for consulting on research and development, marketing, exporting, and other management matters.

Official policy favors private enterprises. Where private capital and interest were lacking, the state created firms to operate essential services and to stimulate further industrial development, notably in the fields of sugar, peat, electricity, steel, fertilizers, industrial alcohol, and transportation. Although efforts have been made to encourage decentralization, about half of all industrial establishments and personnel are concentrated in Dublin and Cork.

Industry grew by an average annual rate of more than 5% from 1968 to 1981, and peaked at 12% in 1984 before subsiding to an annual rate of about 4%. The greatest growth was in high technology industries, like electronics and pharmaceuticals, where labor productivity also was growing substantially, thus limiting increases in the number of jobs. The most important products of manufacturing, by gross output, are food, metal, and engineering goods, chemicals and chemical products, beverages and tobacco, nonmetallic minerals, and paper and printing. The making of glass and crystal are also important industries. Industrial production continued to grow into the late 1990s, the "Celtic Tiger" years, posting a 15.8% growth in 1998.

Industry employed 28% of the labor force in 2000, and accounted for 36% of GDP in 2001. The value of industry output in 2000 was 12.3% higher than in 1999. Computer and pharmaceutical enterprises, largely owned by foreign companies, were responsible for high manufacturing output in 2000. Although there is no formal governmental privatization plan, the government planned to privatize the state-owned natural gas distributor (Bord Gas), the state-owned airline (Aer Lingus), and the state-owned electricity distributor (ESB) as of 2002.

Ireland was shifting attention away from industry and towards services. Activity was quickened by preferential corporation tax rates for manufacturers and manufactures were decreasing relative to services and agriculture. Yet, in 2004 the industrial production growth rate was 7%.

## 29 SCIENCE AND TECHNOLOGY

The major organizations doing scientific research in Ireland are the Agricultural Institute (established in 1958) and the Institute for Industrial Research and Standards (1946). The Dublin Institute of Advanced Studies, established by the state in 1940, includes a School of Theoretical Physics and a School of Cosmic Physics. The Royal Irish Academy, founded in 1785 and headquartered in Dublin, promotes study in science and the humanities and is the principal vehicle for Ireland's participation in international scientific unions. It has sections for mathematical and physical sciences and for biology and the environment.

The Royal Dublin Society (founded in 1731) promotes the advancement of agriculture, industry, science, and art. Ireland has 13 other specialized learned societies concerned with agriculture, medicine, science, and technology. Major scientific facilities include the Dinsink Observatory (founded in 1785) and the National Botanic Gardens (founded in 1795), both in Dublin.

Most scientific research is funded by the government; the government advisory and coordinating body on scientific matters is the National Board for Science and Technology. Medical research is supported by the Medical Research Council and Medico-Social Research Board. Veterinary and cereals research is promoted by the Department of Agriculture. The Department of Fisheries and Forestry and the Department of Industry and Energy have developed their own research programs. The UNESCO prize in science was awarded in 1981 for the development of clofazimines, a leprosy drug produced by the Medical Research Council of Ireland with aid from the Development Cooperation Division of the Department of Foreign Affairs.

Research and development (R&D) expenditures in 2001 (the latest year for which data was available) totaled \$1.427 billion, or 1.14% of GDP. Of that amount, 67.2% came from the business sector, with 25.2% coming from the government. Foreign sources accounted for 6%, while higher education provided 1.7%. As of 2002, there were some 2,471 researchers per one million people that were actively engaged in R&D. In that same year, high-tech exports were valued at \$31.642 billion and accounted for 41% of manufactured exports. Ireland has 21 universities and colleges that offer courses in basic and applied science. In 1987–97, science and engineering students accounted for 31% of university enrollment. In 2002, a total of 29.3% of all bachelor's degrees awarded were in the sciences (natural, mathematics and computers, and engineering).

## 30 DOMESTIC TRADE

Dublin is the financial and commercial center, the distribution point for most imported goods, and the port through which most of the country's agricultural products are shipped to Britain and the Continent. Cork, the second-largest manufacturing city and close to the transatlantic port of Cobh, is also important, as is Limerick, with its proximity to Shannon International Airport. Other important local marketing centers are Galway, Drogheda, Dundalk, Sligo, and Waterford.

The trend in retail establishments was changing from small shops owned and operated by individuals, to larger department stores, outlets, and chain stores operated by management companies. As of 2002, there were about 52,000 retail and 2,500 wholesale outlets across the country. There were about 9,000 retail food outlets. A 21% value-added tax applies to most goods and services.

## Principal Trading Partners – Ireland (2003)

(In millions of US dollars)

Country	Exports	Imports	Balance

(...) data not available or not significant.

SOURCE: 2003 *International Trade Statistics Yearbook*, New York: United Nations, 2004.

Office business hours are usually 9 or 9:30 AM to 5:30 PM. Shops are generally open from 9 AM to 6 PM, although most supermarkets are open until 9 PM on Thursday and Friday. In general, banking hours are 10 AM to 12:30 PM and 1:30 to 4 PM, Monday through Friday, and 3 to 5 PM on Thursday. Most offices are closed on Saturday, and shops close on either Wednesday or Saturday afternoon. Businesses may close for extended periods during the months of July and August.

## 31 FOREIGN TRADE

Ireland began opening to free trade in the 1960s. It is now one of the most open and largest exporting markets (on a per capital level). Growth was heavily encouraged by the export sectors in the 1990s and the average annual export volume growth was near an annual rate of 20% between 1996 and 2000.

Computers and office products have become some of Ireland's most profitable export products (28%). The country also manufactures musical instruments (5.2%), making 12.7% of the world's exports. Other export items include chemicals like nitrogen compounds (10.9%), electronic circuitry (5.2%), and medicines (4.9%).

As of 2003, the United States absorbed 20.5% of Ireland's exports, the United Kingdom 18.1%, Belgium 12.6%, Germany 8.3%, France 6.1%, Netherlands 5.1%, and Italy 4.6%. Import partners include the United Kingdom (34.8% of imports), the United States (15.6%), Germany (8.1%), and the Netherlands (4.1%). Imported commodities include data processing equipment, machinery and equipment, chemicals, petroleum and petroleum products, textiles, and clothing.

## 32 BALANCE OF PAYMENTS

The volume of Irish exports increased dramatically 1995–2000, registering an average annual growth of 16.9%; the rate of import growth over the same period was only slightly lower at 16.6%. The year 2000 was the first since 1991 that the current account was not in surplus. The reduction of the balance of payments surplus in the early 2000s suggested that the level of Irish imports was increasing due to increased demand for luxury items and services, rather than from a decline in exports. The US Central Intelligence Agency (CIA) reported that in 2002 the purchasing power parity of Ireland's exports was \$85.3 billion while imports totaled

\$48.3 billion resulting in a trade surplus of \$37 billion. Irish export growth during those years, in fact, consistently surpassed EU growth. However, the slowdown in the global economy and the slower than predicted growth in the euro area was expected to negatively impact Irish exports.

**33 BANKING AND SECURITIES**

In 1979, Ireland joined the European Monetary System, thus severing the 150-year-old tie with the British pound. The Central Bank of Ireland, established in 1942, is both the monetary authority and the bank of issue. Its role quickly expanded considerably, particularly in monetary policy. Commercial deposits with the Central Bank have strongly increased since 1964, when legislation first permitted it to pay interest on deposits held for purposes other than settlement of clearing balances. Since July 1969, the Central Bank has accepted short-term deposits from various institutions, including commercial and merchant banks. With the advent of the European Monetary Union (EMU) in 1999, authority over monetary policy shifted to the European Central Bank.

The commercial banking sector is dominated by two main Irish-owned groups, the Bank of Ireland Group and the Allied Irish Banks Group. Successive governments have indicated that they would like to see a third banking force (possibly involving a strategic alliance with a foreign bank). Other major banks include the National Irish Bank, a member of the National Australia Bank, and Ulster Bank, a member of the National Westminster Bank Group. The International Monetary Fund reports that in 2001, currency and demand deposits—an aggregate commonly known as M1—were equal to \$21.1 billion. In that same year, M2—an aggregate equal to M1 plus savings deposits, small time deposits, and money market mutual funds—was \$94.1 billion. The money market rate, the rate at which financial institutions lend to one another in the short term, was 3.31%.

A number of other commercial, merchant, and industrial banks also operate. Additionally, Ireland's post office operates the Post

Office Savings Banks and Trustee Savings Banks. The Irish stock exchange has its trading floor in Dublin. All stockbrokers in Ireland are members of this exchange. The Irish Stock Exchange is small by international standards, with a total of 76 domestic companies listed at the end of 2001. Total market capitalization at the end of 2001 was (21.8 billion for the government securities market, making it one of the EU's smallest stock markets, however fast-growing.

The Stock Exchange Act came into effect on 4 December 1995, and separated the Dublin Stock Exchange from the London Stock Exchange. Since that date, the Dublin Stock Exchange has been regulated by the Central Bank of Ireland. As of 2004, there were a total of 53 companies listed on the Irish Stock Exchange, which had a market capitalization of \$114.085 billion. In 2004, the ISEQ index rose 26% from the previous year to 6,197.8.

**34 INSURANCE**

Insurance firms must be licensed by the Insurance Division of the Ministry of Industry, Trade, Commerce, and Tourism. The regulatory body is the Irish Brokers' Association. The Insurance Acts of 1936 and 1989 outline the monitoring of insurers, brokers, and agents.

In Ireland, workers' compensation, third-party automobile, bodily injury, and property damage liability are compulsory. In 1997, shareholders of Irish Life, Ireland's largest life assurance company, unanimously approved the company's £100 million (\$163 million) takeover of an Illinois life assurance company, Guarantee Reserve. In 2003, the value of direct premiums written totaled \$17.328 billion, of which life premiums accounted for \$9.037 billion. Hibernian General in 2003 was Ireland's top non-life insurer, with net written nonlife premiums (less reinsurance) of \$992.2 million, while Irish Life was the nation's leading life insurer with gross written life premiums of \$2.362 million.

### 3<sup>5</sup> PUBLIC FINANCE

Ireland's fiscal year follows the calendar year. Expenditures of local authorities are principally for health, roads, housing, and social welfare.

The US Central Intelligence Agency (CIA) estimated that in 2005 Ireland's central government took in revenues of approximately \$70.4 billion and had expenditures of \$69.4 billion. Revenues minus expenditures totaled approximately \$1 billion. Public debt in 2005 amounted to 27.5% of GDP. Total external debt was \$1.049 trillion.

Government outlays by function were as follows: general public services, 21.9%; defense, 2.9%; economic affairs, 16.7%; housing and community amenities, 2.1%; health, 16.3%; recreation, culture, and religion, 0.7%; education, 13.6%; and social protection, 25.9%.

### 3<sup>6</sup> TAXATION

To stimulate economic expansion and encourage investment in Irish industry, particularly in the area of industrial exports, tax adjustments have been made to give relief to export profits, expenditures for mineral development, shipping, plant and machinery, new industrial buildings, and investments in Irish securities. As of 1 January 2003, with Ireland's accession to the EU, the government had mostly completed the transition of the tax regime from an incentive regime to a low, single-tax regime with 12.5% as the country's rate for most corporate profits. Passive income, including that from interest, royalties, and dividends, is taxed at 20%. Capital gains are also taxed at 20%. As of 2005, Ireland was party to double-taxation agreements with 42 countries the terms of which provide for the reduction or elimination of many capital income tax rates and related withholding taxes. The incentive 10% corporation tax rate, applied to industrial manufacturing, to projects licensed to operate in the Shannon Airport area, and to various service operations, was still in effect in 2003, but, in an agreement with the European Commission, was scheduled to be phased out by 2010.

Ireland has a progressive personal income tax with a top rate of 42% on incomes above €29,400 for single taxpayers. Married taxpayers are subject to a higher income threshold level. For those over 65 years old, tax exemptions amounted to €15,000 per person. Deductions were available for mortgage payments and pension contributions. Since 1969, the government has encouraged artists and writers to live in Ireland by exempting from income tax their earnings from their works of art. Royalties and other income from patent rights are also tax-exempt. The gift and inheritance taxes are based upon the relationship of the beneficiary to the donor. Between a parent and child, the tax-free threshold in 2003 was €441,200; for any other lineal descendent, the tax-free threshold was one-tenth this amount, or €44,120; and for any other person, one-twentieth, or €22,060. Land taxes are assessed at variable rates by local governments, and there is a buildings transfer tax based on the price of the transfer.

The major indirect tax is Ireland's value-added tax (VAT) instituted 1 January 1972 with a standard rate of 16.37% plus a number of reduced, intermediate, and increased rates. As of 1 March 2002, the standard rate was increased to 21% from 20%, and the reduced rate of 12.5% increased to 13.5% as of 1 January 2003. The re-

duced rate applies to domestic fuel and power, newspapers, hotels and new housing. Ireland also has an extensive list of goods and services to which a 0% VAT rate is applied including, books and pamphlets, gold for the Central Bank, basic foodstuffs and beverages, agricultural supplies, medicines and medical equipment, and, more unusually, children's clothing and footwear, and wax candles. A 4.8% rate applies to livestock by unregistered farmers. Excise duties are charged on tobacco products, alcohol, fuel, and motor vehicles. Per unit and/or annual stamp taxes are assessed on checks, credit cards, ATM cards, and Laser cards.

### 3<sup>7</sup> CUSTOMS AND DUTIES

From the time of the establishment of the Irish Free State, government policy was to encourage development of domestic industry by maintaining protective tariffs and quotas on commodities that would compete with Irish-made products. Following Ireland's admission to the European Community (now the European Union), the country's tariff schedule was greatly revised. The schedule vis-à-vis third-world countries and the United States was gradually aligned with EC tariffs and customs duties between Ireland and the EC were phased down to zero by July 1977. Duty rates on manufactured goods from non-EU countries range from 5–8%, while most raw materials enter duty-free. Certain goods still require import licenses and tariffs are based on the Harmonized System. The Shannon Free Trade Zone, the oldest official free trade area in the world, is located at the Shannon International Airport.

### 3<sup>8</sup> FOREIGN INVESTMENT

The Irish government has successfully attracted FDI (foreign direct investment) over the years with various policies and preferential tax rates. To stimulate economic expansion, the Industrial Development Authority encourages and facilitates investment by foreign interests, particularly in the development of industries with export potential. Special concessions include nonrepayable grants to help establish industries in underdeveloped areas and tax relief on export profits. Freedom to take out profits is unimpaired. Engineering goods, computers, electronic products, electrical equipment, pharmaceuticals and chemicals, textiles, foodstuffs, leisure products, and metal and plastic products are among the items produced. Much of the new investment occurred after Ireland became a member of the European Union.

Annual foreign direct investment (FDI) inflows into Ireland increased steadily through the 1990s. In the period 1988 to 1990, Ireland's share of world FDI inflows was only 70% of its share of world GDP, but for the period 1998 to 2000, Ireland's share of FDI inflows was over five times its share of world GDP. In 1998, annual FDI inflow reached \$11 billion, up from \$2.7 billion in 1997, and then jumped to almost \$15 billion in 1999. FDI inflows to Ireland peaked in 2000, at over \$24 billion, mainly from high-tech computer and pharmaceutical companies. FDI inflow dropped sharply to \$9.8 billion in 2001 with the global economic slowdown.

Leading sources of foreign investors, in terms of percent of foreign companies invested in Ireland, have been the United States (43%), the United Kingdom (13%), Germany (13%), other European countries (22%), Japan (4%), and others (5%). As of 2000, the primary destinations of foreign investment were, in order, manufacturing, finance, and other services.

### 3<sup>9</sup> ECONOMIC DEVELOPMENT

Government policies are premised on private enterprise as a predominant factor in the economy. Specific economic programs adopted in recent decades have attempted to increase efficiency in agriculture and industry, stimulate new export industries, create employment opportunities for labor leaving the agricultural sector, and reduce unemployment and net emigration. In pursuit of these objectives, the government provides aids to industry through the Industrial Development Authority (IDA), the Industrial Credit Co., and other agencies. Tax concessions, information, and advisory services are also provided.

The IDA seeks to attract foreign investment by offering a 10% maximum corporation tax rate for manufacturing and certain service industries, generous tax-free grants for staff training, ready-built factories on modern industrial estates, accelerated depreciation, export-risk guarantee programs, and other financial inducements. IDA also administers industrial estates at Waterford and Galway. The Shannon Free Airport Development Co., another government-sponsored entity, administers an industrial estate on the fringes of Shannon Airport, a location that benefits from proximity to the airport's duty-free facilities. A third entity, Udaras Na Gaeltachia, promotes investment and development in western areas where Irish is the predominant language. As of 1986 there were some 900 foreign-owned plants in Ireland.

Price control legislation was introduced under the Prices Act of 1958, amended in 1965 and 1972. In general, manufacturers, service industries, and professions are required to obtain permission from the Ministry of Commerce and Trade for any increase. Price changes are monitored by a National Prices Commission, established in 1971. The economic plan for 1983–1987, called *The Way Forward*, aimed at improving the cost-competitiveness of the economy by cutting government expenditures and restraining the growth of public service pay, among other measures. The 1987–1990 Program for National Recovery is generally credited with creating the conditions to bring government spending and the national debt under control. The 1991–1993 Program for Economic and Social Progress was to further reduce the national debt and budget deficit and to establish a schedule of wage increases.

A 1994–1999 national development plan called for investment of £20 billion and aimed to achieve an average annual GDP growth rate of 3.5%. The government hoped to create 200,000 jobs through this plan, with funding by the state, the EU, and the private sector. Half of the money was earmarked for industry, transport, training, and energy.

At the end of the 1990s, Ireland boasted the fastest growing economy in the EU with a 9.5% GDP real growth rate in 1998. Total expenditures on imports and exports in 2000 were equivalent to 175% of GDP, far ahead of the EU average, which made Ireland's economy one of the most open in the world. Ireland became known as the "Celtic Tiger," to compare with the formerly fast-growing economies of East Asia prior to the Asian financial crisis of 1997. In 2000, the economy grew by 11.5%, the highest growth rate ever recorded in an OECD member country. Wage inequality grew, however, and spending on infrastructure failed to keep pace with social or industrial demands. Corporate taxes were as low as 12.5% in some circumstances in the early 2000s. Economic growth decelerated rapidly in 2001, to 6%. Inflation fell as did housing prices, but they rose again in 2002. Tax increas-

es were expected in 2003 and 2004, and the government was facing pressures to cut spending. GDP growth was 4.4% in 2003 and 4.5% in 2004.

### 4<sup>0</sup> SOCIAL DEVELOPMENT

A social insurance program exists for all employees and self-employed persons, and for all residents with limited means. The system is financed through employee contributions, employer contributions, and government subsidies. Benefits are available for old age, sickness, disability, survivorship, maternity, work injury, unemployment, and adoptive services. There are also funds available for those leaving the workforce to care for one in need of full time assistance. The system also provides bereavement and a widowed parent's grant. The universal medical care system provides medical services to all residents. The workmen's compensation act was first initiated in 1897. Parents with one or more children are entitled to a family allowance.

The predominance of the Roman Catholic Church has had a significant impact on social legislation. Divorce was made legal only in 1995. Contraceptives, the sale of which had been entirely prohibited, became available to married couples by prescription in the early 1980s. In 1985, the need for a prescription was abolished, and the minimum age for marriage was raised from 14 to 18 for girls and from 16 to 18 for boys. Abortion remains illegal.

Domestic abuse and spousal violence remain serious problems, although improvements were seen in 2004. The government funds victim support centers, and there are active women's rights groups to address these issues. The law prohibits gender discrimination in the workplace, but inequalities persist regarding promotion and pay. The government addresses the issue of child abuse, and funds systems to promote child welfare.

The government attempts to curb discrimination against foreign workers and the ethnic community known as "Travellers." There have been reports of racially motivated incidents including violence and intimidation. In general, the government respects the human rights of its citizens.

### 4<sup>1</sup> HEALTH

Health services are provided by regional boards under the administration and control of the Department of Health. A comprehensive health service, with free hospitalization, treatment, and medication, is provided for low-income groups. The middle-income population is entitled to free maternity, hospital, and specialist services, and a free diagnostic and preventive service is available to all persons suffering from specified infectious diseases. Insurance against hospital and certain other medical expenses is available under a voluntary plan introduced in 1957.

Since World War II, many new regional and county hospitals and tuberculosis sanatoriums have been built. As of 2004, there were an estimated 237 physicians, 51 dentists, and 83 pharmacists per 100,000 population. In addition, there were more than 1662 nurses per 100,000 people, the third most per capita in the world.

While deaths from cancer, particularly lung cancer, and heart disease are rising, those from many other causes have been decreasing rapidly. Infant mortality has been reduced from 50.3 per 1,000 live births in 1948 to 5.39 in 2005. Tuberculosis, long a major cause of adult deaths, declined from 3,700 cases in 1947 to only 15 per 100,000 in 2000. Average life expectancy at birth in 2005

was 77.56 years. The general mortality rate was an estimated 8 per 1,000 people as of 2002. The major causes of death were heart and circulatory disease, cancer, and ischemic heart disease. Heart disease rates were higher than average for highly industrialized countries.

The HIV/AIDS prevalence was 0.10 per 100 adults in 2003. As of 2004, there were approximately 2,800 people living with HIV/AIDS in the country. There were an estimated 100 deaths from AIDS in 2003.

## 42 HOUSING

The aim of public housing policy is to ensure, so far as possible, that every family can obtain decent housing at a price or rent it can afford. Government subsidies are given to encourage home ownership, and local authorities provide housing for those unable to house themselves adequately. Housing legislation has encouraged private construction through grants and loans. Projected and existing housing needs are assessed regularly by local authorities, and their reports are the basis for local building programs, which are integrated with national programs and reconciled with available public resources.

According to the 2002 census, there were about 1,279,617 dwellings available in permanent housing units. Of these, about 74% were owner occupied. The number of households was listed as 1,287,958, with 43.7% of all households living in single-family detached homes. The average number of persons per household was 2.95.

## 43 EDUCATION

Ten years of education are compulsory. Primary school covers eight years of education, with most students entering at age four. This is followed by a three-year junior secondary school and a two-year senior secondary program. Some schools offer a transition year program between the junior and senior levels. This transition year is meant to be a time of independent study for the student, when he or she focuses on special interests, while still under the guidance of instructors, in order make a decision concerning the direction of their future studies. At the senior level, students may choose to attend a vocational school instead of a general studies school. While private, religious-based secondary schools were once the norm, there are now many multi-denominational, public schools available at all levels. Coeducational programs have also grown substantially in recent years. The academic year runs from September to June. The primary languages of instruction are Irish and English.

Primary school enrollment in 2003 was estimated at about 96% of age-eligible students. The same year, secondary school enrollment was about 83% of age-eligible students; 80% for boys and 87% for girls. It is estimated that nearly all students complete their primary education. The student-to-teacher ratio for primary school was at about 19:1 in 2003.

Ireland has two main universities: the University of Dublin (Trinity College) and the National University of Ireland, which consists of three constituent colleges in Dublin, Galway, and Cork. St. Patrick's College, Maynooth, is a recognized college of the National University. Universities are self-governing, but each receives an annual state grant, as well as supplementary grants for capital outlays. There are also various colleges of education, home eco-

nomics, technology, and the arts. In 2003, about 52% of the tertiary age population were enrolled in some type of higher education program. The adult literacy rate has been estimated at about 98%.

As of 2003, public expenditure on education was estimated at 4.3% of GDP, or 13.5% of total government expenditures.

## 44 LIBRARIES AND MUSEUMS

Trinity College Library, which dates from 1591 and counts among its many treasures the Book of Kells and the Book of Durrow, two of the most beautiful illuminated manuscripts from the pre-Viking period, is the oldest and largest library in Ireland, with a stock of 4.1 million volumes. The Chester Beatty Library, noted for one of the world's finest collections of Oriental manuscripts and miniatures, is also in Dublin. The National Library of Ireland, which also serves as a lending library, was founded in 1877 and houses over one million books, with special collections including works on or by Jonathan Swift and W. B. Yeats. The National Photographic Archive of over 600,000 photographs is also housed in the National Library. The University College Dublin library has more than one million volumes. The Dublin City Public Library system has about 31 branches and service points and holdings of over 1.5 million items.

Dublin, the center of cultural life in Ireland, has several museums and a number of libraries. The National Museum contains collections on Irish antiquities, folk life, fine arts, natural history, zoology, and geology. The National Gallery houses valuable paintings representing the various European schools from the 13th century to the present. The National Portrait Gallery provides a visual survey of Irish historical personalities over the past three centuries. The Municipal Gallery of Modern Art has a fine collection of works by recent and contemporary artists. There is a Heraldic Museum in Dublin Castle; the National Botanic Gardens are at Glasnevin; and the Zoological Gardens are in Phoenix Park. There is a James Joyce Museum in Dublin housing personal memorabilia of the great writer, including signed manuscripts. Yeats Tower in Gort displays memorabilia of W. B. Yeats. The Dublin Writers' Museum opened in 1991.

Public libraries and small museums, devoted mostly to local historical exhibits, are found in Cork, Limerick, Waterford, Galway, and other cities.

## 45 MEDIA

In 2003, there were an estimated 491 mainline telephones for every 1,000 people. The same year, there were approximately 880 mobile phones in use for every 1,000 people.

An autonomous public corporation, Radio Telefis Éireann (RTE), is the Irish national broadcasting organization. Ireland's second radio service, Raidio na Gaeltachta, an Irish language broadcast, was launched by RTE in 1972; it broadcasts VHF from County Galway. In 2004, there were an additional 49 independent radio stations. RTE operates three television networks and there is one independent television station. In 2003, there were an estimated 695 radios and 694 television sets for every 1,000 people. About 134 of every 1,000 people were cable subscribers. Also in 2003, there were 420.8 personal computers for every 1,000 people and 317 of every 1,000 people had access to the Internet. There were 1,245 secure Internet servers in the country in 2004.

In 2001, there were eight independent national newspapers, as well as many local newspapers. There were three major independent current affairs magazines along with hundreds of special interest magazines. Ireland's major newspapers, with political orientation and estimated 2002 circulation, are: *Sunday Independent*, Fine Gael, 310,500; *Sunday World*, independent, 229,000; *Irish Independent*, Fine Gael, 168,200; *Irish Times*, independent, 119,200; *Irish Examiner* (in Cork), 63,600; and *Cork Evening Echo*, Fine Gael, 28,800. Waterford, Limerick, Galway, and many other smaller cities and towns have their own newspapers, most of them weeklies. The Censorship of Publication Board has the right to censor or ban publication of books and periodicals. In 2003, the Board censored nine magazines for containing pornographic materials.

The constitution provides for free speech and a free press; however, government bodies may decree without public hearing or justification any material unfit for distribution on moral grounds. The Office of Film Censor, which rates films and videos before they can be distributed, can ban or require edits of movies which contain content considered to be "indecent, obscene, or blasphemous," or which expresses principles "contrary to public morality." In 2001, 26 videos were banned, primarily for violent or pornographic content. In 2004, one video was banned.

#### 4<sup>6</sup> ORGANIZATIONS

The Chambers of Commerce of Ireland in Dublin is the umbrella organization for regional chambers. The Irish Congress of Trade Unions is also based in Dublin. There are trade unions and professional associations representing a wide variety of occupations. The Consumers Association of Ireland is active in advocating consumer information services.

The oldest and best known of the learned societies are the Royal Dublin Society, founded in 1731, and the Royal Irish Academy, founded in 1785. The Royal Irish Academy of Music was added in 1856, the Irish Society of Arts and Commerce in 1911, the Irish Academy of Letters in 1932, and the Arts Council of Ireland in 1951. Many organizations exist for research and study in medicine and science, including the Royal Academy of Medicine in Ireland.

National youth organizations include the Church of Ireland Youth Council, Comhchairdeas (the Irish Workcamp Movement), Confederation of Peace Corps, Federation of Irish Scout Associations, Irish Girl Guides, Girls' Brigade Ireland, Junior Chamber, Student Christian Movement of Ireland, Voluntary Service International, Workers Party Youth, Young Fine Gael, and chapters of YMCA/YWCA. The Irish Sports Council serves as an umbrella organization for numerous athletic organizations both on amateur and professional levels.

Civil rights organizations include the Irish Council for Civil Liberties and the National Women's Council of Ireland. Several organizations are available to represent those with disabilities. International organizations with chapters in Ireland include the Red Cross, Habitat for Humanity, and Amnesty International.

#### 4<sup>7</sup> TOURISM, TRAVEL, AND RECREATION

Among Ireland's numerous ancient and prehistoric sights are a restored Bronze Age lake dwelling (*crannog*) near Quin in County Clare, burial mounds at Newgrange and Knowth along the Boyne,

and the palace at the Hill of Tara, the seat of government up to the Middle Ages. Numerous castles may be visited, including Blarney Castle in County Cork, where visitors kiss the famous Blarney Stone. Some, such as Bunratty Castle and Knappogue Castle, County Clare, and Dungaire Castle, County Galway, offer medieval-style banquets, and some rent rooms to tourists.

Among Dublin's tourist attractions are the Trinity College Library, with its 8th-century illuminated Book of Kells; Phoenix Park, the largest enclosed park in Western Europe and home of the Dublin Zoo; and literary landmarks associated with such writers as William Butler Yeats, James Joyce, Jonathan Swift, and Oscar Wilde. Dublin has long been noted for its theaters, foremost among them the Abbey Theatre, Ireland's national theater, which was founded in 1904 by Yeats and Lady Gregory. Dublin was the European Community's Cultural Capital of Europe for 1991, during which time the National Gallery, Civic Museum, and Municipal Gallery were all refurbished and several new museums opened, including the Irish Museum of Modern Art.

Traditional musical events are held frequently, one of the best known being the All-Ireland Fleadh at Ennis in County Clare. Numerous parades, concerts, and other festivities occur on and around the St. Patrick's Day holiday of 17 March. Ireland has numerous golf courses, some of worldwide reputation. Fishing, sailing, horseback riding, hunting, horse racing, and greyhound racing are other popular sports. The traditional sports of Gaelic football, hurling, and camogie (the women's version of hurling) were revived in the 19th century and have become increasingly popular. The All-Ireland Hurling Final and the All-Ireland Football Final are held in September.

A passport is required of all visitors. Visas are not required for stays of up to 90 days, although an onward/return ticket may be needed.

Income from tourism and travel contributes significantly to the economy. Approximately 6,774,000 tourists visited Ireland in 2003, about 61% of whom came from the United Kingdom. That same year tourism receipts totaled \$5.2 billion. There were 62,807 hotel rooms in 2002, with a 59% occupancy rate.

According to the US Department of State in 2005, the daily cost of staying in Dublin was \$403; in Cork, \$292.

#### 4<sup>8</sup> FAMOUS IRISH

A list of famous Irish must begin with St. Patrick (c.385–461), who, though not born in Ireland, represents Ireland to the rest of the world. Among the "saints and scholars" of the 6th to the 8th centuries were St. Columba (521–97), missionary to Scotland; St. Columban (540?–616), who founded monasteries in France and Italy; and Johannes Scotus Erigena (810?–80), a major Neoplatonic philosopher.

For the thousand years after the Viking invasions, the famous names belong to warriors and politicians: Brian Boru (962?–1014), who temporarily united the kings of Ireland and defeated the Vikings; Hugh O'Neill (1547?–1616), Owen Roe O'Neill (1590?–1649), and Patrick Sarsfield (d. 1693), national heroes of the 17th century; and Henry Grattan (1746–1820), Wolf Tone (1763–98), Edward Fitzgerald (1763–98), Robert Emmet (1778–1803), Daniel O'Connell (1775–1847), Michael Davitt (1846–1906), Charles Stewart Parnell (1846–91), Arthur Griffith (1872–1922), Patrick Henry Pearse (1879–1916), and Éamon de Valera (b.US, 1882–

1975), who, with many others, fought Ireland's political battles. The politician and statesman Seán MacBride (1904–88) won the Nobel Peace Prize in 1974.

Irishmen who have made outstanding contributions to science and scholarship include Robert Boyle (1627–91), the physicist who defined Boyle's law relating to pressure and volume of gas; Sir William Rowan Hamilton (1805–65), astronomer and mathematician, who developed the theory of quaternions; George Berkeley (1685–1753), philosopher and clergyman; Edward Hincks (1792–1866), discoverer of the Sumerian language; and John Bagnell Bury (1861–1927), classical scholar. The nuclear physicist Ernest T. S. Walton (1903–95) won the Nobel Prize for physics in 1951.

Painters of note include Sir William Orpen (1878–1931), John Butler Yeats (1839–1922), his son Jack Butler Yeats (1871–1957), and Mainie Jellet (1897–1944). Irish musicians include the pianist and composer John Field (1782–1837), the opera composer Michael William Balfe (1808–70), the tenor John McCormack (1884–1945), and the flutist James Galway (b.Belfast, 1939).

After the Restoration, many brilliant satirists in English literature were born in Ireland, among them Jonathan Swift (1667–1745), dean of St. Patrick's Cathedral in Dublin and creator of *Gulliver's Travels*; Oliver Goldsmith (1730?–74); Richard Brinsley Sheridan (1751–1816); Oscar Fingal O'Flahertie Wills Wilde (1854–1900); and George Bernard Shaw (1856–1950).

Thomas Moore (1779–1852) and James Clarence Mangan (1803–49) wrote patriotic airs, hymns, and love lyrics, while Maria Edgeworth (1767–1849) wrote novels on Irish themes. Half a century later the great literary revival led by Nobel Prize-winning poet-dramatist William Butler Yeats (1865–1939), another son of John Butler Yeats, produced a succession of famous playwrights, poets, novelists, and short-story writers: the dramatists Lady Augusta (Persse) Gregory (1859?–1932), John Millington Synge (1871–1909), Sean O'Casey (1884–1964), and Lennox Robinson (1886–1958); the poets AE (George William Russell, 1867–1935), Oliver St. John Gogarty (1878–1957), Pádraic Colum (1881–1972), James Stephens (1882–1950); Austin Clarke (1890–1974), Thomas Kinsella (b.1928), and Seamus Heaney (b.1939), who won the 1995 Nobel Prize in literature; the novelists and short-story writers George Moore (1852–1932), Edward John Moreton Drax Plunkett, 18th baron of Dunsany (1878–1957), Liam O'Flaherty (1896–1984), Seán O'Faoláin (1900–91), Frank O'Connor (Michael O'Donovan, 1903–66), and Flann O'Brien (Brian O'Nolan, 1911–66). Two outstanding authors of novels and plays whose experimental styles have had worldwide influence are James Augustine Joyce (1882–1941), the author of *Ulysses*, and Samuel Beckett (1906–89), recipient of the 1969 Nobel Prize for literature.

The Abbey Theatre, which was the backbone of the literary revival, also produced many outstanding dramatic performers, such as Dudley Digges (1879–1947), Sara Allgood (1883–1950), Arthur Sinclair (1883–1951), Maire O'Neill (Mrs. Arthur Sinclair,

1887–1952), Barry Fitzgerald (William Shields, 1888–1961), and Siobhan McKenna (1923–1986). For many years Douglas Hyde (1860–1949), first president of Ireland (1938–45), spurred on the Irish-speaking theater as playwright, producer, and actor.

In addition to the genres of Irish folk and dance music, contemporary Irish popular and rock music has gained international attention. Van Morrison (b.1945), is a singer and songwriter from Belfast whose career began in the 1960s and was going strong in the 2000s. Enya (b.1961), is Ireland's best-selling solo musician. The Irish rock band U-2 is led by Bono (b.1960): Bono has also spearheaded efforts to raise money for famine relief in Ethiopia, to fight world poverty, to campaign for third-world debt relief, and to raise world consciousness to the plight of Africa, including the spread of HIV/AIDS on the continent.

## 49 DEPENDENCIES

Ireland has no territories or colonies.

# ITALY

Italian Republic  
*Repubblica Italiana*

**CAPITAL:** Rome (Roma)

**FLAG:** The national flag is a tricolor of green, white, and red vertical stripes.

**ANTHEM:** *Fratelli d'Italia (Brothers of Italy)*.

**MONETARY UNIT:** The euro replaced the lira as the official currency in 2002. The euro is divided into 100 cents. There are coins in denominations of 1, 2, 5, 10, 20, and 50 cents and 1 euro and 2 euros. There are notes of 5, 10, 20, 50, 100, 200, and 500 euros. €1 = \$1.25475 (or \$1 = €0.79697) as of 2005.

**WEIGHTS AND MEASURES:** The metric system is the legal standard.

**HOLIDAYS:** New Year's Day, 1 January; Epiphany, 6 January; Liberation Day, 25 April; Labor Day, 1 May; Assumption, 15 August; All Saints' Day, 1 November; National Unity Day, 5 November; Immaculate Conception, 8 December; Christmas, 25 December; St. Stephen's Day, 26 December. Easter Monday is a movable holiday. In addition, each town has a holiday on its Saint's Day.

**TIME:** 1 PM = noon GMT.

## <sup>1</sup>LOCATION, SIZE, AND EXTENT

Situated in southern Europe, the Italian Republic, including the major islands of Sicily (Sicilia) and Sardinia (Sardegna), covers a land area of 301,230 sq km (116,306 sq mi). Comparatively, the area occupied by Italy is slightly larger than the state of Arizona. The boot-shaped Italian mainland extends into the Mediterranean Sea with a length of 1,185 km (736 mi) SE–NW and a width of 381 km (237 mi) NE–SW. It is bordered on the N by Switzerland and Austria, on the NE by Slovenia, on the E by the Adriatic and Ionian seas, on the W by the Tyrrhenian and Ligurian seas, and on the NW by France, with a total land boundary length of 1,932 km (1,200 mi) and a coastline of 7,600 km (4,712 mi).

Situated off the toe of the Italian boot, Sicily has a surface area of 25,708 sq km (9,926 sq mi). Sardinia, which is about 320 km (200 mi) NW of Sicily, covers an area of some 24,090 sq km (9,300 sq mi). Within the frontiers of Italy are the sovereign Republic of San Marino, with an area of 61.2 sq km (23.6 sq mi), and the sovereign state of Vatican City, which covers 44 hectares (108.7 acres).

The long-disputed problem of Trieste, a 518 sq km (200 sq mi) area situated at the head of the Adriatic Sea, between Italy and Yugoslavia, was resolved in 1954, when Italy assumed the administration of Zone A, the city and harbor of Trieste, and Yugoslavia of Zone B, the rural hinterlands of the Istrian Peninsula. A treaty of October 1975 made the partition permanent.

Italy's capital city, Rome, is located in the west-central part of the country.

## <sup>2</sup>TOPOGRAPHY

Except for the fertile Po River Valley in the north and the narrow coastal belts farther south, Italy's mainland is generally mountainous, with considerable seismic activity. During Roman times, the city of Pompeii, near present-day Naples (Napoli), was devastated first by an earthquake in AD 63 and then by the famed eruption of

Mt. Vesuvius (1,277 m/4,190 ft) in AD 79. In the last century, a 7.2 magnitude earthquake in the Calabrian-Sicilian region occurred in December 1908 that leveled the cities of Reggio di Calabria and Messina and left about 100,000 dead. A quake in the south on 23 November 1980 (and subsequent aftershocks) claimed at least 4,500 lives.

The Alpine mountain area in the north along the French and Swiss borders includes three famous lakes—Como, Maggiore, and Garda—and gives rise to six small rivers that flow southward into the Po. Italy's highest peaks are found in the northwest in the Savoy Alps, the Pennines, and the Graian chain. They include Mont Blanc (4,807 m/15,771 ft), on the French border; Monte Rosa (Dufourspitze, 4,634 m/15,203 ft) and the Matterhorn (Monte Cervino, 4,478 m/14,692 ft), on the Swiss border; and Gran Paradiso (4,061 m/13,323 ft). Marmolada (3,342 m/10,965 ft), in northeast Italy, is the highest peak in the Dolomites.

At the foot of the Alps, the Po River, the only large river in Italy, flows from west to east, draining plains covering about 17% of Italy's total area and forming the agricultural and industrial heartland. The Apennines, the rugged backbone of peninsular Italy, rise to form the southern border of the Po Plain. Numerous streams and a few small rivers, including the Arno and the Tiber (Tevere), flow from the Apennines to the west coast. The highest peak on the peninsula is Corvo Grande (2,912 m/9,554 ft). Vesuvius is the only active volcano on the European mainland.

While altitudes are lower in southern Italy, the Calabrian coast is still rugged. Among the narrow, fertile coastal plains, the Plain of Foggia in northern Apulia, which starts along the Adriatic, and the more extensive lowland areas near Naples, Rome, and Livorno (Leghorn) are the most important. The mountainous western coastline forms natural harbors at Naples, Livorno, La Spezia, Genoa (Genova), and Savona, and the low Adriatic coast permits natural ports at Venice (Venezia), Bari, Brindisi, and Taranto.

Sicily, separated from the mainland by the narrow Strait of Messina, has the Madonie Mountains, a continuation of the Apennines, and the Plain of Catania, the largest plain on the island. Mount Etna (3,369 m/11,053 ft) is an isolated and active volcano in the northeast.

Sardinia, in the Tyrrhenian Sea, is generally mountainous and culminates in the peak of Gennargentu (1,834 m/6,017 ft). The largest and most fertile plains are the Campidano in the south and the Ozieri in the north. The principal bay is Porto Torres in the Gulf of Asinara.

### **3 CLIMATE**

Climate varies with elevation and region. Generally, however, Italy is included between the annual isotherms of 11°C and 19°C (52°F and 66°F). The coldest period occurs in December and January, the hottest in July and August. In the Po Plain, the average annual temperature is about 13°C (55°F); in Sicily, about 18°C (64°F); and in the coastal lowlands, about 14°C (57°F). The climate of the Po Valley and the Alps is characterized by cold winters, warm summers, and considerable rain, falling mostly in spring and autumn, with snow accumulating heavily in the mountains. The climate of the peninsula and of the islands is Mediterranean, with cool, rainy winters and hot, dry summers. Mean annual rainfall varies from about 50 cm (20 in) per year, on the southeast coast and in Sicily and Sardinia, to over 200 cm (80 in), in the Alps and on some westerly slopes of the Apennines. Frosts are rare in the sheltered western coastal areas, but severe winters are common in the Apennine and Alpine uplands.

### **4 FLORA AND FAUNA**

Plants and animals vary with area and altitude. Mountain flora is found above 1,980 m (6,500 ft) in the Alps and above 2,290 m (7,500 ft) in the Apennines. The highest forest belt consists of conifers; beech, oak, and chestnut trees grow on lower mountain slopes. Poplar and willow thrive in the Po Plain. On the peninsula and on the larger islands, Mediterranean vegetation predominates: evergreens, holm oak, cork, juniper, bramble, laurel, myrtle, and dwarf palm.

Although larger mammals are scarce, chamois, ibex, and roe deer are found in the Alps, and bears, chamois, and otters inhabit the Apennines. Ravens and swallows are characteristic birds of Italy. Abundant marine life inhabits the surrounding seas.

As of 2002, there were at least 90 species of mammals, 250 species of birds, and over 5,900 species of plants throughout the country.

### **5 ENVIRONMENT**

Italy has been slow to confront its environmental problems. Central government agencies concerned with the environment are the Ministry for Ecology (established in 1983), the Ministry of Culture and Environmental Quality, the National Council for Research, and the Ministry for Coordination of Scientific and Technological Research. Localities also have responsibility for environmental protection, but most of the burden of planning and enforcement falls on regional authorities. The principal antipollution statute is Law No. 319 of 1976 (the Merli Law), which controls the dis-

posal of organic and chemical wastes; enforcement, however, has proved difficult.

Air pollution is a significant problem in Italy. United Nations sources estimate that carbon monoxide emissions increased by 12% in the period between 1985 and 1989. In the 1990s Italy had the world's 10th highest level of industrial carbon dioxide emissions, which totaled 407.7 million metric tons per year, a per capita level of 7.03 metric tons. In 2000, the total of carbon dioxide emissions was at 428.2 million metric tons.

Water pollution is another important environmental issue in Italy. The nation's rivers and coasts have been polluted by industrial and agricultural contaminants and its lakes contaminated by acid rain. In 2001 the nation had 160 cu km of renewable water resources with 53% used in farming activity and 33% used for industrial purposes. Facilities for the treatment and disposal of industrial wastes are inadequate.

In July 1976, the city of Seveso, north of Milan (Milano), gained international attention after an explosion at a small Swiss-owned chemical plant released a cloud of debris contaminated by a toxic by-product, dioxin. More than 1,000 residents were evacuated, and pregnant women were advised to have abortions.

The long-term threat posed by flooding, pollution, erosion, and sinkage to the island city of Venice was highlighted by a disastrous flood in November 1966, which damaged priceless art treasures and manuscripts in Florence (Firenze). The digging of artesian wells in the nearby mainland cities of Mestre and Marghera so lowered the water table that the Venetian islands sank at many times the normal annual rate of 4 mm (0.16 in) a year between 1900 and 1975; with the wells capped as a protective measure, Venice's normal sinkage rate was restored. As of the mid-1980s, however, little effort had been made to control the number and speed of powerboats on the Grand Canal (the churning of whose waters causes buildings to erode), nor had the national government begun to implement a master plan for Venice approved in principle three years earlier. Rome has implemented a project designed, in part, to protect the Roman Forum and other ancient monuments from the vibration and pollution of motor vehicles.

In 2003, only about 7.9% of the total land area was protected. According to a 2006 report issued by the International Union for Conservation of Nature and Natural Resources (IUCN), threatened species included 12 types of mammals, 15 species of birds, 4 types of reptiles, 5 species of amphibians, 17 species of fish, 16 types of mollusks, 42 species of other invertebrates, and 3 species of plants. Threatened species include the Sicilian fir, the black vulture, the spotted eagle, the wild goat, the great white shark, and the red-breasted goose. The Sardinian pika is extinct.

### **6 POPULATION**

The population of Italy in 2005 was estimated by the United Nations (UN) at 58,742,000, which placed it at number 23 in population among the 193 nations of the world. In 2005, approximately 19% of the population was over 65 years of age, with another 14% of the population under 15 years of age. There were 94 males for every 100 females in the country. According to the UN, the annual population rate of change for 2005–10 was expected to be stagnant at 0.0%, a rate the government viewed as too low. The projected population for the year 2025 was 57,630,000. The population den-

LOCATION: 47°05' to 36°38'N; 6°37' to 18°31' E. BOUNDARY LENGTHS: Switzerland, 744 kilometers (462 miles); Austria, 430 kilometers (267 miles); Slovenia, 209 kilometers (130 miles); total coastline including islands of Sicily and Sardinia, 7,458 kilometers (4,634 miles); France, 514 kilometers (320 miles). TERRITORIAL SEA LIMIT: 12 miles.

sity was 195 per sq km (505 per sq mi), with the Po Valley being one of the most densely populated areas of the country.

The UN estimated that 90% of the population lived in urban areas in 2005, and that population in urban areas was declining at an annual rate of -0.04%. The capital city, Rome (Roma), had a population of 2,665,000 in that year. Other major cities and their estimated populations include Milan, 4,007,000; Naples, 2,905,000; Turin (Torino), 1,182,000; Genoa, 803,000; Florence, 778,000; Palermo, 721,164; and Bologna, 369,955.

## 7 MIGRATION

Emigration, which traditionally provided relief from overpopulation and unemployment, now represents only a fraction of the millions of Italians who emigrated during the two decades prior to 1914. From 1900 to 1914, 16 of every 1,000 Italians left their homeland each year; by the late 1970s, that proportion had declined to about 1.5 per 1,000. Of the 65,647 Italians who emigrated in 1989, some 26,098 went to Germany; 16,347 to Switzerland; 5,277 to France; 4,076 to the United States; and 23,849 to oth-

er countries. Immigration in 1989 totaled approximately 81,201 people, of whom West Germans accounted for 13,198. In 1990, 781,100 immigrants lived in Italy. This figure did not include some 600,000 who were believed to be illegal immigrants.

The overall impetus to emigrate has been greatly reduced by economic expansion within Italy itself and by the shrinking job market in other countries, especially Germany. Nevertheless, Germany had 560,100 Italian residents at the end of 1991, and France had 253,679 in 1990. Particularly significant in the first two decades after World War II was the considerable migration from the rural south to the industrial north, but by the mid-1980s, this flow had become insignificant.

In 1998, Italy received a total of 7,112 asylum applications, an increase of over 380% over the 1,858 applications lodged in 1997. The main countries of origin were Serbia and Montenegro, Iraq, and Turkey. Refugee status was granted in 29.6% of decisions on the applications made in 1998. Italy also hosted 5,816 people who arrived in 1999 from Macedonia under the UNHCR/IOM Humanitarian Evacuation Programme. However, in 2004 there were no asylum seekers in Italy, but 15,604 refugees and 886 stateless persons of concern to United Nations High Commissioner for Refugees (UNHCR). In 2005, the net migration rate was estimated as 2.07 migrants per 1,000 population.

## **8 ETHNIC GROUPS**

Italy has been the home of various peoples: Lombards and Goths in the north; Greeks, Saracens, and Spaniards in Sicily and the south; Latins in and around Rome; and Etruscans and others in central Italy. For centuries, however, Italy has enjoyed a high degree of ethnic homogeneity. The chief minority groups are the German-speaking people in the Alto Adige (South Tyrol) region and the Slavs of the Trieste area.

## **9 LANGUAGES**

Italian, the official language, is spoken by the vast majority of people. While each region has its own dialect, Tuscan, the dialect of Tuscany, is the standard dialect for Italian. French is spoken in parts of Piedmonte and in Valle d'Aosta, where it is the second official language; Slovene is spoken in the Trieste-Gorizia area. German is widely used in Bolzano Province, or South Tyrol (part of the Trentino-Alto Adige region), which was ceded by Austria in 1919; under agreements reached between Italy and Austria in 1946 and 1969, the latter oversees the treatment of these German-speakers, who continue to call for greater linguistic and cultural autonomy.

## **10 RELIGIONS**

Roman Catholicism, affirmed as the state religion under the Lateran Treaty of 1929, lost that distinction under a concordat with the Vatican ratified in 1985. However, the Catholic Church continues to hold a privileged status with the state. An estimated 87% of native-born Italian citizens claim to be members of the Roman Catholic faith; however, only about 20% are active participants. Jehovah's Witnesses form the second-largest denomination among native-born Italian citizens, with about 400,000 adherents. However, if immigrants are counted, the second-largest religion is Islam, with an estimated one million followers. About 100,000 people are Scientologists, 60,000 are Buddhists, 30,000

are Waldensians (a Calvinist sect), 30,000 are Jewish, and 20,000 are Mormons. The Orthodox and Protestant churches have small communities. Hinduism and Bahá'ism are also represented. About 14% of the population claim to be atheists or agnostics.

## **11 TRANSPORTATION**

Italy's highway system, one of the world's best, in 2002 totaled 479,688 km (298,366 mi), all of which were paved, and included 6,620 km (4,117 mi) of expressways. These expressways carry heavy traffic along such routes as Milan-Como-Varese, Venice-Padua, Naples-Salerno, and Milan-Bologna-Florence-Rome-Naples. A major highway runs through the Mont Blanc Tunnel, connecting France and Italy. In 2003, there were an estimated 34,310,446 passenger cars and 4,166,033 commercial vehicles.

In 2004, Italy maintained a total of 19,319 km (12,016 mi) of standard and narrow gauge rail lines. Of that total, standard gauge accounts for 18,001 km (11,196 mi) of which 11,333 km (7,049 mi) are electrified, while 280 km (174 mi) of narrow gauge lines are electrified. The government owns and operates 80% of the rail system, the Italian State Railway (Ferrovie dello Stato-FS), including the principal lines. Connections with French railways are made at Ventimiglia, Tenda, and Mont Cenis; with the Swiss, through the Simplon and St. Gotthard passes; with the Austrian, at the Brenner Pass and Tarvisio; and with the Slovenian, through Gorizia.

The navigable inland waterway system, totaling about 2,400 km (1,490 mi), is mainly in the north and consists of the Po River, the Italian lakes, and the network of Venetian and Po River Valley canals. There is regular train-ferry and automobile-ferry service between Messina and other Sicilian ports. Freight and passengers are carried by ship from Palermo to Naples. Sardinia and the smaller islands are served by regular shipping. Regular passenger service is provided by hydrofoil between Calabria and Sicily, and between Naples, Ischia, and Capri.

As of 2005, Italy had 565 merchant vessels of 1,000 GRT or more, totaling 8,970,017 GRT. Genoa and Savona on the northwest coast and Venice on the Adriatic handle the major share of traffic to and from the northern industrial centers. Naples, second only to Genoa, is the principal port for central and southern Italy, while Livorno is the natural outlet for Florence, Bologna, and Perugia. Messina, Palermo, and Catania are the chief Sicilian ports, and Cagliari handles most Sardinian exports.

In 2004 there were an estimated 134 airports. As of 2005, a total of 98 had paved runways, and there were also three heliports. Italy's one national airline, Alitalia, which is almost entirely government-owned, maintains an extensive domestic and international network of air routes. Rome's Fiumicino and Milan's Malpensa and Linate are among the most important airports, being served by nearly every major international air carrier. In 2003, Italian civil aviation performed a total of 1,359 million freight ton-km and carried about 34.953 million passengers on scheduled domestic and international airline flights.

## **12 HISTORY**

The Italian patrimony, based on Roman antecedents—with a tradition that extends over 2,500 years—is the oldest in Europe, next to Greece's. The Ligurians, Sabines, and Umbrians were among the earliest-known inhabitants of Italy, but in the 9th century BC they

were largely displaced in central Italy by the Etruscans, a seafaring people, probably from Asia Minor. Shortly thereafter there followed conquests in Sicily and southern Italy by the Phoenicians and the Greeks. By 650 BC, Italy was divided into ethnic areas: the Umbrians in the north, the Ligurians in the northwest, the Latins and Etruscans in the central regions, and the Greeks and Phoenicians in the south and Sicily. The Etruscan civilization, a great maritime, commercial, and artistic culture, reached its peak about the 7th century, but by 509 BC, when the Romans overthrew their Etruscan monarchs, its control in Italy was on the wane. By 350 BC, after a series of wars with both Greeks and Etruscans, the Latins, with Rome as their capital, gained the ascendancy, and by 272 BC, they managed to unite the entire Italian peninsula.

This period of unification was followed by one of conquest in the Mediterranean, beginning with the First Punic War against Carthage (264–241 BC). In the course of the century-long struggle against Carthage, the Romans conquered Sicily, Sardinia, and Corsica. Finally, in 146 BC, at the conclusion of the Third Punic War, with Carthage completely destroyed and its inhabitants enslaved, Rome became the dominant power in the Mediterranean. From its inception, Rome was a republican city-state, but four famous civil conflicts destroyed the republic: Sulla against Marius and his son (88–82 BC), Julius Caesar against Pompey (49–45 BC), Brutus and Cassius against Mark Antony and Octavian (43 BC), and Mark Antony against Octavian. Octavian, the final victor (31 BC), was accorded the title of Augustus (“exalted”) by the Senate and thereby became the first Roman emperor. Under imperial rule, Rome undertook a series of conquests that brought Roman law, Roman administration, and Pax Romana (“Roman peace”) to an area extending from the Atlantic to the Rhine, to the British Isles, to the Iberian Peninsula and large parts of North Africa, and to the Middle East as far as the Euphrates.

After two centuries of successful rule, in the 3rd century AD, Rome was threatened by internal discord and menaced by Germanic and Asian invaders, commonly called barbarians (from the Latin word *barbari*, “foreigners”). Emperor Diocletian’s administrative division of the empire into two parts in 285 provided only temporary relief; it became permanent in 395. In 313, Emperor Constantine accepted Christianity, and churches thereafter rose throughout the empire. However, he also moved his capital from Rome to Constantinople, greatly reducing the importance of the former. From the 4th to the 5th century, the Western Roman Empire disintegrated under the blows of barbarian invasions, finally falling in 476, and the unity of Italy came to an end. For a time, Italy was protected by the Byzantine (Eastern Roman) Empire, but a continuing conflict between the bishop of Rome, or pope, and the Byzantine emperor culminated in a schism during the first half of the 8th century.

After the fall of the Roman Empire and the reorganization of the peninsula, from the 6th to the 13th century, Italy suffered a variety of invaders and rulers: the Lombards in the 6th century, the Franks in the 8th century, the Saracens in the 9th, and the Germans in the 10th. The German emperors (of the Holy Roman Empire), the popes, and the rising Italian city-states vied for power from the 10th to the 14th century, and Italy was divided into several, often hostile, territories: in the south, the Kingdom of Naples, under Norman and Angevin rule; in the central area, the Pa-

pal States; and in the north, a welter of large and small city-states, such as Venice, Milan, Florence, and Bologna.

By the 13th century, the city-states had emerged as centers of commerce and of the arts and sciences. Venice, in particular, had become a major maritime power, and the city-states as a group acted as a conduit for goods and learning from the Byzantine and Islamic empires. In this capacity, they provided great impetus to the developing Renaissance, which between the 13th and 16th centuries led to an unparalleled flourishing of the arts, literature, music, and science. However, the emergence of Portugal and Spain as great seagoing nations at the end of the 15th century undercut Italian prosperity. After the Italian Wars (1494–1559), in which France tried unsuccessfully to extend its influence in Italy, Spain emerged as the dominant force in the region. Venice, Milan, and other city-states retained at least some of their former greatness during this period, as did Savoy-Piedmont, protected by the Alps and well defended by its vigorous rulers.

Economic hardship, waves of the plague, and religious unrest tormented the region throughout the 17th century and into the 18th. The French Revolution was brought to the Italian peninsula by Napoleon, and the concepts of nationalism and liberalism infiltrated everywhere. Short-lived republics and even a Kingdom of Italy (under Napoleon’s stepson Eugene) were formed. But reaction set in with the Congress of Vienna (1815), and many of the old rulers and systems were restored under Austrian domination. The concept of nationalism continued strong, however, and sporadic outbreaks led by such inveterate reformers as Giuseppe Mazzini occurred in several parts of the peninsula down to 1848–49. This Risorgimento (“resurgence”) movement was brought to a successful conclusion under the able guidance of Count Camillo Cavour, prime minister of Piedmont. Cavour managed to unite most of Italy under the headship of Victor Emmanuel II of the house of Savoy, and on 17 March 1861, the Kingdom of Italy was proclaimed with Victor Emmanuel II as king. Giuseppe Garibaldi, the popular republican hero of Italy, contributed much to this achievement and to the subsequent incorporation of the Papal States under the Italian monarch. Italian troops occupied Rome in 1870, and in July 1871, it formally became the capital of the kingdom. Pope Pius IX, a longtime rival of Italian kings, considered himself a “prisoner” of the Vatican and refused to cooperate with the royal administration.

### The 20th Century

The new monarchy aspired to great-power status but was severely handicapped by domestic social and economic conditions, particularly in the south. Political and social reforms introduced by Premier Giovanni Giolitti in the first decade of the 20th century improved Italy’s status among Western powers but failed to overcome such basic problems as poverty and illiteracy. Giolitti resigned in March 1914 and was succeeded by Antonia Salandra. During World War I, Italy, previously an ally of the Central Powers, declared itself neutral in 1914 and a year later, in April 1915, joined the British and French in exchange for advantages offered by the secret Treaty of London. At the Versailles Peace Conference, Italy, which had suffered heavy losses on the Alpine front

and felt slighted by its Western allies, failed to obtain all of the territories that it claimed.

This disappointment, coupled with the severe economic depression of the postwar period, created great social unrest and led eventually to the rise of Benito Mussolini, who, after leading his Fascist followers in a mass march on Rome, became premier in 1922. He established a Fascist dictatorship, a corporate state, which scored early successes in social welfare, employment, and transportation; in 1929, he negotiated the Lateran Treaties, under which the Holy See became sovereign within the newly constituted Vatican City State and Roman Catholicism was reaffirmed as Italy's official religion (the latter provision was abolished in 1984). The military conquest of Ethiopia (1935–36) added to Italy's colonial strength and exposed the inability of the League of Nations to punish aggression or keep the peace.

Italy joined Germany in World War II, but defeats in Greece and North Africa and the Allied invasion of Sicily toppled Mussolini's regime on 25 July 1943. Soon Italy was divided into two warring zones, one controlled by the Allies in the south and the other (including Rome) held by the Germans, who had quickly moved in, rescued Mussolini, and established him as head of the puppet "Italian Social Republic." When German power collapsed, Mussolini was captured and executed by Italian partisans.

The conclusion of the war left Italy poverty-stricken and politically disunited. In 1946, Italy became a republic by plebiscite; in the following year, a new constitution was drafted, which went into effect in 1948. Under the peace treaty of 10 February 1947, Italy was required to pay \$360 million in reparations to the USSR, Yugoslavia, Greece, Ethiopia, and Albania. By this time, the Italian economy, initially disorganized by Mussolini's dream of national self-sufficiency and later physically devastated by the war, was in a state of near collapse. By the early 1950s, however, with foreign assistance (including \$1,516.7 million from the United States under the Marshall Plan), Italy managed to restore its economy to the prewar level. From this point, the Italian economy experienced unprecedented development through the 1960s and 1970s.

Politically, postwar Italy has been marked by a pattern of accelerating instability, with 48 different coalition governments through 15 March 1988. In May 1981, the coalition of Prime Minister Arnaldo Forlani was brought down after it was learned that many government officials, including three cabinet ministers, were members of a secret Masonic lodge, Propaganda Due (P-2), that had reportedly been involved in illegal right-wing activities. Left-wing terrorism, notably by the Red Brigades (Brigate Rosse), also plagued Italy in the 1970s and early 1980s. In January 1983, 23 Red Brigade members were sentenced to life imprisonment in connection with the kidnapping and murder of Prime Minister Aldo Moro in 1978; another 36 members received sentences of varying lengths for other crimes, including 11 murders and 11 attempted murders, committed between 1976 and 1980. By the mid-1980s, the Mafia actively engaged in extortion, government corruption, and violent crime, as well as a central role in global heroin trafficking.

By 1986, however, internal security had improved. A major effort against organized crime was under way in the mid-1980s; over 1,000 suspects were tried and the majority convicted in trials that took place in Naples beginning in February 1985 and in Sicily beginning in February 1986.

Revelations of corruption and scandals involving senior politicians, members of the government administration, and business leaders rocked Italy in the early 1990s. Hundreds of politicians, party leaders, and industrialists were either under arrest or under investigation. The scandals discredited the major parties that had governed Italy since 1948, and the instability gave impetus to new reformist groups.

In August 1993, Italy made significant changes in its electoral system. Three-fourths of the seats in both the Chamber and the Senate would be filled by simple majority voting. The remainder would be allocated by proportional representation to those parties securing at least 4% of the vote. The first elections under the new system in March 1994 resulted in a simplification of electoral alliances and brought a center-right government to power. Silvio Berlusconi, founder of the "Go Italy" (Forza Italia) movement, emerged as prime minister. Berlusconi, a successful Italian businessman, was a newcomer to Italian politics. He was supported by the Alliance for Freedom coalition, which had received over 42% of the vote and 366 seats.

Berlusconi's government, however, became victim to charges of government corruption and on 22 December 1994 he was forced to resign in the face of a revolt by the Northern League, one of the parties in his ruling coalition. Three weeks after Berlusconi's resignation, his treasury minister, Lamberto Dini was named prime minister. He formed a government of technocrats and set about to enact fiscal and electoral reforms. Pragmatism and a lack of viable alternatives kept him in power until supporters of his main political rival, Silvio Berlusconi, presented a motion that he step down. When Dini learned that two splinter groups in his center-left coalition (the Greens and the Communist Refounding party) would not vote in his favor, he resigned on 11 January 1996 rather than face a no-confidence vote.

The elections, held on 21 April 1996, saw a center-left coalition, dominated by the former communists (DS), take control of the country for the first time in 50 years. Romano Prodi, an economics professor with little political experience, was chosen to serve as prime minister on 16 May. His coalition government collapsed after it failed to win a vote of no-confidence over the budget. President Oscar Luigi Scalfaro asked Massimo D'Alema, the leader of the DS and of the largest party in the Olive Tree, to form a new administration. His cabinet retained the same members from the left and center as before. This government also continued to pursue fiscal consolidation to join European economic and monetary union in 1999. Prodi left for Brussels to take up the presidency of the European Commission in May 1999. D'Alema reshuffled his cabinet in 1999 but it finally fell in April 2000. The immediate cause was the dismal performance in regional elections. The center-left won 7 out of 15 regions while the right, under the leadership of Silvio Berlusconi, took 8 regions.

The coalition of 12 discordant political blocs backed the Treasury Minister, Giuliano Amato, to become the new prime minister (appointed by President Carlo Azeglio Ciampi, in office since May 1999). Prior to the fall of the D'Alema administration, the government had scheduled an important referendum to scrap the last remaining vestiges of direct proportional representation in the electoral system. Only one-third of the electorate bothered to vote on 21 May 2000, not enough to validate the referendum outcome.

Berlusconi's House of Liberties coalition, led by Go Italy, secured 368 seats in the Chamber of Deputies in the May 2001 parliamentary elections, to the Olive Tree coalition's 242 seats. (The House of Liberties coalition also won a majority in the Senate.) After becoming Italy's 59th postwar prime minister, Berlusconi faced long-standing charges of criminal wrongdoing, including bribery; he became the first sitting Italian prime minister to appear at his own trial. It was not until December 2004 that Berlusconi was cleared of all charges.

Italy offered the use of its airspace and military bases to the US-led coalition in its war with Iraq, which began on 19 March 2003, although Italy did not send troops to the region and did not allow coalition forces to launch a direct attack on Iraq from Italy. Some 75% of Italians opposed the use of military force against the Saddam Hussein regime, but Berlusconi adopted a position of solidarity with the US-led coalition.

### 13 GOVERNMENT

In a plebiscite on 2 June 1946, the Italian people voted (12,700,000 to 10,700,000) to end the constitutional monarchy, which had existed since 1861, and establish a republic. At the same time, a constituent assembly was elected, which proceeded to draft and approve a new constitution; it came into force on 2 January 1948. Under this constitution, as amended, the head of the Italian Republic is the president, who is elected for a seven-year term by an electoral college consisting of both houses of parliament and 58 regional representatives. Elections for a new president must be held 30 days before the end of the presidential term. Presidential powers and duties include nomination of the prime minister (referred to as president of the Council of Ministers) who, in turn, chooses a Council of Ministers (cabinet) with the approval of the president; the power to dissolve parliament, except during the last six months of the presidential term of office; representation of the state on important occasions; ratification of treaties after parliamentary authorization; and the power to grant pardons and commute penalties. Although the constitution limits presidential powers, a strong president can play an important political as well as ceremonial role.

Legislative power is vested in the bicameral parliament, consisting of the Chamber of Deputies and the Senate. Members of the 630-seat lower house, the Chamber of Deputies, must be at least 25 years old and are elected for five-year terms. The 315 elective members of the Senate must be at least 40 years old and are elected for five-year terms. Former presidents of the republic are automatically life senators, and the president may also appoint as life senators persons who have performed meritorious service. Citizens must be at least 25 years of age to vote for senators; otherwise, those over the age of 18 may vote in all other elections.

In August 1993, Italy made significant changes in its electoral system. Three-fourths of the seats in both the Chamber and the Senate would be filled by simple majority voting. The remainder would be allocated by proportional representation to those parties securing at least 4% of the vote. The first elections under the new system in March 1994 resulted in a simplification of electoral alliances and brought a center-right government to power. Silvio Berlusconi, founder of the "Go Italy" (Forza Italia) movement, emerged as prime minister.

The constitution gives the people the right to hold referenda to abrogate laws passed by the parliament; a referendum requires at least 500,000 signatures. Four referenda had been held by 1987 (against the legalization of divorce in 1974, against increased police powers and state financing of the political parties in 1978, and against government cuts in wage indexation in 1985), and in all of them, the voters approved the parliamentary decisions.

In May 1999, Carlo Azeglio Ciampi was elected by the parliament as president of the Republic of Italy.

On 21 May 2000, Italian voters were asked to decide on electoral reform by increasing the number of lower house seats filled on the basis of a nonproportional system to 100%, effectively scrapping the last remaining element of pure proportional representation. The referendum needed to secure a quorum of 50% of the electorate to gain validity. The final turnout of 32% was much lower than expected and was an alarming sign of voter fatigue and popular disaffection.

On 13 May 2001, Silvio Berlusconi was again elected as head of state, this time as the leader of the five-party "Freedom House" political coalition of Forza Italia, the National Alliance, the Northern League, the Christian Democratic Center, and the United Christian Democrats. Although this coalition government was the longest running in Italy's postwar history, after a low showing in regional elections, Berlusconi was forced to resign and form a new government in April 2005. Italy's 60th government since liberation was formed on 23 April 2005.

### 14 POLITICAL PARTIES

Italy has a complex system of political alignments in which the parties, their congresses, and their leaders often appear to wield more power than parliament or the other constitutional branches of government.

Basic party policy is decided at the party congresses—generally held every second year—which are attended by locally elected party leaders. At the same time, the national party leadership is selected.

The most important political party traditionally had been the Christian Democratic Party (Partito Democrazia Cristiana—DC), which stood about midway in the political spectrum. In the 1983 national elections, the DC commanded 32.9% of the vote and won 225 seats in the Chamber of Deputies, down from 38.3% and 262 seats in 1979; in 1987, however, its electoral strength increased again, to 34.3% and 234 seats. From 1948 until 1981, the prime minister of Italy was consistently drawn from the ranks of the DC, whose religious and anti-class base constitutes both its strength and its weakness. Its relationship with the Church gave it added strength but also opened it to criticism, as did its popular association with the Mafia. In 1992, massive investigations uncovered widespread corruption, leading to many arrests and resignations of senior government officials. As a result of these scandals and corruption charges, the DC disbanded in 1994.

To the right and the left of the DC stood a wide range of parties, the most prominent of which was the Italian Communist Party (Partito Comunista Italiano—PCI), the largest Communist party in Western Europe at the time. The PCI had been second in power and influence only to the DC, but in the 1980s, its electoral base declined, despite the fact that it effectively severed its ties with both the former USSR and Marxism-Leninism.

Of all the parties of the mid to late 20th century, the most powerful were, in addition to the DC and PCI, were Italian Socialist Party (Partito Socialista Italiano—PSI), the Italian Socialist Democratic Party (Partito Socialista Democratico Italiano—PSDI), the Italian Republican Party (Partito Repubblicano Italiano—PRI), the Italian Liberal Party (Partito Liberale Italiano—PLI), the Radical Party (Partito Radicale), the Italian Social Movement (Movimento Sociale Italiano—MSI), the Proletarian Democracy (Democrazia Proletaria—DP), and the environmentalist Greens party. However, the 1990s saw the demise, creation, and restructuring of many Italian political parties. As of 2005, only the PRI and the Greens parties exist. Partly due to the end of the Cold War, in part due to the Mafia crackdown in the 1990s, and primarily due to the related corruption scandals that involved most of the major parties, the overhaul of the political party system was so significant that, although there has been little actual constitutional change, the post-1992 period is often referred to as the “Second Republic.”

With the rise in political parties, government functioning was dominated by coalition party formations. The April 1996 election saw a resurgence of the left as the Olive Tree coalition, anchored by former communists calling themselves the Party of the Democratic Left (PDS), gained 284 seats in the 630-seat Chamber of Deputies and 157 seats in the 315-seat Senate. The Refounded Communists won 35 seats in the Chamber of Deputies, the separatist Northern League 59, the center-right Freedom Alliance 246, and others 6. The elections of April 1992 failed to resolve Italy's political and economic problems. The election of March 1994 under new voting rules resulted in the following distribution of seats in the Chamber (lower house): Alliance for Freedom, 42.9% (Forza Italia, Northern League, National Alliance—366 seats); Progressive Alliance, 32.2% (Democratic Party of the Left, Communist Refounding, Democratic Alliance, Greens, Reformers—213 seats); and Pact for Italy, 15.7% (Popular Party, others—46 seats).

The domination of the center-left came to an end in the May 2001 election when Berlusconi's right-leaning coalition, Freedom House (formerly the House of Liberties), was comprised of his Forza Italia (Go Italy) party; the National Alliance, Northern League, Christian-Democratic Center Party; United Christian Democrats; and the New Italian Socialist Party. This coalition won 368 seats in the Chamber of Deputies, and 177 in the Senate. The Olive Tree coalition—composed of the Democrats of the Left, the Daisy Alliance (including the Italian Popular Party, Italian Renewal, Union of Democrats for Europe, and the Democrats), the Sunflower Alliance (including the Greens and the Italian Democratic Socialists), and the Italian Communist Party—came in second with 242 seats in the lower house (128 in the Senate). The Communist Refounding took 11 seats in the Chamber of Deputies, and the Olive-Southern Tyrols People's Party of German speakers secured 5 seats in the lower house.

## <sup>15</sup> LOCAL GOVERNMENT

Under the terms of the 1948 constitution, Italy is divided into 20 regions. Five of these regions (Sicily, Sardinia, Trentino–Alto Adige, Friuli–Venezia Giulia, and the Valle d'Aosta) have been granted semiautonomous status, although the powers of self-government delegated from Rome have not been sufficient to satisfy the militant separatists, especially in Alto Adige. Legislation

passed in 1968 granted the remaining 15 regions an even more limited degree of autonomy. All the regions elect a regional council. The councils and president are elected by universal franchise under a proportional system analogous to that of the parliament at Rome.

The regions are subdivided into a total of 94 provinces, which elect their own council and president, and each region is in turn subdivided into communes—townships, cities, and towns—that constitute the basic units of local administration. Communes are governed by councils elected by universal suffrage for a four-year term. The council elects a mayor and a board of aldermen to administer the commune. A commissioner in each region represents the federal government.

## <sup>16</sup> JUDICIAL SYSTEM

Minor legal matters may be brought before conciliators, while civil cases and lesser criminal cases are tried before judges called *pretori*. There are 159 tribunals, each with jurisdiction over its own district; 90 assize courts, where cases are heard by juries; and 26 assize courts of appeal. The Court of Cassation in Rome acts as the last instance of appeal in all cases except those involving constitutional matters, which are brought before the special Constitutional Court (consisting of 15 judges). For many years, the number of civil and criminal cases has been increasing more rapidly than the judicial resources to deal with them.

The Italian legal system is based on Roman law, although much is also derived from the French Napoleonic model. The law assuring criminal defendants a fair and public trial is largely observed in practice. The 1989 amendments to the criminal procedure law both streamlined the process and provide for a more adversarial (as opposed to inquisitorial) system along the American model.

By law the judiciary is autonomous and independent of the executive branch. In practice, there has been a perception that magistrates were subject to political pressures and that political bias of individual magistrates could affect outcomes. Since the start of “clean hands” investigations of the government, including the judiciary, in 1992 for kickbacks and corruption, magistrates have taken steps to distance themselves from political parties and other pressure groups.

## <sup>17</sup> ARMED FORCES

Since 1949 Italy, as a member of NATO, has maintained large and balanced modern forces. The total strength in 2005 was 191,875 active personnel, with reserves numbering 56,500. Army personnel numbered 112,000, and whose equipment included 320 main battle tanks, 300 reconnaissance vehicles, 122 armored infantry fighting vehicles, 2,036 armored personnel carriers, 14 amphibious assault vehicles, and 1,562 artillery pieces. Navy personnel in 2005 totaled 33,100, including 2,000 Marines. Major Italian naval vessels included 1 aircraft carrier, 2 destroyers, 12 frigates, 8 corvettes, 14 patrol/coastal vessels, 13 mine warfare ships, 3 amphibious ships, and 94 logistics/support vessels. The navy also operated six tactical submarines. The air force had a total strength of 44,743 personnel with 199 combat capable aircraft, in addition to various electronic warfare, anti-air defense, transport and training aircraft. In 2005, Italy also had a paramilitary force of 254,300 active personnel, of which 111,367 were Carabinieri. Italian armed forces were deployed among 19 countries or regions in various peace-

keeping, training or active military missions. Italy's military budget for 2005 was \$17.2 billion.

## 18 INTERNATIONAL COOPERATION

Italy has been a member of the United Nations since 14 December 1955 and participates in the ECE and several UN nonregional specialized agencies, such as FAO, UNESCO, UNIDO, UNHCR, IFC, WHO, and the World Bank. It is a member of the Council of Europe, the European Union, NATO, and the OECD. Italy held the EU presidency from July to December 2003. Italy also participates in the Asian, African, Caribbean, European, and the Inter-American development banks, and is a part of G-7, G-8, and G-10. The country holds observer status in the Black Sea Economic Cooperation Zone, the OAS, and the Latin American Integration Association (LAIA).

Italy is a guest in the Nonaligned Movement. The country has supplied troops for UN operations and missions in Kosovo (est. 1999), Lebanon (est. 1978), India and Pakistan (est. 1949), and Ethiopia and Eritrea (est. 2000), among others. Italy belongs to the Australia Group, the Zangger Committee, the Nuclear Suppliers Group (London Group), the Nuclear Energy Agency, the Organization for the Prohibition of Chemical Weapons, and the European Organization for Nuclear Research (CERN).

In environmental cooperation, Italy is part of the Antarctic Treaty; the Basel Convention; Conventions on Biological Diversity, Whaling, and Air Pollution; Ramsar; CITES; the London Convention; International Tropical Timber Agreements; the Kyoto Protocol; the Montréal Protocol; MARPOL; the Nuclear Test Ban Treaty; and the UN Conventions on the Law of the Sea, Climate Change and Desertification.

## 19 ECONOMY

As the Italian economy, the world's sixth-largest, has expanded since the 1950s, its structure has changed markedly. Agriculture, which in 1953 contributed 25% of the GNP and employed 35% of the labor force, contributed in 1968 only 11% of the GNP and employed only 22% of the active labor force—despite continued increases in the value of agricultural production. Agriculture's contribution to the GDP further declined to 8.4% in 1974, 5% in 2001, and 2.3% in 2004. Conversely, the importance of industry has increased dramatically. Industrial output almost tripled between 1953 and 1968 and generally showed steady growth during the 1970s; in 2004, industry (including fuel, power, and construction) contributed 28.8% to the GDP. Precision machinery and motor vehicles have led the growth in manufacturing, and Italy has generally been a leader in European industrial design and fashion. Services in 2004 accounted for 68.9% of the economy. However, apart from tourism and design, Italy is not internationally competitive in most service sectors.

Despite this economic achievement, a number of basic problems remain. Natural resources are limited, landholdings often are poor and invariably too small, industrial enterprises are of minimal size and productivity, and industrial growth has not been translated into general prosperity. The rise in petroleum prices during the mid-1970s found Italy especially vulnerable, since the country is almost totally dependent on energy imports. In addition, because economic activity is centered predominately in the north, Italians

living in the northern part of the country enjoy a substantially higher standard of living than those living in the south.

Partly because of increased energy costs, inflation increased from an annual rate of about 5% in the early 1970s to an annual average of 16.6% during 1975–81, well above the OECD average. Inflation was brought down to 14.6% in 1983 and to between 4 and 6% during most of the 1990s. In 1997 it was reduced to under 2%, its lowest level in 30 years. The inflation rate was estimated at 2.3% in 2004.

From 1981 through 1983, Italy endured a period of recession, with rising budget deficits, interest rates above 20%, virtually no real GDP growth, and an unemployment rate approaching 10%. Unemployment hovered around the 10 to 12% range for most of the 1990s and at 9% into the 2000s. Between 1985 and 1995, GDP growth averaged 1.9% a year. It was quite low in 2003, at 0.7%. The GDP growth rate stood at an estimated 1.3% in 2004, and was flat in 2005. Economic growth was expected to pick up to a still disappointing 1–1.2% in 2006–07.

Italy's large public debt, public sector deficit, low productivity growth, and burdensome and complex tax system, are generally blamed for the poor state of the economy. A rigid labor market and generous pension system are also seen as responsible for a sluggish economy. The Silvio Berlusconi administration by 2002 had abolished an inheritance tax, a move which was popular among affluent Italians. The 2005 budget included substantial tax cuts and a reduction in the number of tax rates from five to four. The corporate tax rate was reduced from 36% to 33% in 2004. Berlusconi also attempted to loosen labor laws to increase temporary work contracts and to ease hiring and firing practices. The government in the early 2000s was geared toward implementing spending cuts to spur consumer spending and corporate research and development. Pension reform, called a "financial time bomb" by economists, was proposed by the government and resulted in strikes in parts of Italy in mid-2003. Italy spends a massive 14% of GDP on pensions. In 2004, Italy raised the minimum age for state pensions from 57 to 60, but only beginning in 2008.

One of Italy's strengths is the thriving state of its small firms, which are often family owned. In 2003, the average number of workers per enterprise was just over four, the second-lowest figure in the EU. These small businesses are able to succeed in niche markets. However, the high proportion of small businesses has meant that Italy spends less on research and development than other European countries: in 2003, Italian spending on R&D as a share of GDP was barely half of the EU average. This causes Italy to experience a loss of competitiveness, and sluggish growth. In 2004, the economy grew by less than the euro-area average for the eighth time in nine years. Many Italian firms are still in traditional manufacturing areas that should have been abandoned when competition from Southeast Asia and China grew in the 1990s.

Italians spend more than other Europeans on clothes and shoes, and are second only to Spaniards in spending in bars, restaurants, and hotels. Because many Italians rent their living spaces, expenditure on housing is low.

## 20 INCOME

The US Central Intelligence Agency (CIA) reports that in 2005 Italy's gross domestic product (GDP) was estimated at \$1.6 trillion. The CIA defines GDP as the value of all final goods and ser-

vices produced within a nation in a given year and computed on the basis of purchasing power parity (PPP) rather than value as measured on the basis of the rate of exchange based on current dollars. The per capita GDP was estimated at \$28,300. The annual growth rate of GDP was estimated at 0%. The average inflation rate in 2005 was 1.9%. It was estimated that agriculture accounted for 2.1% of GDP, industry 28.8%, and services 69.1%.

According to the World Bank, in 2003 remittances from citizens working abroad totaled \$2.137 billion or about \$37 per capita and accounted for approximately 0.1% of GDP.

The World Bank reports that in 2003 household consumption in Italy totaled \$887.34 billion or about \$15,405 per capita based on a GDP of \$1.5 trillion, measured in current dollars rather than PPP. Household consumption includes expenditures of individuals, households, and nongovernmental organizations on goods and services, excluding purchases of dwellings. It was estimated that for the period 1990 to 2003 household consumption grew at an average annual rate of 1.6%. In 2001 it was estimated that approximately 23% of household consumption was spent on food, 12% on fuel, 3% on health care, and 17% on education.

## 2<sup>1</sup> LABOR

Italy's labor force in 2005 was estimated at 24.49 million. In 2003 the occupational breakdown had 4.9% in agriculture, 32.2% in industry, 62.8% in the services sector, and 0.1% in undefined occupations. The estimated unemployment rate in 2005 was 7.9%.

The law provides the right to form and join unions, and many workers exercise this right. According to union claims, between 35% and 40% of the nation's workforce was unionized as of 2005. About 35% of the labor force was covered by collective bargaining agreements, which also included nonunion employees. The right to strike is constitutionally protected, and workers engage in collective bargaining. Employers may not discriminate against those engaged in union activity.

As of 2005, the legal workweek was set at 40 hours, with overtime not to exceed two hours per day or an average of 12 hours per week. However, in the industrial sector, maximum overtime was set at no more than 80 hours per quarter and 250 hours annually, unless limited by a collective bargaining agreement. Minimum wages in Italy are not set by law, but through collective labor contracts, which establish wages and salaries in every major field. In most industries these minimum rates offered a worker and family a decent standard of living. Labor contracts may also call for additional compulsory bonuses, and basic wages and salaries are adjusted quarterly to compensate for increases in the cost of living. With some limited exceptions, children under age 15 are prohibited by law from employment.

## 2<sup>2</sup> AGRICULTURE

Of Italy's total land area of 29.4 million hectares (72.6 million acres), 10.7 million hectares (26.4 million acres), or 36.4% of the land, were under annual or permanent crops in 2003. Small, individually owned farms predominate, with the majority three hectares (7.4 acres) or less. In 2001, about 5% (1.4 million persons) of the economically active population was in the agricultural sector.

Despite government efforts, the agricultural sector has shown little growth in recent decades. The imports of agricultural products increased from \$19.6 billion in 1987 to \$31.6 billion in 2004.

Italy has to import about half of its meat. The land is well suited for raising fruits and vegetables, both early and late crops, and these are the principal agricultural exports. Although yields per hectare in sugar beets, tomatoes, and other vegetable crops have increased significantly, both plantings and production of wheat declined between 1974 and 1981. Thus, although Italy remains a major cereal-producing country, wheat must be imported. The government controls the supply of domestic wheat and the import of foreign wheat.

Production of major agricultural products in 2004 (in thousands of tons) included sugar beets, 10,100; wheat, 8,628; corn, 10,983; tomatoes, 7,497; oranges, 2,064; potatoes, 1,809; apples, 2,069; barley, 1,167; and rice, 1,496. In 2004, Italy produced 8,692,000 tons of grapes, and 4,531,000 tons of olives, and 879,000 tons of olive oil. In 2003, Italy had 1,680,000 tractors (third in the world) and 37,500 harvester-threshers.

## 2<sup>3</sup> ANIMAL HUSBANDRY

Some 4,377,000 hectares (10,816,000 acres) are meadows and pastures. Both a growing need for fodder and insufficient domestic production compel Italy to import large amounts of corn. In 2005, the country had 6,314,000 head of cattle, 9,272,000 hogs, 8,020,000 sheep, 1,985,000 goats, 300,000 horses, and an estimated 100 million chickens. That year, total meat production from hogs, cattle, sheep, and goats was 4,099,000 tons. Of the meat produced, 38% was pork, 29% was beef, 24% was poultry, 2% was mutton, and 7% was from other sources. Meat production falls short of domestic requirements, and about half of all meat consumed must be imported. Although Italy produced 10.5 million tons of cow milk in 2005, dairy farming remains comparatively undeveloped. Both dairy and beef cattle are raised mainly in the north. The value of animal output in 2003 exceeded €14.3 billion, third highest in the EU after France and Germany.

## 2<sup>4</sup> FISHING

Italy's geography provides abundant access to marine fishing. Peninsular Italy and the islands of Sicily and Sardinia together have over 8,000 km (4,900 mi) of coastline and over 800 landing ports equipped for fishing boats. There are also 1,500 sq km (580 sq mi) of lagoons and 1,700 sq km (650 sq mi) of marine ponds. Although coastal and deep-sea fishing in the Mediterranean engage over 50,000 fishermen, the fishing industry is unable to meet domestic needs. As of 2003 there were 15,915 Italian fishing vessels with a fishing capacity (gross tonnage) of 178,334 tons. Since the extension of the 200-mile limit zones and the consequent drop in the total catch, Italy's fishing industry has declined because their deep-sea vessels were not suited to Mediterranean fishing. Also, about 1,700 vessels (10% of the fleet) went out of service during 2000–02 as a result of EU-funded policies for the reduction of fishing in the Mediterranean. The total catch in 2003 was 314,807 tons, 98% from marine fishing, with a value of about €1.4 billion. Anchovies, sardines, hake, mullets, and swordfish together accounted for 44% of the volume in 2003. In 2003, Italy produced 89,000 tons of canned tuna and 20,000 tons of canned anchovies. The majority of the Italian fish harvest (up to 50%) is not officially recorded but sold directly to restaurants, wholesalers, and fishmongers. Anchovy, rainbow trout, sardine, and European hake are the main finfish species caught. Sponges and coral are also

commercially important. The main commercial fishing ports are Mazara del Vallo, Palermo, San Benedetto del Tronto, Chioggia-Venezia, and Genoa.

There are over a thousand intensive production fish farms that belong to the Italian Fish Farming Association, with 60% located in northern Italy. Total Italian aquaculture production in 2003 was 244,000 tons, valued at €250 million.

## 25 FORESTRY

The major portion of the 10 million hectares (24.7 million acres) of forest is in the Alpine areas of northern Italy; few extensive forests grow in central or southern Italy or on the islands. Italy has more softwood than hardwood growth and extensive coppice (thicket and small shrub) stands. The overall forest structure consists of 42% coppice stands, 26% softwoods, and 25% hardwood high stands. The only species that are commercially important are chestnut, beech, oak, and poplar. Chestnut and beech stands account for 31% of the hardwood forest and for over 40% of Italian wood production; oak comprises 8% of wood production. Poplar is the only species grown using managed forestry practices. Poplar plantations account for only 1% of the total forest area but for 50% of domestic wood output. Forest resources are stable and meet about 19% of annual demand. Italian wood output in 2003 consisted of 9 million cu m (318 million cu ft). Approximately 90% of Italian forest product exports consist of wooden furniture, semifinished wood products, and other finished wood products. The Italian furniture industry accounted for 37,987 firms with 229,054 employees in 2002, with an industry turnover of almost €22.8 billion. The diversity in species composition, ownership patterns, topographic constraints, and conflicting resource management strategies have all contributed to limiting the productivity of Italian forest resources. Italy is a major importer of hardwood and softwood lumber, since its rugged terrain and disjointed forestland restrict domestic production. In 2002, the Italian wood and wood product sectors employed 412,815 workers in 87,906 companies with a total turnover of about \$36 billion. Some 80% of the raw materials used for manufacturing furnished wooden products are imported. Imports of forest products in 2004 were valued at \$9.5 billion, while exports totaled \$4.3 billion.

## 26 MINING

Although Italy was relatively poor in mineral resources, it was, nevertheless, a major producer of feldspar, pumice and related materials, as well as of crude steel, cement (second-largest in the EU), and a leading producer of dimension stone and marble. The country also continued to supply a significant portion of its own need for some minerals. Industrial mineral production in 2003, including construction materials, was the most important sector of the economy. Italy has been a significant processor of imported raw materials, and a significant consumer and exporter of mineral and metal semi-manufactured and finished products.

Production totals for the leading minerals in 2003 were: feldspar, estimated at 2,500 metric tons; barite, estimated at 30,000 metric tons, unchanged from 1999; fluor spar (acid-grade and metallurgical-grade), estimated at 45,000 tons; hydraulic cement, estimated at 40 million tons; pumice and pumiceous lapilli, estimated at 600,000 tons (from Lipari Island, off the northern coast of Sicily); and pozzolan, estimated at 4 million tons (from Lipa-

ri). Alumina production (calcined basis) in 2003 was estimated at 925,000 metric tons. In addition, Italy produced antimony oxides, gold (from Sardinia), mine lead, mine manganese, bromine, crude clays (including bentonite, refractory, fuller's earth, kaolin, and kaolinitic earth), diatomite, gypsum, lime, nitrogen, perlite, mineral pigments, salt (marine, rock, and brine), sand and gravel (including volcanic and silica sands), soda ash, sodium sulfate, stone (alabaster, dolomite, granite, limestone, marble, marl, quartz, quartzite, sandstone, serpentine, and slate), sulfur, and talc and related materials.

Marble and travertine quarrying from the famous mines in the Massa and Carrara areas was still significant. Marble was quarried at hundreds of locations from the Alps to Sicily. The most important white-marble-producing area was in the Apuan Alps, near Carrara, and accounted for one-third of the country's 100,000 tons of white marble. Important colored-marble-producing areas included the Lazio region, Lombardy, the Po Valley, Puglia, Sicily, Venice, and Verona-Vincenza. Reserves of several types were considered to be unlimited; half of the country's output was in block form and half was exported.

## 27 ENERGY AND POWER

Italy's proven oil and natural gas reserves are each the fourth-largest in the European Union (EU). The country has completely stopped the production of coal. Still, Italy must rely heavily on foreign sources to meet its energy needs.

According to the Oil and Gas Journal, Italy has proven oil reserves estimated at 622 million barrels, as of 1 January 2005. Estimated production in 2004 averaged 147,000 barrels daily, of which crude oil accounted for 104,000 barrels per day, of which about 89% was accounted for by the National Hydrocarbon Agency (Ente Nazionale Idrocarburi), or ENI, Italy's largest oil and natural gas company of which the Italian government holds a controlling 35% stake. However, domestic demand far outstrips production, with consumption in 2004 estimated at 1.90 million barrels per day. Net imports for that year are estimated at 1.75 million barrels per day. In 2004, the former Soviet Union was Italy's largest supplier at 28%, followed by Libya (24%), Saudi Arabia (13%), and Iran (10%).

More than 70% of ENI's production comes from the Val d'Agri project in the south of Italy, the Villafortuna project in the north, and from the Aquila project off the Adriatic coast in the southeast. Development of the Tempa Rossa field, with an estimated 200 million barrels of oil, is being led by France's Total, and is expected to enter production by 2007 with a peak output of 50,000 barrels per day.

Oil has been partly replaced by natural gas, whose consumption is expected to continue rising in the future, driven largely by the construction of combined-cycle, gas-fired turbines. Italy has proven natural gas reserves of 8.0 trillion cu ft, as of 1 January 2005, according to the Oil and Gas Journal. Natural gas production in 2004, according to Eurostat totaled 440 billion cu ft. Combined with declining field output, Italy's reliance on natural gas imports has increased. In 2004, imported natural gas accounted 84% of the country's demand vs. 59% in 1985, according to Eurostat. Algeria (38%), Russia (32%), and the Netherlands (14%) were Italy's largest natural gas suppliers in 2004.

In 2001, Italy completely closed down its domestic coal production industry, when it shuttered its last production facility. In 2002, coal met only 6.8% of Italy's energy needs. In that year, demand for coal amounted to 21.8 million short tons, of which most was used to provide electricity. In the first half of 2004, South Africa supplied 26% of the coal consumed by Italy, followed by Colombia (12%) and the United States (11%).

Italy's total electric generating capacity was estimated at 69.1 GW in 2002, with thermal accounting for 78% of capacity, hydro-power at 19% and other renewable sources at 3%. In 2002, it was estimated that output totaled 262 billion kWh, with consumption totaling an estimated 294 billion kWh, and net imports totaling an estimated 32 billion kWh.

## 28 INDUSTRY

Characterized both by a few large industrial concerns controlling the greater part of industrial output and by thousands of small shops engaged in artisan-type production, Italian industry expanded rapidly in the postwar period. Industrial production almost tripled between 1955 and 1968 and has generally showed continued growth, although the global recession that began in 2001 slowed industrial production and the economy as a whole. The lack of domestic raw materials and fuels represents a serious drag on industrial expansion. Industry accounted for 28.8% of GDP in 2004, and employed 32% of the labor force. Manufacturing accounts for approximately 90% of total merchandise exports.

Three state-holding companies have played a large role in industry: ENI (National Hydrocarbon Agency), IRI (Industrial Reconstruction Institute), and EFIM (Agency for Participation and Financing of Manufacturing Industry). IRI was the 16th-largest industrial company in the world in 1993, with sales of \$50.5 billion; it had shareholdings in over 100 companies (including banks, electronics, engineering, and shipbuilding) and 333,600 employees in 1992. EFIM controlled armaments and metallurgy industries. Debt-ridden EFIM was liquidated, IRI became dismantled through sell-offs, and as of 2005, the state had reduced its stake in ENI and Enel (Ente Nazionale per l'Energia Elettrica), the national electricity company. Major private companies are the Fiat automobile company; the Olivetti company (office computers and telecommunications); the Montedison chemical firm; and the Pirelli rubber company. The bulk of heavy industry is concentrated in the northwest, in the Milan-Turin-Genoa industrial triangle. The government has made concerted efforts to attract industry to the underdeveloped southeast.

With the drive toward greater European integration in full gear, Italy, along with its fellow EU member-states, is liberalizing its economic and commercial legislation. These promise a marked change in the Italian business scene as mergers and foreign investment increase. In early 1999, Olivetti mounted a successful hostile takeover for Telecom Italia.

Italy has become known for niche products, including fashion eye-wear, specialized machine tools, packaging, stylish furniture, kitchen equipment, and other products featuring high design. The "made in Italy" stamp is associated with quality and style. Traditional industries are iron and steel, machinery, chemicals, food processing (including olive oil, wine, and cheese), textiles, clothing, footwear, motor vehicles, and ceramics. The construction in-

dustry stands to gain in importance in the early 2000s, as Italy's less-developed regions are slated for infrastructure development.

Foreign competition has cut into the Italian textile industry. Following the expiration of the World Trade Organization's long-standing system of textile quotas at the beginning of 2005, the EU signed an agreement with China in June 2005, imposing new quotas on 10 categories of textile goods, limiting growth in those categories to between 8% and 12.5% a year. The agreement runs until 2007, and was designed to give European textile manufacturers time to adjust to a world of unfettered competition. Nevertheless, barely a month after the EU-China agreement was signed, China reached its quotas for sweaters, followed soon after by blouses, bras, T-shirts, and flax yarn. Tens of millions of garments piled up in warehouses and customs checkpoints, which affected both retailers and consumers.

## 29 SCIENCE AND TECHNOLOGY

The still-standing aqueducts, bathhouses, and other public works of both ancient republic and empire testify to the engineering and architectural skills of the Romans. The rebirth of science during the Renaissance brought the daring speculations of Leonardo da Vinci (including discoveries in anatomy, meteorology, geology, and hydrology, as well as a series of fascinating though ultimately impractical designs for a "flying machine"), advances in physics and astronomy by Galileo Galilei, and the development of the barometer by Evangelista Torricelli. To later Italian scientists and inventors the world owes the electric battery (1800), the electroplating process (1805), and the radiotelegraph (1895).

In 2001, Italy had 1,156 scientists and engineers per million people engaged in research and development (R&D). In that same year, expenditures on R&D totaled \$16.7 trillion or 1.11% of GDP. High technology exports in 2002 totaled \$19.730 billion, or 9% of the country's manufactured exports.

The National Research Council (Consiglio Nazionale delle Ricerche—CNR), founded in 1923, is the country's principal research organization. CNR institutes and associated private and university research centers conduct scientific work in mathematics, physics, chemistry, geology, technology, engineering, medicine, biology, and agriculture. Especially noteworthy are the National Institute of Nuclear Physics, in Rome, and the Enrico Fermi Center for Nuclear Studies, in Milan.

Italy has 47 universities offering courses in basic and applied sciences. The Istituto e Museo di Storia della Scienza di Firenze, founded in 1930, is located in Florence. In 1987–97, science and engineering students accounted for 30% of university enrollment. In 2002, of all bachelor's degrees awarded, 25.8% were in the sciences (natural, mathematics and computers, and engineering)

## 30 DOMESTIC TRADE

Milan is the principal commercial center, followed by Turin, Genoa, Naples, and Rome. Genoa, the chief port of entry for Milan and Turin, handles about one-third of Italy's trade; Naples is the principal entrepôt for central and southern Italy. Adriatic as well as Middle Eastern trade is carried through Ancona, Bari, and Brindisi. Although small retail units predominate, department stores and supermarkets are playing an increasingly important role. In

2000, Italy ranked second in Europe in franchise business operations with about 562 companies and over 31,400 franchises.

Advertising in all forms is well developed, and the usual mass media (billboards, neon signs, newspapers and magazines, radio, cinema, and television) are used extensively. Market research is handled by over 100 firms.

Usual business hours in northern Italy are from 8:30 AM until 12:30 PM and from 3:30 to 6:30 PM. In central and southern Italy, customary hours are 8:30 AM to 12:45 PM and 4:30 or 5 to 7:30 or 8 PM. Most firms are closed in August. In general, banking hours are 8:30 AM to 1:30 PM and 3 PM to 4 PM, Monday through Friday. Retail establishments are generally closed on Sundays.

### 3<sup>1</sup> FOREIGN TRADE

Industrial products, textiles and apparel, shoes, and foodstuffs are Italy's most important exports. However, the textile industry has been hit hard by foreign competition in recent years, especially from China. Fuels, meat, grain products, and various raw materials are among the major imports. Trade deficits were substantial between the end of World War II and 1955, but between 1956 and 1968 the deficit gradually declined, and Italy's trade balance continued in relative equilibrium through 1972. Then, as prices of crude oil and other raw-material imports rose, Italy again began registering growing trade deficits. In 1993, however, a large surplus was recorded because of an export boom that followed the devaluation of the lira in September 1992, and Italy has had a trade surplus ever since. In 2004, the value of exports of goods was \$352.2 billion, and imports were \$341.3 billion, resulting in a trade surplus of \$10.9 billion.

The bulk of manufactured imports come from EU countries and the United States, which are also the leading customers for Italian exports. The big commodity exports from Italy in 2004 included industrial and automobile machinery and parts (40.3%), textiles, clothing, and leather (13.5%), chemicals (9.6%), and metal products (9.5%). The major imports included machinery and transportation equipment (34.5%), chemicals (13.4%), energy minerals (10.3%), and metals and metal products (10.3%). Italy's leading markets in 2004 were Germany (14.1% of all exports), France (12.5%), the United States (8.3%), and the United Kingdom (7.1%). Italy's leading suppliers in 2004 were Germany (18.1% of all imports), France (11.4%), the Netherlands (5.8%), and the United Kingdom (4.8%).

### 3<sup>2</sup> BALANCE OF PAYMENTS

Italy did not have serious balance of payments problems after the mid-1970s. Exports soared after 1992, turning Italy's balance of payments positive. The growth in exports was extremely strong in the northeast, where small and medium-sized companies produce high-quality and low-cost products—ranging from industrial machinery to ski boots—for French, German, Japanese, and Indian customers.

Italy had current account surpluses from 1993 to 1999, but in 2000 the country registered a \$5.6 billion deficit, after an \$8.2 billion surplus in 1999. Italy experienced weak economic growth in the period 2001–05. In 2004, the current account balance showed a deficit estimated at \$15.1 billion (0.9% of GDP).

### 3<sup>3</sup> BANKING AND SECURITIES

The Banca d'Italia, the central bank, was the sole bank of issue and exercised credit control functions until Italy's accession to the European Central Bank, which now controls monetary policy and the euro, the EU's common currency (excepting the United Kingdom, Denmark, and Sweden). La Banca d'Italia is still responsible for controlling domestic inflation and balance of payments pressures.

In March 1979, Italy became a founder member of the European Monetary System (EMS) and its Exchange Rate Mechanism (ERM). During the first 10 years of its membership, the lira was allowed to diverge by up to 6% against other member currencies before action had to be taken, compared with 2.25% for other ERM currencies. Uncertainty about Italy's ability to meet the convergence targets of the 1992 Treaty for European Union (Maastricht) for inflation, interest rates, and participation to stabilize the rate, the lira was withdrawn from the ERM in September 1992, after which the lira declined to just under DM1:L1,000. At the beginning of 1996 it began to appreciate again, and immediately after the April election it rose to L1,021:DM1. The introduction of the euro in 2002, however, made all that irrelevant.

In 2000, five banks are of nationwide standing: Intesa-Bci, San Paolo-IMI, the Banca di Roma, Unicredito Italiano, and the Banca Nazionale del Lavoro. There are many major international banks with branches in Italy. Among the more important are Chase, Citibank, Bank of America, HSBC, and others. The Istituto Mobiliare Italiano is the leading industrial credit institution; it also administers important government industrial investments. In 1987, the government privatized Mediobanca, another major industrial credit institution.

Two major banks, formally part of the Istituto per la Ricostruzione Industriale (IRI) group, were privatized in 1993–94: Unicredito Italiano (CREDIT) and Banca Commerciale Italiana (COMIT). The privatization of another IRI bank specializing in

medium- and long-term lending, the Istituto Mobiliare Italiano (IMI), was completed in 1996.

A new banking law was passed in 1993, to bring Italy into conformity with the EU's Second Banking directive, and to introduce two major innovations which aim to move Italy toward a model of universal banking. It allows banks to hold shares in industrial concerns; and it eliminates the distinction between banks (*aziende di credito*) and special credit institutions (*aziende di credito speciale*), thus allowing all banks to perform operations previously limited to specific types of intermediary.

On 30 January 1997, the government drafted legislation to promote restructuring and consolidation in Italy's largely inefficient and highly fragmented banking sector. The bill is the latest in a series of attempts since 1990 to rationalize the sector. However, it comes just as Italy's two biggest banks, CARIPLO and what is now San Paolo-IMI, announced plans to begin privatization by the end of 1997, and other banks in the private sector begin to negotiate strategic alliances, notably between: the private sector bank Ambroveneto and CARIPLO; Cassa di Risparmia di Torino and the Cassa di Risparmio di Verona. Mergers are also changing the face of the Italian banking industry. In early 1999, four of the five largest Italian banks were involved in such deals. Unicredito Italiano and Banca Commerciale Italiana merged to form Eurobanca, while San Paolo-IMI and Banca di Roma also planned to combine their operations. The International Monetary Fund reports that in 2001, currency and demand deposits—an aggregate commonly known as M1—were equal to \$458.4 billion. In that same year, M2—an aggregate equal to M1 plus savings deposits, small time deposits, and money market mutual funds—was \$628.9 billion. The money market rate, the rate at which financial institutions lend to one another in the short term, was 4.26%.

There are 10 stock exchanges in operation. The most important is that in Milan (established in 1808). The others, in order of importance, are Rome (1812), Turin (1850), Genoa (1855), Bologna (1861), Florence (1859), Naples (1813), Venice (1600), Trieste (1755), and Palermo (1876). Since 1974, the markets have been regulated by the National Commission for Companies and the Stock Exchange.

Radical reforms have been introduced in recent years in order to vitalize the stock market, which is greatly undercapitalized considering the size of the Italian economy. At the end of 1995, the capitalization of the Milan bourse was the equivalent of just 18% of GDP, compared with 32% in France and 122% in the United Kingdom. However, by 2002 market capitalization had increased to 41% of GDP.

In September 1991, stock market intermediation companies (SIM), a new form of stock broking and fund management firm, were introduced to accompany the shift from the open-outcry call auction system to a screen-based continuous auction market, which was completed in July 1994. In order to stimulate the demand for shares, in 1994 shareholders were given the option of paying a 12.5% flat tax rate instead of declaring dividends as part of taxable income. At the beginning of 1996, proposed Services Directive included the privatization of the stock market and the administrative bodies that run it as one of its main objectives.

Despite a certain amount of volatility, the Milan stock exchange index (MIB) has risen by 10.6% on 26 March 1997 since the end of 1996 and daily volume of transactions were up substantially. In

early-mid-2000, the MIB index hovered between 31,700–31,800. However, since the onset of the global recession, the index has dropped significantly. From January 2002 to January 2003, the MIB dropped 4.4%, down to 16,208, slightly more than half of its peak value. In 2004, the MIB-30 Index rose 16.9% from the previous year to 31,220. On the Borsa Italiana, a total of 269 companies were listed as of 2004, which had a market capitalization of \$789.563 billion.

### 34 INSURANCE

The insurance industry is government-supervised, and insurers must be authorized to do business. Automobile insurance was made compulsory in 1971, and coverage is also required for aircraft, powerboats, hunters, auditors, yachts, nuclear facilities, and insurance brokers. Among the most important nonlife insurance companies in Italy as of 2003 were Ras, Generali, Sai, and Assitalia. Leading life insurance companies as of 2003 included Alleanza, Creitras, Generali, and Sanpaolo. In 2003, the value of direct premiums written totaled \$111.761 billion, with life premiums accounting for \$71.694 billion. Italy's top nonlife insurer in 2003 was Fondiaria-SAI, with total written nonlife premiums (including personal accident and healthcare) of \$4,272.6 million. In that same year, the country's leading life insurer was Creditras, with gross written life premiums of \$5,977.6 million.

The insurance regulatory body is the Istituto per Vigilanza sulle Assicurazioni Private di Interesse Collettivo (ISVAP—the Institute for Control of Private Insurance Companies). European Union reporting and other insurance directives are being implemented. A unique and helpful feature of Italian insurance company reports is the inclusion of financial statements of major subsidiary or affiliated companies.

The Italian insurance market was traditionally characterized by a relatively large number of insurers with no one organization dominating the industry, although there were some very large, old insurance organizations which date back to the early 19th century. There are a number of foreign insurance companies operating through subsidiaries in Italy: these are primarily French and German companies. Italy's market indicates moderately low penetration when compared to North America and Northern Europe, especially for life products. In recent years, the volume of life products has increased quite rapidly as the consumer has become aware that the Italian Social Security System benefits will have to be supplemented by individual savings and as insurance awareness has increased through advertising campaigns and the distribution of insurance products through the extensive branch banking system of the country. Foreign influence and industry consolidation in the Italian insurance industry is expected to rise due to the adoption of the euro and the emerging willingness of Italian companies to mount hostile takeover bids. Much of the new merger-mania expected to sweep Italian insurance is projected to come from the banking sector as banks continue to expand their interests in insurance sales.

### 35 PUBLIC FINANCE

Reflecting both increasing economic activity and the pressures of inflation, the Italian budget has expanded continually since 1950. The Italian economy has traditionally run a high govern-

ment debt, but in recent years it has been quelled somewhat, despite lackluster growth. In 1995, the debt stood at 124% of GDP, but declined to 110.6% in 2000 and 109.4% in 2001. At that point the Italian government still had a long way to go to get down to the EU-imposed debt-to-GDP ratio of 60%. Since 1996, Italy has maintained a primary budget surplus, net of interest payments, and has reduced its deficit in public administration from 1.7% of GDP in 2000 to 1.4% in 2001. However, given the high national debt, the EU remains concerned about Italy's budgetary policies.

The US Central Intelligence Agency (CIA) estimated that in 2005 Italy's central government took in revenues of approximately \$785.7 billion and had expenditures of \$861.5 billion. Revenues minus expenditures totaled approximately -\$75.8 billion. Public debt in 2005 amounted to 107.3% of GDP. Total external debt was \$1.682 trillion.

**36 TAXATION**

The Italian tax system is considered among the most complicated in the world. Since the late 1990s, the government has been using tax cuts to stimulate economic growth. On 1 January 1998 the government introduced the Dual Income Tax (DIT) system designed to encourage investment by taxing income deemed to be derived from the increase in equity capital in a company at a lower rate than the standard corporate income tax rate. In 2003, the corporate income tax rate (IRPEG), at 36% in 2002, was reduced to 34%. As of 2005, the standard corporate rate was 33%, excluding a 4.25% regional tax (IRAP) on productive activities. Capital gains realized by companies are taxable as business income under the IRPEG and IRAP, and capital losses are deductible. Dividends are taxed at 27% with complete withholding ("payment at the source" or PAYE). This rate may be reduced to 12.5% if residents can show that they had a "nonsubstantial participation" in the firm. A 0% rate applies to dividends paid to resident companies. The PAYE rate for dividends paid to branches of companies from other EU countries is 12.5%

The schedule of personal income tax rates was reformed in 2003 to reduce tax rates and to increase the amount covered by the lowest income band. As of 2005, the individual tax rate progressively increases to a top rate of 39%. However, a solidarity contribution of 4% pushes the top rate to 43%. On 25 October 2001 Italy's gift and inheritance taxes were abolished by the Parliament.

Italy's main indirect tax is its value-added tax (VAT) introduced on 1 January 1973 with a standard rate of 12%, replacing a turnover tax on goods and services. Since 10 January 1997 the standard rate has been at 20% and is applicable to most goods and services. A reduced rate of 10% is applied to some foodstuffs, certain fuel supplies, some transport and some housing, consumers, catering services and live animals. A 4% rate is applied to some foodstuffs, books, newspapers and periodicals, agricultural inputs, and medical equipment. Basic medical and dental services, as well as financial and insurance services are exempt from VAT. A 0% rate is applied to supplies of unwrought gold and ferrous and nonferrous metal scrap, and land not suitable for buildings. Other taxes on transactions include stamp taxes, and contract registration tax.

**37 CUSTOMS AND DUTIES**

Italy's membership in the European Union has greatly influenced its tariff structure. Duties on imports from then-European Community members and their dependencies were gradually reduced following the Rome Pact in 1957 and disappeared by 1969, more than a year ahead of schedule. Duties on goods from Greece, which entered the European Community in 1981, were reduced gradually and eliminated by 1986. Italy's adjustment of its tariff structure to that of the now-European Union also has resulted in a substantial reduction of duties on products imported from areas other than the European Union, including the United States.

Import duties on manufactured goods from non-EU countries range from 5–8%, while raw materials enter mostly duty-free. Other import taxes include a value-added tax (VAT) that ranges from 0–20% depending on the product and excise taxes on alcoholic beverages, tobacco, sugar and petroleum products.

**38 FOREIGN INVESTMENT**

Because of a lack of domestic venture capital, the government encourages foreign industrial investment through tax concessions on a case-by-case basis. Foreign ownership, however, is limited by law and includes the following regulations: foreign investment can be limited for "reasons essential to the national economy." As a consequence, foreign investment in banks is limited to less than 5% of an institution's capital without government consent. Although privatization is encouraging foreign investment, defense industries remain off limits to non-Italians. However, the extent of the state's direct involvement in the economy has been greatly reduced by the privatization program carried out by successive governments since 1993, encouraged by EU restrictions on state aid to industry and the need to reduce public-sector debt. In an effort to increase confidence of foreign investors in Italy's economic development, the government has enacted legislation providing special incentives, particularly for investments in the south—Sicily, Sardinia, and the peninsula south of Rome. In recent years, and in accordance with EU liberalization, foreign restrictions on foreign

investment in Italy have eased. The corporate tax rate was cut from 36% to 33% in 2004.

Annual foreign direct investment (FDI) into Italy was \$2.6 billion in 1998, down from \$3.7 billion in 1997. Total FDI stock in Italy in 1998 was about \$103 billion. Annual FDI inflow jumped to almost \$7 billion in 1999 and continued to increase for the next three years: to \$13.4 billion in 2000, \$14.9 billion in 2001, and \$15.2 billion in 2002, an average of \$13.7 billion a year. Total FDI stock in Italy reached about \$140 billion by 2002. Italy has remained an underachiever, however, in the attraction of FDI. For the period 1988 to 1990, Italy's share of world FDI inflows was 60% of its share of world GDP. For the period 1998 to 2000, Italy's share of world inward FDI had dropped to only 20% of its share of world GDP. About 63% of inward stock in the 1990s had come from EU countries, up from 55% in the 1980s.

In the 1980s, outward FDI had about equaled inward FDI in Italy, but in the 1990s Italy became a net outward investor. From 1999 to 2002, average annual outward FDI from Italy was \$18.4 billion. As of 2001, FDI stock held by Italians in foreign countries totaled about \$236 billion. Roughly 60% of Italian holdings of outward stock in the 1990s were in EU countries, the same as in the 1980s.

From 2000–04, FDI inflows averaged 1.2% of GDP. In 2004, Italy jumped from 12th to 9th most attractive FDI destination in the world, driven primarily by increased confidence among US and Asian investors, according to the FDI Confidence Index. In 2004, intra-EU-25 FDI inflows to Italy amounted to €10.2 billion; extra-EU-25 inflows amounted to €1.9 billion. That year, outward Italian FDI flows to the EU-25 amounted to €14.2 billion; outward FDI flows from Italy to non-EU-25 countries amounted to €0.5 billion. In all, inward FDI in 2004 totaled \$16.8 billion; outward FDI totaled \$19.3 billion.

### 39 ECONOMIC DEVELOPMENT

Under Mussolini, business and labor were grouped into corporations that, in theory at least, jointly determined economic policy. Also, under the Fascist regime, direct government control over the economy was increased through the creation of powerful economic bodies, such as the Institute for Industrial Reconstruction. Although the corporative system disappeared after the fall of Mussolini, the concept of economic planning remained firmly implanted among the large Marxist parties, as well as among Christian Democratic leaders, who—by different means and for different reasons—sought to create a society free from the class warfare associated with a strictly liberal economic system.

Principal government objectives following World War II were reconstruction of the economy; stabilization of the currency; and long-term, large-scale investment aimed at correcting the imbalance of the Italian economy and, in particular, the imbalance between northern and southern Italy. The first and second phases of this policy were accomplished by 1949. Then the government, supported by domestic financial and industrial groups and by foreign aid, principally from the United States, embarked on the third and most important phase, best known as the Vanoni Plan (after former finance minister Ezio Vanoni). Notable in this development effort was the Cassa per il Mezzogiorno, a government agency set up to develop southern Italy and attract private investment to the region. Between 1951 and 1978, government spending on infra-

structure in the south was \$11.5 billion; additional low-cost loans totaled \$13 billion, and outright grants amounted to \$3.2 billion.

Simultaneously, direct government control of the economy increased through such government agencies as ENI (National Hydrocarbon Agency), whose activities expanded rapidly in the postwar era. The nationalization of the electric industry, in order to lay the industrial base for a more highly planned economy, and the creation of the National Economic Planning Board composed of leaders from government, industry, and labor were further indications of the importance attached to the concept of a planned Italian economy.

The combined effects of inflation, increased energy prices, and political instability posed serious economic problems during the 1970s. With Italy mired in recession in the early 1980s, economic policy was directed at reducing the public sector deficit, tightening controls on credit, and maintaining a stable exchange rate, chiefly through a variety of short-term constraints. A period of recovery began in 1983, leading to expanded output and lower inflation but also to expanded unemployment. The economic policy aims in 1987 included the reduction of the public-sector deficit and unemployment. Furthermore, improvement in the external sector (due mainly to the fall of oil prices and depreciation of the dollar) led to liberalization of the foreign exchange market in 1987.

Priorities of the early 1990s were cutting government spending, fighting tax evasion to reduce public debt, and selling off state-owned enterprises. At the end of the decade the results of these policies were mixed. Liberalization provided the impetus for greater foreign investment, while the funds generated from privatization eased the public debt. Italy qualified for the first round of Economic and Monetary Union (EMU) and entered the euro zone in 1999. Tax evasion remains a problem; the underground economy is still estimated at nearly 25% of official GDP. Moreover, the economic disparities between the prosperous north and the impoverished south remain.

The strength of the economy rests on the back of small- and medium-sized family-owned companies, mostly in the north and center of the country. In 2005, the average Italian company employed 4 people, and industrial companies had an average of around 9 employees, compared with an average 15 employees in the EU. In mid-2000, Italy's largest state holding company, Istituto per la Ricostruzione Industriale (IRI), was liquidated.

Italy's public debt in 2004 was estimated at 105.6% of GDP. The EU's mandated debt to GDP ratio is 60%. The budget deficit was forecast to rise from about 3% of GDP in 2004 to 4–4.5% in 2005–06, before falling to just under 4% in 2007. GDP growth remained flat in 2005, but was expected to pick up to a still disappointing 1–1.2% in 2006–07. Reform of the pension system continues to be a controversial policy issue. The focus of economic policy has been on cutting taxes, fighting unemployment, enhancing competitiveness, and reducing both the budget deficit and debt. However, the only areas in which the government had made limited progress by 2005 were in the labor market and the pension system. Balancing fiscal austerity and policies to promote growth pose a major economic policy challenge.

### 40 SOCIAL DEVELOPMENT

Social welfare legislation in Italy, begun in 1898, was redesigned by law in 1952 and has subsequently been expanded. All workers

and their families are covered and receive old-age, disability, and survivor pensions, unemployment and injury benefits, health and maternity coverage. The system is primarily funded by employer contributions, along with employee payments and some government subsidies. Family allowances are paid for primarily by employer contributions, and are determined by the size and income of the family. Conditions for old age pensions have varying conditions. The first maternity coverage was initiated in 1912, and was most recently updated in 2001.

Despite full legal rights under law, women face some social discrimination in Italy. On average, women earn less than men and are underrepresented in management, the professions, and other areas. Sexual abuse and violence remain a problem, although when reported, the authorities prosecute perpetrators and assist victims. Increased public awareness of sexual harassment and violence increased the number of reported abuses in 2004. The government is committed to protecting and promoting children's rights.

Human rights are generally respected in Italy. Lengthy pretrial detentions still occur due to the slow pace of the judicial system, and occasional cases of the mistreatment of prisoners were reported. Discrimination based on race, sex, religion, ethnicity, disability, and language is prohibited by law.

#### 41 HEALTH

A national health plan, begun in 1980, seeks to provide free health care for all citizens, but certain minimum charges remain. It is financed by contributions from salaries, by employers, and by the central government. Patients are still able to choose their own health care providers. Reform implementation in the 1980s and 1990s has been difficult. In 1994, the government announced plans to dismantle public universal insurance. Reforms in 1999 sought to integrate primary care with other health care programs, including home care, social services, and health education. Consistent health reforms are hampered by frequent political changes in administration. Most private hospitals have contracts with the national plan, but health care services are more highly concentrated in the northern regions of Italy. The shortage of medical personnel and hospital facilities in Italy's rural areas remains serious. Closure of a number of underutilized hospitals was planned and the government has been making efforts to curb the state deficit in health expenditures; budgets and estimates are repeatedly more than demand. Health care expenditures were 8.2% of GDP.

As of 2004, Italy had the highest number of physicians per capita at an estimated 606 per 100,000 people. In addition, there were approximately 446 nurses, 59 dentists and 110 pharmacists per 100,000 population. In the same year, Italy had 842 public hospitals and 539 private ones, for a total of approximately 276,000 beds.

The infant mortality rate, 72.1 per 1,000 live births in 1948, decreased to 5.94 per 1,000 by 2005, when average life expectancy was estimated to be 79.68 years. As of 2002, birth and death rates were estimated respectively at 8.9 and 10.1 per 1,000 people. Approximately 78% of married women (ages 15 to 49) were using contraception.

In 1999, immunization rates for children up to one year of age were: diphtheria, pertussis, and tetanus, 95%, and measles, 70%. The major causes of death were circulatory system diseases, cancers, respiratory diseases, and accidents and violence. As of 2004,

there were approximately 140,000 people living with HIV/AIDS in the country. The HIV/AIDS prevalence was 0.50 per 100 adults in 2003. There were an estimated 1,000 deaths from AIDS in 2003.

#### 42 HOUSING

Italy's housing and public building program was a major item in the general program of postwar reconstruction. Between 1940 and 1945, almost 20% of the habitable rooms in the country were destroyed. From June 1945 to June 1953, however, of the 6,407,000 rooms destroyed or severely damaged, 354,100 were rebuilt and 4,441,000 were repaired. Under a special housing program, originally instituted with funds from UNRRA and subsequently financed by employer and employee contributions, a total of 15 million rooms were constructed between 1953 and 1961, alleviating the nation's immediate housing problems.

In the 1980s 59% of all dwellings were owner occupied and 36% were rented. Almost 88% had indoor flush toilets, 99.5% had electricity, 59% had central heating, and 34% were heated by a stove or similar source. In 1999, 156,000 new dwellings were completed.

#### 43 EDUCATION

Education is free and compulsory for eight years (for students age 6 through 15), this includes five years of elementary school and three years of lower secondary school. Next, students may choose to attend a technical school, a vocational school, or one of several academic secondary schools, which offer a choice of specialized programs in classical, scientific, linguistic, and artistic studies. All secondary programs generally cover a five-year course of study.

In 2001, about 98% of children between the ages of three and five were enrolled in some type of preschool program. Primary school enrollment in 2003 was estimated at about 99% of age-eligible students. The same year, secondary school enrollment was about 91% of age-eligible students. The student-to-teacher ratio for primary school was at about 11:1 in 2003.

There are 55 state universities and 23 other universities, colleges, and higher learning institutes, including the University of Bologna (founded in the 11th century), the oldest in Italy, and the University of Rome, which is the country's largest. In 2003, about 57% of the tertiary age population were enrolled in some type of higher education program; with 49% for men and 65% for women. The adult literacy rate for 2003 was estimated at about 98.6%.

As of 2003, public expenditure on education was estimated at 4.7% of GDP, or 10.3% of total government expenditures.

#### 44 LIBRARIES AND MUSEUMS

Italy, with its rich cultural heritage, is one of the world's great storehouses of books and art. Among its many of libraries, the most important are in the national library system, which contains two central libraries, in Florence (5.3 million volumes) and Rome (5 million), and four regional libraries, in Naples (1.8 million volumes), Milan (1 million), Turin (973,000) and Venice (917,000). The existence of two national central libraries, while most nations have one, came about through the history of the country, as Rome was once part of the Papal States and Florence was the first capital of the unified Kingdom of Italy. While both libraries are designated as copyright libraries, Florence now serves as the site designated for conservation and cataloging of Italian publications and the site in Rome catalogs foreign publications acquired by the

state libraries. All of the national libraries are public. The Estense Library in Modena holds 425,600 volumes, including illuminated manuscripts from the 14th to 18th centuries. The university libraries in Bologna (1.1 million volumes) and Naples (750,000 volumes) each hold important collections. The Medici-Laurentian and Marucelliana (544,000) libraries in Florence and the Ambrosiana Library in Milan are also important research centers. Italy's public library system has about 84 branches and holds a total of 41 million volumes.

Italy, a world center of culture, history and art, has more than 3,000 museums. Among the more important are the Villa Giulia Museum and the National Gallery in Rome; the National Archaeological Museum and the National Museum of San Martino in Naples; the National Museum in Palermo; the Galleria dell'Accademia, and Uffizi, Medici, Pitti, Bargello, and St. Mark's Museums in Florence; the National Museum in Cagliari, Sardinia; the Brera Museum in Milan; the Museum of Siena; the Archaeological Museum of Syracuse (Siracusa); the National Museum of Urbino; and the Guggenheim Museum and the Academy and Libreria Sansoviniana in Venice. Venice also has the Jewish Museum, the Diocesan Museum of Sacred Art, a Natural History Museum, an Archaeological Museum, and the Museum of Byzantine Icons. The Campidoglio Museum, the Museum of Villa Borghese, and the Palazzo Barberini Museum, all in Rome, each contain important works of art by Italian masters. Naples hosts the Museum of Ethnoprohistory of Castel Dell'ovo and museums of paleontology, mineralogy, anthropology, and astronomy. The National Museum of Science and technology in Milan has an extensive exhibit on Leonardo da Vinci, including models of some of the machines designed by the Renaissance man. A Goethe museum, with manuscripts and illustrations describing Goethe's travels in Italy, opened in 1997 in Rome. Villa Torlonia, Mussolini's home, was renovated in 2001 and opened as a museum.

#### 45 MEDIA

Communication systems in Italy, including telephone, telex, and data services, are generally considered to be modern, well developed, and fully automated. In 2003, there were an estimated 484 mainline telephones for every 1,000 people. The same year, there were approximately 1,018 mobile phones in use for every 1,000 people.

Radiotelevisione Italiana (RAI), a government corporation, broadcasts on three channels. In 2004, there were an additional four national broadcast channels, three of which were operated by Mediaset, a company owned by Prime Minister Berlusconi. A 2004 media law initiated an intent to partially privatize RAI. Advertising appears on RAI television, two of the three RAI radio networks, and on many private stations. In 2003, there were an estimated 878 radios for every 1,000 people. The number of television sets was unavailable in the same survey. Also in 2003, there were 230.7 personal computers for every 1,000 people and 337 of every 1,000 people had access to the Internet. There were 1,994 secure Internet servers in the country in 2004.

As of 2002, there were about 90 daily newspapers in the country, but not all of them had national circulation. The major daily newspapers (with their political orientations and estimated circulations) are: *La Repubblica* (Rome), left-wing, 754,300 in 2004; *Corriere della Sera* (Milan), independent, 582,500 in 2002; *La Stampa*

(Turin), liberal, 536,233 in 2004; *Il Sole-24 Ore* (a financial news paper from Milan), 397,000 in 2002; *Il Messaggero* (Rome), left of center, 337,157 in 2004; *Il Resto del Carlino* (Bologna), 251,173 in 2004; *Il Giornale* (Milan), independent, 215,000 in 2002; and *L'Unità* (Rome-Milan), Communist, 200,760 in 2002. *Panorama* is the most popular news weekly with a circulation of 545,500 in 2002. The periodical press is becoming increasingly important. Among the most important periodicals are the pictorial weeklies—*Oggi*, *L'Europeo*, *Epoca*, *L'Espresso*, and *Gente*. *Famiglia Cristiana* is a Catholic weekly periodical with a wide readership.

Italy enjoys a free press, with vigorous expression of all shades of opinion. The majority of papers are published in northern and central Italy, and circulation is highest in these areas. Rome and Milan are the most important publication centers. A considerable number of dailies are owned by the political parties, the Roman Catholic Church, and various economic groups. In general, the journalistic level of the Italian papers is high, and two dailies, Milan's *Corriere della Sera* and Turin's *La Stampa*, enjoy international respect.

The law provides for freedom of speech and the press, and the government is said to respect these rights in practice.

#### 46 ORGANIZATIONS

Italian society abounds with organizations of every description. Many of these are associated with or controlled by political parties, which have their ideological counterparts in labor organizations, agricultural associations, cultural groups, sports clubs, and cooperatives. Among the most important organizations are the National Confederation of Smallholders and the General Confederation of Italian Industry, which strongly influences economic policy. The General Confederation of Agriculture, the General Confederation of Trade, and the General Confederation of Master Craftsmen also are influential. There are chambers of commerce in most major cities. There are labor and trade unions and professional associations representing a wide variety of occupations. A large number of professional organizations are dedicated to research and education in specialized fields of medicine or for particular diseases and conditions.

Catholic Action and the Catholic Association of Italian Workers are the most prominent of the religious organizations. The international religious Order of St. Augustine and the Society of Jesus (Jesuits) are based in Rome.

A number of political and religious organizations sponsor youth chapters. Scouting programs and chapters of the YMCA/YWCA are also active for youth. Sports associations are plentiful and include such a variety of pastimes as tennis, badminton, taekwon do, cricket, and football (soccer). National women's organizations include the National Italian Women's Council, the Italian Association for Women in Development, and the Italian Women's Center, based in Rome.

International organizations within the country include Amnesty International, Caritas, and the Red Cross.

#### 47 TOURISM, TRAVEL, AND RECREATION

Among Italy's tourist attractions are the artistic and architectural treasures of Rome and Florence; the thousands of historic churches and galleries in smaller cities; the canals and palaces of Venice; the ruins of ancient Pompeii; the Shroud of Turin, reputed

to be the burial cloth of Jesus; and the delicacies of northern Italian cooking, as well as the heartier fare of the south. Tourists are also lured by Italy's many beaches and by excellent Alpine skiing. Italians enjoy a wide variety of sports, including football (soccer), bowling, tennis, track and field, and swimming. Italy won the World Cup in soccer three times, in 1934 (as host), 1938, and 1982. Cortina d'Ampezzo, in the Dolomites, was the site of the 1956 Winter Olympics. Rome hosted the Summer Olympics in 1960. Turin was the host the 2006 Winter Olympics.

A valid passport is necessary to travel to Italy. For stays of up to 90 days a visa is not required. Within eight days all travelers must register with local police and obtain a visitor's permit. Proof of sufficient funds for the visit may also be required.

Tourism, a major industry in Italy, brought in 39,604,118 visitors in 2003. There were 999,722 hotel rooms with 1,969,495 beds and an occupancy rate of 39%. Tourism expenditure receipts totaled \$32.5 billion.

In 2005, the US Department of State estimated the daily expenses for staying in Rome at \$490; in Florence, \$437; in Milan, \$442; and in Venice, \$341.

## 48 FAMOUS ITALIANS

The Italian peninsula has been at the heart of Western cultural development at least since Roman times. Important poets of the Roman republic and empire were Lucretius (Titus Lucretius Carus, 96?–55 BC), Gaius Valerius Catullus (84?–54 BC), Vergil (Publius Vergilius Maro, 70–19 BC), Horace (Quintius Horatius Flaccus, 65–8 BC), and Ovid (Publius Ovidius Naso, 43 BC–AD 18). Also prominent in Latin literature were the orator-rhetorician Marcus Tullius Cicero (106–43 BC); the satirists Gaius Petronius Arbiter (d. AD 66) and Juvenal (Decimus Junius Juvenalis, AD 60?–140?); the prose writers Pliny the Elder (Gaius Plinius Secundus, AD 23–79), his nephew Pliny the Younger (Gaius Plinius Caecilius Secundus, AD 61?–113?), and Lucius Apuleius (AD 124?–170?); and the historians Sallust (Gaius Sallustius Crispus, 86–34 BC), Livy (Titus Livius, 59 BC–AD 17), Cornelius Tacitus (AD 55?–117), and Suetonius (Gaius Suetonius Tranquillus, AD 69?–140). Gaius Julius Caesar (100?–44 BC), renowned as a historian and prose stylist, is even more famous as a military and political leader. The first of the Roman emperors was Octavian (Gaius Octavianus, 63 BC–AD 14), better known by the honorific Augustus. Noteworthy among later emperors are the tyrants Caligula (Gaius Caesar Germanicus, AD 12–41) and Nero (Lucius Domitius Ahenobarbus, AD 37–68), the philosopher-statesman Marcus Aurelius (Marcus Annius Verus, AD 121–180), and Constantine I (the Great; Flavius Valerius Aurelius Constantinus, b. Moesia, 280?–337), who was the first to accept Christianity. No history of the Christian Church during the medieval period would be complete without mention of such men of Italian birth as St. Benedict of Nursia (480?–543?), Pope Gregory I (St. Gregory the Great, 540?–604), St. Francis of Assisi (1182?–1226), and the philosopher-theologians St. Anselm (1033?–1109) and St. Thomas Aquinas (1225–74).

No land has made a greater contribution to the visual arts. In the 13th and 14th centuries there were the sculptors Niccolò Pisano (1220–84) and his son Giovanni (1245–1314); the painters Cimabue (Cenni di Pepo, 1240–1302?), Duccio di Buoninsegna (1255?–1319), and Giotto di Bondone (1276?–1337); and, later in the period, the sculptor Andrea Pisano (1270?–1348). Among the

many great artists of the 15th century—the golden age of Florence and Venice—were the architects Filippo Brunelleschi (1377–1446), Lorenzo Ghiberti (1378–1455), and Leone Battista Alberti (1404–72); the sculptors Donatello (Donato di Niccolò di Betto Bardi, 1386?–1466), Luca della Robbia (1400–1482), Desiderio da Settignano (1428–64), and Andrea del Verrocchio (1435–88); and the painters Fra Angelico (Giovanni de Fiesole, 1387–1455), Sassetta (Stefano di Giovanni, 1392–1450?), Uccello (Paolo di Dono, 1397–1475), Masaccio (Tommaso di Giovanni di Simone Guidi, 1401–28?), Fra Filippo Lippi (1406?–69), Piero della Francesca (Pietro de' Franceschi, 1416?–92), Giovanni Bellini (1430?–1516), Andrea Mantegna (1431–1506), Antonio dei Pollaiuolo (1433–98), Luca Signorelli (1441?–1523), Perugino (Pietro Vannucci, 1446–1524), Sandro Botticelli (Alessandro Filipepi, 1447?–1510), Ghirlandaio (Domenico Currado Bigordi, 1449–94), and Vittore Carpaccio (1450–1522).

During the 16th century, the High Renaissance, Rome shared with Florence the leading position in the world of the arts. Major masters included the architects Bramante (Donato d'Agnolo, 1444?–1514) and Andrea Palladio (1508–80); the sculptor Benvenuto Cellini (1500–1571); the painter-designer-inventor Leonardo da Vinci (1452–1519); the painter-sculptor-architect-poet Michelangelo Buonarroti (1475–1564); and the painters Titian (Tiziano Vecelli, 1477–1576), Giorgione da Castelfranco (Giorgio Barbarelli, 1478?–1510), Raphael (Raffaello Sanzio, 1483–1520), Andrea del Sarto (1486–1531), and Correggio (Antonio Allegri, 1494–1534). Among the great painters of the late Renaissance were Tintoretto (Jacopo Robusti, 1518–94) and Veronese (Paolo Cagliari, 1528–88). Giorgio Vasari (1511–74) was a painter, architect, art historian, and critic.

Among the leading artists of the Baroque period were the sculptor and architect Giovanni Lorenzo Bernini (1598–1680) and the painters Michelangelo Merisi da Caravaggio (1560?–1609), Giovanni Battista Tiepolo (1690–1770), Canaletto (Antonio Canal, 1697–1768), Pietro Longhi (1702–85), and Francesco Guardi (1712–93). Leading figures in modern painting were Umberto Boccioni (1882–1916), Amedeo Modigliani (1884–1920), Giorgio di Chirico (b. Greece, 1888–1978), and Giorgio Morandi (1890–1964). A noted contemporary architect was Pier Luigi Nervi (1891–1979).

Music, an integral part of Italian life, owes many of its forms as well as its language to Italy. The musical staff was either invented or established by Guido d'Arezzo (995?–1050). A leading 14th-century composer was the blind Florentine organist Francesco Landini (1325–97). Leading composers of the High Renaissance and early Baroque periods were Giovanni Pierluigi da Palestrina (1525–94); the madrigalists Luca Marenzio (1533–99) and Carlo Gesualdo, prince of Venosa (1560?–1613); the Venetian organists Andrea Gabrieli (1510?–86) and Giovanni Gabrieli (1557–1612); Claudio Monteverdi (1567–1643), the founder of modern opera; organist-composer Girolamo Frescobaldi (1583–1643); and Giacomo Carissimi (1605–74). Important figures of the later Baroque era were Arcangelo Corelli (1653–1713), Antonio Vivaldi (1678–1743), Alessandro Scarlatti (1660–1725), and his son Domenico Scarlatti (1683–1757). Italian-born Luigi Cherubini (1760–1842) was the central figure of French music in the Napoleonic era, while Antonio Salieri (1750–1825) and Gasparo Spontini (1774–1851) played important roles in the musical life of

Vienna and Berlin, respectively. Composers of the 19th century who made their period the great age of Italian opera were Gioacchino Antonio Rossini (1792–1868), Gaetano Donizetti (1797–1848), Vincenzo Bellini (1801–35), and, above all, Giuseppe Verdi (1831–1901). Niccolò Paganini (1782–1840) was the greatest violinist of his time. More recent operatic composers include Ruggero Leoncavallo (1853–1919), Giacomo Puccini (1858–1924), and Pietro Mascagni (1863–1945). Renowned operatic singers include Enrico Caruso (1873–1921), Luisa Tetrazzini (1874–1940), Titta Ruffo (1878–1953), Amelita Galli-Curci (1882–1963), Beniamino Gigli (1890–1957), Ezio Pinza (1892–1957), and Luciano Pavarotti (b.1935). Ferruccio Busoni (1866–1924), Ottorino Respighi (1879–1936), Luigi Dallapiccola (1904–75), Luigi Nono (1924–1990), and Luciano Berio (1925–2003) are major 20th-century composers. Arturo Toscanini (1867–1957) is generally regarded as one of the greatest operatic and orchestral conductors of his time; two noted contemporary conductors are Claudio Abbado (b.1933) and Riccardo Muti (b.1941). The foremost makers of stringed instruments were Gasparo da Salò (Bertolotti, 1540–1609) of Brescia, Niccolò Amati (1596–1684), Antonius Stradivarius (Antonio Stradivari, 1644–1737), and Giuseppe Bartolomeo Guarneri (del Gesù, 1687?–1745) of Cremona. Bartolomeo Cristofori (1655–1731) invented the pianoforte.

Italian literature and literary language began with Dante Alighieri (1265–1321), author of *The Divine Comedy*, and subsequently included Petrarch (Francesco Petrarca, 1304–74), Giovanni Boccaccio (1313–75), Lodovico Ariosto (1474–1533), Pietro Aretino (1492–1556), and Torquato Tasso (1544–95). An outstanding writer of the Baroque period was Metastasio (Pietro Trapassi, 1698–1782), and Carlo Goldoni (1707–93) was the most prominent playwright of the 18th century. The time of Italy's rebirth was heralded by the poets Vittorio Alfieri (1749–1803), Ugo Foscolo (1778–1827), and Giacomo Leopardi (1798–1837). Alessandro Manzoni (1785–1873) was the principal Italian novelist of the 19th century, and Francesco de Sanctis (1817–83) the greatest literary critic. Among the Italian literary figures of the late 19th and early 20th centuries, Giosuè Carducci (1835–1907; Nobel Prize winner, 1906), Giovanni Verga (1840–1922), Gabriele d'Annunzio (1863–1938), Luigi Pirandello (1867–1936; Nobel Prize winner, 1934), and Grazia Deledda (1875–1936; Nobel Prize winner, 1926) achieved international renown. Leading writers of the post-war era are Ignazio Silone (Secondo Tranquilli, 1900–78), Alberto Moravia (Pincherle, 1907–1990), Italo Calvino (1923–87), Umberto Eco (b.1932), and the poets Salvatore Quasimodo (1908–68; Nobel Prize winner, 1959) and Eugenio Montale (1896–1981; Nobel Prize winner, 1975). Outstanding film directors are Italian-born Frank Capra (1897–1991), Vittorio de Sica (1902–74), Luchino Visconti (1906–76), Roberto Rossellini (1906–77), Michelangelo Antonioni (b.1912), Federico Fellini (1920–93), Sergio Leone (1929–1989), Pier Paolo Pasolini (1922–75), Franco Zeffirelli (b.1923), Lina Wertmüller (Arcangela Felice Assunta Wertmüller von Elgg, b.1928), and Bernardo Bertolucci (b.1940). Famous film stars include Italian-born Rudolph Valentino (Rodolfo Alfonso Raffaele Pierre Philibert Guglielmi, 1895–1926), Marcello Mastroianni (1924–1996), and Sophia Loren (Scicoloni, b.1934).

In philosophy, exploration, and statesmanship, Italy has produced many world-renowned figures: the traveler Marco Polo (1254?–1324); the statesman and patron of the arts Cosimo de'

Medici (1389–1464); the statesman, clergyman, and artistic patron Roderigo Borgia (Lanzol y Borja, b. Spain, 1431?–1503), who became Pope Alexander VI (r.1492–1503); the soldier, statesman, and artistic patron Lorenzo de' Medici, the son of Cosimo (1449–92); the explorer John Cabot (Giovanni Caboto, 1450?–98?); the explorer Christopher Columbus (Cristoforo Colombo or Cristóbal Colón, 1451–1506); the explorer Amerigo Vespucci (1454–1512), after whom the Americas are named; the admiral and statesman Andrea Doria (1468?–1540); Niccolò Machiavelli (1469–1527), author of *The Prince* and the outstanding political theorist of the Renaissance; the statesman and clergyman Cesare Borgia (1475?–1507), the son of Rodrigo; the explorer Sebastian Cabot (1476?–1557), the son of John; Baldassare Castiglione (1478–1529), author of *The Courtier*; the historian Francesco Guicciardini (1483–1540); the explorer Giovanni da Verrazano (1485?–1528?); the philosopher Giordano Bruno (1548?–1600); the political philosopher Giovanni Battista Vico (1668–1744); the noted jurist Cesare Bonesana Beccaria (1735–94); Giuseppe Mazzini (1805–72), the leading spirit of the Risorgimento; Camillo Benso di Cavour (1810–61), its prime statesman; and Giuseppe Garibaldi (1807–82), its foremost soldier and man of action. Notable intellectual and political leaders of more recent times include the Nobel Peace Prize winner in 1907, Ernesto Teodoro Moneta (1833–1918); the sociologist and economist Vilfredo Pareto (1848–1923); the political theorist Gaetano Mosca (1858–1941); the philosopher, critic, and historian Benedetto Croce (1866–1952); the educator Maria Montessori (1870–1952); Benito Mussolini (1883–1945), the founder of Fascism and dictator of Italy from 1922 to 1943; Carlo Sforza (1873–1952) and Alcide De Gasperi (1881–1954), famous latter-day statesmen; and the Communist leaders Antonio Gramsci (1891–1937), Palmiro Togliatti (1893–1964), and Enrico Berlinguer (1922–84).

Italian scientists and mathematicians of note include Leonardo Fibonacci (1180?–1250?), Galileo Galilei (1564–1642), Evangelista Torricelli (1608–47), Francesco Redi (1626?–97), Marcello Malpighi (1628–94), Luigi Galvani (1737–98), Lazzaro Spallanzani (1729–99), Alessandro Volta (1745–1827), Amedeo Avogadro (1776–1856), Stanislao Cannizzaro (1826–1910), Camillo Golgi (1843–1926; Nobel Prize winner, 1906), Guglielmo Marconi (1874–1937; Nobel Prize winner, 1909), Enrico Fermi (1901–54; Nobel Prize winner, 1938), Giulio Natta (1903–79; Nobel Prize winner, 1963), Italian-American Emilio Gino Segrè (1905–1989; Nobel Prize winner, 1959), Daniel Bovet (1907–1992; Nobel Prize winner, 1957), Renato Dulbecco (b.1914; Nobel Prize winner, 1975), Carlo Rubbia (b.1934; Nobel Prize winner, 1984), and Rita Levi-Montalcini (1909–1989; Nobel Prize winner, 1986), and Italian-American Riccardo Giacconi (b.1931; Nobel Prize winner, 2002).

# LATVIA

Republic of Latvia  
*Latvijas Republika*

**CAPITAL:** Riga

**FLAG:** The flag consists of a single white horizontal stripe on a maroon field.

**ANTHEM:** *Dievs, svēti Latviju!* (God bless Latvia!).

**MONETARY UNIT:** The lat was introduced as the official currency in May 1993; \$1 = Ls1.78571 (or \$1 = Ls0.56) as of 2005.

**WEIGHTS AND MEASURES:** The metric system is in force.

**HOLIDAYS:** New Year's Day, 1 January; Good Friday (movable); Midsummer Festival, 23–24 June; National Day, Proclamation of the Republic, 18 November; Christmas, 25–26 December; New Year's Eve, 31 December.

**TIME:** 2 PM = noon GMT.

## <sup>1</sup> LOCATION, SIZE, AND EXTENT

Latvia is located in northeastern Europe, bordering the Baltic Sea, between Sweden and Russia. Comparatively, Latvia is slightly larger than the state of West Virginia, with a total area of 64,589 sq km (24,938 sq mi). Latvia shares boundaries with Estonia on the N, Russia on the E, Belarus on the S, Lithuania on the SW, and the Baltic Sea on the W. Latvia's land boundary length totals 1,150 km (713 mi). Its coastline is 531 km (330 mi). Latvia's capital city, Riga, is located near the southern edge of the Gulf of Riga.

## <sup>2</sup> TOPOGRAPHY

The topography of Latvia consists mainly of a central and eastern lowland plains enclosed in areas of uplands consisting of moderate-sized hills. The highest point in the country is Gaizinkalns (312 m/1,024 ft), located near the edge of the Vidzme uplands. The nation's longest river is the Daugava (Dvina); which begins in Russia and passes through both Belarus and Latvia in its course to the Gulf of Riga. The total length of the Daugava is 1,020 km (632 mi).

## <sup>3</sup> CLIMATE

The country's climate is influenced by geographical location and by its closeness to the North Atlantic Ocean. The average temperature in July is between 16.8°C and 17.6°C (62–64°F). In January the average temperature ranges between –2.8°C and 6.6°C (31–44°F). The rainfall in the country is between 56–79 cm (22–31 in).

## <sup>4</sup> FLORA AND FAUNA

Half of Latvia's soil is podzolic humus, which covers about one-third of the country's arable land. Woodlands make up about 47% of the country's territory, with one-half of the forests consisting of pines, birch, and firs. About 10% of the total land area is covered in marshes, swamps, or peat bogs. Species native to Latvia are the wild boar, Eurasian beaver, and brown bear. The Baltic Sea coast is home to a significant population of seals. The routes of migratory

birds pass along the Black Sea and over the country. As of 2002, there were at least 83 species of mammals, 216 species of birds, and over 1,150 species of plants throughout the country.

## <sup>5</sup> ENVIRONMENT

Air and water pollution are among Latvia's most significant environmental concerns and are largely related to a lack of waste treatment facilities. In 2000, the total of carbon dioxide emissions was at 6 million metric tons. Cars and other vehicles account for a majority of the country's air pollution. Acid rain has contributed to the destruction of Latvia's forests. Latvia's water supply is perilously polluted with agricultural chemicals and industrial waste. The Gulf of Riga and the Daugava River are both heavily polluted.

According to a 2006 report issued by the International Union for Conservation of Nature and Natural Resources (IUCN), threatened species included four types of mammals, eight species of birds, three species of fish, and eight species of invertebrates. Threatened species include the black vulture, the asp, the Eurasian beaver, the medicinal leech, the marsh snail, and the Russian desman. In 2003, about 13.4% of the total land area was protected, including six Ramsar wetland sites.

## <sup>6</sup> POPULATION

The population of Latvia in 2005 was estimated by the United Nations (UN) at 2,300,000, which placed it at number 138 in population among the 193 nations of the world. In 2005, approximately 16% of the population was over 65 years of age, with another 15% of the population under 15 years of age. There were 84 males for every 100 females in the country. According to the UN, the annual population rate of change for 2005–10 was expected to be –0.5%, a rate the government viewed as too low. The country has had low fertility rates since the mid-1990s. The projected population for the year 2025 was 2,156,000. The population density was 36 per sq km (92 per sq mi).

The UN estimated that 68% of the population lived in urban areas in 2005, and that population in urban areas was declining

at an annual rate of -0.99%. The capital city, Riga, had a population of 733,000 in that year, and Daugavpils had an estimated of 124,887. There were 75 urban localities, many located on rivers or coastal areas.

## **7** MIGRATION

Some 250,000 Latvians fled Soviet occupation during World War II, and others were sent to Soviet labor camps. After the war many Russians moved to Latvia.

With independence in 1991, citizenship issues surrounding the large non-Latvian ethnic population became a problem. Only 55% were ethnic Latvians; 32% were Russians; 3.9% Belarussians; and 9.1% other. Immigration from other former Soviet republics came to 4,590 in 1992. A breakthrough came in 1998 when the Citizenship Law was changed, abolishing the annual quota of naturalizations and entitling children born after independence to automatically acquire Latvian citizenship upon request from their parents. A total of 51,778 persons emigrated when Latvia gained independence in 1991; almost all of them went to Russia, Ukraine, or Belarus.

In 2000 there were 613,000 migrants living in Latvia. This amounts to about 25% of the total population. In 2004 noncitizens in Latvia numbered 452,003, and 173 were stateless, all of concern to the United Nations High Commissioner for Refugees (UNHCR). In 2005, the net migration rate was an estimated -2.25 migrants per 1,000 population, a change from -8.8 per 1,000 in 1990. The government views the immigration level as too high, but the emigration level as satisfactory.

## **8** ETHNIC GROUPS

According to 2002 estimates, the percentage of ethnic Latvians is about 57.7% of the total population. Russians constitute about 29.6% of the population; Belarussians make up 4.1%; Ukrainians account for 2.7%; Poles for 2.5%; Lithuanians for 1.4%; and others 2%. The Romani population is estimated at about 13,000 to 15,000 people. Nearly half the Russians and Ukrainians lived in Riga, where Russians formed a majority of the population. All residents of pre-1940 Latvia and their descendants are citizens. Naturalization requires 16 years' residence and fluency in Latvian.

## **9** LANGUAGES

Latvian (also called Lettish), a Baltic language written in the Roman alphabet, is the official language; it is spoken by about 58.2% of the population. It is highly inflected, with seven noun cases and six verb declensions. The stress is always on the first syllable. There are three dialects. The macron is used for long vowels, and there is a hacek for "h." A cedilla adds the y sound. Education is now available in both Latvian and Russian, the latter of which is spoken by about 37.5% of the population. Lithuania and other languages are spoken by about 4.3% of the population.

## **10** RELIGIONS

After declaring independence from the Soviet Union in 1991, freedom of religion and worship was restored for the first time since 1941. Christianity had arrived in Latvia in the 12th century, and the Reformation made Lutheranism the primary religious persua-

sion after 1530. Currently the three largest faiths are Catholicism, Lutheranism, and Orthodoxy.

In 2004, the Latvian Justice Ministry had registered more than 1,000 religious congregations, including 308 Lutheran, 264 Roman Catholic, 125 Orthodox, 96 Baptist, 67 Old Believer (a break-away Orthodox sect dating from the 17th century), 50 Seventh-Day Adventist, 15 Muslim, 13 Jehovah's Witnesses, 13 Methodists, 13 Jewish, 11 Hare Krishna, 5 Buddhist, 4 Mormon, and over 100 others. According to church membership rolls submitted to the Justice Ministry, the Lutheran Church has about 556,000 members, the Roman Catholic Church has about 430,405 members, and the Orthodox Churches have about 350,000 members. There are only about 6,000 Jews in the country.

The constitution provides for freedom of religion and this right is generally respected in practice. Though there is no state religion, six religions are recognized by the government as traditional religions: Lutheranism, Roman Catholicism, Orthodoxy, Old Believers, the Baptist Church, and Judaism. All other religions are categorized as "new" religions; these groups have not offered any reports of significant discrimination. Certain Christian holidays are celebrated as national holidays. The New Religions Consultative offers opinions to the government on specific issues. The Ecclesiastical Council offers regular input on issues of common concern.

## **11** TRANSPORTATION

Latvia's railroad system, as of 2004, consisted of 2,303 km (1,432 mi) of broad and narrow gauge railway that linked the country's port cities with Russia. More than 80% of railway use is for daily commuting. Of the total rail lines in operation, 2,270 km (1,412 mi) was broad gauge, of which 257 km (160 mi) had been electrified. In 2003, there were 69,919 km (43,490 mi) of highways in Latvia, all of which were paved. In that same year, there were 619,081 passenger cars and 125,030 commercial vehicles in use. Maritime ports include Riga, Ventspils, and Liepāja. In 2005, the merchant fleet consisted of 19 ships of 1,000 GRT or more, with a total of 53,153 GRT. Ventspils is the terminus of the 750 km (466 mi) oil pipeline from Polotsk, Belarus. As of 2004, the country also had 300 km (186 mi) of navigable waterways.

In 2004, Latvia had an estimated 50 airports, 23 of which had paved runways as of 2005. The principal airport at Riga has international air links to Helsinki, Stockholm, Copenhagen, and New York, as well as direct flights to Austria, Germany, Israel, Russia, and Belarus. In 2003 about 340,000 passengers were carried on scheduled domestic and international airline flights.

## **12** HISTORY

Germans, Poles, Swedes, and Russians competed for influence in what is now Latvia from the Middle Ages until the 18th century, when it was incorporated into the Russian Empire. During the 19th century, a Latvian nationalist movement arose which by the early 20th century sought independence. The political chaos in Europe following World War I provided the opportunity for Latvia to break away from Russia's control.

On 18 November 1918, the independent Republic of Latvia was proclaimed. Moscow recognized Latvian independence in the August 1920 Soviet-Latvian treaty, and the new republic joined the League of Nations in 1922. Latvia prospered economically during

LOCATION: 57°0' N; 25°0' E. BOUNDARY LENGTHS: Total boundary lengths, 1,150 kilometers (715 miles); Belarus, 141 kilometers (88 miles); Estonia, 339 kilometers (211 miles); Lithuania, 453 kilometers (281 miles); Russia, 217 kilometers (135 miles).

the 1920s, and began to export dairy and grain products to Europe. During the 1930s, as tensions in Europe escalated, the Soviet government allied itself with the United Kingdom and France, which in July 1939 granted the concession that Soviet troops could move into the Baltic States in case an indirect aggression was made by Germany. Sensing that an alliance between the United Kingdom, France, and the USSR would leave Germany politically and militarily surrounded, the Nazi government decided to reach its own agreement with the Soviet government in August 1939. A secret protocol to the 1939 Nazi-Soviet pact assigned Latvia to the Soviet sphere of influence.

Soviet forces invaded Latvia on 17 June 1940, and Latvia was incorporated into the USSR. Thousands of Latvia's military and law enforcement officials were executed; political and social leaders were imprisoned. Latvian civilians were deported en masse to Soviet camps in Siberia; 15,000 alone were expelled on the night of 14 June 1941. The Soviets, however, lost control of Latvia to the Germans in July 1941, shortly after Hitler launched his attack on the USSR. Soviet forces recaptured Latvia in 1944. During the Teheran Conference of November/December 1943 between US

president Franklin D. Roosevelt and the Soviet leader Joseph Stalin, it was agreed that the USSR would maintain control of the Baltic States, and this agreement was confirmed at the Conference of Yalta in February 1945.

Following World War II, forced collectivization of agriculture began another round of deportations in 1949, bringing the total number of postwar deportees to more than 200,000. The Soviet policy of russification sought to replace Latvian language and culture with those of Russia. Freedom of speech, press, and religion was denied. For most of the 50 years of Soviet rule, political dissent was strictly forbidden.

Soviet president Mikhail Gorbachev's policy of *glasnost* and *perestroika* allowed Latvians to voice their long-suppressed desire for national self-determination. In June 1987, an openly anti-Soviet demonstration took place in Riga. In 1988, political activists founded the Latvian National Independence Movement and the Latvian Popular Front (LPF). On 23 August 1989, Latvians, Lithuanians, and Estonians organized a massive demonstration of Baltic solidarity. The LPF united independence forces and gained a majority in the elections for the Latvian Supreme Council in the

spring of 1990. On 4 May 1990 provisional independence and a period of transitional rule were proclaimed.

On 21 August 1991—shortly after the failure of a coup against Gorbachev—Latvia proclaimed its full independence. The first postindependence elections for the new Saeima (parliament) were held on 5–6 June 1993. On 30 April 1994, the Latvian and Russian governments signed a series of accords calling for the withdrawal of nearly all Russian armed forces from Latvia by the end of that year. On 12 June 1995, Latvia, Estonia, and Lithuania signed accords with the EU that were to eventually lead to full membership. A second parliamentary election the same year resulted in a legislature that was strongly divided between pro-Western and pro-Russian contingents. At the end of 1995, Andris Shkele, a former government official and businessman, became prime minister, heading a broad-based coalition cabinet. Shkele, who retained his post until 1997, balanced the budget and sped up economic reform, although his leadership style alienated many other politicians.

The Russian economic decline of 1998 decreased the market for Latvian goods and services, seriously hurting its economy and increasing unemployment. In October of the same year, Shkele's People's Party won a plurality of the vote in new parliamentary elections, but the former prime minister's personal unpopularity resulted in the formation of a minority government by a coalition that opted to exclude him. Latvia elected its first female president in June 1999, when Vaira Vike-Freiberga, a Canadian psychology professor of Latvian birth known for promoting Latvian cultural interests internationally, was chosen as her homeland's new head of state. She was inaugurated on 8 July 1999. One of her first acts as president was to veto new legislation that would have required the use of the Latvian language in government and business communications, thus further disenfranchising Latvia's large Russian-speaking minority, whose rights and status remained a problematical issue for the country as the new century began. In May 2002, Latvia changed its election law to omit a clause requiring parliamentary candidates to be speakers of the Latvian language, a provision seen as discriminatory to Russian speakers. The change was seen to improve Latvia's chances for membership in the North Atlantic Treaty Organization.

In November 2002, NATO formally invited Latvia, along with six other countries, to become a member. That December, Latvia also received an invitation to join the European Union (EU). Latvia joined NATO and the EU in the spring of 2004.

General elections were held on 5 October 2002, and a new party, the centrist New Era, topped the polls with 23.9% of the votes, taking 26 of the 100 seats in the Saeima. New Era is led by Einars Repse, the former head of the central bank, who managed the country's economy through difficult post-Soviet years; he oversaw the replacement of the currency, from the Russian rouble to the lat, an event that was seen as heralding Latvia's economic revival. Repse was named prime minister, heading a center-right coalition government formed by New Era, Latvia's First Party, the Alliance of Greens and Farmers, and the For Fatherland and Freedom Party. The For Human Rights in a United Latvia party came in second with 18.9% of the vote and 24 seats. Twenty parties competed for seats in parliament in the election. Repse, who campaigned for lower taxes, a pared-down government, and the elimination of corruption, launched a new office in 2003, an "Anti-Absurdity"

bureau. Dedicated to help ordinary people fight "the arbitrariness of those in power, the laziness of civil servants, and the lack of order in national and local government," it is a sounding board for a variety of public complaints.

Both Repse and President Vike-Freiberga supported the 2003 US-led military campaign against Saddam Hussein's regime in Iraq. Vike-Freiberga emphasized the need to maintain the trans-Atlantic relationship guaranteeing Latvia's security, and the country's opposition to the rule of dictators who challenge the international community.

### 13 GOVERNMENT

The 1990 declaration of provisional independence reinstated the 1922 constitution. From 1990 to 1993, Latvia was in a state of transition and authority was held by the Supreme Council. The new Saeima (parliament) consists of a single chamber with 100 deputies. A party must receive at least 5% of the national vote to hold a seat in parliament. Deputies are elected to a term of four years by citizens over the age of 18.

The executive branch of government is made up of the president, prime minister, and the cabinet. The Saeima elects the president for a four-year term. Executive power lies with the prime minister, who heads the Council of Ministers (cabinet). In June 1999, the Saeima elected Vaira Vike-Freiberga to the presidency. He was reelected in 2003 and will remain in office until the next election, scheduled to take place in June 2007.

Only citizens of Latvia at the time of the 1940 Soviet invasion and their descendants were allowed to vote in the 1993 elections. This meant that an estimated 34% of the country's residents (primarily Russians) were ineligible to vote. A citizenship law passed in June 1944 restricted naturalization to fewer than 2,000 resident aliens a year. On 22 July 1994, bowing to domestic and international pressure, the Saeima amended the citizenship law, eliminating the quota system. Applicants need a minimum of five years of continuous residence, basic knowledge of the Latvian language, history, and constitution, and a legal source of income; they must also take an oath of loyalty to Latvia and renounce any other citizenship. Thus the new citizenship law accelerates the naturalization process for the several hundred thousand Russian-speakers living in Latvia.

### 14 POLITICAL PARTIES

The Latvian Popular Front, established in 1988 to unite pro-independence forces, split apart after independence was achieved, giving way to a number of new parties, many defined by their stance on the status of the country's Russian-speaking population. Following the October 1998 elections the 100 seats in the Saeima were distributed as follows: People's Party, 24; Latvian Way Union, 21; Fatherland and Freedom/Latvian National Conservative Party, 17; Popular Harmony Party, 16; Latvian Social Democratic Alliance, 14; and New Party, 8. There were also other political parties not represented in the Saeima.

Following the October 2002 parliamentary elections, New Era, a new party led by former central bank head Einars Repse, won the most seats in the Saeima (26), followed by the For Human Rights in a United Latvia Party with 24, the People's Party with 21, the Alliance of Greens and Farmers with 12, Latvia's First Party with 10, and the For Fatherland and Freedom Party with 7. Repse

was named prime minister, leading a coalition of New Era, Latvia's First Party, the Alliance of Greens and Farmers, and the For Fatherland and Freedom Party. The next parliamentary elections were scheduled to take place in October 2006.

## 15 LOCAL GOVERNMENT

Latvia's local governmental structure is divided into two levels. On the first tier are cities, parishes (*pagasti*), and newly formed joint municipalities. In addition, there is district government. Citizens who live in the respective territories elect the decision-making bodies of city, parish or joint-municipal governments. These governments delegate representatives to the district governments (counties). As of 2005, there were 7 large municipalities, and 26 administrative counties. The seven large municipalities have dual status as city and regional governments.

## 16 JUDICIAL SYSTEM

A 1991 constitution, which supplements the reinstated 1922 constitution, provides for a number of basic rights and freedoms. The courts have been reorganized along democratic lines. Regional courts were added in 1995 to hear appeals of lower court decisions. There are now district courts, regional courts, a Supreme Court, and the Constitutional Court.

More serious criminal cases are heard before a panel consisting of a judge and two lay assessors. There is a provision for a 12-member jury in capital cases. The judiciary is independent; however, it suffers from a lack of personnel and training. In 1996, a seven-member Constitutional Court was established with power to hear cases at the request of the president, the cabinet, prosecutors, the Supreme Court, local government, or one-third of parliament members. The Constitutional Court may also rule on the constitutionality of legislation or its conformity with Latvia's international obligations.

## 17 ARMED FORCES

The Latvian armed forces in 2005 totaled 5,238 active personnel with reserves numbering 11,204. The Army totaled 1,817 active members, followed by the Navy with 685 active personnel and the Air Force with 255 active members. The remaining active manpower was deployed in Administration and Command (1,055), Central Support (782) and 644 among other forces. Army equipment included three main battle tanks, two reconnaissance vehicles, and 124 artillery pieces. The Air Force operated 14 transport and 5 training fixed wing aircraft, and 6 support helicopters. The Navy operated one patrol/coastal vessel, three mine warfare and two logistics/support vessels. Latvia assisted in UN and NATO operations in Bosnia, Serbia-Montenegro, Iraq and Afghanistan. The defense budget for 2005 totaled \$278 million.

## 18 INTERNATIONAL COOPERATION

Latvia was admitted to the United Nations on 17 September 1991 and serves in several specialized agencies, such as UNESCO, FAO, IFC, the World Bank, WHO, and the ILO. The country is a member of the WTO, the Council of Europe, Euro-Atlantic Partnership Council, the European Bank for Reconstruction and Development, the OSCE, and the Council of the Baltic Sea States. Latvia joined the European Union and NATO in 2004. Latvia is an observer in the OAS and a member affiliate of the Western European

Union. In environmental cooperation, Latvia is part of the Basel Convention, Conventions on Biological Diversity and Air Pollution, CITES, the Kyoto Protocol, the Montréal Protocol, MARPOL, and the UN Conventions on the Law of the Sea and Climate Change.

## 19 ECONOMY

Latvia has a relatively well-developed infrastructure and a diversified industrial base, which accounts for about 26% of GDP. Agriculture constitutes approximately 5% of GDP and centers around the cultivation of potatoes, cereals, fodder, and other crops, as well as dairy farming. The largest sector of the economy is the service sector, with wholesale and retail trade, transportation, financial services, communications, and real estate management the most important industries.

Latvia's GDP fell about 30% in 1992 due to a steep decline in industrial exports to Russia. However, by 1994, GDP rose by 2%. A banking crisis caused by the collapse of Latvia's largest bank (as well as some smaller commercial banks) inhibited economic growth in 1995. Difficulties in revenue collection and inadequate control over governmental spending led to a high budget deficit. As a result, GDP fell by 1.6% in 1995. GDP growth improved markedly during the mid- to late-1990s, but it slowed somewhat in 1999, due to the Russian financial crisis of the previous year. By 2001 it stood at 7.7%. Compared to a 960% inflation rate in 1992, inflation was down to 26.3% in 1994, 16% in 1996, and 4.7% in 1998. Unemployment during the early 2000s remained stable between 7–8%.

Since independence was achieved in 1991, Latvia continued with its privatization program and market reforms in the hope of qualifying for EU accession. By mid-2003, 98% of former state-owned industries had been sold, and the private sector accounted for two-thirds of GDP. Latvia joined the WTO in 1999, and was formally invited to join the EU in December 2002, and was accepted as a full member in May 2004. Latvian governments in the early 2000s implemented strict monetary policies and liberal trade policies, attempted to keep budget deficits low, and tried to provide for a more competitive economic environment. Latvia attracted a large amount of foreign direct investment since 1991; Denmark was its largest investor. However, investors who shy away from Latvia often do so because of corruption, organized crime, excessive bureaucracy, and a need for regulatory reform.

GDP growth was very strong in 2004, at 8.5%, jumping from 7.5% in 2003, and 6.4% in 2002; in 2005, the economy is expected to grow by 6.0%. This rapid growth was mainly fueled by high domestic demand, which, in turn, was fueled by higher rates of bank lending. Other factors that contributed to the GDP growth were foreign investments, and a dynamic export market. Inflation has remained fairly stable until 2003, but in 2004 it made a slight jump, reaching 6.2%. Unemployment continued to be a problem, hovering around 8.5%.

## 20 INCOME

The US Central Intelligence Agency (CIA) reports that in 2005 Latvia's gross domestic product (GDP) was estimated at \$29.4 billion. The CIA defines GDP as the value of all final goods and services produced within a nation in a given year and computed on the basis of purchasing power parity (PPP) rather than value as

measured on the basis of the rate of exchange based on current dollars. The per capita GDP was estimated at \$12,800. The annual growth rate of GDP was estimated at 7.8%. The average inflation rate in 2005 was 5.9%. It was estimated that agriculture accounted for 4.1% of GDP, industry 26%, and services 69.9%.

According to the World Bank, in 2003 remittances from citizens working abroad totaled \$171 million or about \$74 per capita and accounted for approximately 1.5% of GDP. Foreign aid receipts amounted to \$114 million or about \$49 per capita and accounted for approximately 1.0% of the gross national income (GNI).

The World Bank reports that in 2003 household consumption in Latvia totaled \$6.98 billion or about \$3,007 per capita based on a GDP of \$11.1 billion, measured in current dollars rather than PPP. Household consumption includes expenditures of individuals, households, and nongovernmental organizations on goods and services, excluding purchases of dwellings. It was estimated that for the period 1990 to 2003 household consumption grew at an average annual rate of 0.3%. In 2001 it was estimated that approximately 30% of household consumption was spent on food, 16% on fuel, 6% on health care, and 23% on education.

## 21 LABOR

The 2005 labor force was estimated at 1.11 million workers. Unemployment in that year was estimated at 8.8%. As of 2003, the service sector accounted for 59.2% of those employed, with 27% in industry and the remaining 13.8% in agriculture.

Latvian workers have the legal right to form and join labor unions. As of 2002, about 30% of the labor force was unionized. Unions are generally nonpolitical, have the right to strike (with some limits), are free to affiliate internationally, can bargain collectively, and are mostly free of government interference in their negotiations with employers.

The minimum employment age is 15, and the mandatory maximum workweek is set at 40 hours. Latvian labor regulations also provide workers with four weeks of annual vacation and special assistance to working mothers with small children. Certain minimum standards of labor conditions are defined by law, although they are not effectively enforced. The legal minimum wage was \$98 per month in 2002.

## 22 AGRICULTURE

As of 2003, out of a total land area of 6,205,000 hectares (15,333,000 acres), about 30% was crop land. Agriculture accounted for about 5% of GDP and engaged around 12% of the labor force in 2003. Agricultural output declined by an annual average of 7% during 1990–2000.

Privatization of agriculture progressed rapidly after 1991. By the beginning of 1993, over 50,000 private farms had been established, and many agricultural facilities were being privatized. Production of primary crops in 2004 (in thousands of tons) included wheat, 530; barley, 275; rye, 100; potatoes, 628.4; rapeseed, 103.6; and dry beans, 0.5.

## 23 ANIMAL HUSBANDRY

About 621,000 hectares (1,534,000 acres) of land are meadows and pastures, representing 10% of the total land area. In 2005, there were 371,100 head of cattle, 435,700 pigs, 38,600 sheep, 3,450,000 chickens, and 15,500 horses. In 2005, some 74,650 tons of meat

were produced, 80% of which was beef and pork. Milk and egg production in 2005 totaled 790,500 and 32,045 tons, respectively.

Before World War II (1939–45), Latvia was a prominent dairy producer; in the postwar period, the number of cattle, poultry, and pigs rose steeply. Milk production stabilized in 1995, after four years of decreases in dairy cattle and milk production.

## 24 FISHING

The total catch in 2003 was 115,180 tons, down from 416,197 tons in 1991. Nearly all the landings are from marine fishing. Principal species include sprat, herring, sardines, cod, and mackerel. In February 2005, the Latvian government banned the retail sale of salmon caught in the Baltic Sea and Gulf of Riga, due to levels of dioxin detected in tested fish. Fish packing is an important industry in Latvia; in 2003, fisheries exports amounted to nearly \$131.9 million.

## 25 FORESTRY

Latvia's forests and woodlands covered 2.9 million hectares (7 million acres), or approximately 47% of the total land area in 2000 (up from 24.7% in 1923). Before World War II (1939–45), the timber and paper industries accounted for 29% of employment; by 1990, the number had fallen to 9%. In 1939, the timber industry contributed 53.5% to total exports; in 1990, wood and paper exports accounted for 2.2% of total exports. The timber cut in 2004 was 12,419,000 cu m (438 million cu ft), with 8% used as fuel wood. Production amounts in 2004 included: sawn wood, 3,920,000 cu m (138 million cu ft); particleboard and plywood, 394,000 cu m (13.9 million cu ft); and paper and paperboard, 38,000 tons. Exports of forest products amounted to over \$1 billion in 2003.

Jaako Poyry Consulting AB (Sweden), a subsidiary of Finland's Jaako Poyry Group, has been doing a study for a new pulp plant in Jēkabpils, financed by the Latvian government and the Swedish International Development Authority. The new plant will have a capacity to produce 350,000 tons of bleached softwood per year, and will require an investment of up to \$1 billion.

## 26 MINING

Latvia was dependent on imports for raw materials. Limestone (for cement) and sand and gravel mines were spread throughout the country. Ceramic clays, dolomite, and gypsum also were produced. Peat (taken from 85 deposits, for fuel) covered approximately 10% of Latvia's territory, with the heaviest concentration in the eastern plains. Tonnage production figures for 2003 were: peat, 1,076,142 metric tons, compared with 1,484,970 metric tons in 2002; and sand and gravel, 1,044,959 metric tons, compared with 761,614 metric tons in 2003. 2004 production figures for cement totaled 295,205 metric tons; gypsum, 159,133 metric tons; and limestone 431,590 metric tons.

## 27 ENERGY AND POWER

Hydroelectric generated power is the source for the bulk of the electric power Latvia produces. In 2002, hydroelectric sources accounted for 63% of the power produced. However, Latvia's heavy reliance upon hydropower, means that in a dry year, the country is estimated to be capable of producing only around 60% of the power it needs. Latvia's power imports come largely from Russia, and other Baltic Sea nations. During 2004, Latvia produced 4.4

billion kWh of electricity, but demand for that year came to 5.5 billion kWh. Latvia's electric power generating capacity in 2004 stood at 2.2 GW.

As of 2004, Latvia has no known reserves of oil or natural gas, and no oil refining capacity. Thus the country must import all required gas and petroleum products, most of which comes from Russia. However, Latvia's territorial waters in the Baltic Sea are thought to contain as many as 300 million barrels of oil. In 2002 Latvia awarded five-year offshore exploration rights to a US-Norwegian joint venture.

In 2004, refined petroleum was consumed at a rate of 47,000 barrels per day, with imports averaging the same amount. Demand for natural gas in 2004 came to 62 billion cu ft, all of which was imported. Although Latvia did have recoverable coal reserves of two million short tons in 2004, there was no production or imports of coal.

## 28 INDUSTRY

Latvia's industrial base has centered mainly on heavy industries such as chemicals and petrochemicals, metal working, and machine building. Major manufactured items include railway carriages, buses, mopeds, washing machines, radios, electronics, and telephone systems. Since 1995, output of buses has fallen, but there has been an increase in the production of transport vehicles and passenger rail cars. Base chemical production has also declined slightly, as demand for household detergents and fibers has fallen. Other important industries include paper, petrochemicals, mechanical engineering, and communications.

Prior to 1998, the food processing sector provided the largest portion of the country's manufacturing output. Following the 1998 economic crisis in Russia, that sector declined, as Latvia depended upon Russia for exports. As of 2002, however, food processing showed potential for growth. In 2001, industry accounted for 26% of GDP, and employed around 25% of the work force. Although some 50 enterprises are excluded from privatization (including ports, the railway company, and the postal service), only a few large state enterprises had not been privatized as of 2002, including the Latvian Shipping Company (Lasco), and the electricity utility company (Latvenergo). Ninety-eight percent of former state-owned enterprises had been sold as of 2002.

By 2004, the participation of the industry in the overall economic output has decreased to 24.8%, while its share in the labor fell to 25%; agriculture made up 4.4% of the GDP, and employed 15% of the labor force; services came in first with 70.8%, and 60% respectively. The industrial production growth rate equaled the GDP growth rate, at 8.5%, hinting that the services sector grew faster, while the agriculture sector lagged behind.

## 29 SCIENCE AND TECHNOLOGY

The Latvian Academy of Sciences has divisions of physical and technical sciences and of chemical and biological sciences.

Fifteen research institutes, most attached to the academy, conduct medical, technical, and scientific research. The University of Latvia (founded in 1919) has faculties of physics and mathematics, chemistry, and biology. The Riga Technical University (founded in 1990) has various engineering faculties. Both are in Riga, as are the Latvian Academy of Medicine (founded in 1951), the Riga Aviation University (founded in 1919), and the Stradin Museum

of the History of Medicine. The Latvian University of Agriculture (founded in 1939) is located in Jelgava, and the National Botanical Garden is situated in Salaspils.

In 1987–97, science and engineering students accounted for 23% of university enrollment. In 2002, Latvia had 1,478 scientists and engineers and 282 technicians per million people actively engaged in research and development (R&D). For that same year, Latvia's expenditures on R&D totaled \$100.082 million, or 0.46% of GDP, with government providing the largest portion at 42.7%, followed by foreign sources at 35.6%. Business provided the remaining 21.7%. High technology exports in 2002 totaled \$51 million, or 4% of all manufactured exports.

## 30 DOMESTIC TRADE

The traditional, small, privately owned farmer's markets, bakeries, and dairies are still prevalent throughout the country; however, large supermarkets are making their mark in larger cities. Latvia's center of domestic commerce is in Riga. One of the country's first malls opened with major investment from a Finnish department store chain. The most widely demanded domestic services include dressmaking and repair; house construction and repair; and automotive servicing. As of 2002, privatization of previously state-owned companies and industries was nearly complete.

Shops are generally open from 9 or 10 AM to 7 or 8 PM.

## 31 FOREIGN TRADE

Like most of the former Soviet republics, Latvia's trade was formerly dominated by the other Soviet states, but it has been relatively successful in achieving a wider range of trade partners. Latvia's major commodity exports include wood (29%), iron and steel (6.3%), textile yarn (5.6%), furniture (4.5%), and fish (1%).

In 2004, Latvia's exports reached \$3.6 billion (FOB—Free on Board), while imports grew to \$6.0 billion (FOB). Most of the exports went to the United Kingdom (which received 12.8% of total exports), Germany (12%), Sweden (10%), Lithuania (9.1%), Estonia (8%), Russia (6.4%), and Denmark (5.4%). Since domestic demand is predicted to grow slowly in the EU area, Latvian exporters will likely re-orient to faster growing markets, such as Estonia and Russia. Imports included machinery and equipment, chemi-

cals, fuels, and vehicles, and mainly came from Germany (13.9%), Lithuania (12.2%), Russia (8.7%), Estonia (7%), Finland (6.3%), Sweden (6.1%), Poland (5.4%), and Belarus (4.8%).

**3<sup>2</sup> BALANCE OF PAYMENTS**

The US Central Intelligence Agency (CIA) reported that in 2002 the purchasing power parity of Latvia's exports was \$2.3 billion while imports totaled \$3.9 billion resulting in a trade deficit of \$1.6 billion.

The International Monetary Fund (IMF) reported that in 2001 Latvia had exports of goods totaling \$2.22 billion and imports of goods totaling \$3.57 billion. The services credit totaled \$1.19 billion and debit \$692 million.

Exports of goods and services continued to grow in the following years, reaching \$4.7 billion in 2003, and \$5.1 billion in 2004. Imports followed a similar path, totaling \$6.1 billion in 2003, and \$6.5 billion in 2004. The resource balance was consequently negative in both years, at around -\$1.4 billion. The current account balance was also negative, dropping to -\$1 billion in 2003, and -\$1.2 billion in 2004. External debt was relatively high, at \$10.3 billion in 2004, and an expected \$10.8 billion in 2005.

**3<sup>3</sup> BANKING AND SECURITIES**

In 1991 banking matters were transferred to the Bank of Latvia from Soviet bank officials. Previously, Latvia had its branch of the Soviet State Bank (Gosbank). The central bank had the authority to issue Latvian rubles and regulate the commercial banking sector. There are many banks in Latvia, including the Baltic Transit Bank, Banka Atmoda, Latgale Stocj Commercial Bank, Latvian Credit Bank, Investment Bank of Latvia, and the Latvian Land Bank.

Latvia effectively exited the ruble zone on 20 July 1992. By early 1993 the Bank of Latvia introduced a national currency, the lat.

The lat is now fully convertible for capital and current account purposes.

Latvia's banking sector has proved one of the country's most successful industries and also its most controversial. Riga has developed into an offshore financial center, offering numbered accounts and related services, and drawing in a substantial chunk of flight capital from other former Soviet republics. Owing to fairly liberal banking laws in the early 1990s, a large number of banks (54 as of May 1995) had been established. Subsequently, capital and other requirements have been progressively tightened. For existing banks, the minimum reserve requirements have been raised from Ls100,000 as of 1995 to Ls1.0 million by 31 March 1998. As of April 1995 all banks had to be audited by one of the recognized international accounting firms. The stricter capital regime has led to an inevitable attrition, with 11 banks losing their licenses between 1992 and 1995. Only some 15 banks made profits in 1994 and had adequate reserves. The audits also revealed huge losses at Baltija Bank (Latvia's largest institution, with some 200,000 private depositors), which had been incurred as a result of systematic fraud. Latvian banks suffered heavy losses in 1999 as a result of the Russian financial crisis.

In February 1997, the Bank of Latvia gave its approval to the proposed merger between the Latvian Savings Bank and the United Baltic Bank of Riga. As a result of the merger, the state now owns 75% of shares in the Latvian Savings Bank. The government's plans are to privatize the newly merged entity. Total assets of Latvia's 23 commercial banks were us\$5 billion as of June 2001. In recent years, Scandinavian banks have begun acquiring shares in Baltic banks. The International Monetary Fund reports that in 2001, currency and demand deposits—an aggregate commonly known as M1—were equal to \$1.4 billion. In that same year, M2—an aggregate equal to M1 plus savings deposits, small time deposits, and money market mutual funds—was \$2.5 billion. The money market rate, the rate at which financial institutions lend to one another in the short term, was 5.23%. The discount rate, the interest rate at which the central bank lends to financial institutions in the short term, was 3.5%.

In 1995, the Riga Stock Exchange (RIGSE) listed 17 companies and had a market capitalization of \$10 million. As of 2004, a total of 39 companies were listed, with a market capitalization valued at 1.655 billion. In 2004, the RIGSE rose 43.5% from the previous year to 413.6.

**3<sup>4</sup> INSURANCE**

All of Latvia's insurers, foreign and domestic, must be licensed by the Superintendent of Insurance. Foreign companies entering the Latvian market will find that licenses are relatively easy to obtain, although each class of insurance offered must be approved by the Superintendent of Insurance. In Latvia, third-party automobile liability insurance is compulsory. In 2003, the value of all direct premiums written totaled \$209 million, of which nearly all were accounted for by the nonlife lines, which accounted for \$200 million. Latvia's top nonlife insurer in 2003 was Balta, with gross written nonlife premiums of \$45.9 million, while Ergo Latvija Dzīvība

was the country's leading life insurer that year, with gross written life premiums of \$5.4 million.

### 35 PUBLIC FINANCE

Latvia's structural transition out of the planned economy under communism has occurred more or less spontaneously since independence. As of 2002, the thriving private sector accounted for two-thirds of employment and GDP. Privatization is generally considered to be near-finished; although the government still owns a few key companies, most are in private hands, even the utilities, and the government is working to sell off its ownership of what remains in order to satisfy its commitments to the IMF.

The US Central Intelligence Agency (CIA) estimated that in 2005 Latvia's central government took in revenues of approximately \$5.6 billion and had expenditures of \$5.8 billion. Revenues minus expenditures totaled approximately -\$243 million. Public debt in 2005 amounted to 12% of GDP. Total external debt was \$13.2 billion.

The International Monetary Fund (IMF) reported that in 2003, the most recent year for which it had data, central government revenues were Ls1,715.5 million and expenditures were Ls1,796.2 million. The value of revenues was us\$3,004 million and expenditures us\$3,146 million, based on an official exchange rate for 2003 of us\$1 = Ls.571 as reported by the IMF. Government outlays by function were as follows: general public services, 19.3%; defense, 4.5%; public order and safety, 8.1%; economic affairs, 11.8%; housing and community amenities, 1.1%; health, 11.2%; recreation, culture, and religion, 2.4%; education, 6.5%; and social protection, 35.0%.

### 36 TAXATION

In 1995 Latvia replaced its profits tax with 25% business income tax (BIT). Under amendments in 2001, the BIT rate was reduced to 22% for 2002, and to 19% for 2003, and as of 2005, stood at 15% which applies to all businesses. Reduced rates for small-enter-

prises was eliminated in 2004. Branches of foreign companies are taxed at the same rate as Latvian companies, but are eligible for the same deductions and allowances. For companies operating in Latvia, capital gains are included in corporate income and are taxed at the corporate rate. There is a 2% withholding tax for nonresident companies on proceeds from the sale of Latvian real estate. The withholding rate on dividends is either 0% or 10% depending upon whether the payer and receiver meet certain guidelines regarding residency. Withholding taxes on various forms of capital income may be reduced or eliminated according to the terms of bilateral double tax prevention agreements. Shipping companies, cargo or passenger, engaged primarily in international commerce, may choose to be taxed according to a tonnage tax introduced in 2002. There are no local taxes.

As of 1995, Latvians pay personal income tax at a flat rate of 25% of taxable income. Taxable income is determined by lump sum deductions, and specific allowances for social security payments, donations to charity, hospitalization and medical expenses, and some school fees. There is also a property tax and a land tax.

The main indirect tax is Latvia's value-added tax (VAT) with a standard rate of 18% for most goods and services. A reduced rate of 5% is applied to medical (including veterinary) and hotel services, and water and waste collection services. A 0% VAT applies to exports. Exempted from the VAT agricultural services, insurance, rent on dwellings, as well as certain financial services and royalties from copyrights. There are also excise taxes levied on luxury products at rates ranging from 10-100%, customs taxes, and stamp taxes.

### 37 CUSTOMS AND DUTIES

Latvia imposes a standard 18% VAT on imports. However, certain items qualify for lower rates of 0-9%. Tariff rates depend on both the type of good imported and its origin. Goods from countries with most-favored nation (MFN) status receive lower rates, usually 15% (but up to 45% for agricultural products), while goods from non-MFN countries receive slightly higher rates, usually 20% (but up to 55% for agricultural products).

Latvia has free trade agreements with Sweden, Finland, Norway, Switzerland, and Kyrgyzstan. US products receive MFN status. Latvia has also formed a free trade area with Estonia and Lithuania. In January 1995, a free trade agreement went into effect with the European Union, which reduced tariffs on most industrial products to zero and set a schedule on tariff reductions over a course of five years for certain agricultural products. Latvia joined the World Trade Organization in February 1999.

### 38 FOREIGN INVESTMENT

In November 1991, a foreign investment act was passed permitting joint ventures in the form of either public or private limited companies. Businesses that are at least 30% foreign-owned receive a two-year tax holiday and a 50% tax abatement for the following two years.

At the end of 1995, foreign direct investment (FDI) in Latvia totaled \$521 million, based on registered statutory capital. The largest investors were Denmark (26.1%), Russia (19.4%), the United States (13.5%), Germany (6.4%), the United Kingdom (5.2%), and the Netherlands (4.2%). Finland and Sweden were also significant investors. Industry accounted for only 17% of all foreign invest-

#### Public Finance – Latvia (2003)

(In millions of lats, central government figures)

<b>Revenue and Grants</b>	<b>1,715.5</b>	<b>100.0%</b>

SOURCE: Government Finance Statistics Yearbook 2004, Washington, DC: International Monetary Fund, 2004.

ment and there were approximately 5,200 firms with a foreign capital share.

FDI inflow into Latvia reached \$521 million in 1997, averaging \$400 million a year 1996 to 2000, but fell sharply in the global economic downturn of 2001 to less than \$201 million. From 1995 to 2001 Latvia stock of FDI nearly quadrupled, reaching \$2.3 billion in 2001. In the period 1988 to 1990, Latvia's share of world FDI inflows was almost five times its share of world GDP, but for the period 1998 to 2000, Latvia's share of FDI inflows was only 60% greater than its share of world GDP.

The leading sources of FDI from 1996 to 2001 were the United States (13%), Germany (11%), and Denmark (11%). The primary destinations of foreign investment inflow were trade (22%), finance (16%), and business services, especially real estate (16%). The largest foreign affiliate is the telecommunications company Lattelekom SA of Finland. The largest foreign bank invested is Hansabanka SA of Estonia.

As a new member of the EU, Latvia registered an increased inflow of capital from Western Europe in 2004. This trend is expected to temper down in future years however. Also, the relative share of FDI in capital flows will likely go down, which will put an increased burden on domestic banks. Despite this, Latvia remains an attractive market for investments, and the prospects of joining the euro zone works towards the country's favor.

### 39 ECONOMIC DEVELOPMENT

The government began introducing economic reforms in 1990 to effect the transition to a market-driven economy. Individual and family-owned businesses, cooperatives, and privately and publicly held companies are now permitted. The privatization process was simplified with a 1994 law that created the Privatization Agency (PA) and the State Property Fund. Distribution of privatization vouchers was completed by March 1995, with certificates valued at Ls2.8 billion distributed to 2.2 million Latvians.

The privatization program focuses on international tenders and public offerings of shares. By mid-1994, 450 state enterprises had been transferred for privatization. The first international tender of 45 enterprises came in November 1994, followed by 80 more in 1995. Large-scale privatization began in 1996 and continued into the beginning of the 21st century, when privatization was almost complete (with the exception of large state utilities).

In 2001, Latvia negotiated a 20-month, \$44-million Stand-By Arrangement with the International Monetary Fund (IMF). Real GDP growth was strong in 2001–02, led by investment and consumption. Inflation was low during those years. In 2003, per capita GDP stood around 50% above its level in 1995. Latvia's economy in 2003 was regarded as one of the best of the 10 countries slated for EU admission in 2004. The government was taking steps toward achieving a balanced budget by reducing government spending in 2003.

In anticipation of the 2006 election, the government is seeking to exploit the strong revenue growth and increase public spending. In addition, it plans to sell off its share in the Ventspils oil terminal and thus give an extra boost to the overall economic growth. One of the biggest threats to economic expansion is the, recently, growing inflation rate—which could also affect Latvia's prospect of joining the euro zone in 2008. In an attempt to curb inflation the government will likely cut taxes on diesel fuel, and

ask the EU to temporarily lift the ban over imports of fuel that do not meet EU standards.

### 40 SOCIAL DEVELOPMENT

Social insurance provides benefits for old age, disability, and survivorship pensions for employees and self-employed persons. The first laws were enacted in 1922, and most recently were updated in 2001. Pensions are funded by contributions from employees and employers in most sectors. Age requirements for pensions are set at 62 for men and 59.5 for women, but is increasing to meet the same standards for men by 2009. The government funds programs to provide for active military personnel, individuals caring for infants, and spouses of diplomatic staff. Sickness and maternity benefits are provided to employed persons, while medical benefits are provided to all permanent residents. A universal program of family allowances exists, as well as workers' compensation and unemployment programs.

Employment discrimination based on gender is legally banned, although women are barred from certain occupations considered dangerous. In practice, women face unequal treatment in terms of both pay and hiring, including discrimination stemming from the cost of legally mandated childbirth benefits if a woman is hired. Sexual harassment is common in the workplace although prohibited by law. Domestic violence is pervasive. As of 2004 there were no shelters for abused or battered women, and few resources exist for victims of sexual assault.

Latvia's main human rights problem in recent years stems from the large number of minorities who were not granted citizenship after independence. These noncitizens, mainly ethnic Russians, do not have clear travel, property, and residency rights. Instances of excessive use of force by security forces were still reported, and prison conditions remained poor.

### 41 HEALTH

Primary care is provided at large urban health centers, hospital and walk-in emergency facilities, individual and group private practices, rural clinics staffed by midwives and physicians' assistants, and workplace clinics run by large private employers and the military. Total health care expenditure was estimated at 6.7% of GDP. As of 2004, there were an estimated 291 physicians, 509 nurses, 53 dentists, and 21 nurses per 100,000 people. In the same year, Latvia had 151 hospitals, of which 31 were located in Riga (including all specialized hospitals).

As of 2002, the crude birth rate and overall mortality rate were estimated at 8.3 and 14.7 per 1,000 people respectively. Life expectancy in 2005 was 71.05 years and the infant mortality rate was 9.55 per 1,000 live births. The total fertility rate in 2000 was 1.2 per woman during childbearing years. Immunization rates for one-year-olds were as follows: diphtheria, pertussis, and tetanus, 95%; and measles, 97%. Measles, neonatal tetanus and polio had been almost completely eradicated.

Cardiovascular disease is a major cause of mortality in Latvia, with a rate of nearly 400 per 1,000 people over age 65. The HIV/AIDS prevalence was 0.60 per 100 adults in 2003. As of 2004, there were approximately 7,600 people living with HIV/AIDS in the country. There were an estimated 500 deaths from AIDS in 2003.

## 4<sup>2</sup> HOUSING

In the 1990s 165,000 families (one out of five) were registered for new housing. Approximately 200,000 people lived in the 8% of existing housing stock that was in substandard condition. But the government has made some progress in reforms for the housing sector. In 1993, 54% of housing was owned by state and municipalities. In 1999 the majority of property (70%) was privately owned. The government anticipates that by the end of the privatization process about 80% of housing will be private property, while municipalities will maintain only 20% of the housing as low-cost rental or social houses.

At the 2000 census, about 26% of all respondents lived in single-family houses; 68.5% lived in apartments. About 60% of all dwellings were owner occupied. About 52% of the population were living in housing units built in 1970 or earlier. About 43.7% of the population were in dwellings built during the period 1971–95.

Since 1996, the government has signed several agreements with international organizations for funds to improve housing projects. In 2000, the Housing Crediting Program was initiated to promote a new mortgage system.

## 4<sup>3</sup> EDUCATION

The modern Latvian educational system is based on the reforms introduced in 1991. Compulsory education lasts for nine years beginning at the age of seven. At this stage, students have a choice between basic vocational school (two or three years), general secondary school (three years), or vocational secondary school (four years, offering a diploma that may fulfill the prerequisite for university studies).

In 2001, about 60% of children between the ages of three and six were enrolled in some type of preschool program. Primary school enrollment in 2003 was estimated at about 86% of age-eligible students. The same year, secondary school enrollment was about 88% of age-eligible students. Nearly all students complete their primary education. The student-to-teacher ratio for primary school was at about 14:1 in 2003.

Entrance examinations are a prerequisite for admission into universities. Higher education is offered by both private and public institutions. The state offers free higher education in some areas of specialized study. Latvia has a total of about 34 state-recognized institutions of higher learning, including two major universities: the University of Latvia and the Riga Technical University. In 2003, about 73% of the tertiary age population were enrolled in some type of higher education program; with 55% for men and 91% for women. The adult literacy rate for 2004 was estimated at about 99.7%.

As of 2003, public expenditure on education was estimated at 5.8% of GDP.

## 4<sup>4</sup> LIBRARIES AND MUSEUMS

The National Library in Riga holds about 2.1 million volumes; the main library site was designed by Gunnar Birkerts, who was born in Latvia but has an architectural firm in the United States. The Latvian Academic Library in Riga holds 1.2 million books and the University of Latvia holds about two million; both libraries also include large collections of periodicals. The Riga City Library (Bibliotheca Rigensis), established in 1524, was the first public li-

brary in the nation. In 2005, there were about 892 public libraries in the nation, including 7 branches of the Latvian Library for the Blind.

The larger museums are located in Riga, including the State Museum of Fine Arts, the History Museum of Latvia, The Latvian Photography Museum, and the Museum of Foreign Art. Riga also hosts the Museum of Natural History; the Riga Film Museum; the State Museum of Art; the Literature, Theater, and Music Museum; the Latvian Sports Museum, and the Latvian War Museum. In 1990, Bauska Castle was converted into a historic museum. The Bauska Art Museum holds over 8,000 works of art by Russian and Western European artists. With the end of the Soviet era, a number of new museums devoted to Latvian culture and history opened in the 1990s, including museums of architecture, photography, telecommunications, Jewish life in Latvia, and a museum chronicling 50 years of Soviet occupation. There are a local history museums in almost every region.

## 4<sup>5</sup> MEDIA

International communications links are via leased connection to the Moscow international gateway switch and the Finnish cellular network. In 2003, there were an estimated 285 mainline telephones for every 1,000 people; about 16,200 people were on a waiting list for telephone service installation. The same year, there were approximately 526 mobile phones in use for every 1,000 people.

The Committee for Television and Radio controls broadcasting. Domestic and international programming in Latvian, Russian, Swedish, English, and German is broadcast by Latvian Radio. In 1998, there were 8 AM and 56 FM stations. Latvian State Television broadcasts on two channels, and there are several independent television stations with daily broadcasts. Cable and satellite services are available, and foreign broadcasts can also be seen. In 2003, there were an estimated 700 radios and 859 television sets for every 1,000 people. About 176.8 of every 1,000 people were cable subscribers. Also in 2003, there were 188 personal computers for every 1,000 people and 404 of every 1,000 people had access to the Internet. There were 80 secure Internet servers in the country in 2004.

Latvia publishes many newspapers, periodicals, and books, in both Latvian and Russian. The most widely read newspapers (with 2002 circulations) are *Diena* (*The Day*, 110,000), *Sovietskaya Latvija* (*Soviet Latvia*, 71,300), *SM Segodna* (a Russian language daily, 65,000), and *Riga Balss* (*The Voice*, 56,800). Foreign language newspapers include the weekly *Baltic Times* in English.

The constitution provides for free speech and a free press, and the government is said to respect these rights in practice. A 1991 Press Law prohibits censorship of the press or other mass media; however, a Law on the Media imposes regulations on the content and language of broadcasts.

## 4<sup>6</sup> ORGANIZATIONS

Important economic organizations in Latvia include the Latvian Chamber of Commerce, an organization that promotes trade and commerce with its Baltic neighbors, Europe, and The Russian Federation. There are five business and trade organizations including: the Latvia International Commerce Center, Latvian Small Business Association, and the World Latvian Businessmen's Associa-

tion. The largest trade union in Latvia is the umbrella organization of the Association of Free Trade Unions, founded in 1990.

The Latvian Academy of Sciences promotes public interest and education for all branches of science. Several medical fields have professional associations. There are also several environmental protection and preservation organizations.

National youth organizations include the Student Council of the University of Latvia, United Nations Student Association of Latvia, YMCA/YWCA of Latvia, Junior Chamber, and the Scout and Guide Central Organization of Latvia. There are a wide variety of sports associations represented in the country. National women's organizations include the Women's National League of Latvia and the Latvian Association of University Women.

There are national chapters of the Red Cross Society and Caritas.

#### **47 TOURISM, TRAVEL, AND RECREATION**

With a population of almost one million, Riga is the major tourism center of the Baltic states. Its historic architecture has undergone extensive restoration. The white sand beaches offer sailing and river rafting along with many spas. Latvia boasts 12,310 rivers and 3,000 lakes, which are popular for boating, as well as country castles and medieval towns. Tennis, horseback riding, fishing, hunting, sailing, water sports, and winter sports are available to visitors, as well as a ski marathon in February, the Sport Festival of Riga in May, and the International Riga Marathon in July.

All visitors need passports valid for at least three months after the planned stay. Visas are not required for stays of up to 90 days.

There were 2,469,888 foreign visitors who arrived in Latvia in 2003, an 8% increase from 2002. The 7,618 hotel rooms with 14,983 beds had a 32% occupancy rate. The average length of stay was two nights. Tourist expenditure receipts totaled \$271 million.

In 2005, the US Department of State estimated the daily cost of travel in Latvia at \$219.

#### **48 FAMOUS LATVIANS**

Guntis Ulmanis (b.1939) was president of Latvia from 1993 to 1999. Vaira Vike-Freiberga (b.1937), Latvia's first female president, succeeded him in 1999, and was reelected in 2003. Turis Alumans was Latvia's first poet. He started a school of poetry that produced the poets Krisjanis Barons (1823–1923) and Atis Kronvalds in the 19th century. Romantic literature in the 20th century was symbolized by Janis Rainis's (1865–1929) *Fire and Night*.

#### **49 DEPENDENCIES**

Latvia has no territories or colonies.

# LIECHTENSTEIN

Principality of Liechtenstein  
*Fürstentum Liechtenstein*

**CAPITAL:** Vaduz

**FLAG:** The national flag is divided into two horizontal rectangles, blue above red. On the blue rectangle, near the hoist, is the princely crown in gold.

**ANTHEM:** *Oben am jungen Rhein (On the Banks of the Young Rhine)*.

**MONETARY UNIT:** The Swiss franc (SwFr) of 100 centimes, or rappen, has been in use since February 1921. There are coins of 1, 5, 10, 20, and 50 centimes and 1, 2, and 5 francs, and notes of 10, 20, 50, 100, 500, and 1,000 francs. SwFr1 = \$0.80418 (or \$1 = SwFr1.2435; as of 2004).

**WEIGHTS AND MEASURES:** The metric system is the legal standard.

**HOLIDAYS:** New Year's Day, 1 January; Epiphany, 6 January; Candlemas, 2 February; St. Joseph's Day, 19 March; Labor Day, 1 May; Assumption, 15 August; Nativity of Our Lady, 8 September; All Saints' Day, 1 November; Immaculate Conception, 8 December; Christmas, 25 December; St. Stephen's Day, 26 December. Movable religious holidays include Good Friday, Easter Monday, Ascension, Whitmonday, and Corpus Christi.

**TIME:** 1 PM = noon GMT.

## <sup>1</sup> LOCATION, SIZE, AND EXTENT

Liechtenstein, roughly triangular in shape, is a landlocked country situated in the Rhine River Valley. The fourth-smallest country in Europe, it is bordered by the Austrian province of Vorarlberg to the N and E, the Swiss canton of Graubünden to the S, and the Rhine River and the Swiss canton of St. Gallen to the W, with a total boundary length of 76 km (47 mi).

The principality has an area of 160 sq km (62 sq mi) and extends 24.5 km (15.2 mi) N-S and 9.4 km (5.8 mi) E-W. Comparatively, the area occupied by Liechtenstein is about 0.9 times the size of Washington, DC.

Liechtenstein's capital city, Vaduz, is located in the western part of the country.

## <sup>2</sup> TOPOGRAPHY

Liechtenstein is divided into a comparatively narrow area of level land bordering the right bank of the Rhine River and an upland and mountainous region occupying the remainder of the country; the level land occupies about two-fifths of the total surface area. The greatest elevation, Grauspitz (2,599 m/8,527 ft), is in the south, in a spur of the Rhaetian Alps.

## <sup>3</sup> CLIMATE

Climatic conditions in Liechtenstein are less severe than might be expected from its elevated terrain and inland situation; the mitigating factor is a warm south wind called the Föhn. The annual lowland temperature varies between -4.5°C (24°F) in January and 19.9°C (68°F) in July. Late frost and prolonged dry periods are rare. Average annual precipitation is 105 cm (41 in).

## <sup>4</sup> FLORA AND FAUNA

The natural plant and animal life of Liechtenstein displays a considerable variety because of the marked differences in altitude. A number of orchid species are able to grow because of the warmth carried by the Föhn. In the higher mountain reaches are such alpine plants as gentian, alpine rose, and edelweiss. Common trees include the red beech, sycamore, maple, alder, larch, and various conifers. Indigenous mammals include the deer, fox, badger, and chamois. Birds, including ravens and eagles, number about 120 species.

## <sup>5</sup> ENVIRONMENT

The Nature Conservation Act, adopted in 1933, was the nation's first major piece of environmental legislation; the Water Conservation Act dates from 1957, and air pollution laws were passed in 1973 and 1974. All wastewater is purified before being discharged into the Rhine. According to a 2006 report issued by the International Union for Conservation of Nature and Natural Resources (IUCN), threatened species included two types of mammals, one species of bird, and five species of invertebrates. Threatened species include the great horned owl, the Eurasian beaver, the hermit beetle, and the Apollo butterfly.

## <sup>6</sup> POPULATION

The population of Liechtenstein in 2005 was estimated by the United Nations (UN) at 35,000, which placed it at number 187 in population among the 193 nations of the world. In 2005, approximately 11% of the population was over 65 years of age, with another 18% of the population under 15 years of age. According

to the UN, the annual population rate of change for 2005–10 was expected to be 0.4%, a rate the government viewed as satisfactory. The projected population for the year 2025 was 40,000. The population density was 219 per sq km (567 per sq mi), with the population heavily concentrated in the Rhine Valley, in which the two largest communities, Vaduz and Schaan, are located.

The UN estimated that 21% of the population lived in urban areas in 2005, and that urban areas were growing at an annual rate of 1.51%. The capital city, Vaduz, had a population of 5,000 in that year.

## 7 MIGRATION

There were 12,000 foreign residents in Liechtenstein in 2000, comprising approximately one-third of the total population. Moreover, about 6,885 Austrians and Swiss commute to Liechtenstein daily. Several hundred Italian, Greek, and Spanish workers have migrated to the principality on a semipermanent basis. In 1998 and 1999, Liechtenstein accepted a high number of Kosovo Albanian asylum seekers, granting them temporary protection. The number of asylum seekers and people under temporary protection comprised nearly 2% of the overall population of Liechtenstein in 1999. In 2004 there were 149 refugees and 68 asylum seekers. The estimated net migration rate in 2005 was 4.8 migrants per 1,000 population. The government views the migration levels as satisfactory.

## 8 ETHNIC GROUPS

The indigenous population, accounting for 86% of the total population, is described as being chiefly of Alemannic stock, descendants of the German-speaking tribes that settled between the Main and Danube rivers. Italian, Turkish, and various other groups account for the remaining 14%.

## 9 LANGUAGES

German is the official language. The population speaks an Alemannic dialect.

## 10 RELIGIONS

The state religion is Roman Catholicism, to which about 78% of the population adhere; however, absolute freedom of worship prevails. About 0.07% of the population are Protestants and 0.04% are Muslims. The Eastern Orthodox Church has about 254 members. Buddhists, Jehovah's Witnesses, Anglicans, Jews, Baha'is and New Apostolics each have less than 80 members.

## 11 TRANSPORTATION

The line of the Arlberg express (Paris to Vienna) passes through Liechtenstein at Schaan-Vaduz, extending for 18.5 km (11.5 mi), but few international trains stop. The main center for reaching Liechtenstein is Buchs, Switzerland, about 8 km (5 mi) from Vaduz.

Postal buses are the chief means of public transportation both within the country and to Austria and Switzerland. A tunnel, 740 m (2,428 ft) in length, connects the Samina River Valley with the Rhine River Valley.

In 2002, there were some 250 km (155 mi) of paved roadways. A major highway runs through the principality, linking Austria and Switzerland.

The nearest airport is in Zürich, Switzerland. As of 2004, the country had 28 km (17 mi) of navigable waterways.

## 12 HISTORY

The territory now occupied by the Principality of Liechtenstein first acquired a political identity with the formation of the sub-country of Lower Rhaetia after the death of Charlemagne in 814. The County of Vaduz was formally established in 1342 and became a direct dependency of the Holy Roman Empire in 1396. The area (to which, in 1434, was added the Lordship of Schellenberg, in the north) was ruled in turn by various families, such as the counts of Montfort, von Brandis, van Sulz, and von Hohenems.

During the Thirty Years' War (1618–48), the area was invaded first by Austrian troops and then, in 1647, by the Swedes. After the von Hohenems line encountered financial difficulty, Prince Johann Adam of Liechtenstein purchased from them first Schellenberg (1699) and then Vaduz (1712). The Liechtenstein family thus added to its vast holdings in Austria and adjoining territories.

The Principality of Liechtenstein as such was created on 23 January 1719 by act of Holy Roman Emperor Charles VI, who made it a direct fief of the crown and confirmed the rule of Prince Anton-Florian, Johann Adam's successor, under the title of Prince von und zu Liechtenstein.

During the Napoleonic wars, Liechtenstein was invaded by both the French and the Russians. Following the Treaty of Pressburg (1805), Liechtenstein joined the Confederation of the Rhine, which made the principality a sovereign state. In 1815, following the downfall of Napoleon, Liechtenstein joined the newly formed Germanic Confederation.

With Prussia's victory over Austria in the Seven Weeks' War (1866), the Confederation was dissolved and the constitutional ties of Liechtenstein to other German states came to an end. In the war, Liechtenstein had furnished Austria-Hungary with 80 soldiers; two years later, the principality disbanded its military force for all time.

From 1852, when the first treaty establishing a customs union was signed, until the end of World War I, Liechtenstein was closely tied economically to Austria. After the war, the collapse of the Austrian currency and economy inclined the principality to seek economic partnership with its other neighbor, Switzerland. A treaty concluded with Switzerland in 1923 provided for a customs union and the use of Swiss currency.

Liechtenstein (like Switzerland) remained neutral in World War II, as it had in World War I. After Germany was defeated in 1945, Nazi sympathizers in Liechtenstein who had supported incorporation of the principality into Hitler's Third Reich were prosecuted and sentenced. The postwar decades have been marked by political stability and outstanding economic growth.

Prince Franz Josef II, who succeeded his granduncle, Franz I, in 1938, was the first reigning monarch actually to reside in Liechtenstein. On 26 August 1984, Franz Josef II handed over executive authority to his eldest son and heir, Crown Prince Hans-Adam. Hans-Adam II has been ruling prince since 13 November 1989, after Franz Josef II died.

Liechtenstein has sought further integration into the world community. The country was admitted to the UN in September 1991. In Europe, Liechtenstein joined EFTA in 1991 and became a member of the European Economic Area (EEA) in 1995.

Disagreements between Prince Hans-Adam II and parliament arose in the latter half of 1999. In September, the prince's assertion that he had the right to dissolve the government at his discretion raised tensions to the point where Hans-Adam threatened to go into exile in Austria. In October, the European Court of Human Rights ruled on a complaint filed by Dr. Herbert Wille, a senior judge whom the prince had refused to re-appoint because of Wille's assertion that the country's Supreme Court rather than its monarch should be the ultimate authority on constitutional issues. The court ruled that in depriving Wille of his judicial position because of his political views, the prince had violated the judge's freedom of speech. Wille was awarded 10,000 Swiss francs in compensation as well as payment of his legal costs.

Sixty-four percent of Liechtenstein's voters approved a new constitution for Liechtenstein in a referendum held in March 2003; Hans-Adam II will be granted near-absolute powers. Turnout was large, with 14,800 of Liechtenstein's 17,000 electorate casting votes. The prince now has the right to dissolve government, control a committee appointing judges, and has veto power over legislation. The constitution also gives the people the power to call a referendum and abolish the monarchy. As a result of the changes, which many observers deemed undemocratic, Prince Hans-Adam II rescinded his pledge to leave the country. On 15 August 2004 Prince Hans-Adam II transferred the official duties of the ruling prince to his son and heir apparent, Alois, who was seen as less confrontational than his father. Prince Hans-Adam II retained the status of Chief of State.

Liechtenstein ranks as one of the world's most prosperous countries with one of the world's highest living standards while its people pay very low taxes. In 1999, the royal family itself was ranked as the wealthiest in all of Europe while Prince Hans-Adam II personally was ranked as Europe's third-wealthiest monarch. However, in 2000 Liechtenstein ranked among the top 15 countries named by an international task force investigating countries whose banking laws make money laundering possible. Liechtenstein took steps in 2001 to make its banking system more transparent, however a 2003 International Monetary Fund report concluded that although the banking sector had updated its banking regulation, there were not enough staff to fully enforce the regulations.

### 13 GOVERNMENT

Liechtenstein is a constitutional monarchy ruled by the hereditary princes of the house of Liechtenstein. The monarchy is hereditary in the male line. The constitution of 5 October 1921, as amended in 1987, provides for a unicameral parliament (Landtag) of 25 members elected for four years. Election is by universal suffrage at age 18 and is on the basis of proportional representation. Women gained the right to vote in 1984. A new voting system that went into effect as of the 1974 national elections provides nine representatives for the Upper Land district and six representatives for the Lower Land district.

A new constitution was approved in March 2003 that grants the ruling prince extensive powers, including the right to veto legislation and to control the appointment of judges, in addition to the rights guaranteed to him under the former constitution.

The prince can call and dismiss the Landtag. On parliamentary recommendation, he appoints the prime minister, who must be of Liechtenstein birth, and the deputy prime minister for four-year

LOCATION: 47°3' to 47°14' N; 9°29' to 9°38' E. BOUNDARY LENGTHS: Austria, 34.9 kilometers (21.7 miles); Switzerland, 41.1 kilometers (25.5 miles).

terms. It is the regular practice for the prime minister to be of the majority party and the deputy prime minister to be selected from the opposition. The Landtag appoints four councilors for four-year terms to assist in administration. Any group of 1,000 persons or any three communes may propose legislation. Bills passed by the Landtag may be submitted to popular referendum. A law is valid when it receives majority approval by the Landtag and the prince's signed concurrence.

### 14 POLITICAL PARTIES

The two principal parties are the Fatherland Union (Vaterländische Union—VU) and the Progressive Citizens' Party (Fortschrittliche Bürgerpartei—FBP). In the general elections of 1997, the VU, which has held a majority since 1978, won 13 seats in the Landtag

and the FBP 10. Other parties included the Free List (Freie Liste—FL), two seats; and the Liechtenstein Non-party List (Überparteiliche Liste Liechtensteins—ULL), which was not represented.

The general elections in 1993 resulted in a coalition government headed by Mario Frick of the Fatherland Union (VU). Frick was reelected as prime minister by the Landtag in 1997. Although the VU remains the largest single party, Liechtenstein had a coalition government from 1938 until 1997.

In the 2001 elections, the FBP won 49.9% of the vote and 13 seats in the Landtag, to the VU's 41.1% and 11 seats. The Free List (Greens) won 8.8% of the vote and 1 seat. Otmar Hasler was named prime minister. It was the first time since 1978 that the FBP held a majority in parliament. The 2005 elections saw the FBP retaining power with 48.7% of the vote and 12 seats, to the VU's 38.2% and 10 seats. The minority party Free List increased their following with 13% of the vote and 3 seats. The next elections were scheduled for 2009.

### **15 LOCAL GOVERNMENT**

The 11 communes (gemeinden) are fully independent administrative bodies within the laws of the principality. They levy their own taxes. Liechtenstein is divided into two districts—the Upper Land (Vaduz) and the Lower Land (Schellenberg)—for purposes of national elections.

### **16 JUDICIAL SYSTEM**

The principality has its own civil and penal codes, although in certain instances courts composed of Liechtenstein, Swiss, and Austrian judges have jurisdiction over Liechtenstein cases. Courts that function under sole Liechtenstein jurisdiction are the county court (Landgericht), presided over by one judge, which decides minor civil cases and summary criminal offenses; the juvenile court; and the Schöffengericht, a court for misdemeanors. The remaining courts, with five judges each, have a mixed composition for purposes of impartiality: three Liechtenstein lay judges, one Swiss judge, and one Austrian judge. The criminal court (Kriminalgericht) is for major crimes. Other courts of mixed jurisdiction are the assize court (Schöffengericht-Vergehen), the superior court (Obergericht), and a supreme court (Oberster Gerichtshof). An administrative court of appeal hears appeals from government actions, and the Constitutional Court determines the constitutionality of laws. In June 1986, Liechtenstein adopted a new penal code abolishing the death penalty.

The constitution provides for public trials and judicial appeal. The judiciary is separate from the executive and legislative branches. The 2003 referendum gave the prince the ultimate right to control the appointment of the country's judges.

The constitution provides for freedom of assembly, association and religion. Crime is rare and Switzerland is responsible for Liechtenstein's defense. Liechtenstein retains a restrictive law on the availability of abortion, and is allowable only when the life or health of a woman is threatened.

### **17 ARMED FORCES**

Since 1868, no military forces have been maintained in Liechtenstein, but there is obligatory military service for able-bodied men up to 60 years of age in case of emergency.

### **18 INTERNATIONAL COOPERATION**

Liechtenstein became a member of the United Nations on 18 September 1990; it belongs to the IAEA, ITU, UNCTAD, UPU, and WIPO. Liechtenstein is also a member of the Council of Europe, the European Bank for Reconstruction and Development, EFTA, the OSCE, and the WTO. The principality joined the European Economic Area in 1995. Liechtenstein now has diplomatic relations with nearly 50 countries. In environmental cooperation, the country is part of the Basel Convention, Conventions on Biological Diversity and Air Pollution, Ramsar, CITES, the Kyoto Protocol, the Montréal Protocol, and the UN Conventions on Climate Change and Desertification.

### **19 ECONOMY**

Despite its small size and limited national resources, Liechtenstein is one of the richest countries in the world on a per capita GDP basis. It has developed since the 1940s from a mainly agricultural to an industrialized country and a prosperous center of trade and tourism. Factories produce a wide range of high-technology manufactures, especially precision instruments. Liechtenstein is also a world leader in specialized dental products. Industrial products are manufactured almost exclusively for export.

Special economic advantages enjoyed by very small nations of Europe (e.g., the issuance of new postage stamps, free exchange of currencies, and liberal laws that provide incentives for the establishment of bank deposits and of nominal foreign business headquarters) also play a part in this prosperity.

In 1999 Liechtenstein became the subject of an international investigation into money laundering. Although Liechtenstein subsequently drafted legislation to combat money laundering, the Finance Action Task Force placed the principality on the international "black list" for failing to cooperate with international authorities on the matter.

About 35% of the people employed in Liechtenstein commute from Switzerland and Austria. Liechtenstein remains a well-known tax haven, and a location for holding companies to establish nominal offices; these provide for 30% of state revenues. The country has no central bank and does not print its own currency, but uses the Swiss franc instead. Liechtenstein is engaged in harmonizing its economic policies with those of the EU.

In 1999, its GDP (at purchasing power parity) was \$825 million, an 11% improvement over the previous year. In 2002, the unemployment rate for the country's 10,000 domestic workers was 1.3%. More than 19,000 workers commute to Liechtenstein from neighboring countries—Austria, Switzerland, and Germany.

### **20 INCOME**

The US Central Intelligence Agency (CIA) reports that in 2005 Liechtenstein's gross domestic product (GDP) was estimated at \$825.0 million. The CIA defines GDP as the value of all final goods and services produced within a nation in a given year and computed on the basis of purchasing power parity (PPP) rather than

value as measured on the basis of the rate of exchange based on current dollars. The per capita GDP was estimated at \$25,000. The annual growth rate of GDP was estimated at 11%. The average inflation rate in 2001 was 1%.

## 21 LABOR

As of end 2001 (the latest year for which data was available), there were 29,000 persons in the labor force, including 19,000 foreigners, of whom 13,000 commuted to work from Switzerland, Germany and Austria. As of that date, 1.3% of the workforce were in the agricultural sector, with industry accounting for 47.4% and the services sector 51.3%. Liechtenstein's workforce is highly skilled, but there are not enough native-born workers to meet industry's needs. Unemployment as of September 2002 was 1.3%.

All workers, including foreigners, are entitled to form and join unions. There is one trade union that represents about 13% of the workforce. Strikes are permitted but are not generally used. Most collective bargaining agreements are adapted from ones signed between Swiss workers and employers.

There is no minimum wage, although wages are among the highest in the world. The legal workweek is 45 hours in the industrial sector and 48 hours in nonindustrial firms. The actual workweek is usually 40 to 43 hours. Occupational safety and health standards are set by the government and are rigorously enforced. The minimum working age is 16, but exceptions to this may be made for children wishing to leave school at the age of 14.

## 22 AGRICULTURE

Liechtenstein has only 912 hectares (2,254 acres) of arable land. Until the end of World War II (1939–45), the economy was primarily focused on agriculture. In the Rhine Valley, the most productive area, the chief vegetables are corn, potatoes, and garden produce. On gradual mountain slopes, a variety of grapes and orchard fruits are grown.

## 23 ANIMAL HUSBANDRY

Alpine pasture, particularly well suited for cattle grazing, covers over 35% of the total land area.

In 2005, cattle numbered about 6,000; hogs, 3,000; and sheep, 2,900.

## 24 FISHING

There is no commercial fishing in Liechtenstein. Rivers and brooks are stocked for sport fishing.

## 25 FORESTRY

The forests of Liechtenstein not only supply wood but also have an important function in preventing erosion, landslides, and floods. Forests cover about 7,000 hectares (17,200 acres).

More than 90% of all forestland is publicly owned; of the 474 hectares (1,171 acres) of private forest, 158 hectares (390 acres) are the property of the prince. The most common trees are spruce, fir, beech, and pine. Roundwood production in 2004 amounted to 22,167 cu m (782,820 cu ft).

## 26 MINING

There was no mining of commercial importance.

## 27 ENERGY AND POWER

The first Liechtenstein power station went into operation in 1927; its capacity is now 900 kW. Another station was constructed in 1947–49; it has an installed capacity of 9,600 kW. Total installed capacity in 1989 was 23,000 kW; production amounted to 150 million kWh in 1995. Since domestic production no longer meets local requirements, supplementary energy is imported from Switzerland, especially in winter. In 1995, 92.5% of Liechtenstein's energy requirement was imported from abroad. Consumption of electricity in 2001 was 313.5 million kWh. Imports of electricity in the same year totaled 232.8 million kWh.

## 28 INDUSTRY

The industry of Liechtenstein, limited by shortages of raw materials, is primarily devoted to small-scale production of precision manufactures. The output includes optical lenses, dental products, high-vacuum pumps, heating equipment, electron microscopes, electronic measuring and control devices, steel bolts, knitting machines, and textiles. Pharmaceuticals, electronics, ceramics, and metal manufacturing are also important. The largest industrial companies in Liechtenstein are Hilti (construction services), Balzers (electro-optical coatings), Hilcona (frozen foods), and Ivoclar-Vivadent (dental medical technology). Liechtenstein's industry is completely geared to exports; industrial exports rose from SwFr196.7 million in 1967 to SwFr3.0 billion in 1996. Around 48% of the labor force is engaged in industry, trade, and construction.

In 1999, industry made up approximately 40% of the overall GDP. By 2004, this share fell to 26.4%. Trade and services are the main contributors to the economy, with a 71.6% share.

## 29 SCIENCE AND TECHNOLOGY

Like Swiss industry, manufacturing in Liechtenstein entails a high degree of precision and technological sophistication. Balzers, the country's second-largest employer, is known for its leading role in providing equipment and thin film technology for the CD-ROM industry. Liechtenstein itself has no educational institutions offering advanced scientific training. The Liechtensteinische Gesellschaft für Umweltschutz, founded in 1973, is concerned with environmental protection.

## 30 DOMESTIC TRADE

Liechtenstein and Switzerland are essentially linked in one common economic zone. The domestic economy is largely based on industry and financial services. The primary product industries are electronics, metal manufacturing, and medical precision instruments. About 48% of the work force are foreigners, with 29% commuting from Switzerland and Austria. Vaduz and Schaan, the chief commercial centers, have some specialty shops, but the smaller communities have only general stores. Regular business hours are generally from 8 AM to 6:30 PM. Normal banking hours

are from 8:15 AM to noon and from 1:30 PM to 4 or 5 PM, Monday through Friday.

### **3<sup>1</sup> FOREIGN TRADE**

Goods to and from Liechtenstein pass freely across the frontier with Switzerland, with which Liechtenstein maintains a customs union. Exports in the mid-1990s averaged SwFr2,021,800 per year, as compared with SwFr893,385,000 in 1980. Exports in 1994 were valued at \$2.6 billion. Some 40% of exports in 1996 went to EEA countries.

Important exports include precision instruments, ceramics, textiles, and pharmaceuticals. Liechtenstein imports mainly raw materials, light machinery, and processed foods. In the mid-1990s, imports averaged SwFr1,074,600,000 per year.

In 2003, Liechtenstein's exports reached \$3.6 billion. Most of these exports went to the EU and Switzerland. The principal export commodities were construction techniques, electronic products, car parts, dental products, and processed agricultural products.

### **3<sup>2</sup> BALANCE OF PAYMENTS**

The US Central Intelligence Agency (CIA) reported that in 1996 the purchasing power parity of Liechtenstein's exports was \$2.47 billion while imports totaled \$917.3 million resulting in a trade surplus of \$1.5527 billion.

### **3<sup>3</sup> BANKING AND SECURITIES**

Although there is a national bank, the duties of the central bank are performed by the Swiss National Bank, a consequence of the currency union with Switzerland. Liechtenstein's banks form an important part of the economy, and they have experienced significant growth in the 1990s. An estimated 4% of the work force was employed by the banking sector in the 1990s.

The National Bank of Liechtenstein (Liechtensteinische Landesbank), founded in 1861, is the state bank of issue; in addition, it deals in real estate mortgages and ordinary banking operations. Liechtenstein Global Trust (LGT), the country's biggest financial institution (owned by the royal family), and the Private Trust Bank Corp., founded in 1956, play an important role in the finance and credit spheres of Liechtenstein's economy. Banking is linked with the Swiss banking system, as is securities trading. In 1945, Liechtenstein's banks had a combined balance sheet of SwFr38 million; in 2003, it was SwFr120 billion, an astonishing SwFr3.6 million for every person in the country. Net income from Liechtenstein's banks totaled SwFr232.5 million in 1996, and contributed over 12% to the country's national income in terms of taxes and dividends paid.

Because of Liechtenstein's strict bank secrecy, several thousand foreign businesses are nominally headquartered there. The secrecy laws are, however, waived in the case of criminal intent. There are at present no restrictions on foreign investors' access to financing in Liechtenstein. New laws to combat insider trading and money laundering have recently tightened fiduciary regulations.

### **3<sup>4</sup> INSURANCE**

Insurance activities in Liechtenstein are variously conducted by the government (old age and survivors' insurance), by private companies under government regulation (e.g., life, accident, health, and fire), and by farmers' associations. In 1996, a new insurance law

came into force, focusing on attracting insurance business from abroad, as Liechtenstein is now a member of the European Economic Area.

### **3<sup>5</sup> PUBLIC FINANCE**

Liechtenstein's economy has experienced more extensive development and industrialization in the past 40 years than any other Western country. In that period, it went from a predominantly agricultural economy to a highly advanced industry-driven economy.

The US Central Intelligence Agency (CIA) estimated that in 1998 Liechtenstein's central government took in revenues of approximately \$424.2 million and had expenditures of \$414.1 million. Revenues minus expenditures totaled approximately \$10.1 million.

### **3<sup>6</sup> TAXATION**

The main taxes are levied on personal income, business income, and principal. Personal income tax rates are determined by taxable income and taxable wealth. The basic tax rate is 1.2% on income and 0.06% on wealth. However, the communes levy a communal tax of 200%, which brings the combined tax rates to 17.82% on income and 0.89% on wealth. In addition, a surcharge is levied on the basic tax on income and wealth at rates ranging from 5–395%. Thus, the totals of basic tax, communal tax, and surcharges results in the national tax due. Corporations pay income tax at a rate of 7.5–15%. However, if the company's distributed dividends exceed 8% of taxable capital, an increase of 1–5% is added, based upon the dividend distribution percentage, which can push the maximum rate to 20%. Dividends and interest are subject to a 4% withholding tax. Royalty income is not taxed.

Other levies include a capital gains tax on the sale of real estate; death, estate, and gift duties; a motor vehicle registration tax; and a value-added tax (VAT) on goods and services within Liechtenstein and Switzerland at a standard rate of 7.5%.

Firms domiciled in Liechtenstein but conducting no gainful pursuits there benefit from extremely favorable tax arrangements, a prime factor in the establishment of nominal business headquarters. Foreign clients pay 1% per year in capital taxes; and only 0.5% for foundations with taxable assets exceeding SwFr10 million. The communes may impose property and income taxes.

Since joining the European Economic Area in 1995, Liechtenstein has not entered into any agreements covering double taxation, except for Austria.

### **3<sup>7</sup> CUSTOMS AND DUTIES**

There have been no customs between Switzerland and Liechtenstein since a customs treaty was ratified in 1924. On the Austrian border, Switzerland collects the customs at its own rates. Liechtenstein's part of the duties is calculated on the basis of population

and the principality pays an annual indemnification to Switzerland for customs and administration.

### 38 FOREIGN INVESTMENT

The Prince of Liechtenstein Foundation has established a number of ventures abroad, mainly in the field of investment management and counseling.

Several thousand foreign companies have established offices in Liechtenstein because taxes are very low, banking operates in strict secrecy, and the principality is politically stable. Some industrial establishments are owned and managed by Swiss interests.

### 39 ECONOMIC DEVELOPMENT

The government generally encourages the increasing diversification of industry and the development of tourism. The principality's low taxes and highly secret banking system are attractive to foreign corporations wanting to safeguard patents and trademarks and to individuals who want to protect their wealth for the future. Thousands of corporations have established nominal headquarters in Liechtenstein. In recent years, the principality is accused of serving as a center for money laundering. In 2002, the International Monetary Fund (IMF) conducted an Offshore Financial Center (OFC) Assessment of Liechtenstein, to evaluate the regulation and monitoring of the country's financial center. The IMF approved of Liechtenstein's efforts to fight money laundering and the financing of international terrorism, and of its planned establishment of an independent supervisory authority.

Research and development is a driving force of Liechtenstein's economic success; in 2000, total research and development spending rose over 20% to around \$149 million. Also, the industrial sector is diversified and dynamic, serving mostly niche markets outside the country. The relative attractive tax base keeps some of the more prominent companies (Hilti and Unaxis Balzers) in the country, and the low public spending costs (Liechtenstein has no army, no university, and no major medical clinics) keep the federal budget on a surplus. Export income per capita outweighs that of Germany by more than 10 times.

### 40 SOCIAL DEVELOPMENT

There is a universal pension system covering all residents, employed persons, and self-employed individuals. It is funded primarily by the government along with contributions from employees and employers. It provides benefits for old age, disability, and survivorship. A social insurance system and universal medical coverage provides sickness and maternity benefits. All residents and persons employed in Liechtenstein are entitled to medical coverage. Work injury and unemployment insurance are provided to all employed persons. There is a family allowance based on number of children and a birth grant provided to all residents and nonresident workers.

Equality for women is protected by law, and several groups monitor and promote women's rights. An equal opportunity law addresses workplace discrimination and sexual harassment. In 2004 the government-sponsored mentoring classes to inspire women to run for seats in parliament. Domestic violence laws have been enacted and are actively implemented. Human rights are fully respected in Liechtenstein.

### 41 HEALTH

The government regulates the practice of medicine and subsidiary occupations, such as nursing and pharmacy. Life expectancy in 2005 was about 79.55 years. As of 2002, the crude birth rate and overall mortality rate were estimated at, respectively, 11.2 and 6.8 per 1,000 people. The infant mortality rate was an estimated 4.7 per 1,000 births in 2005.

In 2000, Liechtenstein had an estimated 2.5 physicians per 1,000 people. There were approximately 8.3 hospital beds per 1,000 people. A program of preventive medicine, introduced in 1976, provides regular examinations for children up to the age of 10.

### 42 HOUSING

Houses in the countryside are similar to those found in the mountainous areas of Austria and Switzerland. Liechtenstein does not have a significant housing problem. About 82% of all dwellings have central heating, 89% have a kitchen, 91% have a private bath, 95% have hot water, and 88% have a common sewage system.

### 43 EDUCATION

Education is based on Roman Catholic principles and is under government supervision. In 1974, the compulsory primary school attendance period was lowered from eight years to five, beginning at age seven. Kindergarten, offered to children ages five to seven, is optional, followed by five compulsory years of primary school. Secondary education is divided into three tracks: *oberschule* (general); *realschule* (which offers vocational and, in some cases, university preparatory education), and *gymnasium* (which provides an eight-year program to prepare students for a university education, with concentrations in either the classics and humanities or economics and mathematics). Liechtenstein also has an evening technical school, a music school, and a children's pedagogic-welfare day school.

While there are no universities in Liechtenstein, gymnasium graduates are may attend universities in Switzerland and Austria and the University of Tübingen in Germany without passing an examination.

### 44 LIBRARIES AND MUSEUMS

The National Library (founded in 1961) serves as the public, academic, and national library. It is located in Vaduz and has over 200,000 volumes. There are three specialized libraries maintained by private institutes, and a small library attached to a state music school.

The National Museum, located in Vaduz, includes collections from the Prince and the State, containing an important Rubens collection. The Prince Liechtenstein Art Gallery, founded in 1620 and located in Vaduz, is an important cultural institution in Liechtenstein. The museum is housed upstairs in the tourist information office. Also in the capital are a postage museum and a state historical museum. A ski museum opened in Vaduz in 1994, and there are also museums in Schaan, Schellenberg, and Triesenberg.

### 45 MEDIA

The post office (including telegraph and telephone services) is administered by Switzerland. Liechtenstein, however, issues its own postage stamps. The Swiss dial system extends to the principality.

Direct-dialing is used throughout the country and includes international service. In 2002, there were 19,900 mainline phones and 11,400 mobile phones in use throughout the country. Telegraph service is efficient.

As of 2001, there were one state and one private television station broadcast, along with a private radio station. Residents also receive radio and television broadcasts from neighboring countries. In 1997 there were 21,000 radios and 12,000 television sets in the country. In 2002, there were 20,000 Internet subscribers in the country.

Two daily newspapers are published. The *Liechtensteiner Volksblatt* reflects the political outlook of the Progressive Citizen's Party. It had a circulation of about 8,200 in 2002. *The Liechtensteiner Vaterland* reflects the views of the Fatherland Union. It had a circulation of about 9,580 in the same year. *Liechtensteiner Wochenzeitung*, a weekly, had a circulation of 14,000.

The media is said to enjoy a large degree of autonomy and freedom from interference, owing to an independent press, an effective judiciary, and a democratic political system.

#### 46 ORGANIZATIONS

Organizations include the Chamber of Industry and Commerce, the Historical Society of the Principality of Liechtenstein, three concert societies, and various other cultural organizations. There are professional organizations representing several fields and occupations. Kiwanis and Lion's clubs are active in the country. Charitable institutions include the Liechtenstein Caritas Society (founded in 1924) and the Liechtenstein Red Cross Society (1945). Youth organizations include the Scouts and Guides of Liechtenstein. There are also several organizations devoted to sports and leisure activities.

#### 47 TOURISM, TRAVEL, AND RECREATION

Attractions include mountaineering and nature walks, the castles of Vaduz and Gutenberg (overlooking Balzers), the ruins of several fortresses, the numerous local brass bands and choirs, as well as the operetta societies of Vaduz and Balzers. The most popular

sports are swimming, golf, tennis, hiking, and skiing. The ski resort of Malbun has 12 hotels and 7 ski lifts.

Modern, comfortable buses offer regular service throughout Liechtenstein, connecting with Austria and Switzerland. In Vaduz, the lower country, and the Alpine regions there are hotels and guest houses.

The government actively encourages and supports the tourism industry. In 2003, there were 49,002 visitors, mainly from Luxembourg and Switzerland. Hotel rooms numbered 591 with 1,160 beds and an occupancy rate of 25%. The average length of stay that year was two nights.

#### 48 FAMOUS LIECHTENSTEINERS

Joseph Rheinberger (1839–1901), an organist and composer who lived in Munich, was the teacher of many famous composers. Prince John II (r. 1858–1929) was admired for donating some SwFr 75 million to the struggling country after World War I. Prince Franz Josef II (1906–89), whose rule began in 1938, was Europe's longest-reigning sovereign. Liechtenstein's current monarch is Prince Hans Adam II (b.1945), who first was given executive power in 1984 and assumed control in 1989. Prince Alois (b.1968) is regent.

In 1980, Hanni Wenzel (b.1956) and her brother Andreas (b.1958) won the World Cup international skiing championships.

#### 49 DEPENDENCIES

Liechtenstein has no territories or colonies.

# LITHUANIA

Republic of Lithuania  
*Lietuvos Respublika*

**CAPITAL:** Vilnius

**FLAG:** Three equal horizontal bands of yellow (top), green, and red.

**ANTHEM:** *Tautiška Giesmė (The National Song)*.

**MONETARY UNIT:** The Lithuanian lita (LTL) of 100 cents has replaced the transitional system of coupons (talonas) which had been in force since October 1992, when the Soviet ruble was demonetized. There are coins of 1, 2, 5, 10, 20, and 50 cents and 1, 2, and 5 litas, and notes of 10, 20, 50, and 100 litas; LTL1 = \$0.36364 (or \$1 = LTL2.75) as of 2005.

**WEIGHTS AND MEASURES:** The metric system is in force.

**HOLIDAYS:** New Year's Day, 1 January; Day of the Restoration of the Lithuanian State, 16 February; Good Friday (movable); Anniversary of the Coronation of Grand Duke Mindaugas of Lithuania, 6 July; National Day of Hope and Mourning, 1 November; Christmas, 25–26 December.

**TIME:** 2 PM = noon GMT.

## <sup>1</sup> LOCATION, SIZE, AND EXTENT

Lithuania is located in eastern Europe, bordering the Baltic Sea, between Latvia and Poland. Comparatively, it is slightly larger than the state of West Virginia with a total area of 65,200 sq km (25,174 sq mi). Lithuania shares boundaries with Latvia on the N and NE, Belarus on the S and SE, Poland on the SW, Russia-Kaliningrad Oblast on the W, and the Baltic Sea on the NW. Lithuania's land boundary length totals 1,273 km (791 mi). Its coastline is 99 km (62 mi).

Lithuania's capital city, Vilnius, is located in the southeastern part of the country.

## <sup>2</sup> TOPOGRAPHY

The topography of Lithuania features a central lowland terrain with many scattered small lakes and fertile soil. Moderate highlands lie to the east and south, with a few hilly regions in the west. The main hill regions are the Zemaical Uplands of the northwest and the Baltic Highlands of the southeast. The highest point in the country is Juozapine, located in the Baltic Highlands. It has an elevation of 292 meters (958 feet). The lowest point is at sea level (Baltic Sea).

There are about 758 rivers in the country that are longer than 10 kilometers; but very few are navigable. The Neman, which cuts through the center of the country from Belarus to the Baltic Sea, is the longest river, with a length of 936 kilometers (582 miles). There are over 2,500 lakes in the country, most of which are in the eastern central regions. The largest is Lake Druksiai, which is located on the northeast border with Belarus and covers an area of 44.5 square kilometers (17.2 square miles).

## <sup>3</sup> CLIMATE

Lithuania's climate is transitional between maritime and continental. Yearly, the mean temperature is 6.1°C (43°F). The mean

temperature in July is 17.1°C (63°F). Rainfall averages from 49 cm (24 in) to 85 cm (33 in) depending on location.

## <sup>4</sup> FLORA AND FAUNA

The country is located in the mixed forest zone. The country's vegetation is a mixture of coniferous, broadleaf woodlands, arctic, and steppe species. There are about 68 species of mammals, 203 breeding bird species, 7 reptile species, 13 amphibian species, and about 60 fish species. The country has rabbit, fox, red deer, roe, elk, wild boar, badger, raccoon dog, wolf, lynx, and gallinaceous birds. Roach, ruff, bream, and perch can be found in Lithuania's lakes and streams.

## <sup>5</sup> ENVIRONMENT

Lithuania's environmental problems include air pollution, water pollution, and the threat of nuclear contamination. In 2000, the total of carbon dioxide emissions was at 11.9 million metric tons. A UN report on Lithuania stated that air pollution has damaged about 68.4% of the nation's forests. Water pollution results from uncontrolled dumping by industries and the lack of adequate sewage treatment facilities.

After the nuclear accident at Chernobyl that contaminated much of Lithuania with excessive radiation, Lithuanians are concerned about nuclear energy development, especially the use of nuclear power generated by plants of the same kind as the one at Chernobyl.

Lithuania's pollution problems have also affected the nation's wildlife. Although 10% of Lithuania's total land area was protected as of 2003, many of the country's original animal and plant species are now extinct. According to a 2006 report issued by the International Union for Conservation of Nature and Natural Resources (IUCN), threatened species included five types of mammals, four species of birds, three species of fish, and five species of inverte-

brates. Threatened species include the European bison, the asp, the red wood ant, the marsh snail, and the Russian desman. The wild horse has become extinct.

## 6 POPULATION

The population of Lithuania in 2005 was estimated by the United Nations (UN) at 3,415,000, which placed it at number 128 in population among the 193 nations of the world. In 2005, approximately 15% of the population was over 65 years of age, with another 18% of the population under 15 years of age. There were 87 males for every 100 females in the country. According to the UN, the annual population rate of change for 2005–10 was expected to be -0.3%, a rate the government viewed as too low; the population growth rate fell below zero in the mid-1990s. The projected population for the year 2025 was 3,134,000. The population density was 53 per sq km (136 per sq mi).

The UN estimated that 67% of the population lived in urban areas in 2005, but that population in urban areas was declining at an annual rate of -0.49%. The capital city, Vilnius, had a population of 549,000 in that year. Other large cities include Kaunas and Klaipėda.

## 7 MIGRATION

Many Lithuanians unable to accept Soviet occupation in 1940 were deported to Siberia. However, Russian immigration to Lithuania was never as heavy as to the other Baltic republics. Lithuania has been used as a transit country to western Europe for many years. Government policy was to return asylum seekers to their homelands or detain them indefinitely. However, a Lithuanian refugee law passed 27 July 1997 established an asylum procedure. The total number of migrants living in Lithuania in 2000 was 339,000. In 2004, there were 9,459 persons of concern to the United Nations High Commissioner for Refugees (UNHCR), 9,028 stateless, 408 refugees, and 28 asylum seekers. Remittances in 2003 were \$30.5 million. In 2005, the net migration rate was an estimated -1.71 migrants per 1,000 population. The government views the migration levels as satisfactory.

## 8 ETHNIC GROUPS

According to the 2001 census, Lithuanians form about 83.4% of the population. Russians constituted about 6.3%; Poles made up 6.7%; the remaining minority ethnic groups include Belarussians, Ukrainians, Tatars, and Karaites. There are about 3,000 in the Romani community.

## 9 LANGUAGES

Lithuanian, the official language, is noted for its purity in retaining ancient Indo-European language forms and has some remarkable similarities with Sanskrit. It is highly inflected, with seven noun cases. Like Latvian, it has rising, falling, and short intonations. Its Roman alphabet has many special symbols, including the hacek, dot, and cedilla. The majority (82%) speak Lithuanian for their first tongue. Polish (5.6%) and Russian (8%) are also widely used.

Minorities have the right to official use of their languages where they form a substantial part of the population.

## 10 RELIGIONS

The country witnessed extensive suppression of religious activities during the Soviet period. The 2001 census indicated that about 79% of the population were nominally Roman Catholic. The next largest denomination, the Russian Orthodox Church, accounted for about 4.1% of the population. The Old Believers (an Orthodox sect) have about 27,000 members. About 20,000 people are Lutherans, 7,000 are Evangelical Reformed, 4,000 are Jewish, 2,700 are Sunni Muslim, and about 300 are Greek Catholic. About 9.4% of the population claimed no specific religious affiliation.

Lithuania is one of a few countries to have an active community of Karaites. The faith is a branch of Judaism, with tenets based exclusively on a literal interpretation of the Hebrew scriptures. The Karaites have two centers of worship in the country, in Vilnius and Trakia, with a total of about 250 members. The Karaites are considered to be an ethnic community as well. They speak a Turkic-based language and use the Hebrew alphabet.

The constitution allows for freedom of religion, but the government reserves the right to place restrictions on religious organizations with practices that might contradict the constitution or public law. The government recognizes nine groups as “traditional” faiths that are eligible for state assistance: Latin Rite Catholics, Greek Rite Catholics, Evangelical Lutherans, the Evangelical Reformed Church, Orthodox Christians, Old Believers, Jews, Sunni Muslims, and Karaites. Denominations considered “nontraditional” by the government include Jehovah’s Witnesses, Baptists, Seventh-Day Adventists, and Pentecostals, as well as about 160 other religious organizations. Certain Christian holidays are celebrated as national holidays.

## 11 TRANSPORTATION

Lithuania’s railroad system in 2004 consisted of 1,998 km (1,241 mi) of broad, standard and narrow gauge lines that were used to provide rail access to the Baltic Sea for Vilnius, Kaunas, and other major urban areas. Of that total, broad gauge lines accounted for the bulk at 1,807 km (1,124 mi) of which, 122 km (76 mi) was electrified. Narrow gauge accounted for another 169 km (105 mi), with standard gauge accounting for the remainder.

As of 2003, Lithuania had 78,893 km (49,071 mi) of roadway, of which 21,617 km (13,446 mi) were paved, including 417 km (259 mi) of expressways. In 2004 there were 600 km (373 mi) of perennial navigable waterways. Sea routes link Klaipėda on the Baltic Sea with 200 foreign ports. Kaunas is the principal inland port. In 2005, the merchant fleet consisted of 54 ships (of 1,000 GRT or over) totaling 296,856 GRT. A railway sea ferry from Klaipėda to Mukran (Germany) began in 1986. As of 2004, there were an estimated 102 airports, of which 33 had paved runways as of 2005. Principal airports include Palanga, Vilnius, and Kaunas International at Kaunas, and one commercial airport in Siauliai. Two international airlines serve Lithuania: Lithuanian Airlines and Lietuva. In 2003, about 329,000 passengers were carried on scheduled domestic and international airline flights.

LOCATION: 56°0' N; 24°0' E. BOUNDARY LENGTHS: Total boundary lengths, 1,372 kilometers (854 miles); Latvia, 453 kilometers (282 miles); Belarus, 502 kilometers (312 miles); Poland, 91 kilometers (57 miles); Russia, 227 kilometers (141 miles); Baltic Sea coastline, 99 kilometers (62 miles).

## 12 HISTORY

Lithuanians are a branch of the Balts, whose permanent and lasting settlement of modern day Lithuania dates back to 200 BC, much earlier than most of Europe whose people and cultures were still in flux well into the 5th century AD. Lithuanian, along with Latvian, is thus one of the oldest languages in Europe.

The first Lithuanian state was established by Grand Duke and later King Mindaugas in 1236. Grand Duke Gediminas, who ruled from 1316–41, is credited with founding the capital of Vilnius and the Jagiellonian dynasty, whose members would become figures of power in Lithuania, Poland, and Hungary for the next 200 years.

In the late 14th century Lithuania ruled a vast area covering much of modern day Belarus and Ukraine and stretching to the Black Sea. However, the country was constantly threatened by the German Teutonic Order, which occupied the southern Baltic coast. The power struggle had a religious element, since outside of a brief eight-year period, Lithuania remained devoutly pagan until 1386. That year Grand Duke Jogaila (Polish: *Jagiello*) wed the Polish queen Jadwiga and thereby converted to Christianity the last remaining European pagans. The combined Polish-Lithuanian armies led by Jogaila and his cousin Vytautas (Polish: *Witold*) decisively beat the Teutonic Knights at the battle of Grunwald in 1410.

The marriage of Jogaila to Jadwiga and his ascension to the Polish throne marked the beginning of a political union with Poland, intertwining the histories of the two nations for 400 years. The union was made formal in the 1569 Lublin Agreement, which created a Polish-Lithuanian Commonwealth with an elected monarch chosen by the gentry of both states. Although in principle it was a union of two equals, the Polish influence on the culture and politics of the Commonwealth was stronger, due among other things simply to the larger size and population of the Polish state. Lithuania prospered and developed during the Commonwealth's Golden Age in the 16th century with the founding of the region's first university in Vilnius in 1579 and the development of a distinct Lithuanian baroque artistic style.

The 18th century saw the decline of the Commonwealth and occupation by foreign powers. What is now Lithuania was annexed to the Russian Empire in the final partition in 1795. During the 19th century, a Lithuanian nationalist movement arose leading to uprisings against Russian rule and, in turn, to Russian persecutions including the outlawing of the Lithuanian language.

On 16 February 1918, Lithuania proclaimed its independence after the defeat of both Germany and Russia in World War I. The new Bolshevik government in Moscow attempted to establish Soviet power in Lithuania, but failed. After a series of armed border conflicts between Lithuania, Russia and Poland, in 1920 Moscow recognized Lithuanian independence, but Poland annexed Vilnius, and the Lithuanian capital had to be moved to Kaunas. A secret protocol to the 1939 Nazi-Soviet pact assigned Lithuania to the Soviet sphere of influence. Wishing to avoid conflict, the Lithuanian government allowed Soviet forces to be stationed on its territory. The local government was forced to resign in June 1940. Rigged elections created a parliament which proclaimed Lithuania to be a Soviet Socialist Republic in July 1940. Moscow lost control of Lithuania soon after Germany attacked the USSR in June 1941.

Lithuania suffered heavily at the hands of both powers. While the Nazis succeeded in exterminating most of Lithuania's 240,000 Jews, the Soviets deported tens of thousands of Lithuanians to Siberia. Soviet forces recaptured Lithuania in 1944, although armed resistance against Soviet rule continued for several years after World War II.

Forty-five years of Soviet occupation did not erase the Lithuanian national identity. The first open protests against Soviet rule occurred in 1987 and in 1988. Vytautas Landsbergis established the Sajudis anti-Communist political movement which strove to create an autonomous republic and later an independent state. With the crumbling of the Eastern Bloc and fall of the Berlin Wall in 1989, Soviet pressure eased, and opposition parties were allowed to participate in elections to the Lithuanian Supreme Soviet held on 24 February 1990. Sajudis won a clear majority and Lithuania became the first Soviet republic to proclaim independence on 11 March 1990.

Although Soviet president Mikhail Gorbachev's policy of *glasnost* and *perestroika* had intended to allow a greater voice to Lithuanian self-determination, full Lithuanian independence from the Soviet Union was not what many in the Kremlin had in mind. The August 1991 coup by hardliners in Moscow was accompanied by a crackdown in Vilnius, with Soviet troops storming the TV tower killing 14 civilians and injuring 700. It was not until the failure of

the coup and collapse of the Soviet Union that the government in Moscow fully recognized Lithuanian independence.

Since independence, Lithuania has been preoccupied with reforming its economic and political institutions. Privatization has transformed its economy to a market-oriented one. Politically, a thriving press and open democracy have been established. Former Communists won the first postindependence elections in 1992, but conservatives took back the parliament in 1996 elections, in response to growing allegations of government corruption. Presidential elections the following year were surrounded by controversy over the eligibility for office of candidate Valdas Adamkus, who had lived in the United States for over 30 years following World War II. Adamkus was elected in runoff elections in January 1998.

Parliamentary elections were held on 8 October 2000, resulting in a win for former president Algirdas Brazauskas' Social Democratic Coalition, which won 31.1% of the vote, taking 51 of 141 seats in the Seimas. However, a grouping of four smaller parties formed a new centrist government with Rolandas Paksas as prime minister. Presidential elections were held on 22 December 2002, and Adamkus took the lead in the first round of voting, with 35.3% of the vote, to 19.7% for Paksas. In what surprised many experts, Paksas campaigned vigorously for the run-off vote held on 5 January 2003, and won the second round with 54.9% to 45.1% for Adamkus.

Paksas did not serve out his entire term. When he was impeached in April 2004 for having ties with Russian organized crime and participating in influence peddling, the country was temporarily thrown into disarray. In the early election that followed, the Constitutional Court did not allow Paksas to run again despite his continued popularity, especially in rural regions. Adamkus seized the opportunity to return to office and beat Kazimira Prunskiene, the country's first post-Soviet prime minister, who was supported by those loyal to Paksas.

Given the history of Russian domination of Lithuania, it is understandable that Lithuania's primary foreign policy objective has been to improve relations with the West and especially to gain entrance into NATO and the EU. In November 2002, Lithuania was formally invited to join NATO, and became a member in 2004. In May 2004 Lithuania joined the European Union along with nine other ex-Communist states and Malta. Lithuania supported the 2003 US-led military campaign to disarm and remove Saddam Hussein's regime in Iraq.

## 13 GOVERNMENT

On 25 October 1992, Lithuanian voters approved a new constitution, which called for a 141-member unicameral legislature (Seimas) and a popularly elected president. The constitution requires whoever is elected as president to sever his or her formal party ties. All who were permanent residents of Lithuania in November 1989 have been granted the opportunity to become citizens, irrespective of their ethnic origins. Members of the Seimas are elected for four-year terms, and the president is directly elected for a five-year term. The prime minister is appointed by the president; all other ministers are nominated by the prime minister and ap-

pointed by the president. All ministerial appointments must be approved by the Seimas. Suffrage is universal at age 18.

#### **14 POLITICAL PARTIES**

The majority party in the Seimas since the 1996 parliamentary elections was the conservative Homeland Union Party, or TS, led by Vytautas Landsbergis, which won 70 out of 141 seats. Overall, 28 parties competed for the 141 parliamentary seats in elections held on 20 October 1996 (first round) and 10 November 1996 (second round). The other party of the right wing, the Christian Democrats, also did well, winning 16 seats, and entered into a coalition government with the TS and the Lithuanian Center Union, which won 13 seats. The Democratic Labor Party (composed mostly of ex-Communists), which had been the majority party in the previous parliament, won only 12 seats. Other parties with parliamentary representation included the Lithuanian Social Democratic Party and the Lithuanian Democratic Party.

The Homeland Union-Conservative coalition suffered in the October 2000 parliamentary elections, capturing only nine seats. Former president Algirdas Brazauskas led four leftist parties in a Social Democratic Coalition, winning 51 of the 141 seats in parliament. However, a coalition ("New Policy") composed of the ideologically diverse Liberal Union (33 seats), New Alliance (28), Center Union (2), Modern Christian Democratic Union (3), and two smaller parties formed a new government, bypassing the Social Democratic Coalition. Rolandas Paksas was named prime minister.

In the elections of October 2004, the Labor Party—a recent political formation led by Russian millionaire Voktor Uspaskich—won 39 seats, Homeland Union 25, the Social Democrats 20, Liberal and Center Union 18, Social Liberals 11, Union of Farmers and New Democracy 10, Liberal Democrats 10, Electoral Action 2, and independents claimed 6 seats.

In the presidential elections held in June 2004, Valdas Adamkus beat Kazimiera Prunskiene with 52.2% of the vote. Adamkus will be in office until the next election that was scheduled for June 2009.

#### **15 LOCAL GOVERNMENT**

For administrative purposes, Lithuania's 10 provinces are divided into 44 regions, there are also urban districts, towns, and rural administrative units called *apylinkes*. Each level of local government has its own elected officials.

#### **16 JUDICIAL SYSTEM**

After Lithuania broke away from the Soviet Union, its legal system was transformed from that of the old Soviet regime to a democratic model. The system now consists of a Constitutional Court and a Supreme Court, whose members are elected by the Seimas, as well as district and local courts, whose judges are appointed by the president. A Court of Appeals hears appellate cases from the district courts.

A new civil and criminal procedure code and a court reform law were enacted in 1995. The government has reviewed its laws to bring them into accord with the European Convention on Human Rights.

The judiciary is independent.

#### **17 ARMED FORCES**

In 2005 the active armed forces of Lithuania totaled 13,510, supported by 8,200 reservists. The Army numbered 11,600 active personnel, followed by the Air Force with 1,200 members and the Navy with 710 active personnel. The country also had a paramilitary force of 14,600, that consisted of 5,000 border guards and a 9,600-member Riflemen Union. There was also a 540-person Coast Guard. Army equipment included three reconnaissance vehicles, 137 armored personnel carriers, and 133 artillery pieces. Naval forces operated 2 frigates, 3 patrol/coastal vessels, 2 mine warfare ships and, 1 logistics/support vessel. The Air Force operated 11 transport and 6 training fixed wing aircraft, in addition to 12 support helicopters. Lithuanian forces served in Afghanistan, Iraq, Bosnia, and Serbia-Montenegro. The defense budget for 2005 was \$333 million.

#### **18 INTERNATIONAL COOPERATION**

Lithuania was admitted to the United Nations on 17 September 1991; it is a member of several specialized agencies, such as the FAO, IAEA, World Bank, ILO, IMF, UNCTAD, UNESCO, UNIDO, and the WHO. Lithuania is also a member of the WTO, the OSCE, the Council of Europe, the European Bank for Reconstruction and Development, the Euro-Atlantic Partnership Council, and the Council of the Baltic Sea States. It is a member affiliate of the Western European Union. Lithuania joined the European Union and NATO in 2004.

Lithuania has foreign diplomatic missions in 94 countries. The country has offered support to UN missions and operations in Kosovo (est. 1999). It is part of the Australia Group, the Nuclear Suppliers Group (London Group), and the Organization for the Prohibition of Chemical Weapons. In environmental cooperation, Lithuania is part of the Basel Convention, Conventions on Biological Diversity and Air Pollution, Ramsar, CITES, the Kyoto Protocol, the Montréal Protocol, MARPOL, and the UN Conventions on the Law of the Sea and Climate Change.

#### **19 ECONOMY**

Until 1940, Lithuania's economy was primarily agricultural, mainly in the form of dairy farms and livestock raising. The main industries are machine building and metalworking, although light industry and food processing are also well developed. Like the other Baltic states, Lithuania has few natural resources, primarily peat and amber.

Due to modernization that occurred during Soviet dominance, Lithuania built up a large, if somewhat inefficient, industrial sector that in 2001 accounted for 32% of the country's economy. The service sector is 61% while agriculture accounts for about 13% of the economy.

In 1992, Lithuania's GDP fell 21.6%. In that year, the government adopted an IMF-directed program aimed at privatizing the economy, controlling inflation, eliminating price controls, and lowering the budget deficit. In June 1993 Lithuania's convertible currency, the litas, was introduced, setting off another round of inflation, while GDP continued to decline, by 16.2% in 1993 and 9.8% in 1994. In 1994, the government entered into a three-year arrangement with the IMF under its Extended Fund Facility (EFF) aimed primarily at bringing inflation under control. 1995 was the

first year of positive growth (3.3%) since independence, although unemployment remained high, at 16.4% in 1995. Inflation, which was still in double digits in 1996 (23%), fell to single digits (5.1%) by 1998 and unemployment fell to 6.4%. The economy registered real growth until 1999—4.7% in 1996, 7.3% in 1997 and 5.1% in 1998—but then was overtaken by the effects of the August 1998 financial crisis in Russia, still one of Lithuania's largest trading partners. Real GDP declined 3.9% in 1999 as unemployment jumped to 8.4%. Inflation remained under control, however, at 0.3%.

Growth returned in 2000, with real GDP up 3.3%, but unemployment continued to soar, peaking at 13.2% in March 2001. Growth in 2001 was 5.9%, above expectations, and in the first half of 2002, growth averaged about 5.6%. In February 2002, the government repegged the litas from the US dollar to the euro, at a rate of 3.4528 litas per euro. Inflation was about 1% for the year and by December 2002, unemployment had moderated to 10.9%. About 80% of Lithuanian's enterprises have been privatized since independence, and by 2002 over 25% of its trade was with countries outside the old Soviet bloc. Lithuania acceded to the WTO 31 May 2001 and was admitted to the EU in 2004.

In 2003, the Lithuanian economy was one of the most dynamic in Europe with a GDP growth rate of 9.7%. Prime factors for this economic expansion have been domestic and foreign investments. Rising fuel costs, as well as a shortage of qualified labor, have slowed down this boom by 2004—the GDP growth rate returned to a more modest, but still respectable, 6.7%, and was expected to continue to decline to 5.7% in 2005. Unemployment went down, from 10.3% in 2003 to 6.8% in 2004, and was expected to continue the decrease in 2005, to 5.8%. Inflation has remained negligible over all this time period, hovering at around 1%.

Overall, the economy in Lithuania is on a healthy path, with the private sector contributing to more than 80% of the country's GDP, with significant inflows of foreign capital, and with a dynamic and increasingly efficient local market.

## 20 INCOME

The US Central Intelligence Agency (CIA) reports that in 2005 Lithuania's gross domestic product (GDP) was estimated at \$49.4 billion. The CIA defines GDP as the value of all final goods and services produced within a nation in a given year and computed on the basis of purchasing power parity (PPP) rather than value as measured on the basis of the rate of exchange based on current dollars. The per capita GDP was estimated at \$13,700. The annual growth rate of GDP was estimated at 6.4%. The average inflation rate in 2005 was 2.6%. It was estimated that agriculture accounted for 5.7% of GDP, industry 32.4%, and services 62%.

According to the World Bank, in 2003 remittances from citizens working abroad totaled \$115 million or about \$33 per capita and accounted for approximately 0.6% of GDP. Foreign aid receipts amounted to \$372 million or about \$108 per capita and accounted for approximately 2.1% of the gross national income (GNI).

The World Bank reports that in 2003 household consumption in Lithuania totaled \$11.79 billion or about \$3,414 per capita based on a GDP of \$18.4 billion, measured in current dollars rather than PPP. Household consumption includes expenditures of individuals, households, and nongovernmental organizations on goods and services, excluding purchases of dwellings. It was estimated that for the period 1990 to 2003 household consumption grew at

an average annual rate of 5.4%. In 2001 it was estimated that approximately 33% of household consumption was spent on food, 13% on fuel, 4% on health care, and 27% on education.

## 21 LABOR

In 2005, Lithuania's labor force was estimated at 1.61 million. As of 2003, the services sector accounted for 54% of the workforce, with industry employing 28.1% and agriculture the remaining 17.9%. The unemployment rate was approximately 5.3% in 2005.

The constitution recognizes the right for workers to form and join trade unions. Approximately 13% of employees are union members. There are four major trade union organizations. The law also provides the right of workers to strike, except those in essential services in the public sector. Collective bargaining is permitted but only utilized on a limited basis.

The legal minimum wage is periodically adjusted by the government for inflation, but these adjustments lag behind the inflation rate. The minimum wage was \$107.50 per month as of 2002, but it is not universally enforced. The legal minimum age for employment is 16 years without parental consent, and 14 years with written parental consent. The 40-hour workweek is standard for most workers. The law stipulates occupational health and safety standards, but these are not effectively enforced and many industrial plants are unsafe.

## 22 AGRICULTURE

Out of Lithuania's 6,268,000 hectares (15,488,000 acres) of land area, 47.6% consisted of cropland and permanent pastures. Privatization in agriculture rapidly advanced after 1991; over 70,000 private farms had been established by 1996. In 2003, there were over 272,000 agricultural holdings. However, due to a lack of financial resources and inefficiency in the crediting system, many of these new farmers are only operating at subsistence levels. Agricultural output decreased by a yearly average of 1.1% during 1990–2000. However, during 2002–04, crop production was up 9.5% from 1999–2001. In 2003, the value of crop output was €669.7 million and agriculture accounted for 7% of GDP.

Crops of importance in 2004 included potatoes, 1,021,000 tons; barley, 970,000 tons; wheat, 1,315,000 tons; rye, 180,000 tons; dry beans, 5,200 tons, vegetables and melons, 379,000 tons; and rapeseed, 204,500 tons.

## 23 ANIMAL HUSBANDRY

About 8% of the total land area consists of permanent pastureland. Livestock in 2005 included 792,000 head of cattle, 1,074,000 pigs, 8,210,000 chickens, 22,100 sheep, and 63,600 horses. Meat production in 2005 totaled 216,700 tons, of which 28% was beef, 51% was pork, and 21% was chicken. Milk production exceeded 1.7 million tons in 2005, while 50,000 tons of eggs were produced. In 2003, the value of animal and animal product output was €514.9 million.

## 24 FISHING

Klaipeda's fishing port is the center of the fishing industry. In 2003, the total catch was 159,561 tons, down from 470,251 tons in 1991. Principal species in 2003 included mackerel, sardines, and hairtail. Fisheries exports were valued at \$115.1 million in 2003.

There are two aquacultural facilities operating in Lithuania, consisting primarily of carp.

## 25 FORESTRY

Forests cover about 32% of Lithuania. The forestry, wood products, and paper industries are some of Lithuania's oldest—furniture, matches, and timber products were manufactured in Kaunas and Vilnius in the mid-1800s, and furniture-making prevailed from 1919–40. Currently, chemical timber processing, and the production of furniture, pulp, paper, wood fiber, wood chips, joinery articles, and cardboard, are the main activities of the forestry sector. Intensive timber processing, as well as the recycling of industrial waste are being expanded. The timber cut yielded over 6.1 million cu m (216 million cu ft) of roundwood in 2004. Sawn wood production that year was 1,450,000 cu m (51 million cu ft); paper and paperboard, 99,000 tons. Exports of forest products amounted to \$335.7 million in 2004.

## 26 MINING

Lithuania's production of nonhydrocarbon minerals in 2003 included cement, limestone, nitrogen (from ammonia) and peat. Other industrial minerals produced included clays, and sand and gravel. Lithuania remained dependent on imports for its metals and fuel needs. Peat was extracted in the Siauliai, Ezherelis, Paraisitis, and Baltoyi-Boke regions. Mineral production figures in 2003 included: limestone, 944,600 metric tons, down from 984,300 metric tons in 2002; cement, 596,900 metric tons, compared to 605,800 metric tons in 2002; and peat, 366,900 metric tons, down from 513,000 metric tons in 2002. Following complaints from Lithuania's sole producers of cement and quicklime, the government launched antidumping investigations directed against Belarusian products. If the government were to take steps to protect the domestic construction material market, Lithuania could lose its export market in Belarus.

## 27 ENERGY AND POWER

Lithuania is alone among the three nations that comprise the Baltic States (the other two are Latvia and Estonia) to have any known petroleum reserves. Although it does not have any known reserves of natural gas, it does have a small amount of recoverable coal reserves.

Lithuania had 12 million barrels of proven oil reserves in 2004, but potential onshore and offshore reserves could be much greater. Oil production in 2004 averaged 14,000 barrels per day, with consumption averaging 107,000 barrels per day that same year. As a result, Lithuania imports the bulk of its oil, mostly from Russia. Lithuania is also a net natural gas importer, with consumption of 110 billion cu ft in 2004. Russia's Gazprom is a major source of the country's gas imports.

Lithuania also operates the only petroleum refinery among the Baltic States, the Mazheikiai oil refinery, which has a production capacity of 263,000 barrels per day.

Lithuania has recoverable coal reserves of 4 million short tons, as of 2004. However there is no recorded domestic production or consumption of coal for that year.

In 2004, net electricity generation was 19.8 billion kWh. Consumption in that same year came to 11.6 billion kWh. In 2002, most of Lithuania's electric power came from the Ignalina nu-

clear plant. Of the 17.121 billion kWh of power generated that year, the Ignalina facility generated 82.6% of the country's power, while only 15% came from conventional thermal plants and the rest from hydroelectric sources. However, as of March 2005, the Lithuanian government was reported to have plans to close down the Ignalina facility in two stages, starting in 2005 and ending in 2009. Total installed generating capacity in 2004 was placed at 5.8 GW.001 was 5.8 million kW.

## 28 INDUSTRY

Lithuania underwent rapid industrialization during the Soviet era and has significant capacity in machine building and metalworking, as well as the textile and leather industries, and agro-processing (including processed meat, dairy products, and fish). The country's diverse manufacturing base also includes an oil refinery and high-tech minicomputer production. Other industrial products include refrigerators and freezers, electric motors, television sets, metal-cutting machine tools, small ships, furniture, fertilizers, optical equipment, and electronic components. Due to a rapid program of privatization, more than 80% of Lithuania's enterprises are privately owned. Most capital investment has gone into the industrial sector. Major infrastructure projects were planned in 2002, including upgrading the oil refinery, the nuclear power plant, construction of a main highway, and the modernization of sea-port facilities. The industrial sector accounted for about 31% of GDP in 2001.

By 2004, the representation of the industrial sector in the GDP increased to 33.4%, while its representation in the labor force was 30%; agriculture composed 6.1% of the economy, and 20% of the labor force; services came in first with 60.5% and 50% respectively. Industry remained an important growth factor in 2004, registering a 12% increase and outweighing the overall growth rate of the economy.

## 29 SCIENCE AND TECHNOLOGY

The Lithuanian Academy of Science, founded in 1941, has departments of mathematical, physical, and chemical sciences; biological, medical, and agricultural sciences; and technical sciences. In 1987–97, science and engineering students accounted for 31% of university enrollment. Ten research institutes concerned with medicine, natural sciences, and technology, mostly in Vilnius, and a botanical garden in Kaunas are attached to the academy. Four other institutes conduct research in medicine and forestry. Seven universities and colleges offer degrees in basic and applied sciences.

In 2002, Lithuania had 1,824 scientists and engineers and 430 technicians per one million people engaged in research and development (R&D). In that same year, Lithuania spent \$243.617 million, or 0.68% of GDP on R&D. The largest contributor was the government, accounting for 65.1% of expenditures, followed by business at 27.9% and by foreign investors at 7.1%. High technology exports in 2002 totaled \$130 million, or 5% of the country's manufactured exports.

## 30 DOMESTIC TRADE

Vilnius, Klaipėda, and Kaunas each have shopping areas and several markets; many smaller towns have a central market. Several supermarkets have opened within the past few years. There are

also a number of newer privately-owned import businesses taking root. As of 2002, manufacturing accounted for about 23% of the GDP and wholesale/retail sales were up to about 15% and 8.4% respectively. For a time, inflation (estimated at 23% in 1996) severely hindered domestic purchasing power. By 1998, however, inflation was down to 5.1% and the 2002 estimate was at 0.8%. A cash economy still prevails, though some major hotels and restaurants have accepted credit cards.

### 3<sup>1</sup> FOREIGN TRADE

Lithuania depends heavily on trade, particularly with other republics of the former Soviet Union. In 2000, total imports were valued at \$5.5 billion, and exports at \$3.8 billion. In the mid-to-late 1990s, Lithuania was trading more with Western nations, and reducing its reliance on trade with former Soviet republics. Trade with the West increased from 15% to 60% between 1990 and 1995, while trade with former Soviet republics fell from 78% in 1990 to 40% in 1995. Since Lithuania's independence in 1990, growing disruptions in trade with Russia and the other former Soviet republics have resulted in a steep decline in import volumes and numerous domestic shortages.

In 2004, exports grew to \$8.9 billion (FOB—Free on Board), while imports reached \$11 billion. Mineral products make up Lithuania's most beneficial export commodity (23%), followed by textiles and clothing (16%), and machinery and equipment (11%). Other export commodities include chemicals (6%), wood and wood products (5%), and foodstuffs (5%). The most important export partners, in 2004, were Germany (receiving 10.2% of total exports), Latvia (10.2%), Russia (9.3%), France (6.3%), the United Kingdom (5.3%), Sweden (5.1%), Estonia (5%), Poland (4.8%), the Netherlands (4.8%), Denmark (4.8%), the United States (4.7%), and Switzerland (4.6%). The main import commodities were mineral products (21%), machinery and equipment (17%), transport equipment (11%), chemicals (9%), textiles and clothing (9%), and metals (5%); and most of these came from Russia (23.1%), Germany (16.7%), Poland (7.7%), the Netherlands (4.0%), and Latvia (3.8%).

### 3<sup>2</sup> BALANCE OF PAYMENTS

The US Central Intelligence Agency (CIA) reported that in 2002 the purchasing power parity of Lithuania's exports was \$5.4 billion while imports totaled \$6.8 billion resulting in a trade deficit of \$1.4 billion.

The International Monetary Fund (IMF) reported that in 1998 Lithuania had exports of goods totaling \$4.89 billion and imports totaling \$6 billion. The services credit totaled \$1.16 billion and debit \$700 million.

The exports of goods and services continued to grow in the following years, reaching \$9.5 billion in 2003, and \$11 billion in 2004. Imports followed a similar path, totaling \$10.5 billion in 2003, and \$12.4 billion in 2004. The resource balance was consequently negative in both years, at -\$1 billion and -\$1.4 billion respectively. The current account balance was also negative, dropping to -\$1.2 billion in 2003, and -\$1.3 billion in 2004. Total reserves (including gold) decreased from \$3.5 billion in 2003 to \$3 billion in 2004, covering around three months of imports.

### 3<sup>3</sup> BANKING AND SECURITIES

Since 1991, Lithuania has reorganized its banking sector numerous times. A myriad of banks emerged after independence, most of them weak. Consequently, consolidations, mergers, and collapses became a regular feature of the country's banking system.

On 3 July 1992 the government adopted a new currency unit, the lita, to replace the ruble. Between 1992 and 1995, six banks lost their licenses and two were merged; as of mid-1996, 16 were either suspended or facing bankruptcy procedures. The first serious crisis centered on Aurasbankas, the eighth-largest bank in the country, and the deposit bank for many ministries. The Bank of Lithuania suspended Aurasbankas's operations in mid-1995 because of liquidity problems caused by bad lending and deposit-

taking practices. In July 1995, the minimum capital requirement for existing banks was raised from LTL5 million to LTL10 million, the level already established for new banks. By May 1999, only five commercial banks remained. Moreover, foreign investment by Sweden's Swedbank and SE-Banken, helped keep Hansapank-Hoiupank and Uhispank-Tallinna, respectively.

Operations at Lithuania's largest bank, the Joint-Stock Innovation Bank, were suspended on 20 December 1995, and those of the Litimpeks bank, the country's second-largest, two days later. The two were in the process of merging to create the Lithuania United Bank and the fraud was uncovered during pre-merger audits. Due to rumors of a devaluation of the currency, a shortage of foreign exchange throughout the whole banking sector was created.

The International Monetary Fund reports that in 2001, currency and demand deposits—an aggregate commonly known as M1—were equal to \$1.7 billion. In that same year, M2—an aggregate equal to M1 plus savings deposits, small time deposits, and money market mutual funds—was \$3.2 billion. The money market rate, the rate at which financial institutions lend to one another in the short term, was 3.37%.

The National Stock Exchange, which opened in September 1993, is the most active in the region, with 245 listed companies. Monthly turnover by the end of 1994 had reached LTL20.8 million. The market gains continued into 1999 as the index rose 15%. As of 2004, there were a total of 43 companies listed on the Vilnius Stock Exchange (VILSE), with a market capitalization of \$6.463 billion. In 2004, the VILSE Index rose 68.2% from the previous year to 293.4.

In 1997, a key feature of the new economic framework in Lithuania was the pegging of the lita to a currency basket composed of the dollar and the deutschemark. In 1999, the Bank of Lithuania announced its intention to peg the lita to the euro in 2001.

### 34 INSURANCE

Lithuania's health insurance system is reminiscent of the Soviet era through a state-run system of coverage for all residents. In 2003, the value of all direct insurance premiums written totaled \$266 million, of which nonlife premiums accounted for \$196 million. Lithuania's top nonlife insurer in 2003 was Lietuvos Draudimas, with gross written nonlife premiums of \$64.7 million. As of 2004, Lithuania's leading life insurer was Hansa Gywybes Draudimus, which had gross written life insurance premiums of \$32.5 million.

### 35 PUBLIC FINANCE

Lithuania had, of course, a planned economy under the Soviet regime, and the implementation of collective farming ravaged the agricultural sector for over a decade. It was not until the early 1960s and the introduction of chemicals that crop production recovered to pre-WWII levels. The crop boom that followed as a result of the chemical innovations left many ecological problems. Privatization following independence occurred slowly but steadily, and in 1998 it looked like the economy had survived the growing pains of dismantling the socialist system. However, the August 1998 collapse of the Russian ruble reverted Lithuania's economy back to negative growth and refocused the country's trade toward the West. In 1997, exports to former Soviet nations accounted for

45% of total exports. By 2002, that number was only 19%, as 71% of exports went to EU member countries and candidates. Privatization was nearly complete as of 2002, except for the energy sector, where energy company privatization was completely on hold and gas company privatization delayed.

The US Central Intelligence Agency (CIA) estimated that in 2005 Lithuania's central government took in revenues of approximately \$8.4 billion and had expenditures of \$9.1 billion. Revenues minus expenditures totaled approximately -\$674 million. Public debt in 2005 amounted to 21.4% of GDP. Total external debt was \$10.47 billion.

The International Monetary Fund (IMF) reported that in 2003, the most recent year for which it had data, central government revenues were LTL16,091 million and expenditures were LTL17,192 million. The value of revenues was us\$5,257 million and expenditures us\$5,585 million, based on an exchange rate for 2003 of us\$1 = LTL3.061 as reported by the IMF. Government outlays by function were as follows: general public services, 25.3%; defense, 5.2%; public order and safety, 6.3%; economic affairs, 12.7%; environmental protection, 0.6%; health, 12.1%; recreation, culture, and religion, 1.7%; education, 7.2%; and social protection, 28.9%.

### 36 TAXATION

Lithuania has one of the most liberal tax regimes in Europe. The corporate income rate as of 2005 was 15%. Small enterprises with gross income of less than €144,810 (LTL500,000) and which have no more than 10 employees are taxed at 13% of profits. Capital gains are considered part of corporate income and are taxed at the corporate rate. Dividends are generally taxed at 15% but if paid to a nonresident company that owns more than 10% of its voting shares (i.e., its parent company), there is no tax. This provision is not applicable to companies operating in Free Economic Zones (FEZs), which offer 80% reduction in the corporate income tax rate for the first five years, and a 50% reduction for an additional

five years. The statutory withholding rates are 15% for dividend income and 10% for interest and royalties. Withholding rates on capital income are often reduced to 10% and 5% in bilateral double tax prevention treaties between Lithuania and other countries.

Personal income as of 2005 was taxed at a flat rate of 33%. However, plans by the government call for this rate to be reduced to 30% in 2006, 27% in 2007 and to 24% in 2008. In addition, certain other types of income are subject to a 15% rate. These include income from distributed profits, the sale or rental of property, creative activities and other types of individual activities. Individuals receiving capital gains from either the sale of property or shares are taxed at 15% on the gains. However, capital gains from shares held for more than a year may be exempt if certain conditions are met. If the gains are derived from the sale of immovable property in Lithuania, they are exempt if the property was held for more than three years. Deductions from income for the primary flat tax include a nontaxable minimum which is higher for disabled persons, single parents and other specified groups, plus all social security and social assistance payments, death benefits, court awards, gifts, allowances for insurance payments, charity donations, and most payments to pension accounts. In 2003 a 1.5% real estate tax was introduced. Gifts and inheritances are taxed at 0%, 5% and 10% depending on the amount involved.

The main indirect tax is Lithuania's value-added tax (VAT) enacted 22 December 1993 and most lately revised in 1 July 2002 for application in 2003. The VAT has a standard rate of 18%, applicable to most goods and services, and three reduced rates of 9%, 5% and 0%. The 9% rate is applied to the renovation and construction of buildings financed from certain sources. The 5% rate is applied to certain foodstuffs, newspapers, books, passenger and luggage transport, drugs and medicines, and hotel accommodations. Exports and some export related services, international transport, ships and aircraft, and European Union related trade or supplies are zero-rated. Exempted from the VAT are educational, health-care, insurance and financial services, the leasing, sale or transfer of immovable property (including dwellings), and social, sports, cultural, radio and television services, if provided by nonprofit organizations. There are also excise duties on ethyl alcohol and alcoholic beverages, tobacco and fuels. However, by the new Law on Excise Duties of 1 July 2002, excise taxes on jewelry, electrical energy, coffee, chocolate, and other food products were abolished, while turnover taxes replaced excises on sugar, luxury cars, liquid cosmetics containing ethyl alcohol, and publications of an erotic and/or violent nature. In 1999, the government introduced a pollution tax on packets to encourage the recycling of packaging material.

### **37 CUSTOMS AND DUTIES**

Most foreign imports, including all raw materials, are duty-free. Exceptions include food products (5–10%), fabrics (10%), electronics (10%), cement (25%), and window glass (50%). The average tariff on consumer products is 15%. Alcoholic beverages are subject to duties ranging from 10% for beer to 100% for some liquor. An 18% VAT is also placed on imports. In 1993, Lithuania, Estonia, and Latvia formed a free trade area, which eliminated customs duties and quotas between the three Baltic States. In ac-

cordance with Lithuania's participation in the European Union, some duties on EU goods have been lowered.

### **38 FOREIGN INVESTMENT**

In May 1991, a foreign investment law was passed permitting majority holdings by nonresidents and guaranteeing the full transfer of profits.

Various tax benefits may be granted to foreign investors depending on the type and size of the investment. When purchasing privatized Lithuanian companies or forming joint ventures, foreign investors are usually expected to provide employment guarantees.

Foreigners from European Union and NATO-member nations may own land, while foreigners from all other nations may not. The provision is aimed primarily at foreigners from former Soviet republics who are the main non-Western investors in Lithuania. Foreigners not eligible to own land may rent it for a period of up to 99 years.

In 1998, foreign direct investment (FDI) inflow into Lithuania reached \$925.5 million, up from \$354.5 million the year before, due largely to the privatization of Lithuania's telecommunications company. From 1999 to 2001, FDI inflow averaged \$437 million a year. In 2002, contrary to worldwide trends of decreasing inward FDI flows, FDI in Lithuania rose 21.9% to \$543 million.

On 1 July 2004 total foreign direct investment in Lithuania reached \$5.7 billion, with most of it coming from the EU. The largest chunk of this capital inflow went to the following sectors: processing (31.1%), trade (17.9%), transportation and communication (17.1%), and financial mediation (15.7%).

Lithuania continues, despite its small size, to be an attractive location for FDI and a competitive center for product sourcing. It boasts a highly skilled labor force, competitive costs, a stable political and economic environment, a strong currency, and the region's most developed infrastructure.

### **39 ECONOMIC DEVELOPMENT**

In 1990, the Lithuanian government began a comprehensive economic reform program aimed at effecting the transformation to a market-driven economy. Reform measures include price reform, trade reform, and privatization. By mid-1993, 92% of housing and roughly 60% of businesses slated for privatization had been privatized. By 1996, about 36% of state enterprises and about 83% of all state property had been privatized. International aid agencies committed about \$765 million of assistance in 1992–95. Most international aid went either to infrastructure construction or loan credits to business. Citing continued progress toward democratic development, in 1999 the United States announced that it was terminating economic assistance to Lithuania. Having established itself as a democratic society with a market economy, Lithuania was invited to join the EU in 2002, and it became a member in 2004.

In 2001, Lithuania negotiated a 19-month, \$119-million stand-by arrangement with the International Monetary Fund (IMF). In 2002, the country's GDP grew at a rapid pace (6–6.7%), unemployment was declining, the inflation rate fell to near zero, and there was a lower-than-expected general government deficit. In 2002, the tax system was aligned with EU requirements, the financial situation of municipalities and the Health Insurance Fund was

improved, privatization moved forward and the financial sector was strengthened. The privatization program for 2003 included the sale of a second 34% stake in Lithuania Gas, one or two electricity distribution companies, and four alcohol producers.

In 2003, Lithuania was one of the most dynamic economies in Europe, with a 9.7% growth of the GDP, and it continued strongly through 2004 and 2005. Unemployment was on a downward spiral, and inflation was very stable, fluctuating around the 1% mark. However, income levels still lag behind the rest of the EU, and greenfield investments need to be attracted to counteract the effects of a more expensive future market. An inflow of structural funds from the EU is expected to trigger a short-term economic boom.

#### 40 SOCIAL DEVELOPMENT

A national system of social insurance covers all of Lithuania's residents and was most recently updated in 2003. Old age, sickness, disability, and unemployment benefits are paid on an earnings-related basis, from contributions by both employers and employees. Retirement is set at age 62.5 for men, and age 59 for women, gradually increasing to age 60 by 2006. Family allowance benefits are provided by states and municipalities to families with low incomes. There is a universal system of medical care, and a dual social insurance and social assistance program for maternity and health payments. Unemployment benefits are provided to applicants with at least 24 months of previous contributions and is paid for a period not exceeding six months in a 12-month period.

Legally, men and women have equal status, including equal pay for equal work, although in practice women are underrepresented in managerial and professional positions. Discrimination against women in the workplace persists. Violence against women, especially domestic abuse, is common. It is estimated that 80% of women experience psychological abuse, 35% experience physical abuse, and 17% are victims of sexual abuse. Child abuse is also a serious social problem. Authorities link the upsurge in abuse to alcoholism.

Human rights are generally respected in Lithuania, and human rights organizations are permitted to operate freely and openly. Prolonged detention still occurs in some cases, and poor prison conditions persist. Anti-Semitic incidents increased in 2004.

#### 41 HEALTH

In 2004, Lithuania had approximately 403 physicians, 797 nurses, 71 dentists, and 65 pharmacists per 100,000 people. Most primary care providers are women. In 1994, the Public Health Surveillance Service was established to oversee control of communicable diseases, environmental and occupational health, and some other areas. Total health care expenditure was estimated at 6.3% of GDP.

One-year-old children were immunized as follows: tuberculosis, 97%; diphtheria, pertussis, and tetanus, 96%; polio, 89%; and measles, 94%. The rates were 93% for DPT and 97% for measles. The HIV/AIDS prevalence was 0.10 per 100 adults in 2003. As of 2004, there were approximately 1,300 people living with HIV/AIDS in the country. There were an estimated 200 deaths from AIDS in 2003.

Life expectancy was 73.97 years in 2005. The infant mortality rate for that year was 6.89 per 1,000 live births. The maternal mortality rate was 18 per 100,000 live births. As of 2002, the crude

birth rate and overall mortality rate were estimated at, respectively, 8.3 and 14.7 per 1,000 people.

#### 42 HOUSING

In 2001, national statistics indicated that there were about 1,293,029 dwelling units in the country, an average of 356 housing units per 1,000 people. About 32% of all housing units were individual houses; 61% were apartments. About 97% of these units are privately owned. The average living space is about 21.5 square meters per person. About 79% of all conventional dwellings are equipped with piped water, 72% had bath and shower facilities, and 52% had central heating. City governments are being encouraged to take more responsibility for social housing projects. Homeowners associations are being encouraged and new laws are being drafted for residential building associations. The Housing Loan Insurance Company was established in 2000 to provide insurance of loans and to promote housing loans with a low (5%) down payment.

#### 43 EDUCATION

Education is free and compulsory for all children between the ages of 7 and 15 years (for 9 years). While Lithuanian is the most common medium of instruction, children also study Polish, Russian, and Yiddish. Primary school covers four years of study, followed by six years of basic or lower secondary school. Students then move on to either two years of senior secondary school or vocational schools, which offer two- to three-year programs. The academic year runs from September to June.

In 2001, about 55% of children between the ages of three and six were enrolled in some type of preschool program. Primary school enrollment in 2003 was estimated at about 91% of age-eligible students. The same year, secondary school enrollment was about 94% of age-eligible students. Nearly all students complete their primary education. The student-to-teacher ratio for primary school was at about 16:1 in 2003; the ratio for secondary school was about 11:1.

The four main universities are: Kaunas University of Technology (founded in 1950); Vilnius Technical University (founded in 1961); Vilnius University (founded in 1579); and Vytautas Magnus University (founded in 1922). In 2003, about 72% of the tertiary age population were enrolled in some type of higher education program; 56% for men and 88% for women. The adult literacy rate for 2004 was estimated at about 99.6%.

As of 2003, public expenditure on education was estimated at 5.9% of GDP.

#### 44 LIBRARIES AND MUSEUMS

The National Library at Vilnius has about 9.2 million volumes. Founded in 1570, the Vilnius University Library has over 5.3 million volumes. Vilnius also has the Central Library of the Academy of Sciences, with about 3.66 million volumes. There are dozens of other special collections in the country, including libraries maintained by the Union of Lithuanian Writers, the State Institute of Art, and the Institute of Urban Planning. The Institute of Lithuanian Literature and Folklore in Vilnius contains over 240,000 printed items. The Lithuanian Librarians' Association was estab-

lished in 1931, disbanded under German occupation in 1941, and reorganized in 1989.

The majority of Lithuania's museums are in Vilnius, and these include the Lithuanian Art Museum (1941), the National Museum (1856), the Museum of Lithuanian Religious History, and, founded in 1991 just after gaining independence from the Soviet Union, the Lithuanian State Museum, dedicated to the country's suffering under and resistance to Soviet occupation. The Mikalojus Konstantinas Ciurlionis National Art Museum, named for a famous native composer and painter, is located in Kaunas; special branches of this museum include the Devil's Museum, a collection of artwork depicting devils, and a Ceramics Museum. The Museum of the Center of Europe, an open-air museum displaying large-scale works by European artists, was opened in Vilnius in 1994. There is also a Park of Soviet Sculptures in Druskininkai. The Lithuanian Theater, Music and Film Museum in Vilnius was founded by the Ministry of Culture. There are several other specialized museums, including the Museum of Genocide Victims (Vilnius), Museum of the History of Lithuania Medicine and Pharmacy (Kaunas), Museum of Ancient Beekeeping (Ignalina), and the Museum of Vilnius Sport History. There are several regional museums associated with secondary schools; these contain materials on local arts and history, as well as the history of the school to which the museum is linked.

#### 45 MEDIA

In 2003, there were an estimated 239 mainline telephones for every 1,000 people; about 1,300 people were on a waiting list for telephone service installation. The same year, there were approximately 630 mobile phones in use for every 1,000 people.

Broadcasting is controlled by Lithuanian Television and Radio Broadcasting. Radio Vilnius broadcasts in Lithuanian, Russian, Polish, and English. As of 2001 there were 29 AM and 142 FM radio stations. In 2003, there were an estimated 524 radios and 487 television sets for every 1,000 people. About 76.9 of every 1,000 people were cable subscribers. Also in 2003, there were 109.7 personal computers for every 1,000 people and 202 of every 1,000 people had access to the Internet. There were 47 secure Internet servers in the country in 2004.

The most popular daily newspapers are *Lietuvos Rytas* (Lithuania's Morning, in Russian), with a 2002 circulation of 85,000; *Respubliká* (55,000); *Lietuvos Aidas* (*The Echo of Lithuania*, 20,000); and *Kauno Diena* (*Kaunas Daily*, 57,000). There are also several periodicals available.

The constitution provides for free speech and a free press, and the government is said to uphold these provisions. Since independence, the independent print media have flourished, producing some 2,000 newspapers and periodicals, and plans for a number of private radio and television stations are underway.

#### 46 ORGANIZATIONS

Important economic organizations include the Association of Chamber of Commerce and Industry, an organization that coordinates the activities of all the chambers of commerce in Lithuania. There are three umbrella trade union organizations in the country: the Lithuania Confederation of Free Trade Unions, the

Lithuania Union of Trade Unions, and the Lithuanian Workers' Union. Professional associations exist for a number of fields and occupations.

The Lithuanian Academy of Sciences promotes education and research in a wide variety of scientific fields. The Lithuanian Medical Association promotes research and education on health issues and works to establish common policies and standards in health-care. There are several other associations dedicated to research and education for specific fields of medicine and particular diseases and conditions, such as the Lithuanian Heart Association.

There are a number of sports associations in the country, representing such pastimes as speed skating, squash, tae kwon do, tennis, badminton, weightlifting, and baseball. There are also branches of the Paralympic Committee. The Council of Lithuanian Youth Organizations helps organize and support a variety of youth groups. Scouting programs and chapters of the YMCA/YWCA are also active for youth. Volunteer service organizations, such as the Lions Clubs and Kiwanis International, are also present. The Red Cross is also active.

#### 47 TOURISM, TRAVEL, AND RECREATION

The capital city of Vilnius has one of the largest historic districts in Eastern Europe, distinguished primarily by its Baroque churches, many of which have been reclaimed since independence by money and missionaries from abroad. Kaunas, Lithuania's second-largest city, offers the tourist old merchants' buildings and museums. The seaside resort towns are active in the summer. The traveler can participate in tennis, fishing, sailing, rowing, and winter sports. Lithuanians have long distinguished themselves at basketball, and have contributed top players to the Soviet teams. Seven Lithuanians have Olympic gold medals, and the national basketball team won a bronze medal in Barcelona in 1992 and again in Sydney in 2000.

All visitors need a valid passport. Visas are not required for nationals of the European Union states, the United States, Canada, Japan, Australia, and some South American countries. Travelers of non-European Union countries must carry proof of medical insurance to cover travel in Lithuania.

About 3.6 million tourists visited Lithuania in 2003. There were 7,694 hotel rooms with 15,142 beds and an occupancy rate of 32%. The average length of stay in Lithuania was two nights. Tourist expenditure receipts totaled \$700 million that year.

In 2004, the US Department of State estimated the daily cost of traveling in Lithuania at \$205.

#### 48 FAMOUS LITHUANIANS

President Valdas Adamkus (b.1926) was chief of state from 1998–2003, and then beginning again in 2004.

#### 49 DEPENDENCIES

Lithuania has no territories or colonies.

# LUXEMBOURG

Grand Duchy of Luxembourg  
[French] *Grand-Duché de Luxembourg*;  
[German] *Grossherzogtum Luxemburg*

**CAPITAL:** Luxembourg

**FLAG:** The flag is a tricolor of red, white, and blue horizontal stripes.

**ANTHEM:** *Ons Hémécht (Our Homeland)*.

**MONETARY UNIT:** The Luxembourg franc was replaced by the euro as official currency as of 2002. The euro is divided into 100 cents. There are coins in denominations of 1, 2, 5, 10, 20, and 50 cents and 1 euro and 2 euros. There are notes of 5, 10, 20, 50, 100, 200, and 500 euros. €1 euro = \$1.25475 (or \$1 = €0.79697) as of 2005.

**WEIGHTS AND MEASURES:** The metric system is the legal standard.

**HOLIDAYS:** New Year's Day, 1 January; Labor Day, 1 May; public celebration of the Grand Duke's Birthday, 23 June; Assumption, 15 August; All Saints' Day, 1 November; Christmas, 25–26 December. Movable religious holidays include Shrove Monday, Easter Monday, Ascension, and Pentecost Monday.

**TIME:** 1 PM = noon GMT.

## <sup>1</sup>LOCATION, SIZE, AND EXTENT

A landlocked country in Western Europe, Luxembourg has an area of 2,586 sq km (998 sq mi), with a length of 82 km (51 mi) N–S and a width of 57 km (35 mi) E–W. Comparatively, the area occupied by Luxembourg is slightly smaller than the state of Rhode Island. The eastern boundary with Germany is formed by the Our, Sûre (Sauer), and Moselle rivers. Luxembourg is bordered on the S by France and on the W and N by Belgium, with total border length of 359 km (223 mi).

Luxembourg's capital city, Luxembourg, is located in the south central part of the country.

## <sup>2</sup>TOPOGRAPHY

The country is divided into two distinct geographic regions: the rugged uplands (Oesling) of the Ardennes in the north, where the average elevation is 450 m (1,476 ft) with the highest point, Buurgplaatz, at 559 m (1,834 ft); and the fertile southern lowlands, called Bon Pays (Good Land), with an average altitude of 250 m (820 ft).

The entire area is crisscrossed by deep valleys, with most rivers draining eastward into the Sûre, which in turn flows into the Moselle on the eastern border. The northern region, comprising one-third of the country, is forested and has poor soil.

## <sup>3</sup>CLIMATE

Luxembourg's climate is temperate and mild. Summers are generally cool, with a mean temperature of about 17°C (63°F); winters are seldom severe, average temperature being about 0°C (32°F). The high peaks of the Ardennes in the north shelter the country from rigorous north winds, and the prevailing northwesterly winds have a cooling effect. Rainfall is plentiful in the extreme

southwest; precipitation throughout the country averages about 75 cm (30 in) annually.

## <sup>4</sup>FLORA AND FAUNA

The principal trees are pine, chestnut, spruce, oak, linden, elm, and beech, along with fruit trees. There are many shrubs, such as blueberry and genista, and ferns; a multitude of lovely flowers; and many vineyards. Only a few wild animal species (deer, roe deer, and wild boar) remain, but birds are plentiful, and many varieties of fish are found in the rivers, including perch, carp, bream, trout, pike, and eel.

## <sup>5</sup>ENVIRONMENT

The Ministry of the Environment is the main environmental agency. Government statistics indicate considerable improvement in pollution control over the past few decades. Emissions of particles of sulfur dioxide declined substantially from 1972 to 1983. As of 1994, emissions of smoke, sulfur dioxide, nitrogen dioxide, and lead were well within EU acceptable limits. Luxembourg has about 0.2 cu mi of water. Luxembourg has produced an average of about 3.3 tons of particulate emissions and 22 tons of hydrocarbon emissions per year.

Forest reserves have been severely depleted since 1800, when three-fourths of the country was forest; today forest and woodland cover only one-fifth of Luxembourg. During World War II, German requisitions and heavy demands for fuel contributed to this depletion.

According to a 2006 report issued by the International Union for Conservation of Nature and Natural Resources (IUCN), threatened species included three types of mammals, three species of birds, two types of mollusks, and two species of other inverte-

brates. Threatened species include the spotted eagle, the southern damselfly, and the great snipe.

## 6 POPULATION

The population of Luxembourg in 2005 was estimated by the United Nations (UN) at 457,000, which placed it at number 163 in population among the 193 nations of the world. In 2005, approximately 14% of the population was over 65 years of age, with another 19% of the population under 15 years of age. There were 97 males for every 100 females in the country. According to the UN, the annual population rate of change for 2005–10 was expected to be 0.4%, a rate the government viewed as too low. The projected population for the year 2025 was 544,000. The population density was 176 per sq km (457 per sq mi).

The UN estimated that 91% of the population lived in urban areas in 2005, and that urban areas were growing at an annual rate of 1.42%. The capital city, Luxembourg, had a population of 77,000 in that year. The chief industrial city is Esch-sur-Alzette, with a population of 28,000. Other urban areas and their estimated populations include Differdange, 19,005; Dudelange, 17,000; and Schifflange, 8,084.

## 7 MIGRATION

During the 19th century, thousands of Luxembourgers emigrated, chiefly to the United States. In 1870, however, rich deposits of iron ore were uncovered in southern Luxembourg, and during the period of industrialization and prosperity that followed, many persons from neighboring countries migrated to Luxembourg.

Since the adoption of national asylum legislation in April 1996, there has been a significant increase in the number of asylum seekers. In 1997, 431 people applied for asylum. By 1998, 1,709 people applied. Between January and July 1999, as many as 2,404 people submitted asylum applications.

As of 12 August 1999, some 101 people had been evacuated from Macedonia to Luxembourg. Evacuees were given a six-month renewable residence permit, as well as work permits, social assistance, and the right to family reunification. As of 1999, none of the evacuees had returned. Also as of 1999, Luxembourg officials were in the process of adopting a law on temporary protection. In 2004 there were 1,590 refugees and no asylum seekers. The estimated net migration rate in 2005 was 8.86 migrants per 1,000 population.

## 8 ETHNIC GROUPS

The indigenous inhabitants of Luxembourg consider themselves a distinct nationality, with a specific ethnic character. A strong indication of that character is the national motto, “Mir woelle bleiwe wat mir sin” (“We want to remain what we are”), for despite a history of long foreign domination, Luxembourgers have retained their individuality as a nation. There are also native-born residents of Celtic, French, Belgian, or German ancestry, as well as a substantial immigrant population of Portuguese, Italian, and other Europeans (guest and worker residents).

## 9 LANGUAGES

Luxembourgers speak Luxembourgian, or Letzeburgesch, the original dialect of the country, as well as French and German. All three are official languages. Letzeburgesch is a Germanic dialect

related to the Moselle Frankish language that was once spoken in western Germany. It rarely appears in written form.

Letzeburgesch, French, and German are all languages of instruction in primary schools, while French is the most common language of instruction in secondary schools. Government publications are generally in French. English is also spoken.

## 10 RELIGIONS

The country is historically Roman Catholic and it is estimated that over 90% of the population are nominally members of this church. The largest Protestant denominations are the Lutheran and Calvinist churches. About 6,000 people are Muslim, about 5,000 are Orthodox Christians (Greek, Serbian, Russian, and Romanian), and about 1,000 are Jewish. There are also small communities of the Baha'is, Mormons, Jehovah's Witnesses and members of the Universal Church. It is believed that the number of atheists is small, but growing.

The constitution provides for freedom of religion and this right is respected in practice. A special Concordat of 1801 allows certain religious groups to receive financial support. For instance, the state pays salaries for Roman Catholic and Greek and Russian Orthodox priests, Jewish rabbis, and pastors of some Protestant denominations. The state also supports some private religious schools. Certain Christian holidays are celebrated as national holidays.

## 11 TRANSPORTATION

Transportation facilities are excellent. The railways are consolidated into one organization, the *Société Nationale des Chemins de Fers Luxembourgeois* (CFL), with the government of Luxembourg controlling 51% of the stock and the remaining 49% divided between the French and Belgian governments. Railway lines, totaling 274 km (170 mi) in 2004, provide direct links with Belgium via Arlon, with France via Metz and Longwy, and with Germany via Trier. There is through-train service to Paris and various other points in France. In that same year, 242 km (150 mi) of railway were electrified.

In 2002 there were 5,210 km (3,241 mi) of state and local roads, all of which were paved, including 147 km (91 mi) of expressways. Direct roads connect all important towns, and the main arteries are suitable for heavy motor traffic. As of 2003 there were 287,245 cars and 35,904 commercial vehicles in use. In the 1990s, a program was underway to link Luxembourg's highways to those of Belgium, France, and Germany.

The only river available for industrial transport is the Moselle, which for 37 km (23 mi) allows navigation of barges of up to 1,500 tons. In 2005, the merchant fleet comprised 40 ships of 1,000 GRT or more, with a total of 652,454 GRT. There were two airports in 2004, only one of which had a paved runway. There was also a single heliport. The principal airport is Findel, located near the city of Luxembourg. Regular flights to other European cities are operated by Luxair, the national carrier, and by foreign airlines. Luxembourg's largest airline, Cargolux, ranks among Europe's top 10 cargo carriers. Luxembourg and the United States have shared open sky aviation rights since a 1995 agreement. In 2001 (the latest year for which data was available), 885,900 passengers were carried on scheduled airline flights.

## 12 HISTORY

The land now known as Luxembourg fell under the successive domination of the Celts, the Romans, and the Riparian Franks before its founding as the County of Luxembourg in 963 by Sigefroid, count of the Ardennes, who reconstructed a small ruined fortress called Lucilinburhuc (Little Burg) on the site of the present capital. The area tripled in size during the reign of Countess Ermesinde (1196–1247). John, count of Luxembourg (r. 1309–46) and king of Bohemia, became the national hero; although blind for many years, the inveterate knight-errant laid the foundations for a powerful dynasty before he fell in the Battle of Crécy, in northern France, during the Hundred Years' War. His son Charles (1316–78) was the second of four Luxembourg princes to become Holy Roman emperor. He made Luxembourg a duchy, but under his successors the country was ruined financially.

Luxembourg came under Burgundian rule in 1443 and remained in foreign hands for more than 400 years. Successively it passed to Spain (1506–1714, excepting 1684–97, when it was ruled by France), Austria (1714–95), and France (1795–1815). The Congress of Vienna in 1815 made Luxembourg a grand duchy and allotted it as an independent state to the king of the Netherlands, after ceding to Prussia its territory east of the Moselle, Sûre, and Our. Luxembourg lost more than half its territory to Belgium in 1839, but gained a larger measure of autonomy, although Dutch kings continued to rule as grand dukes. By the Treaty of London in 1867, Luxembourg was declared an independent and neutral state under the protection of the Great Powers, but was required to dismantle its mighty fortress. In 1890, the house of Nassau-Weilbourg, through the Grand Duke Adolphe (r. 1890–1905), became the ruling house of Luxembourg. The country was occupied by German troops in World War I. In 1919, Grand Duchess Charlotte succeeded to the throne, and on 28 September 1919, in a referendum held to decide the country's future, a plurality supported her. In 1921, Luxembourg formed an economic union with Brussels.

The Germans again invaded the country in May 1940, but the grand ducal family and most members of the government escaped to safety. Under the Nazi occupation, the people suffered severely, particularly when their revolt in 1942 protesting compulsory service in the German army was savagely repressed. Luxembourg was liberated by Allied forces in September 1944.

That year, while still in exile, the government agreed to form an economic union with Belgium and the Netherlands; the first phase, the Benelux Customs Union, was effected in 1948. In February 1958, a treaty of economic union, which became effective in 1960, was signed by representatives of the three countries. During the postwar decades, Luxembourg also became an active member of NATO and the EC.

In April 1963, Luxembourg celebrated its 1,000th anniversary as an independent state. On 12 November 1964, Grand Duchess Charlotte abdicated in favor of her son, Jean. The Grand Duke announced on Christmas Day 1999 that he planned to abdicate in favor of his eldest son Prince Henri in September 2000. (Prince Henri took the throne on 7 October 2000.) Jean's reign was marked by continued prosperity, as Luxembourg's economy shifted from dependence on steel to an emphasis on services, notably finance and telecommunications. Luxembourg is now among the world's top 10 financial centers and the financial sector employs approximately 10% of the workforce (20,000 people) and accounts

LOCATION: 49°26'52" to 50°10'58" N; 5°44'10" to 6°31'53" E. BOUNDARY LENGTHS: Germany, 135 kilometers (84 miles); France, 73 kilometers (45 miles); Belgium, 148 kilometers (92 miles).

for around 22% of national income. There is an industrial sector which initially was dominated by steel but has become increasingly diversified to include chemicals, rubber, and other products. Luxembourg had an incredibly high 2005 GDP per capita of us\$58,900.

Different governments have played a key role in the diversification process and the development of a skilled workforce has been an important instrument. Equally important is the country's tax

regime. Luxembourg's 0% withholding tax on crossborder savings acts as a magnet for investors. Its favorable tax law is at odds with the rest of the European Union and pressures for European-wide harmonization would diminish the sector's competitive advantage.

The country's growth rate has been among the highest in the European Union and averaged over 4% annually between 1994 and 2000. Luxembourg suffered due to the global economic downturn and the turmoil in international stock markets that began in 2001, as its small, open economy specializes in financial services. Luxembourg joined the Economic and Monetary Union in 1999, and adopted the euro as its currency. Prime Minister Jean-Claude Juncker was considered for the presidency of the European Commission in 2005, however he promised to remain as prime minister if he won the election of 2003, and so stayed on in Luxembourg.

### 13 GOVERNMENT

Luxembourg is a constitutional monarchy, governed by the constitution of 1868 as revised in 1919 (when universal suffrage and proportional representation were introduced) and subsequently. The grand ducal crown is hereditary in the house of Nassau-Weilbourg. Legislative power is vested in the Chamber of Deputies, the 60 (prior to 1984, 64 members) members of which are elected for five-year terms. In addition, the Council of State, composed of 21 members appointed for life by the sovereign, acts as a consulting body in legislative, administrative, and judicial matters and has the right of suspensive veto.

Executive power rests jointly in the sovereign, who may initiate legislation, and a prime minister (president of the government), appointed by the monarch, who in turn selects a cabinet. The prime minister, together with the cabinet, must command a majority in the Chamber of Deputies. Voting is compulsory, and eligibility begins at age 18.

### 14 POLITICAL PARTIES

Since 1947, shifting coalitions among the three largest parties have governed the country. The Christian Social Party (Parti Chrétien Social—PCS) is a Catholic, promonarchist movement favoring progressive labor legislation and government protection for farmers and small business. Except for the period 1974–79, the PCS has been the dominant partner in all ruling coalitions since World War I. The Socialist Party (Parti Ouvrier Socialiste Luxembourggeois—POSL) supports improvement and extension of the present system of social welfare programs. The third major group, the Democratic Party (Parti Démocratique—PD), favors social reforms and minimal government activity in the economy. Other parties have included the Luxembourg Communist Party (Parti Communiste—PC), which has its main strength with steelworkers in the industrialized south, and the Social Democratic Party (Parti Social-Démocrate Luxembourggeois—PSDL), which split from the POSL in 1971. In addition, the ecologist Green Party has representation in parliament, as does the Action Committee for Democracy and Justice (ADR), a pensioners' party. The Marxist and Reformed Communist Party, known as "The Left," secured one seat in the Chamber of Deputies in 1999.

Following the June 1999 elections, the distribution of seats in the 60-member unicameral Chamber of Deputies was: PCS, 19; POSL, 13; PD, 15; and other groups, 13. The coalition of the PCS

and POSL, which had governed for 15 years, was replaced by a coalition of the PCS and PD. Jean-Claude Juncker, leader of PCS, remained as prime minister. Following the June 2004 elections, distribution of seats was: PCS 24, POSL 14, PD 10, Green Party 7, ADR 5. The next elections were scheduled to be held in June 2009.

### 15 LOCAL GOVERNMENT

Luxembourg is divided into three districts (Luxembourg, Diekirch, and Grevenmacher) comprising 12 cantons, which in turn make up 118 communes. The districts are headed by commissioners—civil servants who are responsible to the central government. Each commune elects an autonomous communal council headed by a burgomaster; the councils elect government officials at the local level. Local elections are held every six years.

### 16 JUDICIAL SYSTEM

The legal system is similar to the French Napoleonic Code, except for the commercial and penal divisions, which are similar to their Belgian counterparts. Minor cases generally come before one of three justices of the peace. On a higher level are the two district courts, one in the city of Luxembourg and the other in Diekirch. The Superior Court of Justice is composed of the Court of Cassation, a Court of Appeal, and a department of public prosecution. The Court of Cassation comprises a bench of five judges, responsible for hearing cases that seek to overturn or set aside decisions given by the various benches of the Court of Appeal. The Court of Appeal consists of nine benches of three judges each, hearing civil, commercial, and criminal cases. Judges are appointed for life terms. New administrative courts began operations in 1997, after a 1995 decision by the European Court of Human Rights that Luxembourg's Council of State could no longer serve as both a legislative advisory body and an administrative court. The death penalty was abolished in 1979. The prosecutor as well as the defendant may appeal verdicts in criminal cases. An appeal results in a completely new judicial procedure with the possibility that a sentence may be increased or decreased.

Trade unions and striking are constitutionally guaranteed and news media is free to report without fear of retribution. There is a minority population of Bosnians who live in Luxembourg who face mild social racism.

Luxembourg is a member of the UN and is the site of the European Court of Justice.

### 17 ARMED FORCES

In 1967, Luxembourg abolished conscription and created a volunteer military force that is part of NATO. Responsibility for defense matters is vested in the Ministry of Public Force, which also controls the police and gendarmerie.

In 2005 the armed forces of Luxembourg consisted of the army with 900 active personnel and a gendarmerie of 612. NATO maintains 17 early warning aircraft with Luxembourg registration. Luxembourg maintains 23 personnel in the UN peacekeeping mission in Bosnia. Another nine are in Afghanistan and 26 in Serbia-Montenegro. More than 5,000 American soldiers, including Gen. George S. Patton, are buried at the American Military Cemetery near the capital. Budgeted defense expenditures in 2005 were \$264 million.

## 18 INTERNATIONAL COOPERATION

Luxembourg is a founding member of the United Nations, having joined the organization on 24 October 1945, and participates in ECE and several nonregional specialized agencies, such as the FAO, IAEA, the World Bank, UNESCO, UNIDO, the ILO, IMF, and the WHO. Since 1921, it has been joined with Belgium in the Belgium-Luxembourg Economic Union (BLEU). It is also a partner with Belgium and the Netherlands in the Benelux Economic Union. Luxembourg is a member of the Council of Europe, the Asian Development Bank, NATO, OECD, OSCE, WTO, the Euro-Atlantic Partnership Council, the European Bank for Reconstruction and Development, the Western European Union, and the European Union. Luxembourg held the EU presidency for the first half of 2005. The country is the home site of the European Court of Justice, the European Court of Auditors, European Investment Bank, and other EU organizations. The Secretariat of the European Parliament is also located in Luxembourg.

Luxembourg belongs to the Australia Group, the Zangger Committee, the Nuclear Energy Agency, and the Nuclear Suppliers Group (London Group). In environmental cooperation, the country is part of the Basel Convention, Conventions on Biological Diversity and Air Pollution, Ramsar, CITES, the London Convention, International Tropical Timber Agreements, the Kyoto Protocol, the Montréal Protocol, MARPOL, the Nuclear Test Ban Treaty, and the UN Conventions on the Law of the Sea, Climate Change, and Desertification.

## 19 ECONOMY

In relation to its size and population, Luxembourg is one of the most highly industrialized countries in the world. Its standard of living rivals that of any country in Europe. Steelmaking, traditionally the most important industry, has seen its contribution to GDP decline from 21% in 1974 to 1.8% in 1996. Iron ore, formerly mined in limited quantities, is no longer produced because supplies have been exhausted. The country's lack of industrial fuels makes it completely dependent on imports of coke for steel production. In 2001, Luxembourg's steel producer, ARBED, merged with France's USINOR and Spain's ACERALA to create the world largest steel company, NewCo, in order to increase competitiveness. Other industries—plastics, rubber and chemicals and other light industries—have been successfully developed, and the service industries, most notably banking, have expanded rapidly. Services now contribute 69% to GDP (2000 estimate).

Agriculture is generally small-scale, with livestock and vineyards comprising the most important segment.

The worldwide recession of the early 1980s adversely affected Luxembourg's economy; between 1985 and 1992, however, GDP grew by 32%, or 4% per year. Growth for 1998 was 2.9%. Inflation, as high as 9.4% in 1982, was only 0.3% in 1986 and averaged 3.3% during 1988–92. Average inflation 1999 to 2001 was 2.3%. Total GDP, at \$13.9 billion in 1998 (purchasing power parity) had risen over 38% to \$19.2 billion by 2001. Per capita income in 2001 was \$45,500, one of the highest in the world, with GDP growth reported at 8.3%.

Luxembourg is known for having one the lowest unemployment rates in Europe. The unemployment rate averaged just 1.4% between 1984 and 1991 and was 3% in 1998. In 2001, unemploy-

ment was at 2.7%, the range where it remained until registering a slight increase in 2004, to 4.3%.

Economic expansion continued at stately rates (similar to most other Western European countries), reaching 2.5% in 2002, 2.9% in 2003, and 4.5% in 2004; the GDP growth rate for 2005 was expected to be 3.6%. This expansion was mainly fueled by the country's up and coming financial and service oriented (especially media and communications) sectors. The steel sector, while being the subject of major restructurings in the past two decades, remained one of the backbones of the economy. Inflation remained stable at around 2%.

## 20 INCOME

The US Central Intelligence Agency (CIA) reports that in 2005 Luxembourg's gross domestic product (GDP) was estimated at \$29.4 billion. The CIA defines GDP as the value of all final goods and services produced within a nation in a given year and computed on the basis of purchasing power parity (PPP) rather than value as measured on the basis of the rate of exchange based on current dollars. The per capita GDP was estimated at \$62,700. The annual growth rate of GDP was estimated at 3.5%. The average inflation rate in 2005 was 2.6%. It was estimated that agriculture accounted for 0.5% of GDP, industry 16.3%, and services 83.1%.

Approximately 17% of household consumption was spent on food, 9% on fuel, 3% on health care, and 7% on education.

## 21 LABOR

In 2005, the labor force was estimated at 200,000, of whom 105,000 were foreign workers crossing the border from France, Belgium and Germany. Of those employed as of 2004, the services sector accounted for an estimated 86%, while 13% were in industry and 1% in agriculture. The estimated unemployment rate was 3.7% in 2005.

Labor relations have been generally peaceful since the 1930s. Foreign investors are attracted by the positive relationship which exists in Luxembourg between employers and the labor force. There is a strong trade union movement. About 50% of the labor force was organized into unions as of 2005. Although independent, the two largest labor organizations are associated with major political parties. Workers may strike only after their dispute is submitted to the National Conciliation Office and all mediation efforts have failed. Collective bargaining is widely practiced.

As of 2005, unskilled workers who are over 18 years of age with no dependents are entitled to a minimum wage of \$1,390 per month, while the minimum for skilled workers was \$1,475 per month. However, these totals were insufficient to provide a worker and family with a decent living standard. Most workers earned more than the minimum rate. Wage agreements are generally arrived at by industry-wide bargaining between labor and management. The maximum workweek is legally set at 40 hours. Overtime is paid at premium rates. Work on Sunday is restricted. Children under the age of 16 are prohibited from employment except in some special circumstances. The law mandates a safe working environment and this is effectively enforced by the Ministry of Labor.

## 2<sup>2</sup> AGRICULTURE

Over 27% of the work force and 50% of the land (126,629 hectares/312,900 acres) are devoted to agriculture and grazing; the majority of agricultural land consists of meadows and pastures. Farms are generally small and highly mechanized, although average farm size has been increasing. While the number of farms of 2 hectares (5 acres) or more fell from 10,570 in 1950 to 2,263 in 2002, the average holding increased from 13.16 to 57.18 hectares (from 32.52 to 141.3 acres) over the same period. Crop production in 2002 included (in tons): corn, 137,721; forage crops, 146,182; bread grains, 79,126; potatoes, 20,105; and pulses, 2,327.

Vineyards including Ehnen, Stadtbredmis, and Bech-Kleinmacher are located in the Moselle River Valley. In 2002/03, wine production totaled 15.39 million liters, consisting of rivaner, elbling, auxerrois, riesling, pinot blanc, and pinot gris. Wine and clover seeds are the important agricultural exports. In addition, millions of rosebushes, a major specialty crop, are exported annually. Chief fruits produced include apples, plums, and cherries.

## 2<sup>3</sup> ANIMAL HUSBANDRY

Livestock breeding is relatively important, particularly because of Luxembourg's dairy product exports. In 2005, livestock included 184,172 head of cattle, 75,000 pigs, 7,500 sheep, and 3,100 equines. A total of 48,615 tons of meat, and 272,000 tons of milk were produced in 2005.

## 2<sup>4</sup> FISHING

There is some commercial fishing for domestic consumption and much private fishing for sport. The rivers teem with perch, carp, trout, pike, eel, and bream.

## 2<sup>5</sup> FORESTRY

About 88,620 hectares (218,980 acres) were covered by forests in 2000, of which 53% was private forest. Forestry production in 2004 included 277,180 cu m (9.8 million cu ft) of roundwood, over 50% from broad-leaved trees. Chief commercial woods are spruce and oak. In 2004, forest product imports exceeded exports by \$13.7 million.

## 2<sup>6</sup> MINING

In 2003, Luxembourg's mineral sector consisted primarily of raw materials processing, information systems, and mineral trading. Metals produced included crude and semi-manufactured steel, while industrial minerals consisted of hydraulic cement, crude gypsum and anhydrite, and Thomas slag phosphates. The iron and steel industry was the most important mineral industry sector, with steel products as the country's main export commodity. Mining in Luxembourg was represented by small industrial mineral operations that produced material for domestic construction, including cement manufacture. In 2003, Luxembourg produced 2.7 million metric tons of crude steel and 2.8 million metric tons of semi-manufactured steel. Hydraulic cement production in 2003 was estimated at 700,000 metric tons, with crude gypsum and anhydrite output estimated at 400 metric tons in that same year. Production of Thomas slag phosphates (by gross weight) totaled and estimated 475,000 metric tons in 2003. Luxembourg's traditional source of mineral wealth was iron ore, concentrated between Re-

dange and Dudelange. Because of mine depletion, production declined from 2.08 million tons in 1976, to 429,000 in 1981, when the last iron mines were closed.

## 2<sup>7</sup> ENERGY AND POWER

Luxembourg imports all the petroleum products, natural gas and coal it requires, since it has no oil, natural gas or coal reserves.

In 2002, imports of petroleum products (all refined) averaged 52,290 barrels per day, while consumption for that year averaged 51,680 barrels per day. Natural gas imports and consumption in 2002 each totaled 42.06 billion cu ft. Coal imports that year consisted of hard coal and totaled 140,000 short tons.

Total electric generating capacity in 2002 was 128 MW, of which nearly 52% used fossil fuels, 31% was hydroelectric, and the remainder geothermal/other. Production of electrical energy in 2002 amounted to 2.526 billion kWh of which 92.2% was from fossil fuels, almost 8% from hydropower, and the rest from other renewable sources. Consumption of electricity in 2002 was 5.787 billion kWh. The steel industry consumes 80% of total industrial energy demand.

## 2<sup>8</sup> INDUSTRY

Massive restructuring of the steel industry and continuing diversification of the industrial base characterized the 1980s. Under the ongoing industrial diversification program, more than 80 new firms were launched between 1960 and 1985, providing jobs for 10,332 people. Chemicals, rubber, metal processing, glass, and aluminum became increasingly important, while some other industries, including construction, remained depressed; traditional light industries such as tanneries, glove-making plants, and textile mills were forced either to close down or to greatly reduce their scale of operations.

In 1997, steel was responsible for 29% of all exports. Production of steel was 2,613,000 tons in 1995 (5,462,000 tons in 1970); rolled steel products, 3,709,000 tons (4,252,000 tons in 1970). Luxembourg's blast furnaces and steel mills are located in the Bassin Minier of the southwest. Mergers have given ARBED, a private multinational firm with significant government shareholding, virtually complete control of the steel industry. A merger with France's USINOR and Spain's ACERALIA in 2001 made ARBED the world's largest steel producer; it was renamed "NEWCO" temporarily, and was searching for niche markets for highly specialized steel products.

In recent years, Luxembourg has diversified its industrial production away from steel, producing chemicals, medical products, rubber, tires, glass, and aluminum. The financial sector has compensated for the decline in steel production, and other service-sector growth areas in 2002 were cargo shipping, satellite transmission, and television and radio broadcasting.

In 2004, industry contributed to 16.3% of the GDP, and employed 13% of the labor force. The largest share of the economy went to the services sector, which made up 83.1% of the GDP, and employed 86% of the working force, with some 35% of the people working in Luxembourg representing cross-border labor from France, Belgium, and Germany. The industrial production growth rate, at 2.9%, was slightly smaller than the GDP growth rate, hinting to a more dynamic services sector in 2004.

## 29 SCIENCE AND TECHNOLOGY

The Grand Ducal Institute, the central learned society, includes medical and scientific sections. The Society of Luxembourg Naturalists, founded in 1890, had 575 members in 1996. Two public research centers conduct research on health and applied science. The University Center of Luxembourg, founded in 1969, has a sciences department. The Higher Institute of Technology, founded in 1979, offers courses in engineering and computing. Société Européenne des Satellites at Betzdorf is the control center for a group of satellites important to Europe's broadcasting industry.

In 2000, Luxembourg had 3,757 researchers and 3,820 technicians engaged in research and development (R&D) per one million people. In that same year, the country spent \$420.967 million or 1.71% of GDP on R&D, with the overwhelming majority of the expenditures, 90.7%, coming from business, with government accounting for 7.7% and foreign investors at 1.7%.

## 30 DOMESTIC TRADE

The commercial code is similar to that of Belgium and trade practices are nearly identical. The city of Luxembourg is the headquarters for the distribution of imported goods within the country and Antwerp in Belgium is the principal port of entry. Consequently, manufacturers' agents and importers maintain offices in one or both of those cities. The commercial laws and solid economic base are highly attractive to foreign investors. About 35% of the workforce is made up of foreign workers, many of whom are commuters from neighboring countries. French, German, and English are the languages of business correspondence. Advertising is extensive, particularly in newspapers and on Radio-Télé-Luxembourg.

Most shops and stores are open 9 AM to 6 PM Monday through Friday. Banking hours are on weekdays, 9 AM to 4:30 PM. Private business hours are usually from 8 AM to 5 PM.

## 31 FOREIGN TRADE

Luxembourg remains dependent on foreign trade, even though domestic demand has become an increasingly important factor in fueling the economy. The nation's trade position has weakened with the decline of the steel industry: between 1974 and 1981, imports grew by 55% while exports rose only 7%, as the trade balance swung into deficit. Between 1985 and 1992, imports grew by 42% and exports rose only 24%.

Trade with European nations accounted for 88.6% of imports and 88.7% of exports in 2000. With 23% of the total export volume in 2000, Germany was Luxembourg's biggest customer. Luxembourg imported more goods from Belgium (35%) than any other country.

Unlike some of its Western European counterparts, Luxembourg continued to register a trade deficit in recent years. In 2003, exports totaled \$13.4 billion (FOB—Free on Board), while imports rose to \$16.3 billion (CIF—Cost and Freight). Principal export commodities included machinery and equipment, steel products, chemicals, rubber products, and glass, and mainly went to Germany (which in 2004 received 22.1% of Luxembourg's total exports), France (20.1%), Belgium (10.2%), United Kingdom (8.4%), Italy (7.3%), Spain (5.9%), and the Netherlands (4.3%). Imports included minerals, metals, foodstuffs, and quality consumer goods,

and chiefly came from Belgium (29.8%), Germany (22.6%), China (12.6%), France (12%), and the Netherlands (4.2%).

## 32 BALANCE OF PAYMENTS

Luxembourg enjoyed a favorable trade balance from 1951 until 1975, when rising energy costs and structural weakness in the steel industry led to deterioration in terms of trade. The overall balance of payments has, however, tended to show a surplus, mainly because of income from banking services. The levels of imports and exports remain relatively stable, with the level of imports fluctuating significantly only when large capital purchases are made in the aviation sector.

The US Central Intelligence Agency (CIA) reported that in 2000 the purchasing power parity of Luxembourg's exports was \$7.85

billion while imports totaled \$10.25 billion resulting in a trade deficit of \$2.4 billion.

The International Monetary Fund (IMF) reported that in 2001 Luxembourg had exports of goods totaling \$9 billion and imports totaling \$11.4 billion. The services credit totaled \$19.9 billion and debit \$13.7 billion.

Exports of goods and services totaled \$47 billion in 2004, up from \$36 billion in 2003. Imports followed a similar trend, growing from \$30 billion in 2003, to \$39 billion in 2004. The resource balance was consequently positive, reaching \$6 billion in 2003 and \$8 billion in 2004. The current account balance improved from \$2.2 billion in 2003, to \$2.8 billion in 2004. National reserves (including gold) were insignificant at \$331 million.

**3<sup>3</sup> BANKING AND SECURITIES**

Banking has been gaining in importance since the 1970s and has become the most significant part of the economy; by 1998, banking and insurance employed about 15% of the total workforce. The principal bank and the sole bank of issue is the International Bank of Luxembourg (*Banque Internationale à Luxembourg*), founded in 1856. The Belgium-Luxembourg monetary agreement, as renewed for 10 years in 1991, provided for the establishment of the Luxembourg Monetary Institute to represent the nation at international monetary conferences and institutions. The banking sector has benefited from favorable laws governing holding companies. The European Investment Bank, the European Court of Auditors (both EU institutions), and the European Monetary Fund are headquartered in Luxembourg, as are all of the big six accounting firms. As a financial center, Luxembourg has the advantages of strict banking secrecy, a trained multilingual workforce, and a government that is sympathetic to the sector's needs. These last two factors are proving attractive to the developing cross-border insurance business. In addition, a strict 1992 law aimed at combating money laundering reinforces Luxembourg's reputation as a corrupt-free environment. The financial sector is currently active

in three main areas: the Eurobond market, investment funds, and the developing cross-border life insurance market.

Faced with the impossibility of raising the capital for its steel industry alone, Luxembourg has always been open to the financial world. But its current success in the field owes more to legislation in neighboring countries and external economic factors than to any deliberate policy on the part of the government.

The Euro-markets have made Luxembourg the home of Cedel Bank, one of the two international clearing and settlement depositories. In 2001 this group recorded a consolidated gross operating income of 979.5 million euros and a pretax operating profit of 113.4 million euros. In 1999, Cedel and Deutsche Börse Clearing announced a merger. The new company is called Cedel International and will serve as a single European clearing organization.

Luxembourg controls about 90% of Europe's offshore investment funds, making it the fourth-largest world market. The International Monetary Fund reports that in 2001, currency and demand deposits—an aggregate commonly known as M1—were equal to \$46.0 billion. In that same year, M2—an aggregate equal to M1 plus savings deposits, small scale time deposits, and money market mutual funds—was \$139.4 billion.

The Luxembourg Bourse, founded in 1929 in the city of Luxembourg, primarily handles stocks and bonds issued by domestic companies, although it also lists Belgian securities. The exchange was closed down on 10 May 1940. Dealing resumed but was limited to domestic and German securities. The exchange was again closed down when the country was liberated and did not reopen until October 1945.

**3<sup>4</sup> INSURANCE**

Third-party liability insurance is compulsory for all automobile owners, as is insurance for nuclear operators, hunters, hotel operators, boats and aircraft, windsurfers and parachutists. Domestic insurance companies issue both life and nonlife policies. The Third European Life Directive has permitted life companies to operate in any European Union (EU) country while still being controlled by domestic regulations. As of 1996, there were 23 subsidiaries of leading European companies that had been set up in Luxembourg, attracted by the availability of skilled staff and the proximity to major European markets. Direct premiums written in 2003 totaled us\$8.232 billion, with us\$1.102 billion of the total comprised of nonlife premiums and us\$7.130 comprised of life insurance premiums. In that same year, Luxembourg's top non-life insurer had gross written nonlife premiums (including health-care) of us\$223.2 million, while the country's leading life insurer that same year was le Foyer with gross written life insurance premiums of us\$223.2 million.

The *Commissariat aux Assurances* regulates insurance companies in Luxembourg.

**3<sup>5</sup> PUBLIC FINANCE**

The budget of the Luxembourg government is presented to the Chamber of Deputies late in each calendar year and becomes effective the following year. Government finances are generally strong, and budgets are usually in surplus.

The US Central Intelligence Agency (CIA) estimated that in 2005 Luxembourg's central government took in revenues of approximately \$15.1 billion and had expenditures of \$15.8 bil-

lion. Revenues minus expenditures totaled approximately -\$690 million.

The International Monetary Fund (IMF) reported that in 2003, the most recent year for which it had data, central government revenues were €10,092 million and expenditures were €10,099 million. The value of revenues was us\$11,391 million and expenditures us\$11,242 million, based on a market exchange rate for 2003 of us\$1 = €.8860 as reported by the IMF. Government outlays by function were as follows: general public services, 14.9%; defense, 0.8%; public order and safety, 2.4%; economic affairs, 9.1%; environmental protection, 1.4%; housing and community amenities, 0.8%; health, 12.6%; recreation, culture, and religion, 2.8%; education, 10.0%; and social protection, 45.2%.

### **36 TAXATION**

Luxembourg has come under pressure to share information on the interest paid on the hither-to-secret savings accounts maintained by nonresidents. In June 2003, the EU Commissioners issued a directive that would allow Luxembourg (as well as Belgium and Austria) to apply increased withholding taxes in lieu of directly sharing information on the interest tax paid on these accounts. Withholding rates of 15–20% would be applied 2004 to 2007, rising to 25% 2007 to 2009, and to 35% after 2009. The US Bush administration stood opposed to these EU initiatives to deal with tax evasion on the grounds that they would eliminate useful “tax competition.”

Luxembourg’s corporate income tax (IRC) rates in 2004 ranged from 20–22%. In addition, there is a 4% employment fund surtax. Companies are also subject to municipal taxes that average 7.5%. Taken as a whole, the taxes produce an effective tax rate of 30.38% on profits. Since 2002 the municipal tax was no longer deductible for corporate tax purposes. Capital gains are taxed as ordinary income, although some capital gains are tax-exempt. Dividends paid to nonresidents are subject to 20% withholding unless the payments are to a parent company resident in the EU that owns at least 10% of the subsidiary paying dividends. Subsidiaries of foreign companies are considered resident companies (“capital societies”) and are taxed at the same rate.

Personal income in Luxembourg is taxed according to a progressive schedule with a top rate of 38%. There is a 2.5% surtax for the employment fund. Social security taxes are separate for blue- and white-collar employees. Employer social security tax rates (in 2004) for blue- and white-collar employees are 13.01% and 10.76%, respectively. Employee tax rates are 12.90% and 10.65%, respectively. Other taxes include a wealth tax, gift taxes, local real estate taxes, registration taxes, subscription and net worth taxes.

The main indirect tax is Luxembourg’s value-added tax (VAT), introduced 1 January 1970 with a standard rate of 8% and a reduced rate of 4%. Revisions as of 10 January 1992 instituted a standard rate of 15% with reduced rates of 3% and 6%, and a “parking” (intermediate) rate of 12% (applied to heating oil, intellectual services, advertising, wine and certain other services). The 3% rate is applied to foodstuffs, newspapers, books, and periodicals, medicines and medical equipment, medical and dental care, and other basic goods and services. The 6% rate is applied to gas and electricity.

### **37 CUSTOMS AND DUTIES**

Tariff policies have been traditionally liberal. Luxembourg adheres to the trade regulations of the European Union. Luxembourg levies its own 15% value-added tax on imports if their final destination is Luxembourg. Nontariff barriers exist also in the form of health, safety, and packaging regulations.

### **38 FOREIGN INVESTMENT**

Foreign capital investment in Luxembourg has traditionally been small. In recent years, however, US investments have risen substantially, with the value of direct investments in manufacturing alone in excess of \$1 billion in 1993. Moderate-sized investments by Luxembourg firms have been made in Germany, France, Belgium, and South American countries. To encourage private investment from abroad, the government grants tax relief for up to 10 years in certain cases. Profits from investment may be transferred out of the country and invested capital may be repatriated with a minimum of regulation. Statistics on Luxembourg’s inward and outward foreign investment are calculated and published in conjunction with Belgium’s.

Presently, Luxembourg is one of the main actors (in conjunction with the United Kingdom and France) in terms of FDI outflows external to the EU. In 2003, Luxembourg was the EU’s second-largest investor outside the boundaries of the union, with capital outflows of \$37 billion. At the same time, due to its new role in the financial intermediation sector, Luxembourg has become the biggest recipient of FDI in the EU, with capital inflows reaching around \$46 billion (49% of the EU25 total). It was followed at a distance by Ireland, with FDI inflows of \$6 billion. Financial intermediation, whose receiving and sending actors almost always reside outside Luxembourg, accounted for 94% of outflows and 98% of inflows.

### **39 ECONOMIC DEVELOPMENT**

The keystone of the economic system is free enterprise, and the government has attempted to promote the well-being of private industry by every means short of direct interference. The full-employment policy pursued by every postwar government has produced a high ratio of economically active population to total population. Not only is the population economically active, it is also highly skilled, a fact not overlooked by foreign companies seeking to invest. The government encourages the diversification of industry by tax concessions and other means. Luxembourg’s successful economy continues to attract immigrants; the immigrant population comprises over one-third of the Grand Duchy’s total.

Banking has become an important sector of the economy, compensating for a decline in the steel industry. Successive governments have taken steps to encourage foreign investment, and investment incentives cover taxes, construction, and plant equipment. Government priorities in 2002 included balancing the budget, keeping spending growth in line with GDP growth, and running a general government surplus. The government was enacting tax cuts in 2002, and increased spending in infrastructure, research and development, education, and pension benefits. Obstacles were removed to part-time employment, more flexible work-

ing time arrangements were made, and child care facilities were expanded.

Today, Luxembourg is one of the most developed countries in the world (it actually has the highest income per capita in the world—approximately \$55,000), and offers a welcoming and dynamic business environment. Its investment fund sector is second only to the one in Paris, and in 2004 it managed assets of over \$1.027 trillion. The country is also home to one of Europe's biggest and most successful media conglomerates—RTL Group. Its location within the heart of Europe, its highly educated labor force, a stable tax system, and low business costs, make it a very attractive market for investors, and a reputable competitor for other developed economies.

#### 40 SOCIAL DEVELOPMENT

An extensive system of social insurance covers virtually all employees and their families. Sickness, maternity, old age, disability, and survivors' benefits are paid, with both employee and employer contributing and the government absorbing part of the cost. Retirement is set at age 65 for both men and women. Birth, maternity, child and education allowances are also provided to all residents. There is a choice for medical service providers. Parental leave and child-rearing allowances are available as well. The government covers the total cost for family allowances. Work injury laws were first instituted in 1902.

Women are well represented in politics and the professions. Although legally entitled to equal pay for equal work, in practice women's salaries are somewhat lower than men's for comparable work. However, the number of women in the workplace increased in 2004. The Ministry for the Promotion of Women is charged with ensuring equal opportunities for women. Violence against women is taken seriously by the authorities, and most abusers are prosecuted. Children's rights are fully protected and the government amply funds systems providing education and health care.

Human rights are fully respected in Luxembourg.

#### 41 HEALTH

Luxembourg has an advanced national health service, supervised by the Ministry of Public Health. Public health facilities are available to physicians and treatment of patients is on a private basis. Hospitals are operated either by the state or by the Roman Catholic Church.

In 2004, there were an estimated 255 physicians, 74 pharmacists, 64 dentists, and 39 midwives per 100,000 people. There were 32 hospitals with 4,438 beds. Public health officials have waged efficient national campaigns against contagious diseases and infant mortality has been reduced from 56.8 per 1,000 live births in 1948 to an estimated 4.81 as of 2005.

It was estimated that 80% of the country's children were immunized against measles. As of 2002, the crude birth rate and overall mortality rate were estimated at, respectively, 12 and 8.8 per 1,000 people. The fertility rate was one of the lowest in the world. The average woman living through her childbearing years had 1.5 children. Average life expectancy was estimated at 78.74 years in 2005. Leading causes of death are circulatory/heart diseases, cancer, road accidents, and suicide. The HIV/AIDS prevalence was 0.20 per 100 adults in 2003. As of 2004, there were approximately

500 people living with HIV/AIDS in the country. There were an estimated 100 deaths from AIDS in 2003.

#### 42 HOUSING

The immediate post-World War II housing shortage created by the considerable war damage has been alleviated by substantial construction of private homes and apartment buildings. The government has helped by making home loans at low interest rates available to buyers. In 1981 there were 128,281 private households in Luxembourg. In 2001, there were about 171,953 private households. About 169,198 households were living in single-family units. Of these, 67% were living in owner-occupied dwellings. Housing satisfaction is one of the highest in the European Union.

#### 43 EDUCATION

School attendance is compulsory between the ages of 6 and 15. Pupils attend primary schools for six years and then enter a general secondary or technical school for a period of up to seven years. The school year runs from October to July. The primary languages of instruction are French and German. In 2001, about 84% of children between the ages of three and five were enrolled in some type of preschool program. Primary school enrollment in 2003 was estimated at about 90% of age-eligible students. The same year, secondary school enrollment was about 80% of age-eligible students; 77% for boys and 83% for girls. It is estimated that about 86.5% of all students complete their primary education. The student-to-teacher ratio for primary school was at about 12:1 in 2003; the ratio for secondary school was about 11:1.

Postsecondary institutions in Luxembourg include the Central University of Luxembourg (founded in 1969), Superior Institute of Technology, and teacher training schools. However, most advanced students attend institutions of higher learning in Belgium and France. In 2003, about 12% of the tertiary age population were enrolled in some type of higher education program. The adult literacy rate for 2002 was estimated at about 100%.

As of 2003, public expenditure on education was estimated at 3.6% of GDP, or 8.5% of total government expenditures.

#### 44 LIBRARIES AND MUSEUMS

The National Library in Luxembourg is the largest in the country, with over 650,000 volumes. Other major libraries belong to the Centre Universitaire (120,000 volumes), the European Community Court of Justice (120,000), the Abbey of St. Maurice at Clervaux (100,000), the Seminary of Luxembourg (110,000), and the European Parliament (150,000). The Grand Ducal Institute maintains a few specialized collections in the city of Luxembourg, as does the government. In Esch-sur-Alzette the public library has close to 66,000 volumes and features a special collection of Luxembourgensia.

The National Museum of History and Art (founded in 1845) exhibits fine arts as well as the history of Luxembourg. The city of Luxembourg also hosts the Museum of Natural History, founded in 1988 and moved to a new building in 1996, the year that the Museum of the History of Luxembourg opened in the same city. The home where the 19th-century French writer Victor Hugo lived as an exile is in Vianden, and there is a museum of wine in Ehren.

## 45 MEDIA

Direct-dial telephone service is in use throughout the country, and includes efficient international service. In 2002, there were 355,400 mainline phones and 473,000 mobile phones in use nationwide. Telegraph service is also widely available.

Radio-Télé-Luxembourg broadcasts on five radio channels (in Letzeburgesch, French, German, English, and Dutch) and two television channels (Letzeburgesch and French). The powerful commercial network reaches not only the domestic audience but millions of French, Germans, and other Europeans. The country is home to the Societe Europeenne des Satellites, the largest satellite operator in Europe. In 1999 there were 2 AM and 9 FM radio stations and 5 television stations. In 1997, there were 285,000 radios and about 285,000 television sets. In 2002, there were 165,000 Internet subscribers in the country.

As of 2001, there are six daily and two weekly newspapers. The daily press is small in circulation but has high standards. Luxembourg does not have an independent news agency of its own but relies on foreign news agencies for information. The most popular dailies in 2002 were the *Luxemburger Wort* (German and French, circulation 87,777); *Tageblatt* (German and French) (29,469); and *La République Lorraine* (French) (15,000). The weekly *Telecran* had a 2002 circulation of 45,000.

The law provides for freedom of speech and the press, and the government is said to uphold these provisions in practice.

## 46 ORGANIZATIONS

The principal agricultural organization is Centrale Paysanne Luxembourgeoise, under which are grouped all producer cooperatives and other farmers' societies. Organizations promoting the interests of industry include federations of artisans, manufacturers, merchants, and winegrowers. The Luxembourg Chamber of Commerce is active in representing local business interests. The Luxembourg Confederation of Christian Trade Unions promotes worker's rights for all.

Several professional associations are active in supporting a wide variety of occupations and fields. The Association of Doctors and Dentists serves as a professional networking organization while also promoting research and education on health issues and working to establish common policies and standards in healthcare. There are several other associations dedicated to research and education for specific fields of medicine and particular diseases and conditions.

The Christian Social Women organization promotes women's rights and encourages political participation. Scouting programs are active for youth. There are also several sports associations active within the country, including the multinational European Table Tennis Union.

Kiwanis and Lions clubs also have programs in the country. International organizations with active chapters include the Red Cross, Amnesty International, UNICEF, and Greenpeace.

## 47 TOURISM, TRAVEL, AND RECREATION

Picturesque Luxembourg, with approximately 130 castles, has long been a tourist attraction. Among the points of greatest attraction are Vianden; Clervaux, with its castle of the De Lanno family, forebears of Franklin Delano Roosevelt; the famous abbey

of Clervaux; Echternach, an ancient religious center; the Moselle region; and the fortifications of the capital. Popular sports for both residents and visitors include fishing, rowing, swimming, hiking, rock climbing, cycling, and golf. More than 5,000 American soldiers are buried at the American Military Cemetery near the capital, including Gen. George S. Patton.

Visitors from Canada, Australia, the United States, and most of the Western European and South American countries require a passport. No visas are necessary for stays of less than three months. There were 581,450 visitors who arrived in Luxembourg in 2003, many of whom came from Belgium and the Netherlands. Hotel rooms numbered 7,626 with 14,620 beds and an occupancy rate of 25%. The average length of stay that year was two nights. Tourist expenditure receipts totaled \$2.9 billion.

In 2005, the US Department of State estimated the daily cost of traveling in Luxembourg at \$301.

## 48 FAMOUS LUXEMBOURGERS

Count Sigefroid founded the nation in 963, and Countess Ermesinde (r.1196–1247) tripled the extent of the country. Other outstanding historical personages are Henry VII of Luxembourg (c.1275–1313), who became Holy Roman emperor in 1308; his son John the Blind (1296–1346), count of Luxembourg (1309–46) and king of Bohemia (1310–46), a national hero; and the latter's son Charles (1316–78), who became Holy Roman emperor as Charles IV (1346–78). Grand duke from 1890 to 1905 was Adolphe (1817–1905), one-time duke of Nassau (1839–66) and the founder of the present dynasty, the house of Nassau-Weilbourg, whose origins go back to 1059.

Joseph Bech (1887–1975), prime minister from 1926 to 1937 and from 1953 to 1958, served as foreign minister for 33 years. Luxembourg-born Robert Schuman (1886–1963), French premier (1947–48) and foreign minister (1948–53), was a key figure in the postwar movement for West European integration. Grand Duchess Charlotte (1896–1985) abdicated in 1964 in favor of her son Grand Duke Jean (b.1921), ruled from 1964–2000. The current ruler is his son Grand Duke Henri (b.1955).

An artist of note was painter Joseph Kutter (1894–1941). Gabriel Lippmann (1845–1921) was awarded the Nobel Prize in physics (1908) for his pioneering work in color photography.

## 49 DEPENDENCIES

Luxembourg has no territories or colonies.

# MACEDONIA

Former Yugoslav Republic of Macedonia  
*Republika Makedonija*

**CAPITAL:** Skopje

**FLAG:** The flag consists of a gold sun with eight rays on a red field.

**ANTHEM:** *Denec Nad Makedonija (Today over Macedonia)*

**MONETARY UNIT:** The currency in use is the denar (DEN). Denominations from smallest to largest are fifty deni, one denar, two denari, and five denari. US\$1 = DEN0.02044 (or DEN1 = US\$48.92; as of 2005), but exchange rates are likely to fluctuate.

**WEIGHTS AND MEASURES:** The metric system is in effect in Macedonia.

**HOLIDAYS:** Orthodox Christmas, 7 January; national holiday, 2 August; Day of Referendum, 8 September.

**TIME:** 1 PM = noon GMT.

## <sup>1</sup> LOCATION, SIZE, AND EXTENT

Macedonia is a landlocked nation located in southeastern Europe. Macedonia is slightly larger than the state of Vermont with a total area of 25,333 sq km (9,781 sq mi). Macedonia shares boundaries with Serbia to the N, Bulgaria to the E, Greece to the S, and Albania to the W, and has a total boundary length of 766 km (476 mi). Macedonia's capital city, Skopje, is located in the northwestern part of the country.

## <sup>2</sup> TOPOGRAPHY

The topography of Macedonia features a mountainous landscape covered with deep basins and valleys. There are two large lakes, each divided by a frontier line. Approximately 24% of Macedonia's land is arable. Natural resources include chromium, lead, zinc, manganese, tungsten, nickel, low-grade iron ore, asbestos, sulfur, and timber. Located above a thrust fault line of the Eurasian Tectonic Plate, the nation experiences frequent tremors and occasional severe earthquakes. In 1963, 6.0 magnitude quake at Skopje caused the death of about 1,100 people and destroyed much of the city.

## <sup>3</sup> CLIMATE

Macedonia's climate features hot summers and cold winters. Fall tends to be dry in the country. In July the average temperature is between 20 and 23°C (68 and 73°F). The average temperature in January is between -20 and 0°C (-4 and 32°F). Rainfall averages 51 cm (20 in) a year. Snowfalls can be heavy in winter.

## <sup>4</sup> FLORA AND FAUNA

The terrain of Macedonia is rather hilly. Between the hills are deep basins and valleys, populated by European bison, fox, rabbits, brown bears, and deer. Pine trees are common in the higher mountain regions while beech and oak cover some of the lower mountain regions. The Macedonian pine is an ancient native species found most prominently on Mount Pelister near the south-

west border. Ducks, turtles, frogs, raccoons, and muskrats inhabit the country's waterways. As of 2002, there were at least 78 species of mammals, 109 species of birds, and over 3,500 species of plants throughout the country.

## <sup>5</sup> ENVIRONMENT

Air pollution from metallurgical plants is a problem in Macedonia, as in the other former Yugoslav republics. In 2000, the total of carbon dioxide emissions was at 11.2 million metric tons. All urban dwellers have access to safe drinking water. Earthquakes are a natural hazard. Forest and woodland cover 35% of the nation's land area. As of 2003, approximately 7.1% of Macedonia's total land area was protected, including one World Heritage Site and one Ramsar Wetland of International Importance. According to a 2006 report issued by the International Union for Conservation of Nature and Natural Resources (IUCN), threatened species included nine types of mammals, nine species of birds, two types of reptiles, four species of fish, and five species of invertebrates. Threatened species include the field adder, Apollo butterfly, and noble crayfish. One species of mollusk has become extinct.

## <sup>6</sup> POPULATION

The population of Macedonia in 2005 was estimated by the United Nations (UN) at 2,039,000, which placed it at number 139 in population among the 193 nations of the world. In 2005, approximately 11% of the population was over 65 years of age, with another 20% of the population under 15 years of age. There were 100 males for every 100 females in the country. According to the UN, the annual population rate of change for 2005–10 was expected to be 0.4%, a rate the government viewed as satisfactory. The projected population for the year 2025 was 2,120,000. The population density was 79 per sq km (205 per sq mi), with lowland regions being the most populated.

The UN estimated that 59% of the population lived in urban areas in 2005, and that urban areas were growing at an annual rate of

0.73%. The capital city, Skopje, had a population of 447,000 in that year. Most towns have fewer than 15,000 residents.

## 7 MIGRATION

In February 1999, violence in Kosovo forced more than 10,000 refugees to flee to Macedonia. The situation reached an emergency level when hundreds of thousands of refugees were arriving in late March and early April. By early June, the refugee population had grown to some 260,000. Macedonia did not have sufficient resources to cope with an emergency of this magnitude. At the government's request, some third-country asylum nations enacted bilateral evacuation programs, independently of the United Nations High Commissioner for Refugees (UNHCR). Also, a joint UNHCR/IOM Humanitarian Evacuation Programme was established, under which more than 90,000 refugees were evacuated from Macedonia to 29 countries. A Humanitarian Transfer Programme was also organized to set up camps in Albania for 1,300 refugees. The total number of migrants that year was 626,000, including 484,400 refugees.

In 2003 remittances to Macedonia were \$148 million. The net migration rate for Macedonia in 2005 was -0.7 migrants per 1,000 population. The government views the migration levels as too high.

## 8 ETHNIC GROUPS

According to the 2002 census, Macedonians comprise about 64.2% of the population. Another 25.2% are ethnic Albanians, mostly living in the west, particularly the northwest. Other groups include Turks (3.9%), Roma (2.7%), Serbs (1.8%), and others (including Bosniaks and Vlachs, 2.2%).

## 9 LANGUAGES

Macedonian is a southern Slavic tongue that was not officially recognized until 1944, and is the primary language of 66.5% of the population. Bulgarians claim it is merely a dialect of their own language. As in Bulgarian, there are virtually no declensions and the definite article is suffixed. Also as in Bulgarian—and unlike any other Slavic language—an indefinite article exists as a separate word. It is written in the Cyrillic alphabet, but with two special characters—*r* and *k*. Minority languages are officially recognized at the local level. Albanian is spoken by about 25.1% of the population, Turkish by about 3.5%, Roma by 1.9%, Serbian by 1.2%, and various other languages by 1.8%.

## 10 RELIGIONS

About 66% of the population are nominally Macedonian Orthodox; another 30% are Muslim, 1% are Roman Catholic, and about 3% belong to various other faiths. The other faiths are mostly various Protestant denominations. Islam is commonly practiced among ethnic Albanians living primarily in the western part of the country and in the capital of Skopje. The Roman Catholic community is centered in Skopje, as is a small Jewish community.

Though the constitution allows for religious freedom, the government places some restrictions on religious groups that concern the establishment of houses of worship and the collection of monetary donations. Religious groups are registered under the Law on Religious Communities and Religious Groups.

## 11 TRANSPORTATION

A railway connects Skopje with Serbia to the north and the Greek port of Salonika to the south. In 2004, rail trackage totaled 699 km (434 mi) of standard gauge track, of which 233 km (144 mi) were electrified. As of 2002, a 56 km (35 mi) extension of the Kumanovo-Beljakovce line to the Bulgarian border at Gyueshevo was under construction. In 2001, there were 8,684 km (5,396 mi) of highways, of which 5,540 km (3,442 mi) were paved, including 133 km (83 mi) of expressways.

As of 2004, there were an estimated 17 airports, including 10 with paved runways (as of 2005). In 2003, about 201,000 passengers were carried on scheduled domestic and international flights.

## 12 HISTORY

### Origin and Middle Ages

Macedonia is an ancient name, historically related to Philip II of Macedon, whose son became Alexander the Great, founder of one of the great empires of the ancient world. As a regional name, Macedonia, the land of the Macedons, has been used since ancient Greek times for the territory extending north of Thessaly and into the Vardar River Valley and between Epirus on the west and Thrace on the east. In Alexander the Great's time, Macedonia extended west to the Adriatic Sea over the area then called Illyris, part of today's Albania. Under the Roman Empire, Macedonia was extended south over Thessaly and Achaia.

Beginning in the 5th century AD Slavic tribes began settling in the Balkan area, and by 700 they controlled most of the Central and Peloponnesian Greek lands. The Slavic conquerors were mostly assimilated into Greek culture except in the northern Greek area of Macedonia proper and the areas of northern Thrace populated by "Bulgarian" Slavs. That is how St. Cyril and Methodius, two Greek brothers and scholars who grew up in the Macedonian city of Salonika, were able to become the "Apostles of the Slavs," having first translated Holy Scriptures in 863 into the common Slavic language they had learned in the Macedonian area.

Through most of the later Middle Ages, Macedonia was an area contested by the Byzantine Empire, with its Greek culture and Orthodox Christianity, the Bulgarian Kingdom, and particularly the 14th century Serbian empire of Dušan the Great. The Bulgarian and Serbian empires contributed to the spread of Christianity through the establishment of the Old Church Slavic liturgy.

After Dušan's death in 1355 his empire collapsed, partly due to the struggle for power among his heirs and partly to the advances of the Ottoman Turks. Following the defeat of the Serbs at the Kosovo Field in 1389, the Turks conquered the Macedonian area over the next half century and kept it under their control until the 1912 Balkan war.

### Under Ottoman Rule

The decline of the Ottoman Empire brought about renewed competition over Slavic Macedonia between Bulgaria and Serbia. After the Russo-Turkish war of 1877 ended in a Turkish defeat, Bulgaria, an ally of Russia, was denied the prize of the Treaty of San Stefano (1878) in which Turkey had agreed to an enlarged and autonomous Bulgaria that would have included most of Macedonia. Such an enlarged Bulgaria—with control of the Vardar River

Valley and access to the Aegean Sea—was, however, a violation of a prior Russo-Austrian agreement. The Western powers opposed Russia's penetration into the Mediterranean through the port of Salonika and, at the 1878 Congress of Berlin, forced the "return" of Macedonia and East Rumelia from Bulgaria to Turkey. This action enraged Serbia, which had fought in the war against Turkey, gained its own independence, and hoped to win control of Bosnia and Herzegovina, which had been given over to Austrian control, for itself.

In this situation both Serbia and Bulgaria concentrated their efforts on Macedonia, where Greek influence had been very strong through the Greek Orthodox Church. The Bulgarians obtained their own Orthodox Church in 1870, that extended its influence to the Macedonian area and worked in favor of unification with Bulgaria through intensive educational activities designed to "Bulgarize" the Slavic population. Systematic intimidation was also used, when the Bulgarians sent their terrorist units (*komite*) into the area. The Serbian side considered Macedonia to be Southern Serbia, with its own dialect but using Serbian as its literary language. Serbian schools predated Bulgarian ones in Macedonia and continued with their work.

While individual instances of Macedonian consciousness and language had appeared by the end of the 18th century, it was in the 1850s that "Macedonists" had declared Macedonia a separate Slavic nation. Macedonian Slavs had developed a preference for their central Macedonian dialect and had begun publishing some writings in it rather than using the Bulgaro-Macedonian version promoted by the Bulgarian Church and government emissaries. Thus, Macedonia, in the second half of the 19th century, while still under the weakening rule of the Turks, had become the object of territorial and cultural claims by its Greek, Serb, and Bulgarian neighbors. The most systematic pressure had come from Bulgaria and had caused large numbers of "Bulgaro-Macedonians" to emigrate to Bulgaria—some 100,000 in the 1890s—mainly to Sophia, where they constituted almost half the city's population and an extremely strong pressure group.

### Struggle for Autonomy

More and more Macedonians became convinced that Macedonia should achieve at least an autonomous status under Turkey, if not complete independence. In 1893, a secret organization was formed in Salonika aiming at a revolt against the Turks and the establishment of an autonomous Macedonia. The organization was to be independent of Serbia, Bulgaria, and Greece and was named the Internal Macedonian Revolutionary Organization (IMRO), a group that became Socialist, revolutionary, and terrorist in nature. Much like Ireland's IRA, IMRO spread through Macedonia and became an underground paragovernmental network active up to World War II. A pro-Bulgarian and an independent Macedonian faction soon developed, the first based in Sophia, the second in Salonika. Its strong base in Sophia gave the pro-Bulgarian faction a great advantage and it took control and pushed for an early uprising in order to impress the Western powers into intervening in support of Macedonia.

The large scale uprising took place on 2 August 1903 (Ilinden—"St. Elijah's Day") when the rebels took over the town of Kruševo and proclaimed a Socialist Republic. After initial defeats of the local Turkish forces, the rebels were subdued by massive Ottoman

LOCATION: 41°50' N; 22°0' E. BOUNDARY LENGTHS: Total boundary lengths, 748 kilometers (465 miles); Albania, 151 kilometers (94 miles); Bulgaria, 148 kilometers (92 miles); Greece, 228 kilometers (142 miles); Serbia, 221 kilometers (137.3 miles).

attacks using scorched earth tactics and wholesale massacres of the population over a three-month period. Europe and the United States paid attention and forced Turkey into granting reforms to be supervised by international observers. However, the disillusioned IMRO leadership engaged in factional bloody feuds that weakened the IMRO organization and image. This encouraged both Serbs and Greeks in the use of their own armed bands—Serbian Cetniks and Greek Andarte—creating an atmosphere of gang warfare in which Bulgaria, Serbia, and Greece fought each other (instead of the Turks) over a future division of Macedonia. In the meantime, the Young Turks movement had spread among Turkish officers and military uprisings began in Macedonia in 1906. These uprisings spread and Turkish officers demanded a constitutional system. They believed that Turkey could be saved only by Westernizing. In 1908 the Young Turks prevailed, and offered to the IMRO leadership agrarian reforms, regional autonomy, and introduction of the Macedonian language in the schools. However, the Young Turks turned out to be extreme Turkish nationalists bent on the assimilation of other national groups. Their denation-

alizing efforts caused further rebellions and massacres in the Balkans. Serbia, Greece, Bulgaria, and Montenegro turned for help to the great powers, but to no avail. In 1912 they formed the Balkan League, provisionally agreed on the division of Turkish Balkan territory among themselves, and declared war on Turkey in October 1912 after Turkey refused their request to establish the four autonomous regions of Macedonia—Old Serbia, Epirus, and Albania—already provided for in the 1878 Treaty of Berlin.

### Balkan Wars

The quick defeat of the Turks by the Balkan League stunned the European powers, particularly when Bulgarian forces reached the suburbs of Istanbul. Turkey signed a treaty in London on 30 May 1913 giving up all European possessions with the exception of Istanbul. However, when Italy and Austria vetoed a provision granting Serbia access to the Adriatic at Durazzo and Alessio and agreed to form an independent Albania, Serbia demanded a larger part of Macedonia from Bulgaria. Bulgaria refused and attacked both Serbian and Greek forces. This caused the second Balkan War that ended in a month with Bulgaria's defeat by Serbia and Greece with help from Romania, Montenegro, and Turkey. The outcome was the partitioning of Macedonia between Serbia and Greece. Turkey regained the Adrianople area it had lost to Bulgaria. Romania gained a part of Bulgarian Dobrudja while Bulgaria kept a part of Thrace and the Macedonian town of Strumica. Thus Southern Macedonia came under the Hellenizing influence of Greece while most of Macedonia was annexed to Serbia. Both Serbia and Greece denied any Macedonian "nationhood." In Greece, Macedonians were treated as "Slavophone" Greeks while Serbs viewed Macedonia as Southern Serbia and Serbian was made the official language of government and instruction in schools and churches.

### First and Second Yugoslavia

After World War I, the IMRO organization became a terrorist group operating out of Bulgaria with a nuisance role against Yugoslavia. In later years, some IMRO members joined the Communist Party and tried to work toward a Balkan Federation where Macedonia would be an autonomous member. Its interest in the dissolution of the first Yugoslavia led IMRO members to join with the Croatian Ustaša in the assassination of King Alexander of Yugoslavia and French Foreign Minister Louis Barthou in Marseille on 9 October 1934. During World War II, Bulgaria, Hitler's ally, occupied the central and eastern parts of Macedonia while Albanians, supported by Italy, annexed western Macedonia along with the Kosovo region. Because of Bulgarian control, resistance was slow to develop in Macedonia; a conflict between the Bulgarian and Yugoslav Communist parties also played a part. By the summer of 1943, however, Tito, the leader of the Yugoslav Partisans, took over control of the Communist Party of Macedonia after winning its agreement to form a separate Macedonian republic as part of a Yugoslav federation. Some 120,000 Macedonian Serbs were forced to emigrate to Serbia because they had opted for Serbian citizenship. Partisan activities against the occupiers increased and, by August 1944, the Macedonian People's Republic was proclaimed with Macedonian as the official language and the goal of unifying all Macedonians was confirmed. But this goal was not achieved. However, the "Pirin" Macedonians in Bulgaria were granted their own cultural development rights in 1947, and then lost them after

the Stalin-Tito split in 1948. The Bulgarian claims to Macedonia were revived from time to time after 1948.

On the Greek side, there was no support from the Greek Communist Party for the unification of Macedonian Slavs within Greece with the Yugoslav Macedonians, even though Macedonian Slavs had organized resistance units under Greek command and participated heavily in the postwar Greek Communists' insurrection. With Tito's closing the Yugoslav-Greek frontier in July 1949 and ending his assistance to the pro-Cominform Greek Communists, any chance of territorial gains from Greece had dissipated. On the Yugoslav side, Macedonia became one of the co-equal constituent republics of the Federal Socialist Republic of Yugoslavia under the Communist regime of Marshal Tito. The Macedonian language became one of the official languages of Yugoslavia, along with Slovenian and Serbo-Croatian, and the official language of the Republic of Macedonia where the Albanian and Serbo-Croatian languages were also used. Macedonian was fully developed into the literary language of Macedonians, used as the language of instruction in schools as well as the newly established Macedonian Orthodox Church. A Macedonian University was established in Skopje, the capital city, and all the usual cultural, political, social, and economic institutions were developed within the framework of the Yugoslav Socialist system of self-management. The main goals of autonomy and socialism of the old IMRO organization were fulfilled, with the exception of the unification of the "Pirin" (Bulgarian) and "Greek" Macedonian lands.

All of the republics of the former Federal Socialist Republic of Yugoslavia share a common history between 1945 and 1991, the year of Yugoslavia's dissolution. The World War II Partisan resistance movement, controlled by the Communist Party of Yugoslavia and led by Marshal Tito, won a civil war waged against nationalist groups under foreign occupation, having secured the assistance, and recognition, from both the Western powers and the Soviet Union. Aside from the reconstruction of the country and its economy, the first task facing the new regime was the establishment of its legitimacy and, at the same time, the liquidation of its internal enemies, both actual and potential. The first task was accomplished by the 11 November 1945 elections of a constitutional assembly on the basis of a single candidate list assembled by the People's Front. The list won 90% of the votes cast. The three members of the "coalition" government representing the Royal Yugoslav Government in exile had resigned earlier in frustration and did not run in the elections. The Constitutional Assembly voted against the continuation of the Monarchy and, on 31 January 1946, the new constitution of the Federal People's Republic of Yugoslavia was promulgated. Along with state-building activities, the Yugoslav Communist regime carried out ruthless executions, massacres, and imprisonments to liquidate any potential opposition.

The Tito-Stalin conflict that erupted in 1948 was not a real surprise considering the differences the two had had about Tito's refusal to cooperate with other resistance movements against the occupiers in World War II. The expulsion of Tito from the Cominform group separated Yugoslavia from the Soviet Bloc, caused internal purges of pro-Cominform Yugoslav Communist Party members, and also nudged Yugoslavia into a failed attempt to collectivize its agriculture. Yugoslavia then developed its own brand of Marxist economy based on workers' councils and self-manage-

ment of enterprises and institutions, and became the leader of the nonaligned group of nations in the international arena. Being more open to Western influences, the Yugoslav Communist regime relaxed somewhat its central controls. This allowed for the development of more liberal wings of Communist parties, particularly in Croatia and Slovenia, which agitated for the devolution of power from the federal to the individual republic level in order to better cope with the increasing differentiation between the more productive republics (Slovenia and Croatia) and the less developed areas. Also, nationalism resurfaced with tensions particularly strong between Serbs and Croats in the Croatian Republic, leading to the repression by Tito of the Croatian and Slovenian "Springs" in 1970–71.

The 1974 constitution shifted much of the decision-making power from the federal to the republics' level, turning the Yugoslav Communist Party into a kind of federation (league) of the republican parties, thus further decentralizing the political process. The autonomous provinces of Vojvodina and Kosovo were also given a quasi-sovereign status as republics, and a collective presidency was designed to take over power upon Tito's death. When Tito died in 1980, the delegates of the six republics and the two autonomous provinces represented the interests of each republic or province in the process of shifting coalitions centered on specific issues. The investment of development funds to assist the less developed areas became the burning issue around which nationalist emotions and tensions grew ever stronger, along with the forceful repression of the Albanian majority in Kosovo.

The economic crisis of the 1980s, with runaway inflation, inability to pay the debt service on over \$20 billion in international loans that had accumulated during Tito's rule, and low productivity in the less-developed areas became too much of a burden for Slovenia and Croatia, leading them to stand up to the centralizing power of the Serbian (and other) Republics. The demand for a reorganization of the Yugoslav Federation into a confederation of sovereign states was strongly opposed by the coalition of Serbia, Montenegro, and the Yugoslav army. The pressure towards political pluralism and a market economy also grew stronger, leading to the formation of non-Communist political parties that, by 1990, were able to win majorities in multiparty elections in Slovenia and then in Croatia, thus putting an end to the era of the Communist Party monopoly of power. The inability of the opposing groups of centralist and confederalist republics to find any common ground led to the dissolution of Yugoslavia through the disassociation of Slovenia, Croatia, Bosnia and Herzegovina, and Macedonia, leaving only Serbia and Montenegro together in a new Federal Republic of Yugoslavia.

The years between 1945 and 1990 offered the Macedonians an opportunity for development in some areas, in addition to their cultural and nation-building efforts, within the framework of a one-party Communist system. For the first time in their history the Macedonians had their own republic and government with a very broad range of responsibilities. Forty-five years was a long enough period to have trained generations for public service responsibilities and the governing of an independent state. In addition, Macedonia derived considerable benefits from the Yugoslav framework in terms of federal support for underdeveloped areas (Bosnia and Herzegovina, Kosovo, Macedonia, Montenegro). Macedonia's share of the special development funds ranged from

26% in 1966 to about 20% in 1985, much of it supplied by Croatia and Slovenia.

In the wake of developments in Slovenia and Croatia, Macedonia held its first multiparty elections in November–December 1990, with the participation of over 20 political parties. Four parties formed a coalition government that left the strongest nationalist party (IMRO) in the opposition. In January 1991 the Macedonian Assembly passed a declaration of sovereignty.

### Independence

While early in 1989 Macedonia supported Serbia's Slobodan Milošević in his recentralizing efforts, by 1991, Milošević was viewed as a threat to Macedonia and its leadership took positions closer to the confederal ones of Slovenia and Croatia. A last effort to avoid Yugoslavia's disintegration was made 3 June 1991 through a joint proposal by Macedonia and Bosnia and Herzegovina, offering to form a "community of Yugoslav Republics" with a centrally administered common market, foreign policy, and national defense. However, Serbia opposed the proposal.

On 26 June 1991—one day after Slovenia and Croatia had declared their independence—the Macedonian Assembly debated the issue of secession from Yugoslavia with the IMRO group urging an immediate proclamation of independence. Other parties were more restrained, a position echoed by Macedonian president Kiro Gligorov in his cautious statement that Macedonia would remain faithful to Yugoslavia. Yet by 6 July 1991, the Macedonian Assembly decided in favor of Macedonia's independence if a confederal solution could not be attained.

Thus, when the process of dissolution of Yugoslavia took place in 1990–91, Macedonia refused to join Serbia and Montenegro and opted for independence on 20 November 1991. The unification issue was then raised again, albeit negatively, by the refusal of Greece to recognize the newly independent Macedonia for fear that its very name would incite irredentist designs toward the Slav Macedonians in northern Greece. The issue of recognition became a problem between Greece and its NATO allies in spite of the fact that Macedonia had adopted in 1992 a constitutional amendment forbidding any engagement in territorial expansion or interference in the internal affairs of another country. In April 1993, Macedonia gained membership in the UN, but only under the name of "Former Yugoslav Republic of Macedonia." Greece also voted against Macedonian membership in the Conference on Security and Cooperation in Europe on 1 December 1993. However, on 16 December 1993, the United Kingdom, Germany, Denmark, and the Netherlands had announced the initiation of the recognition process for Macedonia and other countries joined the process, which resulted in recognition of Macedonia by the United States on 8 February 1994. In April 1994 the EU began to take legal action in the European Court of Justice against Greece for refusing to lift a trade blockade against Macedonia that it initiated two months earlier. However, by October 1995, Greece agreed to lift the embargo, in return for concessions from Macedonia that included changing its national flag, which contained an ancient Greek emblem depicting the 16-pointed golden sun of Vergina. The dispute over the name of Macedonia remained, but the agreement defused the threat of violence in the region.

On 3 October 1995, Macedonian president Kiro Gligorov narrowly survived a car-bomb attack that killed his driver. The next

day, parliament named its speaker, Stojan Andov, as the interim president after determining that Gligorov was incapable of performing his functions. Gligorov resumed his duties in early 1996. As tensions between majority Albanians and minority Serbs in the neighboring Yugoslav province of Kosovo heated up from 1997 to 1999, fears mounted that full-scale fighting would spread to Macedonia. Ethnic violence erupted in the town of Gostivar in July 1997 after the Macedonian government sent in special military forces to remove the illegal Albanian, Turkish, and Macedonian flags flying outside the town hall. Several thousand protesters, some armed, had gathered and were in a stalemate with police. During the skirmish, police killed three ethnic Albanians and several policemen were shot. The Albanian nationalist Kosovo Liberation Army also claimed attacks against two police stations in Macedonia in December 1997 and January 1998. As the violence mounted the United Nations Security Council voted unanimously on 21 July 1998 to renew the UNPREDEP (United Nations Preventive Deployment Force) mandate another six months and to bolster the contingent with 350 more soldiers.

When full-scale fighting in Kosovo erupted in early 1999 and NATO responded with air strikes against Serbia, Macedonia became the destination for tens of thousands of Kosovar Albanian refugees fleeing from Serbian ethnic cleansing. For a while the situation in Macedonia remained tense as the government, fearful of a spillover of the fighting into its territory, closed its frontiers to refugees. Nonetheless, the presence of NATO forces and pledges of international aid prevented (aside from errant bombs and a couple of cross-border incursions) a spread of the fighting and maintained domestic stability in Macedonia.

However, in 2000, violence on the border with Kosovo increased, putting Macedonian troops in a state of high alert. In February 2001, fighting broke out between government forces and ethnic Albanian rebels, many of who were from the Kosovo Liberation Army, but some were also ethnic Albanians from within Macedonia. The insurrection broke out in the northwest, where rebels took up arms around the town of Tetovo, where ethnic Albanians make up a majority of the population. NATO deployed additional forces along the border with Kosovo to stop the supply of arms to the rebels; however, the buffer zone proved ineffective. As fighting intensified in March, the government closed the border with Kosovo. The UN High Commissioner for Refugees estimated that 22,000 ethnic Albanians had fled the fighting by that time. Fears in Macedonia of the creation of a "Greater Albania," including Kosovo and parts of Macedonia, were fueled by the separatist movement, and mass demonstrations were held in Skopje urging tougher action against the rebels. The violence continued throughout the summer, until August, when the Ohrid Framework Agreement was signed by the government and ethnic Albanian representatives, granting greater recognition of ethnic Albanian rights in exchange for the rebels' pledge to turn over weapons to the NATO peacekeeping force.

In November 2001, parliament amended the constitution to include reforms laid out in the Ohrid Framework Agreement. The constitution recognizes Albanian as an official language, and increases access for ethnic Albanians to public-sector jobs, including the police. It also gives ethnic Albanians a voice in parliament, and guarantees their political, religious and cultural rights. In March 2002, parliament granted an amnesty to the former rebels who

turned over their weapons to the NATO peacekeepers in August and September 2001. By September 2002, most of the 170,000 people who had fled their homes in advance of the fighting in 2001 had returned.

Parliamentary elections were held on 15 September 2002, which saw a change in leadership from the nationalist VMRO-DPMNE party of Prime Minister Ljubco Georgievski to the moderate Social Democratic League of Macedonia (SDSM)-led "Together for Macedonia" coalition. Branko Crvenkovski became prime minister. At that time Boris Trajkovski was president; he had been elected from the VMRO-DPMNE party in 1999. In the September 2002 elections, former ethnic Albanian rebel-turned-politician Ali Ahmeti saw his Democratic Union for Integration party (DUI) claim victory for the Albanian community, which makes up more than 25% of the Macedonian population. Ahmeti, former political leader of the National Liberation Army (NLA), delayed taking his seat in parliament until December, for fear it would ignite protests among Macedonians who still regarded him as a terrorist. Indeed, in January 2003, the DUI headquarters in Skopje came under assault from machine-gunfire and a grenade, the fourth such attack on DUI offices.

In November 2002, NATO announced that of 10 countries aspiring to join the organization, 7 would accede in 2004, leaving Albania, Macedonia, and Croatia to wait until a later round of expansion. In January 2003, Albania and Macedonia agreed to intensify bilateral cooperation, especially in the economic sphere, so as to prepare their way for NATO and EU membership.

The year 2004 was a rather tumultuous one for Macedonia, and Macedonians. In February, President Trajkovski, who was on his way to a conference in Mostar, Bosnia, died in a plane crash. Two months later, elections were staged to replace him. Branko Crvenkovski, the acting prime minister and the leader of the ruling Social Democratic Union of Macedonia, won the second round of the election, with 62.7% of the vote; his main opponent—Sasko Kedev of the VMRO-DPMNE—got 37.3%. In June 2004, Hari Kostov, the former minister of interior, became prime minister following approval by the parliament. His reign was to be chaotic and short lived though—ethnic protests littered the country as parliament implemented legislation that gave Albanians more autonomy in the areas where they predominated. In November 2004, Kostov resigned and his place was taken by the defense minister, Vlado Buckovski (who also took over the leadership of the Social Democratic Union). In the summer 2005, the parliament passed a law that allowed ethnic Albanians to fly the Albanian flag in the areas where they compose the majority.

### 13 GOVERNMENT

Macedonia achieved its independence from the former Yugoslavia on 20 November 1991, having adopted its constitution on 17 November 1991. Macedonia's unicameral assembly of 120 seats is called the Sobranje. Eighty-five members are elected in single-seat constituencies, and 35 are elected by proportional representation. The executive branch consists of the president (elected by popular vote for a five-year term) and the Council of Ministers (elected by the majority vote of all the deputies in the Sobranje). The prime minister is elected by the assembly. In November 2001, parliament amended the constitution to include greater recognition of ethnic Albanian political, religious, and cultural rights. In October 2005,

the president of Macedonia was Branko Crvenkovski, while Vlado Buckovski—the leader of the Social Democratic Union—occupied the prime minister post.

#### 14 POLITICAL PARTIES

Following the 2002 elections, party representation in the Sobrañje (Assembly) was as follows: the Together for Macedonia coalition (composed of 10 parties led by the Social Democratic League of Macedonia and the Liberal Democratic Party—SDSM-LDP), 40.5% (59 seats); Internal Macedonian Revolutionary Organization-Democratic Party for Macedonian Unity (VMRO-DPMNE), 24.4% (34 seats); Democratic Union for Integration (DUI), 11.9% (16 seats); Democratic Party of Albanians (PDS), 5.2% (7 seats); Democratic Prosperity Party (PDP), 2.3% (2 seats); National-Democratic Party (NDP), 2.1% (1 seat); and the Socialist Party of Macedonia (SPM), 2.1% (1 seat). The DUI, PDS, PDP, and NDP are ethnic Albanian parties. The next legislative elections were scheduled to take place in 2006. The last presidential election was held in 2004 and Social-Democrat Branko Crvenkovski won a majority in the second round over his main opponent, VMRO-DPMNE candidate Sasko Kedev. The next presidential elections were scheduled to take place in April 2009.

#### 15 LOCAL GOVERNMENT

Macedonia's 85 municipalities form the structure of local government. (Out of these municipalities, 10 represent the greater Skopje area.) The municipality is the basic self-managed sociopolitical community. Council members are directly elected for four-year terms, as are the mayors of the municipalities. Citizens may form neighborhood (village and suburb) governing bodies. Where the number of members of a particular nationality exceeds 20% of the total number of inhabitants in a municipality, the language and alphabet of that nationality shall be in official use, in addition to Macedonian and the Cyrillic alphabet.

The local elections held in April 2005 went without ethnic tensions, although international observers drew attention to irregularities during all of the three voting rounds. Despite criticism, Prime Minister Buckovski considered the local election process to be a "model" for the future. The ruling Together for Macedonia coalition won 36 mayoral races; the Albanian Democratic Union of Integration (a coalition partner of the former) won 15; the VMRO-DPMNE, 21; the VMRO-People's Party, 3; the Democratic Party of Albanians/Party of Democratic Prosperity, 2; the Macedonian Roma Alliance, 1; the rest of the seven mayoral seats were won by mayors supported by a voter's bloc. Trifun Kostovski won the city of Skopje race over the candidate of the SDSM-led coalition—Risto Penov.

#### 16 JUDICIAL SYSTEM

The judicial system is comprised of three tiers: municipal courts, district courts, and the Supreme Court. A Constitutional Court handles issues of constitutional interpretation, including protection of individual rights. The constitution directs the establishment of a people's ombudsman to defend citizens' fundamental constitutional rights; the office became functional in 1997. An independent Republican Judicial Council appoints judges, who are confirmed by parliament. The Constitutional Court has not yet rendered any decisions in the area of protection of individual

rights or liberties. The constitution guarantees the autonomy and independence of the judiciary.

#### 17 ARMED FORCES

In January 1992, the Macedonian Assembly approved the formation of a standing army of 25,000–30,000 troops. However, the actual size of the military was 10,890 active personnel in 2005, of which the army was the largest service with 9,760 active members. The army was equipped with 61 main battle tanks, 51 reconnaissance vehicles, 11 armored infantry fighting vehicles, 207 armored personnel carriers, and 944 artillery pieces. Although there is no data as to the number of reservists, the nation's reserve forces were broken down in 2005 into eight infantry brigades and one (each) artillery, antitank and air defense regiments. The army also operated a maritime patrol arm equipped with five patrol/coastal vessels. The air force had 1,130 active personnel which had four combat capable aircraft made up of four fighter ground attack aircraft. The nation's paramilitary force consisted of a police force numbering 7,600, of which some 5,000 were armed. As of 2005, foreign forces stationed in Macedonia consist of 260 US personnel attached to KFOR 1. The national defense budget in 2005 totaled \$129 million.

In March 1997, rioters in neighboring Albania looted government armories, making off with hundreds of thousands of AK-47 assault rifles. Substantial numbers of those weapons were smuggled into Macedonia and sold to ethnic Albanians.

#### 18 INTERNATIONAL COOPERATION

The Former Yugoslav Republic of Macedonia was admitted to the United Nations on 8 April 1993; it is a part of ECE and a member of several nonregional specialized agencies, such as FAO, IAEA, IMF, UNESCO, UNIDO, WHO, and the World Bank. Macedonia is also a member of the Council of Europe, the Euro-Atlantic Partnership Council, the European Bank for Reconstruction and Development, the NATO Partnership for Peace, and the OSCE.

In February 1994 Macedonia's sovereignty was recognized by the United States and EU countries. Greece objected to the use of the name Macedonia by the nation and imposed a trade embargo for this and other issues. Greece and Macedonia signed an interim agreement in 1995 ending the embargo and opening negotiations for diplomatic recognition. Also in 1995, Macedonia ratified the European Convention on Human Rights and accepted the jurisdiction of the European Court of Human Rights. The convention includes several Eastern and Central European nations that see membership as a precursor to possible admission to the European Union in the future.

In environmental cooperation, Macedonia is part of the Basel Convention, Conventions on Biological Diversity and Air Pollution, Ramsar, CITES, the Kyoto Protocol, the Montréal Protocol, and the UN Conventions on the Law of the Sea and Climate Change.

#### 19 ECONOMY

Although the poorest of the six former Yugoslav republics, Macedonia nevertheless can sustain itself in food and energy needs using its own agricultural and coal resources. Due to the scarcity of arable land in the Vardar River Valley and other valleys in the

west, expatriate employment in Serbia and Germany has become more common.

In August 1992, because it resented the use of "Macedonia" as the republic's name and feared a hidden ambition to lay claim to the Greek province with the same name, Greece imposed a partial blockade on Macedonia. Greece later imposed a full trade embargo against Macedonia in February 1994. This blockade, combined with the UN sanctions on Serbia and Montenegro, cost the economy an estimated \$2 billion by the end of 1994. Macedonia's per capita GNP fell from \$1,800 to less than \$760 because of the sanctions and the Greek blockade. After threats of legal action by the EU, in October 1995 Greece ceased the embargo and promised not to interfere with Macedonia's commerce.

From 1998 to 2000 real GDP growth averaged a little over 4%, but in 2001, in the wake of rising global tensions and a global economic slowdown, real GDP growth fell 4.5%. Although 2002 saw an end to the contraction, growth was estimated at only 0.3%. Inflation had jumped to 6.1% in 2000, but moderated to 3.7% in 2001, and was projected at only 1% in 2002. Unemployment remains a serious problem. The official estimate for 2002 was almost 32%, with some 70% of 15- to 24-year-olds without work. In 2001, agriculture accounted for about 10% of GDP; industry, 32%; and services, 58%.

In 2004, the GDP growth rate was 5.3%, up from 4.7% in 2003; by 2005 however, it was expected to fall to 5.0%. Inflation decreased to negative values in 2004 (-0.4%), but overall it tended to hover around 1%. At around 37%, unemployment remains a big problem for the Macedonian economy, although many of the seemingly jobless are thought to hold jobs in the informal sector. The economic growth is expected to remain steady over the next years, and will be fueled by rapid growth in a series of key sectors: transport and telecommunications, trade and financial services. This growth will in turn spur an increase in domestic demand, and a recovery of the industrial sector (especially steel production).

## 20 INCOME

The US Central Intelligence Agency (CIA) reports that in 2005 Macedonia's gross domestic product (GDP) was estimated at \$15.6 billion. The CIA defines GDP as the value of all final goods and services produced within a nation in a given year and computed on the basis of purchasing power parity (PPP) rather than value as measured on the basis of the rate of exchange based on current dollars. The per capita GDP was estimated at \$7,400. The annual growth rate of GDP was estimated at 4%. The average inflation rate in 2005 was 1%. It was estimated that agriculture accounted for 11.7% of GDP, industry 32.1%, and services 56.2%.

According to the World Bank, in 2003 remittances from citizens working abroad totaled \$171 million or about \$8 per capita and accounted for approximately 3.7% of GDP. Foreign aid receipts amounted to \$234 million or about \$114 per capita and accounted for approximately 5.0% of the gross national income (GNI).

The World Bank reports that in 2003 household consumption in Macedonia totaled \$3.46 billion or about \$165 per capita based on a GDP of \$4.7 billion, measured in current dollars rather than PPP. Household consumption includes expenditures of individuals, households, and nongovernmental organizations on goods and services, excluding purchases of dwellings. It was estimated that for the period 1990 to 2003 household consumption grew at

an average annual rate of 2.1%. In 2001 it was estimated that approximately 33% of household consumption was spent on food, 15% on fuel, 6% on health care, and 9% on education. It was estimated that in 2003 about 30.2% of the population had incomes below the poverty line.

## 21 LABOR

There were an estimated 855,000 persons in the Macedonian labor force in 2004. As of 2003, 22% were in agriculture, 33.9% in industry, 43.8% in the services sector, with 0.3% in undefined occupations.

The constitution guarantees citizens the right to form labor unions with restrictions on the military, police, and government workers. Approximately 50% of the workforce is organized. The Confederation of Trade Unions of Macedonia (SSSM) is the labor confederation which is the successor to the old Communist Party labor confederation, and is still the government's primary negotiating partner on social issues. Employees have little bargaining power in the weak economic environment. Strikes may be utilized to protect employee interests.

Macedonian law establishes a 40-hour workweek, with a 24-hour rest period (minimum) plus vacation and sick leave. The minimum employment age by law is 15 years, with minors under the age of 18 limited by the number of hours they can work and by the types of work they can perform. The law provides that workplaces must meet minimum occupational health and safety standards but reports indicate that these are not effectively enforced. As of 2005, Macedonia did not have a legal national minimum wage. The average monthly wage that year was about \$250, and did not provide a family with a living wage. It was estimated by the government that around 29.6% of the population lived below the poverty line.

## 22 AGRICULTURE

As of 2003, there were some 612,000 hectares (1,512,000 acres) of arable land, representing 24% of the total land area. Most private farms are very small; 65% of private farmers own at most one hectare (2.7 acres) sometimes scattered in five or six locations.

Wheat production is concentrated in south central Macedonia and in public farms. Corn and barley are produced throughout the country, mostly by the private sector. About 80% of agricultural land is held by the private sector. The remaining 20% is held by state-owned enterprises known as Kombinats. Estimated grain production in 2004 included: wheat, 358,000 tons; barley, 150,000 tons; and corn, 146,000 tons. Rye, rice, and oats are also grown in smaller quantities. Other important crops produced in 2004 included (in 1,000 tons): tomatoes, 117; potatoes, 199; sunflower seeds, 7.4; sugar beets, 52; and walnuts, 3.7. In 2004, 247,600 tons of grapes and 26,000 tons of plums were produced. Tobacco is grown throughout Macedonia and is planted on 4% of the arable land. Production was 21,140 tons in 2004.

## 23 ANIMAL HUSBANDRY

Meadows and pastures accounted for about 25% of the total land area. Livestock in 2005 consisted of 1,200,000 sheep, 265,000 head of cattle, 200,000 pigs, and 3,000,000 chickens. Cattle numbers have increased slightly since 1992 due mainly to the increase in cows. About 50% of cattle are for the dairy sector. There are about

30 state farms with 250–1,200 cows in the Skopje and Bitola areas. Over 90% of cattle, however, are in private hands, with most farmers rarely having more than three cows because of limited land. Cow milk accounts for 74% of milk production; sheep milk, 26%. The rapidly growing goat sector is also contributing to increasing milk production. The raising of goats was prohibited during the socialist era in order to protect forestry resources. Production in 2005 included (in tons): mutton, 7,500; beef, 10,000; poultry, 4,000; and milk, 263,000.

## 24 FISHING

Inland fishing occurs on Lake Ohrid, Lake Prespa, and the Vardar River. The total catch in 2003 was 1,648 tons (primarily trout and carp), all from inland fishing. Macedonia has no direct access to the sea for marine fishing.

## 25 FORESTRY

About 36% of the total area consisted of forests and woodlands in 2000, mostly in the eastern and southern regions. Bitola is the center for the wood products industry. Total roundwood production in 2004 was 812,000 cu m (28.7 million cu ft), with 85% used as firewood.

## 26 MINING

Macedonia's mining and quarrying sector output, by value, dropped approximately 39% in 2003 from the previous year, although the country's gross domestic product (GDP) that year rose by 3.1% from 2002. Lead-zinc ore was mined at Kamenica and Probistip; copper, at Bucim; and iron ore, at Tajmite, Demir Hisar, and Damjan. Gold, bentonite, diatomite, feldspar, lime, talc, pumice, stone (carbonite and silicate), gypsum, and sand and gravel were also produced in 2003. Most of the industrial minerals produced went mainly to Balkan countries, the EU, and Russia. Production totals in 2003 were: mined lead (by gross weight), 40,000 metric tons, down from 200,000 metric tons in 2002; zinc (refined primary and secondary metal), 15,100 metric tons, down from 38,000 metric tons in 2002; copper (concentrate by gross weight), 15,000 metric tons; silver, 10,000 kg, down from 12,000 kg in 2002; and gold 400 kg, down from 500 kg in 2002. No chromite was produced in 1998, 1999, 2000 or 2003. Nickel output in 2003 totaled 5,600 metric tons, up from 5.100 metric tons in the previous year.

## 27 ENERGY AND POWER

In 2002, 5.762 billion kWh of electricity were generated, of which 86.7% came from conventional thermal plants and the rest from hydropower. Installed capacity totaled 1,568,000 kW in 2001. Consumption of electricity in 2002 was 6.150 billion kWh.

Macedonia's only domestic mineral fuel is coal. In 2002, the country produced 8,356,000 short tons, all of which was brown coal or lignite. Imports of coal totaled 183,000 short tons. Demand for coal in 2002 came to 8,092,000 short tons.

Macedonia imported an average of 11,540 barrels per day of refined petroleum products, with demand that year averaging 20,160 barrels per day. There were no record imports or production of natural gas in 2002.

## 28 INDUSTRY

Macedonia's industries are centered around Skopje. Steel and chemical production, along with buses, textiles, food processing, tobacco, furniture, and ceramics are important industries. In 1995, the government began privatizing its 25 largest public industries. Industry accounted for 31% of GDP in 2001. The Kosovo crisis of 1999 severely disrupted the Macedonian economy, as did the ethnic Albanian armed insurgency in Macedonia in 2001.

In 2004, industry made up 26% of the GDP, down from 32.8% in 2003. Services benefited from this loss, growing from a 55.5% participation in the GDP in 2003, to 62.8% in 2004. Agriculture remained relatively stable, at about 11%. The industrial production growth rate in 2004 was consequently 0%, indicating a loss of momentum for the industrial sector. Main industries were resource based and included coal, metallic chromium, lead, zinc, ferronickel, textiles, wood products, tobacco, food processing, buses, and steel. By 2005, industry showed signs of recovery, with the industrial output growth jumping to 8.2% in the first nine months of the year.

## 29 SCIENCE AND TECHNOLOGY

The Former Yugoslav Republic of Macedonia uses only low levels of technology for its agriculture and mining industries. Oil refining is performed by distillation only.

The Macedonian Academy of Sciences and Arts, founded in 1967 at Skopje, has sections of biological and medical sciences and of mathematical and technical sciences. The country also has an Association of Sciences and Arts, founded in 1960 at Bitola, as well as specialized learned societies concerned with physics, pharmacy, geology, medicine, mathematics and computers, veterinary surgery, engineering, forestry, and agriculture. Macedonia has research institutes dealing with geology, natural history, cotton, animal breeding, tobacco, animal husbandry, and water development.

The University of Skopje (founded in 1949) has faculties of civil engineering, agriculture, veterinary medicine, forestry, medicine, pharmacy, mechanical engineering, electrotechnical engineering, technology and metallurgy, natural and mathematical sciences, stomatology, and geology and mining. In 1987–97, science and engineering students accounted for 47% of university enrollment. The Natural History Museum of Macedonia (founded in 1926) is located in Skopje.

Macedonia in the period 1990–2001, had 387 scientists and engineers and 29 technicians per million people engaged in research and development (R&D). In 2002, Macedonia spent \$34.212 million on R&D, or 0.68% of its GDP. Of that amount, government sources accounted for 76.3% of R&D spending, with foreign sources accounting for 8.6%; business accounted for 7.8%; and higher education 7.3%. High technology exports in 2002 totaled \$9 million, or 1% of its manufactured exports.

## 30 DOMESTIC TRADE

The commercial and industrial center of the country is Skopje, with industries that include glass, beer, bricks, and tobacco. Prilep serves as the nation's agricultural center for tobacco and fruit. Kumanovu is an industrial center for canning and tobacco processing and a trading center for cattle, fruit, and liquor. Domestic

commerce typically centers around an urban marketplace, where marketing of farm products is carried out. Formal trade of products and commodities through state enterprises has declined since independence. However, private traders do not always offer a consistent and reliable market outlet for producers.

### 3<sup>1</sup> FOREIGN TRADE

In 1999, exports amounted to \$1.2 billion, of which manufactured goods accounted for an estimated 89%; agriculture, 9%; and mining, 2%. Imports in 1999 totaled \$1.8 billion, of which machinery and transport equipment accounted for an estimated 20%; manufactured goods, 16%; food and live animals, 12%; chemicals, 10%; fuels and lubricants, 9%; other manufactured products, 5%; raw materials (excluding fuels), 3%; and beverages and tobacco, 2%.

In 2004, exports totaled \$1.6 billion (FOB—Free on Board), while imports grew to \$2.7 billion. Macedonia's main export partners were Serbia and Montenegro (which received 31.4% of total exports), Germany (19.9%), Greece (8.9%), Croatia (6.9%), and the United States (4.9%). Imports mainly came from Greece (15.4%), Germany (13.1%), Serbia and Montenegro (10.4%), Slovenia (8.6%), Bulgaria (8.1%), Turkey (6%), and Romania (4.7%).

The structure of the trade has changed dramatically since 1999. Over the course of only five years, Macedonia's export structure changed to: textiles and clothing (which accounted for 32.3% of all exports), iron and steel (24.2%), chemicals (4.8%), petroleum and petroleum products (4.5%), and tobacco (4.4%). Principal imports included: petroleum and petroleum products (10.2%), road vehicles (6.3%), industrial machinery (4.9%), meat and meat preparations (3.0%), and medical and pharmaceutical products.

### 3<sup>2</sup> BALANCE OF PAYMENTS

The US Central Intelligence Agency (CIA) reported that in 2002 the purchasing power parity of Macedonia's exports was \$1 billion while imports totaled \$1.6 billion resulting in a trade deficit of \$600 million.

The International Monetary Fund (IMF) reported that in 2001 Macedonia had exports of goods totaling \$1.15 billion and imports totaling \$1.58 billion. The services credit totaled \$234 million and debit \$337 million.

Exports of goods and services totaled \$1.7 billion in 2004, up from \$1.4 billion in 2003. Imports grew from \$2.1 billion in 2003, to \$2.8 billion in 2004. The resource balance was on a negative upsurge, growing from -\$0.7 billion in 2003, to -\$1.1 billion in 2004. A similar trend was registered for the current account balance, which deteriorated from -\$149 million in 2003, to -\$414.8 million in 2004 (or -3.3% of the GDP). The national reserves (excluding gold) were \$897 million in 2003, covering approximately five months of imports; in 2004, they grew to \$905 million. Macedonia's balance of payment trade deficit was expected to decrease in 2005 as a result of export growth, especially of metals.

### 3<sup>3</sup> BANKING AND SECURITIES

In 1992, the National Bank of Macedonia was created to issue currency, conduct monetary policies, and regulate the banking sector of the country.

Commercial banks in Macedonia include the Komercijalna Banka and Scopanska Banka, both in Skopje. The currency unit is the Macedonia denar (DEN) introduced on 10 May 1993, at a rate

of 1:1,000 against the coupon. The central bank also introduced a floating rate for the denar against major currencies. There are no security exchanges in the country.

Under a five-year stabilization program agreed with the IMF, the government is focusing on reducing inflation, overhauling the financial system, and launching structural reforms. Despite the Greek blockade, the program met its fiscal targets in 1994 with the state deficit declining to 2.5% of GDP in 1994. Reform of the state banking system made progress in 1996, although banks are still lending to inefficient state enterprises. Privatization has made some progress with the privatization agency raising \$8 million in revenue in 1994 through the sale of four large companies and 14 medium-sized and small companies.

The International Monetary Fund reports that in 2001, currency and demand deposits—an aggregate commonly known as M1—

were equal to \$164.1 million. In that same year, M2—an aggregate equal to M1 plus savings deposits, small time deposits, and money market mutual funds—was \$887.3 million. The discount rate, the interest rate at which the central bank lends to financial institutions in the short term, was 10.7%.

### 34 INSURANCE

In 1995, the Makedonija Insurance and Reinsurance Company was offering the following types of insurance: property, liability, life, accident, motor, fire, and marine.

### 35 PUBLIC FINANCE

The US Central Intelligence Agency (CIA) estimated that in 2005 Macedonia's central government took in revenues of approximately \$2.1 billion and had expenditures of \$2.2 billion. Revenues minus expenditures totaled approximately -\$84 million. Public debt in 2005 amounted to 32.6% of GDP. Total external debt was \$2.207 billion.

### 36 TAXATION

As of 2005, Macedonia had a 15% corporate tax rate, which was also applied to branch operations. Capital gains, interest and royalties are considered income and are taxed at the corporate rate. Dividends paid to resident companies are not considered income, if the dividends were paid out of taxable income. Dividends paid to individuals are taxed at the corporate rate, but are applied to only 50% of the gross dividend amount. Personal income taxes range from 1.28–2.17%. Payroll taxes include a 21.2% rate for the pension fund, a 9.2% rate for the health fund, a 1.6% employment tax, and a 0.5% additional health fund contribution. On 1 April 2000 a value-added tax (VAT) was introduced. As of 2005, the standard VAT rate was 18%. There is also a reduced rate of 5% applied to basic goods and services. Other taxes include excise taxes on petrol, fuel oil, alcoholic beverages, tobacco, and property taxes.

### 37 CUSTOMS AND DUTIES

Macedonia has adopted a duty-free import agreement with Slovenia, Croatia, and Serbia (as of October 1996). Importers pay only a border crossing tax for document handling. Macedonia is also seeking to establish a trade zone with Bulgaria and Albania. Tariffs, as of 2005, ranged from 0–30%, with the average at 10.5%, and were based on the item's cost, insurance and freight (CIF) value. However, products such as beverages, cereals, vegetables and fruit were subject to a 60% rate. The VAT is also applied to imports based on the CIF plus duty value. Corruption in the customs system discourages trade.

### 38 FOREIGN INVESTMENT

Macedonia's isolation, technological disadvantages, and penchant for political instability created a poor climate for potential foreign investors. In 1995, the government began restructuring and privatizing its largest state-owned companies. After 1997, inflows of foreign investment increased substantially.

The country has taken important steps towards attracting new foreign direct investment (FDI), and has created a legislative framework that does not discriminate between domestic investors and their foreign counterparts. In 2004, the Macedonian privatization process was almost complete, with residual shares still be-

ing owned by the government in a couple of key industries. By the end of 2005, the government planned to privatize the national electric company—ESM—and sell off its 48% participation in the telephone company.

After hitting a peak in 2001 (with capital in-flows totaling \$445 million), when Hungary was the largest source of FDI, the rate of foreign investments slowed down in subsequent years, totaling \$82 million in 2002, \$98 million in 2003, and \$104 million in the first three quarters of 2004. The biggest investing countries in 2004 were Switzerland (with \$7.1 million invested), Greece (\$6.6 million), and Slovenia (\$1 million).

### 39 ECONOMIC DEVELOPMENT

In May 1994, the EBRD established a \$10 million facility to guarantee Komercijalna Banka's designated correspondent banks against nonpayment under confirmed letters of credit. By securing credit facilities, the bank's clients are able to stimulate production and increase exports. In 1995, net resource flows from international financial institutions consisted of \$43 million from the World Bank, \$37 million from the International Monetary Fund (IMF), and \$16 million from other institutions.

In 1995, the government began privatizing its largest state-owned industries. A total of 1,200 enterprises were to be privatized, 65% of them classified as small (fewer than 50 employees). The portion of a company's share capital, which is community-owned, is known as social capital; this forms the basis of the privatization process. In theory, social capital is owned by the company's employees. However, there are severe restrictions that make it nontransferable and hence valueless to the individual.

The Kosovo crisis of 1999 placed severe burdens on Macedonia's already-strained economy as an influx of Kosovar refugees flooded across the border and trade routes were disrupted. Fighting between government forces and ethnic Albanian rebels that began in February 2001 further disrupted the economy. Real GDP declined by 4.5% in 2001, and government spending mushroomed. Spending on security raised the general government deficit to 7.2% of GDP, compared with a surplus of 1.8% in 2000.

In 2003, the IMF approved a \$28 million standby arrangement for Macedonia, which expired in June 2004. The loan was geared to support the government's economic program for fiscal stability following the 2001 crisis, to promote growth, improve the business climate, and improve living standards for Macedonians.

Although Macedonia's economy has been improving steadily, there still are a number of problems that need to be dealt with. Two of the most important issues are the rampant unemployment and an inflation rate that discourages exports. A 2005 World Bank report that looked at the business climate in 155 countries ranked Macedonia 81st in terms of the ease of conducting commercial operations. The government responded promptly to the results of this report and implemented a package of laws that would make it easier for entrepreneurs or investors to start a business. However, the 2006 business climate still had numerous weak spots that needed to be addressed through a concerted effort by the legislative.

### 40 SOCIAL DEVELOPMENT

Macedonia, historically the poorest of the former Yugoslav republics, has suffered further from the imposition of international sanctions against Serbia, the rising tide of refugees, and increasing

unemployment. Social care is funded by the government to assist the disabled, elderly, unemployed, and poor. Maternity benefits are available for nine months, and women are guaranteed the right to return to work within two years after childbirth.

Although women have the same legal rights as men, the traditional cultures of both Christian and Muslim communities have limited their advancement in society. There are some professional women but generally women are not represented in the higher levels of professional or public life. Sexual harassment in the workplace is prevalent, especially in the private sector. Widespread violence against women in the home remains unpunished by authorities, and it is extremely rare for criminal charges to be filed against abusive husbands. In 2004 Macedonia submitted its first report to the UN Committee on the Elimination of Discrimination Against Women. Children, like adults, have been victims of internal conflict and ethnic violence. Resources are scarce to fund programs to benefit children.

Ethnic minorities, including Albanians and Turks, complain of widespread discrimination. Restrictive naturalization policies have left many Albanians without Macedonian citizenship, and therefore without voting rights. Abuse by police of prisoners and suspects is widespread, with most cases involving Roma, ethnic Albanians, or Kosovar refugees.

#### 41 HEALTH

Following the breakup of the former Yugoslavia, the availability of health care statistics for Macedonia was hampered by internal hostilities. Separate health care data was slowly emerging from the new independent regions. Physicians in Macedonia are adequately trained, but there is a shortage of pharmaceuticals and medical equipment. Patients who are seriously ill will often go abroad for medical help.

As of 2002, the crude birth rate and overall mortality rate were estimated at, respectively, 13.4 and 7.7 per 1,000 people. There were two births per married woman of childbearing age during 1999. The infant mortality rate has been reduced from 54 per 1,000 live births in 1980 to 10.09 in 2005. The life expectancy at birth for the average Macedonian was 73.73 in 2005.

The immunization rates for children under the age of one were as follows: diphtheria, whooping cough and tetanus, 87%; measles, 85%; and tuberculosis, 90%. The HIV/AIDS prevalence was 0.10 per 100 adults in 2003. As of 2004, there were approximately 200 people living with HIV/AIDS in the country. There were an estimated 100 deaths from AIDS in 2003.

#### 42 HOUSING

During the years of the former Yugoslav SFR, there was a chronic shortage of housing in Macedonia and the other republics. Since independence, the ability to find an available apartment or condominium has improved. Federal banks have begun loan programs making it now possible to finance the construction of seasonal homes in the country or by resort areas. In the 1994, there were about 580,342 dwellings supporting about 501,963 households. There was an average of 3.85 people per household. In 2002, there were about 698,143 dwelling units supporting 564,296 households. The average number of people per household was 3.58.

#### 43 EDUCATION

Public education at the primary level is compulsory for eight years, generally for students between the ages of 7 and 15. Elementary school covers these first eight years of study. This is followed by a four-year secondary program of general, technical, vocational, or special (arts) studies.

In 2001, about 28% of children between the ages of three and six were enrolled in some type of preschool program. Primary school enrollment in 2003 was estimated at about 91% of age-eligible students. In 2001, secondary school enrollment was about 81% of age-eligible students. Nearly all students complete their primary education. The student-to-teacher ratio for primary school was at about 20:1 in 2003; the ratio for secondary school was about 16:1.

At the postsecondary level, there are two universities: the Bitola University, which was founded in 1979, and the University of Skopje, founded in 1949. The language of instruction is Macedonian, and there are faculties of law, engineering, medicine, arts, science, physical education, architecture, and agriculture. In 2003, about 27% of the tertiary age population were enrolled in some type of higher education program; 24% of men and 32% of women. The adult literacy rate for 2004 was estimated at about 96.1%, with 98.2% for men and 94.1% for women.

As of 2003, public expenditure on education was estimated at 3.5% of GDP.

#### 44 LIBRARIES AND MUSEUMS

The Kliment Ohridski National and University Library in Skopje (1944) holds over 1.5 million items and is the largest collection in the country. The District of Skopje Public Library has 953,000 volumes.

In Skopje are the Fine Arts Museum, the Museum of Contemporary Art, and the Museum of the City of Skopje. There are also several archaeological and historical museums. The National Museums, specializing in archeology and ethnology, are in Ohrid and Stip, and there is an Islamic Art museum in Bitola. In Strumica is the Institute for Protection of Cultural Monuments, Natural Rarities, and Museum.

#### 45 MEDIA

In 2003, there were an estimated 271 mainline telephones for every 1,000 people. The same year, there were approximately 177 mobile phones in use for every 1,000 people.

Though most media are government owned, an independent television station, A-1, broadcasts from Skopje. Macedonian Radio and Television (MRTV) is the only public broadcaster in the country and has the widest range, reaching about 90% of the population. This government-owned station operates three national TV networks and one satellite network, as well as one radio station. In 2004, there were about 150 local radio and television stations registered in the country. In 2003, there were an estimated 205 radios for every 1,000 people. The number of television sets was unavailable in the same survey. In 2003, there were 100,000 Internet subscribers in the country.

Several daily newspapers are published in Skopje, as well as a number of periodicals. Newspapers in Albanian and a Turkish language paper are available nationally and subsidized by the government, including the Albanian-language *Flaka e Vlazermit*

(*Flame of Brotherhood*) and the Turkish language *Birlik*. In 1994 *Delo*, a new weekly with reportedly nationalistic leanings, began publication. As of 2002, the leading newspapers were *Nova Macedonia* (circulation 25,000) and *Vecer* (29,200).

The constitution forbids censorship and the government is said to respect this in practice. However, the government has restricted certain parts of the media during civil conflicts.

#### 46 ORGANIZATIONS

The Chamber of Economy of Macedonia coordinates trade and commerce with the world.

The Macedonian Academy of Science, founded in 1967, coordinates and finances scientific research conducted in Macedonia. Macedonian Medical Association promotes research and education on health issues and works to establish common policies and standards in healthcare. There are several other associations dedicated to research and education for specific fields of medicine and particular diseases and conditions. There are professional associations representing other fields as well.

There are youth organizations affiliated with major political parties. There is also an active scouting association. The National Student Union of Macedonia is an umbrella organization representing youth groups involved in cultural, educational, and social activities. National women's organizations include Journalism About Women's and Children's Rights and Environment in Macedonia and the Union of Women's Organizations of the Republic of Macedonia.

There are national chapters of the Red Cross Society, Caritas, and Habitat for Humanity.

#### 47 TOURISM, TRAVEL, AND RECREATION

Macedonia has very modest levels of tourist activity. Medieval monasteries and Orthodox churches are primary attractions. Turkish baths and bazaars can also be found. In the winter tourists are attracted to Popova Shapka, one of the most popular ski resorts in Macedonia. The city of Mavrovo, home to the Mavrovo National Park, has over 140 different bird species and over 45 different species of other animals making it attractive to hunters worldwide. The ski resorts, monasteries, and beautiful topography make Mavrovo one of the most visited cities in Macedonia. In 2000, there were about 224,000 tourist arrivals and tourism receipts totaled \$37 million. The 6,636 hotel rooms had an occupancy rate of only 15% that year. A valid passport is required for entry into Macedonia. A visa is not required for tourist/business stays of up to 90 days.

In 2005, the US Department of State estimated the daily cost of staying in Macedonia at \$230.

#### 48 FAMOUS MACEDONIANS

Kiro Gligorov (b.1917) was president of Macedonia from 1991 to 1999. Boris Trajkovski (1956–2004) was president from 1999 to 2004. Trajkovski died in a plane crash and was succeeded by

Branko Crvenkovski (b.1962). Mother Teresa (Agnes Gonxha Bjaxhiu, 1910–1997) was from Skopje but left at age 17 to join a convent in Calcutta, India. In 1948, Mother Teresa left the convent to found the Missionaries of Charity. She won the Nobel Peace Prize in 1979.

Phillip II (382 BC–336 BC) was the father of Alexander the Great. During Philip II's reign of 359–336 BC, he established a federal system of Greek States. Macedonian Alexander the Great (356 BC–323 BC) founded an enormous empire that extended from Greece to northern India. Cassandar (353 BC–297 BC) succeeded Alexander the Great, and was king of Macedonia between 316 BC and 297 BC. To consolidate his power, Cassandar murdered Alexander's mother, widow, and son. Philip V (237 BC–179 BC) warred against the Romans and tried to rebuild the kingdom.

#### 49 DEPENDENCIES

Macedonia has no territories or colonies.

# MALTA

The Republic of Malta  
*Repubblika Ta' Malta*

**CAPITAL:** Valletta

**FLAG:** The national flag consists of two equal vertical stripes, white at the hoist and red at the fly, with a representation of the Maltese Cross, edged with red, in the canton of the white stripe.

**ANTHEM:** *L'Innu Malti* (*The Maltese Hymn*).

**MONETARY UNIT:** The Maltese lira (LM) consists of 100 cents, with each cent divided into 10 mils. There are coins of 2, 3, and 5 mils and of 1, 2, 5, 10, 25, and 50 cents, and notes of 2, 5, 10, and 20 lira. Gold and silver coins of 1, 2, 4, 5, 10, 20, 25, 50, and 100 lira also are in circulation. ML1 = \$2.70270 (or \$1 = ML0.37) as of 2005.

**WEIGHTS AND MEASURES:** The metric system is the legal standard, but some local measures are still in use.

**HOLIDAYS:** New Year's Day, 1 January; National Day, 31 March; May Day, 1 May; Assumption, 15 August; Republic Day, 13 December; Christmas, 25 December. Movable holidays include Good Friday.

**TIME:** 1PM = noon GMT.

## <sup>1</sup>LOCATION, SIZE, AND EXTENT

Malta lies in the central Mediterranean Sea, 93 km (58 mi) south of Sicily and 290 km (180 mi) from the nearest point of the North African mainland. There are three main islands—Malta, Gozo to the NW, and Comino between them—as well as two small uninhabited islands, Cominotto and Filfla. Extending for 45 km (28 mi) SE–NW and 13 km (8 mi) NE–SW, Malta's total area is 316 sq km (122 sq mi)—Malta, 245.7 sq km (94.9 sq mi); Gozo, 67.1 sq km (25.9 sq mi); Comino, 2.8 sq km (1.1 sq mi). Comparatively, the area occupied by Malta is slightly less than twice the size of Washington, DC. The total coastline is 252.81 km (157 mi).

Malta's capital city, Valletta, is located on the east coast of the island of Malta.

## <sup>2</sup>TOPOGRAPHY

The islands of Malta are a rocky formation (chiefly limestone) running from east to northeast, with clefts that form deep harbors, bays, creeks, and rocky coves. The highest point of the nation is Ta'Dmejrek (253 m/803 ft), located on the southwest shore of Malta. Beaches range from rocky to sandy terrain. The northern beach of Ramla Bay is known for its red sands.

## <sup>3</sup>CLIMATE

The climate is typically Mediterranean, with fairly hot, dry summers and rainy, mild winters. The average winter temperature is 9°C (48°F); the average summer temperature, 31°C (88°F). Rainfall occurs mostly between November and January and averages about 56 cm (22 in) per year.

## <sup>4</sup>FLORA AND FAUNA

The islands are almost treeless. Vegetation is sparse and stunted. Carob and fig are endemic and the grape, bay, and olive have been cultivated for centuries. There are some rock plants.

The weasel, hedgehog, and bat are native to Malta. White rabbits and mice have been introduced. Many types of turtles, tortoises, and butterflies and several varieties of lizard also are found. Common varieties of Mediterranean fish, as well as the seal and porpoise, inhabit the surrounding waters.

## <sup>5</sup>ENVIRONMENT

Malta's most significant environmental problems include inadequate water supply, deforestation, and the preservation of its wildlife. The country's extremely limited fresh water resources have led to increasing dependence on desalination. The nation's agriculture suffers from lack of adequate water for crops due to limited rainfall.

Malta was one of the first countries to ratify the 1976 Barcelona Convention for the protection of the Mediterranean from pollution. Malta's government has made recent efforts to control environmental damage including passage of the Environmental Protection Act of 1991 and the creation of a Ministry for the Environment. The Ministry of Health and Environment belongs to the International Union for the Conservation of Nature and Natural Resources. In cooperation with the World Wildlife Fund, the Ghardira wetland area was made a permanent nature reserve in 1980.

According to a 2006 report issued by the International Union for Conservation of Nature and Natural Resources (IUCN), threatened species included 1 type of mammal, 10 species of birds,

11 species of fish, and 3 types of mollusks. Endangered species include the slender-billed curlew, Mediterranean monk seal, hawks-bill turtle, and Atlantic ridley.

## 6 POPULATION

The population of Malta in 2005 was estimated by the United Nations (UN) at 405,000, which placed it at number 165 in population among the 193 nations of the world. In 2005, approximately 13% of the population was over 65 years of age, with another 18% of the population under 15 years of age. There were 99 males for every 100 females in the country. According to the UN, the annual population rate of change for 2005–10 was expected to be 0.2%, a rate the government viewed as satisfactory. The projected population for the year 2025 was 396,000. The population density was 1,266 per sq km (3,278 per sq mi), which makes it one of the most densely populated countries in the world.

The UN estimated that 91% of the population lived in urban areas in 2005, and that urban areas were growing at an annual rate of 0.56%. The capital city, Valletta, had a population of 83,000 in that year. Other major cities (and their estimated populations) include Birkirkara (25,000), Qormi (19,900), and Sliema (14,000).

## 7 MIGRATION

High population density and unemployment have led to emigration. Most foreigners living in Malta are British nationals and their dependents. Malta has no national refugee law, and all recognized refugees in Malta are resettled in third countries. Since 1983, Malta has received some 2,400 asylum applications. Of these, 1,860 have been resettled. The total number of migrants in 2000 was 9,000. In 2004 refugees in Malta numbered 1,558. There were 141 asylum seekers in that same year. *Migration News* reported that Malta had allowed asylum seekers to stay up to three years, but recent influxes of boatloads of migrants from Africa resulted in migrants held in detention centers, and Malta's threat in August 2005 to suspend its obligations under the 1951 Geneva refugee convention. In 2005 the net migration rate was 2.06 migrants per 1,000 population. The government views the migration levels as satisfactory. In 2003 remittances to Malta were \$633,760.

## 8 ETHNIC GROUPS

Most Maltese are believed to be descended from the ancient Carthaginians and Phoenicians, but there are strong elements of Italian and other Mediterranean stock. A few thousand people are of Arab, African, or Eastern European origin.

## 9 LANGUAGES

Maltese, a Semitic language with Romance-language assimilations, is the national language and the language of the courts. Maltese and English are both official languages.

## 10 RELIGIONS

Roman Catholicism is the official state religion, but there is freedom of worship for all faiths. An estimated 95% of the population is Roman Catholic, with about 63% actively practicing. Most of the Protestants in the country are not Maltese; British retirees and vacationers from other countries tend to form the Protestant population. Jehovah's Witnesses, the Church of Jesus Christ of Latter-day Saints, the Fellowship of Evangelical Churches, and the

Bible Baptist Church have active groups on the island. There is one Muslim mosque and one Jewish congregation. Zen Buddhism and the Baha'i Faith are also represented.

## 11 TRANSPORTATION

Malta has no railways. In 2003, there were 2,254 km (1,402 mi) of roadways, of which 1,973 km (1,227 mi) were paved. Passenger cars in 2003 totaled 200,509, while there were 44,586 commercial vehicles in use that same year. Ferry and hydrofoil services connect Malta and Gozo.

The harbors of Valletta, among the finest in the Mediterranean, are a port of call for many lines connecting northwestern Europe and the Middle and Far East. Roughly 3,000 ships dock at Valletta each year. As of 2005, a total of 1,140 vessels of 1,000 GRT or more totaling 27,208,819 GRT were registered in Malta (a flag of convenience registry with ships from 49 countries). There was one airport in 2004, the principal airport at Luqa. A new terminal is designed to handle 2.2 million passengers per year (or 2,000 at any given moment). The national air carrier is Malta Airlines. In 2001 (the latest year for which data was available), 1,405,200 passengers were carried on scheduled domestic and international air-line flights.

## 12 HISTORY

The strategic importance of the island of Malta was recognized in the time of the Phoenicians, whose occupation of Malta was followed by that of the Greeks, the Carthaginians, and the Romans. The apostle Paul was shipwrecked at Malta in AD 58, and the islanders were converted to Christianity within two years. With the official split of the Roman Empire in 395, Malta was assigned to Byzantium, and in 870 it fell under the domination of the Saracens. In 1090, it was taken by Count Roger of Normandy, and thereafter it was controlled by the rulers of Sicily—Norman and, later, Aragonese. The Emperor Charles V granted it in 1530 to the Knights of St. John, who had been driven from Rhodes by the Turks. The Knights surrendered Malta to Napoleon in 1798. Two years later, the British ousted the French garrison, with the aid of a revolt by the Maltese people. British possession of Malta was confirmed in 1814 by the Treaty of Paris.

During almost the entire 19th century, a British military governor ruled the colony. After World War I, during which the Maltese remained loyal to Britain, discontent and difficulties increased. The 1921 constitution granted a considerable measure of self-government, but political tensions reemerged, and the constitution, after having twice been suspended, was revoked in 1936. A new constitution in 1939 reinstated Malta as a British crown colony. In World War II the Maltese again remained loyal to the United Kingdom, and for gallantry under heavy fire during the German-Italian siege (1940–43), the entire population was awarded the George Cross.

Substantial self-government was restored in 1947. The Maltese, however, carried on negotiations with the United Kingdom for complete self-government, except in matters of defense and foreign affairs. In August 1962, Prime Minister Borg Olivier requested the United Kingdom to grant Malta independence, and Malta became a sovereign and independent nation within the Commonwealth of Nations on 21 September 1964. At the same time, mutual defense and financial agreements were signed with the Unit-

ed Kingdom. Under subsequent accords negotiated between 1970 and 1979, British troops withdrew from Malta, and the NATO naval base on the main island was closed.

On 13 December 1974, Malta formally adopted a republican form of government, and the former governor-general, Sir Anthony Mamo, became the first president. Dom Mintoff, leader of the Malta Labor Party and prime minister from 1971 through 1984, instituted socialist measures and initiated a nonaligned policy in foreign affairs. Although the Labor Party narrowly lost the popular vote in the 1981 elections, it retained its parliamentary majority; to protest the gerrymandering that allegedly made this possible, the opposition Nationalist Party boycotted parliament, and strikes and civil violence ensued. In January 1987, a new law guaranteed that, following future elections, the new government would be formed by the party that won a majority of the popular vote.

On 23 November 1985 Malta became the scene of one of the deadliest hijackings in history, when an Egypt Air flight commandeered by three Palestinian terrorists was forced to land there. In a gun battle, an Egyptian sky marshal on the plane shot and killed the hijackers' leader, and the pilot landed the plane in Malta. After an Israeli and an American passenger were executed, Egyptian commandos set off an explosive charge and rushed the plane, but 57 passengers and another hijacker died in the raid from smoke inhalation, explosive wounds, or gunshots. The surviving hijacker, Omar Mohammed Ali Rezaq, was released from prison by Maltese authorities in 1993 under a general amnesty program. He was later apprehended in Nigeria and extradited to the United States for air piracy, and convicted and sentenced in 1996.

In May 1987, the Nationalist Party won a popular majority but only 31 of 65 seats in parliament. In accordance with the new law, the Nationalists were given four additional seats, for a total of 35 in an expanded 69-seat parliament, and the Nationalist Eddie Fenech Adami became prime minister, replacing the Laborite Carmelo Mifsud Bonnici. The Nationalists were returned to power in February 1992 with a slightly higher majority. Eddie Fenech Adami remained prime minister. Vincent Tabone, president, had been elected in 1989.

Maltese politics have revolved around foreign policy issues, in particular, Malta's relationship with Europe. The Nationalist Party government has been a strong proponent of EU membership. In July 1990, Malta applied for full membership in the European Union. However, after the Labor Party won the 1996 elections, the government's stance shifted towards maintaining neutrality. The Labor government also adopted economic policies, such as raising utility rates, that alienated both the electorate and elements within its own party, which withdrew their support for Prime Minister Alfred Sant. He called new elections three years ahead of schedule, in September 1998, and the Nationalist Party won a majority in a vote seen at least partly as a referendum on the European Union membership question. In March 1999, Guido de Marco of the Nationalist Party was elected president by the House of Representatives. Having regained the post of prime minister, NP leader Fenech Adami moved to reactivate Malta's EU membership application and adopted policies—such as the reimposition of a controversial value-added tax—intended to pave the way for membership approval. Malta was one of 10 new candidate countries formally invited to join the European Union in December 2002. Malta held its referendum on EU membership on 8 March

LOCATION: 35°48' to 36°N; 14°10'30" to 14°35' E. TERRITORIAL SEA LIMIT: 12 miles.

2003, with 53.6% voting in favor of joining the body versus 46.4% against. Malta became an official member on 1 May 2004.

Elections were held on 12 April 2003, resulting in a win for the Nationalist Party (35 seats); the Labor Party received 30 seats. The next scheduled elections for the legislature were to take place in April 2008. On 29 March 2004, the House of Representatives elected a new president, Eddie Fenech Adami; Lawrence Gonzi, former deputy prime minister, took over the post of prime minister. The next presidential elections were scheduled to take place in 2009.

### 13 GOVERNMENT

The Malta independence constitution came to force on 21 September 1964. Ten years later, Malta became a republic, while remaining within the Commonwealth of Nations. The unicameral parliament, the House of Representatives, consists of 65 members elected for a five-year term by universal adult suffrage (18 years of age and over), under a system of proportional representation. Additional seats may be allocated until a majority of one seat is obtained.

The House elects the head of state, the president of the republic, who holds office for five years. The president appoints the prime minister and, on the latter's advice, the other members of the cabinet. The prime minister, who is the leader of the majority party, is responsible for general direction and control of the government.

## 14 POLITICAL PARTIES

There are two major political parties, the Nationalist Party (NP) and the Malta Labor Party (MLP), which have alternated in political power. The Nationalist Party was returned to government in 1987 after 16 years of Labor Party rule, and won reelection in February 1992 with a three-seat majority (34 to 31) in parliament. The MLP regained control in October 1996 but lost it again following early elections held in September 1998, which the NP won by a five-seat margin. Elections held in April 2003 returned the NP to power; it took 35 seats in the House of Representatives to the MLP's 30. The next elections were scheduled for 2008.

Parties not represented in parliament include Democratic Alternative (AD), Malta Democratic Party (PDM), and the Malta Communist Party (PKM).

After the elections of 1996, MLP leader Alfred Sant became prime minister after a narrow upset victory (official results gave the MLP 50.72% of the vote). The MLP campaigned for Maltese neutrality by pledging to stop efforts to join the European Union, to end Malta's associate membership with NATO, and to seek closer ties with Libya. Following the NP victory in the 1998 election, party leader Eddie Fenech Adami was returned to the post of prime minister and took steps to reactivate Malta's application for EU membership. When voters approved EU membership in a March 2003 referendum, Fenech Adami looked upon the NP win in the April 2003 elections as a confirmation of Malta's desire to join the European Union.

## 15 LOCAL GOVERNMENT

Local government was established in 1993 with the approval of the Local Councils Act, setting up 68 local councils in Malta; there are 54 on the main island of Malta, and 14 in Gozo.

## 16 JUDICIAL SYSTEM

The superior courts consist of a Constitutional Court (with the power to review laws and executive acts), two courts of appeal, the civil court, court of magistrates, criminal court, and special tribunals. The president, on the advice of the prime minister, appoints the chief justice and 16 judges. Retirement is at age 65 for judges and age 60 for magistrates. The judiciary operates in an independent manner. Defendants in criminal cases have the right to counsel of choice. Indigent defendants are afforded court-appointed counsel at public expense.

The constitution guarantees the right to free speech, assembly and association. Trade unions are legal and limits on the right to strike were eased in 2002. However, the law permits compulsory arbitration to be held even if it is requested by only one of the parties involved, this is against the International Labor Organization's principles.

Divorce is illegal on the island and violence against women continues to be a problem. Malta is a member of most international organizations including the UN and the WTO.

## 17 ARMED FORCES

The armed forces of Malta numbered 2,237 in 2005 and were divided into three regiments. Malta's defense budget in 2005 totaled \$48.5 million. Equipment included eight patrol/coastal vessels,

two transport aircraft, and seven utility helicopters. Italy has 49 military personnel stationed in Malta.

## 18 INTERNATIONAL COOPERATION

Malta joined the United Nations on 1 December 1964 and participates in ECE and several nonregional specialized agencies, such as the FAO, IAEA, World Bank, ILO, UNESCO, UNIDO, and the WHO. Malta is also a member of the Commonwealth of Nations, the Council of Europe, the European Bank for Reconstruction and Development, the Alliance of Small Island States (AOSIS), and the OSCE. Malta joined the European Union in 2004. The country is an observer affiliate in the Western European Union. Malta is a part of the Nonaligned Movement. The nation also participates in the Nuclear Suppliers Group (London Group) and the Organization for the Prohibition of Chemical Weapons.

In environmental cooperation, Malta is part of the Basel Convention, Conventions on Biological Diversity and Air Pollution, Ramsar, CITES, the London Convention, the Kyoto Protocol, the Montréal Protocol, MARPOL, the Nuclear Test Ban Treaty, and the UN Conventions on the Law of the Sea, Climate Change, and Desertification.

## 19 ECONOMY

Malta has few natural resources besides limestone. Agriculture is limited by the rocky nature of the islands, and most food must be imported. Industrial raw materials are lacking and also must be imported. Until 1964, the dominant factor in the economy was the presence of British military forces; with the withdrawal of UK military personnel by 1979, the dockyards were converted to commercial use. Malta's economy now relies on light industry, tourism, and other service industries, in addition to shipbuilding, maintenance, and repairs. The government holds shares in a variety of enterprises, including joint ventures. A stock exchange opened in 1992.

In 2001 GNP per capita (purchasing power parity) was \$15,000. That same year, GDP real growth was estimated at 4%. Agriculture contributed 3% to GDP, industry amounted to 23%, while services were 74%. Malta became a full member of the European Union in May 2004.

The country's economic performance in recent years has been anything but spectacular. While in 2002, the GDP registered a modest growth rate of 2.2%, in 2003 it fell to -1.8%, and recuperated to 1.4% in 2004; in 2005, the economy was expected to grow by 1.5%. Inflation has been kept stable at around 2.5%. The unemployment rate was on the rise, growing from 4.7% in 2002, to 5.7% in 2003, and 7.2% in 2004.

## 20 INCOME

The US Central Intelligence Agency (CIA) reports that in 2005 Malta's gross domestic product (GDP) was estimated at \$7.5 billion. The CIA defines GDP as the value of all final goods and services produced within a nation in a given year and computed on the basis of purchasing power parity (PPP) rather than value as measured on the basis of the rate of exchange based on current dollars. The per capita GDP was estimated at \$18,800. The annual

growth rate of GDP was estimated at 1.4%. The average inflation rate in 2005 was 2.8%. It was estimated that agriculture accounted for 3% of GDP, industry 23%, and services 74%.

According to the World Bank, in 2003 remittances from citizens working abroad totaled \$1 million or about \$3 per capita.

## 21 LABOR

Malta's workforce in 2005 was estimated at 160,000. In 2005 it was estimated that services accounted for 75% of employment, while 22% were engaged in industry and the remaining 3% in agriculture. The unemployment rate in 2005 was estimated at 7.8%.

Labor is highly organized in Malta, and about 63% of Malta's workers were unionized in 2002. As of that year there were 38 registered trade unions. The largest union, the General Worker's Union, although independent, is informally associated with the Labor Party. The General Workers' Union was integrated with the Socialist Labor Party until 1992, when this affiliation was formally ended. Although certain compulsory arbitration and mediation provisions limit the right to strike, workers still enjoy a broad right to strike including antidiscrimination provisions to protect striking workers' employment. Comprehensive collective bargaining is practiced.

The legal minimum working age is 16, and this is effectively enforced by the government. The standard workweek is 40 hours but workers in some trades can work up to 45 hours per week. Occupational safety and health standards are set by law but enforcement is uneven and accidents remain frequent. In 2002, the weekly minimum wage was \$112 for adults.

## 22 AGRICULTURE

Agriculture is carried out in small fields, consisting usually of strips of soil between rocks, and is characterized to a large extent by terracing. The total area under cultivation was about 11,000 hectares (27,200 acres) in 2003. Most farms are small. Wheat, barley, and grapes are the principal crops for domestic consumption, while potatoes, onions, wine, cut flowers, seeds, and fruit are the chief export crops. The total value of agricultural crops exported in 2004 was estimated at \$76 million, while agricultural imports amounted to nearly \$400.3 million that year.

## 23 ANIMAL HUSBANDRY

Malta's livestock population in 2005 included 17,900 head of cattle, 73,000 pigs, 14,900 sheep, 5,400 goats, and 1,000,000 poultry. Total meat production in 2005 was 18,838 tons, half of it pork.

## 24 FISHING

Fishing is primarily for local consumption. In 2003, the total catch was 2,019 tons. Principal species included gilthead seabream, European sea bass, dolphinfish, and bluefin tuna. Exports of fish products were valued at \$18.8 million in 2003.

## 25 FORESTRY

There are no forests on the islands. In 2004, \$85 million in forest products were imported.

## 26 MINING

In 2004, Malta produced 6,000 cu m of salt, obtained in the desalination of sea water; 20 hard limestone quarries yielded 1.2 million cu m of limestone. The country also produced small amounts of cement, fertilizer, lime and plaster. The mining sector accounted for less than 0.5% of GDP, and the broader mineral industry economy depended mainly on trade and the storage of crude oil, refinery products, and other nonfuel mineral commodities for transshipment.

## 27 ENERGY AND POWER

Malta, with no proven reserves of oil, natural gas, nor any refining capacity, is totally dependent on imported fuel for its energy requirements.

In 2002, imports of petroleum products averaged 17,980 barrels per day, while demand came to 18,050 barrels per day. There were no imports of natural gas or coal in 2002.

Electricity is the main source of power. In 2002, thermal power stations on the main island made up Malta's total installed capacity of 0.570 million kW. Production of electrical energy that year was 1.929 billion kWh, of which 100% was generated from fossil fuels. Consumption of electricity was 1.794 billion kWh. Since 1995, the Maltese government has been exploring offshore areas for crude oil with the help of foreign companies such as Amoco, Royal Dutch Shell, and Nimir of Saudi Arabia.

## 28 INDUSTRY

Malta's principal industries are shipbuilding, maintenance and repairs, food processing, electronics, footwear, and textiles and clothing. Other products include beverages, tobacco products, lace, metals, rubber products, and plastic goods. Total industrial production amounted to 26% of GDP in 1999, the most recent year for which figures are available. The manufacturing sector grew by 17% from 1995-99. As of 2002, Malta's manufacturing sector was seen to be benefiting from the global economic downturn. Some foreign-owned companies closed operations elsewhere in the world and concentrated a degree of production in Malta, which was considered a competitive location for manufacturing activity. Manufacturing output rose 3% in 2001.

In 2003, industry made up 23% of the overall GDP, and was estimated to employ about the same percentage of the labor force; agriculture represented 3% of the GDP, while services came in first with 74%.

## 29 SCIENCE AND TECHNOLOGY

Malta's technological development has been confined largely to the shipbuilding and repair industry and the manufacture of electronic computer parts. The University of Malta has faculties of dental surgery, mechanical and electrical engineering, medicine and surgery, and science. In 1988, research and development expenditures amounted to 10,000 lira; 5 technicians and 34 scientists and engineers were engaged in research and development. The

Agrarian Society founded in 1844 is headquartered in Valletta. The Chamber of Architects and Civil Engineers is headquartered in St. Andrews. In 2000 (the latest year for which data was available), Malta spent \$5.382 million on research and development.

### 3<sup>0</sup> DOMESTIC TRADE

Valletta is the commercial center of Malta. Most large importers prefer to distribute goods through their own shops. Small retail establishments predominate with a few larger supermarkets and outlet stores springing up in the past few years. Billboards, newspapers, radio, and television are the main advertising media.

Shopping hours are from 9 AM to 1 PM and from 3 to 7 PM. Banks are open from 8:30 AM to 2 PM, Monday through Thursday, and from 8:30 AM to 3:30 PM on Friday. Some bank branches are open on Saturdays from 8:30 AM to 12 NOON. Businesses and industries are open on weekdays from 8:30 AM to 5:30 PM and on Saturdays from 8 AM to 1 PM. Most establishments are closed on Sundays and many places have shorter hours during the summer months.

### 3<sup>1</sup> FOREIGN TRADE

Because it depends on external sources for much of its food, fuel, raw materials, and manufactured articles, Malta imports considerably more than it exports.

Most of Malta's commodity exports are electronic microcircuits (62%). Other export commodities include clothes (5.9%), refined petroleum products (4.4%), and toys (4.3%).

In 2004, Malta's exports totaled \$2.6 billion (FOB—Free on Board), while imports grew to \$3.4 billion (FOB). Its main export partners were the United States (which received 15.7% of total exports), France (15.5%), Singapore (14.5%), United Kingdom (11.2%), and Germany (10.8%). Imports included machinery and transport equipment, manufactured and semi-manufactured goods, food, drink, and tobacco, and they mainly came from Italy (25.4%), France (13.1%), United Kingdom (12%), Germany (8.9%), the United States (5.2%), and Singapore (4.1%).

### 3<sup>2</sup> BALANCE OF PAYMENTS

Traditionally, Malta has had a large trade deficit because it must import most of its food and raw materials. The expansion of industry and the improvement of living standards in recent years have further increased the deficit, which is made up by other foreign receipts in the form of tourist revenues, transfers, and financial assistance, formerly from the United Kingdom and more recently from Italy and Libya. Malta's outstanding debt stood at close to \$2 billion by the end of 1999.

The US Central Intelligence Agency (CIA) reported that in 2001 the purchasing power parity of Malta's exports was \$2 billion while imports totaled \$2.8 billion resulting in a trade deficit of \$800 million.

The International Monetary Fund (IMF) reported that in 2001 Malta had exports of goods totaling \$2 billion and imports totaling \$2.5 billion. The services credit totaled \$1.11 billion and debit \$791 million.

Exports of goods and services continued to grow in the following years, reaching \$2.5 billion in 2003, and \$2.7 billion in 2004. Imports followed a similar path, totaling \$3.2 billion in 2003, and \$3.6 billion in 2004. The resource balance was consequently neg-

ative in both years, at around -\$700 million in 2003 and -\$900 million in 2004. The current account balance was on a downward path, dropping to -\$274 million in 2003, and -\$543 million in 2004. Reserves of foreign exchange and gold reached \$2.9 billion in 2004, covering more than nine months of imports.

### 3<sup>3</sup> BANKING AND SECURITIES

In June 1968, activities of the Currency Board were transferred to the new Central Bank of Malta. The Central Bank is responsible for the regulation of the banking system, the money supply, the issue of currency, and the administration of exchange control. The Central Bank manages the official external reserves and advises the Minister of Finance regarding the exchange rate of the Maltese lira. The Maltese lira is calculated on the basis of a currency basket, which currently consists of the ECU, pound sterling, and

US dollar. Foreign reserves, excluding gold, totaled \$1,605 million at the end of 1995. There are four commercial banks—the Bank of Valletta, HSBC Bank Malta, Lombard Bank Malta, and APS Bank—as well as the National Savings Bank.

In November 1995, Midland Bank (United Kingdom) became the first foreign bank to be granted a license to operate in the domestic market. In 1999, Hong Kong and Shanghai Banking Corporation (HSBC) acquired 67.1% of the shares of Mid-Med. The bank was subsequently renamed HSBC Bank Malta and became the largest bank operating on the island. Six international banking institutions are established in Malta: Turkiye Garanti Bankas, First Austrian Bank Malta, First International Merchant Bank, Izola Bank, Bank of Valletta International, and HSBC Bank Malta. Total assets/liabilities of the deposit-money banks stood at LM1.88 billion in 1995, while the assets/liabilities of domestic and international banking institutions amounted to LM155 million and LM407.7 million, respectively.

The International Monetary Fund reports that in 2001, currency and demand deposits—an aggregate commonly known as M1—were equal to \$1.4 billion. In that same year, M2—an aggregate equal to M1 plus savings deposits, small time deposits, and money market mutual funds—was \$6.1 billion. The discount rate, the interest rate at which the central bank lends to financial institutions in the short term, was 4.25%.

Turnover at the Malta Stock Exchange dropped sharply to LM75.8 million (\$70 million) in 2002, a fall of LM93.7 million compared with levels in 2001. Total market capitalization in 2002 was LM1.6 billion. In 1994 the Malta International Business Authority became the Malta Financial Services Center (MFSC), responsible for the regulation and registration of financial services provided in and from Malta.

**34 INSURANCE**

All customary types of insurance are available. Many foreign insurance companies have representatives in Malta. In 2003, the val-

ue of all direct insurance premiums written totaled \$235 million, of which life insurance premiums accounted for \$118 million. For that same year, Middlesea Valletta was Malta's top life insurer, with gross written life insurance premiums of \$58.4 million.

**35 PUBLIC FINANCE**

The principal sources of recurrent revenues are income taxes, and customs and excise taxes. Tourism is steadily increasing as an important segment of the economy, although the 11 September terrorist attacks put a damper on it. Malta has developed a fairly high budget deficit in recent years, and fiscal policy has been dedicated to reversing the situation. Public debt grew from 24% of GDP in 1990 to 56% in 1999, but by 2000 it had been brought down to just 6.6% of GDP.

The US Central Intelligence Agency (CIA) estimated that in 2005 Malta's central government took in revenues of approximately \$2.5 billion and had expenditures of \$2.7 billion. Revenues minus expenditures totaled approximately -\$200 million. Total external debt was \$130 million.

The International Monetary Fund (IMF) reported that in 2000, the most recent year for which it had data, central government revenues were LM532.77 million and expenditures were LM623.77 million. The value of revenues was us\$2,331 million and expenditures us\$2,722 million, based on an exchange rate for 2000 of us\$1 = LMo.22851 as reported by the IMF. Government outlays by function were as follows: general public services, 18.0%; defense, 1.6%; public order and safety, 3.9%; economic affairs, 13.9%; environmental protection, 0.3%; housing and community amenities, 2.5%; health, 11.4%; recreation, culture, and religion, 1.5%; education, 11.6%; and social protection, 35.2%.

**36 TAXATION**

In 1999, the ruling Nationalist government announced that it would raise taxes in an effort to bring the budget in line. An integral part of the new package would be measures to combat tax evasion, a phenomena that Finance Minister John Dalli characterized as a "national sport." In 1998, one of the Nationalist's first steps was the reintroduction of the value-added tax (VAT) that the previous Labor government dismantled. As of 2005, the corporate tax rate was a flat 35% and was the only tax imposed on company profits. Generally, capital gains are taxed as income for both companies and individuals. However gains received from securities listed on the Malta Stock Exchange are exempt. Dividends paid out of resident company profits that have already been taxed at the 35% rate are not taxed further at the individual level. However, dividends paid out of untaxed income to a resident are subject to a 15% withholding tax. Dividends paid out of company income that was taxed below the 35% rate are subject to a withholding tax that is the difference between the current and lower rates.

Individual incomes were taxed according to a progressive schedule with 35% as the top rate. Social security taxes totaled 19%, 10% paid by the employer and 9% by the employee. Reduced rates were available under certain circumstances on both corporate and individual income taxes. The main indirect tax was the VAT, set at a standard rate of 18%. There were also stamp taxes.

### 37 CUSTOMS AND DUTIES

Although traditionally a protectionist state, Malta's nationalist government is moving to dismantle its trade barriers in an effort to prepare for EU accession. Customs are collected mainly in the form of ad valorem duties; there are specific duties on petroleum, spirits, and tobacco. Preferential treatment is accorded to imports from the European Union. There is also a value-added tax (VAT) of 18% on all imports.

### 38 FOREIGN INVESTMENT

Malta encourages foreign investment through tax holidays, export incentives, investment and accelerated depreciation allowances, reduced taxes on reinvested profits, grants to cover training costs and management services, a generous attitude toward repatriation of profits and capital, and few restrictions on foreign ownership of Maltese firms. No data for the total value of foreign direct investment in Malta is available; the only investment figures that are kept are those collected by the government at the time of the original application for assistance by the companies. SGS Thomson Ltd. (Italy and France), first established in Malta in 1981, had an investment of \$266 million in machinery as of 1995.

In 1998, foreign direct investment (FDI) inflows were \$267 million, up from \$80.8 million in 1997, and then soared to \$822 million in 1999. FDI inflows fell to \$652 million in 2000 and then to \$314 million in 2001. For the period 1998 to 2000, Malta was fifth in the world in terms of success in attracting foreign investment. Malta's share of world FDI flows was 4.6 times its share of world GDP during this period.

Capital inflows totaled \$555 million in 2002, and an estimated \$333 million in 2003. Most investments came from Germany, the United States, France, the United Kingdom, Italy, and Austria. Foreign companies employ a significant part of the Maltese population.

### 39 ECONOMIC DEVELOPMENT

The Nationalist government's primary aim was to radically transform Malta's economy in an effort to meet EU standards in time for the next round of enlargement. The elimination of trade barriers, deficit reduction, and more efficient tax collection comprise the most significant elements of the government's EU-harmonization plan. Malta was formally invited to join the European Union in December 2002, and was finally accepted as a full member in May 2004.

Malta's economic growth has fluctuated over the past years, going into the negative in 2001 and 2003. Nonetheless, the economy is projected to grow stronger in the future as a result of higher investments in construction, and due to government efforts to meet fiscal criteria for euro qualification. Also, a slight increase in exports and private consumption are expected to help this trend.

### 40 SOCIAL DEVELOPMENT

The National Insurance Act of 1956, as amended in 1987, provides benefits for sickness, unemployment, old age, widowhood, disability, and industrial injuries. Coverage includes all residents aged 16 and over, and excludes full time students and unemployed married women. Pensions are funded by contributions from employers, employees, and the government. These benefits are sup-

plemented by social assistance under the National Assistance Act of 1956. Legislation establishing family allowances was enacted in 1974, and maternity benefits were mandated in 1981. As of 2004, employers were required to provide 14 weeks of maternity leave with pay set at a flat weekly rate. Work injury laws have been on the books since 1929.

Women make up a growing portion of the labor force due to changing social patterns and economic necessity. However, they are often channeled into traditionally female occupations or work in family-owned businesses, and remain underrepresented at the management level. Working women generally earn less than men. Domestic violence against women remains a problem but is addressed by the government through specialized police units, legal assistance, shelters, and legislation. These efforts paid off with a decrease in domestic violence in 2004. Women have equality in matters of family law, although divorce is not legal.

The law mandates protection of all groups against economic, social, and political discrimination. The government is committed to protecting human rights, and human rights organizations are free to operate in Malta.

### 41 HEALTH

Free health services are administered by the government run polyclinics. British, Belgian, and other foreign medical personnel work in Malta's hospitals. Infant mortality decreased from 23.3 per 1,000 live births in 1973 to an estimated 3.89 in 2005. Average life expectancy at birth was 78.86 years. As of 2004, there was an estimated 293 physicians, 377 nurses, 40 dentists, and 192 pharmacists per 100,000 people. The HIV/AIDS prevalence was 0.20 per 100 adults in 2003. As of 2004, there were approximately 500 people living with HIV/AIDS in the country. There were an estimated 100 deaths from AIDS in 2003.

### 42 HOUSING

Malta has the somewhat unusual situation of having a large surplus of housing stock. In 1995, about 23% of the housing stock was vacant, translating into about 35,723 dwellings. About 36% of vacant homes are considered to be second homes in private ownership. In 2003, an estimated 52,000 homes were vacant. Despite the surplus, the government continues to issue an overabundance of housing construction permits. For the period of 1994–2001, the Planning Authority issued about 3,000 permissions for housing development per year. The average increase in households was only about 1,700 per year for the same period.

Many new homes are being built in rural or suburb areas, a move which has been somewhat detrimental to urban areas since residents leaving the cities are often simply abandoning their urban properties. Some of these properties have fallen into disrepair, but many are still considered to be in adequate and good condition. Residential property is seen as a good investment for those who can afford to own their own homes and about 70% of all homes are owner occupied. Unfortunately, those who own a second home are often not willing to offer the property for affordable rental. Which also means that those who cannot afford to own their own home often find it difficult to find an affordable place to rent. The government provides some rental properties for low-income families and have made plans to encourage property owners to open their properties for rental.

### 4<sup>3</sup> EDUCATION

Maltese law requires that the teachings of the Roman Catholic Church be included in the public school curriculum, and legislation passed in 1983 requires all schools to provide free education. Education is compulsory for 11 years for children between the ages of 5 and 16 and is free in public schools. Primary school covers six years of study, followed by five years of junior lyceum (lower secondary). Students then have an option of attending a two-year high school or a four-year vocational school. Private independent and church secondary schools may have more specialized curriculums. The academic year runs from October to June.

Most children between the ages of three and four are enrolled in some type of preschool program. Primary school enrollment in 2003 was estimated at about 96% of eligible students. The same year, secondary school enrollment was about 87% of eligible students. It is estimated that nearly all students complete their primary education. The student-to-teacher ratio for primary school was at about 19:1 in 2003; the ratio for secondary school was about 10:1. In 2003, private schools accounted for about 36.5% of primary school enrollment and 27.3% of secondary enrollment.

Institutes of higher education include the University of Malta, the International Maritime Law Institute, and the School of Art. In 2003, about 30% of the tertiary age population were enrolled in some type of higher education program. The adult literacy rate for 2004 was estimated at about 87.9%, with 86.4% for men and 89.2% for women.

As of 2003, public expenditure on education was estimated at 4.6% of GDP.

### 4<sup>4</sup> LIBRARIES AND MUSEUMS

The National Library of Malta (founded in 1555) is located in Valletta and held 380,000 volumes in 2002. The National Archives is housed in Rabat. The University of Malta Library (1769) is in Msida and contains over 700,000 volumes. The Malta Public Libraries consist of the main Central Public Library at Floriana, 7 regional libraries and 38 branch libraries. There is also a Gozo Public Library. There are over 50 school libraries throughout Malta.

Valletta is the site of the National Museum of Archaeology, the National Museum of Fine Arts, the Palace Armory, the National War Museum, and the St. John's Museum. The Folk Museum and the Museum of Political History are at Vittoriosa, where the Malta Maritime Museum also opened in 1992. There is an archeological museum located in a Copper Age temple in Mgarr and a museum of Zomon antiquities in Rabat.

### 4<sup>5</sup> MEDIA

In 2003, there were 208,300 mainline phones and 290,000 mobile phone in use nationwide.

Malta's government radio service transmits on two channels (one Maltese, one English). The Labor Party and the Nationalist Party both own one radio and one television station. The Catholic Church also sponsors a radio station. There are other private stations as well. Television programs are received primarily from a local service and from Italy. As of 2001 there were 1 AM and 18 FM radio stations and 6 television stations, plus 1 commercial cable network. In 1997, there were 255,000 radios and 280,000 tele-

vision sets throughout the country. In 2002, there were 120,000 Internet users.

The press includes daily and Sunday newspapers, published in both Maltese and English. Leading papers (with estimated 2002 circulations) are *It-Torca* (Maltese, 30,000 daily), *L'Orizzont* (Maltese, 25,000 weekly), the *Times* (English, 23,000 daily), *Il-Mument* (Maltese, 25,000 weekly), and *In-Nazzion Taghna* (Maltese, 20,000 daily).

The constitution provides for freedom of speech and press, and the government is said to respect these rights in practice.

### 4<sup>6</sup> ORGANIZATIONS

The Chamber of Commerce is located in Valletta. There are several professional and trade organizations representing a variety of occupations. The largest independent private business organization is the General Retailers and Traders' Union—Malta. The Malta Federation of Industry also has some influence. The Medical Association of Malta represents the interests of doctors and patients. Other professional unions and associations are active on a national level.

The Malta Cultural Institute promotes primarily the arts of music and dance. Sports associations include organizations for such sports as cricket, football (soccer), weightlifting, and badminton. National youth organizations include the Malta Youth Labor Brigade, Nationalist Party Youth Movement, Scout Association of Malta, Student Democrats of Malta, University Student Council of Malta, University Students' Catholic Movement, and the Young Christians. The National Council of Woman of Malta encourages equal opportunity for women in business and education.

Multinational organizations based in Malta include the International Ocean Institute and Greenpeace Mediterranean. There is a national chapter of the Red Cross Society.

### 4<sup>7</sup> TOURISM, TRAVEL, AND RECREATION

Tourism, a major industry, has played a large role in developing the Maltese economy since the 1990s. Malta has many scenic and historical attractions, especially in Valletta, plus excellent beaches. Football (soccer) is the national sport; hockey, badminton, darts and rugby are also popular as well as billiards and snooker.

US citizens and most Western Europeans do not require a visa for stays of up to 90 days. In 2003, about 1,127,000 visitors arrived in Malta, of whom 40% came from the United Kingdom. That year there were 41,365 beds available in hotels and other accommodations with a 53% occupancy rate.

In 2005, the US Department of State estimated the daily cost of staying in Malta at \$209.

### 4<sup>8</sup> FAMOUS MALTESE

The city of Valletta derives its nomenclature from Jehan Parisot de la Vallette (1494–1568), Grand Master of the Knights of St. John, who successfully withstood a great Turkish siege in 1565. Dominic (Dom) Mintoff (b.1916), a founder of Malta's Labour Party, was prime minister during 1955–58 and 1971–84. Agatha Barbara (1923–2002), a former cabinet minister, was elected the first woman president of Malta on 16 February 1982. Edward Fenech-

Adami (b.1934), who served as prime minister from 1987–96 and from 1998–2004, became president in 2004.

#### 49 DEPENDENCIES

Malta has no territories or colonies.

# MOLDOVA

Republic of Moldova  
*Republica Moldoveneasca*

**CAPITAL:** Chişinău

**FLAG:** Equal vertical bands of blue, yellow, and red; emblem in center of yellow stripe is Roman eagle with shield on its breast.

**ANTHEM:** n/a

**MONETARY UNIT:** The leu is a paper currency, replacing the Russian ruble. 1MLD = \$0.07962 (or \$1 = MLD12.56) as of 2005.

**WEIGHTS AND MEASURES:** The metric system is in force.

**HOLIDAYS:** Independence Day, 27 August.

**TIME:** 2 PM = noon GMT.

## <sup>1</sup>LOCATION, SIZE, AND EXTENT

Moldova is a landlocked nation located in eastern Europe, between Ukraine and Romania. Comparatively, it is slightly larger than the state of Maryland with a total area of 33,843 sq km (13,067 sq mi). Moldova shares boundaries with Ukraine on the N, E, and S; and Romania on the W. Moldova's border length totals 1,389 km (864 mi).

Its capital city, Chişinău, is located in the south central part of the country.

## <sup>2</sup>TOPOGRAPHY

Moldova consists mostly of a hilly plain that is cut by deep valleys with many rivers and streams. The terrain slopes gradually southward. The Codri Hills run through the center of the country and contain the nation's highest point of Mount Balanesti, at 430 meters (1,410 feet). The lowest point is along the Dniester River, with an elevation of 2 meters (6.6 feet).

The Dniester, along the eastern border, is the longest river with a total length of 1,400 kilometers (870 miles). The second longest river, the Prut, is a major tributary of the Danube. There are no major lakes, but saline marshes are found along the lower reaches of the Prut and in river valleys of southern Moldova.

## <sup>3</sup>CLIMATE

The climate is of the humid continental type. The country is exposed to northerly cold winds in the winter and moderate westerly winds in the summer. The average temperature in July is 20°C (68°F). The average temperature in January is -4°C (24°F). Rainfall averages 58 cm (22.8 in) a year.

## <sup>4</sup>FLORA AND FAUNA

Three-fourths of the country's terrain features chernozem (black soil), which supports the natural vegetation of steppe-like grasslands. The central hill country is densely forested. Common trees include oak, maple, linden, hornbeam, and beech. Badgers, polecats, ermines, wild boar, foxes, and hares are common animals.

Larks, blackbirds, and jays are common birds. Carp, bream, trout, and pike populate the lakes and streams. As of 2002, there were at least 68 species of mammals, 175 species of birds, and over 1,700 species of plants throughout the country.

## <sup>5</sup>ENVIRONMENT

The natural environment in Moldova suffers from the heavy use of agricultural chemicals (including banned pesticides such as DDT), which have contaminated soil and groundwater. Poor farming methods have caused widespread soil erosion. In 2000, total carbon dioxide emissions was at 6.6 million metric tons. As of 2003, 1.4% of Moldova's total land area is protected. According to a 2006 report issued by the International Union for Conservation of Nature and Natural Resources (IUCN), threatened species included four types of mammals, eight species of birds, one type of reptile, nine species of fish, and five species of invertebrates. Threatened species include the European bison, European souslik, and the great bustard.

## <sup>6</sup>POPULATION

The population of Moldova in 2005 was estimated by the United Nations (UN) at 4,206,000, which placed it at number 121 in population among the 193 nations of the world. In 2005, approximately 10% of the population was over 65 years of age, with another 20% of the population under 15 years of age. There were 92 males for every 100 females in the country. According to the UN, the annual population rate of change for 2005-10 was expected to be -0.2%; the rate fell below zero in the mid-1990s. The government is concerned about the low fertility rate and high emigration rate, both of which contribute to the population decline. The projected population for the year 2025 was 3,967,000. The population density was 125 per sq km (323 per sq mi).

The UN estimated that 45% of the population lived in urban areas in 2005, and that urban areas were growing at an annual rate of 0.47%. The capital city, Chişinău, had a population of 662,000 in

that year. Tiraspol had an estimated 209,800 people; Bălți (Beltsy), 207,738; and Tighina, 144,900.

## **7** MIGRATION

There was a net emigration of 6,000 in 1979–88 to other Soviet republics. This grew to 16,300 in 1989 and 29,800 in 1990. Since independence in 1991, Moldova has experienced difficulties. A short but violent civil war in 1992—the Trans-Dniestrian conflict—resulted in the internal displacement of some 51,000 people and the external displacement of some 56,000 refugees, who fled to the Ukraine. There is no central authority in Moldova that registers and determines claims for refugee status. In 2004, there were 57 refugees and 184 asylum seekers. In 2004, some 5,641 Moldovans were refugees in Germany and 4,799 in the United States. Between 2000 and 2004, 900 Moldovans sought asylum in European and non-European countries. However, in 2004 over 6,700 Moldovans sought asylum in European countries, Ireland, and the United Kingdom. In 2005, the net migration rate was an estimated -0.25 migrants per 1,000 population, a significant change from -5.8 per 1,000 in 1990. The government views the immigration level as satisfactory, but the emigration level as too high.

## **8** ETHNIC GROUPS

The most recent estimates indicate that the population is 64.5% Moldovan/Romanian; 13.8% Ukrainian; 13% Russian; 2% Bulgarian; 1.5% Jewish; and 5.2% Gagauz or other. The Gagauz are a Christian Turkic minority that live primarily in the south. The government estimates the number of Roma to be about 11,600; however, nongovernmental organizations have placed the estimated Romani population at anywhere between 20,000 and 200,000.

## **9** LANGUAGES

Moldovan, the official language, is considered a dialect of Romanian rather than a separate language. It is derived from Latin but, unlike the other Romance languages, preserved the neuter gender and a system of three cases. There are a large number of Slavonic-derived words. Under Soviet rule the language was written in the Cyrillic alphabet, but Latin script was restored in 1989. This switch has caused problems, particularly in the separatist Transnistrian region where local authorities have closed schools that were teaching the Latin script.

Russian and Gagauz, a Turkish dialect, are also spoken within the country. Government officials are expected to know both Moldovan and Russian.

## **10** RELIGIONS

Over 90% of the population belong to one of two Orthodox denominations: the Moldovan Orthodox or the Bessarabian Church. About 3.6% of the population belong to the Old Rite Russian Orthodox Church (Old Believers). Other Christian denominations include Roman Catholics, Baptists, Pentecostals, Seventh-Day Adventists, Jehovah's Witnesses, Lutherans, Presbyterians, and Mormons. The Jewish community has about 31,300 members. There are also communities of Muslims and Baha'is. Though there is no state religion, the Moldovan Orthodox Church has a privileged status with the state and the government imposes some restric-

tions on religious groups that are not officially registered. For instance, unregistered groups are not permitted to build churches.

## **11** TRANSPORTATION

In 2004, Moldova's railroad system consisted of 1,138 km (707 mi) of standard and broad gauge railways, not including industrial lines. Of that total, broad gauge accounted for nearly all of it at 1,124 km (698 mi). As of 2003, Moldova's highway system consisted of 12,730 km (7,910 mi) of roadway, of which 10,973 km (6,818 mi) were paved. As of 2004, Moldova had 424 km (263 mi) of inland waterways. As of 2005, Moldova's merchant fleet consisted of two cargo vessels of 1,000 GRT or more. Access to the sea is through Ukraine or Romania. There were an estimated 23 airports in 2004, six with paved runways, as of 2005. Air transport is provided by Air Moldova International and Moldavian Airlines, both private carriers, and a state company, Air Moldova. In 2003, about 179,000 passengers were carried on domestic and international airline flights.

## **12** HISTORY

The region that is now Moldova (also called Bessarabia) has historically been inhabited by a largely Romanian-speaking population. The region was part of the larger Romanian principality of Moldova in the 18th century, which in turn was under Ottoman suzerainty. In 1812, the region was ceded to the Russian Empire, which ruled until March 1918 when it became part of Romania. Moscow laid the basis for reclaiming Moldova by establishing a small Moldovan Autonomous Soviet Socialist Republic on Ukrainian territory in 1924.

The 1939 Nazi-Soviet pact assigned Moldova to the Soviet sphere of influence. Soviet forces seized Moldova in June 1940. After the Nazi invasion of the USSR, Germany helped Romania to regain Moldova. Romania held it from 1941 until Soviet forces reconquered it in 1944.

Moldova declared its independence from the USSR on 27 August 1991. In December, Mircea Snegur was elected the first president of the new nation. Moldova's new constitution was adopted on 28 July 1994, replacing the old Soviet constitution of 1979. The Agrarian Democratic Party, composed largely of former Communist officials, won a majority of seats in the new parliament elected the same year.

Although independent, Moldova has remained one of the poorest countries in Europe and has confronted internal problems with two breakaway regions, the predominantly Turkish Gagauz region in the southern part of the country, and the largely Russian Transdnistria region east of the Dniester River. Russian forces have remained in the latter region and have supported its Russian population in proclaiming an independent "Transdnistria Republic," with which the Moldovan government was still trying to reach a political settlement as of 2003.

Petru Lucinschi (Independent), former speaker of the parliament, defeated Snegur in a December 1996 presidential runoff election (54% to 46%) and became Moldova's new president early in 1997. The following year, Moldova's Communist Party won a parliamentary majority in legislative elections. By 1999 Lucinschi was seeking to strengthen the nation's presidency in order to overcome an extended stalemate between the executive branch and

parliament that was preventing the government from effectively addressing the nation's pressing economic problems. In a referendum, voters approved constitutional changes proposed by Lucinchi, but they were rejected by the parliament.

In July 2000, parliament cancelled the direct election of the president, and he or she is now elected by parliament for a four-year term. Parliament failed to choose a new president by December 2000, and early parliamentary elections were held in February 2001. Communists took 71 of 101 seats, and in April, Vladimir Voronin, head of the Communist Party, became president. Voronin campaigned on a platform of protecting human rights, continuing the process of democratization, and ensuring that citizens had adequate food, employment, and medical care.

In February 2003, Voronin, a native of Transdnister, proposed a new initiative to settle the dispute with Transdnister. He called for a new constitution that would turn Moldova into a loose confederation of two states, and grant the Russian language official status. Both Moldova and Transdnister would have their own governing and legislative bodies, and budgets. Defense, customs, and monetary systems would be common for the federation. However, when in January 2002 plans had been announced to make Russian an official language and compulsory in school, mass protests were held, and ended only when the plans were revoked. As of February 2003, Russia maintained 2,500 troops in Transdnister, although in 1999 it agreed to withdraw all of its troops by 2001. The situation in Transdnister is complicated by fears among the Slavic population of Moldova's unification with Romania. On the other hand, at the beginning of 2003, consultations were taking place on the possible entry of Moldova into a union with Russia and Belarus.

The Communist Party stayed on track with market reforms and the European integration process. Although it is considered to be one of the poorest countries in Europe, and despite an economic base that is fairly fragile, between 2001 and 2004 Moldova registered GDP growth rates of over 6%. Also, the national currency—the Moldovan leu—was very stable over this time period.

In the March 2005 elections the Communist Party managed to hold on to power by garnering 46.1% of the votes; the Democratic Moldova Bloc got 28.4%, the Christian Democratic Popular party (PPCD) got 9.1%, and other parties got 16.4%. The popularity of the Communist Party was not as big as it was in 2001—they only won 56 parliamentary seats out of the 101 available—but they still managed to vote President Voronin in for a second term.

Moldova's middle-term goal of joining the European Union, and its short term goal of having its citizens travel freely within the Schengen space, were hampered by the raging conflict in the Transdnister region. The European Union stated that Moldova had no immediate prospects for integration.

### 13 GOVERNMENT

Elections to Moldova's first postindependence parliament were held on 27 February 1994. The parliament consists of a single chamber of 101 seats, and members are elected for four-year terms on the basis of proportional representation. In order to enter the parliament, parties must garner at least 6% of the votes; blocks of two parties need 9%, blocks of three or more parties need 12%, while independent candidates have to poll at least 3%. The votes

LOCATION: 47°0' N; 29°0' E. BOUNDARY LENGTHS: Total boundary lengths, 1,389 kilometers (864 miles); Romania, 450 kilometers (280 miles); Ukraine, 939 kilometers (584 miles).

obtained by the parties that did not pass these thresholds are redistributed in favor of the parties that did, according to their over-all representation in the Parliament.

Prior to 2000, the president was directly elected. As of July 2000, however, the president is elected by parliament for a four-year term and may serve no more than two consecutive terms. The president nominates the prime minister upon consultation with parliament. The cabinet is selected by the prime minister, subject to approval by parliament.

The July 1994 constitution and the law provide for freedom of speech, press, assembly, and religion; however, the law requires that religious groups register with the government. Peaceful assembly is allowed; however, permits for demonstrations must be approved and political parties and private organizations are required to register with the government.

Reforms approved in 1995 authorized the creation of a court to deal with constitutional issues and a system of appeals courts.

#### **14 POLITICAL PARTIES**

Although 26 parties or coalitions of parties participated in the February 1994 elections, only four received more than the 4% of the national vote (then) required to gain seats.

The Agrarian Party had been the largest political group in the parliament with a plurality of 46 seats, following the departure of 10 deputies in 1995. They left to join a new party, the Party of Renewal and Conciliation, headed by then-president Mircea Snegur. The Socialist-Edenstro bloc had 26 seats, while the pro-Romanian parties, the Popular Front and the Peasants and Intellectuals bloc, had 11 and 9 seats, respectively.

Although the Party of Moldovan Communists won the single largest number of parliamentary seats (40) in the elections held on 22 March 1998, they had insufficient support to form a governing coalition and thus remained an opposition party, while the governing coalition consisted of the Democratic Convention of Moldova (26 seats), the Bloc for a Democratic and Prosperous Moldova (24), and the Party of Democratic Forces (11).

Twelve political parties or blocs participated in the parliamentary elections held on 25 February 2001. Three of them gained seats in parliament: the Communist Party, 71; the centrist Braghis Alliance (led by Dumitru Braghis) of the Social-Democratic Alliance of Moldova, 19; and the conservative Christian Democratic Popular Party, 11.

In 2005, 9 parties, 2 alliances, and 12 independent candidates entered the electoral race. The Communist Party (PCRM) won 56 of 101 parliamentary seats, the centrist and pro-Russian Democratic Moldova Block (BMD)—led by Dumitru Braghis and Chişinău mayor Serafim Urechean—won 34, while the rightist and pro-Romanian Christian Democratic Popular Party (PPCD) won 11. Despite their fragile majority, the communists managed to vote former president Vladimir Voronin in for a second term—he received 75 of the 101 parliamentary votes. Vasile Tarlev was the designated prime minister.

#### **15 LOCAL GOVERNMENT**

Following administrative reforms, Moldova's 40 districts, or *raions*, have been reorganized into nine counties, one municipality (Chişinău), and two territorial units (Transnistria and Gagauzia).

The Russian minority on the east bank of the Dniester River have proclaimed their independence as the "Transnistria Republic," but it has not been recognized by the Moldovan government, which is, however, willing to allow this region a degree of autonomy. The predominantly Turkish Gagauz region has also been granted autonomy.

#### **16 JUDICIAL SYSTEM**

There are courts of first instance, an appellate court, a Supreme Court, and a Constitutional Court. The Supreme Court is divided into civil and criminal sections.

The Constitutional Court was created in 1995. A 1995 judicial reform law provided for a system of appeals courts.

There are district courts of the first instance and five regional tribunals. The Higher Appeals Court and the Supreme Court are both in Chişinău. However, as of 2003, there was a backlog of cases at the tribunal and the Higher Appeals Court levels, due to lack of funding.

The Superior Court of Magistrates nominates and the president appoints judges for an initial period of five years. The judges may be reappointed for a subsequent 10 years, and finally, on their third term, they serve until retirement age. The judiciary is more independent now than when it was subject to the Soviet regime. The Constitutional Court made several rulings in 1996 that demonstrated its independence. For example, in April 1996 the Constitutional Court found that the attempted dismissal of Defense Minister Creanga by President Snegur was unconstitutional. The Constitutional Court also overturned a Central Electoral Commission decision to exclude a presidential candidate from competing in the November 1996 election. And in 2000, the Court ruled that legislation requiring political parties to be registered for two years prior to participating in elections was unconstitutional.

Criminal defendants enjoy a presumption of innocence and are afforded a number of due process rights, including a public trial and a right of appeal. In practice, a number of convictions have been overturned on appeal.

In 2004 Moldova was deemed one of the most corrupt nations in the world. While the constitution states that the judiciary is independent, there have been several reports of political interference in the judicial process, and corruption among underpaid judges was believed to be pervasive.

#### **17 ARMED FORCES**

In 2005 the active armed forces numbered 6,750 personnel, backed by 66,000 reservists. The Army had 5,710 personnel, with 44 armored infantry fighting vehicles, 266 armored personnel carriers, and 227 artillery pieces. The Air Force had 1,040 active members, with five transport aircraft and eight support helicopters. There is also a paramilitary force that consisted of 2,379 internal troops and 900 riot police, all of which are under the Ministry of Interior. The defense budget for 2005 totaled \$9.2 million. Moldova has peacekeeping forces in Sudan, Côte d'Ivoire, and Liberia. Russia has an estimated 1,400 troops stationed in Moldova.

#### **18 INTERNATIONAL COOPERATION**

Moldova was admitted to the United Nations on 2 March 1992, and is a member of the ECE and several nonregional specialized agencies, such as the IAEA, ICAO, ILO, IMF, UNCTAD, UNESCO, UNIDO, WHO, and the World Bank. Moldova joined NATO's Partnership for Peace on 16 March 1994. It is also a member of the Council of Europe, the WTO, the Black Sea Economic Cooperation Zone, the Commonwealth of Independent States (CIS), the Euro-Atlantic Partnership Council, the European Bank for Reconstruction and Development, the OSCE, and the NATO Part-

nership for Peace. In 2001, Georgia, Uzbekistan, Ukraine, Azerbaijan, and Moldova formed a social and economic development union known as GUAAM. Uzbekistan withdrew from the partnership in 2005.

In environmental cooperation, Moldova is part of the Basel Convention, Conventions on Biological Diversity and Air Pollution, CITES, the Kyoto Protocol, the Montréal Protocol, and the UN Conventions on Climate Change and Desertification.

## 19 ECONOMY

At 51% of GDP in 2000, services comprise the most important sector of Moldova's economy, while agriculture accounted for 28%. The country's wide range of crops provides significant export revenue and employment.

Moldova has no major mineral deposits and must import all of its supplies of coal, oil, and natural gas. Since the breakup of the Soviet Union in 1991, energy shortages have contributed to sharp production declines. Moldova is seeking alternative energy sources and working to develop its own energy supplies including solar power, wind, and geothermal. The country is implementing a national energy conservation program.

In 1998, the Moldovan economy experienced an 8.6% decline due primarily to fallout from the financial crisis in Russia, by far its biggest export market. Continuing financial turmoil in Ukraine and Romania hurt Moldova's exports, which were needed to pay for imports of fuel from these countries. About one-fourth of Moldova's external debt burden, which peaked at 75% of GDP in 2000, is traceable to energy imports from Russia, which has on occasion suspended gas supplies, and from the Ukraine and Romania, both of which have on occasion suspended electricity power to Moldova. Further isolation occurred in 1999 when the IMF halted loans following the refusal of the Moldovan parliament to carry out privatization plans. By year's end, the Moldovan economy had contracted to roughly one-third of its 1989 level, with end of period inflation soaring to 45.8%. In 2000, the contraction was halted with real GDP growth of 2.2%, and in December, the government entered into a three-year arrangement with the IMF under its Poverty Reduction and Growth Facility (PRGF). Although average inflation for 2000 was 31.3%, by the end of the year the rate had moderated to 18.5%. In 2001 and 2002, inflation has been reduced to single digits: 6.4% and 8%, respectively. Real growth was 6.1% in 2001 and peaked at 4.8% in 2002. The external debt burden had eased somewhat to 58% of GDP.

The economy continued to expand in the following years, registering GDP growth rates of 6.3% in 2003, and 7.3% in 2004; the estimates for 2005 place the growth at 6.0%. This increase was encouraged mainly by remittances sent by Moldovans working abroad, and by a strong economic performance in Moldova's neighboring countries. However, the prolonged and deep economic recession that preceded this economic expansion put Moldova in a lagging position in comparison with all its neighbors.

Today, Moldova still is one of Europe's poorest economies. The GDP per capita was only \$717 in 2004, and the country's production capacity was reduced due to the exodus of working-age Moldovans. The inflation rate was on the rise in 2004, reaching 12.4%, after falling to 5.2% in 2002. The fact that most of its industry is located in secessionist Transnistria and its dependence on trade with neighboring countries makes Moldova extremely vulnerable.

## 20 INCOME

The US Central Intelligence Agency (CIA) reports that in 2005 Moldova's gross domestic product (GDP) was estimated at \$9.4 billion. The CIA defines GDP as the value of all final goods and services produced within a nation in a given year and computed on the basis of purchasing power parity (PPP) rather than value as measured on the basis of the rate of exchange based on current dollars. The per capita GDP was estimated at \$2,100. The annual growth rate of GDP was estimated at 6%. The average inflation rate in 2005 was 12%. It was estimated that agriculture accounted for 20.5% of GDP, industry 23.9%, and services 55.6%.

According to the World Bank, in 2003 remittances from citizens working abroad totaled \$465 million or about \$110 per capita and accounted for approximately 23.5% of GDP. Foreign aid receipts amounted to \$117 million or about \$28 per capita and accounted for approximately 5.1% of the gross national income (GNI).

The World Bank reports that in 2003 household consumption in Moldova totaled \$1.86 billion or about \$438 per capita based on a GDP of \$2.0 billion, measured in current dollars rather than PPP. Household consumption includes expenditures of individuals, households, and nongovernmental organizations on goods and services, excluding purchases of dwellings. It was estimated that for the period 1990 to 2003 household consumption grew at an average annual rate of 8.7%. In 2001 it was estimated that approximately 31% of household consumption was spent on food, 11% on fuel, 3% on health care, and 15% on education. It was estimated that in 2001 about 80% of the population had incomes below the poverty line.

## 21 LABOR

Moldova's civilian workforce in 2005 totaled 1.34 million. As of 2003, industry accounted for 16% of the labor force, while 43% were in agriculture, and nearly 41% were in the service sector. The unemployment rate in 2002 was estimated at 8%. Approximately 25% of working age Moldovans are employed outside the country.

The law provides workers with the right of association, including the right to form and join labor unions. The General Federation of Trade Unions of Moldova (GFTU) is the successor to the previously existing Soviet trade union system. Various industrial unions still maintain voluntary membership in the GFTU, and there have been no attempts to form alternate trade union structures. Government workers do not have the right to strike, nor do those in essential services such as health care and energy. Unions in the private sector may strike if two-thirds of their membership assents. Collective bargaining is used to negotiate workers' pay and benefits.

The unrestricted minimum working age is 18, with restrictions as to the number of hours that may be worked for those between 16 and 18 years of age. Children generally do not work except in agriculture on family farms. The labor code stipulates a standard workweek of 40 hours, with at least one day off weekly. In 2002, the monthly minimum wage was \$9.00 in the public sector and \$12.75 in private firms. The median salary was estimated to be \$39 per month.

## 2<sup>2</sup> AGRICULTURE

Cropland covers about 65% of the Moldovan land area. Agricultural activities engaged 23% of the labor force in 2000. Agriculture is the most important sector of the Moldovan economy, accounting for 28% of GDP and 60% of exports in 2004. Agricultural output had an average annual decline of 13.7% during 1990–2000. Crop production during 2002–04 was up 7.2% from 1999–2001. In 2000, state-controlled farms accounted for only 1.2% of gross agricultural production, down from 10.2% in 1995. About 14% of all cropland is under irrigation.

Moldovan crops and their 2004 production amounts (in tons) include: sugar beets, 907,000; wheat, 690,000; grapes, 600,000; corn, 1,840,000; sunflowers, 331,000; barley, 260,000; potatoes, 318,000; and soybeans, 35,000.

Wine and tobacco products are important agricultural exports. Wine exports in 2003 were estimated at 20 million liters, accounting for about 3% of world market share. Tobacco production was 10,200 tons in 2004. All tobacco is grown on state farms; the monopoly and lack of buyers has limited privately grown tobacco. Wine and tobacco exports in 2004 were valued at \$215.8 million and \$8.9 million, respectively, and together accounted for about 23% of exports.

## 2<sup>3</sup> ANIMAL HUSBANDRY

About 13% of the total land area consists of pastureland. In 2005, the livestock population included 400,000 head of cattle, 500,000 pigs, 830,000 sheep, 115,000 goats, and 14,000,000 chickens. Pork production amounted to 38,500 tons in 2005, when 23,500 tons of beef were produced. In 2005, 630,000 tons of cow's milk and 43,000 tons of eggs were also produced.

## 2<sup>4</sup> FISHING

With no direct connection to the Black Sea, fishing is limited to the Dnister River. The total catch in 2003 was 2,981 tons, with carp accounting for 93% of the landings. Commercial fishing is not a significant part of the national economy.

## 2<sup>5</sup> FORESTRY

Forested areas accounted for about 9.9% of the total land area in 2000. Production is largely domestically consumed; wood and paper product imports in 2004 amounted to \$29.2 million.

## 2<sup>6</sup> MINING

Moldova did not possess significant mineral resources. More than 100 deposits of gypsum, limestone, sand, and stone were exploited. Production totals for 2002 were: gypsum, 32,000 metric tons (estimated); sand and gravel, 300,000 metric tons; lime, 3,500 metric tons; and cement, 300,000 metric tons. Moldova also produced crude steel, peat, oil, and natural gas.

## 2<sup>7</sup> ENERGY AND POWER

Moldova, as of 1 January 2005, had no proven reserves of oil or natural gas, and as of 2002, no estimated recoverable reserves of coal. As a result, Moldova must rely upon imports of refined oil

products and natural gas from Russia, Ukraine, and Belarus to meet its fossil fuel needs.

In 2004 consumption and imports of refined oil each came to an estimated 33,000 barrels per day. In 2002, natural gas consumption and imports each came to an estimated 78 billion cu ft. In 2002, Moldova imported and consumed 200,000 short tons of coal.

Electric power generating capacity has declined since Moldova gained its independence in 1992 due to lack of funds, civil disturbances, and a general economic downturn in the 1990s. Total installed generating capacity in 2002 was estimated at one million kW. Total electricity generation and consumption in 2002 was estimated at 3.9 billion kWh and 4.6 billion kWh, respectively. Conventional thermal fuel sources provided around 78% to 90% of the electric generated, with hydropower providing the remainder.

## 2<sup>8</sup> INDUSTRY

Moldova's industry, including processed food, is composed of approximately 600 major and mid-sized enterprises and associations. It accounts for 23% of Moldova's GDP.

In 1998 the most prominent industries were: food processing (57%), electric energy (18%), engineering and metal processing (5%); production of construction materials (4%), light industry (5.4%), and forestry, wood processing, pulp and paper (3%). Other industrial products include agricultural machinery, foundry equipment, shoes, hosiery, textiles, washing machines, and refrigerators and freezers.

In the wake of the economic downturn in 1998, Moldova's industrial production declined 11% from the previous year. Growth in industrial output was a component of improved economic performance in 2001, as industrial output registered a 3.1% growth rate that year. This growth expanded to 17% in 2004, but industrial representation in GDP and labor force remained low in 2004, at 24.8% and 14% respectively; agriculture made up 22.4% of the economy, and occupied 40% of the labor force; services came in first with a 52.8% contribution to the GDP, and 46% representation in the labor force. Most of the country's industry is situated in conflict riddled and politically unstable Transnistria, which makes any current industrial strategy superfluous.

## 2<sup>9</sup> SCIENCE AND TECHNOLOGY

The Moldovan Academy of Sciences, founded in 1961, has sections of physico-mathematical sciences, biological and chemical sciences, technical sciences, agricultural sciences, and medical sciences, and 14 research institutes concerned with the natural sciences. Four scientific institutes conduct medical and agricultural research. Moldovan State University, founded in 1945, has faculties of physics, mathematics and cybernetics, chemistry, biology, and soil science. The Technical University of Moldova, founded in 1964, and the Chişinău Medical Institute and State Agricultural University of Moldova, founded in 1932, are located in Chişinău. M.V. Frunze Agricultural Institute is another educational institution in the sciences. In 1987–97, science and engineering students accounted for 52% of university enrollment. In 2002, there were 171 researchers and 201 technicians per million people that were engaged in research and development (R&D). In that same year, high technology exports totaled \$8 million, or 4% of manufactured exports. In 1997 (the latest year for which data was available), Moldova spent \$47.191 million, or 0.81% of GDP on R&D.

Of that amount, 51.4% came from the business sector, followed by 47.8% from government sources. Higher education and foreign sources accounted for 0.2% and 0.6%, respectively.

### 30 DOMESTIC TRADE

Chişinău is the main commercial center, with a well-developed system for product distribution. Both national and foreign firms have a strong presence within the retail sector. Since two-thirds of Moldova is rural, local farm markets play an important role in the domestic economy. A great deal of progress had been made in liberalizing and privatizing the economy. With US assistance, nearly all of the nation's farmlands were under private ownership as of 2000. As of January 2003, nearly 2,000 small, medium, and large-sized enterprises had also been transferred to private ownership.

In purchasing power parity terms, per capita gross domestic product (GDP) was \$1,900 in 2004, with more than 80% of the population under the poverty line. Most of the household consumption is fueled by remittances sent home by Moldovans working abroad.

### 31 FOREIGN TRADE

Traditionally, Moldova has maintained a trade surplus with the other Soviet republics and a trade deficit with the rest of the world. However, as of 2005, Moldova's only significant trade surplus is with Russia. Total imports almost double total exports.

A trade agreement between the United States and Moldova providing reciprocal most-favored-nation tariff treatment became effective in 1992. The same year, an overseas Private Investment Corporation agreement, encouraging US private investment by providing direct loans and loan guarantees, was signed. In 1993 a bilateral investment treaty was signed between the United States and Moldova; a general system of preferences status was granted in 1995 as well as the availability of EX-IM bank coverage. Wine tops the list of Moldova's export commodities (24%), followed by apparel (16%). Other exports include tobacco (6.5%), glassware (5.7%), and meat (5.4%). The European Union was Moldova's main trade partner in 2003. Russia and the Ukraine came in second, with a representation of 22.4% and 16.7% in its overall trade respectively.

SOURCE: Balance of Payment Statistics Yearbook 2004, Washington, DC: International Monetary Fund, 2004.

In 2004, exports totaled \$1.03 billion (FOB—Free on Board), while imports were almost double that at \$1.83 billion (FOB). Russia remains Moldova's main export market, receiving 35.8% of total exports; it is followed by Italy (13.9%), Romania (10%), Germany (7.3%), Ukraine (6.6%), Belarus (6%), and the United States (4.6%). Imports came mainly from the Ukraine (24.6%), Russia (12.2%), Romania (9.3%), Germany (8.5%), and Italy (7.4%). Main import categories were fuel and energy, capital goods, and foods.

### 32 BALANCE OF PAYMENTS

External debt stood at \$1.3 billion in 2002. That year, \$168.7 million in debt service payments were due, accounting for over 60% of all budget revenues. The government took the dramatic step of handing 50% of ownership of its gas lines to Russia's Gazprom, one of its largest creditors. In 2000, the IMF had approved a three-year \$142 million loan to reduce poverty and promote growth.

The US Central Intelligence Agency (CIA) reported that in 2002 the purchasing power parity of Moldova's exports was \$590 million while imports totaled \$980 million, resulting in a trade deficit of \$390 million.

Exports of goods and services reached \$1.2 billion in 2004; imports climbed at \$2.0 billion, resulting in a resource balance of -\$766 million. The current account balance was -\$173 million in 2004, an improvement from the previous year's -\$181 deficit. External debt reached \$1.4 billion in the same year, and its total reserves (including gold) were \$321 million, covering only two months of imports.

### 33 BANKING AND SECURITIES

Moldova's banking sector will play a key role in the country's transition from a managed economy to a market economy. The banking system was reformed in 1991. The National Bank of Moldova (NBM, the central bank) is charged with implementing monetary

policy and issuing currency. State banks include the State Savings Bank, with 1,000 branches, and the Bank for Foreign Economic Exchange. Holdovers from the old Soviet system include three regional banks, which have been changed to joint-stock companies whose shares are owned by state enterprises. There are 20 commercial banks in the country with licenses to perform international transactions. The currency unit is the leu, introduced in late November 1993.

November 1993 was a turning point for Moldova's financial stability. The NBM became a fully independent central bank with its own administrative council, and was no longer required to finance industrial and agricultural funding shortfalls. As the leu was introduced, the NBM started phasing out credit emissions. As of January 1994, the NBM became fully responsible for monetary policy.

The bank has two policy instruments: reserve requirements which were raised progressively throughout 1994, and interest rates. The discount rate reached a peak of 377% in February 1994, and was kept high despite the subsequent dramatic fall in inflation. As of 2001, the money market rate was 11%.

The banking system comprises four former Soviet banks, Agroindbank, Molindconbank, Moldotsbank, and the Savings Bank, as well as 20 commercial banks at the end of 2002. As in many other republics of the former Soviet Union, licensing procedures in the early 1990s were quite lax, with the result that the country is now overbanked, with too many small institutions, and a relatively high level of nonperforming loans (11% of total commercial bank balance sheets as of mid-1996).

Moldova's 15 voucher funds have played an important role in the privatization program. Most citizens have opted to invest their vouchers in the funds rather than directly acquire shares in newly privatized companies.

The International Monetary Fund reports that in 2001, currency and demand deposits—an aggregate commonly known as M1—were equal to \$194.3 million. In that same year, M2—an aggregate equal to M1 plus savings deposits, small time deposits, and money market mutual funds—was \$377.1 million. The money market rate, the rate at which financial institutions lend to one another in the short term, was 11%.

The Chişinău-based Moldovan Stock Exchange opened for business in June 1995. Trading is electronic and is based on an order-driven system. As of mid-1996, it listed 11 shares. The most actively traded shares are Cupicini Canning Factory and Banea de Economii. As of 1998, there were 15 investment funds and eight trust companies. A commodities exchange is planned. The government began auctioning 91-day treasury bills in 1995 and introduced 730-day treasury bills in 1997.

Foreign currency reserves at the NBM rose by one-third in 1996, from \$226.7 million at end-1995 to \$304.1 million. This is to be explained by the substantial inflows of funds from multilateral institutions, notably, the World Bank and the European Bank for Reconstruction and Development. In December 1996, Moldova made its debut in the international bond market with a \$30 million floating rate note issued as a private placement through Merrill Lynch.

### 3<sup>4</sup> INSURANCE

The demand for insurance services continues to rise. Forty companies employing 2,800 persons competed for the insurance market in 1998.

### 3<sup>5</sup> PUBLIC FINANCE

In 1993, following independence, Moldova undertook a massive privatization program. By January 2003, 80% of all housing units were in private hands, as were nearly all small, medium, and large businesses. Agriculture was privatized ending in 2000 through a US-sponsored program called "Pamint" (land).

The US Central Intelligence Agency (CIA) estimated that in 2005 Moldova's central government took in revenues of approximately \$1 billion and had expenditures of \$1 billion. Revenues minus expenditures totaled approximately \$4 million. Public debt in 2005 amounted to 72.9% of GDP. Total external debt was \$1.926 billion.

The International Monetary Fund (IMF) reported that in 2003, the most recent year for which it had data, central government revenues were MLD7,376.8 million and expenditures were MLD6,828.5 million. The value of revenues was us\$529 million and expenditures us\$487 million, based on an exchange rate for 2003 of us\$1 = MLD13.9449 as reported by the IMF. Government outlays by function were as follows: general public services, 33.4%; defense, 1.7%; public order and safety, 7.7%; economic affairs, 3.3%; environmental protection, 0.5%; health, 6.2%; recreation, culture, and religion, 1.5%; education, 9.2%; and social protection, 36.5%.

### 3<sup>6</sup> TAXATION

The personal income tax rate ranges from 10–50%. The corporate rate is a standard 18%. Capital gains derived from the sale, exchange or transfer of capital assets are taxed at an effective rate of 9%. Dividends are subject to a 10% withholding tax if paid to nonresidents, and 18% if paid to resident legal entities. Dividends

#### Public Finance – Moldova (2003)

SOURCE: *Government Finance Statistics Yearbook 2004*, Washington, DC: International Monetary Fund, 2004.

received by resident individuals from resident and nonresident companies are considered part of taxable income. Dividends paid to Moldovan citizens by resident firms are exempt from taxation. Payroll taxes are charged at rates of 4.7–30%. Also levied is a 20% value-added tax (VAT). A reduced rate applies to bread, milk and other dairy products. For five years, 2002 to 2007, a number of housing projects will be exempt from VAT.

### 37 CUSTOMS AND DUTIES

Moldova's foreign trade environment is characterized by extensive export and import tariffs, exhaustive license requirements, and export quotas. Under the provisions of a 2001 budget law, all imports are assessed a 5% tax of their customs cost regardless of their country of origin. Moldova also levies customs tariffs on all imports except those from the former Soviet Union, Romania, the European Union, and a select group of countries with which Moldova has free trade agreements. Excise taxes apply to automobiles (30%), alcoholic beverages (50%), electronics (50%), and cigarettes (70%). Since 1998 most imports are subject to a value-added tax (VAT) that amounts to 20% of the customs value of the goods. Grain and medical supplies may be imported duty-free.

### 38 FOREIGN INVESTMENT

With the exception of certain state-controlled enterprises, current legislation does not restrict foreign capital participation in Moldovan enterprises. Some foreign equity participation in privatization of government-owned enterprises is also possible. Land under privatized enterprises can now be owned by the enterprise owners. Barriers in Moldova to foreign investment involve the underdeveloped banking, insurance, legal, and trade services.

In 1997 and 1998, average annual foreign direct investment (FDI) inflows into Moldova had reached \$77 million, up from about \$24 million in 1996. In 1998, the financial crisis in Russia, which accounts for a 30% share of Moldova's inward FDI, helped reduce inflows to \$40.6 million for the year, but in 2000 and 2001, record levels of FDI inflows of \$143 million and \$160 million, respectively, were attained. Total FDI stock has increased 22 times over since independence. The total stock of FDI in Moldova reached \$620 million in 2001, equivalent to 36% of GDP and about 82% of gross fixed capital formation (compared to the world average of 22%). Moldova's share of world inflows of FDI from 1998 to 2000, while small in absolute terms, was 1.7 times its share of world GDP. Foreign investment was \$110.8 million in 2003, and by 2004 total investments made up 17.1% of the GDP.

Moldova remains a relatively unattractive market for investors due to the ongoing conflict in Transnistria. It has however a significant future potential due to its highly educated population, low wages, and competitive costs.

### 39 ECONOMIC DEVELOPMENT

In March 1993, the Moldovan government inaugurated the Program of Activity of the Government 1992–95 to make the transition to a market-oriented economy. The first stage focused on stabilization, including price liberalization, and the second stage concentrated on economic recovery and growth, including privatization, agrarian reform, infrastructure development, social protection, and trade reform. However, the government was slow to institute privatization in the agricultural sector. Although the gov-

ernment backed privatization, freed prices and interest rates, and removed export controls, economic growth was difficult. By 1998, Moldova's economy stood at one-third its 1989 level. In large part, this decline is due to unfavorable circumstances: the Transnistrian conflict, the collapse of the Soviet Union, the near-total loss of the grape crop in 1997, and the Russian 1998 financial crisis.

As of 2002, close to 2,000 small, medium, and large enterprises had been privatized, as were 80% of all housing units. Nearly all of Moldova's agricultural land is privatized as well. In 2000, Moldova negotiated a three-year \$147 million Poverty Reduction and Growth Facility (PRGF) Arrangement with the International Monetary Fund (IMF), to expire in December 2003. Moldova joined the WTO in 2001. That year, the government adopted laws to combat money laundering and the financing of terrorism. The economy had turned around: spurred by industrial growth and a good harvest in 2001, real gross domestic product (GDP) growth increased by 6%. Nevertheless, Moldova carries a heavy external debt burden, and depends upon international financial support, including from the private sector.

Moldova remains one of Europe's poorest economies, and is highly dependent on agriculture. It has virtually no mineral resources, its industrial base is situated in conflict stricken Transnistria, and it relies on Russia and Romania for most of its energy supply. The World Bank considers Moldova to be a low-income country, and most of the household consumption (and subsequently most of its economic growth) is fueled by remittances from abroad.

### 40 SOCIAL DEVELOPMENT

A social insurance system provides benefits for old age, disability, and survivorship in addition to worker's compensation for injury and unemployment, and family allowances. Benefits are available to salaried citizens, agricultural workers, the self-employed, and public officials. The government contributes the whole cost of social pensions for those who are excluded from coverage from the national social security system. Medical care is available to all residents. Moldova has comprehensive legislation for the protection of children, including programs for paid maternity leave, a birth grant, and family allowances. Sickness and maternity benefits were first implemented in 1993, and were updated in 2003.

Although women are accorded equal rights under the law, they are underrepresented in government and other leadership positions. Nevertheless, the president of the country's largest bank is a woman, and women constitute a growing percentage of public-sector managers. Several women's organizations participate in political or charitable activities. Domestic violence remains a problem and is rarely prosecuted. In 2004 the government took efforts to increase public awareness of the problem.

The constitution provides for equality under the law regardless of race, sex, disability, religion, or social origin, but discrimination persists. The minority Roma population continues to suffer violence and harassment. Human rights are generally observed and respected, although there were reports of mistreatment of prisoners and detainees. Prison conditions remain harsh.

## 41 HEALTH

Moldova has been working on developing its own standards for health care. As of 2004, there were an estimated 35 physicians per 100,000 people. Total health care expenditures were 6.4% of GDP.

The birth rate was 14 per 1,000 people and the maternal mortality rate was 34 per 100,000 live births in 2003. Average life expectancy was 65.18 years in 2005. The infant mortality rate for that year was 40.42 per 1,000 live births. The overall death rate was estimated at 12.6 per 1,000 people as of 2002. In 1992, there were approximately 1,000 deaths from ethnic conflict within the country. Nearly the entire urban population (96%), but only 9% of the rural population, had access to sanitation.

Moldova's immunization rates for children up to one year old were: tuberculosis, 99%; diphtheria, pertussis, and tetanus, 97%; polio, 98%; and measles, 99%. Despite immunization rates, epidemic diphtheria has spread throughout the new independent states of the former Soviet Union. The HIV/AIDS prevalence was 0.20 per 100 adults in 2003. As of 2004, there were approximately 5,500 people living with HIV/AIDS in the country. There were an estimated 300 deaths from AIDS in 2003.

## 42 HOUSING

In 2000, there were about 1.3 million housing units in about 910,000 buildings nationwide. Though the government has encouraged privatization of housing and individual home ownership, most residents, particularly in urban areas, find home ownership to be far too expensive in a poor economy. The existing housing stock is in serious disrepair and overcrowding is an issue. Most structures were built before 1980 and maintenance has been poor. Only about 28.9% of all dwellings have an indoor bathroom; only 31% have access to a sewage system. About 62% of all households use wells as a primary source of water. In 1999, only 2,900 structures were completed. Most new housing is built with brick or stone and concrete frames. The average number of rooms per dwelling is about 2.8.

## 43 EDUCATION

While Moldova was a part of the Soviet Union, its education system was based on the Soviet pattern, and Russian was the language of instruction. However, after its separation, extensive changes were introduced in the education system. Education is compulsory for 11 years, between the ages of 6 and 17. Primary school covers four years of study. This is followed by five years of general secondary studies. Upper secondary studies may cover two or three years of study, depending on a student's interests. The academic year runs from September to July.

In 2001, about 39% of children between the ages of three and six were enrolled in some type of preschool program. Primary school enrollment in 2003 was estimated at about 79% of age-eligible students. The same year, secondary school enrollment was about 69% of age-eligible students. It is estimated that about 82.5% of all students complete their primary education. The student-to-teacher ratio for primary school was at about 19:1 in 2003; the ratio for secondary school was about 13:1.

The Moldovan State University was founded in 1945 and uses both Moldovan and Russian as languages of instruction. In 2003, about 30% of the tertiary age population were enrolled in some

type of higher education program; 26% for men and 34% for women. The adult literacy rate for 2004 was estimated at about 96.2%.

The primary administrative body is the Ministry of Education, Youth and Sports. As of 2003, public expenditure on education was estimated at 4.9% of GDP, or 21.4% of total government expenditures.

## 44 LIBRARIES AND MUSEUMS

The National Library at Chişinău holds 418,000 volumes. The Scientific and Technical Library of Moldova holds about 600,000 volumes. The country's largest library, at the State University of Moldova, has over 1.82 million volumes, including a valuable rare books collection. The Technical University of Moldova has over 1.04 million volumes. The country had a public library system of over 1,300 branches.

Chişinău is home to several museums, including the National Museum of Fine Arts, the National History Museum, the Museum of Ethnography and Archaeology, and the Alexander Pushkin House and Museum. The Museum of Popular Art is in Ivancea.

## 45 MEDIA

Telecommunications links are via land line to the Ukraine and through Moscow's switching center to countries beyond the former USSR. In 2003, there were an estimated 219 mainline telephones for every 1,000 people; about 88,000 people were on a waiting list for telephone service installation. Also in 2003, there were approximately 132 mobile phones in use for every 1,000 people.

The state-operated Teleradio-Moldova operates one television and one radio station. Many stations are independent. In 2003, there were about 20 radio stations and 30 television stations in operation. In 2003, there were an estimated 758 radios and 296 television sets for every 1,000 people. About 24.6 of every 1,000 people were cable subscribers. Also in 2003, there were 17.5 personal computers for every 1,000 people and 80 of every 1,000 people had access to the Internet. There were nine secure Internet servers in the country in 2004.

A wide variety of political views and commentaries are expressed through a number of newspapers and periodicals. National and city governments sponsor newspapers, as do political parties, professional organizations, and trade unions. The largest newspapers in 2002 were *Moldova Suverana* (*Sovereign Moldova*, circulation 105,000), *Nezavisimaya Moldova* (*Independent Moldova*, 60,692), and *Viata Satului* (*Life of the Village*, 50,000).

The constitution provides for free speech and a free press, and the government is said to generally respect these rights.

## 46 ORGANIZATIONS

The Chamber of Commerce and Industry of the Republic of Moldova handles the internal and external economic affairs of the country. The Central Union of Consumers Co-operatives of the Republic of Moldova serves farmers as well as a variety of food producers and retailers. There are trade and professional associations throughout the country as well.

Political associations and organizations in the country include the Union of Council of Labor Collectives (ULC), Ecology Movement of Moldova (EMM), the Christian Democratic League

of Women of Moldova, and the Alliance of Working People of Moldova.

The Academy of Sciences of Moldova works to promote public interest and education in scientific fields.

There are several sports associations within the country, including branches of the Special Olympics and the Paralympic Committee. The National Scout Organization of Moldova offers programs for youth.

The NGO Club was formed to assist in the development and consolidation of various organizations, as well as to serve as an informational network between groups. National women's organizations include the Women's Organization of Moldova (est. 1996) and the Gender in Development (GID) Project (est. 1994). International organizations with national chapters include Save the Children, Caritas, and the Red Cross.

#### 47 TOURISM, TRAVEL, AND RECREATION

Picturesque scenery, several casinos, and wineries are the primary attractions of Moldova, including Cricova, the underground wine city. Unfortunately, civil unrest since Moldova's independence has caused a decline in tourism. In 2003, there were 23,598 tourist arrivals and tourism receipts totaled \$83 million. There were 2,559 hotel rooms with 4,632 beds and an occupancy rate of 22%. Tourists need a valid passport to enter Moldova. Members and candidates to join the European Union, Canada, Japan, the United States, and many other European countries do not need a visa to enter Moldova for stays of up to 90 days.

In 2004, the US Department of State estimated the daily cost of staying in Moldova at \$202.

#### 48 FAMOUS MOLDOVANS

Petru Lucinschi (b.1940) was elected president in 1996, and served until 2001. He succeeded Mircea Snegur (b.1940), the first

president of the Republic of Moldova. Vladimir Nicolae Voronin (b.1941) became president in 2001.

#### 49 DEPENDENCIES

Moldova has no territories or colonies.

# MONACO

Principality of Monaco

*Principauté de Monaco*

**CAPITAL:** The seat of government is at Monaco-Ville

**FLAG:** The national flag consists of a red horizontal stripe above a white horizontal stripe.

**ANTHEM:** *Hymne Monégasque*, beginning “Principauté Monaco, ma patrie” (“Principality of Monaco, my fatherland”).

**MONETARY UNIT:** The euro replaced the French franc as the official currency in 2002. The euro is divided into 100 cents. There are coins in denominations of 1, 2, 5, 10, 20, and 50 cents and 1 euro and 2 euros. There are notes of 5, 10, 20, 50, 100, 200, and 500 euros. €1 = \$1.25475 (or \$1 = €0.79697) as of 2005. Monégasque coins also circulate; denominations are 10, 20, and 50 centimes, and 1, 2, 5, 10, and 50 francs. Fr1 = \$0.184 (or \$1 = Fr5.4) as of March 2006.

**WEIGHTS AND MEASURES:** The metric system is the legal standard.

**HOLIDAYS:** New Year’s Day, 1 January; St. Dévôte, 27 January; Labor Day, 1 May; Assumption, 15 August; All Saints’ Day, 1 November; National Day, 19 November; Immaculate Conception, 8 December; Christmas, 25 December. Movable religious holidays include Easter Monday, Ascension, Pentecost Monday, and Fête-Dieu.

**TIME:** 1 PM = noon GMT.

## <sup>1</sup> LOCATION, SIZE, AND EXTENT

The second-smallest country in Europe and the world after the Vatican, Monaco is situated in the southeastern part of the French department of Alpes-Maritimes. The area, including recent reclamation, is 195 hectares (482 acres), or 1.95 sq km (0.75 sq mi). Comparatively, the area occupied by Monaco is about three times the size of the Mall in Washington, DC. The principality’s length is 3.18 km (1.98 mi) E–W, and its width is 1.1 km (0.68 mi) N–S. Bounded on the N, NE, SW, and W by France and on the E and SE by the Mediterranean Sea, Monaco has a total border length of 8.5 km (5.3 mi), of which 4.1 km (2.5 mi) is coastline.

## <sup>2</sup> TOPOGRAPHY

There are four main areas (determined more by economic activity than geographic difference): La Condamine, the business district around the port; Monte Carlo, the site of the famous casino, which is at a higher elevation; Monaco-Ville, on a rocky promontory about 60 m (200 ft) above sea level; and Fontvieille, a 22-hectare (54-acre) industrial area of La Condamine that was reclaimed by landfill in the 1960s and 1970s.

## <sup>3</sup> CLIMATE

Winters are mild, with temperatures rarely falling below freezing and with a January average of about 8°C (46°F). Summer heat is tempered by sea breezes; the average maximum in July and August is 26°C (79°F). Rainfall averages about 77 cm (30 in) a year, and some 300 days a year have no precipitation whatsoever.

## <sup>4</sup> FLORA AND FAUNA

Palms, aloes, carobs, tamarisks, mimosas, and other Mediterranean trees, shrubs, and flowers are abundant. Monaco does not have a distinctive fauna.

## <sup>5</sup> ENVIRONMENT

Monaco is noted for its beautiful natural scenery and mild, sunny climate. The principality has sponsored numerous marine conservation efforts. Its own environment is entirely urban. According to UN reports, Monaco’s environmental circumstances are very good. The nation has consistently monitored pollution levels in its air and water to ensure the safety of its citizens. One-fifth of the nation’s land area (1.95 sq km) and two marine areas are protected by environmental statutes.

The government has also instituted a system of air pollution control facilities controlled by the Environmental Service. Citizens are encouraged to use public transportation to limit the amount of gas emissions. Similar techniques have been applied to the protection of Monaco’s water supply. Noise levels from industry and transportation are also monitored to ensure safe levels.

Monaco also has a sea-farming area which annually produces 800 tons of fish grown in clean water. Monaco is known for its activity in the field of marine sciences. The Oceanographic Museum, formerly directed by Jacques Cousteau, is renowned for its work and exhibits on marine life.

According to a 2006 report issued by the International Union for Conservation of Nature and Natural Resources (IUCN), threatened species included 26 species of marine life. Threatened species included the great white shark, the blue shark, striped dolphin, albacore tuna, and swordfish.

## 6 POPULATION

The population of Monaco in 2005 was estimated by the United Nations (UN) at 33,000, which placed it at number 188 in population among the 193 nations of the world. In 2005, approximately 22% of the population was over 65 years of age, with another 13% of the population under 15 years of age. According to the UN, the annual population rate of change for 2005–10 was expected to be 0.6%, a rate the government viewed as satisfactory. The projected population for the year 2025 was 44,000. The population density was 16,988 per sq km (44,000 per sq mi), making Monaco the most densely populated nation in the world.

The UN reported that 100% of the population lived in urban areas in 2005. Most of the people in Monaco are resident foreigners.

## 7 MIGRATION

There is a long waiting list for Monégasque citizenship. A 1992 law allows Monégasque women to confer citizenship on their children. In 2005, the net migration rate was an estimated 7.71 migrants per 1,000 population. In 2000, more than two-thirds of the residents were noncitizens. The government views the migration levels as satisfactory.

## 8 ETHNIC GROUPS

On the evidence of certain place names, the native Monégasques are said to be of Rhaetian stock; they make up only 16% of the population. The foreign residents are a highly cosmopolitan group: 47% are French; 16% are Italian; and various other groups comprise the remaining 21%.

## 9 LANGUAGES

French is the official language. English and Italian are also widely spoken. Many inhabitants speak the Monégasque language, which has its origins in the Genoese dialect of Italian and the Provençal language of southern France.

## 10 RELIGIONS

About 90% of the population adheres to Roman Catholicism, which is the official state religion. Freedom of worship is guaranteed by the constitution. Monaco is also part of the diocese of Gibraltar of the Church of England. There are five Catholic churches and one cathedral in the principality, two Protestant churches, and one Jewish synagogue. Though there are a small number of Muslims, there are no mosques.

## 11 TRANSPORTATION

French national roads join Monaco to Nice toward the west, and to Menton and the Italian Riviera toward the east. In 2002 there were 50 km (31 mi) of roadways, all of them paved. There is frequent bus service. The principality itself is served by motorbuses and taxicabs. In 1995 there were 17,000 passenger cars and 4,000 commercial vehicles. The southeastern network of the French national railroad system serves Monaco with about 1.7 km (1 mi) of track. Express trains on the Paris-Marseille-Nice-Ventimiglia line pass through the principality. Monaco is only 10 km (6 mi) from the international airport at Nice and is connected with it by bus and by a helicopter shuttle service. In 2001 (the latest year for

which data was available), 77,800 passengers were carried on domestic and international airline flights. The harbor provides access by sea.

## 12 HISTORY

The ruling family of Monaco, the house of Grimaldi, traces its ancestry to Otto Canella (c.1070–1143), who was consul of Genoa in 1133. The family name, Grimaldi, was adapted from the Christian name of Canella's youngest son, Grimaldo. The Genoese built a fort on the site of present-day Monaco in 1215, and the Grimaldi family secured control late in the 13th century. The principality was founded in 1338 by Charles I, during whose reign Menton and Roquebrune were acquired. Claudine became sovereign upon the death of her father, Catalan, in 1457. She ceded her rights to her husband and cousin, Lambert, during whose reign, in 1489, the duke of Savoy recognized the independence of Monaco. The first Monégasque coins were minted in the 16th century. Full recognition of the princely title was obtained by Honoré II in 1641.

The last male in the Grimaldi line, Antoine I, died in 1731. His daughter Louise-Hippolyte in 1715 had married Jacques-François-Léonor de Goyon-Matignon, Count of Thorigny, who adopted the name Grimaldi and assumed the Monégasque throne. France annexed the principality in 1793, but independence was reestablished in 1814. The following year, the Treaty of Stupinigi placed Monaco under the protection of the neighboring kingdom of Sardinia. In 1848, the towns of Roquebrune and Menton, which constituted the eastern extremity of Monaco, successfully rebelled and established themselves as a republic. In 1861, a year after the Sardinian cession of Savoy and Nice to France, Roquebrune and Menton also became part of that nation.

The economic development of Monaco proceeded rapidly with the opening of the railroad in 1868 and of the gambling casino. Since that time, the principality has become world famous as a tourist and recreation center. Gambling, operated by Société des Bains de Mer, a state controlled group, recorded a 30% increase in gambling receipts in 1998. Real estate and retail sales have also registered strong growth in recent years. As of 2005 Monaco has no unemployment and provides jobs for 25,000 Italian and French commuters. More than half of government revenues, however, come from value-added tax. The rate levied by France is also in effect in Monaco. France has the highest VAT in the European Union and has come under pressure to adjust its rate downward in conformity with the rest of the EU. However, Monaco is not an EU member. Light industry and banking have also become important. Monaco joined the United Nations on 28 May 1993. Monaco is the second-smallest independent state in the world, after the Holy See, and is almost entirely urban.

Prince Rainier III, once married to the American actress Grace Kelly, led the country 1949–2005 and is often credited for the country's impressive economic growth. Tourism, banking and other types of financial services augment the economy's former dependence on gambling. Rainier died in early 2005 and in July 2005, Prince Albert II, son of Rainier and Kelly, assumed the throne. The event was somewhat overshadowed by his admission of having a 22-month-old illegitimate child. His illegitimate son will not be able to inherit the throne, although Prince Albert has acknowledged paternity and assumed his financial responsibilities.

### 13 GOVERNMENT

Monaco is a constitutional monarchy ruled, until 2002, by the hereditary princes of the Grimaldi line. Prior to constitutional changes made in 2002, if the reigning prince were to die without leaving a male heir, Monaco, according to treaty, would be incorporated into France. Because Prince Rainier III's son Albert was a 43-year-old bachelor in 2002, without male heirs, and his own health was failing, Rainier changed Monaco's constitution to allow one of his two daughters, Caroline or Stephanie, to inherit the throne and preserve the Grimaldi dynasty.

On 7 January 1911, Monaco's first constitution was granted by Prince Albert I. On 29 January 1959, Prince Rainier III temporarily suspended part of the constitution because of a disagreement over the budget with the National Council (Conseil National), and decreed that the functions of that body were to be assumed temporarily by the Council of State (Conseil d'État). In February 1961, the National Council was restored and an economic advisory council established to assist it.

A new constitution was promulgated on 17 December 1962. It provides for a unicameral National Council of 18 (now 24) members elected every five years (now 16 by majority vote and 8 by proportional representation); it shares legislative functions with the prince. Executive operations are conducted in the name of the prince by a minister of state (a French citizen) with the assistance of the Council of Government, consisting of three civil servants who are in charge of finances, public works, and internal affairs, respectively. All are appointed by the prince.

Women were enfranchised for municipal elections in 1945, and participated in elections for the National Council for the first time in February 1963. Until 2003, suffrage was exercised only by true-born Monégasques of 21 and over. Naturalized Monégasques were granted voting rights in 2003 and the voting age was reduced to 18.

### 14 POLITICAL PARTIES

Monaco does not have political parties as such, but candidates compete on the basis of various lists. Major political groups have been the National and Democratic Union (Union Nationale et Démocratique—UND), founded in 1962; Communist Action (Action Communale—AC); Évolution Communale (EC); and the Movement of Democratic Union (MUD). In the general election of February 1998, the UND took all 18 seats in the National Council. Elections held on 9 February 2003 were the first under a new electoral law establishing 24 seats in the National Council. A unified opposition list, the Union for Monaco, composed of the National Union for the Future of Monaco and the Rally for the Monégasque Family, took 58.5% of the vote and 21 seats, to the UND's 41.5% and 3 seats. The introduction of proportionality voting enabled the UND to obtain its seats. The next election was scheduled for 2008.

### 15 LOCAL GOVERNMENT

Municipal government is conducted by an elected council (Conseil Communal) of 15 members, headed by a mayor. The council members are elected by universal suffrage for four-year terms, and the mayor is chosen by the Communal Council. The three communes that made up Monaco before 1917—Monaco-Ville,

LOCATION: 43°43'49" N; 7°25'36" E. BOUNDARY LENGTHS: France, 5.4 kilometers (3.4 miles); Mediterranean coastline, 7.3 kilometers (4.5 miles). TERRITORIAL SEA LIMIT: 12 miles.

La Condamine, and Monte Carlo—each had its own mayor from 1911 to 1917. Since that date, they have formed a single commune, together with Fontvieille.

Anne Marie Campora became mayor of Monte Carlo in 1991 succeeding Jean-Louis Médecin who had served as mayor since 1971. Georges Marsan was elected mayor of Monte Carlo in 2003.

### 16 JUDICIAL SYSTEM

A justice of the peace tries petty cases. Other courts are the court of first instance, the court of appeal, the court of revision, and the criminal court. The highest judicial authority is vested in the Supreme Court, established as part of the 1962 constitution, which interprets the constitution and sits as the highest court of appeals. It has five full members and two assistant members, named by the prince on the basis of nominations by the National Council and other government bodies.

The Code Louis, promulgated by Prince Louis I (d.1701) and based on French legal codes, was formally adopted in 1919. Under the 1962 constitution the prince delegates his authority to the judiciary to render justice in his name.

The legal guarantee of a fair and public trial for criminal defendants is respected in practice. Defendants have the right to counsel at public expense if necessary.

The constitution provides for freedom of speech, although the penal code prohibits denunciations of the royal family. The constitution differentiates between the rights of nationals and those of noncitizens; of the estimated 32,000 residents in the principality, only about 7,000 are actual Monégasques.

Monaco is a member of the United Nations and International Criminal Court.

## 17 ARMED FORCES

France assumed responsibility for the defense of Monaco as part of the Versailles Treaty in 1919. There is no army in the principality. A private guard protects the royal family, and a police force of 390 ensures public safety.

## 18 INTERNATIONAL COOPERATION

Monaco joined the United Nations on 28 May 1993 and is a member of the ECE and several nonregional specialized agencies, such as the FAO, IAEA, ICAO, IMO, ITU, UNCTAD, UNESCO, WHO, and WIPO. Monaco is also a member of the Council of Europe and the OSCE. The headquarters of the International Hydrographic Bureau (IHB) is located in Monaco.

A treaty providing in detail for mutual administrative assistance between France and Monaco became operative on 14 December 1954. Fiscal relations between the two countries are governed by a convention signed on 18 May 1963. France may station troops in Monaco and make use of Monaco's territorial waters. As a result of a customs union with France and French control of Monaco's foreign policy, the principality operates within the European Union.

In environmental cooperation, Monaco is part of the Basel Convention; Conventions on Biological Diversity, Whaling, and Air Pollution; Ramsar; CITES; the London Convention; the Montréal Protocol; MARPOL; and the UN Conventions on the Law of the Sea, Climate Change, and Desertification.

## 19 ECONOMY

Monaco depends for its livelihood chiefly on income from tourism, real estate, financial services, and small, high value-added, nonpolluting industry. A substantial part of the principality's revenue from tourist sources comes from the operations of Sea-Bathing Co. (Société des Bains de Mer—SBM), in which the government holds a 69% interest. The SBM operates the gambling casino at Monte Carlo as well as four hotels, 19 restaurants, a cabaret, and the Thermos Margins spa. Its reported profits in 2002 were about \$21 million, down from close to \$30 million in 2001. The government also retains monopolies in telephone services, postal services and tobacco. A 22-hectare landfill project at Fontvieille increased Monaco's total land area. Land reclamation since Prince Rainier's accession to the throne in 1949 has increased Monaco's territory by 23%.

The principality does not publish statistics on its economy and all estimates are rough. The government's annual income was estimated at \$586 million for 1997, about 25% derived from tourism. Monaco also serves as a tax haven for foreign non-French residents. In 2000 the OECD published a list of "uncooperative tax havens" that included Monaco. Two years later, Monaco was

still on the list, though 31 other jurisdictions had been removed by promising to take corrective actions.

Estimate data put together by the United Nations Statistic Division shows that the economy of the principality has been expanding modestly. Similar to other countries in Europe, the GDP growth rate was 2.7% in 2001, falling to 1.9% and 1.4% in 2002 and 2003 respectively, and recuperating again in 2004, at 3%. Unemployment in 1998 was estimated to be around 3.1%.

## 20 INCOME

The US Central Intelligence Agency (CIA) reports that in 2005 Monaco's gross domestic product (GDP) was estimated at \$870.0 million. The CIA defines GDP as the value of all final goods and services produced within a nation in a given year and computed on the basis of purchasing power parity (PPP) rather than value as measured on the basis of the rate of exchange based on current dollars. The per capita GDP was estimated at \$27,000. The annual growth rate of GDP was estimated at 0.9%. The average inflation rate in 2000 was 1.9%. It was estimated that agriculture accounted for 17% of GDP.

## 21 LABOR

There is virtually no unemployment in Monaco, as the Prince guarantees all his subjects lifetime employment. The major employer of the working population is the SBM; others work in industry or in service establishments. As of January 1994 (the latest year for which data was available), the labor force totaled 30,540, of which 4,000 worked in the industrial sector, 2,200 in construction, and 1,500 in the financial sector.

Owners and workers are each grouped in syndicates. Less than 10% of the workforce in 2005 was unionized. However, most of these union workers commute from outside the principality. About two-thirds of all employees commute from France and Italy. Unions operate independently of the government and political parties. The rights to strike, organize, and bargain collectively are protected by law, although public government workers may not strike. Labor disruptions are infrequent.

The minimum working age is 16, although special restrictions apply until the age of 18. Employers who violate the minimum age laws can be criminally prosecuted. The standard workweek is 39 hours. The minimum wage is the French minimum plus an additional 5% to adjust for travel costs for commuters. In 2005, this wage was equivalent to \$9.60 per hour. This provides a family with a decent standard of living, and most workers earn more than the minimum. Health and safety standards are rigorously enforced.

## 22 AGRICULTURE

There is no agriculture.

## 23 ANIMAL HUSBANDRY

There is a dairy industry serving local needs.

## 24 FISHING

Some fishing is carried on to meet domestic requirements. The annual catch was 3,000 tons in 2003. Monaco actively engages in marine science research, and in marine life preservation. The Ocean-

ographic Institute has been studying the effects of radiation in the ocean since 1961.

## 25 FORESTRY

There are no forests.

## 26 MINING

There is no mining.

## 27 ENERGY AND POWER

Services are provided by the Monégasque Electric Co. and Monégasque Gas Co. In 1991, standby electrical capacity totaled 10,000 kW; power is supplied by France.

## 28 INDUSTRY

The tourist industry dominates Monaco's economic life, but small-scale industries produce a variety of items for domestic use and for export, contributing 11.6% of business turnover in the mid-1990s. Most industrial plants are located on Fontvieille. About 700 small businesses make pottery and glass objects, paper and cards, jewelry, perfumes, dolls, precision instruments, plastics, chemicals and pharmaceuticals, machine tools, watches, leather items, and radio parts. There are flour mills, dairies, and chocolate and candy plants, as well as textile mills and a small shipyard. The chemicals, pharmaceuticals, and cosmetics industries consisted of 23 companies with 1,000 employees that generated approximately 45% of the total industrial turnover in the 1990s. Due to territorial constraints, Monaco's industries are forced to expand their facilities upward; some industrial buildings rise as high as 13 stories. A new construction project begun in 2001 was extending the pier used by cruise ships in the main harbor.

## 29 SCIENCE AND TECHNOLOGY

Marine sciences have been the focus of scientific inquiry in the principality for several decades. Prince Albert (1848–1922), who reigned in Monaco during the early 1900s, was well-known internationally for his work as an oceanographer, and he inaugurated the Oceanographic Museum of Monaco at Monaco-Ville in 1910. His interest led to the establishment of a focus on oceanography for scientific pursuits in Monaco. Jacques-Yves Cousteau, a famous oceanographer and activist, was involved with Monaco's activities in marine life research.

In March 1961, in its first research agreement concluded with a member government, the International Atomic Energy Agency, with the government of Monaco and the Oceanographic Institute in Monaco, undertook to research the effects of radioactivity in the sea. The Oceanographic Institute put at the disposal of the project a number of valuable facilities, including marine-biology laboratories, oceanographic vessels, specialized fishing equipment, and a wide variety of electronic and monitoring equipment.

The Scientific Center of Monaco, founded in 1960 at Monte Carlo, conducts pure and applied research in oceanology and the environment. The Museum of Prehistoric Anthropology, founded in 1902 at Monte Carlo, is concerned with prehistory and quaternary geology.

## 30 DOMESTIC TRADE

Domestic trade practices are similar to those in other towns along the French Riviera. Specialty shops deal primarily in tourist souvenirs. The SBM controls most of the amusement facilities and owns most major hotels, sporting clubs, workshops, a printing press, and various retail shops. In the mid-1990s, commerce represented 21% of the economic turnover in Monaco. There is no personal income tax. Business taxes are low, but still account for about 50% of government income. Tourism and related services account for about 25% of revenues.

Advertising media include magazines, billboards, and motion pictures. General business hours are from 8:30 AM to 12:30 PM and from 2 to 6 PM, Monday–Friday. Banking hours are 9 AM to 12 noon and 2 to 4 PM, Monday–Friday.

## 31 FOREIGN TRADE

Statistical information is not available. Foreign trade is included in the statistics for France, with which Monaco has a customs union. France also collects the Monegasque trade duties, and serves as the principality's link to the EU market.

In 2003, the US Department of State estimated that Monaco's exports totaled \$644 million, while its imports reached \$513 million.

## 32 BALANCE OF PAYMENTS

The economy is driven by such foreign currency-earning activities as banking and tourism. Since separate records are not kept of Monaco's foreign trade transactions, payment statistics are not available.

The United Nations Statistics Division has looked at the data available in France, and came up with some estimates of the exports and imports of goods and services in Monaco. Thus, exports totaled \$299 million in 2004, up from \$257 million in 2003 and \$219 million in 2002. Imports grew from \$205 million in 2002, to \$246 million in 2003, and \$296 million in 2004. Consequently, Monaco has, year to year, managed to keep a positive, although fragile, resource balance. In 2000, it was estimated that the country's external debt was \$18 billion—an impressive figure when compared to the size of the principality.

## 33 BANKING AND SECURITIES

Foreign currency circulates within Monaco under the supervision of the French government. The most important local bank is Crédit Foncier de Monaco, founded in 1922. As of 1994, there were 45 banks operating in Monaco. In 1999, Monaco's banking industry had approximately 310,000 accounts and employed 1,700 people. The vast majority of customers were nonresidents. Total assets in 1998 were estimated at a little over \$44 billion.

There is no securities exchange.

## 34 INSURANCE

Branches of French insurance companies provide life, fire, accident, and other forms of insurance. They include: CGRM-Compagnie Générale de Réassurance de Monte Carlo; Concorde; Mutuelle de Marseille Assurances Compagnie Générale de Réas-

urance; and the Shipowners' Mutual Strike Insurance Association (Bermuda)—all located in Monte Carlo.

### 3<sup>5</sup> PUBLIC FINANCE

The US Central Intelligence Agency (CIA) estimated that in 1995 Monaco's central government took in revenues of approximately \$518 million and had expenditures of \$531 million. Revenues minus expenditures totaled approximately -\$13 million. Total external debt was \$18 billion.

### 3<sup>6</sup> TAXATION

There are no personal income taxes. Indirect taxes include the following: a value-added tax of 19.6% (as of 2005); a service tax on compensation received by Monégasque firms for services rendered in Monaco and France; excise taxes on alcoholic beverages; registration fees; and warranty duties on gold, platinum, and silver jewelry. Monaco is treated as part of France for VAT purposes.

There is a tax of up to 33.3% on the profits of businesses that obtain more than 25% of their gross profits from operations outside Monaco. Corporations whose income is derived from royalties, licenses, trademarks, or other industrial or artistic property rights are subject to this tax, whether or not the income arises outside Monaco. Qualifying new companies may be assessed at reduced rates. There are no inheritance or gift taxes between spouses or between parents and children. Between brothers and sisters, the rate is 8%; between uncles or aunts and nephews or nieces, 10%; between other relatives, 13%; and between unrelated persons, 16%.

### 3<sup>7</sup> CUSTOMS AND DUTIES

By treaty, France and Monaco form a customs union that treats the Monaco coast as part of France. The French customs service collects the duties on cargoes discharged in Monaco and pays a share to the principality.

Monaco imposes a duty on all exports to places other than France; the levy applies whether the transfer of goods is actual or fictitious.

### 3<sup>8</sup> FOREIGN INVESTMENT

Monaco permits foreign businesses to establish their headquarters in its territory; ownership and management must be made a matter of public record. Although both corporations and limited partnerships with shares are allowed, in fact only corporations are in existence. Two persons may form a corporation; the minimum capital must be fully subscribed and at least one-fourth paid up front. Foreign companies may establish subsidiaries in Monaco. Low taxes on company profits are a considerable incentive for locating in Monaco.

### 3<sup>9</sup> ECONOMIC DEVELOPMENT

The government strenuously promotes Monaco as a tourist and convention attraction. A government-financed International Convention Center offers large conference rooms, projection equipment, television and radio recording studios, telex communications, and simultaneous translation into five languages.

Two major development and reclamation projects were undertaken under Prince Rainier. These are the major landfill and reclamation project at Fontvieille, and the Monte Carlo Bord de Mer. At Fontvieille, the government financed the reclamation of

220,000 sq m (2,368,000 sq ft) of inundated shore, creating a "platform" for residential construction and new port facilities.

The Monte Carlo seashore scheme, also government-financed, involved the relocation of railroad tracks underground in order to create a man-made beach, with a boardwalk and other tourist attractions. The beach lies between two other land reclamation projects: the Larvotto, a sports complex financed by SBM, and the Portier, an entertainment complex developed by the government.

Near the Larvotto the government has reserved a zone for the construction of residential and tourist accommodations. In the 1980s, Monaco concentrated on the development of business tourism, with the construction of the Monte Carlo Convention Center and the International Conference Center.

### 4<sup>0</sup> SOCIAL DEVELOPMENT

The social insurance system provides old age, survivorship and disability pensions. It is funded through employee and employer contributions. Sickness and maternity benefits are available to all employed persons with a special program for the self-employed. Workers and their dependents are reimbursed for medical expenses including primary and specialized care, pharmaceuticals, hospitalization, transportation, dental care and appliances. Employers are required to provide workers' compensation through private insurance plans. Unemployment benefits are provided through the French system. There is also a family allowance, a prenatal allowance and an education grant.

Women have become increasingly visible in public life, and are well represented in the professions. Equal pay for equal work is prevalent, although women are underrepresented in business. Reports of violence against women are rare, and domestic abuse is a criminal offense. Human rights are respected in Monaco.

### 4<sup>1</sup> HEALTH

In 2004, Monaco had the third most physicians per capita in the world. There were an estimated 586 physicians per 100,000 people in the country, as well as 1,430 nurses, 107 dentists, and 192 pharmacists per 100,000 people. The entire population has access to safe water and sanitation.

As of 2002, the crude birth rate and overall mortality rate were estimated at, respectively, 9.6 and 12.9 per 1,000 people. In 2005, the infant mortality rate was estimated at 5.43 per 1,000 live births. Life expectancy for that year was 79.57. The immunization rates for children under one year of age were as follows: diphtheria, tetanus, and whooping cough, 99%; polio, 99%; measles, 98%; and tuberculosis, 90%.

AIDS cases, although present, are not considered a major problem.

### 4<sup>2</sup> HOUSING

In 2000, there were about 18,396 housing units in the nation. About 31% of the housing stock was built 1915–61; another 26% was built 1968–81. About 21% of the housing stock was built 1982–2000. About 25% of all dwellings are owner occupied. In recent years, the government has stressed the construction of luxury

housing. All new construction or alteration of existing buildings requires government approval.

### 43 EDUCATION

Education is offered in Monaco from the preschool to the secondary and technical levels and is compulsory from age 6 to 16. There are five years of primary school and seven years of secondary school. Attendance is 90%, and virtually all adults are literate. In 2003, approximately 5.1% of total government expenditure was allocated to education.

In 2001, there were about 2,000 students enrolled in primary schools and 3,000 enrolled in secondary schools. The pupil-teacher ratio at the primary level was estimated at 15 to 1 in 2000; the ratio for secondary school was 8 to 1. In 2003, private schools accounted for about 30% of primary school enrollment and 24.7% of secondary enrollment.

The University of Southern Europe was renamed the International University of Monaco in 2002. The university offers degrees in business and business administration. Students may travel abroad for higher education. The adult literacy rate has been estimated at about 99%. In 2003, public expenditure on education was estimated 5.1% of total government expenditures.

### 44 LIBRARIES AND MUSEUMS

The palace archives include the private collections of the princes of Monaco, as well as a collection of money minted since 1640. The Louis Notari Library in Monaco (1909) has a collection of over 285,000 volumes. There is a Princess Grace Irish Library in Monaco featuring 1,500 pieces of Irish folk music and personal papers of Princess Grace and Prince Rainier.

The Oceanographic Museum in Monaco-Ville, founded in 1910 by Prince Albert I and previously directed by the noted Jacques-Yves Cousteau, contains a library of 50,000 volumes, an aquarium, and displays of rare marine specimens. In addition to the museum, the Oceanographic Institute conducts research in various marine areas, including the effects of radiation on the sea and its life forms.

The Exotic Gardens include thousands of varieties of cacti and tropical plants. The National Museum in Monte Carlo was established 1972. There is a Museum of Prehistoric Anthropology in Monte Carlo and a Wax Museum of the Princes of Monaco. There is a Napoleonic Museum in Monaco-Ville. The Museum of Stamps and Coins opened in 1996 to display the private collection of Prince Rainier.

### 45 MEDIA

Postal and telegraphic services are operated by France, but Monaco issues its own postage stamps. Local telephone service is controlled by Monaco, while France is responsible for international service. In 2002, there were 33,700 mainline phones and 19,300 mobile phones in use nationwide.

Radio Monte Carlo and Télé Monte Carlo provide radio and television services and have had broadcast programs since 1954. Radio Monte Carlo's home service is broadcast in French. The system also provides overseas service in 12 foreign languages and is majority owner of the Cyprus-based Radio Monte Carlo relay station, a privately funded religious broadcasting service in 35 languages under the name Trans World Radio. As of 1999, Monaco

had 3 AM and 4 FM radio stations and 5 television stations. In 1997, there were 34,000 radios and 25,000 television sets throughout the country. In 2002, there were 16,000 Internet users in the country.

Two dailies in Nice, *Nice-Matin* and *L'Espoir*, publish special editions for Monaco. International publications are readily available. The *Journal de Monaco*, an official publication, appears once a week, and the *Tribune de Monaco* is published biweekly.

Freedom of expression is legally guaranteed. However, there is a Penal Code prohibition on public denunciations of the ruling family. Otherwise, the government is said to uphold free speech and a free press.

### 46 ORGANIZATIONS

Monaco is the seat of the International Academy of Tourism, which was founded in 1951 by Prince Rainier III. The academy publishes a quarterly, *Revue Technique du Tourisme*, and, in several languages, an international dictionary of tourism.

The International Hydrographic Bureau, which sponsors international conferences in its field, has its headquarters in Monaco. The following international organizations also have their headquarters in Monaco: International Commission for Scientific Exploration of the Mediterranean Sea, International Center for Studies of Human Problems, and the International Commission for Legal-Medical Problems.

National youth organizations include the Association of Scouts and Guides of Monaco, the Princess Stephanie Youth Center, and Catholic Youth of Monaco. There are several sports associations in Monaco; the country is home to the International Association of Athletics Federations.

Other organizations include the Monégasque Red Cross, Caritas, the St. Vincent de Paul Society, the Society of Monégasque Traditions, the Commission for the Monégasque language (established 1985), and the Union of French Interests.

### 47 TOURISM, TRAVEL, AND RECREATION

Monaco has been famous for attracting wealth and titled tourists since its gambling casino was established at Monte Carlo in 1856. In 2005, gambling accounted for almost 25% of the annual revenue. Among the many attractions are the Louis II Stadium, the many museums and gardens, and the beach. The Monte Carlo opera house was the site of many world premiere performances, including Massenet's *Le Jongleur de Notre Dame* (1902) and *Don Quichotte* (1910), Fauré's *Pénélope* (1913), and Ravel's *L'Enfant et les sortilèges* (1925). It was also the home of Serge Diaghilev's Russian Ballet (founded in 1911), later known as the Ballet Russe de Monte Carlo.

The principality has excellent sports facilities. The Monte Carlo Rally, a world-famous driving championship, ends with a finish line in Monaco.

No restriction is placed on the entrance of French nationals into Monaco. A valid passport is required for citizens of other countries who visit. Visas are not required for tourist/business stays of up to 90 days.

About 235,000 visitors arrived in Monaco in 2003, about 25% of whom came from Italy. Hotel rooms numbered 2,191 in 2002 with an occupancy rate of 63%. The average length of stay that year was three nights.

In 2005, the US Department of State estimated the cost of staying in Monaco at \$247 per day.

#### **48 FAMOUS MONEGASQUES**

Prince Albert (1848–1922), who reigned from 1889 to 1922, was famous as an oceanographer. In 1956, his great-grandson Rainier III (1923–2005), reigning monarch from 1949–2005, married Grace Patricia Kelly (1929–82), a US motion picture actress, whose death on 14 September 1982 following an automobile accident was mourned throughout Monaco. Their son, Prince Albert (b.1958) became Prince Albert II upon his father's death; Princess Caroline (b.1957) and Princess Stéphanie (b.1965) are the daughters of Rainier III and Grace.

#### **49 DEPENDENCIES**

Monaco has no territories or colonies.

# MONTENEGRO

Republic of Montenegro

**CAPITAL:** Podgorica

**FLAG:** The flag, adopted in 2004, is a red banner with a gold border bearing the gold coat of arms of Montenegro.

**ANTHEM:** *Oj svijetla majska zoro* (*Oh, Bright Dawn of May*)

**MONETARY UNIT:** The euro is the official currency. The euro is divided into 100 cents. There are coins in denominations of 1, 2, 5, 10, 20, and 50 cents and 1 euro and 2 euros. There are notes of 5, 10, 20, 50, 100, 200, and 500 euros. As of 26 May 2006, €1=\$1.27213 (or \$1=€0.785927).

**WEIGHTS AND MEASURES:** The metric system is in force.

**HOLIDAYS:** For the union of Serbia and Montenegro: New Year's Day, 1 and 2 January; Orthodox Christmas, 7 January; Orthodox New Year, 13 January; Unification of Serbia, 28 March; Yugoslavia Day, 27 April; Labor Day, 1 May; Victory Day, 9 May; St. Vitus Day, 28 June; Serbian Uprising, 7 July.

**TIME:** 1 PM = noon GMT.

## <sup>1</sup>LOCATION, SIZE, AND EXTENT

Montenegro is situated in southeastern Europe along the Adriatic Sea. The total area is 13,812 sq km (5,333 sq mi). Montenegro is bordered on the NW by Bosnia and Herzegovina, on the E by Serbia (the SE border is with the UN-administered province of Kosovo, which is claimed by Serbia), on the S by Albania, and on the SW by the Adriatic Sea and a narrow strip of Croatia; total land boundary length is 614 km (302 mi) and the coastline is 294 km (183 mi). Montenegro's capital is Podgorica, located in the lowland plain region of the south.

## <sup>2</sup>TOPOGRAPHY

The shoreline of southwestern Montenegro is highly elevated, with no offshore islands. The limestone mountains of Rumija, Sutorman, Orjen, and Lovcen separate the narrow strip of land that is the coastline from the inland regions. Of the 294 km (183 mi) of coastline, 52 km (32 mi) are beaches. The largest bay is the Bay of Kotor, which is the world's southernmost fjord. In the limestone area bordering the coastline, plants and animals are scarce, and patches of fertile land can be found in karst depressions and crater-like hollows. Lake Scutari (Skadarsko Jezero) is the largest lake in the country, covering an area of about 400 sq km (150 sq mi). The Zeta plain and Zeta River valley region on which Lake Scutari (Skadarsko) is found is a lowland region. Northern Montenegro is composed of limestone mountains. The highest peak in Montenegro is Mt. Durmitor (Bobotov kuk), at 2,522 m (8,274 ft). Other high peaks are Bjelasica, Komovi, and Visitor. These mountain ranges are rich in pasturelands, forests, and mountain lakes. The Piva, Tara, Moraca, and Cehotina rivers and their tributaries

have carved deep canyons: the Tara Canyon, at a depth of 1,300 m (4,265 ft), is the deepest canyon in Europe.

Located on the Eurasian Tectonic Plate, there are several fault lines running through the country which are seismically active. Earth tremors are fairly common and destructive earthquakes have occurred.

## <sup>3</sup>CLIMATE

The Adriatic climate along the south brings hot and dry summers and relatively cold winters with heavy snowfall inland. Podgorica is the warmest city, with an average July temperature of 26°C (80°F) and an average January temperature of 5°C (41°F). In the mountainous regions, the climate is sub-alpine. Snow on Mt. Durmitor can reach up to 5 m (16 ft). Annual precipitation ranges from 56 to 190 cm (22 to 75 in).

## <sup>4</sup>FLORA AND FAUNA

About 80% of the territory is comprised of forests, natural pasturelands, and meadows. There are 2,833 plant species and subspecies, which comprise nearly one quarter of European flora. The animals found in Montenegro include types of hare, pheasant, deer, stag, wild boar, fox, chamois, mouflon, crane, duck, and goose.

## <sup>5</sup>ENVIRONMENT

Coastal waters are polluted from sewage outlets, especially in resort areas such as Kotor. Destructive earthquakes are a natural hazard.

According to a 2006 report issued by the International Union for Conservation of Nature and Natural Resources (IUCN), the number of threatened species in the combined union of Serbia and Montenegro included 10 types of mammals, 10 species of birds, 1

type of reptile, 1 species of amphibian, 20 species of fish, 19 species of invertebrates, and 1 species of plants. Threatened species include Atlantic sturgeon, slender-billed curlew, black vultures, asps, bald ibis, several species of shark, the red wood ant, and be-luga. At least one type of mollusk has become extinct.

National parks in Montenegro include Durmitor, Lovcen, Biogradska gora, and Lake Skadar. Mt. Durmitor and the old city of Kotor are UNESCO World Heritage sites.

## 6 POPULATION

The population of Montenegro in 2006 was estimated at 678,000. According to the UN, the annual population rate of change for the combined union of Serbia and Montenegro for 2005–2010 was expected to be 0.2%, due to a low fertility rate and high emigration rate. The population density for Serbia and Montenegro was 105 per sq km (272 per sq mi). The UN estimated that 52% of the population lived in urban areas in 2005, and that urban areas were growing at an annual rate of 0.47%. The estimated population of Podgorica in 2003 was 136,500 for the city proper and around 170,000 for the municipality.

## 7 MIGRATION

The following information on migration pertains to the union of Serbia and Montenegro, prior to the 2006 independence of Montenegro. During the 1960s and 1970s, many Serbs fled from the Yugoslav Socialist Federal Republic, seeking political and economic freedom. The breakup of the Yugoslav SFR in the early 1990s and the ethnic hostilities that came in its aftermath resulted in enormous migrations to and from its various former republics. During the first half of 1999, the situation of refugees and internally displaced people deteriorated even further. As of 30 June 1999, the United Nations High Commissioner for Refugees (UNHCR) reported 508,000 refugees from Bosnia and Herzegovina and Croatia; 770,000 returnees to Kosovo, as well as 500,000 affected remained; 220,000 Serb, Montenegrin, and Roma internally displaced persons from Kosovo in the rest of former Yugoslavia. The total number of migrants in 2000 was 626,000. By the end of 2004, these numbers were still rising; UNHCR reported a total of 627,476 persons of concern. There were 276,683 refugees, 180,117 Croats, and over 95,000 from Bosnia and Herzegovina. In addition, in that same year there were 248,154 internally displaced persons, 85,000 local residents at risk, and 8,143 returned refugees (primarily to Croatia), and another 9,456 refugees returning to their place of origin during the year. In 2004, over 204,000 Serbs and Montenegrins were refugees in Germany, the United Kingdom, Sweden, Switzerland, Canada, France, and Australia. Also, in that same year over 29,000 Serbs and Montenegrins sought asylum in 18 countries primarily in Europe, and in the United Kingdom and the United States.

In 2005 the net migration rate was an estimated -1.3 migrants per 1,000 population, down from 3.9 migrants per 1,000 in 1990. The government views the migration levels as too high. Worker remittances in 2003 amounted to \$2.7 billion.

## 8 ETHNIC GROUPS

According to a 2003 census, 43.16% of the population of Montenegro are Montenegrins, 32% Serbs, 7.77% Bosniaks, 5.03% ethnic

Albanians, 4% other Muslim Slavs, 1.1% Croats, 0.42% Roma, and 6.56% other population.

## 9 LANGUAGES

Serbian is the principal language of the population; Albanian accounts for a small minority. There is some disagreement regarding the Montenegrin dialect of Serbian: some Montenegrins claim it as a separate language.

## 10 RELIGIONS

The ancestors of the Serbs converted to Christianity in the 9th century and sided with Eastern Orthodoxy after the Great Schism of 1054 that split Christendom between the Eastern and Roman Churches. Islam came to the area from the Ottoman Turks in the 15th century.

About 74% of the total population are Serbian Orthodox; the Montenegrin Orthodox Church also exists but is canonically unrecognized. Muslims account for 17.74% of the population, with smaller numbers of Roman Catholics and Protestants. Protestant denominations include Baptists, Adventists, Reformed Christians, Evangelical Christians, Evangelical Methodists, Jehovah's Witnesses, the Church of Christ, Mormons, and Pentecostals. There is a small Jewish community in the country.

## 11 TRANSPORTATION

The Belgrade-Bar rail line links Serbia to Montenegro and terminates at the Adriatic Sea. Other major rail lines in Montenegro are Podgorica-Niksic and Podgorica-Skandar (Albania). Rail service is provided by locomotives manufactured in the 1950s and 1960s. The total length of standard-gauge tracks is 250 km (155.35 mi), most of which are electrified.

Two main roads in Montenegro are the Adriatic highway from Igalo to Ulcinj, and the system Petrovac to Podgorica-Kolasin-Bijelo Polje near the Serbian border connecting northern and southern Montenegro. There are 5,227 km (3,248 mi) of roads in Montenegro, of which 1,729 km (1,074.4 mi) are highways and regional roads, while the rest are local.

Important ports are Bar, Kotor, and Zelenika. Montenegro has a fleet of more than 40 ships, with a total carrying capacity of 1,000,000 metric tons. The port of Bar is equipped to handle around 5 million metric tons of cargo per year.

There were five airports in Montenegro in 2004, the major two being Podgorica and Tivat. Montenegro Airlines provides domestic and international service.

## 12 HISTORY

Montenegro's early history is as part of the medieval development of Serbia, known as Duklja or Zeta, north of Lake Scutari (Skadarsko). The Serbs, one of the large family of Slavic nations, first began settling in the Balkans around the 7th century in the areas now known as Bosnia, Kosovo, and Montenegro, straddling the line that since AD 395 had divided the Eastern and Western halves of the Roman Empire.

Tracing the origins of the Serbs (and Croats) has fueled many debates among historians, but there seems to be a consensus on their Sarmatian (Iranian) origin. Having assimilated into the Slavic tribes, the Serbs migrated with them west into central Europe (White Serbia) in the Saxony area and from there moved to the

LOCATION: Approximately 41°50' to 43°35' N; 18°30' to 20°30' E. BOUNDARY LENGTHS: Albania, 172 kilometers (108 miles); Serbia, 203 kilometers (126 miles); Croatia, 25 kilometers (16 miles); Bosnia and Herzegovina, 225 kilometers (140 miles); Adriatic Sea coastline, 199 kilometers, (124 miles).

Balkans around AD 626 upon an invitation by the Byzantine emperor Heraclius to assist him in repelling the Avar and Persian attack on Constantinople. Having settled in the Balkan area the Serbs organized several principalities of their own, made up of a number of clans headed by leaders known as *zupans*. Both the Byzantine Empire and the Bulgars tried to conquer them, but the Serbs were too decentralized to be conquered.

Between the 9th and 12th centuries, several Serbian principalities evolved, among them Raška in the mountainous north of Montenegro and southern Serbia, and Zeta (south Montenegro along the Adriatic coast), whose ruler Mihajlo (Michael) was anointed king by Pope Gregory VII in 1077.

In the late 10th century the Bulgarian khan (leader) Samuilo extended his control over Bosnia, Raška, and Zeta, north to the Sava River, and south over Macedonia. Raška became the area from where the medieval Serbian empire developed. Stephen Nemanja, grand *zupan* of Raška, fought against the Byzantines in AD 1169, and added Zeta to his domain in 1186. He built several Serbian

monasteries, including Hilandar on Mount Athos. His son, Rastko, became a monk (Sava) and the first Serbian archbishop of the new Serbian Autocephalous Church in 1219. The second son, Stephen, received his crown from Pope Innocent IV in 1202. Stephen developed political alliances that, following his death in 1227, allowed Serbia to resist the pressure from Bulgaria and, internally, keep control over subordinate *zupans*. Archbishop Sava (later Saint Sava) preferred the Byzantine Church and utilized the Orthodox religion in his nation-building effort. He began by establishing numerous Serbian-Orthodox monasteries around Serbia. He also succeeded in turning Zeta from Catholicism to Serbian Orthodoxy.

The medieval Serbian empire, under Stephen Dušan the Mighty (1331–55) extended from the Aegean Sea to the Danube (Belgrade), along the Adriatic and Ionian coasts from the Neretva River to the Gulf of Corinth and controlled, aside from the central Serbian lands, Macedonia, Thessaly, the Epirus, and Albania. The Serbian Church obtained its own patriarchate, with its center in

Peć. Serbia became an exporting land with abundant crops and minerals. Dušan, who was crowned tsar of “the Serbs and Greeks” in 1346, gave Serbia its first code of laws based on a combination of Serbian customs and Byzantine law. His attempt to conquer the throne of Byzantium failed, however, when the Byzantines called on the advancing Ottoman Turks for help in 1345. Even though Dušan withstood the attacks from the Turks twice (in 1345 and 1349), the gates to Europe had been opened, and the Ottoman Turks had initiated their campaign to subjugate the Balkans.

Dušan’s heirs could not hold his empire together against the Turks and the Nemanja dynasty ended with the death of his son Stephen Uroš in 1371, the same year his brothers Vukašin and Ivan Ugleš were killed at the battle of Marica. The defeat of the Serbs at Kosovo Polje in 1389 in an epochal battle that took the lives of both Sultan Murad I and Serbian prince Lazar left Serbia open to further Turkish conquest. Following a series of wars, the Turks succeeded in overtaking Constantinople in 1453 and all of Serbia by 1459. For the next three-and-a-half centuries, Serbs and others had to learn how to survive under Ottoman rule.

The Turks did not make any distinctions based on ethnicity, but only on religion. Turkish Muslims were the dominant class while Christians and Jews were subordinated. While maintaining their religious and cultural autonomy, the non-Turks developed most of the nonmilitary administrative professions and carried on most of the economic activities, including internal trade and trade with other countries of the Christian world. There was no regular conscription of non-Turks into the sultan’s armies, but non-Turks were taxed to pay for defense. Christian boys between the age of eight and twenty were forcibly taken from their families to be converted to Islam and trained as “Janissaries” or government administrators. Some these former Christians became administrators and even became grand viziers (advisers) to sultans.

Urban dwellers under Ottoman rule, involved in crafts, trade, and the professions, fared much better than the Christian peasantry, who were forced into serfdom. Heavy regular taxes were levied on the peasants, with corruption making the load so unbearable that the peasants rebelled.

Two distinct cultures lived side by side—Turkish Muslim in cities and towns as administrative centers and Christian Orthodox in the countryside. The numerous Serbian monasteries built around the country since the Nemanja dynasty became the supportive network for Serbian survival. The Serbian Church was subjected after 1459 to the Greek patriarchate for about a century until a Serbian patriarchate emerged again. The Serbian patriarchate covered a large area from north of Ohrid to the Hungarian lands north of the Danube and west through Bosnia.

Montenegro was subjected to continuous fighting for 400 years, from the mid-1400s to the mid-1800s. Living in a very harsh mountain territory, the Montenegrins were natural and fierce fighters, and not even the large Turkish armies could conquer them. Until 1851, Montenegro was ruled by bishops. The bishops’ role strengthened the Montenegrins’ loyalty to the Orthodox Church and prevented their conversion to Islam, except in the lowlands and coastal areas occupied by the Turks. In 1696, Danilo Petrović Njegoš (1696–1737) was elected Vladika (bishop), and his dynastic family ruled Montenegro until its unification with Serbia into the first Yugoslavia.

The Montenegro area was an almost impregnable mountain fortress with some limited access from the Adriatic coast where the Turks had taken hold. In 1714 the Turks were able to occupy the capital of Cetinje, but they could not sustain their hold because of difficulties in getting supplies and constant guerrilla attacks by the Montenegrins.

Meanwhile, Peter the Great of Russia had recognized Montenegro’s independence in 1715, viewing it as an allied Orthodox country valuable in his struggle against the Ottoman Empire. Having gained a greatly supportive ally in Russia, Danilo was successful in opposing the Turks with occasional support from Venice until his death in 1737. His successors had to struggle with the blood feuds among key Montenegrin families. Peter I (1782–1830) was able to bring together the feuding factions, reorganize his administration, issue the first Montenegrin Code of Laws in 1798, and defeat the Turks in 1799. Peter also obtained from the Turks a formal recognition of Montenegro’s independence. During the Napoleonic wars, Montenegro, Russia’s ally, fought the French over Dubrovnik and, in 1806, occupied the Gulf of Kotor, thus gaining access to the Adriatic sea. But Montenegro had to relinquish Kotor to Austria following the Congress of Vienna decisions in 1814–15.

Peter I died in 1830, having repelled again Turkish attacks in 1819–21 and 1828–29. Peter II, considered by many to be the greatest Serbian poet, established a senate of 12 members and centralized his authority by abolishing the office of civil governor, which had existed since 1516. However, his successor, Danilo II (1851–60), effected a radical change by proclaiming himself hereditary prince in 1852. Danilo II introduced a new legal code in 1855 that guaranteed civil and religious freedoms based on the constitution of 1852. Danilo died in 1860 of a wound inflicted by an exiled Montenegrin rebel.

Danilo’s nephew Nicholas took over as the last independent ruler of Montenegro from 1860 until the 1918 unification with Serbia and the first Yugoslavia. During his 58-year reign Nicholas gained the nickname of “Father-in-Law of Europe” by marrying six daughters into Italian, Russian, Serbian, and German royal families. Through a series of wars with Turkey (1862, 1876, 1912, and 1913), Nicholas succeeded in more than doubling Montenegro’s territory. Following the 1913 Balkan War, Montenegro and Serbia divided the Sandžak area and became neighbor states, both primarily populated by Serbs. Montenegro also gained access to the Adriatic Sea south of Lake Scutari (Skadar), which was divided in 1913 between Montenegro and the newly formed Albanian state.

Between 1880 and 1912, Montenegro took advantage of an era of relative peace to develop roads, education, agriculture, postal services, and banks, mostly with foreign investment especially from Italy, whose queen was Nicholas’s daughter Elena.

The first Montenegrin parliament met in 1905, with 62 elected and 14 *ex officio* members. Following the successful Balkan wars, Serbian-Montenegrin relations grew closer, and by 1914, the two Serbian kingdoms proposed a union in which they would share their armed forces, foreign policy, and customs while maintaining their separate royal dynasties. World War I (1913–18) interrupted this process. Montenegro’s poor defense led to Austrian occupation for the better part of the war; thus Montenegro ceased to officially participate in the war.

A Montenegrin Committee for National Union was formed by exiles in Paris who supported the 20 July 1917 Corfu Declaration on the establishment of a Kingdom of Serbs, Croats, and Slovenes. The Montenegrin Committee felt the time had come to unite with the Kingdom of Serbs, Croats, and Slovenes. King Nicholas opposed such a move and was deposed. On 24 November 1918, a resolution was passed in favor of Montenegro's union with the Kingdom of Serbia. Thus, Montenegro became part of the first Yugoslavia on 1 December 1918. Montenegrins participated very actively in political life, mostly supporting the centralist Serbian positions.

During World War II (1939–45), Italy controlled Montenegro and attempted unsuccessfully to revive the old kingdom. In the post-World War II Socialist Federative Yugoslavia, Tito reestablished Montenegro as a separate republic due to strong Montenegrin representation in the circle of his closest collaborators. Most Montenegrins took the side of the Serbian centralists against the liberal elements in the League of Communists and, in the late 1980s and early 1990s, supported Slobodan Milošević. With the demise of Yugoslavia, Montenegro joined Serbia in forming the Federal Republic of Yugoslavia.

On 14 March 2002, under mediation by the European Union (EU), Serbia and Montenegro agreed to form a new federal union, called Serbia and Montenegro. Montenegro's prime minister, Milo Djukanovic, was reluctant to sign the agreement, being the leader of the drive for independence of Montenegro's population of 660,000. However, the union of Serbia and Montenegro came into existence in 2003. The constitution provided for either of the two constituent republics to vote for independence in three years (2006). In February 2005, officials from Montenegro asked their Serbian counterparts for an early secession of the two republics claiming the union was inefficient and squandered money. Serbian Prime Minister Vojislav Kostunica refused the proposal and indicated that European integration and economic development should be the main focus of Serbia and Montenegro.

A referendum on full independence for Montenegro was held on 21 May 2006. To be accepted internationally, a 55% majority was required for a "yes" vote to the question: "Do you want the Republic of Montenegro to be an independent state with full international and legal subjectivity?" The Montenegrin diaspora had the right to vote, with the exception of Montenegrins living in Serbia, who were barred from voting in the referendum. The vote on independence was 55.5% in favor. Voter turnout was 86.3%. A demand by pro-Serbian unionist parties for a recount was rejected. Serb politicians, Orthodox church leaders, and Montenegrins from the mountainous inland regions bordering Serbia opposed secession. However, ethnic Montenegrins and Albanians from the coastal area favored independence. Serbian President Boris Tadic recognized the independence of Montenegro. Serbia became the successor state to the union of Serbia and Montenegro, inheriting its seat in the United Nations (UN) and seats in other international institutions: Montenegro will have to apply for UN and EU membership on its own once it has been granted recognition by other states. Serbia's ambition to join the EU has been hampered by its failure to arrest key war crimes suspects, including Ratko Mladic. Serbia inherits legal claim to the UN-administered province of Kosovo.

Montenegro's independence cuts Serbia off from the sea; therefore, the two nations will need to cooperate on sharing the former union's assets. Montenegrins may be given favorable treatment to use Serbia's hospitals, universities, and other public services. The substantial pro-union minority in Montenegro will also strengthen Serbia's hand in creating a smooth transition to independence. The pro-union bloc in the referendum was led by the Socialist People's Party (SNP), headed by Predrag Bulatovic. National elections were due to be held in autumn 2006.

### 13 GOVERNMENT

Prior to Montenegro's independence in 2006, a constitutional charter for the state of Serbia and Montenegro was ratified by both parliaments in January 2003, and the constitution for the unified state was approved on 4 February 2003. The constitution allowed the member republics to hold independence referendums in 2006, which Montenegro did. Following the yes vote on independence in mid-2006, Montenegro was engaged in forming a new government.

As a constituent state of the union of Serbia and Montenegro, Montenegro had a republican form of government. Representatives in Montenegro's Assembly (parliament) hold office for four years. The Assembly enacted laws, passed the budget, appointed the president and members of the cabinet, the president and justices of the Constitutional Court, and the judges of all courts of law. The Assembly may pass a vote of no-confidence on the government by a vote of its members.

The president of Montenegro proposes candidates to the Assembly for prime minister, as well as for the president and justices of the Constitutional Court; grants pardons; proposes the holding of referenda; and represents the country at home and abroad.

### 14 POLITICAL PARTIES

Elections for Montenegro's parliament were held on 21 October 2002. Eleven parties were represented: the Democratic Party of Socialists of Montenegro (DPS), 30 seats; Social Democratic Party of Montenegro (SDP), 5; Civic Party of Montenegro, 1; non-partisans, 2; Socialist People's Party of Montenegro, 19; Serbian People's Party of Montenegro, 6; People's Party of Montenegro, 5; Liberal Alliance of Montenegro, 4; Democratic Union of Albanians, 1; and the Democratic League of Montenegro, 1. The government coalition was comprised of the DPS, SDP, Civic Party, and non-partisans.

On 11 May 2003, Filip Vujanović of the DPS was elected president with 63.3% of the vote. Voter turnout was 48.5%. As of 2006, Milo Dukanović was serving as prime minister.

### 15 LOCAL GOVERNMENT

Montenegro has 21 municipalities (opština).

### 16 JUDICIAL SYSTEM

The republic of Montenegro followed the system of separation of powers: the judicial, legislative, and executive branches are independent of one another. The judiciary is autonomous and inde-

pendent. The Constitutional Court has the power of judicial review. Appointments to the judiciary are for life.

## 17 ARMED FORCES

The following information on armed forces pertains to the union of Serbia and Montenegro and was reported prior to June 2006, when Montenegrins approved an independence referendum. Active armed forces numbered approximately 65,300 in 2005, supported by 250,000 reservists. The Army had 55,000 active personnel and was equipped with 962 main battle tanks, 525 armored infantry fighting vehicles, 288 armored personnel carriers and 2,729 artillery pieces. The Navy had 3,800 active personnel, including 900 Marines. Major naval units included eight tactical submarines, three frigates, 31 patrol/coastal vessels, 10 mine warfare ships, 23 amphibious landing craft, and seven logistical/support vessels. The Air Force had 6,500 active members, along with 101 combat capable aircraft, including 39 fighters, 51 fighter ground attack aircraft and 17 armed helicopters. There was also a paramilitary force that consisted of 45,100 personnel, of which an estimated 4,100 made up special police units, 35,000 were Ministry of Interior personnel and an estimated 6,000 were Montenegrin Ministry of Interior Personnel. Sixteen military personnel were stationed in four African countries under UN command. In addition, military contingents from 45 countries were stationed in Serbia and Montenegro as part of the Kosovo Peace Implementation Force. The defense budget in 2005 totaled \$706 million.

## 18 INTERNATIONAL COOPERATION

The Socialist Federal Republic of Yugoslavia was an original member of the United Nations (1945) until its dissolution and the establishment of Bosnia and Herzegovina, Croatia, Slovenia, the Former Yugoslav Republic of Macedonia, and the Federal Republic of Yugoslavia as new states. The Federal Republic of Yugoslavia was admitted to the United Nations on 1 November 2000. Following the adoption and promulgation of the Constitutional Charter of Serbia and Montenegro on 4 February 2003, the name of the Federal Republic of Yugoslavia was changed to Serbia and Montenegro. Serbia and Montenegro participated in several nonregional specialized UN agencies, such as the FAO, UNESCO, UNHCR, UNIDO, the World Bank, IAEA, and the WHO.

Serbia and Montenegro was a member of the Council of Europe, the Black Sea Economic Cooperation Zone, the European Bank for Reconstruction and Development, and the OSCE. It had observer status in the OAS and the WTO. In environmental cooperation, the country was part of Basel Convention, Ramsar, the London Convention, the Montréal Protocol, and the UN Conventions on the Law of the Sea and Climate Change.

Serbia is recognized as the successor state to the former union of Serbia and Montenegro. Montenegro will have to apply for membership in the UN and other international bodies.

## 19 ECONOMY

During the UN economic sanctions that lasted from 1992 to 1995, economic activity in the former Yugoslavia was extremely limited. By 1994, hyperinflation had brought formal economic activity to a virtual halt. By 1996, GDP had fallen to only 50.8% of 1990s total. Industry declined to just 46.6% of 1990s output; agriculture, 94.4%; construction, 37.5%; transportation, 29.3%; trade, 60.6%;

and services, 81.1%. Formal lifting of these sanctions occurred in October 1996. However, the United States sponsored an "Outer Wall" of sanctions, which prevented Yugoslavia from joining international organizations and financial institutions. Taken together, the "Outer Wall," the Kosovo war, and continuing corruption continue to stifle Yugoslav economic development. In October 2000, the coalition government began implementation of stabilization and market-reform measures. Real growth in 2000 was reported as 5%. A donors' conference in June 2001 raised \$1.3 billion in pledges for help in infrastructural rebuilding. Real GDP in 2001 was 5.5% and an estimated 4% in 2002.

Economic output was positive, but volatile after 2002, dropping to 2.1% in 2003 and jumping to 8% in 2004; in 2005 the GDP growth rate in Serbia and Montenegro was estimated at 4%.

In Montenegro, inflation fell from 7.5% in 2003 to 5% in 2004. The financial sector showed marked improvement. Economic reforms launched in 2003, driven by the goal of EU integration, had not yet led to markedly higher levels of growth or reduced unemployment by 2006. In 2003, the absolute poverty rate was recorded at 12.2%, with more than a third of the population classified as economically vulnerable.

## 20 INCOME

The following information on income pertains to the union of Serbia and Montenegro, prior to Montenegro's independence in 2006. The CIA defines GDP as the value of all final goods and services produced within a nation in a given year and computed on the basis of purchasing power parity (PPP) rather than value as measured on the basis of the rate of exchange based on current dollars. In 2005, the per capita GDP for Serbia and Montenegro was estimated at \$2,700. The annual growth rate of GDP was estimated at 5%. It was estimated that agriculture accounted for 16.6% of GDP, industry 25.5%, and services 57.9%.

According to the World Bank, in 2003 remittances from citizens working abroad totaled \$1.397 billion or about \$172 per capita and accounted for approximately 6.8% of GDP. Foreign aid receipts amounted to \$1,317 million or about \$163 per capita and accounted for approximately 6.4% of the gross national income (GNI).

The World Bank reports that in 2003 household consumption in Serbia and Montenegro totaled \$18.27 billion or about \$2,246 per capita based on a GDP of \$20.7 billion, measured in current dollars rather than PPP. Household consumption includes expenditures of individuals, households, and nongovernmental organizations on goods and services, excluding purchases of dwellings.

## 21 LABOR

The following information on labor pertains to the union of Serbia and Montenegro, prior to Montenegro's independence in 2006. The labor force in Serbia and Montenegro was estimated at 3.22 million in 2005. The unemployment rate in 2005 was estimated at 31.6%, with Kosovo's unemployment at around 50%. There was no data available as to the occupational breakdown of the country's workforce.

With the exception of the military, all workers are entitled to form unions. However, the majority of unions are government-sponsored or affiliated: independent unions are rare. Therefore, unions have not been effective in improving work conditions or

wage structure increases. Virtually all of the workers in the formal economy are union members. Strikes are permitted and are utilized especially to collect unpaid wages. Collective bargaining is still at rudimentary level.

The minimum employment age is 16 although younger children frequently work on family farms. As of 2005, there was no national minimum wage rate. On average, the full-time monthly wage in the public sector that year was \$181, while the average wage in the private sector was \$250. Neither wage rate offered a decent living wage for a family. The official workweek was set at 40 hours, with required rest periods and overtime limited to 20 hours per week or 40 hours per month. Health and safety standards are not a priority due to harsh economic circumstances.

## 22 AGRICULTURE

In addition to honey and high-quality wines (Vranac, Krstac, among others), Montenegro produces many vegetables (tomatoes, peppers, cucumbers) and fruits (plums, apples, grapes, citrus fruits, and olives). Other crops include blueberries, edible mushrooms, and wild sage.

Serbia and Montenegro had 3,717,000 hectares (9,160,000 acres) of arable land in 2003. Serbia historically accounted for 60% of agricultural production. Vojvodina is the major agricultural region.

In 2000, 20% of the labor force was engaged in agriculture. Between 1991 and 1996, total agricultural production in the former Yugoslavia declined by 10%. During that time, production of farm crops fell by 9%; cereals by 12%. Viticultural production, however, increased by 51%. However, by 1999, total agricultural output was at 92% of the average during 1989–91. During 2002–04, crop production was 10% higher than during 1999–2001.

Agriculture contributed an estimated 17% to GDP in 2002. Major crops produced in 2004 in Serbia and Montenegro included (in thousands of tons): corn, 6,287; wheat, 2,746; sugar beets, 2,643; potatoes, 1,098; and grapes, 490.

## 23 ANIMAL HUSBANDRY

The following information on animal husbandry pertains to the union of Serbia and Montenegro, prior to Montenegro's independence in 2006. In 2005, the livestock population included 3,550,000 pigs and hogs, 1,796,600 sheep, 1,230,000 head of cattle, 182,000 goats, 40,000 horses, and 17,464,000 poultry. Total meat production that year was 848,240 tons; milk, 1,852,000 tons. Between 1990 and 1999, total livestock production increased by 1.8%, but during 2002–04 it fell by 5.4% from 1999–2001.

## 24 FISHING

In Serbia and Montenegro, the total catch in 2003 was 3,665 tons, 86% from inland waters. Common carp accounts for much of the inland catch.

## 25 FORESTRY

Forests and woodlands cover 720,000 ha (1,779,192 acres) in Montenegro, accounting for 54% of the total surface area of the republic. Of this figure, the major part (572,000 ha (1,413,469 acres) is in the northern region of the country. Total roundwood production in Serbia and Montenegro in 2004 was 3,520,000 cu m (124.3 billion cu ft), of which about 75% came from public forests. Sawnwood production amounted to 575,000 cu m (20.3 million

cu ft); plywood and particle board, 59,000 cu m (2.1 million cu ft). In 2004, exports of forest products in Serbia and Montenegro amounted to nearly \$139.1 million; imports, \$352.9 million.

## 26 MINING

The following information on mining pertains to the union of Serbia and Montenegro prior to Montenegro's independence in 2006. In 2003 industrial production in Serbia and Montenegro fell by 3% compared to 2002, although mining and quarrying operations reported a 1% increase from 2002. Aggregated production from the metals mining sector in 2003 fell by 33% from the previous year, although the output of basic metals increased by 2%. The country also confronted continuing economic sanctions and the loss of control of Kosovo, with its ores and production facilities for nickel, lead, zinc, coal, lignite, ferronickel, and tin-plate. In light of this, Serbia and Montenegro's gross domestic product (GDP) was officially reported to have increased by 3% in 2003. The country had significant capacities to produce refined aluminum, lead, silver, and zinc. In 2003, the output of bauxite fell by about 12% from 2002, although aluminum output remained at around 2002 levels. Although exports of primary aluminum and aluminum alloys in 2002 grew by 18% over 2001, data for 2003 indicated a steep drop in those exports. Mining in Serbia dates back to the Middle Ages, when silver, gold, and lead were extracted. Yugoslavia's bauxite mining, alumina-refining, and aluminum-smelting industries were located primarily in Montenegro, which was accorded favorable treatment by the European Commission.

Mine output of metals in 2003 were: lead ore (gross weight), 183,000 metric tons, down from 733,000 metric tons in 2000 and 284,000 metric tons in 2002; bauxite (gross weight), 540,000 metric tons, down from 612,000 metric tons in 2002 and from 630,000 metric tons in 2000; agglomerate iron ore and concentrate saw no recorded production from 2001 through 2003; and copper ore (gross weight), 5,710,000 tons, down from 12.896,000 tons in 2000 and from 7,968,000 tons in 2002. Production of silver in 2003 totaled 2,028 kg, down from 6,838 kg in 2002. Output of refined gold in 2003 was estimated at 600 kg, down from 900 kg in 2002. In 2003, the country also produced alumina, magnesium, palladium, platinum, and selenium. Among the industrial minerals produced were asbestos, bentonite, ceramic clay, fire clay, feldspar, pumice, lime, magnesite, mica, kaolin, gypsum, quartz sand, salt, nitrogen, caustic soda, sodium sulfate, sand and gravel, and stone.

## 27 ENERGY AND POWER

According to Montenegrin government sources, three power plants—the Perucica and Piva hydroelectric plants and the Pljevlja thermoelectric plant—produce approximately 3 billion kWh per year. Montenegro has the capacity to produce 2,700,000 metric tons of coal.

## 28 INDUSTRY

Industry was the primary engine of economic development in Montenegro in the second half of the 20th century. During that period, the growth of the power and energy sector, metallurgy (steel and aluminum), and transportation infrastructure formed the basis for overall economic growth and development. Approxi-

mately 90% of Montenegro's industrial products were marketed outside the republic.

By the early 2000s, Montenegro had facilities for producing 400,000 metric tons of crude steel; 1,000,000 metric tons of bauxite; 280,000 metric tons of alumina; 100,000 metric tons of aluminum; and 75,000 metric tons of sea salt.

Industries in Montenegro include metal processing, engineering, wood-processing, textile manufacture, chemicals, leather and footwear, apparel, household appliances, construction, and machinery.

Montenegro processes and finishes agricultural products. The country has fish-processing plants, flour mills, dairies, slaughterhouses, bakeries, breweries, juice factories, fruit processing factories, grape processing plants and wine cellars, medicinal herb processing plants, tobacco and cigarette factories, and confectioners, among other industries.

By 2006, the industrial sector was in poor shape due to the lingering effects of war and isolation in the former Yugoslavia. Montenegro was expected to seek foreign investment to modernize its industries to enable it to become competitive in world markets.

### **29 SCIENCE AND TECHNOLOGY**

Scientific and technological policies are developed and implemented by the Ministry of Education and Science of the Republic of Montenegro. There are 13 registered research institutions in Montenegro and one university (the University of Montenegro, located in Podgorica).

### **30 DOMESTIC TRADE**

Podgorica serves as the economic and commercial center of the country. The domestic economy has been held back for the past few years due to the lack of major privatization reforms and trouble in the general European economy. Hours of business are usually 8 AM to 4 PM, Monday to Friday.

### **31 FOREIGN TRADE**

The following information on foreign trade pertains to the union of Serbia and Montenegro prior to Montenegro's independence in 2006. The UN imposed sanctions on international trade with Yugoslavia in May 1992 and lifted them in December 1995. During the war, when sanctions were in force, dozens of Cypriot companies, set up by senior Serbian officials and businessmen, trafficked millions of dollars in illegal trade.

Trade started to catch up in subsequent years, and in 2004 exports reached \$3.2 billion (FOB—Free on Board). In the same year, imports were almost triple, at \$9.5 billion (FOB), indicating that the economy in the two republics was in disarray, but that it was trying to redress itself through a renewal of its industrial base. Most of the import commodities included machinery and transport equipment, fuels and lubricants, manufactured goods, chemicals, food and live animals, and raw materials. The imports mainly came from Germany (18.5%), Italy (16.5%), Austria (8.3%), Slovenia (6.7%), Bulgaria (4.7%), and France (4.5%). Exports included manufactured goods, food and live animals, and raw materials, and largely went to Italy (which receive 29% of total

exports), Germany (16.6%), Austria (7%), Greece (6.7%), France (4.9%), and Slovenia (4.1%).

### **32 BALANCE OF PAYMENTS**

Montenegro, both as its own republic and as a constituent republic of Serbia and Montenegro until mid-2006, maintained a relatively high current account deficit. For Serbia and Montenegro, exports of goods and services totaled \$5.9 billion in 2004, up from \$4.2 billion in 2003. Imports grew from \$8.7 billion in 2003, to \$12.8 billion in 2004. Consequently, the resource balance was on a negative upsurge, growing from -\$4.5 billion in 2003, to -\$7.1 billion in 2004. A similar trend was registered for the current account balance, which deteriorated from -\$2.0 billion in 2003, to -\$3.1 billion in 2004. The national reserves of Serbia and Montenegro (including gold) were \$3.6 billion in 2003, covering less than 6 months of imports; by 2004, they increased to \$4.3 billion.

### **33 BANKING AND SECURITIES**

Montenegro has its own independent central bank. There were 10 licensed banks in Montenegro in 2005. Montenegro's last bank with direct government majority ownership was being privatized in 2006.

### **34 INSURANCE**

Insurance of public transport passengers, motor vehicle insurance, aircraft insurance, and insurance on bank deposits are compulsory. In 2003, the value of all direct insurance premiums written in Serbia and Montenegro totaled \$436 million, of which nonlife premiums accounted for \$420 million. In that same year, the top nonlife insurer was Dunav, which had gross written nonlife premiums of \$138.6 million, while the country's leading life insurer was Zepter, which had gross written life insurance premiums of \$7.1 million.

### **35 PUBLIC FINANCE**

As of mid-2006, Montenegro had voted to become an independent nation; statistics on the new country's revenue and expenditures were not available.

The US Central Intelligence Agency (CIA) estimated that in 2005 Serbia and Montenegro's central government took in revenues of approximately \$11.4 billion and had expenditures of \$11.1 billion. Revenues minus expenditures totaled approximately \$330 million. Public debt in 2005 amounted to 53.1% of GDP. Total external debt was \$15.43 billion.

### **36 TAXATION**

Montenegro's top income tax rate is 22%. It has a flat corporate tax rate of 9%.

### **37 CUSTOMS AND DUTIES**

Montenegro has an average customs rate of 3–5%, with a 20% rate applied to seasonal fruits and vegetables. Montenegro applies a 17% value-added tax (VAT) on all products, with water, bread,

milk, fat, oil, sugar and medicines exempt. Montenegro imposes excise taxes on certain luxury goods.

Montenegro has only one authorized free trade zone (FTZ) that has yet to become operational.

### 38 FOREIGN INVESTMENT

Foreign investment was severely restricted during the years of the economic embargo. Since the sanctions were lifted, foreign investors from neighboring countries, Russia, and Asia have expressed an interest in capital investment. The main sectors attracting the interest of foreign investors are metal manufacturing and machinery, infrastructure improvement, agriculture and food processing, and chemicals and pharmaceuticals. Foreign investors may hold majority shares in companies.

In 1997, foreign direct investment (FDI) inflows into the former Yugoslavia reached \$740 million, but dried up with the onset of the conflict in Kosovo. FDI inflows averaged \$122.5 million in 1998 and 1999, then fell to \$25 million in 2000. In 2001, FDI inflow reached \$125 million.

In the following years, Serbia and Montenegro undertook an aggressive program of reforms aimed at both reestablishing the area as a major transportation hub, and at attracting foreign investment. These policies seem to have paid off as in 2004, capital inflows jumped to \$3.4 billion. While Serbia and Montenegro was considered to be a risky place for doing business, the political and economic climate was steadily improving as of 2005. Montenegro both before and after independence placed a great deal of importance upon attracting new foreign investment; such economic development will help make the case for Montenegro's possible entry into the European Union (EU).

### 39 ECONOMIC DEVELOPMENT

Officials in general see revitalization of the infrastructure (roads, rail and air transport, telecommunications, and power production) as one step toward economic recovery. Another important aspect of economic reconstruction will be the revival of former export industry, such as agriculture, textiles, furniture, pharmaceuticals, and nonferrous metallic ores.

In 2002, the International Monetary Fund (IMF) approved a three-year \$829 million Extended Arrangement to support economic programs in Serbia and Montenegro (which was known as Yugoslavia at the time) 2002–05.

While politically and economically Montenegro is much more stable than in previous years, the economy is still in a quasi-state of disarray, with high unemployment, a large gray market, and a relapsing industrial base. Foreign investors, as well as several international financial institutions (EBRD, IMF, and the World Bank), appreciated recent economic developments in Montenegro as being positive, and in 2004 increased their capital transfers to the region.

The economy is expected to grow moderately in 2006, as a result of a boom in several sectors: trade, financial services and transport and communications. The growth is to be sustained by continued investment in newly privatized companies, by strong local demand, and by an expansion of the services sector. Montenegro has privatized most major industries other than electricity. By 2005, approximately 65% of state-owned companies had been

sold off and only 25% of banking assets remained in state or social ownership.

The US Agency for International Development (USAID) remains the primary foreign aid donor in Montenegro. The European Agency for Reconstruction (EAR), Germany, and the United Kingdom have smaller budgets and, like USAID, work in the areas of economic policy reform and enterprise development, among other programs such as civil society, independent media development, and the rule of law. The International Finance Corporation (IFC) focuses on small and medium enterprise development. The World Bank and EBRD focus on economic growth and infrastructure investments. The UN Development Program (UNDP), with funding from EAR, Germany, Canada, and the Netherlands, works in the environment, enterprise development, and civil society development areas. Montenegro has implemented an Economic Reform Agenda.

### 40 SOCIAL DEVELOPMENT

A social insurance system for Serbia and Montenegro, updated in 2003, provides old age, disability, and survivorship benefits. The pension plan is funded by contributions from both employers and employees. The retirement varies depending on years of insurance; retirement from insured employment is necessary. Montenegro provides its own system for sickness and maternity benefits. Medical services are provided directly to patients through government facilities. Workers' compensation, unemployment benefits, and family allowances are also available. Family allowances vary according to the number of children in the family are adjusted periodically for cost of living changes.

Traditional gender roles keep women from enjoying equal status with men and few occupy positions of leadership in the private sector. However, women are active in human rights and political organizations. High levels of domestic abuse persist and social pressures prevent women from obtaining protection against abusers.

### 41 HEALTH

The government provides obligatory health care to citizens for preventive, diagnostic, therapeutic, and rehabilitative services. In the union of Serbia and Montenegro, there were approximately 228 health institutions and about 3,000 other clinics, mostly private, in 2005. As of 2004, there were an estimated 20 physicians per 100,000 people.

In 2005 infant mortality in Serbia and Montenegro was reported at 15.53 per 1,000 live births. Overall mortality was 7.4 per 1,000 people in Montenegro. Average life expectancy in 2005 for Serbia and Montenegro was 74.73 years.

The HIV/AIDS prevalence was 0.20 per 100 adults in 2003. As of 2004, there were approximately 10,000 people living with HIV/AIDS in Serbia and Montenegro. There were an estimated 100 deaths from AIDS in 2003.

### 42 HOUSING

At the beginning of 1996, there were 3,124,000 dwellings in Serbia and Montenegro, with an average of 3.4 persons per dwelling. Housing area at that time averaged 20 sq m (215 sq ft) per

person. New housing completions during 1995 totaled 14,337 units, of which 11,847 were in the public sector, and 2,490 were in the private sector. In 2002, Serbia and Montenegro counted about 2,790,411 households with an average of 2.89 people per household.

### 43 EDUCATION

As of 2005/06, education is compulsory for nine years of primary school. This may be followed by three years of secondary school, with students having the option to attend general, vocational, or art schools. The academic year runs from October to July. In 2001, about 43% of children between the ages of three and six were enrolled in some type of preschool program in the union of Serbia and Montenegro. Primary school enrollment in 2001 was estimated at about 96% of age-eligible students. The same year, secondary school enrollment was about 82% of age-eligible students. It is estimated that about 96% of all students complete their primary education. The student-to-teacher ratio for primary school was at about 20:1 in 2000; the ratio for secondary school was about 14:1. In Montenegro, elementary and secondary schools are managed by school boards, while principals are responsible for day-to-day administration. School boards and principals are appointed by the Ministry of Education and Science for four-year terms. Teachers must have a university degree and pass a professional (state) examination.

Montenegro has one university with 15 faculties. In 2001, it was estimated that about 36% of the tertiary age population were enrolled in tertiary education programs. The adult literacy rate for 2004 was estimated at about 96.4%.

As of 2003, public expenditure on education for the union of Serbia and Montenegro was estimated at 3.3% of GDP.

### 44 LIBRARIES AND MUSEUMS

The Central National Library of Montenegro has 1.5 million volumes.

Serbia and Montenegro prior to Montenegro's independence had over 2,500 cultural monuments, including about 100 museums and 37 historical archives libraries.

Culturally, Montenegro has been shaped by Mediterranean, middle European, Eastern European, and Asian civilizations. Archaeological treasures include Crvena Stijena (Red Rock), Bioce okapine (shelters) in the Moraca Canyon, and Malisina pecina (cave) and Medena stijena (rock) in the Cehotina Canyon.

Pre-Roman, Roman, Gothic, and Baroque architectural styles may be found. The city of Kotor is a UNESCO World Heritage site. The region of Lake Scutari (Skadarsko) has many monasteries built on goricas (small islands), including Beska, Moracnik, Starcevo, Kom, and Vranjina, along with the fortresses of Zabljak and Lesendro.

Islamic culture is evidenced in the Mosque of Husein-pasha Boljanic in Pljevlja, as well as in residential architecture (such as the Redzepagics' Manor in Plav).

Montenegro has a long literary and printing history, beginning in the 12th century. The town of Cetinje, which features a monastery of Cetinje and museum complex and Biljarda, built by

Njegos as a residence in 1838, is recognized as a cultural capital. Other buildings in Cetinje include King Nikola's Palace, numerous embassies, Prince Heir's Palace, the Zetski dom theater, and the house of parliament.

Montenegro has a rich heritage of theater, film, poetry, prose, and painting.

### 45 MEDIA

In 2003, there were an estimated 243 mainline telephones for every 1,000 people in Serbia and Montenegro; about 313,500 people were on a waiting list for telephone service installation. The same year, there were approximately 338 mobile phones in use for every 1,000 people.

Television stations included TV Montenegro, a state-funded company that operated two networks and a satellite channel; TV IN; Montenegrin Broadcasting Company (MBC), private; ntv Montena, private; TV Elmag, private; and TV Pink M—Montenegrin offshoot of Belgrade-based network. The following radio stations were operating: Radio Montenegro, a state-funded company that operated two networks; Radio Elmag, private; Antena M, private; and Radio D, private. The news agency MNNNews-Mina is private.

The ownership and editorial positions of television and radio stations usually reflects regional politics. In 2004, Serbia and Montenegro had about 297 radios and 282 television sets for every 1,000 people. The same year, there were 27.1 personal computers for every 1,000 people and 79 of every 1,000 people had access to the Internet. There were nine secure Internet servers in the country in 2004.

In 1791, the first Serbian-language newspaper was published in Vienna, Austria. Privately owned newspapers are sometimes critical of the government. The dailies with the largest circulation in Serbia and Montenegro (as of 2002) were *Politika* (Politics, 300,000) and *Vecernje Novosti* (Evening News, 169,000). Other newspapers that are essentially controlled by the government, included (with 2002 circulation) *Borba* (85,000), *Jedinstvo* (6,090), *Dnevnik* (61,000), and *Pobjeda* (19,400). There are several minority language newspapers.

While the government provides for freedom of speech and of the press, libel suits have been fairly prevalent and some media sources have practiced self-censorship in order to avoid problems with government officials. In Montenegro press freedom is guaranteed and media laws passed in 2002 provide for the transformation of state-funded broadcasting company into a public broadcaster. But some media watchdogs have pointed to ongoing political influence over editorial policies. In 2004, the killing of Dusko Jovanovic, the editor of the opposition daily newspaper Dan, sparked an outcry. Demonstrators accused the authorities of complicity.

Overseas donors and organizations have encouraged the growth of independent media outlets. But commercial operators compete for a small pool of advertising revenue. The market—with dozens of private radio and TV stations—was said to be saturated. The Montenegrin media enjoyed greater freedom than their Serbian

counterparts in the last years of Slobodan Milošević's rule. Many private outlets managed to break the former state monopoly. In Montenegro, the following media were publishing in 2005: *Vijesti*, private daily; *Pobjeda*, daily; *Dan*, daily; *Republika*, daily; and *Monitor*, private weekly.

#### 46 ORGANIZATIONS

The Montenegrin P.E.N. Center was founded in 1990. There are several organizations for professional journalists in Serbia and Montenegro, including the Journalists' Federation of Yugoslavia, the Journalists' Association of Serbia, Independent Journalists' Association, and the Association of Private Owners of the Media. National youth organizations include the Union of Socialist Youth of Yugoslavia, Junior Chamber, and the Youth Council of Montenegro. Scouting organizations are also active. The Child Rights Center and Child to Child are national groups working to promote the rights of children and youth. There are a variety of sports associations available promoting amateur competition among athletes of all ages. There are active chapters of the Paralympic Committee, as well as a national Olympic Committee.

There is a national chapter of the Red Cross Society.

#### 47 TOURISM, TRAVEL, AND RECREATION

Rich architecture, museums, galleries, cathedrals, parks, rivers, and the many beaches are just some of the attractions that bring visitors to Montenegro. Montenegro has four national parks; the largest are the Lake of Skadar (Skadarsko) Basin (40,000 hectares/98,800 acres) and Durmitor (39,000 hectares/96,300 acres). Montenegro has two UNESCO natural area and heritage sites: Mt. Durmitor and the old city of Kotor. Popular sports in Montenegro are tennis, football, volleyball, water sports, bocanje (a kind of bowling), skiing, and rafting. The Ministry of Sports of the Montenegrin government was founded in 1993. There are numerous sand and pebble beaches on the Montenegrin coastline. It is one of the warmest and sunniest tourist regions in Europe. Although classified as a Mediterranean country, Montenegro is a mountainous region in which areas of 1,000 m (3,280.8 ft) or higher comprise 60.5% of the nation's territory.

Prior to Montenegro's independence, all visitors needed a valid passport to enter Serbia and Montenegro. Serbia requires an onward/return ticket, sufficient funds for the stay, and a certificate showing funds for health care. Visas are required for all nationals except those of 41 countries including the United States, Australia, and Canada. According to 2005 US Department of State estimates, the cost of staying in the country averaged \$157.

In 2003, there were 599,430 visitors to Montenegro (10.7% more than in 2002), of whom 141,787 were foreign tourists. There were 3,976,266 hotel rooms booked (7.8% more than in 2002), of which foreign visitors accounted for 915,738.

#### 48 FAMOUS MONTENEGRINS

Prince Danilo II of Montenegro (r.1851–60) introduced a new legal code in 1855 that guaranteed civil and religious freedoms. King Nikola I Petrović Njegoš (1841–1921) was the only king of Montenegro, reigning as a king from 1910 to 1918 and as a prince from 1860 to 1910. He was also a poet who wrote "Onamo, 'namo,"

the popular anthem of Montenegro. King Alexander of Yugoslavia (1888–1934) was assassinated in Marseille, France. Prince Paul of Yugoslavia (1893–1976) ruled as a regent for Peter II (1923–70) from 1934 to 1941 and was forced into exile after signing a secret pact with the Nazi government.

Important Montenegrin poets of the 20th century include Risto Ratkovic and Radovan Ziogovic. Important prose writers include Mihailo Lalic, whose realistic novels portray Montenegro's place in World War II. Painters include Petar Lubarda, Milo Milunovic, Dado Djuric, Branko Filipovic-Filo, Vojo Stanic, and Uros Toskovic.

#### 49 DEPENDENCIES

Montenegro has no dependencies or territories.

# NETHERLANDS

Kingdom of the Netherlands  
*Koninkrijk der Nederlanden*

**CAPITAL:** Constitutional capital: Amsterdam. Seat of government: The Hague ('S Gravenhage; Den Haag)

**FLAG:** The national flag, standardized in 1937, is a tricolor of red, white, and blue horizontal stripes.

**ANTHEM:** *Wilhelmus van Nassouwen* (*William of Nassau*).

**MONETARY UNIT:** The guilder was replaced by the euro as official currency as of 2002. The euro is divided into 100 cents. There are coins in denominations of 1, 2, 5, 10, 20, and 50 cents and 1 euro and 2 euros. There are notes of 5, 10, 20, 50, 100, 200, and 500 euros. €1 = \$1.25475 (or \$1 = €0.79697) as of 2005.

**WEIGHTS AND MEASURES:** The metric system is the legal standard.

**HOLIDAYS:** New Year's Day, 1 January; Queen's Day, 30 April; National Liberation Day, 5 May; Christmas, 25–26 December. Movable religious holidays include Good Friday, Holy Saturday, Easter Monday, Ascension, and Whitmonday.

**TIME:** 1 PM = noon GMT.

## <sup>1</sup>LOCATION, SIZE, AND EXTENT

Situated in northwestern Europe, the Netherlands has a total area of 41,526 sq km (16,033 sq mi), of which inland water accounts for more than 7,643 sq km (2,951 sq mi). The land area is 33,883 sq km (13,082 sq mi). Comparatively, the area occupied by the Netherlands is slightly less than twice the size of the state of New Jersey. The Netherlands extends 312 km (194 mi) N–S and 264 km (164 mi) E–W. The land area increases slightly each year as a result of continuous land reclamation and drainage. The Netherlands is bounded on the E by Germany on the S by Belgium, and on the W and N by the North Sea, with a total boundary length of 1,478 km (918 mi), of which 451 km (280 mi) is coastline.

The capital city of the Netherlands, Amsterdam, is in the western part of the country.

## <sup>2</sup>TOPOGRAPHY

The country falls into three natural topographical divisions: the dunes, the lowlands or “polders” (low-lying land reclaimed from the sea and from lakes and protected by dikes), and the higher eastern section of the country. About 27% of the land lies below sea level. A long range of sand dunes on the western coast protects the low alluvial land to the east from the high tides of the North Sea, and farther east and southeast are found diluvial sand and gravel soil. The highest point of land, the Vaalserberg, is situated in the extreme south and is 321 m (1,053 ft) above sea level; the lowest point, 7 m (23 ft) below sea level, is Prins Alexanderpolder, an area of reclaimed land situated northeast of Rotterdam. The most extensive polder is that of East Flevoland in the province of Flevoland; it has an area of nearly 55,000 hectares (136,000 acres). Many dikes have been constructed along the lower Rhine and Meuse (Maas) rivers, as well as on a portion of the North Sea coast and along nearly the whole of the coast of the former Zuider Zee (formally called the IJsselmeer since its enclosure by a dike in

1932). There are many canals in the country, most of which have numerous locks.

## <sup>3</sup>CLIMATE

The Netherlands has a maritime climate, with cool summers and mild winters. The average temperature is 2°C (36°F) in January and 19°C (66°F) in July, with an annual average of about 10°C (50°F). Clouds generally appear every day, and in the winter months fog often abounds, while rainfall occurs frequently. Average annual rainfall is about 76.5 cm (30 in). The mild, damp climate is ideal for dairying and livestock raising, but the limited sunshine restricts the growing of food crops.

## <sup>4</sup>FLORA AND FAUNA

Plants and animals that thrive in temperate climates are found in the Netherlands. The most common trees are oak, elm, pine, linden, and beech. The country is famous for its flowers, both cultivated varieties (best known among them the Dutch tulip) and wild flowers such as daisies, buttercups, and the purple heather that blooms on the heaths in September. Birds are those characteristic of Western and Central Europe, with large numbers of seagulls swarming over the coastal areas from time to time. Many kinds of fish abound along the North Sea coast and in the lakes and rivers. Wild or large animals are practically nonexistent. As of 2002, there were at least 55 species of mammals, 192 species of birds, and over 1,200 species of plants throughout the country.

## <sup>5</sup>ENVIRONMENT

In recent years, as a result of rapid population and economic growth, the government has placed increased emphasis on preservation of the natural environment. One key concern is the pressure put on the countryside, traditionally the domain of the smallholder, by the demands of modern mechanized agriculture and the needs of a large urban population for recreational areas and waste disposal. To help solve this environmental problem, the

government has instituted comprehensive land-use planning by means of a system of zoning that indicates the priorities for land use in each zone. Air and water pollution are significant environmental problems in the Netherlands.

The nation has one of the world's highest levels of industrial carbon dioxide emissions, which totaled 155 million metric tons in 1996. Efforts at controlling air pollution reduced sulphur dioxide emissions between 1980 and 1990 from 490,000 tons to 240,000 tons. In 2000, the total of carbon dioxide emissions was at 138.9 million metric tons. Severe pollution of the country's rivers results from industrial and agricultural pollution, including heavy metals, organic compounds, nitrates, and phosphates.

The Netherlands has about 11 cu km of renewable water resources, of which 61% of the annual withdrawal is used for industrial purposes. Solid waste in the nation's cities has been reported at an average of 7.6 million tons yearly. Aggravating the situation are the prevailing southwesterly winds, which carry the pollutants from coastal industries inland, and the great rivers that carry pollution into the Netherlands from originating countries farther inland.

In 1971, the Ministry of Health and Environment was established; a countrywide system of air pollution monitoring by the National Institute of Public Health has been in place since 1975. Since the mid-1970s, discharges of heavy metals into industrial wastewater and emissions of most major air pollutants from industrial use of fossil fuels have been substantially reduced. Progress has also been recorded in reducing automotive emissions. An excise tax surcharge on gasoline and diesel fuel was imposed for pollution abatement in 1981.

As of 2003, 14.2% of the country's total land area was protected, including 49 Ramsar wetland sites. According to a 2006 report issued by the International Union for Conservation of Nature and Natural Resources (IUCN), threatened species included 9 types of mammals, 11 species of birds, 7 species of fish, 1 type of mollusk, and 6 species of other invertebrates. Endangered species include Atlantic sturgeon, slender-billed curlew, Atlantic ridley, and Spengler's freshwater mussel.

## 6 POPULATION

The population of Netherlands in 2005 was estimated by the United Nations (UN) at 16,296,000, which placed it at number 59 in population among the 193 nations of the world. In 2005, approximately 14% of the population was over 65 years of age, with another 19% of the population under 15 years of age. There were 99 males for every 100 females in the country. According to the UN, the annual population rate of change for 2005–10 was expected to be 0.4%, a rate the government viewed as satisfactory. The projected population for the year 2025 was 16,934,000. The population density was 399 per sq km (1,033 per sq mi), with over 45% of the population concentrated in the three most densely populated provinces: Utrecht, North Holland, and South Holland.

The UN estimated that 62% of the population lived in urban areas in 2005, and that urban areas were growing at an annual rate of 1.04%. The constitutional capital, Amsterdam, had a population of 705,000 in that year. The Rotterdam metropolitan area had 1,112,000 inhabitants. Other major cities and their estimated populations include The Hague ('s Gravenhage; Den Haag), which is the seat of government, 472,087; Utrecht, 275,362; Eindhoven,

209,286; Tilburg, 200,251; Groningen, 181,020; and Haarlem, 150,213.

## 7 MIGRATION

In the past although the government encouraged emigration to curb overpopulation, more people migrated to the Netherlands than have left the country. Rapid economic growth in the 1960s drew many unskilled laborers from Mediterranean countries, and during the 1970s many people left Suriname for the Netherlands when the former Dutch colony became independent. At first both groups settled mainly in the western region, but after 1970 the pattern of internal migration changed, as increasing numbers left the western provinces to settle in the east and south. The traditional pattern of migration from the countryside to the cities has likewise been altered, and since the 1970s the trend has been largely from the larger cities to small towns and villages. By 2003 it was becoming harder for asylum migrants to find work. In addition, in 2004, employer groups asked for the streamline of admissions for skilled foreigner workers.

In 1990, some 57,344 persons left the Netherlands, of which 36,749 were Dutch nationals. In the same year, 81,264 immigrants arrived in the Netherlands, representing an increase of 24% over 1989. In 2002 the top 10 migrant-sending countries were Turkey, the Netherlands Antilles and Aruba, Morocco, Germany, the United Kingdom, China (excluding Taiwan), Angola, Suriname, and the United States. However, in 2003 for the first time since 1982, there were more emigrants (104,800) than immigrants (104,500). In that same year, the percent of foreign-born broke down as follows: 17.6% from Africa (mainly Morocco); 21.2% from the Americas (mainly from the Netherlands Antilles and South America); 34.3% from Asia (mainly from Indonesia); and 26.1% from Europe (with Germans the largest group). However, the large numbers of migrants from the Antilles has been decreasing, while emigration to these countries has increased. The number of Turks and Moroccans returning to their country of origin has been increasing between 2000 and 2004.

Since the election of a conservative government in 2002, the Dutch integration policy of multiculturalism (where all cultures were considered of equal value and there was no need for foreigners to integrate into Dutch society) was being eroded with new policies requiring immigrants to pass a test of Dutch language and culture. After the death of filmmaker Theo Van Gogh in 2004 at the hands of a Dutch-born man of Moroccan descent, a law was passed that made being a member of a "terrorist" organization a crime. By 2005, new policies included integration exams for foreign residents under age 65 with less than eight years of schooling in the Netherlands. In 2004, about 5.7% of Dutch residents were Muslim. According to *Migration News*, in 2005 Moroccan and Turkish groups created a working group, "Genoeg is genoeg" (Enough is enough), to coordinate a campaign against these hard-hitting immigration and integration policies.

At the beginning of 1996, there were 72,000 recognized refugees and 23,000 applications for asylum. By 1998, as many as 45,217 asylum applications were submitted. In 1999, 4,060 people were evacuated from Macedonia to the Netherlands. Following the trend in the 25 countries of the European Union, the Netherlands in 2004 had the lowest number of asylum seekers since 1988. In 2004, the United Nations High Commissioner for Refugees (UNHCR) had

LOCATION: 50°45' to 53°52' N; 3°21' to 7°13' E. BOUNDARY LENGTHS: Germany, 577 kilometers (358 miles); Belgium, 450 kilometers (280 miles); North Sea coastline, 451 kilometers (280 miles). TERRITORIAL SEA LIMIT: 12 miles.

a total of 155,257 persons of concern in the Netherlands: 126,805 refugees and 28,452 asylum seekers. The main countries of origin for refugees were Iraq (28,640), Afghanistan (26,437), Bosnia and Herzegovina (19,943), and Somalia (13,046).

In 2005, the net migration rate was an estimated 2.8 migrants per 1,000 population.

### 8 ETHNIC GROUPS

The Dutch are an ethnically homogeneous people descended from Frankish, Saxon, and Frisian tribes. Ethnic homogeneity slightly changed as a result of the arrival of some 300,000 repatriates and immigrants from Indonesia, mostly Eurasian, and more than 140,000 from Suriname. The influx of Turks and other workers

from the Mediterranean area has further added to the ethnic mix. The most recent estimates indicate that about 80% of the total population are Dutch; the principal minority groups are Turkish, Moroccan, Surinamese, and Antillean.

## <sup>9</sup> LANGUAGES

Dutch and Frisian are the official languages. Frisian, the native language of about 300,000 persons, is closely related to the Anglo-Saxon tongue but has many points in common with Dutch, which belongs to the Germanic language group. There are six Dutch dialects. Many Netherlanders speak and understand English, French, and German, which are taught in secondary schools.

## <sup>10</sup> RELIGIONS

Dutch society is becoming increasingly secular. According to the Social Cultural Planning Bureau, church membership has steadily declined from 76% in 1958 to 41% in 1995. Only about 26% of those claiming a religious affiliation are active in their religious community. According to a 2004 report, an estimated 31% of the population were nominally Roman Catholics, 14% were Dutch Reformed, 6% were Muslim, 6% were Calvinist Reformist, 3% were non-Christian (Hindu, Jewish, or Buddhist); and about 40% were atheist or agnostic.

The Dutch Reformed Church, whose membership has declined by more than 60% since 1950, is the largest Protestant denomination. The Calvinist Reformed Church is the second-largest Protestant group. Other Protestant denominations include Baptist, Lutheran, and Remonstrant. The Jewish community has less than 25,000 members. The Muslim community is primarily of the Sunni branch. Many of them are migrant workers from Morocco and Turkey or immigrants from other countries such as Iraq, Somalia, and Bosnia. There are about 95,000 Hindus, primarily from Suriname. The Hindu based movements of Ramakrishna, Hare Krishna, Sai Baba, and Osho are also represented. About 17,000 people are Buddhist.

## <sup>11</sup> TRANSPORTATION

Merchant shipping has always been of great economic importance to the seagoing Dutch. The Netherlands Maritime Institute is internationally famous, and the Dutch ship-testing station at Wageningen is known for its research in marine engineering. The Dutch merchant marine had 558 ships (of 1,000 GRT or over) totaling 4,796,460 GRT in 2005. Emphasis has been placed on the development of new vessels suitable for container transport and on improving the Dutch tanker fleet. Rotterdam is the Netherlands' chief port and the world's largest. There are also ports and harbors at Amsterdam, Delfzijl, Dordrecht, Eemshaven, Groningen, Haarlem, IJmuiden, Maastricht, Terneuzen, and Utrecht.

In 2004, there were 5,046 km (3,136 mi) of navigable waterways of which 3,745 km (2,327 mi) are canals and are capable of handling vessels of up to 50 tons.

The railway system in 2004 consisted of 2,808 km (1,744 mi) of standard gauge rail lines, of which 2,061 km (1,280 mi) was electrified. Passenger transport on railways is subsidized as part of the national policy for promoting public transport. Public transport is provided for urban areas by municipal and regional transport companies, and minibus service in rural areas has ensured public transport for all towns with 1,000 residents or more. Also in

2001, there were 116,500 km (72,393 mi) of roadways, of which 104,850 km (65,153 mi) were paved, including 2,235 km (1,389 mi) of expressways. In 2003 there were 7,151,000 passenger cars and 1,080,000 commercial vehicles in use. The state subsidizes the construction of urban and rural cycle paths.

In 2004, there were an estimated 28 airports. In 2005 a total of 20 had paved runways, and there was also one heliport. Principal airports include Schiphol at Amsterdam, Reina Beatrix at Aruba, and Hato at Curacao. The world's first airline from the standpoint of continuous corporate existence and operation is Royal Dutch Airlines (Koninklijke Luchtvaart Maatschappij-KLM), which began regularly scheduled operations in 1920. The Netherlands government owns a large part of the outstanding capital stock. KLM serves some 115 cities in 70 countries. Also in 2003, about 23.455 million passengers were carried on domestic and international flights.

## <sup>12</sup> HISTORY

When, in about 55 BC, Julius Caesar conquered a large part of the lowlands near the mouths of the Rhine and Meuse (Maas) rivers, this region was populated by Celtic and Germanic tribes. To the north of the Rhine delta, several Germanic tribes had settled, among which the Batavi and the Frisians were the most important. The Batavi served with the Roman legions until they rebelled in AD 70, but even after the revolt was quelled, Batavian soldiers fought for Rome. About 300 years later, successive waves of powerful Germanic tribes, such as the Salic or West Franks, invaded this region, called the Low Countries, and gradually pushed the Frisians back to the east coast of the North Sea, except in the extreme northern section of the mainland where Saxons had settled. By the time of Charlemagne (742–814), the Saxons and Frisians had been completely conquered by the West Franks, and the Frankish language had replaced the languages of the Germanic tribes.

Soon after the death of Charlemagne and the disintegration of his realm, several duchies and counties were founded in the Low Countries by local leaders. With the coming of the Middle Ages, Holland (now the North and South Holland provinces) became the most important region and extended its power and territory under Count Floris V (r.1256–96). The ancient bishopric of Utrecht was another important principality. As the Middle Ages drew to a close, individual cities such as Amsterdam, Haarlem, and Groningen rose to eminence, together with the Duchy of Gelderland. In the 15th century, the dukes of Burgundy acquired, by various means, most of the Low Countries. Upon the extinction of the male line of the Burgundian dynasty and the marriage of Mary of Burgundy and Archduke (later Emperor) Maximilian I in 1477, however, the Austrian house of Habsburg fell heir to the lands.

### The Habsburgs

Mary's son, Philip of Habsburg, married Joanna of Castile, heirless to the Spanish throne, and their son, Charles, became King Charles I of Spain in 1516 and Holy Roman Emperor Charles V in 1519. In 1547, he decreed the formal union of the Netherlands and Austria, and in 1549, the union of the Netherlands and Spain. By the end of his reign in 1555, he was master of the Low Countries. His son, Philip II, concentrated his efforts on the aggrandizement of Spain. To bring the Low Countries under his direct control, he tried to stamp out the rising force of Protestantism and suppressed

the political, economic, and religious liberties long cherished by the population. As a result, both Roman Catholics and Protestants rebelled against him under the leadership of William the Silent, prince of Orange, who by marriage had acquired large properties in the Netherlands.

For 10 years, the 17 provinces comprising the Low Countries united in a common revolt. Much of the area was freed in 1577, with William as the acknowledged ruler, but not even his moderation and statesmanship sufficed to keep the northern and southern provinces united. In 1578, the southern region (now Belgium) began to turn against William. In 1579, the northern provinces concluded the Union of Utrecht, in which the province of Holland was the most prominent. The Union, or United Provinces, carried on the fight against Spain, and William was the soul of the resistance until his death by assassination in 1584. William's son Maurits, governor (*stadtholder*) of the republic from 1584 to 1624, carried on a successful campaign against Spain, but final recognition of Dutch independence by the Spanish government was not obtained until the end of the Eighty Years' War with the Treaty of Westphalia (1648). Meanwhile, the southern provinces remained loyal to Spain and to the Roman Catholic Church, and were thereafter known as the Spanish Netherlands.

Independence brought mixed success in the 17th century for the United Provinces. Dutch prosperity was nourished by settlements and colonies in the East Indies, India, South Africa, the West Indies, South America, and elsewhere. The government was oligarchic but based on republican and federative principles. The Dutch were noted for their religious freedom, welcoming religious refugees—Spanish and Portuguese Jews, French Huguenots, and English Pilgrims.

While they became a leading commercial and maritime power, controversy over the leadership, and external economic and military threats complicated political and economic stability. Trade and territory disagreements with England resulted in the First Anglo-Dutch War that began in 1652 but ended with the Treaty of Westminster in 1654. The English were quick to attack again, beginning the Second Anglo-Dutch War, which ended with successful Dutch attacks, but also in the loss of colonial possession in North America—of the area that now surrounds New York City—via a trade-off under the 1667 Treaty of Breda.

Arts, sciences, literature, and philosophy flourished alongside trade and banking during the Dutch “golden era.” In 1672, however, England declared war on the Republic, igniting the Third Anglo-Dutch War; France, Münster, and Cologne soon followed in their own attack. The new *stadtholder* William III rose out of what is known as the “Disastrous Year” to triumphantly end the war with England in 1674 and lead a coalition against the aggressive France of Louis XIV. William III (r.1672–1702), great-grandson of William the Silent and grandson of the English King Charles I and his English wife, Mary, were invited by the English Parliament to occupy the British throne in 1688, but they continued to take keen interest in Dutch affairs. The Dutch republic of which William had been governor survived for nearly a century after his death. Its position was continually threatened, however, by intense rivalries among and within the provinces. Four naval wars with Britain from the middle of the 17th century to the end of the 18th also sapped Dutch strength. In 1795, a much-weakened republic was overrun by revolutionary French armies.

After the brief Napoleonic occupation, the great powers of Europe at the Congress of Vienna (1814–15) set up a new kingdom of the Netherlands, composed of the former United Provinces and the former Spanish or Austrian Netherlands, and installed a prince of the house of Orange as King William I. The constitution that was founded in 1814 was last revised in 1983. In 1830, a revolt by the southern provinces resulted in the establishment of the kingdom of Belgium. Thereafter, the much-reduced kingdom was mainly concerned with domestic problems, such as the school conflict over secular versus religious instruction, social problems stemming from the industrialization of the country, and electoral reforms.

In foreign affairs, relations with Belgium were gradually improved after a decade of war and tension following Belgian independence, and Dutch claims to the principality of Luxembourg ended with the death of William III in 1890.

### The World Wars to the Present

Foreign policies based on neutrality successfully met their test in World War I. Although the Netherlands mobilized their army, they remained neutral, even as the Germans invaded Belgium and all the surrounding states were at war.

The Netherlands again declared their neutrality when World War II erupted in 1939. Neutrality was preserved until the German World War II war machine overran the country in May 1940. Queen Wilhelmina (r.1890–1948) refused to surrender to the Germans, and instead fled to Britain with other officials of her government. Although Dutch resistance lasted only five days, destruction was widespread; nearly the whole of downtown Rotterdam was wiped out, and the cities of Arnhem and Nijmegen suffered great damage. In addition, Dutch factory equipment was carried away to Germany, bridges and railroads were blown up or removed, cattle were stolen, and part of the land was flooded. The Dutch withstood severe repression until their liberation by Allied forces in May 1945. Wilhelmina abdicated in 1948 and was succeeded by her daughter, Juliana (r.1948–80).

The East Indies, most of which had been under Dutch rule for over 300 years, were invaded by Japanese forces in January 1942. After Japanese troops continued through the territory, the Dutch surrendered in March when Japanese arrived on Java. In 1945, a group of Indonesians proclaimed an independent republic and resisted Dutch reoccupation. After four years of hostilities and following UN intervention, the Netherlands recognized the independence of Indonesia in December 1949. Suriname (formerly Dutch Guiana), controlled by the Netherlands since 1815, became an independent nation on 25 November 1975. This Dutch colonial legacy was the root cause of several violent outbreaks during the late 1970s, as a group of South Moluccans, a few of the 40,000 Moluccans living in the Netherlands, used terrorism on Dutch soil to dramatize their demand for the independence of the South Molucca Islands from Indonesia. The Netherlands Antilles and Aruba continue to be dependent areas.

As for many western countries, the 1960s and 1970s brought extensive cultural and social change. Traditional class and religious lines that had supported separate education and social status were erased, leading to significant change for women's rights, sexuality, economic, and environmental issues.

Reform of the social security system was the major political issue in the 1990s, along with efforts to reduce public spending. Years of administrative tinkering with the social security system has reduced the number of claimants, increased labor force participation, and generated a central government budget surplus of 1% of GDP in 2000. The budget surplus prompted heated cabinet discussions as the Labor Party wished to use the extra money for redistribution while the neo-liberal conservatives hoped to lower tax rates. Buyant growth rates of more than 3% in the period 1996–2001 brought down the official unemployment level to 2.7%. However, the global economic downturn that began in 2001 was one cause of the Netherlands' shrinking economy in late 2002 and early 2003. The government also passed a number of radical social measures that received parliamentary approval in recent years including conditions for administering euthanasia, legalization of prostitution, legalization of gay marriages, and laws banning discrimination.

A founder of the European Coal and Steel Community, the Netherlands became part of the Economic and Monetary Union and strongly supports an independent European central bank, low inflation, and stable currency. It hosted two different intergovernmental conferences of the European Union and chaired the finalization of the Treaty of European Union (Maastricht Treaty) in 1991 and the Amsterdam Treaty in 1997.

In May 2002, Pim Fortuyn, an anti-immigration leader of his own political party, was assassinated by a single gunman. His party, List Pim Fortuyn, came in second in the 15 May 2002 parliamentary elections. The conservative Christian Democrats, led by Jan Peter Balkenende, came in first, and Balkenende became prime minister of a center-right coalition government. In October, Balkenende's government collapsed following disagreements within the List Pim Fortuyn Party. Elections were held on 22 January 2003, and the Christian Democrats narrowly defeated the Labor Party in the Second Chamber. After 125 days, a coalition government was formed comprising the Christian Democrats, the free-market liberal People's Party for Freedom and Democracy, and the socially liberal Democrats.

The Netherlands gave political support to the military action taken by the United States and United Kingdom against Saddam Hussein's regime in Iraq in 2003. Although the Netherlands has a history of open immigration and integration, the increased controversies in Europe surrounding Islamic fundamentalism and immigration have plagued it as well. On 2 November 2004, filmmaker and publicist Theo van Gogh was assassinated reportedly by a Dutch-Moroccan Islamic youth group.

Queen Juliana abdicated in 1980 in favor of her daughter, Beatrix. Juliana died 20 March 2004. In 1966, Beatrix had married Claus von Amsberg, a German diplomat, and his title remained that of Prince of the Netherlands when Beatrix became Queen. Their firstborn son, and Crown Prince, Willem-Alexander was born in 1967. Beatrix and Claus von Amsberg had two other sons, Johan Friso and Constantijn, before Prince Claus's death in 2002. Prince Willem-Alexander has two daughters with his wife, Princess Máxima: Princess Catharina-Amalia was born 7 June 2003, and Princess Alexia was born 26 June 2005.

### <sup>13</sup> GOVERNMENT

The Netherlands is a constitutional monarchy, under the house of Orange-Nassau. The monarch and the Council of Ministers together are called the Crown, and is the center of executive power. The prime minister is the active head of government, is a member of the Council of Ministers, the head of the cabinet, and usually the leader of the largest party within the ruling party coalition. Executive power is also shared with the cabinet, which must have the support of a majority in the parliament. Cabinet ministers may not be members of the parliament. The Council of State, instituted as an advisory body for the government in 1532, is appointed by and presided over by the monarch. It is composed of a vice president, councilors (28 maximum), and honorary members (25 maximum). The council considers all legislation proposed by the sovereign or the cabinet before it is submitted to the parliament. While functioning in an advisory capacity, the council has executive powers when it implements orders of the sovereign and it has judiciary powers when it acts in disputes and citizen appeals concerning the government.

Legislative power is exercised jointly by the crown and the States-General (Staten-Generaal), a bicameral parliament. The upper house (Eerste Kamer) consists of 75 members elected for four years by the provincial representative councils on the basis of proportional representation. The lower house (Tweede Kamer) has 150 members elected for four years directly by the people, also on the basis of proportional representation. Only the lower house has the right to introduce bills and to move amendments, but the upper house can accept or reject bills passed by the other chamber.

All Dutch citizens who have reached the age of 18 years and reside within the Netherlands have the right to vote. All citizens who have reached the age of 18 years are eligible for election to the States-General.

Every year on the third Tuesday in September, the session of the States-General is opened at the Hague by the monarch. In the speech from the throne, the government's program for the year is announced. The monarch acts as an adviser to the cabinet, may propose bills, and signs all bills approved by the legislature. Theoretically she could refuse to sign a bill, but this never occurs in practice because the cabinet is responsible for the actions of the ruler. Thus, if the queen should refuse to sign a bill, the cabinet must resign and she must then find a new cabinet acceptable to the parliament.

Immediately following elections, the monarch appoints a formateur to advise on the program and composition of the new cabinet, and form the Council of Ministers. If he fails to bring together a new ministry, a new formateur is appointed, and so on until a new cabinet has been formed.

### <sup>14</sup> POLITICAL PARTIES

Throughout the political history of the Netherlands, religion has played an important role. During World War II, strenuous efforts were made to reduce this role, but denominational parties continued to exercise considerable influence. However, since the mid-1960s the general trend has been toward the polarization of poli-

tics into conservative and progressive parties, and denominational parties have lost voter support.

The religious political party with the largest membership throughout the postwar period was the Catholic People's Party (Katholieke Volkspartij—KVP), which favored democratic government and a middle-of-the-road social policy. It began to lose votes in the 1960s and the KVP joined the Anti-Revolutionary Party (Anti-Revolutionaire Partij—ARP) and the right-wing Christian Historical Union (Christelijk-Historische Unie—CHU) to form the Christian Democratic Appeal (Christen-Democratisch Appèl—CDA) to contest the 1977 elections, and has since been a major political force. The Labor party (Partij van de Arbeid—PvdA) vied for political leadership with the KVP in the first decades of the postwar period, polling about the same number of votes in national elections until 1972, when the PvdA won a plurality of nearly 25% of the total vote and emerged as the dominant member of a centrist coalition government. The Labor Party, a social democratic party that resulted from the merger of three socialist and liberal parties, has appealed mainly to national interests rather than to socialist ones, although it does favor redistribution and solidarity. Since 1986, it has pursued de-radicalization and has moved to the political center. The conservative People's Party for Freedom and Democracy (Volkspartij voor Vrijheid en Democratie—VVD) advocates free enterprise, separation of church and state, and individual liberties.

Since 1965, discontent with the major political parties and erosion of party discipline have led to the establishment of change-oriented parties like Democrats 66 (Democraten 66—D66), which pushes for greater democratic accountability, political transparency, and involvement of the citizen in the policy process. Smaller parties include the left-wing Green Left (GroenLinks—GL), which is the product of a merger of socialist and ecology parties in 1991. Three small social conservative Calvinist parties have been at the heart of much political debate and change in the end of the 20th and beginning of the 21st century: the Political Reformed Party (Staatkundig Gereformeerde Partij—SGP) which was denied state funding in 2005 for prohibiting women from becoming full members, the Reformed Political Union (Gereformeerd Politiek Verbond—GPV) and the Reformatorian Political Federation (Reformatiorische Politieke Federation—RPF) merged in 2001 to form the far-right Christian Union (ChristenUnie), the fifth-largest party in 2005, that combines fundamental religious values on abortion, gay marriage, and euthanasia, with socially democratic views on economic, immigration, and environmental issues.

As no single party commands a majority in the States-General, the governing cabinet is a coalition of various party representatives, according to their numerical strength. In 1994, for the first time in 80 years, a coalition emerged which did not include a confessional party. The Labor party won a plurality of votes in spite of an absolute loss of votes. Its closest ally, D66, absolutely refused to join a coalition government with the Christian Democrats. In 1994, the first "purple" cabinet emerged, led by Wim Kok of the Labor party, and composed of D66 and the VVD. In 1998 the government fell after D66 failed to push through parliament a bill to make more use of referendums. A month later, in June 1998, voters brought back the purple coalition and Kok led another government of VVD, D66, and PvdA.

Willem Kok initially let it be known in various interviews that he would stand again in the 2002 election, greatly increasing the likelihood of another four years of Labor Party leadership. However, in April 2002, Kok's government resigned following an official report criticizing its role in the 1995 Srebrenica massacre in the former Yugoslavia, when some 100 lightly armed Dutch peacekeepers failed to stop Bosnian Serb forces from murdering around 7,000 Muslims.

Elections were held on 15 May 2002, and resulted in a victory for the Christian Democrats. A surprise showing was made by the List Pim Fortuyn (LPF); a political party formed just a month earlier by the anti-immigrant politician Pim Fortuyn. Fortuyn was assassinated just prior to the election, but his party came in second. Labor, the VVD, and D66 all suffered losses. Christian Democratic leader Jan Peter Balkenende became prime minister; however, his government collapsed in October 2002, and new elections were held on 22 January 2003.

Following the January 2003 elections, the 150 seats in the Second Chamber of the Legislature were distributed as follows: CDA, 28.6% (44 seats); PvdA, 27.3% (42 seats); VVD, 17.9% (28 seats); SP, 6.3% (9 seats); LPF, 5.7% (8 seats); GL, 5.1% (8 seats); D66, 4.1% (6 seats); the Christian Union (CU), 2.1% (3 seats); and the conservative Calvinist party Political Reformed Party (SGP), 1.6% (2 seats). The PvdA scored an increase of 19 seats over the May 2002 elections, and the LPF suffered a loss of 18 seats. After prohibitive disagreement in the formation of a CDA-PvdA cabinet, the center-right CDA, the conservative VVD, and the center-left D66 formed a coalition with Balkenende again as prime minister.

The next general elections were scheduled for May 2007.

## 15 LOCAL GOVERNMENT

Through 2005, the country was divided into 12 provinces, each governed by a locally direct-elected representative provincial council (*provinciale staten*). The size of the council depends on the number of inhabitants in the province. Members are elected for four-year terms. From among their members, the councils elect provincial executives (*gedeputeerde staten*) with six to eight members. Each province has a commissioner appointed by and representing the Crown.

The smaller municipalities (496 in 2003) are administered by municipal councils, which are elected directly for four-year terms by the local inhabitants and make local bylaws. The executive powers of the municipality are entrusted to a corporate board consisting of a burgomaster and two to six aldermen; the latter are elected from and by the council, while the burgomaster (mayor) is appointed by the Crown. The important function of flood control and water management is exercised by autonomous public authorities, some of which date as far back as the 13th century.

## 16 JUDICIAL SYSTEM

The judiciary is independent and the judges irremovable except for malfeasance or incapacity. Roman law still is basic, but the judicial system is largely patterned on that of France. There is no jury system, and the state rather than the individual acts as initiator of legal proceedings. Administrative justice is separate from civil and criminal justice and not uniform in dispensation.

The supreme judiciary body is the Supreme Court of the Netherlands (Court of Cassation). As of 2005 it was staffed by 24 jus-

tices. Its principal task is to supervise administration of justice and to review the judgments of lower courts. There are five courts of appeal (*gerechtshoven*), which act as courts of first instance only in fiscal matters. They are divided into chambers of three justices each. The 19 district courts (*arrondissementsrechtbanken*) deal as courts of first instance with criminal cases and civil cases not handled by the 62 subdistrict courts. Most of these courts are manned by single magistrates. In 2002, the subdistrict courts were incorporated administratively into the district courts; a subdistrict court section is now formed at these courts. There also are juvenile courts and special arbitration courts (for such institutions as the Stock Exchange Association and professional organizations).

Normally appointed for life, judges are usually retired at age 70.

## 17 ARMED FORCES

In 2005 there were 53,130 active personnel in the Netherlands' armed forces, with reserves numbering 54,400. The army numbered 23,150. Equipment included 283 main battle tanks, 569 armored infantry fighting vehicles, 94 armored personnel carriers, and 407 artillery pieces. The navy had 17,130 personnel including 3,100 marines. Its fleet included four tactical submarines and 14 surface combatants (six destroyers and eight frigates). The naval aviation unit of 950 was equipped with 10 maritime patrol aircraft and 21 antisubmarine/search and rescue helicopters. The air force has 11,050 active personnel plus 5,000 reservists subject to immediate recall. The air force had 108 combat capable aircraft and 30 attack helicopters. A paramilitary force known as the Royal Military Constabulary numbered 6,800 persons. The United States stationed about 303 personnel in the Netherlands. The Netherlands maintained forces abroad in Germany, Iceland, Italy and the Netherlands Antilles. The nation also participated in UN and peacekeeping missions in five other countries including Iraq and Afghanistan. The military budget in 2005 totaled \$9.7 billion.

## 18 INTERNATIONAL COOPERATION

The Netherlands is a founding member of the United Nations, having joined on 10 December 1945. It participates in ECE, ECLAC, ESCAP, and several nonregional specialized agencies, such as the FAO, the World Bank, IAEA, ILO, UNESCO, UNHCR, UNIDO, and the WHO. In addition, the Netherlands is a member of the WTO, the Asian Development Bank, the African Development Bank, the Council of Europe, the Euro-Atlantic Partnership Council, G-10 (Paris Club), the Western European Union, the European Union, NATO, OSCE, and OECD. The Netherlands is a permanent observer at OAS. The Netherlands is the home site of the International Court of Justice, Eurojust, Europol, the Organization for the Prohibition of Chemical Weapons, and the International Criminal Court.

On 1 January 1948, Belgium, the Netherlands, and Luxembourg established a joint customs union, Benelux; since that time, the three countries have freed nearly all of their mutual imports from quantitative restrictions. On 3 February 1958, the Benelux Economic Union was established to make it possible for each participating country to apply itself more intensively to the production for which it is best suited as well as to extend the total market for the member countries.

The Netherlands is a part of the Australia Group, the Zanger Committee, the European Organization for Nuclear Research (CERN), the Nuclear Suppliers Group (London Group), the Organization for the Prohibition of Chemical Weapons, and the Nuclear Energy Agency. In environmental cooperation, the Netherlands is part of the Antarctic Treaty; the Basel Convention; Conventions on Biological Diversity, Whaling, and Air Pollution; Ramsar; CITES; the London Convention; International Tropical Timber Agreements; the Kyoto Protocol; the Montréal Protocol; MARPOL; the Nuclear Test Ban Treaty; and the UN Conventions on the Law of the Sea, Climate Change and Desertification.

## 19 ECONOMY

The Netherlands has an advanced economy, which combines high per capita income with a fairly even income distribution. An industrial nation with limited natural resources, the Netherlands bases its economy on the importation of raw materials for processing into finished products for export. Food processing, metallurgy, chemicals, manufacturing, and oil refining are the principal industries. Agriculture is particularly important to the economy, as about 60% of total agricultural production is exported.

Because of its geographic position on the sea, outstanding harbor facilities, and numerous internal waterways, the Netherlands became a trading, transporting, and brokerage nation. A major role in the economy has always been played by the service industries, such as banks, trading companies, shipping enterprises, and brokerage and supply firms. The economy, being involved in international trade, is sharply affected by economic developments abroad—including fluctuations in prices of primary goods—over which the Netherlands has little or no control.

Growth in GDP averaged just under 3% per year during 1988–95 with exceptionally strong growth occurring in 1989 (4.8%) and particularly slow growth in 1993 (1.8%). Inflation was low, averaging about 2% a year between 1986 and 1998. The unemployment rate fell from 10.5% in 1985 to 8.4% in 1995, and has continued to fall steadily, reaching an estimated 6% in 2004. For the four years 1997 to 2000, real GDP growth averaged 4%, well ahead of most of Europe. Growth slowed due to the global economic slowdown of 2001 to 2.8% and was brought close to a standstill in 2002, with estimated growth of 0.3%. Real GDP growth averaged 1.2% over the 2000–04 period. GDP growth was estimated at 0.5% in 2005, but was forecast to pick up to 2% in 2006 and to 2.7% in 2007. Inflation jumped from 2.2% in 1999 and 2.6% in 2000 to a yearly average of 4.5% in 2001 due mainly to a hike in the VAT rate, and increases in gasoline and food prices. The inflation rate averaged 2.7% over the 2000–04 period. The inflation rate in 2005 was estimated at 1.6%; it was forecast to remain at that rate in 2006.

## 20 INCOME

The US Central Intelligence Agency (CIA) reports that in 2005 the Netherlands's gross domestic product (GDP) was estimated at \$500.0 billion. The CIA defines GDP as the value of all final goods and services produced within a nation in a given year and computed on the basis of purchasing power parity (PPP) rather than value as measured on the basis of the rate of exchange based on current dollars. The per capita GDP was estimated at \$30,500. The annual growth rate of GDP was estimated at 0.6%. The average in-

flation rate in 2005 was 1.6%. It was estimated that agriculture accounted for 2.1% of GDP, industry 24.4%, and services 73.5%.

According to the World Bank, in 2003 remittances from citizens working abroad totaled \$767 million or about \$47 per capita and accounted for approximately 0.1% of GDP.

The World Bank reports that in 2003 household consumption in Netherlands totaled \$208.63 billion or about \$12,878 per capita based on a GDP of \$511.5 billion, measured in current dollars rather than PPP. Household consumption includes expenditures of individuals, households, and nongovernmental organizations on goods and services, excluding purchases of dwellings. It was estimated that for the period 1990 to 2003 household consumption grew at an average annual rate of 2.8%. In 2001 it was estimated that approximately 17% of household consumption was spent on food, 7% on fuel, 2% on health care, and 13% on education.

## 21 LABOR

As of 2005, the Netherlands' labor force numbered an estimated 7.53 million. In 2002 (the latest year for which data was available), 74.1% were employed in services, 20.3% in manufacturing, 4% in agriculture, and the remainder in undefined occupations. The unemployed represented about 6.7% of the workforce in 2005, compared with 1.2% in 1970, and 13% in 1985.

As of 2005, workers in the Netherlands were allowed to organize and join unions, engage in collective bargaining and to exercise the right to strike. However, strikes are rare. Labor unions in 2005 accounted for about 25% of the country's workforce. However, collective bargaining agreements cover about 86% of the labor force. Antiunion discrimination is prohibited.

The law stipulates a 40-hour workweek, but in 2005 the average workweek was 30.6 hours (20 hours for part-time employees and 38.7 hours for full-time employees). The five-day workweek has been generally adopted. Workers receive workers' compensation, unemployment insurance, sick pay, payment for legal holidays, and paid vacations. The employment of women and adolescents for night work is forbidden. The minimum wage for adults in 2005 was \$1,517 per month, and was capable of providing a worker and family with a decent living standard. However, most workers earn more. There is a reduced minimum wage for workers under 23, which uses a sliding scale ranging from 35% of the adult minimum wage for a 16-year-old to 85% for those 22 years of age. The minimum age for employment is 16 years. These laws are effectively enforced.

## 22 AGRICULTURE

More than 27% of the total land area of the Netherlands is under seasonal or permanent crop production. Grasslands account for about 54% of all agricultural lands. Most farms are effectively managed and worked intensively with mechanical equipment. The many cooperatives have added to the efficiency of production and distribution.

Although agricultural production has decreased in recent years, labor productivity in Dutch agricultural and horticultural industries has risen sharply. The number of holdings declined by over 17% from the mid-1970s to the mid-1980s; in 2002 there were 89,580 agricultural holdings, of which 45% were smaller than 10 hectares (25 acres). In 2003 there were 108,230 full-time and 153,250 part-time workers in the agricultural labor force. The

crop output in 2003 was valued at almost €10.6 billion, fifth highest in the EU after France, Italy, Spain, and Germany.

Much of the soil in the east and southeast is poor. Moreover, large regions are so moist because of their low altitude that only grass can be grown profitably, a condition that has led to the enormous development of the dairy industry. The best land is found in reclaimed polders. Principal crops and output in 2004 (in thousands of tons) were sugar beets, 6,292; potatoes, 7,488; wheat, 1,224; barley, 288; rye, 17; and triticale, 19.

The Netherlands is famous for its bulbs grown for export, principally tulip, hyacinth, daffodil, narcissus, and crocus. Flower growing is centered at Aalsmeer (near Amsterdam), and nurseries are situated mainly at Boskoop. Bulb growing, done principally at Lisse and Hillegom, between Haarlem and Leiden, has been extended in recent years to areas of North Holland. In 2002, there were 11,793 horticultural holdings and land area for growing bulbs totaled 17,139 hectares (42,350 acres).

Since the beginning of the 20th century, the government has been helping the agrarian sector through extension services, the promotion of scientific research, and the creation of specific types of agricultural education. In the 1930s, an extensive system of governmental controls of agricultural production was introduced, and after World War II (1939–45), an even more active policy was initiated, which evolved into integrated planning covering practically every aspect of rural life. In recent years, the government has actively encouraged the consolidation of small landholdings into larger, more efficient units.

## 23 ANIMAL HUSBANDRY

World-renowned Dutch dairy products outrank all other agricultural produce, and livestock provides two-thirds of total agricultural value. In 2005 there were 3.86 million head of cattle, 11.1 million pigs, 1.2 million sheep, and 86 million chickens. Milk production in 2005 totaled 10.5 million tons. Meat production in 2005 was 2.35 million tons (including pork, 1,299,000; beef and veal, 388,000; and poultry, 646,000). Butter production was 102,000 tons; cheese, 671,000 tons.

Friesland is the most important region for the production of milk and butter. Excellent grazing lands and a long growing season have greatly helped the Frisian dairy industry, whose main support is the famed Frisian strain of cows. The making of cheese is connected with such famous brands as those named for Edam and Gouda, towns in the province of South Holland, and Alkmaar in North Holland.

In 2003, the value of animal products was €7.61 billion. The output of animal products has gradually been falling since 1996, when production was valued at €9.37 billion. The Netherlands regularly imports calves from the United Kingdom. In 1995, the Dutch Ministry of Agriculture, in response to the possible connection of bovine spongiform encephalopathy (BSE) in cattle to Creutzfeldt-Jakob disease in humans, responded with a program to destroy all imported UK veal calves. The total slaughter amounted to 64,000 calves and led to losses of approximately \$32 million to the livestock industry.

## 24 FISHING

Although no longer as important as it was in the 16th and 17th centuries, fishing still contributes substantially to the food sup-

ply. Annual fish consumption in the Netherlands is 21.9 kg (32.2 lb) per person. In 2003 the Dutch fishing fleet had 393 cutters, 17 trawlers, and 69 mussel dredgers; the total capacity of the fishing fleet that year was 195,307 gross tons. About half of the fish catch is landed at the ports of Scheveningen and IJmuiden. The Dutch fishing industry faces declining fish stocks and quota cuts from the EU that make profitability difficult because of excess capacity. In 2003, Dutch imports of fish products totaled \$1.7 billion and exports exceeded \$2.18 billion.

The total catch in 2003 was 593,305 tons, consisting primarily of mackerel, mussels, sardines, herring, plaice, and whiting. Shrimp, oysters, sole, and other saltwater fish were also caught.

## 25 FORESTRY

One of the least forested countries in Europe, the Netherlands produces only about 8% of its wood requirements. Woodland, chiefly pine, covers about 375,000 hectares (927,000 acres), or only 11.1% of the total land area, of which state forest areas comprise some 37%; private owners, 31%; provincial and local governments, 14%; and nature conservation organizations, 18%. Productive woodlands total about 230,000 hectares (580,000 acres); output of timber was approximately 1,026,000 cu m (36.2 million cu ft) in 2004. The Netherlands imports about 95% of its softwood lumber needs, mostly from Sweden, Finland, and Russia. Domestic sources of temperate hardwood lumber usually meet 20–30% of annual demand; production totaled 80,000 cu m (2.8 million cu ft) in 2004.

The Dutch wood industry is focused on the furniture, construction, packing, and pulp and paper sectors. The total turnover of the Dutch furniture sector in 2004 was almost €2 billion; the turnover in the Dutch pulp and paper industry was also around €2 billion. The Netherlands is the ninth biggest European producer of pulp and paper, annually producing 3.3 million tons of paper and paperboard at 27 sites, with over 70% exported to neighboring countries.

Afforestation has not kept pace with increasing consumption. The Dutch government would like to become at least 25% self-sufficient in wood fiber by 2025. In order to meet this goal, some 3.9 million cu m (137.7 million cu ft) of fiber would need to be produced annually (assuming current consumption trends). Currently, Dutch wood fiber production is only 1.2 million cu m (42 million cu ft). During 1990–2000, only 1,000 hectares (2,500 acres) of forest were planted. The government established a goal in 1994 of increasing forested land by 3,000 hectares (7,400 acres) annually until 2020.

## 26 MINING

The Netherlands was an important regional producer of natural gas and petroleum and played a major role as a transshipment center for mineral materials entering and leaving Europe—Rotterdam was the world's largest container port. The only other mineral of commercial importance was salt, and the only other mining operations left in the country were involved in the extraction of limestone, peat, and sand and gravel. The production of salt from the mines at Hengelo and Delfzijl was one of the oldest industries in the country; an estimated 5.0 million tons was produced in 2003 (various types), unchanged since 1999. Akzo Nobel Salt BV was the leading producer of salt. Magnesium chloride and oxide were produced in a plant at Veendam from extracted

salt brines. Also produced in 2003 were hydraulic cement, nitrogen, industrial sand, sodium compounds, and sulfur. No metals were mined, but an estimated 3 million tons of iron ore was sintered from imported ore in 2003, unchanged from 2000. Coal was mined in Limburg until 1974. Among the country's leading industries in 2003 were metal products, chemicals, petroleum, and construction, and chemicals and fuels were top export commodities.

## 27 ENERGY AND POWER

The Netherlands, which has little waterpower, depends mostly on natural gas and petroleum as energy sources.

Natural gas is The Netherlands' most abundant fossil fuel, with major fields located in the North Sea. As of August 2005, the North Sea region contained 169.8 trillion cu ft of natural gas, of which Norway and the Netherlands account for more than 75%. As of 1 January 2002, the Netherlands had proven natural gas reserves of 1.693 trillion cu m. In 2003, production of natural gas totaled 2.6 trillion cu ft. However, natural gas output has fallen as a result of government policy. The country's Natural Gas Law caps production at 2.68 trillion cu ft annually, between 2003 and 2007. From 2008 through 2013, production will be further limited to 2.47 trillion cu ft per year. This policy was instituted so that the country's natural gas reserves will be maintained for future use. In 2002, domestic consumption of natural gas totaled 1.764 trillion cu ft.

The Netherlands' second principal energy source is oil. As of 1 January 2002, the country's proven reserves of oil totaled 88.06 million barrels. In 2002, total oil production included 46,330 barrels per day of crude oil. Although oil output was up from 2000 at 89,000 barrels per day, the nation was still dependent on imported petroleum. In 2002, imports of crude and refined oil products averaged 2,266,990 barrels per day. Consumption of refined petroleum products in that year averaged 899,170 barrels per day. Exports of all petroleum products that year averaged 1,421,620 barrels per day. The Netherlands also re-exports two-thirds of all its imported petroleum in the form of refined oil products. Refinery output in 2002 averaged 1,723,250 barrels per day.

The Netherlands's demand for coal came to 14,803,000 short tons in 2002, all of it imported. Imports that year totaled 24,586,000 short tons; 10,210,000 short tons were re-exported.

Production of electric power in 2002 totaled 91.117 billion kWh, of which thermal power plants using oil and coal as fuel supplied 90% of the power generated. Nuclear power plants accounted for 4%, and other alternative sources 5.4%. Hydropower accounted for less than 1%. Nuclear generating capacity is provided chiefly by a 450 MW station in Borssele, Zeeland. As of 2002, the Netherlands was one of five European Union (EU) countries that had declared a moratorium on building new nuclear facilities. Consumption of electricity in 2002 was 101.138 billion kWh. Installed capacity in 2002 was 20.378 million kW.

## 28 INDUSTRY

Because of World War II and its consequences (the high rate of population increase and the severing of economic ties with Indonesia), drastic structural changes took place in the Dutch economy, and the further development of industry became important. Industry increased to such an extent that it produced 32% of GDP

in 1990. Since then, however, industrial production has declined, accounting for 24.5% of GDP in 2004.

Since World War II, the metallurgical industry in particular has made tremendous progress. Philips, the Dutch electronics giant, has become the greatest electrical products firm in Europe as well as one of the world's major exporters of electric bulbs and appliances. Unilever, the British-Dutch consumer products company, has grown to become one of the world's largest corporations. The Heineken brewing company is one of the world's largest brewing companies in terms of sales volume and profitability. More phenomenal has been the success of Royal Dutch/Shell, which began as a small concern in 1890 and grew to become one of the world's largest income producers. Rotterdam's suburb of Pernis has the largest oil refinery in Europe. Akzo Nobel produces healthcare products, coatings, and chemicals. DSM produces nutritional and pharma ingredients, performance materials, and industrial chemicals.

Pig iron is exported, produced from imported ore at the Velsen-Ijmuiden plant, situated where the canal from Amsterdam reaches the North Sea. The chemical industry has grown increasingly important, but the once prosperous textile industry in Enschede has declined because of foreign competition.

Industrial products include petroleum, metal and engineering products, and pharmaceutical products. The Netherlands produces electrical machinery and equipment (including computers and computer parts), and microelectronics. Agroindustries are important: the Netherlands is one of the world's three largest exporters of agricultural produce. Dairy farming and market gardening are the major agricultural industries. The Netherlands also produces cigarettes, beer, canned fish, cocoa and cocoa products, coffee, tea, sugar, candies, biscuits, and potato flour.

## 29 SCIENCE AND TECHNOLOGY

Advanced scientific research and development (R&D) has provided the technological impetus for the Netherlands' economic recovery since World War II. Dutch universities have traditionally carried out fundamental scientific research, and the government has promoted research activities through the Netherlands Organization for Scientific Research, established in 1988, and the Netherlands Organization for Applied Scientific Research, established in 1930. It also has supported scientific organizations such as the Energy Development Corp. and Energy Research Foundation, Aerospace Development Agency, National Aerospace Laboratory, and Netherlands Maritime Institute.

The highly developed electrotechnical industry produces computers, telecommunications systems, electronic measurement and control equipment, electric switching gear and transformers, and medical and scientific instruments. Dutch firms designed and constructed the Netherlands' astronomical satellites and play a major role in the European Space Agency. The important aerospace industry is led by the world-famous firm of Fokker, which produced Europe's bestselling passenger jet aircraft, the F-27 Friendship, and has been active in the consortium that developed the European Airbus. In 2002, high-tech exports were valued at \$33.667 billion and accounted for 28% of manufactured exports.

Expenditures on scientific R&D in 2001 totaled \$8.6 trillion, or 1.89% of GDP. Of that amount, 51.8% came from the business sector, followed by government sources at 36.2%. Foreign sources ac-

counted for 11%, with higher education at 1.1%. In that same year, there were 2,826 scientists and engineers and 1,424 technicians per million people that were engaged in R&D.

Among the Netherlands' 39 scientific and technical learned societies, the most prominent is the Royal Netherlands Academy of Sciences, founded in 1808. The country also has 37 scientific and technical research institutes. In Leiden are located the National Museum of Natural History and the National Museum of History of Science and Medicine. The Netherlands has 16 universities offering courses in basic and applied sciences. In 1987-97, science and engineering students accounted for 39% of university enrollment. In 2002, of all bachelor's degrees awarded, 16.4% were in the sciences (natural, mathematics and computers, engineering).

## 30 DOMESTIC TRADE

A considerable but declining part of Dutch retail business is still conducted by small enterprises, which are usually owner operated. Some of the larger department stores in the cities have branches in small towns, and there are several nationwide supermarket chains. Cooperatives and associations are important in both purchasing and producing.

Amsterdam is the chief center for commerce and trade, with Rotterdam and The Hague next. Many companies use the Netherlands as a distribution center for European markets. Terms of sale usually call for payment within 90 days. A value-added tax of 19% applies to most goods.

Business offices are generally open from 9 AM to 5 PM on weekdays and are closed Saturdays. Retail stores usually open between 8 and 9 AM and close between 6 and 7 PM Tuesday through Friday. On Mondays, many shops are closed in the mornings. Most cities have late-night shopping (until 9 PM) on Thursdays or Fridays. In the main cities, many shops are open on Sunday from 12 to 5 PM.

The country's most important trade fair is held at Utrecht, twice each year, in the spring and fall.

## 31 FOREIGN TRADE

The Dutch have traditionally been a powerful force in international trade. The Netherlands is the world's eighth-largest exporting nation. As exports and imports of goods and services both ac-

SOURCE: 2003 *International Trade Statistics Yearbook*, New York: United Nations, 2004.

count for well over 60% of GDP, the backbone of Dutch prosperity is foreign trade. Rotterdam is Europe's largest port (and third in the world in 2005, after Shanghai and Singapore), handling twice as much cargo as its nearest European rival, Antwerp. The Netherlands' geographical position as a key hub of Europe's transportation system and the small size of its domestic market have made the Dutch economy one of the most open and outward-looking in the world.

Principal Dutch exports in the early 2000s were manufactured goods, machines, electronics, chemicals, petroleum products, natural gas, and foods. Chief imports are manufactured products, machines, crude petroleum, chemicals, and clothing. From 1981 through 2005, the Netherlands experienced trade surpluses each year.

### 3<sup>2</sup> BALANCE OF PAYMENTS

Dutch merchandise and services exports have grown to represent more than 60% of GDP, making the Dutch economy one of the most internationally oriented in the world. Economic expansion of the Netherlands in the period immediately after World War II paralleled a generally favorable balance of payments. After occasional and minor deficits on current accounts during the mid-1960s, a major deficit occurred in 1970. Since then, the current-accounts balance has generally registered a surplus, despite increased costs of oil imports during the 1970s and beginning in 2005. The Netherlands' reliance upon exports that are resistant to recessions (such as some food and agricultural products, and semifinished products such as chemicals) has protected the Dutch economy from weaker demand from Germany and other EU countries during recessions. In 2004, exports totaled \$311.2 billion and imports \$280.5 billion, resulting in a trade surplus of \$30.7 billion. The current account surplus was \$13.5 billion.

### 3<sup>3</sup> BANKING AND SECURITIES

The Netherlands Bank, nationalized in 1948, is the central bank. It issues the currency and supervises the privately owned banks. Since the 1950s, the Netherlands Bank had used reserve regulations and the central bank discount rate as instruments of monetary policy, but with the introduction of the European Central Bank, those responsibilities are now more centralized for all of the EU. The Dutch financial services industry has a long and distinguished history and has introduced many banking innovations to the world. Since the late 1980s, the sector has undergone a revolution. A common strategic desire to expand and to gain more financial strength, combined with deregulation of the financial market, prompted several bank mergers and the formation of financial conglomerates of banks and insurance groups. As a result, the number of dominant participants in the market has diminished to a handful, each providing the full range of financial services. The Netherlands Middenstands-bank (NMB) and the state-owned Postbank merged to form the NMB Postbank in 1989, which in turn merged again with the Nationale Nederlanden insurance group to form the International Nederlanden Groep (ING) in 1991. The large ABN and Amro commercial banking groups joined up to form ABN-Amro in 1990. VSB-bank, a conglomerate of savings banks, teamed up with the Ameu insurance group and Belgium's AG insurance group in 1990 to form the Dutch-Belgian Fortis group. Rabobank, a large cooperative group which

SOURCE: *Balance of Payment Statistics Yearbook 2004*, Washington, DC: International Monetary Fund, 2004.

specializes in the provision of agricultural credits and mortgage facilities but has been rapidly expanding its product portfolio in recent years, took a 50% share in the Robeco investment group in 1996. The robust nature of the Dutch banking industry came to the fore once again in December 1999. Although it ultimately failed, ING made headlines through its attempted takeover of the French *Crédit Commercial de France* (CCF). Had ING's bid succeeded, it would have been the first successful merger of a French bank with another European financial institution.

The International Monetary Fund reports that in 2001, currency and demand deposits—an aggregate commonly known as M1—were equal to \$145.3 billion. In that same year, M2—an aggregate equal to M1 plus savings deposits, small time deposits, and money market mutual funds—was \$409.3 billion.

The Netherlands has the oldest stock exchange in the world, the Amsterdam Stock Exchange (ASE); founded in the early 17th century, it is now one of the largest stock exchanges in operation. The issuance of new securities on the exchange is supervised by the Netherlands Bank, acting in cooperation with the commercial banks and stockbrokers.

The comparatively large share of foreign security listings and capital supply gives the ASE an international importance disproportionate to its size. Its strong international orientation is also reflected in the fact that its share of Europe's total market capitalization far outweighs the relative importance of the Dutch economy. The multinational nature of the major Dutch companies, which has led to their shares being quoted on a number of international stock markets, means that stock price levels on the ASE are heavily influenced by developments elsewhere. The three largest companies, Royal Dutch Shell, Unilever, and ING, account for around 50% of total stock market capitalization.

In order to enhance the international competitiveness of the ASE, many reform measures have been taken in the past few years, with varying degrees of success. These include the introduction of

a new electronic trading system open to foreign-based brokers, a division of the market into a wholesale and a retail segment, and a revamp of the exchange's organizational structure. Moreover, in early 1996, under pressure from the government, the stock exchange introduced an arrangement that aims to reduce the influence of the wide range of anti-takeover devices quoted corporations are permitted, which has long been considered as one of the exchange's most important shortcomings. Under the new arrangement, a prospective buyer who has gained 70% of a company's shares can turn to the Amsterdam Court of Justice after a period of 12 months.

On 1 January 1997, the Amsterdam Exchanges (AEX) was formed by the merger of the Amsterdam Stock Exchange (ASE) and the city's European Options Exchange (EDE). From approximately 680 at the end of January, the AEX index of 25 leading shares rose to 700 on 11 February 1997 and sped on to almost 775 by mid-March before suffering a correction prompted by the release of disappointing financial results by a brewing company, Grolsch, and fears of interest rate increases in the United States. In 1998 the world capitalization rankings placed the equity market eighth in the world, while the volume of options contracts at the options market ranked fourth. By early 2003, however, the AEX index had dropped to 303.21, down 39% from the previous year. As of 2004, a total of 177 companies were listed on the EURONEXT Amsterdam exchange, which had a market capitalization of \$622.284 billion. In 2004, the AEX rose 3.1% from the previous year to 348.1.

### 34 INSURANCE

There are two sectors of the insurance industry in the Netherlands: the companies operating under control laws set down by the EC and supervised by the government, and the companies (mutuals, reinsurance, marine and aviation) not under official supervision. Compulsory third-party motor insurance has been in effect since 1935. In addition, insurance for workers, hunters, nuclear facilities, and pensions are compulsory. In 2003, the value of all direct insurance premiums written totaled \$50.266 billion, of which life insurance premiums accounted for \$25.371 billion. In 2002, the top nonlife insurer was Achmea Zorg, which had gross written nonlife premiums of \$1,196.1 million, while the leading life insurer that same year was Nationale Nederlanden Leven, with gross written life insurance premiums of \$4,236.9 million.

### 35 PUBLIC FINANCE

The government has gradually cut the deficit from 10% of GDP in 1983 to 2.75% in 1996, slightly below the 3% Maastricht criteria for European Economic and Monetary Union (EMU) in 1999. The deficit is largely financed by government bonds. Financing is also covered by issuing Dutch Treasury Certificates, which replaced a standing credit facility for short-term deficit financing with the Netherlands Central Bank. Under the Maastricht Treaty, the Netherlands Central Bank was abolished in 1994. Although the private sector is the cornerstone of the economy, the government plays a vital role in the Netherlands' economy. It decides microeconomic policy and tax laws, as well as working toward structural and regu-

SOURCE: *Government Finance Statistics Yearbook 2004*, Washington, DC: International Monetary Fund, 2004.

latory reforms. Public spending, however, had dropped to 46% of GDP as of 2000 as privatization and deregulation continued.

The US Central Intelligence Agency (CIA) estimated that in 2005 the Netherlands's central government took in revenues of approximately \$291.8 billion and had expenditures of \$303.7 billion. Revenues minus expenditures totaled approximately -\$11.9 billion. Public debt in 2005 amounted to 56.2% of GDP. Total external debt was \$1.645 trillion.

The International Monetary Fund (IMF) reported that in 2003, the most recent year for which it had data, central government revenues were €184,341 million and expenditures were €197,864 million. The value of revenues was us\$208,060 million and expenditures us\$222,489 million, based on a market exchange rate for 2003 of us\$1 = €.8860 as reported by the IMF. Government outlays by function were as follows: general public services, 22.1%; defense, 3.6%; public order and safety, 3.7%; economic affairs, 6.0%; environmental protection, 0.4%; housing and community amenities, 0.5%; health, 10.4%; recreation, culture, and religion, 0.9%; education, 10.8%; and social protection, 41.5%.

### 36 TAXATION

Principal taxes raised by the central government are income and profits taxes levied on individuals and companies, a value-added tax (VAT) on goods and services, and a tax on enterprises of public bodies (except agricultural enterprises). There is a wealth tax of 0.7% also levied on nonexempt taxable capital of individuals. Provinces and municipalities are not authorized to impose income taxes, and may impose other taxes only to a limited extent. The most important tax levied by municipalities is a real estate tax paid partly by owners and partly by occupants. Residents are taxed on both their local and foreign incomes, but nonresidents pay taxes only on income earned in the Netherlands.

The tax on the net profits of corporations in 2005 was 27% for annual profits up to €22,689 and 31.5% on the increment of profits above that. Depreciation and other business deductions are

permitted. Capital gains were taxed at the same rates, although some capital gains were tax-exempt. Withholding taxes up to a maximum of 25% were applied to dividends, although there is no withholding if the dividends are being paid by a subsidiary to a nonresident parent company, owning more than 25% of the payer. Companies can qualify for tax exemptions and tax reductions under investment incentive regimes. Branches of foreign companies are treated the same as Dutch companies in accordance with the fiscal regime under which they qualify.

Incomes are taxed on a graduated scale, with a top rate of 52%. There are also liberal deductions for dependents. Taxes are withheld by the state on the incomes of wage earners. In the tax reforms of 2001 marginal income tax rates were set in a course of increases in the lower rates, and decreases in the higher ones. The progressive schedule consists of four brackets, not counting a tax-exempt base for each individual taxpayer. Gift and inheritance taxes range from 5–68% depending on the family relationship of the donor or deceased.

The Netherlands' main indirect tax is its VAT introduced 1 January 1969 with a standard rate of 12% and a reduced rate of 4% on basics. Effective 1 January 2001, the standard rate was increased from 17.5% to 19% with a reduced rate of 6%, the latter applied to basic foodstuffs, books, newspapers and periodicals, public ground and sea transport, water supplies, sports centers, and pharmaceuticals. Exempted from VAT are exported goods, medical, cultural, and educational services, and credit and insurance transactions. Other taxes include excise taxes, energy taxes and taxes on legal transactions and on motor vehicles.

### 37 CUSTOMS AND DUTIES

The Dutch government has a traditionally liberal policy on tariffs and its membership in the Benelux Economic Union, the European Union, and other international trade organizations has resulted in comparatively low import duties. Tariffs on imports from the dollar area have also been liberalized and about 90% of imports from the United States are unrestricted quantitatively. Manufactured goods from the United States are generally subject to a duty ranging from 5–8% based on the cost, insurance and freight (CIF) value of the goods. Raw materials are usually not subject to import duties.

Imports are subject to EU customs regulations and tariff rates, plus VAT and other charges levied at entry through customs.

### 38 FOREIGN INVESTMENT

The Netherlands has favorable tax structures for investors, which has made the country one of the top recipients of foreign direct investment in the European Union. The Netherlands has consistently been ranked as one of the most attractive destinations for FDI in the world, ranking sixth among the ten largest foreign investors in the world, as well as the sixth-largest global recipient of FDI (2004). The government has encouraged foreign corporations to set up branch plants in the Netherlands and to establish joint ventures with Dutch companies in order to benefit from the introduction of new production techniques and improved methods of management that outside firms often bring. The government does not discriminate between foreign and domestic companies; foreign entrepreneurs have the same business privileges and obligations as Dutch businessmen and women. As a result, foreign

companies operate in virtually all industries, including high-technology electronics, chemicals, metals, electrical equipment, textiles, and food processing. The labor force is largely well-educated and multilingual.

The corporation tax is 34.5%, but the corporate taxation regime is expected to be reformed in 2006–07. The Corporation Tax Act provides for a participation exemption, applicable to both foreign and domestic shareholdings, thus preventing double taxation when the profits of a subsidiary are distributed to its parent company. Although income taxes were lowered in 2001, the basic rate of the value-added tax was raised from 17.5% to 19%.

Annual foreign direct investment (FDI) inflows were \$11 billion in 1997, down from \$16.6 billion in 1996, but then soared to \$37.6 billion in 1998. The peak was reached in 2000 and 2001, when total inflows reached \$52 billion and \$50 billion, respectively. However, in 2002, FDI inflow fell to an estimated \$30 billion, and to \$19.3 billion in 2003. By 2004, the total stock of FDI had reached \$387 billion, about 75% of GDP.

Overall, the United States, the United Kingdom, Germany, Belgium, and France are the primary sources of and destinations for FDI with the Netherlands.

Foreign companies established in the Netherlands account for roughly one-third of industrial production and employment in industry. At the end of 2004, an estimated 31.5% of foreign establishments in the Netherlands came from the United States, 19.5% from Germany, 14% from the United Kingdom, 7% from Scandinavia, 17% from the rest of Europe, 9% from Asia, and the remaining 2% from other non-OECD and non-EU countries.

### 39 ECONOMIC DEVELOPMENT

For nearly four decades after World War II Dutch governments aimed at increased industrialization. During the 1990s, however, industrial growth slowed, while the service sector continued to expand. In this regard, the Netherlands has made the transition to a more liberalized high technology economy quite successfully.

In an effort to encourage industrialization after the Second World War, the maintenance of internal monetary equilibrium was vitally important, and the government has largely succeeded in this task. Successive governments pursued a policy of easy credits and a “soft” currency, but after the Netherlands had fully recovered from the war by the mid-1950s, a harder currency and credit policy came into effect. In the social sphere, stable relationships were maintained by a deliberate governmental social policy seeking to bridge major differences between management and labor. The organized collaboration of workers and employers in the Labor Foundation has contributed in no small measure to the success of this policy, and as a result, strikes are rare.

Successive wage increases helped bring the overall wage level in the Netherlands up to that of other EC countries by 1968. The Dutch government's policy, meanwhile, was directed toward controlling inflation while seeking to maintain high employment. In 1966, the government raised indirect taxes to help finance rising expenditures, particularly in the fields of education, public transportation, and public health. Further attempts to cope with inflation and other economic problems involved increased government control over the economy. Wage and price controls were imposed in 1970–71, and the States-General approved a measure granting

the government power to control wages, rents, dividends, health and insurance costs, and job layoffs during 1974.

During the mid-1980s, the nation experienced modest recovery from recession; the government's goal was to expand recovery and reduce high unemployment, while cutting down the size of the annual budget deficit. The government generally sought to foster a climate favorable to private industrial investment through such measures as preparing industrial sites, subsidizing or permitting allowances for industrial construction and equipment, assisting in the creation of new markets, granting subsidies for establishing industries in distressed areas, and establishing schools for adult training. In 1978, the government began, by means of a selective investment levy, to discourage investment in the western region (Randstad), while encouraging industrial development in the southern province of Limburg and the northern provinces of Drenthe, Friesland, and Groningen.

The Netherlands' largest economic development projects have involved the reclamation of land from the sea by construction of dikes and dams and by the drainage of lakes to create polders for additional agricultural land. The Zuider Zee project closed off the sea and created the freshwater IJsselmeer by means of a 30 km (19 mi) barrier dam in 1932, and subsequently drained four polders enclosing about 165,000 hectares (408,000 acres). After a storm washed away dikes on islands in Zeeland and South Holland in 1953, killing some 1,800 people, the Delta project was begun. This project, designed to close estuaries between the islands with massive dams, was officially inaugurated in 1986; the cost was \$2.4 billion. The Delta works include a storm-surge barrier with 62 steel gates, each weighing 500 tons that are usually left open to allow normal tidal flow in order to protect the natural environment. Another major engineering project was construction of a bridge and tunnel across the Western Schelde estuary in the south to connect Zeeland Flanders more directly with the rest of the country.

Beginning in the 1980s, Dutch governments began stressing fiscal discipline by reversing the growth of the welfare state and ending a policy of inflation-based wage indexing. The latter policy represented a spirit of consensus among labor and management. At a time when other labor unions fought losing battles with management, Dutch unions agreed to a compromise on this cherished issue in return for a business promise to emphasize job creation. By the late 1990s, these reforms had paid off as Dutch unemployment plummeted to below 5%. As of the early 2000s, the Netherlands had among the lowest unemployment rates in the industrialized world. As of 2005, the Dutch economy was being heralded around the world for its combination of strong employment growth, low inflation, falling public budget deficits, low inequality, and strong social welfare policies.

In January 2004, the government launched its Innovation Partnerships Grant Program, to promote cooperation in research and development. The program encourages businesses and public-sector knowledge institutes to study and launch national and international partnerships. Some 5,000 Dutch companies are conducting research to develop new products and to boost quality and efficiency. The country's five largest multinationals—Philips, Shell, Akzo Nobel, DSM, and Unilever—are at the forefront of industrial research and development.

The Netherlands' commitment to the project of further European integration, however, was stalled in 2005, when on 1 June

Dutch voters rejected the EU constitution by a wide margin (62% to 38%). This vote followed directly upon the heels of the French rejection of the constitution. Many Dutch "no" voters, however, said they were pro-European, but feared that small countries were losing influence in an EU dominated by larger ones. The Dutch treasure their sound money and liberal social policies, and do not want to see these eroded.

#### 40 SOCIAL DEVELOPMENT

A widespread system of social insurance and assistance is in effect. The first laws were implemented in 1901. All residents are provided with old-age and survivorship benefits. Disability pensions are available to all employees, self-employed workers, students, and those disabled since childhood. Unemployment, accidents, illness, and disability are covered by insurance, which is compulsory for most employees and voluntary for self-employed persons. Maternity grants and full insurance for the worker's family are also provided, as are family allowances for children. The government covers the total cost for family allowances. Women receive one month of maternity leave with full pay. Exceptional medical expenses are covered for all residents.

Legislation mandates equal pay for equal work and prohibits dismissal due to marriage, pregnancy, or motherhood. However, cultural factors and lack of day care discourages women from employment. Many women work in part-time positions and are underemployed, and on average women earn less than men. Sexual harassment in the workplace is an issue, and in 2004, the government funded an awareness campaign to combat the problem. Domestic violence is an issue, especially among ethnic minorities. The government provides programs to reduce and prevent violence against women.

Human rights are fully respected in the Netherlands. There were incidents of discrimination against religious minorities and some immigrant groups.

#### 41 HEALTH

The Netherlands has a social insurance system similar to Germany's. About two-thirds of workers are covered by the social insurance program; the remainder are covered by private insurance. Under the Health Insurance Act, everyone with earned income of less than 50,900 guilders per year pays a monthly contribution in return for which they receive medical, pharmaceutical, and dental treatment and hospitalization. People who earn more than this have to take out private medical insurance. The state also pays for preventive medicine including vaccinations for children, school dental services, medical research, and the training of health workers. Preventive care emphasizes education, a clean environment, and regular exams and screenings. As of 2004, there were an estimated 329 physicians, 1,334 nurses, 47 dentists and 20 pharmacists per 100,000 people.

The general health situation has been excellent over a long period, as is shown by an estimated general mortality rate of 8.7 per 1,000 as of 2002 and an infant mortality of only 5.04 per 1,000 live births in 2005, down markedly from the 12.7 rate in 1970. The maternal mortality rate was 7 per 100,000 live births. These low rates are attributed to a rise in the standard of living; improvements in nutrition, hygiene, housing, and working conditions; and the

expansion of public health measures. In 2005, average life expectancy was 78.81 years.

Most doctors and hospitals operate privately. A system of hospital budgeting, which was introduced in 1983, has helped contain costs. In 1990, a proposal to increase competition among insurers, eliminating the distinction between public and private insurers, was developed. A reference price system—to control pharmaceuticals especially—was introduced in 1991. Total health care expenditure was estimated at 8.7% of GDP.

The Ministry of Public Health and Environment is entrusted with matters relating to health care, but health services are not centrally organized. There are numerous local and regional health centers and hospitals, many of which are maintained by religious groups.

In 2002, the estimated birth rate was 11.6 per 1,000 people; 75% of married women (ages 15 to 49) used contraception. The total fertility rate was 1.7 children for each woman living throughout childbearing years. Immunization rates for children up to one year old were as follows: diphtheria, pertussis, and tetanus, 95%; polio, 97%; and measles, 96%.

Major causes of death were attributed to cardiovascular problems and cancer. The HIV/AIDS prevalence was 0.20 per 100 adults in 2003. As of 2004, there were approximately 19,000 people living with HIV/AIDS in the country. There were an estimated 100 deaths from AIDS in 2003.

## 42 HOUSING

During World War II, more than 25% of the nation's two million dwellings were damaged: 95,000 dwellings were completely destroyed, 55,000 were seriously damaged, and 520,000 were slightly damaged. The housing shortage remained acute until 1950, when an accelerated program of housing construction began, and in 1953 the government decided to increase the house-building program to a level of 65,000 dwellings a year. Since then, the production rate has far exceeded both the prewar rate and yearly forecasts. From 1945 to 1985, nearly four million dwellings were built. In 1985 alone, 98,131 dwellings were built, bringing the total housing stock to 5,384,100 units by the end of the year. Most of the new units were subsidized by the national government. Subsidies are granted to municipalities, building societies, and housing associations, which generally build low-income multiple dwellings. Government regulations, which are considerable, are laid down in the Housing Act of 1965 and the Rental Act of 1979.

The government determines on an annual basis the scope of the construction program. On the basis of national estimates, each municipality is allocated a permissible volume of construction. Within this allocation, the municipalities must follow certain guidelines; central government approval is required for all construction projects exceeding a specific cost. All construction must conform to technical and aesthetic requirements, as established by the government.

In 2005, the number of dwellings was at about 6,861, with an average of 2.3 residents per dwelling. The number of residents per dwelling has nearly halved since WWII. Approximately 71,609 new dwellings were constructed in 2004. About 76% of the dwellings built in 2004 were owner occupied.

## 43 EDUCATION

The present Dutch education system has its origins in the Batavian Republic which was constituted after the French Revolution. The role of education gained importance in the Civil and Constitutional Regulations of 1789, and the first legislation on education was passed in 1801. After 1848, the municipalities, supported by state funds, were responsible for managing the schools. Private schools were not originally supported by the government. However, after 1917, private and state schools received equal state funding.

School attendance between the ages of 5 and 18 is compulsory. Apart from play groups and crèches (which do not come under the Ministry of Education), there are no schools for children below the age of four. Children may, however, attend primary school from the age of four. Primary school covers eight years of study. Secondary school is comprised of three types: (1) general secondary school, with two options, the four-year junior general secondary school (MAVO) and the five-year senior general secondary school (HAVO); (2) preuniversity—the athenaeum or the gymnasium—both lasting for six years in preparation for university education; and (3) vocational secondary schools with four-year programs. Special education is provided to children with physical, mental, or social disabilities at special primary and secondary schools. Whenever possible, these children are later transferred into mainstream schools for continued education. The academic year runs from September to June.

Primary school enrollment in 2003 was estimated at about 99% of age-eligible students. The same year, secondary school enrollment was about 89% of age-eligible students. It is estimated that about 98.4% of all students complete their primary education. In 2003, private schools accounted for about 68.7% of primary school enrollment and 83.3% of secondary enrollment.

Facilities have been opened in various municipalities for adult education. Open schools and open universities have also been introduced. Vocational and university education is provided at the eight universities and five institutes (Hogescholen), which are equivalent to universities. These are funded entirely by the government. There are also seven theological colleges. In 2003, about 58% of the tertiary age population were enrolled in some type of higher education program. The adult literacy rate for 2000 was estimated at about 99%.

As of 2003, public expenditure on education was estimated at 5.1% of GDP, or 10.7% of total government expenditures.

## 44 LIBRARIES AND MUSEUMS

The largest public library is the Royal Library at The Hague, which has about 2.2 million volumes; this also serves as the national library. Outstanding libraries are found in the universities: Amsterdam, with over 2.6 million volumes; Leiden, 2.7 million volumes; Utrecht, two million volumes; Groningen, 2.7 million volumes; and Erasmus of Rotterdam, 800,000 volumes. The technical universities at Delft, Wageningen, and Tilburg also have excellent collections. Libraries of importance are found in some provincial capitals, such as Hertogenbosch, Leeuwarden, Middelburg, and Maastricht. Also noteworthy are the International Institute of Social History at Amsterdam, which houses important collections of historical letters and documents, such as the Marx-Engels Archives; and the Institute of the Netherlands Economic-Historical

Archive, which has its library in Amsterdam and its collection of old trade archives at the Hague. There are about 500 public libraries across the country. The Netherlands Public Library Association was founded in 1972.

Among Amsterdam's many museums, particularly outstanding are the Rijksmuseum (1800), the Stedelijk Museum (1895) with special collections of modern art, the Van Gogh Museum (1979), the Museum of the Royal Tropical Institute (1910), and the Jewish Historical Museum (1932). Among Amsterdam's newest museums are the Huis Marseille (1999), which has historic and modern photography exhibits, the hands-on New Metropolis Interactive Science and Technology Museum (1997), and the Tattso Museum (1996). The Boymans–Van Beuningen Museum in Rotterdam has older paintings as well as modern works and a fine collection of minor arts. The Hague's Mauritshuis and the Frans Hals Museum at Haarlem have world-renowned collections of old masters. Other collections of national interest are in the Central Museum in Utrecht, the National Museum of Natural History in Leiden, Teyler's Museum in Haarlem, and the Folklore Museum in Arnhem. In the past, the most important art museums were found mainly in the large population centers of western Holland, but there are now museums of interest in such provincial capitals as Groningen, Leeuwarden, Arnhem, and Maastricht. The government stimulates the spread of artistic culture by providing art objects on loan and by granting subsidies to a number of privately owned museums. There are dozens of museums dedicated to the work of individual Dutch artists.

#### 45 MEDIA

The post office, telegraph, and telephone systems are operated by the government. The state's monopoly on postal services is confined to delivery of letters and postcards; about half of other deliveries are handled by private firms. Significant improvements in the phone systems began in 2001 through the introduction of the third generation of the Global System for Mobile Communications. In 2003, there were an estimated 614 mainline telephones for every 1,000 people. The same year, there were approximately 768 mobile phones in use for every 1,000 people.

There are several radio networks. The Netherlands Broadcasting Foundation, a joint foundation, maintains and makes available all studios, technical equipment, record and music libraries, orchestras, and other facilities. Broadcasting to other countries is carried on by the Netherlands World Broadcasting Service, which is managed by a board of governors appointed by the minister of cultural affairs. As of 2004 there were 4 AM and 246 FM stations. There were also about 21 television stations. Shortwave programs are transmitted in Dutch, Afrikaans, Arabic, English, French, Indonesian, Portuguese, and Spanish. Annual license fees are charged to radio and television set owners. Commercial advertising was introduced in 1967–68 and limited to fixed times before and after news broadcasts. In 2003, there were an estimated 980 radios and 648 television sets for every 1,000 people. About 401.4 of every 1,000 people were cable subscribers. Also in 2003, there were 466.6 personal computers for every 1,000 people and 522 of every 1,000 people had access to the Internet. There were 3,779 secure Internet servers in the country in 2004.

The Dutch were among the first to issue regular daily newspapers. The oldest newspaper, the *Oprechte Haarlemsche Courant*,

was founded in 1656 and is published today as the *Haarlemsche Courant*. The Dutch press is largely a subscription press, depending for two-thirds of its income on advertising. Editorial boards, however, are usually completely independent of the commercial management.

In 2004, the largest national and regional newspapers, with daily circulations, were: *De Telegraaf* (Amsterdam), 776,000; *De Volkscrant* (Amsterdam), 323,000; *Algemeen Dagblad* (Amsterdam), 303,000; *NRC Handelsblad* (Rotterdam), 262,000; *De Gelderlander* (Gelderland), 193,000; *Dagblad van het Noorden* (Groningen), 173,000; *Apeldoornse Courant* (Apeldoorn), 159,000; *Noordhollands Dagblad* (Alkmaar), 155,000; *Brabants Dagblad* (North Brabant), 153,300; *De Stem* (Breda), 140,000; *Dagblad Tubantia* (Enschede), 136,000; *Haagsche Courant* (The Hague), 117,000; and *Trouw* (Amsterdam), 117,000.

Complete freedom of speech and press is guaranteed by the constitution, and the government is said to fully support free expression in practice.

#### 46 ORGANIZATIONS

Associations established on the basis of economic interests include the Federation of Netherlands Industries, the Netherlands Society for the Promotion of Industry and Commerce, the Federation of Christian Employers in the Netherlands, the National Bankers Association, and chambers of commerce in Amsterdam, Rotterdam, The Hague, and other cities.

Learned societies include the Royal Netherlands Academy of Arts and Sciences, the Royal Antiquarian Society, the Netherlands Anthropological Society, the Historical Association, the Royal Netherlands Geographical Society, and similar bodies in the fields of botany, zoology, philology, mathematics, chemistry, and other sciences. The Royal Netherlands Association for the Advancement of Medicine, the General Netherlands Society for Social Medicine and Public Health, the Royal Dutch Medical Association, and the Netherlands Association for Psychiatry and Neurology are some of the organizations active in the field of medicine. The International Statistical Institute is based in the Netherlands. The International Esperanto Institute and the International Montessori Association are also located in the country.

In the arts, there are such groupings as the Society for the Preservation of Cultural and Natural Beauty in the Netherlands, the Society of Netherlands Literature, the St. Luke Association, the Society for the Advancement of Music, the Royal Netherlands Association of Musicians, Holland Society of Arts and Sciences, and national societies of painters, sculptors, and architects. The Netherlands Center of the International Association of Playwrights, Editors, Essayists and Novelists (PEN), the Netherlands Branch of the International Law Association, and the Netherlands Foundation for International Cooperation are among the organizations active internationally in their fields.

National youth organizations include the Evangelical Students of the Netherlands, Dutch United Nations Student Association, Junior Chamber, Youth Organization for Freedom and Democracy, The Netherlands Scouting Association, and YMCA/YWCA. There are numerous sports associations for all ages. The Netherlands is home to the International Korfball Federation. Women's organizations include Netherlands Association for Women's Inter-

ests, Women's Work and Equal Citizenship and the Netherlands Council of Women.

International organizations with national chapters include Amnesty International, Defence for Children International, Greenpeace International, Habitat for Humanity, and the Red Cross.

#### 47 TOURISM, TRAVEL, AND RECREATION

Travel in the Netherlands by public railway, bus, and inland-waterway boat service is frequent and efficient. Principal tourist attractions include the great cities of Amsterdam, Rotterdam, and the Hague, with their famous monuments and museums, particularly the Rijksmuseum in Amsterdam; the flower gardens and bulb fields of the countryside; and North Sea beach resorts. Modern hotels and large conference halls in the large cities are the sites of numerous international congresses, trade shows, and other exhibitions.

Recreational opportunities include theaters, music halls, opera houses, cinemas, zoos, and amusement parks. Popular sports include football (soccer), swimming, cycling, sailing, and hockey. Foreign visitors need only a valid passport for stays of up to 90 days. Proof of sufficient funds, health insurance coverage, return/onward ticket, and lodging reservations may be required upon arrival. Within eight days of arrival, visitors staying long term must register with the local police.

In 2003, approximately 6,930,500 tourists visited the Netherlands, of whom 22% were from the United Kingdom. There were 88,146 hotel rooms with 180,158 beds and an occupancy rate of 43%. Travelers stayed an average of two nights. Tourism expenditure receipts totaled \$11.7 billion in 2002.

In 2005, the US Department of State estimated the daily cost of staying in Amsterdam at \$328; the Hague, \$258; and in Rotterdam, \$339.

#### 48 FAMOUS NETHERLANDERS

*The Imitation of Christ*, usually attributed to the German Thomas à Kempis, is sometimes credited to the Dutch Gerhard Groote (1340–84); written in Latin, it has gone through more than 6,000 editions in about 100 languages. Outstanding Dutch humanists were Wessel Gansfort (1420?–89), precursor of the Reformation; Rodolphus Agricola (Roelof Huysman, 1443–85); and the greatest of Renaissance humanists, Desiderius Erasmus (Gerhard Gherhards, 1466?–1536). Baruch (Benedict de) Spinoza (1632–77), the influential pantheistic philosopher, was born in Amsterdam.

The composers Jacob Obrecht (1453–1505) and Jan Pieterszoon Sweelinck (1562–1621) were renowned throughout Europe; later composers of more local importance were Julius Röntgen (1855–1932), Alfons Diepenbrock (1862–1921), and Cornelis Dopfer (1870–1939). Bernard van Dieren (1887–1936), a composer of highly complex music of distinct individuality, settled in London. Henk Badings (b. Bandung, Java, 1907–87) was a prolific composer of international repute. Outstanding conductors of the Amsterdam Concertgebouw Orchestra include Willem Mengelberg (1871–1951), Eduard van Beinum (1901–59), and Bernard Haitink (b. 1929), who also was principal conductor of the London Philharmonic from 1967 to 1979, music director of the Royal Opera House, Covent Garden, from 1987–2002, and principal conductor of the Dresden Staatskapelle from 2002.

Hieronymus Bosch van Aken (1450?–1516) was a famous painter. Dutch painting reached its greatest heights in the 17th century, when Rembrandt van Rijn (1606–69) and Jan Vermeer (1632–75) painted their masterpieces. Other great painters of the period were Frans Hals (1580–1666), Jan Steen (1626–69), Jacob van Ruisdael (1628–82), and Meindert Hobbema (1638–1709). Two more recent painters, Vincent van Gogh (1853–90) and Piet Mondrian (1872–1944), represent two widely divergent artistic styles and attitudes. Maurits C. Escher (1898–1972) was a skilled and imaginative graphic artist.

Hugo Grotius (Huig de Groot, 1583–1645), who is often regarded as the founder of international law, is famous for his great book, *On the Law of War and Peace*. The outstanding figure in Dutch literature was Joost van den Vondel (1587–1679), poet and playwright. Another noted poet and playwright was Constantijn Huygens (1596–1687), father of the scientist Christian. Popular for several centuries were the poems of Jacob Cats (1577–1660). Distinguished historians include Johan Huizinga (1872–1945) and Pieter Geyl (1887–1966). Anne Frank (b. Germany, 1929–45) became the most famous victim of the Holocaust with the publication of the diary and other material that she had written while hiding from the Nazis in Amsterdam.

Jan Pieterszoon Coen (1587–1630), greatest of Dutch empire builders, founded the city of Batavia in the Malay Archipelago (now Jakarta, the capital of Indonesia). Two Dutch naval heroes, Maarten Harpertzoon Tromp (1597–1653) and Michel Adriaanszoon de Ruyter (1607–76), led the Dutch nation in triumphs in sea wars with France, England, and Sweden. Peter Minuit (Minnewit, 1580–1638) founded the colonies of New Amsterdam (now New York City) and New Sweden (now Delaware). Peter Stuyvesant (1592–1672) took over New Sweden from the Swedish and lost New Netherland (now New York State) to the British.

Leading scientists include the mathematician Simon Stevinus (1548–1620); Christian Huygens (1629–95), mathematician, physicist, and astronomer; Anton van Leeuwenhoek (1632–1723), developer of the microscope; Jan Swammerdam (1637–80), authority on insects; and Hermann Boerhaave (1668–1738), physician, botanist, and chemist. Among more recent scientists are a group of Nobel Prize winners: Johannes Diderik van der Waals (1837–1923), authority on gases and fluids, who received the award for physics in 1910; Jacobus Hendricus van 't Hoff (1852–1911), chemistry, 1901; Hendrik Antoon Lorentz (1853–1928) and Pieter Zeeman (1865–1943), who shared the 1902 award for physics; Heike Kamerlingh Onnes (1853–1926), physics, 1913; Willem Einthoven (1860–1927), physiology, 1924; Christiaan Eijkman (1858–1930), physiology, 1929; Petrus Josephus Wilhelmus Debye (1884–1966), chemistry, 1936; Frits Zernike (1888–1966), physics, 1953; Jan Tinbergen (1903–94), economic science, 1969; Dutch-born Tjalling Koopmans (1910–85), who shared the 1975 prize for economic science; Simon van der Meer (b. 1925), co-winner of the physics prize in 1984; Paul J. Crutzen (b. 1933), who shared the 1995 chemistry prize; and Gerardus 't Hooft (b. 1946) and Martinus J.G. Veltman (b. 1931), who shared the 1999 physics prize. The 1911 Nobel Prize for peace was awarded to Tobias Michael Carel Asser (1838–1913).

The head of state since 1980 has been Queen Beatrix (b. 1938).

## 49 DEPENDENCIES

Aruba and the Netherlands Antilles are part of the Kingdom of the Netherlands; descriptions of them are given in the volume on the *Americas* under Netherlands American Dependencies.

# NORWAY

Kingdom of Norway  
*Kongeriket Norge*

**CAPITAL:** Oslo

**FLAG:** The national flag has a red field on which appears a blue cross (with an extended right horizontal) outlined in white.

**ANTHEM:** *Ja, vi elsker dette landet* (Yes, We Love This Country).

**MONETARY UNIT:** The krone (Kr) of 100 øre is the national currency. There are coins of 50 øre and 1, 5, and 10 kroner, and notes of 20, 50, 100, 200, 500, and 1,000 kroner. Kr1 = \$0.15798 (or \$1 = Kr6.33) as of 2005.

**WEIGHTS AND MEASURES:** The metric system is the legal standard.

**HOLIDAYS:** New Year's Day, 1 January; Labor Day, 1 May; National Independence Day, 17 May; Christmas, 25 December; Boxing Day, 26 December. Movable religious holidays include Holy Thursday, Good Friday, Easter Monday, Ascension, and Whitmonday.

**TIME:** 1 PM = noon GMT.

## <sup>1</sup> LOCATION, SIZE, AND EXTENT

Norway occupies the western part of the Scandinavian peninsula in northern Europe, with almost one-third of the country situated N of the Arctic Circle. It has an area of 324,220 sq km (125,182 sq mi). Comparatively, the area occupied by Norway is slightly larger than the state of New Mexico. Extending 1,752 km (1,089 mi) NNE–SSW, Norway has the greatest length of any European country; its width is 430 km (267 mi) ESE–WNW. Bounded on the N by the Arctic Ocean, on the NE by Finland and Russia, on the E by Sweden, on the S by the Skagerrak, on the SW by the North Sea, and on the W by the Norwegian Sea of the Atlantic Ocean, Norway has a land boundary length of 2,544 km (1,581 mi) and a total coastline estimated at 21,925 km (13,624 mi).

Norway's capital city, Oslo, is in the southern part of the country.

## <sup>2</sup> TOPOGRAPHY

Norway is formed of some of the oldest rocks in the world. It is dominated by mountain masses, with only one-fifth of its total area less than 150 m (500 ft) above sea level. The average altitude is 500 m (1,640 ft). The Glittertinden (2,472 m/8,110 ft, including a glacier at the summit) and Galdhøpiggen (2,469 m/8,100 ft), both in the Jotunheimen, are the highest points in Europe north of the Alpine-Carpathian mountain range. The principal river, the Glåma, 611 km (380 mi) long, flows through the timbered southeast. Much of Norway has been scraped by ice, and there are 1,700 glaciers totaling some 3,400 sq km (1,310 sq mi). In the Lista and Jaeren regions in the far south, extensive glacial deposits form agricultural lowlands. Excellent harbors are provided by the almost numberless fjords, deeply indented bays of scenic beauty that are never closed by ice and penetrate the mainland as far as 182 km (113 mi). Along many coastal stretches is a chain of islands known as the skjærgård.

## <sup>3</sup> CLIMATE

Because of the North Atlantic Drift, Norway has a mild climate for a country so far north. With the great latitudinal range, the north is considerably cooler than the south, while the interior is cooler than the west coast, influenced by prevailing westerly winds and the Gulf Stream. Oslo's average yearly temperature ranges from about 5°C (41°F) in January to 28°C (82°F) in July. The annual range of coastal temperatures is much less than that of the continental interior. The eastern valleys have less than 30 cm (12 in) of rain yearly, whereas at Haukeland in Masfjord the average rainfall is 330 cm (130 in).

Norway is the land of the midnight sun in the North Cape area, with 24-hour daylight from the middle of May to the end of July, during which the sun does not set. Conversely, there are long winter nights from the end of November to the end of January, during which the sun does not rise above the horizon and the northern lights, or aurora borealis, can be seen.

## <sup>4</sup> FLORA AND FAUNA

The richest vegetation is found in the southeast around Oslofjord, which is dominated by conifers (spruce, fir, and pine); at lower levels, deciduous trees such as oak, ash, elm, and maple are common. Conifers are seldom found at altitudes above 1,000 m (3,300 ft). Above the conifer zone extends a zone of birch trees; above that, a zone of dwarf willow and dwarf birch, and a zone of lichens and arctic plants. In areas exposed to salt sea winds, there is little tree growth. Of the larger wild animals, elk, roe deer, red deer, and badger survive, as do fox, lynx, and otter. Bird life is abundant and includes game birds such as capercaillie (cock of the woods) and black grouse. In the rivers are found trout, salmon, and char.

As of 2002, there were at least 54 species of mammals, 241 species of birds, and over 1,700 species of plants throughout the country.

## 5 ENVIRONMENT

Norway's plentiful forests, lakes, flora, and wildlife have suffered encroachment in recent years from the growing population and consequent development of urban areas, roads, and hydroelectric power. The forest floor and waterways have been polluted by Norway's own industry and by airborne industrial pollution from central Europe and the British Isles in the form of acid rain. The acid rain problem has affected the nation's water supply over an area of nearly 7,000 sq mi.

Annual particulate emissions have averaged 22 tons and hydrocarbon emissions have been about 270 tons. In 1992, Norway was among the 50 nations with the world's heaviest emissions of carbon dioxide from industrial sources, which totaled 60.2 million metric tons, a per capita level of 14.03 metric tons. In 2000, however, the total of carbon dioxide emissions was at 49.9 million metric tons. Transportation vehicle emissions are also a significant source of air pollution.

By the early 1980s, the government had enacted stringent regulations to prevent oil spills from wells and tankers operating on the Norwegian continental shelf. Coastal protection devices have since been installed, and new technologies to prevent oil damage have been developed. Industry, mining, and agriculture have polluted 16% of Norway's lake water. The nation has a total of 382 cu km of renewable water resource; 72% of the annual withdrawal is used for industrial activity and 8% is used for farming.

Pollution control laws operate on the premise that the polluter must accept legal and economic responsibility for any damage caused and for preventing any recurrence; the state makes loans and grants for the purchase of pollution control equipment. Municipal authorities supervise waste disposal.

Since its creation in 1972, the Ministry of the Environment has been Norway's principal environmental agency. Between 1962 and 1985, 15 national parks, with a total area of more than 5,000 sq km (2,000 sq mi), and more than 150 nature reserves were established. In 2003, about 6.8% of the total land area was protected. The West Norwegian Fjords—Geirangerfjord and Naerofjord—were named as a natural UNESCO World Heritage site in 2005. The country has 37 Ramsar wetland sites.

According to a 2006 report issued by the International Union for Conservation of Nature and Natural Resources (IUCN), threatened species included 9 types of mammals, 6 species of birds, 7 species of fish, 1 type of mollusk, 8 species of other invertebrates, and 2 species of plants. Threatened species include the Baltic sturgeon, marsh snail, and freshwater pearl mussel.

## 6 POPULATION

The population of Norway in 2005 was estimated by the United Nations (UN) at 4,620,000, which placed it at number 114 in population among the 193 nations of the world. In 2005, approximately 15% of the population was over 65 years of age, with another 20% of the population under 15 years of age. There were 99 males for every 100 females in the country. According to the UN, the annual population rate of change for 2005–10 was expected to be 0.3%, a rate the government viewed as too low. The projected population for the year 2025 was 5,114,000. The overall population

density was 14 per sq km (37 per sq mi), with most inhabitants concentrated in the southern areas of the country.

The UN estimated that 78% of the population lived in urban areas in 2005, and that urban areas were growing at an annual rate of 1.18%. The capital city, Oslo, had a population of 795,000 in that year. The only other towns with populations exceeding 100,000 were Bergen (242,158) and Trondheim (156,161). Most provincial cities are small, with only Stavanger (115,157), Kristiansand (76,066), and Drammen (56,688) having more than 50,000.

## 7 MIGRATION

From 1866 on, North America received great waves of immigration from Norway, including an estimated 880,000 Norwegian immigrants to the United States by 1910. The United States and Canada still provide residence for many of the estimated 400,000 Norwegians living abroad. Emigration in recent years has not been significant. Norwegians moving abroad numbered 23,271 in 2004; immigrants to Norway totaled 36,482. Of the over 20,000 European immigrants, 4,308 were from Sweden; of the 3,875 Africans, 1,068 were from Somalia; of the 8,848 Asian immigrants, 1,220 were from Thailand. Migrants from the United States numbered 1,405. In 2005, Norway's immigrant population numbered 364,981. Of these 301,045 were first-generation immigrants, 361,143 were foreign-born, and 213,303 were foreign citizens. In 2004, internal migration between municipalities was 190,446 and between counties it was 89,940.

Norway is an important resettlement country; as of 2001, it had an allocation of 1,300 places in cooperation with the United Nations High Commissioner for Refugees (UNHCR). In 2004, 7,950 asylum applications were submitted. Main countries of origin included Russia, Serbia and Montenegro, Nigeria, and Afghanistan. The estimated net migration rate for 2005 was 1.73 migrants per 1,000 population.

## 8 ETHNIC GROUPS

The Norwegians have for centuries been a highly homogeneous people of Germanic (Nordic, Alpine, and Baltic) stock, generally tall and fair-skinned, with blue eyes. Small minority communities include some 20,000 Sami (Lapps) and 7,000 descendants of Finnish immigrants.

## 9 LANGUAGES

Norwegian, closely related to Danish and Swedish, is part of the Germanic language group. In addition to the letters of the English alphabet, it has the letters æ, å, and ø. Historically, Old Norse was displaced by a modified form of Danish for writing, but in the 19th century there arose a reaction against Danish usages. Many dialects are spoken. There are two language forms, Bokmål and Nynorsk; the former (spoken by a large majority of Norwegians) is based on the written, town language, the latter on country dialects. Both forms of Norwegian have absorbed many modern international words, particularly from British and American English, despite attempts to provide indigenous substitutes.

While Norwegian is the official language, English is spoken widely in Norway, especially in the urban areas. The Sami (Lapps) in northern Norway have retained their own language, which is of Finno-Ugric origin. There is also a small Finnish-speaking minority.

## 10 RELIGIONS

Citizens are generally considered to be members of the Evangelical Lutheran Church of Norway, which is the state church, unless they specifically indicate other affiliations. As such, reports indicate that about 86% of the population are nominally affiliated with the Evangelical Lutheran Church. About 3.4% of the population belong to other Protestant denominations; 1.6% are Muslim and 1% are Roman Catholic. Buddhists, Jews, Orthodox Christians, Sikhs, and Hindus make up less than 1% of the population. The Norwegian Humanist Association, an organization for atheists and the nonreligious, claims about 69,652 adults as registered members.

The constitution provides for religious freedom for all faiths, even though the religion of state is designated as the Evangelical Lutheran Church of Norway. The king nominates the Lutheran bishops and the Lutheran church receives an endowment from the state. The constitution states that the king and half of the cabinet must be members of this church. There are a number of interfaith groups within the country, including the Cooperation Council for Faith and Secular Society, the Oslo Coalition for Freedom of Religious Beliefs, and the Ecumenical Council of Christian Communities.

## 11 TRANSPORTATION

In spite of Norway's difficult terrain, the road system has been well engineered, with tunnels and zigzags, particularly in the fjordlands of the west; but there are problems of maintenance because of heavy rain in the west and freezing in the east. Road transport accounts for nearly 90% of inland passenger transport. As of 2002, the total length of highway was 91,852 km (57,074 mi), of which 71,185 km (44,232 mi) were paved, including 178 km (111 mi) of expressways. As of 2003, there were 1,932,663 passenger cars and 468,500 commercial vehicles in use. The state railway operates bus routes and has been steadily increasing its activities in this field, which is heavily subsidized by the government. In 2004, there was 4,077 km (2,533 mi) of rail line in operation, all of it standard gauge, of which 2,518 km (1,564 mi) were electrified.

With a merchant fleet of 740 vessels of 1,000 GRT or more, totaling 18,820,495 GRT, as of 2005, Norway possessed one of the world's largest fleets. The sale of Norwegian ships and their registration abroad, which increased considerably during the mid-1980s, severely reduced the size of the fleet. In 1988, the Norwegian International Ship Register program began, whereby ships could be registered offshore, thus allowing foreign vessels to operate under the Norwegian flag while reducing costs to shipowners. Oslo and Bergen have excellent harbor facilities, but several other ports are almost as fully equipped.

Norway had an estimated 101 airports in 2004. As of 2005, a total of 67 had paved runways, and there was also one heliport. Flesland at Bergen, Sola at Stavanger, and Fornebu and Gardermoen at Oslo are the main centers of air traffic. External services are operated by the Scandinavian Airlines System (SAS), which is 21% Norwegian-owned. Braathens Air Transport operates most of the domestic scheduled flights. Important internal air services include that linking Kirkenes, Tromsø, and Bodø; 2,000 km (1,240 mi) long, this air route is reputed to be the most difficult to operate

in western Europe. In 2003, about 12.779 million passengers were carried on scheduled domestic and international flights.

## 12 HISTORY

Humans have lived in Norway for about 10,000 years, but only since the early centuries of the Christian era have the names of tribes and individuals been recorded. This was the period when small kingdoms were forming; the name Norge ("Northern Way") was in use for the coastal district from Vestfold to Hålogaland before AD 900. The Viking period (800–1050) was one of vigorous expansion, aided by consolidation of a kingdom under Olav Haraldsson.

From the death of Olav in 1030, the nation was officially Christian. During the next two centuries—a period marked by dynastic conflicts and civil wars—a landed aristocracy emerged, displacing peasant freeholders. A common legal code was adopted in 1274–76, and the right of succession to the crown was fixed. Shortly before, Iceland (1261) and Greenland (1261–64) came under Norwegian rule, but the Hebrides (Western Isles), also Norwegian possessions, were lost in 1266. Before 1300, Hanseatic merchants of the Baltic towns secured control of the essential grain imports, weakening the Norwegian economy.

Norway lost its independence at the death of Haakon V in 1319, when Magnus VII became ruler of both Norway and Sweden. The Black Death ravaged the country in the middle of the 14th century. In 1397, the three Scandinavian countries were united under Queen Margrethe of Denmark. Sweden left the union in 1523, but for nearly 300 more years Norway was ruled by Danish governors. Although the loss to Sweden of the provinces of Bohuslän (1645), Härjedalen (1658), and Jämtland (1645) was a handicap, gradual exploitation of the forest wealth improved Norwegian status. Denmark's alliance with France during the Napoleonic Wars resulted in the dissolution of the union. With the Peace of Kiel (1814), Norway was ceded to Sweden, but the Faroe Islands, Iceland, and Greenland were retained by Denmark. However, Norwegians resisted Swedish domination, adopted a new constitution on 17 May 1814, and elected the Danish Prince Christian Frederick as king of Norway. Sweden then invaded Norway, but agreed to let Norway keep its constitution in return for accepting union with Sweden under the rule of the Swedish king. During the second half of the 19th century, the *Storting* (parliament) became more powerful; an upsurge of nationalist agitation, both within the *Storting* and among Norway's cultural leaders, paved the way for the referendum that in 1905 gave independence to Norway. Feelings ran high on both sides, but once the results were announced, Norway and Sweden settled down to friendly relations. The Danish Prince Carl was elected king of Norway, assuming the name Haakon VII.

Although Norway remained neutral during World War I, its merchant marine suffered losses. Norway proclaimed its neutrality during the early days of World War II, but Norwegian waters were strategically too important for Norway to remain outside the war. Germany invaded on 9 April 1940; the national resistance was led by King Haakon, who in June escaped together with the government, representing the legally elected *Storting*, to England, where he established Norway's government-in-exile. Governmental affairs in Oslo fell to Vidkun Quisling, a Fascist leader and former Norwegian defense minister who had aided the German invasion and whose name subsequently became a synonym

for collaborator; after the German surrender, he was arrested, convicted of treason, and shot. During the late 1940s, Norway abandoned its former neutrality, accepted Marshall Plan aid from the United States, and joined NATO. King Haakon died in 1957 and was succeeded by Olav V. King Harald V succeeded his father who died 17 January 1991.

The direction of economic policy has been the major issue in Norwegian postwar history, especially as related to taxation and the degree of government intervention in private industry. Economic planning was introduced, and several state-owned enterprises have been established. Prior to the mid-1970s, Labor Party-dominated governments enjoyed a broad public consensus for their foreign and military policies. A crucial development occurred in November 1972, when the Norwegian electorate voted in a referendum to reject Norway's entry into the EC despite a strong pro-EC posture adopted by the minority Labor government. After the 1973 general elections, the Labor Party's hold on government policies began to erode, and in the 1981 elections, the party lost control of the government to the Conservatives. Although the non-Socialists retained a small majority in the 1985 elections, disagreements among them permitted Labor to return to office in 1986.

Norway reconfirmed its rejection of the European Union on 28 November 1994, when the vote was cast 52% against, 47.8% for joining Europe. However, in December 2002, Prime Minister Kjell Magne Bondevik stated a new referendum would probably be held on EU membership. Public opinion polls in June 2003 registered 51.9% of the electorate in favor of joining the EU; 38.2% were opposed and 9.9% were undecided.

Norway was forthright in its support for the US-led war on terror following the 11 September 2001 terrorist attacks. It supported the NATO decision to invoke Article 5 of the alliance's constitution, pledging all members to collective security in the event of an attack on one. However, Norway did not support the US-led war in Iraq that began on 19 March 2003. Prime Minister Bondevik held that international weapons inspectors authorized by UN Security Council Resolution 1441 to inspect Iraq's weapons programs should have been given more time to do their work, and that military action should not be taken without an express Security Council resolution authorizing it. Eight out of ten Norwegian voters agreed in March 2003 that Norway should not support the US and British decision to go to war against Iraq.

On 19 January 2004, the Norwegian cargo ship *Rocknes* capsized after striking rocks in a fjord off the coast of Bergen. Eighteen crew members were killed, most of them Filipinos. Nearly 1,000 animals were oiled, a concern for environmentalists. Another concern for environmentalists was Norway's rejection of the 1986 International Whaling Commission's ban on whaling. Norway began whaling on a commercial basis in 1993.

In the general election held on 12 September 2005, the center-left led by Jens Stoltenberg's Labor Party in a "red-green alliance" with the Socialist and Center parties won more than half the seats in parliament, defeating Bondevik's center-right minority coalition. The populist far-right Progress Party increased its number of seats held in parliament by 12, to 38, and it became the nation's largest opposition party.

### 13 GOVERNMENT

Norway is a constitutional monarchy. The constitution of 17 May 1814, as subsequently amended, vests executive power in the king and legislative power in the Storting. Prior to 1990, sovereignty descended to the eldest son of the monarch. A constitutional amendment in May 1990 allows females to succeed to the throne. The amendment only affects those born after 1990. The sovereign must be a member of the Evangelical Lutheran Church of Norway, which he heads. Royal power is exercised through a cabinet (the Council of State), consisting of a prime minister and at least seven other ministers of state (these numbered 18 in 2005). Since the introduction of parliamentary rule in 1884, the Storting has become the supreme authority, with sole control over finances and with power to override the king's veto under a specified procedure. While the king is theoretically free to choose his own cabinet, in practice the Storting selects the ministers, who must resign if the Storting votes no confidence.

The Storting was made up of 169 representatives in 2005 (an increase of four over the 2001 election) from 19 counties. Election for a four-year term is by direct suffrage at age 18, on the basis of proportional representation. After election, the Storting divides into two sections by choosing one-fourth of its members to form the upper chamber *Lagting*, with the rest constituting the lower chamber *Odelsting*. The Odelsting deals with certain types of bills (chiefly proposed new laws) after the committee stage and forwards them to the Lagting, which, after approval, sends them to the king for the royal assent; financial, organizational, political, and other matters are dealt with in plenary session. Where the two sections disagree, a two-thirds majority of the full Storting is required for passage. Constitutional amendments also require a two-thirds vote. The constitution provides that the Storting may not be dissolved.

A special parliamentary ombudsman supervises the observance of laws and statutes as applied by the courts and by public officials. His main responsibility is to protect citizens against unjust or arbitrary treatment by civil servants.

### 14 POLITICAL PARTIES

The present-day Conservative Party (Høyre) was established in 1885. The Liberal Party (Venstre), founded in 1885 as a counterbalance to the civil servant class, became the rallying organization of the Agrarian Friends' Association. The party's political program stresses social reform. Industrial workers founded the Labor Party (Arbeiderparti) in 1887 and, with the assistance of the Liberals, obtained universal male suffrage in 1898 and votes for women in 1913. The Social Democrats broke away from the Labor Party in 1921–22, and the Communist Party (Kommunistparti), made up of former Laborites, was established in 1923. The moderate Socialists reunited and revived the Labor Party organization in 1927. The Agrarian (Farmers) Party was formed in 1920; it changed its name to the Center Party (Senterparti) in 1958. The Christian People's Party (Kristelig Folkeparti), founded in 1933, and also known as the Christian Democratic Party, supports the principles of Christianity in public life.

For several decades, the Liberals were either in office or held the balance of power, but in 1935, as a result of the economic depression, an alliance between the Agrarian and Labor parties led to the

LOCATION: 57°57'31" to 71°11'8" N; 4°30'13" to 31°10'4" E. BOUNDARY LENGTHS: Finland, 729 kilometers (455 miles); Russia, 167 kilometers (104 miles); Sweden, 1,619 kilometers (1,011 miles); total coastline, 21,925 kilometers (13,703 miles). TERRITORIAL SEA LIMIT: 4 miles.

formation of a Labor government. During World War II, the main parties formed a national cabinet-in-exile. Political differences between right and left sharpened in the postwar period. Attempts to form a national coalition among the four non-Socialist parties proved unsuccessful until the 1965 elections, when they gained a combined majority of 80 seats in the Storting. Per Borten, who

was appointed in October 1965 to form a non-Socialist coalition government, retained office in the 1969 elections, although with a majority of only two seats.

In the 1973 general elections, the Labor Party received only 35.3% of the national vote; its representation in the Storting shrank to 62 seats, but with its Socialist allies, it was able to form a minor-

ity government. The Christian People's Party, meanwhile, registered gains, as did the Socialist Electoral League, a new coalition, which was able to take a number of votes away from the Labor Party. In 1975, the Socialist Electoral League was transformed into a single grouping known as the Socialist Left Party, comprising the former Socialist People's Party, the Norwegian Communist Party, and the Democratic Socialist Party (formed in 1972); the transformation, which resulted in a platform that voiced criticism neither of the former USSR nor of Leninist ideology, marked the first occasion when a Western Communist Party voted to dissolve its organization and merge into a new grouping with other parties.

In the 1977 elections, Labor expanded its representation to 76 seats, but its Socialist Left ally won only two seats, and their coalition commanded a single-seat majority in the Storting. Odvar Nordli, who became prime minister in January 1976, succeeding the retiring Trygve Bratteli, formed a new cabinet and remained in office until February 1981, when he quit because of ill health. His successor was Gro Harlem Brundtland, Norway's first woman prime minister. Her term in office lasted only until September, when the non-Socialist parties obtained a combined total of more than 56% of the vote and a Conservative, Kåre Willoch, became prime minister of a minority government. In April 1983, the government was transformed into a majority coalition.

Following the loss of a vote of confidence, the coalition was replaced in May 1986 by a Labor minority government led by Brundtland, who formed a cabinet of eight female ministers out of 18. With an average age of 47, her cabinet was the youngest ever in Norway.

Labor increased its support in the 1993 election, winning 67 seats. The Center Party became the second-largest party while the Conservatives and other right-wing parties suffered a decline.

The September 1997 election brought to power a coalition of Christian People's party, Liberals, and Center party and was headed by the Lutheran minister, Kjell Magne Bondevik. The coalition claimed only 42 seats in parliament and Bondevik was forced to seek compromises with opposition parties to pass legislation. In March 1999 his government lost a vote of confidence after Bondevik refused to weaken antipollution laws to allow the construction of gas-fired power plants. Norway generates most of its power from nonpolluting hydro power and Bondevik was not ready to compromise Norway's environment for the sake of natural gas energy.

Because the next legislative elections could only be held in September 2001, Jens Stoltenberg, the elected leader of the Labor party, became prime minister at the age of 41, becoming Norway's youngest leader. Stoltenberg pledged to seek strong ties to Europe and favored European Union membership. He also announced the privatization of Statoil, the state's oil company, and Telenor, the state-owned telecommunication group. Especially, the partial sell-off of Statoil was of huge symbolic significance because of its role as the guardian of the nation's oil and gas wealth.

In the September 2001 parliamentary elections, the Labor Party came in first, although it suffered its worst defeat since 1924, taking only 24.3% of the vote, compared with 35% in 1997. Voters were disgruntled with high tax rates—in some cases 50%—and inadequate public services, including hospitals, schools, and public transportation. The far-right Progress Party gained seats. Bondevik was returned to power as prime minister, putting together

a coalition of the Christian People's Party, the Liberals, and the Conservatives, with support from the Progress Party. The distribution of the parties' electoral strength in the Storting following the 2001 elections was as follows: Labor Party, 24.3% (43 seats); Conservative Party, 21.2% (38 seats); Progress Party, 14.7% (26 seats); Christian People's Party, 12.5% (22 seats); Socialist Left Party, 12.4% (23 seats); Center Party, 5.6% (10 seats); the fisherman's Coastal Party, 3.9% (2 seats); and the extreme-left Red Electoral Alliance, 1.7% (1 seat).

In the September 2005 parliamentary elections, the Labor Party came in first, taking 32.7% of the vote (61 seats), an increase of 8.4% (18 seats) over the 2001 elections. The Progress Party came in second with 22.1% of the vote (38 seats), an increase of 7.4% of the vote (and 12 seats) over the 2001 elections. The distribution of the remaining parties' electoral strengths in the Storting following the elections was as follows: Conservative Party, 14.1% (23 seats); Socialist Left Party, 8.8% (15 seats); Christian People's Party, 6.8% (11 seats); Center Party, 6.5% (11 seats); and the Liberal Party, 5.9% (10 seats). Jens Stoltenberg, leader of the Labor Party, claimed he would devote more of the country's oil wealth to jobs, schools, and care for the elderly. Stoltenberg was to form a coalition government with the Socialist Left and Center parties.

## 15 LOCAL GOVERNMENT

Norway has 435 municipalities (*kommuner*) of varying size, each administered by an elected municipal council. They are grouped into 19 counties (*fylker*), each governed by an elected county council. Each county is headed by a governor appointed by the king in council. Oslo is the only urban center that alone constitutes a county; the remaining 18 counties consist of both urban and rural areas. County and municipal councils are popularly elected every four years. The municipalities have wide powers over the local economy, with the state exercising strict supervision. They have the right to tax and to use their resources to support education, libraries, social security, and public works such as streetcar lines, gas and electricity works, roads, and town planning, but they are usually aided in these activities by state funds.

## 16 JUDICIAL SYSTEM

Each municipality has a conciliation council (*forliksråd*), elected by the municipal council, to mediate in lesser civil cases so as to settle them, if possible, before they go to court; under some conditions the conciliation councils also render judgments. The courts of first instance are town courts (*byrett*) and rural courts (*herredsstrett*), which try both civil and criminal cases. Their decisions may be brought before a court of appeals (*lagmannsstrett*), which also serves as a court of first instance in more serious criminal cases. There are six such courts: Borgarting, Eidsivating, Agder, Gulating, Frostating and Hålogaland. Appeals may be taken to the Supreme Court (*Høyesterett*) at Oslo, which consists of a chief justice and 18 judges. Special courts include a Social Insurance Court and a Labor Disputes Court who mediates industrial relations disputes.

The judiciary is independent of both the legislative and the executive branches. In criminal cases, defendants are afforded free legal counsel. Indigent persons are granted free legal counsel in certain civil cases as well.

## 17 ARMED FORCES

Norway's armed forces in 2005 had a total strength of 25,800 active personnel with reserves numbering 219,000. The Army of 14,700 was equipped with 165 main battle tanks, 157 armored infantry fighting vehicles, 189 armored personnel carriers, and 634 artillery pieces. The Navy numbered 6,100 active personnel, including 270 in the coast guard and 160 coastal defense personnel. The Navy operated 6 tactical submarines, 3 frigates, 15 coastal and patrol vessels, and 10 mine warfare ships. The Air Force consisted of 5,000 personnel operating 61 combat capable aircraft, in addition to 15 (each) transport and training aircraft, and 12 search and rescue helicopters. The Air Force also mans air defense guns and missiles.

Norway is the host nation for the NATO Allied Forces North headquarters and provides troops or observers for eight peacekeeping operations. The nation's defense budget in 2005 totaled \$4.69 billion.

## 18 INTERNATIONAL COOPERATION

Norway has been a member of the United Nations since 27 November 1945; the country participates in the ECE and several nonregional specialized agencies, such as the FAO, IAEA, the World Bank, UNSECO, UNHCR, UNIDO, and the WHO. Norwegian experts serve in many countries under the UN Technical Assistance program. Norway has participated in at least 30 UN peacekeeping operations. The Norwegian Peace Corps, launched as an experiment in 1963, was made a permanent part of Norway's program of international aid in 1965.

Norway is a member of the WTO, the African Development Bank, the Asian Development Bank, the Council of the Baltic Sea States, the Euro-Atlantic Partnership Council, the Inter-American Development Bank, the Council of Europe, EFTA, the OSCE, the Paris Club, NATO, the Nordic Council, the Nordic Investment Bank, and OECD. The country holds observer status in the OAS and is an associate member of the Western European Union. A referendum on EU membership was held in November 1994; 52% of the electorate voted against membership.

Norway is part of the Australia Group, the Zangger Committee, the Nuclear Suppliers Group (London Group), the Nuclear Energy Agency, the European Organization for Nuclear Research (CERN), and the Organization for the Prohibition of Chemical Weapons. In environmental cooperation, Norway is part of the Antarctic Treaty, the Basel Convention, the Convention on Biological Diversity, Ramsar, CITES, the London Convention, International Tropical Timber Agreements, the Kyoto Protocol, the Montréal Protocol, MARPOL, the Nuclear Test Ban Treaty, and the UN Conventions on the Law of the Sea, Climate Change and Desertification.

## 19 ECONOMY

Norway, with its long coastline and vast forests, is traditionally a fishing and lumbering country, but since the end of World War II it has greatly increased its transport and manufacturing activities. The exploitation since the late 1970s of major oil reserves

in the North Sea has had considerable impact on the Norwegian economy.

Foreign trade is a critical economic factor. Exports bring in over 40% of the GDP. As a trading nation without a large domestic market, Norway was especially vulnerable to the effects of the worldwide recession of the early 1980s and is sensitive to fluctuations in world prices, particularly those of oil, gas, and shipping. Since the early 1980s, Norway's exports have been dominated by petroleum and natural gas, which produced 56% of commodity exports in 2003.

Norway has a mixed economy with the government owning about 32% of the listed shares on the Oslo stock exchange, and holding shares in around 10–15% of Norwegian industry (as of 2005). State ownership is most dominant in the oil, hydroelectric, and mining sectors. At considerable expense, the government provides subsidies for industry, agriculture, and outlying regions. About half of the total goes to agriculture.

Norwegian competitiveness in the global economy is hampered by a small population (4.6 million), a restrictive immigration policy, and an expensive social welfare system that places high tax burdens on the population.

In the early 1980s, the nation's economy became increasingly dependent on oil revenues, which stimulated domestic consumption and, at the same time, increased costs and prices, thus hampering the competitiveness of Norway's other export industries. The drastic decline of oil prices in 1986 caused the value of Norway's exports to fall by about 20%. Recently, the service sector has grown, accounting for 61.6% of GDP (2004 est.)

From 1949 to 1989 the real GDP rose on the average by 3.9% per year. The GDP fell in 1988 for the first time in 30 years. Since 1989, however, growth resumed, averaging only 1.3% during 1989–91, but climbing by an annual average of 3.7% during 1992–94. In 1998, GDP growth was 2.4%, inflation was 2.3%, and unemployment was 2.6%. In 1999, low world oil prices helped reduce growth to 1.1%, while their recovery, in 2000 helped raise GDP growth to 2.3%. GDP growth fell to 1% by 2002 and to 0.5% in 2003, largely due to the global economic slowdown of 2001–02. The economy recovered strongly in 2004, with real GDP growing by 2.9%. Economic growth was forecast to peak in 2005 at 3%, before falling slightly to 2.5% in 2006.

Unemployment averaged about 3.3% 1999 to 2002, while annual price inflation was about 2.9%. The unemployment rate stood at 4.3% in 2004, and the annual CPI inflation rate was forecast at 1.8% in 2005. Government statistics show that government spending as a percent of GDP declined from 39% in 1999 to about 34.5% in 2001, down from the estimated 50% reported by the OECD in the mid-1990s. Government spending as a percent of GDP stood at approximately 40% in 2005.

Norwegian voters rejected European Union membership in 1994. However, Norway is a member of the European Economic Area (EEA) which consists of the EU member countries together with Norway, Iceland, and Liechtenstein. Membership gives Norway most of the rights and obligation of the EU single market but very little ability to influence EU decisions.

## 20 INCOME

The US Central Intelligence Agency (CIA) reports that in 2005 Norway's gross domestic product (GDP) was estimated at \$194.7

billion. The CIA defines GDP as the value of all final goods and services produced within a nation in a given year and computed on the basis of purchasing power parity (PPP) rather than value as measured on the basis of the rate of exchange based on current dollars. The per capita GDP was estimated at \$42,400. The annual growth rate of GDP was estimated at 3.8%. The average inflation rate in 2005 was 2.1%. It was estimated that agriculture accounted for 2.2% of GDP, industry 37.2%, and services 60.6%.

According to the World Bank, in 2003 remittances from citizens working abroad totaled \$322 million or about \$71 per capita and accounted for approximately 0.1% of GDP.

The World Bank reports that in 2003 household consumption in Norway totaled \$101.96 billion or about \$22,350 per capita based on a GDP of \$220.9 billion, measured in current dollars rather than PPP. Household consumption includes expenditures on individuals, households, and nongovernmental organizations on goods and services, excluding purchases of dwellings. It was estimated that for the period 1990 to 2003 household consumption grew at an average annual rate of 3.4%. In 2001 it was estimated that approximately 16% of household consumption was spent on food, 11% on fuel, 5% on health care, and 4% on education.

## 2<sup>1</sup> LABOR

In 2005, Norway's labor force totaled an estimated 2.4 million workers. As of 2003, services accounted for 74% of the workforce, with 22.1% in industry, and around 4% in the agricultural sector. From 1960–88, Norway's average unemployment rate was only 1.6%. Unemployment gradually increased during the 1970s, and decreased from 5.5% in 1991 to 3.9% in 2002. As of 2005, the unemployment rate was estimated at 4.2%.

As of 2005, about 55% of the labor force was unionized. Under Norwegian law, workers can organize and join unions, engage in collective bargaining, and strike. Government employees, including military personnel, can also organize unions and bargain collectively. Antiunion discrimination is prohibited by law.

In 1919, the eight-hour day was established, together with paid holiday periods. In 1986, the workweek was reduced to 37.5 hours, where as of 2005, it remained. There is also 25 days of paid leave, with 31 days for those 60 and older. There is no legal minimum wage. Wages scales are set through negotiations involving local government, employers and workers. Children between the ages of 13 and 18 years may engage in light work that will not negatively affect their health or education, but only on a part-time basis.

## 2<sup>2</sup> AGRICULTURE

Agricultural land in 2003 comprised 873,000 hectares (2,157,000 acres), or about 2.9% of the country's total land (excluding Svalbard and Jan Mayen). While the area under wheat and mixed grains has dropped sharply since 1949, that for rye, oats, and barley has more than doubled. The greater part of these crops is used to supplement potatoes and hay in the feeding of livestock. In 2004, the area planted with barley, oats, rye, and triticale covered 12,380 hectares (30,590 acres), while wheat covered 65,000 hectares (161,000 acres).

In 2005, Norway had 53,277 agricultural holdings, 96% held by individuals. Because of the small size of the holdings, many farm families pursue additional occupations, mainly in forestry, fishing,

and handicrafts. Yields in 2004 included 1,076,000 tons of coarse grain and 340,000 tons of potatoes. Østfold county accounts for 20% of Norway's grain production; Hedmark county for one-third of potato production. Norway imports most of its grain and large quantities of its fruits and vegetables.

With steep slopes and heavy precipitation, Norway requires substantial quantities of fertilizers to counteract soil leaching. Smallholders and those in marginal farming areas in the north and in the mountains receive considerable government assistance for the purchase of fertilizers. Mechanization of agriculture is developing rapidly. In 2003, Norwegian farmers used 130,000 tractors and 13,400 combines.

Since 1928, the state has subsidized Norwegian grain production; a state monopoly over the import of grains maintains the price of Norwegian-grown grains. The Ministry of Agriculture has divisions dealing with agricultural education, economics, and other aspects. Each county has an agricultural society headed by a government official. These societies, financed half by the district and half by the state, implement government schemes for improving agricultural practices.

## 2<sup>3</sup> ANIMAL HUSBANDRY

Norway is self-sufficient in farm animals and livestock products. In 2005, there were 2,417,000 sheep, 920,000 head of cattle, 515,000 hogs, 28,000 horses, and 3,300,000 fowl. Norway is well known for its working horses. By careful breeding, Norway has developed dairy cows with very good milk qualities; artificial insemination is now widely used. In 2005, production included 83,600 tons of beef and veal, 116,500 tons of pork, 25,400 tons of mutton and lamb, 1,721,000 tons of milk, 81,200 tons of cheese, 51,000 tons of eggs, and 13,000 tons of butter. Norwegian production of milk, cheese, and meat satisfies local demand.

The breeding of furbearing animals has been widely undertaken, and good results have been obtained with mink. In 2003, there were 320,000 farm-raised foxes, 440,000 mink, and 203,000 deer. Reindeer graze in the north and on the lichen-clad mountains. In 2004, wild game hunting yielded 36,770 moose, 3,895 wild reindeer, and 25,896 red deer.

## 2<sup>4</sup> FISHING

Seafood is Norway's third-largest export item, after petroleum products and metals. In 2004, the value of Norway's seafood exports amounted to \$4.2 billion, with salmon and trout accounting for 44%. Norway's wild fish catch in 2004 amounted to 2.5 million tons, valued at \$1.5 billion. The main commercial species are herring, cod, mackerel, and sardines.

Cod spawn in March and April off the Lofoten Islands. The Lofoten fisheries are coastal, permitting the use of small craft, but there has been increased use of large trawlers that fish in the waters of Greenland, the Norwegian Sea, and the Barents Sea. Cod roe and liver (yielding cod-liver oil) are valuable by-products. In recent years there has been concern about declining wild fish stocks in the sea, but for Norway the wild fish catches seem to increase almost every year. According to the Norwegian Institute of Marine Research, the most important fish stocks in northern Norwegian waters have stabilized, and will remain at a high level in the years to come. The traditional wage system is on a share-of-the-catch

basis. In view of the seasonal nature of the fisheries, many men work also in agriculture or forestry, and the supplementary income from part-time fishing is important to small farmers.

Aquaculture is also important in Norway, with over 3,500 workers and 700 facilities located along the entire coast from the Swedish border in the south to Finnmark far north of the Arctic Circle. The production of farmed salmon reached 537,000 tons in 2004, accounting for 45% of the world's farmed salmon production.

In 2003, sealing expeditions hunting in the Arctic Ocean caught 12,870 seals. Norway was one of the four countries that did not agree to phase out whaling by 1986, having opposed a 1982 resolution of the International Whaling Commission to that effect. In 2003, 647 minke whales were reportedly caught.

## 25 FORESTRY

Norway's forestland totals 8,868,000 hectares (21,913,000 acres), of which over 80% is owned by individuals, 9% by the state, and 7% by local governments; the remainder is held by institutions, companies, and cooperatives.

The state subsidizes silviculture and the building of forest roads. In 2004, removals amounted to 8,780,000 cu m (309.9 million cu ft), of which 86% was coniferous industrial wood and 14% was fuel wood. Sawn wood production in 2004 totaled 2,230,000 cu m (78.7 million cu ft); wood pulp, 2,528,000 tons; and paper and paperboard, 2,294,000 tons. The value of forest products exported was \$1.8 billion in 2004, when Norway's trade surplus in forest products amounted to \$641 million. The Norwegian Forest Research Institute has centers near Oslo and Bergen.

## 26 MINING

Mining was Norway's oldest major export industry. Some working mines were established more than 300 years ago and, for a time, silver, iron, and copper were important exports. Iron pyrites and iron ore were still mined in considerable quantities. Petroleum and gas comprised Norway's leading industry in 2004, and metals, chemicals, and mining were among other leading industries. Among export commodities, petroleum and petroleum products ranked first, while metals and chemicals followed close behind. Known deposits of other minerals were small; they included limestone, quartz, dolomite, feldspar, and mica (flake). In 2004, production of iron ore and concentrate (metal content) was 408,000 metric tons, up from 340,000 metric tons in 2003. Titanium (metal content) production in 2004 was 387,000 metric tons. Norway also produced nickel, hydraulic cement, dolomite, feldspar, graphite, lime (hydrated, quicklime), limestone, flake mica, nepheline syenite, nitrogen, olivine sand, quartz, quartzite, soapstone, steatite, sulfur (as a by-product), and talc. No lead or zinc was mined from 1998 through 2004, and no copper or pyrite from 1999 through 2004. The largest titanium deposit in Europe was at Soknedal. A large plant at Thamshavn used half the Orkla mines' output of pyrites for sulfur production. Reserves of minerals generally have been depleted, except for olivine, which was abundant. There has been recent gold exploration, and a zinc exploration program in the Roros district confirmed the existence of extensive

stratiform sulfide mineralization with dimensions of a type that could host commercial deposits.

## 27 ENERGY AND POWER

Norway has Western Europe's largest proven reserves of oil, which are located on the country's continental shelf. Norway is also the second-largest supplier of natural gas to continental Europe and one of the largest producers in the world. In spite of its oil and gas reserves, hydropower is the primary source of electric power for Norway.

As of 1 January 2005, Norway's proven reserves of oil amounted to 8.5 billion barrels. In 2004, Norway produced an estimated 3,183,900 barrels of oil per day, of which crude oil accounted for 88%. Domestic consumption for oil averaged 244,300,000 barrels of oil per day. In 2005, Norway's crude oil refining capacity averaged 310,000 barrels per day, according to the Oil and Gas Journal. There are two major refining facilities: the 200,000 barrel-per-day Mongstad plant, which is operated by 71% government owned Statoil; and the 110,000 barrel-per-day Slagen plant, which is operated by ExxonMobil.

Norway's natural gas reserves are mainly in the North Sea, although the Barents and Norwegian Seas are known to have significant reserves. As of 1 January 2005, Norway's proven reserves of natural gas were estimated at 73.6 trillion cu ft. In 2003, natural gas production was estimated at 2.6 trillion cu ft, with domestic consumption that year estimated at 146.2 billion cu ft.

Norway's reserves of coal, unlike its reserves of oil and natural gas, are very modest. In 2003, Norway's recoverable coal reserves were estimated at 5.5 million short tons. Output and consumption that year were estimated at 3.2 million short tons and 1.4 million short tons, respectively.

Norway's installed electric power generating capacity in 2003 was estimated at 26.6 GW. In that same year, electric power output was estimated at 1205.6 billion kWh, of which hydroelectric generated power amounted to 99% of the electricity produced. Geothermal/other and conventional thermal generated power account for the remainder. Domestic consumption in 2003 was estimated at 106.1 billion kWh.

## 28 INDUSTRY

Manufacturing, mining, and crude petroleum and gas production accounted for nearly 36.3% of the GDP in 2004. The most important export industries are oil and gas extraction, metalworking, pulp and paper, chemical products, and processed fish. Products traditionally classified as home market industries (electrical and nonelectrical machinery, casting and foundry products, textiles, paints, varnishes, rubber goods, and furniture) also make an important contribution. Electrochemical and electrometallurgical products—aluminum, ferroalloys, steel, nickel, copper, magnesium, and fertilizers—are based mainly on Norway's low-cost electric power. Without any bauxite reserves of its own, Norway has thus been able to become a leading producer of aluminum. Industrial output is being increasingly diversified.

About half of Norway's industries are situated in the Oslofjord area. Other industrial centers are located around major cities along the coast as far north as Trondheim. Norway has two oil refineries. Daily Norwegian offshore production in 2003 averaged

3.26 million barrels of oil. In the early 2000s, despite an improvement in world oil prices, investment in offshore oil and natural gas remained in decline, in part due to the completion of major projects, such as the Aasgard field. Norway's oil and gas reserves are declining; discovered oil reserves were projected to last 18 years in 2000, and natural gas reserves to last 95 years. The state oil company is Statoil. Norway's price support level for the oil industry is low, at around \$20 per barrel of oil. Norway's oil economy employs more than 100,000 Norwegians.

Norway is also Europe's largest natural gas producer, and one of the largest natural gas exporters in the world. Natural gas reserves were measured at 1.71 trillion cu m in 2005. By 2020, natural gas production in Norway will overtake its oil output.

As Norway's economy will not be able to depend indefinitely upon oil, it must diversify. In addition to developing its knowledge-based economy (biotechnology, nanotechnology, the Internet, and knowledge-services), Norway may look to further develop its mineral resources.

## 29 SCIENCE AND TECHNOLOGY

A highly advanced industrialized nation, Norway invested \$2,625.414 million or 1.6% of its GDP into research and development (R&D) in 2001. Of that amount, 51.7% came from the business sector, followed by government sources at 39.8%. Foreign sources accounted for 7.1% and higher education at 1.4%. In 2002, high-tech exports were valued at \$2.863 billion and accounted for 22% of manufactured exports. Public funds come either as direct grants from the central government or as proceeds from the State Football Pool, whose net receipts are divided between research and sports. In 2001 (the latest year for which data was available), there were 1,524 technicians and 4,442 scientists and engineers engaged in R&D per million people.

The four principal research councils are the Agricultural Research Council of Norway, the Norwegian Research Council for Science and the Humanities, the Royal Norwegian Council for Scientific and Industrial Research, and the Norwegian Fisheries Research Council, each attached to separate government ministries. The councils recruit researchers by means of fellowship programs and allocate research grants to universities. They are part of the Science Policy Council of Norway, an advisory board to the government on all research matters. Principal areas of current study are arctic research, specifically studies of the northern lights; oceanography, especially ocean currents; marine biology, with special attention to fish migration; and meteorology.

The Royal Norwegian Society of Sciences and Letters, founded in 1760, has a Natural Sciences section. The country has 12 other scientific and technical learned societies and 24 scientific and technical research institutes. Located in Oslo are the Botanical Garden and Museum (founded in 1814), the Norwegian Museum of Science and Industry (founded in 1914), and other museums devoted to mineralogy-geology, paleontology, and zoology. The country has six universities and colleges offering courses in basic and applied sciences. In 1987-97, science and engineering students accounted for 26% of university enrollment. In 2002, of all bachelor's degrees awarded, 14.5% were in the sciences (natural, mathematics and computers, engineering).

## 30 DOMESTIC TRADE

Oslo, the principal merchandising center, handles the distribution of many import products; Bergen and Stavanger are other west coast distribution centers. Trondheim is the chief northern center; Tromsø and Narvik are also important. The largest number of importers, exporters, and manufacturers' agents are in Oslo and Bergen. An 11% value-added tax (VAT) applies to many food products. A 25% VAT applies to most other goods and services, effective 2005.

Cooperative societies are an important distribution factor, with local groups operating retail stores for many kinds of consumer goods, especially in the food sector. Food market chains have developed rapidly in recent years. The Norwegian Cooperative Union and Wholesale Society represents a large number of societies, with over half a million members. Agricultural cooperatives are active in produce marketing and cooperative purchasing societies (*Felleskjöp*) do much of the buying of farm equipment, fertilizer, and seed.

The Norwegian Consumer Council (established by the Storting in 1953) advances and safeguards the fundamental interests of consumers. It publishes comprehensive reports on accepted standards for key consumer goods, conducts conferences and buying courses in various parts of Norway, arranges consumer fairs, and cooperates closely with other organizations and institutions interested in consumer protection. Newspapers provide an important medium for advertisements; trade and other journals carry advertising, but the state-owned radio and television do not. However, in 1992, a national commercial television channel, TV2, was established in competition with the noncommercial Norwegian Broadcasting Corporation (NRK). TV2 currently has the sole right to broadcast advertising via Norwegian Telecom's terrestrial broadcasting network. Advertising is not permitted on NRK, but the growth of foreign-based commercial television channels broadcasting by satellite, and commercial television channels broadcasting via cable, opened the way for nationwide advertising on television. The advent of commercial television and radio advertising in Norway has led to new official control systems.

Shopping hours are usually from 9 AM to 5 PM on weekdays (often until 7 PM on Thursdays) and from 9 AM to 1 or 3 PM on Saturdays. Banks stay open from 9 AM to 3:30 PM Mondays, Tuesdays, Wednesdays, and Fridays, and until 5 PM on Thursdays. Some manufacturers and major businesses will close for three to four weeks in July and/or August for a summer vacation.

## 31 FOREIGN TRADE

Foreign trade plays an exceptionally important role in the Norwegian economy, accounting, with exports of goods and services, for some 43% of the GDP in the mid-1990s and about 41% in 2004. Exports are largely based on oil, natural gas, shipbuilding, metals, forestry (including pulp and paper), fishing, and electrochemical and electrometallurgical products. Norway is the world's third-largest exporter of oil, after Saudi Arabia and Russia. The manufacture of oil rigs, drilling platforms, and associated equipment has developed into a sizable export industry. Norway im-

ports considerable quantities of motor vehicles and other transport equipment, raw materials, and industrial equipment.

Exports tripled between 1974 and 1981, largely on the strength of the petroleum sector, which accounted for a negligible percentage of exports in 1974 but half the total export value in 1981. During the same period, imports advanced by 93%. Following years of trade deficits, Norway had surpluses from 1980 through 1985. However, the drastic fall in oil prices caused a decline in export value resulting in deficits between 1986 and 1988. Since 1989, Norway has once again consistently recorded trade surpluses. In 2004, the value of Norwegian exports was \$76.64 billion, and the value of imports totaled \$45.96 billion, for a trade surplus of \$30.68 billion. The leading markets for Norway's exports in 2004 were the United Kingdom (22.3% of all exports), Germany (12.9%), the Netherlands (9.9%), France (9.6%), and the United States (8.4%). Norway's leading suppliers in 2004 were: Sweden (15.7% of all imports), Germany (13.6%), Denmark (7.3%), the United Kingdom (6.5%), and the United States (4.9%). In total, 78.2% of all Norwegian exports are traded with the EU, and Norway receives 70.8% of its imports from the EU.

**3<sup>2</sup> BALANCE OF PAYMENTS**

Norway's foreign exchange reserves have been built up to meet adverse developments in the balance of payments without the necessity of a retreat from the liberalization of imports. Until the oil boom of the late 1970s, imports regularly exceeded exports, but large deficits on current account were more than offset by the capital account surplus, giving a net increase in foreign exchange reserves. As of 2005 Norway was the world's third-largest exporter of oil, behind only Saudi Arabia and Russia.

Norway's economy is less open to trade than the Western European average, with total exports and imports of goods and services equal to 41.5% and 27.3% of GDP, respectively, in 2002.

The price of oil rose sharply in 2005 (averaging \$53.27 per barrel), and was forecast to remain at \$50.50 per barrel in 2006. The higher oil prices were expected to boost Norway's trade surplus in both years, which means that the current account surplus will also

widen, reaching 17.3% of GDP in 2005, before narrowing slightly in 2006. The current account balance was estimated at \$30.52 billion in 2004.

**3<sup>3</sup> BANKING AND SECURITIES**

The Bank of Norway was founded as a commercial bank in 1816; in 1949, all its share capital was acquired by the state. It is the central bank and the sole note-issuing authority. The bank discounts treasury bills and some commercial paper; trades in bonds, foreign exchange, and gold and silver; and administers foreign exchange regulations. The bank also receives money for deposit on current account but generally pays no interest on deposits. The head office is in Oslo, and there are 20 branches.

In 1938 there were 105 commercial banks, but mergers brought the total down to only 31 in 1974 and 21 in 1984. As of 1993, the total was down to 20. The three largest—the Norske Creditbank, Bergen Bank, and Christiania Bank og Kreditkasse—account for more than half of the total resources of the commercial banks. In 1988, a number of small savings banks and one medium-sized commercial bank, Sunnmørsbanken, became illiquid or insolvent. Most were rescued by merging with larger banks. After a slight improvement in 1989, however, banks' positions deteriorated again in 1990 following heavy losses sustained in the securities markets. As commercial property prices continued to fall, the position of the country's second and third-largest commercial banks, Christiania and Fokus, became increasingly precarious. To prevent a loss of confidence in the banking system, the government established a Government Bank Insurance Fund in March 1991. Within months this was called upon to provide capital to support the country's three largest banks, two of which—Christiania and Fokus—were by then insolvent.

By the late 1990s, increasing pressure fell upon Norway to shed its nationalistic protection of its banking industry and allow for for-

eign investment, particularly from its Nordic neighbors. Throughout the fall of 1998 and into 1999, attention centered on the fate of Christiania as two attempted merger attempts fell through. In mid-October 1999, Christiania was seeking to merge with MeritaNordbanken in order to avert a hostile takeover by either Swedish Svenska Handelbanken or Danish Den Norske Bank.

Ten state banks and other financial institutions serve particular industries or undertakings, including agriculture, fisheries, manufacturing, student loans, mortgages, and others. Although savings banks also have been merging in recent years, there were still 133 private savings banks and many credit associations in 1993.

A law of 1961 contains measures to implement the principle that banking policies are to be based on social as well as economic and financial considerations. The government appoints 25% of the representatives on the board of every commercial bank with funds of over Kr100 million. Guidelines for these banks are worked out cooperatively with public authorities.

The International Monetary Fund reports that in 2001, currency and demand deposits—an aggregate commonly known as M1—were equal to \$73.4 billion. In that same year, M2—an aggregate equal to M1 plus savings deposits, small time deposits, and money market mutual funds—was \$87.6 billion. The discount rate, the interest rate at which the central bank lends to financial institutions in the short term, was 8.5%.

The stock exchanges of Norway are at Oslo (the oldest, founded 1818), Trondheim, Bergen, Kristiansund, Drammen, Stavanger, Ålesund, Haugesund, and Fredrikstad. Amid the increasing consolidation among European stock exchanges in the late 1990s, calls increased for the Norwegian markets to merge. As of 2004, there were 148 companies listed on the Oslo exchange, which had a market capitalization of \$141.430 billion. In 2004, the Oslo exchange rose 31.3% from the previous year to 821.6.

### 3<sup>4</sup>INSURANCE

Norwegian insurance can be undertaken only by joint-stock companies of mutual assistance associations. Foreign life insurance companies have practically ceased to operate in Norway. Life insurance policies and those for pension schemes are exempt from income tax and cannot be written by firms doing other insurance work.

The crown in 1767 initiated compulsory fire insurance in towns and this fund still exists. Workers' compensation, third-party auto liability, pharmaceutical product liability, and aircraft liability are all compulsory insurances as well.

For marine insurance, stock companies now are more important than mutual associations. While a number of foreign insurance underwriters transact business in Norway, there is considerable direct insurance of Norwegian vessels abroad, especially in London. Most other insurance, such as automobile and burglary, is underwritten by Norwegian concerns. The insurance regulatory authority is the Banking, Insurance, and Securities Commission (BISC). The insurance sector is highly regulated, deeply influenced by the failure of a nonlife insurance company, Dovre, which spurred the Insurance Activities Act of 1988, which became effective in April 1989. The Insurance Activities Act of 1988 allows the BISC to control premium rates, monitor the financial position of insurance companies, and the risks that the insurance company writes. The BISC has wide powers of intervention. Com-

panies may engage in insurance business after special permission has been granted and a license is obtained from the government. Recent liberalization throughout Europe promises to change radically the structure of the Norwegian insurance industry as foreign firms tap into the market. Direct insurance premiums written in 2003 totaled us\$11.532 billion, of which us\$5.501 billion of the total was nonlife insurance premiums, and us\$6.031 billion was life insurance. In 2003, Norway's top nonlife insurer was If Skadeforsikring, which had gross written nonlife premiums of us\$1,436.6 million. In 2004, the country's leading life insurer was Vital, with gross written life insurance premiums of \$2,344.6 million.

### 3<sup>5</sup>PUBLIC FINANCE

Norway's fiscal year coincides with the calendar year. As one of the per capita richest countries in the world, Norway has a great deal of money to spend on investment, focusing especially on the offshore oil sector. The government maintains a Petroleum Fund that reached \$67 billion at the end of 2001. The Fund will be used to finance government programs once oil and gas resources are depleted.

The US Central Intelligence Agency (CIA) estimated that in 2005 Norway's central government took in revenues of approximately \$176.1 billion and had expenditures of \$131.3 billion. Revenues minus expenditures totaled approximately \$44.8 billion. Public debt in 2005 amounted to 36% of GDP. Total external debt was \$281 billion.

The International Monetary Fund (IMF) reported that in 2003, the most recent year for which it had data, central government revenues were Kr746.8 billion and expenditures were Kr605.3 billion. The value of revenues was us\$105 million and expenditures us\$85 million, based on an exchange rate for 2003 of us\$1 = Kr7.0802 as reported by the IMF. Government outlays by function were as follows: general public services, 17.5%; defense, 5.0%; public order and safety, 2.6%; economic affairs, 10.1%; environmental protection, 0.3%; housing and community amenities, 0.2%; health,

#### Public Finance – Norway (2003)

(In billions of kroner, central government figures)

<b>Revenue and Grants</b>	<b>746.8</b>	<b>100.0%</b>

15.9%; recreation, culture, and religion, 1.2%; education, 6.5%; and social protection, 40.7%.

### 36 TAXATION

Both the central government and the municipal governments levy income and capital taxes. There is also a premium payable to the National Insurance Scheme. For individual taxpayers, income taxes and premiums adhere to the pay-as-you-earn system.

Taxes on corporations are paid in the year following the income year. As of 2004, corporate income taxes are levied at a flat rate of 28% of aggregate income. Companies involved in oil or gas pay a special oil tax of 50% in addition to the standard 28%. All income from capital is taxable at 28%. Although dividends received by resident shareholders from Norwegian countries are taxed at the corporate rate, a credit for the tax already paid by the distributing company on income effectively negates the tax. Dividends paid to nonresident shareholders are taxed at 25%. Interest and royalty income are not subject to a withholding tax.

Personal income taxes are levied at progressive tax rates that have a top rate of 55.3%. However, that rate is made up of: a combined 28% rate for national and municipal taxes; a national gross income tax of rate of 19.5%; and the employee's social security contribution of 7.8% (3% for pensioners, and 10.7% for the self-employed). A number of additional deductions from taxable income are available including allowance for some travel expenses, insurance payments, mortgage interest payments, living allowances, and deductions for contributions to capital investments. A withholding tax on wages can be credited against income taxes. There is also a municipal wealth tax, ranging from 0–1.1% and a land tax with rates from 0.2–0.7%. Gifts and inheritances are taxed according to progressive schedules with a maximum rate of 30%.

The main indirect tax is Norway's value-added tax (VAT), with a standard rate that has increased from 20% in 1999 to 24% in 2004. A reduced rate of 12% is applied to basic foodstuffs, and there is an extensive list of VAT-exempt goods and services, including health and social services, education, passenger transport, hotel accommodations, travel agents, government supplies, etc. Stamp duties are charged at a rate of 2.5%.

### 37 CUSTOMS AND DUTIES

Heavily dependent on foreign trade, Norway has traditionally supported abolition of trade barriers. During the 1950s, direct control of imports was gradually abolished. Tariff rates on industrial raw materials and most manufactured goods are low. Duties on finished textile products are levied at 15–25%.

A signatory of GATT and a member of EFTA, Norway has bilateral trade agreements with many countries in every part of the world. In 1973, Norway signed a Special Relations Agreement with the European Community (now the European Union), whereby both sides abolished all tariffs on industrial goods over the 1973–77 period. Other trade goods receiving gradual tariff reductions were fish, agricultural products, and wine.

Although Norwegian voters rejected EU membership in a 1994 referendum, Norway, as a member of the European Economic Area (EEA) maintains a free trade agreement with the European Union.

### 38 FOREIGN INVESTMENT

Norway welcomes foreign investment as a matter of policy and in general grants national treatment to foreign investors. Investment is encouraged particularly in the key offshore petroleum sector, mainland industry (including high-technology and other advanced areas), and in less developed regions such as northern Norway. Corporate taxation is levied at a flat rate of 28%, low by European standards.

Foreign capital has traditionally been largely centered in Norway's electrochemical and electrometallurgical industries, the primary iron and metal industry, and mining. The discovery of oil and natural gas in the North Sea area spurred foreign investments. The Ekofisk oil field was discovered in 1969 by an American Phillips Petroleum Co. consortium, including Petrofina of Belgium, ENI of Italy, and Norway's Petronord. A joint Norwegian-Phillips group company, Norpiepe, was formed in 1973 to construct the pipelines and to operate them for 30 years. Another US company, McDermott International, was awarded a \$150-million contract in 1982 to lay pipe from the Statfjord gas field in the North Sea to the Norwegian mainland. In 1995, 11 international oil and gas companies announced plans for a \$1.2–\$1.35 billion gas pipeline from Norway's North Sea production area to the European continent. That same year, Fokus, Norway's third-largest commercial bank, fell under foreign control as foreign investors captured more than half the shares for sale in the bank's privatization.

Foreign direct investment (FDI) stock in Norway totaled about \$21.4 billion in 1997. FDI inflow was nearly \$3 billion in 1997 and more than \$3.3 billion in 1998. Annual FDI inflow peaked in 1999 and 2000, at \$6.7 billion and \$6.3 billion, respectively, but in the global economic slowdown of 2001 fell to \$2.8 billion. In 2002, FDI inflows increased to \$3.4 billion. In terms of its attractiveness for foreign investment, Norway was ranked fourth in the world on UNCTAD's list of 140 countries for the period 1998 to 2000, up from fifth place for 1988 to 1990. Total FDI stock in Norway as of 2001 was \$40.2 billion, equivalent to 18.7% of GDP. Norway's share in world FDI flows has been approximately equal to its share of world GDP.

Outward FDI flows from Norway averaged \$5.3 billion for the four years 1999 to 2002. More than 2,000 enterprises have foreign investors holding at least 20% of the capital. Total outward FDI stock held by Norwegians totaled \$40.7 billion as of 2001.

In 2003, FDI comprised 20.4% of GDP; total FDI stock in Norway was Kr327.1 billion (\$46.2 billion). Leading investors were (in order) Sweden, the Netherlands, Denmark, the United States, and the United Kingdom. Most of Norway's investment abroad goes to (in order) the United States, the United Kingdom, Sweden, Denmark, the Netherlands, and Germany.

### 39 ECONOMIC DEVELOPMENT

The government holds shares in a number of large enterprises: a minority of shares in most industrial establishments and all or controlling shares in some armaments factories, as well as in chemical and electrometallurgical companies, power stations, and mines. The government also participates in joint industrial undertakings with private capital, in enterprises too large or risky for private capital, and in establishments with shares formerly held

by German interests. Government policy also aims at attracting foreign investment.

Rapid industrial development and exploitation of resources are major governmental goals, with special emphasis on northern Norway, where development has lagged behind that of the southern areas. The Development Fund for North Norway, established in 1952, together with a policy of tax concessions, resulted in progress there at a rate more rapid than that of the rest of the country. The exploitation of offshore oil and natural gas reserves has had a profound effect on Norway's economy. Increased oil revenues have expanded both domestic consumption and investment. The government has used oil revenues to ease taxes and increase public investment in regional development, environmental protection, social welfare, education, and communications. Although the expansion of innovative oil development projects continues (one of which was the \$4.2 billion Heidrun oil project), Norway is looking to produce more natural gas than oil. The \$5 billion Troll gas field was one such project.

A tax law permits industry and commerce to build up tax-free reserves for future investment, foreign sales promotion, and research. Designed to provide a flexible tool for influencing cyclical developments, the law's intent is to help ensure that total demand at any given time is sufficient to create full employment and strong economic growth. In the late 1970s, the government introduced combined price and wage agreements in an effort to restrain inflation and ensure real increases in buying power for consumers.

To stimulate industry, incentives are available for undertakings in the north as well as in other economically weak regions; companies may set aside up to 25% of taxable income for tax-free investment. Tariff incentives are available for essential imports. A Regional Development Fund grants low-interest, long-term loans to firms to strengthen the economy of low-income, high-unemployment areas anywhere in the country.

In 1991, the government introduced a three-year program to improve infrastructure and reduce unemployment. This plan was to spend nearly Kr10 billion, primarily for road and rail communications, with the money coming from budget cuts in other areas.

Although Norwegians rejected EU membership in a 1994 referendum, Norway's economy is largely integrated with that of the EU. Norway has a free trade agreement with the EU; its currency is generally kept on par with the euro. Yet despite these elements of association, Norway retains extensive control over its own economic development policies.

Norway has been active in aiding developing nations under the Norwegian Agency for International Development (Norad). The leading recipients have been Tanzania, Mozambique, Zambia, Bangladesh, Nicaragua, and Ethiopia. Norway is one of five countries meeting the UN international aid target for donor countries (0.7% of national income); Norway gave 0.87% of gross domestic product (GDP) in 2004, more than any other country, ahead of Luxemburg, Denmark, Sweden, and the Netherlands.

The country's Petroleum Fund reached \$190 billion in 2005; the fund will be used to finance government programs once Norway's oil and gas resources run out. As of 2005, unemployment was low, wages were high, and the UN ranked Norway as the most desirable country in which to live. Non-oil business was also booming in 2005; a survey of some 114,000 non-oil companies showed an

average 43.9% increase in profits. However, high taxes and a welfare system burdened by an aging population remain challenges for continued economic prosperity.

#### 40 SOCIAL DEVELOPMENT

Norway has been a pioneer in the field of social welfare and is often called a welfare state. Accident insurance for factory workers was introduced in 1894, unemployment insurance in 1906, compulsory health insurance in 1909, and accident insurance for fishermen in 1908 and for seamen in 1911. In the 1930s, further social welfare schemes were introduced: an old-age pension scheme; aid for the blind and crippled; and unemployment insurance for all workers except fishermen, whalers, sealers, civil servants, domestic servants, self-employed persons, salesmen, and agents. In the postwar period, health insurance became compulsory for all employees and available to self-employed persons; coverage includes dependents, with medical treatment including hospital and other benefits. Sickness benefits, family allowances during hospitalization, and grants for funeral expenses are paid. Costs of this scheme are met by deductions from wages and contributions by employers and by state and local authorities. Public assistance, available in Norway since 1845, supplements the foregoing programs. Social welfare has long included maternity benefits with free prenatal clinics.

The National Insurance Act, which came into effect in 1967, provides old-age pensions, rehabilitation allowances, disability pensions, widow and widower pensions, and survivor benefits to children. Membership is obligatory for all residents of Norway, including noncitizens, and for Norwegian foreign-service employees. Pensions begin at the age of 67. As of 2004, the system of varying rates for employers was reformed to eliminate intermediate levels. The source of funds is divided between employees, employers, and the government funds any deficit.

Workers' compensation covers both accidents and occupational diseases. Compensation is paid to a widow until she remarries, and to children up to the age of 18 (or for life if they are unemployable). Dependent parents and grandparents also are eligible for life annuities. Family allowance coverage, in force since 1946, is provided for children under the age of 16.

The law mandates equal wages for equal work by men and women, although economic discrimination persists. An Equal Rights Ombudsman addresses complaints of sexual discrimination. A provision protecting against sexual harassment is outlined in the Working Environment Act. A resolution mandating that 40% of publicly held companies be directed by women by 2005, and noncompliance will result in removal from the stock exchange in 2007. Violence against women persisted but is seriously investigated and prosecuted by authorities. Victim's assistance programs and battered women's shelters are available.

Human rights are fully respected and protected in Norway. Provisions exist to protect the rights and cultural heritage of minority peoples. The Sami (Lapps) located in the northeast are entitled to schooling in their local language, and also receive radio and television broadcast subtitled in Sami. The Sami also have a constituent assembly that acts as a consultative body on issues that affect them.

## 41 HEALTH

Since 1971, there has been a tax-based National Insurance Scheme. The public health service and the hospitals are the responsibility of the government at the central, county, and municipal levels. There are very few private hospitals in Norway. Hospital care is free of charge, but a minor sum is charged for medicine and primary health care. As of 1984, there has been a ceiling on the total amount one must pay for medical services. There is a three-part system made up of regional hospitals serving parts of the country, central hospitals serving the various counties, and local hospitals, also run by the counties. The country is in need of more nursing homes for the elderly. Most general hospitals are public; others are owned by the Norwegian Red Cross or other health or religious organizations. As of 2004, there were an estimated 356 physicians per 100,000 people. In addition, Norway had the second most nurses per capita at an estimated 2,065 per 100,000 population, and the most dentists at 125 per 100,000 people. Total health care expenditure was estimated at 9.2% of GDP.

On the local level, health councils are responsible for public health services, including tuberculosis control and school health services, and for environmental sanitation. Only in densely populated areas are public health officers appointed on a full-time basis; otherwise they engage in private practice as well. In some areas, they are the only physicians available.

Infant mortality has been appreciably reduced and in 2005 stood at 3.70 per 1,000 live births, one of the lowest rates in the world. As of 2002, the crude birth rate and overall mortality rate were estimated at, respectively, 12.4 and 9.8 per 1,000 people. About 71% of married women (ages 15 to 49) use contraception. Low birth weight was seen in 5% of all births. The maternal mortality rate was only 6 per 100,000 live births. Average life expectancy, among the highest in the world, was 79.40 years in 2005. The HIV/AIDS prevalence was 0.10 per 100 adults in 2003. As of 2004, there were approximately 2,100 people living with HIV/AIDS in the country. There were an estimated 100 deaths from AIDS in 2003.

Children up to one year of age were vaccinated against diphtheria, pertussis, and tetanus, 92%; polio, 92%; and measles, 93%. Tuberculosis tests are given on a regular basis from infancy onward. Children go through a comprehensive vaccination program and also receive psychotherapy and dental care throughout their nine years of basic school.

The heart disease mortality rates were higher than the average for high human development countries. In the mid-1990s the likelihood of dying after age 65 of heart disease was 340 per 1,000 people for men and 374 per 1,000 for women.

## 42 HOUSING

Before World War II, responsibility for housing rested mainly with the municipalities, but the state has since assumed the major burden. Loans and subsidies keep rents under a certain percentage of a family's income. Cooperative housing has made great progress in such densely populated areas as Oslo, where the Oslo Housing and Savings Society pioneered the practice for Norway. With housing problems compounded by wartime destruction and post-war increases in marriages and in the birthrate, Norway built more dwellings per 1,000 inhabitants than any other European country,

completing between 31,000 and 42,000 units annually from 1967 through 1981.

Home construction financing has come principally from two state loan organizations, the Norwegian Smallholdings and Housing Bank and the Norwegian State Housing Bank, but one-fourth of the nation's housing is still privately financed.

As of 2001, Norway had 1,961,548 dwelling units; 57% of them were detached houses. About 29% of the housing stock was built 1981–2001. About 19.5% of the housing stock was built in 1945 or earlier. About 77% of all dwellings were owner occupied. In 2002, at least 22,980 new dwellings were under construction and in 2003 about 22,677 units were started. According to estimates for 2004, about 52% of all households lived in single-family detached homes and 82% of all households were owner occupied. The rate of overcrowding (defined as having fewer rooms in the dwelling than the number of people in the household) was only at about 6%.

## 43 EDUCATION

Elementary school education has been compulsory since the middle of the 18th century. As of 1997, education is compulsory for 10 years of study, with students entering school in the year that they reach the age of six. Primary school covers seven years of study, followed by three years of lower secondary school. At this stage, students may choose to continue in a three-year general secondary school (gymnasium), which prepares students for the university. Since 1976, the upper secondary school system has also included vocational schools of various types, operated by the state, by local authorities, and by the industrial sector. A three-year trade apprenticeship program is also available for some secondary students.

Local authorities generally provide school buildings and equipment and the central government contributes funds towards teachers' salaries and covers a considerable proportion of the cost of running the schools. Although there are private schools, government authorities bear a major share of the financial responsibility for these through a system of grants.

In 2001, about 80% of children between the ages of three and five were enrolled in some type of preschool program. Primary school enrollment in 2003 was estimated at about 100% of age-eligible students. The same year, secondary school enrollment was about 96% of age-eligible students. It is estimated that about nearly all students complete their primary education. The student-to-teacher ratio for primary school was at about 10:1 in 2003; the ratio for secondary school was about 9:1.

Norway's institutions of higher education include 130 colleges and four universities. The four major universities include the University of Oslo (founded in 1811), the University of Bergen (1948), the University of Trondheim (1969), and the University of Tromsø (1969). Representing fields not covered by the universities, there are also specialized institutions, such as the Agricultural University of Norway (near Oslo); the Norwegian School of Economics and Business Administration (Bergen); and the Norwegian College of Veterinary Medicine (Oslo). Universities and colleges in Norway serve a dual function—both learning and research. At the four universities, degrees are granted at three levels: Lower degree (a four-year study program); higher degree (five to seven-year course of study); and doctorate degree. There are also

courses lasting from five to seven years in law, medicine, agriculture, or engineering.

With a goal of placing adults on an equal standing with the educated youth and giving them access to knowledge and job skills, a program of adult education was introduced in August 1977. An official administrative body for adult education exists in all municipalities and counties. However, the Ministry of Education and Research has the highest administrative responsibility for adult education. Folk high schools are associated with a long Scandinavian tradition of public enlightenment. There are more than 80 folk schools in Norway geared toward providing personal growth and development rather than academic achievement. In 2003, about 81% of the tertiary age population were enrolled in some type of higher education program; 64% for men and 99% for women. The adult literacy rate has been estimated at about 99%.

As of 2003, public expenditure on education was estimated at 7.6% of GDP, or 16.2% of total government expenditures.

#### 44 LIBRARIES AND MUSEUMS

The National Library of Norway in Oslo has over two million volumes in its central library. Since 1882, copies of all Norwegian publications have had to be deposited in the national library; since 1939, copies have been deposited at Bergen and Trondheim as well. Bergen University Library has over one million volumes, largely devoted to the natural sciences. Oslo University Library (founded in 1811), has the largest academic library system in the country, with four libraries and a central administrative unit. A special collection at the Oslo University Library includes the world's largest collection of materials on the life and works of Henrik Ibsen as part of the Centre for Ibsen Studies. The library of the Scientific Society in Trondheim, founded in 1760, is the country's oldest research library and has over one million volumes, including 330,000 pictures and UNESCO and GATT (General Agreement on Tariffs and Trade) documents. The Tromsø Museum Library has been organized to make it the research library for the north. There are technical and specialized libraries at many research institutes and higher educational centers. State archives are kept in Oslo, and there are record offices for provincial archives at Oslo, Kristiansund, Stavanger, Bergen, Hamar, Trondheim, and Tromsø.

The first municipal libraries were founded in the late 18th century. By law every municipality and every school must maintain a library; each such library receives financial support from state and municipality. Regional libraries also have been created. A special library service is provided for ships in the merchant navy, and a floating library service provides books to fishermen-farmers living in the sparsely populated regions.

There are natural history museums in Oslo, Stavanger, Bergen, Trondheim, and Tromsø. Oslo, Lillehammer, and Bergen have notable art collections. A traveling "national gallery" was established in 1952. The most important museums in Norway are those dealing with antiquities and folklore, such as the Norwegian Folk Museum in Oslo. Oslo has a unique collection of ships from the Viking period. Open-air museums in Oslo and elsewhere show old farm and other buildings, as well as objects of Norwegian historical and cultural interest. Also in Oslo are the International Museum of Children's Art; the Munch Museum, displaying the works of Edvard Munch, Norway's most famous artist; Norway's Resistance Museum, detailing the country's occupation during World War II;

and the Viking Ship Museum. Among Norway's newer museums are the Astrup Fearnley Fine Arts Museum (1993), which features modern art; the National Museum of Contemporary Art (1990); and the Stenersen Museum (1994), which exhibits paintings from the 19th and 20th centuries. All three museums are in Oslo. There are at least three museums in the country that are dedicated to Henrik Ibsen.

#### 45 MEDIA

Most of the telecommunications network is operated by the government-owned Televerket. The state owns all telephone facilities. In 2003, there were an estimated 713 mainline telephones for every 1,000 people. The same year, there were approximately 909 mobile phones in use for every 1,000 people.

The first private broadcasting stations launched in 1981. The public Norwegian Broadcasting Corp. continues to operate two television channels and three national radio stations, as well as a number of local radio stations. As of 1998 Norway had 5 AM and at least 650 FM radio broadcasting stations. Educational broadcasts supplement school facilities in remote districts. Radio license fees have not been required since 1977. Television programming on an experimental basis was initiated in 1958 and full-scale television transmission began in July 1960. In 2003, there were an estimated 3,324 radios and 884 television sets for every 1,000 people. About 184.5 of every 1,000 people were cable subscribers. Also in 2003, there were 528.3 personal computers for every 1,000 people and 346 of every 1,000 people had access to the Internet. There were 1,130 secure Internet servers in the country in 2004.

The Norwegian press is characterized by a large number of small newspapers. Five regional dailies account for about 20% of the total press circulation in the country. *Verdens Gang* and *Dagbladet*, both national tabloids, account for another 20% of circulation totals. The largest dailies (with their affiliations and circulations in 2004 unless noted) are: *Verdens Gang* (independent, 365,000), *Aftenposten*, (independent, 398,000), *Dagbladet* (liberal, 183,000), *Daens Naeringsliv* (60,027 in 2002), and *Arbeiderbladet* (Labor Party, 51,790 in 2002). Major regional papers include: *De Fire Neste* (Drammen, 442,000 circulation in 2002), *Hedmark* (Hamar, 91,100 in 2002), *Bergens Tidende* (in Bergen, independent, 89,000 in 2004), *Adresseavisen* (Trondheim, conservative, 85,000 in 2004), *Stavanger Aftenblad* (Stavanger, independent, 69,000 in 2004), *Faerdelandsvennen* (Kristiansund, independent, 46,960 in 2002), *Akershus* (Lillestrom, 42,100 in 2002), *Haugesunds Avis* (Haugesund, 38,490 in 2002), and *Sunnmorsposten* (Ålesund, independent, 37,900 in 2002).

The constitution provides for freedom of speech and of the press and the government generally respects these rights.

#### 46 ORGANIZATIONS

Cooperative societies are numerous and important in Norway. About 2,500 agricultural cooperatives are active; these include purchasing, processing, and marketing organizations. Some 528 retail cooperatives are affiliated with the Norwegian Cooperative Union and Wholesale Society.

Doctors are organized in the Norwegian Medical Association and in local associations. Farming organizations and agricultural cooperatives are represented in the Federation of Agriculture. There are associations of small and large forest owners, fur breed-

ers, and employers' organizations in most sectors of industry, as well as a central Norwegian Employers' Confederation.

The Norwegian Academy of Science and Letters, the Royal Norwegian Society of Science and Letters, the Norwegian Academy of Technological Sciences, and the Society for the Advancement of Science are leading learned society. Other learned and professional organizations include the Nobel Committee of the Storting, which awards the Nobel Peace Prize; the Norwegian Research Council for Science and the Humanities; and various legal, scientific, economic, literary, historical, musical, artistic, and research societies.

National youth organizations include the Norwegian Student Union, Christian Democratic Party Youth, En Verden Youth, European Democratic Students, European Good Templar Youth Federation, Federation of Young Conservatives, Norwegian Union of Social Democratic Youth, Norwegian YWCA/YMCA, and the Norwegian Guides and Scouts Association. There are numerous sports associations and clubs.

Health and relief organizations include the Norwegian Red Cross, the Norwegian Women's Health Organization, and societies to combat a variety of conditions and diseases. Volunteer service organizations, such as the Lions Clubs International, are also present. International organizations with national chapters include Amnesty International and CARE Norge.

#### 47 TOURISM, TRAVEL, AND RECREATION

Norway's main tourist attractions are the cities of Oslo, Bergen, and Trondheim, which are connected by road, rail, and daily flights; the marvelous scenery of the fjord country in the west; and the arctic coast with the North Cape and "midnight sun." In 2005, UNESCO named two Norwegian fjords, the Geirangerfjord and the Naeroyfjord to its World Heritage List.

A favorite method of tourist travel is by coastal steamer, sailing from Bergen northward to Kirkenes, near the Soviet frontier. Many cruise ships ply the Norwegian fjords and coastal towns as far north as Spitsbergen. Notable outdoor recreational facilities include the Oslomarka, a 100,000 hectare (247,000 acre) area located near Oslo, with ski trails and walking paths. To compensate for the shortness of winter days, several trails are illuminated for evening skiing. Other popular sports include ice skating, freshwater fishing, mountaineering, hunting (grouse, reindeer, and elk), and football (soccer). In 1994, Norway hosted the XVII Olympic Winter Games in Lillehammer, and the women's soccer team won the World Cup in 1995.

There are major theaters in Oslo and Bergen, as well as six regional theaters; Den Norske Opera in Oslo; and four symphony orchestras. International musical events include the Bergen Festival, held annually in late May or early June; and several jazz festivals in July.

No passport is required of visitors from the Nordic area, but travelers arriving in Norway directly from non-Nordic countries are subject to passport control. A visa is not required for visits of up to 90 days.

Tourist expenditure receipts totaled \$3 billion when 3,146,000 tourists visited Norway in 2003. There were 67,114 hotel rooms with 143,798 beds and an occupancy rate of 35%.

In 2005, the US Department of State estimated the daily cost of staying in Oslo at \$308, and Stavanger, \$304.

#### 48 FAMOUS NORWEGIANS

Ludvig Holberg (1684–1745), the father of Danish and Norwegian literature, was a leading dramatist whose comedies are still performed. Henrik Wergeland (1808–45), Norway's greatest poet, was also a patriot and social reformer; his sister Camilla Collett (1813–95), author of the first Norwegian realistic novel, was a pioneer in the movement for women's rights. Henrik Ibsen (1827–1906), founder of modern dramas, placed Norway in the forefront of world literature. Bjørnstjerne Bjørnson (1832–1910), poet, playwright, and novelist, received the Nobel Prize for literature in 1903. Other noted novelists are Jonas Lie (1833–1908); Alexander Kielland (1849–1906); Knut Hamsun (1859–1952), Nobel Prize winner in 1920; Sigrid Undset (1882–1949), awarded the Nobel Prize in 1928; and Johan Bojer (1872–1959).

Ole Bull (1810–80) was a world-famous violinist. Edvard Grieg (1843–1907) was the first Norwegian composer to win broad popularity. His leading contemporaries and successors were Johan Svendsen (1840–1911), Christian Sinding (1856–1941), Johan Halvorsen (1864–1935), and Fartein Valen (1887–1953). Kirsten Flagstad (1895–1962), world-renowned soprano, served for a time as director of the Norwegian State Opera. In painting, Harriet Backer (1845–1932), Christian Krohg (1852–1925), and Erik Werenskiold (1855–1938) were outstanding in the traditional manner; leading the way to newer styles was Edvard Munch (1863–1944), an outstanding expressionist, as well as Axel Revold (1887–1962) and Per Krohg (1889–1965). Norway's foremost sculptor is Gustav Vigeland (1869–1943); the Frogner Park in Oslo is the site of a vast collection of his work in bronze and granite.

Outstanding scientists are Christopher Hansteen (1784–1873), famous for his work in terrestrial magnetism; Niels Henrik Abel (1802–29), noted for his work on the theory of equations; Armauer (Gerhard Henrik) Hansen (1841–1912), discoverer of the leprosy bacillus; Vilhelm Bjerknes (1862–1951), who advanced the science of meteorology; Fridtjof Nansen (1861–1930), an oceanographer and Arctic explorer who won the Nobel Peace Prize in 1922 for organizing famine relief in Russia; Otto Sverdrup (1854–1930), Roald Amundsen (1872–1928), and Bernt Balchen (1899–1973), polar explorers; Johan Hjort (1869–1948), a specialist in deep-sea fishery research; Regnar Frisch (1895–1978), who shared the first Nobel Prize in Economic Science in 1969 for developing econometrics; Odd Hassel (1897–1981), co-winner of the 1969 Nobel Prize in chemistry for his studies of molecular structure; and Thor Heyerdahl (1914–2002), explorer and anthropologist.

The first secretary-general of the UN was a Norwegian, Trygve (Halvdan) Lie (1896–1968), who served from 1946 to 1953. The historian Christian Louis Lange (1869–1938) was co-winner of the Nobel Peace Prize in 1921.

Sonja Henie (1913–69) was the leading woman figure skater of her time, and Liv Ullmann (b.1939) is an internationally known actress. Linn Ullmann (b.1966), daughter of Liv Ullman and Ingmar Bergman, is a respected novelist and journalist. Grete Waitz (b.1953) is a champion long-distance runner.

#### 49 DEPENDENCIES

##### Svalbard

The Svalbard group includes all the islands between 10° and 35° E and 74° and 81° N: the archipelago of Spitsbergen, White Island

(Kvitøya), King Charles' Land (Kong Karls Land), Hope Island, and Bear Island (Bjørnøya), which have a combined area of about 62,700 sq km (24,200 sq mi). The largest islands are Spitsbergen, about 39,400 sq km (15,200 sq mi); North-East Land (Nordaustlandet), 14,530 sq km (5,610 sq mi); Edge Island (Edgeøya), 5,030 sq km (1,940 sq mi); and Barents Island (Barentsøya), 1,330 sq km (510 sq mi). Svalbard's population totaled 2,868 in 2002, down from 3,181 at the end of 1991. The population is 55.4% Norwegian and 44.3% Russian and Ukrainian.

Discovered by Norwegians in the 12th century and rediscovered in 1596 by the Dutch navigator Willem Barents, Svalbard served in the 17th and 18th centuries as a base for British, Dutch, Danish, Norwegian, German, and other whalers, but no permanent sovereignty was established. Russian and Norwegian trappers wintered there, and coal mining started early in the 20th century. Norway's sovereignty was recognized by the League of Nations in 1920, and the territory was taken over officially by Norway in 1925. Much of the high land is ice-covered; glaciers descend to the sea, where they calve to produce icebergs. The west and south coasts have many fjords, while the western coastal lowland is up to 10 km (6 mi) broad.

The most important mineral, coal, occurs in vast deposits in Spitsbergen. The west coast is kept clear of ice for six months of the year by the relatively warm water of the North Atlantic Drift, but an air temperature as low as  $-62^{\circ}\text{C}$  ( $-80^{\circ}\text{F}$ ) has been recorded. In this region there are 112 days without the sun's appearance above the horizon.

The chief official, a governor, lives at Longyearbyen; his administration is controlled by the Ministry of Industry. Coal mining is the main industry, with Norwegian-worked mines at Longyearbyen, Sveagruva, and Ny Ålesund and Russian worked mines at Barentsburg, Grumantbyen, and elsewhere. Russia has extraterritorial rights in the areas where they mine. Cod fishing takes place around Bear Island, but whaling has virtually ceased. Norwegian sealers hunt seals, polar bears, and walrus in the summer. For centuries, trappers wintered in Spitsbergen to catch fox and bear while the pelts were in the best condition, but few trappers have wintered there in recent years.

Communications are maintained during the summer months by ships from Tromsø carrying goods and passengers, while colliers put in frequently at the mine piers. There are no roads and no local ship services.

### Jan Mayen

Located in the Norwegian Sea at  $70^{\circ}30'$  N and  $8^{\circ}30'$  W, 893 km (555 mi) from Tromsø, the island of Jan Mayen has an area of about 380 sq km (150 sq mi). The island is dominated by the volcano Beerenberg, 2,277 m (7,470 ft) high, which is responsible for its existence; a major eruption occurred in September 1970. Jan Mayen was discovered by Henry Hudson in 1607 and was visited in 1614 by the Dutch navigator Jay Mayen, who used it subsequently as a whaling base. In 1929, the island was placed under Norwegian sovereignty. It is the site of a meteorological station and an airfield.

### Bouvet Island

Bouvet Island (Bouvetøya), situated at  $54^{\circ}26'$  S and  $3^{\circ}24'$  E in the South Atlantic Ocean, was discovered in 1739, and in 1928 was placed under Norwegian sovereignty. An uninhabited volcanic island of 59 sq km (23 sq mi), Bouvet is almost entirely covered by ice and is difficult to approach.

### Peter I Island

Peter I Island (Peter I Øy), an uninhabited Antarctic island of volcanic origin, is located at  $68^{\circ}48'$  S and  $90^{\circ}35'$  W. It has an area of 249 sq km (96 sq mi), rises to over 1,233 m (4,045 ft), and is almost entirely ice-covered. The island was discovered in 1821 by a Russian admiral. In 1931, it was placed under Norwegian sovereignty, and by a parliamentary act of 1933 became a dependency.

### Queen Maud Land

Queen Maud Land (Dronning Mauds land) consists of the sector of Antarctica between  $20^{\circ}\text{W}$  and  $45^{\circ}\text{E}$ , adjoining the Falkland Islands on the W and the Australian Antarctic Dependency on the E. It was placed under Norwegian sovereignty in 1939, and has been a Norwegian dependency since 1957. The land is basically uninhabited, except for several stations operated by Japan, South Africa, and Russia.

# POLAND

Republic of Poland  
*Rzeczpospolita Polska*

**CAPITAL:** Warsaw (Warszawa)

**FLAG:** The national flag consists of two horizontal stripes, the upper white and the lower red.

**ANTHEM:** *Jeszcze Polska nie zginęła* (*Poland Is Not Yet Lost*).

**MONETARY UNIT:** The zloty (z) is a paper currency of 100 groszy. There are coins of 1, 2, 5, 10, 20, and 50 groszy and 1, 2, 5, 10, 20, 50, and 100 zlotys, and notes of 10, 20, 50, 100, 200, 500, 1,000, 2,000, and 5,000 zlotys. A currency reform on 1 January 1995 replaced 10,000 old zlotys with 1 new zloty. z1 = \$0.31348 (or \$1 = z3.19) as of 2005.

**WEIGHTS AND MEASURES:** The metric system is the legal standard.

**HOLIDAYS:** New Year's Day, 1 January; Labor Day, 1 May; National Day, 3 May; Victory Day, 9 May; All Saints' Day, 1 November; Christmas, 25–26 December. Movable holidays are Easter Monday and Corpus Christi.

**TIME:** 1 PM = noon GMT.

## <sup>1</sup> LOCATION, SIZE, AND EXTENT

Situated in Eastern Europe, Poland has an area of 312,680 sq km (120,726 sq mi), extending 689 km (428 mi) E–W and 649 km (403 mi) N–S. It is bounded on the N by the Baltic Sea, on the N and E by Russia, Lithuania, Belarus, and Ukraine, on the S by Slovakia and the Czech Republic, and on the W by Germany, with a total land boundary of 2,788 km (1,794 mi) and a coastline of 491 km (305 mi). Comparatively, the area occupied by Poland is slightly smaller than the state of New Mexico.

Before World War II, Poland encompassed a territory of nearly 390,000 sq km (150,600 sq mi). On 11 July 1920, an armistice mediated by Britain in a Polish-Soviet conflict established the “Curzon line” (named for George Nathaniel Curzon, the British statesman who proposed it), conferring the former Austrian territory of Galicia to the Soviet side. However, under the Treaty of Riga (1921), all of Galicia was assigned to Poland, and a boundary well to the east of the Curzon line prevailed until World War II. At the Yalta Conference in February 1945, the Allies accepted Soviet claims to eastern Poland, with a border running approximately along the Curzon line.

On 21 April 1945, a Polish-Soviet treaty of friendship and cooperation was signed, followed by a new agreement on the Polish-Soviet border. To compensate for the loss of 46% of Poland's territory to the USSR, the Potsdam Conference of July–August 1945 placed former German territories east of the Oder (Odra) and western Neisse rivers under Polish administration, pending a final determination by a German peace treaty. On 6 August 1950, an agreement was signed between Poland and the GDR according to which both parties recognized the frontier on the Oder-Neisse line. The Federal Republic of Germany (FRG) recognized this boundary under the terms of a treaty signed with Poland on 7 December 1970 and ratified by the FRG on 23 May 1972.

Poland's capital city, Warsaw, is located in the east central part of the country.

## <sup>2</sup> TOPOGRAPHY

Poland's average altitude is 173 m (568 ft); 75.4% of the land is less than 200 m (656 ft) above sea level. The highest point, Mount Rysy (2,499 m/8,199 ft), is located in the Tatra Mountains on the Slovakian border. The principal topographic regions are an undulating central lowland with a crystalline platform and warped bedrock; the Baltic highland in the north, a glaciated region with many lakes and sandy soils; and the coastland, a narrow lowland with promontories, bays, and lakes. The southern uplands are marked by rich loam and mineral deposits.

Several important navigable rivers drain into the Baltic Sea, among them the Vistula (Wisła), the Oder, the Bug, and the Warta. There are over 6,000 lakes in the northern lake region. Good harbors have been developed on the Baltic Sea.

## <sup>3</sup> CLIMATE

Poland has a continental climate, conditioned especially by westerly winds. Only the southern areas are humid. Summers are cool, and winters range from moderately cold to cold. The average mean temperature is about 7°C (45°F); temperatures in Warsaw range, on average, from -6° to -1°C (21–30°F) in January and from 13° to 24°C (55–75°F) in July. Precipitation is greatest during the summer months, lasting 85 to 100 days. Annual rainfall ranges from about 50 cm (20 in) in the lowlands and 135 cm (53 in) in the mountains; the overall average is about 64 cm (25 in).

## <sup>4</sup> FLORA AND FAUNA

Coniferous trees, especially pine, account for 70% of the forests; deciduous species include birch, beech, and elm. Lynx, wildcat, European bison, moose, wild horse (tarpan), and wild goat are among the few remaining large mammals. Birds, fish, and in-

sects are plentiful. As of 2002, there were at least 84 species of mammals, 233 species of birds, and over 2,450 species of plants throughout the country.

## 5 ENVIRONMENT

Poland's environmental situation has improved since the ousting of its communist regime, which has been accompanied by decreased emphasis on heavy industry and increased government awareness of environmental issues. However, Poland has yet to recover from the overexploitation of forests during World War II and the loss of about 1.6 million hectares (4 million acres) of forestland after the war. As of the mid-1990s, 75% of Poland's forests have been damaged by airborne contaminants and acid rain. In 2000, about 29.7% of the total land area was forested.

Pollution of the air, water, and land was the most significant environmental problem facing Poland in the 1990s. Air pollution results from hazardous concentrations of airborne dust and chemicals, including carbon dioxide, nitrogen compounds, fluorine, formaldehyde, ammonia, lead, and cadmium. In 1992 Poland had the world's 12th highest level of industrial carbon dioxide emissions, which totaled 341.8 million metric tons, a per capita level of 8.9 metric tons. In 1996, the total rose to 356 million metric tons. However, some measures for reduction must be working, since in 2000, the total of carbon dioxide emissions was at 301.3 million metric tons. Industry-related pollution affects particularly the Katowice region, where dust and sulfur dioxide emissions exceed acceptable levels.

Water pollution in the Baltic Sea is 10 times higher than ocean water. Poland has 54 cu km of renewable water. Eleven percent of the annual withdrawal is used to support farming and 76% is for industrial purposes.

The nation's wildlife has also suffered from degeneration of its habitats. As of 2003, 12.4% of Poland's total land area was protected. According to a 2006 report issued by the International Union for Conservation of Nature and Natural Resources (IUCN), threatened species included 12 types of mammals, 12 species of birds, 3 species of fish, 1 type of mollusk, 14 species of other invertebrates, and 4 species of plants. The *cerambyx longicorn* and *rosalia longicorn* are among the endangered species. The wild horse has become extinct.

## 6 POPULATION

The population of Poland in 2005 was estimated by the United Nations (UN) at 38,163,000, which placed it at number 32 in population among the 193 nations of the world. In 2005, approximately 13% of the population was over 65 years of age, with another 17% of the population under 15 years of age. There were 94 males for every 100 females in the country. According to the UN, the annual population rate of change for 2005–10 was expected to be stagnant at 0.0%, a rate the government viewed as too low. The fertility rate, at 1.6 births per woman in 2005, has been below replacement level since the mid-1990s. The projected population for the year 2025 was 36,661,000. The population density was 118 per sq km (306 per sq mi).

The UN estimated that 62% of the population lived in urban areas in 2005, and that urban areas were growing at an annual rate of 0.18%. The capital city, Warsaw (Warszawa), had a population of 2,200,000 in that year. Other large metropolitan areas and their

estimated populations were Katowice, 2,914,000; Łódź, 943,000; Gdańsk, 851,000; and Kraków (Crakow), 822,000.

## 7 MIGRATION

Large-scale emigration from Poland took place before World War II, with the heaviest exodus in the decades before World War I. Between 1871–1915, a total of 3,510,000 Poles, Polish Jews, and Ukrainians emigrated, about half of them to the United States. Emigration diminished greatly during the interwar period, when France became the chief country of destination. From 1921–38, some 1,400,000 Poles emigrated, while 700,000 returned. Poland suffered a net population loss of nearly 11,000,000 between 1939–49 through war losses, deportations, voluntary emigrations, and population transfers arising out of territorial changes. An estimated 6,000,000 Germans left the present western territories of Poland when these territories came under Polish jurisdiction, and since the end of World War II more than 7,500,000 Poles have settled in the area. From the 1950s through the 1980s, Germans leaving for Germany constituted the bulk of emigrants; Jews also left in substantial numbers for Israel, both in the immediate postwar years and during the 1950s and 1960s. Another emigration wave occurred after the imposition of martial law in December 1981. In 2000, the total number of migrants was 2,088,000. In 2003, total remittances to Poland were \$2.8 billion. In 2005, the Polish Ministry of Labor reported that 500,000 Poles were legally employed in 15 EU countries. Amongst these, Germany was the chief destination for Polish migrant labor, 350,000 legally admitted workers, including 90% employed seasonally in agriculture.

Since 1989, Poland has been open to refugees. However, while tens of thousands of people transit Poland every year, the number of recognized refugees has been rather limited. As of 2004, there were 2,507 recognized refugees. Since 1997, there has been a significant increase in the number of asylum applicants, from some 800 in 1995 to 3,743 in 2004. The main country of origin was the Russian Federation, with smaller numbers from India and Pakistan. In that same year, 340 Poles sought asylum in Canada. In 2005, the net migration rate was -0.49 migrants per 1,000 population. The government views the migration levels as satisfactory.

## 8 ETHNIC GROUPS

Before World War II, over 30% of the people living within the boundaries of Poland were non-Poles. As a result of World War II, and of the boundary changes and population transfers that followed, Poland today is a predominantly homogeneous state with only about 3% of the population being non-Polish. According to the most recent census (2002), Poles constitute about 98% of the total population. Germans make up 0.4%, Ukrainians account for 0.1%; and Belarussians, 0.1%. There are about 50,000 Lithuanians in the country. There is also a significant number of Roma.

## 9 LANGUAGES

Polish is one of the western Slavic languages using the Latin alphabet and the only major Slavic language to preserve the old Slavic nasal vowels. It is easily distinguishable from other Slavic languages by the frequent accumulation of consonants. In addition to the letters of the English alphabet, it has the following letters and diphthongs: *a*, *ch*, *ci*, *cz*, *dź*, *dzi*, *e*, *l*, *ń*, *ni*, *ó*, *rz*, *ś*, *si*, *sz*, *z*, *ź*, *ż*, and *zi*. It has no *q*, *v*, or *x*. Among the several dialects are Great Polish (spo-

LOCATION: 14°7' to 24°8' E; 49° to 54°50' N. BOUNDARY LENGTHS: Baltic coastline, 491 kilometers (304 miles); Russia, 432 kilometers (268 miles); Lithuania 91 kilometers (56 miles); Belarus, 605 kilometers (378 miles); and Ukraine, 428 kilometers (265 miles); Czech Republic, 658 kilometers (408 miles); Slovakia, 444 kilometers (275 miles); Germany, 456 kilometers (286 miles). TERRITORIAL SEA LIMIT: 12 miles.

ken around Poznań), Kuyavian (around Inowrocław), Little Polish (around Cracow), Silesian (around Katowice and Wrocław), and Mazovian (around Warsaw and extending north and east). Some philologists consider that Kashubian, spoken along the Baltic, is not a Polish dialect but a separate language.

Many Poles speak English, French, German, or Russian, and understand other Slavic languages in varying degrees. By law, ethnic minorities have the right to be taught in their own language.

## 10 RELIGIONS

Poland has historically been one of the world's most strongly Roman Catholic countries. During the period of Communist domination that began in 1945, that church suffered extensive repression by the state. A change in party leadership in October 1956, however, brought about a new relationship between church and state, which included voluntary religious instruction in schools and other guarantees to the Roman Catholic Church. In 1974, the Polish government established permanent working contacts with

the Holy See. The position of the Church was further enhanced when the archbishop of Cracow, Karol Cardinal Wojtyła, became Pope John Paul II in 1978. In 1989, the Roman Catholic Church was finally granted legal status and control of its schools, hospitals, and its university in Lublin. A concordat was signed with the Vatican in 1993 and ratified by parliament in 1998.

It is estimated that over 96% of Poles are nominally Roman Catholics. About 509,700 people, about 1.3% of the population, are registered members of the Eastern Orthodox Church, 82,000 are Greek Catholics, 124,294 are Jehovah's Witnesses, and 79,050 are Lutherans (Augsburg). Other established Christian denominations include Old Catholic Mariavits, Polish-Catholics, Pentecostals, Seventh-Day Adventists, Baptists, Methodists, the Church of Christ, Reformed Lutherans, Mormons, and the New Apostolic Church. About 109 people are registered members of Muslim associations; there are, however, many more Muslims in the country who are not officially registered with a group. About 895 people are registered Hare Krishnas. A 2001 poll indicated that only 58%

of the entire population were active practitioners of their chosen faith.

On the eve of World War II, an estimated 3,351,000 Jews lived in Poland, more than in any other country; they constituted about 10% of the Polish population and nearly 20% of world Jewry. During the course of the Nazi occupation (1939–45), nearly 3,000,000 Polish Jews were killed, many of them in extermination camps such as Auschwitz (Oświęcim), near Cracow. Most of the survivors had fled to the USSR; at the end of the war, only about 55,000 Jews remained in Poland. Repatriation raised the total Jewish population to 250,000 in 1946. However, the establishment of the State of Israel in 1948, combined with a series of anti-Semitic outbreaks in Poland (including a government-led campaign in 1968–69), induced most Jews to emigrate. As of 2003, Poland had only about 20,000–30,000 Jews living in the country.

## <sup>11</sup>TRANSPORTATION

In 2004, Poland's operational rail network totaled 23,852 km (14,835 mi) of broad and standard gauge rail lines, of which 11,962 km (7,440 mi) were electrified. Of all lines in use, standard gauge accounts for nearly all at 23,223 km (14,445 mi). In terms of line length the Polish State Railways (PKP) is the third-largest railway system in Europe. However, equipment and service is far behind EU countries. In 2000 PKP began privatization of passenger, cargo and infrastructure.

There is a dense road and highway network. Improvement and repair have not kept up with the increased usage—an 80% increase in freight and a 1,800% increase in passenger transport between 1950 and 1970, and a 60% increase in freight traffic and a 70% increase in passenger transport during 1971–82. In 2001 out of a total of 364,697 km (226,842 mi) of roadways, 249,088 km (154,932 mi) were paved roads, including 399 km (248 mi) of expressways. In 2003, there were 11,243,800 passenger cars and 2,274,600 commercial vehicles.

As of 2005, Poland had seven merchant ships of 1,000 GRT or more, totaling 154,710 GRT. Before World War II, Polish merchant marine operations were mainly with the Western countries, especially the United States, but much of the current traffic is with Asian and African countries. The major ports are Szczecin, Gdynia, Gdąnsk, and Swinoujście. The ports were badly damaged during World War II but have since been rehabilitated and enlarged. As of 2003, there were 3,812 km (2,369 mi) of navigable rivers and canals. The principal inland waterways are the Oder, with Szczecin near its mouth, the Wista, and the Warta.

In 2004, Poland had an estimated 123 airports. As of 2005, a total of 84 had paved runways, and there were also two heliports. Polish Air Transport (Polskie Linie Lotnicze-LOT), organized in 1922 and reorganized after World War II, is a state enterprise, with Warsaw's Okecie International Airport as the center. In 2003, about 3.252 million passengers were carried on scheduled domestic and international airline flights.

## <sup>12</sup>HISTORY

The land now known as Poland was sparsely populated in prehistoric times. The oldest preserved settlements, most notably at Biskupin in northwest Poland, date back to 1000 BC. A lack of Roman conquest and settlement delayed early urbanization in relation to the territories of Western Europe such as Germany and

France. Slavic tribes, from whom modern Poles are descendants in terms of language and culture, began settling Poland in the fourth and fifth centuries AD after the Hunnic invasions and mass migrations of peoples from Asia to Europe. By AD 800, the population was probably around one million and stabilized into permanent settlements. Rulers of the Piast dynasty united the Polish tribes of the Vistula and Oder basins about the middle of the 10th century. In 966, Mieszko I, a member of this dynasty, was baptized, and consequently Poland became a Christian nation. Thirty-three years later, his eldest son and successor, Boleslaw I “the Brave” (992–1025), whose military campaigns took him as far east as Kiev, secured recognition of Polish sovereignty and received a royal crown from Holy Roman Emperor Otto III, becoming the first king of Poland.

During the next three centuries, Poland was continually embroiled in conflicts with the Germans to the west and with the Eastern Slavs and Mongol invaders to the east, while developing cultural relations with Western civilizations. Foreign penetration and internal difficulties led to the division of Poland among members of the Piast dynasty. Under Casimir III “the Great” (1333–1370), the last of the Piast rulers, Poland was restored to unity and greatness. Casimir made peace with the Teutonic Knights, added Galicia to the realm, and welcomed Jewish refugees from the west; internally, law was codified, administration centralized, and a university was established in Kraków in 1364. In 1386, a Polish-Lithuanian federal union was created through a dynastic marriage, which also gave birth to the Jagiellonian dynasty, named for Jagiello, grand duke of Lithuania, who ruled Poland as Ladislas II (1386–1434). The union extended from the Baltic to the Black Sea and held control over other territories in Central Europe, notably West Prussia and Pomerania. The combined forces of the union annihilated the Teutonic Knights in 1410, in the Battle of Grunwald. The 16th century, known as Poland's Golden Age, saw the flourishing of the arts, scholarship, and architecture, most notable examples of which are the poetry of Jan Kochanowski, the revolutionary astronomical work of Nicolaus Copernicus, and the Renaissance architecture of old Kraków. During this time Poland was the largest state in Europe and a regional military power. In order to preserve the union during the reign of Sigismund II (1548–72), the last of the Jagiellonians, provisions were made for an elective monarch and a single parliament (Sejm) for Poland and Lithuania. The fact that kings were elected by the Polish/Lithuanian gentry (*szlachta*) and the ratification of the first constitution in Europe in 1792 are often mentioned to support the claim that Poland is a pioneer of European democracy.

Unfortunately, many of the political reforms contributed to the nation's subsequent decline. The *szlachta* had progressively gained influence and power at the expense of the king. Meeting in the Sejm, the gentry adopted the legislative practice whereby a single dissenting voice was sufficient to block passage. Such policies prevented any decisive action by the government with the gentry cementing their position of power in an economy based on agricultural serfdom. The nobility imposed such far-reaching limitations upon the monarchy that national unity and integrity could not be maintained. Internal disorders, including the Cossack and peasant uprising (1648–49) led by Bogdan Chmielnicki against Polish domination of the Ukraine—a revolt that struck with particular ferocity against Polish Jews, many of whom had served as agents

of the nobility in administering Ukrainian lands—further weakened the nation, as did the very destructive Swedish invasion in 1655–60. In 1683, Polish troops led by John III Sobieski (1674–96) rescued Vienna from a Turkish siege, but this was perhaps the last great military victory of an increasingly weakened and war-weary state.

The decline of Poland's power was taken advantage of by its neighboring states. A Russian, Prussian, and Austrian agreement led to the first partitioning of Poland in 1772; the second (1793) and third (1795) partitions led to the demise of Poland as a sovereign state. Galicia was ruled by Austria-Hungary, northwestern Poland by Prussia, and the Ukraine and eastern and central Poland by Russia, which extended its domains to include the Duchy of Warsaw, reconstituted as the Kingdom of Poland (under Russian imperial rule) at the Congress of Vienna in 1815. The Poles rebelled in 1830 and 1863 against the tsarist rulers, but each insurrection was suppressed. However, the peasants were emancipated by Prussia in 1823, by Austria in 1849, and by Russia in 1864. Galicia, which won partial autonomy from Austria following the Habsburg monarchy's constitutional reforms, became the cultural center of the Poles.

With the Russian Revolution of 1917 and the defeat of the Central Powers in World War I, Poland regained its independence. On 18 November 1918, Jozef Pilsudski, leader of the prewar anti-Russian independence movement, formed a civilian government. Dispute over the eastern borders of the re-born state led to a military clash with the Soviet Union. The conflict, in which the Bolshevik hope of spreading socialist revolution beyond Poland to Germany and France was dashed by a fortuitous Polish counter-attack near Warsaw, ended with the Treaty of Riga in 1921, under which Galicia was restored to Poland.

In the next two decades Poland was plagued by economic difficulties and political instability, and by increasingly menacing pressures from its Soviet and German neighbors. Following the Nazi-Soviet Pact in 1939, Germany invaded Poland on 1 September, occupying Warsaw four weeks later. Meanwhile, the USSR began occupation of the eastern half of the country on 17 September, despite nonaggression treaties Poland signed with both the USSR and Germany. Almost immediately Nazi forces began to brutally oppress large segments of the Polish population and loot Poland's industrial sector and major resources such as timber, coal, and wheat. Ghettos for Jews were set up in Warsaw and other cities, and numerous concentration camps were established on Polish territory, including the extermination camp at Auschwitz, where at least one million people perished between 1940 and 1944. Poland suffered tremendous losses in life and property during World War II. An estimated six million Poles were killed, half of them Jews; 2.5 million were deported for compulsory labor in Germany; more than 500,000 were permanently crippled; and the remaining population suffered virtual starvation throughout the Nazi occupation. Losses in property were evaluated at z258 billion (more than us\$50 billion).

The seeds of Poland's postwar political history were sown long before the war ended. A Polish government-in-exile was set up in France and later in the United Kingdom. Units of the Polish army fought together with the Allies while in Poland underground groups, organized along political lines, maintained resistance activities. The Home Army (*Armia Krajowa*) was the major non-

Communist resistance group and took its orders from the government-in-exile in London. Although formally allied to the Soviet Union, relations between Moscow and the London-based Polish government continued to deteriorate, especially after the discovery of mass graves of thousands of Polish officers murdered by the Soviets in 1940. In July 1944, the Polish National Council, a Soviet-backed resistance group, set up the Polish Committee of National Liberation as a provisional government in liberated Lublin, declaring the émigré Polish government illegal. In August 1944 the Home Army in Warsaw rose against the Nazis in hopes of liberating the capital in step with the Soviet military advance. In the events that followed and still breed controversy to this day, the Red Army halted its advance and allowed the Nazis to use their remaining forces to brutally suppress the rising and completely destroy the city. It was only on 17 January 1945 that the Red Army entered Warsaw and installed the provisional pro-Soviet government. At Yalta, the Allies agreed to accept the Curzon line, thereby awarding the USSR nearly half of former Polish territory (including Galicia) in return for a Soviet agreement to broaden the political base of the provisional government with the addition of non-Communist Polish leaders. After subsequent negotiations, the Provisional Government of National Unity was formally recognized by the United States and Britain in July 1945.

Despite Stalin's promises of free elections, a bloc of four parties dominated by the Communists emerged victorious in the elections of January 1947. The Communists and the Socialists merged in December 1948 to form the Polish United Workers' Party (PZPR). The PZPR consistently followed a pro-Soviet policy. Domestically, the party pursued a reconstruction program stressing agriculture and industrial development. It shunned the Marshall Plan and, in its first two decades, renounced all dealings with the Western powers.

The first decade of Communist rule was dominated by Stalinist repressions, tensions with the Roman Catholic Church, and a strong-handed Soviet influence, as practiced by Konstantin Rokossovsky, a Soviet general of Polish birth, who became Poland's defense minister in 1949 and served as deputy prime minister from 1952 until his resignation four years later. Rising nationalist sentiment, heightened by stagnating economic conditions, led to worker riots in Poznan on 28–29 July 1956. In response to the unrest, a new Polish Politburo, headed by Wladyslaw Gomulka (who had been purged from the PZPR in 1949 and subsequently imprisoned because of his nationalist leanings), introduced liberalizations, including the abolition of farm collectivization, and improved relations with the Church. Conditions improved from those immediately after the war, but by the late 1950s, the reform movement had been halted, and the government took a harder line against dissent. In 1968 there were student demonstrations against the government in the university centers; the Gomulka regime countered with a political offensive in which many government officials and party members accused of anti-Socialist or pro-Zionist sentiments were removed from office, and an estimated 12,000 Polish Jews left Poland.

Two years later, following a drought in 1969 and an exceptionally severe winter, demonstrations by shipyard workers in Gdańsk broke out on 16 December 1970 to protest economic conditions, the privileges of the Communist party elite, and an announced rise in food prices. The government responded with military force and

after widespread violence, with soldiers firing on striking workers, at least 44 people were killed. The unrest led to the removal from power of Gomulka and the installation of Edward Gierek as the first secretary of the politburo on December 20. Under continued pressure from strikes, Gierek's government postponed the controversial incentive system and froze prices at their new levels. After receiving a substantial long-term Soviet grant (estimated at \$100 million), the Polish government rolled back prices to their pre-December 1970 levels, and labor peace was restored. In a move to bolster his support, Gierek reinstated Church control over thousands of religious properties in northwestern Poland to which the government had held title since 1945.

During the 1970s, Gierek's government vigorously pursued a policy of *détente* with the West. Three US presidents visited Poland and Gierek himself traveled to the United States and to several West European countries. Peace agreements governing the Oder-Neisse line and formally recognizing Polish sovereignty in former German territories were concluded with West Germany, and trade pacts were signed with the United States, Britain, France, Italy, Austria, and other nations. With a bold plan of creating a "second Japan," Gierek secured huge loans (several billion dollars) from the West in hopes of building an industrial export economy and improving living conditions, which were at this point glaringly inferior to those in the capitalist world. Although many ambitious projects were undertaken, including the building of an oil refinery in Gdańsk and a new steel works plant in Katowice, mismanagement and the inefficiency of the socialist economy crippled real economic output and the prospects of repaying the foreign debts became increasingly dim. In 1976, the government announced food price increases but had to rescind them after the workers responded by striking. During the next several years, the economic situation kept deteriorating, and Polish nationalism, buoyed in 1978 by the election of the archbishop of Kraków to the papacy as John Paul II, continued to rise. In July 1980, new meat price increases were announced, and within a few weeks, well-organized workers all over Poland demanded a series of economic and political concessions, including the right to organize independent trade unions outside of the Communist party. The center of labor activity was the Lenin Shipyard in Gdańsk, where in a public ceremony on 31 August, government officials agreed to allow workers the right to organize and to strike. The independent labor movement Solidarity, headed by Lech Walesa, the leader of the Gdańsk workers, and strongly supported by the Roman Catholic clergy, soon claimed a membership of about 10 million (about a fourth of the population), with its ranks filled not only with workers but also intellectuals. That month, Stanisław Kania replaced Gierek as first secretary.

For more than a year, the government and Solidarity leaders negotiated, with Catholic Church officials often acting as mediators. As Solidarity became more and more overtly political—demanding, for example, free parliamentary elections—Poland's Communist leaders came under increasing pressure from the USSR to stop the "anti-Socialist" and "anti-Soviet" forces. On 18 October 1981, Gen. Wojciech Jaruzelski, prime minister since February, replaced Kania as first secretary. On 13 December, after union leaders in Gdańsk called for a national referendum on forming a non-Communist government in Poland, Jaruzelski set up the Military Council for National Salvation and declared martial law. To what

extent Jaruzelski's abrupt crackdown was carried out to prevent direct Soviet military intervention is still unclear, although evidence suggests that the Kremlin had not drawn up any plans for a military intrusion into Poland. Almost the whole leadership of Solidarity, including Walesa, was arrested, and the union was suspended. Despite further strikes and rioting, which resulted in several deaths, the military had soon gained complete control. More than 10,000 people were arrested and detained for up to 12 months, and all rights and freedoms gained in the preceding year and a half were abolished. In January 1982, the United States imposed sanctions against Poland, including withdrawal of most-favored-nation status, veto of Poland's entry into the IMF, and suspension of fishing rights in US waters and of LOT flights to the United States. Protests and rioting continued sporadically into 1983, and some Solidarity leaders remained active underground, but these disturbances did not seriously threaten the military regime. On 22 July 1983, the government formally ended martial law and proclaimed an amnesty, but a series of legislative measures had meanwhile institutionalized many of the powers the government had exercised, including the power to dissolve organizations, forbid public meetings, and run the universities.

The internal political situation stabilized to such a degree that in July 1984 the government proclaimed a general amnesty, and the United States began to lift its sanctions the following month (the last sanctions were lifted in early 1987). When an outspoken priest, Father Jerzy Popiełuszko, was kidnapped and subsequently murdered by two secret police officers, the government, in an unprecedented step, permitted a trial to take place in February 1985 in the result of which four security officers were convicted and sentenced. Another amnesty was proclaimed in September 1986, leading to the release of all remaining political prisoners. Economically, however, the country was spiraling out of control. Continued declines in standards of living and shortages of even basic necessities led to waves of strikes throughout Poland in spring and fall 1988, essentially paralyzing the nation. By November 1987 public antipathy had been so widespread that the government called for the first public referendum to be held in Poland in more than 40 years; this was also the first open election to be held within the Warsaw Pact. Although the ballot itself asked only for public support of an accelerated economic reform package, the people of Poland understood the referendum to be a vote of confidence in the government itself. The final tally was approximately two-thirds in support of the government, but because of a Solidarity-inspired voter boycott, only 67% of the eligible voters cast their ballots, which meant that the referendum failed to pass, a first-ever defeat for the government.

In autumn 1988, the entire government resigned and it became clear that talks with labor activists were inevitable. The negotiations leading up to the so-called "round-table talks," which finally opened in February 1989, were as delicate and prolonged as the talks themselves. However, in April 1989 agreement was reached on a number of unprecedented concessions: Solidarity was recognized as a legal entity; the post of president was created, to be filled by legislative appointment; some independent media were permitted to operate; and the Catholic Church was given full legal status. In June 1989 came perhaps the most far-reaching change, the establishment of a senate, complementing the existing Sejm,

with the seats to be filled by open election. In addition, 35% of the seats in the Sejm were also made subject to direct election.

The government did all it could to make it difficult for opposition candidates to run: only two months were allowed in which candidates could gather the petitions necessary to get on the ballot, and the ballots themselves listed candidates alphabetically, with no indication of party affiliation. Despite those efforts, Solidarity won a decisive victory; 99 of the 100 seats in the Senate went to Solidarity members. Moreover, many government candidates in the *Sejm* lost seats because voters crossed out the names of unopposed government candidates, thus denying them the necessary 50% of the total votes cast.

In June 1989, the newly elected parliament named General Wojciech Jaruzelski Poland's president by the slenderest of margins. Two months later, Solidarity pressed to balance Jaruzelski's post of president with a non-Communist prime minister and at this point the discredited PZPR could do little but comply. Although it was widely expected that Lech Walesa might lead the first Solidarity government, he demurred, instead putting forward Tadeusz Mazowiecki, who took office on 24 August 1989, as the first non-Communist prime minister in the Eastern Bloc. That autumn, motivated at least in part by the events unfolding in Poland, a wave of "velvet revolutions" spread across Eastern Europe culminating in the fall of the Berlin Wall. These events further accelerated the de-Sovietization of Polish government. In September 1990, Jaruzelski resigned, opening the way for new elections.

The election of Walesa as president was the formal end to Poland's Communist rule, with Poland rejoining the community of democratic nations. In what would become known as "shock therapy," the previously Socialist economy was abruptly opened to free market forces. Although initially inflation sky-rocketed and economic output continued to fall, by 1997 Poland was attracting large amounts of foreign investment and enjoying the highest growth rates in Europe. At the same time, not everyone enjoyed economic prosperity and political discord continued to grow. The number of political parties ballooned, making it difficult to undertake such complex and contentious issues as large-scale privatization, economic rationalization of Soviet-era giant industry, and fundamental constitutional revision. The October 1991 election saw 69 parties competing, with 29 actually winning seats, none of them with more than 14% of the vote. Inevitably, this resulted in coalition governments without clear mandates, giving Poland five prime ministers and four governments in 1991–93. This proliferation of parties reflected disparities among the electorate that emerged once the Communists had been removed as a unifying focus for opposition.

In the September 1993 election, the two most popular parties, the Polish Peasant Party (PSL) and the Democratic Left Alliance (SLD) were made up largely of ex-Communists or other figures from the governments of the past. The apparent rejection of the gains of Solidarity and the return of the vanquished ex-Communists was variously interpreted as a rejection of "shock-therapy" economic transformation, the electorate's nostalgia for the more ordered life of the past, and a vote against the Catholic Church, or at least its social agenda of asserting close control on social issues such as abortion, school curriculum, and women's role in society.

Fears associated with the return of the many ex-Communists to power proved unfounded. Although differing from their pre-

decessors on the pace of Poland's economic transformation, the government of Polish Peasant Party (PSL) leader Waldemar Pawlak, and his Democratic Left Alliance (SLD) partner, Aleksander Kwasniewski, remained generally committed to Poland's course of democratization and economic transition. The Constitution Commission proposed a new constitution that passed the National Assembly in April 1997, and was approved in a national referendum on 23 May 1997.

The parliamentary elections of 1997 saw the return to power of centrist and right of center Solidarity legacy parties, with Solidarity Electoral Action (AWS) and the Freedom Union (UW) forming a coalition with Jerzy Buzek as prime minister. The Buzek government presided over many successful reforms, including reorganization of local and regional administration, but an economic downturn and rising unemployment caused the voters to resoundingly return the reigns of power to the post-Communist SLD in 2001.

In 2005 the power pendulum swung again to the right with the scandal ridden SLD achieving less than 12% of the vote and the right of center Law and Justice (PiS) and centrist Civic Platform (PO) gaining the majority. The constant and almost predictable shift of power can be interpreted as a political maturation of the young democracy or as the failure of either side to address the main economic issue of unemployment, which reached its maximum level of 20% in December 2004. The exception to the changing political tides has been the reformed Communist Aleksander Kwasniewski of the SLD, who beat Walesa to be elected president in 1995 and won a second term in 2000.

It has been on the international scene that Poland has made its most visible strides since the end of Communist rule. In 1997, NATO invited Poland, along with the Czech Republic and Hungary, to join the alliance, and the three countries became members in March 1999. In May 2004 Poland became a member of the European Union (EU) and is now the organization's sixth most populous member. Poland asserted itself as a close American ally by being one of the few countries to participate in the 2003 invasion of Iraq and subsequently administering an Iraqi occupied zone with the initial involvement of 2,400 of its own troops. Poland has also attempted to play a leading role in the politics of eastern and central Europe and has invested its political capital in encouraging democratization in Belarus and supporting the Orange Revolution in the Ukraine in December 2004.

Since joining the EU, investment and economic growth picked up, with new manufacturing jobs coming from Western Europe. However, corruption, inefficient bureaucracy and weak infrastructure continued to be problems and slowed economic growth. Unemployment began to drop, but at 17.9% it still remained the highest in the European Union.

### 13 GOVERNMENT

Until 1997, the form of government in Poland was in the midst of a protracted transformation, which left a number of its important features unclear. Without a formal constitution, Poland had been functioning on a much-amended form of its Communist-era constitution. The most important modifications were the Jaruzelski government's concessions of April 1989, which created both the Senate and the office of president, and a package of amendments passed in October 1992 which are collectively called the

“Little Constitution.” Another important modification was the agreement of 1990, which made the presidency a popularly elected post, rather than parliamentary appointment.

The president is directly elected, for a term of five years. The post has traditional executive obligations and powers, such as the duty to sign into law or veto legislations, but also retains substantial legislative powers, including the right to introduce bills and draft legal amendments.

During his tenure, Lech Walesa fought to widen the powers of the presidency, arguing that at least during the transition period Poland required a strong president able to resolve impasses and disputes on the basis of “practical experience,” rather than on points of legal niceties.

Walesa’s successor, Aleksander Kwasniewski, succeeded in putting forth a new constitution in 1997.

The parliament consists of two houses, the Sejm, or lower house, with 460 seats, and the Senate, with 100 seats. The members of both houses serve four-year terms. Seats are filled on the basis of party lists; there is a minimum national vote threshold of 5% for parties, or 8% for coalitions, with the votes for parties which fail to reach those minimums assigned to victorious parties. The prime minister proposes, the president appoints, and the Sejm approves the Council of Ministers or cabinet. The president, who is elected by popular vote for a five-year term, appoints the prime minister, who is then confirmed by the Sejm.

## 14 POLITICAL PARTIES

After the political poverty of its Communist past, Poland initially saw a proliferation of political parties ranging across the full political spectrum, from the rabidly xenophobic nationalism of the Polish National Front (whose leader, Janusz Bryczkowski, invited Russian extremist Vladimir Zhirinovskiy to Poland in 1994) to the socialist party, Union of Labor (UP). In between were special interest and even quirky parties, of which the best example may be the Polish Beerdrinkers’ Party. Overall, 69 parties participated in the 1991 parliamentary elections, of which 29 gained seats, none with more than 14% of the total vote. By 1993, however, the political scene was stabilizing. Only 35 parties participated in that election; perhaps more significantly, only five received seats.

The local elections of 1994 showed the emergence of three basic political orientations shaped by shifting coalitions of parties, with the parties themselves often dissolving and reorganizing under new names. The Polish political spectrum slightly deviates from the traditional notions of right and left in part because in contrast to most countries where labor movements are associated with the political left, the Polish right has its roots in the Solidarity labor movement.

The Polish far right was initially represented by several coalitions: the Alliance for Poland, which included the Christian National Union, the Center Alliance, the Movement for the Republic, Peasant Alliance, and the Conservative Coalition, and the 11 November Agreement, which included the Conservative Party, the Party of Christian Democrats, the Christian-Peasant Alliance, and the Real Politics Union (a radical *laissez-faire* party). These parties generally favored a major role for the Catholic Church, and tended to draw their support from Poland’s rural sectors; in 1994, they did best in the eastern districts. The religious right is represented by the League of Polish Families (LPR), which has a social

platform based on traditional Catholic values and was not in favor of Polish membership in the EU. LPR won 7.97% of the vote in the October 2005 elections.

The mainstream right was represented in the years 1997–2001 by Elective Action Solidarity (AWS). AWS led the government in coalition with UW. However, after a resounding defeat in 2001 AWS dissolved and its members eventually migrated to either the centrist Civic Platform (PO) or the right of center Law and Justice (PiS). PiS supports continuous but careful economic reforms, is in favor of raising retirement benefits, and remains socially conservative, as evidenced by the prohibition of a gay pride parade in Warsaw by its leader Lech Kaczynski in 2005. Another important aspect of the PiS is a strong stand against corruption. In the recent parliamentary elections in October 2005 PiS was the most popular party with 26.99% of the vote.

The center was dominated by Freedom Union (UW), which was formed in April 1994, when the Liberal Democratic Congress merged with the Democratic Union. The centrist position derives largely from the intellectual wing of the original Solidarity, favoring radical economic transformation, while being less concerned with immediate impact upon workers. UW formed a coalition with AWS as the junior partner in 1997–2000. UW’s most prominent member was Leszek Balcerowicz, the architect of the “shock therapy” economic reform and president of Poland’s National Bank. After the elections of 1997 UW largely dissolved, with its members joining the newly formed Civic Platform (PO), which also absorbed politicians from AWS. Both the UW and PO draw much of their support from smaller cities and university centers, such as Kraków, and the prosperous regions of western Poland. In the last parliamentary election in October 2005, PO’s platform included a proposal for a 15% flat tax. PO was the second most popular party with 24.14% and was set to rule in a coalition with PiS.

The left, which was almost entirely discredited in 1991, has shown remarkable resilience. Through the 1990s, the two major parties were the Democratic Left Alliance (SLD) and the Polish Peasant Party (PSL), both descendants of elements of the old Communist party and its affiliates. The far left (some would argue far-right) is dominated by Self-Defense (SO) headed by Andrzej Lepper. Lepper’s party is in favor of protectionist agriculture and sometimes anti-western isolationist foreign policy. In 2001 the Democratic Left Alliance (SLD) in coalition with the Labor Union (UP), a minor left-wing party, won a decisive victory and formed a government under Leszek Miller. Although Miller’s government presided over Poland’s entry into the European Union, it became increasingly unpopular due to a series of scandals involving corruption and bribery, and failure to accelerate economic growth. With Miller himself forced to resign amid scandal in May 2005, SLD continued to rule as a minority government under Marek Belka until the elections in October 2005. Unhappy with Miller’s leadership of the party, many members withdrew from SLD in 2004 and formed a new leftist party called Polish Social Democracy (SDPL). In the October 2005 elections SLD won 11.31%, SO 11.41% and PSL 6.96%. SDPL failed to make the 3% threshold to enter the parliament.

In addition to the major parties, a German Minority Party is active with most of its support from the Opole region in southwest Poland.

In the 1995 presidential elections, Aleksander Kwasniewski of SLD beat Lech Walesa by a small margin (51.7% to 48.3%) to become president for a five-year term. He was reelected in 2000 with 53.9% of the vote to nonparty candidate Andrzej Olechowski's 17.3% and AWS chairman Marian Krzaklewski's 15.6%. In a striking reversal, Walesa finished seventh with 0.8% of the vote.

Constitutionally limited to only two terms, Kwasniewski did not run again in 2005. The October presidential elections saw 14 candidates compete. In the first round the top five contenders were Donald Tusk (PO) with 36.33% of the vote, Lech Kaczyński (PiS) with 33.10%, Andrzej Lepper (SO) with 15.11%, and Marek Borowski (SDPL) with 10.33%. The SDL candidate withdrew from the election due to a scandal. In the second round, which included only the top two candidates, Tusk and Kaczyński, Kaczyński won with 54.04% of the vote to Tusk's 45.96%. Kaczyński's term as president extended to 2010.

## 15 LOCAL GOVERNMENT

Poland had been divided into 49 administrative districts, or *voivodships*, which were the basic administrative units under the Communists. In 1989 Solidarity government replaced that system with one in which the basic unit was the *gmina*, or local authority, which owned property and had responsibility for its own budget. The *gmina* elected a council, which appointed the executive officials actually responsible for day-to-day administration of the locality.

In 1994, there were 2,383 such local councils, with a mixed system of election. In districts containing more than 40,000 people, of which there were 110 in 1994, council representation was proportionally determined, based upon party affiliation. In the smaller districts, council representatives were elected by direct majority vote.

Originally these *gmina* councils were similar in makeup to the Solidarity Citizens Committees, from which they originated. Increasingly, however, the councils differentiated themselves, some becoming controlled by national parties, others remaining dominated by personalities who responded primarily to local issues.

Changes in local government structure were introduced in 1999, transforming Poland's 49 provinces into 16 new ones. A three-tier division of government was established: municipalities/communes, 308 counties (*powiaty*), and 16 provinces (*województwa*). Each of these divisions is governed by a council. Council members are directly elected, and appoint and dismiss the heads of the municipalities/communes (*wojt*), the town mayors, the *starosta* or head of the county, and the speaker of the provincial councils.

## 16 JUDICIAL SYSTEM

There is a four-tiered court system in Poland: regional, provincial, appellate divisions, and a Supreme Court. The Supreme Court, the highest judicial organ, functions primarily as a court of appeal. The Supreme Court and lower courts are divided into criminal, civil, military, labor, and family chambers. Judges are nominated by the National Judicial Council and are appointed by the president for life.

There is also a Constitutional Tribunal which offers opinions on legislation and exercises authority of judicial review. Constitutional Tribunal judges are appointed to nine-year terms by the Sejm.

Defendants enjoy a presumption of innocence and have the right to appeal. Although the judiciary is independent, it suffers from inefficiency, lack of resources and lack of public confidence.

## 17 ARMED FORCES

Polish armed forces numbered 141,500 active personnel in 2005, with reservists numbering 234,000. Army personnel numbered an estimated 89,000 members, equipped with 947 main battle tanks, 435 reconnaissance vehicles, 1,281 armored infantry fighting vehicles, 33 armored personnel carriers, and 1,482 artillery pieces. The army's aviation arm included 65 attack and 80 support helicopters. Naval manpower in 2005 totaled 12,300, including 2,000 naval aviation personnel. Equipment included three tactical submarines, one destroyer, three frigates, four corvettes, 19 patrol/coastal vessels, and 22 mine warfare vessels. The naval aviation wing was supplied with 18 combat capable aircraft and a total of 30 helicopters for use in search and rescue, antisubmarine warfare and for support missions. The air force had 30,000 active personnel and 142 combat capable aircraft, including 28 fighter and 53 fighter ground attack aircraft, as well as 53 transport and 220 training aircraft. Poland also had a paramilitary force of 21,400 personnel, of which 14,100 were border guards and 7,300 police. Poland provided troops and observers to 13 different nations or regions as part of UN, NATO or European Union missions. The defense budget in 2005 amounted to \$5.16 billion.

## 18 INTERNATIONAL COOPERATION

Poland is a charter member of the United Nations, having signed on 24 October 1945; it participates in ECE and several nonregional specialized agencies, such as the FAO, IAEA, the World Bank, UNESCO, UNIDO, and the WHO. Poland was admitted to NATO on 12 March 1999. The nation is also a member of the Council of Europe, the Council of the Baltic Sea States, the Euro-Atlantic Partnership Council, the European Bank for Reconstruction and Development, the OECD, and the OSCE. Poland became a member of the European Union in 2004. The country has observer status in the OAS.

Polish troops have supported UN missions and operations in Kosovo (est. 1999), Lebanon (est. 1978), Western Sahara (est. 1991), Ethiopia and Eritrea (est. 2000), Liberia (est. 2003), Georgia (est., 1993), and the DROC (est. 1999), among others. In 2003, Poland assumed command of division of multinational forces working on peacekeeping and stabilization efforts in Iraq.

Poland is part of the Australia Group, the Zangger Committee, the European Organization for Nuclear Research (CERN), the Nuclear Suppliers Group (London Group), and the Organization for the Prohibition of Chemical Weapons. In environmental cooperation, Poland is part of the Antarctic Treaty, the Basel Convention, Conventions on Biological Diversity and Air Pollution, Ramsar, CITES, the London Convention, the Kyoto Protocol, the Montréal Protocol, MARPOL, the Nuclear Test Ban Treaty, and the UN Conventions on the Law of the Sea, Climate Change and Desertification.

## 19 ECONOMY

Until 1990, Poland had a centrally planned economy that was primarily state controlled. Agriculture, however, was only partly socialized, with state farms and cooperatives accounting for 23% of

the country's total farmland in 1984. Since World War II, agriculture's predominance in the economy has been waning; in 1990, it accounted for 16.2% of the NMP, compared to 22.7% in 1970. In 2004, its contribution to GDP was an estimated 2.9%, although it continued to employ about 24% of the labor force. Poland, with its sizable coastline, has become a maritime nation of some note, having developed three major ports on the Baltic and a greatly expanded shipbuilding industry, which in 1991 produced 53 ships. In 2003, yearly production was reported as 50 ships, about one-tenth of the number of ships produced by South Korea and Japan, the industry leaders. However, in June 2002 the Szczecin Shipyards, considered an example of successful privatization, declared bankruptcy. Poland has rich coal deposits, but it lacks some important natural resources, such as petroleum and iron ore.

During 1971–75, Poland's NMP increased by about 12.8% annually; the growth was, to a substantial degree, the result of loans from the West. After 1975, however, Poland's economic performance deteriorated because of excessive investments, internal market problems, several bad harvests, the worldwide recession, and the political upheaval of 1980–81. An economic growth rate of 2.5% annually during 1976–78 was followed by declines of 2% in 1979, 4% in 1980, 12% in 1981, and 5.5% in 1982, while the debt to Western governments reached nearly \$25 billion by 1983, rising to \$33 billion in 1991, when the total hard-currency debt reached \$52.5 billion. During 1980–91, the GNP grew at an annual average rate of only 1.2%. Inflation averaged 54.3% annually in the 1980s.

With Poland subjected to the "shock therapy" of a transition to a market economy, GDP fell 31.5% from 1990–92 and consumer prices shot up almost sixfold. However, the economy did not stay down long and it soon became one of the most robust in Eastern and Central Europe thanks to the government's tight fiscal and monetary policies. The economy grew by just under 7% in 1995, and by 5.5% in 1996 and 1997, for an average of over 5% a year 1994 to 1997. Most of the growth since 1991 came from the booming private sector, by 1997 accounting for about 70% of GDP (up from 50% in 1992), due in large part to the creation of new private firms. Poland's pace of growth declined after 1998, as the economy was impacted by the Russian financial crisis and then the global economic slowdown in 2001. In 1998, growth fell to 4.8%; in 1999, 4.1%; in 2000, to 4%; and in 2001, to 1%. Signs of economic recovery began to be seen in 2003. In 2002 GDP grew at 1.4%, but in 2003 at 3.8% and reached an impressive 5.3% in 2004, when Poland joined the EU. Similarly, inflation shot up to 10.1% in 2000 with the recovery of oil prices, but in 2001 moderated to 5.5%. In 2002 inflation was only 1.9%, in 2003 0.8%, in 2004 3.6% and in 2005 3.2%. The growth of the economy was accompanied by privatization. About 72% of the economy had been privatized by 2002, and the government has continued to privatize state-owned industries in recent years by successfully utilizing the Warsaw Stock Exchange to this end. The goal is to achieve the ownership structure similar to that of other EU member states, where private ownership is close to 80%.

The major problems facing the economy are unemployment and persistently high fiscal deficits. Unemployment increased to 13% in 1999, to 15% in 2000, to 16% in 2001, to 17% reaching 20% in 2002, before it started to fall again, to 19% in 2004 and 17.3% in 2005. On 7 June 2003, 75% in a vote with a 57.34% turnout (above the 50% minimum turnout required) voted "yes" to the referen-

dum of Poland's joining the EU. Poland became a member of the EU on 1 May 2004. Economists estimate that it will take decades for per capita average income in Poland, which was about \$4,800 in 2002 (\$9,500 in purchasing power parity terms), to reach the EU average. In 2004 per capita average grew to \$12,000.

## 20 INCOME

The US Central Intelligence Agency (CIA) reports that in 2005 Poland's gross domestic product (GDP) was estimated at \$489.3 billion. The CIA defines GDP as the value of all final goods and services produced within a nation in a given year and computed on the basis of purchasing power parity (PPP) rather than value as measured on the basis of the rate of exchange based on current dollars. The per capita GDP was estimated at \$12,700. The annual growth rate of GDP was estimated at 3.3%. The average inflation rate in 2005 was 2.1%. It was estimated that agriculture accounted for 2.8% of GDP, industry 31.7%, and services 65.5%.

According to the World Bank, in 2003 remittances from citizens working abroad totaled \$2.314 billion or about \$61 per capita and accounted for approximately 1.1% of GDP. Foreign aid receipts amounted to \$1.2 trillion or about \$31 per capita and accounted for approximately 0.6% of the gross national income (GNI).

The World Bank reports that in 2003 household consumption in Poland totaled \$136.49 billion or about \$3,573 per capita based on a GDP of \$209.6 billion, measured in current dollars rather than PPP. Household consumption includes expenditures of individuals, households, and nongovernmental organizations on goods and services, excluding purchases of dwellings. It was estimated that for the period 1990 to 2003 household consumption grew at an average annual rate of 4.7%. In 2001 it was estimated that approximately 28% of household consumption was spent on food, 19% on fuel, 6% on health care, and 1% on education. It was estimated that in 2003 about 17% of the population had incomes below the poverty line.

## 21 LABOR

The labor force in 2005 totaled an estimated 17.1 million persons. As of 2003, agriculture accounted for 18.4% of the workforce, with industry at 28.6% and 53% in the services sector. In 2005, the estimated unemployment rate was 18.3%, with considerable underemployment as well.

Unions have the right to strike and bargain collectively, although union officials report that workers in the private sector are encouraged not to join unions by their employers and workers organizing unions often face discrimination. According to press reports, 17% of Poland's workforce was unionized.

The labor code prohibits employment for children under the age of 15. There are strict rules governing the work standards for those between 15 and 18 years old, however these are not regularly enforced. The minimum wage in state-owned enterprises was around \$300 per month as of 1 January 2006. However, a large number of construction and seasonal agricultural workers earn less than the minimum wage. The legal standard workweek is 40 hours with 35 hours of uninterrupted rest per week. Overtime is subject to premium pay rates. The labor code defines occupational safety and health standards but they are not consistently enforced.

## 22 AGRICULTURE

In 2003, agriculture engaged 18.4% of the Polish labor force (as compared with 53.5% in 1948 and 39.9% in 1967). About 62% of Poland's land is agricultural; of this area, 78% is cultivated. Overall agricultural output during 1980–90 fell by nearly 0.4% annually. Between 1990 and 2000, agricultural production dropped by 0.2% annually. Crop output was valued at nearly €5.76 billion in 2003. During 2002–04, crop output was down 8.5% compared with 1999–2001. In 2005, agriculture accounted for 5% of GDP, down from 14.5% in 1985.

The transition from an agricultural economy is due partly to territorial changes resulting from World War II (1939–45); largely agricultural areas were transferred to the USSR, whereas the areas acquired in the west were predominantly industrial. During the war, approximately one-third of the Polish farms were completely or partly laid waste, and five-sixths of the hogs and two-thirds of the cattle and sheep were destroyed, leaving farmers almost without draft animals and fertilizer. At the same time, population transfers delayed cultivation in the areas of resettlement.

Land redistribution followed both world wars but was much more extensive after World War II. A 1944 decree expropriated all holdings larger than 100 hectares (247 acres); land belonging to Germans or collaborators was also expropriated. Attempts at collectivization were generally resisted; after 1956, most collective farms were disbanded and their land redistributed. During the 1990s, about 3.7 million Poles were engaged in small plot farming (with an average farm size of 6 hectares/15 acres) on 2.1 million private farms, which produced about 75% of agricultural output. In 2003, Poland had over 2,172,000 agricultural holdings and the largest number of full-time agricultural employment in the 25-nation EU, at over 1,048,000 workers, and another 3,248,000 part-time agricultural workers that year.

In 2004, principal crops and their estimated yields (in thousands of tons) were potatoes, 13,746; sugar beets, 11,471; wheat, 9,450; rye, 4,129; barley, 3,476; triticale, 3,349 (highest in the world); and oats, 1,462. Yields have been poor because of infertile soil, insufficient use of fertilizers, and inadequate mechanization, in addition to the drought. There were 1,310,500 tractors in 1997, up from 620,724 during 1979–81. Although grain production has been Poland's traditional agricultural pursuit, since World War II, Poland has become an importer—instead of an exporter—of grains, particularly wheat.

Poland grows an assortment of fruits and vegetables. Fruit and berry yields (in thousands of tons) for 2004 included: apples, 2,500; currants, 192; strawberries, 185; raspberries, 42; plums, 119; and pears, 77. Field vegetable production in 2004 (in thousands of tons) included: cabbage, 1,370; carrots, 928; onions, 866; cucumbers, 256; cauliflower, 206; and tomatoes, 213.

## 23 ANIMAL HUSBANDRY

Pastures covered about 10.7% of the total land area in 2003. The government has encouraged the development of livestock production through increased fodder supply and improvement in breeding stock and partial tax relief for hog raising. Emphasis has been placed on the raising of hogs and sheep. In 2005, there were 18.1 million pigs, 5,483,000 head of cattle, and 316,000 sheep. In 2005

there were an estimated 90 million chickens, 5 million ducks, 3 million geese, and 600,000 turkeys.

Estimated livestock production in 2005 included (in thousands of tons): pork, 1,923; beef and veal, 304; poultry, 984; mutton, 1.6; and milk, 11,401. Butter production in 2005 was 190,000 tons; cheese, 595,000; and honey, 12,500.

## 24 FISHING

Most of the fishing industry has been brought under state ownership. Sea fishing is conducted in the Baltic and North seas and in the Atlantic (Labrador, Newfoundland, and African waters), and there are inland fisheries in lakes, ponds, and rivers. The 2003 salt-water catch was 160,260 tons, predominantly sprat, herring, and cod; freshwater fishing yielded about 54,520 tons. Aquaculture in 2003 produced 54,000 tons. Exports of fish products amounted to \$313.2 million in 2003, with processed and preserved fish and caviar accounting for \$100 million.

## 25 FORESTRY

As of 2003, 28.4% of Poland's land was forested. Pine, larch, spruce, and fir are the most important varieties of trees. Polish forests are subject to difficult growing conditions such as wide temperature fluctuations in winter, hurricane strength winds, and unusually high temperatures in summer. Most Polish forests grow on highly degraded sandy soils that hold little moisture. Moreover, much of Poland suffered from drought during the 1990s. Almost 50% of forests are young trees; only 17% of the stand can be cut. The Wielkopolski National Forest, a reservation in Rogalin, is famous for its thousand-year-old oak trees.

Despite the adversity, the forest products industry was one of the most rapidly growing sectors of the Polish economy in the 1990s. Since 1992, output of value-added products has doubled, excluding sawn timber. Wood processing occurs in the Biala Podlaska region, while large areas of forest in the Zamosc region foster development in the furniture industry. In 2004, exports of furniture were valued at \$3.4 billion (mainly to Germany), making it a leading export commodity. In 2004, over 80% of furniture production was exported, compared to 17% in 1989. The timber cut in 2004 was estimated at 28 million cu m (1 billion cu ft) of roundwood. The annual allowable cut is typically around 28.7 million cu m (1.01 billion cu ft), equivalent to 33% of annual growth. Poland was once an exporter of timber, but given the booming construction of private homes, domestic production does not meet local demand. In 2004, imports of forestry products exceeded exports by \$233.2 million.

The government has been attempting to offset losses from territorial redistribution and wartime destruction by afforestation. During 1990–2000, the forested area increased in size by an annual average of 18,000 hectares (44,500 acres) per year. Although land is being returned to forests, industrial pollution and pests are still causing deterioration. As of 2004, 31% of commercial forests were plantation or regrowth forests.

## 26 MINING

Poland ranked third globally in mined zinc, sixth in silver, seventh in coal and sulfur (a major export commodity), among the top ten in mine copper (3% of world output, and second in Europe and Central Eurasia), and was a leading producer in Central Eurasia

and Europe of lead, lime, nitrogen, and salt. Poland had 9% of world sulfur reserves, about 6% of world copper ore reserves, and had significant resources of bituminous coal, salt, silver, and lead and zinc ores. The mining and quarrying sector, which included mineral fuels and processing, accounted for around 2% of Poland's gross domestic product (GDP) in 2002, which grew by 2.3% in that year from 2001. Total sales by the mining and quarrying sector contracted by 3% in 2002, with sales by the coal, lignite and peat mining industries falling by 5.8% in that same year.

Mine output of metals in 2002 included: mined zinc, 171,200 metric tons, down from 172,300 in 2001; silver (refined, primary), 1,229 metric tons; copper (ore and concentrate by metal content), 1,071,000 metric tons; and lead (by total mine content), 120,400 metric tons, down from 121,600 metric tons in 2001. All copper ore was mined by KGHM S.A., in the Lubin area; the government's share in KGHM's stock was 52%. Total copper reserves were 2,300 million tons containing 44 million tons of metal. Lead and zinc resources totaled 184 million tons; limestone and marl, 17,450 million tons; and gravel aggregates, 14,600 million tons. No gold was mined in 2003. Important industrial minerals produced in 2003 included hydraulic cement (10.948 million metric tons), glass sand (1.6 million tons), and sulfur (native [Frasch]), by-product, and from gypsum), 1.195 million tons. Also produced in 2002 were palladium, platinum, selenium, anhydrite, diatomite, feldspar, fuller's earth, fire clay, kaolin, gypsum, magnesite ore (crude), nitrogen, foundry sand, filing sand, lime sand, quartz, quartz crystal, sodium compounds, dolomite, limestone, and crushed and dimension stone. Barite mining, at Boguszow, was stopped in 1997, because of large-scale flooding.

Poland's mining and mineral-processing industry was extensive and appeared well positioned to respond to the country's rising needs for all forms of raw materials, especially those consumed by the construction sector. A major trend in Poland's nonferrous metals sector was the denationalization program that encompassed the aluminum, copper, and zinc industries. The acquisition of former German territories in 1945 enriched Poland with hard coal and, to a lesser extent, zinc and lead. Iron ore was found around Czestochowa, in south-central Poland, but in deposits of low metal content. Uranium deposits occurred in Lower Silesia.

## 27 ENERGY AND POWER

Poland has only modest reserves of crude oil and natural gas. The country's main domestic energy sources are coal, lignite, and peat; and rivers remain a largely untapped source of power.

As of 1 January 2004, Poland had proven reserves of crude oil estimated at 96.4 million barrels and proven natural gas reserves estimated at 5.83 trillion cu ft. In 2003, oil production was estimated to average 23,500 barrels per day, while consumption in that year was tentatively placed at 424,000 barrels per day. As a result, Poland was a net importer of oil, most of which comes from Russia. Poland has the largest crude oil refining capacity in North-Central Europe, estimated at 350,000 barrels per day, as of 1 January 2004.

With natural gas reserves estimated at 5.83 trillion cu ft, as of 1 January 2004, Poland was North Central Europe's largest natural gas producer. In 2002, Poland produced an estimated 196 billion cu ft of natural gas, which accounted for 41% of domestic consumption, and came to an estimated 479 billion cu ft.

Coal, as previously noted, is Poland's most abundant energy source. Proven coal reserves at the beginning of 2003 amounted to 24.4 billion tons (of which about two-thirds are anthracite and bituminous), and are the largest in North Central Europe. In 2002, production of all types of coal was estimated at 177.8 million short tons, with demand at an estimated 149 million short tons in that year. Poland's hard coal reserves are concentrated in Upper Silesia, near the border with the Czech Republic. Other major coal basins are located in Lower Silesia and Lublin. Although the coal industry is one of the country's largest employers, a major restructuring of the industry has been initiated. From 1998 through 2002, employment in the industry went from 248,000 to 140,000 by the close of 2002. In addition, a further restructuring was planned for the period 2003 through 2006, and involves further reductions in employment and the closing of inefficient mines.

In 2002, Poland's electric power generating capacity was estimated at 29.307 million kW, of which 28.404 billion kW of capacity was dedicated to conventional thermal fuel plants. Hydroelectric capacity in 2002 was put at 0.868 billion kW, followed by geothermal/other at 0.035 billion kW. Electricity production in 2002 came to 133.980 billion kWh, of which 97.6% was from fossil fuels, 1.6% from hydropower, and less than 1% from other renewable sources. Consumption of electricity in 2002 was 117.533 billion kWh. In 2001, coal accounted for 93% of Poland's primary energy production. However, consumption had declined 23% between 1993 and 2002.

Poland has been gradually deregulating its power market since 1998. Each year an increasing number of companies are allowed to choose their own electricity provider. By 2006 the sector will be completely open.

## 28 INDUSTRY

Leading industries in Poland include food processing, fuel, metals and metal products, automotive parts, chemicals, coal mining, glass, shipbuilding, and textiles. Industrial production increased by 14.5% annually during 1971–75, but in the late 1970s, the growth rate began to fall. During the 1980s, it grew at an annual rate of 1.1%. With the destabilizing effects of the dissolution of the Soviet bloc and central planning, industrial production initially fell by 26% in 1990 before returning to positive growth between 1991–98. Poland produced 10 million tons of steel per year in the mid-1990s. Sulfur is another important industrial commodity; and its production totaled 1,901 tons per year. The cement industry turned out 12.3 million tons during the same period.

Light industries were long relegated to a secondary position but, since the 1970s, Poland has increased its production of durable household articles and other consumer goods. In the mid-1990s, Poland produced 401,000 automatic washing machines, 584,000 refrigerators and freezers, 841,000 television sets, 307,000 radios, and 21,000 tape recorders and dictaphones per year.

Currently Poland is among the top 10 world producers of coal, copper and sulphur, and among the top 20 producers of sulphuric acid, cement, television sets, passenger cars, buses and trucks, and power engineering. Poland is also a leading world producer of some food stuffs such as rye, sugar beets, meat, milk barley, wheat, sugar, and eggs.

Since the accession to the EU, there has been a rapid increase in exports as well as in relocation of production facilities such as car

and truck assembly plants and household appliances plants from Western Europe to Polish commercial zones such as Łódź and Wrocław. In addition, there have been many investments from non-European countries such as plans to build an LCD factory near Wrocław by the South Korean concern LG Electronics.

## 2<sup>9</sup> SCIENCE AND TECHNOLOGY

Destruction of the Polish scientific community, buildings, and equipment during World War II was nearly total, requiring a tremendous rebuilding program. Attached to the various university faculties and government bodies are institutes, laboratories, and clinics devoted primarily to research, but some offering advanced instruction. In 1952, the Polish Academy of Sciences, established in Warsaw, replaced the old Polish Academy of Sciences and Letters of Cracow; it has sections of biological sciences; mathematical, physical, and chemical sciences; technical sciences; agricultural and forestry sciences; medical sciences; and earth and mining sciences. As of 1996, 54 scientific and technological research institutes were affiliated with the Academy of Sciences, and there were 101 scientific and technological research institutes attached to government ministries. In Warsaw are located a botanical garden and museums devoted to zoology, technology, and the earth. The Polish Maritime Museum is located in Gdańsk. The Nicholas Kopernik Museum in Frombork includes exhibits on the history of medicine and astronomy.

Research and development (R&D) expenditures in 2002 amounted to \$2.4 trillion or 0.59% of GDP. Of that amount, 61.1% came from government sources, followed by the business sector at 31%. Higher education, private nonprofit groups and foreign sources accounted for 2.9%, 0.3% and 4.8%, respectively. Personnel engaged in R&D in that same year included 1,469 scientists and engineers and 296 technicians per million people. High technology exports in 2002 totaled \$915 million, or 3% of the country's manufactured exports.

In 1996, Poland had 50 universities offering courses in basic and applied sciences. In 1987–1997, science and engineering students accounted for 28% of university enrollment. In 2002, of all bachelor's degrees awarded, 16.3% were in the sciences (natural, mathematics and computers, engineering).

## 3<sup>0</sup> DOMESTIC TRADE

In 1990, Poland replaced its 40-year old centrally planned economy with a free market system. Most small enterprises were privatized, bringing an end to chronic shortages of consumer goods. At the end of 1996, the share of private enterprises in retail trade exceeded 90%. The resulting increase in domestic demand was a primary factor in strengthening the business cycle. In the past few years, the trend in retail establishments, particularly in major cities, has moved from small, independent shops to international supermarket chains, hypermarkets, and large specialty stores. However, small business-owners have been forming associations aimed at promoting and preserving local, independent retailing.

Offices are open from 8 or 9 AM to 4 PM Monday through Friday. Food stores are open from 6 or 7 AM to 7 PM; other stores, from 11 AM to 7 or 8 PM; and banks, from 9 AM to 4 PM Monday through Friday, and 9 AM to 1 PM on Saturday. The most important trade exhibition is the annual Poznan International Fair, which takes place in June.

According to World Bank report published in 2004, Poland is among the top 10 countries improving their operating climate for enterprises. There were over 90 franchises in operation, with national firms as well as foreign firms represented. The number of foreign enterprises has been growing constantly. According to GUS (the Central Statistical Office), in 2002, about 10–12% of the retail market was operated by foreign firms, particularly through chain stores providing a range of goods from food and apparel to furniture and hardware supplies; in the first half of 2004, the number of foreign enterprises exceeded 50,000 an increase of 1,034 companies. The attractiveness of Poland is connected with its advantageous geographical location, EU membership, low labor costs and a high number of people with higher education. The largest inflow of foreign direct investment has been recorded by the manufacturing sector, especially by the automotive and electronic equipment and pharmaceutical branches.

## 3<sup>1</sup> FOREIGN TRADE

Until recently, foreign trade was a state monopoly under the control of the Ministry of Foreign Trade. After World War II, the orientation of Polish trade shifted from Western and Central European countries to Eastern Europe. This changed with the dissolution of the Soviet-bloc CMEA in 1991. In December of that year, Poland signed an association agreement with the EC (now the EU) and by 2000, 70% of its exports and 61% of its imports were going to EC members. Poland also fosters trade through its membership in the Central European Free Trade Agreement (CEFTA), which includes Hungary, the Czech Republic, and the Slovak Republic. Since gaining full membership in the EU in 2004, Polish exports to the West have continued to increase faster than imports. Trade with the countries to the east has recently recovered to the levels from before the 1998 Russian financial crisis, although it is often stifled by minor frictions with Russia and Belarus, for example the controversial restrictions on Polish meat exports to Russia in the fall of 2005.

Poland's export commodities are a mixture of manufactured goods including furniture (7.0%), garments (6.1%), motor vehicles (4.6%), iron and steel (3.9%), and ships (3.3%). Export com-

modities formed from natural resources include wood (2.5%); coal, lignite, and peat (2.3%); and copper (2.3%).

**3<sup>2</sup> BALANCE OF PAYMENTS**

Measured in terms of commodity trade figures, negative balances have been the rule in Poland in the post-World War II period. In 1991, the collapse of exports to the Soviet Union dealt a sharp blow to overall export performance. The requirement to exchange by means of hard currency for Soviet raw materials and energy prevented a repeat of the 1990 trade surplus. Poland attracted approximately \$50 billion of foreign direct investment between 1990 and 2000. Net official reserves have increased in recent years, due to large capital surpluses due to foreign direct investment and portfolio inflows.

The US Central Intelligence Agency (CIA) reported that in 2002 the purchasing power parity of Poland's exports was \$32.4 billion while imports totaled \$43.4 billion resulting in a trade deficit of \$11 billion.

According to the International Monetary Fund (IMF), in 2001 Poland had exports of goods totaling \$41.7 billion and imports totaling \$49.3 billion. In 2005 imports totaled €50.9 billion and exports totaled €45.0 billion.

**3<sup>3</sup> BANKING AND SECURITIES**

The Banking Law of 1 July 1982 substantially reformed the Polish banking system by giving banks an effective role in setting monetary and credit policy, thereby allowing them to influence economic planning. The Council of Banks, consisting of top bank officers and representatives of the Planning Commission and the Ministry of Finance, is the principal coordinating body.

The National Bank of Poland (Narodowy Bank Polski-NBP), created in 1945 to replace the former Bank of Poland, is a state institution and the bank of issue. It also controls foreign transactions and prepares financial plans for the economy. On 1 January 1970,

the National Bank merged with the Investment Bank and has since controlled funds for finance and investment transactions of state enterprises and organizations. The function of the Food Economy Bank and its associated cooperative banks is to supply short and long-term credits to rural areas. The national commercial bank, Bank Handlowy w Warszawie (BH), finances foreign trade operations. The General Savings Bank (Bank Polska Kasa Opieki-PKO), a central institution for personal savings, also handles financial transfers into Poland of persons living abroad.

In March 1985, two types of hard-currency accounts were introduced: "A" accounts, bearing interest, for currency earned in an approved way; and "B" accounts, for other currency, bearing no interest. "B" accounts can be converted into "A" accounts after one year. Major enterprises in Poland conduct their business by interaccount settlements through the National Bank rather than by check, and wages are paid in cash. Banking laws in 1989 opened the country's banking system to foreign banks.

A fundamental reorganization of the banking sector took place between 1990 and 1992. The NBP lost all its central planning functions, including holding the accounts of state enterprises, making transfers among them, crediting their operations, and exercising financial control of their activities. The NBP thus became only a central bank, and state enterprises competed with other businesses for the scarce credits available from commercial banks. Nine independent (so-called commercial), although state-owned, regional banks were created.

In 1993, the first of these, the Poznan-based Wielkopolski Bank Kredytowy (WBK), was privatized. A second highly controversial privatization took place in early 1994 with the sale of the Silesian Bank (Bank Slaski). Also, the Krakow-based Bank Przemyslowo-Handlowy (BPH) was disposed of at the start of 1995 and Bank Gdanski was sold in late 1995. With four major banks privatized, five remained to be sold off in a process that was supposed to have been completed by 1996. With no real hope of meeting this deadline, the Polish government returned in 1996 to proposals for "bank consolidation" prior to privatization. A major round of privatization was due to begin in 1998-99 beginning with the sale of Pekao, the country's largest commercial bank. This sale finally put over half of the industry's holdings in private hands. At the same time, foreign investment in Polish banks continued to increase. Citibank, ING, Commerzbank, Allied Irish Bank, and J.P. Morgan were leading foreign investors in 1998. In 2001, Bank Handlowy w Warszawie SA merged with Citibank (Poland) SA, but retained its historic name.

The International Monetary Fund reports that in 2001, currency and demand deposits—an aggregate commonly known as M1—were equal to \$23.0 billion. In that same year, M2—an aggregate equal to M1 plus savings deposits, small time deposits, and money market mutual funds—was \$82.8 billion. The money market rate, the rate at which financial institutions lend to one another in the short term, was 16.2%. The discount rate, the interest rate at which the central bank lends to financial institutions in the short term, was 14%.

In early 1991 important legislation was introduced to regulate securities transactions and establish a stock exchange in Warsaw. At the same time, a securities commission was formed for consumer protection. A year later, the shares of 11 Polish companies were being traded weekly on the new exchange. Restructuring the

financial market not only was necessary for increasing the overall efficiency of the economy and accelerating privatization, but also was a precondition for the rapid influx of Western capital critical to economic development.

When the Warsaw Stock Exchange opened in April 1991, it had only five listed companies, but by September 1996 that figure had increased to 63. Into 1998, the market still suffered growing pains similar to those afflicting other emerging markets. In particular, the high liquidity of Polish stocks made Poland particularly vulnerable to panic selling. Market capitalization in 2001 was \$26 billion, down 17% from the \$31.3 billion level of 2000. The WIG All Share Performance Index was at 13,922.2 in 2001, down 22% from 17,847.6 in 2000. As of 2004, a total of 225 companies were listed on the Warsaw Stock Exchange, which had a market capitalization of \$71.102 billion. In 2004 the WIG All Share Performance Index rose 27.9% from the previous year to 26,636.2.

**34 INSURANCE**

In 1948, all insurance other than social insurance was included in a centralized State Insurance Bureau, with the former reinsurance organization, Warta, continuing its activity. In 1994, Warta was privatized and was one of three major insurers who, together, controlled over 90% of Poland's insurance market. In 1999, 54 licensed insurance companies competed in the Polish market.

Insurance is dominated by a state concern, PZU, but a number of Western companies, including the United Kingdom's Commercial Union (CU), have been tempted into joint ventures in the life insurance end of this underdeveloped market. CU began its Polish operations in cooperation with the Wielkopolski Bank Kredytowy (WBK) bank. It sold around 130,000 policies in its first four years. PZU was privatized in 1999. In Poland, third-party auto liability, farmer's liability, fire insurance, workers' compensation, and nuclear liability are all compulsory. For 2003, the value of direct premiums written totaled \$6.258 billion, of which nonlife premiums accounted for \$3.946 billion. In 2003, Poland's top nonlife insurer

was PZU, while PZU Zycie was the nation's leading life insurer, with gross written nonlife and life insurance premiums of \$1.86 billion and \$1.32 billion, respectively.

**35 PUBLIC FINANCE**

The annual budget is presented to the Sejm in December and becomes effective for the fiscal year beginning on 1 January. A new set of economic reforms, announced in early 2002, aim to improve the country's investment climate and public finances. Privatization in the former Eastern bloc nation has been fairly successful, with approximately two-thirds of GDP now coming from the private sector. By the early 1990s, Poland was the first formerly planned economy in Eastern Europe to come out of recession and experience economic growth.

The US Central Intelligence Agency (CIA) estimated that in 2005 Poland's central government took in revenues of approximately \$52.7 billion and had expenditures of \$63.2 billion. Revenues minus expenditures totaled approximately -\$10.4 billion. Public debt in 2005 amounted to 47.3% of GDP. Total external debt was \$123.4 billion.

The International Monetary Fund (IMF) reported that in 2001, the most recent year for which it had data, central government revenues were z223.6 million and expenditures were z263.58 million. The value of revenues was us\$54.6 billion and expenditures us\$65.6 billion, based on a market exchange rate for 2001 of us\$1 = z4.0939 as reported by the IMF. Government outlays by function were as follows: general public services, 30.8%; defense, 3.4%; public order and safety, 3.3%; economic affairs, 4.5%; housing and community amenities, 2.0%; health, 0.8%; recreation, culture, and religion, 0.7%; education, 4.8%; and social protection, 51.5%.

**36 TAXATION**

Personal income tax in Poland in 2005 is progressively structured with a top rate of 40%, although under certain circumstances, an individual may opt to be taxed at a flat 19% rate on business income. Individuals realizing capital gains from the sale of land, a building, or dwelling not used for business purposes is subject to a 10% rate.

Poland has a general corporate profits tax rate of 19%. Capital gains and branch operations are each taxed at the corporate rate. Dividends and interest paid to residents and nonresidents are taxed at a flat 19% rate. Income from interest, fees and royalties are subject to a 20% withholding rate, unless other rates have been agreed to in bilateral tax treaties (BITs). Poland has BITs with at least 66 countries. In the BIT with the United States, withholding rates are 0% on interest income, 10% on income from royalties, and 5% on dividend income if the receiving company owns at least 10% of voting shares.

The main indirect tax is a system of value-added taxes (VATs). There are four VAT rates: 22% on most goods and some services; 7% on processed foodstuffs and construction materials; 3% on unprocessed foodstuffs; 0% on exported goods and services, and "VAT-exempt" applied to several groups of services, including financial services, insurance and health care. Excise taxes are charged on alcohol, cars, petrol, and tobacco products. There is also a civil transactions tax.

### **37 CUSTOMS AND DUTIES**

Poland uses the Harmonized System of Classification. Products are divided into three categories to determine which rate they receive: developing nations, WTO members, and countries with which Poland has a special trade relationship such as a bilateral preferential trade agreement. Under the terms of a 1992 agreement, Poland uses the EU Nomenclature System of Tariff classification and has granted duty-free status to over 1,000 line items from EU countries. Tariffs range from 0% to nearly 400%. In addition, all goods are subject to a 5% import tax, an excise tax on luxury items, and a VAT of 0%, 3%, 7%, or 22%, depending on the commodity. As a result of its efforts to join in the next round of EU expansion, Poland is bringing its trade regulations in line with EU standards.

### **38 FOREIGN INVESTMENT**

Prior to World War II, considerable foreign capital was invested in the Polish economy, particularly in petroleum and mining, which were mostly foreign owned. A nationalization decree in 1946 confiscated foreign properties and nationalized Poland's industries, eliminating foreign investments completely. The decree provided for no compensation procedures and foreign governments involved negotiated directly with Poland. The first joint venture with Western counterparts (one Austrian and one US company) was formed in early 1987 to build a new airport terminal in Warsaw. In mid-1991, there were 4,100 foreign registrations, worth \$506 million, and in 1993 another \$2 billion in foreign investment entered Poland. Among the industrial companies sold to Western interests were Polam-Pila (lightbulbs) to Phillips, Polkolor (TV sets) to Thomson, Pollena-Bydgoszcz (detergents) to Unilever, and Wedel (confectioneries) to Pepsico Foods.

In 1996–97, Poland continued to invite foreign investors to help the government turn some of its banks and oil, arms, and telecommunications companies over to the private sector. In October 1996 President Aleksander Kwasniewski stated that the government's campaign to shed costly state-owned enterprises had been successful, with the private sector now accounting for about 70% of the goods and services produced in the economy. Total foreign direct investment (FDI) reached nearly \$27.3 billion in 1998. FDI inflow in 1998 was \$6.3 billion, up from nearly \$5 billion in 1997, and increased to \$7.2 billion in 1999, undeterred by the effects of the Russian financial crisis. Annual FDI inflow peaked at over \$9.3 billion in 2000, having grown at an average rate of 44% a year since 1991 to 2000. Total FDI stock was over \$42 billion in 2000. In 2001 and 2002, the economic slowdown, and, particularly, the worldwide decline in foreign investments, helped reduce annual FDI inflows into Poland to \$8.3 billion in 2001 and to \$6.06 billion in 2002. Cumulative FDI as of 2002 was \$61.45 billion.

### **39 ECONOMIC DEVELOPMENT**

After World War II, the economy of Poland was centrally planned and almost completely under state control, especially in nonagricultural sectors. The nationalized industries and businesses operated within the national economic plan and were governed by the directives issued by the pertinent ministries. After 1963, however, centralized planning and management were somewhat relaxed, and state-owned enterprises gained more freedom in the design

and implementation of their programs. Private undertakings were confined to personal crafts and trades and agriculture.

Under the three-year plan for 1947–49, principal emphasis was placed on the reconstruction of war-devastated areas and industries, in order to raise production and living conditions at least to their prewar levels. Economic planning followed Soviet lines, setting production goals that determined tasks for each sector on a long-term basis. Under the six-year plan for 1950–55, the emphasis continued to be on heavy industry, and the housing, transport, agriculture, and consumer sectors lagged. The five-year plan for 1956–60, originally cast along the same lines, was modified after the 1956 disturbances. It called for a lessened rate of industrial expansion and for increases in agricultural output, housing, consumer goods, and social services. Under a long-range plan for 1961–75, which governed the three five-year plans falling within that period, emphasis was placed on a direct improvement in living standards. The first and second of these plans (1961–65 and 1966–70) were oriented toward investments intended (1) to develop the raw-material base of the country, especially the newly discovered resources of sulfur, copper, and lignite; (2) to secure employment opportunities for the rapidly growing population of working age; and (3) to improve Poland's international trade balance. The five-year plan for 1961–65 reached its industrial targets but fell short in the areas of agriculture and consumer goods. The period 1966–70 witnessed two poor agricultural years in addition to export lags, and there were shortages of basic food commodities in 1969–70.

In late 1970, violent protests erupted over the government's stepped-up efforts to increase production. After the change in political leadership from Gomulka to Gierek, government emphasis shifted from heavy industry to light, consumer-oriented production. In addition, through a concentration of investment in mechanization, fertilizers, and other farm improvements, the government sought and achieved a 50% increase in food production. Overall, the 1971–75 five-year plan achieved its main targets by a wide margin, with industrial production up about 73%. The 1976–80 plan, which aimed at a 50% increase in industrial production and a 16% increase in agricultural output, ran into difficulty almost from the beginning, and by 1979 the economy had entered a period of decline and dislocation that continued into 1982. An economic reform stressing decentralization of the economy was introduced in January 1982, but it failed to produce any significant improvements. With price rises and consumer goods shortages continuing to fuel popular discontent, the government in March 1983 announced a three-year austerity plan for 1983–85. Its aims included a general consolidation of the economy, self-sufficiency in food production, and increased emphasis on housing and the production of industrial consumer goods. By 1986, the economy had rebounded. The 1986–90 plan expected the national income to grow 3–3.5% annually, industrial output to increase by 3.2% each year, and exports to grow by 5% (in fixed prices) annually. These goals were not reached. A "second stage," proclaimed in 1986, called for more autonomy for individual enterprises and for more efficient management, with top jobs filled without regard to political affiliations.

The Economic Transformation Program adopted in January 1990 aimed to convert Poland from a planned to a market economy. Measures were aimed at drastically reducing the large budget

deficit, abolishing all trade monopolies, and selling many state-owned enterprises to private interests.

The slow pace of privatization picked up somewhat in 1995, as 512 smaller state enterprises were transferred to private National Investment Funds under the Mass Privatization Program, but large-scale industry remained largely under state control. However, the government subsequently made an attempt to privatize such large-scale sectors of the economy as banks and oil, arms, and telecommunications. Poland in the early 2000s was in the process of bringing its economic policies in line with EU standards. These policies promise even further liberalization and foreign investment into the Polish economy. Poland officially joined the EU in May 2004. In 2002, the government announced a new set of economic reforms, including improving the investment climate (particularly for small- and medium-sized enterprises), and improving the country's public finances to prepare the way for the adoption of the euro. Recently, the government has focused utilizing the EU funds to improve Poland's infrastructure.

#### 40 SOCIAL DEVELOPMENT

A social insurance institute administers social security programs through a network of branch offices, under the provision of new legislation passed in 1998 and implemented in 1999. Social security, including social insurance and medical care, covers virtually the entire population. Old age, disability, and survivors' pensions are provided, as well as family allowances, sickness benefits, maternity benefits, workers' compensation, and unemployment. The system is funded by contributions from employers and employees and government subsidies. In 2004 a revised universal system of family allowances funded by the government covers all residents.

The constitution establishes that all citizens are equal, regardless of gender, but discrimination persists. Women participate actively in the labor force, but are concentrated in low-paying professions and earn less than men on average. Also, women are more likely to be fired and less likely to be promoted than men. Violence against women and domestic abuse remain a widespread problem. The law does not provide restraining orders, and even convicted abusers generally go unpunished. As of 2004, there were not enough shelters for battered women. Sexual harassment in the workplace is slowly being addressed.

The Romani minority living in Poland faces discrimination by local authorities. Anti-Semitic harassment, vandalism, and violence persist. The judicial system is hampered by inefficiency and budget constraints, and there are marginal restrictions on freedoms of speech and press.

#### 41 HEALTH

As of 2004, there were an estimated 220 physicians, 490 nurses, and 30 dentists per 100,000 people. The same year, the total health care expenditure was estimated at 6.2% of GDP.

Poland's birth rate was an estimated 10.3 per 1,000 people as of 2002. Approximately 75% of married women (ages 15 to 49) used contraception. Poland immunized children up to one year old against tuberculosis, 94%; diphtheria, pertussis, and tetanus, 98%; polio, 96%; and measles, 97%.

Life expectancy in 2005 averaged 74.74 years and infant mortality was 7.36 per 1,000 live births. The general mortality rate was 10 per 1,000 people.

There were many cases of tuberculosis as part of the spread of the disease throughout much of Eastern Europe. The heart disease mortality rate for Polish men and women was below average for high development countries. The likelihood of dying after 65 of heart disease was 240 in 1,000 for men and 201 in 1,000 for women. The HIV/AIDS prevalence was 0.10 per 100 adults in 2003. As of 2004, there were approximately 14,000 people living with HIV/AIDS in the country. There were an estimated 100 deaths from AIDS in 2003.

#### 42 HOUSING

Almost 40% of all urban dwelling space was destroyed during World War II. Although investment in public housing has increased, and credits have been assigned for cooperative and private construction, the housing shortage remained critical five decades later. The average wait for an apartment ranged from 10–15 years. In 1984 there were 10,253,000 dwelling units; an additional 193,000 dwelling units were constructed in 1985. In 2002, there were about 12.5 million dwelling units registered in the census serving about 13.3 million households; about 93.9% of these were occupied dwellings. About 67.6% of all dwellings were in urban areas. About 55.2% of all dwellings were owned by private individuals. The average number of persons per dwelling was 3.25. At least 76.2% of all dwellings were built after 1944. The housing deficit in 2002 was estimated at about 1,567,000; an estimated 6.5 million people were living in substandard housing.

#### 43 EDUCATION

Primary, secondary, and most university and other education is free. State and local expenditure on education is, therefore, substantial. Lower schools are financed by local budgets, higher and vocational schools from the state budget. As of 2003, public expenditure on education was estimated at 5.6% of GDP, or 12.8% of total government expenditures.

Since 1999, the school system, which is centralized, consists of an six-year primary school followed by a three-year lower secondary general education school. Students then have an option to enroll in a four-year technical school, a three-year upper secondary school, or a two- to three year vocational school. Vocational schools are attended by students studying technology, agriculture, forestry, economy, education, health services, and the arts. The academic year runs from October to June.

In 2001, about 49% of children between the ages of three and six were enrolled in some type of preschool program. Primary school enrollment in 2003 was estimated at about 98% of age-eligible students. The same year, secondary school enrollment was about 91% of age-eligible students. It is estimated that about 98.5% of all students complete their primary education. The student-to-teacher ratio for primary school was at about 13:1 in 2003; the ratio for secondary school was about 14:1.

Higher learning is under the jurisdiction of the Ministry of Higher Education and other ministries. A matriculation examination, which is common for all students, is required for admission to institutions of higher learning. As of 2004, there were 128 state institutions of higher learning and 304 nonstate institutions. Jagiellonian University, among the oldest in Europe, was established at Cracow in 1364. Other prominent universities are the Warsaw University; the Central School of Planning and Statistics (War-

saw); the Higher Theater School (Warsaw); the Academy of Fine Arts (Cracow); and the Adam Mickiewicz University (Poznań). During the communist era the Roman Catholic University at Lublin was the only free private university in the Socialist bloc. Evening and extramural courses are available for anyone who is interested and is not a part of the school system. Foreign students are also welcome to study in Poland, either as regular students or at their summer schools. In 2003, about 60% of the tertiary age population were enrolled in some type of higher education program; 50% for men and 71% for women. The adult literacy rate for 2003 was estimated at about 99.8%.

As of 2003, public expenditure on education was estimated at 5.6% of GDP, or 12.8% of total government expenditures.

#### 44 LIBRARIES AND MUSEUMS

The National Library, established in Warsaw in 1928, is the second-largest in Poland, with about 2.8 million items, including periodicals, manuscripts, maps, illustrations, and music. Other important libraries are the Public University and the government departmental libraries in Warsaw; Poland's largest library, the Jagiellonian University Library in Cracow, which has 3.5 million volumes; and the Ossolineum Library in Wroclaw. There are over 9,000 public libraries in the country. Lax security at Poland's libraries poses a challenge to the preservation of rare documents: in 1998, a scientific library in Cracow reported the theft of a rare book by Nicholas Copernicus, and in 1999, the Jagiellonian University Library reported the theft of an indeterminate number of rare manuscripts.

Of the more than 500 museums in Poland, the foremost is the National Museum in Warsaw, which has an extensive and important art collection as well as a collection of Polish art from the 12th century to present day. Other important museums are the National Museum in Cracow, notable for its collection of Far Eastern Art, and the National Museum in Poznań, which has a celebrated collection of musical instruments. Cracow also has an important collection of European decorative arts at the Wawel Royal Castle, housed in a 16th century manor house, and the Czartoryski Museum, a world-class collection of antiquities and contemporary artifacts including 35,000 prints, drawings, and paintings. Warsaw has dozens of museums, including the Center for Contemporary Art, founded in 1986, in Ujazdowski Castle; the Museum of Independence, founded in 1990, chronicling Poland's pivotal role in the collapse of the Soviet Empire; the Museum of Polish Emigration to America; the Frederick Chopin Museum, chronicling the life of one of the country's best-known composers; the Marie Curie Museum, housed at her birthplace; and the Museum of the Jewish Historical Institute.

#### 45 MEDIA

In 2003, there were an estimated 319 mainline telephones for every 1,000 people; about 500,000 people were on a waiting list for telephone service installation. The same year, there were approximately 451 mobile phones in use for every 1,000 people.

In 2004, the government-owned Polish Television (TVP) was the most widely viewed network with four channels accounting for about 54% of the broadcasting market share. The main privately held competitors were the TVN and Polsat networks. Cable television and various satellite services are available. As of 1998,

there were 14 AM and 777 FM radio stations. In 2003, there were an estimated 523 radios and 229 television sets for every 1,000 people. About 94 of every 1,000 people were cable subscribers. Also in 2003, there were 142 personal computers for every 1,000 people and 232 of every 1,000 people had access to the Internet. There were 565 secure Internet servers in the country in 2004.

The largest Polish daily newspapers, with circulation as noted, are: *Trybuna Slaska*, 800,000 in 2002; *Gazeta Wyborcza*, 558,000 in 2004; 460,000 (weekend edition in 2005); *Express Wieczorny*, 400,000 in 2002; *Zycie Warszawy*, *Express Ilustrowany*, 370,000; *Gazeta Poznanska*, 320,000 (weekend edition); *Gazeta Robotnicza*, 315,000; *Fakt*, 300,000 in 2003; *Czas Krakowski*, 260,000 in 2002 (weekend edition); *Nasz Dziennik*, 250,000 in 2005; *Sztandar Mlodych*, 250,000 in 2002; and *Rzeczpospolita*, 244,000 in 2004.

Though the constitution provides for free speech and a free press, there are some restrictions on these rights. The Penal Code prohibits speech which publicly insults or ridicules the Polish state or its principal organs; it also prohibits advocating discord or offending religious groups. Though the media are not censored, they may be subject to prosecution under these and other penal codes.

#### 46 ORGANIZATIONS

The Polish Chamber of Commerce and the Chamber of Foreign Trade promote foreign trade by furnishing information, establishing or extending commercial relations, and arranging for Polish participation in trade fairs, and exhibitions abroad. The most important worker's organization in Poland is Solidarity, founded in 1980 by Lech Welesa. There are a number of professional associations and trade unions representing a wide variety of occupations.

The P.E.N. Club-Poland is based in Warsaw. The Frederick Chopin Society is a multinational organization promoting the life and works of this Polish composer and pianist. Several professional associations, such as the Polish Medical Association, also serve to promote research and education in specific fields.

There are also many cultural, sports and social organizations in Poland. National youth organizations include the European Federalist Youth, Junior Chamber, Polish Students' Union, Polish Environmental Youth Movement, Union of Young Christian Democrats, The Polish Scouting and Guiding Association, and YMCA/YWCA. There are numerous sports associations promoting amateur competitions in a wide variety of sports for athletes of all ages. There are organizations affiliated with the Special Olympics and the Paralympic Committee, as well as the Olympic Committee.

National women's organizations include the Democratic Women's Union and the Polish Association of University Women. Other social action groups include the Helsinki Human Rights Foundation and Fundacja Stefana Batorego, a group which promotes a democratic and open society. There are national chapters of the Red Cross Society, Habitat for Humanity, UNICEF, and Amnesty International.

#### 47 TOURISM, TRAVEL, AND RECREATION

The main tourist attractions include the historic city of Cracow, which suffered little war damage; the resort towns of Zakopane, in the Tatras, and Sopot, on the Baltic; and the restored Old Town in Warsaw, as well as the capital's museums and Palace of Science

and Culture. Camping, hiking, and football (soccer) are among the most popular recreational activities.

Foreign visitors to Poland must have a valid passport. All visitors are required to carry a visa except citizens of over 30 nations including the United States and members of the European Union.

There were approximately 52 million visitors who arrived in Poland in 2003, about 99% of whom came from Europe. Hotel rooms numbered 68,588 with 134,323 beds and an occupancy rate of about 36%. The average length of stay was three nights. That year tourism receipts totaled \$4.7 billion.

In 2005, the US Department of State estimated the cost of staying in Warsaw at \$286 per day. Elsewhere in Poland, daily travel expenses were estimated to be between \$139 and \$221.

#### 48 FAMOUS POLES

Figures prominent in Polish history include Mieszko I (fl.10th century), who led Poland to Christianity; his son and successor, Boleslaw I ("the Brave," d.1025), the first king of sovereign Poland; Casimir III ("the Great," 1309–70), who sponsored domestic reforms; and John III Sobieski (1624–96), who led the Polish-German army that lifted the siege of Vienna in 1683 and repelled the Turkish invaders. Tadeusz Andrzej Bonawentura Kościuszko (1746–1817), trained as a military engineer, served with colonial forces during the American Revolution and then led a Polish rebellion against Russia in 1794; he was wounded, captured, and finally exiled. Kazimierz Pulaski (1747–79) fought and died in the American Revolution, and Haym Salomon (1740–85) helped to finance it. The reconstituted Polish state after World War I was led by Józef Pilsudski (1867–1935), who ruled as a dictator from 1926 until his death. Polish public life since World War II has been dominated by Wladyslaw Gomulka (1905–82), Edward Gierek (1913–2001), and Gen. Wojciech Jaruzelski (b.1923), Communist leaders, respectively, during 1956–70, during 1970–80, and after 1981. Important roles have also been played by Stefan Cardinal Wyszyński (1901–81), Roman Catholic primate of Poland, archbishop of Gniezno and Warsaw, and frequent adversary of the postwar Communist regime; Karol Wojtyła (1920–2005), archbishop of Cracow from 1963 until his elevation to the papacy as John Paul II in 1978; and Lech Walesa (b.1943), leader of the Solidarity movement during 1980–81, Nobel Peace Prize laureate in 1983, and President of Poland from 1990 to 1995.

The father of Polish literature is Nicholas Rey (1505–69), one of the earliest Polish writers to turn from Latin to the vernacular. Poland's golden age is marked by the beginning of literature in Polish; its greatest poet was Jan Kochanowski (1530–84). Notable among 19th-century poets and dramatists was Adam Mickiewicz (1798–1855), whose *The Books of the Polish Nation and of the Polish Pilgrimage*, *Pan Tadeusz*, and other works exerted a paramount influence on all future generations. Other leading literary figures were the poets and dramatists Juliusz Slowacki (1809–49) and Zygmunt Krasiński (1812–59), whose *Dawn* breathed an inspired patriotism. Józef Kraszewski (1812–87), prolific and patriotic prose writer, is considered the father of the Polish novel. The leading late-19th-century novelists were the realists Aleksander Glowacki (1847–1912), who wrote under the pseudonym of Boleslaw Prus, and Henryk Sienkiewicz (1846–1916), Poland's first Nobel Prize winner (1905), whose *The Trilogy* described the 17th-century wars of Poland; he is internationally famous for *Quo*

*Vadis*. Another Nobel Prize winner (1924) was the novelist Wladyslaw Reymont (1867–1925), acclaimed for *The Peasants*. A Pole who achieved stature as an English novelist was Joseph Conrad (Józef Teodor Konrad Korzeniowski, 1857–1924). Other important literary figures around the turn of the century were the playwright and painter Stanislaw Wyspiański (1869–1907), the novelist Stefan Zeromski (1864–1926), and the novelist Stanislaw Ignacy Witkiewicz (1885–1939). The best-known modern authors are novelist and short-story writer Isaac Bashevis Singer (1904–91), a Nobel Prize winner in 1978 and a US resident after 1935; the satirist Witold Gombrowicz (1904–69); science-fiction writer Stanislaw Lem (b.1921); the dissident novelist Jerzy Andrzejewski (1909–83); the poet Czeslaw Milosz (1911–2004), a Nobel Prize winner in 1980 and resident of the United States after 1960; and novelist Jerzy Kosinski (1933–91), who lived in the United States after 1957 and wrote in English.

The greatest Polish composer was Frédéric Chopin (1810–49), born in Warsaw, who lived in Paris after 1831. A popular composer was Stanislaw Moniuszko (1819–72), founder of the Polish national opera and composer of many songs; he influenced such later composers as Wladyslaw Zeleński (1837–1921), Zygmunt Noskowski (1846–1909), and Stanislaw Niewiadomski (1859–1936). Other prominent musicians include the pianist Ignacy Jan Paderewski (1860–1941), also his country's first prime minister following World War I; the great harpsichordist Wanda Landowska (1877–1959); the renowned pianist Arthur Rubinstein (1887–1982); the violinist Wanda Wilkomirska (b.1929); the conductor Stanislaw Skrowaczewski (b.1923); and the composers Mieczyslaw Karłowicz (1876–1909) and Karol Szymanowski (1883–1937). Witold Lutoslawski (1913–94) and Krzysztof Penderecki (b.1933) are internationally known contemporary composers.

The first Polish painters of European importance were Piotr Michalowski (1800–55) and Henryk Rodakowski (1823–94). In the second half of the 19th century, Polish realism reached its height in the historical paintings of Jan Matejko (1838–93), Artur Grottger (1837–67), Juliusz Kossak (1824–99), and Józef Brandt (1841–1915), as well as in genre painting and the landscapes of Wojciech Gerson (1831–1901), Józef Szermentowski (1833–76), Aleksander Kotsis (1836–77), Maksymilian Gierymski (1846–74), Aleksander Gierymski (1849–1901), and Józef Chelmoński (1849–1914). Feliks Topolski (1907–89), who lived in London after 1935, is well known for his oil paintings, watercolors, and drawings. Andrzej Wajda (b.1926), Roman Polański (b.1933), an expatriate since the mid-1960s, Krzysztof Zanussi (b.1939), and Krzysztof Kieślowski (1941–1996) are famous film directors, and Jerzy Grotowski (1933–1999) was a well-known stage director.

The outstanding scientist and scholar Nicolaus Copernicus (Mikolaj Kopernik, 1473–1543) is world renowned. Among Poland's brilliant scientists are Maria Sklodowska-Curie (1867–1934), a codiscoverer of radium and the recipient of two Nobel Prizes, and Casimir Funk (1884–1967), the discoverer of vitamins. Oskar Lange (1904–66) achieved renown as an economist.

**49 DEPENDENCIES**

Poland has no territories or colonies.

# PORTUGAL

Portuguese Republic  
*República Portuguesa*

**CAPITAL:** Lisbon (Lisboa)

**FLAG:** The national flag, adopted in 1911, consists of a green field at the hoist and a larger red field. At the junction of the two, in yellow, red, blue, and white, is the national coat of arms.

**ANTHEM:** *A Portuguesa (The Portuguese)*.

**MONETARY UNIT:** The escudo (₣) was replaced by the euro as official currency as of 2002. The euro is divided into 100 cents. There are coins in denominations of 1, 2, 5, 10, 20, and 50 cents and 1 euro and 2 euros. There are notes of 5, 10, 20, 50, 100, 200, and 500 euros. €1 = \$1.25475 (or \$1 = €0.79697) as of 2005.

**WEIGHTS AND MEASURES:** The metric system is the legal standard.

**HOLIDAYS:** New Year's Day, 1 January; Carnival Day, 15 February; Anniversary of the Revolution, 25 April; Labor Day, 1 May; National Day, 10 June; Assumption, 15 August; Republic Day, 5 October; All Saints' Day, 1 November; Independence Day, 1 December; Immaculate Conception, 8 December; Christmas, 25 December. Movable religious holidays include Carnival Day, Good Friday, and Corpus Christi.

**TIME:** GMT.

## <sup>1</sup> LOCATION, SIZE, AND EXTENT

The westernmost country of Europe, Portugal occupies the greater portion of the western littoral of the Iberian Peninsula. Portugal has an area of 92,391 sq km (35,672 sq mi), including the Azores (Açores) Archipelago, and Madeira and Porto Santo. Comparatively, the area occupied by Portugal is slightly smaller than the state of Indiana. The mainland of Portugal extends 561 km (349 mi) N–S and 218 km (135 mi) E–W. Bordered on the N and E by Spain and on the S and W by the Atlantic Ocean, Portugal has a total boundary length of 3,007 km (1,868 mi), of which 1,793 km (1,114 mi) is coastline.

Portugal's capital city, Lisbon, is located on Portugal's west coast.

## <sup>2</sup> TOPOGRAPHY

Portugal exhibits sharp topographic contrasts. Although the north is largely lowland or land of medium altitude, the distribution of highlands is unequal north and south of the Tagus (Tejo) River. From north to south, the principal mountain ranges are the Peneda (reaching a maximum height of 1,416 m/4,646 ft), Gerês (1,507 m/4,944 ft), Marão (1,415 m/4,642 ft), Montemuro (1,382 m/4,534 ft), the Açor (1,340 m/4,396 ft), and Lousã (1,204 m/3,950 ft), all north of the Tagus. The uplands of Beira, traversed by the Tagus on its way to the sea, contain Portugal's highest peak, Estrêla (1,991 m/6,532 ft). Westward lies the low coast of the Beira Littoral. The Tagus and Sado basins lie adjacent to the hilly area of Estremadura and rise to the hills of Alentejo on the east.

The interior lowland of lower Alentejo, farther south, is limited by the hills of Algarve. The south coast, from the mouth of the Guadiana to Cape St. Vincent, is mainly steep, but northward from Cape St. Vincent to the Tagus, including the great Bay of Setúbal and the estuary of the Tagus, the coast is low. North of the

Tagus, it rises steeply toward the hills of Sintra, beyond which is a low coast of dunes interrupted by the marshes of Aveiro. Beyond the mouth of the Douro River, the coast is steep all the way to the Spanish frontier and the mouth of the Minho River. The larger rivers—the Minho, the Douro, the Tagus, and the Guadiana—all rise in Spain. The Douro has the longest course in Portugal (322 km/200 mi).

Portugal is located on the Eurasian Tectonic Plate near its southern boundary with the African plate. The region is seismically active, but fortunately, most earthquakes within the last century have been fairly moderate and were primarily centered in the northern part of the country. One of the most destructive earthquakes in history occurred in Lisbon on 1 November 1755 when an 8.7 magnitude earthquake was felt throughout the country and triggered a tsunami. The destruction from these events caused the deaths of about 70,000 people.

## <sup>3</sup> CLIMATE

Marked seasonal and regional variations within temperate limits characterize the climate. In the north, an oceanic climate prevails: cool summers and rainy winters (average rainfall 125–150 cm/50–60 in annually), with occasional snowfall. Central Portugal has hot summers and cool, rainy winters, with 50–75 cm (20–30 in) average annual rainfall. The southern climate is very dry, with rainfall not exceeding 50 cm (20 in) along the coast. In Lisbon, the average temperature is about 24°C (75°F) in July and 4°C (39°F) in January. The annual mean temperature in Portugal is 16°C (61°F).

## <sup>4</sup> FLORA AND FAUNA

Three types of vegetation can be distinguished in Portugal: the green forests of eucalyptus, pine, and chestnut in the north; the open dry grasslands, interrupted by stands of cork and other types

of evergreen oak, in the central areas; and the dry, almost steppe-like grasslands and evergreen brush in the south. Few wild animals remain in Portugal. The coastal waters abound with fish, sardines and tuna being among the most common species. As of 2002, there were at least 63 species of mammals, 235 species of birds, and over 5,000 species of plants throughout the country.

## 5 ENVIRONMENT

Air and water pollution are significant environmental problems especially in Portugal's urban centers. Industrial pollutants include nitrous oxide, sulfur dioxides, and carbon emissions. In 1996, industrial carbon dioxide emissions totaled 47.9 million metric tons. In 2000, the total of carbon dioxide emissions was at 59.8 million metric tons.

The nation's water supply, especially in coastal areas, is threatened by pollutants from the oil and cellulose industries. Portugal has 38 cu km of renewable water, of which 48% of the annual withdrawal is used to support farming and 37% is for industrial activity. The nation's wildlife and agricultural activities are threatened by erosion and desertification of the land. The principal environmental agencies in Portugal include the Ministry of Quality of Life and the Office of the Secretary of State for the Environment. The nation's basic environmental legislation dates from 1976.

According to a 2006 report issued by the International Union for Conservation of Nature and Natural Resources (IUCN), threatened species included 15 types of mammals, 15 species of birds, 1 type of reptile, 20 species of fish, 67 types of mollusks, 15 species of other invertebrates, and 15 species of plants. Threatened species in Portugal include the Spanish Lynx, rosalia, Mediterranean monk seal, and Spanish imperial eagle. The São Miguel bullfinch and three species of turtle (green sea, hawksbill, and leatherback) were endangered in the Azores. The Mediterranean monk seal and four species of turtle (green sea, hawksbill, Kemp's ridley, and leatherback) were endangered in Madeira. The Madeiran land snail and the Canarian black oyster catcher have become extinct.

## 6 POPULATION

The population of Portugal in 2005 was estimated by the United Nations (UN) at 10,576,000, which placed it at number 76 in population among the 193 nations of the world. In 2005, approximately 17% of the population was over 65 years of age, with another 16% of the population under 15 years of age. There were 94 males for every 100 females in the country. According to the UN, the annual population rate of change for 2005–10 was expected to be stagnant at 0.0%, a rate the government viewed as too low. The projected population for the year 2025 was 10,356,000. The overall population density was 115 per sq km (298 per sq mi), with approximately two-thirds of the population living in coastal areas.

The UN estimated that 53% of the population lived in urban areas in 2005, and that urban areas were growing at an annual rate of 0.93%. The capital city, Lisbon (Lisboa), had a population of 1,962,000 in that year. Porto, the next largest city, had a metropolitan population of 1,551,950. These two metropolitan areas account for most of the urban dwellers in the country.

## 7 MIGRATION

Portuguese emigration, which decreased from an annual average of 48,000 persons during the decade 1904–13 to 37,562 in 1961,

increased sharply after 1963 as a result of acute labor shortages in other European countries, especially in France and the Federal Republic of Germany (FRG). By 1970, it was estimated that more than 100,000 Portuguese were emigrating yearly. Legal emigration to the FRG continued to increase until November 1973, when the FRG suspended non-EC immigration. Overall, more than 130,000 Portuguese emigrated in 1973. Because of the loss of Portugal's African colonies in 1975, an estimated 800,000 Portuguese settlers returned to Portugal. Since then at least 25,000 generally return from abroad each year, mostly from other European countries or America. As of 1989, some 4,000,000 Portuguese were living abroad, mainly in France, Germany, Brazil, South Africa, Canada, Venezuela, and the United States. In 2003, remittances home came to \$2.8 billion.

In 2001, Portugal introduced major innovations to its immigration law, together with multiple and flexible visa arrangements, duties were clarified and the legalization process streamlined. Children born to immigrants living in the country legally for at least six years would automatically be granted citizenship. In 2003, Ukrainians displaced Brazilians as the dominant nationality. There were 466,000 legal migrants at the end of 2004, including 52,037 Africans. In 2004, there were a total of 377 refugees and no asylum applications were filed. In 1999 the net migration rate was -1.51 migrants per 1,000 population; by 2005 it was an estimated 3.49 per 1,000 population.

## 8 ETHNIC GROUPS

The Portuguese people represent a mixture of various ethnic strains. In the north are traces of Celtic influence; in the south, Arab and Berber influence is considerable. Other groups—Lusitanians, Phoenicians, Carthaginians, Romans, Visigoths, and Jews—also left their mark on the Portuguese people. The present-day Portuguese population is one of the most homogeneous in Europe. Minority groups are primarily made up of immigrants, both legal and illegal, from Brazil, African colonies, and Eastern Europe. Legal immigrants account for about 5% of the total population. There are about 50,000 Roma in the country.

## 9 LANGUAGES

Portuguese, the national language, evolved from ancient dialects of Latin; its rules of orthography were reformulated in 1911. Portuguese is also the official language of Brazil and the former African provinces. Mirandese is a second official language, but is not as widely used. Spanish, French, and English are the most common second languages.

## 10 RELIGIONS

According to 2004 reports, about 80% of the population aged 12 or older identified themselves as Roman Catholic; though many claimed that they are not active participants in the church. Protestants constituted about 4% of the populace; and various other groups made up about 1%. Nearly 3% claimed no religious affiliation. Christian groups include Seventh-Day Adventists, the Church of Jesus Christ of Latter-day Saints, Orthodox Christians, and Brazilian syncretic Catholic churches. There are about 35,000 Muslims, 700 Jews, and small groups of Buddhists, Taoists, and Zoroastrians. About 7,000 people are Hindus. There are also congregations of the Igreja Universal do Reino de Deus (the Universal

LOCATION: 36°57'39" to 42°9'8" N; 6°11'10" to 9°29'45" W. BOUNDARY LENGTHS: Spain, 1,214 kilometers (755 miles); Atlantic coastline, 1,793 kilometers (1,113 miles). TERRITORIAL SEA LIMIT: 12 miles.

Church of the Kingdom of God), which originated in Brazil. The Church of Scientology claims to have about 200 active members.

In 2001, a new law on religious freedom was passed to extend to minority religions more of the privileges previously granted only to the Roman Catholic Church. The Catholic Church has, however, maintained a special status with the government through

a 1940 concordat which was amended in 2004. Certain Catholic holidays are recognized as national holidays.

### 11 TRANSPORTATION

The Portuguese railways are almost entirely owned and operated by the state-owned Portuguese Railway Company. As of 2004,

the railway system, which is adequate for Portugal's needs, totals 2,850 km (1,771 mi) of broad and narrow gauge track. Of that total, broad gauge accounts for 2,576 km (1,602 mi), of which 623 km (387 mi) have been electrified.

The length of usable highways in 2002 was 17,135 km (10,657 mi), of which 14,736 km (9,165 mi) were paved, including 1,659 km (1,031 mi) of expressways. The principal highways connect Lisbon and Porto with La Coruña in Spain, and Lisbon with Madrid via Badajoz. Bus service links all Portuguese cities, towns, and principal villages. In 2003 there were 5,241,100 motor vehicles registered in continental Portugal, including 3,966,000 passenger cars, and 1,275,100 commercial vehicles.

As of 2005, the Portuguese merchant fleet had 114 oceangoing vessels of 1,000 GRT or more, totaling 872,557 GRT. The main shipping firm is the Portuguese Maritime Transport Co., created after the private shipping companies were nationalized in 1975. It maintains scheduled services to the Azores, Madeira, Macao, and the former overseas territories in Africa. There is also regular service to Brazil and North America. The chief ports—Lisbon (the largest), Porto, Ponta Delgada, and Sines—are all fully equipped and have adequate warehousing facilities. Portugal has created a captive register of convenience on Madeira for Portuguese-owned ships, allowing for taxation and crewing benefits. As of 2003, Portugal's internal waterway system consisted of a 210 km (130 mi) stretch on the Douro River from Porto.

In 2004, Portugal had an estimated 65 airports, 42 of which had paved runways as of 2005. Because of their geographical position, Lisbon's Portela Airport and Santa Maria in the Azores are of great importance in international aviation. Portela is one of the principal airports for overseas flights to North and South America and to western and central Africa; Santa Maria is a stopping point for transoceanic flights from Europe to North America. The most important aviation company in Portugal is Transportes Aereos Portugueses (TAP), which was nationalized in 1975. In 2003, about 7.590 million passengers were carried on domestic and international scheduled flights.

## 12 HISTORY

Portugal derives its name from ancient *Portus Cale* (now Porto), at the mouth of the Douro River, where the Portuguese monarchy began. The country's early history is indistinguishable from that of the other Iberian peoples. Lusitanians were successively overrun by Celts, Romans, Visigoths, and Moors (711). In 1094, Henry of Burgundy was given the county of Portugal by the king of Castile and León for his success against the Moors; his son, Alfonso I (Alfonso Henriques), became king and achieved independence for Portugal in 1143, beginning the Burgundy dynasty. By the mid-13th century, the present boundaries of Portugal were established, and Lisbon became the capital.

During the reign of King John (João) I, the founder of the powerful Aviz dynasty and husband of the English princess Philippa of Lancaster, the Portuguese defeated the Spanish in a war over the throne (1385), established a political alliance with England (by the Treaty of Windsor in 1386) that has endured to the present day, and inaugurated their most brilliant era. Prince Henry the Navigator (Henrique o Navegador), a son of John I, founded a nautical school at Sagres, where he gathered the world's best navigators, cosmographers, geographers, and astronomers and commenced a

series of voyages and explorations that culminated in the formation of the Portuguese Empire. In the 15th and 16th centuries, the golden age of Portugal, Portuguese explorers sailed most of the world's seas; made the European discovery of the Cape of Good Hope, Brazil, and Labrador; founded Portugal's overseas provinces in western and eastern Africa, India, Southeast Asia, and Brazil; and poured the vast riches of the empire into the homeland. In 1580–81, Philip II of Spain, claiming the throne, conquered Portugal and acquired its empire, but national sovereignty was restored by the revolution of 1640 and the accession of John IV, founder of the Bragança dynasty, to the Portuguese throne. John IV ushered in Portugal's silver age, the 17th and 18th centuries, when the wealth of Brazil once more made Lisbon one of the most brilliant of European capitals. The city was largely destroyed by a great earthquake in 1755 but was subsequently rebuilt. During the Napoleonic wars, Portugal, faithful to its British alliance, was the base of British operations against the French in the Iberian Peninsula. The royal family, however, withdrew to Brazil, and from 1807 to 1821, Rio de Janeiro was the seat of the Portuguese monarchy. In 1822, Brazil, ruled by Pedro, the son of King John VI of Portugal, formally declared its independence; Pedro became Emperor Pedro I of Brazil but was deposed in 1831.

The Bragança dynasty, which had ruled Portugal since 1640, came to an end with the revolution of 1910, when the monarchy was replaced by a republican regime. Lack of stability under the new republic led to a military dictatorship in 1926. Marshal António Carmona served as president from 1926 to 1951. António de Oliveira Salazar, brought to the government in 1928 as minister of finance, emerged as Portugal's prime minister in 1932. In 1933, Salazar proclaimed a new constitution, which consolidated his regime and established Portugal as a corporative state. During World War II, Portugal supported the Allies but did not take part in combat; it subsequently became a member of NATO.

Despite its reduced status as a European power, Portugal attempted to maintain its overseas empire, especially its resource-rich African provinces. In 1961, Portugal surrendered Goa, Daman, and Diu to India. In the same year, uprisings in Angola began, organized by the Union of Angolan Peoples in protest against Portugal's oppressive policies in the territory. These uprisings led to serious disagreements between the UN and Portugal; following Portugal's refusal to heed its recommendations for liberalization of policies with a view toward eventual self-government, the UN General Assembly passed a resolution in 1965 calling for a worldwide economic and arms boycott of Portugal in order to force it to grant independence to its African dependencies. Subsequently, the Assembly passed a number of resolutions condemning Portugal for its policies in its African territories. Meanwhile, guerrilla movements in Angola, Mozambique, and Guinea-Bissau were met by a steadily increasing commitment of Portuguese troops and supplies.

Salazar, who served as prime minister of Portugal from 1932 to 1968, died in July 1970 at the age of 81. When he was incapacitated in September 1968, he was succeeded by Marcello Caetano. The unwillingness of the Caetano regime to institute democratic and economic reforms, coupled with growing discontent over the continuance of the ever more costly colonial war in Africa, led to a military coup by the left-wing Armed Forces Movement in April 1974. Broad democratic liberties were immediately granted and

opposition political parties legalized, while the corporate state apparatus was gradually dismantled. A decolonization program was also begun, resulting by November 1975 in the independence of all of Portugal's African provinces.

The first provisional coalition government came to power in May 1974, with Gen. António Sebastião Ribeiro de Spínola, whose book *Portugal and the Future* had played a key role in focusing antiwar sentiment among the military, as president. In September 1974, after a power struggle with the leftist forces, Gen. Spínola resigned and was replaced by Gen. Francisco da Costa Gomes. Following an unsuccessful right-wing coup attempt in March 1975, Gen. Spínola was forced to flee the country, along with a number of officers. The continued dissension between right and left—and between Communist and Socialist factions on the left—was evidenced by the numerous provisional governments that followed the coup. In April 1975, general elections were held for a Constituent Assembly, whose task was to draw up a new constitution. Legislative elections were held in April 1976 and presidential elections in June. Gen. António dos Santos Ramalho Eanes was elected president, and the leader of the Portuguese Socialist Party, Mário Alberto Nobre Lopes Soares, became prime minister. Mainly as a result of policy differences within the governing coalition, this administration fell in July 1978 and was replaced by a caretaker cabinet.

After a succession of different coalitions, the Socialist Party won a 35% plurality in the parliamentary elections of April 1983, and Soares was again named prime minister, forming a coalition government with the center-right Social Democratic Party (Partido Social Democratico—PSD). Political turbulence increased after the election, and in 1984, urban terrorism appeared. In the following year, Portugal entered the EC, boosting the economy. Political instability continued, however, and a general election was called in October 1985. The vote brought the PSD to power with a slim plurality; Prof. Aníbal Cavaço Silva was able to form a minority government. In 1986, four candidates ran for president; none was able to win a majority, and in the ensuing runoff election, former Prime Minister Soares won a narrow victory to become the nation's first civilian president in 60 years. In 1987, the government lost a vote of confidence, and Soares called a general election; the PSD under Silva won a majority in the Assembly, achieving the first such government since democracy was restored in 1974.

The PSD was returned to power in 1991 and Mário Soares was reelected president for a second five-year term on 13 January 1991. Economic recession, government deficits, and regional development initiatives were major concerns in the 1990s.

Following the success of the Socialist Party (Partido Socialista—PS) in the legislative elections held in October 1995, Socialist Jorge Sampaio defeated Silva to succeed Soares as president on 14 January 1996. (Sampaio won reelection for a second five-year term in January 2001.) Antonio Guterres was reappointed prime minister. The goal of the Guterres government was to prepare Portugal for entry into the European economic and monetary union. Successive austerity measures were legislated, with the support of the center-right PSD, to guarantee Portugal's participation in the euro zone (this took place in 1999). The socialist government at the same time presided over a remarkable economic recovery after 1996. Thanks to strong economic growth and a real drop in unemployment, the PS retained power after the 10 October 1999 As-

sembly elections. Its program for the succeeding four years was to speed up Portugal's economic and bureaucratic modernization in order to attract investment and promote export-led growth.

The Socialist government's ability to manage a slowing economy deteriorated in Guterres' second term, and the PS suffered a major defeat in local elections held in December 2001. Guterres resigned, and early elections were held in March 2002. They resulted in a change in government, with the center-right PSD forming a coalition with the conservative Popular Party. PSD leader José Manuel Durão Barroso was named prime minister. Durão Barroso experienced his own troubles with the economy, as Portugal headed into a recession at the end of 2002 and into 2003. Portugal's economy was forecast to grow by 0.4% in 2003, the worst performance in the euro currency zone. As well, Portugal's budget deficit in 2002 was far above the 3% of GDP limit established by the EU's Growth and Stability Pact, putting it in jeopardy of punitive sanctions from the EU. In 2005, GDP growth was forecast at just 0.5%, and the budget deficit was 6.8% of GDP.

Portugal's overseas possession, Macau, was turned over to Chinese administration on 20 December 1999. Portugal supported independence for its former colony of East Timor; this was achieved in May 2002. Portugal took steps to normalize relations with Indonesia following the independence of East Timor.

Barroso supported the United States in its war in Iraq which began in 2003. The prime minister faced criticism from within parliament and among the Portuguese electorate for his stance. In July 2004, Barroso resigned as prime minister to become president of the European Commission. Pedro Santana Lopes, his successor as leader of the PSD, formed a new government. Four months into Lopes's government, President Sampaio called for early elections amidst growing public dissent over the center-right government's inability to tackle the country's economic problems. The general elections were held in February 2005; the Socialists swept to victory and José Sócrates became prime minister. The Socialists secured their first absolute majority in parliament since democracy returned to Portugal in 1974. Sócrates said his primary objective would be to boost the economy by investing in training and technology. His government had to face the task of bringing the budget deficit under control and putting a stop to rising unemployment.

The government declared a national calamity in August 2003 as forest fires swept across vast areas of woodlands; an area the size of Luxembourg was lost to the fires. At least 18 people were killed, and the damages were estimated at €1 billion. Portugal was plagued by deadly wildfires once again in August 2005. They were said to be the worst in recent times. Portugal appealed to the EU for emergency financial aid to cover the costs to farmers of lost harvests in the wake of the fires.

Presidential elections were held on 22 January 2006. Social Democratic Party candidate and former Prime Minister Aníbal Cavaco Silva won with 50.54% of the vote. Independent candidate Manuel Alegre Duarte came in second with 20.74% of the vote.

### 13 GOVERNMENT

A constitution made public on 9 April 1975 and effective 25 April 1976 stipulated that the Armed Forces Movement would maintain governmental responsibilities as the guarantor of democracy and defined Portugal as a republic "engaged in the formation of a classless society." The document provided for a strong, popularly elect-

ed president, empowered to appoint the prime minister and cabinet. This constitution was substantially revised in 1982 and later in 1989; the most important new provisions were the elimination of the military Council of the Revolution and the limitation of presidential power. The new government system is parliamentary.

According to the constitution as amended (further amendments were added in 1992, to accommodate the Maastricht Treaty on European Union; in 1997, to allow referendums; and in 2001, to facilitate extradition), the president is elected by popular vote for a five-year term. The president appoints the prime minister and, at the prime minister's proposal, a Council of Ministers. A Council of State advises the president. The main lawmaking body is the unicameral Assembly of the Republic, the 230 members of which are directly elected to four-year terms, subject to dissolution. Suffrage is universal from age 18.

## 14 POLITICAL PARTIES

Under the Salazar regime, although the constitution did not prohibit political activity, the National Union (União Nacional) was the only political party represented in the legislature. Candidates of the old Center parties, which had been active prior to 1926–28, were allowed to participate in national elections starting in 1932, although none were ever elected.

After the 1974 revolution, several right-wing parties were banned, and various left-wing parties that had functioned underground or in exile were recognized. Among these was the Portuguese Communist Party (Partido Comunista Português—PCP), which was founded in 1921 and is Portugal's oldest political party. It is especially strong among industrial workers and southern farm workers. The government also recognized the Portuguese Socialist Party (Partido Socialista Português—PSP), founded in exile in 1973, and the Popular Democratic Party (Partido Popular Democrático—PPD), formed during the Caetano regime; both the PSP and the PPD favored the establishment of a Western European-style social democracy. Tied to the policies of the Caetano regime was the Social Democratic Center (Centro Democrático Social—CDS), founded in 1974, which held its first conference in January 1975 and became a target for left-wing disruptions. In June 1976, Gen. António Ramalho Eanes, the army chief of staff, who was supported by the major non-communist parties, won election as Portugal's first president.

In 1979, the right-of-center Democratic Alliance (Aliança Democrática—AD) was formed by the Social Democratic Party (Partido Social Democrático—PSD), founded in 1974; the CDS; and the People's Monarchist Party (Partido Popular Monárquico—PPM). The leftist United People's Alliance (Aliança Povo Unido), also formed in 1979, included the People's Democratic Movement (Movimento Democrático Popular—MDP), dating from 1969, and the PCP.

The Republican and Socialist Front (Frente Republicana e Socialista—FRS), formed in 1980, consists of the PSP, the Union of the Socialist and Democratic Left (União da Esquerda Socialista Democrática—UESD), founded in 1978, and Social Democratic Independent Action (Acção Social Democrata Independente—ASDI), founded in 1980. The People's Democratic Union (União Democrática Popular—UDP), dating from 1974, comprises political groups of the revolutionary left.

In October 1985, former President Eanes's centrist Democratic Renewal Party (Partido Renovador Democrático—PRD) entered the ballot for the first time, taking 18% of the vote. In 1991, the seats were distributed as follows: PSO, 135; PSP, 72; CDU, 17; Center Democrats, 5; National Solidarity, 1. The latter was formed in 1990 to address the needs of pensioners.

In the legislative elections of 10 October 1999, the seats were distributed as follows: PS, 114; PSD, 83; CDU, 17; CDS/PP, 15, and Left Bloc, 2. Antonio Manuel de Oliveira Guterres was reappointed prime minister. The first PS victory in October 1995 carried through to the presidential elections of 14 January 1996, when Jorge Sampaio was elected president, with 53.8% of the vote to Aníbal Silva's 46.2%.

Guterres ruled during a downturn in the global economy in his second term, and in December 2001 he resigned following a defeat for the PS in municipal elections. The PSD, led by José Manuel Durão Barroso, won 40.1% of the vote and took 105 seats in parliament in the 17 March 2002 elections, to the PS's 37.9% and 96 seats. The Popular Party (PP) won 8.8% of the vote and secured 14 seats; the PSD formed a coalition government with the PP. Also winning seats were the CDU (Unitarian Democratic Coalition, comprised of the Portuguese Communist Party and the Greens), 7% of the vote and 12 seats; and the Left Bloc (BE—comprised of the communist Democratic People's Union, the Revolutionary Socialist Party, and the extreme left party Politics XXI), 2.8% of the vote and 3 seats.

Sampaio called for early legislative elections in December 2004 because he lacked confidence in the governing center-right government of Pedro Santana Lopes (who became prime minister in July 2004 after Barroso stepped down to become president of the European Commission). The elections were held in February 2005. The results were as follows: PS, 45.1% of the vote (121 seats); PSD, 28.7% (75 seats); CDU, 7.6% (14 seats); PP, 7.3% (12 seats); BE, 6.4% (8 seats). The next elections were scheduled for February 2009.

## 15 LOCAL GOVERNMENT

Portugal is grouped into districts, including 18 on the mainland and the autonomous regions of the Azores and Madeira islands. Each district has a governor, appointed by the minister of the interior, and an assembly. There are more than 300 municipalities, subdivided into parishes.

## 16 JUDICIAL SYSTEM

Justice is administered by ordinary and special courts, including a Constitutional Tribunal; the Supreme Court of Justice in Lisbon, consisting of a president and some 60 judges; five courts of appeal, at Lisbon, Porto, Coimbra, Évora and Guimarães; courts of first instance in every district; and special courts. The jury system was reintroduced in 1976, but it is used only when requested by either the prosecutor or the defendant.

The judiciary is independent and impartial. Citizens enjoy a wide range of protections of fundamental civil and political rights which are outlined in the constitution with specific reference to the Universal Declaration of Human Rights. An Ombudsman, elected by the Assembly of the Republic (legislature) to a four-year term, serves as the nation's chief civil and human rights officer.

The legal system is based on the civil law system. Portugal accepts compulsory jurisdiction of the International Court of Justice with reservations.

## 17 ARMED FORCES

As of 2005, the total armed forces of Portugal numbered 44,900 active personnel. Reservists numbered 210,930 for all services. The army had 26,700 personnel, with equipment that included 187 main battle tanks, 40 reconnaissance vehicles, 353 armored personnel carriers, and over 350 artillery pieces. The navy had 10,950 active members, including 1,980 marines. The navy operated two tactical submarines, six frigates, and 29 patrol/coastal vessels. The air force had 7,250 active personnel and was equipped with 50 combat capable aircraft, including 19 fighters, two reconnaissance and six maritime patrol aircraft. Paramilitary police and republican guards numbered 47,700. The United States maintains a military presence with 1,008 personnel. Armed forces personnel are deployed to eight different countries either in a support role or as part of UN, European Union or NATO missions. The 2005 defense budget totaled \$2.43 billion.

## 18 INTERNATIONAL COOPERATION

Portugal joined the United Nations on 14 December 1955 and participates in ECE and several nonregional specialized agencies, such as the FAO, IAEA, the World Bank, ILO, UNESCO, UNIDO, and the WHO. The nation is one of the 12 original signatories to NATO. Portugal is a member of the WTO, the OECD, the African Development Bank, the Asian Development Bank, the Council of Europe, the Euro-Atlantic Partnership Council, the European Bank for Reconstruction and Development, the OSCE, and the Western European Union. Portugal joined the European Union in 1986. It also has observer status in the OAS and the Latin American Integration Association (LAIA).

Portugal has offered support to UN missions and operations in Kosovo (est. 1999), East Timor (est. 2002), and Burundi (est. 2004).

Portugal belongs to the Australia Group, the Zangger Committee, the European Organization for Nuclear Research (CERN), the Nuclear Suppliers Group (London Group), the Nuclear Energy Agency, and the Organization for the Prohibition of Chemical Weapons. In environmental cooperation, Portugal is part of the Basel Convention, Conventions on Biological Diversity and Air Pollution, Ramsar, CITES, the London Convention, International Tropical Timber Agreements, the Kyoto Protocol, the Montréal Protocol, MARPOL, and the UN Conventions on the Law of the Sea, Climate Change and Desertification.

## 19 ECONOMY

Manufacturing and construction together accounted for 30.2% of Portugal's GDP in 2004. The largest industries are clothing, textiles, and footwear; food processing; wood pulp, paper, and cork; metal working; oil refining; chemicals; fish canning; wine; and tourism. Agriculture, forestry, hunting and fishing employs about 12.5% of the work force (down from 26.2% in 1971) but contributed about 5.9% of the GDP in 2004. The percent of the labor force in services rose from 39% in 1971 to 52.4% in 2000, accounting for about 63.9% of GDP in 2004. Traditionally, productivity has been hampered by low investment and a lack of machinery and fertil-

izers. The economy experienced robust growth after 1993, however, primarily due to increased investment and domestic consumption, both in turn traceable to advantages Portugal gained through its entry into the European Community in 1986. In 1986, Portuguese income was about 52% of the EU average; by 2002, GDP per capita on a purchasing power parity basis had risen to over 70% of the EU average. In 2005, it was expected to be 65.1%. Economic growth, which had been above the EU average for most of the 1990s, fell back during 2001–04.

From the end of 1973 through 1983, the energy crisis and insufficient liquidity jeopardized economic growth, which dropped still further following the overthrow of the Caetano regime in April 1974. GNP growth in 1974 fell to 2.3% from 8.1% in the previous year. The decline was caused by a sharp drop in new offers of investment and credit from abroad (investors feared rising Communist influence and government takeovers of private firms), coupled with a decline in tourism and a massive increase in unemployment primarily resulting from the return of Portuguese settlers and soldiers from newly independent Angola. During the late 1970s, Portugal adopted an austerity program and succeeded in lowering inflation to 16.6% and increasing GDP growth to 5.5% in 1980. However, adverse interest and exchange rates and a severe drought during 1980–81 resulted in a resurgence of inflation (an estimated 22.5% in 1982) and sluggish economic growth (1.7% in 1981 and 2% in 1982).

In mid-1983, the Soares government implemented an IMF stabilization plan of drastic internal tightening, which brought steady economic improvement. The persistent current account deficits ended in 1985, partially as a result of the decline in world oil prices and entry into the EC. The Silva government's economic liberalization emphasized competitiveness and accountability. From 1987 to 1999 Portugal was the net recipient of financial inflow from the EU of about \$27 billion, most disbursed through the European Regional Development Fund. The money was spent on infrastructural improvements, most notably the highway system. With the accession into the EU of 10 new central and east European countries in 2004, Portugal lost its historic competitive advantage in Europe due to low labor costs in the new EU members.

Through the 1990s, until the beginning of 2001, Portugal enjoyed strong economic growth generally above the EU average. The economy grew 4.2% in 1998, at 3.1% in 1999, and at 3.3% in 2000. Unemployment was at 5% in 1998, but dropped to 4.5% in 1999 and then to 4% in 2000. Even as growth slowed to 2.2% in 2001, unemployment in Portugal remained below most of its neighbors, at 4.2%. In 2002, growth slowed to 0.4% and unemployment increased to 5.05%. Inflation in Portugal has been moderate but growing, increasing from 2.4% in 1998 to 4.6% in 2000. Consumer prices rose 4.4% in 2001 and about 3.7% in 2002. The Socialist government pledged its dedication both to meeting the Maastricht monetary convergence criteria and to increasing social spending, including provision of a guaranteed minimum income. This policy bore fruit when Portugal qualified for the first round of entry into the Economic and Monetary Union (EMU) in 1999. As of January 2002, the euro became Portugal's only official currency. The government's privatization program reduced the public sector to 7.5% of GDP and 2.6% of employment by the end of 1999 from 19.7% of GDP and 5.5% of employment in 1988.

In 2003, the economy was officially in a recession, with the GDP declining by 1.1%. Unemployment shot up to 6.5%. In 2004, real GDP growth was in the positive figures once again, albeit estimated at a paltry 1.1%. Unemployment that year remained at 6.5%. After weak growth in 2005, GDP growth was expected to rise modestly in 2006, to 1%, and to 1.6% in 2007, as domestic demand picked up. Inflation was forecast to remain comparatively low in 2006–07 (the inflation rate stood at 2.4% in 2004), although increases in the rate of value-added tax (VAT) and in excise duties in mid-2005—in addition to high oil prices—was forecast to lead to a sharp increase in inflation in early 2006.

The unofficial, or underground, economy is estimated at 20% of official GDP, about the same level as that of Spain and Italy.

## 2<sup>0</sup> INCOME

The US Central Intelligence Agency (CIA) reports that in 2005 Portugal's gross domestic product (GDP) was estimated at \$194.8 billion. The CIA defines GDP as the value of all final goods and services produced within a nation in a given year and computed on the basis of purchasing power parity (PPP) rather than value as measured on the basis of the rate of exchange based on current dollars. The per capita GDP was estimated at \$18,400. The annual growth rate of GDP was estimated at 0.7%. The average inflation rate in 2005 was 2.4%. It was estimated that agriculture accounted for 5.2% of GDP, industry 28.9%, and services 65.9%.

According to the World Bank, in 2003 remittances from citizens working abroad totaled \$3.024 billion or about \$291 per capita and accounted for approximately 2.0% of GDP.

The World Bank reports that in 2003 household consumption in Portugal totaled \$74.27 billion or about \$7,141 per capita based on a GDP of \$147.9 billion, measured in current dollars rather than PPP. Household consumption includes expenditures of individuals, households, and nongovernmental organizations on goods and services, excluding purchases of dwellings. It was estimated that for the period 1990 to 2003 household consumption grew at an average annual rate of 2.8%. In 2001 it was estimated that approximately 29% of household consumption was spent on food, 7% on fuel, 2% on health care, and 19% on education.

## 2<sup>1</sup> LABOR

The labor force in Portugal in 2005 totaled an estimated 5.52 million. As of 2003, the services sector employed 55.8% of the country's workforce, with industry at 32.6% and agriculture at 12.7%. In 2005, the estimated unemployment rate was 7.3%.

As of 2005, workers in Portugal can form and join unions, can engage in collective bargaining and strikes. About 35% of the nation's workforce was unionized as of 2005. Armed forces and police personnel are banned from striking, but they have unions and have legal mechanisms to settle grievances. The government approves all collective bargaining contracts and regulates such matters as social insurance, pensions, hours of labor, and vacation provisions. Strikes are generally resolved quickly through negotiations.

A minimum wage was established in 1975. In 2005, the minimum monthly salary was about \$449, which is not sufficient to provide a decent standard of living to a worker and family. However, rent controls and subsidized food and utilities help increase the standard of living. In addition, most workers earn more than

this amount. The maximum legal workday is 10 hours, with the workweek set at 40 hours with a minimum of 12 hours between workdays. Overtime is limited to two hours per day up to 200 hours annually. Minimum standards of occupational safety and health are set by law, but they are not adequately enforced and workplace accidents do occur, particularly in the construction industry. The minimum working age is 16 years.

## 2<sup>2</sup> AGRICULTURE

In 2003, 25.3% of the land was considered arable. Of the 2.3 million hectares (5.7 million acres), 74% was cultivated with seasonal crops and 26% was under permanent crops. In 2003, the gross agricultural product accounted for 4% of GDP. Estimates of agriculture production in 2004 included potatoes, 1,250,000 tons; tomatoes, 1,100,000 tons; corn, 798,000 tons; wheat, 251,000 tons; olives, 270,000 tons; rice, 148,000 tons; and rye, 27,000 tons. Production of olive oil reached 30,000 tons in 2004/05. Wine, particularly port and Madeira from the Douro region and the Madeira islands, is an important agricultural export; production totaled 724 million liters in 2004. Portugal is the world's ninth-largest producer of wine, although Portugal's wines are mostly unknown internationally apart from port and rosé. Under the influence of EU policies, vineyard areas have been reduced in recent years. In 2004, the value of agricultural products imported by Portugal exceeded that of agricultural exports by \$3.36 billion.

According to government estimates, about 900,000 hectares (2,200,000 acres) of agricultural land were occupied between April 1974 and December 1975 in the name of land reform; about 32% of the occupations were ruled illegal. In January 1976, the government pledged to restore the illegally occupied land to its owners, and in 1977, it promulgated the Land Reform Review Law. Restoration of illegally occupied land began in 1978.

Agriculture is the main problem area of the economy; yields per hectare are less than one-third of the European average, with a severe drought in 1991/92 only exacerbating the problem. The situation has actually been deteriorating since the mid-1970s, with many yields falling and arable and permanent crop areas declining. By 1999, crop output was only 87% of what it had been on average during 1989–91. However, during 2002–04, crop output was down 1.8% from 1999–2001. With the reform of the EU's Common Agriculture Policy (CAP), a significant reduction in the number of producers through consolidation (especially in the north) will result in the end of traditional, subsistence-like based agriculture. Between 1995 and 2003, the number of agricultural holdings decreased from 450,600 to 359,200, while the value of crop output increased from €3.7 billion to €4.33 billion during that time.

## 2<sup>3</sup> ANIMAL HUSBANDRY

The Alentejo region is Portugal's grazing heartland. In 2005, Portuguese livestock population estimates included 5,000,000 sheep, 2,248,000 hogs, and 1,443,000 head of cattle. There were 547,000 goats, 125,000 donkeys, 40,000 mules, 17,000 horses, 35,000,000 chickens, and 7,000,000 turkeys in 2005. Mules and donkeys, as well as horses and oxen, often provide draft power for the farms. The main districts for cattle are northern and north-central Portugal; most of the sheep, goats, and pigs are raised in the central and southern sections. In 2005, Portugal's meat production included an estimated 321,000 tons of pork, 242,000 tons of poultry

meat, 119,500 tons of beef and veal, and 22,100 tons of mutton. Other production estimates for 2005 included 2,076,000 tons of milk, 132,450 tons of eggs, 75,600 tons of cheese, and 26,000 tons of butter.

## 24 FISHING

Three main fields of activity make up the Portuguese fishing enterprise: coastal fishing, with sardines as the most important catch; trawl fishing on the high seas; and cod fishing on the Grand Banks, off Newfoundland. In 2004, the Portuguese fishing fleet consisted of 10,089 vessels with 112,978 GRT. National fish landings totaled 210,526 tons in 2004, of which aquaculture accounted for 3.6%. Dominant species are sardines, mackerel, red fish, scabbardfish, and octopus. These species accounted for nearly half the landings. Virtually all the total catch is sold fresh, but small amounts of sardines and octopus are frozen. The total catch fell from 375,413 tons in 1973 to 247,596 tons in 1983 but increased to 325,349 tons in 1991. The average annual catch during 1990–94 was 295,007 tons, 318,600 tons during 1995–99, and 205,611 tons during 2000–04. The annual catch declined since the 1990s because Portugal was affected by internationally-set limits (Total Allowable Catches) that restrict fishing access for certain species in the international waters of the North Atlantic and by EU fishing quotas. The fishing potential has also been affected by a reduction in the national fleet in association with EU fleet reduction incentives. The Portuguese fishing fleet was reduced by 40% during 1990–2000. There was an additional 5% reduction in fleet tonnage during 2000–04.

## 25 FORESTRY

With about 40% of the total land area forested, Portugal is an important producer of forestry products. The country is the world's leading producer of cork, harvested exclusively from cork oak (*Quercus suber*) found predominantly in the Mediterranean region. Portugal ordinarily supplies around 175,000 tons of cork per year (about half of world output) from some 725,000 hectares (1,791,000 acres) of cork forests. Portugal is also an important producer of resin and turpentine. Roundwood production in 2004 was 9,672,000 cu m (341.4 million cu ft), with a sawn wood output of 1,383,000 cu m (48.8 million cu ft). Other commodities produced that year included wood pulp, 1,935,000 tons; paper and paperboard, 1,536,000 tons; and particleboard and other wood-based panels, 1,215,000 cu m (42.9 million cu ft). In 2004, timber and other forest product exports amounted to \$1,684 million. Wine stoppers account for 55% of cork export value. Cork demand has fallen in recent years, and production is limited by the botanical fact that a single tree can only be stripped once every nine years. Eucalyptus logs (the crux of the pulp industry) are exported as well; reforestation of eucalyptus is a major national controversy, with opponents charging that it displaces traditional farmers and damages the soil and water table. Pine accounts for most lumber exports.

## 26 MINING

Portugal's mineral wealth is significant but the deposits are scattered and are not easily exploitable on a large scale. The country's most important metallic mineral resources are copper, tin and tungsten. Portugal is a leading producer of mined copper in the European Union (EU), as well as being an important producer of

dimension stone and tungsten concentrates. Minerals were one of the country's dynamic industrial sectors, mainly because of the discovery and development of the Neves-Corvo copper and tin deposits. The Panasqueira mine was one of the world's largest producers of tungsten concentrates.

In 2003, the output of mined copper (metal content) was 77,581 metric tons, up slightly from 77,227 metric tons in 2002. Output of mined tungsten (metal content) was 715 metric tons, compared to 693 metric tons in 2002. Tin mine output (metal content) in 2003 totaled 354 metric tons, down from 574 metric tons in 2002. Production of iron ore and concentrates (gross weight) in 2003 totaled was estimated at 14,000 metric tons, unchanged from 2002. Portugal also produced white arsenic, manganese, silver, uranium, anhydrite, hydraulic cement, refractory clays, diatomite, feldspar, gypsum, kaolin, hydrated lime, quicklime, lepidolite (a lithium mineral), nitrogen, pyrite and pyrrhotite (including cuprous), rock salt, sand, soda ash, sodium sulfate, stone (basalt, dolomite, diorite, gabbro, granite, both crushed and ornamental, graywacke, calcite marl limestone, marble, ophite, quartz, quartzite, schist, slate, and syenite), sulfur, and talc. Marble, mainly from the Evora District, was the most valuable of the stone products. A new deposit, at the Aljustrel mine/mill complex, encompassing five massive sulfide deposits, could be brought into production relatively quickly as a low-cost zinc producer; the most significant deposit, at Feitais, had 12 million tons of proven and probable minable zinc reserves with an average grade of 5.67% zinc, 1.7% lead, and 64 grams per ton of silver, and 1.6 million tons of proven and probable copper ore reserves with an average grade of 2.2% copper, 0.97% zinc, and 14 grams per ton of silver.

The southern Iberian Peninsula, known as the Iberian Pyrite Belt (IPB), was one of the most mineralized areas of Western Europe and was geologically very complex. The IPB's internationally well-known volcanogenic massive sulfide (VMS) deposits, in the southwestern part of the peninsula, dated to the Upper Devonian and the Lower Carboniferous ages. Clusters of deposits occurred around individual volcanic centers, and the largest individual deposit located to date may have held an original reserve of 500 million tons, out of IPB's total resource of 1,725 million tons. Sulfide deposit resources in 1999 were 1,100 million tons.

The government continued its privatization program and was proceeding with legislation to privatize many public companies, part of a broader program to make the economy more market driven. The structure of the mineral industry could change in the near future because of significant mining exploration by several foreign companies, particularly for copper, gold, kaolin, lead, lithium, pyrites, and tin. The IPB was the prime area for exploration activity, and had an above-average potential for success based on an unusually high number of large VMS deposits.

## 27 ENERGY AND POWER

Portugal operates two refineries, which allows the country to meet a portion of its refined petroleum product needs. However, the country must import all of the crude oil it refines, as well as additional amounts of refined petroleum products, in addition to all of the natural gas and coal the country consumes.

In 2002, Portugal's two refineries, one at Sines and the other at Porto, had a combined output of 271,740 barrels per day. However, domestic demand for refined oil in that year averaged 343,160

barrels per day. Imports of refined and crude petroleum averaged a combined 355,580 barrels per day, although the country did re-export an average of 28,790 barrels per day.

Natural gas imports and consumption for 2002 totaled 109.83 billion cu ft and 109.26 billion cu ft, respectively. Demand for coal in 2003 was met entirely by imports. Consumption of coal that year totaled 5.9 million short tons, most of which was used to generate electricity.

Portugal's electric generating capacity in 2002 totaled 10.394 million kW, of which hydroelectric capacity accounted for 3.963 million kW, and conventional thermal capacity accounting for 6.217 million kW. Geothermal/other capacity accounted for 0.214 million kW. Total output of electric power in 2002 came to 43.439 billion kWh, of which conventional thermal sources provided 33.633 billion kWh, and hydroelectric 7.722 billion kWh. Geothermal/other provided 2.084 billion kWh. Demand for electric power totaled 42.297 billion kWh.

## 28 INDUSTRY

Industry (including construction, energy, and water) employs about one-third of the labor force, and its contribution to the national economy has grown significantly in recent decades. It accounted for 30.2% of GDP in 2004. Industrial production in 2004 had maintained a 1.1% growth rate over 2003. Portuguese industry is mainly light; the development of heavy industry has been hampered by a shortage of electric power. Textiles—especially cottons and woollens—are the oldest and most important of Portugal's manufactures. Other principal industries are automotive assembly, electronics, glass, porcelain, and pottery, footwear, cement, cellulose and paper, rubber and chemicals, cork and cork products, and food industries (mainly canned fish). Small artisan industries, such as jewelry and homespun and hand-embroidered clothing, are of local importance.

Manufactured goods in the early 2000s included cement, wood pulp, crude steel for ingots, paper and paperboard, and radios and televisions. In 2005, footwear, textiles, wood and cork, chemicals, paper, and food and beverages (wine) were the central industries. In addition, the country has increased its role in Europe's automotive sector, and has a fine mold-making industry.

Foreign competition has cut into Portugal's textile industry. Following the expiration of the World Trade Organization's long-standing system of textile quotas at the beginning of 2005, the EU signed an agreement with China in June 2005, imposing new quotas on 10 categories of textile goods, limiting growth in those categories to between 8% and 12.5% a year. The agreement runs until 2007, and was designed to give European textile manufacturers time to adjust to a world of unfettered competition. Nevertheless, barely a month after the EU-China agreement was signed, China reached its quotas for sweaters, followed soon after by blouses, bras, T-shirts, and flax yarn. Tens of millions of garments piled up in warehouses and customs checkpoints, which affected both retailers and consumers.

## 29 SCIENCE AND TECHNOLOGY

In 1996, Portugal had 18 scientific and technological learning societies, and 20 scientific and technological research institutes. The leading scientific academy is the Lisbon Academy of Sciences, founded in 1779. In 1996, Portugal had 27 universities and col-

leges offering courses in basic and applied sciences. Attached to the University of Lisbon is the Museum and Laboratory of Mineralogy and Geology, founded in 1837. In 1987–97, science and engineering students accounted for 36% of university enrollment. In 2000 (the latest year for which data was available) of all bachelor's degrees awarded, 17.5% were for the sciences (natural, mathematics and computers, engineering). Total government expenditures on research and development (R&D) in 2001 totaled \$1.548.302 million, or 0.84% of GDP. Of that amount, 61% came from government sources, while the business sector accounted for 31.5%. In 2002, R&D spending amounted to \$1,732.108 million, or 0.93% of GDP. In that same year, there were 1,842 scientists and engineers engaged in R&D per million people. High technology exports in 2002 totaled \$1.628 billion, or 7% of the country's manufactured exports.

## 30 DOMESTIC TRADE

Lisbon and Porto are the two leading commercial and distribution centers. Larger retail stores, shopping malls, and supermarkets have become well-established in many areas. Franchising has also gained ground, particularly in the clothing and fast-food markets. Direct marketing through television and mail order sales has grown considerably. The most common advertising media are newspapers, outdoor billboards, radio, and television; movie theaters also carry advertisements.

The usual business hours are from 9 AM to 6 PM, Monday through Friday. Banking hours are generally 8:30 AM to 2:45 PM, Monday through Friday. An increasing number of shopping centers in urban areas have more flexible hours, including hours on Sundays.

## 31 FOREIGN TRADE

Portugal's foreign trade balance has regularly shown a heavy deficit, which it finances through net receipts from tourism, remittances from Portuguese workers abroad, and net transfers from the EU. In 2004, merchandise exports were an estimated \$37.9 billion, and imports totaled \$56.2 billion, which widened the trade deficit to \$18.2 billion, up from \$13.4 billion in 2003, as a result of stronger domestic demand.

SOURCE: 2003 *International Trade Statistics Yearbook*, New York: United Nations, 2004.

In 2004, Portugal's exports consisted of capital goods (34.8% of total exports), consumer goods (32.4%), raw materials and intermediate products (30.2%), and energy products (2.6%). The major imports in 2004 consisted of capital goods (33.9% of all imports), raw materials and intermediate products (30.5%), consumer goods (24.6%), and energy products (11%). Portugal's leading markets in 2004 were Spain (24.9% of all exports), France (14%), Germany (13.5%), the United Kingdom (9.6%), the United States (6.1%), and Italy (4.3%). In all, 79.4% of all exports were traded with the 25 EU member nations. Portugal's leading suppliers in 2004 were Spain (29.3% of all imports), Germany (14.3%), France (9.3%), Italy (6.1%), the United Kingdom (4.6%), and the United States (2.4%). In total, 76.6% of all imports came from the 25 EU member nations. Portugal received 5% of its imports from OPEC nations.

### 32 BALANCE OF PAYMENTS

Despite chronic trade deficits, Portugal until 1973 managed to achieve a balance-of-payments surplus through tourist revenues and remittances from emigrant workers. With the economic dislocations of 1974, net tourist receipts fell 30%; the trade deficit almost doubled; and emigrant remittances stagnated—thus, the 1973 payments surplus of \$255.7 million became a \$647.7 million deficit in 1974. Emigrant remittances grew steadily between 1976 and 1980, when they peaked at \$2,946 million. Because of this, Portugal's balance of payments improved and in 1979 even showed a surplus of \$761 million. Subsequently, increasing trade deficits resulted in balance-of-payments deficits that reached \$3.2 billion in 1982. By 1985, however, the deficit had become a surplus of \$0.4 billion, which rose to \$1.1 billion in 1986; the chief reason was the weakening dollar, which boosted the value of tourism earnings and remittances. The 1990 Portuguese external payments surplus stabilized at the previous year's record level of nearly \$4 billion. After a few years of surplus boom, mainly due to the enor-

mous influx of foreign capital and transfers to Portugal following EC membership in 1986, measures were taken in July 1990 to restrict foreign credit and investment thereby helping the authorities get better control over monetary aggregates. These measures, along with the hiatus in international investment caused by the 1990–91 Persian Gulf crisis and some deterioration in the merchandise trade account contributed to halting the growth of the total nonmonetary balance.

The country's large current account deficit was 7.5% of GDP in 2002. Although foreign direct investment (FDI) in new manufacturing projects, such as the automotive and electronics sectors, increased in the 1990s, in the early 2000s FDI flowed to lower-cost manufacturing locations in central and eastern Europe, away from Portugal. In 2004, the current account deficit grew to \$13.7 billion (8.1% of GDP), up from \$8.4 billion in 2003. The current account deficit was expected to widen in 2005, reflecting deteriorating export competitiveness and slower external demand, but lower oil prices from the second half of 2006 were predicted to help narrow the deficit slightly in 2006–07.

### 33 BANKING AND SECURITIES

All 22 banks in Portugal, except for three foreign-owned ones (Banco do Brasil, Credit Franco-Portugais, and the Bank of London and South America), were nationalized in 1975. A 1983 law, however, permitted private enterprise to return to the banking industry. The Bank of Portugal, the central bank (founded in 1846), functions as a bank of issue, while the European Central Bank controls monetary policy.

During the late 1990s, Portugal's banking industry underwent significant restructuring due to foreign investment and consolidation. A major series of consolidations in 1996 left Banco Comercial Português (BCP), Banco Pinto and Sotto Mayor, and Banco Português de Investimento as the three largest private banks. Further consolidation came in 1999 when Spain's Banco Santander Central Hispano (BSCH) merged with Champalimaud. Fearing increased Spanish influence in the Portuguese banking industry, the Portuguese government sought to block the deal and the dispute appeared headed for the European Court. Ultimately, Portugal's finance minister, Joaquim Pina Moura, forged a compromise in which BSCH acquired two banks in the Champalimaud group.

The International Monetary Fund reports that in 2001, currency and demand deposits—an aggregate commonly known as M1—were equal to \$47.0 billion. In that same year, M2—an aggregate equal to M1 plus savings deposits, small time deposits, and money market mutual funds—was \$111.7 billion.

Portugal's two stock exchanges, located in Lisbon and Porto, were closed after the coup of April 1974. The Lisbon exchange reopened in 1976, and the Porto exchange in 1981. In January 1992 the market was split into three tiers, of which the first is the major liquid market: this included the 11 firms whose shares are traded regularly and which have a minimum market capitalization of €500 million. Trading outside the stock exchanges is still widespread. Into the late 1990s trade on the exchange continued to grow as continued privatization led to greater amounts of Initial Public Offerings (IPOs). As of 2004, there were 56 companies listed on the Euronext Portugal exchange, which had a market capitalization of \$73.404 billion. In 2004, the PSI 20 Index rose 12.6% from the previous year to 7,600.2.

### 3<sup>4</sup> INSURANCE

Portugal's domestic insurance companies were nationalized in 1975. Foreign companies were required to accept government representatives among their directors. A new law, approved in 1983, allowed the private sector to reenter the domestic insurance industry. Almost all Portuguese companies sell life and nonlife insurance, although some specialize in reinsurance only. In the wake of the reprivatization of the insurance industry, many insurance companies have sought alliances with banks. This position, in turn, serves as an impediment to new entrants into the insurance field, particularly from foreign countries. However, the market is opening up and brokers from any European Union (EU) country can operate in Portugal. Third-party auto insurance and workers' compensation are compulsory in Portugal. Contractors, travel agents, insurance brokers and other professionals are also required to carry liability insurance. In 2003, the value of direct insurance premiums written totaled \$10.810 billion, of which life insurance premiums accounted for \$6.122 billion. In that same year, Portugal's top nonlife insurer was Fidelidade-Mundial, which had gross written nonlife premiums of \$998.9 million. The country's leading life insurer, Occidental Vida, that year, had gross written life insurance premiums of \$1,039.9 million.

### 3<sup>5</sup> PUBLIC FINANCE

Portugal's budgets (accounting for the effects of loans and transfers) have been in deficit since 1974. Major factors contributing to the deficits included spending on health and education programs, funding for major public investment projects, and large state-owned enterprise payrolls. To finance the deficit, the government issued bonds in the domestic market, which also serves the monetary policy purpose of absorbing excess liquidity. The government's objective to join the Economic and Monetary Union (EMU) was achieved in 1999. Since then, monetary policy responsibilities have been absorbed by the European Central Bank. Public debt exceeded 3% of GDP in 2001, exceeding EU limits and

opening the country up to sanctions from the rest of the EU. By 2004 it continued to hover around 3%, but was expected to top 6% in 2005. In 2005 the EU ordered the country to reduce deficits, which the government planned to do by raising the value-added tax and cutting spending.

The US Central Intelligence Agency (CIA) estimated that in 2005 Portugal's central government took in revenues of approximately \$78.8 billion and had expenditures of \$90.2 billion. Revenues minus expenditures totaled approximately -\$11.4 billion. Public debt in 2005 amounted to 69.4% of GDP. Total external debt was \$298.7 billion.

### 3<sup>6</sup> TAXATION

The national corporate tax rate in Portugal as of 2005 was 25%, although rates in Madeira were 22.5% and 17.5% in the Azores. In addition, municipalities can levy a 10% surtax on the tax liability, pushing the effective rate to 27.5%. Allowable deductions in calculating taxable corporate income include depreciation, interest payments, executives' salaries, and royalties. Capital gains are taxed at 25%. Dividends paid to parent companies by subsidiaries (owned at least 25% by the payee) are excluded from taxable income to avoid double taxation. Otherwise dividends are taxed at general income tax rates.

The progressive personal income tax schedule has six bands, not including a tax-exempt base. The schedule bands as of 2003 were 15% (up to €4,100); 14% (on the next increment of income to €6,201); 24% (on the next increment to €15,375); 34% (on the next increment to €35,363); 38% (on the next increment to €51,251); and 40% (on the increment of income above €15,375). Social security taxes amount to 23.75% of nominal income. There are also taxes municipal taxes on the value of real estate.

The main indirect tax is Portugal's value-added tax (VAT) introduced 1 January 1986 with a standard rate of 16%, which was raised to 17% as of 1 January 1995 and to 19% as of 6 May 2002. There is also a reduced rate of 5% (applied to basic foodstuffs, water supplies, books, newspapers and periodicals, social housing, some medical equipment and drugs, hotel accommodations, repair and domestic services); an intermediate "parking" rate of 12% (applied to some foodstuffs, catering, and some fuels and lubricants); and exemptions from VAT (for social services, some medical and dental services, waste collection and disposal, transportation services, gold transfers to the central bank, and cremation.). For the Azores and Madeira, the standard VAT rate is 13%, the reduced rate 4% and the parking rate 8%. Other transactions taxes include stamp duties and transfer fees.

### 3<sup>7</sup> CUSTOMS AND DUTIES

Portugal uses the Harmonized Nomenclature and Classification System (HS) to organize imports into tariff categories. Almost all tariffs are levied on an ad valorem basis according to the EU Customs Code, excepting luxury goods and petroleum, which have special higher rates. Portugal adheres to all EU trade policies, including multilateral trade agreements, and conforms to WTO regulations. It also levies a value-added tax (VAT) of up to 21% on most imports, although there is a lower rate of 5%. In Madeira and

the Azores, the lower rates of 4% and 13% apply. The VAT on imports from EU countries is not collected until the product is sold.

### 38 FOREIGN INVESTMENT

The government actively promotes foreign investment as an integral part of its economic development policy, and specifically through a government agency, API (Agency for Investment in Portugal). As a member of the European Union, Portugal abides by the investment rules that govern the rest of the union. New foreign investment legislation was enacted in 1986. The Institute of Foreign Investment (ICEP) is the supervising agency. Foreign investment is permitted in all sectors except ports, water management, rail services, public service telecommunications operators, and the arms industry. Portugal restricts non-EU investment in regular air transport to 49%, and restricts non-EU investment in television operations to 15%. Even in these areas, however, deregulation is under way. The foreign investment code contains liberal profit remittance regulations and tax incentives. The rate of corporation tax was reduced from 30% to 25% in 2004 as part of that year's budget, but rates in most municipalities are higher by some three percentage points due to the effects of local surcharges.

Foreign direct investment (FDI) inflows in Portugal averaged about \$2 billion per year in 1992–95, or 1.6% of GDP. Main investing countries are the United Kingdom, Spain, and France. The financial sector accounted for about 60% of all new foreign investment. In 1998, FDI inflows reached \$3.1 billion, up from \$2.5 billion in 1997, but fell to \$1.2 billion in 1999. FDI inflows soared to \$6.4 billion in 2000, and were still above \$6 billion in 2001, despite the global economic slowdown.

Total FDI inflows into Portugal in 2003 were €852.2 million. Portuguese FDI abroad was in the negative numbers, at -€84.6 million. Portugal invests most heavily in Brazil and Spain, followed by Germany and other EU countries. Low labor costs, combined with unrestricted access to the EU market, have attracted foreign investment in new manufacturing projects, especially in the automotive and electronics sectors. However, FDI has slowed as low-cost manufacturing locations in central and Eastern Europe have become increasingly appealing to investors, especially since the admission of 10 new EU members in 2004. Therefore, Portugal can no longer afford to rely solely upon low wage costs to attract further investment.

### 39 ECONOMIC DEVELOPMENT

In 1975, radical economic transformations were accomplished through a series of decrees that nationalized the domestically owned parts of major sectors of the national economy. These decrees affected the leading banks, insurance companies (representing 99% of insurance companies' capital), petroleum refineries, the transportation sector, the steel industry, and eventually Portugal's leading privately owned industrial monopoly, Companhia União Fabril. At the same time, large-scale agrarian reform measures led to expropriation of many of the country's privately owned large landholdings; other holdings were seized illegally by peasants. In an attempt to stimulate agricultural production, the government decreed a 30% reduction in the price of fertilizer to farm workers and small and medium farmers. When the nationalization and agrarian reform measures met with only limited success, partly because of liquidity problems, an emergency austerity

plan was approved by the Council of Ministers in October 1975. The program included wage and import controls and the reduction of subsidies on consumer goods.

As a result of Portugal's entry into the EC (now EU), the highly protected, unresponsive, and inefficient economy is being transformed. State intervention is being reduced, and the physical infrastructure is being modernized. Privatization began in 1989, with the share of gross domestic product (GDP) for non-financial public enterprises reduced from 17.9% in 1985 to 10.7% in 1991. In 1992, \$3.6 billion was raised as banks, insurance companies, and a 25% interest in Petrogal—the state oil company—were sold. The government estimated that privatized companies would represent half of stock market capitalization by the end of 1994.

In 1996 and 1997, a series of important investments and acquisitions were made by companies such as Sonae and Jernimo Martins, Portugal's leading retail distributors; Cimpor, a cement producer; and Portugal Telecom and Electricidade de Portugal, the last of which was privatized. The big banks were developing new overseas operations as well. The best indicator of Portugal's economic progress was Portugal's acceptance into the European Economic and Monetary Union in 1999.

During the 1990s and into the 2000s, the economy grew at rates well above EU averages; however, growth slowed in 2002–03, and fell below the euro-area average for the first time in close to a decade. In 2002, the external current account deficit remained one of the largest (in relation to GDP) among industrialized countries. The unemployment rate also increased sharply. Nonetheless, an inflow of capital funds has financed infrastructure projects.

In 2001, Portugal became the first country to breach the eurozone's Stability and Growth pact budget deficit target of 3%, with a gap equal to 4.2% of GDP. Portugal's government met the 3% target in 2002 and 2003, but despite a hiring freeze and other measures, the country had a structural budget deficit in 2004 projected at 4.9%. Public spending was expected to equal 47.9% of GDP in 2004. The 2005 budget projected a structural deficit in excess of 3%, and violated the 60% limit on public debt. Due to labor reform legislation, which took effect in early 2004, and corporate and personal tax cuts in 2004 and 2005, the government expected the economy to recover strongly in 2006.

The government is attempting to change Portugal's economic development model from one based on public consumption and public investment to one focused on exports and private investment.

### 40 SOCIAL DEVELOPMENT

A social insurance and social assistance program has been frequently updated since 1935. The program provides old-age, disability, sickness, and unemployment benefits, family allowances, and health and medical care. The system is funded by payroll contributions from employers and employees. The government subsidizes social pensions for those persons not employed. Retirement is set at age 50 for miners, age 55 for fishermen and seamen, and age 65 for other professions. Medical benefits are provided to all residents, and cash sickness and maternity benefits are provided to employees. Maternity benefits of 100% of earnings and benefits are paid for 120 days for all employed persons. Paternity and

adoption benefits are also available. There is a need based family allowance, a special education allowance, and a funeral grant.

Women have full rights and protections under both the constitution and civil code. According to law, women must receive equal pay for equal work. In practice, however, a salary gap still exists between men and women. Spousal abuse and other violence against women are widespread problems and remain underreported. The judicial system is supportive when cases are brought forward. Sexual harassment in the workplace is considered a crime, but only if committed by a superior.

Immigrants from Portugal's former African colonies face social prejudice and discrimination. There were reports of right-wing groups carrying out racially motivated attacks against immigrants and other nonethnic Portuguese. Human rights are generally respected in Portugal. Prison conditions are poor, but the government is engaging in dialogue with human rights organizations on this and other issues.

#### 41 HEALTH

The public health care sector is by far the largest. The country planned to construct 12 new hospital districts, 84 health centers, and 5 technical schools for nurses, and to enlarge or remodel several hospital centers, hospital districts, and maternity wards. The Santa Maria Hospital in Lisbon is the largest hospital in Portugal. The number of physicians in Portugal grew steadily throughout the 1990s. As of 2004, there were an estimated 324 physicians, 374 nurses, 44 dentists, and 84 pharmacists per 100,000 people. Total health care expenditure was estimated at 7.7% of GDP.

As of 2002, the crude birth rate and overall mortality rate were estimated at, respectively, 11.5 and 10.2 per 1,000 people. Approximately 66% of married women (ages 15 to 49) were using contraception. The infant mortality rate decreased from 61 to 5.05 per 1,000 live births between 1968 and 2005. Average life expectancy in 2005 was 77.53 years.

The leading natural causes of death are circulatory disorders, cancer, and respiratory disorders. Children up to one year of age were vaccinated against diphtheria, pertussis, and tetanus, 95%, and measles, 99%. The cancer and heart disease rates in Portugal are well below the industrialized countries average.

The HIV/AIDS prevalence was 0.40 per 100 adults in 2003. As of 2004, there were approximately 22,000 people living with HIV/AIDS in the country. There were an estimated 1,000 deaths from AIDS in 2003.

#### 42 HOUSING

According to the 2001 census, Portugal had about 5,054,922 dwelling units. However, about 65% of all families live in dilapidated structures and nearly 8.5% live in shacks. While the Government Social Housing Program has made some progress in rehousing families into more adequate structures, there are not enough programs to help the households rise above the poverty level. Traditional Portuguese houses are made of brick walls and tile roofs.

#### 43 EDUCATION

Basic education is compulsory for nine years. This includes three cycles of four, two, and three years each. Secondary level education covers a three-year program; students choose between gener-

al secondary, professional, and specialized technical or vocational schools. The academic year runs from September to July.

In 2001, about 70% of children between the ages of three and five were enrolled in some type of preschool program. Primary school enrollment in 2003 was estimated at about 100% of age-eligible students. The same year, secondary school enrollment was about 85% of age-eligible students. It is estimated that about 98% of all students complete their primary education. The student-to-teacher ratio for primary school was at about 13:1 in 2003; the ratio for secondary school was about 8:1. In 2003, private schools accounted for about 10.5% of primary school enrollment and 14.7% of secondary enrollment.

Coimbra University, founded in 1290, is Portugal's oldest institution of higher learning, and the universities of Lisbon and Porto are two of the largest. There are also art schools, music schools, and a school of tropical medicine. The Portuguese Catholic University was instituted by decree of the Holy See. In 2003, about 56% of the tertiary age population were enrolled in some type of higher education program; 48% for men and 64% for women. The adult literacy rate for 2003 was estimated at about 93.3%.

As of 2003, public expenditure on education was estimated at 5.8% of GDP, or 12.7% of total government expenditures.

#### 44 LIBRARIES AND MUSEUMS

The leading libraries of Portugal are the National Library, founded in 1796 (about 2.3 million volumes) and the Library of the Academy of Sciences (400,000) in Lisbon, the University Library in Coimbra (one million), and the Municipal Library in Porto (1.27 million). The Public Libraries Programme in Portugal was launched in 1987 with a goal of providing public library services in each of the country's 275 municipalities. By 1999, about 166 libraries had been established.

There are some 300 museums in Portugal. Most feature exhibits relating to Portuguese history. Lisbon has the National Museum of Ancient Art, the Museum of Decorative Arts, the Calouste Gulbenkian Museum, and the Center for Modern Art, as well as the National Museum of Natural History. The Abbey of the Friars of St. Jerome in Belém and the Battle Abbey in Batalha contain some of the finest examples of Portuguese art. There are dozens of municipal ethnographic and historic museums, as well as many finely restored castles and manors.

#### 45 MEDIA

Direct radiotelephone service connects Portugal with its former and current overseas provinces in Africa and Asia. In 2003, there were an estimated 411 mainline telephones for every 1,000 people. The same year, there were approximately 898 mobile phones in use for every 1,000 people.

The government broadcasting network, Radiodifusão Portuguesa, and Radio Renascença, a religious network, operate AM and FM stations. The state-owned television network, Radiotelevisão Portuguesa, offers color broadcasts on two channels. In 2005, there were an additional 300 local and regional commercial radio stations and at least two other commercial television stations. In 2003, there were an estimated 299 radios and 413 television sets for every 1,000 people. About 128.2 of every 1,000 people were cable subscribers. Also in 2003, there were 134.4 personal

computers for every 1,000 people and 194 of every 1,000 people had access to the Internet. There were 458 secure Internet servers in the country in 2004.

The constitution of 1976 guaranteed freedom of the press. The principal daily newspapers (with their affiliation estimated 2002 circulations) include: *Correio da Manhã* (independent, 85,000), *Diário de Notícias* (Communist, 75,560), *Público* (75,000), *Diário Popular* (leftist, 62,000), *A Capital* (leftist, 40,000), *Jornal de Notícias* (leftist, 90,000), *Comércio do Porto* (moderate, 30,300), and *O Primeiro de Janeiro* (conservative, 20,200). The weekly paper *Expresso* has a circulation of 160,000.

## 46 ORGANIZATIONS

The principal current organizations are syndicates, the majority of which are linked to the national trade union confederation; residents' commissions; workers' commissions; and popular assemblies. Many of these associations, particularly in rural areas, are involved in local community improvement projects as well as political and cultural activities. There are four chambers of commerce and three main industrial organizations, the oldest of which, the Industrial Association of Porto, dates from 1849.

The Academy of Sciences Lisbon is primarily a scholarly and research organization. Several professional associations also promote research and public education in a variety of fields, particularly in medicine and healthcare. There are organizations for hobbyists, including the multinational Federation of European Philatelic Associations.

National youth organizations include Association of Young Farmers of Portugal, Communist Youth of Portugal, International Friendship League of Portugal, Monarchist Youth of Portugal, the Scout Federation of Portugal, and YMCA/YWCA. There are several sports associations in the country, representing a variety of pastimes such as tae kwon do, badminton, tennis, and track and field. There is a national chapter of the Special Olympics.

The Kiwanis and Lion's Clubs also have active programs. Amnesty International, Habitat for Humanity, and the Red Cross have national chapters.

## 47 TOURISM, TRAVEL, AND RECREATION

Portugal's historic cities—Lisbon, Porto, Coimbra, and others—offer numerous museums, old churches, and castles. Most villages still celebrate market days with dances and other festivities. There are more than 800 km (500 mi) of beaches. The Portuguese bullfight (differing from the Spanish variety in that the bulls are not killed) is a popular spectator sport; the season lasts from Easter Sunday to October. Football (soccer) is popular as both a participant and a spectator sport. A valid passport is required; visas are needed for stays of more than 90 days.

Tourism has become a major contributor of foreign exchange earnings and a stimulus to employment and investment in the hotel industry and related services. The number of tourists was 11,644,231 in 2002. Hotel rooms numbered 105,986 in 2003 with 238,759 beds and an occupancy rate of 38%.

The daily cost of staying in Lisbon, according to 2005 US Department of State estimates, was \$232. Other areas were between \$159 and \$255, with some rates varying by season.

## 48 FAMOUS PORTUGUESE

During Portugal's golden age, the 15th and 16th centuries, the small Portuguese nation built an overseas empire that stretched halfway around the globe. Prince Henry the Navigator (Henrique Navegador, 1394–1460) laid the foundations of the empire. Among the leaders in overseas exploration were Bartholomeu Dias (1450?–1500), the first European to round the Cape of Good Hope; Vasco da Gama (1469–1524), who reached India and founded Portuguese India in 1498; and Pedro Alvares Cabral (1460?–1526), who took possession of Brazil for Portugal in 1500. Ferdinand Magellan (Fernão de Magalhães, 1480?–1521) led a Spanish expedition, the survivors of which were the first to sail around the world, although Magellan himself was killed after reaching the Philippines. Afonso de Albuquerque (1453–1515) was foremost among the builders of Portugal's Far Eastern empire.

Famous literary figures of the golden age include the historians Diogo do Couto (1542–1616) and João de Barros (1496–1570); Portugal's greatest writer, Luis Vas de Camões (1524?–80), the author of *Os Lusíadas*, the Portuguese national epic, and of lyric and dramatic poetry; the dramatists Gil Vicente (1465?–1537?) and Francisco de Sá de Miranda (1482–1558); the poets Bernardim Ribeiro (1482?–1552) and Diogo Bernardes (1532?–96?); and the travel writer Fernão Mendes Pinto (1509–83). Portugal's leading painter was Nuno Gonçalves (fl.1450–80).

Among the noted Portuguese of more recent times are Sebastião José de Carvalho e Mello, marquis de Pombal (1699–1782), the celebrated prime minister of King Joseph Emanuel (José Manuel, 1715–77); the novelists Camilo Castelo Branco, viscount of Correia-Botelho (1825–90), and José Maria Eça de Queirós (1843–1900); the poets João Baptista da Silva Leitão, viscount of Almeida-Garrett (1799–1854), Antero Tarquinio de Quental (1842–91), João de Deus Nogueira Ramos (1830–96), Teófilo Braga (1843–1924), and Abílio Manuel Guerra Junqueiro (1850–1923); the satirist José Duarte Ramalho Ortigão (1836–1915); and the painter Domingos António de Sequeira (1768–1837). António Caetano de Abreu Freire Egas Moniz (1874–1955) won the Nobel Prize in physiology in 1949.

António de Oliveira Salazar (1889–1970), prime minister for more than 30 years, was Portugal's best-known modern leader. Gen. (later Marshal) António Sebastião Ribeiro de Spínola (1910–96) played a key role in the revolution of April 1974. Gen. António dos Santos Ramalho Eanes (b.1935) became president in 1976 and was reelected in 1980. Other political leaders include: Mário Alberto Nobre Lopes Soares (b.1924), Francisco Sá Carneiro (1934–80), Jorge Fernando Branco de Sampaio (b.1939), Aníbal António Cavaco Silva (b.1939), António Manuel de Oliveira Guterres (b.1949)—a former prime minister who became the United Nations High Commissioner for Refugees, and José Manuel Durão Barroso (b.1956)—a former prime minister who became president of the European Commission.

## 49 DEPENDENCIES

Between 1974 and 1976, all of Portugal's overseas possessions in Africa—including Angola, the Cape Verde Islands, Portuguese Guinea (now Guinea-Bissau), Mozambique, and São Tomé and Príncipe—became independent countries in accordance with the Armed Forces Movement's decolonization policy. After the Portu-

guese withdrew from East Timor, in the Indonesian archipelago, the former colony was invaded by Indonesian forces in 1975 and became a province of Indonesia in 1976; East Timor became an independent nation in 2002. Macau, on the south coast of China, was a “Chinese territory under Portuguese administration” from 1975–99.

# ROMANIA

*Romania*

**CAPITAL:** Bucharest (Bucuresti)

**FLAG:** The national flag, adopted in 1965, is a tricolor of blue, yellow, and red vertical stripes.

**ANTHEM:** *Trei culori* (*Three Colors*).

**MONETARY UNIT:** The leu (L) is a paper currency of 100 bani. There are coins of 25 bani and 1, 3, 5, 10, 20, 50, and 100 lei, and notes of 10, 25, 50, 100, 200, 500, 1,000, and 5,000 lei. 1L = \$0.00003 (or \$1 = L28800) as of 2005.

**WEIGHTS AND MEASURES:** The metric system is the legal standard.

**HOLIDAYS:** New Year's Day, 1 January; International Labor Day, 1–2 May; Liberation Day, 23 August; National Day, 1 December; Christmas Day, 25 December.

**TIME:** 2 PM = noon GMT.

## <sup>1</sup> LOCATION, SIZE, AND EXTENT

Situated in Eastern Europe, north of the Balkan Peninsula, Romania has a total area of 237,500 sq km (91,699 sq mi). Comparatively, the area occupied by Romania is slightly smaller than the state of Oregon. The dimensions of the country are 789 km (490 mi) E–W and 475 km (295 mi) N–S. It is bounded on the N and NE by Ukraine and Moldova, on the E by the Black Sea, on the S by Bulgaria, on the SW by Serbia, and on the W by Hungary, with a total boundary length of 2,733 km (1,698 mi), of which 225 km (140 mi) is coastline. Romania's capital city, Bucharest, is located in the south central part of the country.

## <sup>2</sup> TOPOGRAPHY

The backbone of Romania is formed by the Carpathian Mountains, which swing southeastward and then westward through the country. The southern limb of this arc-shaped system is known as the Transylvanian Alps, whose compact, rugged peaks rise to 2,543 m (8,343 ft) in Mt. Moldoveanu, Romania's highest. The eastern Carpathians have an average elevation of 1,000 m (3,300 ft) and exceed 1,900 m (6,200 ft) only in the highest ranges.

On the eastern and southern fringes of the Carpathian arc are the low plateaus and plains of Walachia, extending to the Prut River (Moldovan border) in the east and to the Danube (Bulgarian border) in the south. On the inside of the Carpathian arc is the Transylvanian Basin, a hilly region dissected by the wide, deep valleys of the Mures and Somes rivers.

The Dobruja, located between the lower Danube and the Black Sea, is an eroded plateau with average elevations of 400 to 600 m (1,310–1,970 ft). Except for the low-lying, swampy Danube Delta in the north, the Black Sea coast of the Dobruja is steep, facing the sea with almost vertical cliffs.

Romania is susceptible to severe earthquakes. An earthquake that struck Romania on 4 March 1977 destroyed or severely damaged some 33,000 buildings and left more than 34,000 families

homeless. The shock, measuring 7.2 on the open-ended Richter scale, was the most severe in Europe since a series of shocks in October–November 1940, also in Romania.

## <sup>3</sup> CLIMATE

Romania's climate is of the moderate humid continental type, exposed to predominant northerly cold winds in the winter and moderate westerly winds from the Atlantic in the summer. Average January temperatures range from  $-4^{\circ}\text{C}$  to  $0^{\circ}\text{C}$  ( $25$ – $32^{\circ}\text{F}$ ). During the summer, the highest temperatures are recorded in the Danube Valley ( $24^{\circ}\text{C}/75^{\circ}\text{F}$ ). Temperatures decrease toward the high elevations in the northwest and toward the southeast, where the Black Sea exerts a moderating influence. Precipitation decreases from west to east and from the mountains to the plains, with an annual average of between 100 and 125 cm (about 40 and 50 in) in the mountains and about 38 cm (15 in) in the delta.

## <sup>4</sup> FLORA AND FAUNA

Natural vegetation consists mainly of steppe like grasslands in the Moldavian and Walachian lowlands, with tall, deep-rooted grasses in the more humid sections and short, shallow-rooted grass in the drier parts. The Carpathian system is covered with forests, with deciduous trees at lower elevations and conifers at altitudes above 1,070–1,220 m (3,500–4,000 ft). Alpine meadows occupy the highest parts of the mountains.

Wild animals, including the black chamois, Carpathian deer, wolves, hares, marten, brown bear, lynx, boar, and fox, have sought refuge in the sparsely inhabited and forested Carpathians. Water birds flourish in the Danube Delta, and sturgeon abound in the waters of the lower Danube. Carp, bream, and pike populate the lakes; dace, barbel, and trout are found in rivers and streams.

As of 2002, there were at least 84 species of mammals, 257 species of birds, and over 3,400 species of plants throughout the country.

## 5 ENVIRONMENT

Rapid industrialization since World War II has caused widespread water and air pollution, particularly in Prahova County, an oil-refining region. The nation has 42 cu km of renewable water sources, with about 59% of the annual withdrawal used to support farming and 33% used for industrial purposes.

Air pollution is heaviest in the nation's cities, where industry produces hazardous levels of sulphur dioxide. In 1992, Romania had the world's 28th highest level of industrial carbon dioxide emissions, which totaled 122.1 million metric tons, a per capita level of 5.24 metric tons. However, by 2000 total of carbon dioxide emissions had dropped to 86.3 million metric tons.

Damage to the nation's soils from erosion and pollution has decreased agricultural production by 50% in some areas. Acid rain originating in Hungary is another environmental problem. Some water conservation programs were initiated in the mid-1980s, but the Environmental Protection Law of 1972 has not been strictly enforced.

Romania's forests and natural steppes have been encroached on by farmers. Radioactivity from the Chernobyl nuclear site, two floods, and two earthquakes have also contributed to the nation's environmental problems. Moreover, intensive exploitation of forests before, during, and immediately after World War II necessitated a reforestation program that, between 1950 and 1964, resulted in the replanting of 1,159,600 hectares (2,865,400 acres).

As of 2003, 4.7% of Romania's total land area was protected. According to a 2006 report issued by the International Union for Conservation of Nature and Natural Resources (IUCN), threatened species included 15 types of mammals, 13 species of birds, 2 types of reptiles, 10 species of fish, 22 species of invertebrates, and 1 species of plant. The Romanian bullhead perch, Atlantic sturgeon, slender-billed curlew, and Mediterranean monk seals are among those listed as endangered.

## 6 POPULATION

The population of Romania in 2005 was estimated by the United Nations (UN) at 21,612,000, which placed it at number 50 in population among the 193 nations of the world. In 2005, approximately 14% of the population was over 65 years of age, with another 16% of the population under 15 years of age. There were 95 males for every 100 females in the country. According to the UN, the annual population rate of change for 2005–10 was expected to be -0.2%, a rate the government viewed as too low. To address the decline in population, the government established the Population Commission in 2004. The projected population for the year 2025 was 18,129,000. The population density was 91 per sq km (235 per sq mi).

The UN estimated that 53% of the population lived in urban areas in 2005, and that urban areas were growing at an annual rate of 0.09%. The capital city, Bucharest (Bucuresti), had a population of 1,853,000 in that year. Other major cities and their population estimates were Constanța, 350,581; Iași, 348,000; Timișoara, 334,115; Cluj-Napoca, 332,000; Galati, 326,141; Brașov, 323,736; Craiova, 313,000; Ploiești, 253,623; and Brăila, 235,763.

## 7 MIGRATION

Population shifts numbering in the millions occurred as a result of the two world wars—because of territorial changes, deportation and liquidation of Jews by the Nazis, flight before the Soviet military forces, deportations to the USSR, expulsion of the Volksdeutsche (ethnic Germans), and departures following the Communist takeover and before stringent security measures halted the flow. About 117,950 Jews emigrated to Israel between 1948 and 1951; another 90,000 were permitted to emigrate during 1958–64. Some 120,000 ethnic Germans left Romania between 1978–88, and some 40,000 ethnic Hungarians fled in 1987 alone. In 1990, 80,346 people left, 78% to Germany, 9% to Hungary. Some 44,160 Romanians emigrated in 1991 and 31,152 in 1992. In 1992, 103,787 Romanians were given asylum in Germany, but in September of that year Germany returned 43,000 refugees, over half of whom were Gypsies. According to *Migration News*, in 2005 the Romanian government discouraged illegal migration by preventing some 1–4 million Romanians from leaving to travel to EU countries on the grounds that they had insufficient funds, or could not prove that they were merely visiting abroad. In addition, returning Romanians who overstay 90 days abroad have their passports confiscated. Between 1990–2000, remittances to Romania increased tenfold. In 2003 remittances were \$7.3 million.

During the Kosovo crisis in 1999, Romania offered to accept 6,000 Kosovar refugees from Macedonia under the UNHCR/IOM Humanitarian Evacuation Programme. It only actually hosted about 100, until the end of July 1999 when all but one returned to Kosovo. By the end of 2004, there were a total of 2,237 persons of concern to the United Nations High Commissioner for Refugees (UNHCR) in Romania, 1,627 refugees, 210 asylum seekers primarily from Iraq, and 400 stateless Roma.

From 1991–2003, some 10,000 Romanians per year were permanent emigrants. In 2004, 3,730 Romanians applied for asylum in 10 countries, predominantly to Italy. In 2005, the net migration rate was an estimated -0.13 migrants per 1,000 population.

## 8 ETHNIC GROUPS

According to the 2002 census, Romanians constitute about 89.5% of the total population. Hungarians make up the largest minority group with about 6.6% of the total population. Roma account for about 2.5% of the population according to census figures; however, international groups estimate that the actual number of Roma may include up to 10% of the population. Despite government efforts for improvement, the Romani community continues to face discrimination and harassment. Lesser minority groups include Ukrainians (0.3%), Germans (0.3%), and Russians (0.2%). Others include Turks, Serbs, Croats, Jews, Poles, Bulgarians, Czechs, Greeks, Armenians, Tatars, and Slovaks.

## 9 LANGUAGES

Romanian is the official language. As a Romance language derived from the Latin spoken in the Eastern Roman Empire, Latin word elements make up 85–90% of the modern Romanian vocabulary. In the 2,000 years of its development, the language was also influenced by contacts with Slavonic, Albanian, Hungarian, Greek, and Turkish. Of the loanwords, Slavonic elements are the most numerous. Earliest Romanian written texts still extant date from the 16th

LOCATION: 48°15'06" to 43°37'07" N; 20°15'44" to 29°41'24" E. BOUNDARY LENGTHS: Ukraine, 531 kilometers (329 miles); Moldova, 450 kilometers (279 miles); Black Sea coastline, 234 kilometers (145 miles); Bulgaria, 608 kilometers (377 miles); Serbia, 476 kilometers (295 miles); Hungary, 445 kilometers (277 miles). TERRITORIAL SEA LIMIT: 12 miles.

century. In addition to letters of the English alphabet, Romanian has the letters *ă*, *î*, *â*, *ș*, and *ț*. Hungarian and German are spoken by a large percentage of the inhabitants of Transylvania.

## 10 RELIGIONS

According to the 2002 census, about 86.8% of the population were members of the Romanian Orthodox Church, one of the autocephalous Eastern Orthodox churches. Under Bulgarian influence, the Slavonic rite was maintained in the Romanian Church until the 17th century, when Romanian became the liturgical language. The Romanian Church enjoyed a large measure of autonomy in the Middle Ages and, after Romania achieved full independence from the Turks in 1878, was formally declared independent of the Patriarchate of Constantinople; it is now headed by its own

patriarch. The Greek Catholic (Uniate) Church was formed in 1698 by the Transylvanian Orthodox, who acknowledged the jurisdiction of the Holy See. In October 1948, the new Communist regime compelled the Uniate Church to sever its ties with Rome and to merge with the Romanian Orthodox Church.

Roman Catholics account for about 4.7% of the population. The Greek Catholic Church is also represented as a recognized religion in the country. Protestant denominations make up about 7.5% of the population. Officially recognized Protestant denominations include the Reformed Church (which is the largest in the country), the Romanian Evangelical Church, the Unitarian Church (mostly Hungarian), Baptists, Seventh-Day Adventists, Pentecostals, Jehovah's Witnesses, and the Evangelical Augustinian Church. Islam and Judaism are also officially recognized religions; there

are about 67,257 Muslims and 10,200 Jews. There are also small communities of Methodists, Presbyterians, Baha'is, God's Children (The Family), Hare Krishnas, Zen Buddhists, and Mormons (Church of Jesus Christ of Latter-day Saints), all of which are not officially recognized by the state.

The constitution provides for religious freedom, but the government retains a great deal of legal control over religious groups and activities. The Romanian Orthodox Church holds substantial influence in political and social venues. All religious groups must register with the government. Those that are granted official recognition are eligible for state support; the government officially recognizes 17 religions. Proselytizing is not illegal, but minority religions engaging in such activities have reported restrictions and harassment by local government officials. Some tension does exist between religious groups; particularly between the Romanian Orthodox and minority groups.

## 1<sup>1</sup>TRANSPORTATION

Romania is strategically located at the crossroads of Europe and Asia. As of 2004, Romania's railroad network totaled 11,385 km (7,074 mi), of standard, broad and narrow gauge lines, of which 3,888 km (2,416 mi) were electrified. Standard gauge railways predominate at 10,898 km (6,779 mi), followed by narrow gauge at 427 km (266 mi), and broad gauge railways making up the remainder.

There were 198,755 km (123,625 mi) of roads at the end of 2002, of which 100,173 km (62,307 mi) were paved, including 113 km (70 mi) of expressways. In 2003, there were 3,087,628 passenger cars and 635,342 commercial vehicles in use.

Only the Danube and, to a lesser extent, the Prut rivers are suitable for inland navigation, which accounts for only about 1% of the total freight traffic. The main Danube ports include Galati, Brăila, and Giurgiu. At Giurgiu, on the main transportation line between Romania and Bulgaria, a road-and-rail bridge was completed in 1954, replacing the former Danube ferry to Ruse, Bulgaria. A major project, the Danube-Black Sea Canal, designed to bypass the shallow, silted arms of the Danube Delta, was started in 1949 but abandoned in 1953. It was revived in the early 1980s and opened in 1984. The canal is 64 km (40 mi) long and connects Cernavoda with Constanța. Overall, Romania as of 2004, had 1,731 km (1,076 mi) of navigable inland waterways. The Romanian merchant fleet consisted of 34 vessels of 1,000 GRT or more, totaling 395,350 GRT in 2005, and was based in Constanța, the nation's chief Black Sea port.

Romanian airports totaled an estimated 61 in 2004. As of 2005, a total of 25 had paved runways, and there was also one heliport. Otopeni International Airport, near Bucharest, was opened in 1970 and remains the nation's principal international air terminal. Baneasa Airport, also near Bucharest, handles local traffic. Other important airports include M. Kogalniceanu at Constanța and Giarmata at Timișoara. Romanian Air Transport (Transporturile Aeriene Române-TAROM) and Romanian Air Lines (Linile Aeriene Române-LAR) are the primary air carriers. In 2003, about 1.251 million passengers were carried on scheduled domestic and international airline flights.

## 1<sup>2</sup>HISTORY

Archaeological excavations show that the land now known as Romania has been inhabited for thousands of years. Agriculture was introduced in the 6th century BC, and by the 3rd century BC the Cucuteni civilization had produced polychrome pottery. The Dacians, of Thracian stock, had become a distinct people by the end of the 1st century BC. The kingdom of Dacia reached the highest stage of its development toward the end of the 1st century AD, in the reign of Decebalus (87–106), but after four years of war, Dacia fell to the Roman Emperor Trajan in AD 106. The withdrawal of the Romans in AD 271 left the Romanians a partly Christianized Dacian-Roman people, speaking Latin and living in towns and villages built on the Roman pattern. In the following centuries, as Dacia was overrun by successive waves of invaders, the early Romanians are believed to have sought refuge in the mountains or to have migrated south of the Danube River. There the Dacian-Romanians, assimilating Slavic influences, became known by the 7th century as Vlachs (Walachians). The Vlachs apparently remained independent of their neighbors, but came under Mongol domination in the 13th century.

The establishment of the two principalities of Walachia and Moldavia in the late 13th and early 14th centuries opened one of the most important chapters in the history of Romania. Walachia came under Turkish suzerainty in 1476 and Moldavia in 1513; 13 years later, Transylvania, which had been under Hungarian control since 1003, also passed into Turkish hands. The tide of Ottoman domination began to ebb under Russian pressure in the second half of the 17th century; in 1699, under the Treaty of Karlowitz, Transylvania was taken by Austria (later Austria-Hungary), and in 1812, Russia obtained Bessarabia, a section of Moldavia, from the Turks. The Congress of Paris in 1856, which ended the Crimean War, guaranteed the autonomy of the principalities of Walachia and Moldavia and forced Russia to return the southernmost part of Bessarabia to Moldavia. The two principalities formed a union in 1859, with Alexandru Ioan Cuza as its first prince, but he was replaced in 1866 by Carol I of the house of Hohenzollern-Sigmaringen, under a new governing document that proclaimed Romania a constitutional monarchy. At the Congress of Berlin in 1878, Romania obtained full independence from Turkey but returned southern Bessarabia to Russia. Under the rule of Carol I, Romania developed into a modern political and economic unit.

As a result of the Balkan Wars in 1912–13, Romania gained southern Dobruja from Bulgaria. Carol I died in 1914 and was succeeded by Ferdinand I. In World War I, Romania joined the Allies and as a result acquired Bessarabia from Russia, Bukovina from Austria, and Transylvania from Hungary. The establishment of a greatly expanded Romania was confirmed in 1919–20 by the treaties of St. Germain, Trianon, and Neuilly. In the early postwar period, Ion Bratianu (son of a 19th-century premier) instituted agrarian and electoral reforms. Both Ferdinand and Bratianu died in 1927. A brief regency period under Iuliu Maniu, Peasant Party leader, was followed in 1930 by the return to Romania of Carol II, who, having earlier renounced his right of succession, now deposed his nine-year-old son, Michael (Mihai), and established a royal dictatorship.

As economic conditions deteriorated, Fascism and anti-Semitism became increasingly powerful, and Carol II sought to appease both Germany and the USSR, which by August 1939 had

concluded their nonaggression agreement. In 1940, Romania ceded Bessarabia and northern Bukovina to the USSR, northern Transylvania to Hungary, and southern Dobruja to Bulgaria. In the same year, Carol II abdicated in favor of his son Michael, and German troops entered the country. Romania joined the Axis in war against the Allies in 1941. As Soviet forces drove into Romania in 1944, a coup overthrew the wartime regime of Gen. Ion Antonescu on 23 August, and Romania joined the Allies against Germany. A Communist-led coalition government under Premier Petru Groza was set up in March 1945. King Michael was forced to abdicate on 30 December 1947, and the Romanian People's Republic was proclaimed. The Paris Peace Treaty of 1947 fixed Romania's frontiers as of 1 January 1941, with the exception of the border with Hungary, which was restored as of 1 January 1938, so northern Transylvania was once again part of the Romanian state.

The Communist constitution of 1948 was superseded in 1952 by a constitution patterned more directly on that of the USSR. In international affairs, Romania followed a distinctly pro-Soviet line, becoming a member of CMEA and the Warsaw Pact. Internally, the regime nationalized the economy and pursued a policy of industrialization and the collectivization of agriculture. During the 1960s, however, and especially after the emergence of Nicolae Ceausescu as Communist Party and national leader, Romania followed a more independent course, increasing its trade with Western nations and avoiding a definite stand in the Sino-Soviet dispute. In 1967, Romania was the only Communist country that did not break diplomatic relations with Israel following the Six-Day War. In 1968, Romania denounced the Soviet intervention in Czechoslovakia and the USSR-Romania treaty of friendship and cooperation expired; a new accord was not signed until 1970. Further examples of Romania's independent foreign policy in the 1970s were the gradual improvement of relations with China, numerous bilateral agreements with the nations of Western Europe, and President Ceausescu's state visit in December 1973 to Washington, where he signed a joint declaration on economic, industrial, and technical cooperation with the United States. In the 1970s and early 1980s, Romania also became increasingly involved in the nonaligned movement. In 1982, Ceausescu called on the USSR to withdraw from Afghanistan.

In contrast to some other East European countries, there was relatively little political and cultural dissent in Romania during the first 30 years of Communist rule. In 1977, however, about 35,000 miners in the Jiu Valley, west of Bucharest, went on strike because of economic grievances. Afterwards, the Romanian Communist Party hierarchy was frequently reshuffled, ostensibly to improve economic management, with Ceausescu and several members of his family (particularly his wife, Elena) increasing their power.

In the early and mid-1980s, there were a number of work stoppages and strikes caused by food and energy shortages. In early 1987, Ceausescu indicated that Romania would not follow the reform trend initiated by Mikhail Gorbachev in the USSR.

The progress of *perestroika* (restructuring) in the Soviet Union, intensified by the wave of "velvet revolutions" which rolled across Eastern Europe in autumn 1989, only served to highlight the repressiveness of the Ceausescu regime, which had all but starved and frozen the country to death in its attempt to repay international indebtedness, which President Ceausescu said in April 1989 had

been us\$10 billion. The regime was also single-mindedly pushing ahead with the "systemization plan" begun in March 1988, which intended to force about half the country's peasants into urbanized "agro-industrial" complexes by bulldozing their villages.

The policy was especially offensive to the 2.5 million Hungarians in Romania's western regions, who understood the policy to be an attempt to further undercut their cultural autonomy. In mid-December 1989, abysmal economic conditions and ethnic tension led to spontaneous demonstrations in the western city of Timișoara. When the Securitate, Romania's secret police, attempted to deport Laszlo Toekes, a popular clergyman who had been a leading spokesperson for the local Hungarians, thousands of people took to the streets. Troops were summoned, and two days of rioting ensued, during which several thousand citizens were killed.

News of the riot, and of the government's handling of it, fanned further demonstrations around the country. Probably unwisely, President Ceausescu went ahead with a planned three-day visit to Iran. Upon his return, he convened a mass rally at which he attempted to portray his opponents as fascists. However, the rally turned into an antigovernment demonstration, in which the army sided with the demonstrators.

Ceausescu and his wife attempted to flee the country, but were apprehended, tried, and summarily executed, on 25 December 1989. Several days of fighting raged, as the Securitate and the army battled for power. A hastily assembled Council of National Salvation took power, repealing a number of Ceausescu's most hated policies and laws. The Council's president was Ion Iliescu, a former secretary of the Communist Party, who had been one of several signatories to a letter, which had accused Ceausescu of gross mismanagement of Romania's economy, made public in March 1989. The prime minister, Peter Roman, was also a prominent Communist.

Although the Council contained some non-Communists, the majority had been prominent officials in Ceausescu's regime, which prompted almost continuous public protests. Despite a continued government monopoly on media, political opposition groups managed to rally public support to demand the banning of the Communist Party, and the widening of the government. In February 1990, Iliescu agreed, replacing the 145-member Council of National Salvation with a 241-member Council of National Unity, which included members of opposition parties, national minorities, and former political prisoners; it also contained the full membership of the former Council, and Iliescu remained president.

Parliamentary elections were held in May 1990 against a background of continued civil unrest, especially in the Hungarian west. Although international observers considered the elections to have been generally fair, the National Salvation Front—now a political party—made ruthless use of its media monopoly to take about two-thirds of the parliamentary seats from a divided, disorganized, and inexperienced opposition. Iliescu was elected president, with about 85% of the votes, in a contest in which there had been more than 94% voter turnout.

The conviction that ex-Communists had "stolen" the election brought continued demonstrations in Bucharest and elsewhere. In April 1990, in a move that was criticized internationally, the Iliescu government trucked in miners from the northern part of the

country, urging them to beat up and disperse the demonstrators, ending what threatened to become a coup d'état against Iliescu.

After the failure of those demonstrations, the opposition began to link up into parties, hoping to challenge Iliescu and his party in the next parliamentary elections, to be held in 1992. Popular discontent, however, continued to find more direct expression. Angry that the promises which had brought them to Bucharest in June had not been kept, the miners returned in September 1991, this time to link up with many of the opposition figures that they earlier had attacked, now to mount a mass attack on the government. Iliescu had no choice but to dismiss Prime Minister Roman, replacing him with Theodor Stolojan, an economist who managed to contain popular discontent until the general elections of September 1992, largely by delaying implementation of economic reforms. The parliamentary elections demonstrated a wide diffusion of political support. Iliescu's National Salvation Front won 28% of the seats, making it the largest party, but the Democratic Convention, an anti-Communist opposition coalition with a strong monarchist wing, took 20%, while former Prime Minister Roman's National Salvation Front, now opposed to Iliescu, took 10%. The remaining 42% of the seats were divided among five other parties.

The popular vote for president showed that Iliescu still had support, although it had dropped to just above 60% of the electorate. The success of his opponent, Emil Constantinescu, a former rector of Bucharest University, demonstrated the continuing hostility to Iliescu and the other ex-Communists who had managed to retain power.

Iliescu's dismissal of Stolojan, in November 1992, was widely seen as a recognition of that significant minority's opposition. Iliescu chose Nicolae Vacaroiu as prime minister, who had no earlier ties to the Ceausescu or Iliescu governments. However, the move was addressed as much to the International Monetary Fund (IMF) as the rest of the international financial community, which had emerged as Romania's chief source of support. Continued political instability and the fitful pace of privatization, combined with a strong nationalist bloc in the parliament which warned against "selling out" Romania to foreigners, all kept foreign investment quite low, a total of only about \$785 million for all of 1990–94. As a consequence Romania has had to rely upon loans from Western sources, especially the IMF, piling up foreign debt at the rate of about \$1 billion a year. In return for this infusion of cash the foreign donors have set stringent requirements of economic reform, which Romania is not finding easy to meet.

Romania's fitful progress toward democratization exacerbates the social pressures of its continued economic decline. Romanians began the post-Ceausescu period as among the poorest people in Europe, and their economy worsened for several years. Inflation for 1992 was 210%, and more than 300% for 1993, while unemployment was almost 10%. Most significantly, production fell for the first couple of years after the anti-Communist revolution. Beginning in 1994, however, Romania began slowly turning its economy around. In 1996, it even applied for membership in the European Union (EU)—although it knew that admission before 2000 was doubtful.

In November 1996, presidential and parliamentary elections were held as the economy, while still fairly grim, continued to improve in several sectors. Popular opposition to the ex-Communist

Iliescu had grown strong leading up to the elections, mainly due to broken promises of economic security and widespread corruption that saw the enrichment of a small clique of ex-Communist insiders amid general economic hardships across the country. Iliescu also failed to deliver on many privatization schemes, angering the middle-class merchants. In the election's first round on 3 November, the Democratic Convention Alliance of Opposition Groups, led by Emil Constantinescu, Iliescu's 1990 opponent, earned the highest percentage of votes (30%) followed by Iliescu's Party of Social Democracy (PDSR) and the Social Democratic Union (22%), and former prime minister Peter Roman's center-left party (13%). In the presidential election, neither Iliescu nor Constantinescu received a majority, so a runoff was held on 17 November, in which Constantinescu took 54% of the vote, becoming Romania's first true post-Communist leader. The West was thrilled with the victory, as Constantinescu was seen as significantly more pro-free market and pro-international investment than Iliescu. The new government immediately began imposing austerity measures, vowing to reduce the deficit significantly by the end of 1997. However, it was hobbled by disagreements among coalition members, and in March 1998, the prime minister, Victor Ciorbea, was replaced by Radu Vasile. The government's position was weakened even further in January 1999 when it backed down in the face of demands by striking coal miners in order to avert potential violence. In December 1999, in order to save face, and boost the popularity of the coalition for the upcoming elections, President Constantinescu forced Radu Vasile to resign and replaced him with Mugur Isarescu, the governor of the Romanian National Bank.

By the first half of 2000, the failure of the reformist government to bring about the promised economic recovery had led to widespread disenchantment. Inflation, unemployment, and debt remained serious problems, and Romania had also failed to achieve its major foreign policy objectives—admission to NATO and the EU. Public discontent had led to a resurgence in the popularity by Iliescu's ex-Communists, who won a decisive victory in the June local elections. At midyear it was widely expected that the November general elections would bring a change in both the government and the presidency, and it was considered possible that Iliescu himself might stage a political comeback.

Presidential and parliamentary elections were held on 26 November 2000, which were won by Iliescu's PDSR. Iliescu became president after a second round of voting was held on 10 December, defeating extreme right-wing candidate Corneliu Vadim Tudor of the xenophobic Greater Romania Party (PRM). Tudor has been compared to France's Jean-Marie Le Pen, Russia's Vladimir Zhirinovskiy, Austria's Jörg Haider, and the late Pym Fortuyn of the Netherlands. Voter turnout was around 60%, 20% lower than in 1996. Iliescu won 36.4% of the vote in the first round, to Tudor's 28.3%; in the second round, Iliescu took 66.8%, and Tudor won 33.2% of the vote.

In December 2001, under pressure from the EU, Romania repealed a provision of its penal code that discriminated against homosexuals. In November 2002, NATO formally invited Romania to join the organization, one of seven Eastern European nations to join in 2004.

Although between 2000 and 2004 Romania registered some of the highest economic growth rates in Europe, endemic corruption and internal problems within the ruling PDSR led to a surprise

victory by the Truth and Justice Alliance in the November 2004 elections. Traian Basescu, a former sea captain who served as the minister of transportation from 1996 to 2000, and as the mayor of Bucharest from 2000 to 2004, won the presidential elections. Basescu, who ran for the Truth and Justice Alliance, garnered 51.23% of the votes in the second round, while his opponent, Adrian Nastase, the former prime minister of Romania and a member of PDSR got 48.77%. The Alliance formed by the National Liberal Party (PNL) and the Democratic Party (PD), sustains a fragile parliamentary majority with the backing of the UDMR, the Humanist Party (PUR), and several ethnic minority groups.

Internal problems within the Alliance, the kidnapping of three Romanian journalists in Iraq, and massive floods that covered most of Romania in the spring and summer of 2005 threatened to break the coalition apart. President Basescu and the new prime minister, Calin Popescu Tariceanu, agreed to put their differences aside in order to achieve one of the most important goals for Romania—the accession to the EU.

In April 2005, the European parliament gave the green light to Romania and Bulgaria, with 497 votes in favor of the accession, 93 against, and 71 abstentions; both countries are expected to join in 2007. The EU specified however that Romania's accession could be delayed until 2008 if the reform of the judicial system failed and if the fight against corruption was not intensified.

### 13 GOVERNMENT

The Council for National Unity enacted a new constitution for Romania in November 1991, and the document carried many of the hallmarks of Soviet-era constitutions, granting rights in some articles and revoking them in others. In October 2003, the constitution was revised, following a national referendum. The legal system is generally based on Romania's old 1923 constitution, and on the constitution of France's Fifth Republic.

The present arrangement has a directly elected president who serves for a maximum of two five-year terms; he is head of state. The president, in consultation with the parliament, names the prime minister. The prime minister, in turn, chooses his governing body, which has to be approved by the parliament. The government, together with the president, represents the executive power in the country.

The legislature is made up of two houses, the Senate, with 137 seats (one senator for 160,000 inhabitants), and the Chamber of Deputies, with 332 seats (one deputy for 70,000 inhabitants); members of both bodies are directly elected on a proportional representation basis to serve four-year terms.

### 14 POLITICAL PARTIES

After the coup against Ceausescu, some 80 political parties appeared—some new; others, like the Liberals and the Peasant Party, revivals of prewar parties that the Communists had outlawed. The dominant party in the 1990 elections, however, proved to be the National Salvation Front (NSF), which took two-thirds of the seats in the National Assembly.

By 1992, the NSF had split over the issue of whether or not to support Iliescu. The main party renamed itself the Party of Social Democracy in Romania (PDSR), while a pro-Iliescu wing became the Democratic National Salvation Front, and an anti-Iliescu wing, headed by ex-Prime Minister Roman, became the Front

for National Salvation (FSN). The PDSR took 28% of the vote and the FSN, 10%.

The second-largest party in the 1992 elections was a coalition, called the Democratic Convention of Romania (DCR), which incorporated such parties as the National Peasant Party Christian Democratic (PNTCD), the Movement of Civic Alliance, the Party of Civic Alliance, Liberal Party '93, and the Social Democratic Party. There are also small ultranationalist parties, the Party of Romanian National Unity and the Greater Romania Party (PRM), and the Communists have been reborn as the Socialist Labor Party. Despite superficial political differences, all three parties are anti-Hungarian, anti-Gypsy, and anti-Semitic, as well as anti-democratic.

In the parliamentary elections held on 3 November 1996, the PDSR lost its majority standing, and the DCR won a strong majority. The DCR became the ruling party with 53 seats in the Senate and 122 in the Chamber of Deputies; the PSDR held 41 and 91, respectively; the Social Democratic Union, 23 and 53; Hungarian Democratic Union, 8 and 19; Greater Romania Party, 8 and 19; and National Union Party, 7 and 18. Victor Ciorbea, a trade union leader and former mayor of Bucharest, became prime minister, and Emil Constantinescu became president.

Parliamentary and presidential elections were held on 26 November 2000, which were won by the PDSR. The PDSR merged with the Romanian Social Democratic Party to form the Social Democratic Party (PSD), and with the Humanist Party of Romania, formed the Democratic Social Pole of Romania. This coalition won 155 of 346 seats in the Chamber of Deputies and 65 of 143 seats in the Senate. The PRM took 84 seats in the Chamber of Deputies and 37 in the Senate; the Democratic Party took 31 and 13 seats, respectively; the National Liberal Party won 30 and 13; the Hungarian Democratic Alliance (UDMR) won 27 and 12; and 19 ethnic parties were represented with 1 seat each in the Chamber of Deputies.

On 28 November 2004, the Truth and Justice Alliance, comprised of the National Liberal Party (PNL) and the Democratic Party (PD), scored a surprise victory over the ruling PSD. The Alliance formed a fragile coalition with UDMR, the Humanist Party (which recently changed its name to the Conservative Party), and several ethnic minorities. The coalition holds only 169 of 332 seats in the Chamber of Deputies, and 71 of 137 seats in the Senate, while PSD won 110 and 45 respectively, and PRM 32 and 19. At that time there were also 19 deputies with no political affiliation.

### 15 LOCAL GOVERNMENT

Romania is divided into 41 counties (*judete*), as well as the municipality of Bucharest, which has separate status. Below the counties, there are three other categories of local authority: approximately 2,800 communes (with populations up to 5,000), 280 *orase* (towns with populations of approximately 5,000–20,000) and 86 municipalities. In the Ceausescu era the counties were administered by appointees of the central government, whose responsibility was solely to Bucharest. The Iliescu government attempted to reshape local government, but most sources agree that the result was to further remove authority from the countryside. Much of Romania

is deeply rural, with almost no contact between localities or with the central government.

While more than 40% of the Romanian population lives in the rural countryside, attending to a highly fragmented agricultural system, almost 40% of the national wealth is concentrated in Bucharest. As a result, prominent figures from all of Romania's main provinces have pleaded for a more decentralized government system. To date, all 41 counties are led by a prefect who is appointed by the government. The prefects respond directly to the Ministry of Public Administration.

## 16 JUDICIAL SYSTEM

The 1992 law on reorganization of the judiciary established a four-tier legal system, including the reestablishment of appellate courts, which existed prior to Communist rule in 1952. The four tiers consist of courts of first instance, intermediate appellate level courts, a Supreme Court, and a Constitutional Court. The Constitutional Court, six of whose nine members are chosen by the parliament and three by the president, has judicial responsibility for judicial review of constitutional issues. The Constitutional Court judges are appointed for nine-year terms. The Supreme Court was reorganized under a separate 1993 law; its members are appointed by the president of Romania and exercise ultimate authority over all other courts in the country. The judges of the Supreme Court are appointed for a term of six years and may serve consecutive terms.

Under the law, the courts are independent of the executive branch. The constitution vests authority for selection and promotion of judges in the Ministry of Justice. Judges are appointed for life by the president upon recommendation from a panel of judges and prosecutors selected by parliament.

Alongside this ordinary court system is a three-tiered military court system, which handles cases involving military personnel.

## 17 ARMED FORCES

The Romanian armed forces have been reorganized in the wake of the revolution of 1989–90, which destroyed the Communist armed forces and security establishment. In 2005, the armed forces numbered 97,200 active personnel, supported by 104,000 reservists. There were 66,000 active personnel in the Army, 7,200 in the Navy, and 14,000 in the Air Force. The Army was equipped with 1,258 main battle tanks, four reconnaissance vehicles, 177 armored infantry fighting vehicles, 1,583 armored personnel carriers, and 1,238 artillery pieces. The Navy operated one frigate, six corvettes, 38 patrol/coastal vessels, 12 mine warfare, and 11 logistics/support vessels. The Air Force was equipped with 106 combat capable aircraft, including 25 fighters and 68 fighter ground attack aircraft, as well as 8 assault helicopters. Romania also had a paramilitary force of 79,900 members that consisted of 22,900 border guards and an estimated gendarmerie of 57,000. Romania participated in Operation Enduring Freedom in Afghanistan and in peacekeeping or military missions in 10 other countries or regions. The defense budget in 2005 was \$2.10 billion.

## 18 INTERNATIONAL COOPERATION

Romania, which became a member of the United Nations on 14 December 1955, participates in ECE and several nonregional specialized agencies, such as the World Bank, the ILO, the FAO,

UNESCO, UNIDO, and the WHO. Romania served on the UN Security Council from 2004–05. The Romanian government has supported UN missions and operations in Kosovo (est. 1999), Ethiopia and Eritrea (est. 2000), Liberia (est. 2003), Burundi (est. 2004), and Côte d'Ivoire (est. 2004), among others.

Romania is also a member of the WTO, G-9, G-77, the Council of Europe, the Black Sea Economic Cooperation Zone, the Euro-Atlantic Partnership Council, the European Bank for Reconstruction and Development, and the OSCE. Romania became a member of NATO in 2004. The country has observer status in the OAS and the Latin American Integration Association (LAIA). Romania is an applicant for membership in the European Union.

Romania is part of the Australia Group, the Zangger Committee, the Organization for the Prohibition of Chemical Weapons, and the Nuclear Suppliers Group (London Group). In environmental cooperation, Romania is part of the Antarctic Treaty, the Basel Convention, Conventions on Biological Diversity and Air Pollution, Ramsar, CITES, the Kyoto Protocol, the Montréal Protocol, MARPOL, the Nuclear Test Ban Treaty, and the UN Conventions on the Law of the Sea, Climate Change and Desertification.

## 19 ECONOMY

Before World War II, the economy was predominantly agricultural, with agriculture and forestry contributing 38.1% of the national income in 1938, and industry (including construction) 35.2%. As a result of the industrialization program of the Communist government, this ratio has changed greatly. In 1996, agriculture and forestry contributed 19% to national income; industry, 36%; construction, 7%; and services, 38%. Within industry, structural changes reflected the government's emphasis on the development of heavy industry, particularly machine-building, as opposed to consumer goods. The relative neglect of the agricultural sector, in addition to peasants' resistance to collectivization, resulted in agricultural difficulties, including shortages.

The basic organization of economic management in Romania was highly centralized, like its original Soviet model, with few of the modifications introduced elsewhere in Eastern Europe. During the late 1970s and in the 1980s, the continued emphasis on industrial expansion and consequent neglect of agriculture led to food shortages and rationing. Romania's economic problems in the 1980s were exacerbated by the government's program to reduce foreign debt: the debt was indeed reduced, from \$10.5 billion in 1981 to \$6.6 billion at the end of 1987, but at the cost of reduced industrial development. In addition, two extremely harsh winters (1985 and 1987) resulted in widespread power shortages and loss of production. In the 1990s, foreign debt has once again been on the rise; after reaching a low of \$3.5 billion in 1992, it had risen to \$10 billion in 1998.

The transition to a market economy also proved extremely painful. By 1992, grain production was only two-thirds of the 1989 level, GDP had fallen by 30%, industrial production had fallen 47% and inflation had reached 300%. Growth returned weakly in 1993, with GDP increasing 1%, but then gained some momentum, rising 3.9% in 1994, 6.9% in 1995 and 4% in 1996. In 1997, the government entered into an arrangement with the IMF for a standby agreement (SBA) supported by a credit line of \$430 million, but the agreement was suspended because of the government's slowness in implementing agricultural reform. At the end of 1997,

GDP had fallen -6.6% and inflation had soared to 151.4%. The effects of the Russian financial crisis in 1998, which came to a head in August, spread quickly to Romania, helping produce a further contraction of 7.3% of GDP for the year. Inflation, however, under new government restraints, moderated to 40.6%. Despite an austerity budget for 1999, inflation increased to 54.8% and the GDP contracted 3.2% for the year. In August 1999 the government entered into another SBA with the IMF, and in 2000 and 2001, GDP registered positive growth (1.6% and 4.1%, respectively), and decreasing inflation rates (40.7% and 37.5%, respectively). In October 2001 the government entered into its third SBA arrangement with the IMF, which was successfully completed in October 2003. In July 2004, a stand-by agreement was signed with the IMF. The agreement is to be completed in two years and is aimed at decreasing the account deficit and the inflation rate through a mix of monetary policies and structural reforms.

Romania's macroeconomic performance improved dramatically in the 21st century. Between 2001 and 2003, the GDP registered a 5% average growth; in 2004 the growth rate jumped to 8.3%—second only to Latvia in Europe. Inflation has decreased steadily over this time period, to reach single digit values (at 9.6%) in 2004, and predicted to fall to 7.5% in 2005, and 5.0% in 2006. The unemployment rate has remained fairly stable, averaging around 6% between 1997 and 2004.

This growth of the economy can be attributed to several factors. First and foremost, household consumption has expanded radically, fueled by higher real wages and remittances sent from people working abroad. Investments are another factor that contributed to this growth, peaking in 2004 with the acquiring of Petrom (the national oil company) by the Austrian OMV. Exports improved annually at double digits, although strong internal demand translated into higher imports.

Today, Romania boasts a technologically advanced market economy, a diverse and dynamic economic base, agricultural self-sufficiency, and a strong will to sustain the present economic boom.

## 20 INCOME

The US Central Intelligence Agency (CIA) reports that in 2005 Romania's gross domestic product (GDP) was estimated at \$186.4 billion. The CIA defines GDP as the value of all final goods and services produced within a nation in a given year and computed on the basis of purchasing power parity (PPP) rather than value as measured on the basis of the rate of exchange based on current dollars. The per capita GDP was estimated at \$8,300. The annual growth rate of GDP was estimated at 5.2%. The average inflation rate in 2005 was 8.9%. It was estimated that agriculture accounted for 13.1% of GDP, industry 33.7%, and services 53.2%.

According to the World Bank, in 2003 remittances from citizens working abroad totaled \$124 million or about \$6 per capita and accounted for approximately 0.2% of GDP. Foreign aid receipts amounted to \$601 million or about \$28 per capita and accounted for approximately 1.1% of the gross national income (GNI).

The World Bank reports that in 2003 household consumption in Romania totaled \$40.32 billion or about \$1,858 per capita based on a GDP of \$57.0 billion, measured in current dollars rather than PPP. Household consumption includes expenditures of individuals, households, and nongovernmental organizations on goods and services, excluding purchases of dwellings. It was estimated

that for the period 1990 to 2003 household consumption grew at an average annual rate of 2.2%. In 2001 it was estimated that approximately 36% of household consumption was spent on food, 9% on fuel, 3% on health care, and 20% on education. It was estimated that in 2002 about 28.9% of the population had incomes below the poverty line.

## 21 LABOR

Romania's labor force in 2005 was estimated at 9.31 million people. As of 2004, agriculture accounted for 31.6%, with 30.7% in industry, and 37.7% in the services sector. Unemployment was estimated at 6.5% in 2005. The Romanian economy is in the process of privatization. Private firms accounted for 64.5% of the workforce in 2001. However, the government was still prominent in the large industrial sector.

Labor legislation adopted in 1991 guarantees the right of private sector employees to associate freely, organize and join unions, bargain collectively, and carry out strikes. In 2005, there were about 18 nationwide trade confederations plus smaller independent unions. Unions are permitted to strike, but only after all attempts at arbitration have failed and a 48-hour advance notice is given to employers. However there have been complaints that the courts are biased towards ruling strikes illegal. Also, while the law protects the right to bargain collectively, contracts arising from collective bargaining have not been consistently enforced. However, at the branch and unit level, collective bargaining contracts covered around 80% of Romania's workforce in 2005.

Most employees work a five-day, 40-hour week with overtime pay rates for weekends, holidays and work over 40 hours. The minimum wage in 2005 was \$105 per month, and while the government also subsidizes necessities such as housing and health care, this does not provide a decent standard of living for a worker and family. Children under the age of 16 years are not permitted to work, although 15-year-olds may be employed with parental consent. Minors are also banned from working under hazardous conditions. However, child labor remains a problem in Romania. Neither the government nor industry has the resources to enforce safety and health standards in the workplace.

## 22 AGRICULTURE

Although under Communism the emphasis had been on industrialization, Romania is still largely an agricultural country. Of the total land area, 43% was arable land in 2003. Agriculture engaged about 15% of the active population and accounted for 12% of GDP in 2003.

The government began forming collective farms in 1949 and had largely completed the collectivization process by 1962. By 1985, of a total of 15,020,178 hectares (37,115,460 acres) of agricultural land, 29.7% was in state farms, with another 60.8% in large cooperative farms. The socialized sector consisted of 3,745 collectives, 419 state farms, and 573 farming mechanization units by 1985. The Land Reform of 1991 returned 80% of agricultural land to private ownership. Of the 14.8 million acres of agricultural land in 1996, some 2.6 million private producers farmed 44.6%; 20,400 associations of private producers farmed 25%; 1,171 state farms operated 12.8%; and public land accounted for the remaining 17.6%. Average farm size for private producers that year was 2.5 hectares (6.2 acres); for associations, 180 hectares (445 acres);

and for state farms, 1,620 hectares (4,003 acres). In 2003, Romania had 4,484,890 agricultural holdings, the highest in the European Union. That year, 64% of holdings were used for crops, 35% for animal farming, and 1% for agricultural services.

Grain growing has been the traditional agricultural pursuit, but the acreage has been reduced since World War II, and more area has been assigned to industrial and fodder crops. The 2004 production totals (in thousand tons) for major crops was wheat, 7,735; barley, 1,406; corn, 4,452; oats, 447; soybeans, 298; sunflower seeds, 1,558; sugar beets, 673; vegetables and melons, 4,573; potatoes, 4,230; and grapes, 1,230. In 2004, Romania produced an estimated 57 million liters of wine. That year, exports of agricultural products totaled \$765.3 million and agricultural imports amounted to \$2,145 million.

### **2<sup>3</sup> ANIMAL HUSBANDRY**

Romania has some 4.8 million hectares (11.9 million acres) of pastures. Animal production in Romania has developed somewhat more rapidly than crop production. The 1970 value of total livestock production, including the increase in herds and flocks as well as livestock products, was slightly more than double the level of 1938, and the 1974 value was 34% above that of 1970. In view of the initially low level of Romanian livestock production, development has been slow, however. The major reasons for the inadequate increases had been lack of economic incentives, insufficient fodder, and inadequate shelter. Since the overthrow of the Ceausescu regime in 1989, privatization of much of the grazing land has begun. In order to improve livestock raising, the government continues to stress agricultural modernization. Livestock productivity during 2002–04 was 10.8% higher than during 1999–2001.

The livestock numbers (in thousands) for 2005 were cattle, 2,950; hogs, 6,500; sheep, 7,430; and chickens, 87,500. After several years of livestock reduction, the hog and poultry inventories rose at the end of 1995, due to increases in the private sector. Sheep numbers have dropped because of exports. State farms were also forced to cut their flocks due to reduced grazing land and financial difficulties.

Production of livestock food products for 2005 consisted of 781,380 tons of meat, 5,720,000 tons of cow's milk, 344,000 tons of sheep's milk, 37,900 tons of cheese, 405,600 tons of eggs, and 7,154 tons of butter. In 2004, exports of meat amounted to \$37.2 million.

### **2<sup>4</sup> FISHING**

Romania lost an important fishing region and nearly all its caviar-producing lakes with the cession of Bessarabia to the USSR in 1940. But the Black Sea, the Danube and its floodlands, as well as other rivers, lakes, and ponds, are favorable to the development of the fishing industry, which expanded rapidly during the early 1970s. About 90% of the fish comes from the Danube floodlands and delta and 10% from the Black Sea. In 2003, the total catch was 19,092 tons, as compared with 95,473 tons in 1991 and 16,000 in 1960.

### **2<sup>5</sup> FORESTRY**

In 2004, forests covered 6.5 million hectares (16 million acres), representing about 27% of the total area of Romania, with 68% of forests state-owned. The forests are found mainly in the Carpathi-

an Mountains and in Transylvania, and are 70% hardwood (mostly beech and oak) and 30% softwood (mainly spruce and pine). Commercial forests account for 98% of the total forest area. About 40% of Romania's forests are damaged, and up to 25% are defoliated. Insects, air pollution, and fires are the main causes of tree damage. The amount of timber permitted to be cut is approved annually by the Romanian parliament, and was set at 18 million cu m (643 million cu ft) for 2005 (63% from state-owned forests). Roundwood production in 2004 was estimated at 17,500,000 cu m (618 million cu ft). Domestic lumber production is estimated at 5 million cu m (175 million cu ft) with more than half coming from small factories. Romania's furniture industry consists of about 2,400 furniture producers employing about 100,000 people, with exports of around €850 million in 2004. Forestry accounts for 3.5% of GDP and 9% of exports.

Between 1976 and 1985, 580,000 hectares (1,433,200 acres) were reforested. After the collapse of the Communist regime, domestic demand, exports, and reforestation plummeted. During 1990–2000, some 15,000 hectares (37,000 acres) were annually reforested. Since trade liberalization in 1997, Romania's wood industry has expanded; there are nearly 7,000 small and medium sized firms.

### **2<sup>6</sup> MINING**

Romania's production of metals, industrial minerals, and mineral fuels was mainly of regional importance. The country is a producer of aluminum, copper, lead, zinc, manganese, steel and ferroalloys.

Production of mined iron ore (gross weight) totaled 304,000 tons in 2003. Mined copper production (gross weight) totaled 21,317 metric tons in 2003. Bismuth (metal) output in 2003 was estimated at 40 metric tons in 2003, while gold mine output (metal content) in that year came to 400 kg. Silver mine production (metal content) totaled 18 metric tons in 2003. Among industrial minerals in 2003, Romania produced barite, bentonite, diatomite, feldspar, fluorspar, graphite, gypsum (394,000 tons), kaolin, lime (2.025 million tons), lime, nitrogen (content of ammonia), pyrites, salt, sand and gravel, caustic soda, soda ash, sulfur, and talc.

Metals and metalworking in the region were well documented by Roman times, when Romania and Bulgaria, respectively known as Dacia and Thrace, were important sources of base and precious metals. Gold and nonferrous metals mined in the region remained attractive investment opportunities.

### **2<sup>7</sup> ENERGY AND POWER**

Although Romania is the largest producer of oil in Central and Eastern Europe, it is a net importer of oil. The country also dominates the downstream petroleum industry in Southeastern Europe.

As of 1 January 2005, Romania had proven oil reserves estimated at 956 million barrels. Although Romania's oil production averaged an estimated 114,000 barrels per day in 2004, domestic demand for that year averaged an estimated 277,000 barrels per day, making the country a net importer, that year averaging 163,000 barrels per day. Romania is also the region's largest producer of refined petroleum products. Of the 11 refineries located in Southeastern Europe, 10 are located in Romania.

Romania, as of 1 January 2005, had proven reserves of natural gas estimated at 3.6 trillion cu ft. In 2002, natural gas production totaled an estimated 470 billion cu ft, while demand that year came to an estimated 646 billion cu ft, thus requiring imports totaling an estimated 176 billion cu ft.

In 2002, Romania had recoverable coal reserves estimated at 1,606 million short tons. As with oil and natural gas, Romania's demand for coal outstripped production. In 2002, demand was estimated at 36.3 million short tons, while output in that same year came to an estimated 33.6 million short tons. Imports that year were estimated at 2.7 million short tons. Romania's coal production consists of low-quality brown coal (lignite), while imports consist of anthracite for use in thermal power plants.

Romania's electric power is mostly generated by conventional thermal fuel plants, followed by hydroelectric and a single nuclear power plant. In 2002, Romania's electric generating capacity came to 21,568 million kW, with conventional thermal fuel plants accounting for 14,741 million kW, hydroelectric plants 6,122 million kW, and nuclear power for 0.705 million kW. Production in 2002 totaled 52,367 billion kWh, of which 59.9% was from fossil fuels, 30.3% from hydropower, and the rest from the country's sole nuclear plant. Consumption of electricity in 2002 was 45.847 billion kWh.

Romania's Cernavoda nuclear plant has one operating reactor. However, a second reactor is to start generating commercial power in 2006.

## 28 INDUSTRY

Industrial development received about half of all investment during the 1951–80 period. As officially measured, the average annual growth rate in gross industrial production between 1950 and 1980 was 12.3%, one of the highest in Eastern Europe. In 1993, however, industrial production was at only 47% of the 1989 level. The next year, industrial production increased by 3.3%. In 1995, it increased by 9.4% in absolute volume and was 13% higher than the 1992 output. In 1996, industrial production increased by 9.9% with the largest increases coming in the processing industry (12.5%) and machine and electronics (27.3%). After the Russian collapse of 1997, however, the industrial growth rate for 1998 was -17%. Industrial production picked up after Romania began to recover from its recession in 2000, and in 2001, the industrial growth rate was 6.5%.

Although industry continues to be a large sector of the economy (38% of GDP in 2003), it is partially in need of modernization and restructuring. (Agriculture contributed 13% to the GDP in 2003, while services came in first with 49.1%.) Key industries in 2004 included textiles and footwear, light machinery and automobile assembly, construction materials, metallurgy, chemicals, food processing, and petroleum refining. While in 2001 all of Romania's car manufacturers produced 68,761 automobiles, by 2004, Dacia alone produced 94,720.

Romania has been fairly successful in privatizing its industrial base—in 2005, less than 5% of the industrial assets were still in the hands of the state. While some privatizations have been plagued by corruption accusations, and while some of the newly privatized companies are not yet economically viable, the rest have benefited from switching leadership. Some of success stories include the privatization of Dacia (Romania's main car manufacturer), and of

Petrom (the national oil company), which were acquired by Renault and OMV respectively; the privatization of the bank sector has also been hailed as an important step towards a functional market economy—BCR and CEC, two of Romania's largest banks, are to be fully privatized by 2006.

## 29 SCIENCE AND TECHNOLOGY

The Romanian Academy, founded in 1866, has sections of mathematical sciences, physical sciences, chemical sciences, biological sciences, economical sciences, technical sciences, agricultural sciences and forestry, medical sciences, and science and technology of information. The Academy of Medical Sciences and the Academy of Agricultural and Forestry Sciences were both founded in 1969. All three organizations are located in Bucharest, and in 1996, had 67 research institutes attached to them.

In 2002, total research and development (R&D) expenditures amounted to \$555.266 million or 0.38% of GDP. Of that amount, 48.4% came from the government, while the business sector accounted for 41.6%. Foreign sources provided 7.1%, while higher education accounted for 3%. In that same year, there were 286 technicians and 910 scientists and engineers engaged in R&D per one million people. High technology exports in 2002 were valued at \$390 million, or 3% of the country's manufactured exports. In 1996, Romania had 22 universities offering courses in basic and applied sciences. In 1987–97, science and engineering students accounted for 21% of university enrollment.

## 30 DOMESTIC TRADE

Wholesale and retail trade were entirely in the socialized sector before 1990. By 1993, however, 50% of retail trade had been privatized. Since 1996, the government has worked more diligently, yet slowly, to create a market economy by eliminating consumer subsidies, liberalizing the exchange rates, and initiating tighter monetary policies. Further privatization programs are also underway and the government is considering ways to promote and encourage foreign commercial investment.

Domestic trade of consumer goods has been limited to local markets. There are only a few professional distributors and independent retailers tend to be rather small. The chief seaport is at Constanța. Cluj-Napoca, Timișoara, Iași, Craiova, and Brașov serve as regional industrial centers and railroad hubs. Oradea serves as a regional marketing and shipping center for livestock and agriculture. Arad is a regional commercial and industrial center in the west while Pitesti serves as a hub for the south-central region. Turgu-Mures serves as a regional industrial and agricultural center for central Romania.

Stores are open daily, except Sunday, from 10 AM to 6 PM. Food shop and retail department store hours are 7 AM to 9 PM Monday to Saturday and 7 AM to 12 noon on Sundays. There are however shops, especially small privately owned neighborhood stores, that are open nonstop. Also, the number of retailers and products has increased dramatically in the past years. Big companies like Metro, Billa, Selgros, and Carrefour opened stores in most of Romania's big cities, offering an increasing array of products.

Offices generally open at 7 or 8 AM and close at 3 or 4 PM. Exchange counters in banks transact public business from 8 AM to 12 noon, but exchange offices at border crossings remain open 24 hours a day.

SOURCE: 2003 *International Trade Statistics Yearbook*, New York: United Nations, 2004.**3<sup>1</sup> FOREIGN TRADE**

Before 1990, foreign trade was a state monopoly carried out through export-import agencies under the administration of the Ministry of Foreign Trade. Since World War II, the orientation and structure of Romanian foreign trade have shifted. Before the war, cereals, oil, timber, livestock, and animal derivatives accounted for over 90% of total exports, while consumer goods (60%) and raw materials (20%) accounted for the bulk of the imports. Under the Communist industrialization program, structural changes were particularly striking in exports, with machinery and nonedible consumer goods emerging as important export items. Foreign trade was in surplus throughout the 1980s, but fell into deficit in the 1990s. Romania's increasing trade deficit after 1994 was due in large part to the depreciation of its currency, large energy imports (despite large domestic reserves), and the loss of two important export markets due to international sanctions: Iraq and the former Yugoslavia (Serbia and Montenegro). The low quality of Romania's export products has also contributed to its large trade deficits. Additionally, with 80% of all imports taking the form of raw materials—principally oil, natural gas, and minerals—the country has little foreign exchange for the importation of equipment and technology of the type needed to modernize its sluggish industrial sector.

Exports in 2000 totaled \$10.4 billion and imports \$13.1 billion; the major export categories were apparel (22%); machinery and electric equipment (19%); metals and their manufactures (17%); mineral fuels (7.2%); chemicals and related exports (5.8%); and food products, beverages, and tobacco (2.6%). By 2004, the exports doubled to \$21 billion (FOB—Free on Board), while the imports grew to \$28 billion (CIF—Cost, Freight, and Insurance). For 2005, the exports were expected to grow to \$25 billion, and the imports to \$31 billion. Major export groups in 2004 were manufactures (especially textiles and footwear), basic metals and articles, and mineral products; the major import groups included capital goods, food, fuel and energy.

Trade with the EU countries, especially Germany, has increased substantially in recent years, largely because of Romania's expanding need for advanced Western technology and equipment. In the first quarter of 2004, Romania's main export markets were Italy

(with 22.8% of total exports), Germany (15.5%), France (8.5%), Turkey (6.8%), the United Kingdom (6.8%), Hungary (3.6%), Austria (3.3%), the Netherlands (3.2%), Greece (2.6%), and the United States (2.3%). Imports came mainly from Italy (16.9% of the total imports), Germany (13.8%), the Russian Federation (8.0%), France (7.0%), Turkey (4.3%), the United Kingdom (3.6%), Austria (3.4%), Ukraine (3.4%), China (3.2%), and Hungary (3.2%)

**3<sup>2</sup> BALANCE OF PAYMENTS**

Trade with Western countries has involved growing amounts of credits in recent years. As a result of a series of devaluations of the Romanian leu dating from February 1990, Western imports became increasingly costly while the quality of Romania's exports significantly declined. Romania's poor performance was additionally due to its reliance on the importation of raw materials—such as oil, natural gas and minerals—which accounted for as much as 80% of imports in 1995, leaving little exchange currency for equipment and technology.

Current account deficits have been financed in large measure by loans and grants from international financial institutions, but Romania has attempted to diversify its sources of external financing. Romania's external debt stood at \$11.6 billion in 2001. The country's international risk ratings have made it difficult for Romania to borrow from the private international credit market.

The US Central Intelligence Agency (CIA) reported that in 2001 the purchasing power parity of Romania's exports was \$11.5 billion while imports totaled \$14.4 billion resulting in a trade deficit of \$2.9 billion.

The International Monetary Fund (IMF) reported that in 2001 Romania had exports of goods totaling \$11.4 billion and imports totaling \$14.4 billion. The services credit totaled \$1.99 billion and debit \$2.20 billion. The exports of goods and services rose to \$24.6 billion in 2004, while the imports grew to \$29.2 billion; the trade deficit totaled \$4.6 billion.

### 33 BANKING AND SECURITIES

Romanian banks were nationalized in 1948. Established in 1880, the bank of issue is the National Bank of the Socialist Republic of Romania, which also extends short-term loans to state enterprises and supervises their financial activities. The Romanian Bank for Development (1990) finances investments of state enterprises and institutions and grants long-term credit. As investments increased in volume, this bank was required to intensify its control over the use of funds allocated for investment. The Romanian Bank for Foreign Trade conducts operations with foreign countries. Savings are deposited with the Loans and Savings Bank. In 1974, New York's Manufacturers Hanover Trust opened an office in Bucharest, the first such instance for a Western commercial bank in a communist nation.

Romania has generally been very cautious in its approach to banking reform. Since 1990, the financial sector has undergone a fundamental overhaul, although the pace of change has been slower than elsewhere in the region. The number of banks rose from five in December 1990 to 41 by the end of 2000—including four branches of foreign banks, four branches of joint ventures based abroad, and 33 domestic banks. The foreign specialized banks—for development, agriculture, and foreign trade—still handle almost all of the business in these areas. The Romanian Commercial Bank is still the banker to most Romanian firms, while the Savings Bank retains a virtual monopoly on personal savings deposits. At decade's end, Romania's financial institutions, like the rest of its economy, remained in severe and protracted crisis. Despite repeated calls from the IMF to privatize, the seven state-owned banks still controlled 70% of all assets in Romania's banks. Moreover, these banks continued to be plagued by bad debt.

The International Monetary Fund reports that in 2001, currency and demand deposits—an aggregate commonly known as M1—were equal to \$2.1 billion. In that same year, M2—an aggregate equal to M1 plus savings deposits, small time deposits, and money market mutual funds—was \$9.3 billion. The discount rate, the interest rate at which the central bank lends to financial institutions in the short term, was 35%.

Romania set up its first postwar stock exchange in 1995, after the enabling legislation has been delayed for several years. The RASDAQ (Romanian Association of Securities Dealers Automatic Quotation), an over-the-counter securities market, opened in 1996. As of 2001, the total market capitalization of the RASDAQ was \$2.1 billion, up 98% from the previous year. As of 2004, a total of 4,030 companies were listed on the combined Bucharest Stock Exchange and RASDAQ exchanges, which had a combined market capitalization of \$11.786 billion. In 2004, the BET Index rose 101% from the previous year to 4,364.7.

### 34 INSURANCE

During the Communist era, all commercial insurance was nationalized. Since 1991, casualty, automobile, and life insurance have been made available through private insurers with foreign partners. Private insurers are only legally permitted as joint-stock or limited liability companies. Policies available include life, automobile, maritime and transport, aircraft, fire, civil liability, credit and guarantee, and agricultural insurance, with third-party auto insurance compulsory. Foreign insurance companies and agencies

are now allowed to set up representative offices within Romania, though they must have a joint venture with a local company; a foreign company can own any percentage but 100%. In 2003, the value of all direct insurance premiums written totaled \$795 million, of which nonlife premiums accounted for \$608 million. Romania's top nonlife insurer that year had direct written nonlife premiums of \$139.5 million, while the nation's leading life insurer had gross written life insurance premiums of \$79.2 million.

### 35 PUBLIC FINANCE

The annual budget is presented to the Grand National Assembly around December and becomes effective for the fiscal year on 1 January. The state budget, prepared by the Ministry of Finance, is a central part of the financial plan for the whole economy. The reduction of the growth rate of expenditures during the early 1980s was in keeping with an economic stabilization program designed to hold down domestic investment and consumption. As a result of fiscal reforms begun since the fall of the Ceausescu regime in December 1989, adherence to IMF fiscal targets, and an unanticipated inflation-fed revenue windfall during the first half, the central government unofficially recorded a relatively modest deficit for 1991. Privatization of industry was accomplished in 1992 with the transfer of 30% of the shares of about 6,000 state-owned businesses to five private ownership funds, in which each adult citizen received certificates of ownership. As of the first decade of the 21st century, the government's priorities included reigning in of its fiscal policy, continuing to develop its relationship with the IMF, and continuing the process of privatization.

The US Central Intelligence Agency (CIA) estimated that in 2005 Romania's central government took in revenues of approximately \$29.9 billion and had expenditures of \$31.3 billion. Revenues minus expenditures totaled approximately -\$1.4 billion. Public debt in 2005 amounted to 21.1% of GDP. Total external debt was \$29.47 billion.

(...) data not available or not significant.

SOURCE: *Government Finance Statistics Yearbook 2004*, Washington, DC: International Monetary Fund, 2004.

The International Monetary Fund (IMF) reported that in 2001, the most recent year for which it had data, central government revenues were L312,534 billion and expenditures were L354,837 billion. The value of revenues was us\$9 million and expenditures us\$11 million, based on a market exchange rate for 2001 of us\$1 = L33,200.1 as reported by the IMF. Government outlays by function were as follows: general public services, 18.2%; defense, 5.1%; public order and safety, 7.1%; economic affairs, 13.9%; housing and community amenities, 1.9%; health, 15.5%; recreation, culture, and religion, 1.1%; education, 5.9%; and social protection, 31.4%.

### 36 TAXATION

Romania's taxation system in the 1990s was notable for its erratic and confusing nature, but with reforms in late 1999 there has been movement towards uniformity and simplicity. As of 2005, the standard corporate income tax rate in Romania was 16%. Profits from nightclubs, casinos, and discotheques were taxed at the standard corporate rate, with the stipulation that total tax could not be lower than 5% of qualifying gross revenue earnings. Capital gains are taxable at the normal corporate income tax rate of 16%, although a lower rate of 10% applies to the sale of corporate shares held in Romanian companies and the sale of Romanian real estate if the seller owned the real estate or shares for more than two years, and if the buyer is not related to the seller. Dividends, paid to either residents or resident companies by Romanian firms are subject to 10% withholding. Dividends paid to nonresident companies or individuals by Romanian firms are subject to a 15% withholding tax. Interest and royalties earned through nonresident companies are subject to withholding tax rates of 5% and 15%, respectively.

As part of the tax reform; Romania's top marginal rate for personal income tax was dropped from 60% to 40%. Personal income tax in 2003 was levied according to a progressive schedule with rates ranging from 18% (for taxable income above \$67/month; as of 1 January 2003 the monthly personal deduction was about \$57.35 up from \$51 in 2002), to 40% plus \$98/month (on increments of monthly income above \$370), with intermediate rates of 23% plus \$12; 28% plus \$35; and 34% plus \$62. The tax-exempt limit for a monthly pension payment was raised from \$159 in 2002 to \$182 in 2003. There are also property taxes.

The main indirect tax is Romania's value-added tax (VAT), with a standard rate of 19% as of 2005. Many basic services are exempt from VAT including banking and financial services. Other taxes include excise and stamp taxes.

### 37 CUSTOMS AND DUTIES

Romania joined the European Free Trade Association (EFTA) in December 1992 and signed an association agreement with the European Union early in 1993, which provided for Romania to adapt to EU economic-commercial standards over a 10-year period. Under an interim collaborative agreement effective 1 May 1993, a revised Romanian import tariff schedule was introduced with preferential tariffs for imports from European Union and EFTA member nations. Generally, customs duties range from 0–30%, with a weighted average of 11.7%. For imports of ores and fuels, the duties are zero or 3–10%. Duties are higher for cigarettes (8 ECUs plus 20%), spirits (100–150%), wines (20%), beer (55–70%),

and coffee (80%). Tariff rates are on an ad valorem basis. There is also a value-added tax (VAT) of 19% levied on almost all goods.

### 38 FOREIGN INVESTMENT

Foreign investment was negligible before the overthrow of the Communist regime. A new 1991 foreign investment law was enacted in 1991. Incentives to foreign investors include tax holidays and reduction, full foreign ownership of an enterprise, and full conversion and repatriation of after-tax profits. However, the latter is a drawn-out process because of the central bank's shortage of hard currency.

In 1997, the inflow of foreign direct investment (FDI) reached \$1.2 billion, and then rose to a record of over \$2 billion in 1998. Affected by the Russian financial crisis of August 1998, FDI inflow fell to a little over \$1 billion in 1999. Annual FDI inflow averaged about \$1.1 billion from 2000 to 2002. The FDI inflow continued to grow, reaching \$1.6 billion in 2003, and a whopping \$5.1 billion in 2004.

France, Austria, the Netherlands, Germany, the United States, and Italy have been the largest sources of FDI. The largest foreign operations are in the automobile, steel, oil and banking industries.

### 39 ECONOMIC DEVELOPMENT

The economy of Romania before 1990 was centrally planned and, for the most part, under complete state control. The nationalized industries and other economic enterprises operated within the state economic plan and were governed by the directives issued by the pertinent ministries. Economic planning, conducted by the State Planning Commission, emulated the Soviet example.

Nationalization of industry, mining, transportation, banking, and insurance on 11 June 1948 was followed by one-year economic plans in 1949 and 1950. These were succeeded by the first five-year plan (1951–55), which laid the groundwork for rapid industrialization, with emphasis on heavy industry, primarily machine-building. The state's second five-year plan (1956–60) provided for an increase of industrialization by 60–65%. Greater attention was given to consumer goods and to agriculture. A subsequent six-year plan (1960–65) envisaged an overall industrial increase of 110%, especially in producer goods. The five-year plan for 1966–70 realized an overall industrial increase of 73%. The five-year plans for 1971–75, 1976–80, and 1981–85 called for further industrial expansion and, according to official figures, during 1966–85 industrial production grew by 9.5% annually. The eighth five-year plan, for 1986–90, projected a 13.3–14.2% annual increase in Romania's net industrial production.

In the farming sector, the government has assiduously pursued a policy of collectivization. By virtue of the 22 March 1945 land reform, most farms over 50 hectares (123 acres)—a total of about 1.5 million hectares (3.7 million acres)—were confiscated without compensation. In 1949, the remaining large private farms were seized, and their 500,000 hectares (1,236,000 acres) organized into state farms. Various pressures, including coercion, were used to force peasants into joining. In April 1962, collectivization was announced as virtually completed, although there were farms, especially in remote areas, that were left in the hands of their rightful owners. Agricultural development in following years was comparatively neglected.

As of 1 January 1979, Romania began implementing the “new economic-financial mechanism,” an attempt to introduce into the Romanian economy the principle of workers’ self-management as previously developed elsewhere in Eastern Europe, notably in the former Yugoslavia and Hungary. Accordingly, autonomous production units were expected to plan for their own revenues and expenditures and manpower needs. These separate plans were, however, to be harmonized with the national economic plan, so that Romania’s centralized system of goal and price setting was not significantly altered.

One of the major economic targets in the 1980s was the reduction of foreign debt, which was achieved but at the cost of drastic austerity measures and reduced industrial growth. After the fall of Communism, a major objective was the privatization of 6,200 state enterprises. The economy was to be completely restructured, with the emphasis on private ownership and adherence to the market for the allocation of resources. By late 1996, nearly all the country’s agricultural land had been returned to private ownership, but only 65% of all eligible recipients had been officially given title. By 2002, Romania had privatized many major state-owned enterprises, with the help of the World Bank, International Monetary Fund (IMF), and the European Union. The private sector in 2002 accounted for an estimated 65% of gross domestic product (GDP).

Economic growth declined in the late 1990s, but picked up in the early 2000s. Inflation, once a problem (it stood at 18% at the end of 2002), has been reduced to single figures in 2004, and is predicted to drop to 5% by 2006. In 2004, the foreign direct investment in Romania reached \$5.1 billion (second only to the Czech Republic in Europe), while the GDP registered a whopping 8.3% increase (second only to Latvia in Europe). The economy is expected to grow at a rate of around 7% in the coming years.

Romania is seeking admission to the European Union, with accession envisaged for 2007. The accession could however be postponed until 2008 if Romania fails to implement the necessary reforms (one of the biggest problems that still needs to be addressed is corruption). The center-right government that was elected in 2004 is confident however that 2007 is a realistic target, and is working hard towards achieving that goal. In December 2004 Romania closed the pre-accession negotiation with the European Union, in October 2004 it received the “functionally market economy” status, and it is looking to continue its sustained economic growth in the years preceding the accession.

However, one of the biggest concerns that Romanian policy makers are having is the capacity of the country to respond to EU market pressures once it will be part of that organization. While some sectors have registered significant progress, others are still lagging and will probably suffer once the accession is completed. For example, Romania’s main car manufacturer, Dacia—now owned by Renault, has been very successful in acquiring an important share of the internal and external market with its new model—Logan; the information technology (IT) industry is one of the most vibrant in Europe (a study recently done by Brain-bench found that Romania is in fourth place globally, in terms of its IT workforce numbers). The agriculture sector, on the other hand, suffers from fragmentation, lack of economic cohesion (economies of scale are hard to achieve on small parcels of land that are owned by people with different interests), and a lack of future perspective.

In 2005, the new center-right government has introduced a 16% flat tax on both wages and firm turnover—one of Europe’s most liberal taxation systems. This fiscal reform is expected to strengthen the economic boom, increase foreign investment, bring to light the gray economy, and lower corruption.

#### 40 SOCIAL DEVELOPMENT

A social insurance system has been in place since 1912. Social security covers most wage earners, and a voluntary system is in place for persons wishing additional coverage. Old-age pensions are granted at age 65 for men and at 60 for women. Those engaged in hazardous or arduous work are eligible for retirement earlier. The program is funded by contributions from employers and employees, with deficits covered by the government. Workers who do not meet the conditions of duration of employment at retirement age are provided with social assistance. Survivors’ benefits are payable to the spouse, father and mother, and brothers and sisters who are dependents of the deceased, and to children up to age 16. Workers’ compensation and unemployment insurance are also provided, as well as maternity benefits and family allowances.

All residents are entitled to medical care. Families with children under age 16 receive family allowances and a birth grant for each child. In addition to state social insurance, other schemes cover members of artisans’ cooperatives, the clergy, and the professions.

The constitution guarantees equal pay for equal work, but women are still concentrated in low-paying professions. Few women are in senior management positions in the private sector. Women also face considerable employment discrimination in Romania’s harsh economic climate and suffer from a higher rate of unemployment than do men. Violence against women, including rape, is a serious problem. It is difficult to bring rape cases to trial because the victim’s testimony is not considered sufficient evidence; medical evidence and witnesses are required. Domestic abuse is widespread.

Ethnic Hungarians are the largest minority and are subject to discrimination. The Roma population continues to be harassed, and there are reports of anti-Semitic activity. Human rights are generally respected although there were continued reports of the mistreatment of detainees. The government has improved prison conditions and instituted vocational training, but prisons are still overcrowded.

#### 41 HEALTH

As part of a broader social and economic transition, Romania’s health care system underwent major reforms in the 1990s as it was transformed from a centralized, tax-based system to a pluralistic one based on contractual relationships between health care providers and insurance funds. Until the end of the decade, primary care was provided mainly through some 6,000 public-sector dispensaries throughout the country, with each patient assigned to a facility. Patients have subsequently been allowed to choose their own dispensary and general practitioner. As of 2004, there were an estimated 189 physicians, 402 nurses, and 23 dentists per 100,000 people. Total health care expenditure was estimated at 4.6% of GDP.

Increased mother and child care lowered the infant mortality rate from 143 per 1,000 live births in 1948 to 15.39 in 2005.

The general health of the population has likewise improved, with several previously serious diseases eliminated or greatly reduced (e.g., diphtheria, tuberculosis), although proper sanitation was available to only 53% of the population and safe drinking water to 58%. Leading causes of death were cardiovascular disease, cancer, and respiratory diseases. Overall mortality was 12.3 per 1,000 people as of 2002. Average life expectancy in 2005 was 71.35 years. Romania's birth rate in 2002 was an estimated 10.8 per 1,000 people. About 48% of married women (ages 15 to 49) used contraception. The total fertility rate was 1.3 children per woman during her childbearing years. Immunization rates for children up to one year old were: tuberculosis, 100%; diphtheria, pertussis, and tetanus, 97%; polio, 97%; and measles, 97%.

The HIV/AIDS prevalence was 0.10 per 100 adults in 2003. As of 2004, there were approximately 6,500 people living with HIV/AIDS in the country. There were an estimated 350 deaths from AIDS in 2003.

#### 42 HOUSING

Inadequate housing has been a serious problem since World War II. Romanian housing suffered from the 1940 earthquake, war damage, neglect, and inadequate repair and maintenance after the war. An increase in the urban population caused by industrialization and emphasis on capital construction exacerbated the problem. Since 1965, the government has encouraged private construction by state support in the form of credits and expertise. However, an uncertain economy means that maintenance for existing properties has been somewhat poor.

In 1999, the total housing stock was at about 7.88 million units. At the 2002 census, there were 8,107,114 dwellings serving 21.6 million people. About 56.8% of all dwellings were single-family detached houses of two or three rooms. About 97% of all units are under private ownership. About 47% of all residential buildings were built in the period 1945–70.

#### 43 EDUCATION

Education is compulsory for students between the ages of 6 and 16. The general course of study includes four years of primary school followed by four years of lower secondary school. Students may attend art or trade schools after their primary education is complete. At the upper secondary level, students may choose between schools offering general studies, vocational programs, or technical studies. Upper secondary programs generally last from three to four years. The academic year runs from October to June.

In 2001, about 75% of children between the ages of three and six were enrolled in some type of preschool program. Primary school enrollment in 2003 was estimated at about 89% of age-eligible students. The same year, secondary school enrollment was about 81% of age-eligible students. It is estimated that about 89.4% of all students complete their primary education. The student-to-teacher ratio for primary school was at about 18:1 in 2003; the ratio for secondary school was about 14:1.

Admission to an advanced institution depends on a variety of factors, including the student's social background. Over half the students receive government assistance. Yearly quotas are established by the Ministry of Education according to manpower needs. Students in some fields must first complete six months of practical work in industry or agriculture.

In 1959, the Romanian Victor Babes University (founded 1919) and the János Bolyai University (1945) for Hungarian minority students, both in Cluj-Napoca, were merged into the Babes-Bolyai University in order to strengthen "socialist patriotism." There are six other universities—in Bucharest (founded in 1864), Braşov (1971), Craiova (1966), Galati (1948), Iaşi (1860), and Timişoara (1962).

Like the other formerly Communist countries, Romania has emphasized polytechnic education in recent years. This "link of education with life" in the early grades means studying practical subjects; however, beginning in the upper grades there are work programs, often directly in enterprises, in workshops, or on collective farms, depending on the locality.

In 2003, about 35% of the tertiary age population were enrolled in some type of higher education program. The adult literacy rate for 2004 was estimated at about 97.3%. As of 2003, public expenditure on education was estimated at 3.5% of GDP.

#### 44 LIBRARIES AND MUSEUMS

The National Library in Bucharest holds over 8.7 million items. The Romanian Academy Library in Bucharest is also a national library. It holds about 10 million items, mainly on the history and culture of the Romanian people. The next largest public libraries are the university libraries at Bucharest (1.4 million volumes), Iaşi (3 million), and Cluj-Napoca (3.6 million).

Romania has some 400 museums. Bucharest is home to many of the most important museums, including the National History Museum of Romania, the National Museum of Art, and the newer Historical Museum of Bucharest (founded in 1984) and Cotroceni National Museum (1991), featuring Romanian fine art, architecture, and decorative art. Also in the capital are the Cecilia and Frederick Storck Museum, highlighting the works of Karl Storck, a great Romanian sculptor, and his family, also prominent artists; the Curteio Veche Museum, featuring archaeological exhibits and housed in a 15th-century palace; and the Museum of Romanian Literature.

#### 45 MEDIA

In 2003, there were an estimated 199 mainline telephones for every 1,000 people; about 465,000 people were on a waiting list for telephone service installation. The same year, there were approximately 324 mobile phones in use for every 1,000 people.

In 2004, Romanian Public Television controlled four national stations. Radio Romania operates one domestic and one external service. There are several privately owned commercial stations in both television and radio. As of 1998, there were 40 AM and 202 FM radio broadcasting stations. A 1995 report indicated there were 48 television stations. In 2003, there were an estimated 358 radios and 697 television sets for every 1,000 people. About 172.5 of every 1,000 people are cable subscribers. Also in 2003, there were 96.6 personal computers for every 1,000 people and 184 of every 1,000 people had access to the Internet. There were 65 secure Internet servers in the country in 2004.

The leading daily newspapers (with 2002 circulation figures) are *Evenimentul Zilei* (*Events of the Day*, 200,000); *Adevarul de Cluj* (*Truth of Cluj*, 200,000); *Romania Libera* (*Free Romania*, 100,000); *Adevarul* (*Truth*, 85,000); and *Libertatea* (*Liberty*, 75,000).

Though the constitution provides for freedom of expression and prohibits censorship, it is illegal to “defame” the country. Journalists are prosecuted under this law and sentenced to prison terms.

#### 46 ORGANIZATIONS

Economic organizations concerned with Romania’s internal and external economic activities include the Romanian Chamber of Commerce and Industry. In 1992 the Council for National Minority Affairs was formed for the discussion of minority issues. The organization helps the government formulate policies favorable to the minorities of the country. The body is headed by the Secretary General of the government. Representatives from 16 officially recognized minority groups and 12 government ministries make up the organization.

There are also many cooperatives in key sectors of the economy. Many Romanian farmers belong to the private Farmers’ Federation. There are about 4,000 farming cooperatives and 41 district unions. A large cooperative located in the manufacturing and consumers sectors of the economy is the Central Union of Commerce and Credit Cooperative. There are over 2,500 production and 850 credit cooperatives. Another important cooperative is the Central Union of Handicraft Cooperatives. The National Union of the Consumers’ Cooperatives is based in Bucharest. There is also an active Association for the Protection of Consumers.

The Romanian Academy was founded in 1866 to promote public interest, education, and research in scientific fields. Several professional associations also promote research and public education in specific fields, such as the Romanian Medical Association.

Serving a very specific cultural niche, the Transylvania Society of Dracula, based in Bucharest, promotes the study of the Bram Stoker novel, *Dracula*, and the life of Prince Vlad Dracula, on whom the book is loosely based.

National youth organizations include the Free Youth Association of Bucharest, the League of Students, National Union of Independent Students of Romania, Junior Chamber, Romanian Council of Churches-Youth Unit, the National Scout Organization of Romania, and YMCA/YWCA. There are several sports associations representing a variety of pastimes, such as tennis, skating, track and field, baseball and softball, and badminton.

Civitas Foundation for the Civil Society, established in 1992, sponsors community development and social programs promoting an open, democratic society. Other social action groups include the League for the Defense of Human Rights in Romania and the Women’s Association of Romania. There are national chapters of the Red Cross Society, UNICEF, and Habitat for Humanity.

#### 47 TOURISM, TRAVEL, AND RECREATION

The Carpathian Mountains, the Black Sea coast, and the Danube region were developed to attract large numbers of tourists. Major attractions include many old cities and towns (Braşov, Constanţa, Sibiu, Sighisoara, Suceava, Timişoara, and others) and more than 120 health resorts and spas. The monasteries in Bukovina are famous for their exterior frescoes. Castle Dracula, the castle of Prince Vlad of Wallachia, has been a tourist attraction since the 1970s.

Popular sports are football (soccer), skiing, hiking, swimming, canoeing, wrestling, handball, and gymnastics. Between 1965 and 1984, Romanian athletes won 176 Olympic medals (48 gold, 52

silver, and 76 bronze). Romania was the only Socialist country to send athletes to the 1984 games in Los Angeles; all the others, following the USSR’s lead, boycotted these games.

A valid passport is required to enter Romania of all foreign nationals except those of the countries of the European Union who only need an identity card. Citizens of the United States, Canada and most European countries do not need a visa for stays of up to 90 days.

In 2003, tourist arrivals numbered 5,594,828, of whom 96% came from Europe. Tourism expenditure receipts totaled \$523 million. There were 97,320 hotel rooms with 201,636 beds and an occupancy rate of 34%. The average length of stay was 3.5 nights.

In 2004, the US Department of State estimated the daily cost of staying in Bucharest at \$228. Other areas were significantly lower at \$152 per day.

#### 48 FAMOUS ROMANIANS

Perhaps the most famous historical figure in what is now Romania was Vlad (1431?–76), a prince of Wallachia who resisted the Turkish invasion and was called Tepes (“the impaler”) and Dracula (“son of the devil”) because of his practice of impaling his enemies on stakes; he was made into a vampire by Bram Stoker in his novel *Dracula*. The first leader of Communist Romania was Gheorghe Gheorghiu-Dej (1901–65), who held the office of premier from 1952 to 1955 and of president of the State Council from 1961 until his death. Nicolae Ceausescu (1918–89) was general secretary of the Communist Party between 1965 and 1989 and head of state from 1967 to 1989; his wife, Elena (1919–89), was a member of the Permanent Bureau of the Executive Committee of the Communist Party.

Ion Heliade-Radulescu (1802–72) founded the Bucharest Conservatory and the National Theater and became first president of the Romanian Academy. Mihail Kogalniceanu (1817–91), a leading statesman in the early Romanian monarchy, inaugurated modern Romanian historiography. Vasile Alecsandri (1821–90) was a leader of the traditionalist school of writers, which sought its inspiration in the Romanian past rather than in imitations of foreign writers. Mihail Eminescu (1850–89) is regarded as an outstanding poet, famous for romantic lyricism. His friend Ion Creanga (1837–87) drew from folklore and wrote with a gaiety and gusto recalling Rabelais. The nation’s greatest playwright was Ion Luca Caragiale (1852–1912), who excelled in social comedy; an internationally famous Romanian-born playwright, Eugène Ionesco (1912–94), settled in Paris in 1938. Mihail Sadoveanu (1880–1961) was an important novelist in the period between the two world wars. Romanian-born Elie Wiesel (b.1928), in the United States from 1956, is a writer on Jewish subjects, especially the Holocaust, and a winner of the Nobel Peace Prize in 1986. Romanian-born Mircea Eliade (1907–86) was a scholar in comparative religion and comparative mythology, in the United States from 1948. Romanian-born Tristan Tzara (1896–1963), a literary and artistic critic who settled in Paris, was one of the founders of Dadaism. Nicolae Grigorescu (1838–1907) and Ion Andreescu (1850–82) were leading painters, as was Theodor Aman (1831–91), a modern artist and founder of the School of Fine Arts in Bucharest. Saul Steinberg (1914–1999) was a cartoonist and illustrator, best known for his work for *The New Yorker* magazine; he emigrated to the United States in 1942. Sculpture was greatly advanced by Constantin Brâncusi (1876–

1957). Perhaps the greatest names Romania has given to the musical world are those of the violinist and composer Georges Enescu (1881–1955), known for his *Romanian Rhapsodies*, and the pianist Dinu Lipatti (1917–50). A prominent tennis player is Ilie Nastase (1946–94); gymnast Nadia Comaneci (b.1961) won three gold medals at the 1976 Olympics and two gold medals at the 1980 games.

#### **49 DEPENDENCIES**

Romania has no territories or colonies.

# RUSSIA

Russian Federation  
*Rossiyskaya Federatsiya*

**CAPITAL:** Moscow

**FLAG:** Equal horizontal bands of white (top), blue, and red.

**ANTHEM:** *Patriotic Song*.

**MONETARY UNIT:** The ruble (₽) is a paper currency of 100 kopecks. There are coins of 1, 2, 3, 5, 10, 15, 20, and 50 kopecks and 1 ruble, and notes of 100, 200, 500, 1,000, 5,000, 10,000 and 50,000 rubles. 1₽ = \$0.03550 (or \$1 = 28.17) as of 2005.

**WEIGHTS AND MEASURES:** The metric system is the legal standard.

**HOLIDAYS:** New Year's Day, 1–2 January; Christmas, 7 January; Women's Day, 8 March; Spring and Labor Day, 1–2 May; Victory Day, 9 May; State Sovereignty Day, 12 June; Socialist Revolution Day, 7 November.

**TIME:** 3 PM Moscow = noon GMT.

## <sup>1</sup>LOCATION, SIZE, AND EXTENT

Russia is located in northeastern Europe and northern Asia. It is the largest country in the world—slightly less than 1.8 times the size of the United States—with a total area of 17,075,200 sq km (6,592,771 sq mi). Russia shares boundaries with the Arctic Ocean on the n; northern Pacific Ocean on the e; China, Mongolia, Kazakhstan, the Caspian Sea, Azerbaijan, Georgia on the s; and the Black Sea, Ukraine, Belarus, Latvia, Estonia, Finland on the w with a total land boundary of 19,990 km (12,421 mi) and a coastline of 37,653 km (23,396 mi). Russia's capital city, Moscow, is located in the western part of the country.

## <sup>2</sup>TOPOGRAPHY

From west to east, the country can be roughly divided into five large geographic regions: the Great European Plain, the Ural Mountains, the West Siberian Plain, the Central Siberian Plateau, and the mountains of the northeast and southeast. The Great European and West Siberian Plains contain a variety of terrain, including grasslands and farmlands as well as forests, swamps, and large regions of tundra. The Caucasus Mountains, located between the Black Sea and the Caspian Sea at the southwest of the Great European Plain, are divided into two chains separated by lowlands. The Caucasus Mountains form the border with Russia, Azerbaijan, and Georgia and mark the boundary between Asia to the south and Europe to the north. The highest peak in the Caucasus Mountains is the extinct volcano Mt. Elbrus (5,642 m/18,510 ft); this is also the highest peak in Russia and Europe. The lowest point in Russia is at the Caspian Sea, 28 m (92 ft) below sea level. The Caspian Sea is the world's largest lake.

The plains are divided by the Ural Mountains, which define the boundary between Asia on the east and Europe on the west. They extend about 2,100 km (1,300 mi) from the Arctic Ocean to the northern border of Kazakhstan; the highest point in the Urals is Mt. Narodnaya at 1,894 m (6,212 ft). The Central Siberian Plateau ranges in height from 500–700 m (1,600–2,300 ft). A number

of rivers and deep canyons stretch across this area. The highest mountains of the eastern region are the Altay Shan, which reach a peak of 4,619 m (15,157 ft) at Mt. Pelukha. The other eastern mountain regions average less than 3,048 m (10,000 ft) in height.

The longest river in Russia is the Ob, which stretches through the West Siberian Plain to the Arctic Ocean for a length of 5,410 km (3,362 mi). The most important river commercially is the Volga, which stretches for 3,689 km (2,293 mi) through the Great European Plain to the Caspian Sea. The Volga is the longest river in Europe. The Dnieper is another important river in this region. The Amur River flows along the southeast border of the country into the Pacific. The largest lake in Russia is Lake Baikal (Ozero Baykal—30,510 sq km/11,870 sq mi), located in the southern plateau region.

Despite its size, only a small percentage of Russia's land is arable, with much of it too far north for cultivation.

Most of western Russia is located on the Eurasian Tectonic Plate, with seismic activity occurring frequently in the Caucasus Mountains. The eastern coast lies on the North American Plate near the boundary with the Pacific Plate. This eastern coast is part of the "Ring of Fire," a seismically active band surrounding the Pacific Ocean. While many of the resulting earthquakes are moderate (below 6.0 magnitude on the Richter scale), more severe quakes are not uncommon. In 2003, a 6.8 magnitude quake occurred near Primorye in July. In September of the same year, a 7.3 magnitude quake occurred along the Xinjiang border region; in October a 6.7 magnitude quake hit in southwestern Siberia; and in December another 6.7 quake hit at Komandorskiye Ostrova. On 10 June 2004, a 6.9 magnitude quake occurred at the Kamchatka Peninsula (Poluostrov Kamchatka).

## <sup>3</sup>CLIMATE

Most of the country has a continental climate, with long, cold winters and brief summers. There is a wide range of summer and winter temperatures and relatively low precipitation. January temperatures are in the range of 6°C (45°F) on the southeastern shore

of the Black Sea. A record low temperature of  $-71^{\circ}\text{C}$  ( $-96^{\circ}\text{F}$ ) was recorded in 1974 at the northeast Siberian village of Oymyakon, the lowest temperature ever recorded anywhere in the world for an inhabited region. In many areas of Siberia the soil never thaws for more than a foot.

Annual precipitation decreases from about 64–76 cm (25–30 in) in the European region to less than 5 cm (2 in) a year in parts of Central Asia. The tundra has long winters, with summers lasting one or two months, and receives 8–12 months of snow or rain. The far northern forest, like most of the country, has long severe winters, short summers, and extremely short springs and autumns. Precipitation is low but falls throughout the year, varying from 53 cm (21 in) at Moscow to 20–25 cm (8–10 in) in eastern Siberia. The steppes have very cold winters and hot, dry summers.

#### 4 FLORA AND FAUNA

Russia has several soil and vegetation zones, each with its characteristic flora and fauna. Northernmost is the so-called arctic desert zone, which includes most of the islands of the Arctic Ocean and the seacoast of the Taymyr Peninsula. These areas are characterized by the almost complete absence of plant cover; only mosses and lichens are to be found. Birds and mammals associated with the sea (sea calf, seal, and walrus) are typical of this zone.

The tundra, which extends along the extreme northern part of Asia, is divided into arctic, moss-lichen, and shrubby tundra subzones. Only dwarf birches, willows, lichens, and mosses grow in the thin layer of acidic soil. Indigenous fauna include the arctic fox, reindeer, white hare, lemming, and common and willow ptarmigan.

South of the tundra is the vast forest zone, or taiga, covering half of the country; the soil here is podzolic. The northern areas of this zone are characterized by the alternation of tundra landscape with sparse growth of birches, other deciduous trees, and spruce. Farther south are spruce, pine, fir, cedar, and some deciduous trees. There are subzones of mixed and broadleaf forests on the Great Russian Plain in the southern half of the forest zone. Wildlife in the taiga include moose, Russian bear, reindeer, lynx, sable, squirrel, and among the birds, capercaillie, hazel-grouse, owl, and woodpecker. In the broadleaf woods are European wild boar, deer, roe deer, red deer, mink, and marten.

Farther south is the forest-steppe zone, a narrow band with the boundaries of the Great Russian plain and the West Siberian low country. Steppes with various grasses alternate with small tracts of oak, birch, and aspen. Still farther south, the forest-steppe changes to a region of varied grasses and small plants. The black and chestnut soils of this zone produce the best agricultural land in Russia. Typical mammals are various rodents (hamsters and jerboas); birds include skylarks, cranes, eagles, and the great bustard.

In the semidesert zone, plant cover includes xerophytic grasses and shrubs. Typical animals are the wildcat and saiga antelope; lizards, snakes, and tortoises are common. The semidesert areas and the deserts of Central Asia and Kazakhstan make up a separate subregion.

As of 2002, there were at least 269 species of mammals, 528 species of birds, and over 11,400 species of plants throughout the country.

#### 5 ENVIRONMENT

Decades of Soviet mismanagement resulted in the catastrophic pollution of land, air, rivers, and seacoasts. Air pollution is especially a problem in the Urals and Kuznetsk (where vast populations are exposed to hazardous emissions from metal-processing plants) as well as in the Volga and Moscow regions. In 1992 Russia had the world's third-highest level of industrial carbon dioxide emissions, which totaled 2.1 billion metric tons, a per capita level of 14.11 metric tons. However, in 1996 the total dropped to 1.5 billion metric tons and in 2000 the total was about 1.4 billion metric tons.

The Volga River has been damaged through rash exploitation of hydroelectric power. Lake Baikal (Ozero Baykul) is the largest freshwater reservoir in the world, but has been heavily polluted through agricultural and industrial development.

About 7.8% of Russia's total land area was protected as of 2003, including 8 natural UNESCO World Heritage Sites and 35 Ramsar wetland sites. According to a 2006 report issued by the International Union for Conservation of Nature and Natural Resources (IUCN), threatened species included 43 types of mammals, 47 species of birds, 6 types of reptiles, 18 species of fish, 1 type of mollusk, 29 species of other invertebrates, and 7 species of plants. Threatened species included Atlantic sturgeon, beluga, crested shelduck, Amur leopard, Siberian tiger, Mediterranean monk seal, Wrangel lemming, and the Oriental stork. The great auk, Palla's cormorant, and Steller's sea cow have become extinct.

#### 6 POPULATION

The population of Russia in 2005 was estimated by the United Nations (UN) at 143,025,000, which placed it at number 8 in population among the 193 nations of the world. In 2005, approximately 13% of the population was over 65 years of age, with another 16% of the population under 15 years of age. There were 87 males for every 100 females in the country. According to the UN, the annual population rate of change for 2005–10 was expected to be  $-0.6\%$ , a rate the government viewed as too low. Russia's fertility rate is among the lowest in the world. The projected population for the year 2025 was 130,175,000. The overall population density was 8 per sq km (22 per sq mi), but the population is distributed unequally, with rural areas being very sparsely populated.

The UN estimated that 73% of the population lived in urban areas in 2005, and that urban areas were growing at an annual rate of  $-0.49\%$ . The capital city, Moscow, had a population of 10,469,000 in that year. Other large urban areas and their population estimates include St. Petersburg (formerly Leningrad), 5,315,000; Novosibirsk, 1,425,000; Nizhniy Novgorod (formerly Gorkiy), 1,288,000; Yekaterinburg (formerly Sverdlovsk), 1,420,000; Samara (formerly Kuybyshev), 1,140,000; Omsk, 1,132,000; Kazan, 1,108,000; Rostov-on-Don, 1,081,000; Chelyabinsk, 1,067,000; Ufa, 1,035,000; Volgograd, 1,016,000; Perm, 984,000; Krasnoyarsk, 912,000; Saratov, 868,000; and Voronezh, 842,000.

#### 7 MIGRATION

During 1979–88, Russia gained 1,747,040 people through net migration from other Soviet republics. Germany took in 156,299 former Soviet Germans in 1991. As of May, 1996, there were

LOCATION: 60°0' N; 30°0' E. BOUNDARY LENGTHS: Total land boundary lengths, 20,139 kilometers (12,514 miles); Azerbaijan, 284 kilometers (177 miles); Belarus, 959 kilometers (596 miles); China (southeast), 3,605 kilometers (2,240 miles); China (south), 40 kilometers (25 miles); Estonia, 290 kilometers (180.2 miles); Finland, 1,313 kilometers (816 miles); Georgia, 723 kilometers (450 miles); Kazakhstan, 6,846 kilometers (4,254 miles); North Korea, 19 kilometers (12 miles); Latvia, 217 kilometers (135 miles); Lithuania, 227 kilometers (141 miles); Mongolia, 3,441 kilometers (2,138 miles); Norway, 167 kilometers (104 miles); Poland 432 kilometers (268 miles); Ukraine, 1,576 kilometers (980 miles); total coastline 37,653 kilometers (23,398 miles).

still 75,000 internally displaced persons from the Chernobyl accident in 1986. Following the military conflicts in Chechnya of 1994, 220,000 people fled to the neighboring republics of Dagestan, Ingushetia, and North Ossetia. Between 1989–95, 169,000 Russians returned from Azerbaijan, and 296,000 returned from Kyrgyzstan. Between 1991–95, 50,000 Russians returned from Belarus; 614,000 returned from Kazakhstan; and 300,000 from Tajikistan. In 1991, 400,000 returned from Uzbekistan, and 100,000 returned from Turkmenistan from 1993–95. As reported in 2005 by the US Department of State, Russia is a major source of women trafficked globally for the purpose of sexual exploitation. It is also a significant destination and transit country for persons trafficked for sexual and labor exploitation from regional and neighboring countries into Russia, and on to the Gulf states, Europe, Asia, and North America. In addition, the International Labour Organization estimated that of the five million illegal immigrants in Russia, 20% are victims of forced labor. Trafficking of children and of

child sex tourism is also reported. Internal trafficking from rural to urban areas remained a problem.

As of 1999, there were 400 refugees, 10,000 asylum seekers, 173,000 internally displaced people (mainly from Chechnya and Ingushetia), and an estimated 3.5–4 million forced migrants. By the end of 2004, there were 1,852 refugees, 315 asylum seekers, 54 returned refugees, mainly from the surrounding former Soviet states. In addition, there were 334,796 internally displaced persons, which included 100,000 Afghans in a refugee-like situation, 73,004 forced migrants, 10,755 Meskhetians, and 5,177 non-CIS asylum seekers.

In 2005, the net migration rate was an estimated 1.03 migrants per 1,000 population. Remittances reported for 2003 were \$300 million.

## <sup>8</sup>ETHNIC GROUPS

According to the 2002 census, about 79.8% of the population is Russian. Tatars constitute 3.8%, Ukrainians make up 2%, Bashkir

account for 1.2%, and Chuvash form 1.1%. Belarussians and Moldovans each make up less than 1% of the population. The Romani population, according to the 2002 census, was reported at about 182,000 people; however, unofficial estimates place the number at about 1.2 million. Small communities of indigenous groups include the Buryats in Siberia and the Enver, Tatarli, and Chukchi in the North.

## <sup>9</sup>LANGUAGES

About 90% of the population speaks Russian, a member of the eastern group of Slavic languages. It is highly inflected, with nouns, pronouns, and adjectives declined in six cases. There are three grammatical genders. The language, which has been written since about AD 1000, uses the Cyrillic alphabet of 33 letters. In addition, a wide variety of other Slavic, Finno-Ugric, Turkic, Mongol, Tungus, and Paleo-Asiatic languages also are spoken. In the republic of Dagestan alone, two million people share 28 languages, 14 of which are unwritten.

The breakup of the Soviet Union has produced a surge in regional autonomy and a backlash against the Russian language and the Cyrillic alphabet in many of Russia's 21 republics. Tatarstan, for example, is considering a reintroduction of the Latin script for Tatar, while Buriatia may restore Old Mongol lettering for Buriat. Stalin imposed the Cyrillic alphabet on Russia's minority groups in an effort to make Russian the national language. Russian is the official language of the country and one of the six official languages of the United Nations.

## <sup>10</sup>RELIGIONS

The Russian Orthodox Church (ROC) dates back to the "Kievan Rus" period (the first organized Russian state). In 988, Prince Vladimir, in order to gain an alliance with the powerful Byzantine Empire, declared Christianity as the religion of his realm and mandated the baptism of Kiev's population and the construction of cathedrals. During the Mongol occupation (1240–1480), the head of the ROC (Metropolitan) was moved to Moscow. Throughout the reign of the tsars, Orthodoxy was synonymous with autocracy and national identity. After the Communist revolution of 1917, the Soviet government, based on Marxism, imposed a dogma of militant atheism and subordinated the ROC through fear and persecution. Other Christians, Muslims, and Jews were also oppressed (anti-Semitism was widespread before and after the 1917 revolution). Since 1985 and the subsequent dissolution of the Soviet Union, thousands of churches have been reopened; freedom of religion was incorporated into the draft constitution of 1993.

According to a 2004 report from the Ministry of Justice, there were about 21,664 registered religious groups in the country. The Russian Orthodox Church had the largest number, at about 11,525 registered groups. It is estimated that about 50% of the population describe consider themselves to be Russian Orthodox, but a much smaller percentage are actually active church members. Other Orthodox denominations include the Russian Orthodox Autonomous Church, the Russian Orthodox Church Abroad, the True Orthodox Church, the Russian Orthodox Free Church, and the Ukrainian Orthodox Church.

Islam is the largest minority religion, with about 3,537 registered groups and, perhaps over 1,000 unregistered groups. Muslims are believed to make up about 14% of the population. Protes-

tants make up the third-largest group of the country with a variety of denominations, including Pentecostals (1,467 groups), Baptists (979 groups), Lutherans, Methodists, Presbyterians, and the Church of Christ. There are also registered groups of Seventh-Day Adventists, Jehovah's Witnesses (386 groups), the Church of Jesus Christ of Latter-day Saints, Mennonites, and the Salvation Army. The Molokane (28 groups) and Dukhobor are Christian-based movements that originated in Russia. There are about 267 Jewish registered groups, with an estimated 600,000–1,000,000 Jews in the country. There are 80 groups of Hare Krishnas. Hindus, Scientologists, Taoists, Baha'is, Zoroastrians, Buddhists, Karaites, and shamanists are also represented. There are about 11 registered pagan groups.

The 1997 Law on Freedom of Conscience does not claim a state religion but recognizes Russian Orthodoxy, Judaism, Islam, and Buddhism as traditional religions. Theoretically, no special privileges are granted to these traditional religions; however, the ROC has made special agreements with the government that seem to place the church in a preferred status. Many citizens and government officials consider the acceptance or practice of Russian Orthodoxy to be a form of nationalism. Though registration is not required, many groups do so in order to enjoy certain tax and legal benefits. Some minority groups have reported incidents of discrimination and harassment on social and local political levels.

## <sup>11</sup>TRANSPORTATION

Russia's transportation system is extensive, but is in a state of general decay. Maintenance, modernization, and expansion are required for Russia's infrastructure, much of which operates beyond capacity.

Railroads have long been an important means of transportation in Russia. In the 1890s, a vast state-sponsored program of railway construction commenced, with the goal of nurturing private enterprise, exploiting natural resources, and expanding heavy industry (especially metallurgy and mineral fuels). The Trans-Siberian Railroad was the cornerstone of this development. From 1898–1901, more than 3,000 km (1,900 mi) of track were constructed per year. Railroad development also figured prominently during the Soviet era. Railways in 2004 extended some 87,157 km (54,160 mi), of which 86,200 km (53,616 mi) were primarily 1.52-m broad gauge track.

There were 537,289 km (334,194 mi) of highways in 2001 (the latest year for which data was available), of which 362,133 km (225,247 mi) were paved. As of 2003, there were 23,383,000 passenger cars and 5,400,000 commercial vehicles registered for use. Many imports from Europe are increasingly arriving in Russia. Russia's ratio of population per car is 6.2.

Marine access has been important to Russia ever since the construction of St. Petersburg was ordered by Peter the Great on the marshland adjoining the Gulf of Finland, in order to provide imperial Russia with a "window on the West." Other important maritime ports include Kaliningrad, on the Baltic Sea; Murmansk and Arkhangel'sk, both on the Barents Sea; Novorossiysk, on the Black Sea; Vladivostok and Nakhodka, both on the Sea of Japan; Tiksi on the Laptev Sea; and Magadan and Korsakov on the Sea of Okhotsk (the latter is on Sakhalin). As of 2004, Russia had 96,000 km (59,712 mi) of navigable inland waterways. Of that total, 72,000 km (44,784 mi) were in European Russia and linked the Black

Sea, the White Sea, the Baltic Sea, the Caspian Sea and the Sea of Azov. Major inland ports include Nizhniy Novgorod, Kazan, Khabarovsk, Krasnoyarsk, Samara, Moscow, Rostov, and Volgograd. The merchant fleet consisted in 2005 of 1,194 ships of 1,000 GRT or over, totaling 4,521,472 GRT. Early in the 21st century, a new port is scheduled to be built in the Batareynaya Harbor of the Baltic Sea about 70 km (43 mi) southwest of St. Petersburg. The new facility will handle oil shipments.

In 2004, Russia had an estimated 2,586 airports and airfields. As of 2005, a total of 640 had paved runways, and there were also 42 heliports. Principal airports include Novy at Khabarovsk, Sheremetyevo and Vnukovo at Moskva, Tolmachevo at Novosibirsk, Rostov-Na-Donu, Pulkovo at St. Petersburg, Adler at Sochi, and Yekaterinburg at Coltsovo. In 2003, about 22.723 million passengers were carried on scheduled domestic and international flights.

## 12 HISTORY

The history of Russia is usually dated from the 9th century AD when a loose federation of the eastern Slavic tribes was achieved under the legendary Rurik. At this time, Kiev was the political and cultural center. Vulnerable due to the flat land that surrounded them, the Kievan rulers sought security through expansion—a policy that subsequent Russian leaders frequently pursued.

By the 11th century, Kievan Rus had united all the eastern Slavs. However, over the next two centuries, Kievan dominance was eroded by other Slavic and non-Slavic centers of power. The Mongol conquest of Russia marked the eclipse of Kiev as a center of power. When Mongol power declined and collapsed in the 14th and 15th centuries, it was Moscow that emerged as the new Russian power center. The military victories of Grand Duke Ivan III (r. 1462–1505) in particular established Moscow's predominance over almost all other Russian principalities. In 1547, Grand Duke Ivan IV was crowned as the first "Tsar of All the Russians."

When the Rurik dynasty died out in 1598, Russia experienced internal political turmoil and territorial encroachment from the West. In 1618, the first of the Romanovs was crowned tsar, and Russia set about regaining the territory it had lost. In the 17th century, Russian power expanded across Siberia to the Pacific Ocean. During the reign of Peter I (r. 1682–1725), Russian power was extended to the Baltic Sea in the early 18th century. It was under Peter that the Russian capital was moved from Moscow to St. Petersburg, on the Baltic Sea.

Russian power expanded further into Europe and Asia during the 18th century. The French Emperor, Napoleon, attacked Russia in 1812. Despite the considerable advances that he made, he was forced to withdraw from Russia and back across Europe in 1814. By the end of the Napoleonic wars in 1815, Russia had acquired Bessarabia (Moldova), Finland, and eastern Poland.

Russia's European borders remained relatively stable in the 19th century. It was during this period, though, that Russia completed its conquest of the Caucasus, Central Asia, and what became its Maritime Province (Vladivostok).

From the rise of Moscow after the Mongols until the early 20th century, Russia was ruled as an autocracy. Peter I founded a senate, but this was an advisory and honorific body, not a legislative one.

Some reform was made. Alexander II (r. 1855–81) emancipated the serfs of Russia in 1861. Alexander II appeared to be embarking on a course of political reform involving elections when he was assassinated by revolutionaries in 1881. Alexander III (r. 1881–94), his son, ended political reform efforts and reverted to autocratic rule. Under him, however, economic development made considerable progress in Russia.

The autocratic nature of Tsarist rule generated growing opposition in Russia, beginning with the abortive "Decembrist" uprising of 1825. By the reign of the last tsar, Nicholas II (r. 1894–1917), many opposition groups had arisen. With the Tsarist regime's weakness evident as a result of its defeats in the 1905 Russo-Japanese War, a revolutionary movement grew up in Russia that same year. Under the leadership of the socialists, revolutionary "soviets" or councils seized power in parts of St. Petersburg and Moscow. The government was able to defuse the revolutionary impetus through promising an elected Duma (legislature). The First Duma (1906) met only briefly; its demands for land reform were unacceptable to the tsar, who dissolved it. The Second Duma (1907) was also dissolved shortly after it was convened. A Third Duma (1907–11) and Fourth Duma (1912–17) were elected on more restrictive franchises. While the Third Duma in particular made some progress in economic and social reform, the Tsar and his ministers retained firm control over the government.

It was Russia's disastrous involvement in World War I that led to the end of the monarchy. By early 1917, Russia had suffered a number of defeats in its struggle with superior German forces. The war and continued autocratic rule had grown increasingly unpopular. Riots broke out in the major cities in March 1917. The Tsar attempted to dissolve the Fourth Duma, but it refused to be dissolved. "Soviets" again rose up in Petrograd (St. Petersburg had been renamed in 1914) and Moscow. Nicholas II was forced to abdicate on 15 March 1917.

A provisional government, based on the old Fourth Duma, was declared. But its authority was challenged by the Soviets. In addition, the provisional government refused to end Russia's involvement in the war. This was seen as a major decision, which only a duly elected government could make. Over the course of 1917, the Mensheviks (socialists) increasingly gained control over the provisional government but lost control over the Soviets to the Bolsheviks, led by Vladimir Lenin. On the night of 6 November 1917, the Bolsheviks seized control of St. Petersburg.

Elections for a Constituent Assembly organized by the provisional government took place on 25 November 1917—Russia's freest elections until the 1990s. Only 168 of the 703 deputies elected were Bolsheviks. The Constituent Assembly convened on 18 January 1918, but was prevented from meeting again by Bolshevik forces.

Lenin moved quickly to end Russia's involvement in World War I. In March 1918, he agreed to a peace treaty with Germany, which deprived Russia of considerable territory (it was at this time that the Bolsheviks moved the capital back to Moscow). From 1918 to 1921, the Bolsheviks fought a civil war against a large number of opponents, whom they defeated. After the German surrender to the Western powers in November 1918, Lenin's forces moved to take back the territory it had given up. Except for Finland, Poland, the Baltic states (temporarily), and Bessarabia (Moldova), Lenin's forces succeeded in regaining what they had given up.

The Bolshevik regime was based on Marxist-Leninist ideology. It sought to overthrow the rule of economic “oppressors” (the aristocracy and the bourgeoisie) and replace it with rule by the proletariat. There were two main concepts in Lenin’s political theory: the dictatorship of the proletariat and democratic centralism. In Lenin’s view, the working class had to impose dictatorial rule over its class enemies to prevent them from regaining power. But within the instrument of this class dictatorship—the Communist Party—there was to be freedom of debate. Once a policy question had been resolved, however, debate was to cease.

Theoretically, power in the Communist Party was vested in an elected party congress, which then elected a smaller Central Committee, which in turn elected an even smaller Politburo to run day-to-day affairs. In fact, it was the top party leadership—Lenin and his Politburo colleagues—who established and maintained dictatorial control.

After the civil war, Lenin relented on his ambitious plans for the state to control the entire economy. He ushered in the New Economic Policy (NEP), which allowed peasants to own land and sell their produce at market, and permitted private business to operate (though the state retained control of large enterprises). Lenin died on 21 January 1924. A power struggle among the top Communist leaders broke out. By 1928, Joseph Stalin had eliminated all his rivals and achieved full power. He then ended NEP and ushered in a brutal period of forced industrialization and collectivization of agriculture. Stalin’s rule was especially harsh in the non-Russian republics of the USSR. Scholars estimate that as many as 20 million Soviet citizens died during the 1928–38 period either because of state terror or famine.

In August 1939, the infamous Nazi-Soviet pact was signed dividing Eastern Europe into spheres of influence. Under this agreement, the USSR regained most of the territories that had belonged to the Russian Empire but had been lost during the Russian Revolution (Poland, the Baltic states, and Bessarabia [Moldova]). But on 22 June 1941, Hitler’s forces invaded the USSR and Moscow quickly lost all the territory that it had recently gained. German forces reached the outskirts of Moscow. With the help of massive materiel shipments from the United States and other Western countries, Soviet forces were able to rally and drive the Germans back. By the end of the war in May 1945, the USSR had reconquered everything it lost. With the Red Army in Eastern Europe, Stalin was able to establish satellite Communist regimes in Poland, Czechoslovakia, Hungary, Romania, Bulgaria, and East Germany. (Communist regimes also came to power in Yugoslavia and Albania, but did not remain allied to Moscow.)

Stalin’s rule was especially harsh during the last years of his life. He died in 1953 and the ensuing power struggle was eventually won by Nikita Khrushchev. Khrushchev ended the terror of the Stalin years, but the basic features of the Stalinist system (Communist Party monopoly on power, centralized economy allowing for little private initiative, limited opportunities for free expression) remained until Mikhail Gorbachev came to power in March 1985.

Realizing that the old Stalinist system had led to a stagnant economy, which would undermine the USSR’s ability to remain a superpower, Gorbachev sought to reform the Communist system. But although greater freedom of expression led to an enhanced understanding of the serious economic and ethnic problems the

USSR faced, Gorbachev was unwilling to implement the economic and other reforms necessary to create a free-market democracy. The intense division on how to solve the problems faced by the USSR led to the ultimate dissolution in 1991 of the country into its separate republics.

For the first time, relatively free multicandidate elections were held in Russia in March 1990. In May 1990, the new Russian Supreme Soviet selected Boris Yeltsin as its chairman. Yeltsin had been an ally of Gorbachev until they disagreed over the pace of reform and Yeltsin was pushed out of the Politburo and his other positions. On 12 June 1991, the first elections to the Russian presidency were held, and Yeltsin won. Yeltsin played the central role in foiling the August 1991 coup attempt by Soviet conservatives against Gorbachev.

On 8 December 1991, Yeltsin, together with the leaders of Ukraine and Belarus, formed the nucleus of the Commonwealth of Independent States (CIS), which spelled the end of the USSR later that month. Like the other former Soviet republics, Russia had become an independent sovereign state.

In early 1992, Yeltsin and his acting prime minister, Egor Gaidar, sought to introduce rapid economic reform. Price controls were lifted on all but a few items. Prices rose rapidly, and as time passed, public opposition to economic reform grew. The Yeltsin government’s relations with the legislature grew increasingly acrimonious. Many of the deputies had close ties with the state-run economy and bureaucracy, which were threatened by economic reform.

Much of Russian politics in 1993 consisted of bitter squabbling between Yeltsin and the legislature. No progress was made on drafting a new constitution to replace the much-amended Soviet-era constitution that still governed Russia.

On 21 September 1993, Yeltsin unilaterally dissolved the Supreme Soviet and introduced rule by presidential decree until new legislative elections and a referendum on his draft constitution could be held on 12 December. Many of the anti-Yeltsin legislators refused to accept Yeltsin’s suspension, and barricaded themselves inside the legislature building. On 3 October, forces loyal to the legislature briefly occupied the office of the mayor of Moscow and attempted to seize the Ostankino television center. Forces loyal to Yeltsin, backed by the military, attacked and seized the legislature building. A state of emergency and press censorship were briefly introduced. Yeltsin banned several opposition parties, purged opponents from the government, and reaffirmed his intention to serve out his full term.

The constitutional referendum and legislative elections were held as planned in December 1993. The electorate approved Russia’s first post-Communist constitution, which called for a strong presidency. In the legislative elections, though, the Communist and ultra nationalist forces did well. Analysts attribute the Communist’s strong showing to popular dissatisfaction with the radical economic reforms that had depressed the economy and left the Russian people at subsistence levels. Only 50% of the electorate turned out to vote. After a hard-fought campaign, Yeltsin won reelection on 3 July 1996 with 54% of the vote. Some 67% of the voters turned out for the elections.

As Yeltsin struggled to stabilize the government and reform the economy, nationalistic fervor in the “ethnic” republics tore at the fabric of the Russian Federation. War broke out in Chech-

nya in December 1994 after the rebellious North Caucasus region claimed its independence. The inability of the Russian military to subdue the region led to a withdrawal of Russian forces in late 1996. The bloody and unpopular conflict ultimately led Yeltsin to sign a peace treaty with Chechen leader Aslan Maskhadov on 12 May 1997. The agreement deferred a decision on the region for five years. In the meantime, Russia claimed that the region remained a part of Russia, while Chechnya (called Ichkeria by the rebels) claimed it was already independent.

Russia's position in the world was further weakened in 1997 when three of its former satellites (Hungary, Poland, and the Czech Republic) were admitted to NATO effective in 1999. Romania and Slovenia were in line to join next. Russia, initially opposed to the new admissions, ultimately signed a pact for mutual cooperation with NATO on 27 May 1997. The pact established a new NATO-Russia council for consultation on security issues and NATO assured Russia that it had no plans to deploy nuclear weapons on the territories of any new members. For its part, Russia pledged its commitment to transforming itself into a democracy. Seeking also to improve relations with Ukraine, on 31 May 1997, Yeltsin signed a treaty of "friendship, cooperation, and partnership" with Ukraine's president Leonid Kuchma. The agreement affirmed that the Russian-populated Crimean peninsula was indeed part of Ukraine. At issue was ownership of the old Soviet Black Sea Fleet and use of the naval port at Sebastopol. Under the agreement, Russia took 80% of the fleet and a 20-year lease on Sevastopol's main bays. In addition to affirmation of its territorial borders, Ukraine was to receive us\$100 million a year in rent for the bays.

Yeltsin dismissed his entire cabinet in March 1998, causing the currency to take a one-day dip. In August 1998, the Russian currency collapsed, and the country experienced the worst harvest in 45 years. The government defaulted on us\$40 billion in ruble bonds, and the banking system experienced a swift decline. Losses during 1999 were estimated at two billion dollars per month. In February 1999 Prime Minister Primakov met with IMF officials to reschedule debt payment aid. Accounts of large-scale money laundering were reported in both 1998 and 1999 by Russian mobsters and offshore money-laundering operations. The Russian Central Bank had used the ruble to prop up defunct parastatals, and the banks were lending money from state coffers that were empty to begin with. The lack of active currency prompted the downward spiral of the entire economy.

The conflict with Chechnya never really ended. On 23 September 1999, following a series of Chechen terrorist attacks (which might have been a provocation by Russian intelligence), Yeltsin signed the order to begin military action in Chechnya. When Vladimir Putin became prime minister and a head of FSB (former KGB), he ordered a withdrawal of most of the military troops from Chechnya. He employed instead the use of intelligence forces and local police to fight the separatists. Presidential elections were held and Kadirov was elected president. The conflict however was not resolved. The war with Chechnya raged on through the summer of 2000, climaxing with a bomb attack in a Moscow subway that killed 11 and wounded many others. It was estimated that about one dozen Russian fighters lost their lives daily on the Russian-Chechen border during 1999. This was not the only front on which Russia showed a military presence: Yeltsin called for the

removal of NATO from Yugoslavia in early 1999, but his bark was stronger than his bite.

President Yeltsin resigned in December 1999, under allegations of financial crimes and from ailing health. Supported by the former president, Vladimir Putin was elected to the executive. Putin graduated from the Law School of the Leningrad State University and joined the KGB. In the 1980s, he was sent to East Germany where he handled issues of economic intelligence. He returned to Leningrad in 1989, and left the KGB to enter the St. Petersburg University administration. After about a year, he left the university to join the administration of the newly elected major of Leningrad: Sobchak. Putin transferred to Moscow in 1996 to work in presidential apparatus. In 1998, Putin was made a head of FSB. The Yeltsin Administration decided that Putin was the right person to deal with opposition and protect their best interests. In contrast with the gregarious and outgoing Yeltsin, Putin seemed cold and ascetic. Additionally, Putin's initial success in Chechnya brought him widespread public sympathy and support.

President Putin took office in 2000. After some time as president, Putin assembled a new team known as "The People of the St. Petersburg;" his closest confidante was Sergey Ivanov, a potential successor to Putin as president in 2008.

President Putin had certain concerns that he felt called for his immediate attention. Putin's first concern was to make Russia even more centralized, which he accomplished by limiting the power of regional leaders. Secondly, Putin was determined to bring monopolies under state control and cut the oligarch's access to the decision-making process. Finally, he was concerned about the state of the military.

Putin's policy to centralize the state was aimed at regional governors. Almost immediately upon taking the office he established seven super-regions and passed a law that enabled the president to appoint the heads of these regions himself, while governors were to be chosen by electorate. Moreover, Putin passed two other meaningful laws that transformed the legislative branch of the Russian Federation and the balance of power in the government. The first law altered the composition of the Federation Council (upper house of the parliament), to deprive governors of their seats. The second law granted the president the power to dismiss regional leaders and legislatures.

Following the 11 September 2001 terrorist attacks on the United States, Putin turned Russian foreign policy towards the West. He came out in favor of Russia joining the counterterrorism campaign announced by US president George W. Bush, despite opposition from his own advisors and from the Russian political elite. This shift in policy coincided with a move for closer relations with Europe; Russia became a member of the Council of Europe, and began to strengthen its civil society and rule of law, designed to bring it into the good graces of the EU. Russia accepted the arrival of US and coalition troops in some Central Asian republics in the US-led war in Afghanistan to oust the Taliban regime and the al-Qaeda network. Russia tacitly accepted the arrival of US Special Forces into Georgia in 2002: the United States wished to combat what it believed to be international terrorists linked to the al-Qaeda network in the Pankisi Gorge region of Georgia. However, on 11 September 2002, when Putin announced Russia would take unilateral action against Chechen fighters and international ter-

rorists in the Pankisi Gorge; the United States stated its unequivocal opposition to any such unilateral military action.

In May 2002, Russia and the United States announced a new agreement on strategic nuclear weapons reduction: operationally deployed strategic nuclear warheads would be reduced by each side to a level of 1,700–2,200 over the next 10 years. This “Moscow Treaty” was followed by an agreement between Russia and NATO foreign ministers to establish a “NATO-Russia Council” in which Russia and the 19 NATO countries would have an equal role in decision-making on counterterrorism policy and policy on other security threats. The “Moscow Treaty” was counterbalanced by events in June, however, when the United States announced it formally withdrew from the 1972 Anti-Ballistic Missile Treaty and Russia subsequently pulled out of the START II Treaty.

Concerns about Russia’s guarantee of freedom of speech were raised in January 2002, when the last major independent television network in Russia, TV-6, was forced by the government to stop broadcasting. The government claimed the sole reason for the shutdown was bankruptcy, but many were not convinced that Putin’s decision was purely business-related. The Russian media are either state-owned or controlled by “oligarchs” such as Boris Berezovsky and Vladimir Gusinsky, and in bringing court cases against these men, the government effectively took control of their media outlets, curbing independent reporting and causing a setback to freedom of speech and press.

The conflict with Chechnya intensified in 2002. On 23 October, Chechen separatist rebels seized a theater in Moscow and held some 800 hostages for three days. The hostage-takers demanded that Putin withdraw Russian troops from Chechnya. On 26 October, the president ordered an early-morning raid on the theater, using the gas Fentanyl, a fast-acting opiate that was meant to incapacitate the rebels. As a result of the operation, 117 hostages died, all but one (who died of gunshot wounds) due to the effects of the gas. All 50 of the hostage-takers died. Putin claimed the operation was an unprecedented success, but many wondered about the effectiveness of the raid due to the number of hostages who died. That December, suicide bombers attacked the Grozny headquarters of the pro-Moscow Chechen administration led by Akhmed Kadyrov, and more than 50 people were killed. It was the first use of suicide bombers undertaken by Chechen separatist rebels against Russia, and Putin described the attack as “inhuman.” In March 2003, a referendum on a new constitution for Chechnya was approved, stipulating that Chechnya would remain a part of the Russia; many were critical of Russia for holding the referendum before peace was established.

On 8 November 2002, the UN Security Council unanimously passed Resolution 1441, calling upon Iraq to disarm itself of chemical, biological, and nuclear weapons, to allow the immediate return of UN and International Atomic Energy Agency (IAEA) arms inspectors (they had been expelled in 1998), and to comply with all previous UN resolutions regarding the country since the end of the Gulf War in 1991. Arms inspectors began work in Iraq, but the United States and the United Kingdom were dissatisfied with the slow pace of inspections and began to prepare for war. On 19 March 2003, the United States launched air strikes against Iraq, and war began. US-Russian relations were severely tested at the end of 2002 and into 2003, as Russia sided with France and Germany in their opposition to war. In mid-April, Putin, who had

previously called the war “a big political mistake,” was softening his tone toward the United States and the United Kingdom, and stressed the importance of Russia’s role in a postwar Iraq. Analysts estimate that in 2003 Iraq had US\$52 billion in contracts with Russia, primarily in energy and communications.

In September 2004, ongoing conflict with Chechnya took the form of a major terrorist attack on a public schools in Beslan, Northern Ossetia. The shocking actions of terrorism in Beslan gave President Putin the momentum to push through his radical administrative reforms. Investigations revealed that Beslan tragedy was a result of incompetence and corruption of regional leaders and the lack of coordination between the regional executives and police. The reorganization of the Federation Council (substituting appointed senators for elected governors) was followed by a number of actions. The system of direct vote for governors was abandoned in favor of a system whereby the president appointed the governors; State Duma elections were to be based solely on party ballots, therefore eliminating elections in one-mandate districts; and a Public Chamber—a public body on a federal level that was supposed to become an intermediary between society and the state—was created.

New constitutional amendments were not well received and caused controversy in the Duma. There was a negative reaction by the Communist Party, Liberal Democratic Party, Yabloko, and Union of Right Forces. Even Putin’s own Unity Party survived a split in opinions, with some members opposing Putin’s reforms. European powers and the United States do not always agree with Russia’s policies toward Chechnya, considering them to violate human rights. In December 2004 President Putin met with German Chancellor Gerhard Schroeder to discuss the possibility of European involvement in the conflict. In essence, no one knew how to formulate a solution for this conflict, since territorial disputes have existed in Chechnya for centuries.

Putin’s presidency had a positive effect on Russia’s long-struggling economy. In the period 1999–2004, the Russian economy experience annual growth of 7%. After inheriting a weak economy caused by financial crises of 1998, Putin passed legislature aimed at reforming the economy. As of 2006, it appeared that these reforms established solid, long-term institutional changes that were enabling high growth rates.

### 13 GOVERNMENT

Russia is a democratic federative state based on rule of law with a division of power among the legislative, executive, and judicial branches. It is a constitutional government, based on a post-Soviet constitution, which was approved in a referendum held 12 December 1993. The constitution establishes a bicameral legislature known as the Federal Assembly. The lower house (State Duma) consists of 450 elected deputies while the 178-member upper house (Council of the Federation) is composed of representatives of the provinces and autonomous republics that make up Russia.

The executive branch of the presidential administration consisted of three bodies: Administration of the President, generally responsible for domestic political issues, Government, usually in charge of economic development, and the Security Council of the Russian Federation, chiefly responsible for the foreign policy, security and defense of the country. The responsibilities of the three centers in the executive branch often overlap.

The president is elected by popular vote for a four-year term; elections were held 14 March 2004 (next were scheduled to be held March 2008). As of 2005 the president of the Russian Federation was Vladimir Vladimirovich Putin (acting president since 31 December 1999 and reelected president since 7 May 2000).

The president heads the Executive Branch—currently the president is the Head of State and the Supreme Commander in Chief of the Armed Forces. According to the constitution of 1993, the president drafts and issues legal regulations, settles disputes, and ensures that the constitution is observed. The president is also responsible for ensuring the state's mechanisms for protecting and respecting citizen's rights and liberties.

The president appoints the cabinet and other top government posts, but the appointments must be confirmed by the legislature. Presidential appointments of prime minister, deputy prime ministers, and chairman of the central bank are subject to confirmation by the State Duma while appointments of high court judges and the prosecutor general are subject to confirmation by the Council of the Federation. The president can refuse to accept the State Duma's rejection of an appointment to the prime ministership. If the State Duma refuses three times to confirm a new prime minister, the president may dissolve the lower house and order new elections. If the State Duma votes a no-confidence motion against the prime minister and cabinet twice within three months, the president may respond either by dismissing the cabinet or dissolving the State Duma. The president, however, cannot dissolve the State Duma due to its passing a no-confidence motion during the first year of the State Duma's term of office.

The president protects the nation's independence, sovereignty, and integrity, and prevents aggression against Russia or its allies. The president may declare war or a state of emergency on his own authority. Finally, the president must ensure the peaceful and democratic development of the country.

Impeachment of the president is provided for in the constitution, but is very difficult. Two-thirds of the State Duma must vote to initiate the impeachment process. Both the Constitutional Court, established to arbitrate any disputes between the executive and legislative branches, and the Supreme Court must review the charges. The findings of all three organizations are then submitted to the Council of the Federation, which can impeach the president by a two-thirds majority vote. This process must be completed within three months from beginning to end.

The President's Administration or Presidential Executive Office is an important governmental body that prepares the president's bills for submission to the State Duma. It prepares drafts of decrees, orders, instructions, presidential speeches, and other documents. The Presidential Executive Office coordinates all of the president's interactions with various political parties and leaders, nongovernmental organizations (NGOs), nonprofit organizations, unions, and foreign governments. Although the president oversees the work of the Executive Office, it is the Chief of Staff of the Presidential Executive Office who manages it. As of 2006, this position was held by Dmitry Medvedev (since October 2003).

The government is responsible for financial, credit, and monetary policies. It also develops uniform state policies regarding culture, science, education, health, social welfare, ecology, and all other areas of social life. The government is headed by the prime minister (Mikhail Fradkov since 5 March 2004). The president

presides over government meetings and gives instructions to the government and other federal bodies.

The Security Council is responsible for national security, including but not limited to state security, public security, safety, socioeconomic security, and security in the spheres of defense, information, the military, and international affairs. The Security Council also advises the president on security issues. It interacts with the Scholarly Council made up of representatives of the Russian Academy of Science and the specialized academies of science and educational institutions and individual experts. The president is also chairman of the Security Council.

The State Council is an advisory body that deals with the issues, especially those related to economic and social reforms. The president also acts as chairman of the State Council, and the acting secretary is the Secretary of State (Alexander S. Abramov as of 2005). The State Council is composed of the leaders of the local governments.

During his presidency, Putin shifted the balance of power within the Executive Branch; during the Yeltsin era, power was distributed equally, but Putin shifted the center of power to the President's Administration.

The legislative branch, the Federal Assembly, consists of two chambers. The State Duma (Gosuderstvennaya Duma), the lower house, is made up of 450 seats; 225 seats elected by proportional representation from party lists winning at least 5% of the vote and 225 seats from single-member constituencies. Members are elected by direct popular vote to serve four-year terms. The upper house or Federation Council (Sovet Federalistov) is made up of 178 seats. Members Federation Council were appointed by the president and legislative officials in each of the 89 federal administrative units (Chechnya included).

The two chambers of the Federal Assembly have different powers and responsibilities. The State Duma is more powerful. The Federation Council has jurisdiction over issues affecting the provinces and autonomous republics, including border changes and the use of force within Russia. Its other responsibility is to confirm justices of the Constitutional court, Supreme Court, and Superior Court of Arbitration. It also handles the bills dealing with finance and treaty ratifications. The State Duma handles all other bills. Even those bills that are proposed by the Federation Council must first be considered by the Duma.

## 14 POLITICAL PARTIES

In the elections to the State Duma held 12 December 1993, 225 of the 450 seats were elected on the basis of proportional representation from party lists, which had to receive a minimum of 5% of the national vote to gain representation. The other 225 seats were elected from single-member districts.

The party to receive the largest number of seats (76) was the radical reformist Russia's Choice led by Boris Yeltsin's former acting prime minister, Egor Gaidar. The centrist New Regional Policy group (which was actually formed by nonaligned deputies from single member districts after the election) won 65. Vladimir Zhirinovskiy's ultranationalist, antidemocratic Liberal Democratic Party won 63. The pro-Communist Agrarian Party won 55 seats, while the Communist Party of the Russian Federation won 45. Six other parties or blocs (some of which were also formed after the election) won between 12 and 30 seats each.

Deputies to the 178-seat Council of the Federation were elected in two-member districts, where they mostly ran as individuals. Of the 171 seats that were filled, only 27 identified themselves with a particular party. The ultranationalists, Communists, and their sympathizers predominated in the State Duma.

In the December 1995 elections, the Communists again dominated the Duma, taking 149 of the 450 seats. They were supported by two left-wing factions, Power to the People (37 seats) and the Agrarians (35); together they were only 5 votes shy of an outright majority. The center-right party, Our Home Is Russia, won 50 seats, as did Vladimir Zhirinovskiy's far-right Liberal Democratic Party, and Yabloko, the moderate-reformist bloc led by Grigoriy Yavlinsky.

In the December 1999 Duma elections, six parties surmounted the 5% threshold on the party list vote, accounting for over 80% of the votes cast. Three of the six parties that received seats in the party list vote were created just prior to the election. (This did not include the newly formed ultranationalist Zhirinovskiy bloc, which was essentially a relabeling of his Liberal Democratic Party.) Unity ("The Bear") was created in late September 1999 by the Yeltsin government, and the Union of Right-Wing Forces and Fatherland-All Russia (OVR) in August 1999. In contrast to previous Duma races, many liberal groups (with the major exception of Yabloko) cooperated in forming the Union of Right-Wing Forces electoral bloc to enhance their chances for surmounting the 5% hurdle. The newly formed Unity and Union blocs received crucial publicity when Putin endorsed them. Results from the single-member constituency races added some seats to those gained by the six successful parties and provided a few seats for minor parties. In all, the Communist Party won 120 seats, Unity 73, OVR 70, Union 29, Yabloko 20, and the Zhirinovskiy bloc 19. Unaffiliated candidates won 95 seats, and a few seats faced runoffs. A little over one-third of the deputies elected were incumbents from the previous Duma.

In general, the election represented a major loss for Our Home (headed by presidential aspirant and former prime minister Viktor Chernomyrdin), which no longer was a faction in the legislature. Zhirinovskiy's bloc lost more than half its seats, compared to 1995, as did Yabloko. The new Duma convened in January 2000, and in a bold move, Unity and the Communist Party temporarily joined forces to grab the largest number of leadership posts and committee chairmanships.

In the first round of the June 1996 presidential election, Aleksandr I. Lebed received 15% of the vote to Yeltsin's 35% and Communist party candidate Gennadiy A. Zyuganov's 32%. Lebed, a retired general viewed by voters as a tough law-and-order strong man, dropped out of the race when Yeltsin named him national security advisor. Lebed gave his support to Yeltsin, which helped Yeltsin win 54% of the vote in the 3 July 1996 election. Two months later, however, Yeltsin forced Lebed out of the government. Yeltsin was barred from running for a third term.

Toward the end of his second term Yeltsin confronted growing unpopularity and instability in his administration. Opposition forces (including Communist party, Moscow-oriented Yuri Luzhkov and groups of local governors) did not take any drastic measures to bring Yeltsin down.

The Communist Party tried unsuccessfully to reconcile a range of leftist groups to back a common candidate, Genadiy Zuganov,

against Vladimir Putin. Another candidate, Yurii Luzhkov, won the support of Muscovites and attempted to appeal for support to the governors. Meanwhile the governors were forming coalitions that later resulted in the formation of the Fatherland-All Russia (OVR) party affiliated with Yevgeni Primakov. Primakov was a popular politician who was credited with bringing Russia out of the 1998 financial crises. As a result, OVR became a threat to Yeltsin. In response, Yeltsin organized a media campaign to discredit the OVR party and Primakov in particular, and to promote Vladimir Putin.

In 1999, six months before the end of his term, President Yeltsin resigned from power, appointing Putin as an acting president. Putin then issued a decree granting Yeltsin and his family complete immunity from persecution. Yeltsin's resignation moved the term of election to March, leaving the opponents with less time to prepare. In little time, Putin managed to organize strong support for Unity and forged cooperation between Unity and OVR. In the first round of presidential elections held on 26 March 2000, among the 11 candidates, Putin won 53% of 75.2 million votes, trouncing his nearest rival by 23.7%. The runner-up, Gennadiy Zyuganov, received 29%, down from the 32% he received in the first round of the 1996 race. Putin was formally inaugurated as president on 7 May 2000.

National elections were held again 7 December 2003, with Putin's Unity party winning 37.1% of the vote. The Communist Party came in second with 12.7% of the vote, and Vladimir Zhirinovskiy's ultranationalist party (the Liberal Democratic Party) took 11.6%. The pro-Western liberal parties—Union of Right Forces (SPS) and Yabloko—faired poorly. Another leftist-nationalist party, Rodina, was formed. The Organization for Security and Cooperation in Europe (OSCE) said the government used resources and control of the media to dominate the election.

In March 2004, Putin ran for a second term. He was reelected with more than 70% of the vote. His closest opponent, Communist Party candidate Nikolai Kharitonov, got 13.7%. The next presidential election was scheduled for March 2008.

## 15 LOCAL GOVERNMENT

Russia has a complicated patchwork of regional and local governments, including 89 federal subjects of constituencies. Those 89 units are not of equal status. Russia is divided into 6 kraia, 49 oblasts, 1 autonomous oblast, 10 autonomous okrugs, and two independent cities (Moscow and St. Petersburg). There are also 21 autonomous republics where non-Russian minorities predominate (or once predominated). The Chechen republic of Ichkeria, is, de facto, a separate state, although not recognized as such by the federal authorities.

For all but the 21 autonomous republics, President Yeltsin issued decrees reorganizing the system of local government in October 1993. Each unit has an elected legislature. Most of these are unicameral, though two (Magadan Oblast and Altai Krai) opted for bicameral ones. In late 1996 and early 1997, regional popular elections of governors took place, replacing the system of appointments by the president. By contrast, the Russian president never appointed the heads of the 21 autonomous republics. These (usually called presidents) were selected in whatever manner is prescribed by their individual constitutions. The regional and republic executive and legislative heads were ex officio members of the

Russian Federal Assembly's upper chamber, the Federation Council, where they endeavor to guard local power against encroachment from Moscow.

When Putin came to power, he felt it necessary to bring the regional leaders under a more central control, reversing bottom-to-top relations from the Yeltsin-era. In 2000, Putin set out to correct regional relations by grouping the administrative units of Russia into seven regional administrative districts: Northwest, Central, Volga, North Caucasus, Ural, Siberia, and Far East. A presidential representative is appointed to each. Putin appointed seven presidential representatives to coordinate the activities of federal organs. In February 2001, the law went into effect that allowed the president to dismiss governors. Furthermore, after the September 2004 Beslan School tragedy, Putin passed a bill to abolish popular elections for Russia's regional governors and to elect all State Duma deputies according to a proportional party system, abolishing single-mandate districts.

## 16 JUDICIAL SYSTEM

The judicial system is divided into three branches. There are courts of general jurisdiction (including military courts), which are subordinated to the Supreme Court; the arbitration (commercial) court system, which is under the High Court of Arbitration; and the Constitutional Court, which arbitrates any disputes between the executive and legislative branches and determines questions pertaining to constitutional issues. Civil and criminal cases are tried in courts of primary jurisdiction (municipal and regional), courts of appeals, and higher courts.

Procurators are also organized at the district, regional, and federal levels. The head of the procurators, the Procurator General, is nominated by the president and confirmed by the Federation Council. The trials are inquisitorial, not adversarial, and procurators are quite influential in nonjury trial.

## 17 ARMED FORCES

With the collapse of the original Soviet Union in 1992, Russia established a separate Ministry of Defense and military establishment upon the wreckage of the Soviet armed forces. Still formidable in terms of weapons and equipment, the Russian armed forces reached a low state of morale and effectiveness in 1993, "hollowed" by low-manning, the failure of draft calls, diversion to survival tasks rather than training, and lack of discipline. In the following years, military reforms were undertaken. The first phase, completed by the end of 1998, involved reorganization of the military command structure, redistricting, and troop reductions. The second phase focused on equipment modernization and operational readiness. Readiness was also improved in response to the NATO bombing of Serbia following hostilities in Kosovo.

In 2005, active Russian armed forces personnel numbered 1,037,000, with the number of reservists totaling 20,000,000. The Russian Army in 2005 had an estimated 395,000 active members, which were backed by a formidable weapons inventory of over 22,800 main battle tanks, 150 light tanks, more than 2,000 reconnaissance vehicles, over 15,090 armored infantry fighting vehicles, more than 9,900 armored personnel carriers, over 30,045 artillery pieces (towed and self-propelled), and over 628 attack helicopters. Russia has assumed the responsibility of the Soviet Union to reduce by treaty its strategic arsenal and conventional forces in

Europe, but remains the world's second most formidable nuclear nation. Russia's nuclear arsenal is estimated at 12,000–19,000 strategic and nonstrategic nuclear weapons.

The Russian Navy has surrendered little of its strength to the break-away republics. The Navy numbers 142,000 personnel. It controls 46 tactical submarines, including 8 nuclear-powered nonballistic missile submarines (SSGNs), and 18 nuclear-powered attack submarines (SSNs). Major surface combat units include 1 aircraft carrier, 6 cruisers, 15 destroyers, 19 frigates, 25 corvettes, 72 patrol and coastal vessels, 41 mine warfare ships, and 436 logistics/support vessels. The naval air arm has an estimated 35,000 personnel backed by 226 combat capable aircraft including 58 bombers, 49 fighters, 68 fighter ground attack aircraft, 11 attack helicopters, and 120 antisubmarine warfare helicopters. Naval infantry and coastal defense forces (designed for naval base defense) deploy 9,500 troops with ground combat artillery and missile weapons.

Russia's Air Force consists of a long-range aviation command, a tactical aviation command, military transport aviation command, training schools, and operational combat units. As of 2005, active personnel numbered an estimated 170,000. The principal tactical weapons systems remain MiG and Su fighters and fighter-attack aircraft and armed helicopters. In 2005, the Air Force had 1,852 combat capable aircraft that included 1,094 fighters and 757 fighter ground attack aircraft.

Russia's joint service Strategic Deterrent Forces had an estimated 129,000 active personnel in 2005. Of that total, the Navy accounted for 11,000 personnel and was responsible for the nation's fleet of 15 SSBNs and its submarine launched ballistic missile force. The Air Force accounted for another 38,000 personnel through its Long-Range Aviation Command, which was responsible for the country's strategic bomber force of 80 aircraft. Another estimated 40,000 personnel were assigned to three Rocket Armies and were known as Strategic Missile Force Troops. This element of the Strategic Defense Forces was responsible for the operation of the nation's land-based ICBMs, of which there were around 570 launchers carrying 2,035 nuclear warheads. In addition to the Strategic Defense Forces, another 40,000 personnel were assigned to the Space Forces, whose mission was to detect a possible missile attack on the Russian Federation and its allies, as well as to implement the nation's Ballistic Missile Defense (BMD) and the launch and control of military/dual-use spacecraft.

There are also 415,100 paramilitary forces assigned to specialized security functions for border protection, river patrols, customs duties, installation and plant protection, transportation security, riot duty, and internal security. The number of border guards are estimated at 160,000, while interior troops number 170,000.

Although Russia has scaled back the Soviet Union's defense forces, the Russian armed forces still maintain a global presence. In addition to troops remaining in Armenia, Georgia, Moldova, and Tajikistan, Russia maintains military missions or units in the Ukraine, Syria, and Africa. Russian units have also participated in peacekeeping operations in the region and supported the UN in other separate missions. The defense budget in 2005 totaled \$18.8 billion.

## 18 INTERNATIONAL COOPERATION

Russia has essentially assumed and expanded upon the foreign relations ties established by the former Soviet Union. In one form or another, it has held a seat in the United Nations since 24 October 1945; it is a part of several nonregional specialized agencies, such as IAEA, ICAO, ILO, UNHCR, UNIDO, and the WHO. Russia is a permanent member of the UN Security Council. The nation is also member of APEC, the Commonwealth of Independent Nations, the Black Sea Economic Cooperation Zone, the Council of the Baltic Sea States, the Council of Europe, the Euro-Atlantic Partnership Council, the European Bank for Reconstruction and Development, G-8, the Paris Club (G-10), and the OSCE. In June 2001, leaders of Russia, China, Kazakhstan, Kyrgyzstan, Tajikistan and Uzbekistan met in China to launch the Shanghai Cooperation Organization (SCO) and sign an agreement to fight terrorism and ethnic and religious militancy while promoting trade. The country holds observer status in the OAS, the WTO, and the Latin American Integration Association (LAIA). Russia is a dialogue partner in ASEAN and part of the ASEAN Regional Forum.

The Russian government has supported UN operations and missions in Kosovo (est. 1999), Western Sahara (est. 1991), Ethiopia and Eritrea (est. 2000), Liberia (est. 2003), Sierra Leone (est. 1999), East Timor (est. 2002), Georgia (est. 1993), and Burundi (est. 2004), among others. Russia is a partner in the Middle East Peace Process "Quartet." The country is a guest in the Nonaligned Movement.

Russia is part of the Zangger Committee, the Organization for the Prohibition of Chemical Weapons, and the Nuclear Suppliers Group (London Group). It is an observer in the European Organization for Nuclear Research (CERN). In environmental cooperation, Russia is part of the Antarctic Treaty; the Basel Convention; Conventions on Biological Diversity, Whaling, and Air Pollution; Ramsar; CITES; the London Convention; International Tropical Timber Agreements; the Kyoto Protocol; the Montréal Protocol; MARPOL; the Nuclear Test Ban Treaty; and the UN Conventions on the Law of the Sea and Climate Change.

## 19 ECONOMY

Russia's economy, \$1.5 trillion in purchasing power parity (PPP) terms (as of 2005), is the largest within the former Soviet bloc. It was undergoing a painful transformation from a centrally planned economy to a market-oriented one with limited public ownership. Per capita income in 2005 was only \$5,165 in nominal terms, although \$10,758 in PPP terms. By 2004, services comprised the largest sector of the economy (61.2%), while industrial production accounted for 33.9% of GDP. The manufacturing centers around Moscow and St. Petersburg are the most important, as they were for the entire former USSR. Russia has rich energy and mineral resources, including large deposits of iron ore, coal, phosphates, and nonferrous metals, as well as one-fifth of the world's gold deposits and substantial oil and gas reserves. There are also vast forest resources. Agricultural production accounted for 4.9% of GDP in 2004. Although the share of agriculture in total output fell from 14% in 1991 to 4.9% in 2004, the collapse has led to underemployment rather than unemployment among rural workers, and therefore agriculture still accounted for more than 12% of official

employment in 2002. There is an acute excess demand for goods, especially consumer goods.

Russia's economic situation deteriorated rapidly after the break-up of the Soviet Union, which destroyed major economic links. President Yeltsin's 1992 economic reform program slashed defense spending, eliminated the old centralized distribution system, established private financial institutions, decentralized foreign trade, and began a program of privatizing state owned enterprises. Success was not immediate, however, as the GDP declined by over 12% in 1994 and 4% in 1995. By then, 25% of the population was living in poverty, corruption was rampant, and segments of the economy had gone "underground" to escape backbreaking taxes and bureaucratic regulation. However, government policies kept unemployment at the relatively low rate of 8%, even though there was no money to pay salaries and pensions. A stabilization program enacted in 1995 tightened the budget, liberalized trade, and lowered inflation through noninflationary financing of the budget deficit. Although the economy declined by 3.6% in 1996, segments of the economy were showing signs of recovery. In 1997, overall GDP registered its first positive growth, albeit only 0.9%. Inflation moderated to 11.3% from 21.8% in 1996, and unemployment fell from 9.3% to 9%. In a major privatization program, the government turned over to the growing private sector thousands of enterprises.

However, in 1998, the effects of the 1997 Asian financial crisis swept the economy, propelling a massive outflow of foreign investment. In August 1998 it became the Russian financial crisis as the government defaulted on payments due on \$40 billion in ruble bonds and allowed the ruble to depreciate. Real GDP fell 4.9% in 1998 as inflation shot up to 84.5%. However, Russia weathered the crisis well: in 1999, one year after the crisis, real GDP increased by the highest percentage since the fall of the Soviet Union, the ruble stabilized, inflation was modest, and investment began to increase again. In 1999, real GDP increased 5.4%, and in 2000, a strong 8.3% while inflation fell to 36.5% in 1999 and then to 20.2% in 2000. The global economic slowdown after 2001 served to decelerate but not reverse economic recovery as GDP growth fell to 4.9% in 2001 and then to 3.5% in 2002. Inflation fell to 18.6% in 2001, and 16.5% in 2002, above predictions of 11–13% mainly because of increased fuel costs. Official unemployment, which peaked at 11.8% and 11.7% in 1998 and 1999, moderated to an estimated 8% in 2002, down from 8.9% in 2001.

From 2001–05, real GDP growth averaged 6.1%, and inflation averaged 14.9%. From 2000 to 2005, Russia ran trade and budget surpluses. GDP growth was forecast at 5.8% in 2005; inflation hit 11.7% in 2004, and was predicted to near 13% in 2005, well above a revised target of 10%. Although real GDP growth had slowed by 2005, high oil prices were expected to limit the extent of the deceleration, especially in 2006. Even though proceeds from the sale of oil strengthen the ruble, damaging competitiveness, high oil prices have not compensated for a lack of effective governmental economic policy. Oil production began to stagnate in late 2004; oil companies must look beyond the easy-to-tap oil reserves of western Siberia for new fields. Also, a string of investigations launched against Yukos, a major oil company, culminating in the arrest of its CEO, Mikhail Khodorkovsky, in the fall of 2003, raised concerns that President Vladimir Putin was granting more influence to forces within his government that desire to reassert state

control over the economy. Companies looking to invest in Russia discover a plethora of rules that are often changed and capriciously applied; the large, unwieldy, corrupt bureaucracy is impossible to avoid. The gas, electricity, and railway industries are dominated by inefficient monopolies, particularly Gazprom, the state gas monopoly. Ownership structures are opaque, not transparent, but according to some estimates, 20 large conglomerates account for up to 70% of Russian GDP. Capital flight was a net \$33 billion in 2004. These problems must be addressed if full economic reform is to be achieved.

## 20 INCOME

The US Central Intelligence Agency (CIA) reports that in 2005 the Russian Federation's gross domestic product (GDP) was estimated at \$1.5 trillion. The CIA defines GDP as the value of all final goods and services produced within a nation in a given year and computed on the basis of purchasing power parity (PPP) rather than value as measured on the basis of the rate of exchange based on current dollars. The per capita GDP was estimated at \$10,700. The annual growth rate of GDP was estimated at 5.9%. The average inflation rate in 2005 was 12.9%. It was estimated that agriculture accounted for 5% of GDP, industry 35%, and services 60%.

According to the World Bank, in 2003 remittances from citizens working abroad totaled \$1.453 billion or about \$10 per capita and accounted for approximately 0.3% of GDP. Foreign aid receipts amounted to \$1,255 million or about \$9 per capita and accounted for approximately 0.3% of the gross national income (GNI).

The World Bank reports that in 2003 household consumption in Russia totaled \$219.03 billion or about \$1,532 per capita based on a GDP of \$430.1 billion, measured in current dollars rather than PPP. Household consumption includes expenditures of individuals, households, and nongovernmental organizations on goods and services, excluding purchases of dwellings. It was estimated that for the period 1990 to 2003 household consumption grew at an average annual rate of 0.9%. In 2001 it was estimated that approximately 28% of household consumption was spent on food, 16% on fuel, 7% on health care, and 15% on education. It was estimated that in 2004 about 17.8% of the population had incomes below the poverty line.

## 21 LABOR

In 2005, Russia's labor force was estimated at 74.22 million. As of 2004, it was estimated that agriculture accounted for 10.3% of the country's workforce, with 68.3% in the services sector, and 21.4% in industry. Although Russia's unemployment rate in 2005 was estimated at 7.6%, a considerable number of workers were underemployed.

A legacy from the Soviet era, the Federation of Independent Trade Unions of Russia (FNPR) still dominates organized labor and claims to represent 80% of all workers. The mining and air transport industries (along with the state sector) are highly unionized. Overall, about 46% of the workforce is at least nominally organized, with around 90% of them members of the FNPR. The legal right to strike is hindered by complex requirements. Court rulings have determined that nonpayment of wages, the most prevalent labor complaint, is an individual issue and cannot be addressed by the union. The right to bargain collectively is not regularly protected.

The monthly minimum wage was \$28 as of September 2005, which was not sufficient to provide a family with a decent standard of living. Most workers earn more than this amount, however it was estimated that 18% of the workforce earned less. Although the labor code provides a maximum regular workweek of 40 hours with a 24-hour rest period, many laborers put in 10- to 12-hour days. Children under the age of 16 are banned from most employment, but 14 year old minors can work under certain conditions with the approval of a parent or guardian. In such cases, the health and the welfare of the child must not be threatened. While these provisions are generally enforced through government action, prevailing social norms and a large pool of low-wage adult workers, child labor remains a problem, especially in the informal economy. The law establishes minimum standards of workplace safety and worker health, but these are not effectively enforced.

## 22 AGRICULTURE

In 2003, Russia had 124.4 million hectares (307.4 million acres) of arable land (8.5% of the world's total), covering 7.6% of the country's land area. In 2003, the share of agriculture in the GDP was 5%. Agricultural production dropped by an average of 6% annually during 1990–2000. However, during 2002–04, crop production was 13.1% higher than during 1999–2001. A surge in imports of food products during that period is the direct result of difficulties faced by domestic farmers and processors, and has brought with it a desire for protection from foreign competition in the name of national security. In 2004, Russia's agricultural trade deficit was over \$10.1 billion, fifth highest in the world.

The 2004 harvest included (in millions of tons): wheat, 45.4; potatoes, 35.9; sugar beets, 21.8; barley, 17.2; vegetables, 15.5; oats, 5; sunflower seeds, 4.8; corn, 3.5; rye, 2.9; buckwheat, 0.6; soybeans, 0.6; and rice, 0.5. The government is promoting the expansion of small-plot farming; about 150,000 new farms have begun operating since 1991, primarily in the south.

Agricultural policy has changed several times since market reforms began. Low interest loans were initially offered to the old state farms, but the government's budget soon could not afford all the demands made by farmers. The low interest loans were replaced by in-kind loans to suppliers, which were then modified to in-kind loans from the federal government to local governments. The general agricultural policy trend is now an ongoing devolution of power from the federal government to local governments.

## 23 ANIMAL HUSBANDRY

Some 91.9 million hectares (227 million acres) are pastureland, representing 5.6% of the total area. In 2005, the livestock population included: cattle, 22,987,700; sheep, 15,499,700; and pigs, 13,412,800. Russia also had 1.5 million horses, 328.9 million chickens, 2.7 million geese, and 2.5 million turkeys in 2005.

The 2005 meat production amounts included (in thousands of tons): beef, 1,915; pork, 1,610; mutton, 123; and poultry, 1,130. In 1999, Russia's livestock production was only 50% of what it had been in 1990. During 2002–04, livestock production was 7.8% higher than during 1999–2001. Milk production in 2005 was estimated at 30.9 million tons (down from 55.7 million tons in 1991), and egg production amounted to 2 billion tons in 2005. Infrastructural and distributional problems have exacerbated declining production. Many Russian dairy farms have been unprofitable

due to low-quality dairy cows, limited supplies of quality feed, and lack of support services. Continued decline in livestock production, especially poultry, as well as the rapid growth of imports have been a source of trade friction. In 2004, Russia imported over \$2 billion in meat and meat products.

## 24 FISHING

Russia's fish production ranks eighth in the world, following China, Peru, USA, Indonesia, Japan, India, and Chile. In 2003, 91% of the catch was marine, while 9% came from inland waters. The total catch in 2003 was 3,429,121 tons. The main species of the commercial catch in 2003 included (in thousands of tons): whiting, 360; herring, 335; cod, 277; and salmon, 188. Russia is a leading producer of crabmeat, fish roe, whole groundfish, and salmon products. More than half of Russian fish product exports consist of frozen products. Exports of frozen fish fillets in 2003 were valued at \$141.9 million; and roe, \$145.6 million.

Russia is known for its sturgeon and caviar. About 70% of the world's sturgeon stocks are in the Caspian Sea. Illegal trade of sturgeon and caviar have resulted in all 11 of Russia's commercial sturgeon species to be in decline. The Russian share of the world caviar market is estimated at 23–30%.

Overfishing and pollution of territorial waters have forced fishermen farther away from traditional fishing waters. For example, pollutants like mercury have partly caused the decline of the sturgeon and pike perch catches, which fell by 50% and 90%, respectively, from 1974 to 1987 in the Caspian Sea. Similar ecological problems also have affected fishing in the Azov Sea. Russia's enormous fishing fleet has many old vessels, and fuel shortages are common. Since 1991, more than 70 vessels have been leased from Spanish, Norwegian, and German shipbuilding yards. In 2003 alone, 36 Russian fishing vessels of 100 gross tons or more were added to the fishing fleet. Russian fishing vessels account for about 24% of the world's fishing fleet capacity.

Despite problems with pollution, the Russian catch expanded during the 1980s (the marine catch by 24%, the freshwater catch by 26%) due to intensified fishing in dam reservoirs, consumption substitution toward nontraditional fish stocks, and acceptance of higher levels of contaminants. Since 1990, the production of fish and fish products has declined without interruption. Direct subsidies from the federal government ceased in 1994. As a result, the proportion of unprocessed fish products has steadily risen since 1990. Badly worn ships and equipment continue to limit production. Russia is eligible to catch up to five million tons of fish outside its territorial waters, but typically only reaches one million tons.

## 25 FORESTRY

Russia's forested areas are vast. In 2000 an estimated 851.4 million hectares (2,104 million acres) were classified as forested—an area larger than the total land area of Australia. Only half of this area is commercially accessible and only 7–10% is currently exploited. Russia contains 25% of the world's forested area; 20% of the world's forests are in Siberia. The forest stock in Russia is 80% coniferous, consisting mainly of spruce, fir, larch, and pine in subarctic areas; these stands account for 52% of the world's coniferous areas. De-

ciduous trees (birch, oak, beech, ash, maple, elm) grow further south and account for 13% of the world's deciduous forests.

In 2004, the timber cut yielded 182 million cu m (6.4 billion cu ft) of roundwood. Production that year included (in cubic meters): sawn timber, 21,500,000; plywood and particleboard, 7,159,000. Paper and paperboard production totaled 6,789,000 tons. In 2004, Russian exports of forest products were valued at over \$5.4 billion. China, Finland, and Japan are the major export markets.

In 1992, a year after the dissolution of the USSR, the forest products industry underwent massive changes. Hundreds of inexperienced new businessmen were attracted to the business of buying logs from newly unregulated leskhozoes (forest villages legally entitled to harvest and manage forests). Widespread privatization in the forest products industry began in 1993. Rocleskhoz, the federal forest service, is responsible for overseeing management of forests. The forestry industry is a multi-layered bureaucracy where wood processing companies must pay about 40 different taxes, which has prompted some to act outside the official system. During the 1990s, about 50% of all forestry firms went out of business, and about 60% of the firms remaining are believed to be on the verge of bankruptcy. The failing firms are often pressured to cut trees and sell logs for quick cash to pay off debts so they will be allowed to stay in business. Poaching, unsustainable logging, and fire damage are growing problems. Much of the forestry equipment is too old or expensive to operate, with the result that output per worker is at 1960s levels. Although the allowable forest cut is 559 million cu m (1.97 billion cu ft), an estimated 52% of logging enterprises were operating at a loss in 2005. Though the government is trying to encourage exports of higher value products, lack of investment has hindered plans to decrease the 40% export share of softwood and hardwood logs. Russia's forestry sector only contributes 3% to GDP.

## 26 MINING

With bountiful and diverse minerals, Russia, the world's largest country in land area, occupying 75% of the former Soviet Union, had a significant percentage of the world's mineral resources and mineral production. Russia is one of the largest producers of palladium and nickel, as well as of aluminum and platinum-group metals (PGMs), potash, gold, and mined copper. Russia also produced a large percentage of the Commonwealth of Independent States' (CIS) bauxite, coal, cobalt, diamond, lead, mica, natural gas, oil, tin, zinc, and many other metals, industrial minerals, and mineral fuels. Exports under the "Mineral Products" category accounted for around 75% or \$80 billion of Russia's exports by value in 2002. Of that total, natural gas exports by value totaled over \$15 billion, while crude oil and petroleum products accounted for nearly another \$40 billion in 2002.

More than half of Russia's mineral resources were east of the Urals. The most significant regions for mining were Siberia, particularly East Siberia, for cobalt, columbium (niobium), copper (70% of Russia's reserves), gold, iron ore, lead (76% of the country's reserves), molybdenum, nickel (becoming depleted), PGMs, tin, tungsten, zinc, asbestos, diamond, fluorspar, mica, and talc; the Kola Peninsula, for cobalt, columbium, copper, nickel, rare-earth metals, phosphate (the majority, in the form of apatite), and tantalum; North Caucasus (copper, lead, molybdenum, tungsten, and zinc); the Russian Far East (gold, lead, silver, tin, tungsten,

and zinc); the Urals, with bauxite, beryllium, cobalt, copper, iron ore, lead, magnesite, nickel, titanium, vanadium, zinc, asbestos, bismuth, potash (96% of the country's reserves), soda ash, talc, and vermiculite; and the region near the Arctic Circle (cobalt, gold, mercury, nickel, tin, phosphate, and uranium). The Kaliningrad region contained 95% of the world's amber deposits, and Russia possessed 10% of the world's copper reserves. Metallurgical enterprises in Kola, North Caucasus, and the Urals were operating on rapidly depleting resource bases, and were experiencing raw material shortages.

A large percentage of Russian reserves were in remote northern and eastern regions that lack transport, were distant from major population and industrial centers, and experience severe climates, and enterprises built there in the Soviet era had curtailed operations sharply. Efforts to develop new large deposits of nonferrous metals near the eastern Baikal-Amur railroad were not progressing. One researcher proposed the creation of small mining enterprises to develop the rich small deposits of eastern Russia. Reserves of iron ore were sufficient to last 15–20 years; those of nonferrous metals, 10–30 years. Reserves of major minerals included potash, 1.8 billion tons; magnesite, 585 million tons; bauxite, 250 million tons; phosphate rock, 240 million tons; asbestos, 100 million tons; fluorspar, 60 million tons; manganese, 15 million tons; nickel, 6.3 million tons; vanadium, 5 million tons; zinc, 4 million tons; antimony, 3 million tons; and lead, 3 million tons.

Output of iron ore (gross weight) was 84.236 million tons in 2002, up from an estimated 82.5 million metric tons in 2001. The largest producer was Kursk Magnetic Anomaly, at Zheleznogorsk and Gubkin, with a 50 million ton per year capacity.

Output of copper was 695,000 metric tons in 2002. The Noril'sk complex, in East Siberia, produced 70% of the country's copper, and planned to increase output of cuprous ore from its Oktyabr'skiy underground mine, from 100,000 tons per year to 1.6 million tons, because the cuprous ores were 40% higher in copper content than the nickel-rich ores. The Oktyabr'skiy mine supplied 70% of Noril'sk's copper output, and was planning to decrease production of the nickel-rich ores.

PGM production included 69,000 kg of palladium, and 34,000 kg of platinum. Sixty percent of PGM output came from the Oktyabr'skiy mine, Noril'sk, and a plan to expand output at the mine of cuprous ores by a factor of 16 was projected to yield more PGMs, as would two new nickel-rich mines, the Glubokiy and the Skalisty, that had a high PGM content.

The output of other metals in 2002 was: bauxite, 3.8 million metric tons (estimated); mined nickel, 310,000 metric tons (estimated); mined zinc, 130,000 metric tons; mined lead, 13,500 metric tons (estimated); magnesite, one million metric tons (estimated); mined tin, 2,900 metric tons (estimated); titanium sponge, from the Perm' region in the Urals, 23,000 metric tons (estimated); molybdenum, 2,900 metric tons (estimated); and mined cobalt, 4,600 metric tons (estimated). Gold mine output was 158,000 kg (estimated). Russia also produced the metal minerals alumina, nepheline concentrate, antimony, white arsenic, bismuth, chromium, manganese, mercury, silver, tungsten, and baddeleyite zirconium. Russia, which had the capacity to mine vanadium, stopped mining beryllium in the mid-1990s, and continued producing cobbled beryl.

Industrial mineral production in 2002 included: phosphate rock (apatite concentrate and sedimentary rock), 4.4 million metric tons (estimated); marketable potash, 4.4 million metric tons (estimated); mica, 100,000 metric tons (estimated); fluorspar concentrate, 200,000 metric tons (estimated); and gem and industrial diamonds, 11.5 million carats each. Russia also produced the industrial minerals amber, asbestos, barite, boron, hydraulic cement, kaolin clay, feldspar, graphite, gypsum, iodine, lime, lithium minerals, nitrogen, salt, sodium compounds, sulfur (including native and pyrites), sulfuric acid, talc, and vermiculite. Russia's only producer of amber, Kaliningrad Amber Works, was the world's largest producer, yielding 441.8 tons in 2000, 364.5 in 1999, and 512.2 in 1998.

Despite decreased metal output compared with the Soviet period (e.g., 20% as much tin), Russia was producing more aluminum, lead, and zinc in 2000 than during the Soviet era. Ten percent of the technology employed in the nonferrous mining and metallurgy sector was rated as world class, labor productivity was one-third below that of advanced industrialized countries, and energy expenditures were 20–30% higher. Another problem was that the resource base for metallurgical enterprises was not competitive in terms of quality, with the exception of antimony, copper, nickel, and molybdenum. More than one-half of industrial mineral output was exported, depriving the domestic sector of needed supplies, especially barite, bentonite, crystalline graphite, and kaolin. Russia has not been successful in attracting foreign investment for developing its mineral deposits, because of high and unpredictable taxes, an unreliable legal system, insecure licensing, unequal treatment between domestic and foreign partners, a weak banking system, and the inability to directly export commodities.

## 27 ENERGY AND POWER

Russia possesses enormous reserves of oil, natural gas, and coal. It is the largest exporter of natural gas in the world, the world's second-largest exporter of petroleum, and the third-largest consumer of energy in the world.

As of 1 January 2005, Russia's proven reserves of oil were estimated at 60 billion barrels, according to the Oil and Gas Journal. Most of that oil is located between the Central Siberian Plateau and the Ural Mountains, in Western Siberia. Of that amount, about 14 billion barrels are located just north of Japan on Sakhalin Island. Although Russian production fell from 7,819,000 barrels per day in 1992 to 6,070,000 barrels per day in 1998, output since 1999 has risen steadily to an estimated 9,300,000 barrels per day in 2004. Russia has 41 oil refineries with a combined crude oil processing capacity estimated at 5.44 million barrels per day, as of December 2004. However, many are inefficient, old and in need of being modernized. Exports are handled by pipeline, rail and barge transport. For the period January through September 2004, pipelines carried 60% or 4 million barrels of oil per day. Exports by rail accounted for 33% of oil exports, or 2.2 million barrels per day. Barges and other traffic accounted for 7% or two million barrels per day. In 2004, net oil exports were estimated at 6.7 million barrels per day.

As of 1 January 2005, Russia had the world's largest reserves of natural gas, estimated at 1,680 trillion cubic ft, more than two times those of Iran, the next largest country. Russia in 2004 was also the world's largest producer and exporter of natural gas. In

that year, natural gas output totaled an estimated 22.4 trillion cu ft, with exports at an estimated 6.5 trillion cu ft. However, in spite of its vast reserves of natural gas, Russia's natural gas production and consumption have remained relatively flat since 1992. In that year natural gas production totaled 22.62 trillion cu ft, with domestic demand at 16.46 trillion cu ft. In 2004, production and consumption were estimated at 21.80 trillion cubic ft and 15.29 cu ft, respectively. The main causes for this are: aging fields; insufficient export pipeline capacity; government regulation; and Russia's state-run natural gas monopoly, Gazprom, which operates the country's network of natural gas pipelines, and produces almost 90% of the country's natural gas. In addition, three major gas fields in Western Siberia, the Urengoi, Yamburg, and Medvezh'ye Fields, which provide Gazprom with more than 70% of its production, are in decline.

Russia's proven coal reserves, estimated at 173 billion short tons as of 1 January 2004, were also the second-largest in the world. Coal production in 2003, according to the Energy Information Administration (EIA), was estimated at 294.1 million short tons, while output in 2004, was estimated by the Russian Energy Ministry at 308.6 million short tons, less than one-third of US production. Domestic demand for coal in 2003 was estimated at 254.8 million short tons.

Although electric power generation fell following the breakup of the Soviet Union, output has begun to recover since 1999. In 2003 and 2004, Russian electric power output was estimated at 850.6 billion kWh, and at 915.0 billion kWh, respectively. Consumption of electricity in 2003 and 2004 was estimated at 780.0 billion kWh and 860.0 billion kWh, respectively. Total installed capacity in 2004 was estimated at 208 million kW, of which thermal generation accounted for 68% of electrical capacity, hydro accounted for 22% of capacity, and nuclear 10% of capacity. As of February 2005, Russia had more than 440 thermal and hydroelectric generating stations and 31 nuclear reactors. In 2001, a 1,000 MW reactor began operating at the Rostov facility.

## 28 INDUSTRY

Major manufacturing industries include crude steel, cars and trucks, aircraft, machine equipment, chemicals (including fertilizers), plastics, cement and other building materials, medical and scientific instruments, textiles, handicrafts, paper, television sets, appliances, and foodstuffs.

Steel production remains a key industry. Once the world leader in the production of steel, that Russian industry fell on hard times in the 1980s as Soviet-made products could not keep up with the quality or output of competitors. Nonetheless, plants continue to operate although less than half use updated equipment.

Aluminum and nickel production continue, particularly in mineral-rich Siberia. The largest companies are the Noril'sk Nickel Joint-Stock Company, Bratsk Aluminum, Krasnoyarsk Aluminum, and Sayan Aluminum. European Russia and the Ural region continue to serve as the center for the production of textiles and machine industry. Chemical production is scattered throughout the country, while the center of the oil and gas industry remains the region of the Caucasus Mountains and Caspian Sea. Russia holds the world's largest natural gas reserves, the second-largest coal reserves, and the eighth-largest oil reserves. It is also the world's largest exporter of natural gas, the second-largest oil ex-

porter, and the third-largest energy consumer. The oil industry is dominated by 11 large companies which account for around 90% of production and close to 80% of refining. Russia had 41 oil refineries in 2005, with a total capacity of 5.44 million barrels per day. Russia's energy riches bring it political power. As of 2006, a proposed 1,200 km, \$5 billion gas pipeline along the Baltic seabed was due to be completed in 2010; it would offer Russia's gas export monopoly, Gazprom, a direct link with its main Western European markets, bypassing Poland and the Baltic states, which had hoped for an alternate route bringing them extra transit fees.

Industrial expansion is mainly in consumer goods and food processing, often embraced by enterprises converting from military production, which dominated industry output in the former Soviet Union.

Russia's industrial base is outmoded and must be restructured or replaced in order for the country to maintain strong economic growth. Nonetheless, Russia emerged from its 1998 economic crisis with an industrial growth rate of 5.2% in 2001. That year, industry accounted for 39% of GDP and employed 28% of the work force. In 2004, the industrial production growth rate was 6.4%; industry accounted for 33.9% of GDP and some 22% of the labor force. Oil, natural gas, metals, and timber made up 80% of Russia's exports in 2004, followed by iron and steel, aluminum, and machinery and equipment. Russia's wealth of, and export of, natural resources leave it vulnerable to swings in world prices. Other industrial areas of growth in the mid-2000s included construction, automotive equipment, aircraft, and food processing.

## 29 SCIENCE AND TECHNOLOGY

The Russian Academy of Sciences, founded in 1725, is the chief coordinating body for scientific research in Russia through its science councils and commissions. It has sections of physical, technical, and mathematical sciences; chemical, technological, and biological sciences, and earth sciences, and controls a network of nearly 300 research institutes. The Russian Academy of Agricultural Sciences, founded in 1929, has departments of plant breeding and genetics; arable farming and the use of agricultural chemicals; feed and fodder crops production; plant protection; livestock production; veterinary science; mechanization, electrification, and automation in farming; forestry; the economics and management of agricultural production; land reform and the organization of land use; land reclamation and water resources; and the storage and processing of agricultural products. It controls a network of nearly 100 research institutes. It supervises a number of research institutes, experimental and breeding stations, dendraria and arboreta. The Russian Academy of Medical Sciences, founded in 1944, has departments of preventive medicine, clinical medicine, and medical and biological sciences, and controls a network of nearly 100 research institutes.

The Russian Federation in 2002 had 3,415 scientists and engineers, and 579 technicians engaged in research and development (R&D) per million people. In the same period, R&D expenditures totaled \$14,733.916 million, or 1.24% of GDP. Of that amount, the largest portion, 58.4%, came from government sources, while business accounted for 30.8%. Higher education, private nonprofit organizations and foreign sources accounted for 0.3%, 0.1% and 8%, respectively. High technology exports in 2002 totaled \$2.897 billion, or 13% of the country's manufactured exports.

Russia has nearly 250 universities and institutes offering courses in basic and applied sciences. In 1987–97, science and engineering students accounted for 50% of university enrollment.

### 30 DOMESTIC TRADE

A central marketplace is a common feature of urban areas in Russia. Outside of Moscow and St. Petersburg, small open markets and kiosks are the primary retail establishments. Nationwide distribution channels are still largely undefined.

Many consumer goods, which were often traded via the black market during the Soviet era, are now openly available. However, inflation and slow economic recovery severely constrain domestic purchasing power. Since the underground economy was so well-developed during the Soviet period, distribution and trade through informal channels is still common. The appearance and rapid development of organized crime in post-Soviet Russia may also be seen as a result of Russia's affinity for informal domestic economic activity; local businesses are often forced to pay protection money to organized crime. Commercial advertisement, virtually unknown during the Soviet era, is now commonly used.

As of 2006, a value-added tax of 18% (VAT) applies to most goods and services. The VAT is reduced to 10% for certain foods and children's clothing. Pharmaceuticals and certain financial services are exempt. In 2004, a regional 5% sales tax was abolished. Credit cards are being accepted at major hotels and restaurants in Moscow and St. Petersburg, but many other retail establishments still operate on a cash-only basis.

Business hours are generally 9 AM to 5 PM, Monday to Friday, but the most common times to find workers working is from 10 AM to 6 PM. In the provinces, work finishes earlier.

### 31 FOREIGN TRADE

Principal exports have traditionally been oil, natural gas, minerals, military equipment and weapons, gold, shipping, and transport services. Principal imports include machinery and equipment, consumer goods, medicines, meat, grain, sugar, and semifinished metal products. Mainly because of high international oil prices, export revenue soared after 2000. Import growth picked up over the same period as a result of rising real incomes and real ruble appreciation. The trade surplus increased to \$87 billion in 2004.

The primary exports in 2004 were: oil, fuel, and gas (54.6% of all exports); precious metals (15.8%); machinery and transportation equipment (6.8%); and chemicals (6%). The main imports were: machinery and transportation equipment (27.6% of total imports); food, beverages, and agricultural products (12.3%); chemicals (11%); and metals (4.9%). Russia's major markets in 2004 were Germany (7.9% of all exports), the Netherlands (6.1%), China (6.1%), and the United States (5.7%). Russia's main suppliers in 2004 were Germany (13% of all imports), Ukraine (5.8%), China (5.8%), and Italy (5.1%).

### 32 BALANCE OF PAYMENTS

Foreign trade was largely deregulated in early 1992, and the trade balance contracted throughout the year; exports declined by 35% to \$15.4 billion, while imports fell by 24% to \$14.9 billion during the first half of 1992 compared with the same period of 1991. The current account deficit was estimated at \$4 billion in 1992, due to the significant decrease in imports. As of the beginning of

1993, there was a dire shortage of hard currency reserves, which severely limited importation possibilities of consumer and capital goods. Since 1993, however, Russia has run a surplus on the current account.

In 2004, Russia's total exports were \$182 billion and imports were \$94.8 billion for a trade surplus of roughly \$87 billion. The current-account surplus had been sizeable as of 2004, reaching \$60.6 billion that year. The current-account balance averaged 10% of GDP over the 2001–05 period.

### 33 BANKING AND SECURITIES

The Central Bank of the Russian Federation was created in January 1992 from the old Soviet banking system headed by Gosbank (The Soviet State Bank). The bank heads a two-tier banking system, and implements a monetary policy and regulates the com-

mercial banking sector by setting the reserve requirements and the discount rate. The currency unit of Russia is the ruble, a currency that is in the process of becoming fully convertible with world currency. Russia, along with a few other countries of the former Soviet Union, decided to keep the ruble as its currency. The other important state bank is the Rosevneshtorgbank (Bank for Foreign Trade of the Russian Federation).

Around 2,000 commercial banks operate in Russia, a third of which are former specialized state banks. The rest are new institutions. Commercial banks include the Commercial Bank Industriaserbis, the Commercial Credit Bank, the Commercial Conservation Bank, the Commercial Innovation Bank, the International Moscow Bank, St. Petersburg's Investment Bank, and the Construction Bank. The International Bank is a bank whose shares are owned by western banks, such as Citibank (US) and the Barclays Groups (UK), interested in doing business in the country.

Sberbank held around 86% of the population's savings in 1994. Having around 2,000 branches, it is by far the largest banking institution in the country. Sberbank became a joint-stock company in 1991, with the Central Bank taking a 20% shareholding. In addition to Sberbank (the Savings Bank), there were four other specialized banks: the Foreign Trade Bank (Vneshtorgbank), which is now more concerned with retail and corporate banking; the Bank for Construction and Industry (Promstroibank); the Agriculture Bank (Agroprombank); and the Social Sector Bank (Zhilotsbank). Formerly these were joint-stock banks but they relied on cheap credit from Gosbank.

The International Monetary Fund reports that in 2001, currency and demand deposits—an aggregate commonly known as M1—were equal to \$40.9 billion. In that same year, M2—an aggregate equal to M1 plus savings deposits, small time deposits, and money market mutual funds—was \$72.8 billion. The money market rate, the rate at which financial institutions lend to one another in the short term, was 10.1%. The discount rate, the interest rate at which the central bank lends to financial institutions in the short term, was 25%.

Russia had a small stock market in 1992. The market is considered an emerging market by Western investors with the potential for significant growth in coming years. Although the first stock market opened in Moscow in 1991, over 100 were in operation by 1996. The range, as well as the volume, of securities traded has been rapidly expanding. Inadequate regulation and custody registration systems have been the main bottlenecks in development. A Commission for Securities and Stock Market was established in late 1994. The second half of 1996 witnessed a huge rally in the value of Russian equity as it became clear that economic reforms would continue following the reelection of Boris Yeltsin as president.

Nevertheless, Russia's financial woes continued. In August 1998 the government defaulted on its debt. This action, in turn, led to the collapse of Russia's financial markets as the government abandoned support for the ruble and ceased bond payments. As a result, many banks became insolvent; only Central Bank intervention allowed many depositors to rescue a portion of their funds. Since Sberbank was originally a savings bank for the Soviet people, after the financial crisis of 1998 it received individual accounts from banks liquidated by the government. As a result, it has an unmatched network of 50 branches and over 2,000 outlets han-

dling millions of accounts, both private and commercial. Also following the 1998 crisis, a group of new banks actually grew larger because of their avoidance of speculation in the short term loans on which the government had to default, and their dedication to professional services. These banks, which have prospered despite the weak economy (or perhaps because of it), include the Bank of Moscow, Alfa-Bank, Rosbank, Mezhprombank, Mosbusinessbank, MDM Bank, Sobinbank, National Reserve Bank, and Gazprom Bank.

The subsequent adoption of a tight monetary policy prevented the onset of hyperinflation and has contributed to the ongoing recovery. In fact, 2001 saw a considerable amount of economic firming. Market capitalization in combined Russian stock markets was, at \$76 billion, nearly double the 2000 level, and the RSF Russia 100 Index, at 8602.7, was up 91% from the previous year. As of January 2002, the RSF Russia 100 Index was replaced by the S&P/RUX Composite Index. As of end 2004, that index stood at 760.9, up 15% from the previous year. In 2004, there were 215 companies listed on Russia's stock exchanges, which as of that year had a combined market capitalization of \$267.957 billion.

### 3<sup>4</sup> INSURANCE

In 1993, a total of 1,524 Russian companies were licensed to sell insurance and another 750 companies had applied for licenses. However, fewer than 2% of the operating firms had assets over R100 million (\$80,000), and premium volume for the first nine months of 1993 amounted to only 1.3% of the GDP (as compared with volume of 2.9% for the former Soviet Union in 1990).

Property insurance is the largest segment of the market with 880 companies. There are 775 cargo insurance firms, and 600 that sell life insurance. The various companies are gradually consolidating into groups.

Regulation of the industry is low. For example, in 1994, to open a business, the minimum capital requirement was two million rubles for an insurance company and 15 million rubles for reinsurance. Rosgosstrakh held a virtual monopoly on the domestic insurance market with 90% of policies, while Ingosstrakh held about 50% of the market in export and import insurance. One of the largest newcomers is Ask, a commercial company. Foreign ownership in insurance companies in 2002 was limited to 49% in order to protect private insurers. The industry is regulated by the Russian Insurance Inspectorate. Compulsory insurance includes third-party automobile liability, medical insurance, pension, social insurance, and fire and accident insurance. Starting in January of 1996, companies were able to deduct their insurance premiums as a business expense for tax purposes.

In 2003, the value of all direct insurance premiums written totaled \$14.088 billion, of which nonlife premiums accounted for \$9.220 billion. For that same year, Russia's top nonlife insurer was Ingosstrakh, with gross written nonlife premiums (excluding compulsory insurance) of \$416 million, while the country's leading life insurers that year, was Stolichnoe, with gross domestic life insurance premiums of \$1,319.8 million.

### 3<sup>5</sup> PUBLIC FINANCE

Since the breakup of the COMECON and the Soviet Union, trade disruptions and friction between Russia and the governments of the former Soviet republics had led to an enormous expansion of

the fiscal deficit. The deficit was financed largely through sales of domestic government securities and borrowing from international financial institutions.

The US Central Intelligence Agency (CIA) estimated that in 2005 the Russian Federation's central government took in revenues of approximately \$176.7 billion and had expenditures of \$125.6 billion. Revenues minus expenditures totaled approximately \$51.1 billion. Public debt in 2005 amounted to 15.6% of GDP. Total external debt was \$230.3 billion.

The International Monetary Fund (IMF) reported that in 2003, the most recent year for which it had data, central government revenues were R3,644.5 billion and expenditures were R3,348.6 billion. The value of revenues was us\$119 million and expenditures us\$109 million, based on an exchange rate for 2003 of us\$1 = R30.6920 as reported by the IMF. Government outlays by function were as follows: general public services, 35.2%; defense, 11.4%; public order and safety, 8.2%; economic affairs, 4.9%; environmental protection, 0.3%; health, 1.1%; recreation, culture, and religion, 0.9%; education, 3.0%; and social protection, 35.1%.

**36 TAXATION**

Russia's tax system has historically been confusing, inefficient, unwieldy, and overbearing. Businesses and individuals routinely fail to pay their taxes on time, if at all. The government's need for money to pay pensions and salaries fueled a proliferation of taxes, including a tax on people crossing Russia's borders, additional levies on freight, new transit fees, and a tax on yields from government securities. In 1996, 26 tax collectors were killed, six were kidnapped, and 41 had their homes burned down. In the first half of 1997, the government only collected 57% of its targeted tax revenues.

Since 1999, the tax system has been the focus of a major reform effort aimed at reducing tax loads, improving collection rates, and bringing the system in line with those of advanced, market economies. The new Tax Code cut the number of official taxes from over

200 to about 40, and sought to end many loopholes. Part One of the new Tax Code, effective 1 January 1999, set out the administrative framework for the new system. There are three levels of taxation, federal, regional, and local. The principal taxes collected at the federal level are the profit tax on organizations (with payments divided among all three levels of government), a capital gains tax, a personal income tax (13% flat tax), the Unified Social Tax (replacing payroll contributions to four separate social benefit funds), a value-added tax (VAT—with the standard rate of 18% as of 2005), excise taxes, a securities tax (0.8% on nominal value with exemptions for initial issues), customs duties and customs fees, and federal license fees. At the regional level the principal taxes are an assets tax (2.2%), a real estate tax, a transport tax, sales taxes (maximum 5% in 2003), a tax on gambling, and regional license fees. Two turnover taxes at the state level, a social infrastructure maintenance tax (Housing Fund Tax) and a road users' tax, considered to be among the most onerous under the previous tax system, have been abolished; the Housing Fund Tax in 2001, and the roads tax in 2003. At the local level there are land taxes, individual property taxes, taxes on advertising expenses (beyond allowable limits as a proportion of sales), inheritance and gift taxes, and local license fees.

As of 2005, the corporate income tax was 24%, with payments split 5% to the federal budget, 13–17% payable to the regional governments, and 2% to the local level. Because regional governments are allowed to reduce their corporate rate to as low as 13%, the total minimum rate is 20%. Foreign companies pay withholding of 20%, and dividends paid to nonresidents are charged a 15% withholding rate (down from 18%).

The most striking provision in Russia's 1999 tax reforms is the replacement of its progressive income tax schedule (set out in the tax law of December 1991 with rates from 12–30%) with a flat tax of 13% applied to almost all income categories. The rationale is that the lower, simpler tax will generate more revenue by reducing Russia's pervasive tax-evasion. Exceptions to the 13% rate include a 15% rate on dividend income and on the income of nonresidents from Russian sources. There are also taxes on gambling income, lottery prizes, deemed income from low-interest or interest-free loans, some insurance payments, and excessive bank interest. The Unified Social Tax is a regressive schedule of payroll taxes ranging from 35.6–2% and is based on the gross income received by the employee. All voluntary insurance payments are tax deductible.

Russia's VAT, its main indirect tax, had a standard rate of 18% as of January 2005 that was scheduled to 16% as of January 2006. Exemptions from VAT for pharmaceuticals and license fees have been narrowed or removed. There are also excise taxes on items such as gasoline and other oil products, natural gas, alcohol, tobacco, and cars, motorcycles, and jewelry.

**37 CUSTOMS AND DUTIES**

In 1992, Russia eliminated many of the import restrictions imposed by the former Soviet Union. At the beginning of 2001, Russia put into effect a new and simpler tariff structure, consisting of four basic rates: 5%, 10%, 15%, and 20%. This effectively lowered the tariff ceiling from 30% to 20%. There is also an 18% value-added tax (VAT) on most imported goods, except for food products, which carry a VAT of only 10%. There are excise taxes on luxury goods, alcohol, tobacco, and autos. In total, these duties make im-

ported goods essentially noncompetitive in the troubled Russian economy.

### **3<sup>8</sup> FOREIGN INVESTMENT**

In September 1991, a foreign investment law promoting the transfer of capital, technology, and know-how went into effect. Nonresidents may acquire partial shareholdings or form wholly owned subsidiaries in Russia. Foreign firms may obtain licenses to exploit natural resources. Foreign investors can be exempted from import duties and export taxes, and there is limited relief from profits tax, varying by sector and region. However, foreign investors remain concerned with the overall business climate in Russia. Vague business laws, an incoherent tax system, crime and corruption in commercial transactions, and a weak commitment to reform continue to erode investor confidence.

In 1997, the annual inflow of foreign direct investment (FDI) to Russia peaked at \$4.87 billion, but then fell to \$2.76 billion in 1998 in the context of the Russian financial crisis. FDI recovered to \$3.3 billion in 1999, and for the three years 2000, 2001, and 2002 averaged about \$2.6 billion a year. Cumulative FDI in Russia from 1991 to April 2003 was \$19.6 billion. Russia's share of world FDI flows has persistently been only about 30% of its share of world GDP, an indication of its lack of success in attracting foreign investment.

As of 2005, roughly three-quarters of the economy had been privatized, although many privatized enterprises continue to have significant state-held blocks of shares. Tax reforms since 2000 have aimed to rationalize the tax system, reducing the number of taxes and the corporate tax burden. The corporate tax rate was lowered from 35% to 24% at the start of 2002. FDI inflows averaged 1.6% of GDP over the 2001–05 period. Investment inflows for the first nine months of 2004 amounted to just over \$29 billion (this figure includes direct investment, portfolio investment, and “other” investment—largely trade credits). The top foreign investors in Russia are Germany, the United Kingdom, Luxembourg, the Netherlands, the United States, France, and Switzerland.

### **3<sup>9</sup> ECONOMIC DEVELOPMENT**

In 1991, Russia's parliament enacted legislation aimed at fully privatizing the commercial and service sector by 1994 and placing about half the medium and large companies in private hands by 1995. By the end of 1992, about 6,000 firms had applied to become joint-stock companies, and 1,560 had completed the process; almost one-third of Russia's approximately 250,000 small businesses had been privatized. Housing privatization began late in 1992, and over 2.6 million apartments—about 8% of the total—had been privatized by the end of 1993. In 1996, the government claimed that the nonstate sector produced approximately 70% of gross domestic product (GDP), up from 62% in 1995. Russia's Communist-dominated parliament, however, was quick to criticize the government's privatization efforts which they thought were responsible for the economic decline. In March 1997, over two million people took part in a national strike protesting the economic hardships of privatization and over 100,000 attended rallies in Moscow and St. Petersburg. The government, however, was committed to privatization and largely ignored the parliament and the protests.

During the financial crisis of 1998, Russia became the first modern country to default on its debt. The subsequent collapse of the

ruble and investor flight left analysts concerned that Russia would face famine and even governmental collapse. Instead, a period of fiscal restraint restored growth to the Russian economy although it remains vulnerable to sudden fluctuations in the world market. Russia in the early 2000s remained current on its foreign debt; service of the foreign debt amounted to around \$14 billion in 2002.

Russia's GDP increased by 4.3% in 2002 over 2001. Lowered inflation and high oil prices fueled that growth. Unemployment and underemployment remain problems, however. In 1998 the government passed an improved bankruptcy code, and in 2001, the Duma passed a deregulation package to improve the business and investment sector. A new corporate tax code went into effect in 2002, lowering the corporate tax rate to 24% from 35%. Cumulative foreign investment increased by 20% in 2002, but was mostly due to increases in loans and trade credits. The banking system is poorly developed, which inhibits economic development. In 2002, the US Department of Commerce designated Russia a “market economy,” and the country was invited by the G-7 nations to take part in negotiations, causing the group to be named the G-8.

As of 2006, Russia's reforms had made considerable progress since Vladimir Putin became president in 2000. Progress in such sensitive areas as utilities restructuring and housing reform is slower than in those areas that were targeted by the 2000–02 reform agenda, namely tax reform and deregulation. As of 2006, roughly three-quarters of the Russian economy had been privatized, although the state still held significant blocks of shares in privatized businesses. The large, unwieldy and corrupt bureaucracy remains a problem for reform. Russia ended 2005 with its seventh straight year of economic growth, which averaged about 6.5% annually since the 1998 financial crisis. Russia also improved its international financial position over this period, with foreign debt declining from 90% of GDP in 1998 to approximately 28% of GDP in 2004. Strong oil export earnings allowed Russia to increase its foreign reserves from \$12 billion to some \$120 billion by yearend 2004. These achievements raised business and investor confidence in Russia's economy, but, in addition to problems already mentioned, the manufacturing base is in serious need of modernization, the banking system is weak, there is a widespread lack of trust in institutions, and underemployment is a severe problem. President Putin by 2006 had taken a number of steps to shore up presidential power, and concerns have been raised that certain forces within the government are looking to reassert further state control over the economy.

### **4<sup>0</sup> SOCIAL DEVELOPMENT**

A social insurance system provides pensions for old-age, survivorship, and disability. The program is funded by employer payrolls, and self-employed persons and independent farmers contribute a fixed amount monthly. The government provides subsidies when needed. The first laws governing sickness benefits were implemented in 1912. All citizens and refugees are entitled to medical care; employed persons receive cash benefits for sickness. There is also a benefit provided to those caring for a sick child. Work injury is funded by the employer. Maternity benefits cover 100% of earnings from between 10 and 12 weeks before the expected date of childbirth and 10 to 16 weeks after childbirth. A universal system

of family allowances provides a birth grant, a funeral grant, and a monthly benefit for each child under the age of 16.

The constitution prohibits discrimination based on race, sex, religion, language, social status or other circumstances. Despite these constitutional provisions, employment discrimination against women and minorities occurs. On average women earn significantly less than men and cluster in the lower-paid jobs and professions. The high cost of maternity care benefits leads some employers to hire men rather than women. Women suffer disproportionately in situations of worker layoffs. There is no law against sexual harassment and abuses in the workplace are common. Spousal abuse is a widespread problem and is treated as a domestic matter rather than a criminal offense. It was estimated in 2004 that 70% of wives were victims of some kind of domestic abuse. Sexual violence and other crimes against women are underreported and the government provides no support services to victims.

In general human rights are respected, but serious violations occur concerning the struggle against rebels in Chechnya. Also, ethnic minorities are subjected to harassment, searches, and arrest by police, and are sometimes denied local authority permission to reside in Moscow. Anti-Semitic rhetoric is increasing and several instances of intimidation and violence have been reported. Muslims continue to face discrimination. Prisoners are subject to mistreatment, unhealthy living conditions, and lack of medical care.

#### 4<sup>1</sup> HEALTH

As of the mid-1990s, the overall organization of the health care system has largely been carried over from the Soviet era. Primary care has been delivered through basic units called *uchastoks*. In rural areas, these districts are served by health posts staffed by midwives or physicians' assistants, while health centers and urban polyclinics are available in larger population centers. The secondary-care network has also been retained from the Soviet era and consisted of *uchastok* hospitals and health centers, district hospitals and polyclinics, and regional hospitals and polyclinics. Medical facilities throughout the country are generally inadequate, with equipment that is both outdated and in poor condition. A survey conducted in the mid-1990s found a high level of dissatisfaction with the health care system on the part of both the general public and health care personnel, as well as widespread support for privatization. As of 2004, there were an estimated 417 physicians, 787 nurses, and 32 dentists per 100,000 people. Total health care expenditure was estimated at 4.6% of GDP.

As of 2002, the crude birth rate and overall mortality rate were estimated at, respectively, 9.7 and 13.9 per 1,000 people. Infant mortality was 15.39 per 1,000 live births in 2005 and average life expectancy was 67.10 years. The total fertility rate was 1.3 children per woman during her childbearing years. Children up to one year of age were immunized against tuberculosis, 97%; diphtheria, pertussis, and tetanus, 87%; polio, 97%; and measles, 95%.

The heart disease mortality rates for Russian men and women were higher than the average for countries of high human development. The HIV/AIDS prevalence was 1.10 per 100 adults in 2003. As of 2004, there were approximately 860,000 people living with HIV/AIDS in the country. There were an estimated 9,000 deaths from AIDS in 2003.

After the breakup of the Soviet Union diphtheria spread from Russia to its former republics in epidemic numbers. The incidence

of tuberculosis was 123 per 100,000 people. The Russian Federation and countries of Central and Eastern Europe lag behind the West in injury prevention. The accidental death rate for children 5–14 in was 39.6 per 100,000 for boys and 16.4 per 100,000 for girls. Deaths by suicide are also very high in the Russian Federation at 41.7 per 100,000 people for men and 7.9 per 100,000 for women (aged 15–24).

#### 4<sup>2</sup> HOUSING

The right to housing is guaranteed to all citizens by the constitution, but providing for adequate housing for all has become a problem in a time of major economic reforms. In the Soviet-era, most housing (state-owned) was provided free or at very low costs for many citizens. Since 2002, economic reform has called for many residents to begin paying more of the costs for rent, maintenance, and utilities. The government still allows somewhat generous subsidies for low-income families. But the main housing problem seems to be in maintenance and renovation of buildings that are in urgent need of both structural repairs and upgrades in utility systems. In 2004 it was estimated that at least two million people lived in housing that was officially classified as dilapidated. About 11% of all homes were in urgent need of repair and about 9% of all homes needed to be demolished and rebuilt. The annual need for renovation of the existing housing stock was estimated at about 4.5%. In 2004, about 70% of all housing was privately owned.

#### 4<sup>3</sup> EDUCATION

Education, mostly free and state funded, is also compulsory for 10 years. Primary school covers four years, followed by another five years of basic school. Senior secondary schools offer two-year programs. Vocational secondary schools offer a four-year course of studies. Although Russian is the most common medium of instruction, other languages are also taught, especially at the secondary level. In the early 1990s, many privately owned institutions were opened, and the education system was modified with the introduction of a revised curriculum. The academic year runs from September to June.

In 2001, about 92% of children between the ages of four and five were enrolled in some type of preschool program. Primary school enrollment in 2003 was estimated at about 90% of age-eligible students. In 2001, secondary school enrollment was estimated at about 90% of all age-eligible students. It is estimated that about 93.5% of all students complete their primary education. The student-to-teacher ratio for primary school was at about 17:1 in 2003; the ratio for secondary school was about 11:1.

The St. Petersburg State University, which was founded in 1724, is well known for its education. In 2004, there were 685 state and 367 accredited nonstate higher education institutions in Russia. In 2003, about 69% of the tertiary age population were enrolled in some type of higher education program, 59% for men and 79% for women. The adult literacy rate for 2004 was estimated at about 99.4%.

As of 2003, public expenditure on education was estimated at 3.8% of GDP, or 10.7% of total government expenditures.

#### 4<sup>4</sup> LIBRARIES AND MUSEUMS

The Russian State Library in Moscow serves as the national library as well as a public, with the largest collection in the country (about

45 million items). It should not be confused with Russian National Library in St. Petersburg, which is one of the oldest public libraries in eastern Europe; it holds over 34 million volumes. There are over 50,000 public libraries throughout the country. Some of the larger collections include the Gorky Moscow Institute of Literature library in Moscow (13.2 million volumes), the State University of Technology library in St. Petersburg (2.9 million volumes), the Bauman Moscow State Engineering University library (three million volumes), the Moscow M. V. Lomonosov State University (7.27 million volumes), the State University at Petersburg (6.4 million volumes), and dozens of other massive collections throughout the country. The Russian Library Association was established in 1994.

Russia has over 1,000 museums. Russian museums house some of the finest collections of European art in the world, the best known of which is the Hermitage in St. Petersburg. Also in St. Petersburg are Dostoevsky Memorial House-Museum, the Literary Museum of the Institute of Russian Literature, the State Russian Museum, and the State Museum of Sculpture, housing the country's largest collection of sculpture. Among the dozens of important museums in Moscow are the State Historical Museum, the State Literature Museum, the Tolstoy House Museum, the Pushkin Museum, the Chekhov House Museum, the Paleontological Museum of the Academy of Sciences, and the Cathedral of the Assumption, a religious arts museum housed in a 15th-century cathedral. The St. Petersburg Erotica Museum opened in 2004.

#### 45 MEDIA

As of 1999, over 1,000 companies were licensed to offer telecommunications services. In 2003, there were an estimated 242 main-line telephones for every 1,000 people; over 5 million people were on a waiting list for telephone service installation. The same year, there were approximately 249 mobile phones in use for every 1,000 people.

In 2004, there were about 2,500 television stations in the country, with about 66% completely or partially owned by the government. The government also maintained ownership of the largest radio stations, Radio Mayak and Radio Rossiya, and the news agencies ITAR TASS and RIA Novosti. In 2000, there were 418 radios and 421 television sets for every 1,000 people. In 2003, there were about 88.7 personal computers in use for every 1,000 people. There were 6 million Internet subscribers in 2002.

In 2005, there were more than 400 daily newspapers in circulation. In 2005, Russia's major daily newspapers, all published in Moscow, were: *Moskovski Komsomolets* (Moscow Communist Youth, 800,000 est. circulation in 2005); *Komsomolskaya Pravda* (686,000 in 2005); *Trud* (Labor, 613,000 in 2005); *Rossiiskaya Gazeta* (374,000 in 2005); *Izvestia* (209,000 in 2004); *Kommersant* (94,000 in 2005); and *Nezavisimaya Gazeta* (27,000 in 2004). *Argumenty I Fakty* is a popular weekly with an estimated 2005 circulation of 2.9 million. *Novaya Gazeta*, published twice a week, has a 2004 estimated circulation of 106,000. *Vedomosti* is a business daily owned as a joint venture of the Wall Street Journal, Financial Times, and the Independent Media group (a Dutch organization); it has an estimated circulation of 42,000. In 2004, there were an estimated 45,000 registered local periodicals and newspapers.

The constitution provides for freedom of the press and mass information, and the government is said at present to respect these

provisions. However, the law contains provisions which give broad interpretive authority to government at all levels for the enforcement of secrecy of sensitive information. Russians are enjoying a freer media than at any time in recent history.

#### 46 ORGANIZATIONS

A chamber of commerce that promotes the economic and business activities of the country to the rest of the world operates in Moscow. The Russian Academy of Entrepreneurship assists business owners. There are several professional associations representing a wide variety of fields, such as the Health Workers Union of the Russian Federation and the Association of Russian Automobile Dealers. Some professional associations also promote public education and research in specific technical or scientific fields, such as the Russian Medical Society.

National youth organizations include the Girl Guides and Girl Scouts of Russia, The All-Russia Scout Organizations, the Youth Agrarian Union of Russia, the Siberian Youth Initiative, and YMCA/YWCA. Sports associations are popular and represent a wide variety of pastimes. There are active chapters of the Paralympic Committee and the Special Olympics. The Gaia International Women's Center promotes the advancement of women in business and politics. Several women's groups are organized under the umbrella of the Women's Union of Russia.

Volunteer service organizations, such as the Lions Clubs and Kiwanis International, are also present. The All-Russian Society for Disabled represents the concerns of over 2.5 million people. The International Red Cross and the Red Crescent operate branches throughout the federation. There are also branches of Amnesty International, Greenpeace, United Way, UNICEF, and Habitat for Humanity.

#### 47 TOURISM, TRAVEL, AND RECREATION

In September 1992, Russia lifted its travel restrictions on foreigners, opening the entire country to visitors and tourists. Moscow is a major tourist destination with many attractions including Red Square, the Kremlin, St. Basil's Cathedral, and many other monasteries, churches, museums and other cultural attractions. The most famous of Moscow's parks and gardens is Gorky Park. St. Petersburg is a beautifully preserved neoclassical city with palacelined waterways. Attractions include the State Hermitage Museum, Peter and Paul Fortress, and the Nevsky Prospekt. Football (soccer), ice hockey, and tennis are popular sports in Russia. Maria Sharapova won the Wimbledon women's title in 2004.

There were 22,521,059 visitors who arrived in Russia in 2003, about 90% of the tourists came from Europe. Tourism receipts totaled \$5.8 billion that year. Hotel rooms numbered 177,200 with 364,000 beds and an occupancy rate of 34%.

In 2005, the US Department of State estimated the daily expenses of staying in Moscow at \$378. Other areas were less expensive averaging \$279 per day.

#### 48 FAMOUS RUSSIANS

Notable among the rulers of prerevolutionary Russia were Ivan III (the Great, 1440–1505), who established Moscow as a sovereign state; Peter I (the Great, 1672–1725), a key figure in the modernization of Russia; Alexander I (1777–1825), prominent both in the war against Napoleon and the political reaction that followed the

war; and Alexander II (1818–81), a social reformer who freed the serfs. Mikhail Gorbachev (b.1931) came to power in 1985, initiated reforms of the old Communist system and won the Nobel Peace Prize in 1990.

Mikhail Lomonosov (1711–65), poet and grammarian, also was a founder of natural science in Russia. The poet Gavrila Derzhavin (1743–1816) combined elements of topical satire with intimate, lyrical themes. Aleksandar Radishchev (1749–1802) criticized both religion and government absolutism. Nikolay Karamzin (1766–1826), an early translator of Shakespeare, was the founder of Russian Sentimentalism. The fables of Ivan Krylov (1768/69?–1844) exposed human foibles and the shortcomings of court society. Russia's greatest poet, Aleksandr Pushkin (1799–1837), was also a brilliant writer of prose. Other outstanding poets were Fyodor Tyutchev (1803–73), Mikhail Lermontov (1814–41), and Afanasy Fet (Shen-shing 1820–92). Nikolay Gogol (1809–52), best known for his novel *Dead Souls* and his short stories, founded the realistic trend in Russian literature. Vissarion Belinsky (1811–48) was an influential critic. Noted radical philosophers were Aleksandr Herzen (1812–70). Nikolay Chernyshevsky (1828–89), and Nikolay Dobrolyubov (1812–91), satirized the weakness of Russian society. Ivan Turgenev (1818–83) is noted for his sketches, short stories, and the novel *Fathers and Sons*. Fyodor Dostoyevsky (1821–81) wrote outstanding psychological novels (*Crime and Punishment*, *The Brothers Karamazov*). Leo (Lev) Tolstoy (1828–1910), perhaps the greatest Russian novelist (*War and Peace*, *Anna Karenina*), also wrote plays, essays and short stories. Aleksandr Ostrovsky (1823–86) was a prolific dramatist. The consummate playwright and short-story writer Anton Chekhov (1860–1904) was the greatest Russian writer of the late 19th century. Leonid Nikolayevich Aandreyev (1871–1919) wrote plays and short stories. The novels, stories, and plays of Maksim Gorky (Aleksy Peshkov, 1868–1936) bridged the tsarist and Soviet periods. Ivan Bunin (1870–1953) received the Nobel Prize in 1933 for his novels and short stories. Georgy Plekhanov (1856–1918), a Marxist philosopher and propagandist, also was a literary critic and art theorist, as was Anatoly Lunacharsky (1875–1933).

Russian composers of note include Mikhail Glinka (1804–57), Aleksandar Borodin (1833–87), also a distinguished chemist, Mily Balakirev (1837–1910), Modest Mussorgsky (1839–81), Pyotr Ilyich Tchaikovsky (1840–93), Nikolay Rimsky-Korsakov (1844–1908), Aleksandr Skryabin (1871–1915), Sergey Rakhmaninov (1873–1943), Igor Stravinsky (1882–1971), Sergey Prokofyev (1891–1953), Aram Ilyich Khachaturian (1903–78), Dmitry Kabalevsky (1904–87), and Dmitry Shostakovich (1906–75). Two of the greatest basses of modern times are the Russian-born Fyodor Chaliapin (1873–1938) and Alexander Kipnis (1891–1978). Serge Koussevitzky (1874–1951), noted conductor of the Boston Symphony Orchestra, was important in Russian musical life before the Revolution.

Outstanding figures in the ballet are the impresario Sergey Diaghilev (1872–1929); the choreographers Marius Petipa (1819–1910), Lev Ivanov (1834–1901), and Mikhail Fokine (1880–1942); the ballet dancers Vaslav Nijinsky (1890–1950), Anna Pavlova (1881–1931), Tamaara Karsavina (1885–1978), Galina Ulanova (1909–1998), and Maya Plisetskaya (b.1925); and the ballet teacher Agrippina Vaganova (1879–1951).

Outstanding figures in the theater include Kostantin Stanislavsky (Aleksyev, 1863–1938), director, actor and theoretician; Vladimir Nemirovich-Danchenko (1858–1943), director, playwright, and founder, with Stanislavsky, of the Moscow Art Theater; and Vsevolod Meyerhold (1873–1942), noted for innovations in stagecraft. Important film directors were Vsevolod Pudovkin (1893–1953), Aleksandr Dovzhenko (1864–1956), Sergey Eisenstein (1898–1948), Vasily Shiksin (1929–74), and Andrei Tarkovsky (1932–87).

Varfolomey (Bartolomeo Francesco) Rastrelli (1700–1771) designed many of the most beautiful buildings in St. Petersburg. Other important Russian architects include Vasily Bazhenov (1737–99), Matvey Kazakov (1733–1812), Andreyan Zakharov (1761–1811), Ivan Starov (1806–58), Vasily Perov (1833/34–82), Vasily Vereshchagin (1842–1904), Ilya Repin (1844–1930), Mikhail Vrubel (1856–1910), Leon (Lev) Bakst (Rosenberg, 1866–1924), and Aleksandr Benois (1870–1960). Modern Russian artists whose work is internationally important include the Suprematist painters Kasimir Malevich (1878–1935) and El (Lazar) Lissitzky (1890–1941), the "Rayonist" painters Natalya Goncharova (1881–1962) and Mikhail Larionov (1881–1964), the Constructivist artist Vladimir Tatlin (1885–1953), and the Spatial sculptor Aleksandar Rodchenko (1891–1956). Famous Russian-born artists who left their native country to work abroad include the painters Alexei von Jawlensky (1864–1941), Vasily Kandinsky (1866–1944), Marc Chagall (1897–1985), and Chaim Soutine (1894–1943) and the sculptors Antoine Pevsner (1886–1962), his brother Naum Gabo (1890–1977), Alexander Archipenko (1887–1964), and Ossip Zadkine (1890–1967).

Prominent Russian scientists of the 19th and 20th centuries include the chemist Dmitry Ivanovich Mendeleev (1834–1907), inventor of the periodic table; Aleksandr Mikhailovich Butlerov (1828–86), a creator of the theory of chemical structure; Nikolay Yegorovich Zhukovsky (1847–1921), a founder of modern hydrodynamics and aerodynamics; Pyotr Nikolayevich Lebedev (1866–1912), who discovered the existence of the pressure of light; Nikolay Ivanovich Lobachevsky (1792–1856), pioneer in non-Euclidean geometry; Ivan Petrovich Pavlov (1849–1936), creator of the theory on the higher nervous systems of animals and man, who received the Nobel Prize in 1904 for his work on digestive glands; Ilya Ilyich Mechnikov (Elie Metchnikoff, 1845–1916), who received the Nobel Prize in 1908 for his Phagocyte theory; Kliment Arkadyevich Timiryazev (1843–1920), biologist and founder of the Russian school of plant physiology; and Aleksandr Stepanovich Popov (1859–1906), pioneer in radio transmission. Among later scientists and inventors are Ivan Vladimirovich Michurin (1855–1935), biologist and plant breeder; Konstantin Eduardovich Tsiolkovsky (1857–1935), scientist and the inventor in the field of the theory and technology of rocket engines, interplanetary travel and aerodynamics; Vladimir Petrovich Filatov (1875–1956), ophthalmologist; Ivan Pavlovich Bardin (1883–1960), metallurgist; Yevgeny Nikanorovich Pavlovsky (1884–1965), parasitologist; Nikolay Ivanovich Vavilov (1887–1943), geneticist; and Leon Theremin (Lev Termen, 1896–1993), pioneer of electronic music. Cosmonaut Yuri Alekseyevich Gagarin (1934–68) was the first person to ever venture into space.

**49 DEPENDENCIES**

The Russian Federation has no territories or dependencies.

# SAN MARINO

The Most Serene Republic of San Marino  
*La Serenissima Repubblica di San Marino*

**CAPITAL:** San Marino

**FLAG:** The flag is divided horizontally into two equal bands, sky blue below and white above.

**ANTHEM:** *Onore a te, onore, o antica repubblica (Honor to You, O Ancient Republic).*

**MONETARY UNIT:** The Italian lira was replaced by the euro as official currency as of 2002. The euro is divided into 100 cents. There are coins in denominations of 1, 2, 5, 10, 20, and 50 cents and 1 euro and 2 euros. There are notes of 5, 10, 20, 50, 100, 200, and 500 euros. €1 = \$1.25475 (or \$1 = €0.79697) as of 2005. The country issues its own coins in limited numbers as well. Coins of San Marino may circulate in both the republic and in Italy.

**WEIGHTS AND MEASURES:** The metric system is the legal standard.

**HOLIDAYS:** New Year's Day, 1 January; Epiphany, 6 January; Anniversary of St. Agatha, second patron saint of the republic, and of the liberation of San Marino (1740), 5 February; Anniversary of the Arengo, 25 March; Investiture of the Captains-Regent, 1 April and 1 October; Labor Day, 1 May; Fall of Fascism, 28 July; Assumption and August Bank Holiday, 14–16 August; Anniversary of the Foundation of San Marino, 3 September; All Saint's Day, 1 November; Commemoration of the Dead, 2 November; Immaculate Conception, 8 December; Christmas, 24–26 December; New Year's Eve, 31 December. Movable religious holidays include Easter Monday and Ascension.

**TIME:** 1 PM = noon GMT.

## <sup>1</sup> LOCATION, SIZE, AND EXTENT

San Marino is the third-smallest country in Europe. With an area of 60 sq km (23 sq mi), it extends 13.1 km (8.1 mi) NE–SW and 9.1 km (5.7 mi) SE–NW. Comparatively, the area occupied by San Marino is about 0.3 times the size of Washington, DC. It is a landlocked state completely surrounded by Italy, with a total boundary length of 39 km (24 mi).

## <sup>2</sup> TOPOGRAPHY

The town of San Marino is on the slopes and at the summit of Mt. Titano (755 m/2,477 ft), and much of the republic is coextensive with the mountain, which has major limestone pinnacles. Each of the peaks is crowned by old fortifications; on the north by a castle and the other two by towers. Level areas around the base of Mt. Titano provide land for agricultural use. The San Marino River begins in Italy and flows northward through the western portion of the country, forming part of the nation's western border. The Ausa River in the northwest and the Marano River of the east central region both drain into the Adriatic Sea.

## <sup>3</sup> CLIMATE

The climate is that of northeastern Italy: rather mild in winter, but with temperatures frequently below freezing, and warm and pleasant in the summer, reaching a maximum of 26°C (79°F). Winter temperatures rarely fall below 7°C (19°F). Annual rainfall averages between 56 and 80 cm (22 to 32 in).

## <sup>4</sup> FLORA AND FAUNA

The republic has generally the same flora and fauna as northeastern Italy. The hare, squirrel, badger, fox, and porcupine are among the more common animals seen. Most of the landscape has been cultivated with orchards, vineyards, and olive groves.

## <sup>5</sup> ENVIRONMENT

Urbanization is the primary concern for the environment; however, the country has shown great care for environmental protection and preservation both within its own borders and in the global arena. Environmental protection is controlled by the Ministry of State for Territory, Environment, and Agriculture. San Marino has no endangered species; however, the lesser horseshoe bat and the common otter are listed as near threatened.

## <sup>6</sup> POPULATION

The population of San Marino in 2005 was estimated by the United Nations (UN) at 30,000, which placed it at number 189 in population among the 193 nations of the world. In 2005, approximately 16% of the population was over 65 years of age, with another 15% of the population under 15 years of age. According to the UN, the annual population rate of change for 2005–10 was expected to be 0.3%, a rate the government viewed as satisfactory. The projected population for the year 2025 was 30,000. The population density was 500 per sq km (1,295 per sq mi). San Marino is one of the most densely populated countries in the world.

The UN estimated that 84% of the population lived in urban areas in 2005, and that urban areas were growing at an annual rate

of 0.89%. The capital city, San Marino, had a population of 5,000 in that year.

## **7** MIGRATION

Immigrants come chiefly from Italy; emigration is mainly to Italy, the United States, France, and Belgium. Foreigners who have been resident in San Marino for 30 years can become naturalized citizens.

In 1999, the net migration rate was 4.23 migrants per 1,000 population. In 2005, there was an increase to an estimated 10.84 migrants per 1,000 population. In 2000 the number of migrants living in San Marino was 9,000, approximately one-third of the total population. The government views the migration levels as satisfactory.

## **8** ETHNIC GROUPS

The native population is predominantly of Italian origin.

## **9** LANGUAGES

Italian is the official language.

## **10** RELIGIONS

It has been estimated that over 95% of the population is Roman Catholic; however, while Roman Catholicism is dominant, it is not the state religion. The Catholic Church does receive direct benefits from the State, but so do other charities, including two religions—the Waldensian Church and Jehovah's Witnesses. There are small groups of Baha'is and Muslims. Certain Catholic holidays are recognized as national holidays.

## **11** TRANSPORTATION

Streets and roads within the republic totaled about 220 km (140 mi) in 2002, and there is regular bus service between San Marino and Rimini. Motor vehicle registrations in 1995 included 22,945 passenger cars and 3,546 commercial vehicles. An electric railroad, 32 km (20 mi) long, between Rimini and San Marino was inaugurated in 1932. Damaged as a result of a British air raid on 26 June 1944, it has been out of service since that time. A 1.5-km (0.9-mi) cable-car service from the city of San Marino to Borgo Maggiore is operated by the government. There is helicopter service between San Marino and Rimini in summer.

## **12** HISTORY

San Marino, the oldest republic in the world, is the sole survivor of the independent states that existed in Italy at various times from the downfall of the Western Roman Empire to the proclamation of the Kingdom of Italy in 1861. (The Vatican City State, which is also an independent enclave in Italy, was not constituted in its present form until the 20th century.)

According to tradition, the republic was founded in AD 301 by Marinus, a Christian stonecutter who fled from Dalmatia to avoid religious persecution; later canonized, St. Marinus is known in Italian as San Marino. If founded at the time asserted by tradition, San Marino is the oldest existing national state in Europe. There was a monastery in San Marino in existence at least as early as 885.

Because of the poverty of the region and the difficult terrain, San Marino was rarely disturbed by outside powers, and it generally avoided the factional fights of the Middle Ages. For a time, it joined the Ghibellines and was therefore interdicted by Pope Innocent IV in 1247–49. It was protected by the Montefeltro family, later dukes of Urbino, and in 1441, with Urbino, it defeated Sigismondo Malatesta and extended the size of its territory. It was briefly held by Cesare Borgia in 1503, but in 1549 its sovereignty was confirmed by Pope Paul III. In 1739, however, a military force under a papal legate, Cardinal Giulio Alberoni, occupied San Marino and unsuccessfully attempted to get the Sanmarinese to acknowledge his sovereignty over them. In the following year, Pope Clement II terminated the occupation and signed a treaty of friendship with the tiny republic. Napoleon allowed San Marino to retain its liberty; the Sanmarinese are said to have declined his offer to increase their territory on the grounds that smallness and poverty alone had kept them from falling prey to larger states.

In 1849, Giuseppe Garibaldi, the liberator of Italy, took refuge from the Austrians in San Marino; he departed voluntarily shortly before the Austrians were to invade the republic to capture him. San Marino and Italy entered into a treaty of friendship and customs union in 1862. This treaty was renewed in March 1939 and amended in September 1971.

During the period of Mussolini's rule in Italy, San Marino adopted a Fascist type of government. Despite its claim to neutrality in World War II, Allied planes bombed it on 26 June 1944. The raid caused heavy damage, especially to the railway line, and killed a number of persons. San Marino's resources were sorely taxed to provide food and shelter for the over 100,000 refugees who obtained sanctuary during the war.

The elections of 1945 put a coalition of Communists and left-wing Socialists in control of the country. In 1957, some defections from the ruling coalition were followed by a bloodless revolution, aided by Italy, against the government. The leftists surrendered, and some were imprisoned. The rightists, chiefly Christian Democrats, won the election of 1959 and remained in power until 1973, chiefly in coalition with the Social Democrats. In March 1973, after splitting with the Social Democrats, the Christian Democrats formed an unstable coalition with the Socialists. After new elections in May 1978, the Communists, the Socialists, and the Socialist Unity Party, who together commanded a one-seat majority in the legislature, formed a governing coalition; San Marino thus became the only West European country with a Communist-led government. This coalition governed until 1986, when a Communist-Christian Democratic coalition replaced it; this was the first coalition government formed by these two parties in San Marino's history.

As of 2005, the ruling coalition was composed of the Sanmarinese Christian-Democratic Party and the Sanmarinese Socialist Party. In December 2003, Fabio Berardi was named secretary of state for foreign and political affairs, the equivalent of the office of a prime minister.

San Marino's high standard of living makes Sanmarinese citizenship a valuable commodity. With the only ways for foreigners to obtain citizenship being to reside in San Marino for 30 years or marry a male citizen, the government passed a law in August 1999 prohibiting female household servants under 50 because of the

potential for elderly men to fall for their young female help who may have suspicious motives.

Also in 1999, San Marino joined the European Monetary Union and adopted the euro as its currency. The Europe-wide single currency was forecast to boost tourism but simultaneously hurt Sanmarinese bank revenues as the banks would no longer be able to charge fees for currency exchange. In June 2000, the OECD accused Sanmarinese banks of making the country a “harmful” tax haven; San Marino promised to reform its banking practices.

Because San Marino has a customs union with Italy, it enjoys all of the benefits that flow from European Union membership. However, San Marino’s goal ultimately is to become a full-fledged member of the EU.

### 13 GOVERNMENT

Legislative power is exercised by the Grand and General Council (Consiglio Grande e Generale) of 60 members, regularly elected every five years by universal suffrage at age 18. The Council elects from among its members a State Congress (Congresso di Stato) of 10 members (3 secretaries of state and 7 ministers of state), which makes most administrative decisions and carries them out. In 1960, universal male suffrage was established in place of the previous system, whereby only heads of families voted. Women also received the franchise effective in 1960 and were first permitted to run for office in 1974 (they voted in national elections for the first time in 1964). Nearly 100% of eligible voters participate in elections.

Two members of the Council are named every six months to head the executive branch of the government; one represents the town of San Marino and the other the countryside. The terms of these officials, called captains-regent (*capitani reggenti*), begin on 1 April and 1 October. The captains-regent, who must be native-born citizens, are eligible for reelection after three years. As of September 2005, the captains-regent were Cesare Gasperoni (PDCS) and Fausta Simona Morganti (Party of Democrats—PD). The secretary of state for foreign and political affairs serves the function of a prime minister. Fabio Berardi was chosen to fill this office in December 2003. The next election for captains-regent was scheduled for March 2006 and for secretary of state for foreign and political affairs in June 2006.

### 14 POLITICAL PARTIES

The political parties in San Marino have close ties with the corresponding parties in Italy. Parties represented in the Grand and General Council following the 2001 elections were as follows: Christian Democratic Party (PDCS), 25; San Marino Socialist Party (PSS), 15; the Party of Democrats (PD), 12; Popular Alliance of Sanmarinese Democrats for the Republic (APDS), 5; Communist Refounding (RCS), 2; and the Sanmarinese National Alliance (ANS), 1. The next election was scheduled to be held by June 2006.

### 15 LOCAL GOVERNMENT

San Marino consists of nine administrative divisions or castles (*castelli*): Acquaviva, Borgo Maggiore, Chiesanuova, Domagnano, Faetano, Fiorentino, Monte Giardino, San Marino, and Serravalle. Each castle has an auxiliary council, elected for a four-year term.

LOCATION: 12°27' E and 43°56' N.

It is headed by an official called the captain of the castle, who is elected every two years.

### 16 JUDICIAL SYSTEM

There is a civil court, a criminal court, and a superior court, but most criminal cases are tried before Italian magistrates because, with the exception of minor civil suits, the judges in Sanmarinese cases are not allowed to be citizens of San Marino. Appeals go, in the first instance, to an Italian judge residing in Italy. The highest appellate court is the Council of Twelve, chosen for six-year terms from members of the Grand and General Council. The rights of the accused, including the rights to a public trial, legal counsel and other procedural safeguards, are guaranteed by law and observed in practice.

### 17 ARMED FORCES

The San Marino militia nominally consists of all able-bodied citizens between the ages of 16 and 55, but the armed forces actually maintained are principally for purposes of ceremonial display; these include the noble guard used in various functions.

## 18 INTERNATIONAL COOPERATION

San Marino became a member of the United Nations on 2 March 1992; it belongs to several nonregional specialized agencies, such as the FAO, the World Bank, ILO, UNCTAD, UNESCO, and the WHO.

San Marino is also a member of the OSCE and the Council of Europe. In environmental cooperation, the nation is part of the Convention on Biological Diversity, the Nuclear Test Ban Treaty, and the UN Conventions on Climate Change and Desertification.

## 19 ECONOMY

Farming was formerly the principal occupation, but it has been replaced in importance by light manufacturing. However, the main sources of income are tourism, which accounted for more than 50% in 2001, and remittances from Sanmarinese living abroad. Some government revenue comes from the sale of postage stamps and coins and from Italy's subsidy to San Marino in exchange for which San Marino does not impose customs duties. The GDP growth has been impressive and consistent, averaging 7.68% from 1997 to 2001. Inflation, at 2% in 1997, increased to 3.3% in 2001, averaging 2.8% across the five-year period. Unemployment dropped steadily from 4.9% in 1997 to 2.6% in 2001. In purchasing power parity (PPP) terms, per capita income was at \$34,600 in 2001.

The fact that San Marino is an enclave of Italy means that, apart from political links, it shares strong economic ties to the latter. The two countries form a customs union and share the same currency, although San Marino mints its own coins. Migrant workers from surrounding Italian regions boost the country's small labor force. The economic data available for San Marino is scattered and highly estimative.

Thus, in 2002 the GDP was \$1.1 billion, and per capita income, in real terms, reached \$29,000. The economy seems to be fairly dynamic as in 2004 the GDP growth rate was 2%. Natural resources include building stone and agricultural products (wheat, grapes, maize, olives, cattle, pigs, horses, meat, cheese, and hides).

## 20 INCOME

The US Central Intelligence Agency (CIA) reports that in 2005 San Marino's gross domestic product (GDP) was estimated at \$940.0 million. The CIA defines GDP as the value of all final goods and services produced within a nation in a given year and computed on the basis of purchasing power parity (PPP) rather than value as measured on the basis of the rate of exchange based on current dollars. The per capita GDP was estimated at \$34,600. The annual growth rate of GDP was estimated at 7.5%. The average inflation rate in 2001 was 3.3%.

## 21 LABOR

In the latest years for which data was available, the labor force in 1999 totaled about 18,500. In 2000, it was estimated that the services sector provided employment for 57% of the workforce, with industry accounting for 42% and agriculture 1%. The unemployment rate in 2001 stood at 2.6%.

Labor federations include the Democratic Federation of Sanmarinese Workers, affiliated with the International Confederation of Free Trade Unions, and the General Federation of Labor.

About 50% of the workforce is unionized. The minimum working age is 16 without any exceptions. In 2001, the minimum wage was \$1,200 per month although most wages are higher than the minimum.

## 22 AGRICULTURE

About 17% of the land is arable. Annual crop production includes wheat and grapes, as well as other grains, vegetables, fruits, and fodder.

## 23 ANIMAL HUSBANDRY

Livestock raising uses some 1,400 hectares (3,500 acres), or about 23% of the total area. Cattle, hogs, sheep, and horses are raised.

## 24 FISHING

There is no fishing.

## 25 FORESTRY

Small quantities of wood are cut for local use.

## 26 MINING

San Marino had no commercial mineral resources.

## 27 ENERGY AND POWER

Electric power is imported from Italy.

## 28 INDUSTRY

Manufacturing is limited to light industries such as textiles, bricks and tiles, leather goods, clothing, and metalwork. Cotton textiles are woven at Serravalle; bricks and tiles are made in La Dogana, which also has a dyeing plant; and cement factories and a tannery are located in Acquaviva, as well as a paper-making plant. Synthetic rubber is also produced. The pottery of Borgo Maggiore is well known. Gold and silver souvenirs are made for the tourist trade. Other products are Moscato wine, olive oil, and baked goods. A significant source of revenue is the selling of stamps to foreign collectors.

## 29 SCIENCE AND TECHNOLOGY

Sanmarinese students generally pursue their scientific and technical training abroad, since science and technology resources are domestically limited. The Università Degli Studi, founded in 1987, has a department of technology. The Institute of Cybernetics, founded in 1965, offers courses in computer science.

## 30 DOMESTIC TRADE

There are small general stores in the capital and the smaller towns. Billboards and newspapers are the main advertising medium. A weekly market is held at Borgo Maggiore, which also sponsors an annual fair for the sale of cattle and sheep. Most retail trade within the country is focused on goods and services that support the tourism industry.

## 31 FOREIGN TRADE

Records of foreign trade are not published, but it is known that imports exceed exports. Principal exports are wine, textiles, furniture, quarried stone, ceramics, and handicrafts. The chief imports

are raw materials and a wide variety of consumer goods. San Marino has a customs union with Italy. In 1999, San Marino joined the European Monetary Union (EMU), further strengthening its ties to the EU.

Estimates of the US State Department show that in 2001, exports totaled around \$2.0 billion, while imports amounted to \$2.1 billion. More than 85% of the exports went to Italy, and included mainly manufactured goods, lime, wood, and food. Most of the imports came also from Italy and included consumer manufactures, food, and raw materials (including energy). San Marino also does trade with countries in Western and Eastern Europe, with South America, China, and Taiwan.

### 3<sup>2</sup> BALANCE OF PAYMENTS

Since imports and exports are not subject to customs duties, no record is kept of foreign payments transactions. Receipts from tourism, remittances from Sanmarinese working abroad, and sales of postage stamps to foreign collectors are principal sources of foreign exchange.

### 3<sup>3</sup> BANKING AND SECURITIES

The principal bank, the Cassa di Risparmio, was founded in 1882. Other banks include the Banca Agricola and the Cassa Rurale. There are no securities transactions in San Marino. In 1999 San Marino joined the European Monetary Union (EMU) and adopted the euro.

### 3<sup>4</sup> INSURANCE

Several major Italian insurance companies have agencies in San Marino.

### 3<sup>5</sup> PUBLIC FINANCE

The government derives its revenues mainly from the worldwide sale of postage stamps, direct and indirect taxes, and yearly sub-

sidies by the Italian government. State budgets have increased sharply in recent years.

The US Central Intelligence Agency (CIA) estimated that in 2000 San Marino's central government took in revenues of approximately \$400 million and had expenditures of \$400 million.

The International Monetary Fund (IMF) reported that in 2002, the most recent year for which it had data, central government revenues were €438,922 and expenditures were €426,864. The value of revenues was us\$413,064 and expenditures us\$388,722, based on a market exchange rate for 2002 of us\$1 = €1.0626 as reported by the IMF. Government outlays by function were as follows: general public services, 14.5%; public order and safety, 2.9%; economic affairs, 14.3%; environmental protection, 3.2%; housing and community amenities, 2.3%; health, 18.1%; recreation, culture, and religion, 2.3%; education, 9.4%; and social protection, 32.8%.

### 3<sup>6</sup> TAXATION

Legislation introducing San Marino's first income tax was passed by the Grand and General Council in October 1984. A general income tax is applied progressively to individuals (12–50% in 1992) and a flat rate of 24% to corporations. Also levied are a stamp duty, registration tax, mortgage tax, and succession duty.

### 3<sup>7</sup> CUSTOMS AND DUTIES

San Marino's trade policy is governed by its customs union with Italy. There is a one-phase duty system on imported goods, which closely follows the rates of the Italian value-added tax (VAT) system. In 1992, there was a 14% tax on imports. In 1999 San Marino joined the European Monetary Union.

### 3<sup>8</sup> FOREIGN INVESTMENT

Information on foreign investment is not available.

### 3<sup>9</sup> ECONOMIC DEVELOPMENT

In addition to promoting tourism in San Marino, the government has encouraged the establishment of small-scale industries and service-oriented enterprises (40–60 employees) by offering tax exemptions for 5–10 years.

The tourist industry is the main source of revenue for the country (about 50% of total revenues), so economic development strategies are coiled around this sector. More than 3 million tourists visit the small republic every year, and they constitute the primary market for all of San Marino's other industries. Stamps are one of the country's main export goods.

### 4<sup>0</sup> SOCIAL DEVELOPMENT

A social insurance system provides pensions for old age and disability. Employers, employees, and the government all contribute to the system. Self-employed contributions vary. There is universal medical coverage and maternity benefits of 100% of earnings for five months. All employees and self-employed persons have work injury insurance. Unemployment is only available to salaried employees and excludes civil servants.

The law mandates that women have equal access to employment opportunities, and in practice women face little or no discrimination in employment and in pay. Women actively participate in all

#### Public Finance – San Marino (2002)

(In thousands of euros, central government figures)

<b>Revenue and Grants</b>	<b>438,922</b>	<b>100.0%</b>

careers including high public office. Laws protect women from violence, and instances of spousal abuse are infrequent.

The government is committed to protecting human rights. Prisons meet international standards and are open for inspection by human rights monitors.

#### 41 HEALTH

Public health institutions include the State Hospital (opened in 1975), a dispensary for the poor, and a laboratory of hygiene and prophylaxis. All citizens receive free, comprehensive medical care. As of 2004, there were an estimated 251 physicians, 506 nurses, 26 midwives, 41 dentists, and 52 pharmacists per 100,000 people.

As of 2002, the crude birth rate and overall mortality rate were estimated at, respectively, 10.6 and 7.8 per 1,000 people. In 2005, the estimated average life expectancy was 81.62 years and infant mortality was estimated at 5.73 per 1,000 live births. The estimated maternal mortality was 5 per 100,000 live births.

The immunization rates for children under one year old in San Marino were as follows: diphtheria, pertussis, and tetanus, 93%; polio, 100%; measles, 96%; and hepatitis B, 98%.

#### 42 HOUSING

San Marino has over 7,000 dwellings, virtually all with electricity and piped-in water. Most new construction is financed privately. The housing stock for the nation is generally adequate to supply the population. Government concerns are primarily focused on preventing over-construction of rural areas.

#### 43 EDUCATION

Primary education is compulsory for all children between the ages of 6 and 16; the adult literacy rate is about 98%. The program of instruction is patterned after the Italian curriculum, and San Marinese school certificates are recognized by Italy. Children go through five years of primary education followed by three years of secondary education at the first stage and a further three years of senior secondary school. At the secondary level, students may choose to attend technical or vocational programs instead of general (classical) studies. The academic year runs from October to July.

In 2000, there were about 1,000 students enrolled in primary school and 1,000 enrolled in secondary school. Nearly all students complete their primary education.

The University of San Marino is the primary institution of higher education. The adult literacy rate has been estimated at about 96%.

#### 44 LIBRARIES AND MUSEUMS

In the capital city is the Biblioteca di Stato, containing a library of some 110,000 books, documents, and pamphlets. The Palazzo del Valloni also houses the state archives, as well as a collection of rare coins and medals. The State University has a small collection of 23,000 volumes.

The Palazzo del Governo (built in 1894) and most other large buildings in the capital are of comparatively recent date, but many monuments have been rebuilt in an earlier style. In 2001, there were 10 museums in the country. One of them is devoted to the postage stamps of San Marino and other countries. The National Gallery of Modern Art is also in San Marino. The 14th-century

church of San Francesco has paintings by several minor masters. The three old fortresses of Guaita, Fratta, and Montale are situated on the three pinnacles of Mt. Titano. There is also a museum in Borgia Maggiore devoted to objects connected with Garibaldi's stay in the republic.

#### 45 MEDIA

An automatic telephone system, integrated into Italy's system, served 20,600 mainline telephones in 2002. The same year, there were an additional 16,800 mobile cellular phones in use throughout the country. In 1998, there were 3 FM radio stations and one television station receiving mostly foreign broadcasts. San Marino RTV was the state-owned national TV and radio broadcaster. There were 595 radios and 357 television sets per 1,000 population in 1997. In 2002, there were 14,300 Internet users in the country. In 2004, there were 1,763 Internet hosts.

In 2002, there were five major daily newspapers: *Il Nuovo Titano* (circulation 1,300), *Riscossa Socialista*, *Notiziario*, *San Marino*, and *La Scintilla*. There are also a number of government bulletins. The law provides for freedom of speech and of the press and the government generally respects these rights in practice.

#### 46 ORGANIZATIONS

Business and labor organizations include the National Association for Industry of San Marino, National Small Enterprise Association of San Marino, Autonomous Workers Association of San Marino, Labour Confederation of San Marino, and the Democratic Workers Confederation of San Marino.

National youth organizations include the Young Christian Democrats and The Catholic Guide and Scout Association of San Marino. There are sports associations representing athletes in a variety of pastimes, such as weightlifting, tennis, football (soccer), and track and field. Many sports clubs are affiliated with the national Olympic Committee and other international organizations.

Volunteer service organizations, such as the Lions Clubs and Kiwanis International, are also present. The Red Cross and UNICEF have national chapters.

#### 47 TOURISM, TRAVEL, AND RECREATION

The government has promoted tourism so successfully that in the summer during the 1980s the number of San Marino residents was often exceeded by the number of visitors (20,000–30,000 daily). Growth in the tourist industry has increased the demand for San Marino's stamps and coins, gold and silver souvenirs, handicrafts, and pottery.

Principal attractions are the three medieval fortresses at the summit of Mt. Titano and the magnificent view from there of Rimini and the Adriatic Sea. The State Tourism, Sports, and Entertainment Board maintains various recreational facilities.

There were 683 hotel rooms in 2003, with 1,549 beds. The average length of stay was 1.5 nights that year.

In 2005, the US Department of State estimated the daily cost of travel in San Marino at \$227.

#### 48 FAMOUS SANMARINESE

Giambattista Belluzzi, a 16th-century military engineer in the service of Florence, was born in San Marino. Well-known Italians

who were associated with San Marino include Cardinal Giulio Alberoni (1664–1752), who attempted to subject the republic to papal domination in 1739–40; Count Alessandro Cagliostro (Giuseppe Balsamo, 1743–95), a Sicilian adventurer, imposter, and alchemist; Bartolommeo Borghesi (1781–1860), an antiquarian, epigrapher, and numismatist, who resided in San Marino from 1821 to 1860; and Giuseppe Garibaldi (1807–82), the great Italian patriot, who obtained refuge from the Austrians in San Marino in 1849.

#### 49 DEPENDENCIES

San Marino has no territories or colonies.

# SERBIA

Republic of Serbia

**CAPITAL:** Belgrade

**FLAG:** The flag has three equal horizontal stripes of red (top), blue, and white, with the coat of arms set slightly to the hoist side.

**ANTHEM:** *Boze Pravde (God of Justice)*

**MONETARY UNIT:** The new dinar (JD) replaced the dinar on 24 January 1994. JD1 = \$0.01499 (or \$1 = JD66.68973; as of 2 June 2006).

**WEIGHTS AND MEASURES:** The metric system is in force.

**HOLIDAYS:** New Year's Day, 1 and 2 January; Orthodox Christmas, 7 January; Orthodox New Year, 13 January; Unification of Serbia, 28 March; FR Yugoslavia Day, 27 April; Labor Day, 1 May; Victory Day, 9 May; St. Vitus Day, 28 June; Serbian Uprising, 7 July.

**TIME:** 1 PM = noon GMT.

## <sup>1</sup>LOCATION, SIZE, AND EXTENT

Serbia is situated on the central part of the Balkan Peninsula. The total area was approximately 88,412 sq km (34,135 sq mi). The entire country is about the size of Maine. Serbia is bordered on the N by Hungary, on the NE by Romania, on the E by Bulgaria, on the S by Macedonia and Albania, on the SW by Montenegro, on the W by Bosnia and Herzegovina, and on the NW by Croatia; total land boundary length is 2,114.2 km (1,313.76 mi). There are territorial disputes with Bosnia and Herzegovina over Serbian-populated areas.

Serbia's capital is Belgrade, situated in north central Serbia.

## <sup>2</sup>TOPOGRAPHY

Rich fertile plains are found in the Serbian north, while in the east there are limestone ranges and basins. Nearly half of Serbia is mountainous, with the Dinaric Alps on the western border, the North Albanian Alps (Prokletija) and the Sar Mountains in the south, and the Balkan Mountains along the southeast border. The highest point is Daravica, in the North Albanian Alps, at 2,656 m (8,714 ft). Of its mountains, 15 reach heights of over 2,000 m (6,600 ft).

The Danube is the longest river. With a total length of 2,783 km (1,729 mi), about 588 km (365 mi) flows from west to east through the northern region of Serbia. The Tisa, Sava and Morava rivers are major tributaries of the Danube.

Located on the Eurasian Tectonic Plate, there are several fault lines running through the country which seismically active. Earth tremors are fairly common and destructive earthquakes have occurred.

## <sup>3</sup>CLIMATE

In the north, winters are cold and summers are hot and humid. In the central and southern regions, the climate is more continental. Annual precipitation in most of the country is 56 to 190 cm (22 to 75 in).

## <sup>4</sup>FLORA AND FAUNA

The forests of Serbia contain about 170 broadleaf species of trees and shrubs, along with about 35 coniferous species. The animals found in Serbia include types of hare, pheasant, deer, stag, wild boar, fox, chamois, mouflon, crane, duck, and goose. As of 2002, in the union of Serbia and Montenegro, there were at least 96 species of mammals, 238 species of birds, and over 4,000 species of plants throughout the country.

## <sup>5</sup>ENVIRONMENT

Industrial wastes are dumped into the Sava, which flows into the Danube. Air pollution is a problem around Belgrade and other industrial cities. Thermal energy plants utilize technology from the 1950s and mostly burn lignite; since combustion is inefficient, air pollution is a major problem in Kosovo. Destructive earthquakes are a natural hazard.

In 2001, the union of Serbia and Montenegro had 104 protected areas, covering about 3.3% of the nation's total land area. There are four Wetlands of International Importance in Serbia and three World Heritage Sites. According to a 2006 report issued by the International Union for Conservation of Nature and Natural Resources (IUCN), the number of threatened species in the union of Serbia and Montenegro included 10 types of mammals, 10 species of birds, 1 type of reptile, 1 species of amphibian, 20 species of fish, 19 species of invertebrates, and 1 species of plants. Threatened species include Atlantic sturgeon, slender-billed curlew, black vultures, asps, bald ibis, Danube salmon, several species of shark, the red wood ant, and beluga. At least one type of mollusk has become extinct.

## <sup>6</sup>POPULATION

The population of Serbia in 2002 was 7,498,001 (excluding Kosovo). In 2005, in the union of Serbia and Montenegro, approximately 14% of the population was over 65 years of age, with another 19% of the population under 15 years of age. There were 99 males

for every 100 females in the country. According to the UN, the annual population rate of change for 2005–10 was expected to be 0.2%, due to a low fertility rate and high emigration rate. The government of Serbia and Montenegro viewed the population decline as a major concern. The population density of the union of Serbia and Montenegro was 105 per sq km (272 per sq mi).

The UN estimated that 52% of the population of the union of Serbia and Montenegro lived in urban areas in 2005, and that urban areas were growing at an annual rate of 0.47%. The capital city, Belgrade, had a population of 1,576,124 in 2002.

## 7 MIGRATION

The following information on migration pertains to the union of Serbia and Montenegro based on statistics gathered prior to Montenegro's independence in 2006. During the 1960s and 1970s, many Serbs fled from the Yugoslav Socialist Federal Republic, seeking political and economic freedom. The breakup of the Yugoslav SFR in the early 1990s and the ethnic hostilities that came in its aftermath resulted in enormous migrations to and from its various former republics. During the first half of 1999, the situation of refugees and internally displaced people deteriorated even further. As of 30 June 1999, the United Nations High Commissioner for Refugees (UNHCR) reported 508,000 refugees from Bosnia and Herzegovina and Croatia; 770,000 returnees to Kosovo, and 500,000 other refugees remained; 220,000 Serb, Montenegrin, and Roma internally displaced persons from Kosovo were living in other parts of the former Yugoslavia. The total number of migrants in 2000 was 626,000. By the end of 2004, these numbers were still rising; UNHCR reported a total of 627,476 persons of concern. There were 276,683 refugees, 180,117 Croatians and over 95,000 from Bosnia and Herzegovina. In addition, in that same year there were 248,154 internally displaced persons, 85,000 local residents at risk, 8,143 refugees who returned primarily to Croatia), and another 9,456 refugees returning to other places of origin during the year. In 2004, over 204,000 Serbs and Montenegrins were refugees in Germany, the United Kingdom, Sweden, Switzerland, Canada, France, and Australia. Also, in that same year over 29,000 Serbs and Montenegrins sought asylum in 18 countries primarily in Europe, in the United Kingdom and the United States.

In 2005 the net migration rate was an estimated -1.3 migrants per 1,000 population, down from 3.9 migrants per 1,000 in 1990. The government views the migration levels as too high. Worker remittances in 2003 amounted to \$2.7 billion.

## 8 ETHNIC GROUPS

Ethnic Serbs constitute a majority in Serbia, at about 82.86% (excluding Kosovo). There are 37 different ethnicities in Serbia. Ethnic Albanians are concentrated in the Kosovo region of southwest Serbia. Ethnic Hungarians make up about 3.91% of the population and live in northern Serbia near the Hungarian border. The remaining population consists primarily of Slavic Muslims, Bulgarians, Slovaks, Macedonians, Croats, Roma, Montenegrins, Ruthenians, Romanians, Vlachs, Bunjevci, and Turks.

## 9 LANGUAGES

Serbian is the official language; more than 95% of the population speak it; Albanian accounts for the remaining 5%. The script in of-

ficial use is Cyrillic, while the Latin script is also used. In the areas inhabited by ethnic minorities, the languages and scripts of the minorities are in official use, as provided by law.

## 10 RELIGIONS

The ancestors of the Serbs converted to Christianity in the 9th century and sided with Eastern Orthodoxy after the Great Schism of 1054 that split Christendom between the Eastern and Roman Churches. The Serbian Orthodox Church has been autonomous since 1219. Islam came to the area from the Ottoman Turks in the 15th century. Though there is no state religion, the Serbian Orthodox Church does receive some preferential treatment from the state.

About 78% of the total population of the union of Serbia and Montenegro prior to Montenegro's independence in 2006 were Serbian Orthodox. Muslims accounted for 5% of the total population, Roman Catholics for 4%, and Protestants 1%. Protestant denominations include Baptists, Adventists, Reformed Christians, Evangelical Christians, Evangelical Methodists, Jehovah's Witnesses, the Church of Christ, Mormons, and Pentecostals. There is a small Jewish community in the country. In Kosovo, Islam is the dominant religion, but Serbs in Kosovo are generally Serbian Orthodox.

## 11 TRANSPORTATION

In 2002, Serbia had 3,619 km (2,248.8 mi) of railroads, all of it standard gauge. Railways connect Belgrade with Budapest and Zagreb. The Belgrade-Bar line links Serbia to Montenegro and terminates at the Adriatic Sea. Rail service is provided by locomotives manufactured in the 1950s and 1960s.

Asphalt road length totaled 42,692 km (26,528.8 mi) in 2002 in Serbia, and there were 24,860 km (15,448 mi) of concrete roads. While the freeway between Belgrade and Zagreb is officially open, the lack of normal relations between Serbia and Croatia has kept commercial traffic on the highway to a minimum. In 2003, there were 1,650,000 passenger cars and 155,000 commercial vehicles in the union of Serbia and Montenegro.

The Danube, Sava, and Tisa are important commercial rivers, with ports at Belgrade, Novi Sad, Sabac, Pancevo, Smederevo, and Prahovo. Serbia's river fleet has a large transport capacity in Europe. As of 2004, the union of Serbia and Montenegro's navigable inland waterway system totaled 587 km (365 mi).

There were an estimated 43 airports in Serbia in 2004. As of 2005, half of them had paved runways, and there were also four heliports. Yugoslav Aero Transport (YAT) operates from Belgrade. YAT is considering upgrading its aging fleet for European destinations. Passengers carried on scheduled domestic and international flights in 2003 in the union of Serbia and Montenegro were about 1.298 million.

## 12 HISTORY

The Serbs, one of the large family of Slavic nations, first began settling in the Balkans around the 7th century in the areas now known as Bosnia, Kosovo, and Montenegro, straddling the line that since AD 395 had divided the Eastern and Western halves of the Roman Empire.

Tracing the origins of the Serbs (and Croats) has fueled many debates among historians, but there seems to be a consensus on

LOCATION: Approximately 41°50' N; 19°5' to 23° E. BOUNDARY LENGTHS: Romania, 476 kilometers (296 miles); Bulgaria, 318 kilometers (198 miles); Macedonia, 221 kilometers, (137 miles); Albania, 115 kilometers (70 miles); Montenegro, 203 kilometers (126 miles); Bosnia and Herzegovina, 302 kilometers (187 miles); Croatia (north), 241 kilometers (150 miles); Hungary, 151 kilometers (94 miles).

their Sarmatian (Iranian) origin. Having assimilated into the Slavic tribes, the Serbs migrated with them west into central Europe (White Serbia) in the Saxony area and from there moved to the Balkans around AD 626 upon an invitation by the Byzantine emperor Heraclius to assist him in repelling the Avar and Persian attack on Constantinople. Having settled in the Balkan area the

Serbs organized several principalities of their own, made up of a number of clans headed by leaders known as *zupans*. Both the Byzantine Empire and the Bulgars tried to conquer them, but the Serbs were too decentralized to be conquered.

Between the 9th and 12th centuries, several Serbian principalities evolved, among them Raška in the mountainous north

of Montenegro and southern Serbia, and Zeta (south Montenegro along the Adriatic coast), whose ruler Mihajlo (Michael) was anointed king by Pope Gregory VII in 1077.

In the late 10th century the Bulgarian khan (leader) Samuil extended his control over Bosnia, Raška, and Zeta, north to the Sava River, and south over Macedonia. Raška became the area from where the medieval Serbian empire developed. Stephen Nemanja, grand zupan of Raška, fought against the Byzantines in AD 1169, and added Zeta to his domain in 1186. He built several Serbian monasteries, including Hilandar on Mount Athos. His son, Rastko, became a monk (Sava) and the first Serbian archbishop of the new Serbian Autocephalous Church in 1219. The second son, Stephen, received his crown from Pope Innocent IV in 1202. Stephen developed political alliances that, following his death in 1227, allowed Serbia to resist the pressure from Bulgaria and, internally, keep control over subordinate zupans. Archbishop Sava (later Saint Sava) preferred the Byzantine Church and utilized the Orthodox religion in his nation-building effort. He began by establishing numerous Serbian-Orthodox monasteries around Serbia. He also succeeded in turning Zeta from Catholicism to Serbian Orthodoxy.

The medieval Serbian empire, under Stephen Dušan the Mighty (1331–55) extended from the Aegean Sea to the Danube (Belgrade), along the Adriatic and Ionian coasts from the Neretva River to the Gulf of Corinth and controlled, aside from the central Serbian lands, Macedonia, Thessaly, the Epirus, and Albania. The Serbian Church obtained its own patriarchate, with its center in Peć. Serbia became an exporting land with abundant crops and minerals. Dušan, who was crowned tsar of “the Serbs and Greeks” in 1346, gave Serbia its first code of laws based on a combination of Serbian customs and Byzantine law. His attempt to conquer the throne of Byzantium failed, however, when the Byzantines called on the advancing Ottoman Turks for help in 1345. Even though Dušan withstood the attacks from the Turks twice (in 1345 and 1349), the gates to Europe had been opened, and the Ottoman Turks had initiated their campaign to subjugate the Balkans.

#### Under Ottoman Rule

Dušan's heirs could not hold his empire together against the Turks and the Nemanja dynasty ended with the death of his son Stephen Uroš in 1371, the same year his brothers Vukašin and Ivan Ugleš were killed at the battle of Marica. The defeat of the Serbs at Kosovo Polje in 1389 in an epochal battle that took the lives of both Sultan Murad I and Serbian prince Lazar left Serbia open to further Turkish conquest. Following a series of wars, the Turks succeeded in overtaking Constantinople in 1453 and all of Serbia by 1459. For the next three-and-a-half centuries, Serbs and others had to learn how to survive under Ottoman rule.

The Turks did not make any distinctions based on ethnicity, but only on religion. Turkish Muslims were the dominant class while Christians and Jews were subordinated. While maintaining their religious and cultural autonomy, the non-Turks developed most of the nonmilitary administrative professions and carried on most of the economic activities, including internal trade and trade with other countries of the Christian world. There was no regular conscription of non-Turks into the sultan's armies, but non-Turks were taxed to pay for defense. Christian boys between the age of eight and twenty were forcibly taken from their families to be con-

verted to Islam and trained as “Janissaries” or government administrators. Some these former Christians became administrators and even became grand viziers (advisers) to sultans.

Urban dwellers under Ottoman rule, involved in crafts, trade, and the professions, fared much better than the Christian peasantry, who were forced into serfdom. Heavy regular taxes were levied on the peasants, with corruption making the load so unbearable that the peasants rebelled.

Two distinct cultures lived side by side—Turkish Muslim in cities and towns as administrative centers and Christian Orthodox in the countryside of Serbia. The numerous Serbian monasteries built around the country since the Nemanja dynasty became the supportive network for Serbian survival. The Serbian Church was subjected after 1459 to the Greek patriarchate for about a century until a Serbian patriarchate emerged again. The Serbian patriarchate covered a large area from north of Ohrid to the Hungarian lands north of the Danube and west through Bosnia.

#### The Serbian Diaspora

Over the two centuries 1459–1659 many Serbs left their lands and settled north of the Sava and Danube Rivers where Hungary had promised their leader (“Vojvoda”) an autonomous arrangement in exchange for military service against the Turks. The region is called “Vojvodina” by Serbs, even though the Hungarians had reneged on their promise of autonomy. Fleeing the Turkish conquest many Serbs and Croats settled in Venetian-occupied Dalmatia and continued fighting against the Turks from fortified areas. The wars between Austria and the Turks in the late 17th through the mid-18th centuries caused both mass migrations from Serbia and the hardening of Ottoman treatment of their Christian subjects. Following the defeat of the Turks in 1683 at the gates of Vienna by a coalition led by Poland's king Jan Sobieski, the Christian armies pursued the Turks all the way to Macedonia and had a good chance to drive the Turks off the European continent. Turk reprisals were violent and many Serbs fled, leaving Serbian lands, particularly Kosovo, unpopulated. Albanians, whom the Turks favored because they were mostly Muslims, moved in. Conversion to Islam increased considerably.

A second large-scale migration took place 50 years later, after the 1736–39 Austrian defeat by the Turks. All these movements of population resulted in the loss of the Kosovo area—the cradle of Serbian nationhood—to Albanians. As a result, the Serbs were unable to give up control over an area to which they feel a tremendously deep emotional attachment, even though they represent only about 10% of its population. This situation persisted and remained unresolved as of the early 21st century.

#### Serbian Revolts and Independence

Meanwhile, two areas of active Serbian national activity developed, one under the Turks in the northern Šumadija region and the other in Hungary. Šumadija, a forested region, became the refuge for many *hajduks* (Serbian “Robin Hoods”) that raided Turkish establishments. These hajduks were legendary heroes among the Serbian people.

In 1805, the Serbs defeated the Turks and gained control of the Belgrade region. The sultan agreed to Serbian terms for political autonomy in September 1806. A partially elected government structure was established, and by 1811 the Serbian assembly confirmed Karadjordje as supreme leader with hereditary rights. The

drive of Serbia for complete independence was thwarted, however, because Serbia was still under Ottoman rule. The Turks reoccupied Serbia by 1813, retaliating against the Serbs by pillaging, looting, enslaving women and children, while killing all males over age 15, and torturing any captured leader.

A second uprising by the Serbs occurred in 1815 and spread all over Šumadija. It was led by Miloš Obrenović, who had participated in the first revolt. Successful in repelling Turkish forces, Obrenović gained the support of the Russian tsar, and after some six months he negotiated an agreement giving Serbia a *de facto* autonomy in its internal administration. By 1830, Serbia had gained its full autonomy and Miloš was recognized as an hereditary prince of Serbia. Serbia was internationally accepted as a virtually independent state.

Miloš Obrenović was an authoritarian ruler who had to be forced to promulgate a constitution for Serbia, establishing a council of chiefs sharing power with him. In 1838 a council was appointed to pass laws and taxes, a council of ministers was created, and provisions were formulated for an eventual assembly. A succession of rulers were installed and deposed over the next decade until, in 1848, the Serbian assembly demanded the incorporation of Vojvodina into Serbia.

The 1858 assembly restored Miloš Obrenović to power, but he died in 1860 and was succeeded, again, by his son Mihajlo. Mihajlo built up the Serbian army to fight a war of liberation against the Turks as a first step towards the goal of a Greater Serbia. Mihajlo developed a highly centralized state organization, a functioning parliament, two political parties, a judicial system, and urban educational institutions prior to his murder in 1868. Mihajlo's cousin, Milan, succeeded him, and accomplished total independence from the Ottomans in 1882. Despite this success, during the same period Austria conquered Bosnia and Herzegovina, badly wanted by Serbia. Milan became dependent on Austria when that country saved Serbia from an invasion by Bulgaria.

Milan Obrenović abdicated in 1889 in favor of his son Alexander, who abolished the constitution, led a corrupt and scandalous life, and was murdered along with his wife, the premier, and other court members by a group of young officers in June 1903. The assembly then called on Peter, Alexander Karadjordjević's son, to take the crown. Under Peter Karadjordjević, a period of stable political and economic development ensued, interrupted by the 1908 Austrian annexation of Bosnia and Herzegovina, the 1912 and 1913 Balkan wars, and World War I (1913–18).

### The Balkan Wars

Austria's annexation of Bosnia and Herzegovina was carried out in 1908 with the full backing of Germany. The Serbs saw Austria's move as a serious blow to their goal of a Greater Serbia with an outlet to the Adriatic Sea through Bosnia and Herzegovina. They turned to the only other possible access routes to the sea—Macedonia, with its port city of Salonika, and the northern coast of Albania. The Balkan countries (Serbia, Bulgaria, Montenegro, and Greece) formed the Balkan League and attacked Turkey in 1912, quickly defeated them and driving them to the gates of Constantinople. Austria and Italy opposed a Serbian outlet to the Adriatic in Albania, supporting instead an independent Albanian state and assisted its establishment in 1913. Serbia, deprived of access to the sea, requested it from Bulgaria. Bulgaria responded by at-

tacking Serbia and Greece, hoping to obtain all of Macedonia. The resulting second Balkan War ended with the defeat of Bulgaria by Serbia, Montenegro, Greece, Romania, and Turkey, which gained back Adrianople and Thrace. Romania gained northern Dobruja, Serbia kept central and northern Macedonia, and Greece was given control over the southern part with Salonika and Kavalla in addition to southern Epirus.

Austria viewed Serbian expansion with great alarm, and the "Greater Serbia" plans became a serious threat to the Austro-Hungarian empire. The Austro-Hungarians felt Serbia had to be restrained by whatever means, including war. They needed only a spark to ignite a conflagration against the Serbs.

### World War I and Royal Yugoslavia

The spark was provided by the 28 June 1914 assassination in Sarajevo of Austria's Archduke Ferdinand and his wife. The archduke's visit to Sarajevo during large-scale maneuvers was viewed as a provocation by Bosnian Serbs, and they conspired to assassinate him with the assistance of the Serbian secret organization, Black Hand, which had also been behind the murder of Serbian king Miloš and his wife in 1903.

Austria presented an ultimatum to Serbia on 23 July with 10 requests, all of which were accepted by Serbia in a desperate effort to avoid a war. Austria, however, declared war on Serbia on 28 July 1914. They began bombing Belgrade the same day and sent armies across the Danube and Sava rivers to invade Serbia on 11 August 1914, taking the Serbs by surprise. The Serbian army twice repelled the Austrian forces in 1914, with tremendous losses in men and materials and civilian refugees. In addition, a typhus epidemic exacted some 150,000 victims among Serbian soldiers and civilians throughout Serbia, where there were almost no doctors or medical supplies. Still, an army of some 120,000 men joined the Allied forces holding the Salonika front in the fall of 1916. From there, after two years, they were successful in driving the Austrian forces out of Serbia in October 1918.

The Serbian elite's political goal for the main outcome of World War I was the same—a greater Serbia, with the liberation of their South Slavic brethren, particularly Serbs, from the Austro-Hungarian yoke. The dissolution of the Austro-Hungarian empire was not yet an operational concept. On 20 July 1916 the Corfu Declaration delineated the future joint state of Serbs, Croats, and Slovenes while treating both Macedonians and Montenegrins as Serbs.

But Austro-Hungary was losing the war and disintegrating from the inside. In May 1917, the "Yugoslav Club" in the Vienna parliament, consisting of deputies from Slovenia, Istria, and Dalmatia issued a declaration demanding the independence of all Slovenes, Croats, and Serbs united in one national state. (The phrase "under the scepter of the Hapsburgs" was added to their declaration for safety reasons, to avoid prosecution for treason.) Poles, Czechs, and Slovaks were also agitating for their independence, and they all had received support from their communities in the United States. On 20 October 1918, US President Woodrow Wilson declared his support for the independence of all the nation subjects of the Austro-Hungarian monarchy.

Under the leadership of Monsignor Anton Korošec, a council of Slovenes, Croats, and Serbs was formed in Zagreb, Croatia, to negotiate a union with the Kingdom of Serbia. The Serbian army entered Belgrade on 1 November 1918 and proceeded to take

over the Vojvodina region. The armistice ending World War I was signed on 3 November 1918, and on 6–9 November a conference was held in Geneva by Serbia's prime minister Nikola Pašić, Monsignor Korošec, and the Yugoslav Committee.

The conference was empowered by the Zagreb Council to negotiate for it with the Allies. Prime Minister Pašić could not ignore the provisional government set up by elected representatives of the Slovenes, Croats, and Serbs. Thus, Pašić signed a declaration setting up a joint provisional government with the right of the National Council in Zagreb to administer its territories until a constitutional assembly could be elected to agree on the form of government for the new state. However, the Serbian government reneged on Pašić's commitment. The National Council delegation with Monsignor Korošec was detained abroad and, given the pressures from the ongoing Italian occupation of Slovene and Croat territories and the urgent need for international recognition, the National Council sent a delegation to Belgrade on 27 November 1918 to negotiate terms for unification with Serbia. But time was running out and the unification was proclaimed on 1 December 1918 without any details on the nature of the new state, since Bosnia and Herzegovina, Vojvodina, and Montenegro had already voted for their union with Serbia.

The Corfu declaration of 1917 had left open the issue of the unitarist or federalist structure of the new state by providing for a constitutional assembly to decide the issue on the basis of a "numerically qualified majority." Serbs interpreted this to mean a simple majority whereas others advocated a two-thirds majority. Following the 28 November 1920 elections, the simple majority prevailed, and a constitution (mirroring the 1903 constitution of Serbia) for a unitary state was approved on 28 June 1921 by a vote of 223 to 35, with 111 abstentions out of a total of 419 members. The 50 members of the Croatian Peasant Party refused to participate in the work of the assembly, advocating instead an independent Croatian Republic.

After 10 years of a contentious parliamentary system that ended in the murder of Croatian deputies and their leader Stjepan Radić, King Alexander abrogated the 1921 constitution, dissolved the parliament and political parties, took over power directly, renamed the country "Yugoslavia," and abolished the 33 administrative departments.

A new policy was initiated with the goal of creating a single "Yugoslav" nation out of the three "tribes" of Serbs, Croats, and Slovenes. In practice, this meant the Serbian king's hegemony over the rest of the nation. The reaction was intense, and King Alexander himself was assassinated in Marseille in 1934. Alexander's cousin, Prince Paul, assumed power and managed to reach an agreement in 1939 with the Croats. An autonomous Croatian *banovina* (territory headed by a leader called a *ban*) headed by Ivan Subašić was established, including most Croatian lands outside of the Bosnia and Herzegovina area. Strong opposition developed among Serbs and there was no time for further negotiations, since Prince Paul's government was deposed on 27 March 1941 and Germany's Adolph Hitler and his allies (Italy, Hungary, Bulgaria) attacked Yugoslavia on 6 April 1941.

### World War II

Yugoslavia was divided up and occupied by Germany and its allies. Serbia was put under the administration of General Milan Nedić who was allowed to organize his own military force for in-

ternal peacekeeping purposes. In Serbia the resistance was led by the "Cetniks," the "Yugoslav army in the homeland." The Cetniks recognized the authority of the Yugoslav government-in-exile, which, in fact, promoted Draža Mihajlović to general and appointed him its Minister of War. In the fall of 1941 Mihajlović and Josip Broz Tito, who led the Communist partisan movement, met to seek agreement on a common front against the Nazis. However, Mihajlović saw that Tito's goal was to conquer Yugoslavia for Communism. Mihajlović could not go along with this, nor could he accept Tito's request that he subordinate his command to Tito. A civil war between the two movements (under foreign occupation) followed. Meanwhile, large numbers of Serbs fled Croatia, either to join the partisans or to seek refuge in the Dalmatian areas under Italian control. British leader Winston Churchill, convinced by reports that Mihajlović was collaborating with the Germans while Marshal Tito's partisans were against the Germans, decided to recognize Tito as the legitimate Yugoslav resistance. Though aware of Tito's Communist allegiance to Stalin, Churchill threw his support to Tito.

When Soviet armies, accompanied by Tito, entered Yugoslavia from Romania and Bulgaria in the fall of 1944, military units and civilians that had opposed the partisans had no choice but to retreat to Austria or Italy. After the end of the war, the Communist-led forces took control of Serbia and Yugoslavia and instituted a violent dictatorship that committed systematic crimes and human rights violations. Thousands upon thousands of their former opponents who were returned from Austria by British military authorities were tortured and massacred by partisan executioners. General Mihajlović was captured in Bosnia in March 1946 and publicly tried and executed on 17 July 1946.

### Communist Yugoslavia

Such was the background for the formation of the second Yugoslavia as a Federative People's Republic of five nations (Slovenes, Croats, Serbs, Macedonians, Montenegrins) with their individual republics and Bosnia and Herzegovina as a buffer area with its mix of Serb, Muslim, and Croat populations. The problem of large Hungarian and Muslim Albanian populations in Serbia was solved by creating for them the autonomous region of Vojvodina (Hungarian minority) and Kosovo (Muslim Albanian majority) that assured their political and cultural development.

Tito attempted a balancing act to satisfy most of the nationality issues that were carried over, unresolved, from the first Yugoslavia. However, he failed to satisfy anyone. The numerically stronger Serbs had lost the Macedonian area they considered Southern Serbia; lost the opportunity to incorporate Montenegro into Serbia; lost direct control over the Hungarian minority in Vojvodina and Muslim Albanians of Kosovo (viewed as the cradle of the Serbian nation since the Middle Ages); were not able to incorporate into Serbia the large Serbian-populated areas of Bosnia; and had not obtained an autonomous region for the large minority Serbian population within the Croatian Republic. The official position of the Marxist Yugoslav regime was that national rivalries and conflicting interests would gradually diminish through their sublimation into a new Socialist order. Without capitalism, nationalism was supposed to wither away. Therefore, in the name of their unity and brotherhood motto, any nationalistic expression of concern was prohibited.

After a short post-war coalition government, the elections of 11 November 1945—boycotted by the non-Communist coalition parties—gave the Communist-led People's Front 90% of the vote. A Constituent Assembly met on 29 November, abolished the monarchy and established the Federative People's Republic of Yugoslavia. In January 1946, a new constitution was adopted based on the 1936 Soviet constitution.

Yugoslavia was expelled from the Soviet-dominated Cominform Group in 1948, and was forced to find its own road to Socialism, balancing its position between the North Atlantic Treaty Organization (NATO) alliance and the Soviet bloc. Tito quickly nationalized the economy through a policy of forced industrialization, supported by the collectivization of the agriculture.

The agricultural reform of 1945–46 included limited private ownership of a maximum of 35 hectares (85 acres) and a limited free market (after the initial forced delivery of quotas to the state at very low prices) but had to be abandoned because of resistance by the peasants. Collectivization was initiated in 1949 but had to be abandoned by 1958 because its inefficiency and low productivity could not support the concentrated effort of industrial development.

By the 1950s, Yugoslavia had initiated the development of its internal trademark: self-management of enterprises through workers councils and local decision-making. Following the failure of the first five-year plan (1947–51), the second five-year plan (1957–61) was completed in four years by relying on the well-established self-management system. Economic targets were set from the local to the republic level and then coordinated by a federal planning institute to meet an overall national economic strategy. This system supported a period of very rapid industrial growth in the 1950s. But public subsidies, cheap credit, and other artificial measures led to a serious crisis by 1961, leading to the introduction of market socialism in 1965. Laws abolished most price controls and halved import duties while withdrawing export subsidies. Councils were given more decision-making power on investing their earnings, and they also tended to vote for higher salaries to meet steep increases in the cost of living. Unemployment grew rapidly even though political factories were still subsidized. The government responded by relaxing restrictions on labor migration particularly to West Germany, encouraging up to 49% foreign investment in joint enterprises, and removing barriers to the exchange of ideas.

Yugoslavia began to develop a foreign policy independent of the Soviet Union. In October 1949, Yugoslavia was elected to one of the nonpermanent seats on the United Nations (UN) Security Council and openly condemned North Korea's aggression in South Korea. Tito intensified his commitment to the movement of nonaligned "third world" nations in cooperation with Jawaharlal Nehru of India, Gamal Abdel-Nasser of Egypt, and others.

With the September 1961 Belgrade summit conference of non-aligned nations, Tito became the recognized leader of the movement. The nonaligned position served Tito's Yugoslavia well by allowing Tito to draw on economic and political support from the Western powers while neutralizing any aggression from the Soviet bloc. Tito condemned all Soviet aggression. Just before his death on 4 May 1980, Tito condemned the Soviet invasion of Afghanistan. In the 1970s and 1980s, Yugoslavia maintained fairly good relations with its neighboring states by playing down or solving

pending disputes and developing cooperative projects and increased trade.

As an integral part of the Yugoslav federation, Serbia naturally was impacted by Yugoslavia's internal and external political developments. The main problem facing communist Yugoslavia was the force of nationalism.

As nationalism was on the rise in Yugoslavia, particularly in Croatia and Slovenia, Serbs were facing a real dilemma with the rising of Albanian nationalism in Kosovo. After World War II, Tito had set up Kosovo as an autonomous province and the Albanians were able to develop their own political and cultural autonomy, including a university with instructors and textbooks from Albania. Immigration from Albania also increased and after Tito's death in 1980, Albanians became more assertive and began agitating for a republic of their own, since by then they comprised about 80% of Kosovo's population.

The reverberations of the Kosovo events were very serious throughout Yugoslavia since most non-Serbs viewed the repression of the Albanians as a possible precedent for the use of force elsewhere. Serbs were accused of using a double standard—one for themselves in the defense of Serbs in Kosovo by denying the Albanians' political autonomy and violating their human rights, and a different standard for themselves by demanding political autonomy and human rights for Serbs in Croatia.

In 1986, the Serbian Academy of Arts and Sciences issued a draft manifesto that called for the creation of a unified Serbia whereby all lands inhabited by Serbs would be united with Serbia while bringing Kosovo under control to be eventually repopulated by Serbs. To accomplish this goal, the 1974 constitution would need to be amended into an instrument for a recentralizing effort of both the government and the economy.

#### **Recentralization vs. Confederation**

In 1986, work was begun on amendments to the 1974 constitution that, when submitted in 1987, created a furor, particularly in Slovenia and Croatia. The main points of contention were the creation of a unified legal system, the establishment of central control over the means of transportation and communication, the centralization of the economy into a unified market, and the granting of more control to Serbia over its autonomous provinces of Kosovo and Vojvodina. These moves were all viewed as coming at the expense of the individual republics. Serbia also proposed replacing the bicameral federal Skupština (assembly) with a tricameral one where deputies would no longer be elected by their republican assemblies but through a "one person, one vote" nationwide system. Slovenia, Croatia, and Bosnia and Herzegovina strongly opposed the change, just as they opposed the additional Chamber of Associated Labor that would have increased the federal role in the economy.

Meanwhile, Slobodan Milošević had become the head of the Communist Party in Serbia in early 1987. An ardent advocate of the Serbs in Kosovo (and elsewhere) and a vocal proponent of the recentralizing constitutional amendments, he was able to take control of the leadership in Montenegro and Vojvodina and impose Serbian control over Kosovo.

The Slovenian Communist Party had taken the leadership in opposing the recentralizing initiatives and in advocating a confederate reorganization of Yugoslavia. Thus a political dueling took place between Slovenia and Serbia. Slobodan Milošević directed

the organization of mass demonstrations by Serbs in Ljubljana, the capital city of Slovenia. Serbs began a boycott of Slovenian products, withdrew savings from Slovenian banks, and terminated economic cooperation and trade with Slovenia. The tensions with Serbia convinced the Slovenian leadership of the need to undertake protective measures and, in September 1989, draft amendments to the constitution of Slovenia were published that included the right to secession, the sole right of the Slovenian legislature to introduce martial law, and the right to control deployment of armed forces in Slovenia. The latter seemed particularly necessary since the Yugoslav Army was largely controlled by a Serbian and Montenegrin officer corps.

A last attempt at salvaging Yugoslavia was made when the League of Communists of Yugoslavia convened in January 1990 to review proposed reforms. The Slovenian delegation walked out on 23 January 1990 when their attempts to broaden the reforms was rebuffed.

### Yugoslavia's Dissolution

In October 1990, Slovenia and Croatia published a joint proposal for a confederation of Yugoslavia as a last attempt at a negotiated solution, but to no avail. The Slovenian legislature also adopted a draft constitution proclaiming that "Slovenia will become an independent state. . . ." On 23 December, a plebiscite was held on Slovenia's secession from Yugoslavia if a confederate solution could not be negotiated within a six-month period. An overwhelming majority of 88.5% of voters approved the secession provision, and on 26 December 1990 a Declaration of Sovereignty was also adopted. All federal laws were declared void in Slovenia as of 20 February 1991 and, since no negotiated agreement was possible, Slovenia declared its independence on 25 June 1991.

On 27 June, the Yugoslav army tried to seize control of Slovenia under the pretext that it was its constitutional duty to assure the integrity of Socialist Yugoslavia. The Slovenian "territorial guards" surrounded Yugoslav army tank units, isolated them, and engaged in close combat along border checkpoints, and the Yugoslav units often surrendered. Over 3,200 Yugoslav army soldiers surrendered, and the Slovenes scored an international public relations coup by having the prisoners call their parents all over Yugoslavia to come to Slovenia and take their sons back home. The European Community negotiated a cease-fire after ten days, with a three-month moratorium of Slovenia's implementation of independence.

The collapse of Communist regimes in Eastern Europe in 1989 had a deep impact in Yugoslavia. Communist leaders there realized that, in order to stay in power, they needed to embrace the goals of nationalistic movements. In Serbia and Montenegro, the Communists won on 9 December 1990 on the basis of their strong Serbian nationalism. In its last years, Yugoslavia became a house divided, prompting the parliament of Slovenia to pass a resolution on 20 February 1991 proposing the division of Yugoslavia into two separate states.

### Suppression of Kosovo and Revolt in Croatia

On 2 July 1990, Albanian members of the Yugoslav legislature declared Kosovo a separate territory within the Yugoslav federation. Three days later, on 5 July 1990, the Serbian parliament countered the Albanian move by suspending the autonomous government of Kosovo. The next month (August 1990), an open Serb insurrection

against the Croatian government was initiated apparently with the support of Slobodan Milošević. On 17 March 1991, Milošević declared that Krajina, a region in Croatia, was a Serbian autonomous region. Clashes between the Serbian militia and Croatian police required the use of Yugoslav army units to keep the peace.

The Serbian determination to maintain a united Yugoslavia hardened, while the determination of the Slovenes and Croats to gain their independence grew stronger. This caused the closing of ranks by the Yugoslav army command in support of the Serbian leadership and Slobodan Milošević. Since there was no substantial Serbian population in Slovenia, its secession did not present a real problem to Milošević, but secession by Croatia and Bosnia and Herzegovina would necessitate border revisions to allow land with Serbian populations to be joined to Serbia.

The new constitution promulgated by Serbia in September 1990 provided for a unicameral legislature of 250 seats and the elimination of autonomy for Vojvodina and Kosovo. The first elections were held on 9 December 1990. More than 50 parties and 32 presidential candidates participated. Slobodan Milošević's Socialist Party of Serbia received two-thirds of the votes and 194 out of the 250 seats. The Movement for Renewal, headed by Vuk Drašković, received 19 seats while the Democratic Party won 7 seats. With the mandate from two-thirds of the electorate, Slobodan Milošević had complete control of Serbia. Having gained control of Serbia, Montenegro, Kosovo, and Vojvodina, Milošević controlled four of the eight votes in the collective presidency of Yugoslavia. With the collective presidency stalemated, the top army leadership became more independent of the normal civilian controls and was able to make its own political decisions on rendering support to the Serbs in Croatia and their armed rebellion.

On 3 June 1991 Bosnia and Herzegovina and Macedonia proposed the formation of a Community of Yugoslav Republics as a compromise. In this community, national defense, foreign policy, and a common market would be centrally administered while all other areas would fall to the jurisdiction of the member states (except for the armed forces and diplomatic representation). But it was already too late. Serbia disliked the confederate nature of the proposal and objected to leaving an opening for the establishment of separate armed forces. In addition, Milošević and the army had already committed to the support of the revolt of the Serbs in Croatia. At their meeting in Split on 12 June 1991, Milošević and Croatia's president Tudjman were past the stage of salvaging Yugoslavia when discussing how to divide Bosnia and Herzegovina into ethnic cantons.

The international community stood firmly in support of the preservation of Yugoslavia, of the economic reforms initiated by the Marković government, and of the peaceful solution to the centralist vs. confederate conflict. The United States and the European Community had indicated that they would not recognize the independence of Slovenia and Croatia if they unilaterally seceded from the Yugoslav Federation. With the then-Soviet Union also supporting Socialist Federal Yugoslavia, Milošević was assured of strong international backing. Slovenia and Croatia proceeded with their declarations of independence on 25 June 1991.

As a shrewd politician, Slobodan Milošević knew that a military attack on a member republic would deal a mortal blow to both the idea and the reality of a Yugoslavia in any form. Thus, following the Yugoslav army's attack on Slovenia on 27 June 1991, Milošević

and the Serbian leadership concentrated on the goal of uniting all Serbian lands to Serbia.

This position led to the direct use of the Yugoslav army and its superior capabilities in establishing the Serbian autonomous region of Krajina in Croatia. Increased fighting from July 1991 caused tremendous destruction of entire cities (Vukovar), and large scale damage to the medieval city of Dubrovnik. Croatia, which was poorly armed and caught by surprise, fought over a seven-month period. It suffered some 10,000 dead, 30,000 wounded, over 14,000 missing, and lost to the Krajina Serbs (and to the Yugoslav Army) about one-third of its territory, from Slavonia to the west and around the border with Bosnia and south to northern Dalmatia.

The intervention of the European Community (as earlier in the case of Slovenia) and the United Nations (UN) brought about a cease-fire on 3 January 1992. UN peacekeepers were stationed by March 1991 to separate the Serb-controlled areas from Croatian army and paramilitary forces. Milošević had very good reasons to press the Krajina Serbs and the Yugoslav army to accept the cease-fire because the Serb forces had already achieved control of about one-third of Croatian territory. He was confident that the UN forces would actually protect the Serb-occupied territories from the Croats.

#### **Aggression in Bosnia and Herzegovina**

In the meantime, a far worse situation was developing in Bosnia and Herzegovina. Following the deployment in Croatia of UN peacekeepers, the Yugoslav army moved into Bosnia and Herzegovina. Bosnia and Herzegovina held a referendum on independence in February 1992 in accordance with the European Community's conditions for eventual international recognition. In 1991, Bosnia and Herzegovina was about 44% Muslim, 31% Serbian, 17% Croatian, and 6% Yugoslav. Milošević's goal of unifying all Serbian lands would become impossible with an independent Bosnia and Herzegovina. Therefore, Bosnian Serbs abstained from voting, while 64% of eligible voters approved of an independent Bosnia and Herzegovina by an almost unanimous 99.7%.

At the same time, a provisional agreement had been reached at a conference in Lisbon in late February 1992 on dividing Bosnia and Herzegovina into three ethnic units, with related central power sharing. This agreement was rejected by the Muslim side, and the Bosnian Serbs, who had earlier organized their territory into the Serbian Republic of Bosnia and Herzegovina, prepared for hostilities with the support of the Yugoslav army and volunteers from Serbia and Montenegro.

International recognition of Bosnia and Herzegovina came on 6 April 1992, the anniversary of the 1941 Nazi invasion of Yugoslavia. The fear of another genocidal orgy against Serbs steered the Serbs' determination to fight for their own survival. On 1 March 1992 a Serbian wedding party was attacked in the Muslim section of Sarajevo. This was the spark that ignited the fighting in Bosnia and Herzegovina. Serbs pounded Sarajevo for two years, reducing it to rubble. They took control of two-thirds of the territory, and carried out ferocious "ethnic cleansing" of Muslims in areas they intended to add to their own. Under international pressure, the Yugoslav army moved to Serbia, leaving to the Bosnian Serbs an abundance of weaponry and supplies.

Serbia and Montenegro formed their own Federal Republic of Yugoslavia on 27 April 1992. Despite the lack of international support, Milošević was elected president in December with 56% versus 34% for his opponent, Milan Panić. Inflation, unemployment, and savage corruption convinced Milošević to support the various plans for bringing about peace to Bosnia and Herzegovina. Even with the eventual settlement of hostilities in Bosnia and Herzegovina, Yugoslavia faced serious internal political problems in addition to its ruined economy: the tradition of independence in Montenegro, the Albanian majority in Kosovo, the Muslims of the Sandžak area, the Hungarians in Vojvodina, and independent Macedonia.

#### **Kosovo**

Kosovo was the center of the Serbian kingdom in the Middle Ages. Firmly attached to their Christian faith and opposed to conversion into Islam, large numbers of Serbs were forced to leave the Kosovo region because of Turkish persecutions. In their place Muslim Albanians were settled in increasing numbers so that liberation of Serbian Kosovo in 1912 actually liberated an almost entirely Albanian area. By the end of World War II, the Kosovo area was already about 70% Albanian. Tito granted Kosovo a special autonomous status, keeping Serbian hopes alive that eventually Serbs could repopulate Kosovo.

The Albanians clamored for their right to self-determination and a republic of their own (still within Yugoslavia). Albanians increased their pressure on the remaining Serbian population, which had dwindled to some 10% of the total by 1991. Cries of genocide were raised by Serbian media, and a series of bloody clashes justified Slobodan Milošević's administration to develop a new Serbian constitution of September 1990, drastically limiting Kosovo's autonomy. Albanians then organized their own political parties, the strongest of which became the Kosovo Democratic Alliance led by Ibrahim Rugova.

In a street meeting on 2 July 1990, the adjourned Kosovo Assembly adopted a declaration proclaiming Kosovo a separate republican entity. Serbs reacted by suspending the Kosovo Assembly on 5 July 1990. Most of the Albanian delegates had to flee the country to avoid imprisonment.

Serbia found itself in a very peculiar and dangerous situation. Through several past centuries the Serbian people expanded their reach by forced mass migrations and wars that have contributed to the depopulation of its own cradle area—Kosovo. The Serbian claims to these lands were being contested by neighboring states or other older populations. Serbia and Montenegro became isolated and were facing adversary states.

#### **The Ongoing Conflict**

The quest to create a "Greater Serbia"—that is, to unite the Serbs under a single Serbian government—resulted in continued fighting, particularly in Bosnia and Herzegovina. Over 8,000 Bosnian Muslim men and boys were summarily executed at Srebrenica in July 1995. On 8 September 1995, the leaders of Serbia, Croatia, and Bosnia and Herzegovina agreed on a new governmental structure for Bosnia and Herzegovina; the three parties soon afterwards refined their agreement to include a group presidency, a parliament,

and a constitutional court in which Bosnia and Herzegovina and Croatia would share power with the Serbian republic.

In October 1995, Bosnia and Herzegovina accused the Bosnian Serbs of war crimes, leading to international suspicion that Serbian soldiers had massacred thousands of Muslims. Pressured by air strikes and diplomacy, Serb authorities joined leaders from Bosnia and Herzegovina and Croatia on 31 October 1995 in Dayton, Ohio, for a round of peace talks sponsored by the United States. On 21 November 1995, the three presidents of Bosnia and Herzegovina, Croatia, and Serbia finally agreed to terms that would end the fighting in Bosnia and Herzegovina after four years and an estimated 250,000 casualties. The agreement, formally signed in Paris in mid-December, called for 60,000 UN peacekeepers. The United States then ended its economic sanctions against Serbia.

Enforcement of the peace was difficult and problems arose over the exchange of prisoners. The United States ordered the leaders of the former warring parties to meet in Rome in February 1996 to recommit themselves to the Dayton agreement. Meanwhile, the International Criminal Tribunal for the former Yugoslavia at The Hague set out to find and prosecute Serbian soldiers accused of atrocities. In March 1996, the UN Tribunal filed its first charges. Among those cited were Serb generals Djordje Djukic and Ratko Mladic, and Bosnian Serb leader Radovan Karadzic. The latter two remained at large, spurring accusations by the United States and Europe that the Serbian government was protecting the international outlaws. In May 1996, Serbian President Milošević pledged that Karadzic would be removed from power. The presidents of Serbia, Croatia, and Bosnia and Herzegovina agreed to hold Bosnian elections in mid-September 1996.

While international suspicion swirled about him for his role in the Bosnian conflict, Serbian President Milošević was not very successful in delivering promised reforms for Serbia. In March 1996, a demonstration in Belgrade brought out 20,000 protestors against the Milošević regime, which opponents charged with starting the Bosnian conflict and devastating the Serbian economy.

Mass demonstrations against Milošević flared later in 1996 when he voided local elections won by the opposition. In December, the Milošević administration shut down Belgrade's independent radio station, which further alienated Serb citizens. Thousands of protesters met in the streets of Belgrade, hoping to topple the Milošević administration. In February 1997, Milošević relented and agreed to recognize the results of the previous local elections, in which opposition parties won majorities in 14 of Serbia's 19 largest cities. In July 1997, Milošević was appointed to the presidency of Yugoslavia by the federal parliament, allowing him to maintain control for another four years.

During early March of 1999, Albanian moderates led by Ibrahim Rugova (president of the self-proclaimed Republic of Kosovo) and representatives of the Yugoslav government held talks in Ramboulet, France; they came up with a plan to give Kosovo back its autonomy under a three-year NATO occupational guarantee. The Serbs refused to sign the accord, and Yugoslav forces grew to 40,000 in Kosovo, continuing hostilities. Beginning 24 March 1999 NATO forces bombed Serbia and Kosovo, in an attempt to check human rights violations and end fighting. NATO bombs and cruise missiles fell on military targets in Belgrade and Pristina. Fears ran high that other European nations would get involved in the conflict and take sides, resulting in a third world war. Rus-

sia disagreed with the NATO bombing runs, attempting its own peace process. After 11 weeks of bombing, casualties reported by the Yugoslav government amounted to 462 soldiers and 114 police officers, but NATO estimates claimed 5,000 had died including 2,000 civilians. On 3 June, the Yugoslav government accepted a peace plan that involved removing Yugoslav troops from Kosovo, and giving some autonomy to the province. NATO troops entered Kosovo on 12 June to enforce the peace plan. Some 170,000 Kosovar Serbs were thrown out of Kosovo by the ethnic Albanian majority during the conflict, adding to an already large refugee population.

On 29 June 1999, 10,000 Serbian protestors gathered in Čačak, in northern Serbia, to demand the resignation of Milošević. In August, more than 100,000 Serbians called for an end to his rule in a march on Belgrade. The UN began the unwieldy task of reconciliation in the region during the fall of 1999. Kosovo was to remain under the sovereignty of Yugoslavia as a Serbian province, but with some future determination of further self-government (scheduled to follow the fall of the Milošević regime). The next regular presidential elections were set for 2001. Sweeping constitutional changes in July 2000 changed the presidential term so that Milošević could run for two additional four-year terms. They also made the weight of the Montenegrin vote in the Yugoslav parliament equal to its population, or only 7%. Milošević called presidential elections early, for 24 September 2000; most believed that they would be rigged in his favor, and were planning to boycott the elections.

Milošević banned international observers from the process of monitoring the 24 September elections. The opposition to Milošević was strong, and a crowd of 150,000 turned out for the final pre-election rally against him. The opposition claimed victory in the election, with Vojislav Kostunica proclaiming himself the "people's president." The Federal Election Commission called for a second vote, stating that neither candidate had won an outright majority; this plan was met with worldwide opposition.

On 27 September, 250,000 people took to the streets to demand that Milošević step down. On 28 September, the Electoral Commission announced that while the Democratic Opposition group had won the largest single block of seats, the Socialists and their coalition partners had won an absolute majority. By 2 October, protesters had called a general strike, were blocking Belgrade's main streets and had caused a halt to economic activity in other Yugoslav cities. On 4 October 2000, the Constitutional Court annulled the election results and ruled that Milošević should serve out his last term in office. Tens of thousands of opposition supporters stormed and burned the parliament building on 5 October and captured the state television service; police joined the crowds. Kostunica told approximately 500,000 supporters at a rally in Belgrade that Serbia had been liberated. On 6 October, Milošević conceded defeat, and Kostunica was sworn in as president on 7 October. He stated his first objective as president would be to right the economy and lead reconstruction efforts. Milošević was indicted for atrocities in Kosovo by the UN war crimes tribunal in The Hague. A bounty of us\$5 million was offered by the US government to find the war criminal, but he remained in power even after losing the war.

The European Union (EU) and United States lifted their economic sanctions against Yugoslavia, and in November the country

rejoined the UN; Kostunica indicated the country wanted to join the EU as soon as possible. In January 2001, Yugoslavia and Albania reestablished diplomatic relations after they had been broken off during the crisis in Kosovo in 1999.

On 1 April 2001, Milošević was arrested at his home in Belgrade after a tense standoff in which shots were fired; he had been charged with corruption and abuse of power within Yugoslavia. Kostunica had originally ruled out extraditing Milošević to the war crimes tribunal at The Hague. Milošević was formerly indicted by the tribunal in May 1999 for alleged war crimes in Kosovo; other indictments later included war crimes carried out in Bosnia and Herzegovina and Croatia, including charges of genocide carried out in Bosnia and Herzegovina from 1992–95. This was the first time a sitting head of state had been charged with war crimes. In June, then-Serbian prime minister Zoran Djindjic authorized the extradition of Milošević to the tribunal, exacerbating a rift between him and Kostunica, who favored a trial for Milošević in Belgrade. Milošević's trial at The Hague began in February 2002; Milošević died of a heart attack in prison in The Hague on 11 March 2006 with just 50 hours of testimony left before the conclusion of the trial.

#### Serbia and Montenegro

On 14 March 2002, in an agreement mediated by the EU, Serbia and Montenegro agreed to consign the Yugoslav Republic to history and create a loose federation called "Serbia and Montenegro." Both republics would share defense and foreign policies, but would maintain separate economies, currencies (the dinar for Serbia and the euro for Montenegro), and customs services for the immediate future. Each republic would have its own parliament with a central 126-member parliament located in Belgrade. Montenegrin president Milo Djukanovic reluctantly agreed to the union, committing Montenegro to a three-year moratorium on an independence referendum, but in April, the Montenegrin government collapsed over differences on the new union. Kosovo, which remained under UN administration, remained part of Serbia. This angered many Kosovo activists, although the agreement looked to some as possibly accelerating the process of independence for the province. The parliament of the Federal Republic of Yugoslavia voted to disband itself on 4 February 2003, dissolving the country and introducing the new state of Serbia and Montenegro. Both republics agreed they would be able to hold referendums on full independence in 2006.

Serbian presidential elections were held on 29 September 2002, with 55.5% of registered voters casting ballots. Kostunica won 30.9% of the vote, and his opponent Miroslav Labus finished second with 27.4%. The second round of voting was held two weeks later, with Kostunica winning 66.8% of the votes, to 30.9% for Labus. However, voter turnout failed to reach a mandated 50% (it was 45.5%), and the elections were declared to be invalid. Nataša Micić, formerly the speaker of parliament, became acting president. She stated Serbian presidential elections would be held after the adoption of the new Serbian constitution, after it was harmonized with the constitution of Serbia and Montenegro. Montenegrin general elections were held in October 2002, and in November, Djukanovic resigned as president to take on the job of prime minister. Presidential elections held in Montenegro in December 2002 and February 2003 were invalidated due to low voter turn-

out. Filip Vujanovich was finally elected president of Montenegro in the third round of voting.

On 7 March 2003, Svetozar Marovic, deputy leader of the Montenegrin Democratic Party of Socialists, was elected the first president of Serbia and Montenegro after Kostunica stepped down as president of the former Yugoslavia. Marovic was the only candidate to run; the next presidential elections were to be held in 2007.

On 12 March 2003, Serbian prime minister Zoran Djindjic was assassinated outside the main government building in Belgrade. Members of criminal organizations were suspected of carrying out the assassination; Djindjic had declared war on organized crime in Serbia, which was said to flourish under Milošević. After the assassination, Serbia was placed under a state of emergency and police arrested some 1,000 people, including members of Serbia's secret service and policemen. Zoran Živkovic, a leading official of the ruling Democratic Party, was elected prime minister to replace Djindjic.

While the Montenegrins managed to elect a president for their small republic, the Serbs failed to do so, even after the third voting round (in November 2003), due to low voter turnout. In addition, the indecisive parliamentary elections results from December 2003 led to a crisis within the Serbian parliament. The crisis was ended on March 2004 when former Yugoslav president, Vojislav Kostunica, was appointed the new prime minister of Serbia. In June 2004, the Serbs also got a new president, Boris Tadić. Tadić, the leader of the Democratic Party, managed to defeat his main contender—the nationalist Tomislav Nikolić, taking 52.34% of the tally in the second voting round.

In February 2005, officials from Montenegro asked their Serbian counterparts for an early vote on independence, claiming the union was inefficient and that it squandered money. Vojislav Kostunica refused the proposal and indicated that European integration and economic development should be the main focus of Serbia and Montenegro. A referendum on full independence for Montenegro was held on 21 May 2006; to be accepted internationally, a 55% majority was required for a "yes" vote. The vote on independence was 55.5% in favor. Voter turnout was 86.3%. A demand by pro-Serbian unionist parties for a recount was rejected. Serb politicians, Orthodox church leaders, and Montenegrins from the mountainous inland regions bordering Serbia opposed secession. However, ethnic Montenegrins and Albanians from the coastal area favored independence. Serbian President Boris Tadić recognized the independence of Montenegro. Serbia became the successor state to the union of Serbia and Montenegro, inheriting its UN seat and seats in other international institutions: the newly independent Montenegro would have to apply for UN and EU membership on its own, once it had been granted recognition by other states. Serbia's ambition to join the EU was hampered by its failure to arrest key war crimes suspects, including Ratko Mladić. Serbia inherited legal claim to the UN-administered province of Kosovo.

### 13 GOVERNMENT

Prior to Montenegro's independence in 2006, the union of Serbia and Montenegro was a confederal parliamentary democratic republic, with two constituent states—the Republic of Serbia and the Republic of Montenegro. As of June 2006, the Serbian prov-

ince of Kosovo remained governed by the UN Interim Administration Mission in Kosovo (UNMIK), and had self-government. The Serbian province of Vojvodina is nominally autonomous. A constitutional charter for the state of Serbia and Montenegro was ratified by both the Serbian and Montenegrin parliaments in January 2003, and the constitution for the unified state was approved on 4 February 2003. The constitution allowed the member republics to hold independence referendums in 2006, which Montenegro did on 21 May of that year.

Following the dissolution of the union of Serbia and Montenegro on 5 June 2006, the Republic of Serbia was faced with drafting a new constitution. As of June 2006, Serbia had a legislature (National Assembly) of 250 deputies chosen in direct general elections for a period of four years. The deputies in the National Assembly elect the government of the Republic of Serbia, which, together with the president, represents the country's executive authority. The Serbian government was formed on 3 March 2004 with the appointment of Vojislav Kostunica as the prime minister. Boris Tadić was serving as president in June 2006. The judiciary is independent.

#### **14 POLITICAL PARTIES**

The Republic of Serbia held parliamentary elections on 28 December 2003. The following political parties won seats in the National Assembly: Serbian Radical Party, 82 seats; Democratic Party of Serbia, 53 (includes candidates of the People's Democratic Party, the Serbian Liberal Party, and the Serbian Democratic Party); the Democratic Party, 37 (includes candidates from the Civic Alliance of Serbia, Democratic Center, Social Democratic Union, Bosniak Democratic Party of Sandzak, and the Social Liberal Party of Sandzak); the G17 Plus, 34 (including candidates from the Social Democratic Party); the Serbian Renewal Movement, 22; and the Socialist Party of Serbia, 22.

Other minor parties and coalitions which were not represented in the National Assembly include: Together for Tolerance; Democratic Alternative; For National Unity; Otpor; and Independent Serbia.

#### **15 LOCAL GOVERNMENT**

The Republic of Serbia is made up of 29 districts and the city of Belgrade. Each district is, in turn, divided into several municipalities.

Serbia's ethnic diversity often makes local governance a burdensome task. Besides Serbs and Albanians, there are considerable populations of Romanians, Hungarians, Roma, Bulgarians, Bosnians, Croats, Slovaks, and Montenegrins.

#### **16 JUDICIAL SYSTEM**

The Serbian Constitutional Court determines whether Serbian laws, regulations and other enactments are in conformity with the Serbian constitution. Any citizen may begin an initiative in the Court. The Supreme Court is the highest appellate court. It also has an administrative law department with jurisdiction over all appeals of final decisions by administrative organs. As of 2002, a new intermediate appellate body became effective, the Court of Appeals. It has jurisdiction over appeals from the municipal and district courts. Its decisions may be appealed to the Supreme Court. The Administrative Court provides first instance review of

all final administrative organ decisions. The decisions of the Administrative Court may be appealed to the Supreme Court.

The district courts' jurisdiction is limited to first instance matters. The courts have jurisdiction to try criminal offenses punishable by ten years' imprisonment or more, and other specified offenses, juvenile offenses, civil disputes of substantial value and in other specified areas, labor disputes, and certain other matters. There are 30 district courts in Serbia. The 143 municipal courts are the principal first instance courts. The courts have first instance jurisdiction over all criminal and civil cases that do not fall within the first instance jurisdiction of the district courts.

Commercial courts have jurisdiction over a wide range of commercial disputes, including copyright, privatization, foreign investment, unfair competition, maritime and other matters. These courts also are responsible for the registration of commercial enterprises. There are 16 commercial courts, and their decisions may be appealed to the High Commercial Court, located in Belgrade. Decisions of the latter court may be appealed to the Supreme Court.

#### **17 ARMED FORCES**

The following information on armed forces pertains to the union of Serbia and Montenegro prior to Montenegro's independence in 2006. Active armed forces numbered approximately 65,300 in 2005, supported by 250,000 reservists. The Army had 55,000 active personnel and was equipped with 962 main battle tanks, 525 armored infantry fighting vehicles, 288 armored personnel carriers and 2,729 artillery pieces. The Navy had 3,800 active personnel, including 900 Marines. Major naval units included eight tactical submarines, three frigates, 31 patrol/coastal vessels, 10 mine warfare ships, 23 amphibious landing craft, and seven logistical/support vessels. The Air Force had 6,500 active members, along with 101 combat capable aircraft, including 39 fighters, 51 fighter ground attack aircraft and 17 armed helicopters. There was also a paramilitary force that consisted of 45,100 personnel, of which an estimated 4,100 made up special police units, 35,000 were Ministry of Interior personnel and an estimated 6,000 were Montenegrin Ministry of Interior Personnel. Sixteen military personnel were stationed in four African countries under UN command. In addition, military contingents from 45 countries were stationed in Serbia and Montenegro as part of the Kosovo Peace Implementation Force. The defense budget in 2005 totaled \$706 million.

#### **18 INTERNATIONAL COOPERATION**

The Socialist Federal Republic of Yugoslavia was an original member of the United Nations (1945) until its dissolution and the establishment of Bosnia and Herzegovina, Croatia, Slovenia, the Former Yugoslav Republic of Macedonia, and the Federal Republic of Yugoslavia as new states. The Federal Republic of Yugoslavia was admitted to the United Nations on 1 November 2000. Following the adoption and promulgation of the Constitutional Charter of Serbia and Montenegro on 4 February 2003, the name of the Federal Republic of Yugoslavia was changed to Serbia and Montenegro. Following Montenegro's referendum on independence, Serbia became the successor state to the union of Serbia and Montenegro on 5 June 2006, and thus retained its membership in international bodies, including the UN and the specialized UN agen-

cies, such as the FAO, UNESCO, UNHCR, UNIDO, the World Bank, IAEA, and the WHO.

Serbia is a member of the Council of Europe, the Black Sea Economic Cooperation Zone, the European Bank for Reconstruction and Development, and the OSCE. It has observer status in the OAS and the WTO. In environmental cooperation, the country is part of Basel Convention, Ramsar, the London Convention, the Montréal Protocol, and the UN Conventions on the Law of the Sea and Climate Change.

## 19 ECONOMY

During the UN economic sanctions that lasted from 1992 to 1995, economic activity was extremely limited. By 1994, hyperinflation had brought formal economic activity to a virtual halt. By 1996, GDP had fallen to only 50.8% of 1990s total. Industry declined to just 46.6% of 1990s output; agriculture, 94.4%; construction, 37.5%; transportation, 29.3%; trade, 60.6%; and services, 81.1%. Formal lifting of these sanctions occurred in October 1996. However, the United States sponsored an "Outer Wall" of sanctions, which prevented Yugoslavia from joining international organizations and financial institutions. Taken together, the "Outer Wall," the Kosovo war, and continuing corruption continued to stifle economic development. In October 2000, the coalition government began implementation of stabilization and market-reform measures. Real growth in 2000 was reported as 5%. A donors' conference in June 2001 raised \$1.3 billion in pledges for help in infrastructural rebuilding. Real GDP in 2001 was 5.5% and an estimated 4% in 2002. The average lending rate, at 79.6% in 2000 dropped to 33.2% in 2001, reflecting some improvement in economic security.

Economic output was positive but volatile after 2002, dropping 2.1% in 2003 and jumping to 8% in 2004; in 2005 it was estimated at 5.5%. Inflation was on a downward spiral, reaching 9.8%, but grew again in 2005 (to 15.5%) as a result of the increase of service and oil derivatives prices. Unemployment remained unusually high, hovering around 30%, but a large chunk of the unemployed are considered to work in the informal economy. One of Serbia's main tasks was to bring about fiscal and monetary stability, and create a legal framework that will allow the market economy to flourish.

## 20 INCOME

The CIA defines GDP as the value of all final goods and services produced within a nation in a given year and computed on the basis of purchasing power parity (PPP) rather than value as measured on the basis of the rate of exchange based on current dollars. The per capita GDP was estimated at \$5,000 in 2005. The annual growth rate of GDP was estimated at 5.5%. The average inflation rate in 2005 was 15.5%. It was estimated that agriculture accounted for 16.6% of GDP, industry 25.5%, and services 57.9%.

According to the World Bank, in 2003 remittances from citizens working abroad totaled \$1.397 billion or about \$172 per capita and accounted for approximately 6.8% of GDP. Foreign aid receipts amounted to \$1,317 million or about \$163 per capita and accounted for approximately 6.4% of the gross national income (GNI).

The World Bank reported that in 2003 household consumption in Serbia and Montenegro totaled \$18.27 billion or about \$2,246

per capita based on a GDP of \$20.7 billion, measured in current dollars rather than PPP. Household consumption includes expenditures of individuals, households, and nongovernmental organizations on goods and services, excluding purchases of dwellings. It was estimated that in 1999 about 30% of the population had incomes below the poverty line.

## 21 LABOR

The labor force in the union of Serbia and Montenegro was estimated at 3.22 million in 2005. The unemployment rate in 2005 was estimated at 31.6%, with Kosovo's unemployment at around 50%. There was no data available as to the occupational breakdown of the country's workforce.

With the exception of the military, all workers are entitled to form unions. However, the majority of unions are government-sponsored or affiliated: independent unions are rare. Therefore, unions have not been effective in improving work conditions or wage structure increases. Virtually all of the workers in the formal economy are union members. Strikes are permitted and are utilized especially to collect unpaid wages. Collective bargaining is still at rudimentary level.

The minimum employment age is 16 although younger children frequently work on family farms. As of 2005, there was no national minimum wage rate. On average, the full-time monthly wage in the public sector that year was \$181, while the average wage in the private sector was \$250. Neither wage rate offered a decent living wage for a family. The official workweek is set at 40 hours, with required rest periods and overtime limited to 20 hours per week or 40 hours per month. Health and safety standards are not a priority due to harsh economic circumstances.

## 22 AGRICULTURE

The union of Serbia and Montenegro had 3,717,000 hectares (9,160,000 acres) of arable land in 2003. Serbia historically accounted for 60% of agricultural production. Vojvodina is the major agricultural region. In 2000, 20% of the labor force was engaged in agriculture.

Between 1991 and 1996, total agricultural production declined by 10%. During that time, production of farm crops fell by 9%; cereals by 12%. Viticultural production, however, increased by 51%. However, by 1999, total agricultural output was at 92% of the average during 1989–91. During 2002–04, crop production was 10% higher than during 1999–2001.

Agriculture contributed an estimated 17% to GDP in 2002. Major crops produced in 2004 included (in thousands of tons): corn, 6,287; wheat, 2,746; sugar beets, 2,643; potatoes, 1,098; and grapes, 490.

Serbia has a network of agrarian organizations in the form of chambers, farmers' cooperatives, and unions.

## 23 ANIMAL HUSBANDRY

In 2005, the livestock population in the union of Serbia and Montenegro included 3,550,000 pigs and hogs, 1,796,600 sheep, 1,230,000 head of cattle, 182,000 goats, 40,000 horses, and 17,464,000 poultry. Total meat production that year was 848,240 tons; milk, 1,852,000 tons. Between 1990 and 1999, total livestock

production increased by 1.8%, but during 2002–04 it fell by 5.4% from 1999–2001.

## 24 FISHING

The total catch in 2003 was 3,665 tons in the union of Serbia and Montenegro, 86% from inland waters. Common carp accounts for much of the inland catch.

## 25 FORESTRY

In 2000, estimated forest coverage was 2,887,000 hectares (7,134,000 acres) in the former Yugoslavia. Total roundwood production in the union of Serbia and Montenegro in 2004 was 3,520,000 cu m (124.3 billion cu ft), of which about 75% came from public forests. Sawnwood production amounted to 575,000 cu m (20.3 million cu ft); plywood and particle board, 59,000 cu m (2.1 million cu ft). In 2004, exports of forest products amounted to nearly \$139.1 million; imports, \$352.9 million.

## 26 MINING

In 2003 industrial production in the union of Serbia and Montenegro fell by 3% compared to 2002, although mining and quarrying operations reported a 1% increase from 2002. Aggregated production from the metals mining sector in 2003 fell by 33% from the previous year, although the output of basic metals increased by 2%. The country also confronted continuing economic sanctions and the loss of control of Kosovo, with its ores and production facilities for nickel, lead, zinc, coal, lignite, ferronickel, and tin-plate. In light of this, Serbia and Montenegro's gross domestic product (GDP) was officially reported to have increased by 3% in 2003. The country had significant capacities to produce refined aluminum, lead, silver, and zinc. In 2003, the output of bauxite fell by about 12% from 2002, although aluminum output remained at around 2002 levels. Although exports of primary aluminum and aluminum alloys grew by 18% in 2002, from 2001, eight-month data (January through August) for 2003 appeared to indicate a steep drop in those exports. Mining in Serbia dates back to the Middle Ages, when silver, gold, and lead were extracted.

Mine output of metals in 2003 were: lead ore (gross weight), 183,000 metric tons, down from 733,000 metric tons in 2000 and 284,000 metric tons in 2002; bauxite (gross weight), 540,000 metric tons, down from 612,000 metric tons in 2002 and from 630,000 metric tons in 2000; agglomerate iron ore and concentrate saw no recorded production from 2001 through 2003; and copper ore (gross weight), 5,710,000 tons, down from 12,896,000 tons in 2000 and from 7,968,000 tons in 2002. Production of silver in 2003 totaled 2,028 kg, down from 6,838 kg in 2002. Output of refined gold in 2003 was estimated at 600 kg, down from 900 kg in 2002. In 2003, the country also produced alumina, magnesium, palladium, platinum, and selenium. Among the industrial minerals produced were asbestos, bentonite, ceramic clay, fire clay, feldspar, pumice, lime, magnesite, mica, kaolin, gypsum, quartz sand, salt, nitrogen, caustic soda, sodium sulfate, sand and gravel, and stone.

## 27 ENERGY AND POWER

The Electric Utility Company of Serbia (EPS) has control over coal mines, electric power sources (hydroelectric power plants, thermal power plants, heating plants) and grid distribution systems. Serbia has abundant hydroelectric potential, but there are fre-

quent electrical blackouts and brownouts during the peak winter months. Since 1992 energy supplies have been interrupted by UN and US sanctions. Hydroelectric projects are located on the Danube, Drina, Vlasina, and Lim rivers. Thermal plants are located at Kostolac and in Kosovo. Total electrical generating capacity in 2002 was 9.6 million kW. Electric power production in that year amounted to 31.696 billion kWh, of which 67% was thermal and 33% hydroelectric. Consumption of electricity in 2002 was 33.090 billion kWh.

Serbia is the only Balkan country with substantial coal deposits. Proven reserves as of 1999 totaled 18.2 billion tons, 95% of which was lignite. The country's largest lignite mine has an annual capacity of 14,000 tons. Total coal output in 2002 was 39,568,000 short tons, of which lignite accounted for 39,445,000 short tons. Coal imports totaled 310,000 short tons in 2002, of which 171,000 short tons was hard coal.

Serbia has limited proven reserves of oil and natural gas. As of 1 January 2002, these reserves totaled 38.75 million barrels and 24.07 billion cu m, respectively. Production of crude oil in the union of Serbia and Montenegro in 2002 averaged 14,000 barrels per day. Refined petroleum product output in that year averaged 53,000 barrels per day. Imports of petroleum products in 2002 averaged 68,98 barrels per day, which included an average of 37,460 barrels per day of crude oil. Demand for refined oil products in 2002 averaged 83,82 barrels per day.

Natural gas production totaled 22.95 billion cu ft in 2002. Dry consumption totaled 80.87 billion cu ft. Dry gas imports totaled 59.68 billion cu ft in 2002.

## 28 INDUSTRY

Serbia contributed 35% to the total industrial production of the former Yugoslav SFR. Between 1989 and 1996, total industrial output fell by 60%. Production declines by sector during that time were as follows: metals and electrical products, 85%; textiles, leather, and rubber products, 75%; wood products, 63%; nonmetals, 56%; and chemicals and paper, 54%. In the mid-1990s, industry accounted for approximately 50% of the country's GDP.

The industrial production growth rate in 2000 was 11%, and industry accounted for 36% of GDP in 2001. Principal industries in Serbia include machine building (aircraft, trucks, automobiles, tanks and weapons, electrical equipment, agricultural machinery), metallurgy, textiles, footwear, foodstuffs, appliances, electronics, petroleum products, chemicals, and pharmaceuticals. The country produced 8,978 automobiles in 2001, a 30% decline from 2000; it also produced 555 heavy trucks in 2000, a 33% increase over 1999.

The industrial production growth rate in 2002 was only 1.2%, way under the real GDP growth rate—an indication that industry plays an increasing marginal role in the economy. In 2005, the industry of Serbia and Montenegro made up only 25.5% of the GDP. Agriculture contributed with 16.6%, and services came in first with 57.9%.

In 2000, there were 696,540 workers employed in industrial and mining companies in the Republic of Serbia, comprising 52% of the total active labor force. Small enterprises employed 82,273 workers, with 146,972 in medium-size and 457,286 in large enterprises. The Law on Privatization established conditions for reform of the industrial sector. Large industrial enterprises with financial

difficulties are obliged to undertake a program of restructuring, which, it is hoped, will further attract foreign investment.

### **29 SCIENCE AND TECHNOLOGY**

A large communications satellite station was made operational in Ivanica during the 1970s. Scientific and technological policies are developed and implemented by the Ministry of Science and Technology of the Republic of Serbia. As of 2002, there were a combined 1,330 scientists and 568 technicians engaged in research and development (R&D) per million people in the union of Serbia and Montenegro. There were 98 registered research institutions in Serbia and six public universities.

A nationwide scientific and technological development policy formulated in 1994 created 250 five-year basic research projects in all scientific disciplines.

### **30 DOMESTIC TRADE**

Belgrade serves as the economic and commercial center of the country. Pristina and Subotica serve as regional market centers. The domestic economy has been held back for the past few years due the lack of major privatization reforms and trouble in the general European economy. Hours of business are usually between 8 AM and 4 PM.

### **31 FOREIGN TRADE**

The United Nations imposed sanctions on international trade with Yugoslavia in May 1992 and lifted them in December 1995. During the war, when sanctions were in force, dozens of Cypriot companies, set up by senior Serbian officials and businessmen, trafficked millions of dollars in illegal trade.

Trade started to catch up in subsequent years, and in 2004 exports in the union of Serbia and Montenegro reached \$3.2 billion (FOB—Free on Board). In the same year, imports were almost triple that amount, at \$9.5 billion (FOB), indicating that the economy in the two republics was in disarray, but that the union was trying to renew its industrial base. Most of the import commodities included machinery and transport equipment, fuels and lubricants, manufactured goods, chemicals, food and live animals, and raw materials. The imports mainly came from Germany (18.5%), Italy (16.5%), Austria (8.3%), Slovenia (6.7%), Bulgaria (4.7%), and France (4.5%). Exports included manufactured goods, food and live animals, and raw materials, and largely went to Italy (which receive 29% of total exports), Germany (16.6%), Austria (7%), Greece (6.7%), France (4.9%), and Slovenia (4.1%).

Imports were expected to be constrained by tight fiscal and monetary policies, while exports will be encouraged through targeted policy measures, and as a result of a restructured and more competitive economic base.

### **32 BALANCE OF PAYMENTS**

The US Central Intelligence Agency (CIA) reported that in 2005 the purchasing power parity of Serbia and Montenegro's exports was \$5.485 billion while imports totaled \$11.94 billion.

Exports of goods and services totaled \$5.9 billion in 2004, up from \$4.2 billion in 2003. Imports grew from \$8.7 billion in 2003, to \$12.8 billion in 2004. Consequently, the resource balance was on a negative upsurge, growing from -\$4.5 billion in 2003, to -\$7.1 billion in 2004. A similar trend was registered for the current ac-

count balance, which deteriorated from -\$2.0 billion in 2003, to -\$3.1 billion in 2004. The national reserves (including gold) were \$3.6 billion in 2003, covering less than 6 months of imports; by 2004, they increased to \$4.3 billion.

### **33 BANKING AND SECURITIES**

Serbia's banking system was still hampered by the history of international sanctions. Banks are severely hampered by a lack of liquidity, a result of the tight monetary policy prevalent in the country.

### **34 INSURANCE**

Insurance of public transport passengers, motor vehicle insurance, aircraft insurance, and insurance on bank deposits are compulsory. Only domestic insurance companies may provide insurance. In 2003, the value of all direct insurance premiums written in the union of Serbia and Montenegro totaled \$436 million, of which nonlife premiums accounted for \$420 million. In that same year, the top nonlife insurer was Dunav, which had gross written nonlife premiums of \$138.6 million, while the country's leading life insurer was Zepter, which had gross written life insurance premiums of \$7.1 million.

### **35 PUBLIC FINANCE**

The US Central Intelligence Agency (CIA) estimated that in 2005 the union of Serbia and Montenegro's central government took in revenues of approximately \$11.4 billion and had expenditures of \$11.1 billion. Revenues minus expenditures totaled approximately \$330 million. Public debt in 2005 amounted to 53.1% of GDP. Total external debt was \$15.43 billion.

### **36 TAXATION**

The republic of Serbia has a standard corporate tax rate of 10%. Capital gains derived from the sale of industrial property rights, real estate, shares and other securities, and capital participations are considered taxable income, and are taxed at the corporate rate. However, gains arising from certain government bonds or from bonds issued by the national bank are excluded from the tax. Dividends, interest and royalties are subject to a 20% withholding tax. Other taxes includes a value-added tax (VAT), with a standard rate of 18% and a lower rate of 8%, property taxes, transfer taxes, a tax on financial transactions, payroll taxes, and social security contributions. In Serbia, the republic government, rather than the city governments, collects local taxes and then disperses part of the funds to city officials. Local factories pay no city taxes in Serbia.

### **37 CUSTOMS AND DUTIES**

Serbia's has six tariff rates that range from 1–30%, with a weighted duty average of 9.37%. Serbia applies a VAT of 18%, with an 8% reduced rate for basic foodstuffs, medicines, published materials, public utilities and certain services. Serbia imposes excise taxes on certain luxury goods.

Serbia has established free trade zones (FTZ) in Smedererro, Kovin, Nis, Belgrade, Novi Sad, Šabac, Pahovo, Sombor, Sremska Mitrovica, Subotica, and Zrenjanin.

### 38 FOREIGN INVESTMENT

Foreign investment was severely restricted during the years of the economic embargo. Since the sanctions have been lifted, foreign investors from neighboring countries, Russia, and Asia have expressed an interest in capital investment. The main sectors attracting the interest of foreign investors are metal manufacturing and machinery, infrastructure improvement, agriculture and food processing, and chemicals and pharmaceuticals. Foreign investors may hold majority shares in companies.

In 1997, foreign direct investment (FDI) inflows into the former Yugoslavia reached \$740 million, but dried up with the onset of the conflict in Kosovo. FDI inflows averaged \$122.5 million in 1998 and 1999, then fell to \$25 million in 2000. In 2001, FDI inflow reached \$125 million.

In the following years, Serbia and Montenegro undertook an aggressive program of reforms aimed at both re-establishing the area as a major transportation hub, and at attracting foreign investment. These policies seem to have paid off as in 2004, capital inflows jumped to \$3.4 billion. While Serbia is still considered to be a risky place for doing business, the political and economic climate is steadily improving.

### 39 ECONOMIC DEVELOPMENT

Officials in general see revitalization of the infrastructure (roads, rail and air transport, telecommunications, and power production) as one step toward economic recovery. Another important aspect of economic reconstruction will be the revival of former export industry, such as agriculture, textiles, furniture, pharmaceuticals, and nonferrous metallic ores.

The Kosovo war in 1999 left much of Serbia's infrastructure in ruins, but reconstruction efforts were proceeding slowly in the early 2000s. The new government that came to power in 2000 faced numerous economic challenges. Nevertheless, inflation decreased sharply from 113% at the end of 2000 to 23% in April 2002. In 2002, the International Monetary Fund (IMF) approved a three-year \$829 million Extended Arrangement to support Serbia and Montenegro's (then Yugoslavia's) 2002–05 economic program. In 2002, the dinar became convertible. Privatization has been slow, and foreign direct investment lagged in the early 2000s.

While politically, and economically, Serbia is much more stable than in previous years, the economy is still in a quasi-state of disarray, with rampant unemployment, with a large grey market, and a relapsing industrial base. Foreign investors, as well as several international financial institutions (EBRD, IMF, and the World Bank), have recognized economic reforms as being positive, and in 2004 increased their capital transfers to the region.

In 2005 there was a boom in several sectors: trade, financial services and transport and communications. The growth is to be sustained by continued investment in newly privatized companies, by strong local demand, and by an expansion of the services sector.

### 40 SOCIAL DEVELOPMENT

A social insurance system, updated in 2003, provides old age, disability, and survivorship benefits. The pension plan is funded by contributions from both employers and employees. The retirement varies depending on years of insurance; retirement from insured employment is necessary. Each Republic provides its own

system for sickness and maternity benefits. Medical services are provided directly to patients through government facilities. Workers' compensation, unemployment benefits, and family allowances are also available. Family allowances vary according to the number of children in the family are adjusted periodically for cost of living changes.

Traditional gender roles keep women from enjoying equal status with men and few occupy positions of leadership in the private sector. However, women are active in human rights and political organizations. High levels of domestic abuse persist and social pressures prevent women from obtaining protection against abusers.

The government's human rights record remains poor and is additionally marred by the crisis in Kosovo, where police are responsible for beatings, rape, torture, and killings, committed with impunity. In May 1999, the International Criminal Tribunal for the former Yugoslavia in The Hague indicted Yugoslavian president Slobodan Milosevic for war crimes against the citizens of Kosovo. Milosevic was brought to trial at The Hague in 2002 for war crimes and crimes against humanity in Kosovo and Croatia, and for war crimes, crimes against humanity, and genocide in Bosnia and Herzegovina; in March 2006 Milosevic died in prison before a verdict could be decided.

### 41 HEALTH

The government provides obligatory health care to citizens for preventive, diagnostic, therapeutic, and rehabilitative services. There were 228 health institutions and about 3,000 other clinics, mostly private in Serbia and Montenegro in the mid-2000s. As of 2004, there were an estimated 20 physicians per 100,000 people. The University Clinical Center in Belgrade conducts about nine million examinations and 46,000 emergency operations per year and functions as one of the World Health Organization's largest diagnostic and referral centers.

In 2005 infant mortality in the union of Serbia and Montenegro was reported at 15.53 per 1,000 live births. Overall mortality was 9.7 per 1,000 people in the Republic of Serbia. Average life expectancy in 2005 in the union was 74.73 years.

The HIV/AIDS prevalence was 0.20 per 100 adults in 2003 in the union of Serbia and Montenegro. As of 2004, there were approximately 10,000 people living with HIV/AIDS in the country. There were an estimated 100 deaths from AIDS in 2003.

### 42 HOUSING

At the beginning of 1996, the former Yugoslavia had 3,124,000 dwellings, with an average of 3.4 persons per dwelling. Housing area at that time averaged 20 sq m (215 sq ft) per person. New housing completions during 1995 totaled 14,337 units, of which 11,847 were in the public sector, and 2,490 were in the private sector. According to a 1999 assessment, it was estimated that about 120,000 dwellings were damaged or destroyed in Kosovo due to internal conflicts. About 50,000 homes had been damaged in Serbia. Overcrowding, particularly in urban areas, has become more of a problem as Serbian refugees have returned from Croatia and Bosnia and Herzegovina. In 2002, the nation counted about 2,790,411 households with an average of 2.89 people per household.

### 4<sup>3</sup> EDUCATION

As of 2005/2006, education was compulsory for nine years of primary school. This may be followed by three years of secondary school, with students having the option to attend general, vocational, or art schools. The academic year runs from October to July. In 2001, about 43% of children between the ages of three and six in the union of Serbia and Montenegro were enrolled in some type of preschool program. Primary school enrollment in 2001 was estimated at about 96% of age-eligible students. The same year, secondary school enrollment was about 82% of age-eligible students. It is estimated that about 96% of all students complete their primary education. The student-to-teacher ratio for primary school was at about 20:1 in 2000; the ratio for secondary school was about 14:1.

Serbia has six universities (at Belgrade, Novi Sad, Pristina, Nis, and Kragujevac) with 76 academic departments. In 2001, it was estimated that about 36% of the tertiary age population in the union of Serbia and Montenegro were enrolled in tertiary education programs. The adult literacy rate for 2004 was estimated at about 96.4%.

As of 2003, public expenditure on education was estimated at 3.3% of GDP.

### 4<sup>4</sup> LIBRARIES AND MUSEUMS

The National Library of Serbia (1.6 million volumes) is in Belgrade. The Matica Srpska Library has over 3 million volumes in holdings. The Serbian Academy of Arts and Sciences in Belgrade has about one million volumes and the library system at the University of Belgrade has 1.45 million volumes. The Belgrade City Library is the largest public lending library system in the country; the network contains 14 branches and over 1.7 million items in collection.

Serbia has over 2,500 cultural monuments, including about 100 museums and 37 historical archives libraries. The Belgrade National Museum, founded in 1844, includes exhibits featuring national history, archaeology, medieval frescoes, and works by Yugoslavian and other European artists. Belgrade also has the Museum of Modern Art, the Museum of the Serbian Orthodox Church, the Museum of Natural History, and the Museum of Science and Technology, which opened in 1989.

### 4<sup>5</sup> MEDIA

In 2003, there were an estimated 243 mainline telephones for every 1,000 people in the union of Serbia and Montenegro; about 313,500 people were on a waiting list for telephone service installation. The same year, there were approximately 338 mobile phones in use for every 1,000 people. PTT Serbia is the monopoly owner/operator of Serbia's telecom network. There are 2.2 million installed fixed lines (700,000 are duplex shared lines) in the republic.

In Serbia and Montenegro, only the RTS television network was owned by the state; the other six (BK, TV Studio Spectrum Čačak, Kanal 9 Kragujevac, Pink, Palma, and Art Kanal) are privately owned. The ownership and editorial positions of television and radio stations usually reflects regional politics. Government control over independent broadcasts and the print media has discouraged political opposition parties that have called for greater democracy

and a more open economy. In 2004, Serbia and Montenegro had about 297 radios and 282 television sets for every 1,000 people. The same year, there were 27.1 personal computers for every 1,000 people and 79 of every 1,000 people had access to the Internet. There were nine secure Internet servers in the country in 2004.

In 1791, the first Serbian-language newspaper was published in Vienna, Austria. Privately owned newspapers are sometimes critical of the government. The dailies with the largest circulation (as of 2002) are *Politika* (Politics, 300,000) and *Vecernje Novosti* (Evening News, 169,000). Other newspapers that are essentially controlled by the government, include (with 2002 circulation) *Borba* (85,000), *Jedinstvo* (6,090), *Dnevnik* (61,000), and *Pobjeda* (19,400). There are several minority language newspapers.

While the government provides for freedom of speech and of the press, libel suits have been fairly prevalent and some media sources have practiced self-censorship in order to avoid problems with government officials.

### 4<sup>6</sup> ORGANIZATIONS

The Chamber of Commerce and Economy of Serbia is located in Belgrade.

The Matica Srpska was founded in Novi Sad in 1824 as a literary and cultural society. The Serbian Academy of Science and Art was founded in Belgrade in 1886. There are several organizations for professional journalists, including the Journalists' Federation of Yugoslavia, the Journalists' Association of Serbia, Independent Journalists' Association, and the Association of Private Owners of the Media.

National youth organizations include the Bureau of International Cooperation of Youth of Serbia, Union of Socialist Youth of Yugoslavia, and the Junior Chamber. Scouting organizations are also active. The Child Rights Centre and Child to Child are national groups working to promote the rights of children and youth. Creative Youth of Novi Sad offers a variety of educational, volunteer, and development programs for youth as well. There are a variety of sports associations available promoting amateur competition among athletes of all ages. There are active chapters of the Paralympic Committee, as well as a national Olympic Committee. There is a national chapter of the Red Cross Society.

### 4<sup>7</sup> TOURISM, TRAVEL, AND RECREATION

Rich architecture, museums, galleries, cathedrals, parks, and rivers, are just some of the attractions that bring visitors to Serbia. The largest two of Serbia's five national parks are Djerdap (64,000 ha/158,000 acres) and Sar planina (39,000 ha/96,000 acres). Serbia has dozens of spa resorts such as Vrnjacka Banja, Mataruska Banja, and Niska Banja. Serbia has three UNESCO heritage sites. Popular sports in Serbia are rafting, hunting, fishing, skiing, and cycling.

All visitors need a valid passport to enter Serbia. Serbia requires an onward/return ticket, sufficient funds for the stay, and a certificate showing funds for health care. Visas are required for all nationals except those of 41 countries including the United States, Australia, and Canada.

In 2003, about 1.4 million tourists arrived in Serbia and Montenegro, of whom 93% came from Europe. Hotel rooms numbered 2,435 with 4,926 beds and an occupancy rate of 46%

According to 2005 US Department of State estimates, the cost of staying in Belgrade was \$340 per day. The daily costs elsewhere in the country averaged \$157.

#### 48 FAMOUS SERBS

Sava Rastko Nemanjić (c.1174–1235) was the first Serbian archbishop and a writer who became one of Serbia's most prominent figures of the Middle Ages. Vuk Stefanović Karadžić (1787–1864) reformed the Serbian language by clarifying grammar, standardizing the spelling, and compiling a dictionary. Dositej Obradović (1742–1811) was a famous writer, philosopher, and teacher.

Djordje Petrović Karadjordje (1768–1817) led a rebellion against the Turks in 1804. Zivojin Misić (1855–1921) was a distinguished military leader during World War I. Prince Miloš Obrenović (r.1815–1839) founded the Obrenović dynasty and ruled Serbia as an absolute monarch. King Alexander of Yugoslavia (1888–1934) was assassinated in Marseille, France. Prince Paul of Yugoslavia (1893–1976) ruled as a regent for Peter II (1923–70) from 1934 to 1941 and was forced into exile after signing a secret pact with the Nazi government.

Slobodan Milošević (1941–2006) was elected president of Serbia in 1990 and 1992 before being elected president of Yugoslavia in July 1997. He came before the UN's International Criminal Tribunal for the Former Yugoslavia in 2002 for genocide, crimes against humanity, and war crimes, and died of a heart attack in his cell just months before the trial was due to end.

Ibrahim Rugova (1944–2006) was president of Kosovo and its leading political party, the Democratic League of Kosovo (LDK). During the many conflicts in Kosovo, Rugova was regarded as a moderate ethnic Albanian leader, and later by some as "Father of the Nation."

Ivo Andrić (1892–1975) received the Nobel Prize for Literature in 1961. Danilo Kiš (1935–89) established his reputation with his work *A Tomb for Boris Davidovich* (1976). Other notable Serbian authors include Meša Selimović, Miloš Crnjanski, Milorad Pavić, Dobrica Ćosić and David Albahari. Anastas Jovanović (1817–99) was a pioneering photographer. Kirilo Kutlik set up the first school of art in Serbia in 1895. Nadežda Petrović (1873–1915) was influenced by Fauvism while Suva Šumanović worked in Cubism. Other Serbian artists include Milan Konjović, Marko Čelebonović, Petar Lubarda, Milo Milunović, and Vladimir Veličković.

#### 49 DEPENDENCIES

Serbia has no dependencies or territories.

# SLOVAKIA

Slovak Republic  
*Slovenska Republika*

**CAPITAL:** Bratislava

**FLAG:** Horizontal bands of white (top), blue, and red superimposed with a crest of a white double cross on three blue mountains.

**ANTHEM:** *Nad Tatru sa blyska (Over Tatra it lightens).*

**MONETARY UNIT:** The currency of the Slovak Republic is the Slovak koruna (SK) consisting of 100 hellers, which replaced the Czechoslovak Koruna (KCS) on 8 February 1993. There are coins of 10, 20, and 50 hellers and 1, 2, 5, and 10 korun, and notes of 20, 50, 100, 500, 1,000, and 5,000 korun. SK1 = \$0.03333 (or \$1 = SK30) as of 2005.

**WEIGHTS AND MEASURES:** The metric system is the legal standard.

**HOLIDAYS:** New Year's Day, 1 January; May Day, 1 May; Anniversary of Liberation, 8 May; Day of the Slav Apostles, 5 July; Anniversary of the Slovak National Uprising, 29 August; Reconciliation Day, 1 November; Christmas, 24–26 December. Movable holiday is Easter Monday.

**TIME:** 1 PM = noon GMT.

## <sup>1</sup>LOCATION, SIZE, AND EXTENT

Slovakia is a landlocked country located in Eastern Europe. Comparatively, it is about twice the size of the state of New Hampshire with a total area of 48,845 sq km (18,859 sq mi). Slovakia shares boundaries with Poland on the N, Ukraine on the E, Hungary on the S, and Austria and the Czech Republic on the W, and has a total boundary length of 1,355 km (842 mi). Slovakia's capital city, Bratislava, is located on the southwestern border of the country.

## <sup>2</sup>TOPOGRAPHY

The topography of Slovakia features rugged mountains in the central and northern part of the country, and lowlands in the south. The High Tatras (Tatry) mountains along the Polish border are interspersed between many lakes and deep valleys. The highest peak in the country, Gerlachovský štít, is found in the High Tatras with an elevation of 2,655 m (8,711 ft). Bratislava is situated in Slovakia's only substantial region of plains, where the Danube River forms part of the border with Hungary.

## <sup>3</sup>CLIMATE

Slovakia's climate is continental, with hot summers and cold winters. In July the mean temperature is 21°C (70°F). January's mean temperature is -1°C (30°F). Rainfall averages roughly 49 cm (19.3 in) a year and can exceed 200 cm (80 in) annually in the High Tatras.

## <sup>4</sup>FLORA AND FAUNA

Some original steppe grassland areas can be found in the southwestern lowland region, where marsh grasses and reeds are also abundant. While oak is a primary tree found in the lowlands, beech, spruce, pine, and mountain maple are found on mountain

slopes. Alpine meadows include carnations, glacial gentians, and edelweiss. The High Tatras support the growth of many types of moss, lichens, and fungi. Mammals found in the country include fox, rabbits, and wild pig. A wide variety of birds inhabit the valleys of Slovakia. Carp, pike, and trout are found in the country's rivers, lakes, and streams. As of 2002, there were at least 85 species of mammals, 199 species of birds, and over 3,100 species of plants throughout the country.

## <sup>5</sup>ENVIRONMENT

Like the Czech Republic, Slovakia has had its air contaminated by sulfur dioxide emissions resulting from the use of lignite as an energy source by the former Czechoslovakia, which once had the highest levels of sulfur dioxide emissions in Europe. Slovakia instituted a program to reduce pollution in the late 1980s. Air pollution by metallurgical plants endangers human health as well as the environment, and lung cancer is prevalent in areas with the highest pollution levels. Airborne emissions in the form of acid rain, combined with air pollution from Poland and the former German Democratic Republic, have damaged Slovakia's forests. Land erosion caused by agricultural and mining practices is also a significant problem.

There are 13 Ramsar wetland sites in the country and 2 natural UNESCO World Heritage sites. According to a 2006 report issued by the International Union for Conservation of Nature and Natural Resources (IUCN), threatened species included 7 types of mammals, 11 species of birds, 1 type of reptiles, 8 species of fish, 6 types of mollusks, 13 species of other invertebrates, and 2 species of plants. Threatened species include the Danube salmon, marsh snail, and false ringlet butterfly.

## 6 POPULATION

The population of Slovakia in 2005 was estimated by the United Nations (UN) at 5,382,000, which placed it at number 109 in population among the 193 nations of the world. In 2005, approximately 12% of the population was over 65 years of age, with another 18% of the population under 15 years of age. There were 94 males for every 100 females in the country. According to the UN, the annual population rate of change for 2005–10 was expected to be stagnant at 0.0%, a rate the government viewed as too low. The projected population for the year 2025 was 5,237,000. The overall population density was 110 per sq km (284 per sq mi), with the highest density concentrated in the river valleys.

The UN estimated that 56% of the population lived in urban areas in 2005, and that urban areas were growing at an annual rate of 0.57%. The capital city, Bratislava, had a population of 425,000 in that year. Košice had a population of 242,066.

## 7 MIGRATION

Slovakia receives about 400 refugees every year. In April 1999 Slovakia granted temporary protection to 90 refugees from Kosovo. Of these, 70 left Slovakia in July 1999 and returned home. In 2004, Slovakia had 409 refugees, and maintained higher numbers of asylum seekers, including 2,916 from India, China, Russia, and Armenia. In 2005, the net migration rate was an estimated 0.3 migrants per 1,000 population.

## 8 ETHNIC GROUPS

The population is about 85.8% Slovak according to the latest census (2001). Hungarians, heavily concentrated in southern border areas, total 10.6%. While the census reported that Roma make up about 1.6% of the populace, unofficial estimates place the number at about 7%. Czechs, Ruthenians, Ukrainians, Germans, Poles, and various other groups account for the remainder.

## 9 LANGUAGES

Slovak is the official language, spoken by about 83.8% of the population. It belongs to the western Slavic group and is written in the Roman alphabet. There are only slight differences between Slovak and Czech, and the two are mutually intelligible. Slovak lacks the *ě*, *ů*, and *ř* in Czech but adds *ä*, *ľ*, *ô*, and *í*. As in Czech, *q*, *w*, and *x* are found only in foreign words. A minority language like Hungarian may be used for official business if its speakers make up at least 20% of the population on the local level.

## 10 RELIGIONS

The Slovak Republic has been a strongly Catholic region, even during the period of communist repression of religion from 1944–89. According to the 2001 census, about 69% of the population were Roman Catholics. About 7% of the population were Augsburg Lutheran, 4% were Byzantine Catholics, 2% were members of the Reformed Christian Church, and 1% were Orthodox. Other registered groups include Jehovah's Witnesses, Baptists, Brethren Church members, Seventh-Day Adventists, Apostolic Church members, Evangelical Methodists, and members of the Christian Corps in Slovakia and the Czechoslovak Hussite Church. There

are small communities of Muslims and Jews. About 12% of the population claimed no religious affiliation.

There are about 30 unregistered groups in the country, including: Hare Krishnas, Shambaola Slovakia, Shri Chinmoy, Zazen International Slovakia, Zen Centermyo Sahn Sah, the Church of Scientology, the Baha'i Faith, the Society of Friends of Jesus Christ (Quaker), Nazarenes, and the Church of Jesus Christ of Latter-day Saints (Mormon).

The constitution provides for freedom of religion and this right is generally respected in practice. While there is no specific state religion, the government signed an international treaty with the Vatican in 2001 which creates a special relationship between the state and the Roman Catholic Church. Though the government has signed special agreements with at least 11 other religious groups within the country, these agreements are subject to national law, while the Vatican agreement is governed by international law, making the latter more difficult to amend. The government offers subsidies to registered religious groups based on the number of clergy within the organization. Since the Catholic Church is the predominant religion, this church receives the largest amount of money.

## 11 TRANSPORTATION

There were some 3,662 km (2,277 mi) of broad, standard and narrow gauge railroads in 2004, primarily consisting of the Bratislava-Koice route. Of that total, standard gauge railways predominated at 3,512 km (2,184 mi), followed by 100 km (62 mi) of broad gauge.

The road system totaled 42,970 km (26,727 mi) in 2002, of which 37,698 km (23,448 mi) were paved, including 302 km (188 mi) of expressways. In 2003, there were 1,356,185 passenger cars and 161,559 commercial vehicles registered for use.

As an inland country, Slovakia relies on the Danube, 172 km (45 mi), for transportation of goods. Bratislava and Komárno are the major ports on the Danube, which connects with the European waterway system to Rotterdam and the Black Sea. In 2005, Slovakia's merchant fleet was comprised of 24 ships of 1,000 GRT or more, totaling 41,891 GRT.

Slovakia had an estimated 34 airports in 2004. As of 2005 a total of 17 had paved runways, and there was also a single heliport. Air service in Slovakia is conducted primarily through M.R. Stefanik Airport at Bratislava. In 2003, about 208,000 passengers were carried on scheduled domestic and international airline flights.

## 12 HISTORY

The first known peoples of the territory of present-day Slovakia were Celts, who lived in the region about 50 BC. The Celts were pushed out by Slavs, who moved in from the east at the beginning of the modern era. A Frankish merchant named Samo formed the first unified state in the region in the mid-7th century. The Moravia Empire appeared in the 9th century, incorporating parts of present-day Slovakia. Although the first Christian missionaries active in the area were Orthodox (including the monks Cyril and Methodius, who introduced an alphabet of their own invention—still called Cyrillic—in which to write the Slavic languages), it was the Roman church that eventually established dominance. At the end of the 9th century the Magyars (Hungarians) began to move into Slovakia, incorporating the territory into their own.

LOCATION: 47°44' to 49°37' N; 16°51' to 22°34' E. BOUNDARY LENGTHS: Total boundary lengths, 1,355 kilometers (842 miles); Austria, 91 kilometers (57 miles); Czech Republic, 215 kilometers (134 miles); Hungary, 515 kilometers (320 miles); Poland, 444 kilometers (275 miles); Ukraine, 90 kilometers (56 miles).

For many centuries the Hungarians treated the Slovaks as subject people, so it was not until the 13th century, when Hungary had been ravished by Tatar invasions, that the territory began to develop. Some contact with the Czechs, who speak a closely related language, began in the early 15th century, as refugees from the Hussite religious wars in Bohemia moved east.

After the Turkish victory at Mohacs in 1526 the Kingdom of Hungary was divided into three parts; so-called "Royal Hungary," which included Slovakia, was passed to the rule of the Hapsburg dynasty. Bratislava became the Hapsburg capital until the end of the 17th century, when the Turks were driven from Hungarian territory, and the Hungarian capital moved to Budapest. Although there was some religious spillover of Protestantism from the west, Slovakia was solidly in control of the Catholic Counter-Reformation, establishing the long tradition of strong church influence in the region.

In the late 18th century the attempt of the Hapsburg rulers, especially Josef II (1765–1790), to germanify the empire led to a rise in Hungarian nationalism, which in turn stimulated a rise in Slovak national self-consciousness. During the 1848 Revolution a program, "Demands of the Slovak Nation," was formulated, which called for the use of Slovak in schools, courts, and other settings, and demanded creation of a Slovak assembly. These demands were rejected, and the Hungarians continued their efforts to suppress Slovak nationalism. When the Austro-Hungarian Empire was

formed in 1867, the Hungarians began a program of intense Magyarification. In the absence of a Slovak intellectual elite, nationalistic ideals were largely maintained by the local clergy.

When World War I began the Slovaks joined with the Czechs and other suppressed nationalities of the Austro-Hungarian Empire in pushing for their own state. Czech and Slovak immigrants in America were united in their efforts to prod the United States to recognize a postwar combined Czech and Slovak state. The Czechs declared independence on 28 October 1918, and the Slovaks seceded from Hungary two days later, to create the Czecho-Slovak Republic.

The relationship between the two parts of the new state was never firmly fixed. The Czech lands were more developed economically, and Czech politicians dominated the political debate. Although they were supported by a portion of Slovak society, there remained a large constituency of Slovak nationalists, most of them in Jozef Tiso's People's Party, who wanted complete independence.

Attempts to deal with Slovak separatist sentiments occupied a good deal of legislative time during the first Czechoslovak Republic, particularly since economic development continued to favor the Czech lands over the Slovak.

In 1938 Adolph Hitler demanded that the Sudeten German area, in the Czech part of the country, be ceded to Germany. Representatives of Germany, Italy, France, and the United Kingdom met

in Munich, without participation by Czechoslovakia, and decided that in order to achieve “peace in our time” Germany could occupy the Sudetenland, which it did in October 1938. Slovak nationalists argued that once the dismemberment of Czechoslovakia had begun, they too should secede, particularly because both Poland and Hungary also took advantage of the situation to seize parts of Slovakia. When Hitler’s forces seized Prague in March 1939, a separate Slovak state was declared, which immediately fell under Nazi domination. Although nominally independent, the Slovakia of President Tiso was never more than a Nazi puppet.

During the war Slovak leaders like Stefan Osusky and Juraj Slavik cooperated with E. Benes’ Czechoslovak government-in-exile, headquartered in London. There was also a small group of Slovak communists who took refuge in Moscow. In December 1943 a Slovak National Council was formed in opposition to the Tiso government, with both democratic and communist members. They began an uprising in Banska Bystrica in August 1944, which failed because of lack of support by both the West and the Soviet Union. When the war ended, the Slovak National Council took control of the country. Soviet attempts to use Slovak nationalism as a tool of control failed in the 1946 elections, when noncommunist parties received 63% of the vote. The communists switched their tactics to encouraging civil disorder and arresting people accused of participation in the wartime Slovak government. Tiso himself was executed in 1947.

Elsewhere in Czechoslovakia, the communists had been the largest vote getters in the 1946 elections, but in 1948 it seemed that they might lose. Rather than risk the election, they organized a Soviet-backed coup, forcing President Benes to accept a government headed by Klement Gottwald, a communist. Benes resigned in June 1948, leaving the presidency open for Gottwald, while A. Zapotocky became prime minister.

Once Czechoslovakia became a People’s Republic, and a faithful ally of the Soviet Union, a wave of purges and arrests rolled over the country, from 1949 to 1954. In 1952 a number of high officials, including Foreign Minister V. Clementis and R. Slansky, head of the Czech Communist Party, were hanged for “Tito-ism” and “national deviation.”

Gottwald died in March 1953, a few days after Stalin, setting off the slow erosion of communist control. Zapotocky succeeded to the presidency, while A. Novotny became head of the party; neither had Gottwald’s authority, and so clung even more tightly to the Stalinist methods, which, after Nikita Khrushchev’s secret denunciation of Stalin in 1956, had begun to be discredited even in the USSR. Novotny became president upon Zapotocky’s death in 1957, holding Czechoslovakia in a tight grip until well into the 1960s.

Khrushchev’s liberalization in the USSR encouraged liberals within the Czechoslovak party to try to emulate Moscow. Past abuses of the party, including the hanging of Slansky and Clementis, were repudiated, and Novotny was eventually forced to fire many of his most conservative allies, including Karol Bacilek, head of the Slovak Communist Party, and Viliam Siroky, premier for more than a decade. Slovaks detested both men because of their submission to Prague’s continued policies of centralization, which in practice subordinated Slovak interests to those of the Czechs.

Alexander Dubček, the new head of the Slovak Communist Party, attacked Novotny at a meeting in late 1967, accusing him

of undermining economic reform and ignoring Slovak demands for greater self-government. Two months later, in January 1968, the presidency was separated from the party chairmanship, and Dubček was named head of the Czechoslovak Communist Party, the first Slovak ever to hold the post.

Novotny resigned in March 1968, and Czechoslovakia embarked on a radical liberalization, which Dubček termed “socialism with a human face.” The leaders of the other eastern bloc nations and the Soviet leaders viewed these developments with alarm. Delegations went back and forth from Moscow during the “Prague Spring” of 1968, warning of “counter-revolution.” By July the neighbors’ alarm had grown; at a meeting in Warsaw they issued a warning to Czechoslovakia against leaving the socialist camp. Although Dubček himself traveled to Moscow twice, in July and early August, to reassure Soviet party leader Brezhnev, the Soviets remained unconvinced.

Finally, on the night of 20–21 August 1968, military units from all the Warsaw Pact nations except Romania invaded Czechoslovakia, to “save it from counter-revolution.” Dubček and other officials were arrested, and the country was placed under Soviet control. Difficulties in finding local officials willing to act as Soviet puppets caused the Soviets to play on Czech and Slovak antagonisms. On 31 December 1968 the country was made into a federative state, comprised of the Czech Socialist Republic and the Slovak Socialist Republic, each with its own legislature and government. In April Gustav Husak, once a reformer, but now viewing harmony with the USSR as the highest priority, was named head of the Czech Communist Party. A purge of liberals followed, and in May 1970 a new Soviet-Czechoslovak friendship treaty was signed; in June Dubček was expelled from the party.

Between 1970 and 1975 nearly one-third of the party was dismissed, as Husak consolidated power, re-establishing the priority of the federal government over its constituent parts and, in May 1975, reuniting the titles of party head and republic president.

Once again it was liberalization in the USSR which set off political change in Czechoslovakia. Husak ignored Soviet leader Mikhail Gorbachev’s calls for perestroika and glasnost until 1987, when he reluctantly endorsed the general concept of Party reform, but delayed implementation until 1991. Aging and in ill health, Husak announced his retirement in December 1987, declaring that Milos Jakes would take his post; Jakes had been a life-long compromiser and accommodator who was unable to control dissenting factions within his party, which were now using the radical changes in the Soviet Union as weapons against one another.

Enthusiasm for political change was not as great in Slovakia as it was in the Czech west, where in November 1989 people had begun to gather on Prague’s Wenceslas Square, demanding free elections. The so-called “velvet revolution” ended on 24 November, when Jakes and all his government resigned. Novotny resigned his presidency soon after.

Alexander Dubček was brought out of exile and put forward as a potential replacement, but the hostility of Czech intellectuals and activists, who felt that they had to drag unwilling Slovaks into the new era, made it impossible to choose a Slovak as president. The choice fell instead on Vaclav Havel, a Czech playwright and dissident, who was named president by acclamation on 29 December 1989, while Dubček was named leader of the National Assembly.

Dismantling the apparatus of a Soviet-style state began immediately, but economic change came more slowly, in part because elections were not scheduled until June 1990. The old struggle between Czechs and Slovaks intensified, as Slovaks grew increasingly to resist the programs of economic and political change being proposed in Prague. Slovak demands led to an almost immediate renaming of the country, as the Czech and Slovak Federal Republic.

In the June elections the Slovaks voted overwhelmingly for Public Against Violence, the Slovak partner of the Czech Civic Forum, which meant that economic transformation was begun. Again there was much greater enthusiasm for returning to private ownership in the west than there was in the east, intensifying Slovak separatism. In December 1990 the country's Federal Assembly attempted to defuse the problem by increasing the roles of the Czech and Slovak regional governments, but it also gave President Havel extraordinary powers, to head off attempts at Slovak secession. The nationalists found an articulate and persuasive voice for growing separatist sentiments in Vladimir Meciar, the Slovak premier.

During a visit to Bratislava in March 1991, President Havel was jeered by thousands of Slovaks, making obvious the degree of Slovak discontent. Meciar was replaced in April 1991, by Jan Carnogursky, but the easing of tensions was only temporary, since Carnogursky, too, favored an independent Slovakia.

By June 1992 matters had reached a legislative impasse, so new federal elections were called. Slovakia chose to hold elections for its National Council at the same time. In July the new Slovak legislature issued a declaration of sovereignty and adopted a new constitution as an independent state, to take effect 1 January 1993. Throughout 1991 and 1992 a struggle followed, with the Federal Assembly and president on one side, trying to devise ways of increasing the strength of the federal state, and the Czech and Slovak National Councils, or legislatures, on the other, seeking to shore up their own autonomy at the expense of the central authorities. Although polls indicated that most Slovaks continued to favor some form of union with the Czechs, the absence of any national figure able or willing to articulate what form that union might take, left the field to the separatists and the charismatic Meciar.

In the federal election the vote split along national and regional lines, with the Czechs voting for right-of-center, reformist candidates, especially Vaclav Klaus's Civic Democratic Party, while the Slovaks voted for leftist and nationalist parties, especially Vladimir Meciar's Movement for a Democratic Slovakia (MDS). Although the federal government and President Havel continued to try to hold the state together, Czech Prime Minister Klaus made it clear that the Czechs would offer no financial incentives or assistance to induce the Slovaks to remain in the union. Increasingly the republics began to behave as though they were already separate so that, for example, by the end of 1992, 25.2% of Czech industry had been privatized, while only 5.3% of Slovak industry had. By the end of 1992 it was obvious that separation was inevitable. The two prime ministers, Klaus and Meciar, agreed to the so-called "velvet divorce," which took effect 1 January 1993. Czechs and Slovaks alike have objected that this move was never put to a popular referendum.

The new constitution created a 150-seat National Assembly, which elects the head of state, the president. Despite the strong

showing of his party, Prime Minister Meciar was unable to get his first candidate through, and so put up Michal Kovac, a Dubček supporter and former finance minister in Slovakia, who had served as the last chairman of Czechoslovakia's federal parliament.

The Meciar government rejected the moves toward political and economic liberalization which the Czechs were pursuing, attempting instead to retain a socialist-style government, with strong central control. Swift economic decline, especially relative to the Czech's obviously growing prosperity, combined with Meciar's own erratic and autocratic manner, caused him to lose a vote of no-confidence in March 1994.

Kovac was elected for a five-year term by the National Parliament on 8 February 1993; on 12 December 1994 he appointed Meciar prime minister. Meciar's party (MDS), which won 35% of the vote in the 1994 elections, formed a ruling government with the Slovak National Party and the Association of Slovak Workers. However, Meciar again was slow to implement economic reforms, and his attempts to consolidate his power via undemocratic legislation were rebuffed in 1996 by President Kovac. The MDS-led coalition government managed to remain in power until the September 1998 elections. During the MDS era, opportunities to privatize state-owned property were used to reward political loyalty, and election laws were changed in a way that favored the MDS. Much of the legislation introduced by the Meciar government was found to be unconstitutional.

Under the new election laws, the Slovak Democratic Coalition (SDC) was formed by five small political groups in 1997. Mikulas Dzurinda was its leader. Elections held in September 1998 saw the SDC gain 26.33% of the vote. On 30 October 1998, SDC formed a coalition government with Dzurinda as prime minister.

In January 1999, parliament passed a new law allowing for the direct election of the president. Presidential elections were held on 15 and 29 May, and in the second round, Rudolf Schuster of the small centrist Party of Civic Understanding (SOP) was elected with 57.2% of the vote over Meciar (42.8%). The Organization for Security and Cooperation in Europe (OSCE) found the elections to be free and fair. In July 1999, a law was passed improving the status of minority languages. In February 2001, parliament amended the constitution as a step toward gaining membership in the EU and NATO. Among the 85 amendments bringing the 1992 constitution in line with EU judiciary and financial standards were the creation of an ombudsman as a public protector of human rights, and an initiative to have the government support the aspirations of ethnic Slovaks living abroad to preserve their national identity and culture.

Parliamentary elections were held on 20 and 21 September 2002, and although Meciar's HZDS party won the most seats in the 150-member National Council (36), three core center-right parties formed a coalition without left-wing parties that had previously hampered it. Dzurinda continued in office as prime minister.

At a NATO summit in Prague held in November 2002, Slovakia was formally invited to join the organization, and in December, it was one of 10 new countries invited to join the EU. In the spring of 2004, it became member of both these organizations. Also, in April 2004, a new president was elected, Ivan Gasparovic. Although in the first voting round Gasparovic received less votes than his main contestant—Meciar—he managed to rally the support of the other

presidential candidates in the second round, taking 59.9% of the vote. In May 2005, Slovakia ratified the EU constitution.

### **13 GOVERNMENT**

The constitution that the Slovak National Assembly adopted in July 1992 calls for a unicameral legislature of 150 members (the National Council of the Slovak Republic). Voting is by party slate, with proportional seat allotment affecting the gains of the winner. Thus, in the 1994 election, Meciar's party gained 61 of the 150 seats, with only 35% of the popular vote. In the 2002 election, Meciar's party gained 36 seats in the National Council, with 19.5% of the vote. The government is formed by the leading party, or coalition of parties, and the prime minister is head of the government. A coalition of center-right parties formed the government in 2002. Head of state is the president, who, after 1999, was directly elected by popular vote for a five-year term. A cabinet is appointed by the president on the recommendation of the prime minister. Rudolf Schuster was Slovakia's first directly elected president; Ivan Gasparovic was elected president in 2004, defeating Meciar in the second round of voting. The next presidential election was to be held April 2009.

### **14 POLITICAL PARTIES**

There were 18 parties contesting the 150 seats of the National Council in the 1994 election, but only 7 or 8 were considered to be serious contenders, because of the necessity of receiving 5% of the total vote in order to take a seat. In 2002, there were 7 parties that won seats in the National Council. The single most popular party in 1994 was the Movement for a Democratic Slovakia (HZDS), which won 35% of the vote. By 2002, HZDS won just 19.5% of the vote and 36 seats; although it won the most votes it was unable to form a government. Prime Minister Mikulas Dzurinda headed a coalition consisting of the Slovak Democratic and Christian Union (SDKU) with 15.1% of the vote and 28 seats; the Party of the Hungarian Coalition (SMK) with 11.2% of the vote and 20 seats; the Christian Democratic Movement (KDH) with 8.3% of the vote and 15 seats; and the Alliance of a New Citizen (ANO) with 8% of the vote and 15 seats. Also winning seats in parliament were the populist Smer Party (Party Direction—Third Way) with 13.5% of the vote and 25 seats, and the Slovak Communist Party with 6.3% of the vote and 11 seats. The next legislative elections were to be held September 2006.

### **15 LOCAL GOVERNMENT**

Slovakia is currently divided into 79 districts and 8 regions (*kraje*), and each region has a parliament and governor. In February 2001, in an effort to speed up Slovakia's EU accession process, the parliament implemented a series of constitutional changes aimed at decentralizing the country's power structure. Thus, the state audit office, the judiciary, and the minorities gain in independence and authority. In January 2002, Slovakia was divided into eight Upper-Tier Territorial Units—self-governing entities, named after their principal city. These changes responded to one of EU's key

requirements for increased decentralization and flexibility of the administrative apparatus.

### **16 JUDICIAL SYSTEM**

The judicial system consists of a republic-level Supreme Court as the highest court of appeal; 8 regional courts seated in regional capitals; and 55 local courts seated in some district capitals. The courts have begun to form specialized sections, including commercial, civil, and criminal branches.

The 13-member Constitutional Court reviews the constitutionality of laws as well as the constitutional questions of lower level courts and national and local government bodies. Until 2002, parliament nominated and the president appointed the Constitutional Court and Supreme Court judges, and parliament chose all other judges based on the recommendations from the Ministry of Justice. In 2002, however, parliament passed legislation creating a Judicial Council, composed of judges, law professors, and other legal experts, to nominate judges. All judges except those of the Constitutional Court are now appointed by the president from a list proposed by the 18-member Council. The president still appoints the Constitutional Court judges from a slate of candidates nominated by parliament.

The constitution declares the independence of the judiciary from the other branches of government. Judges are appointed for life, but Constitutional Court judges serve seven-year terms. There is also a military court system, and appeals may be taken to the Supreme Court and the Constitutional Court. Defendants in criminal cases have the right to free legal counsel and are guaranteed a fair and open public trial.

### **17 ARMED FORCES**

In 2005 the total active armed forces of Slovakia numbered 20,195, with estimated reserves numbering 20,000. The Army had 12,860 active personnel, armed with 271 main battle tanks, 291 reconnaissance vehicles, 404 armored infantry fighting vehicles, 120 armored personnel carriers, and 374 artillery pieces. Air Force personnel totaled 5,160, equipped with 71 combat capable aircraft and 19 attack helicopters. As of 2005, there were 4,700 members in paramilitary units, including border police, guard troops, civil defense troops, and railway defense troops. Slovak armed forces in 2005 were deployed to eight countries or regions as part of NATO, European Union or UN missions. The defense budget for 2005 was \$828 million.

### **18 INTERNATIONAL COOPERATION**

Slovakia is a member of the United Nations, which it joined in 1993 when Czechoslovakia agreed to split into two parts. Slovakia serves on several nonregional specialized agencies, such as the FAO, UNESCO, UNIDO, the World Bank, ILO, and the WHO. The country is also a member of the Council of Europe, the European Bank for Reconstruction and Development, the OECD, OSCE, the Euro-Atlantic Partnership Council, and the WTO. Slovakia became an official member of NATO and the European Union in 2004. The country has observer status in the OAS and is an affiliate member of the Western European Union.

The government has actively participated in US- and NATO-led military actions in Iraq and Afghanistan. The country also participates in a joint Czech-Slovak peacekeeping force in Kosovo and

supports UN missions and operations in Sierra Leone (est. 1999) and Cyprus (est. 1964).

Slovakia serves on the Australia Group, the Zangger Committee, the European Organization for Nuclear Research (CERN), the Nuclear Energy Agency, the Nuclear Suppliers Group (London Group), and the Organization for the Prohibition of Chemical Weapons. In environmental cooperation, is part of the Antarctic Treaty, the Basel Convention, Conventions on Biological Diversity and Air Pollution, Ramsar, CITES, the Kyoto Protocol, the Montréal Protocol, MARPOL, the Nuclear Test Ban Treaty, and the UN Conventions on the Law of the Sea, Climate Change, and Desertification

## 19 ECONOMY

Slovakia is continuing the difficult transformation from a centrally controlled economy to a market-oriented economy with some measure of success. Sustained GDP growth, although slowed after 1998, has been achieved, and inflation has moderated to single digits. While privatization has been carried out at an uneven pace, macroeconomic performance has improved steadily with 4.8% growth in 1994 and an average annual GDP growth rate of 6.66% 1995 to 1997. In 1998, however, the effects of the Russian financial crisis slowed investment and demand, reducing annual GDP growth to 4.4% in 1998, and to 1.9% in 1999. The pace of growth accelerated slowly from 2000 to 2002, from 2.2% to 3.3% to 4.4%, respectively. Average annual inflation after independence fell from 13.4% to 5.8% in 1996, but then hit double digits again in 2000, at 12%. In 2000 the government implemented austerity measures that helped to bring inflation down to 7.3% in 2001 and 3.1% in 2002. Unemployment remains a serious concern, at 19.8% in 2001 and 17.2% in 2002. The per capita GDP in purchasing power parity (PPP) terms, at \$8,300 in 1998, had reached \$11,500 (CIA est.) in 2001.

The progress made by the Dzurinda government between 2001 and 2004 has been remarkable. In 2004, Slovakia joined NATO and the EU, most of the major privatizations have been completed, massive foreign investment has been attracted to the country, and the economic expansion has been significant (despite the general European slowdown). In 2004, the GDP growth rate was 5.5%, up from 4.5% in 2003; for 2005, it was expected to stabilize at 5.3%. Inflation was on the upsurge in 2003, reaching 8.6%, but by 2004 it decreased to 7.5%, and was expected to decrease even further in 2005, to 2.9%. Unemployment was reduced steadily since 2001, but at 14.3% in 2004 it was still very high, and negatively influenced the economic performance of Slovakia. Other factors that affect the healthiness of the economy are corruption and poor living conditions for the population.

## 20 INCOME

The US Central Intelligence Agency (CIA) reports that in 2005 Slovakia's gross domestic product (GDP) was estimated at \$85.1 billion. The CIA defines GDP as the value of all final goods and services produced within a nation in a given year and computed on the basis of purchasing power parity (PPP) rather than value as measured on the basis of the rate of exchange based on current dollars. The per capita GDP was estimated at \$15,700. The annual growth rate of GDP was estimated at 5.1%. The average inflation

rate in 2005 was 2.8%. It was estimated that agriculture accounted for 3.6% of GDP, industry 29.7%, and services 66.7%.

According to the World Bank, in 2003 remittances from citizens working abroad totaled \$425 million or about \$79 per capita and accounted for approximately 1.3% of GDP. Foreign aid receipts amounted to \$160 million or about \$30 per capita and accounted for approximately 0.5% of the gross national income (GNI).

The World Bank reports that in 2003 household consumption in Slovakia totaled \$18.15 billion or about \$3,368 per capita based on a GDP of \$32.7 billion, measured in current dollars rather than PPP. Household consumption includes expenditures of individuals, households, and nongovernmental organizations on goods and services, excluding purchases of dwellings. It was estimated that for the period 1990 to 2003 household consumption grew at an average annual rate of 4.1%. In 2001 it was estimated that approximately 26% of household consumption was spent on food, 16% on fuel, 5% on health care, and 12% on education.

## 21 LABOR

As of 2005, there was an estimated 2.62 million people in Slovakia's workforce. As of 2003, agriculture accounted for 5.8%, with 29.3% in industry, 9% in construction, and 55.9% in the services sector. Unemployment was estimated at 11.5% in 2005.

Unions are freely allowed to organize in Slovakia as well as engage in collective bargaining. Strikes are legal only if they meet certain stringent requirements. About 45% of the workforce was unionized in 2002.

Children may not work until the age of 15. After age 16, minors may work without restrictions as to hours or condition of work. These provisions are effectively enforced by the government. The minimum wage was \$105 per month in 2002. The standard workweek was 42.5 hours, although under collective bargaining agreements, many workweeks are 40 hours. The government sets minimum occupational health and safety standards and it effectively monitors them.

## 22 AGRICULTURE

Agriculture engaged 9% of the economically active population in 2000. The total cultivated area in 2003 was 1,564,000 hectares (3,865,000 acres), or 33% of the land area. Agriculture accounted for about 4% of GDP in 2003.

Barley and hops are important agricultural exports; fruit, wine, and seed oil are also produced for export. Important crops in Slovakia in 2004 (in thousands of tons) included: wheat, 1,764; barley, 916; corn, 862; potatoes, 382; rye, 124; and sugar beets, 1,599. In 2003, 22,615 tractors and 3,748 combines were in use.

During 1980–90, agricultural production grew by an average of 1.6% annually. During 1990–2000, agriculture increased by an annual average of 1.2%. Cereal production in 1999 was only 71% of the average during 1989–91. In 2004, cereal production was 6.9% higher than during 1999–2001.

## 23 ANIMAL HUSBANDRY

Some 874,000 hectares (2,160,000 acres) of land are meadows and pastures, representing 18.2% of the total land area. In 2005, there were some 1,300,000 pigs, 580,000 head of cattle, 316,000 sheep, 9,000 horses, and 5,600,000 chickens. Meat production was estimated at 314,000 tons in 2005, with pork accounting for 44%; beef,

14%; turkey, 23%; chicken, 14%; and others, 5%. Milk production was 1,153,000 tons in 2005. Due to the concern over bovine spongiform encephalopathy (mad cow disease), in July 1996 Slovakia banned selected imports and transit of cattle and sheep, and beef and mutton imports and transits coming from the United Kingdom, Ireland, Portugal, France, and Switzerland.

## 24 FISHING

Fishing is only a minor source of the domestic food supply. Production comes mostly from mountain streams and stocked ponds. Some of the rivers and ponds near Bratislava are polluted with chemicals and petrochemical seepings, impairing the growth of fish stocks regionally. The total catch in 2003 was 2,527 tons, with common carp and rainbow trout the dominant species.

## 25 FORESTRY

About 45% of Slovakia is under forest cover. Forests have been severely damaged by acid rain from coal-fired power stations. Roundwood production in 2004 was 7,240,000 cu m (255.6 million cu ft). Slovakian forest product exports include paper, wood, and furniture. In 2004, wood pulp production amounted to 520,000 tons; paper and paperboard, 798,000 tons; and wood-based panels, 508,000 cu m (17.9 million cu ft). Slovakia's trade surplus in forestry products was nearly \$331.8 million in 2004.

## 26 MINING

Metal and metal products, particularly aluminum and steel, comprised Slovakia's leading industries in 2002, each of which was heavily dependent upon imports of raw materials. Gas, coke, oil, nuclear fuel, and chemicals were other top industries. Industrial mineral production in 2002 included: dolomite, 1.357 million tons, down from 1.471 million tons in 2001; lime (hydrated and quicklime), 911,000 tons; magnesite concentrate, 930,000 metric tons, down from 961,000 metric tons in 2001; crude gypsum and anhydrite, 121,700 metric tons; salt, 97,400 metric tons; barite concentrate, 25,820 metric tons, up from 14,450 metric tons in 2001; bentonite, 66,128 metric tons; kaolin, 24,600 metric tons; perlite, 18,630 metric tons, up from 14,910 metric tons in 2001; and zeolites, 15,000 metric tons. The Košice magnesite mines were put on care-and-maintenance. Also produced in 2002 were arsenic, diatomite, feldspar, illite, iron ore, refractory clays, nitrogen, sand and gravel, sodium compounds, limestone and other calcareous stones, crushed stone, sulfur, sulfuric acid, and talc. No zinc, lead, gold, silver, or copper was mined in 2002. Other mineral resources included antimony ore, mercury, brick soils, ceramic materials, and stonessalt. All mining companies were government owned.

## 27 ENERGY AND POWER

Total electric power production in 2002 amounted to 30.486 billion kWh, of which 26.9% was from fossil fuels, 17.1% from hydropower, and 55.9% from nuclear power. By 2001 nuclear power accounted for 54% of production, thanks to two new reactors that had come on line between 1998 and 2000, reducing Slovakia's dependence on fossil fuels and allowing it to become a net exporter of electricity. Consumption of electricity in 2002 was 24.196 billion kWh. As of 2002, total installed capacity was 7,417,000 kW.

Slovenske elektrarne (SE) is Slovakia's main power producer, accounting for 91% of the country's generating capacity.

Coal mining produced some 3,752,000 short tons of lignite in 2002, from reserves estimated at 190 million tons in 2001. In 2002, Slovakia imported 6,076,000 short tons of coal, of which 5,103,000 short tons consisted of hard coal.

As of 1 January 2004, Slovakia had crude oil reserves of 9 million barrels, natural gas reserves of 0.53 trillion cu ft., and a crude oil refining capacity of 115,000 barrels per day. Production of oil in 2003 was estimated at 3,500 barrels per day. Natural gas output in 2002 was estimated at 7.5 billion cu ft. Domestic demand for oil averaged 81,000 barrels per day in 2003. Natural gas consumption in 2002, was estimated at 270 billion cu ft. In 2002, natural gas was used by 80% of all Slovak households.

## 28 INDUSTRY

Major industries include heavy engineering, armaments, iron and steel production, nonferrous metals, and chemicals. In 2000, industry accounted for 34% of Slovakia's GDP, and the industrial growth rate was estimated at 4% in 2001. Foreign firms such as Volkswagen, US Steel, and Whirlpool are major investors in Slovak industry. Although privatization was ongoing in 2002 (including the Slovak Gas Company and oil-pipeline operator Transpetrol), and the country was attracting more foreign investment, many firms untouched by foreign investment were in trouble. Nonetheless, many Slovakian enterprises were restructuring and modernizing their equipment and methods. Slovakia produced 182,003 automobiles in 2001, and 264 heavy trucks in 2000. The country had one oil refinery in 2002, with a capacity of 115,000 barrels per day.

By 2004, the industrial sector had suffered a series of setbacks. Its representation in the total economic output had decreased to 30.1%, it employed only 29.3% of the labor force, and the industrial production growth rate was only 5.1%—as opposed to the 5.5% GDP growth rate. Agriculture made up 3.5% of the GDP and employed 5.8% of the working population; services came in first with 66.4% and 55.9% respectively; 9% of the workforce was employed by the construction sector. Major industries in 2004 were: metal and metal products; food and beverages; electricity, gas, coke, oil, nuclear fuel; chemicals and manmade fibers; machinery; paper and printing; earthenware and ceramics; transport vehicles; textiles; electrical and optical apparatus; and, rubber products.

## 29 SCIENCE AND TECHNOLOGY

The Slovak Academy of Sciences, founded in 1953, has departments of exact and technical sciences and of natural sciences and chemistry, and 36 affiliated research institutes. The Council of Scientific Societies, headquartered in Bratislava, coordinates the activities of 16 societies concerned with specific scientific and technical fields. Natural history exhibits are displayed in the Slovak National Museum in Bratislava, the Central Slovak Museum in Banská Bstrica, and the Museum of Eastern Slovakia in Košice. The Slovak Mining Museum, founded in 1900, is located in Banská Stiavnica. Eight universities offer scientific and technical degrees. In 1987–97, science and engineering students accounted for 40% of university enrollment.

In 2002, research and development (R&D) expenditures totaled \$407.279 million, or 0.59% of GDP. Of that amount, 53.6%

came from the business sector, followed by government sources at 44.1%. Foreign sources accounted for 2.1% and higher education 0.1%. In that same year, there were 1,707 scientists and engineers, and 564 technicians per one million people that were engaged in R&D. High technology exports in 2002 totaled \$386 million, or 3% of the country's manufactured exports.

### 3<sup>0</sup> DOMESTIC TRADE

Bratislav is the primary commercial center of the country. Other major centers include Košice, Trenčín, Zilina, and Poprad. Nitra is a primary distribution center for agricultural products.

Retail trade is currently undergoing rapid privatization along with other sectors of the economy. As of 2002, about 98% of all retail establishments were privatized. Most establishments are small, family-owned shops specializing in one type of product, such as groceries, flowers, books, clothing, music, etc. However, the trend is slowly moving towards larger Western-style stores and hypermarkets that offer a wider variety of products under one roof. Wholesalers tend to be directly involved in the retailing of their products as well. A few franchise firms have recently made their way into the country.

Retail shops are generally open from 9 AM to 6 PM, Monday through Friday. New chain stores are open seven days a week from about 7 AM to 8 PM. Grocery stores often operate from 6 AM to 7 PM. Many stores will open for half a day on Saturdays, but most businesses and shops are closed on Sundays.

### 3<sup>1</sup> FOREIGN TRADE

The Czech Republic, which used to account for as much as one-third of Slovakia's foreign trade, has dropped behind Germany as Slovakia's leading trade partner. Trade with the former Soviet Union has declined in importance and has increasingly been replaced by trade with the OECD, whose members buy over 90% of all Slovak exports.

In the Far East, China has emerged as the top trading partner, with imports and exports between the two nations increasing by almost 300% in 1995.

In 2004, exports totaled \$29.2 billion (FOB—Free on Board), and were only slightly surpassed by imports at \$29.7 billion (FOB).

#### Principal Trading Partners – Slovakia (2003)

(In millions of US dollars)

Country	Exports	Imports	Balance
World	21,958.4	22,603.1	-644.7

Vehicles (25.9%), machinery and electrical equipment (21.3%), base metals (14.6%), chemicals and minerals (10.1%), and plastics (5.4%) topped the list for Slovakia's export commodities. Slovakia's main export partners were Germany (which received 34.4% of total exports), the Czech Republic (14.7%), Austria (8.2%), Italy (5.8%), Poland (5.3%), the United States (4.5%), and Hungary (4.3%). The imports were distributed among the following categories: machinery and transport equipment (41.1%), intermediate manufactured goods (19.3%), fuels (12.3%), chemicals (9.8%), and miscellaneous manufactured goods (10.2%). Most of the imports came from Germany (26.1%), the Czech Republic (21.3%), Russia (9.1%), Austria (6.6%), Poland (4.9%), and Italy (4.9%).

### 3<sup>2</sup> BALANCE OF PAYMENTS

A decline in foreign trade in 2001 caused the central bank to revise its forecast of the current account deficit up from 4% to 5.7% of GDP.

The US Central Intelligence Agency (CIA) reported that in 2001 the purchasing power parity of Slovakia's exports was \$12.9 billion while imports totaled \$15.4 billion resulting in a trade deficit of \$2.5 billion.

The International Monetary Fund (IMF) reported that in 2000 Slovakia had exports of goods totaling \$11.9 billion and imports totaling \$12.8 billion. The services credit totaled \$2.2 billion and debit \$1.81 billion.

Exports of goods and services totaled \$31.5 billion in 2004, up from \$25.1 billion in 2003. Imports grew from \$25.5 billion in 2003, to \$32.6 billion in 2004. Although Slovakia has managed to keep a fine balance between imports and exports, the resource balance was on a negative upsurge, growing from -\$407 million in 2003, to -\$1.2 billion in 2004. A similar trend was registered for the current account balance, which deteriorated from -\$278 million in 2003, to -\$1.4 billion in 2004. The national reserves (including gold) were \$12.1 billion in 2003, covering approximately

six months of imports; by 2004, they decreased to \$11.7 billion, covering only four months of imports.

### 3<sup>3</sup> BANKING AND SECURITIES

Four years after the Soviet system relinquished control over the eastern bloc, Slovakia formed a National Bank. In January 1992 the banking system of Czechoslovakia was split. From that point on the National Bank of Slovakia was charged with the responsibility of circulating currency and regulating the banking sector. At the end of 2002, there were 23 commercial banks operating in the Slovak Republic, including the Investment and Development Bank (1992); People's Bank (1992); Postal Bank Inc. (1991); Industrial Bank, Inc. (1992); First Commercial Bank Inc. (1993); Slovak Credit Bank (1993); Slovak Agricultural Bank (1991); and the General Credit Bank (1990). Twelve of the 23 commercial banks were partly or wholly foreign-owned. In addition, two branches and 10 representative offices of foreign banks had been established. In 2000, plans called for the privatization of the three largest banks, Vseobecna Uverova Banka (VUB), Slovenska Sporitelna, and Investicna a Rozvojova Banka (IRB) by the end of the year. The International Monetary Fund reports that in 2001, currency and demand deposits—an aggregate commonly known as M1—were equal to \$4.7 billion. In that same year, M2—an aggregate equal to M1 plus savings deposits, small time deposits, and money market mutual funds—was \$13.9 billion. The money market rate, the rate at which financial institutions lend to one another in the short term, was 7.76%.

The Bratislava Stock Exchange (BSE) opened on 8 July 1990 and acts as a share holding company formed by all Slovakian financial institutions, banks and savings banks, and companies authorized to trade securities. Brokers and other mediators are not permitted in the trading system. The volume of stocks traded on the BSE, however, remained low until 1996. In 2001, there were 844 companies listed on the BSE, with a trading value of \$966 million (up 141% from 2000) and total market capitalization of \$665 million (down 10.3% from 2000). As of 2004, a total of 258 companies were listed on the BSE, which had a market capitalization of \$4.410 Billion. The Bratislava Option and Futures Exchange opened in 1994.

### 3<sup>4</sup> INSURANCE

The pre-World War II insurance companies and institutions of the former Czechoslovakia after 1945 were reorganized, merged, nationalized and centralized. Since 1952, the insurance industry has been administered by the State Insurance Office, under the jurisdiction of the Ministry of Finance, and two enterprises conducted insurance activities, the Czech and the Slovak Insurance Enterprises of the State. In 1997, at least 20 insurance companies were doing business in Slovakia. Nonetheless, the Slovak Insurance Company remains the only company authorized to write the compulsory third-party automobile liability insurance. Lawyers, architects and dentists are also required to carry liability insurance. There are no restrictions on foreign ownership of companies. In 2003, the value of all direct insurance premiums written totaled \$1.140 billion, of which nonlife premiums accounted for \$676 million. In that same year, the top nonlife and life insurer was Allianz Poistovna, which had gross written nonlife premiums

totaling \$369.8 million, and gross written life insurance premiums of \$141.9 million.

### 3<sup>5</sup> PUBLIC FINANCE

Since the dissolution of Czechoslovakia, the Slovak government has implemented several measures to compensate for the large loss of fiscal transfers it received from the Federation, which were equivalent to between Sk20–25 billion in 1992. The Slovak government's initial budget was balanced at the beginning of 1992, with revenues and expenditures equivalent to Sk159 billion. Since that time, however, Slovakia's budget has fallen into deficit. Privatization efforts have been successful, attracting a large amount of foreign direct investment (FDI).

The US Central Intelligence Agency (CIA) estimated that in 2005 Slovakia's central government took in revenues of approximately \$21.4 billion and had expenditures of \$23.1 billion. Revenues minus expenditures totaled approximately -\$1.6 billion. Public debt in 2005 amounted to 16.9% of GDP. Total external debt was \$25.81 billion.

The International Monetary Fund (IMF) reported that in 2003, the most recent year for which it had data, central government revenues were Sk422.55 billion and expenditures were Sk461.99 billion. The value of revenues was us\$11 million and expenditures us\$12 million, based on an exchange rate for 2003 of us\$1 = Sk36.773 as reported by the IMF. Government outlays by function were as follows: general public services, 20.6%; defense, 4.7%; public order and safety, 5.0%; economic affairs, 10.2%; environmental protection, 0.7%; housing and community amenities, 0.8%; health, 20.3%; recreation, culture, and religion, 1.2%; education, 3.4%; and social protection, 33.2%.

### 3<sup>6</sup> TAXATION

The principal taxes are corporate income tax, personal income tax, and value-added tax. Individuals are liable for tax on all sources of worldwide income. Corporate income tax is levied on joint stock

companies, limited liability companies, and limited partnerships. In 2005, the corporate tax rate for resident companies was 19%. Capital gains were also taxed at 19%. Dividends paid out of after-tax profits are not taxed. Interest income from loans or bonds are taxed at the corporate rate, as is income from royalties. Other taxes include a road tax, excise duties, import duties, and taxes on property.

As of 2005, individual income was taxed according to a flat 19% rate. Dividends paid to individuals is not taxed. Income from interest and capital are included in total income.

The principle indirect tax is Slovakia's value-added tax (VAT). As of 2005, the standard rate was 19% and was applied to most transactions. However, exports are zero-rated, and financial, broadcasting, insurance and educational services are exempt.

### 37 CUSTOMS AND DUTIES

As a WTO member, Slovakia uses the Brussels Tariff Nomenclature. Goods imported into Slovakia are liable to three kinds of charges: customs duties, value-added tax (VAT) of 10% or 19%, and an excise tax. A 3% import surcharge was eliminated on 1 January 2001. However, Slovakia imposes surcharges on approximately 80% of its imports. Slovakia is also a member of the Central European Free Trade Area (CEFTA) along with Bulgaria, the Czech Republic, Hungary, Poland, Romania, and Slovenia.

### 38 FOREIGN INVESTMENT

Prior to the defeat of Prime Minister Vladimir Meciar, Slovakia experienced difficulty attracting foreign investment due to perceived political uncertainty and vacillations in its privatization policy. The government has introduced tax incentives to attract more capital from abroad.

Annual foreign direct investment (FDI) inflow was \$220 million in 1997 and rose to \$648 million in 1998. Affected by the Russian financial crisis, FDI inflow fell to \$390 million in 1999, but then recovered sharply in 2000 to reach a peak of over \$2 billion. FDI inflow to Slovakia in 2001 was \$1.5 billion. The Netherlands has been the single largest investor.

At the end of the first three quarters in 2004, cumulative foreign investment had risen to \$11.4 billion. Most of the capital inflow was generated through privatization sales, but since 2003 significant greenfield investments have been made. In 2004, Hyundai invested \$1.5 billion in its first European assembly plant; Ford constructed a \$400 million gearbox production plant in the same year. Most of the investments went to industrial manufacturing (38.2%), the banking sector (22.7%), retail and wholesale (11.7%), and to the production and distribution of gas and electricity (11.0%). The biggest investing countries were Germany (with 22.7% of total investments), the Netherlands (16%), and Austria (14.3%).

### 39 ECONOMIC DEVELOPMENT

The government in the early 1990s slowed economic reforms due to the social burden imposed by the transformation to a market economy. Measures included stimulation of demand through price subsidies and public spending. Slovakia's most successful structural reform has been privatization. The first stage of large-scale privatization included 751 companies, and a second stage,

which involved 650 medium- and large-scale enterprises, was implemented in late 1993.

However, the Meciar government was slow to implement the \$1.5 billion privatization program after he regained power in 1994 and the country continued to rely heavily on foreign aid. Western investors cheered his defeat and replacement by reformer Mikulas Dzurinda in 1998. The Dzurinda government quickly earned praise for its implementation of reforms. The renewed liberalization measures, combined with a new attitude toward Slovakia's Roma (Gypsy) population, caused the EU to place Slovakia back on its list of candidate members. In December 2002, Slovakia was officially invited to join the EU, and accession took place in May 2004.

Slovakia's foreign debt at the beginning of 2002 was about \$11 billion, approximately 55% of gross domestic product (GDP). The current account deficit was high, largely due to a shortfall in foreign trade. Foreign direct investment (FDI) has been relatively small in recent years, although FDI in 2000 alone was greater than cumulative investment received by Slovakia in the preceding 10 years. Although growth was strong and inflation relatively low in the early 2000s, the unemployment rate remained high. By 2002, the main banks and utilities had been privatized; but further corporate restructuring and labor market reform, improved banking supervision, and strengthening state administration and the judicial system remained structural reforms to be implemented.

A strong economic expansion followed in 2003 and 2004, with GDP growth rates of 4.5% and 5.5% respectively. In 2004, Slovakia joined NATO and the EU, which greatly improved the stability of the political and economic climate. In addition, an investment friendly environment was created, which led to a dramatic increase in the inflow of foreign capital. In 2005, Slovakia was considered by the World Bank the world's top performer in improving its business climate over the last year; in the same year it was deemed one of the top 20 countries in the world for ease of doing business. As of 2006, Slovakia was able to boast a highly skilled and relatively low-cost labor force, an attractive tax system (19% flat tax), a liberal labor code, and a favorable geographic location.

### 40 SOCIAL DEVELOPMENT

Slovakia's social security system was first introduced in 1906. The current program was implemented in 2004. Old age, disability and survivor's pensions are funded by employee and employer contributions as well as government subsidies. Retirement is set at age 62 for both men and women. The first laws covering sickness benefits were instituted in 1888. A family allowance system provides benefits for all residents funded totally by the government. There are also sickness and maternity benefits, a workers' compensation program, and unemployment benefits.

Women and men are equal under the law, enjoying the same property, inheritance, and other rights, however discrimination persists. Women on the average earn 30% less than men. Despite legal safeguards, the small number of women in private and public leadership roles is evidence of continuing cultural barriers to full equality. The Coordinating Committee for Women's Affairs has not been successful at protecting women against violence, health risks, or economic disadvantages. Domestic abuse and sexual violence against women remains an extensive and underreported problem.

Roma minorities suffer from high levels of unemployment and housing discrimination. Attacks against Roma and other minorities by skinhead extremists were reported. Human rights were generally well respected, but some democratic freedoms were not respected. These include the intimidation of political opponents and interference with the media. There were also reports of police abuse of Roma.

#### 41 HEALTH

Since 1995 general public health services have been organized into a system of state health institutes. However, primary health care services, formerly operated by the state, are now separate from the public health sector and reimbursed through a compulsory insurance program. As of 2004 there were 77 polyclinics in the country; Slovakia had 84 hospitals, 23 specialized institutes, and 1 maternity facility. As of 2004, there were an estimated 325 physicians, 731 nurses, 44 dentists, 48 pharmacists, and 7 midwives per 100,000 people. Total health care expenditure was estimated at 6.5% of GDP.

Life expectancy in 2005 was 74.50 years and infant mortality was 7.41 per 1,000 live births. As of 2002, the crude birth rate and overall mortality rate were estimated at, respectively, 10.1 and 9.2 per 1,000 people. A Slovakian woman living through her child-bearing years had an average of 1.3 children. A large proportion of Slovakian women (74%) used some form of contraception. Immunization rates for children up to one year old were impressively high: tuberculosis, 90%; diphtheria, pertussis, and tetanus, 98%; polio, 98%; and measles, 98%.

The HIV/AIDS prevalence was 0.10 per 100 adults in 2003. As of 2004, there were approximately 200 people living with HIV/AIDS in the country. There were an estimated 100 deaths from AIDS in 2003.

#### 42 HOUSING

In 1992, the Slovak Association of Towns and Villages, comprised of some 2,000 towns, was engaged in recovering all housing units from former state administration authorities. As of 2001, there were about 1,884,846 dwelling units nationwide. Most of these were detached houses. About 88% of all dwellings were permanently occupied. About 11% of all dwellings were unoccupied. Of the permanently occupied units, the average number of rooms per unit was 3.2; nearly 73% of all dwellings had 3 rooms or more. The average number of people per dwelling was also 3.21. About 76.3% of all dwellings had central heating and 92.8% had a separate bathroom or shower facility. About 28,507 units were considered unsuitable for habitation.

#### 43 EDUCATION

Slovakia has an estimated adult literacy rate of 99%. Education is compulsory for nine years, approximately up to the age of 15. This basic schooling is accomplished in two stages of four years and five years. At the secondary level, there are a variety of general, vocational, professional, and art school programs to choose from. Most secondary programs last about four years.

In 2001, about 82% of children between the ages of three and five were enrolled in some type of preschool program. Primary school enrollment in 2003 was estimated at about 86% of age-eligible students. The same year, secondary school enrollment was

about 88% of age-eligible students. It is estimated that about 99% of all students complete their primary education. The student-to-teacher ratio for primary school was at about 18:1 in 2003; the ratio for secondary school was about 13:1.

Slovakia has 13 universities, with the oldest being Comenius (Komensky) University in Bratislava—founded in 1919. The Pavel Josef Afarik University, founded in 1959, is in Košice. In 2003, it was estimated that about 34% of the tertiary age population were enrolled in tertiary education programs. The adult literacy rate for 2004 was estimated at about 99%.

As of 2003, public expenditure on education was estimated at 4.4% of GDP, or 13.8% of total government expenditures.

#### 44 LIBRARIES AND MUSEUMS

The most important library in Slovakia is the Slovak National Library (4.4 million volumes), founded in 1863 and located at Martin. The State Scientific Library in Banská Bstrica (1926) holds almost two million volumes, and the Comenius University in Bratislava has the country's largest university collection of 2.2 million volumes. In total there are over 450 libraries in universities and other higher-educational institutions and about 2,600 public library branches nationwide.

The Slovak National Gallery (1948), the Slovak National Museum (1924), the Natural History Museum (1948), and the History Museum (1924), are all in Bratislava. The administrators of the Slovak National Museum also sponsor the branch museums of the Museum of Archaeology, the Museum of Ethnography, the Museum of Music, the Museum of Puppetry and Toys, and the Museum of Jewish Culture. The State Gallery of Art is in Banská Bstrica. There are dozens of regional museums throughout the country.

#### 45 MEDIA

In 2003, there were an estimated 241 mainline telephones for every 1,000 people; about 7,000 people were on a waiting list for telephone service installation. The same year, there were approximately 684 mobile phones in use for every 1,000 people.

There are three government boards appointed by a majority vote of parliament to supervise radio and television broadcasting: The Slovak Television Council and the Slovak Radio Council establish broadcasting policy for state-owned television and radio. The Slovak Council for Radio and Television Broadcasting issues broadcast licenses for nongovernment groups and administers advertising laws and other regulations. The privately owned TV Markiza has the widest broadcast audience. In 2005, there were at two other commercial television stations and at least four commercial radios stations. The public broadcaster, Slovak TV and Radio, sponsored two national television networks and five national radio networks. In 2003, there were an estimated 965 radios and 409 television sets for every 1,000 people. About 127.3 of every 1,000 people were cable subscribers. Also in 2003, there were 180.4 personal computers for every 1,000 people and 256 of every 1,000 people had access to the Internet. There were 63 secure Internet servers in the country in 2004.

In 2002, there were 14 major daily newspapers, including (with average circulation figures): *Novy Cas* (*New Time*, 230,000), *Pravda* (*Truth*, 165,000), *Praca* (*Labor*, 80,000), and *SMENA* (a youth journal, 80,000). The daily sports newspaper *Sport* had a circulation of 85,000 in 2002. The two major Hungarian newspapers

are the daily *Uj Szo* (*New Word*, 42,000) and the weekly *Szabad Ujsag* (*Free Journal*, 40,000). There are also a number of government bulletins and small circulation publications printed by and for minority language groups.

#### 46 ORGANIZATIONS

The Slovak Chamber of Commerce and Industry is located in Bratislava. There are professional associations for a number of occupations, including teaching and a number of medical professions.

The Slovak Academy of Sciences promotes public interest, education, and research in various scientific fields. Cultural and educational associations include the Organization of Slovak Writers. The Slovak Medical Association promotes research and education on health issues and works to establish common policies and standards in healthcare. There are several other associations dedicated to research and education for specific fields of medicine and particular diseases and conditions.

National youth organizations include the Association of Slovak Students, Civic Democratic Youth, YMCA/YWCA, and Slovak Scouting. There are several sports associations promoting amateur competition in a variety of pastimes, such as Frisbee, aikido, badminton, baseball, figure skating, floorball, and track and field; many sports associations are affiliated with international groups as well. There are national chapters of the Paralympic Committee and the Special Olympics, as well as a national Olympic Committee.

Kiwanis and Lion's Clubs have programs in the country. Women's organizations include the Alliance of Women in Slovakia. Greenpeace, Habitat for Humanity, and the Red Cross have national chapters.

#### 47 TOURISM, TRAVEL, AND RECREATION

Slovakia's outdoor tourist attractions include mountains (the most famous being the High and Low Tatras), forests, cave formations, and over 1,000 mineral and hot springs. In addition, tourists can visit ancient castles, monuments, chateaux, museums, and galleries. Slovakia is also home to many health spas. Horse racing is a national pastime. Golf, skiing, mountaineering, and rafting are popular sports among tourists. All visitors are required to have valid passports, onward/return tickets and sufficient funds for their stay. Visas are required for nationals of 154 countries including China, Australia, and India.

In 2003, about 1.4 million tourists arrived in Slovakia. There were 35,853 hotel rooms that year with 90,773 beds and an occupancy rate of 38%. The average length of stay was three nights.

According to 2005 US Department of State estimates, the cost of staying in Bratislava was \$272 per day. Estimated daily travel costs elsewhere in the country averaged \$157.

#### 48 FAMOUS SLOVAKS

Ján Kollár (1793–1852), writer, poet, Slavist, and archaeologist, was a Slovak patriot who championed the Slav struggle against foreign oppression. Ludovít Stúr (1815–56) is the founder of the Slovak literary language and modern Slovak literature. Founder of scientific Slavic studies was Pavel Josef Safačrík (1795–1861), whose *Slavonic Antiquities* had great scholarly influence. Andrej Hlinka (1864–1938) led the Slovak Catholic autonomist movement. The greatest Slovak poet, Pavel Hviezdoslav (1849–1921), translated foreign poetry, refined the language, and contributed to Slovak awakening. The Robin Hood of the Slovaks, Juraj Jánošík (1688–1713), fought the Hungarians. Milan Rastislav Štefánik (1880–1919), military leader, astronomer, and ally of Tomáš Masaryk, represented the Slovaks in their struggle for liberty. Alexander Dubček (1921–92) was first secretary of the Czechoslovak Communist Party (1968–69). His attempt to increase civil liberties led to the invasion of Czechoslovakia by the Warsaw Pact in 1968. In 1989 he was elected the Federal Assembly's first speaker.

#### 49 DEPENDENCIES

Slovakia has no territories or colonies.

# SLOVENIA

Republic of Slovenia

*Republika Slovenije*

**CAPITAL:** Ljubljana

**FLAG:** Equal horizontal bands of white (top), blue, and red with seal superimposed on upper hoist side.

**ANTHEM:** *Zive naj vsi narodi.* (The national anthem begins, "Let all nations live . . .")

**MONETARY UNIT:** The currency of Slovenia is the tolar (SLT), which consists of 100 stotinov. There are coins of 50 stotinov and 1, 2, and 5 toolars, and notes of 10, 20, 50, and 200 toolars. SLT1 = \$0.00534 (or \$1 = SLT187.42) as of 2005.

**WEIGHTS AND MEASURES:** The metric system is in force.

**HOLIDAYS:** New Year, 1–2 January; Prešeren Day, Day of Culture, 8 February; Resistance Day, 27 April; Labor Days, 1–2 May; National Statehood Day, 25 June; Assumption, 15 August; Reformation Day, 31 October; All Saints' Day, 1 November; Christmas Day, 25 December; Independence Day, 26 December. Movable holidays are Easter Sunday and Monday.

**TIME:** 1 PM = noon GMT.

## <sup>1</sup>LOCATION, SIZE, AND EXTENT

Slovenia is located in central Europe. Slovenia is slightly larger than the state of New Jersey with a total area of 20,273 sq km (7,827 sq mi). Slovenia shares boundaries with Austria on the N, Hungary on the E, Croatia on the S, and the Adriatic Sea and Italy on the W, and has a total land boundary of 1,334 km (829 mi) and a coastline of 46.6 km (29 mi). Slovenia's capital city, Ljubljana, is located near the center of the country.

## <sup>2</sup>TOPOGRAPHY

The topography of Slovenia features a small coastal strip on the Adriatic, the Julian Alps adjacent to Italy, the Karawanken Mountains of the northern border with Austria, and mixed mountains and valleys with numerous rivers in the central and eastern regions. The highest point of Mt. Triglav is found in the Julian Alps with an elevation of 2,864 m (9,396 ft). The longest river is the Sava, which flows through the center of the country for 221 km (137 mi). A unique feature of Slovenia is the presence of over 6,500 karst formed caves, the most well-known being the Skocjan caves in the southwest, which are designated as a natural UNESCO World Heritage Site.

## <sup>3</sup>CLIMATE

Slovenia's coastal climate is influenced by the Mediterranean Sea. Its interior climate ranges from mild to hot summers, with cold winters in the plateaus and valleys to the east. In Ljubljana, July's mean temperature is 20°C (68°F). The mean temperature in January is -1°C (30°F). Rainfall in the capital averages 139 cm (59 in) a year.

## <sup>4</sup>FLORA AND FAUNA

The region's climate has given Slovenia a wealth of diverse flora and fauna. Ferns, flowers, mosses, and common trees populate

the landscape. There are subtropical plants along the Adriatic Sea. Wild animals include deer, brown bear, rabbit, fox, and wild boar. Farmers plant vineyards on the hillsides and raise livestock in the fertile lowlands of the country. As of 2002, there were at least 75 species of mammals, 201 species of birds, and over 3,200 species of plants throughout the country.

## <sup>5</sup>ENVIRONMENT

Slovenia's natural environment suffers from damage to forests by industrial pollutants, especially chemical and metallurgical plant emissions and the resulting acid rain. Water pollution is also a problem. The Sava River is polluted with domestic and industrial waste; heavy metals and toxic chemicals can be found in the coastal waters. The country is subject to flooding and earthquakes.

As of 2003, 6% of Slovenia's total land area was protected. One of the largest protected areas is Triglav National Park. According to a 2006 report issued by the International Union for Conservation of Nature and Natural Resources (IUCN), threatened species included 7 types of mammals, 7 species of birds, 2 species of amphibians, 16 species of fish, and 42 species of invertebrates. Threatened species include the Italian agile frog, slender-billed curlew, beluga, Danube salmon, the garden dormouse, and the great snipe.

## <sup>6</sup>POPULATION

The population of Slovenia in 2005 was estimated by the United Nations (UN) at 1,998,000, which placed it at number 141 in population among the 193 nations of the world. In 2005, approximately 15% of the population was over 65 years of age, with another 14% of the population under 15 years of age. There were 95 males for every 100 females in the country. According to the UN, the annual population rate of change for 2005–10 was expected to be -0.1%, a rate the government viewed as satisfactory. The fertility rate, at 1.4 births per woman, has been below replacement levels since the mid-1990s. The projected population for the year 2025

was 2,014,000. The population density was 99 per sq km (256 per sq mi).

The UN estimated that 51% of the population lived in urban areas in 2005, and that urban areas were growing at an annual rate of 0.03%. The capital city, Ljubljana, had a population of 256,000 in that year. Maribor had a population of 110,668.

## 7 MIGRATION

In 1995, Slovenia was harboring 29,000 refugees from the former Yugoslav SFR. Of the 5,000–10,000 that remained in 1999, most had opted not to take Slovene citizenship during a six-month window of opportunity in 1991–92 and had been living in the country as stateless persons ever since. In 1999, parliament passed legislation that offered these persons permanent resident status; a six-week window for applications closed at the end of the year. The number of migrants living in Slovenia in 2000 was 51,000. By the end of 2004, there were 304 refugees in Slovenia and 323 asylum seekers. In addition, there were 584 citizens of the former Yugoslavia who remained of concern to the United Nations High Commissioner for Refugees (UNHCR). The net migration rate in 2005 was an estimated 1 migrant per 1,000 population. The government views the migration levels as satisfactory.

## 8 ETHNIC GROUPS

According to the 2002 census, the total population is about 83.1% Slovene. Minority groups include Serbs (2%), Croats (1.8%), and Bosniaks (1.1%). There are about 10,467 Muslims, 6,243 Hungarians, 6,186 Albanians, 3,246 Roma and 2,254 Italians.

## 9 LANGUAGES

Like Serbo-Croatian, Macedonian, and Bulgarian, Slovene is a language of the southern Slavic group. It is closest to Serbo-Croatian, but the two are not mutually intelligible. Slovene is written in the Roman alphabet and has the special letters *č*, *š*, and *ž*. The letters *q*, *w*, *x*, and *y* are missing. As of 2002, 91% of the populace spoke Slovene; 6% spoke Serbo-Croatian; and 3% used various other languages.

## 10 RELIGIONS

According to the 2002 census, the largest denominational group in the country was the Roman Catholic Church, representing about 57.8% of the population. There is also a Slovenian Old Catholic Church and some Eastern Orthodox that made up about 2% of the population. Although Calvinism played an important role during the Reformation, the only well-established Protestant group is the Evangelical Lutheran Church of Slovenia, which has about 14,736 members. Muslims make up about 2.4% of the population. The census reported only 99 Jews. About 199,264 people responded as atheists. Freedom of religion is guaranteed in the constitution. Religious organizations register with the Office of Religious Communities in order to secure legal status and conduct business.

## 11 TRANSPORTATION

Rail lines, emanating from Ljubljana, connect the capital to Kranj and Jesenice, Postojna and Novo Gorica, Celje and Maribor, and Nova Mesto before continuing to Austria, Italy, and Croatia. As of 2004, there were some 1,201 km (747 mi) of railway, all of it standard gauge. Of that total, 499 km (310 mi) are electrified. With

over 150 passenger stations and 140 freight stations, almost every town in Slovenia can be reached by train. Slovenian Railways uses high-speed trains and container transports.

In 2002, Slovenia had 20,250 km (12,596 mi) of roads, all of which were paved, and included 456 km (284 mi) of expressways. Slovenia has two expressways: one connecting Ljubljana, Postojna, and Razdrto with the coastal region; the other linking Ljubljana with Kranj and the Gorenjska region in the northwest and with the Karawanken tunnel to Austria. In 2003, there were 889,600 passenger cars and 69,300 commercial vehicles registered for use.

The principal marine port is Koper. Technically there is no merchant fleet, but Slovenian owners have registered their respective vessels in 23 countries as of 2005.

Slovenia had an estimated 14 airports in 2004, 6 of which had paved runways as of 2005. In 2003, about 758,000 passengers were carried on scheduled domestic and international flights.

## 12 HISTORY

### Origins and Middle Ages

Slovenia is located in the central European area where Latin, Germanic, Slavic, and Magyar people have come into contact with one another. The historical dynamics of these four groups have impacted the development of this small nation.

Until the 8th–9th centuries AD, Slavs used the same common Slavic language that was codified by St. Cyril and Methodius in their AD 863 translations of Holy Scriptures into the Slavic tongue. Essentially an agricultural people, the Slovenes settled from around AD 550 in the eastern Alps and in the western Pannonian Plains. The ancestors of today's Slovenes developed their own form of political organization in which power was delegated to their rulers through an "electors" group of peasant leaders/soldiers (the "Kosezi"). Allies of the Bavarians against the Avars, whom they defeated in AD 743, the Carantania Slovenes came under control of the numerically stronger Bavarians and both were overtaken by the Franks in AD 745.

In 863, the Greek scholars Constantine (Cyril) and Methodius were sent to Moravia, having first developed an original alphabet (called "Glagolitic") and translated the necessary Holy Scriptures into the Slavic tongue of the time. The work of the two "Apostles of the Slavs" was opposed by the Frankish Bishops who accused them of teaching heresy and using a nonsacred language and script. Invited by Pope Nicholas I to Rome to explain their work, the brothers visited with the Slovene Prince Kocelj in 867 and took along some 50 young men to be instructed in the Slavic scriptures and liturgy that were competing with the traditionally "sacred" liturgical languages of Latin and Greek. Political events prevented the utilization of the Slavic language in Central European Churches with the exception of Croatia and Bosnia. However, the liturgy in Slavic spread among Balkan and Eastern Slavs.

Slovenes view the installation of the Dukes of Carinthia with great pride as the expression of a nonfeudal, bottom-up delegation of authority—by the people's "electors" through a ceremony inspired by old Slavic egalitarian customs. All the people assembled would intone a Slovene hymn of praise—"Glory and praise to God Almighty, who created heaven and earth, for giving us and our land the Duke and master according to our will."

LOCATION: 46°15' N; 15°10' E. BOUNDARY LENGTHS: Total boundary lengths, 999 kilometers (621 miles); Austria 262 kilometers (163 miles); Croatia, 455 kilometers (283 miles); Italy, 199 kilometers (124 miles); Hungary, 83 kilometers (52 miles).

This ceremony lasted for 700 years with some feudal accretions and was conducted in the Slovenian language until the last one in 1414. The uniqueness of the Carinthian installation ceremony is confirmed by several sources, including medieval reports, the writing of Pope Pius II in 1509, and its recounting in Jean Bodin's *Treatise on Republican Government* (1576) as "unrivaled in the entire world." In fact, Thomas Jefferson's copy of Bodin's *Republic* contains Jefferson's own initials calling attention to the description of the Carinthian installation and, therefore, to its conceptual impact on the writer of the American Declaration of Independence.

The eastward expansion of the Franks in the 9th century brought all Slovene lands under Frankish control. Carantania then lost its autonomy and, following the 955 victory of the Franks over the Hungarians, the Slovene lands were organized into separate frontier regions. This facilitated their colonization by German elements while inhibiting any effort at unifying the shrinking Slovene territories. Under the feudal system, various families of mostly Germanic nobility were granted fiefdoms over Slovene lands and competed among themselves bent on increasing their holdings.

The Bohemian King Premysl Otokar II was an exception and attempted to unite the Czech, Slovak, and Slovene lands in the second half of the 13th century. Otokar II acquired the Duchy of

Austria in 1251, Styria in 1260, and Carinthia, Carniola, and Istria in 1269, thus laying the foundation for the future Austrian empire. However, Otokar II was defeated in 1278 by a Hapsburg-led coalition that conquered Styria and Austria by 1282. The Hapsburgs, of Swiss origin, grew steadily in power and by the 15th century became the leading Austrian feudal family in control of most Slovene lands.

Christianization and the feudal system supported the Germanization process and created a society divided into "haves" (German) and "have nots" (Slovene), which were further separated into the nobility/urban dwellers versus the Slovene peasants/serfs. The Slovenes were deprived of their original, egalitarian "Freemen" rights and subjected to harsh oppression of economic, social, and political nature. The increasing demands imposed on the serfs due to the feudal lords' commitment in support of the fighting against the Turks and the suffering caused by Turkish invasions led to a series of insurrections by Slovene and Croat peasants in the 15th to 18th centuries, cruelly repressed by the feudal system.

#### Reformation

The Reformation gave an impetus to the national identity process through the efforts of Protestant Slovenes to provide printed materials in the Slovenian language in support of the Reformation movement itself. Martin Luther's translation of the New Testament

into German in 1521 encouraged translations into other vernaculars, including the Slovenian. Thus Primož Trubar, a Slovenian Protestant preacher and scholar, published the first *Catechism* in Slovenian in 1551 and, among other works, a smaller elementary grammar (*Abecedarium*) of the Slovenian language in 1552. These works were followed by the complete Slovenian translation of the Bible by Jurij Dalmatin in 1578, printed in 1584. The same year Adam Bohorič published, in Latin, the first comprehensive grammar of the Slovenian language which was also the first published grammar of any Slavic language. The first Slovenian publishing house (1575) and a Jesuit College (1595) were established in Ljubljana, the central Slovenian city, and between 1550 and 1600 over 50 books in Slovenian were published. In addition, Primož Trubar and his co-workers encouraged the opening of Slovenian elementary and high schools. This sudden explosion of literary activity built the foundation for the further development of literature in Slovenian and its use by the educated classes of Slovenes. The Catholic Counter-Reformation reacted to the spread of Protestantism very strongly within Catholic Austria, and slowed down the entire process until the Napoleonic period. Despite these efforts, important cultural institutions were established, such as an Academy of Arts and Sciences (1673) and the Philharmonic Society in 1701 (perhaps the oldest in Europe).

The Jesuits, heavily involved in the Counter-Reformation, had to use religious literature and songs in the Slovene language, but generally Latin was used as the main language in Jesuit schools. However, the first Catholic books in Slovenian were issued in 1615 to assist priests in the reading of Gospel passages and delivery of sermons. The Protestant books in Slovenian were used for such purposes, and they thus assisted in the further development of a standard literary Slovenian. Since Primož Trubar used his dialect from the Carniola region, it heavily influenced the literary standard. From the late 17th and through the 18th century the Slovenes continued their divided existence under Austrian control.

Standing over trade routes connecting the German/Austrian hinterland to the Adriatic Sea and the Italian plains eastward into the Balkan region, the Slovenes partook of the benefits from such trade in terms of both economic and cultural enrichment. Thus by the end of the 18th century, a significant change occurred in the urban centers where an educated Slovene middle class came into existence. Deeply rooted in the Slovene peasantry, this element ceased to assimilate into the Germanized mainstream and began to assert its own cultural/national identity. Many of their sons were educated in German, French, and Italian universities and thus exposed to the influence of the Enlightenment. Such a person was, for instance, Baron Ziga Zois (1749–1819), an industrialist, landowner, and linguist who became the patron of the Slovene literary movement. When the ideas of the French Revolution spread through Europe and the Napoleonic conquest reached the Slovenes, they were ready to embrace them.

During the reign of Maria Teresa (1740–80) and Joseph II (1780–90), the influence of Jansenism—the emancipation of serfs, the introduction of public schools (in German), equality of religions, closing of monasteries not involved in education or tending to the sick—weakened the hold of the nobility. On the other hand, the stronger Germanization emphasis generated resistance to it from an awakening Slovene national consciousness and the publication of Slovene nonreligious works, such as Marko Pohlin's

*Abecedika* (1765), a *Carniolan Grammar* (1783) with explanations in German, and other educational works in Slovenian, which include a Slovenian-German-Latin dictionary (1781). Pohlin's theory of metrics and poetics became the foundation of secular poetry in Slovenian, which reached its zenith only 50 years later with France Prešeren (1800–49), still considered the greatest Slovene poet. Just prior to the short Napoleonic occupation of Slovenia, the first Slovenian newspaper was published in 1797 by Valentin Vodnik (1758–1819), a very popular poet and grammarian. The first drama in Slovenian appeared in 1789 by Anton Tomaž Linhart (1756–95), playwright and historian of Slovenes and South Slavs. Both authors were members of Baron Zois' circle.

### Napoleon and the Spring of Nations

When Napoleon defeated Austria and established his Illyrian Provinces (1809–13), comprising the southern half of the Slovenian lands, parts of Croatia, and Dalmatia all the way to Dubrovnik with Ljubljana as the capital, the Slovene language was encouraged in the schools and also used, along with French, as an official language in order to communicate with the Slovene population. The four-year French occupation served to reinforce the national awakening of the Slovenes and other nations that had been submerged through the long feudal era of the Austrian Empire. Austria, however, regained the Illyrian Provinces in 1813 and reestablished its direct control over the Slovene lands.

The 1848 “spring of nations” brought about various demands for national freedom of Slovenes and other Slavic nations of Austria. An important role was played by Jernej Kopitar with his influence as librarian/censor in the Imperial Library in Vienna, as the developer of Slavic studies in Austria, as the mentor to Vuk Karadžić (one of the founders of the contemporary Serbo-Croatian language standard), as the advocate of Austro-Slavism (a state for all Slavs of Austria), and as author of the first modern Slovenian grammar in 1808. In mid-May 1848, the “United Slovenia” manifesto demanded that the Austrian Emperor establish a Kingdom of Slovenia with its own parliament, consisting of the then-separate historical regions of Carniola, Carinthia, Styria, and the Littoral, with Slovenian as its official language. This kingdom would remain a part of Austria, but not of the German Empire. While other nations based their demands on the “historical statehood” principle, the Slovenian demands were based on the principle of national self-determination some 70 years before American President Woodrow Wilson would embrace the principle in his “Fourteen Points.”

Matija Kavčič, one of 14 Slovenian deputies elected to the 1848–49 Austrian parliament, proposed a plan of turning the Austrian Empire into a federation of 14 national states that would completely do away with the system of historic regions based on the old feudal system. At the 1848 Slavic Congress in Prague, the Slovenian delegates also demanded the establishment of the Slovenian University in Ljubljana. A map of a United Slovenia was designed by Peter Kozler based on then available ethnic data. It was confiscated by Austrian authorities, and Kozler was accused of treason in 1852 but was later released for insufficient evidence. The revolts of 1848 were repressed after a few years, and absolutistic regimes kept control on any movements in support of national rights. However, recognition was given to equal rights of the Slovenian language in principle, while denied in practice by the Ger-

man/Hungarian element that considered Slovenian the language of servants and peasants. Even the “minimalist” Maribor program of 1865 (a common assembly of deputies from the historical provinces to discuss mutual problems) was fiercely opposed by most Austrians that supported the Pan-German plan of a unified German nation from the Baltic to the Adriatic seas. The Slovenian nation was blocking the Pan-German plan simply by being located between the Adriatic Sea (Trieste) and the German/Austrian Alpine areas; therefore, any concessions had to be refused in order to speed up its total assimilation. Hitler’s World War II plan to “cleanse” the Slovenians was an accelerated approach to the same end by use of extreme violence.

#### Toward “Yugoslavism”

In 1867, the German and Hungarian majorities agreed to the reorganization of the state into a “Dualistic” Austro-Hungarian Monarchy in order to be better able to control the minority elements in each half of the empire. The same year, in view of such intransigence, the Slovenes reverted back to their “maximalist” demand of a “United Slovenia” (1867 Ljubljana Manifesto) and initiated a series of mass political meetings, called “Tabori,” after the Czech model. Their motto became “Umreti nočemo!” (“We refuse to die!”), and a movement was initiated to bring about a cultural/political coalition of Slovenes, Croats, and Serbs of Austro-Hungary in order to more successfully defend themselves from the increasing efforts of Germanization/Magyarization. At the same time, Slovenes, Croats, and Serbs followed with great interest several movements of national liberation and unification, such as those in Italy, Germany, Greece, and Serbia, and drew from them much inspiration. While Austria lost its northern Italian provinces to the Italian “Risorgimento,” it gained, on the other hand, Bosnia and Herzegovina through occupation (1878) and annexation (1908). These actions increased the interest of Slovenes, Croats, and Serbs of Austro-Hungary in a “Trialistic” arrangement that would allow the South Slavic groups (“Yugoslavs”) to form their own joint (and “Third”) unit within Austro-Hungary. A federalist solution, they believed, would make possible the survival of a country to which they had been loyal subjects for many centuries. Crown Prince Ferdinand supported this approach, called “The United States of greater Austria” by his advisers, also because it would remove the attraction of a Greater Serbia. But the German leadership’s sense of its own superiority and consequent expansionist goals prevented any compromise and led to two world wars.

#### World War I and Royal Yugoslavia

Unable to achieve their maximalist goals, the Slovenes concentrated their effort at the micro-level and made tremendous strides prior to World War I in introducing education in Slovenian, organizing literary and reading rooms in every town, participating in economic development, upgrading their agriculture, organizing cultural societies and political parties, such as the Catholic People’s Party in 1892 and the Liberal Party in 1894, and participating in the Socialist movement of the 1890s. World War I brought about the dissolution of centuries-old ties between the Slovenes and the Austrian Monarchy and the Croats/Serbs with the Hungarian Crown. Toward the end of the war, on 12 August 1918, the National Council for Slovenian Lands was formed in Ljubljana. On 12 October 1918, the National Council for all Slavs of former Austro-Hungary was founded in Zagreb, Croatia, and was chaired

by Msgr. Anton Korošec, head of the Slovenian People’s Party. This Council proclaimed on 29 October 1918 the separation of the South Slavs from Austro-Hungary and the formation of a new state of Slovenes, Croats, and Serbs.

A National Government for Slovenia was established in Ljubljana. The Zagreb Council intended to negotiate a Federal Union with the Kingdom of Serbia that would preserve the respective national autonomies of the Slovenes, Croats, and Serbs. Msgr. Korošec had negotiated a similar agreement in Geneva with Nikola Pašić, his Serbian counterpart, but a new Serbian government reneged on it. There was no time for further negotiations due to the Italian occupation of much Slovenian and Croatian territory and only Serbia, a victor state, could resist Italy. Thus, a delegation of the Zagreb Council submitted to Serbia a declaration expressing the will to unite with The Kingdom of Serbia. At that time, there were no conditions presented or demand made regarding the type of union, and Serbia immediately accepted the proposed unification under its strongly centralized government; a unitary “Kingdom of Serbs, Croats, and Slovenes” was declared on 1 December 1918. Because of the absence of an initial compromise between the Unitarists and Federalists, what became Yugoslavia never gained a solid consensual foundation. Serbs were winners and viewed their expansion as liberation of their Slavic brethren from Austria-Hungary, as compensation for their tremendous war sacrifices, and as the realization of their “Greater Serbia” goal. Slovenes and Croats, while freed from the Austro-Hungarian domination, were nevertheless the losers in terms of their desired political/cultural autonomy. In addition, they suffered painful territorial losses to Italy (some 700,000 Slovenes and Croats were denied any national rights by Fascist Italy and subjected to all kinds of persecutions) and to Austria (a similar fate for some 100,000 Slovenes left within Austria in the Carinthia region).

After 10 years of a contentious parliamentary system that ended in the murder of Croatian deputies and their leader Stjepan Radić, King Alexander abrogated the 1921 constitution, dissolved the parliament and political parties, took over power directly, and renamed the country “Yugoslavia.” He abolished the 33 administrative departments that had replaced the historic political/national regions in favor of administrative areas named mostly after rivers. A new policy was initiated with the goal of creating a single “Yugoslav” nation out of the three “Tribes” of Serbs, Croats, and Slovenes. But in practice this policy meant the King’s Serbian hegemony over the rest of the nations. The reaction was intense, and King Alexander himself fell victim of Croat-Ustaša and Macedonian terrorists and died in Marseille in 1934. A regency ruled Yugoslavia, headed by Alexander’s cousin, Prince Paul, who managed to reach an agreement in 1939 with the Croats. An autonomous Croatian “Banovina” headed by “Ban” Ivan Subašić was established, including most Croatian lands outside of the Bosnia and Herzegovina area. Strong opposition developed among Serbs because they viewed the Croatian Banovina as a privilege for Croats while Serbs were split among six old administrative units with a large Serbian population left inside the Croatian Banovina itself. Still, there might have been a chance for further similar agreements that would have satisfied the Serbs and Slovenes. But there was no time left—Hitler and his allies (Italy, Hungary, Bulgaria) attacked Yugoslavia on 6 April 1941, after a coup on 27 March 1941 had deposed Prince Paul’s government, which had yielded to

Hitler's pressures on 25 March. Thus the first Yugoslavia, born out of the distress of World War I, had not had time to consolidate and work out its problems in a mere 23 years and was then dismembered by its aggressors. Still, the first Yugoslavia allowed the Slovenes a chance for fuller development of their cultural, economic, and political life, in greater freedom and relative independence for the first time in modern times.

### World War II

Slovenia was divided in 1941 among Germany, Italy, and Hungary. Germany annexed northern Slovenia, mobilized its men into the German army, interned, expelled, or killed most of the Slovenian leaders, and removed to labor camps the populations of entire areas, repopulating them with Germans. Italy annexed southern Slovenia but did not mobilize its men. In both areas, particularly the Italian, resistance movements were initiated by both nationalist groups and by Communist-dominated Partisans, the latter particularly after Hitler's attack on the Soviet Union on 22 June 1941. The Partisans claimed monopoly of the resistance leadership and dealt cruelly with anyone that dared to oppose their intended power grab. Spontaneous resistance to the Partisans by the non-Communist Slovenian peasantry led to a bloody civil war in Slovenia under foreign occupiers, who encouraged the bloodshed. The resistance movement led by General Draža Mihajlović, appointed minister of war of the Yugoslav government-in-exile, was handicapped by the exile government's lack of unity and clear purpose (mostly due to the fact that the Serbian side had reneged on the 1939 agreement on Croatia). On the other hand, Winston Churchill, convinced by rather one-sided reports that Mihajlović was "collaborating" with the Germans while the Partisans under Marshal Tito were the ones "who killed more Germans," decided to recognize Tito as the only legitimate Yugoslav resistance. Though aware of Tito's communist allegiance to Stalin, Churchill threw his support to Tito, and forced the Yugoslav government-in-exile into a coalition government with Tito, who had no intention of keeping the agreement and, in fact, would have fought against an Allied landing in Yugoslavia along with the Germans.

When Soviet armies, accompanied by Tito, entered Yugoslavia from Romania and Bulgaria in the fall of 1944, military units and civilians that had opposed the Partisans retreated to Austria or Italy. Among them were the Cetnik units of Draža Mihajlović and "homeguards" from Serbia, Croatia, and Slovenia that had been under German control but were pro-Allies in their convictions and hopes. Also in retreat were the units of the Croatian Ustaša that had collaborated with Italy and Germany in order to achieve (and control) an "independent" greater Croatia and, in the process, had committed terrible and large-scale massacres of Serbs, Jews, Gypsies, and others who opposed them. Serbs and Partisans counteracted, and a fratricidal civil war raged over Yugoslavia. After the end of the war, the Communist-led forces took control of Slovenia and Yugoslavia and instituted a violent dictatorship that committed systematic crimes and human rights violations on an unexpectedly large scale. Thousands upon thousands of their former opponents that were returned, unaware, from Austria by British military authorities were tortured and massacred by Partisan executioners.

### Communist Yugoslavia

Such was the background for the formation of the second Yugoslavia as a Federative People's Republic of five nations (Slovenes,

Croats, Serbs, Macedonians, Montenegrins) with their individual republics and Bosnia and Herzegovina as a buffer area with its mix of Serb, Muslim, and Croat populations. The problem of large Hungarian and Muslim Albanian populations in Serbia was solved by creating for them the autonomous region of Vojvodina (Hungarian minority) and Kosovo (Muslim Albanian majority) that assured their political and cultural development. Tito attempted a balancing act to satisfy most of the nationality issues that were carried over unresolved from the first Yugoslavia, but failed to satisfy anyone.

Compared to pre-1941 Yugoslavia where Serbs enjoyed a controlling role, the numerically stronger Serbs had lost both the Macedonian area they considered "Southern Serbia" and the opportunity to incorporate Montenegro into Serbia, as well as losing direct control over the Hungarian minority in Vojvodina and the Muslim Albanians of Kosovo, viewed as the cradle of the Serbian nation since the Middle Ages. They further were not able to incorporate into Serbia the large Serbian populated areas of Bosnia and had not obtained an autonomous region for the large minority of Serbian population within the Croatian Republic. The Croats, while gaining back the Medjumurje area from Hungary, and from Italy, the cities of Rijeka (Fiume), Zadar (Zara), some Dalmatian islands, and the Istrian Peninsula had, on the other hand, lost other areas. These included the Srem area to Serbia, and also Bosnia and Herzegovina, which had been part of the World War II "independent" Croatian state under the Ustaša leadership.

In addition, the Croats were confronted with a deeply resentful Serbian minority that became ever more pervasive in public administrative and security positions. The Slovenes had regained the Prekmurje enclave from Hungary and most of the Slovenian lands that had been taken over by Italy following World War I (Julian region and Northern Istria), except for the "Venetian Slovenia" area, the Gorizia area, and the port city of Trieste. The latter was initially part of the UN protected "Free Territory of Trieste," split in 1954 between Italy and Yugoslavia with Trieste itself given to Italy. Nor were the Slovenian claims to the southern Carinthia area of Austria satisfied. The loss of Trieste was a bitter pill for the Slovenes and many blamed it on the fact that Tito's Yugoslavia was, initially, Stalin's advance threat to Western Europe, thus making the Allies more supportive of Italy.

The official position of the Marxist Yugoslav regime was that national rivalries and conflicting interests would gradually diminish through their sublimation into a new Socialist order. Without capitalism, nationalism was supposed to wither away. Therefore, in the name of their "unity and brotherhood" motto, any nationalistic expression of concern was prohibited and repressed by the dictatorial and centralized regime of the "League of Yugoslav Communists" acting through the "Socialist Alliance" as its mass front organization.

After a short postwar "coalition" government period, the elections of 11 November 1945, boycotted by the non-communist "coalition" parties, gave the Communist-led People's Front 90% of the vote. A Constituent Assembly met on 29 November, abolishing the monarchy and establishing the Federative People's Republic of Yugoslavia. In January 1946 a new constitution was adopted, based on the 1936 Soviet constitution. The Stalin-engineered expulsion of Yugoslavia from the Soviet-dominated Cominform Group in 1948 was actually a blessing for Yugoslavia after its leadership was able to survive Stalin's pressures. Survival had to be jus-

tified, both practically and in theory, by developing a “Road to Socialism” based on Yugoslavia’s own circumstances. This new “road map” evolved rather quickly in response to some of Stalin’s accusations and Yugoslavia’s need to perform a balancing act between the North Atlantic Treaty Organization (NATO) alliance and the Soviet bloc. Tito quickly nationalized the economy through a policy of forced industrialization, to be supported by the collectivization of the agriculture.

The agricultural reform of 1945–46 (limited private ownership of a maximum of 35 hectares/85 acres, and a limited free market after the initial forced delivery of quotas to the state at very low prices) had to be abandoned because of the strong resistance by the peasants. The actual collectivization efforts were initiated in 1949 using welfare benefits and lower taxes as incentives along with direct coercion. But collectivization had to be abandoned by 1958 simply because its inefficiency and low productivity could not support the concentrated effort of industrial development.

By the 1950s Yugoslavia had initiated the development of its internal trademark: self-management of enterprises through workers councils and local decision-making as the road to Marx’s “withering away of the state.” The second five-year plan (1957–61), as opposed to the failed first one (1947–51), was completed in four years by relying on the well-established self-management system. Economic targets were set from the local to the republic level and then coordinated by a Federal Planning Institute to meet an overall national economic strategy. This system supported a period of very rapid industrial growth in the 1950s from a very low base. But a high consumption rate encouraged a volume of imports far in excess of exports, largely financed by foreign loans. In addition, inefficient and low productivity industries were kept in place through public subsidies, cheap credit, and other artificial measures that led to a serious crisis by 1961.

Reforms were necessary and, by 1965, “market socialism” was introduced with laws that abolished most price controls and halved import duties while withdrawing export subsidies. After necessary amounts were left with the earning enterprise, the rest of the earned foreign currencies were deposited with the national bank and used by the state, other enterprises, or were used to assist less-developed areas. Councils were given more decision-making power in investing their earnings, and they also tended to vote for higher salaries in order to meet steep increases in the cost of living. Unemployment grew rapidly even though “political factories” were still subsidized. The government thus relaxed its restrictions to allow labor migration, particularly to West Germany where workers were needed for its thriving economy. Foreign investment was encouraged up to 49% in joint enterprises, and barriers to the movement of people and exchange of ideas were largely removed.

The role of trade unions continued to be one of transmission of instructions from government to workers, allocation of perks along with the education/training of workers, monitoring legislation, and overall protection of the self-management system. Strikes were legally neither allowed nor forbidden, but until the 1958 miners strike in Trbovlje, Slovenia, were not publicly acknowledged and were suppressed. After 1958 strikes were tolerated as an indication of problems to be resolved. Unions, however, did not initiate strikes but were expected to convince workers to go back to work.

Having survived its expulsion from the Cominform in 1948 and Stalin’s attempts to take control, Yugoslavia began to develop

a foreign policy independent of the Soviet Union. By mid-1949 Yugoslavia withdrew its support from the Greek Communists in their civil war against the then-Royalist government. In October 1949, Yugoslavia was elected to one of the nonpermanent seats on the UN Security Council and openly condemned North Korea’s aggression towards South Korea. Following the “rapprochement” opening with the Soviet Union, initiated by Nikita Khrushchev and his 1956 denunciation of Stalin, Tito intensified his work on developing the movement of nonaligned “third world” nations as Yugoslavia’s external trademark in cooperation with Nehru of India, Nasser of Egypt, and others. With the September 1961 Belgrade summit conference of nonaligned nations, Tito became the recognized leader of the movement. The nonaligned position served Tito’s Yugoslavia well by allowing Tito to draw on economic and political support from the Western powers while neutralizing any aggression from the Soviet bloc. While Tito had acquiesced, reluctantly, to the 1956 Soviet invasion of Hungary for fear of chaos and any liberalizing impact on Yugoslavia, he condemned the Soviet invasion of Dubček’s Czechoslovakia in 1968, as did Romania’s Ceausescu, both fearing their countries might be the next in line for “corrective” action by the Red Army and the Warsaw Pact. Just before his death on 4 May 1980, Tito also condemned the Soviet invasion of Afghanistan. Yugoslavia actively participated in the 1975 Helsinki Conference and agreements and the first 1977–78 review conference that took place in Belgrade, even though Yugoslavia’s one-party Communist regime perpetrated and condoned numerous human rights violations. Overall, in the 1970s–80s Yugoslavia maintained fairly good relations with its neighboring states by playing down or solving pending disputes such as the Trieste issue with Italy in 1975, and developing cooperative projects and increased trade.

Compared to the other republics of the Federative People’s Republic of Yugoslavia, the Republic of Slovenia had several advantages. It was 95% homogeneous. The Slovenes had the highest level of literacy. Their prewar economy was the most advanced and so was their agriculture, which was based on an extensive network of peasant cooperatives and savings and loans institutions developed as a primary initiative of the Slovenian People’s Party (“clerical”). Though ravaged by the war, occupation, resistance and civil war losses, and preoccupied with carrying out the elimination of all actual and potential opposition, the Communist government faced the double task of building its Socialist economy while rebuilding the country. As an integral part of the Yugoslav federation, Slovenia was, naturally, affected by Yugoslavia’s internal and external political developments. The main problems facing communist Yugoslavia/Slovenia were essentially the same as the unresolved ones under Royalist Yugoslavia. As the “Royal Yugoslavism” had failed in its assimilative efforts, so did the “Socialist Yugoslavism” fail to overcome the forces of nationalism. In the case of Slovenia there were several key factors in the continued attraction to its national identity: more than a thousand years of historical development; a location within Central Europe (not part of the Balkan area) and related identification with Western European civilization; the Catholic religion with the traditional role of Catholic priests (even under the persecutions by the Communist regime); the most developed and productive economy with a standard of living far superior to most other areas of the Yugoslav Federation; and finally, the increased political and economic autonomy enjoyed by the Republic after the 1974 constitution, particularly fol-

lowing Tito's death in 1980. Tito's motto of "unity and brotherhood" was replaced by "freedom and democracy" to be achieved through either a confederative rearrangement of Yugoslavia or by complete independence.

In December 1964, the eighth Congress of the League of Communists of Yugoslavia (LCY) acknowledged that ethnic prejudice and antagonisms existed in socialist Yugoslavia and went on record against the position that Yugoslavia's nations had become obsolete and were disintegrating into a socialist "Yugoslavism." Thus the republics, based on individual nations, became bastions of a strong Federalism that advocated the devolution and decentralization of authority from the federal to the republic level. "Yugoslav Socialist Patriotism" was at times defined as a deep feeling for both one's own national identity and for the socialist self-management of Yugoslavia. Economic reforms were the other focus of the Eighth LCY Congress, led by Croatia and Slovenia with emphasis on efficiencies and local economic development decisions with profit criteria as their basis. The "liberal" bloc (Slovenia, Croatia, Macedonia, Vojvodina) prevailed over the "conservative" group and the reforms of 1965 did away with central investment planning and "political factories." The positions of the two blocs hardened into a national-liberal coalition that viewed the conservative, centralist group led by Serbia as the "Greater Serbian" attempt at majority domination. The devolution of power in economic decision-making spearheaded by the Slovenes assisted in the "federalization" of the League of Communists of Yugoslavia as a league of "quasi-sovereign" republican parties. Under strong prodding from the Croats, the party agreed in 1970 to the principle of unanimity for decision-making that, in practice, meant a veto power for each republic. However, the concentration of economic resources in Serbian hands continued with Belgrade banks controlling half of total credits and some 80% of foreign credits. This was also combined with the fear of Serbian political and cultural domination, particularly with respect to Croatian language sensitivities, which had been aroused by the use of the Serbian version of Serbo-Croatian as the norm, with the Croatian version as a deviation. The debates over the reforms of the 1960s led to a closer scrutiny, not only of the economic system, but also of the decision-making process at the republic and federal levels, particularly the investment of funds to less developed areas that Slovenia and Croatia felt were very poorly managed, if not squandered. Other issues fueled acrimony between individual nations, such as the 1967 Declaration in Zagreb claiming a Croatian linguistic and literary tradition separate from the Serbian one, thus undermining the validity of the Serbo-Croatian language. Also, Kosovo Albanians and Montenegrins, along with Slovenes and Croats, began to assert their national rights as superior to the Federation ones.

The language controversy exacerbated the economic and political tensions between Serbs and Croats, which spilled into the easily inflamed area of ethnic confrontations. To the conservative centralists the devolution of power to the republic level meant the subordination of the broad "Yugoslav" and "Socialist" interests to the narrow "nationalist" interest of republic national majorities. With the Croat League of Communists taking the liberal position in 1970, nationalism was rehabilitated. Thus the "Croatian Spring" bloomed and impacted all the other republics of Yugoslavia. Meanwhile, through a series of 1967–68 constitutional amendments that had limited federal power in favor of the republics and

autonomous provinces, the federal government came to be seen by liberals more as an inter-republican problem-solving mechanism bordering on a confederative arrangement. A network of inter-republican committees established by mid-1971 proved to be very efficient at resolving a large number of difficult issues in a short time. The coalition of liberals and nationalists in Croatia also generated sharp condemnation in Serbia whose own brand of nationalism grew stronger, but as part of a conservative/centralist alliance. Thus the liberal/federalist versus conservative/centralist opposition became entangled in the rising nationalism within each opposing bloc. The situation in Croatia and Serbia was particularly difficult because of their minorities issues—Serbian in Croatia and Hungarian/Albanian in Serbia.

Serbs in Croatia sided with the Croat conservatives and sought a constitutional amendment guaranteeing their own national identity and rights and, in the process, challenged the sovereignty of the Croatian nation and state as well as the right to self-determination, including the right to secession. The conservatives won and the amendment declared that "the Socialist Republic of Croatia (was) the national state of the Croatian nation, the state of the Serbian nation in Croatia, and the state of the nationalities inhabiting it.

#### Slovenian "Spring"

Meanwhile, Slovenia, not burdened by large minorities, developed a similar liberal and nationalist direction along with Croatia. This fostered an incipient separatist sentiment opposed by both the liberal and conservative party wings. Led by Stane Kavčič, head of the Slovenian government, the liberal wing gained as much local political latitude as possible from the federal level during the early 1970s "Slovenian Spring." By the summer of 1971, the Serbian party leadership was pressuring President Tito to put an end to the "dangerous" development of Croatian nationalism. While Tito wavered because of his support for the balancing system of autonomous republic units, the situation quickly reached critical proportions.

Croat nationalists, complaining about discrimination against Croats in Bosnia and Herzegovina, demanded the incorporation of Western Herzegovina into Croatia. Serbia countered by claiming Southeastern Herzegovina for itself. Croats also advanced claims to a larger share of their foreign currency earnings, to the issuance of their own currency, the creation of their own national bank that would directly negotiate foreign loans, the printing of Croatian postage stamps, the creation of a Croatian army, and recognition of the Croatian *Sabor* (assembly) as the highest Croatian political body, and, finally, to Croatian secession and complete independence. Confronted with such intensive agitation, the liberal Croatian party leadership could not back down and did not try to restrain the maximalist public demands nor the widespread university students' strike of November 1971. This situation caused a loss of support from the liberal party wings of Slovenia and even Macedonia. At this point Tito intervened, condemned the Croatian liberal leadership on 1 December 1971, and supported the conservative wing. The liberal leadership group resigned on 12 December 1971. When Croatian students demonstrated and demanded an independent Croatia, the Yugoslav army was ready to move in if necessary. A wholesale purge of the party liberals followed with tens of thousands expelled, key functionaries lost their

positions, several thousand were imprisoned (including Franjo Tuđman who later became president in independent Croatia), and leading Croatian nationalist organizations and their publications were closed.

On 8 May 1972, the Croatian party also expelled its liberal wing leaders and the purge of nationalists continued through 1973 in Croatia, as well as in Slovenia and Macedonia. However, the issues and sentiments raised during the “Slovene and Croat Springs” of 1969–71 did not disappear. Tito and the conservatives were forced to satisfy nominally some demands. The 1974 constitution was an attempt to resolve the strained inter-republican relations as each republic pursued its own interests over and above an overall “Yugoslav” interest. The repression of liberal-nationalist Croats was accompanied by the growing influence of the Serbian element in the Croatian Party (24% in 1980) and police force (majority) that contributed to the continued persecution and imprisonments of Croatian nationalists into the 1980s.

### Yugoslavia—House Divided

In Slovenia, developments took a direction of their own. The purge of the nationalists took place as in Croatia but on a lesser scale, and after a decade or so, nationalism was revived through the development of grassroots movements in the arts, music, peace, and environmental concerns. Activism was particularly strong among young people, who shrewdly used the regime-supported youth organizations, youth periodicals—such as *Mladina* (in Ljubljana) and *Katedra* (in Maribor)—and an independent student radio station. The journal *Nova Revija* published a series of articles focusing on problems confronting the Slovenian nation in February 1987; these included such varied topics as the status of the Slovenian language, the role of the Communist Party, the multiparty system, and independence. The *Nova Revija* was in reality a Slovenian national manifesto that, along with yearly public opinion polls showing ever higher support for Slovenian independence, indicated a definite mood toward secession. In this charged atmosphere, the Yugoslav army committed two actions that led the Slovenes to the path of actual separation from Yugoslavia. In March 1988, the army’s Military Council submitted a confidential report to the federal presidency claiming that Slovenia was planning a counter revolution and calling for repressive measures against liberals and a *coup d’état*. An army document delineating such actions was delivered by an army sergeant to the journal *Mladina*. But, before it could be published, *Mladina*’s editor and two journalists were arrested by the army on 31 March 1988. Meanwhile, the strong intervention of the Slovenian political leadership succeeded in stopping any army action. But the four men involved in the affair were put on trial by the Yugoslav army.

The second army *faux pas* was to hold the trial in Ljubljana, capital of Slovenia, and to conduct it in the Serbo-Croatian language, an action declared constitutional by the Yugoslav presidency, claiming that Slovenian law could not be applied to the Yugoslav army. This trial brought about complete unity among Slovenians in opposition to the Yugoslav army and what it represented, and the four individuals on trial became overnight heroes. One of them was Janez Janša who had written articles in *Mladina* critical of the Yugoslav army and was the head of the Slovenian pacifist movement and president of the Slovenian Youth Organization. (Ironically, three years later Janša led the successful defense of Slo-

venia against the Yugoslav army and became the first minister of defense of independent Slovenia.) The four men were found guilty and sentenced to jail terms from four years (Janša) to five months. The total mobilization of Slovenia against the military trials led to the formation of the first non-Communist political organizations and political parties. In a time of perceived national crisis, both the Communist and non-Communist leadership found it possible to work closely together. But from that time on the liberal/nationalist vs. conservative/centralist positions hardened in Yugoslavia and no amount of negotiation at the federal presidency level regarding a possible confederal solution could hold Yugoslavia together any longer.

Since 1986, work had been done on amendments to the 1974 constitution that, when submitted in 1987, created a furor, particularly in Slovenia, due to the proposed creation of a unified legal system, the establishment of central control over the means of transportation and communication, centralization of the economy into a unified market, and the granting of more control to Serbia over its autonomous provinces of Kosovo and Vojvodina. This all came at the expense of the individual republics. A recentralization of the League of Communists was also recommended but opposed by liberal/nationalist groups. Serbia’s President Slobodan Milošević also proposed changes to the bicameral Federal Skupština (Assembly) by replacing it with a tricameral one where deputies would no longer be elected by their republican assemblies but through a “one person, one vote” national system. Slovenia, Croatia, and Bosnia and Herzegovina strongly opposed the change as they opposed the additional Chamber of Associated Labor that would have increased the federal role in the economy. The debates over the recentralizing amendments caused an even greater focus in Slovenia and Croatia on the concept of a confederative structure based on self-determination by “sovereign” states and a multiparty democratic system as the only one that could maintain some semblance of a “Yugoslav” state.

By 1989 and the period following the Serbian assertion of control in the Kosovo and Vojvodina provinces, as well as in the republic of Montenegro, relations between Slovenia and Serbia reached a crisis point: Serbian President Milošević attempted to orchestrate mass demonstrations by Serbs in Ljubljana, the capital city of Slovenia, and the Slovenian leadership vetoed it. Then Serbs started to boycott Slovenian products, to withdraw their savings from Slovenian banks, and to terminate economic cooperation and trade with Slovenia. Serbian President Milošević’s tactics were extremely distasteful to the Slovenians and the use of force against the Albanian population of the Kosovo province worried the Slovenes (and Croats) about the possible use of force by Serbia against Slovenia itself. The tensions with Serbia convinced the Slovenian leadership of the need to take necessary protective measures. In September 1989, draft amendments to the constitution of Slovenia were published that included the right to secession, and the sole right of the Slovenian legislature to introduce martial law. The Yugoslav army particularly needed the amendment granting control over deployment of armed forces in Slovenia, since the Yugoslav army, controlled by a mostly Serbian/Montenegrin officer corps dedicated to the preservation of a Communist system, had a self-interest in preserving the source of their own budgetary allocations of some 51% of the Yugoslav federal budget.

A last attempt at salvaging Yugoslavia was to be made at the extraordinary Congress of the League of Communists of Yugoslavia convened in January 1990 to review proposed reforms such as free multiparty elections, and freedom of speech. The Slovenian delegation attempted to broaden the spectrum of reforms but was rebuffed and walked out on 23 January 1990, pulling out of the Yugoslav League. The Slovenian Communists then renamed their party the Party for Democratic Renewal. The political debate in Slovenia intensified and some 19 parties were formed by early 1990. On 10 April 1990 the first free elections since before World War II were held in Slovenia, where there still was a three-chamber Assembly: political affairs, associated labor, and territorial communities. A coalition of six newly formed democratic parties, called *Demos*, won 55% of the votes, with the remainder going to the Party for Democratic Renewal, the former Communists (17%), the Socialist Party (5%), and the Liberal Democratic Party—heir to the Slovenia Youth Organization (15%). The *Demos* coalition organized the first freely elected Slovenian government of the post-Communist era with Dr. Lojze Peterle as the prime minister.

Milan Kucan, former head of the League of Communists of Slovenia, was elected president with 54% of the vote in recognition of his efforts to effect a bloodless transfer of power from a monopoly by the Communist party to a free multiparty system and his standing up to the recentralizing attempts by Serbia.

#### Toward Independence

In October 1990, Slovenia and Croatia published a joint proposal for a Yugoslavian confederation as a last attempt at a negotiated solution, but to no avail. The Slovenian legislature also adopted in October a draft constitution proclaiming that “Slovenia will become an independent state.” On 23 December 1990, a plebiscite was held on Slovenia’s disassociation from Yugoslavia if a confederate solution could not be negotiated within a six-month period. An overwhelming majority of 89% of voters approved the secession provision and a declaration of sovereignty was adopted on 26 December 1990. All federal laws were declared void in Slovenia as of 20 February 1991, and since no negotiated agreement was possible, Slovenia declared its independence on 25 June 1991. On 27 June 1991, the Yugoslav army tried to seize control of Slovenia and its common borders with Italy, Austria, and Hungary under the pretext that it was the army’s constitutional duty to assure the integrity of Socialist Yugoslavia. The Yugoslav army units were surprised and shocked by the resistance they encountered from the Slovenian “territorial guards,” who surrounded Yugoslav army tank units, isolated them, and engaged in close combat, mostly along border checkpoints that ended in most cases with Yugoslav units surrendering to the Slovenian forces. Fortunately, casualties were limited on both sides. Over 3,200 Yugoslav army soldiers surrendered and were well treated by the Slovenes, who scored a public relations coup by having the prisoners call their parents all over Yugoslavia to come to Slovenia and take their sons back home.

The war in Slovenia ended in 10 days due to the intervention of the European Community, who negotiated a cease-fire and a three-month moratorium on Slovenia’s implementation of independence, giving the Yugoslav army time to retreat from Slovenia by the end of October 1991. Thus Slovenia was able to “disassociate” itself from Yugoslavia with a minimum of casualties, although

the military operations caused considerable physical damages estimated at almost US\$3 billion. On 23 December 1991, one year following the independence plebiscite, a new constitution was adopted by Slovenia establishing a parliamentary democracy with a bicameral legislature. Even though US Secretary of State James Baker, in his visit to Belgrade on 21 June 1991, had declared that the United States opposed unilateral secessions by Slovenia and Croatia and that the United States would therefore not recognize them as independent countries, such recognition came first from Germany on 18 December 1991, from the European Community on 15 January 1992, and finally from the United States on 7 April 1992. Slovenia was accepted as a member of the UN on 23 April 1992 and has since become a member of many other international organizations, including the Council of Europe in 1993 and the NATO related Partnership for Peace in 1994.

On 6 December 1992, general elections were held in accordance with the new constitution, with 22 parties participating and eight receiving sufficient votes to assure representation. A coalition government was formed by the Liberal Democrats, Christian Democrats, and the United List Group of Leftist Parties. Dr. Milan Kucan was elected president, and Dr. Janez Drnovšek became prime minister. In 1997 a compromise was struck which allowed Poland, the Czech Republic, and Hungary to join the NATO alliance in 1999 while Romania and Slovenia were identified as prime candidates for future nomination into the alliance. Also in 1997, Slovenia signed an association agreement with the European Union (EU) and was invited to talks on EU membership.

In the 1970s, Slovenia had reached a standard of living close to the one in neighboring Austria and Italy. However, the burdens imposed by the excessive cost of maintaining a large Yugoslav army, heavy contributions to the Fund for Less Developed Areas, and the repayments on a US\$20 billion international debt, caused a lowering of its living standard over the 1980s. The situation worsened with the trauma of secession from Yugoslavia, the war damages suffered, and the loss of the former Yugoslav markets. In spite of all these problems Slovenia has made progress since independence by improving its productivity, controlling inflation, and reorienting its exports to Western Europe. The Slovenian economy has been quite strong since 1994, growing at an annual rate of about 4% during the late 1990s. Based on past experience, its industriousness, and good relationship with its trading partners, Slovenia has a very good chance of becoming a successful example of the transition from authoritarian socialism to a free democratic system and a market economy capable of sustaining a comfortable standard and quality of life.

Although governed from independence by centrist coalitions headed by Prime Minister Janez Drnovšek, the coalition collapsed in April 2000. Economist and center-right Social Democrat Party leader Andrej Bajuk became prime minister, until elections on 15 October 2000 saw Drnovšek return to power at the head of a four-party coalition. Drnovšek ran for president in elections held on 1 December 2002, and emerged with 56.5% of the vote in the second round, defeating Barbara Brezigar, who took 43.5%. Both supported EU and NATO membership for Slovenia. Liberal Democrat Anton Rop took over as prime minister when Drnovšek was elected president. The next presidential election was to be held fall 2007.

In the spring of 2004, Slovenia became a member of NATO and the EU. Later that year it held parliamentary elections, which were won by the center-right Slovenian Democratic Party—the first time in 13 years that a party other than the Liberal Democrats took power. In December 2004, Janez Jansa, who served as defense minister in previous governments, became, with the support of the parliament, prime minister. Jansa promised to reduce state administrative costs and to speed up the euro adoption process. The next National Assembly elections were scheduled for October 2008. In February 2005, Slovenia ratified the EU constitution.

### **13 GOVERNMENT**

Slovenia is a republic based on a constitution adopted on 23 December 1991, one year following the plebiscite that supported its independence. As of early 2006, the president was Janez Drnovšek, elected in November 2002. The prime minister was Janez Jansa, elected in October 2004.

The constitution provides for a National Assembly as the highest legislative authority with 90 seats. Deputies are elected to four-year terms of office. The National Council, with 40 seats, has an advisory role, and councilors represent social, economic, professional, and local interests. They are elected to five-year terms of office and may propose laws to the National Assembly, request the latter to review its decisions, and may demand the calling of a constitutional referendum.

The executive branch consists of a president of the republic who is also Supreme Commander of the Armed Forces, and is elected to a five-year term of office, limited to two consecutive terms. The president calls for elections to the National Assembly, proclaims the adopted laws, and proposes candidates for prime minister to the National Assembly. A Council of Ministers to advise the president is nominated by the prime minister and elected by the National Assembly.

### **14 POLITICAL PARTIES**

Parliamentary elections were held on 3 October 2004, with the Slovene Democratic Party (SDS) garnering the highest number of seats—29; the Liberal Democratic Party (which dominated the political scene since Slovenia's independence, in 1991) got 23; the United List of Social Democrats (ZLSD), 10 seats; New Slovenia (Nsi), 9 seats; Slovene People's Party (SLS), 7 seats; Slovenian National Party (SNS), 6 seats; Democratic Party of Retired People of Slovenia (DeSUS), 4 seats; Italian Minority, 1 seat; and the Hungarian Minority, 1 seat. The SDS forged a coalition with two center-right parties—Nsi and SLS—and a center-left party—DeSUS. In November 2004, the National Assembly elected Janez Jansa prime minister, with 57 votes in favor. The next parliamentary elections were scheduled for October 2008.

Party candidates are elected by each district. A candidate is only elected when votes for each party reach a given threshold. A new electoral code was passed in 2000, raising the threshold for securing seats from 3.2% to 4% and ending the use of preferential party lists for allocating seats to candidates who did not win direct mandates.

### **15 LOCAL GOVERNMENT**

The commune or municipality (*občina*) is the basic self-managed sociopolitical community. There are 193 municipalities and 11 ur-

ban municipalities in Slovenia, which have directly elected councils as their representative bodies. A municipality must have at least 5,000 inhabitants. An urban municipality must have at least 20,000 inhabitants, be the place of employment for at least 15,000 people, and be the geographic, economic, and cultural center of the area. There are 58 state administrative units in Slovenia, which have jurisdiction over one or several municipalities. Advisory committees are formed to ensure cooperation between municipal bodies and administrative units. Members of these committees are appointed by the municipal councils. There are also local, village, and ward communities in Slovenia.

In May 2005, the country was divided into 12 statistical regions, and the government plans another partition into 10 to 12 administrative regions. This new divide might follow the borders of the statistical regions, but parliamentary debates, and constitutional changes, had to precede this process.

### **16 JUDICIAL SYSTEM**

The judicial system consists of local and district courts and a Supreme Court, which hears appeals from these courts. A nine-member Constitutional Court resolves jurisdictional disputes and rules on the constitutionality of legislation and regulations. The Constitutional Court also acts as a final court of appeal in cases requiring constitutional interpretation.

Judges are elected by parliament after nomination by a Judicial Council composed of 11 members—six judges selected by their peers and five persons elected by the National Assembly on nomination of the president. The constitution guarantees the independence of judges. Judges are appointed to permanent positions subject to an age limit.

The constitution affords criminal defendants a presumption of innocence, open court proceedings, the right to an appeal, a prohibition against double jeopardy, and a number of other procedural due process protections.

### **17 ARMED FORCES**

The Slovenian armed forces numbered 6,550 active personnel in 2005, with 20,000 reservists. The Slovene Army was equipped with 70 main battle tanks, eight reconnaissance vehicles, 26 armored infantry fighting vehicles, 64 armored personnel carriers, and 140 artillery pieces. The Army's air wing of 530 personnel operated three transport and 12 training fixed wing aircraft, as well as 13 helicopters. There was also a small maritime element with 47 active personnel, operating a single patrol boat. Paramilitary personnel consisted of a 4,500-member police force, with 5,000 reservists. Slovenia participated in UN, NATO, and European Union peacekeeping or military missions in four regions or countries. The defense budget in 2005 totaled \$580 million.

### **18 INTERNATIONAL COOPERATION**

Slovenia was admitted to the United Nations in 1992; it is part of several nonregional specialized agencies, such as the FAO, IAEA, UNCTAD, UNESCO, UNIDO, ILO, the World Bank and the WHO. Slovenia is also a member of the Council of Europe, OSCE, the WTO, the European Bank for Reconstruction and Development, the Inter-American Development Bank, NATO, the Euro-Atlantic Partnership Council, and the European Union. The coun-

try holds observer status in the OAS and is a member affiliate of the Western European Union.

Slovenia is part of the Australia Group, the Zangger Committee, and the Nuclear Suppliers Group (London Group). In environmental cooperation, the nation is part of the Basel Convention, Conventions on Biological Diversity and Air Pollution, Ramsar, CITES, the London Convention, the Kyoto Protocol, the Montréal Protocol, MARPOL, the Nuclear Test Ban Treaty, and the UN Conventions on the Law of the Sea, Climate Change, and Desertification.

## 19 ECONOMY

Before its independence, Slovenia was the most highly developed and wealthiest republic of the former Yugoslav SFR, with a per capita income more than double that of the Yugoslav average, and nearly comparable to levels in neighboring Austria and Italy. The painful transition to a market-based economy was exacerbated by the disruption of intra-Yugoslav trade. However, Slovenia's economy has not suffered as much as was predicted during the breakup of the Yugoslav SFR, due to strong ties with Western Europe. Whereas GDP fell by 9% in 1991 and 6% in 1992, the 1993 GDP grew by 1.3%. Since then real GDP growth has averaged 4% a year. In 2001 and 2002, a weak external environment slowed growth to 3% and 2.9% (est.). Until 1991 to 1999, Slovenia's budget deficit rarely exceeded 1% of GDP. In 2000 and 2001, the general government debt increased to 1.4% of GDP, and was projected to reach 2.9% in 2002. The unemployment rate (ILO definition) has fallen from 7.6% in 1999 to 6.4% in 2001 and an estimated 6.3% in 2002. Inflation as measured by consumer prices (end of period) rose from 8% in 1998 and 1999 to 8.9% in 2000, but then fell to 7% in 2001 and 7.2% (est.) in 2002.

Under the Communists, large parts of the economy were nationalized, with most restructuring involving the infrastructure, electricity, telecommunications, utilities, major banks, insurers, and the steel industry. Subsequent reforms enabled managers and workers to purchase up to 60% of their companies. As a result, nearly 70% of manufacturing firms in Slovenia are owned by their employees.

Slovenia freed prices and implemented a privatization law in November 1992, which has enabled private businesses to expand. The Slovene privatization program began in 1993 and involved 1,500 companies, 1,000 of which had completed privatization by mid-1997, including most small and medium-sized enterprises. In 2001, an estimated 55% of the economy had been privatized.

The outlook for Slovenia's economy is good, as both inflation and unemployment are expected to continue edging down. By 2002 the country's real GDP per capita had risen to about 70% the EU average, and in May 2004 Slovenia was accepted as a full member of the latter.

Moderate growth rates were registered in 2003 and 2004 (2.5% and 3.9% respectively), and the trend was expected to continue in 2005, with a predicted GDP growth rate of 3.6%. Inflation continued on its downward spiral, reaching 5.6% in 2003, and 3.3% in 2004; predictions show it to continue to decrease in 2005, at 2.6%. Unemployment has remained fairly stable (although on a slight decrease path), hovering around 10.5%. Slovenia remains one of the most developed Central and Eastern European countries and

was the first to make the transition from a borrower status to a partner at the World Bank. Privatizations, structural reforms, and policy implementations have happened at an accelerated pace, and Slovenia is expected to adopt the euro by 2007.

## 20 INCOME

The US Central Intelligence Agency (CIA) reports that in 2005 Slovenia's gross domestic product (GDP) was estimated at \$42.1 billion. The CIA defines GDP as the value of all final goods and services produced within a nation in a given year and computed on the basis of purchasing power parity (PPP) rather than value as measured on the basis of the rate of exchange based on current dollars. The per capita GDP was estimated at \$20,900. The annual growth rate of GDP was estimated at 3.8%. The average inflation rate in 2005 was 2.4%. It was estimated that agriculture accounted for 2.8% of GDP, industry 36.9%, and services 60.3%.

According to the World Bank, in 2003 remittances from citizens working abroad totaled \$255 million or about \$128 per capita and accounted for approximately 0.9% of GDP. Foreign aid receipts amounted to \$66 million or about \$33 per capita and accounted for approximately 0.2% of the gross national income (GNI).

The World Bank reports that in 2003 household consumption in Slovenia totaled \$15.10 billion or about \$7,570 per capita based on a GDP of \$27.7 billion, measured in current dollars rather than PPP. Household consumption includes expenditures of individuals, households, and nongovernmental organizations on goods and services, excluding purchases of dwellings. It was estimated that for the period 1990 to 2003 household consumption grew at an average annual rate of 3.4%. In 2001 it was estimated that approximately 27% of household consumption was spent on food, 14% on fuel, 4% on health care, and 16% on education.

## 21 LABOR

As of 2005, Slovenia's labor force totaled an estimated 920,000 persons. As of 2002, agriculture accounted for 6% of the workforce, with industry at 40% and 55% in the services sector. Unemployment was estimated at 9.8% in 2005.

The constitution provides that the establishment, activities, and recruitment of members of labor unions shall be unrestricted. There are two main labor federations, with constituent branches throughout the society, as well as a smaller regional union. Virtually all workers except for police and military personnel are eligible to form and join unions. The right to strike is also guaranteed by the constitution. Collective bargaining is still undergoing development, and the government still has the principal role in setting labor conditions.

The minimum wage was \$373 monthly in 2002, although increasingly, private businesses are setting pay scales directly with their employees' unions or representatives. The workweek is 42 hours, and the minimum working age is 16. Occupational health and safety standards are set by the government and regularly enforced.

## 22 AGRICULTURE

Some 202,000 hectares (499,000 acres), or 10% of the total land area, were in use as cropland in 2003. Agriculture contributed about 3% to GDP in 2003; Slovenia was the least agriculturally ac-

tive of all the republics of the former Yugoslav SFR. Major crops produced in 2004 included: wheat, 147,000 tons; corn, 357,000 tons; potatoes, 171,000 tons; sugar beets, 213,000 tons; olives, 2,100 tons; and fruit, 411,000 tons (of which grapes accounted for 33%).

### 23 ANIMAL HUSBANDRY

Permanent pasture land covers about 15% of the total land area. Sheep and cattle breeding, as well as dairy farming, dominate the agricultural sector of the economy. In 2005, the livestock population included: pigs, 534,000; cattle, 451,000; sheep, 94,000; goats, 22,000; horses, 20,000; and chickens, 4.8 million. Meat production in 2005 included 45,500 tons of beef, 70,000 tons of pork, and 64,000 tons of poultry. Productivity rates for livestock and dairy farming are comparable to much of Western Europe. In 2005, 654,000 tons of milk and 20,000 tons of eggs were produced. Poultry and eggs are some of the few agricultural products where Slovenia's domestic production still exceeds domestic demand.

### 24 FISHING

The total catch in 2003 was 2,635 tons, 49% from marine fishing. The freshwater catch is dominated by rainbow trout and common carp. Exports of fish products amounted to \$7.3 million in 2003, up from \$5.1 million in 1997. The fishing sector accounts for less than 1% of foreign investment.

### 25 FORESTRY

Forests cover 55% of the total area; they are Slovenia's most significant natural resource. Roundwood production was 2,551,000 cu m (90 million cu ft) in 2004. Production included wood pulp, 153,000 tons; paper and paperboard, 557,600 tons; and wood-based panels, 474,000 cu m (16.7 million cu ft). Exports of forest product in 2004 totaled \$624 million. The furniture-making industry is also a prominent consumer of forest products.

### 26 MINING

Slovenia's output of metals in 2003 included refined and secondary lead, aluminum ingot, and crude steel. The country's mining and quarrying sector accounted for around 0.9% of Slovenia's gross domestic product (GDP) in 2003. Slovenia's industrial output grew by about 1.4% in 2003 from 2002. Apart from being a substantial producer of quartz, quartzite and glass sand (200,000 metric tons in 2003), Slovenia was also a modest producer of common clay, coke and petroleum products. In 2003 output of: aluminum ingot (primary and secondary) totaled 109,800 metric tons; crude steel, 543,000 metric tons; and lead (refined and secondary), 15,000 metric tons. Industrial mineral production in 2003 included: cement, 1.3 million tons; bentonite, 4,000 metric tons; lime, 150,000 tons; salt (all sources) 125,000 metric tons; and di-

mension stone, 12,603 metric tons. Also produced was pumice, and sand and gravel.

### 27 ENERGY AND POWER

Slovenia, with miniscule reserves of oil and no natural gas reserves, is heavily reliant upon imports to meet its petroleum and natural gas needs.

In 2002, Slovenia's imports of all petroleum products averaged 53,640 barrels per day, of which crude oil imports averaged 100 barrels per day. Distillates and gasoline were the top two refined oil products imported that year, averaging 28,140 barrels per day and 18,180 barrels per day, respectively. Crude oil production in 2002 averaged 100 barrels per day. Domestic demand for refined oil products averaged 51,040 barrels per day. Domestic output of refined oil products averaged 100 barrels per day.

Slovenia imported all of the natural gas it consumed in 2002. Imports and demand for dry natural gas totaled 34.26 billion cu ft.

Coal was Slovenia's most abundant fossil fuel. Domestic output of all coal products totaled 5,166,000 short tons in 2002, of which lignite or brown coal accounted for 4,462,000 short tons. Coal product imports in 2002 totaled 694,000 short tons, of which 631,000 short tons was hard coal, and 63,000 short tons were coke. Demand for coal products in 2002 totaled 6,212,000 short tons.

Slovenia's electric power generation sector relies upon fossil fuels, hydropower and nuclear power. In 2002, total installed electrical capacity was 2.735 million kW, of which conventional thermal capacity was the largest at 1.220 million kW. Hydroelectric capacity that year stood at 0.839 million kW, followed by nuclear at 0.676 million kW. Electric power production in 2002 amounted to 13.882 billion kWh, with nuclear energy providing the largest portion of electric power generated at 5.310 billion kWh, followed by conventional thermal sources at 5.120 billion kWh and hydropower at 3.355 billion kWh. Domestic consumption of electricity totaled 11.780 billion kWh in 2002.

Slovenia imports oil from the former republics of the USSR and the developing world to supply a refinery at Lendava. Coal is mined at Velenje. Natural gas is used extensively for industry and is supplied by the former USSR and Algeria via 305 km (190 mi) of natural gas pipelines.

### 28 INDUSTRY

Manufacturing is widely diversified. Important manufacturing sectors include: electrical and nonelectrical machinery, metal processing, chemicals, textiles and clothing, wood processing and furniture, transport equipment, and food processing. In the composition of total value-added by economic activity, the share from industry declined from 50% in 1989 to 43% in 1991. Industry declined still further to 36% of GDP by 2001. Industrial production, which fell by about 25% in the early 1990s due in part to the international sanctions against Serbia, grew by an estimated 1% in 1996 and increased by 3.3% in 2001. The recovery of industrial production has been slower than expected, as the shift from parastatal to private ownership continues. Only in the late 1990s were steps taken to privatize key industrial sectors such as telecommu-

nications, utilities, and steel. Slovenia produced 116,082 automobiles in 2001, a 6% decline from 2000.

The industry seemed to have stabilized by 2004, contributing 36% to the total GDP, and with an industrial production growth rate that equaled the GDP growth rate, at 3.9%; industry employed 40% of the labor force. Agriculture made up 3% of the total economy, and employed 6% of the working people; services came in first, with 60% and 55% respectively. Main industries included ferrous metallurgy and aluminum products, lead and zinc smelting, electronics (including military electronics), trucks, electric power equipment, wood products, textiles, chemicals, machine tools.

## 29 SCIENCE AND TECHNOLOGY

The Slovenian Academy of Sciences and Arts, founded in 1938, has institutes conducting research in biology, paleontology, and medicine. Headquartered in Ljubljana are the Association of Engineers and Technicians of Slovenia; the Association of Mathematicians, Physicists, and Astronomers of Slovenia, and the Society for Natural Sciences of Slovenia. The Ljubljana Geological Institute was founded in 1946, and the Institute for Karst Research a year later in Postojna. The University of Ljubljana has faculties of arts and sciences; natural sciences and technology; architecture, civil engineering, and geodesy; electrical and computer engineering; mechanical engineering; medicine; and veterinary medicine. The University of Maribor has a college of agriculture, a faculty of technical sciences, and a center for applied mathematics and theoretical physics. In 1987–97, science and engineering students accounted for 26% of university enrollment.

In 2002 research and development (R&D) expenditures totaled \$562.019 million, or 1.54% of GDP. Of that amount, the largest portion came from the business sector at 60%, followed by government sources at 35.6%. Foreign sources accounted for 3.7% and higher education 0.6%. In that same year, there were 2,364 scientists and engineers engaged in R&D per one million people. High technology exports in 2002 were valued at \$488 million, or 5% of the country's manufactured exports.

## 30 DOMESTIC TRADE

Slovenia's domestic economy has historically been small, thus necessitating an emphasis on exports. New legislation in 1994 regarding tax exemptions on imported inputs was expected to help domestic companies compete with foreign firms. More recent reforms are aimed at encouraging and increasing both local and foreign investment.

There are a number of wholesalers and retailers throughout the country. American and European franchises have been established within the country. Installment financing, even for small ticket items, is common. Consumer prices are generally high due to the high cost of labor and transportation. The government maintains price controls on certain goods and services, such as gasoline, railway travel, telecommunications, and milk.

Retail hours are generally between 8 AM and 8 PM on weekdays. Stores may be open for a half-day on Saturdays.

## 31 FOREIGN TRADE

Slovenia has reoriented much of its trade away from its former Yugoslav neighbors toward Western Europe. Sanctions imposed by the UN on trade with Serbia severed Slovenia from its largest

foreign market. In 1992, 55% of Slovenia's exports were sent to the European Union (EU), and only 30% to Croatia and the other former Yugoslav republics. By 2000, the EU was buying 64% of Slovenia's exports.

Slovenia manufactures and exports mostly motor vehicles (8.5%), furniture (6.8%), and household electrical equipment (5.7%). Other exports include medicinal and pharmaceutical products (4.5%), clothes (4.4%), paper (3.4%), and iron and steel (3.3%).

In 2004, exports totaled \$15 billion (FOB—Free on Board), with imports slightly higher at \$16 billion (FOB). Slovenia's main export partners were Germany (which received 18.3% of total exports), Italy (11.6%), Austria (11.5%), France (7.4%), Croatia (7.4%), and Bosnia and Herzegovina (4.8%). Imports included machinery and transport equipment, manufactured goods, chemicals, fuels and lubricants, food, and mainly came from Germany (19.9%), Italy (17%), Austria (14.9%), France (10.2%), and Hungary (3.8%).

## 32 BALANCE OF PAYMENTS

Slovenia's public finances are among the strongest and most stable of the emerging nations in Eastern and Central Europe.

The US Central Intelligence Agency (CIA) reported that in 2002 the purchasing power parity of Slovenia's exports was \$10.3 billion while imports totaled \$11.1 billion resulting in a trade deficit of \$800 million.

The International Monetary Fund (IMF) reported that in 2001 Slovenia had exports of goods totaling \$9.34 billion and imports totaling \$9.96 billion. The services credit totaled \$1.96 billion and debit \$1.46 million.

Exports of goods and services totaled \$19.3 billion in 2004, up from \$15.7 billion in 2003. Imports grew from \$15.7 billion in 2003, to \$19.5 billion in 2004. Although Slovenia has managed to keep a fine balance between imports and exports, the resource balance was on a negative upsurge, growing from -\$19 million in 2003, to -\$212 million in 2004. A similar trend was registered for the current account balance, which deteriorated from -\$99 million in 2003, to -\$275 million in 2004. The national reserves (including gold) were \$8.6 billion in 2003, covering more than six months of imports; by 2004, they grew to \$8.9 billion.

SOURCE: *Government Finance Statistics Yearbook 2004*, Washington, DC: International Monetary Fund, 2004.**33 BANKING AND SECURITIES**

The Bank of Slovenia is the country's central bank, and it is independent of the government. It has pursued a tight monetary and credit policy, aimed at the gradual reduction of inflation, since the introduction of the tolar in October 1991. The bank ended some of the worst abuses of the banking system under the Yugoslavian federation, such as enterprises setting up their own banks from which they borrowed freely.

At the end of 1996, the Bank of Slovenia changed its method of calculating the revalorization rate for other banks. From January 1997, the rate is derived from price increases over the preceding six months, instead of four months as before.

Yet not until 1999 did Slovenia move to reform its banking sector by privatizing some of its largest banks and permitting foreign investment. Two of the largest state-owned banks, Nova Ljubljanska Banka and Nova Kreditna banka Maribor, were prime candidates for privatization. Analysts also expected large-scale consolidation to follow in the wake of the banking divestment.

The International Monetary Fund reports that in 2001, currency and demand deposits—an aggregate commonly known as M1—were equal to \$1.9 billion. In that same year, M2—an aggregate equal to M1 plus savings deposits, small time deposits, and money market mutual funds—was \$10.8 billion. The money market rate, the rate at which financial institutions lend to one another in the short term, was 6.9%.

Commercial banks in the country include the Albania Joint-Stock Company. The currency unit is the tolar (Slt).

The Ljubljana Stock Exchange, abolished in 1953, was reopened in December 1989. As of 2001, it listed 38 securities and had 60 members. Total market capitalization was \$2.8 billion that year, and trading value was \$794 million, an increase of 30.5% from the previous year. As of 2004, a total of 140 companies were listed on the Ljubljana Stock Exchange, which had a market capitalization of \$9.677 billion. Trading value that year was \$1.170 billion, up

14.7% from the previous year. The Ljubljana International Futures and Options Exchange, Ltd. opened in 1998.

**34 INSURANCE**

In 1996, the company Zavarovalnica Triglav wrote all classes of insurance. There were at least 13 companies operating in Slovenia in 1997. In 2003, the value of all direct insurance premiums written totaled \$1.440 billion, of which nonlife premiums accounted for \$1.095 billion. In that same year, Triglav was Slovenia's top nonlife and life insurer, with gross written premiums of \$346.3 million and \$145.1 million, respectively.

**35 PUBLIC FINANCE**

Economic management is fairly good in Slovenia. Public finances showed modest deficits of about 1.4% of GDP through 2001. The debt to GDP ratio was 37% in 2001. Privatization has been relatively successful, although some of the business practices of the Yugoslav brand of communism have carried over to the newly private enterprises.

The US Central Intelligence Agency (CIA) estimated that in 2005 Slovenia's central government took in revenues of approximately \$16 billion and had expenditures of \$16.7 billion. Revenues minus expenditures totaled approximately -\$710 million. Public debt in 2005 amounted to 29.9% of GDP. Total external debt was \$20.57 billion.

The International Monetary Fund (IMF) reported that in 2003, the most recent year for which it had data, central government revenues were Slt2,529.8 billion and expenditures were Slt2,609.3 billion. The value of revenues was us\$12 million and expenditures us\$12 million, based on an exchange rate for 2003 of us\$1 = Slt207.11 as reported by the IMF. Government outlays by function were as follows: general public services, 10.7%; defense, 2.8%; public order and safety, 4.0%; economic affairs, 8.4%; environmental protection, 0.9%; housing and community amenities,

0.9%; health, 14.9%; recreation, culture, and religion, 2.6%; education, 13.9%; and social protection, 40.9%.

### **3<sup>6</sup>TAXATION**

As of 2005, Slovenia had a flat 25% tax rate on corporate income. Capital gains are included as business income and taxed at the same corporate rate. Generally, the withholding tax on dividends distributed to residents and nonresidents is 25%, as it is with interest and royalties. The resident branches of foreign companies are taxed at the same 25% rate as Slovenian companies.

Personal income is taxed according to a progressive schedule up to 50%. All taxpayers can subtract 11% of their annual income from their taxable base. In addition, families with children can deduct 10% of their income for the first child and 5% for each additional child. There is a standard 3% deduction for investment in real estate, plus allowances for other living expenses, medical expenses, etc. Payroll taxes are assessed for health insurance and employment. There are gift and inheritance, and land taxes.

A sales tax of 20% on consumer products and 10% on services was replaced as of 1 July 1999 with Slovenia's value-added tax (VAT) introduced at a standard rate of 19% and a reduced rate of 7.5%. As of 1 January 2002 the standard rate was increased to 20% and the reduced rate upped to 8.5%, where it stood as of 2005. The reduced rate applies to food, medicines and agricultural products. Exports, insurance, banking and financial services are exempt. There are also excise taxes on alcohol, tobacco, and fuel.

### **3<sup>7</sup>CUSTOMS AND DUTIES**

Imports to Slovenia are generally unrestricted, except for certain agricultural, textile, and wood products. Customs duties on raw materials are 0–5%, semifinished products are assessed 5–10%, and equipment is charged 8–15%, while finished products or consumer goods are levied 15–27%. Many import taxes have been abolished, and further liberalization is planned. However, a sales tax and a customs clearance fee still exist.

The European Union (EU) signed a cooperation agreement with Slovenia in April 1993, which provided for greater access to the EU market. Slovenia also entered into trade agreements with Hungary, the Czech Republic, and Slovakia in 1993 that will gradually eliminate most trade barriers. By 1997, countries enjoying most-favored nation (MFN) status with Slovenia were assessed a 10.7% weighted average tariff. In 1999, following a reduction in its bilateral tariff with the European Union, Slovenia also lowered its MFN tariff.

### **3<sup>8</sup>FOREIGN INVESTMENT**

Since independence, the foreign investment climate has steadily improved in Slovenia, despite constraints that have inhibited investment. The small domestic economy has been viewed by many prospective investors as the least risky of the former Yugoslav republics, but to date Slovenia's share of world foreign direct investment (FDI) flows have been well below its share of world GDP. From 1988 to 1990, its share of world FDI was 60% of its share of world GDP, and from 1998 to 2000, it was only 30% of its share of world GDP.

Until the late 1990s Slovenia retained several barriers to foreign investment. Any company incorporated in Slovenia was required to have a majority of Slovenes on its board of directors,

or a managing director or proxy of Slovene nationality. Foreign companies and individuals of foreign nationality were prohibited from owning land in Slovenia. However, any company incorporated in Slovenia was permitted to purchase real estate, regardless of the origin of its founding capital. Liberalization laws enacted in 1999 lowered the threshold of foreign direct investment from 50% to 10%. This allowed more foreign investors to avert the custody account regime.

FDI inflow amounted to \$375.2 million in 1997, but fell to about \$250 million in 1998. In 1999 and 2000, FDI inflows averaged close to \$180 million. In 2001, contrary to the trend toward the decline of foreign investment worldwide, FDI inflow into Slovenia rose to a record \$442 million.

Despite its overall attractiveness, Slovenia has not managed to attract significant levels of FDI, as compared to some other Central and Eastern European Countries (like Hungary or the Czech Republic). At the end of 2003 the total stock of FDI in the country was roughly \$5.1 billion, with the majority of capital inflows coming from the European Union. A major reason for the recent poor performance in this sector can be attributed to the shelving of proposed privatizations in the energy, telecommunication, and financial sectors by the government of Slovenia.

### **3<sup>9</sup>ECONOMIC DEVELOPMENT**

The most productive of the former Yugoslav republics, Slovenia enjoys a high degree of prosperity and stability, and has made a successful transition to a market economy. It has become a member of the International Monetary Fund (IMF) as well as the World Bank; it obtained an \$80 million loan for financial rehabilitation from the latter. The EBRD loaned Slovenia \$50 million for the improvement of the railway sector. The country is a founding member of the WTO. Unlike the rest of the former communist states of Eastern Europe, Slovenia never received assistance from the International Monetary Fund. Its per capita gross domestic product (GDP) is comparable to EU members Portugal and Greece.

Slovenia's economy is heavily dependent upon foreign trade, with trade equaling around 120% of GDP. The budgets for 2003 and 2004 restricted the public deficit to 1% of GDP. Inflation fell from 200% in 1992 to 7.5% in 2002. Further privatizations—especially in the telecommunications, financial, and energy sectors—were planned as of 2003 but were put on hold indefinitely. Foreign direct investment has been high since 2000, almost tripling from 2001 to 2002 (accounting for 6.5% of GDP), but returned to lower levels in 2003 and 2004.

On 1 May 2004 Slovenia joined the European Union, which further strengthened the aura of political and economic stability it already had. It is one of the first 10 newly accepted countries, expected to introduce the euro by 2007. Slovenia registered steady growth rates since 1993 and is now behaving like a fully developed economy, boasting a modern and extensive infrastructure, a highly educated work force, and a prime geographic location. However, the levels of foreign investment remained under the capacity of the Slovenian economy, due in part to protectionist measures by the government. Corruption, although lower than in other Central and Eastern European countries, remains an issue that has to be addressed.

## 40 SOCIAL DEVELOPMENT

Slovenia's first social insurance programs were established in 1922, and were updated in 2003. The system provides old age, disability, survivor's pensions, sickness, work injury, and unemployment benefits. The pension system covers most employed persons. Funds are provided by employee and employer contributions, with any unforeseen deficit covered by the government. The government funds the total cost for some groups of insured including veterans. The age of retirement is variable, depending upon the numbers of years worked. A universal system of family allowances provides benefits to families with children with incomes below a specified monthly amount. There is a maternity grant available to all permanent residents in Slovakia to purchase clothing and other necessities for a newborn child.

Women and men have equal status under the law. Discrimination against women or minorities in housing, jobs, or other areas is illegal. Officially, both spouses are equal in marriage, and the constitution asserts the state's responsibility to protect the family. Women are well represented in business, academia, and government, although they still hold a disproportionate share of lower-paying jobs. On average, women earn less than men. Violence against women is underreported, but awareness has been increasing. There have been improved efforts to assist victims. The constitution provides for special protection for children.

The constitution ensures minority participation in government by mandating that Italian and Hungarian minorities each receive at least one representative in the National Assembly. The Roma population continues to experience discrimination. Human rights are generally respected by the government and upheld by the legal and judicial systems.

## 41 HEALTH

In 1992, health care reforms were adopted to modify the health care system in place when Slovenia was part of the former Communist country of Yugoslavia. Direct health care funding by the government was replaced by a mostly employer-funded system run in conjunction with a new system of compulsory public health insurance. However, Slovenia still provides universal, comprehensive health care to all its citizens and its health care system remains fairly centralized. As of 2004, there were an estimated 219 physicians, 717 nurses, 59 dentists and 39 pharmacists per 100,000 people. In the same year, total health care expenditure was estimated at 7.6% of GDP. In 2002 Slovenia had 26 hospitals, which included nine regional facilities, three local general hospitals, and the country's main teaching hospital and tertiary care center, the Clinical Center in Ljubljana.

In 2000, each Slovenian woman had an average of 1.2 children during her childbearing years. An estimated 11 mothers died during childbirth or pregnancy for each 100,000 live births. The infant mortality rate, which was 15 deaths per 1,000 in 1980, dropped significantly by 2005 to only 4.45 infant deaths per 1,000 live births. The immunization rates for a child under one were as follows: diphtheria, pertussis, and tetanus, 91%, and measles, 82%. The life expectancy at birth was 76.14 years by 2005.

The leading cause of death was cardiovascular disease, to which nearly half of all deaths were attributed. The other major causes of mortality, in order of prevalence, were cancer, injuries, poisoning, respiratory diseases, and diseases of the digestive system. The

HIV/AIDS prevalence was 0.10 per 100 adults in 2003. As of 2004, there were approximately 9,000 people living with HIV/AIDS in the country. There were an estimated 500 deaths from AIDS in 2003.

## 42 HOUSING

According to the 2002 census, there were 777,772 dwelling units. About 92% of all dwellings were privately owned by a citizen and 82% of all dwellings were owner occupied. About 44% of all households were living in single-family detached homes and 52% of all dwellings were in urban areas. About 94,635 dwellings, or 12% of the housing stock, had been built since 1991. The average household had 2.8 people.

Since the 1991 Housing Act, the State is no longer directly responsible for housing provisions. Municipalities have responsibility for social housing projects. The State does, however, offer subsidized loans for the construction of individual private homes and nonprofit rental housing.

## 43 EDUCATION

Between 1999 and 2009, Slovenia will be gradually replacing an eight-year basic schooling program with a nine-year program, which will contain three-cycles of three years each and cover primary and lower secondary studies. Upper secondary studies generally cover an additional three to four years with students given the options of attending general, technical, or vocational schools. The academic year runs from October to June.

In 2001, about 73% of children between the ages of three and six were enrolled in some type of preschool program. Primary school enrollment in 2003 was estimated at about 93% of age-eligible students. The same year, secondary school enrollment was about 93% of age-eligible students. It is estimated that about 95% of all students complete their primary education. The student-to-teacher ratio for primary school was at about 13:1 in 2003; the ratio for secondary school was about 14:1.

Higher education at public institutions is free for native, full-time students and students from other European Union countries. Slovenia has 3 universities, 3 art academies or professional colleges, and 10 private higher education institutions. The University of Ljubljana, founded in 1919, has 25 faculties. The University of Maribor has a faculty for teaching, a faculty for economics and business, and a faculty for technology. There are also two colleges attached to it. In 2003, it was estimated that about 68% of the tertiary age population were enrolled in tertiary education programs; 58% for men and 79% for women. The adult literacy rate for 2004 was estimated at about 99.7%.

As of 2003, public expenditure on education was estimated at 6.1% of GDP.

## 44 LIBRARIES AND MUSEUMS

The National and University Library of Slovenia is located in Ljubljana and holds 2.3 million items. The University of Ljubljana maintains 39 faculty libraries. The University of Maribor Library maintains eight faculty libraries and serves as a legal depository for all Slovenian materials printed in the Slovene language. The Slovenian Academy of Sciences and Arts, also in the capital, holds 450,000 volumes. There are about 60 public library systems, with over 280 branch locations and nine mobile library services. One of the largest, the Oton Župančič Public Library in Ljubljana, main-

tains six locations and a mobile service. There are about 138 special libraries in the country, including the Slovene National Museum Library that holds about 200,000 printed materials.

Ljubljana hosts the National Gallery, Museum of Modern Art, Museum of Architecture, National Museum of Slovenia, Slovene Sports Museum, and the Slovene Ethnographic Museum, among others. The Technology Museum of Slovenia is in Vrhnika. The National Liberation Museum is in Maribor, a city which also hosts several smaller art and history museums. The Slovene Religious Museum is in Gorica. There are dozens of other regional museums throughout the country, including several in restored historical houses and castles.

#### 45 MEDIA

In 2003, there were an estimated 407 mainline telephones for every 1,000 people. The same year, there were approximately 871 mobile phones in use for every 1,000 people.

In 2004, three of the six national television channels were operated by the government-subsidized RTV Slovenia network. Pop TV and Kanal A are the two main private network operators. Every major town has a radio station. RTV Slovenia operates three national radio stations and several regional ones. Radio Hit and Radio City are the two main private network operators. Minority language television and radio broadcasts were available. As of 2005, about two-thirds of all households were connected to satellite or cable television services. In 2003, there were an estimated 405 radios and 366 television sets for every 1,000 people. About 160.3 of every 1,000 people were cable subscribers. Also in 2003, there were 300.6 personal computers for every 1,000 people and 376 of every 1,000 people had access to the Internet. There were 130 secure Internet servers in the country in 2004.

As of 2002, there were four major independent daily and several weekly newspapers published. The dailies are *Delo* (2002 circulation of 90,000), *Slovenske Novice* (80,000), *Dnevnik* (62,000), and *Vecer* (70,000).

The constitution provides for free expression, including freedom of speech and the press; however, it is said that lingering self-censorship and some indirect political pressures do continue to influence the media.

#### 46 ORGANIZATIONS

The Slovenia Chamber of Commerce (Chamber of Economy of Slovenia) coordinates all economic activities within and outside the country. In the 1990s, two large associations of trade unions were formed: the Confederation of New Trade Unions of Slovenia and the Association of Independent Trade Unions. There are professional associations for the advancement of research and education in a variety of medical fields.

The Slovenian Academy of Sciences and the Arts was founded in 1938.

National youth organizations include the UN Student Club of Slovenia, the Catholic Student Movement of Slovenia, the Students Union of Slovenia, Girl Guides, and the Scout Association of Slovenia. There are sports associations promoting amateur competition among athletes of all ages; many of these groups are affiliated with international counterparts as well. Women's organizations include The Center for Gender and Politics at the Peace Institute and Soroptimist International.

International organizations with national chapters include Amnesty International, the Society of St. Vincent de Paul, UNICEF, and the Red Cross.

#### 47 TOURISM, TRAVEL, AND RECREATION

The rich architecture, museums, caves, and springs are some of Slovenia's main tourist attractions. Health resorts are popular, many in the north where there are mineral and thermal springs. The 10 casinos also attract visitors each year, making entertainment a major part of the tourism industry. Slovenia has convention centers in Ljubljana and three other cities and international airports in Ljubljana, Maribor, and Portoroz. Popular recreational activities include skiing, snowboarding, tennis, golf, mountain climbing, canoeing, and fishing. Visitors from Europe and most other countries can enter Slovenia without visas.

In 2003, there were 1,052,847 tourist arrivals in Slovenia. Hotel rooms numbered 15,534 with 31,997 beds and a 47% occupancy rate. Tourism expenditure receipts totaled \$1.4 billion.

According to 2005 US Department of State estimates, the daily cost of staying in Ljubljana was estimated at \$217.

#### 48 FAMOUS SLOVENIANS

Milan Kučan (b.1941) was president from 1991–2002, when he was succeeded by Janez Drnovšek (b.1950), who had previously served as prime minister. In 1551, Primož Trubar translated the New Bible into Slovene. The poet, Valentin Vodnik (1754–1819), wrote poems in praise of Napoleon; literature in praise of the French flourished during the French occupation of Slovenia in 1813. Slovenian tennis star Mima Jausovec (b.1956) won the Italian Open in 1976 and the French Open in 1977.

#### 49 DEPENDENCIES

Slovenia has no territories or colonies.

# SPAIN

Kingdom of Spain  
*España*

**CAPITAL:** Madrid

**FLAG:** The national flag, adopted in 1785, consists of three horizontal stripes: a yellow one—equal in size to the other two combined—between two red ones, with the coat of arms on the yellow stripe.

**ANTHEM:** *Marcha Real Granadera (March of the Royal Grenadier)*.

**MONETARY UNIT:** The peseta was replaced by the euro as official currency as of 2002. The euro is divided into 100 cents. There are coins in denominations of 1, 2, 5, 10, 20, and 50 cents and 1 euro and 2 euros. There are notes of 5, 10, 20, 50, 100, 200, and 500 euros. €1 = \$1.25475 (or \$1 = €0.79697) as of 2005.

**WEIGHTS AND MEASURES:** The metric system is the legal standard.

**HOLIDAYS:** New Year's Day, 1 January; St. Joseph's Day, 19 March; Epiphany, 31 March; Day of St. Joseph the Artisan, 1 May; St. James's Day, 25 July; Assumption, 15 August; National Day and Hispanic Day, 12 October; All Saints' Day, 1 November; Immaculate Conception, 8 December; Christmas, 25 December. Movable religious holidays include Holy Thursday, Good Friday, Easter Monday, and Corpus Christi.

**TIME:** 1 PM = noon GMT.

## <sup>1</sup> LOCATION, SIZE, AND EXTENT

Occupying the greater part of the Iberian Peninsula, Spain is the third-largest country in Europe, with an area of 504,782 sq km (194,897 sq mi). Comparatively, the area occupied by Spain is slightly more than twice the size of the state of Oregon. This total includes the Balearic Islands (Islas Baleares) in the western Mediterranean Sea and the Canary Islands (Islas Canarias) in the Atlantic Ocean west of Morocco; both island groups are regarded as integral parts of metropolitan Spain. The Spanish mainland extends 1,085 km (674 mi) E–W and 950 km (590 mi) N–S. Bordered by the Bay of Biscay, France, and Andorra on the N, by the Mediterranean on the E and S, by Gibraltar and the Strait of Gibraltar on the S, by the Gulf of Cádiz on the SW, and by Portugal and the Atlantic on the W, Spain has a total land boundary of 1,918 km (1,192 mi) and a coastline of 4,964 km (3,084 mi). Spain also holds Ceuta, Melilla, and other “places of sovereignty” in the north of Morocco.

Spain has long claimed Gibraltar, a narrow peninsula on the south coast, which was taken by a British-Dutch fleet in 1704 and became a British colony under the Treaty of Utrecht (1713). In 2003, Gibraltar residents voted to remain a British colony and demanded greater participation in talks between the United Kingdom and Spain concerning the future of Gibraltar. The United Kingdom plans to grant Gibraltar greater autonomy, but Spain does not agree with this plan.

Spain's capital city, Madrid, is located in the center of the country.

## <sup>2</sup> TOPOGRAPHY

Continental Spain is divided into five general topographic regions: (1) The northern coastal belt is a mountainous region with fertile valleys and large areas under pasture and covered with forests. (2)

The central plateau, or Meseta, with an average altitude of about 670 m (2,200 ft), comprises most of Castilla y León, Castilla–La Mancha, and the city of Madrid. (3) Andalucía, with Sevilla its largest city, covers the whole of southern and southwestern Spain and, except for the flat fertile plain of the Guadalquivir River, is a mountainous region with deep fertile valleys. (4) The Levante is on the Mediterranean coastal belt, with Valencia its chief city. (5) Catalonia (Cataluña) and the Ebro Valley comprise the northeastern region.

Spain has six principal mountain ranges—the Pyrenees, the Cordillera Cantábrica, the Montes de Toledo, the Sierra Morena, the Serranías Penibéticas, and the Sistema Ibérico. The principal peaks are Pico de Aneto (3,404 m/11,168 ft) in the Pyrenees and Mulhacén (3,478 m/11,411 ft) in the Penibéticas. The main rivers are the Tagus (Tajo), Duero, Guadiana, and Guadalquivir, which flow to the Atlantic, and the Ebro, which flows to the Mediterranean. The Duero and the Guadalquivir form broad valleys and alluvial plains and at their mouths deposit saline soils, creating deltas and salt marshes. The coastline has few natural harbors except the estuaries (rías) in the northwest, formed by glaciers, and those in the Levante and the south, created by sandbars during the Quaternary period.

The Canary Islands are a group of 13 volcanic islands, of which 6 are barren. They have a ruggedly mountainous terrain interspersed with some fertile valleys. Spain's highest mountain, Pico de Teide (3,718 m/12,198 ft), is on Tenerife. The Balearic Islands are a picturesque group with sharply indented coastlines; they combine steep mountains with rolling, fertile ranges.

## <sup>3</sup> CLIMATE

The climate of Spain is extremely varied. The northern coastal regions are cool and humid, with an average annual temperature of

14°C (57°F); temperatures at Bilbao range from an average of 10°C (50°F) in January–March to 19°C (66°F) during July–September. The central plateau is cold in the winter and hot in the summer; Madrid has a winter average of about 8°C (46°F) and a summer average of 23°C (73°F). In Andalucía and the Levante, the climate is temperate except in summer, when temperatures sometimes reach above 40°C (104°F) in the shade. The northern coastal regions have an average annual rainfall of 99 cm (39 in); the southern coastal belt has 41–79 cm (16–31 in); and the interior central plain averages no more than 50 cm (20 in) annually.

#### 4 FLORA AND FAUNA

Because of its wide variety of climate, Spain has a greater variety of natural vegetation than any other European country; some 8,000 species are cataloged. Nevertheless, vegetation is generally sparse. In the humid areas of the north there are deciduous trees (including oak, chestnut, elm, beech, and poplar), as well as varieties of pine. Pine, juniper, and other evergreens, particularly the ilex and cork oak, and drought-resistant shrubs predominate in the dry southern region. Much of the Meseta and of Andalucía has steppe vegetation. The Canaries, named for the wild dogs (*Canariae insulae*) once found there, support both Mediterranean and African flora. A small, yellow-tinged finch on the islands has given the name “canary” to a variety of yellow songbirds widely bred as house pets. Animal life in Spain is limited by the pressure of population and few wild species remain. As of 2002, there were at least 82 species of mammals, 281 species of birds, and over 5,000 species of plants throughout the country.

#### 5 ENVIRONMENT

Extensive forests are now limited to the Pyrenees and the Asturias-Galicia area in the north because centuries of unplanned cutting have depleted stands. Fire eliminates 700,000 to 1,000,000 hectares of forestland each year. Government reforestation schemes meet with difficulties where sheep and goats graze freely over large areas. During the 1980s, an average of 92,000 hectares (227,000 acres) were reforested annually. Erosion affects about 18% of the total land mass of Spain.

Air pollution is also a problem in Spain. In 1995 industrial carbon dioxide emissions totaled 223.2 million metric tons (a per capita level of 5.72 metric tons), ranking Spain 20th compared to the other nations of the world. In 2000, the total of carbon dioxide emissions was at 282.9 million metric tons. Industrial and agricultural sources contribute to the nation's water pollution problem. Spain is also vulnerable to oil pollution from tankers which travel the shipping routes near the nation's shores. Spain's cities produce about 13.8 million tons of solid waste per year.

Principal environmental responsibility is vested in the Directorate General of the Environment, within the Ministry of Public Works and Urban Affairs. As of 2003, 8.5% of the country's total land area is protected, including 4 natural UNESCO World Heritage sites and 49 Ramsar wetland sites. According to a 2006 report issued by the International Union for Conservation of Nature and Natural Resources (IUCN), threatened species included 20 types of mammals, 20 species of birds, 8 types of reptiles, 4 species of amphibians, 24 species of fish, 27 types of mollusks, 36 species of other invertebrates, and 14 species of plants. Threatened species included the Spanish lynx, Pyrenean ibex, Mediterranean monk

seal, northern bald ibis, Spanish imperial eagle, Cantabrian capercaillie, dusky large blue and Nevada blue butterflies, and on the Canary Islands, the green sea turtle and Hierro giant lizard. The Canarian black oystercatcher and the Canary mouse have become extinct.

#### 6 POPULATION

The population of Spain in 2005 was estimated by the United Nations (UN) at 43,484,000, which placed it at number 29 in population among the 193 nations of the world. In 2005, approximately 17% of the population was over 65 years of age, with another 15% of the population under 15 years of age. There were 96 males for every 100 females in the country. According to the UN, the annual population rate of change for 2005–10 was expected to be 0.1%, a rate the government viewed as too low. The projected population for the year 2025 was 46,164,000. The population density was 86 per sq km (223 per sq mi).

The UN estimated that 76% of the population lived in urban areas in 2005, and that urban areas were growing at an annual rate of 0.21%. The capital city, Madrid, had a population of 5,103,000 in that year. Other large urban areas and their estimated populations include Barcelona (4,424,000), Valencia (796,549), Sevilla (704,154), Zaragoza (647,373), and Málaga (558,287).

#### 7 MIGRATION

Emigration of Spanish workers to the more industrialized countries of Western Europe, notably to the Federal Republic of Germany (FRG), France, Switzerland, and Belgium, increased markedly during the 1960s, but since 1973 the number of Spaniards returning to Spain has been greater than the number of those leaving. Nevertheless, more than 1.7 million Spanish citizens were residing outside the country in 1987. In 2001 there were 1,109,060 foreign residents in Spain, 2.5% of total population. There were 234,937 Moroccans, 84,699 Ecuadorians, 80,183 British, 62,506 Germans, 48,710 Colombians, 44,798 French, and 42,634 Portuguese.

Internal migration was 685,966 in 1990. In the past it has been directed toward the more industrialized zones and the great urban centers, and away from the rural areas. Rural-to-urban and urban-to-rural migration is now roughly in balance.

Placed into practice in 2001, Plan Greco was a scheme to regularize the immigration process; it was paralleled by a labor quota system aimed at responding to short and long-term labor shortages. However, both employers and labor unions agreed that the 2002 labor quota was a failure, falling short of the necessary workers. Between 1995–2004 Spain's legal foreign-born population quadrupled from 500,000 to 2,000,000. All the same, Spain still had an estimated 1.2 million unauthorized migrants at the end of 2004. In 2005, Spain had its fifth and largest legalization program with 690,679 unauthorized foreign workers applying.

A gateway into Europe, Spain receives large numbers of non-European migrants through Ceuta and Melilla. Between 1984–98, an estimated 8,000 people were granted refugee status. In 2004, 15,675 illegal migrants traveled on 740 boats that were intercepted, and in 2005 a boat with 300 Moroccans attempting to enter southern Spain was seized. In 1998, 6,654 people applied for asylum in Spain, up from 4,730 in 1996, however by 2004 none applied. Also in 2004, 5,635 people were recognized as refugees and there were 14 others of concern to the United Nations High Com-

LOCATION: 36° to 43°47' N; 3°19' E to 9°30' W. BOUNDARY LENGTHS: France, 623 kilometers (387 miles); Andorra, 65 kilometers (40 miles); Mediterranean coastline, 1,670 kilometers (1,038 miles); Gibraltar, 1 kilometer (0.6 miles); Portugal, 1,214 kilometers (754 miles); Atlantic and Bay of Biscay coastlines, 2,234 kilometers (1,388 miles). The Balearic Islands extend from 1°12' to 4°19' E and 38°38' to 40°5' N; coastline, 910 kilometers (565 miles). The Canary Islands, 1,400 kilometers (900 miles) to the southwest, extend from 13°20' to 18°19' W and 27°38' to 29°25' N; coastline, 1,126 kilometers (700 miles). territorial sea limit: 12 miles.

missioner for Refugees (UNHCR). In 2005, the net migration rate was an estimated 0.99 migrants per 1,000 population. In 2003 worker remittances were \$4.7 billion.

## 8 ETHNIC GROUPS

Ethnological studies reveal a homogeneous Latin stock in three-fourths of the country. The greatest contrasts are found between those of Celtic, Iberic, and Gothic antecedents in the north and those of southern lineage. The great mobility of the population toward the urban centers, the coast, and the islands has contributed to the diffusion of ethnic characteristics.

Cultural groups, but not properly distinct ethnic groups, include the Castilians of central Spain, the Asturians and the Basques of Vizcaya, Álava, Guipúzcoa, and (in part) Navarra provinces in the north, the Catalans of Catalonia, the Galicians of the far northwest, and the Andalusians of the south. The Basques, Galicians, and Catalans consider themselves separate nations within Spain;

they enjoy considerable cultural, economic, and political autonomy. Estimates of the Roma population are usually given as several hundred thousand.

## 9 LANGUAGES

According to the 1978 constitution, Spanish is the national language. Castilian, the dialect of the central and southern regions, is spoken by most Spaniards (74%) and is used in the schools and courts. Regional languages—Catalan (spoken by 17% of the population), Galician (7%), Basque (2%), Bable, and Valencian—are also official in the respective autonomous communities, where education is bilingual.

Regional languages are spoken by over 16 million persons in Spain. A majority of those who live in the northeastern provinces and the Balearic Islands spoke Catalan, a neo-Latin tongue. Galician, close to Portuguese, was used in Galicia, in the northwest corner of Spain. The Basques in northern Spain spoke Basque, a

pre-Roman language unrelated to any other known tongue and using an ancient script. Bable, a form of Old Castilian was spoken in Asturias (northwest), and Valencian, a dialect of Catalan, was used by inhabitants of the eastern province of Valencia.

## **1<sup>0</sup>RELIGIONS**

In 2003, the Center for Sociological Investigations reported that about 81% of respondents were nominally Catholic, but 42% admitted that they never attend Mass. In the same survey, 11.6% claimed to be agnostics and 4.1% claimed to be atheists. Protestants, numbering about 350,000, are represented by the Federation of Evangelical Religious Entities. The Federation of Spanish Islamic Entities (FEERI), located in Córdoba, reports that there are about one million Muslims, including both legal and illegal immigrants. There are about 40,000–50,000 Jews in the country. There are also about 9,000 practicing Buddhists.

Roman Catholicism was once the official religion of Spain, but the constitution of 1978 established the principles of religious freedom and separation of church and state. The Roman Catholic Church does, however, continue to maintain certain privileges, as well as monetary support, from the state.

## **1<sup>1</sup>TRANSPORTATION**

In 2002, Spain had an estimated 346,858 km (215,538 mi) of roadways, of which 343,389 km (213,382 mi) were paved highways, including 9,063 km (5,632 mi) of expressways. The Mediterranean and Cantábrico routes are the most important. In 2003, there were 19,293,263 passenger cars and 4,255,275 commercial vehicles.

In 2004, the National Spanish Railway Network encompassed 14,781 km (9,194 mi) of broad, standard and narrow gauge railways, of which broad gauge was the largest portion at 11,829 km (7,358 mi), followed by narrow gauge at 1,954 km (1,215 mi), and standard gauge at 998 km (621 mi). A total of 7,718 km (4,801 mi) of railway (broad, standard and narrow gauge) were electrified.

Of Spain's 200 ports, 26 are of commercial significance. The largest are Barcelona, Tarragona, and Cartagena on the Mediterranean, Algeciras on the Strait of Gibraltar, La Coruña on the Atlantic, and Las Palmas and Santa Cruz de Tenerife in the Canaries. The port of Bilbao, on the Bay of Biscay, can accommodate tankers of up to 500,000 tons. Substantial improvements were made during the 1970s at Gijón, Huelva, and Valencia. Scheduled ferry services connect Spain with neighboring countries and North Africa. In 2005, the merchant fleet was comprised of 182 vessels of 1,000 GRT or more, totaling 1,740,974 GRT. As of 2003, Spain had 1,045 km (650 mi) of navigable inland waterways.

Spain had an estimated 156 airports and airfields in 2004. As of 2005, a total of 95 had paved runways, and there were also eight heliports. Principal airports include Alicante, Prat at Barcelona, Ibiza, Lanzarote, Gran Canaria at Las Palmas, Barajas at Madrid, Málaga, Menorca, Son San Juan at Palma Mallorca, and Valencia. The state-owned Iberia Air Lines has regular connections with 50 countries and 89 cities in Europe, Africa, Asia (including the Middle East), and the Western Hemisphere. Other Spanish airlines are Aviaco, Air Europa, Viva Air, Binter Canarias, and Spanair. In 2003, about 42.507 million passengers were carried on domestic and international flights, and 879 million ton-km (546 million ton-mi) of freight.

## **1<sup>2</sup>HISTORY**

Archaeological findings indicate that the region now known as Spain has been inhabited for thousands of years. A shrine near Santander, discovered in 1981, is believed to be over 14,000 years old, and the paintings discovered in the nearby caves of Altamira in 1879 are of comparable antiquity. The recorded history of Spain begins about 1000 BC, when the prehistoric Iberian culture was transformed by the invasion of Celtic tribes from the north and the coming of Phoenician and Greek colonists to the Spanish coast. From the 6th to the 2nd century BC, Carthage controlled the Iberian Peninsula up to the Ebro River; from 133 BC, with the fall of Numantia, until the barbarian invasions of the 5th century AD, Rome held Hispania, from which the name Spain is derived. During the Roman period, cities and roads were built, and Christianity and Latin, the language from which Spanish originated, were introduced. In the 5th century, the Visigoths, or western Goths, settled in Spain, dominating the country until 711, when the invading Moors defeated King Roderick. All of Spain, except for a few northern districts, knew Muslim rule for periods ranging from 300 to 800 years. Under Islam, a rich civilization arose, characterized by prosperous cities, industries, and agriculture and by brilliant writers, philosophers, and physicians, including Jews as well as Muslims. Throughout this period (711–1492), however, Christian Spain waged intermittent and local war against the Moors. The most prominent figure in this battle was El Cid, who fought for both Christians and Moors in the 11th century. By the 13th century, Muslim rule was restricted to the south of Spain. In 1492, Granada, the last Moorish stronghold on Spanish soil, fell, and Spain was unified under Ferdinand II of Aragón and Isabella I of Castile, the "Catholic Sovereigns." Until then, Aragón (consisting of Aragón, Catalonia, Valencia, and the Balearic Islands) had been an independent kingdom, which had expanded toward the eastern Mediterranean, incorporating Sicily and Naples, and had competed with Genoa and Venice. In order to strengthen the unity of the new state, Moors and Jews were expelled from Spain; Catholic converts who chose to stay were subject to the terrors of the Inquisition if suspected of practicing their former religions. The year 1492 also witnessed the official European discovery of the Americas by Christopher Columbus, sailing under the Castilian flag. In 1519, Ferdinand Magellan, a Portuguese in the service of Spain, began the first circumnavigation of the world, completed in 1522 by Juan Sebastián Elcano.

The 16th century, particularly under Charles I, who was also Holy Roman Emperor Charles V, was the golden age of Spain: its empire in the Americas produced vast wealth; its arts flourished; its fleet ruled the high seas; and its armies were the strongest in Europe. By the latter part of the 16th century, however, under Philip II, the toll of religious wars in Europe and the flow of people and resources to the New World had drained the strength of the Spanish nation; in 1588, the "invincible" Spanish Armada was defeated by England. Spain's continental power was ended by wars with England, the Netherlands, and France in the 17th century and by the War of the Spanish Succession (1701–14), which also established the Bourbon (Borbón) dynasty in Spain. In 1808, the enfeebled Spanish monarchy was temporarily ended, and Napoleon Bonaparte's brother Joseph was proclaimed king of Spain. On 2 May 1808, however, the Spanish people revolted and, later assisted by the British, drove the French from Spain. In the post-Napo-

leonic period, the Bourbons were restored to the Spanish throne, but a spirit of liberalism, symbolized by the 1812 Constitution of Cádiz, remained strong.

Much of the 19th and early 20th centuries were consumed in passionate struggles between radical republicanism and absolute monarchy. Abroad, imperial Spain lost most of its dominions in the Western Hemisphere as a result of colonial rebellions in the first half of the 19th century; Cuba, Puerto Rico, and the Philippines were lost as a result of the Spanish-American War in 1898. Spain remained neutral in World War I but in the postwar period engaged in extensive military action to maintain its colonial possessions in Morocco. Early defeats in the Moroccan campaign paved the way in 1923 for the benevolent dictatorship of Primo de Rivera, who successfully ended the war in 1927 and remained in power under the monarchy until 1930. In 1931, after municipal elections indicated a large urban vote in favor of a republic, Alfonso XIII left Spain and a republic was established.

The constitution of December 1931 defined Spain as a “democratic republic of workers,” with “no official religion,” respecting the “rules of international law . . . renouncing war as an instrument of national policy and recognizing the principle of regional autonomy.” Neither right nor left had a parliamentary majority, and on the whole the coalition governments were ineffective. On 17 July 1936, an army revolt against the republic took place in Spanish Morocco. On the following day, Gen. Francisco Franco landed in Spain, and for the next two and a half years, until 31 March 1939, Spain was ravaged by civil war. The two contending parties were the Republicans, made up partly of democrats and partly of antidemocratic left-wing groups, and the rebels (Nationalists), who favored the establishment of a right-wing dictatorship. Almost from the beginning, a number of foreign countries intervened. Germany and Italy furnished manpower and armaments to the Nationalists, while the USSR, Czechoslovakia, and Mexico supported the Republicans. Finally the Republicans were defeated, and General Franco formed a corporative state. Under the Franco regime, Spain gave aid to the Axis powers in World War II but was itself a nonbelligerent.

### The Postwar Years

Diplomatically isolated following the end of World War II, Spain in succeeding decades improved its international standing, in part by signing economic and military agreements with the United States in 1953 and 1963. Spain was admitted to the UN in 1955. While relations with its European neighbors approached normality, the repressive nature of the Franco regime kept Spain apart from the main social, political, and economic currents of postwar Western Europe.

On 22 July 1969, Juan Carlos de Borbón y Borbón was officially designated by Franco as his successor, to rule with the title of king; formally, Franco had been ruling as regent for the prince since 1947. On 20 November 1975, Gen. Franco died at the age of 82, thus ending a career that had dominated nearly four decades of Spanish history. Two days later, Juan Carlos I was sworn in as king. He reconfirmed Carlos Arias Navarro as prime minister on 5 December. Despite Juan Carlos I's announcement, in early 1976, of a program of moderate political and social reform, the new government was received with widespread demonstrations by labor groups and Catalan and Basque separatists. Continued political

unrest, coupled with a sharp rise in living costs, led ultimately to the king's dismissal of Arias Navarro, who was replaced, on 7 July, by Adolfo Suárez González.

On 15 June 1977, the first democratic elections in Spain in 40 years took place, with the Union of the Democratic Center (Unión de Centro Democrático—UCD), headed by Suárez, winning a majority in the new Cortes. The Cortes prepared a new constitution (in many respects similar to that of 1931), which was approved by popular referendum and sanctioned by the king in December 1978. In the elections of March 1979, the UCD was again the victor, and in the April local elections it captured more than 75% of the municipalities.

When Suárez announced his resignation in January 1981, the king named Leopoldo Calvo Sotelo y Bustelo to the premiership. As the Cortes wavered over the appointment, a group of armed civil guards stormed parliament on 23 February and held more than 300 deputies hostage for 17 hours. The attempted coup was swiftly neutralized by the king, who secured the loyalty of other military commanders. The plotters were arrested, and Sotelo was swiftly confirmed. A year of political wrangling followed; by mid-1982 the UCD was in disarray, and Sotelo called new elections. In October 1982, the Spanish Socialist Worker's Party (Partido Socialista Obrero Español—PSOE), headed by Felipe González Márquez, won absolute majorities in both houses of parliament. The new government was characterized by its relative youthfulness—the average age of cabinet ministers was 41—and by the fact that its members had no links with the Franco dictatorship. In the 1986 and 1989 elections, the PSOE again won majorities in both houses of parliament. The PSOE failed to win a majority in 1993 but governed with the support of the Basque and Catalan nationalist parties.

A continuing problem since the late 1960s has been political violence, especially in the Basque region. Political murders and kidnappings, mainly perpetrated by the separatist Basque Nation and Liberty (Euzkadi ta Askatasuna), commonly known as ETA, by the Antifascist Resistance Groups (GRAPO), and by several right-wing groups, abated only slightly in recent years. Another uncertainty in Spain's political future was the role of the military. Several army officers were arrested in October 1982 on charges of plotting a preelection coup, which reportedly had the backing of those involved in the February 1981 attempt. Spain joined NATO in 1982, but the membership question became so controversial that a referendum on it was held in March 1986; about two-thirds of the electorate voted, and 53% chose continued NATO membership. On 1 January of that year, Spain became a full member of the EC (now EU). In January 1988, the United States, acceding to Spain's demands, agreed to withdraw 72 jet fighters based near Madrid.

Spain received considerable recognition with the holding of the 1992 Summer Olympics in Barcelona, and Expo 92, a world's fair, in Sevilla. Other notable events included the designation of Madrid as the culture capital of Europe in 1992.

Throughout 1995–2000 Basque terrorists continued their attacks on civilian, police, and military targets and began to target more visible political targets. In August of 1995, the terrorists came close to assassinating King Juan Carlos while he was vacationing on the island of Majorca, off the southeastern coast of Spain. In 1997 Basque terrorists killed an important Socialist official of one of the Basque regions. In 2000, Jose Luis Lopez de la Calle, a Ma-

drid newspaper columnist who was outspoken in his criticism of the Basque group, ETA, was shot to death outside his home. Thousands marched in the streets to protest his killing.

In 1995 information came to light that revealed that from 1983 to 1987 government officials in cooperation with the Civil Guard (Spain's national police force) formed death squads to hunt down and kill Basque terrorists living in France. The squads were disbanded after France agreed to greater cooperation with Spanish authorities, but not before 27 suspected Basque terrorists had been killed. The existence of the death squads may have remained a secret, but two death squad members were caught in the course of an attack and prosecuted for murder. At first government officials secured the silence of these two men by agreeing to make yearly payments to their wives, but by 1994 they felt that the story should no longer be hidden and revealed it to the world from their jail cells. Initially, Prime Minister Gonzalez had been charged with having knowledge of the attacks but an official inquiry into the charges concluded that they were groundless and he was completely exonerated.

Although French and Spanish security officials worked together to combat terrorism, violence attributed to the Basque terrorists continued into the 2000s. However, public support for Basque terrorists had waned nearly completely. A 1996 Basque execution of a kidnapped university professor brought out almost a half-million protesters in Madrid alone denouncing the Basque terrorists. A year later and again in 2000, assassinations allegedly carried out by Basque terrorists triggered large protests as well. The ETA was suspected of being behind bombings in several tourist resorts in June 2002 as an EU summit was held in Seville. In February 2003, Basque Socialist Party activist Joseba Pagazaurtundua was assassinated; the shooting was attributed to the ETA. Batasuna, the separatist Basque political party believed to be the political arm of the ETA, was banned by the Supreme Court in 2003. This ban prevented Batasuna candidates from running in municipal elections that year. In February 2005, a car bomb exploded in Madrid, injuring about 40 people: ETA was suspected of being responsible for the attack. In May 2005, the government offered to hold peace talks with the ETA if the group disarmed.

As Spain attempts to hold itself together against regional separatism, it joined with seven other nations in 1995 to create a passport-free zone that allowed much greater mobility between them. Spain also rejoined the NATO Military Command in the mid-1990s, making it once again a full member of the alliance. The adjustments to Spain's economy carried out in the mid- and late-1990s were successful. As a result, Spain was one of the 11 countries that joined together in launching the euro, the European Union's single currency, on 1 January 1999. (Greece joined shortly thereafter, bringing the number of countries in the euro zone to 12.)

On 11 July 2002, 12 Moroccan frontier guards landed on the island of Perejil, which is claimed by Spain, and claimed it as Moroccan territory. Spain's Prime Minister José María Aznar opposed the occupation, and sent troops to evacuate the Moroccan guards. Diplomatic relations between Spain and Morocco improved in December 2002, when plans were made for the return of each state's ambassadors.

During 2002 and into 2003, Aznar affirmed Spain's support for the United States and British position on the use of military force

to force Iraq to disarm itself of weapons of mass destruction. Over 90% of Spain's citizens were against a war in Iraq, which began on 19 March 2003. Spain's pro-US stance alienated France and Germany, among other nations opposing the use of military force. Spain did not commit combat troops to fight alongside US and British forces, but it sent 900 troops trained in medical support and anti-mine specialties to assist the coalition forces.

On 11 March 2004, Madrid suffered a major terrorist attack as four rush-hour trains were bombed simultaneously in 10 explosions, killing 191 people and wounding more than 1,400. An Islamic group with links to the al-Qaeda organization was later blamed for the attacks. The attacks took place three days prior to general elections. On 12 March, massive demonstrations in many Spanish cities were held (some 11.4 million people took part, more than a fourth of the Spanish population), which denounced terrorism, and in part the Aznar administration for its support of the war in Iraq and the presence of Spanish troops there. In the general elections held on 14 March, the Socialists, led by José Luis Rodríguez Zapatero, defied earlier public opinion polls and won nearly 43% of the vote for a gain of 39 seats in the Congress of Deputies. When Zapatero was sworn in as president of the government and prime minister in April, he ordered the withdrawal of all Spanish troops from Iraq. The next presidential elections were scheduled for March 2008.

In February 2005, Spanish voters approved the EU constitution in a referendum by 77%. However, the French and Dutch rejections of the constitution in May and June 2005 indefinitely shelved plans for the EU to adopt such a document for itself.

In June 2005, the Spanish parliament defied the Roman Catholic Church by legalizing gay marriage and granting homosexual couples the same adoption and inheritance rights as heterosexual couples. As of late 2005, four countries in the world—Spain, the Netherlands, Belgium, and Canada—had legalized same-sex marriages.

### 13 GOVERNMENT

Between 1966 and 1978, Spain was governed under the Organic Law of the Spanish State. A new constitution, approved by the Cortes on 31 October 1978 and by the electorate in a national referendum on 6 December, and ratified by King Juan Carlos I on 27 December 1978, repealed all the laws of the Franco regime and confirmed Spain as a parliamentary monarchy. It also guaranteed the democratic functioning of all political parties, disestablished the Roman Catholic Church, and recognized the right to autonomy of distinct nationalities and regions.

According to the constitution, the king is the head of state, symbolizing its unity. Legislative power is vested in the Cortes Generales (General Courts), consisting of two chambers: the Congreso de los Diputados (Congress of Deputies) with 350 members (deputies); and the Senado (Senate) with 259 members (senators). All deputies and 208 of the senators are popularly elected to four-year terms under universal adult suffrage. The remaining senators (51) are chosen by the assemblies in the 17 autonomous regions. The government, which is answerable to the congress, consists of the president (prime minister), vice president, and ministers, all appointed by the king. The supreme consultative organ of government is the Council of State. Also established by the constitution is the function of "defender of the people," inspired by medieval

tradition and by the Scandinavian ombudsman. Suffrage is universal at age 18.

## 14 POLITICAL PARTIES

The Falange, known officially as the Nationalist Movement, was the only legally functioning party in Spain during the Franco regime. Founded in 1933 by José Antonio Primo de Rivera, it dated in its later form from 1937, when various right-wing groups were united under Gen. Franco. Nationalists, monarchists, and national syndicalists (Fascists) were the leading groups within the Falange. It lost some of its former power and much of its prestige during the last decades of Franco's regime. On 21 December 1974, the Franco government passed a law conferring a limited right of political association. On 9 June 1976, after Franco's death, the Cortes voted to legalize political parties; by the 1977 parliamentary elections, no fewer than 156 political parties were organized into 10 national coalitions and 12 regional alliances.

The Spanish political scene is characterized by changing parties and shifting alliances. The Union of the Democratic Center (Unión de Centro Democrático—UCD) was formed as an electoral coalition of smaller moderate parties. From 1977 to 1982, the UCD was the governing political body, headed first by Adolfo Suárez González and then by Leopoldo Calvo Sotelo y Bustelo. In late 1981, the UCD began to disintegrate; it won only 8% of the vote in the 1982 elections and was dissolved in February 1983. A new centrist party, the Democratic and Social Center (Centro Democrático y Social—CDS), was created in 1982. The Spanish Socialist Worker's Party (Partido Socialista Obrero Español—PSOE), which traces its lineage to the late 19th century, won absolute majorities in both chambers of the Cortes in October 1982 and June 1986.

The right is represented by the Popular Party or PP, embracing the Alianza Popular, the Christian Democratic Partido Demócrata Popular, and the Partido Liberal; the coalition took 26% of the 1986 vote. An extreme rightist party, New Force (Fuerza Nueva), lost its only seat in parliament in 1982 and thereupon dissolved. The Communist Party (Partido Comunista—PC), legalized in 1977, was one of the most outspoken "Eurocommunist" parties in the late 1970s, harshly criticizing the former USSR for human rights abuses. In the 1986 election, the PC formed part of the United Left coalition (Izquierda Unida—IU), which included a rival Communist faction and several socialist parties; the IU's share of the vote was 4.6%. Nationalist parties function in Catalonia, Andalucía, the Basque Provinces, and other areas. The most powerful are the Catalan Convergence and Union (CIU), the Basque Nationalists (PNV), and the Canaries Coalition (CC).

Despite charges of corruption and economic mismanagement, the PSOE secured electoral victories in 1989 and 1993; however, the party finished 17 seats short of a parliamentary majority in 1993. A noticeable shift toward the conservative PP was evident with a 34-seat gain between 1989 and 1993. PSOE secretary-general Felipe Gonzalez Marquez received endorsement for a fourth term as prime minister, receiving support from the small Basque and Catalan nationalist parties.

In 1996, however, Gonzalez was turned out of power by José María Aznar, a young conservative leader with little international visibility. Aznar, as leader of PP, won reelection as prime minister in the March 2000 election, the first in which a center-right party

won majority control of the government outright. In the March 2004 election, which was held three days after the 11 March Madrid train bombings, Aznar's PP lost 39 seats in the Congress of Deputies and the PSOE gained 35 seats to hold 164 seats in the chamber. The PSOE victory was seen to have been a reaction to the train bombings, which were blamed in part on the Aznar administration for its support of the US-led war in Iraq. José Luis Rodríguez Zapatero of the PSOE became prime minister.

The distribution of seats in the Congress of Deputies following the March 2004 election was as follows: PSOE, 164; PP, 148; CIU, 10; ERC (a Catalan party), 8; PNV, 7; CC, 3; IU, 2; and others, 8. Election results for the Senate were as follows: PP, 102; PSOE, 81; Entesa Catalana de Progress, 12; PNV, 6; CIU, 4; and CC, 3. The next elections for the Congress of Deputies and the Senate were scheduled for March 2008.

## 15 LOCAL GOVERNMENT

Spain is divided into 17 autonomous regions, each of which has an elected assembly and a governor appointed by the central government. Municipalities are gradually becoming consolidated; their number had declined to about 8,000 by the early 2000s. Each municipality has a mayor (*alcalde*) and councilmen (*concejales*); the councilmen, directly elected by the people, elect the mayors. Fifty-one of the 259 members of the Senate are chosen by the regional assemblies.

The statutes governing the Basque and Catalan autonomous communities, providing for regional high courts and legislative assemblies, were approved by referendum in October 1979; the statutes for Galicia in December 1980; and those for Andalucía in October 1981. Autonomy statutes for the other 11 historic regions of continental Spain and the Balearic and Canary Islands were subsequently approved and a regular electoral process begun.

## 16 JUDICIAL SYSTEM

According to the 1978 constitution, the judiciary is independent and subject only to the rule of law. The highest judicial body is the Supreme Court (*Tribunal Supremo*), the president of which is nominated by the 20 judges of the General Council of the Judiciary and appointed by the king.

Territorial high courts (*audiencias*) are the courts of last appeal in the 17 regions of the country; provincial audiencias serve as appellate courts in civil matters and as courts of first instance in criminal cases. On the lowest level are the judges of the first instance and instruction, district judges, and justices of the peace.

The National High Court (*Audiencia Nacional*), created in 1977, has jurisdiction over criminal cases that transgress regional boundaries and over civil cases involving the central state administration. The constitution of 1978 also established the 12-member Constitutional Court (*Tribunal Constitucional*), with competence to judge the constitutionality of laws and decide disputes between the central government and the autonomous regions. The European Court of Human Rights is the final arbiter in cases concerning human rights.

Defendants in criminal cases have the right to counsel at state expense if indigent. The constitution prohibits arbitrary arrest and detention. Suspects may be held for no more than three days without a judicial hearing.

A jury system was established in 1995, and a new penal code was enacted in 1996.

The constitution provides for the right to a fair public trial and the government respects this provision in practice.

## 17 ARMED FORCES

In 2005, Spain's active armed forces totaled 147,255 active personnel. Reservists numbered 319,000 for all three services. The 95,600-member Army was armed with 323 main battle tanks, 270 reconnaissance vehicles, 144 armored infantry fighting vehicles, 2,022 armored personnel carriers, and 2,013 artillery pieces. The Navy had 19,455 active personnel, including 814 naval aviation personnel and 5,300 Marines. Major naval units included one aircraft carrier, 12 frigates, 5 tactical submarines, 36 coastal and patrol vessels, in addition to various mine warfare, amphibious and transport vessels. The Spanish Air Force had 22,750 personnel and 177 combat capable aircraft, including 75 fighters and 91 fighter ground attack aircraft. Spain in 2005 had a paramilitary force of 73,360 personnel, of which 72,600 were members of the Guardia Civil. Another 760 comprised the Guardia Civil del Mar. Spain provided troops to UN peacekeeping and other European Union and NATO military missions in eight regions or countries. In 2005 Spain's defense budget totaled spent \$8.8 billion.

## 18 INTERNATIONAL COOPERATION

Spain joined the United Nations on 14 December 1955; it participates in ECE, ECLAC, and several nonregional specialized agencies, such as the FAO, UNESCO, UNHCR, UNIDO, ILO, the World Bank, and the WHO. Spain is also a member of the Council of Europe, the African Development Bank, the Asian Development Bank, the European Bank for Reconstruction and Development, the Inter-American Development Bank, NATO, OECD, the WTO, OSCE, the Paris Club, the Western European Union, and the European Union. The nation holds observer status in the OAS and the Latin American Integration Association (LAIA).

Spain has supported UN missions and operations in Kosovo (est. 1999), Ethiopia and Eritrea (est. 2000), Burundi (est. 2004), Haiti (est. 2004), and the DROC (est. 1999). The nation is part of the Australia Group, the Zangger Committee, the Nuclear Suppliers Group (London Group), and the Nuclear Energy Agency. In environmental cooperation, Spain is part of the Antarctic Treaty; the Basel Convention; Conventions on Biological Diversity, Whaling, and Air Pollution; Ramsar; CITES; the London Convention; International Tropical Timber Agreements; the Kyoto Protocol; the Montréal Protocol; MARPOL; the Nuclear Test Ban Treaty; and the UN Conventions on the Law of the Sea, Climate Change, and Desertification.

## 19 ECONOMY

Agriculture, livestock, and mining—the traditional economic mainstays—no longer occupy the greater part of the labor force or provide most of the exports. In order to offset the damage suffered by the industrial sector during the Civil War and to cope with the problems created by Spain's post-World War II isolation, the Franco regime concentrated its efforts on industrial expansion. Especially after 1953, the industrial sector expanded rapidly. In terms of per capita income, Spain's economy stands at 80% of the four

largest West European economies, with an estimated GDP (purchasing power parity) of \$23,300 per person in 2004.

From 1974 through the early 1980s, the Spanish economy was adversely affected by international factors, especially oil price increases. Tourism is a major source of foreign exchange, and in 2000 was generating 10% of GDP (up from 3.3% in 1995) and employing, directly or indirectly, one eighth of the labor force. Spain is the world's second most popular tourist destination, after France. Spain had 53.6 million tourists in 2004, a 3.4% increase over 2003, despite the terrorist attacks on Spain's commuter trains on 11 March 2004, which killed 191 people and injured 1,500. The annual GDP growth rate during 1974–77 was 3%, higher than that in other OECD countries, but the inflation rate reached 24% in 1977. Real GDP growth slowed to about 1.6% during 1980–85, averaged 3.5% between 1985 and 1992, but slowed to a yearly average of 1.3% between 1993–95. By 1998, however, it had increased to 3.5%, and in 1999 and 2000, averaged over 4%. The global economic slowdown after 2001 helped reduce GDP growth to 2.5% in 2001 and to 2.3% in 2002. Real GDP growth averaged 3.3% over the period 2000–04. Spanish economic growth was expected to be 3.1% in 2005, due to strong momentum in the domestic economy, and then was forecast to gradually slow to 2.4% by 2007. This slowdown was forecast to stabilize the large current account deficit, which was estimated at 5.9% of GDP in 2005.

Consumer prices rose 37% between 1989 and 1995, and unemployment rose from 17.3% to 21.3%, the highest in the EU. Macroeconomic improvements from 1995 to 1998, however, were sufficient for Spain to be included in the first group of EU members to enter the Economic and Monetary Union (EMU) in 1999. By 1998 inflation had been reduced to 1.8%. From 1999 to 2002, inflation was held to between 2% and 4%. Unemployment fell to 18.7% in 1998 and then to 15.7% in 1999. Although still quite high, unemployment continued to fall—to 13.9% in 2000 and 10.5% in 2001—before registering an increase to 11.2% in 2002. The inflation rate averaged 3.3% from 2000–04. Inflation was predicted to fall from the rate of 3.4% in 2005, as was unemployment; the unemployment rate in 2004 stood at 10.4%. The Rodriguez Zapatero government pursued job creation upon coming into power in April 2004; joblessness is among the highest in the EU, and profound changes to labor market regulations have been called for to reduce unemployment further.

## 20 INCOME

The US Central Intelligence Agency (CIA) reports that in 2005 Spain's gross domestic product (GDP) was estimated at \$1.0 trillion. The CIA defines GDP as the value of all final goods and services produced within a nation in a given year and computed on the basis of purchasing power parity (PPP) rather than value as measured on the basis of the rate of exchange based on current dollars. The per capita GDP was estimated at \$25,100. The annual growth rate of GDP was estimated at 3.3%. The average inflation rate in 2005 was 3.4%. It was estimated that agriculture accounted for 3.4% of GDP, industry 28.7%, and services 67.9%.

According to the World Bank, in 2003 remittances from citizens working abroad totaled \$6.068 billion or about \$148 per capita and accounted for approximately 0.7% of GDP. Foreign aid receipts amounted to \$672 million and accounted for approximately 3.7% of the gross national income (GNI).

The World Bank reports that in 2003 household consumption in Spain totaled \$485.78 billion or about \$11,819 per capita based on a GDP of \$838.7 billion, measured in current dollars rather than PPP. Household consumption includes expenditures of individuals, households, and nongovernmental organizations on goods and services, excluding purchases of dwellings. It was estimated that for the period 1990 to 2003 household consumption grew at an average annual rate of 2.6%. In 2001 it was estimated that approximately 33% of household consumption was spent on food, 11% on fuel, 3% on health care, and 5% on education.

## 2<sup>1</sup> LABOR

In 2005, Spain's labor force totaled an estimated 20.67 million. As of 2004, the workforce was distributed as follows: services 64.6%; manufacturing, mining and construction 30.1%; and agriculture 5.3%. Employment in agriculture has been in steady decline; many farm workers have been absorbed by construction and industry. Unemployment averaged about 22% during 1997, but had fallen to 11% by 2002. As of 2005, Spain's unemployment rate was estimated at 10.1%.

The constitution of 1978 guarantees the freedom to form unions and the right to strike. The law provides for the right to bargain collectively, and unions exercise this right in practice. In the private sector, as of 2005, 85–90% of workers were covered by a collective bargaining agreement. Discrimination against union activity is illegal. In 2005, approximately 15% of the workforce was unionized.

The monthly minimum wage was \$620 in 2005. This wage provides a decent standard of living for a family. The regular workweek was 40 hours, with a mandated 36-hour rest period. In addition, workers receive 12 paid holidays per year and one month's paid vacation. The legal minimum age for employment was 16 years, and this is enforced by the Ministry of Labor and Social Affairs.

## 2<sup>2</sup> AGRICULTURE

During 1970–2003, the proportion of the GDP from agriculture fell from 11.3% to 3%, and the proportion of workers employed in agriculture decreased from 26% to about 7%. Arable cropland in 2003 covered 18,715,000 hectares (46,245,000 acres), of which 67% was used for field crops, and 33% planted with olive trees, vineyards, and orchards.

In 2003, Spain's crop output was valued third highest among the EU nations, at over €27.1 billion. Agricultural commodities harvested in 2004 (in thousands of tons) included wheat, 7,108; barley, 10,609; corn, 4,748; rice, 900; beans, 19; sugar beets, 6,997; sunflower seeds, 785; grapes, 7,148; peaches, 1,107; potatoes, 2,570; and tomatoes, 4,367. Grapes are cultivated in every region; the most important olive groves are in Andalucía. After France and Italy, Spain is the world's leading wine producer, with an estimated 421 million liters produced in 2004. Within the domestic market, the use of sunflower oil and soybean oil has grown considerably.

Agricultural mechanization has been increasing steadily. In 2003 there were 943,653 tractors and 50,454 harvester-threshers. The use of fertilizers has also increased. The Institute for Agrarian Development and Reform directly or indirectly regulates some 10

million hectares (25 million acres) of land, promoting intensive cultivation and irrigation to improve productivity.

## 2<sup>3</sup> ANIMAL HUSBANDRY

Spain's pastures cover about 23% of the total area. Because much of Spain is arid or semiarid, sheep are by far the most important domestic animals. In 2005, Spain's livestock population (in millions) included sheep, 22.5; hogs, 25.2; and cattle, 6.7. There also were 2.8 million goats, 240,000 horses, 142,000 asses, and 110,000 mules in 2005. Meat production that year included (in thousands of tons): pork, 3,310; poultry, 1,341; beef and veal, 715; and lamb and mutton, 235. In 2005, milk production was 7.4 million tons (12% from sheep and goats); 725,000 tons of eggs were also produced.

## 2<sup>4</sup> FISHING

Fishing is important, especially along the northern coastline. The Spanish fishing fleet is the largest within the European Union (EU). As of 2004, the fleet had a capacity of 491,246 gross tons, 26% of EU total and about 6% of the world's fishing fleet capacity.

In 2004, the total quantity of fish caught by Spanish vessels and landed in Spanish ports amounted to 875,000 tons (including nonedible fish). The main species landed in 2003 were (in thousands of tons): sardines, 55.8; yellowfin tuna, 108.7; skipjack tuna, 155.4; and Atlantic mackerel, 23.6.

The most common species processed by the Spanish canning industry are: tuna, mussels, sardines, white tuna, cephalopod, mackerel, and anchovy. In 2003, Spain exported 95.9 million tons of canned fish, valued at \$385 million. Exports of seafood that year amounted to 529.6 million tons, worth \$1,105 million.

The main aquacultural commodities are mussels, trout, oysters, clams, and gilthead bream. Mussel production began in 1940 in northwestern Spain, and today there are thousands of floating mollusk beds found in many Spanish bays. Trout farming began in 1960, and is located in the north and northwest. In 2003, aquacultural production included 248,827 tons of mussels and 33,113 tons of trout. Spain is the world's second leading producer of mussels after China.

## 2<sup>5</sup> FORESTRY

Spain's forested area in 2004 was estimated at 15 million hectares (37 million acres), of which 7.5 million hectares (18.5 million acres) was commercial forest (73% softwood, 27% temperate hardwood). The northern Cantabrian range accounts for about one-third of the timberland. In addition, Spain has 2.5 million hectares (6.2 million acres) of woodlots typically comprised of oaks and cork trees, located mostly in the west (especially in Estremadura and Salamanca). During 1999–2003, the annual average area reforested was 75,000 hectares (185,000 acres).

Roundwood production in 2004 was 16.3 million cu m (575 million cu ft), with about 13% used as fuel wood. Spain is one of the largest producers of cork, its most important commercial forest product. Spain's annual production of cork amounts to about 110,000 tons, or 32% of world production. Scotch and maritime pine, as well as radiata pine, are the main softwood lumber species produced in Spain; eucalyptus and poplar are the principal hardwood species. In 2004, Spain imported \$4.9 billion in forest products, primarily lumber (\$989.4 million) and wood-based panels (\$699 million).

## 26 MINING

Spain had some of the most mineralized territory in Western Europe, including the volcanic-hosted massive sulfide (VMS) deposits of the Iberian Pyrite Belt (IPB) of southern Spain. The IPB alone was estimated to have yielded 1.7 billion tons of sulfides, and more than 80 VMS deposits have been recorded in which individual tonnages were in excess of one million tons. Spain had the largest known reserves of celestite (Europe's sole producer, ranking second in world production, behind Mexico); was home to the richest mercury deposit in the world and one of the biggest open-pit zinc mines in Europe; and remained the leading producer of sepiolite, with 70% of world reserves (around Madrid). Spain was the largest EU producer of mine lead and zinc, and a major producer of pyrites, among other nonferrous and precious metals. Production far exceeded domestic consumption for most nonmetallic minerals, and Spain was a net exporter to other EU countries of lead, mercury, nonmetallic-mineral manufactured products, slate, other crude industrial minerals, and zinc. In terms of value, Spain was one of the leading EU countries, with one of its highest levels of self-sufficiency in mineral raw materials. Almost all known minerals were found in Spain, and mining was still a notable, though much diminished, factor in the economy. Of the 100 minerals mined, 18 were produced in large quantities—bentonite, copper, fluor spar, glauberite, gold, iron, lead, magnetite, mercury, potash, pyrites, quartz, refractory argillite, sea and rock salt, sepiolitic salts, tin, tungsten, and zinc. Metals and chemicals were leading industries in 2002. The output of lead, zinc, and copper ores, all once important to the Spanish economy, has been declining. The number of active operations has halved in recent years, with copper production a notable casualty. Quarried mineral products, particularly quarried stone, accounted for a significant share of the value of all minerals produced.

Lead mine output was 1,765 metric tons in 2003, down from 6,171 metric tons in 2002 and 36,000 metric tons in 2001. Zinc mine output totaled 44,600 metric tons in 2003, down from 69,926 metric tons in 2002 and from 164,900 metric tons in 2001. Copper mine production in 2003 was estimated at 643 metric tons, down from 1,248 metric tons in 2002 and from 9,748 metric tons in 2001. Gold mine output in 2003 totaled 5,362 kg, up from 5,158 kg in 2002 and from 3,720 kg in 2001. Silver mine output in 2003 totaled 2,246 kg in 2003, down from 3,409 kg in 2002, and from 54,836 kg in 2001. Germanium oxide, tin, titanium dioxide, and uranium also were mined. Because of market conditions, iron mining was halted in 1997, after 588,000 tons (metal content) was produced in 1996. Iron ore was one of Spain's principal mineral assets, with 6 million tons of total reserves in the north (Basque provinces, Asturias, León) and in Andalucía; the Alquife mine, in Granada, which was closed for maintenance, had a capacity of 4 million tons per year.

Among industrial minerals, Spain in 2003 produced an estimated: 10 million tons of marl; 12 million tons of dolomite; 5 million tons of ornamental marble; 2.48 million tons of limestone; 690,395 metric tons (reported) of meerschaum sepiolite; 594,355 metric tons of potash (reported); and 150,000 metric tons of calcined magnesite (from deposits in Navarra and Lugo), unchanged from 2002. Spain also produced barite, bromine, calcium carbonate, hydraulic cement, clays (including attapulgite, bentonite, and washed kaolin), diatomite, tripoli, feldspar, fluor spar (acid-grade

and metallurgical grade), gypsum, anhydrite, andalusite kyanite, hydrated lime and quicklime, mica, nitrogen, mineral pigments (ocher and red iron oxide), pumice, salt (including rock, marine, and by-product from potash), silica sand (including as by-product of feldspar and kaolin production), soda ash, natural sulfate (including glauberite and thenardite), large quantities of all stone (including basalt, chalk, ornamental granite, ophite, phonolite, porphyry, quartz, quartzite, sandstone, serpentine, slate), strontium minerals, sulfur, talc, and steatite.

Historically, minerals belonged to the state, with the industry comprising a mix of state-owned, state-and-privately owned, and privately owned companies. However, the Spanish government has been moving rapidly toward privatization and continued to do so in 2003. In mid-2002, legislation was passed that would abolish state and private monopolies. The economic development of certain areas, such as the Asturias and the Basque regions, was based on their mineral wealth, and mining continued to be an important current and potential source of income in these and other mineral-rich areas. The independent government of Andalucía completed its first mining development plan (1996–2000). Several old and new prospects were being evaluated, and exploration activity was high, particularly for feldspar (in Badajoz, Toledo, and Salamanca), garnet (Galicia), pyrites (Badajoz), and rutile and zircon (Ciudad Real). The main polymetallic deposits included Tharsis, Scotiel, Rio Tinto, and Aznalcollar.

## 27 ENERGY AND POWER

Spain has only small reserves of oil and natural gas, with coal being the country's most abundant energy source.

As of 1 January 2002, Spain's proven reserves of oil and natural gas came to 10.5 million barrels and 254.9 million cu m, respectively. In 2004, Spain's production of oil averaged 5,980 barrels per day in 2004 (7,099 barrels per day in 2001), while consumption in that year averaged 1.5687 million barrels per day. As a result, Spain had to rely heavily on imports to meet its petroleum needs. Spain has seven active oil fields all of them operated by Repsol-YPF. Spain's refining sector has a combined capacity of 1.27 million barrels and is spread among seven refineries, of which the largest is the Cadiz plant operated by Cepsa, with a capacity of 240,000 barrels per day. However, Repsol-YPF has the largest total capacity at 520,000 barrels per day.

As with oil, Spain relies heavily on imports to meet its natural gas needs. In 2003, Spain produced 7.3 billion cu ft of natural gas, but demand that year totaled 822 billion cu ft. Spanish demand for natural gas rose sharply between 1993 and 2003, increasing by 266%, and was driven in large part by the introduction of gas-fired power plants. In 2002, of the 1,073.7 billion cu ft of natural gas imported by Spain, Algeria was the main source, providing 627.7 billion cu ft, followed by Norway at 116.0 cu ft and Qatar at 107.2 billion cu ft. Nigeria, Oman and other countries accounted for the remainder.

Spain's most abundant energy source is coal. In 2003, Spain had reserves of 584 million short tons, with production in that year at 22.7 million short tons. However, as with oil and natural gas, demand for coal in 2003 outstripped supply, with consumption at 45.6 million short tons, thus necessitating imports to fill the gap.

Spain is the European Union's fifth-largest electricity market. Production of electricity in 2002 reached 230.082 billion kWh, of

which fossil fuels accounted for 134.834 billion kWh, hydropower at nuclear at 59.865 billion kWh, hydropower at 22.807 billion kWh and geothermal/other sources at 12.576 billion kWh. Demand for electric power in 2002 totaled 219.305 billion kWh. Electric power capacity in 2002 totaled 50.591 million kW, of which conventional thermal capacity accounted for 26.359 million kW, hydroelectric at 12.744 million kW, nuclear at 7.519 million kW, and geothermal/other at 3.969 million kW. Spain, as of July 2005, had nine nuclear reactors in operation. However, the Jose Cabrera nuclear plant is slated for closure in April 2006.

## 28 INDUSTRY

Industrial production grew by 3% in 2004, and industry accounted for 28.5% of GDP. The chief industrial sectors are food and beverages, textiles and footwear, energy, and transport materials. Chemical production, particularly of superphosphates, sulfuric acid, dyestuffs, and pharmaceutical products, is also significant. Of the heavy industries, iron and steel, centered mainly in Bilbao and Avilés, is the most important. Petroleum refinery production capacity at Spain's nine refineries was 1.27 million barrels per day in 2004. Approximately three million automobiles were produced in Spain in 2004; automobiles are Spain's leading manufacturing industry, accounting for about 5% of GDP and exporting more than 80% of output.

Prior to the 1990s wave of privatization, government participation in industry was through the National Industrial Institute (INI), which owned mining enterprises, oil refineries, steel and chemical plants, shipbuilding yards, and artificial fiber factories, or through Patrimonio. As of 2005, Telefónica, Gas Natural, and the petrochemical company Repsol had been privatized. A wave of consolidations was taking place in the energy industry, as Gas Natural launched a \$28.1 billion unsolicited bid for Endesa, a Spanish electricity company, mirroring a series of energy deals taking place across Europe in 2005. In the Spanish mobile-phone market, which was growing strongly in 2005, France Télécom bought an 80% stake in Amena, Spain's third-largest mobile phone operator, behind Telefónica and Britain's Vodafone.

Industries demonstrating significant growth in the early 2000s were metalworking industries, due to increased production in shipbuilding, data-processing equipment, and other transportation equipment. Other growth sectors included food processing, medical products and services, chemicals, computer equipment, electronics, footwear, construction and security equipment, cosmetics and jewelry, and industrial machinery. In the early 2000s, the construction industry was aided by such public works projects as a high-speed train link between Madrid and Barcelona, and an increase in property development on the Mediterranean coast.

Foreign competition has cut into the Spanish textile industry. Following the expiration of the World Trade Organization's long-standing system of textile quotas at the beginning of 2005, the EU signed an agreement with China in June 2005, imposing new quotas on 10 categories of textile goods, limiting growth in those categories to between 8% and 12.5% a year. The agreement runs until 2007, and was designed to give European textile manufacturers time to adjust to a world of unfettered competition. Nevertheless, barely a month after the EU-China agreement was signed, China reached its quotas for sweaters, followed soon after by blouses, bras, T-shirts, and flax yarn. Tens of millions of garments piled up

in warehouses and customs checkpoints, which affected both retailers and consumers.

## 29 SCIENCE AND TECHNOLOGY

The Council for Scientific Research, founded in 1940, coordinates research in science and technology and operates numerous constituent research institutes in a wide variety of disciplines. The Royal Academy of Exact, Physical, and Natural Sciences, founded in 1916, is the nation's chief scientific academy. The National Science Museum and the National Railway Museum are located in Madrid, and two geology museums are located in Barcelona. Spain has 32 universities, colleges, and polytechnics offering courses in basic and applied sciences.

In 1987-97, science and engineering students accounted for 31% of university enrollment. In 2002, of all bachelor's degrees awarded, 23.8% were for the sciences (natural, mathematics and computers, engineering). In 2002, total expenditures on research and development (R&D) amounted to \$9,101.393 million, or 1.04% of GDP. Of that amount, the business sector accounted for the largest portion at 48.9%, followed by the government at 39.1%. Higher education and foreign sources accounted for 5.2% and 6.8%, respectively. In that same year, there were 742 technicians and 2,036 scientists and engineers engaged in R&D per one million people. High technology exports in 2002 were valued at \$6.777 billion, or 7% of the country's manufactured exports.

## 30 DOMESTIC TRADE

Madrid and Barcelona are the primary commercial hubs for distribution of goods throughout the country. Spain has no free ports, but free-zone privileges are granted at Barcelona, Bilbao, Cádiz, Vigo, and the Canary Islands. There are bonded warehouses at the larger ports. The government has established a market distribution program to regulate the flow of goods to and from the producing and consuming areas. Since 1972, wholesale market networks have been established in cities with more than 150,000 inhabitants. The National Consumption Institute promotes consumer cooperatives and credit unions.

A wide variety of shops are available in Spain, from small specialty boutiques to large department stores, shopping centers, and outlet stores. Franchises are becoming more popular throughout the country. As of 2003, there were about 960 franchise firms with over 48,000 franchised units represented in the country, with national companies holding ownership of 82% of them. Direct marketing and sales, particularly through mail order and television sales, are also gaining in popularity. A 16% value-added tax applies to most goods and services. This rate is reduced for some products, such as food, books, and medical supplies. Advertising is largely through newspapers, magazines, radio, and motion picture theaters.

Usual business hours are from 9 AM to 6 PM, Monday through Friday. Banks are open from 8:30 AM to 2:30 PM, Monday through Friday, and to 1 PM on Saturday. Department stores are often open from 10 AM to 8 PM, Monday through Saturday. Many small shops and businesses are often closed in the afternoons, from 2 PM to 4 or 5 PM.

### 3<sup>1</sup> FOREIGN TRADE

Traditionally, exports consisted mainly of agricultural products (chiefly wine, citrus fruits, olives and olive oil, and cork) and minerals. While agricultural products and minerals remain important, they have, since the 1960s, been overtaken by industrial exports. Imports habitually exceed exports by a large margin.

Of Spain's export commodities, transport-related items make up more than 20% of the total. Fruits, nuts, and vegetables are also exported in sizable amounts. Spain is the world's largest producer of olive oil; the country supplies about one-third of the olive oil in the world. Footwear and chemicals (chiefly pharmaceuticals) are other important exports.

The liberalization of product markets and more effective anti-trust mechanisms have been called for as ways to boost Spain's economic growth potential. Merchandise exports rose to \$184.1 billion in 2004. Strong domestic demand resulted in a larger increase in imports, causing the trade deficit to widen from \$45.1 billion in 2003 to \$65.8 billion in 2004. Spain's leading markets in 2004 were France (19.4% of all exports), Germany (11.7%), and Portugal and Italy (each with 9% of Spain's total exports). In all, the EU accounted for 73.9% of Spain's total exports. Leading suppliers in 2004 were Germany (16.1% of Spanish imports), France (15.2%), Italy (9.1%), and the United Kingdom (6.1%). The EU made up 65.6% of all imports that year.

### 3<sup>2</sup> BALANCE OF PAYMENTS

Tourism, remittances from Spaniards living abroad, investment income, and loans to the private sector have been the principal factors that help to offset recurrent trade deficits, especially deficits in merchandise trade and net investment income. Between 1992 and 1995 exports grew by 70% and imports grew by approximately the same amount. In 2000, Spain experienced a large increase in its trade deficit due in large measure to increased petroleum prices, the weakness of the euro, and decreased competitiveness. The current account deficit widened considerably in 2004 to 5.3% of GDP, up from 3.6% in 2003, largely due to the large trade deficit of \$65.8 billion, which was caused by strong domestic demand and an increase in imports. In 2004, the current account balance stood at -\$30.89 billion.

### 3<sup>3</sup> BANKING AND SECURITIES

The banking and credit structure centers on the Bank of Spain, the government's national bank of issue since 1874. The bank acts as the government depository as well as a banker's bank for discount and other operations. The European Central Bank determines monetary policy for the EU. Other "official" but privately owned banks are the Mortgage Bank of Spain, the Local Credit Bank of Spain, the Industrial Credit Bank, the Agricultural Credit Bank, and the External Credit Bank.

In 2002, the private banking system consisted of 146 banks, comprising national banks, industrial banks, regional banks, local banks, and foreign banks. The liberalization of the banking system and Spain's entry into the EC raised the number and presence of foreign banks. During the process of financial liberalization required by the EU, the government tried to promote a series of mergers within the banking industry, which it hoped could enable the banks to compete more effectively. As a result, there were two

major mergers: Banco de Vizcaya and Banco de Bilbao formed Banco Bilbao Vizcaya (BBV), and Banco Central and Banco Hispanoamericano merged to form Banco Central Hispanoamericano (BCH). The government also brought together all the state-owned banking institutions to form Corporación Bancaria de España, better known by its trade name Argentaria, whose most important component is Banco Exterior (BEX). The government subsequently privatized a 50% stake in Argentaria in 1993 and a further 25% in early 1996. Ultimately, the state sold its remaining 25% share in Argentaria, thereby leaving the banking sector entirely in private hands. In October 1999, BBV took over Argentaria to create Spain's largest banking group. The International Monetary Fund reports that in 2001, currency and demand deposits—an aggregate commonly known as M1—were equal to \$193.7 billion. In that same year, M2—an aggregate equal to M1 plus savings depos-

its, small time deposits, and money market mutual funds—was \$548.2 billion. The money market rate, the rate at which financial institutions lend to one another in the short term, was 4.36%.

Spain has major stock exchanges in Madrid, Barcelona, Bilbao, and Valencia. These exchanges are open for a few hours a day, Tuesday through Friday. Since 1961, foreign investment in these exchanges has increased rapidly. The major commercial banks invest in the equity and debt securities of private firms and carry on brokerage businesses as well. Latibex, a Madrid-based stock exchange providing a market for the trading (in euros) of Latin American stocks, opened in late 1999. The exchange lists companies based in Latin American nations such as Argentina, Brazil, Chile, Columbia, and Venezuela. As of 2004, there were 3,272 companies listed on the BME Spanish Exchanges, which had a market capitalization of \$940.673 billion.

### 34 INSURANCE

Insurance companies are supervised by the government through the Direccion General de Seguros. The Spanish insurance market is characterized by a relatively large number of insurers with one organization dominating the industry. Latest information available indicates an insurance market in Spain with moderate penetration when compared to North America and Europe, especially for life products. Recently, however, Spanish insurance firms such as Euroseguros are taking advantage of linguistic, cultural, and historical ties and are expanding operations to Latin America. Compulsory insurance includes third-party automobile liability, workers' compensation, hunters', nuclear and professional liability, and personal injury insurance. Workers' compensation and property insurance can only be obtained through the government. Spain's insurance market is made up of both local and foreign insurers, with the local insurers often owned by Spanish banks. In 2003, the value of all direct insurance premiums written totaled \$47.014 billion, of which nonlife premiums accounted for \$26.972 billion. In that same year, the top nonlife insurer was MAPFRE Mutualidad, which had gross written nonlife premiums of \$2,088.2 million, while the country's leading life insurer was Mapfre Vida, which had gross written life insurance premiums of \$1,808.6 million.

### 35 PUBLIC FINANCE

The public sector deficit in 1996 was equivalent to 4.3% of GDP (compared to 3.8% in 1993 and 4.4% in 1992). Because of Spain's desire to enter the European Monetary Union, it had to meet stringent limits on its public debt and finances, including a 3% debt-to-GDP ratio. The government trimmed the budget by reducing the civil service payroll and limiting transfers to government-owned companies.

The US Central Intelligence Agency (CIA) estimated that in 2005 Spain's central government took in revenues of approximately \$440.9 billion and had expenditures of \$448.4 billion. Revenues minus expenditures totaled approximately -\$7.5 billion. Public debt in 2005 amounted to 48.5% of GDP. Total external debt was \$1.249 trillion.

Government outlays by function were as follows: general public services, 28.6%; defense, 3.7%; public order and safety, 3.8%; economic affairs, 6.2%; environmental protection, 0.2%; housing and community amenities, 0.1%; health, 15.3%; recreation, culture, and religion, 1.2%; education, 1.6%; and social protection, 39.3%.

### 36 TAXATION

As of 2005, Spain had a basic corporation tax rate of 35%. A reduced rate of 30% is applied to companies with annual turnover of less than €6 million in the preceding tax year on initial profits of €90,151. Generally, capital gains are taxed at the corporate rate, while dividends, interest and royalties are subject to withholding taxes of 15%, 15% and 25%, respectively.

Spain, as of 2005, had a progressive individual income tax with a top rate of 45%. The tax is imposed on aggregate income and includes dividends, interest and royalties received. However, dividends received from a resident company may be subject to an imputation credit. There is also a wealth tax with a maximum rate of 2.5%.

The main indirect tax is Spain's value-added tax (VAT), introduced 1 January 1986 as a condition for membership in the European Union (EU). As of 2005, the VAT had a standard rate of 16%, with two reduced rates: 4% on basic necessities; and 7% on food, dwellings, tourism and certain transport services. Indirect taxes include levies on inheritances, documents, sales, special products (alcohol, petroleum, and others), luxury items, and fiscal monopolies.

### 37 CUSTOMS AND DUTIES

Spain, a member of the European Union and the World Trade Organization, adheres to EU and GATT trading rules. Spain determines customs duties based on cost, insurance, and freight (CIF), and applies the EU Common External Tariff to non-EU imports. Most customs costs amount to 20–30% of CIF (cost, insurance, freight), including the duty, the VAT, and customs agent and handling fees.

### 38 FOREIGN INVESTMENT

In keeping with the rest of the European Union, in recent years the Spanish government has instituted a wholesale revision of its

previously restrictive foreign investment laws. With the exception of strategic sectors, up to 100% foreign investment is permitted in all sectors of the Spanish economy. The corporation tax is levied at a standard rate of 35% and at 30% on the first €90,151 for companies with a turnover of less than €5 million.

In 1998, foreign direct investment (FDI) inflow was nearly \$12 billion, up from \$7.7 billion in 1997, and peaking at \$37.5 billion in 2000. In 2001, FDI inflow fell to \$21.8 billion. From 1998 to 2001 FDI inflow averaged about \$19 billion a year, and in 2001 cumulative FDI stock totaled approximately \$157 billion. Outward FDI from Spain from 1998 to 2001 averaged about \$31.1 billion, and in 2001 cumulative foreign stock held by Spaniards totaled about \$184 billion.

In 2004, new investment in Spain totaled \$18.4 billion. Spanish FDI outflows totaled \$54.5 billion. In 2004, cumulative FDI stock in Spain totaled \$346.7 billion. Cumulative outward FDI stock totaled \$332.6 billion. In 2003, most new FDI in Spain came from (in order): the United States, the Netherlands, the United Kingdom, Canada, Luxembourg, Italy, Germany, France, and Sweden. From 2000–04, FDI inflows as a percentage of GDP averaged 4%. In 2004, Spain was the 11th most attractive country in the world for US investors, up from 17th place, according to the FDI Confidence Index. In 2004, Spain was the largest net EU-25 investor, while the United Kingdom was the largest net recipient of FDI.

### **3<sup>9</sup> ECONOMIC DEVELOPMENT**

After 1939, Spanish economic policy was characterized by the attempt to achieve economic self-sufficiency. This policy, largely imposed by Spain's position during World War II and the isolation to which Spain was subjected in the decade following 1945, was also favored by many Spanish political and business leaders. In 1959, following two decades of little or no overall growth, the Spanish government acceded to reforms suggested by the International Monetary Fund (IMF), OECD, and IBRD, and encouraged by the promise of foreign financial assistance, announced its acceptance of the so-called Stabilization Plan, intended to curb domestic inflation and adverse foreign payment balances.

Long-range planning began with Spain's first four-year development plan (1964–67), providing a total investment of ₧355 billion. The second four-year plan (1968–71) called for an investment of ₧553 billion, with an average annual growth of 5.5% in GNP. The third plan (1972–75) called for investments of ₧871 billion; drastic readjustments had to be made in 1975 to compensate for an economic slump brought on by increased petroleum costs, a tourist slowdown, and a surge in imports. A fifth plan (1976–79) focused on development of energy resources, with investments to increase annually by 9% increments. A stabilization program introduced in 1977 included devaluation of the peseta and tightening of monetary policy. The economic plan of 1979–82 committed Spain to a market economy and rejected protectionism.

Accession to the EU generated increased foreign investment but also turned Spain's former trade surplus with the EU into a growing deficit: the lowering of tariffs boosted imports, but exports did not keep pace. The government responded by pursuing market liberalization and deregulation, in hopes of boosting productivity and efficiency to respond to EU competition. A number of projects, such as the construction of airports, highways, and a high-speed rail line between Madrid and Seville, received EU funding.

To prepare Spain for European economic and monetary union, the government in 1992 planned to cut public spending. The currency was devalued three times in 1992–93. Additionally, Spain was a principal beneficiary of the EU's "harmonization fund." This fund provides financial support to poorer EU nations to attempt to reduce the disparities in economic development.

After an economic downturn in the early and mid-1990s, the Spanish economy turned around to register a new dynamism characterized by strong growth rates and a rise in foreign investment sparked by increased liberalization. Moreover, unemployment dropped and inflation remained in check. Spain capped its success by entering the Economic and Monetary Union (EMU) in 1999. Reducing the public sector deficit, decreasing unemployment, reforming labor laws, lowering inflation, and raising per capita gross domestic product (GDP) were all goals in the early 2000s. Economic growth was forecast at 3.1% in 2005. The construction sector was thriving, driven by higher levels of investment and public infrastructure projects.

Spain cushioned the effects of the 2001–03 global economic slowdown on its economy through effective management of fiscal policy, but the constraints of the European Stability and Growth Pact—which requires EU members to keep their budget deficits within 3% of GDP—continues to limit freedom to maneuver. After coming to power in April 2004, the Socialist government made little change in economic policy. Despite a decline in unemployment in the early 2000s, the jobless rate remains one of the highest in the EU. Expansion of the services sector, including retailing, tourism, banking, and telecommunications, has led to recent economic growth. Spain has developed a greenhouse industry in the southeast region of the country, which has become one of the most competitive suppliers of fresh produce to the main European markets. Fishing remains a growth industry as well.

### **4<sup>0</sup> SOCIAL DEVELOPMENT**

The social insurance system provides pensions for employees in industry and services, with a special system for the self-employed, farmers, domestic workers, seamen and coal miners. The system is funded through employee and employer contributions, and an annual government subsidy. The fund provides for health and maternity benefits, old age and incapacity insurance, a widow and widower pension, orphan pension, a family subsidy, workers' compensation, job-related disability payments, unemployment insurance and a funeral grant. Retirement is set at age 65, but is allowed at age 64 under certain conditions. Maternity benefits are payable for 16 weeks, and is applicable to adoption as well. Fathers may also take parental leave. Work injury legislation was first instituted in 1900 and covers all employed persons. It is funded solely by the employer.

Discrimination against women in the workplace persists although it is prohibited by law. The female rate of unemployment is about twice that for men, and the median salary for women was lower than that of men. There are a growing number of women entering the medical and legal professions. Women take an active role in politics. The law prohibits sexual harassment in the workplace but it is not effectively enforced. The government takes steps to address the problems of domestic abuse and violence against women. The Integral Law Against Gender Violence enacted in 2005 provides harsher penalties to those convicted of domestic

violence. The government is strongly committed to children's welfare and rights.

Roma minorities suffer from housing, education, and employment discrimination. The government provides mechanisms for legal redress for discrimination and harassment for Roma and other minorities. In addition, a growing number of right-wing extremist attacks against minorities have been reported in recent years. Human rights abuses have been committed by both the government and Basque (ETA) separatist groups. The ETA has carried out killings and kidnapping, while the government has failed to prevent the mistreatment of prisoners.

#### 41 HEALTH

Following the adoption of the country's constitution, Spain's health care system underwent major reforms in the 1980s and 1990s. Instead of being organized directly as part of the social security system, it was transformed to the more decentralized National Health System. Coverage was extended further than before and the primary care network was reorganized. Spanish officials say that public contributions to the cost of health care must be limited in the face of potentially unlimited demand. Total health care expenditure was estimated at 7% of GDP.

The public sector in health care is the largest and continues to grow. There are 354 public hospitals, 149 private hospitals, and 312 private business hospitals. The public health sector contracts a significant number of beds from both types of private hospitals. As of 2004, there were an estimated 320 physicians, 362 nurses, 43 dentists, 77 pharmacists per 100,000 people. Recent programs have created special residences for elderly and retired people, eye clinics, a network of government health centers in the principal cities, and more than a dozen human tissue and organ banks for transplantation and research.

As of 2002, the crude birth rate and overall mortality rate were estimated at, respectively, 9.3 and 9.2 per 1,000 people. About 59% of married women (ages 15 to 49) were using contraception. Average life expectancy in 2005 was 78 years. That year the infant mortality rate was 4.42 per 1,000 live births, down from 38 in 1965. Immunization rates for children up to one year old were: diphtheria, pertussis, and tetanus, 88%; polio, 88%; and measles, 90%.

Leading causes of death were communicable diseases and maternal/perinatal causes, noncommunicable diseases, and injuries. The HIV/AIDS prevalence was 0.70 per 100 adults in 2003. As of 2004, there were approximately 140,000 people living with HIV/AIDS in the country. There were an estimated 1,000 deaths from AIDS in 2003.

The smoking rates for both men and women in Spain are above the average of "high human development" countries as defined by the World Bank. Approximately 58% of men and 27% of women were smokers. However, the likelihood of dying after the age of 65 of heart disease was below the highly industrialized country average at 235 (male) and 277 (female) per 1,000 people.

#### 42 HOUSING

A housing boom beginning around 1998-2001 saw the creation of over two million new houses with about 600,000 new houses built in 2000. In 2000, about 20-25% of the housing market was attributed to those building second homes/vacation homes. At the 2001 census, there were about 20,946,554 dwellings nationwide.

About 31.9% were single-family dwellings; 35% were dwellings in multi-family buildings. About 16% of the existing stock was built in the period 1991-2001; with an average of about 307,000 units per year. Some 52% of all dwellings were owned by private individuals; 46% were owned by communities. Nearly 90% of all dwellings were listed in good condition; 195,910 dwellings were listed as in ruin.

#### 43 EDUCATION

Since 1990, schooling has been compulsory for ten years, including six years of primary school and four years of secondary school. Many students continue on for an additional two years of higher secondary school. Vocational programs are available at the secondary level. The academic year runs from October to July.

Most children between the ages of three and five are enrolled in some type of preschool program. Primary school enrollment in 2003 was estimated at about 100% of age-eligible students. The same year, secondary school enrollment was about 96% of age-eligible students. It is estimated that nearly all students complete their primary education. The student-to-teacher ratio for primary school was at about 14:1 in 2003; the ratio for secondary school was about 11:1. In 2003, private schools accounted for about 33% of primary school enrollment and 29% of secondary enrollment.

The Pontifical University of Salamanca, founded in 1254, is the oldest university, while the University of Madrid has the largest student body. In 2003, it was estimated that about 62% of the tertiary age population were enrolled in tertiary education programs; 57% for men and 67% for women. The adult literacy rate for 2003 was estimated at about 97.9%.

As of 2003, public expenditure on education was estimated at 4.5% of GDP, or 11.3% of total government expenditures.

#### 44 LIBRARIES AND MUSEUMS

The National Library in Madrid (four million volumes), the Library of Catalonia in Barcelona (one million volumes), the university libraries of Santiago de Compostela (one million volumes), Salamanca (906,000 volumes), Barcelona (two million volumes), and Sevilla (777,000 volumes), Valladolid (500,000 volumes), and the public library in Toledo (with many imprints from the 15th to the 18th centuries) are among the most important collections. Spain also has 61 historical archives, among them the Archivo General de Indias in Sevilla, with 60,000 volumes and files, and the archives of Simancas, with 86,000 volumes and files. In total, Spain's public library collection holds more than 32.8 million volumes. There are over 2,500 public libraries nationwide. In the province of Barcelona there are about 143 public libraries and 8 mobile services.

The Prado, in Madrid, with its extensive collection of Spanish art, is the most famous museum of Spain and one of the best in the world, featuring Picasso's world-famous *Guernica*. The National Archaeological Museum, also in Madrid, contains the prehistoric cave paintings of Altamira. The Museum of Modern Art, in Barcelona, houses excellent cubist and surrealist collections. There are also important art collections in the Escorial and Aranjuez palaces, near Madrid. Also in Madrid are the Museum of America, with artifacts from Spain's colonial holdings; the African Museum, with exhibits of many African cultures, especially Makonde art from Mozambique; and the Antiquities Collection of the Academy of

History, founded in 1738, which houses Iberian and Visigoth artifacts, Islamic art, 4th century relics, including the Silver Dish of Theodosius, general European art, and 11th century documents. Barcelona also has the Museum of Ceramics, the Museum of Decorative Arts, a Picasso museum, the National Museum of Catalan Art, and the Museum of Perfume. The Guggenheim Museum Bilbao, designed by American architect Frank Gehry, opened in 1997 as a joint project of the Guggenheim Foundation and the Basque regional government. The innovative design of the 24,000-sq-m (257,000 sq-ft) metal-and-stone structure has won worldwide attention and acclaim.

#### 45 MEDIA

The government owns, operates, or supervises all internal telephone, telegraph, and radio and television service. Postal and telegraph facilities are provided by the Mail and Telecommunications Service. The National Telephone Co. is an autonomous enterprise. In 2003, there were an estimated 434 mainline telephones for every 1,000 people. The same year, there were approximately 909 mobile phones in use for every 1,000 people.

RadioTelevision Espanola operates public radio and television broadcasts. There are hundreds of privately owned stations as well. In 2003, there were an estimated 330 radios and 564 television sets for every 1,000 people. About 24.3 of every 1,000 people were cable subscribers. Also in 2003, there were 196 personal computers for every 1,000 people and 239 of every 1,000 people had access to the Internet. There were 2,837 secure Internet servers in the country in 2004.

There are about 100 daily papers published in Spain, but very few have a circulation exceeding 100,000. Sunday newspaper editions have become increasingly common, with circulations often double the weekday runs. English-language papers are now printed in Madrid and Palma de Mallorca. There are also over 3,000 magazines, bulletins, and journals. Formerly, the Falange published the newspapers in all provincial capitals and controlled some 35% of the total national circulation; censorship was obligatory. In 1966, a new press law abolished censorship but established stiff penalties for editors who published news "contrary to the principles of the national interest"; offending newspapers could be seized.

The leading Spanish dailies, with 2005 weekday circulations, include: *El País* (Madrid), 458,000; *El Mundo* (Madrid), 310,000; *ABC* (Madrid and Sevilla), 277,000; *La Vanguardia* (Barcelona), 202,000; *El Periódico de Cataluña* (Barcelona, published in both Spanish and Catalan), 172,000; *El Correo* (Bilbao), 126,000; and *El Diario Vasco* (San Sebastian), 90,000. *Marca*, a sports daily, was believed to be the most widely read paper in the country.

The 1978 constitution guarantees freedom of the press and the government is said to uphold this freedom in practice.

#### 46 ORGANIZATIONS

Under the Falangist system of corporate organization, all branches of society were required to participate in business and in agricultural or professional syndicates. Despite this system, cooperatives emerged in various sectors of Spanish society, among them agricultural, consumer, credit, industrial, maritime, fishing, rural, housing, and educational organizations. Chambers of commerce function in all provincial capitals, and there are numerous industrial and trade associations. The Association of Mediterra-

nean Chambers of Commerce and Industry is based in Barcelona. Trade and professional associations exist representing a broad range of occupations.

Cultural and educational organizations include the Royal Academy of Belles Lettres, the Scientific and Literary and Art Society, the Association of Spanish Artists and Sculptors, The Royal Society of Physics, Institute of Catalan Studies, and the Society of Natural Sciences.

National youth organizations include Christian Democratic Youth of Spain, Socialist Youth, Junior Chamber, a national students' union, the Counting Federation of Spain, Girl Guides, and chapters of YMCA/YWCA. There are sports associations representing a wide variety of pastimes.

National women's organizations include University Women of Spain and the National Council of Women in Spain. International organizations with national chapters include Save the Children, Amnesty International, Greenpeace, and the Red Cross.

#### 47 TOURISM, TRAVEL, AND RECREATION

Many are attracted to the country by its accessibility, warm climate, beaches, and relatively low costs. Among the principal tourist attractions are Madrid, with its museums, the Escorial Palace, and the nearby Valley of the Fallen (dead in the civil war); Toledo, with its churches and its paintings by El Greco; the Emerald Coast around San Sebastián; the Costa Brava on the coast of Catalonia, north of Barcelona; Granada, with the Alhambra and the Generalife; Sevilla, with its cathedral and religious processions; and the Canary and Balearic islands.

Football (soccer) is the most popular sport in Spain, and many cities have large soccer stadiums; Spain was host to the World Cup competition in 1982. Barcelona was the site of the 1992 Summer Olympics, and in the same year, an International Exposition was held in Sevilla. Among traditional attractions are the bullfights, held in Madrid from April through October, and pelota, an indoor ball game in which spectators bet on the outcome.

Passports are required to enter Spain. Citizens of many countries, including the United States, may stay up to 90 days without a visa.

In 2003, tourist arrivals numbered 51,829,596 with tourist expenditure receipts of \$46 billion. There were 740,747 hotel rooms, with 1,451,883 beds and an occupancy rate of 54%. Visitors stayed an average of four nights on their trips to Spain.

In 2005, the US Department of State estimated the daily cost of staying in Madrid at \$330; in Barcelona, \$367; and other areas, \$262.

#### 48 FAMOUS SPANIARDS

The Hispanic-Roman epoch produced the philosopher and dramatist Marcus (or Lucius) Annaeus Seneca (54 BC–AD 39), while the Gothic period was marked by the encyclopedist Isidore of Seville (560?–636), author of the *Etymologies*. Important Spanish thinkers of the Middle Ages included Averroës (Ibn Rushd, or Abu al-Walid Muhammad ibn Ahmad ibn Rushd, 1126–98), philosopher; Maimonides (Moses ben Maimon, also known as the Rambam, 1135–1204), the great Jewish physician and philosopher; Benjamin de Tudela (d.1173), geographer and historian; King Alfonso X (the Wise, 1226?–84), jurist, historian, musician, and astronomer; Juan Ruiz (1283?–1351?), archpriest of Hita, the

greatest Spanish medieval poet; and Fernando de Rojas (1475?–1538?), a dramatic poet. *El Cid* (Rodrigo Díaz de Vivar, 1043?–99) has become the national hero of Spain for his fight against the Moors, although he also fought for them at times.

The golden age of Spanish exploration and conquest began with the Catholic Sovereigns, Ferdinand (1452–1516) and Isabella (1451–1504), in the late 15th century. The first great explorer for Spain was Christopher Columbus (Cristoforo Colombo or Cristóbal Colón, 1451–1506), a seaman of Genoese birth but possibly of Judeo-Catalán origin, who made four voyages of discovery to the Americas, the first landing occurring on 12 October 1492 on the island of Guanahani (probably on the island now called San Salvador) in the Bahamas. Among the later explorers, Alvar Núñez Cabeza de Vaca (1490?–1557?), Hernando de Soto (d.1542), and Francisco Vázquez de Coronado (1510–54) became famous for their explorations in the southern and southwestern parts of the present US; Juan Ponce de León (1460?–1521), for his travels in Florida; Vasco Núñez de Balboa (1475–1517), for his European discovery of the Pacific Ocean and claim of it for Spain; Francisco Pizarro (1470?–1541), for his conquest of Peru; and Hernán Cortés (1485–1547) for his conquest of Mexico. Juan de la Costa (1460?–1510) was a great cartographer of the period. Spanish power was at its greatest under Charles I (1500–1558), who was also Holy Roman Emperor Charles V. It began to decline under Philip II (1527–98).

In Spanish art, architecture, and literature, the great age was the 16th century and the early part of the 17th. Among the painters, El Greco (Domenikos Theotokopoulos, b.Crete, 1541–1614), Lo Spagnoletto (Jusepe de Ribera, 1589?–1652?), Francisco de Zurbarán (1598?–1660), Diego Rodríguez de Silva y Velázquez (1599–1660), and Bartolomé Esteban Murillo (1617–82) were the leading figures. In architecture, Juan de Herrera (1530–97), the designer of the royal palace, monastery, and tomb of the Escorial, and the baroque architect José Churriguera (1650–1723) are among the most important names. In literature, the dramatists Lope Félix de Vega Carpio (1562–1635) and Pedro Calderón de la Barca (1600–1681) and the novelist Miguel de Cervantes y Saavedra (1547–1616), author of *Don Quixote*, are immortal names. Other leading literary figures include the great poet Luis de Góngora y Argote (1561–1627), the satirist Francisco Gómez de Quevedo y Villegas (1580–1645), and the playwrights Tirso de Molina (Gabriel Téllez, 1571?–1648) and Mexican-born Juan Ruiz de Alarcón y Mendoza (1580?–1639). Outstanding personalities in the annals of the Roman Catholic Church are St. Ignatius de Loyola (Íñigo de Oñez y Loyola, 1491–1556), founder of the Jesuit order; St. Francis Xavier (Francisco Javier, 1506–52), Jesuit “apostle to the Indies”; and the great mystics St. Teresa of Ávila (Teresa de Cepeda y Ahumada, 1515–82) and St. John of the Cross (Juan de Yepes y Álvarez, 1542–91). The phenomenon of pulmonary blood circulation was discovered by Michael Servetus (Miguel Servet, 1511–53), a heretical theologian, while he was still a medical student.

The 16th century was also the golden age of Spanish music. Cristóbal de Morales (1500?–53) and Tomás Luis de Vittoria (1549?–1611) were the greatest Spanish masters of sacred vocal polyphony. Important composers include Luis Milán (1500?–1565?), Antonio de Cabezón (1510–66), Alonso Mudarra (1510–80), and Miguel de Fuenllana. Juan Bermudo (1510?–55?), Francisco de Salinas (1513–90), and Diego Ortiz (c.1525–c.1570) were theo-

rists of note. Two leading 18th-century composers in Spain were the Italians Domenico Scarlatti (1685–1757) and Luigi Boccherini (1743–1805). Padre Antonio Soler (1729–83) was strongly influenced by Scarlatti. Leading modern composers are Isaac Albéniz (1860–1909), Enrique Granados y Campina (1867–1916), Manuel du Falla (1876–1946), and Joaquín Turina (1882–1949). World-famous performers include the cellist and conductor Pablo Casals (1876–1973), the guitarist Andrés Segovia (1894–1987), operatic singers Victoria de los Angeles (Victoria Gómez Cima, 1923–2005), José Carreras (b.1946), and Plácido Domingo (b.1941), and the pianist Alicia de Larrocha (b.1923).

Francisco Goya y Lucientes (1746–1828) was the outstanding Spanish painter and etcher of his time. Pablo Ruiz y Picasso (1881–1973) was perhaps the most powerful single influence on contemporary art; other major figures include Juan Gris (1887–1927), Joan Miró (1893–1983), and Salvador Dali (1904–89), who, like Picasso, spent most of his creative life outside Spain. The sculptor Julio González (1876–1942) was noted for his work in iron. A leading architect was Antonio Gaudí (1852–1926); an influential modern architect was José Luis Sert (1902–83), dean of the Graduate School of Design at Harvard University for 16 years.

Miguel de Unamuno y Jugo (1864–1936) and José Ortega y Gasset (1883–1955) are highly regarded Spanish philosophers. Benito Pérez Galdos (1843–1920) was one of the greatest 19th-century novelists. Other Spanish novelists include Pedro Antonio de Alarcón (1833–91), Emilia Pardo Bazán (1852–1921), Vicente Blasco Ibáñez (1867–1928), Pío Baroja y Nessi (1872–1956), Ramón Pérez de Ayala (1880–1962), and Ramón José Sender (1902–82). Prominent dramatists include José Zorrilla y Moral (1817–93), José de Echegaray y Eizaguirre (1832–1916), and Jacinto Benavente y Martínez (1886–1954). The poets Juan Ramón Jiménez (1881–1958) and Vicente Aleixandre (1900–84) were winners of the Nobel Prize for literature in 1956 and 1977, respectively. Other outstanding poets are Gustavo Adolfo Bécquer (1836–70), Antonio Machado Ruiz (1875–1939), Pedro Salinas (1891–1951), Jorge Guillén (1893–1984), Dámaso Alonso (1898–1990), Federico García Lorca (1899–1936), Luis Cernuda (1902–63), and José Angel Valente (1929–2000). Ramón María del Valle-Inclán (1866–1936) was a novelist, dramatist, poet, and essayist. A noted novelist, essayist, and critic was Azorín (José Martínez Ruiz, 1876–1967). Salvador de Madariaga y Rojo (1886–1978) was an important cultural historian and former diplomat. Luis Buñuel (1900–83), who also lived in Mexico, was one of the world's leading film directors. Pedro Almodóvar (b.1951) is a contemporary film director, and Antonio Banderas (b.1960) is a Spanish film actor who has had success in Hollywood.

Santiago Ramón y Cajal (1852–1934), histologist, was awarded the first Nobel Prize for medicine in 1906. The physicians Gregorio Marañón (1887–1960) and Pedro Laín Entralgo (1908–2001) were scholars and humanists of distinction. Juan de la Cierva y Codorniu (1896–1937) invented the autogyro. Severo Ochoa (1905–93), who lived in the United States, won the Nobel Prize for medicine in 1959.

Francisco Franco (1892–1975), the leader of the right-wing insurgency that led to the Spanish Civil War (1936–39), was chief of state during 1939–47 and lifetime regent of the Spanish monarchy after 1947. After Franco's death, King Juan Carlos I (b.1938)

guided Spain through the transitional period between dictatorship and democracy.

#### 49 DEPENDENCIES

Spanish "places of sovereignty" on the North African shore, which are part of metropolitan Spain subject to special statutes owing to their location, include Alborán Island (at 35°56' N and 3°2' W), Islas de Alhucemas (at 35°13' N and 3°52' W), Islas Chafarinas (at 35°10' N and 2°26' W), and Perejil (at 35°54' N and 5°25' W). The two major places of sovereignty are Ceuta and Melilla. Ceuta (19 sq km/7.3 sq mi; population 71,403 in 1993) is a fortified port on the Moroccan coast opposite Gibraltar. Melilla (12.3 sq km/4.7 sq mi; resident population 55,613 in 1993), on a rocky promontory on the Rif coast, is connected with the African mainland by a narrow isthmus. Melilla has been Spanish since 1496; Ceuta since 1580. Since 1956, Morocco has repeatedly advanced claims to these areas. Under the 1978 constitution, Ceuta and Melilla are represented in the Cortes by one deputy and two senators each.

# SWEDEN

Kingdom of Sweden  
*Konungariket Sverige*

**CAPITAL:** Stockholm

**FLAG:** The national flag, dating from 1569 and employing a blue and gold motif used as early as the mid-14th century, consists of a yellow cross with extended right horizontal on a blue field.

**ANTHEM:** *Du gamla, du fria, du fjällhöga nord* (*O Glorious Old Mountain-Crowned Land of the North*).

**MONETARY UNIT:** The krona (KR) is a paper currency of 100 öre. There are coins of 50 öre and 1, 2, 5, and 10 kronor, and notes of 5, 10, 20, 50, 100, 500, and 1,000 kronor. KR1 = \$0.13661 (or \$1 = KR7.32) as of 2005.

**WEIGHTS AND MEASURES:** The metric system is the legal standard, but some old local measures are still in use, notably the Swedish mile (10 kilometers).

**HOLIDAYS:** New Year's Day, 1 January; Epiphany, 6 January; Labor Day, 1 May; Midsummer Day, Saturday nearest 24 June; All Saints' Day, 5 November; Christmas, 25–26 December. Movable religious holidays include Good Friday, Easter Monday, Ascension, and Whitmonday.

**TIME:** 1 PM = noon GMT.

## <sup>1</sup> LOCATION, SIZE, AND EXTENT

Fourth in size among the countries of Europe, Sweden is the largest of the Scandinavian countries, with about 15% of its total area situated north of the Arctic Circle. Extreme length N–S is 1,574 km (978 mi) and greatest breadth E–W is 499 km (310 mi). Sweden has a total area of 449,964 sq km (173,732 sq mi): land area, 410,934 sq km (158,663 sq mi); water area, 39,030 sq km (15,070 sq mi), including some 96,000 lakes. Comparatively, the area occupied by Sweden is slightly larger than the state of California. Sweden is bounded on the N and NE by Finland, on the E by the Gulf of Bothnia, on the SE by the Baltic Sea, on the SW by the Öresund, the Kattegat, and the Skagarrak, and on the W by Norway, with a total boundary length of 5,423 km (3,370 mi), of which 3,218 km (2000 mi) is coastline. The two largest Swedish islands in the Baltic Sea are Gotland and Öland. Sweden's capital city, Stockholm, is located on the southeast Baltic Sea coast.

## <sup>2</sup> TOPOGRAPHY

Northern Sweden (Norrland) slopes from the Kjölen Mountains along the Norwegian frontier (with the high point at Kebnekaise, 2,111 m/6,926 ft) to the coast of the Gulf of Bothnia. The many rivers—notably the Göta, the Dal, the Ångerman, the Ume, and the Lule—flow generally toward the southeast and have incised the plateau surface; waterfalls abound. Central Sweden, consisting of a down-faulted lowland, has several large lakes, of which Vänern (5,584 sq km/2,156 sq mi) is the largest in Europe outside the former USSR. To the south of the lake belt rises the upland of Smaland and its small but fertile appendage, Skane. The lowlands were once submerged and so acquired a cover of fertile, silty soils. Much of Sweden is composed of ancient rock; most ice erosion has resulted in generally poor sandy or stony soils. The best, most lime-rich soils are found in Skane, and this southernmost

district is the leading agricultural region; it resembles Denmark in its physical endowments and development.

## <sup>3</sup> CLIMATE

Because of maritime influences, particularly the warm North Atlantic Drift and the prevailing westerly airstreams, Sweden has higher temperatures than its northerly latitude would suggest. Stockholm averages  $-3^{\circ}\text{C}$  ( $26^{\circ}\text{F}$ ) in February and  $18^{\circ}\text{C}$  ( $64^{\circ}\text{F}$ ) in July. As would be expected from its latitudinal extent, there is a wide divergence of climate between northern and southern Sweden: the north has a winter of more than seven months and a summer of less than three, while Skane in the south has a winter of about two months and a summer of more than four. The increasing shortness of summer northward is partly compensated for by comparatively high summer temperatures, the greater length of day, and the infrequency of summer cloud; the considerable cloud cover in winter reduces heat loss by radiation.

Annual rainfall averages 61 cm (24 in) and is heaviest in the southwest and along the frontier between Norrland and Norway; the average rainfall for Lapland is about 30 cm (12 in) a year. The maximum rainfall occurs in late summer, and the minimum in early spring. There is considerable snowfall, and in the north snow remains on the ground for about half the year. Ice conditions in the surrounding seas, especially the Gulf of Bothnia, often are severe in winter and seriously interfere with navigation.

## <sup>4</sup> FLORA AND FAUNA

Vegetation ranges from Alpine-Arctic types in the north and upland areas to coniferous forests in the central regions and deciduous trees in the south. Common trees include birch, aspen, beech, elm, oak, and Norway spruce. Black cock, woodcock, duck, partridge, swan, and many other varieties of birds are abundant. Fish

and insects are plentiful. As of 2002, there were at least 60 species of mammals, 259 species of birds, and over 1,750 species of plants throughout the country.

## 5 ENVIRONMENT

Sweden's relatively slow population growth and an effective conservation movement have helped preserve the nation's extensive forest resources. By the end of 1985 there were 19 national parks covering 618,070 hectares (1,527,276 acres), 1,215 nature reserves of 870,748 hectares (2,151,653 acres), and 2,016 other protected landscape areas of 540,064 hectares (1,334,520 acres). As of 2003, protected areas accounted for 9.1% of Sweden's total land area, including 51 Ramsar wetland sites. Principal responsibility for the environment is vested in the National Environmental Protection Agency.

In 2000, the total of carbon dioxide emissions was at 46.9 million metric tons. Other pollutants include sulphur air, nitrogen compounds, oil, VOCs (volatile organic compounds), radon, and methane. The pollution of the nation's water supply is also a significant problem. Factory effluents represent a threat to water quality, and airborne sulfur pollutants have so acidified more than 16,000 lakes that fish can no longer breed in them. Sweden has 171 cu km of renewable water resources with 9% of annual withdrawals used for farming and 55% used for industrial purposes.

One of the most controversial environmental questions was put to rest by a March 1980 referendum in which a small plurality of the electorate (39.3%) supported expansion of nuclear power to no more than 12 reactors by the mid-1980s, but with provisions for the nationalization of nuclear energy, for energy conservation, and for the phaseout of nuclear power within an estimated 20–25 years. As of 2005, there were still 10 nuclear power reactors providing nearly half of the nation's electricity.

According to a 2006 report issued by the International Union for Conservation of Nature and Natural Resources (IUCN), threatened species included 5 types of mammals, 9 species of birds, 6 species of fish, 1 type of mollusk, 12 species of other invertebrates, and 3 species of plants. Threatened species include the blue ground beetle and cerambyx longhorn. Protected fauna include the wild reindeer, golden eagle, and crane.

## 6 POPULATION

The population of Sweden in 2005 was estimated by the United Nations (UN) at 9,029,000, which placed it at number 84 in population among the 193 nations of the world. In 2005, approximately 17% of the population was over 65 years of age, with another 18% of the population under 15 years of age. There were 98 males for every 100 females in the country. According to the UN, the annual population rate of change for 2005–10 was expected to be 0.1%, a rate the government viewed as satisfactory. The projected population for the year 2025 was 9,936,000. The overall population density was 20 per sq km (52 per sq mi), but the southern two-fifths of the country are more densely populated, with approximately 80% of the population living there.

The UN estimated that 84% of the population lived in urban areas in 2005, and that urban areas were growing at an annual rate of 0.18%. The capital city, Stockholm, had a population of 1,697,000 in that year. Göteborg had a metropolitan population of 829,000. Other large cities (and their estimated populations)

include Malmö (267,171), Uppsala (130,000), Västerås (129,987), Örebro (95,354), and Norrköping (83,000).

## 7 MIGRATION

In the period 1865–1930, nearly 1,400,000 Swedes, or about one-fifth of the country's population, emigrated; over 80% went to the United States, and about 15% to other Nordic countries. The exodus ended by the 1930s, when resource development in Sweden started to keep pace with the population growth. In the 1960s there was a flood of immigration—especially by Finns—that increased the number of aliens in Sweden from 190,621 to 411,280. The number remained steady in the 1970s but increased, though at a slower rate, in the 1980s.

As of 1999, 3,729 people had been evacuated from Macedonia to Sweden under the UNHCR/IOM Humanitarian Evacuation Programme. Evacuees, as well as Kosovars who had already sought asylum but whose cases were still pending, were granted temporary protection for an 11-month period, renewable for a maximum of four years. During 2004, 73,408 refugees were hosted in Sweden. Main countries of origin for refugees included Iraq (23,918), Bosnia and Herzegovina (25,836), Serbia and Montenegro (20,890), and Iran (5,181). Asylum applications came from 25 countries of origin, the largest numbers from Serbia and Montenegro, and Iraq. The net migration rate in 2005 was an estimated 1.67 migrants per 1,000 population. Worker remittances in 2002 were \$190 million.

## 8 ETHNIC GROUPS

The Swedes are primarily Scandinavians of Germanic origin. There are about 17,000 to 20,000 Sami (Lapps) within the country. The remaining 12% of the population is comprised of foreign-born or first-generation immigrants, including Finns in the north, Danes, Iraqis, Iranians, Norwegians, Greeks, and Turks.

## 9 LANGUAGES

Swedish is a national language. In addition to the letters of the English language, it has *å*, *ä*, and *ö*. Swedish is closely related to Norwegian and Danish. Many Swedes speak English and German, and many more understand these languages. The Sami speak their own language. There is also a spread of Finnish-speaking people from across the frontier.

## 10 RELIGIONS

For hundreds of years, the Church of Sweden, an Evangelical Lutheran church, represented the religion of state. However, in 2000, the Church and government placed into effect a formal separation of church and state, with a stipulation that the Church of Sweden will continue to receive a certain degree of state support. This new agreement triggered a decline in membership for this church. According to recent estimates, about 79.6% of the population belong to the Church of Sweden, down from over 85% in 2000. Protestant groups other than the Church of Sweden have about 400,000 people. Roman Catholics constitute less than 1% of the populace, with about 140,000 members. About 100,000 people are members of Christian Orthodox churches, including Greek, Serbian, Syrian, Romanian, and Macedonian. The number of Muslims is at about 350,000, with about 100,000 active practitioners primarily of the Sunni and Shia branches. There are also about 20,000 Jews

(Orthodox, Conservative, and Reform), with about half being active. Buddhists and Hindus number around 3,000 to 4,000 each. It is estimated that about 15–20% of the adult population are atheists. Small numbers of people are represented by groups such as the Church of Scientology, Hare Krishnas, Opus Dei, and the Unification Church.

The constitution provides for freedom of religion. Since the separation of church and state, all religions are eligible for financial support from the government through the “church tax.” Individuals may now designate which organization they wish to receive their contribution, or they may receive a tax reduction. The Commission for State Grants to Religious Communities is the government body that oversees religious funding, in cooperation with the Swedish Free Church Council.

The Muslim and Jewish communities have protested government laws which they believe interfere with religious practice. For instance, a 1930 law requires the use of anesthesia before slaughter of animals in order to minimize suffering. This practice interferes with kosher. A 2001 law requires that mohels (who perform circumcisions according to Jewish customs) must be certified by the National Board of Health and the procedure must be completed in the presence of a medical doctor or an anesthesia nurse. Some Jews (and Muslims) claim that this interferes with their religious ceremony; as of 2005, the law was scheduled for review.

## 11 TRANSPORTATION

As of 2002, the total length of highways was 213,237 km (132,633 mi), of which about 167,604 km (104,250 mi) were paved, including 1,514 km (942 mi) of expressways. As of 2003, there were 4,078,000 passenger cars and 435,561 commercial vehicles. In 1967, Sweden changed from left- to right-hand traffic. As of 2004, Sweden’s 11,481 km (7,141 mi) railroad system was operated by the state-owned Statens Järnvagar. Of that total, 9,400 km (5,847 mi) of the track was electrified. All tracks are standard gauge.

Since the 1960s, the number of ships in the merchant navy has decreased because of competition from low-cost shipping nations and, more recently, the slump in world trade. Sweden has an increasing number of special-purpose vessels, such as fruit tramps, ore carriers, and oil tankers. Most of the larger vessels, representing the majority of Sweden’s commercial tonnage, are engaged in traffic that never touches home ports, and less than half of Swedish foreign trade is carried in Swedish ships. Göteborg, Stockholm, and Malmö, the three largest ports, and a number of smaller ports are well-equipped to handle large oceangoing vessels. In 2005, the Swedish merchant fleet consisted of 205 ships of 1,000 GRT or more, with a combined capacity of 2,702,763 GRT. Canals in central Sweden have opened the lakes to seagoing craft; inland waterways add up to 2,052 km (1,275 mi), navigable by small steamers and barges.

In 2004 there were an estimated 254 airports. As of 2005, a total of 155 had paved runways, and there were also two heliports. Arlanda international airport at Stockholm received its first jet aircraft in 1960; other principal airports are Sturup at Malmö and Landvetter at Göteborg. The Scandinavian Airlines System (SAS) is operated jointly by Sweden, Denmark, and Norway, each of which owns a 50% share of the company operating in its own territory; the other half in Sweden is owned by private investors. Linjeflyg, a subsidiary of SAS, operates a domestic service to most of

the larger cities and resorts. In 2003, about 11.586 million passengers were carried on scheduled domestic and international flights.

## 12 HISTORY

Sweden and the Swedes are first referred to in written records by the Roman historian Tacitus, who, in his *Germania* (AD 98), mentions the Suiones, a people “mighty in ships and arms.” These people, also referred to as Svear, conquered their southern neighbors, the Gotar, merged with them, and extended their dominion over most of what is now central and southern Sweden. In the 9th and 10th centuries when Vikings from the Norwegian homeland traveled west to Iceland, Greenland and farther afield to Newfoundland, Vikings from eastern Sweden raided areas southeastward across Russia to Constantinople. Archeologists and historians hold that the descendants of one of their chieftains, Rurik, founded the Kievan Russian state. Some other settled regions and place-names in various parts of Europe also show Swedish influence through rune-stones found across Eastern Europe.

In the Viking era, the Swedish kingdom took shape but was not very centralized. Political power became more centralized with the advent of Christianity, which came gradually between the 9th and 11th centuries. During the 12th century, the Swedish kingdom consolidated internally and under the guise of the crusades began to expand into the Baltic, incorporating Finland, between 1150 and 1300. Among the institutions established in Sweden during the 12th and 13th centuries were Latin education, new modes and styles of architecture and literature, town life, and a more centralized monarchy with new standards in royal administration—all with significant economic, legal, and social implications.

Norway and Sweden were united in 1319 under the infant king Magnus VII, but Waldemar IV, King of Denmark, regained Skåne, the southern part of Sweden, and all the Scandinavian countries were united in the Kalmar Union under his daughter Margaret (Margrethe) in 1397. For over a century, Sweden resisted Danish rule, and the union was marked by internal tensions.

In 1523, following a war with Denmark whose notable feature was the Stortorget (Great Square) massacre in Stockholm where hundreds of Swedish nobles were executed, the Swedes elected Gustavus Vasa (Gustaf I) to the Swedish throne. A great king and the founder of modern Sweden, Gustavus made Lutheranism the state religion, established a hereditary monarchy, and organized a national army and navy. His successors incorporated Estonia and other areas in Eastern Europe. The growth of nationalism, the decline of the Hanseatic League’s control of Baltic trade, and Protestantism contributed to the rise of Sweden in the following century.

Another great king and one of the world’s outstanding military geniuses, Gustavus Adolphus (Gustaf II Adolf, r.1611–32), is generally regarded as the creator of the first modern army. He defeated Poland and conquered the rest of Livonia, and by winning a war with Russia acquired Ingermanland and Karelia. In the period of the Thirty Years’ War (1618–48), Sweden was the foremost Protestant power on the Continent, and for the following half century the Baltic Sea became a Swedish lake. Although the king was killed at Lützen in 1632, his policies were carried on during the reign of his daughter Christina by the prime minister, Axel Oxenstierna. By terms of the Peace of Westphalia (1648) Sweden gained

Pomerania and the archbishopric of Bremen, part of the Holy Roman Empire. Swedish expansionism resulted, in 1658, in the recapture of the southern Swedish provinces that Denmark had retained since the early 16th century. Renewed wars extended the Swedish frontier to the west coast while reducing Danish control over trade by taking away the eastern shore of the Öresund.

Under young Charles XII (r.1697–1718), Sweden fought the Great Northern War (1700–1721) against a coalition of Denmark, Poland, Saxony, and Russia. Sweden at first was militarily successful, but after a crushing defeat by Russian forces under Peter the Great (Peter I) in 1709 at the Battle of Poltava, the nation lost territories to Russia, Prussia, and Hannover. Thereafter Sweden was a second-rate power. Throughout the 18th century there was internal dissension between those that favored increased political liberties and constitutionally shared political power and those who favored monarchical absolutism. In 1770, a power struggle between the nobility and the commoner estates, including the clergy, burghers and farmers, ended when Gustav III carried out a bloodless coup and restored absolutism. Gustavus III (r.1771–92), a poet, playwright, and patron of the arts and sciences, and founder of the Swedish Academy, was eventually assassinated by a group of disgruntled nobles.

Sweden entered the Napoleonic Wars in 1805, allying itself with Great Britain, Austria, and Russia against France. Russia switched sides in 1807, however, and the ensuing Russo-Swedish conflict (1808–9) resulted in the loss of Finland. King Gustavus IV was then overthrown by the army, and a more democratic constitution was adopted. In 1810, one of Napoleon's marshals, a Frenchman from Pau named Jean Baptiste Jules Bernadotte, was invited to become the heir to the Swedish throne. Three years later, he brought his adopted country once again over to the side of the allies against Napoleon in the last full-scale war fought by Sweden. His reward for being on the winning side of the Napoleonic wars was to wrest a reluctant Norway from Danish control. After a show of Swedish force, Norway was forced into political union with Sweden that lasted until 1905 when the union was largely peacefully dissolved.

Bernadotte assumed the name Charles John (Carl Johan) and succeeded to the Swedish throne in 1818 as Charles XIV John. The Bernadotte dynasty, which has reigned successively since 1818, gradually relinquished virtually all of its powers, which were assumed by the Riksdag, Sweden's parliament. Sweden has become one of the most progressive countries in the world. Industry was developed, the cooperative movement began to play an important part in the economy, and the Social Democratic Labor Party gained a dominant position in political life.

Carl XVI Gustaf has been king since the death of his grandfather, Gustav VI Adolf, in 1973. In September 1976, a coalition of three non-Socialist parties won a majority in parliamentary elections, ending 44 years of almost uninterrupted Social Democratic rule that had established a modern welfare state. The country's economic situation worsened, however, and the Social Democrats were returned to power in the elections of September 1982. Prime Minister Olof Palme, leader of the Social Democratic Party since 1969, was assassinated in February 1986. In the ensuing years, investigators have been unable to establish a motive for the killing or to find the assassin.

### Sweden and Neutrality

Sweden remained neutral in both world wars; during World War II, however, Sweden had difficulty maintaining neutrality as its Nordic neighbors were drawn into the conflict. Sweden served as a haven for refugees from the Nazis, allowed the Danish resistance movement to operate on its soil, and sent volunteers to assist Finland's fight against the Russians. On the other hand, Sweden was compelled to comply with German demands to transport its troops through Sweden to and from Nazi-occupied Norway. After the war, Sweden did not join NATO, as did its Scandinavian neighbors Norway and Denmark, but it did become a member of the UN in 1946 and participated in some of the European Recovery Program benefits. In 1953, Sweden joined with Denmark, Norway, Iceland, and, later, Finland to form the Nordic Council, and was instrumental in creating EFTA in 1960. Subsequently Sweden declined an invitation to join the EEC with Denmark, Ireland, and the United Kingdom; a free-trade agreement with the EEC was signed 22 July 1972. Sweden's post-WWII foreign policy has been termed "active neutrality." Neutral Sweden tried to mediate in the Cold War confrontation between the Western and Soviet blocs and sought a major role in development assistance toward newly independent countries in the Third World.

Sweden's traditional policy of neutrality was strained in late October 1981 when a Soviet submarine ran aground inside a restricted military zone near the Swedish naval base at Karlskrona. The Swedish government protested this "flagrant violation of territorial rights" and produced reasons for believing that the submarine had been carrying nuclear weapons. Swedish naval vessels raised the damaged submarine and permitted it to return to the Soviet fleet in early November. In 1984, a Swedish military report stated that at least 10 "alien" submarines had been detected in Swedish waters.

The environment and nuclear energy were major political issues in the 1980s. In the 1990s and into the new century, the major concerns have been conflicts over immigration policies, the economy, and Sweden's relationship to the European Communities. Sweden's economic crisis led to large-scale public spending cuts by a center-right government. In 1991, Sweden applied for membership in the EC against a background of considerable opposition. In May 1993, the Riksdag altered Sweden's long-standing foreign policy of neutrality. In the future, neutrality would only be followed in time of war. The Riksdag also opened up the possibility of Sweden's participation in defense alliances, which remains a hotly debated issue in Sweden.

In 1994, Swedes voted to join the EU and the country officially became a member on 1 January 1995. Sweden did not join the 11 EU countries participating in the launch of the new European currency, the euro, on 1 January 1999. Public opinion over the succeeding years softened on the issue of euro membership, however, and a referendum on joining the monetary union was held on 14 September 2003. The ruling Social Democratic Party supported euro membership, but its coalition partners in 2003, the ex-communist Left Party and the Greens, were strongly opposed, as those parties feared Sweden would lose not only its currency, but its status as an advanced welfare state. On 10 September, Swedish Foreign Minister Anna Lindh was stabbed in a Stockholm department store by an assailant unknown to her; she died the next day. Lindh was one of the primary spokespersons for the "yes" cam-

paign for the euro, and was one of the country's best-loved politicians; many thought she could have become prime minister. The referendum was defeated by a margin of 56.1% to 41.8% with a turnout of 81.2%.

Following the 11 September 2001 terrorist attacks on the United States, Sweden pledged support for US-led retaliation against terrorists. At the same time, Sweden relaxed further its policy of neutrality, and some have speculated that it will eventually join NATO. Sweden since 1992 has been a member of NATO's "Partnership for Peace" program, and in 1999, the first Swedish troops were sent to Kosovo in the Balkans. In February 2002, Prime Minister Göran Persson's government made the decision for Sweden to enter into military alliances and defensive pacts with other nations. As of 2005, Swedish troops were also serving in Liberia, the Democratic Republic of the Congo, and Afghanistan. Sweden at the turn of the 21st century was concerned with issues of international terrorism and organized transnational crime, such as drug smuggling and trafficking in human beings.

Sweden pledged itself to give 1% of its GNP to development assistance for poor countries, effective 2006. Sweden will give priority to four areas: conflict prevention measures, the fight against drugs, efforts to combat HIV/AIDS, and sexual and reproductive health and rights.

### 13 GOVERNMENT

Sweden developed as a constitutional monarchy under the constitution of 1809, which remained in effect until 1 January 1975, when a new instrument of government replaced it. Legislative authority is vested in the parliament (Riksdag). The monarch ceded involvement in power-brokering among the parties as early as 1917 when the Liberals and Social Democrats entered into a coalition. Today, the monarch performs only ceremonial duties as the official head of state; the monarch's last political duty, regular participation in cabinet meetings, was taken away under the most recent constitution. The king must belong to the Lutheran Church; the throne was hereditary only for male descendants until 1980, when female descendants were granted the right to the throne.

The Riksdag was bicameral until 1971, when a unicameral body of 350 members serving three-year terms was established; the 1975 constitution provided for 349 members, and the parliamentary term was lengthened to four years in 1994. All members of the Riksdag are directly elected by universal suffrage at age 18. Voter turnout has traditionally been very high in Sweden, though in the 2002 election turnout dipped to 80.1% compared with turnout over 86% for the previous two elections. Foreign nationals may vote in regional and municipal elections. Elections at all levels are simultaneous and are held on the third Sunday of September every fourth year. The parties' share of the national vote is directly translated into seats in Riksdag. Interim national elections may be called by the government between regular elections, but the mandate of the interim election is valid only for the remaining portion of the regular four-year parliamentary term of office.

In Sweden's parliamentary system, executive power lies with the government, or cabinet, that is formed by the majority party in parliament or by a coalition of parties. Sweden has also functioned with a minority government in which the largest party does not enjoy a majority in parliament and must form ad-hoc coalitions with other parties in the Riksdag. The cabinet as a whole is

LOCATION: 55°20' to 69°4' N; 10°58' to 24°10' E. BOUNDARY LENGTHS: Finland, 586 kilometers (364 miles); coastline, 2,746 kilometers (1,706 miles); Norway, 1,619 kilometers (1,006 miles); Gotland Island coastline, 400 kilometers (249 miles); Öland Island coastline, 72 kilometers (45 miles). TERRITORIAL SEA LIMIT: 12 miles.

responsible for all government decisions and must defend their legislative agenda in the plenary sessions of the Riksdag. A vote of no confidence by an absolute majority of the Riksdag allows for the forced resignation of individual ministers or of the entire

cabinet. A vote of no confidence becomes moot if within one week of the vote the government calls for new elections for the entire Riksdag.

Chief executive power is wielded by the prime minister, who is formally proposed by the speaker of the Riksdag and confirmed by vote of the parliamentary parties. The prime minister appoints a cabinet usually consisting of 18–20 members reflecting the party or coalition of parties in power. Once a week the government takes decisions in a formal meeting presided over by the prime minister. The cabinet as a whole discusses all-important decisions prior to taking a decision. After a decision has been taken by the cabinet, the ministers practice collective responsibility in which all support the decision taken by the government. Ministers may issue directives but administrative decisions are taken by central boards, which have their respective spheres of activity delimited by the Riksdag.

National referenda on policy questions of national importance are permitted by the constitution. Sweden's parliament has the highest level of political representation of women in the world; 11 of the 20 ministers in the 2005 government were women, and 45% of the Riksdag members are women.

## 14 POLITICAL PARTIES

The unicameral system and the electoral system of proportional representation have allowed almost exact equality in proportional representation among the constituencies on the national level and has produced a multiparty system. The constitution requires, however, that a party must gain at least 4% of the national popular vote or 12% in a constituency to be represented in the Riksdag. Sweden has for many years utilized the party list system in which the candidates for office from any given party are listed in order of party preference. If a party won 10 seats in the Riksdag, the top 10 candidates from that party would be represented in parliament. In 1998, voters for the first time had the option of indicating which candidates on the party list whom they preferred to see elected to parliament and to local councils. A given candidate must receive at least 8% of his or her party's ballots in any electoral district to be moved to the top of the party's nomination list. If no candidate attains the 8% threshold, the party's nomination list remains in force.

Sweden had a stable party system until the end of the 1980s. The parties of the political right include the Moderate (formerly Conservative) Party (Moderata Samlingspartiet, M), which favors tax reform and trimming the welfare state; the Liberal Party (Folkpartiet Liberalerna, FP), which is a traditional European liberal party; and the Center (formerly Agrarian) Party (Centerpartiet, C), which has in the past represented rural interests and has tried to refashion itself as an "alternative" centrist party favoring environmental issues. The left side of the Swedish political spectrum includes the dominant Social Democratic Party (Socialdemokratiska Arbetarepartiet, S), which is responsible for creating the welfare state and which gets considerable support from organized labor in Sweden; and the Left (formerly Communist Left) Party (Vänsterpartiet, V), which has distanced itself from its communist past and now advocates positions that champion gender equality and attracts voters that are wary of the Social Democrats' move toward the center. In 1988, the environmentalist Green Party (Miljöpartiet de Gröna, MP) joined the long-standing par-

ties on the left represented in the Riksdag. In the 1991 election, two new parties emerged on the right, the Christian Democrats (Kristdemokraterna, KD) and the New Democracy Party (Ny Demokratiska, NyD).

Except for a brief period in 1936, the Social Democratic Labor Party was in power almost uninterruptedly from 1932 to 1976, either alone or in coalition. In 1945, the Social Democrats dissolved the wartime Grand Coalition Cabinet representing every party except the Left Party Communists and launched a program of social reform. Although inflation and other difficulties slowed the Social Democratic program, steadily mounting production encouraged the government to push through its huge social welfare program, which was sanctioned in principle by all major parties.

The Social Democrats held or controlled all parliamentary majorities until the elections of September 1976 when a non-Socialist coalition including the Center Party, the Moderates, and the Liberals won 180 of the 349 seats at stake. The center-right coalition retained control in the 1979 election with a reduced majority of 175 seats and a stronger showing for the Moderates. In the election on 19 September 1982, however, the Social Democrats returned to power. Olof Palme, who had been the Social Democratic prime minister from 1969 to 1976, was able to put together a new coalition cabinet on 8 October 1982. His party remained in power, though with a reduction of seats, following the 1985 election. Palme was assassinated in February 1986; he was succeeded by Ingvar Carlsson.

The 1988 election was a watershed that registered political discontentment. The Social Democrats lost seats as the Moderates' and Liberals' share of the vote continued to increase. More remarkably, for the first time in 70 years, a new party gained representation in the Riksdag—the Green Party (MP), which obtained 20 seats. The Social Democrats were narrowly defeated in September 1991, and the government of Ingvar Carlsson gave way to that of Carl Bildt (Moderate Party), who headed a minority four-party, center-right coalition composed of the Moderates, the Liberals, the Center Party, and the Christian Democratic party, which together controlled 170 seats.

The 1991 election represented a gain for two previously unrepresented parties—Christian Democrats (26 seats) and New Democracy (25 seats)—who managed to exceed the 4% threshold while the Greens fell below the threshold and lost representation in the Riksdag. New Democracy emerged prior to the 1991 general election as a party of discontent urging tax cuts and reduced immigration. The Left Party-Communists were renamed the Left Party (VP) in 1990.

The Moderate Coalition, which promised to end Sweden's deepening recession, found itself unable to address the country's problems, largely because of Social Democrat and popular opposition to its cost-cutting measures. In 1994, the Social Democrats were returned to office by a population reluctantly willing to bear austerity if initiated and directed by the party that created the welfare state. The Social Democratic Coalition government under Prime Minister Ingvar Carlsson navigated Sweden through the referendum on Swedish membership into the EU in late 1994. Carlsson was replaced as prime minister by the former finance minister, Göran Persson.

The September 1998 election represented a protest vote against the mainstream parties and perhaps greater voter polarization in

Sweden. The mainstream party of the left, the Social Democrats, had their worst election showing in over 70 years but maintained power in a minority government dependent upon support from a formal alliance from the Left and Green parties. The Social Democrats slipped from 45.3% of the vote in 1994 to 36.4% in 1998, while the Left Party advanced from 6.2% in 1994 to 12% in 1998 and the Greens returned to the Riksdag with 4.5% of the national vote. Similarly on the right, the Christian Democrats advanced from 4.1% of vote in 1994 to 11.8% in 1998 at the expense of the more centrist Center and Liberal parties, which narrowly passed the 4% threshold. The Moderates' share of the vote held basically steady.

Much of this discontent in the 1998 election was attributed to the budget tightening process that resulted in major cutbacks in social welfare benefits. A growing level of public distrust of politicians was fueled by prominent scandals of misuse of public funds. The reform to allow voters to select individual candidates did not seem to have diminished the distance between voters and elected representatives as only 29.9% took advantage of the opportunity to do so at the national level.

The 2002 general election campaign focused largely on the issues of immigration and membership in the euro zone. The Liberals and Moderates supported a plan to import large numbers of guest workers, who would be classed as noncitizens. The Social Democrats and the Left Party denounced this plan. The Social Democrats registered a strong showing in the elections, winning 39.8% of the vote (up from 36.4% in 1998) and taking 144 of 349 seats in the Riksdag. The Social Democrats under Göran Persson formed a government with the Left Party (8.3% of the vote and 30 seats) and the Greens (4.6% and 17 seats). However, the Liberal Party, with its immigration plan, increased its strength in parliament, with 13.3% of the vote (up from 4.7% in 1998) and 48 seats. The Christian Democrats fell from 11.8% in 1998 to 9.1% of the vote in 2002 (33 seats). The Moderates took 15.2% of the vote and 55 seats. The next general elections were to be held September 2006.

## 15 LOCAL GOVERNMENT

Local self-government has a long tradition in Sweden as the civil role of the Lutheran Church has been gradually reduced. The first legislation establishing municipal governance is the Local Government Ordinances of 1862 that separated religious tasks from civil tasks which were given to cities and rural municipal districts. On 1 January 2000, the Church of Sweden separated from the central government, and local parishes lost their local government status.

Decentralization is markedly characteristic of Sweden's governmental structure. With the most recent reforms there are two types of local governance in Sweden: the municipality, or *kommun*, as the local unit and the county council as the regional unit. The country is divided into 21 counties, 2 regions, 289 municipalities, and one "county council-free municipality" on the island of Gotland, each with an elected council. Local government is administered by county councils and municipalities consisting of at least 20 members popularly elected, on a proportional basis, for four years. Under each council is an executive board with various committees. In addition, there is a governor (prefect), the government-appointed head of the administrative board in each of Swe-

den's counties, who holds supreme police and other supervisory authority. Local authorities are responsible for most social welfare services, including hospitals, elementary education, certain utilities, and the police force. It is up to the Swedish cabinet and parliament to decide on the overall framework of public sector activities, but within these wide parameters, local governments have a large measure of freedom to implement public programs.

## 16 JUDICIAL SYSTEM

Ordinary criminal and civil cases are tried in a local court (*tingsrätt*), consisting of a judge and a panel of lay assessors appointed by the municipal council. Above these local courts are six courts of appeal (*hovrätter*). The highest tribunal is the Supreme Court (*Högsta Domstolen*), made up of at least 16 justices. Special cases are heard by the Supreme Administrative Court and other courts. The Swedish judicial procedure uses a jury of the Anglo-US type only in press libel suits. Capital punishment, last employed in 1910, is expressly forbidden by the constitution.

The judiciary is independent of executive control or political influence. The right to counsel of criminal defendants is restricted to cases in which the maximum penalty possible is six-month imprisonment or greater.

Sweden originated the judicial practice of the ombudsman when its first ombudsman was designated in 1766. The office has been in continuous existence since 1809. The institution has also been enshrined by the constitution and provides parliamentary control over the executive. The Riksdag elects four ombudsmen representing various interests such as consumers, gender equality, the press, children, the disabled, those experiencing ethnic and/or sexual orientation discrimination. The ombudsman is charged with supervising the observance of laws and statutes as applied by the courts and by public officials, excluding cabinet ministers, members of the Riksdag, or directly elected local government officials. The ombudsmen are concerned especially with protecting the civil rights of individual citizens and of religious and other groups. There are some 5,000 complaints lodged with the office of the ombudsman annually, though about 40% are dismissed immediately for a variety of reasons. Only about 20–25% of these complaints are investigated fully and usually reflect an individual caught on a bureaucratic "merry-go-round." Ombudsmen may admonish or prosecute offenders, although prosecutions are relatively rare.

## 17 ARMED FORCES

Sweden's policy of neutrality and nonalignment requires a strong, modern, and independent defense establishment. The budget allocated \$5.6 billion for defense in 2005. Active armed forces that year totaled 27,600 with reservists numbering 262,000. The Army in 2005 had 13,800 active personnel, with 280 main battle tanks, 705 armored infantry fighting vehicles, 1,521 armored personnel carriers, and 820 artillery pieces. The Swedish Navy had 7,900 active personnel including a 1,300-member coastal defense force, and a 320-member naval aviation wing. There are naval stations at Stockholm, Karlskrona, and Göteborg. Major naval units include seven tactical submarines, 36 patrol and coastal vessels, and 21 mine warfare vessels. The Air Force in 2005 totaled 5,900 active personnel, operating 170 combat capable aircraft, including 13 fighter ground attack aircraft and 151 JAS-39 Gripen multi-

role aircraft. A 600-person paramilitary force acts as the nation's coast guard and there are more than 35,000 people that belong to voluntary auxiliary organizations. Sweden participates in UN and peacekeeping missions in 11 countries or regions.

## 18 INTERNATIONAL COOPERATION

Sweden joined the United Nations on 19 November 1946; it takes part in ECE and several nonregional specialized agencies, such as UNESCO, UNCTAD, UNHCR, the FAO, the World Bank, IAEA, ILO, and the WHO. The country served on the UN Security Council from 1997–98. The first UN Conference on the Human Environment was held in Stockholm in June 1972. Together with Denmark, Finland, Iceland, and Norway, Sweden has been a member of the advisory Nordic Council since 1953 and cooperates with these other Scandinavian countries in social welfare and health insurance and in freeing frontiers of passport control. The nation is also a member of the Asian Development Bank, the African Development Bank, the Council of the Baltic Sea States, G-6, G-9, the Paris Club (G-10), the Inter-American Development Bank, the Nordic Investment Bank, OECD, OSCE, the NATO Partnership for Peace, and the Council of Europe. In 1995, Sweden became a member of the European Union. It has observer status in the OAS and the Western European Union.

Sweden has offered support to UN missions and operations in Kosovo (est. 1999), India and Pakistan (est. 1949), Ethiopia and Eritrea (est. 2000), Liberia (est. 2003), Sierra Leone (est. 1999), East Timor (est. 2002), Georgia (est. 1993), and the DROC (est. 1999), among others. Sweden is part of the Australia Group, the Zangger Committee, the European Organization for Nuclear Research (CERN), the Nuclear Suppliers Group (London Group), Organization for the Prohibition of Chemical Weapons, and the Nuclear Energy Agency.

In environmental cooperation, Sweden is part of the Antarctic Treaty; the Basel Convention; Conventions on Biological Diversity, Whaling, and Air Pollution; Ramsar; CITES; the London Convention; International Tropical Timber Agreements; the Kyoto Protocol; the Montréal Protocol; MARPOL; the Nuclear Test Ban Treaty; and the UN Conventions on the Law of the Sea, Climate Change, and Desertification.

## 19 ECONOMY

Sweden is a highly industrialized country. The shift from agriculture to industry began in the 1930s and developed rapidly during the postwar period. Average annual growth of the GDP declined from 4.3% in the 1960s to 2% in the 1970s and to 1.6% in the 1980s. It grew by 1.4% in 1990 but fell 1.4% in 1991, 1.9% in 1992, and 2.1% in 1993, the longest period of decline in the 20th century. In 1994, the economy grew by 2.2%, ending the deeply troubling reversals of past years. From 1998 to 2000 GDP growth averaged 3.77%, but the global economic slowdown from 2001 helped reduce GDP growth to 1.6% in 2001 and 1.9% in 2002. Growth remained sluggish in 2003, but picked up in 2004. Real GDP growth was expected to accelerate from 2.4% in 2005 to 3% in 2006, before a modest slowdown in 2007. Over the 2001–05 period, real GDP growth averaged 2%.

Swedish living standards and purchasing power are among the highest in the world. However, inflation was a problem for several years after the international oil shocks of the 1970s, the annual rise

in consumer prices peaking at 13.7% in 1980 after the second oil shock. The rate of price increases declined thereafter, but was still 10.4% in 1990 and 9.4% in 1991 before falling to 2.2% in 1992. By 1998 and 1999, inflation had all but disappeared, with annual rates of 0.4% and 0.3% respectively. In 2000, inflation rose to 1.3%, and during 2001 and 2002, the annual inflation rate averaged 2.5%. By 2005, the annual inflation rate averaged 0.7%, but inflationary pressures were expected to rise gradually over the period 2006–07. Over the 2001–05 period, inflation averaged 1.5%.

After hitting 14% in 1994, unemployment began to gradually recede. By 1998, unemployment was down to 6.5%, and by 2001, 3.9%. The unemployment rate stood at 4% in 2002, and was estimated at 5.6% in 2004. However, by 2005, the unemployment rate remained well above the government's 4% target: an unadjusted figure of 7.1% was registered in June 2005. While not high by European standards, many economists believed the true number of the unemployed is even larger.

Swedish industry is outstanding in supplying quality goods and specialized products—ball bearings, high-grade steel, machine tools, and glassware—that are in world demand. Intimate contact between trade, industry, and finance is a feature of the economy, as is the spread of factories to rural districts. Some natural resources are ample, the foremost being lumber, iron ore, and waterpower. Sweden's lack of oil and coal resources makes it dependent on imports for energy production, despite abundant waterpower.

## 20 INCOME

The US Central Intelligence Agency (CIA) reports that in 2005 Sweden's gross domestic product (GDP) was estimated at \$266.5 billion. The CIA defines GDP as the value of all final goods and services produced within a nation in a given year and computed on the basis of purchasing power parity (PPP) rather than value as measured on the basis of the rate of exchange based on current dollars. The per capita GDP was estimated at \$29,600. The annual growth rate of GDP was estimated at 2.4%. The average inflation rate in 2005 was 0.5%. It was estimated that agriculture accounted for 1.8% of GDP, industry 28.6%, and services 69.7%.

According to the World Bank, in 2003 remittances from citizens working abroad totaled \$578 million or about \$65 per capita and accounted for approximately 0.2% of GDP.

The World Bank reports that in 2003 household consumption in Sweden totaled \$147.76 billion or about \$16,499 per capita based on a GDP of \$301.6 billion, measured in current dollars rather than PPP. Household consumption includes expenditures of individuals, households, and nongovernmental organizations on goods and services, excluding purchases of dwellings. It was estimated that for the period 1990 to 2003 household consumption grew at an average annual rate of 1.7%. In 2001 it was estimated that approximately 17% of household consumption was spent on food, 12% on fuel, 4% on health care, and 14% on education.

## 21 LABOR

In 2005, Sweden's labor force was estimated at 4.49 million persons. As of 2003, the services sector accounted for 75.1% of the workforce, with 22.6% engaged in industry, 2.1% in agriculture,

and the remainder in undefined occupations. The unemployment rate in 2005 was estimated at 6%.

In 2005, about 80% of Swedish wage earners are members of trade unions, and within certain industrial branches the percentage is even higher. The trade union movement is based on voluntary membership, and there is neither a closed shop nor a union shop. Although workers have the right to strike, employers also have the right to use the lockout.

Agreements between employers and trade unions are generally worked out by negotiation. Public mediators or mediation commissions intervene if necessary. A labor court, made up of three impartial members and five representing employers, workers, and salaried employees, has jurisdiction over the application and interpretation of collective agreements already signed and may impose damages on employers, trade unions, or trade union members violating a contract. For many years, an overwhelming majority of the court's decisions have been unanimous, and since the end of the 1930s industrial peace has generally prevailed. In 1997, management and labor agreed to a new negotiating framework that has decreased strikes and increased wages. Swedish law requires employee representation on company boards of directors. A law passed in 1983 introduced employee funds, partly funded by contributions from profits of all Swedish companies, which give unions and employees equity in companies, while providing the companies with investment capital.

The legal minimum age for full-time employment is 16 years old, but only under the supervision of local authorities. In addition, minors under 18 can only work in the daytime and must be supervised. The regular workweek cannot exceed 40 hours, and overtime is limited to 48 hours over a four-week period and a total of 200 hours a year. However, these regulations may be modified by collective bargaining agreement. A minimum of five weeks of holiday with pay is stipulated by law. There is no national minimum wage: wages are negotiated in collective bargaining agreements. Workers, even at the lowest end of the pay scale, are able to provide a decent standard of living for their families. Health and safety standards are very high and are stringently enforced.

## 22 AGRICULTURE

Only about 3% of Sweden's labor force earned their living in agriculture in 2000, compared with more than 50% at the beginning of the 20th century and about 20% in 1950. Production exceeds domestic consumption; however, a considerable amount of food is imported. About 6.5% of the land area of Sweden, or 2,672,000 hectares (6,603,000 acres), is classed as land cultivated with permanent or temporary crops. In 2003 there were 66,780 holdings with more than two hectares (five acres) of arable land. Farm holdings are intensively tilled; fertilizers are used heavily and mechanization is increasing. During 1980–90, the agricultural sector grew by an annual average of 1.5%. However, during 1990–2000, it remained essentially unchanged. During 2002–04, crop production was 3% higher than during 1999–2001.

Most farmers are elderly, and few small farms have a successor waiting to replace the present farmer. Government policy in recent years has been to merge small unprofitable farms into larger units of 10–20 hectares (25–50 acres) of arable land with some woodland, the size estimated able to support a family in the same living standard as an industrial worker. Most Swedish farmers are

small landowners who also support themselves through forestry and fishing, and in 2003, 51% of farms were less than 20 hectares (50 acres) in extent. Farmer participation in the government's set-aside program resulted in about 300,000 hectares (741,300 acres) of cropland being retired from production in 1990, and again in 1991. The full-time farm labor force has fallen from 45,000 in 1995 to 32,000 in 2003.

Grains (particularly oats, wheat, barley, and rye), potatoes and other root crops, vegetables, and fruits are the chief agricultural products. Sugar beet cultivation in Skåne is important and produces almost enough sugar to make Sweden self-sufficient. In 2004, Sweden produced 1,691,900 tons of barley; 925,300 tons of oats; 2,412,300 tons of wheat; 979,100 tons of potatoes; and 133,400 tons of rye.

In the last 50 years, Swedish agricultural policy for major commodities has developed under an official system of import levies, export support, and market intervention. This policy was in response to the economic depression of the 1930s, and for the country's need for food security in times of risk or war. The Warfare Preparedness Program, developed after World War II (1939–45), protected Swedish agriculture, resulting in high costs and overproduction. In 1991, a five-year agricultural reform program came into effect, whereby most subsidies and price regulations were eliminated, allowing consumer demand to determine production volumes. By 1995, Sweden's agricultural policy was fully in line with EU rules. Sweden also enacted a plan to convert 10% of the country's arable land to ecological, or organic, agriculture by increasing taxes on energy, fertilizers, and biocides. The government has also introduced incentives to promote the production of biomass for energy production. Due to a relatively short growing season, Sweden relies heavily on imported food and agricultural products. In 2003, agricultural and food products accounted for 8% of Sweden's imports.

## 23 ANIMAL HUSBANDRY

Although the long winters necessitate indoor feeding from October to May, pastoral farming is important, and about 80% of farm income derives from animal products, especially dairy products. In 2005, there were 1.6 million head of cattle. Beef production totaled 142,100 tons in 2005. Liquid milk production totaled 3.32 million tons in 2005. Other dairy products made that year were cheese, 121,800 tons, and butter, 50,000 tons. Because the oversufficiency of butter before 1970 weakened Sweden's position in world markets, the government encouraged farmers to shift to meat production. An agricultural reform program in the early 1990s dismantled many of the price regulations and subsidies for products like milk and meat in favor of market-oriented pricing. As these adjustments were made, the number of dairy producers fell from 24,786 in 1990 to 12,168 by 2000. Sweden's beef industry is now supported by direct EU subsidies and in programs connected with less favored area and environment supports.

The sheep population was 479,400 in 2005, and pigs numbered 1,823,000. There were 6,600,000 chickens during the same year. Fur farms breed large numbers of mink and a declining number of fox. Reindeer are raised by 51 Sami (Lapp) communities in the north, and between 1970 and 2003 the reindeer population in Lapp villages increased from 166,200 to 238,800.

## 2<sup>4</sup> FISHING

Fish is an important item in the Swedish diet, and Sweden is both a major importer of fish products and a principal supplier to other countries. Göteborg, Bohus, and Halland are the principal fishing districts, but large quantities of fish are caught all along the coasts. At the beginning of 2004, there were 1,597 vessels in the Swedish fishing fleet, with 1,731 professional fishermen. Herring, cod, plaice, flounder, salmon, eel, mackerel, and shellfish are the most important saltwater varieties. Freshwater fish include trout, salmon, and crayfish, a national delicacy. In 2003, there were 360 aquacultural enterprises, yielding 4,585 tons of fish. The saltwater fish catch increased from 228,000 tons in 1971 to 259,000 tons in 1984, overcoming a significant drop in the 1974–79 period because of government conservation measures and the declining number of fishermen. The total catch amounted to 293,209 tons in 2003. By tradition, a large part of the annual catch is landed in Denmark. Fish for feed is the largest single commodity, accounting for 65% of the 2003 catch. Total landings were valued at \$107.5 million in 2003. Herring and cod accounted for 19% and 6%, respectively, of total landings.

## 2<sup>5</sup> FORESTRY

Sweden is one of the world's most heavily forested countries, with forests covering some 70% of the land area. Around 55% of the land area consists of productive forestry land, for a total of 22.7 million hectares (56.1 million acres). The percentage has only varied between 55.5% and 58.1 since the first National Forestry Inventory of 1923–29. Virtually all of Sweden's forests are regrowth; virgin forests cover 788,000 hectares (1,947,000 acres) and are almost exclusively found in national parks and nature reserves. The growing stock is estimated at 3 billion cu m (106 billion cu ft). The annual growth amounts to about 101 million cu m (3.5 billion cu ft). Annual removals decreased from an average of 70.8 million cu m (2.5 billion cu ft) during 1970/71–1974/75 to an average of 55.5 million cu m (1.96 billion cu ft) during 1976/77–1980/81 but increased to roughly 83 million cu m (2.93 billion cu ft) during recent years. Important varieties include spruce (46% of commercial stands), pine (38%), birch (11%), and oak, beech, alder, and aspen (5% combined). About half of the total forest area is owned by private persons and 30% by private corporations and rural communes. The government owns most of the remaining 20% of forests, but they are located, for the most part, in the north, where climatic conditions slow the trees' growth.

Forestry and farming are interdependent everywhere except in the most fertile plains; in northern Sweden, almost one of every two men works in the woods for at least part of the winter. Both the number of workers and the productivity of those who stayed on declined in the late 1970s. Since the early 1970s, the number of employees in the forestry sector has fallen by over 40%.

The exploitation of forest wealth ranks second in importance in the economy (after metal-based industry). Sweden competes with Canada for world leadership in the export of wood pulp and is the world's leading exporter of cellulose. In 2004, net exports of wood and wood products came to \$14.9 billion and made up 12% of exports. The total timber felled in 2004 amounted to an estimated 63.3 million cu m (2.38 billion cu ft), of which coniferous sawlogs accounted for 53% of production; pulpwood, 38%; and fuel wood,

9%. Mostly roads and trains are used to transport timber; only a few of the biggest rivers are used. About 70% of timber harvested comes from clear-cutting, and 30% from thinning. About 60% of Sweden's annual forestry production is exported every year. Sweden is the third-largest exporter of paper and board, supplying 10% of the export market, with production amounting to 3% of the world's total. In 2004, Sweden's production of sawn timber reached its highest level ever. That year, Sweden's 180 major saw mills processed 16.9 million cu m (597 million cu ft) of lumber, 44 mills produced 12.8 million tons of pulp, and 46 paper facilities manufactured 11.9 million tons of paper.

A forest policy introduced in 1980 coordinates forestry measures more closely with industrial needs and places increased emphasis on clear-cutting and more complete use of the forest biomass, including stumps and small trees. The government, through the Forest Commission, enforces pest control, the prevention of premature cutting, and the use of proper methods of preserving permanent forest cover. The government decided in the early 1990s to eliminate subsidies to commercial forestry because such subsidies had been counterproductive in a strongly competitive international market. Nature conservation agreements between forest owners and the government have been established to protect and develop natural areas. Between 1994 and 2003, 1,750 agreements were negotiated, with landowners' compensation totaling \$11.2 million.

In January 2005 a severe storm raged through southern Sweden and caused major damage to forests. About 75 million cu m (2.6 billion cu ft) of timber, nearly the total annual cut for all of Sweden, was damaged by the storm, 80% Norway spruce.

## 2<sup>6</sup> MINING

Since ancient days, mining and the iron industry have been of great importance in the economic life of Sweden, which was among the most active mining countries in Europe. In addition to iron ore, Sweden also is a producer of primary metals such as zinc, copper and lead, as well as industrial minerals such as dolomite, feldspar, granite, kaolin, quartz and limestone. Sweden accounted for a large percentage of Western Europe's iron output, and was home to the region's largest gold mine.

Iron-ore production in 2004 (concentrate and pellets) was estimated at 22,300,000 metric tons, up from an estimated 21,500,000 metric tons in 2003. The Bergslagen region, in central Sweden, yielded high-grade ores for quality steel. Gold mine output in 2004 totaled 5,300 kg, up from 4,300 kg in 2003, while silver mine output in 2004 totaled 292,600 kg, down from 306,800 kg in 2003. Lead mine output in 2004 totaled 33,900 metric tons, while copper mine output, in that year, totaled 85,500 metric tons. Zinc mine output in 2004 totaled 160,600 metric tons. Lead, copper, zinc, gold, and silver were produced in the rich Skellefte (Boliden) region, where bismuth, cobalt, and huge quantities of arsenic were also found. The open-pit Björgal gold mine upgraded its facility, to increase production capacity to 3,000 kg per year, from 2,600 kg per year in 1996. Further south, phosphate, tungsten, kyanite, and pyrite were found. Sweden also produced hydraulic cement, kaolin clay, feldspar, fertilizer, graphite, lime, quartz, quartzite, dimension and crushed stone (including dolomite, granite (for domestic use and for export), limestone, sandstone, and slate), sul-

fur, and soapstone talc. Marble (in Askersund) and ilmenite were also found in Sweden.

## 27 ENERGY AND POWER

Sweden has no proven reserves of oil or natural gas, and only small reserves of coal. However, the country does possess the ability to refine crude oil, and with many rivers, waterfalls, and lakes, the country has favorable conditions for waterpower.

As of 1 January 2005, Sweden had no proven reserves of natural gas or crude oil, but did have a crude oil refining capacity of 434,000 barrels per day. Sweden's limited coal reserves, as of 2001, were placed at one million short tons. Since the 1970s, Sweden has been reducing its petroleum imports. The share of oil in the primary energy supply declined from nearly 70% in 1979 to 31.6% in 2002. In the same year, nuclear energy accounted for another 29.6% of primary energy, hydroelectricity 30%, coal 4.1%, natural gas 1.5%, and renewable sources for the rest. In 2002, Sweden's imports of all petroleum products, including crude oil, averaged 510,990 barrels per day. Of that amount, crude oil accounted for 370,430 barrels per day. Refined oil output in 2002 averaged 381,640 barrels per day, while demand that year for refined products averaged 337,340 barrels per day.

In 2002, Sweden's demand for dry natural gas totaled 34.47 billion cu ft, all of which was met by imports, which came to 34.75 billion cu ft. There was no domestic production of coal in 2002. All of Sweden's coal needs were met by imports. In that year, imports of coal totaled 3,666,000 short tons, of which 3,042,000 short tons consisted of hard coal, and 624,000 tons of coke.

Sweden's electric generating sector is marked by a high dependence upon hydroelectric power, and to a lesser extent on nuclear power. Total electric power generating capacity in 2002 was 33.793 million kW, of which hydroelectric generating capacity came to 16.523 million kW and nuclear power at 9.436 million kW. Conventional thermal fuel generating capacity in 2002 stood at 7.536 million kW, with geothermal/other sources at 0.298 million kW. For that same year, electric power output totaled 140.662 billion kWh, of which 4.4% was from fossil fuels, 46.8% from hydropower, 45.6% from nuclear power, and 3.2% from other sources. Consumption of electricity in 2002 was 136.172 billion kWh.

Sweden's heavy use of nuclear energy stems from an ambitious nuclear energy program, under which seven nuclear reactors came into operation between 1972 and 1980. By 1986, 12 units offered a capacity of 9.4 million kWh. However, by 2010, all 12 will be shut down. Plants fired by natural gas will replace nuclear energy's role. Energy conservation, development of alternative energy sources, and increased use of imported coal are also planned.

More than half of Sweden's hydroelectric output is produced underground. Because of environmental considerations, high production costs, and low world market prices, Sweden's substantial uranium reserves—some 250,000–300,000 tons (or about 20% of the known world reserves)—have not been exploited.

## 28 INDUSTRY

The basic resources for industrial development are forests, iron ore, and waterpower. Forest products, machinery, and motor vehicles are primary exports. Industrial production accounted for 29% of GDP in 2001. From 1990 to 1992, Swedish industry suffered as a result of the deep national recession as well as an overpriced

labor pool. In those years, manufacturing output fell by 10%. Between 1989 and 1992, 260,000 Swedes lost their jobs in the manufacturing sector. As the economy rebounded in subsequent years, however, especially the growth turnaround in 1994–96, industrial output has grown. In 1996, it was up 17% from 1990. Between 1993 and 1996, industrial investments more than doubled. Industrial growth remained a solid 4.5% in 2001 and 5.5% in 2004.

Since the end of World War II, emphasis has shifted from production of consumer goods to the manufacture of export items. Swedish-made ships, airplanes, and automobiles are considered outstanding in quality. Sweden's motor vehicle producers are Volvo and SAAB-Scania. As evidence of the growing consolidation of the world automotive industry, however, in 1990 the US's General Motors Corp. made a successful offer for half of Saab's automotive operations, and in 2000 it bought the remaining 50%. In 1999, the US's Ford Motor Co. purchased Sweden's Volvo car operations (excluding its heavy truck operations). In 2005, General Motors indicated it would begin to make the first truly non-Swedish Saab, by building the automobiles in Germany to save costs.

Before World War II, virtually the entire tonnage of iron and steel products consisted of high-grade steels, but in recent years exports have included considerable quantities of commercial grades. Transport equipment and iron and steel are of declining importance, however, while exports of machinery, precision equipment, chemicals, and paper have been growing in value.

Sweden is a world leader in telecommunications, computers, electronics, robotics, pharmaceutical and medical products, and biotechnology. Sweden's Ericsson is the world's largest telecommunications service provider, with 18,000 service professionals in over 140 countries in 2005. Ericsson supports networks that handle more than 550 million subscribers. Sweden has the largest number of biotechnology companies per capita in the world.

## 29 SCIENCE AND TECHNOLOGY

Sweden's high-quality scientific and technological development is renowned throughout the world. Technological products invented or developed by Swedish firms include the self-aligning ball bearing, the cream separator, the three-phase electric motor, and a refrigerator without moving parts. Sweden's more recent applications of sophisticated technology range from powder metallurgy to the Hasselblad camera and the Viggen jet fighter. Six of Sweden's largest industrial corporations are engineering companies: Volvo, SAAB-Scania, ASEA, Electrolux, SKF, and L. M. Ericsson. In 2002, high-tech exports were valued at \$10.76 billion and accounted for 16% of manufactured exports.

State-financed research, centering on the universities, is directed by the Council for Planning and Coordination of Research. Long-term industrial research and development is the responsibility of the government through the National Board for Technological Development. In 1987–97, Swedish students graduating with science and engineering degrees account for 38% of all university students. In 2002, of all bachelor's degrees awarded, 30.3% were for the sciences (natural, mathematics and computers, engineering). In 2001, expenditures for research and development (R&D) totaled \$9.6 billion, or 4.27% of GDP. Of that amount, the business sector accounted for 71.9%, followed by the government at 21%, higher education at 3.8% and foreign sources at 3.4%. As

of 2001, there were 5,171 scientists and engineers engaged in R&D per million people.

Institutions that have played an important role in the advancement of science, both in Sweden and throughout the world, are the Nobel Foundation, which sponsors annual awards in chemistry, physics, and physiology or medicine, as well as for peace, literature, and economic science; the Royal Academy of Sciences, founded in 1739 in Stockholm; the Royal Swedish Academy of Engineering Sciences, founded in 1919 at Stockholm; and the Karolinska Institute, founded in 1810 in Stockholm, specializing in medical research. Sweden has 18 universities that offer courses in basic and applied sciences.

### 30 DOMESTIC TRADE

Stockholm, Gothenburg, and Malmö are the nation's primary distribution centers. Of the country's retail business, most is in private hands, but the consumer cooperative movement has long been one of the strongest in Europe. The local organizations belong to the Cooperative Union and Wholesale Society, a central buying and manufacturing organization, which operates factories, department stores, supermarkets, and specialized shops. The Swedish Federation of Trade is another important organization for importers and traders in the private sector. Competition between the cooperatives and private enterprise has improved selling methods, so that Sweden's self-service shops are among the most modern in Europe.

Department stores are located in the major cities. Franchising has become popular in the fast-food, apparel, home improvement, and business services sectors. Wholesale and retail outlets, as well as supermarkets, are plentiful. Value-added taxes apply to all goods and services. The general VAT tax is 25%, with reduced rates of 12% on food and 6% on items including books, magazines, and personal transportation.

The nation's three major trade fair/exhibition sites are the Stockholm International Fair, the Swedish Exhibition and Congress Center, and the Sollentuna Fair.

Offices and stores are open on weekdays from 9 AM to 5 or 6 PM (in summer, sometimes to 3 or 4 PM) and close early on Saturdays. However, many stores stay open one night a week, and some department stores are open on Sundays. Many businesses are closed, or management is unavailable, for extended vacations in the summer and around the Christmas holidays.

### 31 FOREIGN TRADE

Sweden is one of the world's leading free-trading nations, with about half the economy dependent upon trade, and business operating largely free of political influence. The volume of Sweden's foreign trade has increased very rapidly since World War II, mainly as a result of the gradual liberalization of trade restrictions within the framework of the OECD, EFTA, and the EU. Telecommunications equipment, automobile manufacturing, and logging dominate export commodities from Sweden. Sweden has one of the most open and competitive markets in the world, as of 2005 ranking behind only Finland and the United States in the International Competitiveness Ranking. Sweden is home to more multinational corporations per capita than any other nation in the world. It is at the economic center of the Nordic and Baltic world, a market of over 27 million consumers. The United States is the number one

export market for Swedish products (followed by Germany, Norway, the United Kingdom, and Denmark), while imports from the United States rank 8th, behind Germany, Denmark, the United Kingdom, Norway, the Netherlands, France, and Finland. In 2004, with exports of \$123.1 billion and imports of \$99.6 billion, Sweden had a trade surplus of \$23.5 billion. The major exports in 2004 were machinery and transportation equipment (51.4% of total exports), wood and paper products (12.2%), chemicals and rubber products (12.1%), and miscellaneous manufactures (11%). The major imports in 2004 were machinery and transportation equipment (45.8% of all imports), miscellaneous manufactures (19.7%), chemicals and rubber products (12.1%), and mineral fuels and lubricants (9.7%).

### 3<sup>2</sup> BALANCE OF PAYMENTS

From 1974 through 1985, Sweden ran annual current-account deficits (except in 1984) because of increases in world oil prices and a decline in the competitiveness of Swedish export products on the world market. Until 1977, deficits were financed mainly through long-term foreign private borrowing by the private sector. Thereafter, however, central government borrowing expanded rapidly. Current account deficits increased through much of the 1990s, but a turnaround began in 1996 when the deficit comprised 2% of GDP after a high of 12% in 1993. A rebounding trade balance surplus and a turnaround in direct investment aided in the improvement. The lifting of controls on foreign direct investment, combined with improved competitiveness accruing from greater wage restraint and rising productivity, are expected to bring continued interest in investing in Sweden. Also attractive is Sweden's liberal international investment policy, allowing 100% foreign ownership of virtually any sector, other than certain types of transportation and arms manufacture. The current account surplus was \$28.7 billion in 2004 (equivalent to 8.3% of GDP).

### 3<sup>3</sup> BANKING AND SECURITIES

The Central Bank of Sweden (Sveriges Riksbank), founded in 1656, is the oldest bank in the world. It is the bank of issue and regulates domestic banking operations. The European Central Bank is responsible for determining monetary policy and setting interest rates. The largest commercial bank is the Skandinaviska Enskilda Banken. In the early 1990s, Swedish banks suffered severe losses; the government was forced to intervene and support two of the five largest commercial banks, Nordbanken and Gota Bank, by taking them over and eventually merging them, and the savings bank Forsta Sparbanken. By the end of 1996, Swedish banks showed improved results, with reduced credit losses and a stricter control of costs since the banking crises set in at the beginning of the 1990s. The smaller banks serve provincial interests. Deposit accounts at various lengths of call are used for short-term credit by industry and trade. The deregulation of financial markets has paved the way for foreign banks to open offices in Sweden. In 1997, Sweden's banking sector saw a series of mergers and acquisitions as Svenska Handelsbanken, the nation's largest bank, acquired the country's largest mortgage lender, Stadshypotek. Swedbank and Föreningsbanken merged, creating the second-largest bank. ForeningsSparbanken is now trying to merge with Skandinaviska Enskilda Banken (SEB) to compete with Nordea for dominance of the Nordic banking market. However, this deal must still garner the approval of the EU. Den Danske Bank, based in Denmark, made the first incursion by a foreign bank into the Swedish retail sector when it purchased Ostgöta Enskilda Bank. By December 2000, 41 commercial banks remained in Sweden.

Mortgage banks of various types meet the needs of property owners, home builders, farmers, and shipbuilders. Credit also is extended by some 500 local rural credit societies and by about an equal number of agricultural cooperatives. There are four semi-governmental credit concerns, organized as business companies and created in cooperation with private commercial banks to facilitate long-term lending to agriculture, industry, small industry, and exports. Although the Riksbank's note issue is not tied to its gold reserves, there is an adjustable legal limit.

The International Monetary Fund reports that in 2001, M2—an aggregate equal to currency and demand deposits plus savings deposits, small time deposits, and money market mutual funds—was \$88.1 billion. The money market rate, the rate at which financial institutions lend to one another in the short term, was 4.08%. The discount rate, the interest rate at which the central bank lends to financial institutions in the short term, was 2%.

The Riksbank lends money to the commercial banks and other credit associations against securities. Traditionally, the Swedish people have preferred to save by placing money in these banks rather than by direct investment, although this seemed likely to change if the Swedish pension reforms of 1997 were fully enacted, allowing workers to decide how to invest a portion of their retirement reserves. In 1992, 118 Swedish companies and 10 foreign companies were listed on the Stockholm Stock Exchange (Stockholms Fondbörs), which was computerized that year. In 1997, the Stockholm Stock Exchange entered into a joint equity trading union with the Danish bourse, creating the first trans-national link of its kind in Europe. The joint equities market became Europe's sixth-largest.

Profits from the sale of securities are taxable provided they have been owned for less than five years. The capital gain is wholly taxable for securities held less than two years, but only 40% of the gain is taxable if the shares have been held more than two years. For machinery and equipment a minimum write-off period of three years is prescribed. The 1985 deregulation of the credit market included the removal of ceilings on lending banks, finance houses, and housing credit institutions and had the effect of diminishing part of Sweden's "gray market": direct contact between companies and private individuals with money for loans. Stockbroking is authorized by the Bank Inspection Board. As of 2004, a total of 256 companies were listed on the Stockholmsborsen, which had a market capitalization of \$376.781 billion.

### 3<sup>4</sup> INSURANCE

The Swedish people are very life-insurance conscious. In 1985, there were at least 560 Swedish insurance companies. Most companies are very small, however, and only 65 firms operated on a nationwide scale in 1995. The five largest companies held almost 80% of total insurance assets. Automobile liability insurance is compulsory in Sweden, as are nuclear liability and workers' compensation.

Since the deregulation of financial markets in the late 1980s, new credit institutions have appeared which target niche sectors in banking and other financial services. Insurance companies, such as Skandia, have created their own banks. The National Insurance Pension Fund and private insurance funds are among the largest single domestic investors on the Stockholm Stock Exchange. The insurance regulatory authority is the Financial Supervisory Authority which is an independent state agency. In 2003, the value of all direct insurance premiums written totaled \$21.040 billion, of which life insurance premiums accounted for \$14.297 billion. In that same year, Sweden's top nonlife insurer was IF Skade, which had gross written nonlife premiums of \$1.1 billion, while the country's leading life insurer was Alecta, with gross written life insurance premiums of \$2.3 billion.

### 35 PUBLIC FINANCE

The financial year extends from 1 July to 30 June. Estimates are prepared in the autumn by the Ministry of the Budget and examined by the Riksdag early the following year. The budget contains two sections: an operating budget and a capital budget, the latter generally representing investments in state enterprises. The policy of running a surplus on the budget in boom years and a deficit in depression was used in the period between the two world wars and has been continued as a way of combating inflation. From 1982 to 1989, the budget balance improved from a deficit equivalent to about 13% of GDP to a surplus of nearly 2% of GDP. In 1990, however, a deficit reappeared that was equivalent to 1.2% of GDP. In 1991 and 1992, the budget deficits widened to 4.3% and 9.6% of GDP, respectively. The deficit increased to 12.3% of GDP in 1993, before beginning a sharp decline due to austerity measures, put in place by the Social Democrats; although smaller, deficits remained the norm through the late 1990s. Surpluses were projected for the early 2000s.

The US Central Intelligence Agency (CIA) estimated that in 2005 Sweden's central government took in revenues of approximately \$210.5 billion and had expenditures of \$205.9 billion. Revenues minus expenditures totaled approximately \$4.6 billion. Public debt in 2005 amounted to 50.3% of GDP. Total external debt was \$516.1 billion.

The International Monetary Fund (IMF) reported that in 2002, the most recent year for which it had data, central government revenues were KR890.5 billion and expenditures were KR883.2 billion. The value of revenues was us\$91 million and expenditures us\$90 million, based on an exchange rate for 2002 of us\$1 = KR9.7371 as reported by the IMF. Government outlays by function were as follows: general public services, 23.5%; defense, 5.7%; public order and safety, 3.2%; economic affairs, 9.4%; environmental protection, 0.5%; housing and community amenities, 0.6%; health, 2.9%; recreation, culture, and religion, 0.8%; education, 6.4%; and social protection, 47.2%.

### 36 TAXATION

With so many social services in effect, and a virtual absence of poverty, Sweden's personal income taxes are the highest in the world. As of 2005, Sweden's top personal income tax rates effectively stood at 53% to 58%. Depending upon the locality, this included municipal income taxes on employment income averaging 31%, in addition to national income tax rates of 20–25%. In addition, capital income is taxed at a flat rate of 30%. Income of non-residents is subject to a flat rate of 25%. Personal deductions vary between 8,600 and 18,100 krona (\$6,364 and \$13,400). A health tax is levied at 1.5%. There is also a real estate tax.

In contrast, corporations are taxed relatively lightly in comparison with those in many other countries. The national income tax rate on corporations was 28% in 2005 (separate municipal income tax on corporations was abolished as of 1985), with no distinction between distributed and undistributed profits. Capital gains are taxed like other corporate income at 28%, although capital gains on shares held for business purposes are tax exempt. The withholding tax on dividends is 30%, which is applied to nonresidents. Royalties paid to residents are not taxed, but those paid to non-residents are subject to the corporate rate. These rates are often

reduced or eliminated in bilateral tax treaties. Interest income is not subject to withholding.

Tax liability is determined according to a firm's books so long as these are properly kept. Companies are allowed considerable discretion in determining their net income for any particular year; they can take advantage of the flexible rules governing the valuation of stocks and the depreciation of equipment and machinery. Swedish companies may set aside an investment reserve in boom years and use this reserve in years of slack production.

For decades, the Swedish ratio of indirect taxes to total tax revenue was one of the lowest in the world. During World War II and the early postwar years, however, a national sales tax was in effect. The national sales tax was replaced by a value-added tax (VAT) with a standard rate of 10% on 1 January 1969. The standard rate was increased to 17.65% in 1971, to 20.63% in 1977, to 46% in 1980, to 21.51% in 1981, to 23.46% in 1983, to 25% in 1992, where it has since remained, as of 2005. Almost all goods and most services are subject to this tax. There are two reduced rates: 12%, applied to food, and 6%, applied to domestic passenger transport, newspapers, and, as of 1 January 2002, books and magazines. A zero VAT rate applies to printing services, ship and airplane building and repair, sea rescue services, prescription medicine, aircraft fuel, and gold supplied to the Central Bank.

### 37 CUSTOMS AND DUTIES

Tariffs were established in the 19th century to allow for the development of Swedish industry, but the rates have traditionally been among the lowest in the world. Sweden subscribes to the OECD trade liberalization program and imports, with few exceptions, are not subject to controls. As a member of EFTA, Sweden abolished customs duties against other EFTA countries by the end of 1966. In 1991, Sweden formally began the process of joining the European Union and officially became a member on 1 January 1995. Some 90% of imports from developing countries are duty-free.

In general, the importation of raw materials is duty-free. Import duties are based on freight, insurance and handling costs, broker fees, package costs, royalties or license fees, and the seller's yield if sale will be to a third party. Import restrictions apply mainly to protected agricultural products, automobiles, and trade with Eastern Europe and the Far East. Sweden applies common external European Union tariffs to imports from the United States at rates ranging from 2–14% for industrial products. Other import taxes include a 25% value-added tax (VAT). A lower 12% VAT applies for food and selected services, and a 6% rate for periodicals and books.

### 38 FOREIGN INVESTMENT

Sweden has some of the most liberal foreign investment laws in the world. Sweden's corporate income tax rate of 28%, one of the lowest in Europe, makes Sweden an attractive target of foreign investors. It is open to nearly all foreign investment and allows 100% foreign ownership, except in certain transportation sectors (air and maritime) and in arms manufacture. For the period 1988–1990, Sweden was ranked third of 140 countries on UNCTAD's Inward FDI Potential Index, after the United States and Canada. For the period 1988–2000, Sweden was number two, behind only the United States. Investing in Sweden is also attractive due to its competent employees, excellent infrastructure, and good access to

capital. On the negative side are high labor costs, rigid labor legislation, and overall high costs in Sweden.

Sweden's outward FDI rose steadily during the 1990s, from \$1.4 billion in 1993 to a peak of \$41.7 billion in 2000, ahead of inward FDI for the year by \$18.3 billion. Outward FDI dropped to \$6.2 billion in 2001 but rose to \$11.3 billion in 2002. Inward FDI flow was only \$3.7 billion in 1993, but had reached \$19.5 billion by 1998. FDI inflows peaked in 1999 at \$60.8 billion, then moderated to \$23.4 billion in 2000. The world economic slowdown reduced FDI inflows to \$12.7 billion in 2001, and an estimated \$11.5 billion in 2002. These figures must be considered in light of FDI flows worldwide during that period, which dropped 50%. Another dramatic decline of FDI inflows took place in 2003, with a net outflow from Sweden amounting to \$15.7 billion. The rate of net outflow slowed somewhat in 2004. Over the 2001–05 period, FDI inflows amounted to 2.5% of GDP.

By 2001, cumulative FDI in Sweden totaled \$155 billion, the 10th-highest total in the world. The countries with the largest Swedish investments in 2005 were, in order: the United States, Finland, the United Kingdom, the Netherlands, Belgium/Luxembourg, Norway, Germany, Switzerland, Denmark, and France.

### 3<sup>9</sup> ECONOMIC DEVELOPMENT

Between 1946 and 1953, the Swedish economy was dominated by expansion. Thereafter, although production continued to increase (at a lessened rate), inflation was a matter of concern. Expansion of output slowed down during the international oil crisis and recession of 1974–75, largely as a result of a weakening of foreign demand for Swedish products, but employment remained high. Thus far, the economy has managed to contain inflationary trends within reasonable limits. Although some industries (the railways, iron-ore mines, etc.) have been nationalized for a long time, private concerns carry on most of Sweden's industry, in terms of both number of workers and value of output.

During periods of unemployment such as the world recession of 1980–81, the central government and the municipalities have expended funds to provide additional employment and to keep the unemployment rate relatively low. The jobless have been put to work building dwellings and highways, extending reforestation work, and constructing water and sewer installations, harbors, lighthouses, railroads, defense projects, and telecommunications facilities. Although the government resorted to stockpiling industrial goods to combat the economic slowdown in the mid-1970s, the cost was considered too high, and the policy was not repeated during the recession of the early 1980s. More recently, the emphasis has been on cutting costs and restraining inflation to make Swedish goods more competitive in the international marketplace.

Regional development has been fostered by the use of investment funds (a tax device permitting enterprises to set aside tax-free reserves during boom years to be used for investment during recessions), relief works, and government lending to small-scale industry. A national program for regional development was introduced in 1972 to develop services and job opportunities in provinces that have lagged behind in industrial development. Projects in northern Sweden benefited most from this program.

In 1991, the government announced a plan to privatize 35 wholly or partially state-owned firms with annual turnovers total-

ing Kr150 billion. This program was delayed by the economic recession, however. A 10-year, Kr110 billion program of infrastructure investment was announced in 1994. More than 90% of the money would be spent on the road and rail networks, and a bridge that would link Malmö with Copenhagen. The Øresund Bridge opened in 2000, covering 10.5 miles (17 km). It physically links Sweden with the rest of Western Europe.

Sweden's entry into the EU in 1995 dominated the second half of the 1990s. As a result of EU membership, Sweden harmonized its trade laws with those of its fellow members and continued privatization and liberalization of its economy. Sweden also qualified for membership in the Economic and Monetary Union (EMU) but decided to opt out. Future membership was contingent upon passage of a referendum, which was held in September 2003. Swedes decided not to join the euro zone by a vote of 56% to 42%. Along with the United Kingdom and Denmark, Sweden continues to stand aside from the EU's 12 other countries that, by 2005, had abandoned their old currencies.

As of 2002, around 34% of the labor force was employed in the public sector, and general government expenditure accounted for around 55% of GDP. Economic growth in the late 1990s and in the early 2000s was relatively strong, employment rates were high, there were large surpluses in both the general government and the external current accounts, and the public debt was declining. Despite the global economic slowdown of 2001–02, with the Swedish labor market situation weakening, by 2004 signs of a cyclical recovery had become clear. The strongest signs of recovery could be seen in the export industry. Sweden has made large investments in education and entrepreneurship, and is at the forefront of the global telecommunications and IT industry. These factors have contributed to a well-performing economy.

The key challenge for the Swedish economy will be to maintain the core of the social-welfare system as the population ages. Because Sweden has a budget surplus, it is better placed than most other OECD nations to do this. By 2015, the number of people 65 years of age and older is expected to be 25% larger than in 2005, while the total population in other age categories will remain largely unchanged. Although this trend is not unique to Sweden, it will need to respond to the higher demand for medical care and related social services. In this light, high labor force participation and high employment are desirable.

### 4<sup>0</sup> SOCIAL DEVELOPMENT

Sweden has been called the model welfare state; every citizen is guaranteed a minimum subsistence income and medical care. Social welfare legislation was introduced relatively early and was greatly expanded after World War II. The system is financed partly by insurance premium payments and partly by state and local taxation. Basic benefits are often increased by cost-of-living supplements. Employers and employees contribute to the program, with government funding certain aspects of the system. All residents are covered by sickness and maternity benefits. There is also a universal system for family allowances completely funded by the government.

Old-age pensions are paid to all residents 65 years of age or older, but an earlier retirement is possible, with a reduction in pension benefits. Under the new system, there is a flexible retirement age, starting from 61, and is funded by 6.95% of employee earn-

ings and 6.4% of employer payroll. Unemployment insurance is administered by the trade unions and provides benefits according to salary to those who voluntarily enroll. Unemployment relief, through monetary assistance or public works, is provided by the central government or by state-subsidized municipalities.

Compulsory health service was introduced in 1955. Hospital care is free for up to two years. Medical services and medicines are provided at substantially reduced rates or, in some cases, without charge. In the event of illness, employed persons and women staying at home to raise children receive cash payments and get further benefits according to income. Costs of confinement and maternity allowances for women are covered by health insurance. There is also a national program of dental insurance.

Workers' compensation is coordinated with the national health service scheme. This type of insurance, financed entirely by employers, covers work time as well as travel to and from work for all employees. Benefits include free medical treatment, medicines, and appliances. Annuities are paid to persons permanently disabled, and funeral benefits and pensions to dependents are provided in case of death. Public assistance is provided for blind or infirm persons confined to their homes and to people who are in sanitariums, special hospitals, or charitable institutions.

The law requires women to have equal opportunities and equal pay. Despite these legal protections, women are underrepresented in higher-paying jobs, and often receive less pay for equal work. The Equal Opportunity Ombudsman, a government official, reviews equality plans required by employers and investigates allegations of gender discrimination. Violence against women, primarily spousal abuse, persists, although the government has many programs to deal with these issues. The laws protect women, and shelters and other assistance to victims is available. Strict laws protecting children from abuse are also in effect.

There is general tolerance for religious and ethnic minorities, although right-wing and neo-nazi activities are reported. The government protects and supports minority languages. Human rights are deeply respected in Sweden.

#### 41 HEALTH

The national health insurance system, financed by the state and employer contributions, was established in January 1955 and covers all Swedish citizens and alien residents. Total expenditure for health care insurance was 7.9% of the gross domestic product. Principal health care reform issues in the 1990s include universal and equal access to services and equitable funding of health care. For rural medical attention, doctors are supplemented by district nurses. Only about 5% of all physicians are in full-time private practice. The corresponding figure for private dentists, however, is more than 50%. Swedish hospitals are well known for their high standards.

Cardiovascular disease accounted for about half of all deaths; cancer was the next leading cause of death. Many health problems are related to environment and lifestyle (including tobacco smoking, alcohol consumption, and overeating). The smoking rates were similar between men (22%) and women (24%) over the age of 15. Periodic campaigns are conducted to reduce tuberculosis (with a nationwide X-ray survey), cancer, rheumatism, and venereal diseases.

Immunization rates for children under age one were as follows: diphtheria, pertussis, and tetanus, 99% and measles, 96%. There is a well-developed prenatal service. Children receive free dental care until the age of 20.

Sweden's population is the world's oldest; nearly one in five people is 64 years of age or older. In 2005, average life expectancy in Sweden was 80.40 years. As of 2002, the crude birth rate and overall mortality rate were estimated at, respectively, 9.8 and 10.6 per 1,000 people. Infant mortality has been sharply reduced, from 60 per 1,000 live births in 1920 to 2.77 per 1,000 in 2000, one of the lowest rates in the world.

The HIV/AIDS prevalence was 0.10 per 100 adults in 2003. As of 2004, there were approximately 3,600 people living with HIV/AIDS in the country. There were an estimated 100 deaths from AIDS in 2003.

#### 42 HOUSING

In 1998, there were 4.3 million dwellings nationwide. Of these, about 2.3 million were multi-family dwellings and the remainder were one- or two-family homes. In 1998, about 20% of all dwellings were tenant owned, 40% were rental units, and 20% were owner occupied. There were about 4.2 million households that year, with an average of 2.1 people per household. In 1999, 15,000 new dwellings were started. The projected number of dwellings in 2004 was 4,379,541.

Nearly all of Sweden's housing stock was modernized during a mass housing improvement program in the 1980s. Most houses are built by private contractors, but more than half of new housing is designed, planned, and financed by nonprofit organizations and cooperatives. NPOs and cooperatives provide dwellings for members who are designated as tenant-owners of their dwellings.

The government subsidizes new construction and reconditioning, helps various groups to obtain better housing, and extends credit at interest rates lower than those obtainable in the open market. A system of rent controls, introduced in 1942 and designed to freeze rents at the existing rate, was abolished in 1975. It has been replaced by a policy known as a utility-value provision, through which the rent of a flat may not be higher than that of a similar flat in the same area which is of the same general value to the occupant. Many tenant organizations negotiate rental agreements with landlords and rent increases can be reviewed by a tribunal. The National Board of Housing, Building, and Planning estimates that 250,000 new dwellings will be built from 2000–10. About 30,000 dwellings per year will be renovated or rebuilt during the same period.

#### 43 EDUCATION

Education is free and compulsory between ages 7 and 15. A nine-year comprehensive course was introduced in 1962. All pupils receive the same course of instruction for six years; beginning in the seventh year the curriculum is differentiated, and students may choose between a classical and a vocational course. About 80% of all students then enter gymnasium (senior high school) or continuation schools. The gymnasium specializes in classical or modern languages or science; after the three-year course, students may take a final graduating examination. The continuation schools offer a two-year curriculum that is more practical and specialized than that of the gymnasium and leads more quickly to the practice

of a trade. Both comprehensive schools and secondary schools are administered by local authorities, while the central government provides grants-in-aid to cover the greater part of the costs.

In 2001, about 75% of children between the ages of three and six were enrolled in some type of preschool program. Primary school enrollment in 2003 was estimated at about 100% of age-eligible students. The same year, secondary school enrollment was about 99% of age-eligible students. It is estimated that nearly all students complete their primary education. The student-to-teacher ratio for primary school was at about 11:1 in 2003; the ratio for secondary school was about 13:1. In 2003, private schools accounted for about 5% of primary school enrollment and 3.9% of secondary enrollment.

Sweden's six universities, all largely financed by the state, are at Uppsala (founded in 1477), Lund (1666), Stockholm (1877), Göteborg (1891), and Umea and Linköping (both completed in 1963). Uppsala and Lund have four faculties each—law, theology, medicine, and philosophy (arts and sciences). Stockholm has faculties of humanities, law, mathematics, and science; Göteborg, medicine and humanities. There are also more than two dozen specialized schools and institutions of university rank for such subjects as medicine, dentistry, pharmacology, veterinary science, music, economics, commerce, technology, agriculture, and forestry. Tuition is free, except for some special courses; most university students receive government loans to help them meet their living expenses.

Sweden has an active adult general education movement in which some three million persons participate each year. People's schools and other educational institutions give courses for all those who want to study. All the universities have extension divisions for general studies. There are 130 state-subsidized folk high schools for working adults that provide courses ranging in length from a few days to 80 weeks. In 2003, it was estimated that about 83% of the tertiary age population were enrolled in tertiary education programs. The adult literacy rate has been estimated at about 99%.

As of 2003, public expenditure on education was estimated at 7.7% of GDP, or 12.8% of total government expenditures.

#### 44 LIBRARIES AND MUSEUMS

The four major libraries, the Royal Library at Stockholm (three million volumes) and the university libraries of Uppsala (5.4 million), Lunds (3.2 million), and Göteborg (2.7 million), receive free copies of all Swedish publications. There are technical and other special libraries, all of which have an interlibrary loan scheme with the university libraries, the state-aided municipal libraries, and the 24 county libraries. The largest public library is the Stockholm Public Library which holds over 2.1 million books and over 150,000 materials of other media. The Stockholm Public Library supports 44 city branches, 60 hospital branches, 90 lending points in workplaces and correctional facilities, and bookmobile services. The Göteborg Public Library holds 1.6 million volumes. Altogether, the public library systems had a combined total of about 46.3 million volumes. The Swedish Library of Talking Books and Braille is a government program that works through local public libraries; founded in 1955, the library has over 86,500 talking book titles (in 50 languages) and over 12,000 books in Braille. The Swedish Authors' Fund administers a library loan compen-

sation system that pays an author royalties each time a book is borrowed.

Most of the outstanding museums are in Stockholm. Especially renowned are the rich art collections of the Swedish National Art Museum and the sculptures of Carl Milles in the artist's former home at Millesgården in Lidingö. In Stockholm are located the Swedish Museum of Natural History (founded 1739) and the National Museum of Science and Technology (founded 1924). The Aquaria Vatten Museum, opened in 1991, is a natural history museum that includes a shark aquarium, salmon ladder, and living rain forest. The Nobel Museum celebrates the life and work of Alfred Nobel and many of the Nobel Prize laureates; the Nobel Museum also houses the 15,000-volume private library of Alfred Nobel. Göteborg has a number of museums including the Göteborg Art Gallery and a maritime museum reflecting the interests of that city. The finest Swedish folk museum is in Skansen, near Stockholm. Göteborg also has a public affairs museum including an exhibit of the history of the East India Tea Company of Sweden. Lund has the Museum of Cultural History and the Museum of Zoology. The Victoria Museum for Egyptian Antiquities is in Uppsala.

#### 45 MEDIA

In 2003, there were an estimated 736 mainline telephones for every 1,000 people. The same year, there were approximately 980 mobile phones in use for every 1,000 people.

Sveriges Radio and Television operates several public broadcasting channels. There are several private commercial stations, including satellite and cable networks. As of 1999, there were a total of 5 AM and 360 FM radio stations and 163 television stations. In 2003, there were an estimated 2,811 radios and 965 television sets for every 1,000 people. About 246 of every 1,000 people were cable subscribers. Also in 2003, there were 621.3 personal computers for every 1,000 people and 573 of every 1,000 people had access to the Internet. There were 2,354 secure Internet servers in the country in 2004.

The Swedish press is said to be the oldest in which censorship is legally forbidden. The first regular newspaper, *Post-och Inrikes Tidningar*, appeared in 1645 and is still published. The first daily was *Norrköpings Tidningen* (1758). In 2001, there were 169 daily newspapers and 455 weeklies.

News is drawn largely from the Swedish News Agency (Tidningarnas Telegrambyrå—TT), an agency owned by the Swedish press. The leading newspapers in Stockholm (with affiliation and circulation rates in 2005) were: *Aftonbladet* (Labor, 441,000), *Expressen* (liberal, 342,000), *Dagens Nyheter* (independent, 363,000), and *Svenska Dagbladet* (conservative, 179,000). In other regions, the leading papers in 2002 were: *Göteborgs-Posten* in Göteborg, (liberal, circulation 246,000), *Idag Väst* in Göteborg (172,800 in 2002), *Sydsvenskan* in Malmö (155,600 in 2002), *Sydsvenska Dagbladet* in Malmö (independent liberal, 136,000), *GT* in Göteborg (68,500 in 2002), *Nerikes Allehanda* in Örebro (68,000 in 2002), *Uppsala Nya Tidning* in Uppsala (64,400 in 2002), *Kvallsposten* in Malmö (62,900 in 2002) and *Nya Wermlands-Tidningen* in Karlstad (conservative, 59,500 in 2002).

## 46 ORGANIZATIONS

Almost all farmers are members of agricultural cooperatives, which buy supplies and sell products for the farmers and represent farmers' interests to state agencies. Over 300,000 farmers belong to a member body of the Federation of Swedish Farmers, a powerful organization that provides farmers with legal and tax advice as well as educational services on agricultural matters. There are two farm credit institutions, a dairies association, a meat marketing association, and an egg marketing association. The National Union of Swedish Farmers (formed in 1905) supplies its members with fertilizer, seeds, feeds, and other supplies and buys their crops.

The Federation of Swedish Industries (founded 1910) is active in promoting trade. Chambers of commerce operate in all the principal cities and towns. There are specialist industrial and trade associations such as those of the glass exporters and wood exporters. There are professional organizations in agriculture, archaeology, art, education, engineering, ethnology, geography, geology, law, literature, mathematics, medicine, music, science, and other fields. The Swedish Medical Association is a major physicians union.

The three most distinguished scholarly organizations are the Swedish Academy (founded 1786), the Royal Academy of Letters, History, and Antiquities (founded 1753), and the Royal Academy of Arts and Sciences (founded 1776). The Nobel Foundation administers the trust fund established by Swedish scientist and inventor Alfred Nobel (1833-96) and presents the annual Nobel Prizes. The Royal Swedish Academy of Sciences assists in awarding the annual Nobel Prizes for physics, chemistry, and economic sciences. The Swedish National Council for Cultural Affairs helps promote study in arts and culture, in part by serving as an advisory council for the national cultural budget. The Swedish P.E.N. Centre is based in Stockholm. There are several clubs and associations available for hobbyists and amateur participants in a variety of fields, such as the Gothenburg Ornithological Society.

Numerous national youth organizations include the Association of Young Catholics in Sweden, Center Party University Students Federation, Christian Democratic Youth Union, Good Templar Youth of Sweden, Liberal Student Federation, Swedish 4-H Youth, Junior Chamber, Swedish National Union of Students, Young Left of Sweden, YMCA/YWCA, and the Swedish Guide and Scout Council. Some youth councils are organized under the National Council of Swedish Youth Organizations. There are numerous sports associations promoting amateur competitions for athletes of all ages.

The Women's Front serves as an umbrella organization for groups campaigning for equal rights. There are strong women's groups within political parties. International organizations with national chapters include Greenpeace, Save the Children, Amnesty International, and the Red Cross.

## 47 TOURISM, TRAVEL, AND RECREATION

Tourism, a major industry in Sweden, was stagnant in the 1990s due to a value-added tax on hotels, restaurants, and travel services. Since 2000, however, the industry has steadily grown.

Principal tourist sites include the Royal Palace in Stockholm, the "garden city" of Göteborg, the resort island of Öland off the Baltic coast, and the lake and mountain country in the north. Cul-

tural centers in Stockholm are the Royal Opera, Royal Dramatic Theater, and Berwald Concert Hall. Popular recreational activities include football (soccer), polo, skiing, ice skating, swimming, mountain climbing, and gymnastics.

The number of foreign tourists to Sweden cannot be reliably ascertained because of uncontrolled tourist movements across borders within Scandinavia; statistics of Scandinavian visitors to Sweden have not been kept since 1951. However, tourist arrivals totaled 7,627,000 in 2003, when tourism receipts reached \$6.5 billion. That year Sweden had 96,372 hotel rooms and 184,771 beds with a 34% occupancy rate. All visitors must have a valid passport as well as sufficient funds for their stay and an onward/return ticket. Citizens of 133 countries including the United Kingdom, Russia, and China are required to carry an entry visa. Citizens of Canada, the United States, Western European countries, and some other nations may enter Sweden with a valid passport and do not require a visa.

In 2005, the US Department of State estimated the cost of staying in Stockholm at \$419 per day.

## 48 FAMOUS SWEDES

Esaias Tegnér (1782-1846), considered the national poet of Sweden, and Erik Gustaf Geijer (1783-1847), historian and poet, are the best-known Swedish writers of the early 19th century. A new impulse was given to literature by August Strindberg (1849-1912), a major literary figure whose powerful, socially oriented plays and stories reflected the advanced thought of the age. Selma Lagerlöf (1858-1940), who won the Nobel Prize for literature in 1909, showed in her novels a depth of narrative genius reminiscent of the Norse sagas. Other Swedish winners of the Nobel Prize for literature were the novelist and poet Karl Gustav Verner von Heidenstam (1859-1940), in 1916; the novelist and short-story writer Pär Lagerkvist (1891-1974), in 1951; and the novelists Eyvind Johnson (1900-1976) and Harry Edmund Martinson (1904-78), who shared the 1974 award. A noted contemporary novelist is Vilhelm Moberg (1889-1974).

The painter, etcher, and sculptor Anders Leonhard Zorn (1860-1920) and the sculptor Carl Milles (1875-1955) are the greatest figures in Swedish art. The outstanding Swedish musician of the 19th century was Franz Adolf Berwald (1796-1868), composer of symphonies, operas, and chamber music. August Johan Söderman (1832-76) is considered the leading Swedish operatic composer. Two famous sopranos were Jenny Lind (1820-87), the "Swedish nightingale," and Christine (Kristina) Nilsson (1843-1921). Outstanding 20th-century musicians are the composers Wilhelm Stenhammar (1871-1927), Hugo Alfvén (1872-1960), Ture Rangström (1884-1947), Kurt Atterberg (1887-1974), Hilding Constantin Rosenberg (1892-1985), and the singers Jussi Björling (1910-60) and Birgit Nilsson (1918-2006).

Famous 18th-century scientists were the astronomer and physicist Anders Celsius (1705-44), who devised the temperature scale named after him; the chemist Karl Wilhelm Scheele (1742-86); and the botanist Carolus Linnaeus (Carl von Linné, 1707-78), who established the classification schemes of plants and animals named after him. Emanuel Swedenborg (1688-1772) was a scientist, philosopher, and religious writer whose followers founded a religious sect in his name.

Swante August Arrhenius (1859–1927), a great pioneer in physical chemistry, is renowned for his theory of electrolytic dissociation and his speculations in the field of cosmic physics; in 1903, he was awarded the Nobel Prize for chemistry. Other Swedish Nobel Prize winners in science or medicine are Gustaf Dalén (1869–1957), for his work in automatic beacons for coast lighting (1912); Allvar Gullstrand (1862–1930), for work on dioptrics of the eye (1911); Karl Manne Georg Siegbahn (1886–1978), for work on X-ray spectroscopy (1924); Theodor Svedberg (1884–1971), for work in colloidal chemistry (1926); Hans Karl August Simon von Euler-Chelpin (b.Augsburg, 1873–1964), for work in enzyme chemistry (1929); George Karl de Hevesy (b.Budapest, 1885–1966), for work on isotopes (1943); Arne Wilhelm Kaurin Tiselius (1902–71), for investigations in electrophoresis (1948); Axel Hugo Theodor Theorell (1903–82), for work on enzymes (1955); Ragnar Arthur Granit (Finland, 1900–91), for “discoveries in primary physiological and chemical visual processes in the eye” (1967); Hannes Olof Gösta Alfvén (1908–95), for work in magnetohydrodynamics (1970); and Ulf von Euler-Chelpin (1905–83), for work on the treatment of nervous and mental disorders (1970). In addition, Kai M. Siegbahn (b.1918) shared the 1981 Nobel Prize in physics for developing spectroscopy; and Sune Karl Bergström (1916–2004) and Bengt Ingemar Samuelsson (b.1934) shared the 1982 prize in medicine for their research on prostaglandins. Bergström also served as chairman of the Nobel Foundation.

Three distinguished political economists are Karl Gunnar Myrdal (1898–1987), who was awarded the 1974 Nobel Prize in economic science for work in the theory of money and economic fluctuations and whose 1944 book *An American Dilemma* contributed to the overthrowing of legally sanctioned racial segregation in the United States; Bertil Gotthard Ohlin (1899–1979), who shared the 1977 prize for his contribution to international trade theory; and Dag Hammarskjöld (1905–61), who was secretary-general of the UN from 1953 until his death and was posthumously awarded the 1961 Nobel Prize for peace. Other Swedish winners of the Nobel Peace Prize were Klas Pontus Arnoldson (1844–1916), in 1908; Karl Hjalmar Branting (1860–1925), in 1921; Nathan Söderblom (Lars Olof Jonathan, 1866–1931), in 1930; and Alva Reimer Myrdal (1902–86), the wife of Gunnar Myrdal, in 1982. Swedish inventors who have done much to promote manufacturing and technical advances include the Swedish-American John Ericsson (1803–89), who pioneered the screw propeller and designed the first Western armored-turret warship, the *Monitor*; Alfred Nobel (1833–96), inventor of dynamite and progenitor of the Nobel Prizes; Lars Magnus Ericsson (1846–1926), who contributed much to the development of telephones; and Gustaf de

Laval (1845–1913), who developed steam turbines and invented a centrifugal cream separator.

One of the most noted film directors of our times is Ingmar Bergman (b.1918); other noted directors were Victor Seastrom (Sjöström, 1879–1960) and Mauritz (Moshe) Stiller (b.Finland, 1883–1928). Famous screen personalities have included Greta Garbo (Greta Louisa Gustafsson, 1905–90) and Ingrid Bergman (1917–82). More recent stars of Swedish theater and films include Erland Josephson (b.1923), Max Von Sydow (b.1929), Ingrid Thulin (1929–2004), Harriet Andersson (b.1932), and Bibi Andersson (b.1935). Sweden's sports stars include five-time Wimbledon tennis champion Björn Borg (b.1956); Alpine skiing champion Ingemar Stenmark (b.1956); and eight-time Rolex Player of the Year (as of 2005) golfer Annika Sörenstam (b.1970).

## 49 DEPENDENCIES

Sweden has no territories or colonies.

# SWITZERLAND

Swiss Confederation

[French] *Suisse*; (*Confédération Suisse*); [German] *Schweiz*; (*Schweizerische Eidgenossenschaft*); [Italian] *Svizzera*; (*Confederazione Svizzera*); [Romansh] *Svizra* (*Confederaziun Helvetica*)

**CAPITAL:** Bern

**FLAG:** The national flag consists of an equilateral white cross on a red background, each arm of the cross being one-sixth longer than its width.

**ANTHEM:** The Swiss Hymn begins “Trittst in Morgenrot daher, Seh’ ich dich in Strahlenmeer” (“Radiant in the morning sky, Lord, I see that Thou art nigh”).

**MONETARY UNIT:** The Swiss franc (SwFr) of 100 centimes, or rappen, is the national currency. There are coins of 1, 5, 10, 20, and 50 centimes and 1, 2, and 5 francs, and notes of 10, 20, 50, 100, 500, and 1,000 francs. SwFr 1 = \$0.81301 (or \$1 = SwFr 1.23) as of 2005.

**WEIGHTS AND MEASURES:** The metric system is the legal standard.

**HOLIDAYS:** New Year, 1–2 January; Labor Day, 1 May; Christmas, 25–26 December. Movable religious holidays include Good Friday, Easter Monday, Ascension, and Whitmonday.

**TIME:** 1 PM = noon GMT.

## <sup>1</sup> LOCATION, SIZE, AND EXTENT

A landlocked country in central Europe, Switzerland has an area of 41,290 sq km (15,942 sq mi), extending 348 km (216 mi) E–W and 220 km (137 mi) N–S. Comparatively, the area occupied by Switzerland is slightly less than twice the size of New Jersey. Bounded on the N by Germany, on the E by Liechtenstein and Austria, on the SE and S by Italy, and on the W and NW by France, Switzerland has a total boundary length of 1,852 km (1,151 mi).

Switzerland’s capital city, Bern, is located in the western part of the country.

## <sup>2</sup> TOPOGRAPHY

Switzerland is divided into three natural topographical regions: (1) the Jura Mountains in the northwest, rising between Switzerland and eastern France; (2) the Alps in the south, covering three-fifths of the country’s total area; and (3) the central Swiss plateau, or Mittelland, consisting of fertile plains and rolling hills that run between the Jura and the Alps. The Mittelland, with a mean altitude of 580 m (1,900 ft), covers about 30% of Switzerland and is the heartland of Swiss farming and industry; Zürich, Bern, Lausanne, and Geneva (Genève) are on the plateau. The central portion of the Alps, around the St. Gotthard Pass, is a major watershed and the source of the Rhine, which drains into the North Sea; of the Aare, a tributary of the Rhine; of the Rhône, which flows into the Mediterranean; and of the Ticino, a tributary of the Po, and of the Inn, a tributary of the Danube, which flow into the Adriatic and the Black seas, respectively.

The highest point in Switzerland is the Dufourspitze of Monte Rosa at 4,634 m (15,203 ft); the lowest is the shore of Lake Maggiore at less than 195 m (640 ft). The second-highest and most celebrated of the Swiss Alps is the Matterhorn (4,478 m/14,692 ft), long a challenge to mountaineers and first scaled in 1865.

Switzerland has 1,484 lakes, more than 12,900 smaller bodies of water, and many waterfalls. Lake Geneva (Léman), with an area of 581 sq km (224 sq mi), is considered the largest Swiss lake, though its southern shore is in France. Lake Neuchâtel, the largest lake totally within Switzerland, has an area of 218 sq km (84 sq mi). Switzerland also contains more than 1,000 glaciers, many the relics of Pleistocene glaciation. The largest area of permanent ice is in the Valais.

## <sup>3</sup> CLIMATE

The climate of Switzerland north of the Alps is temperate but varies with altitude, wind exposure, and other factors; the average annual temperature is 9°C (48°F). The average rainfall varies from 53 cm (21 in) in the Rhône Valley to 170 cm (67 in) in Lugano. Generally, the areas to the west and north of the Alps have a cool, rainy climate, with winter averages near or below freezing and summer temperatures seldom above 21°C (70°F). South of the Alps, the canton of Ticino has a warm, moist, Mediterranean climate, and frost is almost unknown. The climate of the Alps and of the Jura uplands is mostly raw, rainy, or snowy, with frost occurring above 1,830 m (6,000 ft).

## <sup>4</sup> FLORA AND FAUNA

Variation in climate and altitude produces a varied flora and fauna. In the lowest zone (below 550 m/1,800 ft), chestnut, walnut, cypress, and palm trees grow, as well as figs, oranges, and almonds; up to 1,200 m (3,940 ft), forests of beech, maple, and oak; around 1,680 m (5,500 ft), fir and pine; around 2,130 m (7,000 ft), rhododendron, larches, dwarf and cembra pine, and whortleberries; and above the snow line, more than 100 species of flowering plants, including the edelweiss. Wild animals include the chamois, boar, deer, otter, and fox. There are large birds of prey, as well as snipe, heath cock, and cuckoo. Lakes and rivers teem with fish. As

of 2002, there were at least 75 species of mammals, 199 species of birds, and over 3,000 species of plants throughout the country.

## 5 ENVIRONMENT

The Swiss have long been aware of the need to protect their natural resources. Switzerland's federal forestry law of 1876 is among the world's earliest pieces of environmental legislation. Since 1953, provisions for environmental protection have been incorporated in the federal constitution. A measure creating a federal role in town and rural planning by allowing the central government to set the ground rules for the cantonal master plans took effect in January 1980.

Air pollution is a major environmental concern in Switzerland; automobiles and other transportation vehicles are the main contributors. In 2000, the total of carbon dioxide emissions was at 39.1 million metric tons. Strict standards for exhaust emissions were imposed on new passenger cars manufactured after October 1987. Water pollution is also a problem due to the presence of phosphates, fertilizers, and pesticides in the water supply. The nation has 40 cu km of renewable water resources, of which 73% of the annual withdrawal is used for industrial purposes. The country's cities have produced about 3.1 million tons of solid waste annually. On 1 November 1986, as a result of a fire in a chemical warehouse near Basel, in northern Switzerland, some 30 tons of toxic waste flowed into the Rhine River, killing an estimated 500,000 fish and eels. Despite a Swiss report in January 1987 that damage to the river had not been so great as was first thought, most environmentalists considered the chemical spill a major disaster.

Chemical contaminants and erosion damage the nation's soil and limit productivity. In 1986, the Swiss Federal Office of Forestry issued a report stating that 36% of the country's forests had been killed or damaged by acid rain and other types of air pollution.

Important environmental groups include the Swiss League for the Protection of Nature, founded in 1909; the Swiss Foundation for the Protection and Care of the Landscape, 1970; and the Swiss Society for the Protection of the Environment. The principal federal agency is the Department of Environment.

According to a 2006 report issued by the International Union for Conservation of Nature and Natural Resources (IUCN), threatened species included 4 types of mammals, 8 species of birds, 1 species of amphibian, 4 species of fish, 30 species of invertebrate, and 2 species of plants. The northern bald ibis and the Italian spadefoot toad are extinct; the false ringlet butterfly, Italian agile frog, and marsh snail are threatened. The bear and wolf were exterminated by the end of the 19th century, but the lynx, once extinct in Switzerland, has been reestablished.

## 6 POPULATION

The population of Switzerland in 2005 was estimated by the United Nations (UN) at 7,446,000, which placed it at number 95 in population among the 193 nations of the world. In 2005, approximately 16% of the population was over 65 years of age, with another 16% of the population under 15 years of age. There were 94 males for every 100 females in the country. According to the UN, the annual population rate of change for 2005–10 was expected to be 0.2%, a rate the government viewed as too low. The projected

population for the year 2025 was 7,401,000. The population density was 180 per sq km (467 per sq mi).

The UN estimated that 68% of the population lived in urban areas in 2005, and that population in urban areas was declining at an annual rate of -0.06%. The capital city, Bern, had a population of 320,000 in that year. The largest metropolitan area is Zürich, with 984,000 residents in 2000. Other large cities and their estimated populations include Basel, 186,871; Geneva, 185,526; and Lausanne, 126,766.

## 7 MIGRATION

Foreign residents in Switzerland comprised about 20% of the total population in 1998. Nearly a third of all resident foreigners were of Italian nationality; the former Yugoslavia, Spain, Portugal, Germany and Turkey were the next-leading countries of origin. In April 1987, Swiss voters approved a government plan to tighten rules on immigration and political asylum.

From the beginning of the civil war in Bosnia, Switzerland took in some 27,000 Bosnian refugees by 1997, granting most only temporary protection. In 1997, 8,000 singles and couples without children returned to Bosnia; another 2,800 returned voluntarily. Nonetheless, as a result of the drastic increase in the number of asylum seekers, Switzerland suspended its resettlement policy in mid-1998.

As a result of the Kosovo conflict, Switzerland again faced a major increase in asylum seekers in 1999. The Swiss government offered temporary protection to about 65,000 Kosovars living in the country. In 2004, Switzerland hosted 47,678 refugees, 18,633 asylum seekers, and 25 stateless persons. Main countries of origin for refugees included Bosnia and Herzegovina, Serbia and Montenegro, and Turkey. Asylum applications came from 19 countries of origin, the largest numbers from Bulgaria and Belarus. The net migration rate in 2005 was an estimated 3.58 migrants per 1,000 population. Worker remittances in 2002 were \$146 million.

## 8 ETHNIC GROUPS

The four ethnolinguistic groups (Germanic, French, Italian, and Rhaeto-Romansch) that make up the native Swiss population have retained their specific characteristics. Originally, the country was inhabited by Celtic tribes in the west and south and by Rhaetians in the east. With the collapse of Roman rule, Germanic tribes poured in, among them the Alemanni and Burgundians. The Alemanni ultimately became the dominant group, and the present Alemannic vernacular (Schwyzertütsch, or Schweizerdeutsch) is spoken by nearly two-thirds of the total population as their principal language. About 65% of the population is German, 18% is French, 10% is Italian, 1% is Romansch, and 6% are of various other groups.

## 9 LANGUAGES

Switzerland is a multilingual state with four national languages—German, French, Italian, and Rhaeto-Romansch. About 63.7% of the resident population speaks German as their principal language, predominantly in northern, central, and western Switzerland; 19.2% speak French, mainly in the west and southwest; 7.6% Italian, primarily in the southern region closest to Italy; and 0.6% Rhaeto-Romansch, used widely only in the southeastern canton of

LOCATION: 5°57'24" to 10°29'36" E; 45°49'8" to 47°48'35" N. BOUNDARY LENGTHS: Germany, 334 kilometers (208 miles); Liechtenstein, 41 kilometers (25 miles); Austria, 164 kilometers (103 miles); Italy, 740 kilometers (460 miles); France, 573 kilometers (355 miles).

Graubünden (Grisons). The remaining 8.9% speak various other languages. There are numerous local dialects.

## 10 RELIGIONS

Religious denominations as of a 2002 report stood at about 44% Roman Catholic, 47% Protestant, 4.5% Muslim, and about 1% Orthodox Christian. There are about 17,577 members of the Jewish community and about 11,748 Old Catholics. About 12% of the population claimed no religious affiliation.

There is no official state church and religious freedom is guaranteed. However, all of the cantons financially support at least one of three traditional denominations—Roman Catholic, Old Catholic, or Protestant—with money collected through taxes. In all cantons, individuals may also choose not to contribute to church taxes if they do not formally belong to a church. As a result, since

the 1970s there has been a trend of individuals formally resigning their church membership in order to avoid church taxation. According to the latest statistics, about 41.8% of the population are Roman Catholic, 33% are Protestant, 4.3% are Muslim, and 1.8% are Orthodox Christians. Jews, Buddhists, Hindus, and other Christian churches each report membership of less than 1% of the population. About 11% have no church affiliation.

## 11 TRANSPORTATION

As of 2004, Switzerland's railway system consisted of 4,527 km (2,816 mi) of standard and narrow gauge track. Of that total, 3,232 km were standard gauge. Nearly all of the railway system (4,494 km/2,795 mi) was electrified. Because of its geographical position, Switzerland is an international railway center, with traffic moving from France, Germany, Austria, and northern Europe through the

Simplon, Lötschberg, and St. Gotthard tunnels to Italy and southern Europe.

The Swiss road network covered 71,212 km (44,293 mi) in 2002, all of which was paved, and included 1,706 km (1,061 mi) of expressways. In 2003, there were 3,753,890 passenger cars, and 335,958 commercial vehicles. The longest road tunnel in the world, the 17-km (10.6-mi) St. Gotthard, in the Ticino, opened in September 1980.

Inland waterway (65 km/40 mi) traffic is an important component of Swiss transportation. Basel, the only river port, has direct connections to Strasbourg, the German Rhineland, the Ruhr, Rotterdam, and Antwerp. The Rhine-Rhône canal provides an alternative link between Basel and Strasbourg. There are 12 navigable lakes. During World War II, the Swiss organized a merchant marine to carry Swiss imports and exports on the high seas. In 2005, it consisted of 23 ships of 1,000 GRT or more, totaling 604,843 GRT. Switzerland's merchant fleet is larger than that of any other landlocked nation.

There were an estimated 65 airports in 2004. As of 2005, a total of 42 had paved runways and there were also two heliports. Swissair, partially owned by the federal and local governments, is the flag line of Switzerland. It has flights from the principal international airports at Zürich, Geneva (Cointrin), and Basel to major European cities, North and South America, the Middle East, Asia, and West Africa. In 2003, about 10.589 million passengers were carried on scheduled domestic and international flights, and 1,248 million freight ton-km of service.

## 12 HISTORY

The Helvetii, a Celtic tribe conquered by Julius Caesar in 58 BC, were the first inhabitants of Switzerland (Helvetia) known by name. A Roman province for 200 years, Switzerland was a prosperous land with large cities (Avenches was the capital) and a flourishing trade. In AD 250, however, Switzerland was occupied by the Alemanni, a Germanic tribe, and in 433 by the Burgundians. The Franks, who defeated the Alemanni in 496 and the Burgundians about 534, incorporated the country into the Frankish Empire. Under Frankish rule, new cities were founded; others, such as Zürich and Lausanne, were rebuilt; and Christianity was introduced.

In 1032, some 200 years after the death of Charlemagne, king of the Franks, and the defeat of his weak successors, Switzerland became part of the Holy Roman Empire. In the 13th century, it was placed under the House of Habsburg. Harsh domination resulted in the rebellion of several cities and the formation on 1 August 1291 of the "eternal alliance" between the three forest cantons of Schwyz, Uri, and Unterwalden, the first step toward the Swiss Confederation. The Habsburgs invaded the three provinces, but with their defeat at Morgarten Pass on 15 November 1315, the Swiss secured their independence. By 1353, five other cantons, Luzern (1332), Zürich (1351), Glarus and Zug (1352), and Bern (1353), had joined the confederacy. All these allies were called Swiss (Schwyzer), after the largest canton. Four victories over Austria (1386, 1388, 1476, and 1499) confirmed the confederation. The Swiss also defeated Charles of Burgundy, whose ambitions threatened their independence until his death in 1477. Complete independence was secured by the Treaty of Basel (1499) with the Holy Roman Empire. Switzerland thereafter remained unmo-

lest by foreign troops until the French Revolution of 1789. Such legendary or real heroes as William Tell, Arnold von Winkelried, and Nikolaus von der Flüe symbolized Swiss bravery and love of freedom. The Helvetic Confederation (Eidgenossenschaft) continued to grow with the inclusion of Aargau (1415), Thurgau (1460), Fribourg and Solothurn (1481), Basel and Schaffhausen (1501), and Appenzell (1513). As of 1513, there were 13 cantons and several affiliated cities and regions. Swiss sovereignty reached south of the crest of the Alps into the Ticino. The Swiss also controlled many of the vital mountain passes linking southern and northern Europe.

The power of the Confederation was, however, undermined by conflicts stemming from the Reformation, led by Ulrich Zwingli in Zürich and John Calvin in Geneva. Seven cantons resisted the Reformation, and a prolonged conflict resulted. In its first round, Zwingli was killed in action (1531). The Catholic cantons later allied with Savoy and Spain. The struggle with the Protestant cantons centered during the Thirty Years' War (1618–48) on control of the Valtelline pass. The Treaty of Westphalia ending that war granted the Swiss Confederation formal recognition of independence by all European powers.

In the following centuries, the Catholic-Protestant conflict continued with varying success for each side. Apart from this struggle, a number of abortive uprisings against oligarchic control occurred in such places as Geneva and the canton of Vaud. The oligarchs were still in power in most cantons when the French Revolution broke out. With the progress of the revolution, radical groups gained the upper hand in several cities. In 1798, the Helvetic Republic was proclaimed, under French tutelage, and during the Napoleonic imperial era Switzerland was governed as an appendage of France. Boundaries were partly redrawn, and six new cantons were added to the original 13.

In 1815, the Congress of Vienna reconstituted the independent Swiss Confederation with three additional cantons (for a total of 22) and recognized its perpetual neutrality. Switzerland, however, did not remain untouched by the great conflict between liberalism and conservatism that affected all of Europe in the first half of the 19th century. Many revolutionaries found temporary refuge in Switzerland and influenced some of its citizens. Under their goading, several cantons introduced more progressive governments and liberalized their old constitutions.

In 1848, a new federal constitution, quite similar to that of the United States, was promulgated. Meanwhile, the struggle between Protestants and Catholics had culminated in the Secession (Sonderbund) War of 1847, in which the Protestant cantons quickly overcame the secessionist movement of the seven Catholic cantons. As a result of the war, federal authority was greatly strengthened.

In 1874, the constitution was again revised to enlarge federal authority, especially in fiscal and military affairs. Since the last quarter of the 19th century, Switzerland has been concerned primarily with domestic matters, such as social legislation, communications, and industrialization. In foreign affairs, it remained rigidly neutral through both world wars, resolutely determined to protect its independence with its highly reputed militia. In 1978, Switzerland's 23rd sovereign canton, Jura, was established by nationwide vote. In 1991, Switzerland celebrated the 700th anniversary of Confederation.

Despite its neutrality, Switzerland has cooperated wholeheartedly in various international organizations, offering home and hospitality to such diverse bodies as the League of Nations, the Red Cross, and the UPU. Switzerland has long resisted joining the UN, however, partly on the grounds that imposition of sanctions, as entailed in various UN resolutions, is contrary to a policy of strict neutrality. In a March 1986 referendum, a proposal for UN membership, approved by the Federal Assembly, was rejected by Swiss voters. Switzerland is a member of most specialized UN agencies and is a party to the Statute of the International Court of Justice. Swiss attitudes toward UN membership changed at the beginning of the 21st century, as citizens decreasingly saw participation in the UN as jeopardizing the country's neutrality. In a referendum held on 3 March 2002, nearly 55% of Swiss voters approved of joining the UN, but approval by the country's 23 cantons received a narrower 12 to 11 vote. On 10 September 2002 Switzerland became a full member of the UN.

Foreign governments have targeted Switzerland's tight bank secrecy laws as providing a haven for tax evasion and money laundering. The EU maintains that if Switzerland were to join the body, such laws would have to be reformed. Switzerland suffered from the global economic downturn that began in 2001; it employs 220,000 people (out of a total population of some seven million) in financial services, of which more than half work in banking. The Swiss have also expressed ambivalence toward Europe. In December 1992, the Swiss rejected participation in the two major European organizations—the European Economic Area (EEA) of the European Union (EU). Fearing adverse effects from non-participation, the Swiss government has taken steps to bring the country's laws and economy into harmony with the EEA. Because of the fact that all legislation can be subjected to referenda, however, the government is finding it difficult to alter certain protectionist policies and to lower certain barriers. Officially, the government is committed to eventually joining the EU, although in order to do so it will have to convince a majority of voters it is the correct path.

In a blow to Euro skeptics, in June 2005 voters, in a referendum endorsed by a 55–45% majority, planned to join the other European Union members then in the Schengen passport-free travel zone. Voters also approved joining the EU's Dublin agreement on handling asylum seekers, and of participating in further coordination of policing and crime-fighting. In September 2005, a bilateral accord on the free movement of labor to the 10 newest EU member states was approved in a referendum.

In October 2003, the right-wing Swiss People's Party (SVP) became the largest force in the National Council after winning 26.6% of the vote in general elections. That December, parliament decided to grant the SVP the second post in the seven-seat government at the expense of the Christian Democrats, altering the "magic formula" which had brought stability to Swiss politics since 1959.

### 13 GOVERNMENT

The Swiss Confederation is a federal union governed, until 2000, under the constitution of 1874, which vested supreme authority in the Federal Assembly, the legislative body, and executive power in the Federal Council. On 1 January 2000, a new federal constitution entered into force, replacing the 1874 constitution. The new constitution formally separates and codifies four pillars of Swiss

constitutional law: democracy; the rule of law; social welfare; and federalism. Fundamental rights, such as freedom of speech and assembly, which had not been explicitly mentioned in the 1874 constitution, now received their formal expression.

The Federal Assembly consists of two chambers: the National Council (*Nationalrat*) of 200 members, elected by direct ballot for four-year terms by citizens 18 years of age or older, and the Council of States (*Ständerat*) of 46 members, two appointed by each of the 20 cantons, and one from each of the six half-cantons, and paid by the cantons; deputies are elected according to the laws of the cantons. Legislation must be approved by both houses.

The Federal Council of seven members is elected for four-year terms by joint session of the Federal Assembly. The president and vice president of the Federal Council and of the Confederation are elected by the assembly for one-year terms and cannot be reelected to the same office until after the expiration of another year. The seven members of the Federal Council, which has no veto power, are the respective heads of the main departments of the federal government. After general elections held in October 2003, the four-party power-sharing agreement known as the "magic formula"—whereby the Free Democrats, Social Democrats, and Christian Democrats each held two seats, and the Swiss People's Party held one seat—was disturbed, as the SVP, which had campaigned on an antiforeigner and anti-EU platform, became the largest party in parliament. The Christian Democrats forfeited one seat to the SVP. After the 2004 election for president, the Federal Council elected Samuel Schmid. The Federal Council meets in secret and tries to appear congenial at all times. Moritz Luenberger won the 2005 election and took office 8 January 2006.

The cantons are sovereign in all matters not delegated to the federal government by the constitution and may force federal law to a plebiscite by the right of referendum. In addition, by popular initiative, 50,000 citizens may demand a direct popular vote on any legislation or regulation proposed by the federal government, and 100,000 citizens may demand a referendum on a constitutional revision. Any proposed amendments to the constitution must be submitted for public approval.

In 1971, Swiss women were granted the right to vote in federal elections. In November 1990, the Federal Court ruled in favor of female suffrage in the half-canton of Appenzell-Inner Rhoden, the last area with male-only suffrage.

### 14 POLITICAL PARTIES

Swiss politics are generally stable, and until 2003, the strengths of the chief political parties varied little over the past several decades. The conduct of national-level politics is generally calm and is marked by mutual esteem and cooperation. On the cantonal and municipal levels, however, the give-and-take of political life is more lively and unrestrained, as well as more partisan. The ruling Federal Council is made up of what the Swiss refer to as the "magic formula" coalition, an informal, but strictly adhered to, arrangement whereby the four largest political parties fill the seven positions on the Federal Council. The four strongest parties are now the Swiss People's Party, a right-wing, xenophobic and anti-EU party; the Social Democratic Party, similar to the Scandinavian Social Democrats, which advocates wider state participation in industry and strong social legislation; the Radical Free Democratic Party, a progressive middle-class party, which favors increased so-

cial welfare, strengthening of national defense, and a democratic federally structured government; and the Christian Democrats (formerly the Christian Social-Conservatives), a clerical federalist party, which opposes centralization of power. The Swiss People's Party was formed in 1971 by a union of the Farmers, Traders, and Citizens Party, which favored agrarian reform, protective tariffs, and a stronger national defense, and the Democratic Party, a leftist middle-class group. Other parties include the League of Independents, a progressive, middle-class consumers' group; the Communist-inclined Workers Party, with some strength in Zürich, Basel, and Geneva; the Liberal Party; and the Independent and Evangelical Party, which is Protestant, federalist, and conservative. In 1985, two small right-wing parties were formed: the National Socialist Party and the Conservative and Liberal Movement.

After the October 1991 elections the Radical Democratic Party held 44 seats, Social Democrats 42 seats, Christian Democrats 37 seats, Swiss People's Party 25 seats, Greens 14 seats, Liberals 10 seats, and minor parties, 28 seats.

In the Council of States, the 46 seats were distributed as follows in 1991: Radical Democratic Party 18 seats, Christian Democrats 16 seats, Social Democrats 4 seats, Liberals 3 seats, Independents 1 seat, and Ticino League 1 seat.

The 1995 elections for the National Council saw the Radical Democratic Party take 45 seats; the Social Democratic Party, 54; the Christian Democratic People's Party, 34; the Swiss People's Party, 30; the Greens, 8; the Liberal Party, 7; the Alliance of Independents Party, 6; the Swiss Democratic Party, 3; the Evangelical People's Party, 3; the Workers' Party, 2; and the Ticino League, 2.

In the Council of States, the 46 seats were distributed as follows: Radical Democrats, 17; Christian Democrats, 17; Swiss People's Party, 4; Social Democrats, 3; Liberals, 3; Independents, 1; Ticino League, 1.

Following the October 1999 elections, the Social Democratic Party took 51 seats; the Swiss People's Party took 44; the Radical Democratic Party, 43; Christian Democrats, 35; Greens, 9; Liberals, 6; Evangelical People's Party, 3; the xenophobic Swiss Democratic Party, 1; the conservative Federal Democratic Union, 1; the Workers' Party, 2; the Ticino League, 2; Independents, 1; the socialist party Solidarities, 1; and the progressive Christian Social Party, 1.

In the Council of States after the 1999 elections, the Radical Democratic Party held 18 seats; the Christian Democrats held 15; the Swiss People's Party had 7; and the Social Democrats held 6.

Following the 2003 elections, in the National Council the Swiss People's Party took 55 seats; the Social Democratic Party took 54; the Radical Free Democratic Party took 36; the Christian Democrats took 28; the Greens took 13; and other small parties held 14 seats. In the Council of States the Christian Democrats took 15 seats; the Radical Free Democrats took 14; the Swiss People's Party took 8; the Social Democrats took 6; and others held three seats. The next elections were scheduled to take place October 2007.

## <sup>15</sup> LOCAL GOVERNMENT

The Swiss Confederation consists of 23 sovereign cantons, three of which are divided into half-cantons (i.e., 20 cantons and six half-cantons). The most recent of these, Jura, was formed from six French-speaking districts in the German-speaking area of Bern Canton in 1978. In 1993, the German-speaking Laufental district

of Beru joined the canton of Basel-Land. This was the first time a political unit in Switzerland left one canton to join another. Swiss cantons are highly autonomous and exercise wide administrative control, with the weak federal government controlling only foreign affairs, national security, customs, communications, and monetary policy. The cantons have their own constitutions and laws, and are responsible for their own public works, education, care of the poor, justice, and police forces. Local forms of government vary, but each canton has a legislative council (called Grand Conseil, Grosser Rat, Kantonsrat, or Gran Consiglio), which appoints a chief executive. In a few of the small cantons, the general assembly of all voting citizens, or Landsgemeinde, decides on major matters by voice vote; in the majority of the cantons, this ancient institution has been replaced by referendum. Communes, numbering over 3,000, are the basic units of local government. For the most part, Swiss districts (Bezirke), constituting a middle level of organization between the cantons and communes, are little more than judicial circuits.

## <sup>16</sup> JUDICIAL SYSTEM

The Federal Court of Justice in Lausanne is composed of 30 permanent members appointed for six-year terms by the Federal Assembly. Until 2000, the court had both original and final jurisdiction in the majority of cases where a canton or the federal government was involved, and was the highest appeals court for many types of cases. Judicial reforms carried out in 2000 reduced the caseload of the Federal Court, by creating a federal criminal court and federal administrative bodies with judicial competence. Now, the Federal Court exists as a pure appellate court.

Each canton has its own cantonal courts. District courts have three to five members and try lesser criminal and civil cases. Each canton has an appeals court and a court of cassation, the jurisdiction of which is limited to reviewing judicial procedures. Capital punishment was abolished in 1942. Minor cases are tried by a single judge, difficult cases by a panel of judges, and murder and other serious crimes by a public jury.

The judiciary is independent and free from interference by other branches of government. The trials are fair and the judicial process is efficient. The judicial system is based on civil law influenced by customary law. Switzerland accepts compulsory jurisdiction of the International Court of Justice.

## <sup>17</sup> ARMED FORCES

Switzerland's armed forces in 2005 were built around a core of 4,300 active military personnel and a well-trained force of 210,000 citizen-soldier reservists that can be mobilized within 48 hours. The country has universal compulsory military service for males at age 19–20, followed by varied annual training requirements until age 42 (55 for officers), with exemption only for physical disability. Initial basic training of 15 weeks is followed by regular short training periods. In addition, there is also a paramilitary civil defense force of 105,000 members. When fully mobilized, Switzerland's land forces (Army) would have an estimated manpower of 153,200, with 355 main battle tanks, 446 reconnaissance vehicles, 127 armored infantry fighting vehicles, 1049 armored personnel carriers, and 1,008 artillery pieces. The land forces also have a marine arm that is outfitted with 10 patrol/coastal boats. The air force, when fully mobilized, had an estimated 32,900 per-

sonnel and has 90 combat capable aircraft, including 57 fighters and 33 fighter ground attack aircraft.

Swiss fighting men are world famous, and from the 16th to the 19th century some two million Swiss served as mercenaries in foreign armies. The modern Swiss citizen-soldier is trained only for territorial defense in prepared mountain positions, which is his only mission. A continuing legacy of Swiss mercenary service is the ceremonial Vatican Swiss Guard. Switzerland has military personnel deployed to eight countries or regions under UN, NATO, European Union or other auspices. The military budget in 2005 totaled \$3.82 billion.

## 18 INTERNATIONAL COOPERATION

Although it was a member of and served as the site for the League of Nations, Switzerland was not a member of the United Nations until 10 September 2002, partly from a fear of compromising traditional Swiss neutrality. The country participates in ECE and in several nonregional specialized agencies, such as the FAO, UNESCO, UNHCR, UNIDO, the World Bank, ILO, IAEA, and the WHO. Switzerland has actively participated in the OSCE. The nation is also a member of the Asian Development Bank, the African Development Bank, the Euro-Atlantic Partnership Council, the European Bank for Reconstruction and Development, the Council of Europe, the Paris Club, the Inter-American Development Bank, OSCE, EFTA, the WTO, and the OECD. Switzerland holds observer status in the OAS and the Latin American Integration Association (LAIA). The headquarters of the International Committee of the Red Cross is located in Geneva. Switzerland is also the repository of the Geneva Convention, governing treatment of civilians, prisoners, and the wounded in wartime.

Switzerland is part of the NATO Partnership for Peace and a guest of the Nonaligned Movement. The nation has supported UN missions and operations in Kosovo (est. 1999), Ethiopia and Eritrea (est. 2000), and the DROC (est. 1999). Switzerland is part of the Australia Group, the Zangger Committee, the European Organization for Nuclear Research (CERN), the Nuclear Suppliers Group (London Group), the Organization for the Prohibition of Chemical Weapons, and the Nuclear Energy Agency.

In environmental cooperation, Switzerland is part of the Antarctic Treaty; the Basel Convention; Conventions on Biological Diversity, Whaling, and Air Pollution; Ramsar; CITES; the London Convention; International Tropical Timber Agreements; the Kyoto Protocol; the Montréal Protocol; MARPOL; the Nuclear Test Ban Treaty; and the UN Conventions on Climate Change and Desertification.

## 19 ECONOMY

Because of the paucity of its minerals and other raw materials and its limited agricultural production, Switzerland depends upon imports of food and fodder and industrial raw materials, which it finances with exports of manufactured goods. Agriculture is important (in agriculture, Switzerland is about 60% self-sufficient) though limited by a scarcity of level and fertile land, but manufacturing engages more than five times as many workers as farming. Swiss manufacturers excel in quality of workmanship rather than quantity of output. Other important branches of the economy include international banking, insurance, tourism, and transportation. Switzerland ranks among leading countries in research and

development (R&D), and is among the world's top five countries for R&D for biotech and nanotechnology.

Switzerland was less affected than most other nations by the worldwide recession of the early 1980s and experienced a strong recovery beginning in 1983. However, between 1986 and 1992, GNP grew by an annual average of only 0.7% and it fell in 1991, 1992, and 1993. From 1993–95, growth averaged barely 1% a year and decreased once again in 1996. In 1998, however, the economy grew by 2% and by 1.9% in 1999, before soaring, relatively speaking, to 3.4% in 2000. Switzerland's economy was in recession in 2002: the global international slowdown in 2001 and the appreciation of the Swiss franc brought small contractions in 2001 (-0.9%) and 2002 (-0.2%). The financial sector was particularly affected by the slowdown in the economy. However, by 2004, the economy was growing by 1.7%, thanks to eastern and Asian export markets. The GDP growth rate was forecast for 1.5% in 2006 and 2% in 2007.

From 1990 to 1992, the annual inflation rate averaged 5.1%. By 1994 inflation had plummeted to 0.9%; it was 1.8% in 1995, 0.8% in 1996, and 0% in 1998. From 1999 to 2002, average annual inflation was about 1%. In 2004, the inflation rate stood at 0.9% and at 1.1% in 2005. Despite high oil prices forecast for 2006, inflation was expected to remain low. Swiss unemployment has remained consistently low in comparison with other countries, although it reached an unusually high 4.5% in 1993. In 1994 unemployment was 3.8%, and 3.6% in 1998—rates a fraction of France and Germany. Unemployment fell further, to an average annual rate of 2.3%, 1999 to 2002. The unemployment rate in 2004 had risen to 3.4%, and young workers (ages 15–25) were particularly hard hit, as were restaurant and hotel industry workers. Meanwhile, the Swiss GDP per capita—in 2004, \$48,596 in market exchange rate terms and \$34,160 in purchasing power parity (PPP) terms—continued to be among the highest in the world.

## 20 INCOME

The US Central Intelligence Agency (CIA) reports that in 2005 Switzerland's gross domestic product (GDP) was estimated at \$262.1 billion. The CIA defines GDP as the value of all final goods and services produced within a nation in a given year and computed on the basis of purchasing power parity (PPP) rather than value as measured on the basis of the rate of exchange based on current dollars. The per capita GDP was estimated at \$35,000. The annual growth rate of GDP was estimated at 1.2%. The average inflation rate in 2005 was 1.2%. It was estimated that agriculture accounted for 1.5% of GDP, industry 34%, and services 64.5%.

According to the World Bank, in 2003 remittances from citizens working abroad totaled \$1.709 billion or about \$233 per capita and accounted for approximately 0.5% of GDP.

The World Bank reports that in 2003 household consumption in Switzerland totaled \$167.22 billion or about \$22,751 per capita based on a GDP of \$320.1 billion, measured in current dollars rather than PPP. Household consumption includes expenditures of individuals, households, and nongovernmental organizations on goods and services, excluding purchases of dwellings. It was estimated that for the period 1990 to 2003 household consumption grew at an average annual rate of 1.3%. In 2001 it was estimated that approximately 19% of household consumption was spent on food, 9% on fuel, 3% on health care, and 18% on education.

## **2<sup>1</sup> LABOR**

In 2005, the Swiss workforce numbered an estimated 3.8 million. As of 2003, the service sector employed 72% of the labor force, with 23.9% engaged in industry, and 4.1% in agriculture. Foreign workers account for about 30% of the country's workforce. In 2005, Switzerland's unemployment rate was estimated at 3.8%.

About 25% of the labor force was unionized in 2005. Swiss law provides for and regulates union organization and collective bargaining. Most labor disputes are settled on the basis of a so-called peace agreement existing since 1937 between the head organizations of employers and employees. Other collective disputes are dealt with by the various cantonal courts of conciliation. Strikes are rare and Switzerland generally records the lowest number of days lost to strikes in the OECD. Approximately 50% of the country's labor force in 2005 was covered by collective bargaining agreements.

The legally mandated maximum workweek is set at 45 hours for blue- and white-collar workers in the services, industrial and retail sectors. A 50-hour workweek covers the rest. Minors as young as 13 may perform light work for up to nine hours per week during the school year and 15 hours otherwise. There are severe restrictions on the hours and conditions of employment of workers until the age of 20. There is no government mandated minimum wage. The Federal Labor Act and the Code of Obligations mandate various other workplace requirements.

## **2<sup>2</sup> AGRICULTURE**

Some 443,000 hectares (1,095,000 acres), or about 10.8% of the country's total land area, is under seasonal or permanent crops. Most of the cultivable land is in the Mittelland, or central plateau, and the cantons regularly producing the largest quantities of wheat are Bern, Vaud, Fribourg, Zürich, and Aargau. Soil quality is often poor, but yields have been increasing as a result of modern technology. In 2003, agriculture contributed 2% to GDP.

Agricultural production provides only about 60% of the nation's food needs. Although productivity per worker has been increasing steadily, the proportion of the total labor force engaged in agriculture has fallen from 30% in 1900 to about 4.2% in 2000. Between 1955 and 2003, the number of farm holdings fell from 205,997 to 65,866. Some principal crops, with their production figures for 2004, were as follows: potatoes, 484,000 tons; sugar beets, 1,340,000 tons; wheat, 456,000 tons; barley, 230,000 tons; maize, 220,000 tons; oats, 35,000 tons; and rye, 20,000 tons. In the same year, an estimated 11.6 million liters of wine were produced, and there were 15,000 hectares (37,000 acres) of vineyards.

Swiss agricultural policy is highly regulated, with fixed prices and quota restrictions maintained on several products. Domestic production is encouraged by the imposition of protective customs and duties on imported goods, and by restrictions on imports. The Federal Council has the authority to fix prices of bread grains, flour, milk, and other foodstuffs. Production costs in Switzerland, as well as international exchange rates favorable to the Swiss franc, make competition with foreign products difficult. This highly protectionist system has led to excess production and mounting costs associated with the management of surpluses. The Uruguay Round and subsequent Swiss implementation of its provisions in July 1995 (along with rising costs in the agricultural sec-

tor) has forced the government to begin reforming its agricultural support system.

## **2<sup>3</sup> ANIMAL HUSBANDRY**

More than half of Switzerland's productive area is grassland exploited for hay production and/or grazing. Livestock production contributes about 2% to GDP. Dairying and cattle breeding are practiced, more or less intensively, in all but the barren parts of the country and, during the summer months, even at altitudes of more than 1,200 m (4,000 ft). In 2005 there were 1,540,000 head of cattle and 1,594,000 pigs, 443,000 sheep and 74,000 goats. Meat production in 2005 included (in tons): pork, 233,000; beef, 134,000; poultry, 58,000; mutton/lamb, 6,000; and horse meat, 1,000. Swiss cheeses are world famous; production was 178,000 tons in 2005. That year, 34,000 tons of eggs were produced.

While home production almost covers or exceeds the domestic requirements for milk and dairy products, substantial quantities of eggs and meat must be imported. New agricultural reforms for 2004-07 entail the progressive abolition of the milk quota system, and changes in import tariffs for meat. Selective cattle breeding, research, and improvement of production standards are promoted by the federal government and by farmers' cooperatives. Exports of milk, dairy products, and eggs amounted to \$467.6 million in 2004.

## **2<sup>4</sup> FISHING**

Fishing is relatively unimportant but is carried on in many Swiss rivers and on lakes Constance, Neuchâtel, and Geneva. The total catch was 2,950 tons in 2003. Rainbow trout, whitefish, and perch are the main species. Local fish supply about 12% of domestic needs.

## **2<sup>5</sup> FORESTRY**

Forests occupied 1,199,000 hectares (2,962,000 acres) in 2000. About two-thirds of the forested land is owned by communes; most of the remainder is owned privately. Federal and cantonal governments account for about 8%. About 80% of the wood in Swiss forests is coniferous, primarily spruce; the remaining 20% is deciduous, predominantly red beech.

The timber cut yielded 4,713,000 cu m (166 million cu ft) of roundwood in 2004, with 21% used as fuel wood. The government estimates that the annual cut represents only two-thirds of potential. Forestry production in 2004 amounted to about 1,505,000 cu m (53 million cu ft) of sawnwood, 1,777,000 tons of paper and paperboard, and 271,000 tons of wood pulp. The trade deficit in forestry products amounted to \$169 million in 2004.

## **2<sup>6</sup> MINING**

Mining, exclusively of industrial minerals for construction, played a minor role in Switzerland's economy. Metal mining has ceased, reserves of the small deposits of iron, nickel-cobalt, gold, and silver were mostly depleted, and new mining activities were discouraged for environmental reasons. Industrial minerals produced in 2004 included hydraulic cement, common clay, gravel, gypsum, lime, nitrogen, salt, sand, stone, and sulfur (from petroleum refining). Metal processing, restricted to primary and secondary aluminum, secondary lead, and steel, depended on imported raw materials or scrap. Environmental concerns have led to a policy to curtail

or gradually cease smelting activities. The production and export of chemicals were among the nation's leading industries. Steel was another leading export commodity. A large diamond center, Switzerland was actively involved in cutting and polishing diamonds, and played a big role in international trade activities.

## 27 ENERGY AND POWER

Switzerland is heavily dependent on imported oil, natural gas and coal to meet its hydrocarbon needs, although it does have the refining capacity to permit a modest amount of refined petroleum products to be exported.

In 2002, Switzerland's imports of all petroleum products averaged 277,350 barrels per day, of which 99,860 barrels per day were crude oil. Total refinery output in 2002 averaged 104,280 barrels per day. Demand for refined oil products in 2002 averaged 267,230 barrels per day, allowing Switzerland to export an average of 11,550 barrels per day of refined oil products.

In 2002, Switzerland's imports and consumption of natural gas each totaled 107.18 billion cu ft. Coal imports that year totaled 169,000 short tons, with demand at 221,000 short tons.

Switzerland's electric power plants had an installed capacity of 17.268 million kW in 2002, of which hydroelectric plants accounted for 13.240 million kW of capacity, followed by nuclear plants at 3.200 million kW, conventional thermal plants at 0.453 million kW and geothermal/other plants at 0.375 million kW. Electricity production in 2002 totaled 63.240 billion kWh, of which 1.6% was from fossil fuels, 55.1% from hydropower, 40.9% from nuclear power, and 2.3% from renewable sources.

## 28 INDUSTRY

Manufacturing industries contributed 34% of GDP in 2003. The industrial growth rate in 2004 was 4.7%. Swiss industries are chiefly engaged in the manufacture, from imported raw materials, of highly finished goods for domestic consumption and for export. Most of the industrial enterprises are located in the plains and the Swiss plateau, especially in the cantons of Zürich, Bern, Aargau, St. Gallen, Solothurn, Vaud, Basel (Baselstadt and Baselland), and Thurgau. Some industries are concentrated in certain regions: the watch and jewelry industry in the Jura Mountains; machinery in Zürich, Geneva, and Basel; chemical industries (dyes and pharmaceuticals) in Basel; and the textile industry in northeastern Switzerland. In 1993, the industrial sector was targeted for assistance by a government-initiated revitalization program; in 1995, the sector again benefited from government policy when the turnover tax was replaced by a value-added tax system, expected to relieve industry of SwFr1–2 billion per year in taxes. Switzerland, along with Germany and Japan, is at the forefront of the emerging industry of environmental technology.

The textile industry, using wool, cotton, silk, and synthetics, is the oldest Swiss industry and, despite foreign competition resulting from the elimination of textile quotas by the World Trade Organization in 2005, remains important. The machine industry, first among Swiss industries today, produces goods ranging from heavy arms and ammunition to fine precision and optical instruments. Switzerland is the world's largest exporter of watches and watch products (followed by Hong Kong and China), with exports worth \$9 billion in 2004. For the first half of 2005, Swiss watch exports were up 11% over the same period in 2004 and exceeding

forecasts. Chemicals, especially dyes and pharmaceuticals, also are important. As of 2003, Switzerland had a 4.3% share of the world export of chemical and pharmaceutical products, and ranked 9th among the largest export nations. Pharmaceutical exports as a percentage of total chemical industry exports increased from 40% in 1980 to 70.3% in 2003. Switzerland has also developed a major food industry, relying in part on the country's capacity for milk production. Condensed milk was first developed in Switzerland, as were two other important processed food products: chocolate and baby food. The Swiss company Nestlé S. A., headquartered in Vevey, is one of the world's largest food companies. In addition to Switzerland's major industries, such as textiles, nonmetallic minerals, and watchmaking and clockmaking, others, such as chemicals, plastics, and paper, have grown rapidly.

## 29 SCIENCE AND TECHNOLOGY

The major scientific learned societies, headquartered in Bern, are the Swiss Academy of Sciences, founded in 1815, and the Swiss Academy of Engineering Sciences, founded in 1981. About two-thirds of the funds for Swiss research and development (R&D), a high proportion by world standards, are supplied by industry and the rest by federal and cantonal governments. In 2000 (the latest year for which data was available), expenditures for R&D totaled \$5,316.302 million, or 2.63% of GDP. Of that amount, the business sector accounted for 69.1%, followed by the government at 23.2%, foreign sources at 4.3%, higher education at 2.1% and private non-profit organizations at 1.4%. For that same year, there were 3,594 scientists and 2,315 technicians per million people, that were engaged in R&D. The Swiss National Science Foundation was established in 1952 to finance noncommercial research for which funds would not otherwise be available. Most such spending is in the important chemicals sector. The Ministry of Public Economy, the center for federal agricultural research, has six research stations. In 2002, high-tech exports were valued at \$17.077 billion and accounted for 21% of manufactured exports. In that same year, of all bachelor's degrees awarded, 25.7% were for the sciences (natural, mathematics and computers, engineering).

## 30 DOMESTIC TRADE

Zürich, the largest city, is the commercial, financial, and industrial center of Switzerland. Basel is the second most important commercial city, followed by Geneva and Lausanne. Most Swiss wholesale firms are importers as well, specializing in one commodity or a group of related commodities.

The trend in retail trade is moving from independent establishments to larger supermarkets, department stores, and discount chains. As such, many small retailers have joined together to form purchasing cooperatives. However, Switzerland is a challenging market for franchising, due to Switzerland's limited market size, high salaries, and high costs of services; also, consumer preference for high quality and authentic products or a new innovative idea over already existing products is another challenge facing potential franchisees. Companies sponsoring home shopping parties (Tupperware, Mary Kay, Body Shop, etc.) have become very popular. Some agricultural products, such as butter, grains, and edible fats and oils, are subject to import controls and price controls apply to many goods and services. The use of electronic debit cards for purchases is growing rapidly.

Advertising, mostly entrusted to firms of specialists, uses as media billboards, movie theaters, television, local transportation facilities, railroads, newspapers, and magazines.

Usual business hours are from 8 or 9 AM to 5 or 6 PM. Shops are normally open from 9 AM to 6:30 PM on weekdays but only to 5 PM on Saturdays; some shops close from 12 PM to 2 PM at lunchtime. In larger cities, shops generally extend their hours until 8 PM on one evening of the week, usually Thursday. Banks are open to the public from 8:30 AM to 4:30 PM Monday–Friday.

### 3<sup>1</sup> FOREIGN TRADE

Switzerland's export commodities are split into two categories: machinery sold to other manufacturers, and commodities used by consumers. The country exports a large number of the world's watches and clocks.

While Switzerland is not a member of the EU, it has been seeking ways to adopt some of the advantages of membership without relinquishing sovereignty. As of 2005, 62% of Swiss exports were destined for the EU market. As of 2004, Switzerland's main export partners, in order of importance, were Germany, the United States, France, Italy, the United Kingdom, and Spain. By that date, Switzerland's primary import partners were Germany, Italy, France, the United States, the Netherlands, and Austria.

### 3<sup>2</sup> BALANCE OF PAYMENTS

In the past, Switzerland typically had a foreign trade deficit. More recently, however, this imbalance was more than compensated for by income from services, investments, insurance, and tourism. Restructuring of enterprises in the 1990s, due to the strength of the Swiss franc, caused the export-oriented manufacturing sector to become highly successful. Exports of goods and services amounted to some 46% of GDP in 2000.

In 2004, merchandise exports totaled \$138.2 billion, and merchandise imports \$122.6 billion, for a trade surplus of \$15.6 billion. The current account surplus amounted to \$50.6 billion, equivalent to 14.2% of GDP, making Switzerland a net creditor nation.

### 3<sup>3</sup> BANKING AND SECURITIES

In 2000, Switzerland had two major banks, 24 cantonal banks, and numerous foreign-owned banks, savings banks, and other banks and finance companies. There were a total of 375 banks in the country in that year. The bank balance-sheet total per capita in Switzerland is higher than that of any other nation in the world. Total assets of the Swiss banking system amounted to \$1.3 trillion at the end of 2000, while total securities deposits were \$3.4 trillion. Moreover, registered banks and bank-like finance companies numbered 494 in 1995, offering the Swiss, on average, the greatest access to banking services of all the world's nations.

The government-supervised Swiss National Bank, incorporated in 1905 and the sole bank of issue, is a semiprivate institution owned by the cantons, by former banks of issue, and by the public. The National Bank acts as a central clearinghouse and participates in many foreign and domestic banking operations. The two big banks, (United Bank of Switzerland (UBS) and Credit Suisse Group) dominate the Swiss banking scene and are expanding aggressively overseas. They are universal banks, providing a full range of services to all types of customers.

Regional banks specialize in mortgage lending and credits for small businesses. Since 1994, most of the country's regional banks have been linked in a common holding company providing back-office operations and other services to members in a bid to cut costs.

Foreign banks make up about a third of banks active in Switzerland. In contrast to domestic banks, their numbers have risen over the last decade but their business is increasingly focused on asset management, mostly of funds from abroad. On 1 January 1995 a new banking law came into effect allowing for foreign banks to open subsidiaries, branches, or representative offices in the country without first getting approval of the Federal Banking Commission.

The transactions of private and foreign banks doing business in Switzerland traditionally play a significant role in both Swiss and

foreign capital markets; however, precise accounting of assets and liabilities in this sector are not usually made available as public information. Switzerland's strong financial position and its tradition (protected by the penal code since 1934) of preserving the secrecy of individual bank depositors have made it a favorite depository with persons throughout the world. (However, Swiss secrecy provisions are not absolute and have been lifted to provide information in criminal investigations.) The Swiss Office for Compensation executes clearing traffic with foreign countries.

In 1997, Swiss banks came under heavy criticism for losing track of money, gold, and other valuables belonging to Jewish Holocaust victims and held by the banks during World War II. Records also showed the banks had closed thousands of victims' accounts without notice after the war. The banks claimed they had lost the old records, but a group of journalists found the records archived in Lausanne in April of that year.

Also in 1997, an embarrassed Swiss government selected four members to a panel empowered to run a fund for Holocaust victims. Nobel laureate, Elie Weisel, a concentration camp survivor, turned down an invitation to serve as one of the three foreign members on the board. The fund, intended to help impoverished Holocaust victims and their families, is supported by funds appropriated by Nazis from Jews sent to concentration camps. Much of the gold, jewels, bonds, and currency taken by the Nazis had been placed in Swiss banks. In March 1998, Switzerland's banks agreed to create a \$1.25 billion fund designed to compensate Holocaust survivors and their families.

Swiss banks were also under fire in 1997 for possibly facilitating money laundering of drug money accrued by a former Mexican president's brother and for failing to adequately recover the billions of dollars supposedly plundered by former Zairian dictator Mobutu Sese Seko, who was overthrown that year. All the negative publicity has caused some to question the usefulness of Swiss banks' much-lauded secrecy.

The International Monetary Fund reports that in 2001, currency and demand deposits—an aggregate commonly known as M1—were equal to \$102.9 billion. In that same year, M2—an aggregate equal to M1 plus savings deposits, small time deposits, and money market mutual funds—was \$326.3 billion. The money market rate, the rate at which financial institutions lend to one another in the short term, was 1.65%. The discount rate, the interest rate at which the central bank lends to financial institutions in the short term, was 1.59%.

Stock exchanges operate in Geneva (founded 1850), Basel (1875), and Zürich (1876). The Zürich exchange is the most important in the country. In terms of market capitalization, the Swiss stock exchanges rank seventh in the world, behind New York, Tokyo, Osaka, London, Frankfurt, and Paris, as of 1997. Overall, turnover, including shares, bonds, and options, amounted to SwFr1.2 trillion in 2002, a drop of 2.3% from the prior year. The open outcry stock exchanges in Zürich, Geneva, and Basel closed in 1994 when a national electronic stock exchange for all securities trading began operations in August. In 2004, a total of 282 companies were listed on the SWX Swiss Exchange, which had a market capitalization of \$825.849 billion.

### 3<sup>4</sup> INSURANCE

The Swiss people are the most heavily insured in the world, although this reflects social insurance such as health insurance, as well as more commercial types of business. Nevertheless, Swiss insurers now rely on foreign business for two-thirds of their premium income. The insurance sector has been steadily deregulated during the 1990s. One of the last set of controls was scrapped in 1996 when the fixed tariff regime for third-party vehicle insurance was abolished. As of 1999, Swiss insurance companies numbered over 100.

Switzerland controls an estimated one-third of the world's reinsurance, and insurance income represents a major item in the Swiss balance of payments. Insurance investments are represented heavily in the Swiss capital market, and Swiss insurance firms have invested widely in foreign real estate. About half the domestic insurance business is in the hands of the state. The Swiss Reinsurance Co. in Zürich is the largest of its kind in the world. As of 1999, about 10% of all Swiss insurance companies dealt solely with reinsurance. There are several types of compulsory insurance in Switzerland, including workers' compensation, third-party automobile liability, fire, pension, hunters', aircraft, nuclear power station, old age, unemployment, and disability insurance. In 1999, the total income of the Swiss domestic insurance market was 48 million, making it the 12th largest insurance market globally. In 2003, the value of all direct insurance premiums written totaled \$40.760 billion, of which life insurance premiums accounted for \$24.713 billion. In that same year, Switzerland's top nonlife insurer was Winterthur, which had gross written nonlife premiums of \$2.21 billion, while Winterthur Leben was the country's leading life insurer, with gross written life insurance premiums of \$6.09 billion.

### 3<sup>5</sup> PUBLIC FINANCE

The Swiss government has been known historically for maintaining a relatively high degree of austerity in comparison to its European neighbors. In 1991, the federal government incurred a budget deficit of over SwFr1.5 billion, the first budget discrepancy in seven years. Cantonal budgets also were in deficit. These deficits continued throughout the 1990s and into the 2000s, prompting governments at all levels to take further cost-cutting steps. As an international creditor, debt management policies are not relevant to Switzerland, which participates in the Paris Club debt reschedulings and is an active member of the OECD.

The US Central Intelligence Agency (CIA) estimated that in 2005 Switzerland's central government took in revenues of approximately \$138.1 billion and had expenditures of \$143.6 billion. Revenues minus expenditures totaled approximately -\$5.5 billion. Public debt in 2005 amounted to 53.3% of GDP. Total external debt was \$856 billion.

The International Monetary Fund (IMF) reported that in 2001, the most recent year for which it had data, central government revenues were SwFr81,727 million and expenditures were SwFr80,498 million. The value of revenues was us\$48,428 million and expenditures us\$47,700 million, based on a market exchange rate for 2001 of us\$1 = SwFr1.6876 as reported by the IMF. Government outlays by function were as follows: general public services, 18.1%; defense, 6.2%; public order and safety, 0.8%; economic

affairs, 14.6%; housing and community amenities, 1.0%; health, 0.3%; recreation, culture, and religion, 0.6%; education, 3.3%; and social protection, 55.3%.

**36 TAXATION**

The Swiss Confederation, the cantons, and the communes all levy taxes on income or profits. Periodic federal, cantonal, and communal taxes also are charged against capital values belonging to corporations and other corporate entities. The cantons all levy wealth taxes based on individual net assets, stamp duties, taxes on entertainment or admissions, and special charges for educational, social, and sanitary services. Most cantons also levy a tax surcharge on members of certain major churches for the support of those religions. Localities may impose taxes on land, rents, and entertainment, as well as a head tax and a dog tax.

Although corporate income taxes are taxed at a flat rate of 8.5%, the effective rate is actually between 8% and 25% when federal and cantonal taxes are taken into account. Generally, capital gains received by a company are taxed as ordinary business income at regular business rates. However, different rules may apply to gains received from real estate or to real estate companies at the cantonal/communal level. Generally, dividends distributed by Swiss companies are taxed as ordinary income, to which a withholding rate of 35% is applied. However, applicable participation exemption rules may lower the federal tax liability for the recipient. Interest income from banks, and publicly offered debentures, bonds and other debt instruments issued by a Swiss borrower are subject to a withholding rate of 35%. However, loans from a foreign parent company to Swiss subsidiaries and commercial loans, generally are exempt.

Federal tax is levied on personal income at rates up to 11.5%. However, cantonal rates can range from 10% to around 30%. Various deductions and personal allowances are granted according to circumstances. Those between the ages of 20 and 50 who do not fulfill their military obligation are liable for an additional tax.

Cantonal and communal taxes are generally imposed at progressive rates.

In 1995 Switzerland replaced its old system of taxing turnover with a value-added tax (VAT) similar to those of its European neighbors. As of 2005, the VAT was 7.6% and was levied on all deliveries of goods and services, including investments, consumer goods, animals and plants, consulting and entertainment services, license fees, and the sale of rights. The VAT is also levied on imported goods and services. However, hotel and lodging services are subject to a lower rate of 3.6%, while items such as foodstuffs, medicines, newspapers, farming supplies and agricultural products were subject to a 2.4% rate. Exports were zero-rated. There are also miscellaneous federal taxes, such as stamp duties, payroll and excise taxes.

**37 CUSTOMS AND DUTIES**

Switzerland joined EFTA in 1960 and became a full member of the GATT group in 1966. In 1973, Switzerland entered into an industrial free trade agreement with the European Community (now the European Union). Duties on industrial imports from the European Community were eliminated by 1977. Although it generally favors free trade, Switzerland protects domestic agriculture for national defense reasons and its customs tariff, established in 1921, is primarily a revenue-raising instrument. Specific duties, low for raw materials, moderate for semifinished goods, and high for manufactured goods, are levied by weight of import. Import duties average 3.2% on industrial goods. Switzerland gives preferential treatment to imports from developing nations. Other import taxes include a 3% statistical tax, a standard 7.6% VAT, and an environmental tax. Specific luxuries like cigarettes and spirits are subject to an excise tax. Quotas regulate the importation of certain agricultural items such as white wine.

**38 FOREIGN INVESTMENT**

Switzerland is generally open to foreign investment and grants foreign investors national treatment. However, the government restricts investment in vacation real estate, utilities, and other sectors considered essential to national security (such as hydroelectric and nuclear power plants, operation of oil pipelines, operation of airlines and marine navigation, and the transportation of explosive materials). There are no restrictions on repatriation of profits. Federal grants are offered for investments in depressed areas. The cantonal governments offer tax and nontax incentives for new investments or extensions of existing investments on a case-by-case basis.

In 1997, total foreign direct investment (FDI) stock in Switzerland exceeded \$56.58 billion (22% of GDP). US companies accounted for 23% of that total. By 1999, FDI stock had risen to over \$83 billion (32% of GDP), and the United States share to 26.6%. FDI inflows were \$6.6 billion in 1997, climbing to a peak of \$16.3 billion in 2000, before falling back to about \$10 billion in 2001. In 2003, FDI inflows amounted to \$12.2 billion.

Stocks of Swiss FDI abroad totaled \$170 billion (62.3% of GDP) in 1997 rising to \$205.2 billion (79% of GDP) in 1999. In 1999, the largest holders of Swiss outward FDI were the United States (with \$45 billion, 23%); the United Kingdom (\$23.7 billion, 11.5%); Germany (\$17.4 billion, 8.5%); the Netherlands (\$12.5 billion, 6.1%);

and France (\$10.4 billion, 5%). FDI outflows in 2003 amounted to \$10.9 billion.

### 3<sup>9</sup> ECONOMIC DEVELOPMENT

Private enterprise is the basis of Swiss economic policy. Although government intervention has traditionally been kept to a minimum, the international monetary crises from late 1974 to mid-1975 led to imposition of various interim control measures; in 1982, with inflation rising, a constitutional amendment mandating permanent government price controls was approved by popular referendum. The Swiss National Bank has followed a general policy of limiting monetary growth. To further raise the standard of living, the government also grants subsidies for educational and research purposes, promotes professional training, and encourages exports. Although certain foreign transactions are regulated, there is free currency exchange and a guarantee to repatriate earnings of foreign corporations.

The cause of the remarkable stability of Switzerland's economy lies in the adaptability of its industries; in the soundness of its convertible currency, which is backed by gold to an extent unmatched in any other country; and in the fact that the particular pattern of Swiss democracy, where every law may be submitted to the popular vote, entails taking into account the wishes of all parties whose interests would be affected by a change in legislation.

Switzerland's development assistance program takes the form of technical cooperation, preferential customs treatment for certain third-world products, and a limited number of bilateral aid arrangements.

The question of future European Union (EU) membership remains a point of contention among the Swiss. The French-speaking minority overwhelmingly favors EU membership, while the German-speaking majority strongly opposes it. In a 2000 referendum, Swiss voters approved closer ties to the EU. Some of the key provisions of the deal included agreement to allow EU trucks transit rights through Switzerland, as well as granting Swiss freedom of movement in the EU. Full access to the Swiss market by the original 15 EU member countries was achieved in a June 2004 agreement, ending as a result the "national preference." Switzerland approved another pact, the Schengen-Dublin agreement with the EU, in June 2005, which allows for the free movement of peoples, although fears of cheap labor coming from new EU member nations remained. However, voters approved by a referendum held on 25 September 2005 a measure to extend the provision of free movement of peoples to the 10 predominantly eastern European nations which joined the EU in 2004.

A new ordinance covering the banking sector was enacted in 2002, to combat money laundering and the financing of terrorism. Switzerland joined the UN in 2002.

### 4<sup>0</sup> SOCIAL DEVELOPMENT

There is a social insurance system and mandatory occupational pension system financed by employer and employee contributions as well as governmental subsidies. Old-age pensions are paid at age 65 for men and 63 for women. Disability and survivorship pensions are also available to qualified recipients. Sickness and Maternity benefits were first implemented in 1911. Medical care is available to all persons living in Switzerland, and there is a voluntary insurance plan for all employees to provide cash benefits. Ma-

ternity benefits are payable up to 16 weeks. Work injury insurance is compulsory, with contribution rates varying according to risk. Unemployment and disability is also covered. Family allowances are provided by the cantons, but there is a federal program covering agricultural workers. Some cantons provide birth grants.

The law provides for equal pay and prohibits gender discrimination, but there is significant bias against women in the workplace. Women earn less than men, and are less likely to receive training. There are few women in managerial positions, and they are also promoted less than men. Sexual harassment in the workplace continues, although laws and advocacy groups work to eradicate the problem. The Federal Office for Equality Between Women and Men and the Federal Commission on Women are charged with eliminating all types of gender discrimination. Physical and sexual violence against women and domestic abuse persist.

Extremist organizations continue physical and verbal attacks on religious, racial, and ethnic minorities. The government is taking some action to curtail the activities of these groups. Human rights are generally respected in Switzerland.

### 4<sup>1</sup> HEALTH

Health standards and medical care are excellent. The pharmaceuticals industry ranks as one of the major producers of specialized pharmaceutical products. Managed-care systems are widely used, especially with a "gatekeeper" component to control costs. As of 2004, there were an estimated 352 physicians, 834 nurses, 48 dentists, and 62 pharmacists per 1,000 people. The ratio of doctors per population varies by region, with the highest proportions in Basle and Geneva and the lowest in Appenzell. Total health care expenditure was estimated at 10.4% of GDP.

As of 2002, the crude birth rate and overall mortality rate were estimated at, respectively, 9.8 and 8.8 per 1,000 people. About 71% of married women (ages 15 to 49) were using contraception. The fertility rate was 1.5 children per woman surviving her childbearing years in 2000. The infant mortality rate, which had been 70.3 per 1,000 live births in 1924, was 4.39 in 2005. The vaccination rates for DPT and measles were, respectively, 94% and 81%. In 2005, life expectancy was averaged at 80.39 years.

There were about nine cases of tuberculosis per 100,000 people reported in 1999. Cardiovascular disease-related deaths numbered nearly 30,000 in the mid-1990s. Tobacco consumption has dramatically decreased from 3.1 kg (6.8 lbs) per year per adult in 1984-86 to 2.4 kg (5.3 lbs) in 1995. In 1996, voters in Zurich approved a government plan to supply heroin addicts with free access to their drug.

The HIV/AIDS prevalence was 0.40 per 100 adults in 2003. As of 2004, there were approximately 13,000 people living with HIV/AIDS in the country. There were an estimated 100 deaths from AIDS in 2003.

### 4<sup>2</sup> HOUSING

Although housing standards are comparatively high, there are shortages in certain areas. In the mid-1990s, less than 40,000 new dwellings per year were constructed in communities of 2,000 or more inhabitants, down from 44,228 in 1985. In 2000, there were about 3,115,399 private households and about 1,377,552 residential buildings. About 30% of all residential buildings were designed

for two or more households. The total housing stock in 2001 was about 3,604,340 dwellings.

### 43 EDUCATION

Education at all levels is first and foremost the responsibility of the cantons. Thus, Switzerland has 26 different systems based on differing education laws and varied cultural and linguistic needs. The cantons decide on the types of schools, length of study, teaching materials, and teachers' salaries. Education is compulsory in most cantons for nine years, and in a few for eight. An optional 10th year has been introduced in several cantons. Church schools in some cantons are tax supported. After primary school, students complete the compulsory portion of their education in various types of secondary Grade I schools, which emphasize vocational or academic subjects to varying degrees. Secondary Grade II schools, which are not compulsory, include trade and vocational preparatory schools and gymnasiums, which prepare students for the university and lead to the *matura*, or higher school-leaving certificate.

Switzerland has a large number of private schools attracting primarily foreign students. These schools, most of them located in the French-speaking cantons, are known for their high-quality education, of either the academic or "finishing school" variety.

In 2001, about 97% of children between the ages of five and six were enrolled in some type of preschool program. Primary school enrollment in 2003 was estimated at about 99% of age-eligible students. The same year, secondary school enrollment was about 87% of age-eligible students. It is estimated that about 98.6% of all students complete their primary education. The student-to-teacher ratio for primary school was at about 13:1 in 2000; the ratio for secondary school was about 10:1. In 2003, private schools accounted for about 3.7% of primary school enrollment and 7% of secondary enrollment.

Switzerland has 10 cantonal universities, including four in French-speaking areas and four in German-speaking ones. The universities' expenditures are largely financed by the cantons, with a 53% contribution from the Confederation. Approximately one-third of all higher-level educational funding goes to research and development. The largest universities are those of Zürich, Geneva, and Basel; others include those of Lausanne, Bern, Fribourg, and Neuchâtel. The Federal Institute of Technology in Zürich, the Economics College at St. Gallen, and the Federal Institute of Technology in Lausanne are also important. In 2003, it was estimated that about 49% of the tertiary age population were enrolled in tertiary education programs; 53% for men and 44% for women. The adult literacy rate has been estimated at about 99%.

As of 2003, public expenditure on education was estimated at 5.8% of GDP, or 15.1% of total government expenditures.

### 44 LIBRARIES AND MUSEUMS

The library of Basel University (3 million volumes) and the Swiss National Library in Bern (3.6 million volumes) are the largest in Switzerland. The University of Geneva has 1.8 million volumes; the University of Lausanne has about 1.7 million; and the University of Fribourg has two million. Switzerland has an extensive public library system with about 2,344 service points holding over 28 million volumes in total. The Library and Archives of the United

Nations is located in Geneva, as is the library of the International Labor Organization (over 580,000 items).

The National Museum, a federal institution in Zürich, houses historic objects; other historical museums are located in Basel, Bern, and Geneva. Basel houses both the Museum of Ancient Art and the Basel Museum of Fine Arts, which has a fine collection of 15th- and 16th-century German masterworks, paintings by Dutch artists of the 17th and 18th centuries, and a survey from Corot to Picasso. The Museum of Fine Arts in Bern contains paintings by old masters and impressionists (Klee Foundation). The Zürich Art Museum houses modern Swiss paintings, as well as works by Dutch and Flemish masters of the 17th century. Geneva houses the Museum of the Voltaire Institute, the Museum of the Institute of Henri Dunant, founder of the International Red Cross, the Jean-Jacques Rousseau Museum, and the Museum of Modern and Contemporary Art, which opened in 1994. The League of Nations (United Nations) Museum is in Geneva. There are arts and crafts museums in most of the larger cities, and Neuchâtel has an ethnographic museum. Many fine examples of Romanesque, Gothic, and Baroque architecture are found in Switzerland.

### 45 MEDIA

The postal system and the telephone, telegraph, radio, and television systems are government owned and operated. The telephone system is completely automatic. International communications, air navigation services, and the new electronic media, including data transmission and electronic mail, are the province of Radio Suisse, a public corporation. In 2003, there were an estimated 744 mainline telephones for every 1,000 people. The same year, there were approximately 843 mobile phones in use for every 1,000 people.

Broadcasting is controlled by the Swiss Broadcasting Corp. (SBC), an autonomous corporation under federal supervision. A number of independent local radio stations have been operating since 1983. Radio programs are broadcast in German, French, Italian, and Romansch. As of 1999, Switzerland had seven AM and 50 FM radio stations and 108 television stations. In 2003, there were an estimated 1,002 radios and 552 television sets for every 1,000 people. About 376.2 of every 1,000 people were cable subscribers. Also in 2003, there were 708.7 personal computers for every 1,000 people and 351 of every 1,000 people had access to the Internet. There were 2,821 secure Internet servers in the country in 2004.

A few papers, such as the *Neue Zürcher Zeitung* and the *Tribune de Genève*, are widely read even beyond the borders of Switzerland and have excellent international coverage. The Agence Télégraphique Suisse (Schweizerische Depeschagentur), co-owned by some 40 newspaper publishers, is Switzerland's most important national news agency.

Among the largest dailies in 2005 were *Blick* (in Zürich, circulation 362,000), *Tages-Anzeiger* (Zürich, 231,000), and *Neue Zürcher Zeitung* (Zürich, 151,000). *Tribune de Genève* was the best-selling French daily in 2005 with a circulation of about 71,000. *Corriere del Ticino* is a best-selling Italian paper with a 2005 circulation of about 39,000. The *Schweizer Illustrierte* (circulation 195,894) is the most popular illustrated weekly, and the *Nebenspalter* (38,630) is the best-known satirical periodical.

The constitution provides for freedom of speech and a free press, and the government is said to uphold these freedoms in practice.

## 46 ORGANIZATIONS

Both agricultural and consumer cooperatives are numerous. The Swiss Office for Commercial Expansion is an important foreign trade promotion organization. The Swiss Federation of Commerce and Industry also promotes commerce, trade and industry. The Swiss Confederation of Trade Unions serves the interests of workers/employees. The International Labour Organization has a base office in Geneva. There are chambers of commerce in all the major cities. Trade unions and professional associations exist for most occupations.

Geneva serves as home to a variety of international organizations including the International Red Cross and Red Crescent Society, the World Council of Churches, the Lutheran World Federation, the World Alliance of Reformed Churches, The World Health Organization, and the World Scout Foundation. Several United Nations committee offices are based here as well, the UN Economic Commission for Europe, UN Environment Programme, UN High Commission for Refugees, the UN Institute for Training and Research, and the UN Research Institute for Social Development. Other international organizations with national chapters include Amnesty International, Defence for Children International, Caritas, and Greenpeace.

There are numerous cultural and educational organizations. A few with national interest include the Swiss Academy of Humanities and Social Sciences, the Swiss Academy of Medical Sciences, and the Swiss Academy of Sciences. The European Center for Culture is a multinational organization promoting understanding and cooperation between cultures.

Active youth groups within the country include Junior Chamber, YMCA/YWCA, and the Swiss Guide and Scout Movement. There are a large number of sports associations nationwide, including several international organizations such as the International Baseball Federation, the International Basketball Federation, and the International Gymnastic Federation. The International Olympic Committee is based in Lausanne.

Several human rights, social justice, and social action organizations exist, including the Association of International Consultants on Human Rights, the Berne Declaration, Green Cross, The National Council of Women of Switzerland, and the Women's International League for Peace and Freedom. The International Alliance Women and the Women's World Summit Foundation both focus on health and equal rights for women. Soroptimist International of Europe is a multinational organization of business-women working toward the causes of peace, justice, health, and equal rights.

## 47 TOURISM, TRAVEL, AND RECREATION

Switzerland has long been one of the most famous tourist areas in the world, and Swiss hospitality and the Swiss hotel industry are justly renowned. Scenic attractions are manifold, and in the Swiss Alps and on the shores of the Swiss lakes there are features of interest for the skier, the swimmer, the hiker, the mountain climber, and the high alpinist. There are approximately 50,000 km (31,000 mi) of marked footpaths and 500 ski lifts. The hotels are among the best in the world; Switzerland pioneered in modern hotel management and in specialized training for hotel personnel. Central Switzerland and the Geneva region attract the largest number

of foreign tourists. Passports and visas are required of all visitors except citizens of the Americas, Europe, Japan, Australia, and New Zealand who do not need visas for stays of up to 90 days.

In 2003, there were 6,530,108 visitors who arrived in Switzerland, almost 28% of whom were German. Tourism receipts totaled \$11.3 billion, and hotel rooms numbered 139,969 with 258,726 beds and an occupancy rate of 38%. Visitors stayed an average of three nights.

In 2005, the US Department of State estimated the daily cost of staying in Geneva at \$380; in Zürich, \$295; in Basel, \$379; and in Montreux at \$394.

## 48 FAMOUS SWISS

World-famous Swiss scientists include the physician and alchemist Philippus Aureolus Paracelsus (Theophrastus Bombastus von Hohenheim, 1493?-1541); the outstanding mathematicians Johann Bernoulli (1667-1748) and Leonhard Euler (1707-83); the geologist Louis Agassiz (Jean Louis Rodolphe Agassiz, 1807-73), who was active in the United States; the physiologist, pathologist, and surgeon Emil Theodor Kocher (1841-1917), who received the Nobel Prize for medicine in 1909; Charles Édouard Guillaume (1861-1938) and the German-born Albert Einstein (1879-1955, a naturalized Swiss citizen), Nobel Prize winners in physics in 1920 and 1921, respectively; and Paul Karrer (b.Russia, 1889-1971), authority on vitamins, who shared the 1937 Nobel Prize in chemistry. Other Nobel Prize winners in the sciences include Alfred Werner (1866-1919; chemistry, 1913); Yugoslav-born Leopold Ruzicka (1887-1976; chemistry, 1939); Yugoslav-born Vladimir Prelog (1906-1998; chemistry, 1975); Austrian-born Wolfgang Pauli (1900-1958; physics, 1945); Paul Hermann Müller (1899-1965), Walter Rudolf Hess (1881-1973), and Polish-born Tadeus Reichstein (1897-1996), Nobel laureates for medicine in 1948, 1949, and 1950, respectively; Werner Arber (b.1929; medicine, 1978); Heinrich Rohrer (b.1933; physics, 1986); and K. Alex Müller (b.1927) and German-born J. Georg Bednorz (b.1950), for physics in 1987.

Jean-Jacques Rousseau (1712-78), a Geneva-born philosopher, musician, novelist, and diarist in France, was a great figure of the 18th century whose writings exerted a profound influence on education and political thought. Swiss-born Mme. Germaine de Staël (Anne Louise Germaine Necker, 1766-1817) was acclaimed the world over as defender of liberty against Napoleon. Other noted Swiss writers include Albrecht von Haller (1708-77), also an anatomist and physiologist; the novelists and short-story writers Johann Heinrich David Zschokke (1771-1848) and Jeremias Gotthelf (Albert Bitzius, 1797-1854), also a clergyman and poet; and the poets and novelists Gottfried Keller (1819-90), Conrad Ferdinand Meyer (1825-98), and Carl Spitteler (1845-1924), the last of whom won the Nobel Prize for literature in 1919. The diaries of the philosopher, poet, and essayist Henri-Frédéric Amiel (1821-81) are famous as the stirring confessions of a sensitive man's aspirations and failures. Charles Ferdinand Ramuz (1878-1947) is often regarded as the most powerful Swiss writer since Rousseau. The German-born novelist and poet Hermann Hesse (1877-1962) was awarded the Nobel Prize for literature in 1946. Other recent and contemporary Swiss writers include Robert Walser (1878-1956), a highly individualistic author, and the novelists and playwrights Max Rudolf Frisch (1911-91) and Friedrich Dürrenmatt (1921-

90), whose psychological dramas have been performed throughout Europe and the United States.

Ludwig Senfl (1490–1543) was an outstanding Renaissance composer. The *Dodecachordon* (1547) of Henricus Glareanus (Heinrich Loris, 1488–1563) was one of the most important music treatises of the Renaissance period. Swiss-born composers of more recent times include Ernest Bloch (1880–1959), Othmar Schoeck (1886–1957), Arthur Honegger (1892–1955), Frank Martin (1890–1974), Ernst Lévy (1895–1981), Conrad Beck (1901–89), and Paul Burkhard (1911–77). Ernest Ansermet (1883–1969) was a noted conductor. Renowned Swiss painters include Konrad Witz (1400–1447), Henry Fuseli (Johann Heinrich Füssli, 1741–1825), Arnold Böcklin (1827–1901), Ferdinand Hodler (1853–1918), and Paul Klee (1879–1940). In sculpture and painting, artist Alberto Giacometti (1901–66) won world acclaim for his hauntingly elongated figures. Le Corbusier (Charles Édouard Jeanneret, 1887–1965) was a leading 20th-century architect.

Swiss religious leaders include Ulrich Zwingli (1484–1531), French-born John Calvin (Jean Chauvin, 1509–64), and Karl Barth (1886–1968). Other famous Swiss are Johann Heinrich Pestalozzi (1746–1827), an educational reformer who introduced new teaching methods; Ferdinand de Saussure (1857–1913), the founder of modern linguistics; Auguste Henri Forel (1848–1931), psychologist and entomologist; the noted art historians Jakob Burckhardt (1818–97) and Heinrich Wölfflin (1864–1945); the psychiatrists Eugen Bleuler (1857–1939), Carl Gustav Jung (1875–1961), and Hermann Rorschach (1884–1922); Jean Piaget (1896–1980), authority on child psychology; and the philosopher Karl Jaspers (1883–1969). Swiss winners of the Nobel Prize for peace are Henri Dunant (1828–1910) in 1901, founder of the Red Cross, and Elie

Ducommun (1833–1906) and Charles Albert Gobat (1843–1914), both in 1902.

## 49 DEPENDENCIES

Switzerland has no territories or colonies.

# UKRAINE

*Ukraina*

**CAPITAL:** Kiev (Kyiv)

**FLAG:** Equal horizontal bands of azure blue (top) and yellow.

**ANTHEM:** *The National Anthem of Ukraine.*

**MONETARY UNIT:** The official currency, introduced in early 1993, is the hryvnia (HRN), which consists of 100 shahy. \$1 = HRN0.19493 (or \$1 = HRN5.13) as of 2005.

**WEIGHTS AND MEASURES:** The metric system is used.

**HOLIDAYS:** New Year's Day, 1–2 January; Christmas, 7 January; Women's Day, 8 March; Spring and Labor Day, 1–2 May; Victory Day, 9 May; Ukrainian Independence Day, 24 August.

**TIME:** 2 PM = noon GMT.

## <sup>1</sup>LOCATION, SIZE, AND EXTENT

Ukraine, the second-largest country in Europe, is located in Eastern Europe, bordering the Black Sea, between Poland and Russia. Comparatively, Ukraine is slightly smaller than the state of Texas with a total area of 603,700 sq km (233,090 sq mi). Ukraine shares boundaries with Belarus on the N, Russia on the E, the Black Sea on the S, Romania, Moldova, Hungary, and Slovakia on the W, and Poland on the NW. Ukraine's location is one of strategic importance at the crossroads between Europe and Asia. Its land boundary totals 4,663 km (2,897 mi) and its coastline is 2,782 km (1,729 mi). Ukraine's capital city, Kiev, is located in the north central part of the country.

## <sup>2</sup>TOPOGRAPHY

The topography of Ukraine consists mainly of fertile plains (steppes) and plateaus. True mountains (the Carpathians) are found only in the west and in the Crimean Peninsula in the extreme south. The Dnieper Uplands run through a central region of the country. The Donets Hills and Azov Uplands are located along the eastern border.

The coastal region of the Black Sea is a lowland area. The indent of Karkint Bay nearly separates the Crimean Peninsula from the mainland. The Kerch Strait connects the Black Sea to the Sea of Azov, which lies between Ukraine and Russia covering an area of 37,599 sq km (14,517 sq mi). An area of wetlands, the Polesye Marshes, is located near the northwest border.

The most important river in Ukraine is the Dnipro (Dnieper), the third longest river in Europe. It serves as a major source of hydro-electric power. Other major rivers include the Danube, Western Buh, the Tisza, the Pripyat, and the Desna. There are over 20,000 small lakes throughout the country, but the largest lakes are artificial, created by dams along the Dnipro.

## <sup>3</sup>CLIMATE

The climate is subtropical on the Crimean Peninsula. Precipitation is disproportionately distributed, highest in the west and north,

least in the east and southeast. Winters vary from cool along the Black Sea to cold farther inland. Summers are warm across the greater part of the country, except for the south where it becomes hot.

The rest of the country's climate is temperate. The mean temperature in July is about 10°C (66°F). In January, however, the mean temperature drops to -6°C (21°F). Average rainfall is 50 cm (20 in) a year, with variations in different regions.

## <sup>4</sup>FLORA AND FAUNA

The land's soil, chernozem (black soil), is very fertile. When the Ukraine was part of the former Soviet Union it was called the country's "bread basket." A steppe zone covers about a third of the southern region of the country. Mixed shrubs, grasses, and evergreens can be found along the Mediterranean-like zone of the Crimean coast. Forest regions include such tree species as beech, linden, oak, and spruce. European bison, fox, and rabbits can be found living on the vast steppes of the country. As of 2002, there were at least 108 species of mammals, 245 species of birds, and over 5,100 species of plants throughout the country.

## <sup>5</sup>ENVIRONMENT

Ukraine's environmental problems include the nuclear contamination which resulted from the 1986 Chernobyl accident. One-tenth of Ukraine's land area was affected by the radiation. According to UN reports, approximately one million people were exposed to unsafe levels of radiation through the consumption of food. Approximately 3.5 million hectare (8.6 million acre) of agricultural land and 1.5 million hectare (3.7 million acre) of forest were also contaminated.

Pollution from other sources also poses a threat to the environment. Ukraine releases polluted water, heavy metal, organic compounds, and oil-related pollutants into the Black Sea. The water supply in some areas of the country contains toxic industrial chemicals up to 10 times the concentration considered to be within safety limits.

Air pollution is also a significant environmental problem in the Ukraine. In 1992, Ukraine had the world's seventh-highest level of industrial carbon dioxide emissions, which totaled 611.3 million metric tons, a per capita level of 11.72. However, in 2000, the total of carbon dioxide emissions was at 342.8 million metric tons. The pollution of the nation's water has resulted in large-scale elimination of the fish population, particularly in the Sea of Azov.

As of 2003, only 3.9% of Ukraine's total land area was protected, including 33 Wetlands of International Importance. According to a 2006 report issued by the International Union for Conservation of Nature and Natural Resources (IUCN), threatened species included 14 types of mammals, 13 species of birds, 2 types of reptiles, 11 species of fish, 14 species of invertebrates, and 1 species of plant. Threatened species include the European bison, the Russian desman, and the Dalmatian pelican. The wild horse has become extinct.

## 6 POPULATION

The population of Ukraine in 2005 was estimated by the United Nations (UN) at 47,110,000, which placed it at number 26 in population among the 193 nations of the world. In 2005, approximately 16% of the population was over 65 years of age, with another 15% of the population under 15 years of age. There were 85 males for every 100 females in the country. According to the UN, the annual population rate of change for 2005–10 was expected to be -0.7%, a rate the government viewed as too low. The projected population for the year 2025 was 41,650,000. The population density was 78 per sq km (202 per sq mi), with the Dnieper Lowlands and the Donets Basin being the most densely populated regions.

The UN estimated that 68% of the population lived in urban areas in 2005, and that population in urban areas was declining at an annual rate of -0.57%. The capital city, Kiev (Kyiv), had a population of 2,618,000 in that year. Other cities and their estimated populations were Kharkiv, 1,436,000; Dnipropetrovsk, 1,036,000; Odesa, 1,010,000; Donetsk, 992,000; Lvov, 876,000; and Zaporizhzhya, 798,000.

## 7 MIGRATION

Since the breakup of the former Soviet Union, tens of thousands of Ukrainians have returned to the Ukraine. Between 1989–95, 15,000 returned from Azerbaijan, and 39,000 returned from Kyrgyzstan. Between 1991–95, 15,000 returned from Belarus; 82,000 returned from Kazakhstan; and 30,000 returned from Tajikistan. There were still 150,000 ecological migrants internally displaced from the 1986 Chernobyl accident. As of February 1996, 250,000 Tatars had returned from Central Asia, mostly from Uzbekistan. These Tatars belong to the 500,000 Tatars that were forcibly deported from the Crimean peninsula under the Stalin regime. The signature of an agreement between Ukraine and Uzbekistan in 1998 on the simultaneous release from Uzbek citizenship and acquisition of Ukrainian citizenship enabled more than 38,000 Crimean Tatars to obtain Ukrainian citizenship. Many of the rest of the Crimean Tatars in Central Asia wish to return to the Crimea.

Due to a series of amendments to the Law of Citizenship and a naturalization campaign, all formerly deported stateless persons residing in Ukraine had acquired Ukrainian citizenship as of 1999. The total number of migrants living in the Ukraine in 2000 was 6,947,000. In 2004, there were 2,459 refugees and 1,838 asy-

lum seekers in the Ukraine. In addition, in that same year there were 80,569 others of concern to the United Nations High Commissioner for Refugees (UNHCR), made up of 2,809 Abkhazians, 6,500 Crimean Tartars (formerly deported persons), and 71,260 stateless persons. Also in 2004, 50,693 Ukrainians were refugees in Germany, and 28,484 in the United States, and over 5,000 Ukrainians sought asylum in 10 countries, in Europe, the United Kingdom, and the United States.

The net migration rate was estimated as -0.63 migrants per 1,000 population in 2005. The government views the immigration level as too low, and the emigration level as too high. Worker remittances in 2003 were \$185 million.

## 8 ETHNIC GROUPS

According to the latest census (2001), 77.8% of the total population is Ukrainian. Russians form 17.3%, mainly in eastern Ukraine. Belarussians, Moldovans, Crimean Tatars, Bulgarians, Hungarians, Romanians, Poles, and Jews each account for less than 1% of the population. About 700,000 Rusyns (Ruthenians) live within the country, but they are not an officially recognized ethnic group.

## 9 LANGUAGES

Like Russian, Ukrainian is an eastern Slavic language. It has several distinctive vowel and consonant sounds, however. It is written in the Cyrillic alphabet but has three extra letters. Ukrainian began to emerge as a separate language from Russian in the late 12th century. Ukrainian is the official language and is spoken by about 67% of the population. Russian is spoken by about 24% of the population. Other languages include Romanian, Polish, and Hungarian.

## 10 RELIGIONS

Ukraine was Christianized by St. Volodymyr in 988. Under Soviet rule, churches and religion were subject to suppression and political manipulation, a situation that ended with the declaration of independence in 1991. Based on a 2003 survey, over 90% of the population claim to be Christians, primarily from one of three denominations: the Ukrainian Orthodox Church—Moscow Patriarchate (10.7%), the Ukrainian Orthodox Church—Kiev Patriarchate (14.8%), and the Ukrainian Autocephalous Orthodox Church (1%).

About 6.4% of the religiously active population are members of the Ukrainian Greek Catholic Church, also known as the Uniate, Byzantine, or Eastern Rite church. Roman Catholics claim about 2% of the population and are largely concentrated in the formerly Austro-Hungarian and Polish western territories. Other Christian groups represented include Baptists, Pentecostals, Jehovah's Witnesses, Mormons, Anglicans, Lutherans, Methodists, Calvinists, Pentecostals and Evangelicals. The head of the Spiritual Directorate of the Muslims of Ukraine estimates that there are as many as two million members of the nation's Muslim community. Islam is practiced mainly by the Tatar population of the autonomous republic of the Crimea. There are an estimated 300,000 Jews in the country. Small communities of Buddhists, Baha'is, and Hare Krishnas are also present.

The constitution provides for freedom of religion and this right is generally respected. However, some smaller and nontraditional religious groups have reported problems in meeting government

LOCATION: 49°0' N; 32°0' E. BOUNDARY LENGTHS: Total boundary lengths, 4,558 kilometers (2,834 miles); Belarus, 891 kilometers (554 miles); Hungary, 103 kilometers (64 miles); Moldova, 939 kilometers (584 miles); Poland, 428 kilometers (266 miles); Romania (southeast), 169 kilometers (105 miles); Romania (west), 362 kilometers (225 miles); Russia 1,576 kilometers (980 miles); Slovakia, 90 kilometers (56 miles).

registration requirements. An All-Ukrainian Council, composed of members from various religions, meets regularly with the State Committee of Religious Affairs to discuss potential problems between religions.

## <sup>11</sup>TRANSPORTATION

As of 2004, there were 22,473 km (13,988 mi) of railway in the Ukraine, all of it 1.5 m (broad) gauge. Highways in 2002 totaled 169,679 km (105,540 mi), of which 164,249 km (102,162 mi) are hard-surfaced, including 1,770 km (1,100 mi) of expressways. In 2003, there were 5,603,800 passengers cars and 985,700 commercial vehicles registered for use.

The main marine ports are Berdyans'k, Illichiv's'k, Kerch, Kher-son, Mariupol', Mykolayiv, Odesa, and Sevastopol'. The merchant marine fleet had 201 ships of 1,000 GRT or over, for a total capacity of 675,904 GRT in 2005. There are 1,672 km (1,040 mi) of navigable inland waterways as of 2004. The Dnipro River is the primary inland waterway, but the Danube, western Pivd Buh, Pryp'yat', and Desna are also used for import-export traffic.

Ukraine had an estimated 656 airports in 2004. As of 2005 a total of 199 had paved runways, and there were also 10 heliports. The largest airports are in Kiev, Kharkiv, Donetsk, Odesa, and Simferopol'. In 2003, 1.477 million passengers were carried on scheduled domestic and international airline flights.

## <sup>12</sup>HISTORY

Ukrainians, Russians, and Belarussians belong to the eastern branch of the Slavic peoples, all of which trace their origins to medieval Kievan Rus. Kievan Rus was established in the 9th century AD. St. Volodymyr the Great, one of the most celebrated rulers of Kievan Rus, adopted Christianity as the national faith in 988. Internal strife in the 12th century and the Mongol invasion in the 13th led to the ultimate destruction of Kievan Rus as a major power. Halych-Volhynia in Western Ukraine, however, became the new political center until it fell to Polish-Lithuanian rule in the 14th century. During the following centuries Ukraine found itself the object of power struggles among its more powerful neighbors.

In a protracted struggle against Poland, Ukrainian Cossacks were able to establish an independent state in the 16th and 17th

centuries. To safeguard Ukrainian independence from the Poles, Ukraine concluded the Treaty of Pereyaslav in 1654 with Moscow. The nature of this agreement has generated much historical controversy: Russian historians claim that, as part of the agreement, Ukraine accepted Moscow's rule, while Ukrainians claim that Ukraine was to retain its autonomy. The ensuing war between Russia and Poland resulted in the partition of Ukraine. Most of the rest of Ukraine's territory was incorporated into the Russian Empire with the partition of Poland in 1795. Small parts of Ukrainian territory to the west were absorbed by the Hapsburg Empire.

A Ukrainian national movement arose in the 19th century. Later, the collapse of the Tsarist regime and the chaos of the Russian revolution in 1917 allowed Ukraine to assert its independence. In April 1917, the National Ukrainian Assembly met in Kiev and in November proclaimed the creation of the Ukrainian People's Republic. When the Bolsheviks formed a rival Ukrainian Communist government, the National Assembly proclaimed the independence for Ukraine on 22 January 1918.

On 1 November 1918, an independent Republic of Western Ukraine was declared after the disintegration of the Austro-Hungarian Empire. On 22 January 1919, the Ukrainian People's Republic and the Republic of Western Ukraine united and established an independent Ukrainian state, recognized by over 40 other nations.

The new government, however, could not maintain its authority in the face of civil strife and the threat of the approaching Bolshevik, pro-Tsarist, and Polish forces. By 1920, eastern Ukraine fell to the Bolsheviks and became the Ukrainian Soviet Socialist Republic while Poland occupied most of western Ukraine. Small areas of the west went to Romania, Hungary, and Czechoslovakia.

Early Soviet policy allowed for cultural autonomy and local administration by Ukrainian Communists. But Stalin changed this liberal policy in the 1930s when he initiated strict Russification and persecution of Ukrainian nationalists. This policy culminated in the Soviet-engineered famine of 1932–33 that resulted in the death of 7 to 10 million Ukrainians.

The 1939 Nazi-Soviet pact assigned Poland's Ukrainian territory to the Soviet sphere of influence. When Germany invaded the Soviet Union in 1941, Ukrainian nationalists in Lviv proclaimed the restoration of the Ukrainian state. The Germans arrested these nationalists and turned Ukraine into a German colony. When it became clear that the Nazis wanted to enslave them and not liberate them, a resistance movement led by nationalists fought both the Soviet and German armies. During World War II, Ukraine lost six million people through death or deportation and a total of 18,000 villages were destroyed.

The Ukrainian resistance movement continued to fight in Soviet Ukraine (the western Ukraine which had been part of Poland had been incorporated into the Ukrainian S.S.R.). It was not until the 1950s that they were completely defeated by the better-equipped Soviet Red Army.

In March 1990, semi-free elections for parliament were held. The Communist-dominated parliament declared Ukraine a sovereign state on 16 July 1990. On 24 August 1991, following the failed coup in Moscow, the parliament proclaimed the independence of Ukraine and declared that only the constitution and laws of Ukraine were valid on its territory. On 1 December 1991 the citizens of Ukraine confirmed this proclamation with a 90.3% vote

in favor of independence. At the time of this referendum, Leonid Kravchuk was elected as the first president.

Ukraine joined Russia and Belarus in creating the Commonwealth of Independent States (CIS) in December 1991. This agreement was meant to facilitate coordination of policy in various fields. But despite their efforts, Ukrainian-Russian differences arose in several areas, including the command and control of nuclear weapons, the formation of a unified military command, and the character and pace of economic reform.

In light of the 1986 Chernobyl nuclear power plant accident, Ukraine declared its intention to become a nuclear-free state. However, this process progressed much more slowly than expected. The lack of fuel resources and disagreements with Russia over pricing had induced the government to keep the Chernobyl plant running. The START I agreement received the Ukrainian parliament's conditional ratification in November 1993 and unconditional ratification in February 1994, but the transfer of nuclear weapons to Russia did not occur as smoothly as planned. On 6 May 1992 it was announced that all Ukrainian tactical nuclear weapons had been shipped to Russia for dismantling. However, Ukraine cited Russia's failure to dismantle these weapons, inadequate compensation, and security concerns as the reasons for not turning over its entire strategic arsenal.

The CIS countries agreed to a unified nuclear command, but Ukraine declared its intent to create its own national conventional military and opposed any efforts to create a unified CIS conventional force. President Kravchuk declared all conventional forces on Ukrainian territory to be the property of Ukraine. This has given rise to disputes and disagreements about the Black Sea fleet, to which Russia has also laid claim.

Since its independence, Ukraine has experienced unrest in some of the predominantly Russian areas in the east and south-east. Crimea is the most notable example, declaring independence on 6 May 1992. At the same time the Russian parliament approved a resolution that declared the 1954 Soviet grant of the Crimea to Ukraine unconstitutional and void. This resolution, however, was rejected by Russian president Boris Yeltsin. Demands for secession in Crimea have continued to complicate Ukrainian-Russian relations.

Ukraine adopted a new constitution in June 1996 establishing a presidency (elected for a five-year term) and a one-chamber parliament called the Supreme Council (elected for a four-year term). Under transitional provisions, President Leonid Kuchma, elected over incumbent Leonid Kravchuk in 1994, was to serve until elections in 1999. The Supreme Council adopted a new civil code in June 1997. In the same year, Ukraine signed a 10-year friendship treaty with Russia and an agreement with Western nations on shutting down the Chernobyl nuclear plant by 2005. It was shut down in 2000. Public discontent with the slow pace of economic reforms was evident in the strong showing by the Communist Party in the 1998 legislative elections, in which it won 25% of the vote (116 of 450 seats). However, support for the party did not translate into support for union with Russia, proposed by Petro Symonenko, the party's candidate in the 1999 presidential elections. Leonid Kuchma was reelected in a November 1999 runoff election with 56% of the vote and nominated central bank chairman Victor Yushchenko to be prime minister. Soon after taking office, Yushchenko reached a restructuring agreement with for-

foreign bond holders to avoid default on the nation's \$2.6 billion foreign debt. As the new century began, Ukraine's much-needed economic reforms remained stalled by the long-standing problems of corruption and political stalemate between reformists and their parliamentary opponents.

In November 2000, the body of Ukrainian journalist Georgiy Gongadze was found decapitated: opposition demonstrators alleged Kuchma was involved in the murder of the journalist who was critical of the administration, and there were calls for Kuchma's impeachment. Kuchma denied the allegations, but in February 2001, the EU called for an inquiry into the journalist's murder. In September 2002, an ad hoc commission set up by parliament to investigate Gongadze's murder recommended that criminal charges be brought against the president and other top officials, based on tape recordings of a meeting at which Kuchma allegedly asked security officials to "take care" of the journalist. Anti-Kuchma protests were held throughout the country to call for the president's resignation. All six national television stations were off the air on the morning of the 16 September demonstrations, purportedly for "maintenance." Many protesters were beaten and arrested. In October, the Kiev Court of Appeals opened a criminal case against Kuchma, based upon the allegations of his involvement in the murder.

In parliamentary elections held on 30 March 2002, Ukrainians voted for many opposition parties, although parties opposed to Kuchma alleged widespread fraud. In April, Yushchenko's government was dismissed following a no-confidence vote in parliament; he was replaced with Viktor Yanukovich—the governor of the eastern province of Donetsk Oblast.

Although Yushchenko is respected in the West for fighting corruption and furthering economic reforms, he is unpopular with many Ukrainian businessmen, who are seen to be corrupt. Presidential elections were scheduled for 2004, and Kuchma was constitutionally barred from running for a third term. In 2002, he announced plans to amend the constitution and weaken his executive powers. This was seen as a move to transfer power to parliament, in the event that a reformer such as Yushchenko would be elected president. Kuchma's plans also included splitting parliament into two chambers. In March 2003, Yushchenko stated he feared the new amendments would postpone presidential elections for two years, and extend Kuchma's rule until 2006. Tens of thousands of protesters nationwide took to the streets in March, calling once again on Kuchma to resign for abuse of office, arms dealing, vote-rigging, corruption, the involvement in Gongadze's murder, and for impoverishing the country.

For the 2004 presidential elections Yushchenko announced that he would be running as an independent. His main contender was the current prime minister Viktor Yanukovich. Since the latter was backed by Kuchma, and by most of the Ukrainian TV channels, Yushchenko relied heavily on direct interaction with the people for bringing his message across.

The initial vote was held on the 31 October 2004 and neither of the two candidates obtained a comfortable lead—Yushchenko won 39.87% of the votes, while Yanukovich won 39.32%. A second voting round was therefore staged on 21 November, with the final vote tally showing Yanukovich as the winner. However, observers noted several cases where the voting process was rigged to Yanukovich's favor. The suspicion that loomed over the Oc-

tober elections was strengthened by the major discrepancies between the exit poll results conducted by the observers, and the official vote count. As a result, Yushchenko called for the people from Kiev, and from all over the country, to take to the streets and protest. After 13 days, the so-called Orange Revolution (named so after the orange ribbons worn by Yushchenko's supporters) determined the Supreme Court to nullify the election results and order a re-run, to be held on 26 December 2004. This time, Yushchenko emerged victorious, by an 8% margin. Yanukovich contested the results but eventually stepped down from his post.

In January 2005, Yushchenko was sworn in as president, and in February 2005 he nominated Yulia Tymoshenko—one of his former deputies, and an ardent supporter of the Orange Revolution—as prime minister. Although there had been some controversy regarding her "oligarch status" (she is one of the wealthiest people in Ukraine), her nomination was accepted by the parliament with 373 out of 450 possible votes. On 8 September 2005, after only a couple of months as prime minister, and following several resignations and accusations of corruption, Tymoshenko and her government were ousted by Yushchenko. Yuriy Yekhanurov, head of the Dnipropetrovsk Oblast state administration, was appointed as the new prime minister.

Drawing on the political capital he garnered in the West after winning the troubled 2004 elections (he was allegedly poisoned with dioxins that lead to severe facial disfigurements), Yushchenko pressed for EU and NATO integration. Both organizations cautioned, however, that the pace of political, economic and military reforms would have to be increased before Ukraine's candidacy could be seriously considered. Constitutional reforms went into effect on 1 January 2006.

### 13 GOVERNMENT

Ukraine is governed by a constitution adopted in June 1996, which allows for an elected parliament and president. The constitution was amended on December 2004 as a response to the presidential election crisis.

The Ukrainian parliament consists of a single chamber with 450 seats called the Rada (Supreme Council). Seats are allocated proportionally to the parties that acquire more than 3% of the electoral votes. Members of parliament currently serve four-year terms, while the president serves a five-year term. (Following the 2006 elections members of parliament will serve five-year terms.) The prime minister and cabinet are nominated by the president and confirmed by the Supreme Council. Although many parties participate in the elections, many candidates run as independents as well.

Ukraine's first postindependence presidential elections were held in two rounds on 26 June and 10 July 1994. In this election, the incumbent Leonid Kravchuk was defeated by his former prime minister, Leonid Kuchma, who was reelected in November 1999. In December 2004, following massive popular protests and after the Supreme Court ordered a re-run of the allegedly rigged November 2004 elections, Kuchma's former prime minister—Viktor Yushchenko—was elected president.

## <sup>14</sup>POLITICAL PARTIES

There are some 120 political parties active in Ukraine. They fall roughly into four different categories: radical nationalist, democratic nationalist, liberal-centrist, and Communist-socialist.

The radical nationalist parties are fearful of Russia and advocate a strong presidency. Their commitment to democracy—particularly if regions of Ukraine seek to secede—is not firm. The democratic nationalist parties are also fearful of Russia, but also appear strongly committed to democracy, individual rights, and the protection of private property. The influential Rukh Party (Ukrainian Popular Movement), which won 43 seats in the 1998 elections, belongs to this group. The liberal-centrist parties are particularly concerned with promoting free market economic reform. They are also committed to democracy and individual rights. The communist-socialist parties oppose privatization and seek continued state control of the economy. They generally favor close relations with Russia. The most important party in this group, the Communist Party of Ukraine, won 116 seats in 1998.

In the March 2002 parliamentary elections, many parties grouped together into voting blocs. Winning the most seats in the Rada was the “Our Ukraine” coalition, led by Viktor Yushchenko, which took 23.6% of the vote and 112 of 450 seats. The coalition was registered in January 2002, and then included the Ukrainian People’s Rukh Party (registered in 2003 as the Ukrainian People’s Party), the People’s Rukh of Ukraine, the Congress of Ukrainian Nationalists, the Reforms and Order Party, Solidarity, the Liberal Party, the Youth Party of Ukraine, the Christian People’s Union, the Go Forward, Ukraine! Party, and the Republican Christian Party. In March 2003, Yushchenko announced a “new political force” would be created that would form the basis for a European-style political party. Yushchenko was elected president in December 2004.

Also gaining seats in parliament in the 2002 elections were: the “For a United Ukraine” bloc, 101; the Communist Party, 67; the United Social-Democratic Party of Ukraine, 24; the Socialist Party of Ukraine, 23; the Yuliya Tymoshenko bloc, 21; the Democratic Party of Ukraine/Democratic Union liberal bloc, 4; the “Unity” bloc, 3; and independents and others held 95 seats.

On 8 September 2005, the government led by Yuliya Tymoshenko was ousted by Yushchenko after allegations of corruption made their way into the media.

Parliamentary elections were held on 26 March 2006. Yanukovich’s Party of Regions won the most seats, taking 186 of 450 (32.1%). Tymoshenko’s Bloc won 129 seats (22.3%); Our Ukraine, 81 seats (13.9%); the Socialist Party of Ukraine 33 seats (5.7%); and the Communist Party of Ukraine 21 seats (3.7%). The next parliamentary elections were scheduled for March 2011.

## <sup>15</sup>LOCAL GOVERNMENT

Ukraine is divided into 24 administrative regions (oblasts) plus the autonomous Republic of Crimea. In addition, the cities of Kiev, the capital of Ukraine, and Sevastopol, capital of Crimea, enjoy oblast status. The oblast is divided into districts, each of which has a representative in the Rada (Supreme Council).

A strong secessionist movement has risen up in Crimea. In a nonbinding referendum held in 1994, over 78% of the 1.3 million people who voted supported greater autonomy from Ukraine. In

1995 Ukraine’s parliament and President Leonid Kuchma moved to contain secessionist elements in the region. Kuchma temporarily took direct control over the area and afterward decreed that he must approve all candidates for premier of the region. The Crimea adopted a new constitution in 1999 providing for additional budgetary autonomy from the rest of Ukraine.

In spite of the election of the reform-oriented Yushchenko in 2004, Ukrainian local government officials complained that budget expenditures were still done in a centralized and inefficient fashion. On 13 September 2005 the Constitutional Court of Ukraine enforced a series of constitutional amendments that shift most of the presidential clout to the parliament. The new laws came in effect on 1 January 2006 and were expected to give more power to local governments.

## <sup>16</sup>JUDICIAL SYSTEM

The court system, until 2001, remained similar to that which existed under the former Soviet regime. In July 2001, a series of laws were passed designed to bring existing legislation regarding the judiciary and the administration of justice more in line with the requirements for an independent judiciary. The three levels of courts are rayon (also known as regional or people’s courts), oblast (provincial) courts, and the Supreme Court. All three levels serve as courts of first instance, the choice of level varying with the severity of the crime. A case heard in first instance at the rayon level can be appealed through the next two higher stages. A case heard in first instance in the Supreme Court is not subject to appeal or review. A 1992 law added a Constitutional Court to the existing system. The Constitutional Court consists of 19 members appointed for nine-year terms. It is the final interpreter of legislation and the constitution, and it determines the constitutionality of legislation, presidential edicts, cabinet acts, and acts of the Crimean autonomous republic.

The Rada (Supreme Council) selects judges on recommendation from the Ministry of Justice based partly upon government test results. Oblast and Supreme Court judges must have five years of experience in order to be appointed and may not be members of political parties.

A new constitution, adopted in 1996, and amended in 2004, provides that the judiciary is funded separately from the Ministry of Justice to ensure an independent judiciary. Because the courts are funded by the Ministry of Justice, however, they have been subject to executive influence, and have suffered from corruption and inefficiency.

## <sup>17</sup>ARMED FORCES

Ukraine was able to quickly organize an impressive national army, in part because it had always been an important contributor to the Soviet armed forces. In 2005 Ukrainian armed forces numbered 187,600 active personnel with 1,000,000 reservists. Ground forces (Army) numbered 125,000 and was organized into three commands and a number of specialized brigades and regiments of artillery, special forces, air defense, rocket and missile, and attack helicopter units. It was equipped with 3,784 main battle tanks, 600 reconnaissance vehicles, 3,043 armored infantry fighting vehicles, 8,492 armored personnel carriers, and 3,705 artillery pieces. The Air Force and Air Defense Force had a combined total of 49,100 active personnel, that operated 444 combat capable aircraft, in-

cluding 26 bombers, 280 fighters, and 187 fighter ground attack aircraft. The Air Defense force was outfitted with 825 surface-to-air missile batteries. The Navy numbered 13,500 personnel. Major naval units included one tactical submarine, one frigate, three corvettes, and five patrol/coastal vessels. A cruiser and another frigate are listed as nonoperational. The Navy's aviation arm had up to 2,500 active personnel. Equipment included 11 fixed wing and 72 rotary wing antisubmarine warfare aircraft. The Navy also had a single brigade of 3,000 naval infantry personnel.

Of greatest international concern has been the fate of the ICBMs and strategic bombers on Ukrainian soil, which are supposed to return to Russia for dismantling. As of 2000, the number of ICBMs had been reduced from 174 to 44. As of 2005 the number of strategic bombers had been cut to 26.

Paramilitary forces included an estimated 39,900 internal security troops, 45,000 border guards, 14,000 coast guard personnel, and more than 9,500 civil defense troops. The Ukraine participated in missions in eight foreign countries or regions. The defense budget for 2005 was \$1.09 billion.

## 18 INTERNATIONAL COOPERATION

Ukraine became a member of the United Nations on 24 October 1945; the country is part of the ECE and several nonregional specialized agencies, such as the IAEA, the FAO, the World Bank, UNCTAD, UNESCO, UNIDO, and the WHO. It is a member of the Commonwealth of Independent States (CIS), the Council of Europe, the Black Sea Economic Cooperation Zone, the Euro-Atlantic Partnership Council, the European Bank for Reconstruction and Development, and the OSCE. The nation has observer status in the WTO, the OAS, and the Nonaligned Movement. In 2001, Georgia, Uzbekistan, Ukraine, Azerbaijan, and Moldova formed a social and economic development union known as GUAAM. Uzbekistan withdrew from the partnership in 2005.

Ukraine is an active member of the NATO Partnership for Peace. The government has supported UN missions and operations in Kosovo (est. 1999), Lebanon (est. 1978), Ethiopia and Eritrea (est. 2000), Liberia (est. 2003), Sierra Leone (est. 1999), Georgia (est. 1993), and the DROC (est. 1999). Ukraine is a member of the Zangger Committee and the Nuclear Suppliers Group (London Group).

In environmental cooperation, Ukraine is part of the Basel Convention, the Conventions on Biological Diversity and Air Pollution, Ramsar, CITES, the London Convention, the Kyoto Protocol, the Montréal Protocol, MARPOL, and the UN Conventions on the Law of the Sea and Climate Change.

## 19 ECONOMY

Ukraine was central to the Soviet agricultural and industrial system. The rich agricultural land of this region (commonly called the "breadbasket" of the former Soviet Union) provided 46% of Soviet agricultural output in the 1980s, and also accounted for 25% of the USSR's coal production. Ukraine's economic base is dominated by industry, which accounts for over 45% of GDP (2005 est.). However, agriculture continues to play a major role in the economy, representing about 18% of GDP.

Real GDP declined 3% in 1990, 11% in 1991, and an estimated 15% in 1992. Recovery in 1997 was cut short by the effects of the Russian financial crisis of 1998. Real GDP fell -1.7% in 1998

and -0.2% in 1999. However, the economy has registered strong positive growth since 2000—5.9% in 2000; 9.1% in 2001, and a projected 5% in 2002—despite the global slowdown beginning in 2001. Official unemployment since 1999 has averaged about 4.2%. Inflation, averaging 21.67% 1998 to 2000, was reduced to a single-digit rate (6%) in 2001, and reached 0.8% in 2002. Although still high, this is a marked improvement over the 400% hyperinflation that plagued the country in 1994. In response to the hyperinflation, the government introduced a new currency and instituted mass privatization in 1995. Yet the country remained plagued by a slow economic decline. A new civil code adopted by parliament in 1997 was expected to stabilize the country's business climate. Economic recovery beginning in 2000 is attributable to a number of factors: double-digit growth in industrial output in 2001; a good grain harvest resulting from good weather and reduced governmental controls; improved export competitiveness from the depreciation of the currency in 1998–99; the clearance of many wage and pension arrears; increased domestic demand as a result of wage and pension increases granted in 2000 and 2001; considerable idle capacity; and the expansion of export markets.

This economic expansion continued in the following years, with GDP growth rates of 5.2% in 2002, 9.6% in 2003, and an astonishing 12.1% in 2004; the economy was expected to grow by 6.0% in 2005. Inflation started growing again after 2002, reaching 12% in 2004, and being expected to reach 14.0% in 2005. The unemployment rate remained fairly stable, hovering around 3.5%.

Ukraine's economic dynamism was driven mainly by exports. The most effective growth engines in 2003–04 were manufactured goods, construction, oil and gas transport, services, private consumption, and government spending. The end of 2004 saw a hampering of this trend as three rounds of presidential elections and weeks of protesting throughout the country (the Orange Revolution), took their toll on the Ukrainian economy. The newly elected president has openly stated that Ukraine will take a clear course towards an open market economy, and that the mid-term goal is EU integration. His reign, although plagued by corruption and government inefficiency, promises great potential for the future.

## 20 INCOME

The US Central Intelligence Agency (CIA) reports that in 2005 Ukraine's gross domestic product (GDP) was estimated at \$340.4 billion. The CIA defines GDP as the value of all final goods and services produced within a nation in a given year and computed on the basis of purchasing power parity (PPP) rather than value as measured on the basis of the rate of exchange based on current dollars. The per capita GDP was estimated at \$7,200. The annual growth rate of GDP was estimated at 4.4%. The average inflation rate in 2005 was 13.9%. It was estimated that agriculture accounted for 18.5% of GDP, industry 45.2%, and services 36.1%.

According to the World Bank, in 2003 remittances from citizens working abroad totaled \$330 million or about \$7 per capita and accounted for approximately 0.7% of GDP. Foreign aid receipts amounted to \$323 million or about \$7 per capita and accounted for approximately 0.7% of the gross national income (GNI).

The World Bank reports that in 2003 household consumption in Ukraine totaled \$28.07 billion or about \$580 per capita based on a GDP of \$50.1 billion, measured in current dollars rather than PPP. Household consumption includes expenditures of individ-

uals, households, and nongovernmental organizations on goods and services, excluding purchases of dwellings. It was estimated that for the period 1990 to 2003 household consumption fell at an average annual rate of -3.6%. In 2001 it was estimated that approximately 34% of household consumption was spent on food, 16% on fuel, 6% on health care, and 4% on education. It was estimated that in 2003 about 29% of the population had incomes below the poverty line.

## 2<sup>1</sup> LABOR

As of 2005, the Ukraine's labor force totaled an estimated 20.46 million persons. In 2003, the services sector accounted for 51.2% of the workforce, with 29.9% in industry and 18.9% in agriculture. For the year 2005, Ukraine's official unemployment rate was 3.8%. However, the International Labor Organization had calculated that the country's actual unemployment rate was around 9–10%, due to the large number of workers that were either underemployed or not registered as unemployed.

In November 1992, the official Soviet-era unions were renamed the Federation of Trade Unions (FPU), which began then to operate independently from the government. Since 1992, many independent unions have been formed, providing an alternative to the official unions in most sectors of the economy. As of 2002, estimates of independent union membership was estimated to be three million. Membership in the FPU was thought to be 14 million. The right to strike is protected, except for the military, police, and continuing process plants.

The minimum employment age is 17, although children aged 15 to 17 can be employed by businesses with governmental permission. However, child labor remains a problem. In 2002, the minimum wage was \$22 per month, which was significantly below the cost of living. The maximum workweek is set at 40 hours; the law also provides for a minimum of 24 days of vacation per year. Ukraine's laws set forth occupational health and safety standards but these are frequently ignored in practice and are not sufficiently enforced by the government.

## 2<sup>2</sup> AGRICULTURE

About 57% of the total land area is arable, with another 14% utilized as permanent pasture land. Agriculture accounted for 14% of GDP in 2003. As in other former Soviet republics, total agricultural production dramatically declined after 1990. The average annual decline during 1990–2000 was 5.8%. By 1999, the agricultural sector was only producing 47% as much as it had during 1989–91. However, during 2002–04, crop production was 12.8% higher than during 1999–2001. Production amounts in 2004 included (in 1,000 tons): sugar beets, 16,502; potatoes, 20,755; wheat, 17,517; fruit, 2,131; sunflower seeds, 3,050; cabbage, 1,559; grapes, 500; raspberries, 20; rapeseed, 148; soybeans, 363; and tobacco, 4.

Ukraine's steppe region in the south is possibly the most fertile region in the world. Ukraine's famous humus-rich black soil accounts for one-third of the world's black soil and holds great potential for agricultural production. However, the soil is rapidly losing its fertility due to improper land and crop management. Ukraine typically produced over half of the sugar beets and one-fifth of all grains grown for the former USSR. In addition, two of the largest vegetable-oil research centers in the world are at Odesa and Zaporizhzhya. Agroindustry accounts for one-third of ag-

ricultural employment. To some extent, however, agroindustrial development has been hampered by the deteriorating environment as well as a shortage of investment funds due to the aftermath of the nuclear power plant disaster at Chernobyl. According to estimates, nearly 60,000 hectares (148,250 acres) of arable land in the Chernobyl vicinity are now unavailable for cultivation. Out of 33 million hectares (81.5 million acres) of total arable land, more than 17 million hectares (42 million acres) are depleted, 10 million hectares (24.7 million acres) are eroded, and another 10 million have excessive acidity. Furthermore, 17% of arable land is located in areas where there is risk of drought.

## 2<sup>3</sup> ANIMAL HUSBANDRY

Just under 14% of Ukraine's total land area is composed of permanent pasture land. As of 2005, there were 6.9 million head of cattle, 6.5 million pigs, 875,000 sheep, 894,000 goats, 120 million chickens, and 20 million ducks. Horses, turkeys, goats, and rabbits are also bred and raised. Between 1990 and 2000, livestock production declined by 50%. Lack of finances for buying fuel pushed farmers in the public sector to sell their cattle abroad, mostly to Asian buyers. During 2002–04, livestock production was up 7.2% from 1999–2001. In 2005, meat production included: beef, 556,000 tons (down from 1,986,000 tons in 1990); pork, 510,000 tons (1,576,000 tons in 1990); and poultry, 470,000 tons (708,000 tons in 1990). There are several factors involved with Ukraine's declining meat production: decentralization of meat processing, with greater use of processing facilities at the farms; lack of cheap credits to buy animals; and antiquated meat processing equipment. Milk and egg production in 2005 amounted to 14.3 million tons and 726,000 tons, respectively. In 2004, exports of meat and meat products were valued at \$191.8 million; milk, dairy, and eggs, \$438.5 million. In 2005, Ukraine produced 60,500 tons of honey, fifth highest in the world.

## 2<sup>4</sup> FISHING

Fishing occurs mainly on the Black Sea. In 2003, the total catch came to 248,198 tons, reflecting diminished landings since the 1990 catch of 1,048,360 tons. Mackerel and sardines together accounted for 22% of the 2003 catch. Exports of fish and fish products amounted to \$17.6 million in 2003. Ukrainian fish consumption per capita amounts to 12.8 kg (28.2 lb) per year—less than half that of western Europe (24.2 kg/53.2 lb).

## 2<sup>5</sup> FORESTRY

About 16.5% of the total area was forest in 2000. While the radioactive contamination of forestland from the 1986 Chernobyl disaster is well-known, there is also widespread land, water, and air pollution from toxic wastes, which has also adversely affected timberlands. Forestry production in 2004 included: roundwood, 4.8 million cu m (169 million cu ft); wood-based panels, 1,308,000 cu m (46.2 million cu ft); wood pulp, 27,000 tons; and paper and paperboard, 701,000 tons.

## 2<sup>6</sup> MINING

Ukraine is one of the world's leading producers of iron ore, as well as a major world producer of ferroalloys, ilmenite, steel, and manganese ore (with 75% of the former Soviet Union's reserves). The mining and metallurgical industry employed 500,000 persons;

270,000 worked in ironmaking, steelmaking, and ferroalloys enterprises. In 2002, over 60% by value of Ukraine's \$18 billion in exports came from the "mineral products" category. Ferrous and nonferrous metals were Ukraine's top export commodities in 2002. Fuel and petroleum products were the country's second-leading export commodities.

Production outputs for 2002 included: marketable iron ore (gross weight), 58.9 million metric tons; manganese, mined in the Nikopol' and Bol'shoy Tokmak basins (metal content), 940,000 metric tons; rock salt, 2.3 million metric tons (estimated); and potash (at the Stebnik and Kalush mines), 60,000 metric tons. In addition, Ukraine produced alumina, mercury, titanium (ilmenite and rutile concentrates), zirconium (the FSU's only ore producer), cement, clays (bentonite and kaolin), graphite, nitrogen, and sulfur (from the Rozdol and Yavoriv deposits). Iron ore production, concentrated at seven mining and beneficiation complexes in the Krivyy Rih (Krivoy Rog) Basin, and at the Poltavskiy complex, fell by 50% from 1990 through 1995. Explored iron ore reserves totaled 33 billion tons, including 28 billion tons of industrial reserves; total capacity was 108.5 million tons per year. Manganese reserves totaled 2.2 billion tons, and annual capacity was 6 million tons. No antimony, cadmium lead, nickel, tin, zinc, zircon, dolomite, limestone fluxes, quartz, soda ash, talc, or uranium was mined in the past several years, the Ukraine having sharply reduced or ceased producing a number of these commodities as a result of the large reduction in demand following the breakup of the Soviet Union.

At the end of the 1980s, Ukraine mined 5% of the world's output of mineral products. After the breakup of the Soviet Union, production fell precipitously, and recovery of the mining sector was considered critical for the country's economic recovery. A 1999 law provided tax benefits for mining and metal industry firms for two and a half years. By 2000, the privatization of small-scale enterprises was virtually completed. The mining industry was a major source of waste, having accumulated 30 billion tons of mineral wastes.

## 27 ENERGY AND POWER

Ukraine has only modest reserves of oil and natural gas, but more robust reserves of coal.

As of 1 January 2004, Ukraine had proven oil reserves estimated at 395 million barrels, according to the Oil and Gas Journal. In 2003 and 2004, oil production was estimated at 86,800 barrels per day and 86,000 barrels per day, respectively. However, consumption outstripped output for both years. In 2003, demand for oil averaged an estimated 415,000 barrels per day, and at an estimated 422,000 barrels per day in 2004. Net imports of oil in 2003 were estimated at 328,200 barrels per day, and at an estimated 336,000 barrels per day in 2004. Imports in 2003 accounted for around 80% of demand, most of which came from Russia. Most of Ukraine's oil reserves are located in the eastern Dnieper-Donetsk basin.

Ukraine's six oil refineries have a combined crude oil refining capacity estimated as of 1 January 2004 at 1.05 million barrels per day. However, domestic consumption of refined oil products is just over 30% of capacity, and have even had problems securing enough crude oil to supply the country's needs.

Ukraine, as of 1 January 2004, had proven natural gas reserves estimated at 39.6 trillion cu ft, according to the Oil and Gas Jour-

nal. In 2003, natural gas production was estimated at 0.69 trillion cu ft, with consumption that year estimated at 3.03 trillion cu ft. As a result, Ukraine has had to resort to imports to make up the difference. In 2003, net imports of natural gas were estimated at 2.34 trillion cu ft. Turkmenistan has become its primary source for natural gas imports, following an agreement signed in 2001 that calls for 8.8 trillion cu ft per year to be provided from 2002 to 2006.

In 2004, Ukraine had coal reserves estimated at 37.6 billion short tons, of which 17.9 billion short tons consisted of anthracite and bituminous coal, and 19.7 billion short tons consisted of sub-bituminous coal and lignite. In 2003, coal production was estimated at 63.5 million short tons. However, demand for coal that year totaled 67 billion short tons, making Ukraine a net importer of coal. Most of the country's coal comes from the eastern region in the Donetsk/Donbas basin.

Ukraine's electric power generating capacity in 2002 totaled 52.811 million kW, of which conventional thermal plants accounted for 36.241 million kW of capacity, and nuclear power 11.835 million kW. Hydroelectric capacity in that year accounted for 4.731 million kW of capacity and geothermal/other 0.004 million kW. Electric power output in 2002 totaled 163.870 billion kWh, of which conventional thermal fueled plants provided 80.777 billion kWh, followed by nuclear plants with 73.380 billion kWh, hydroelectric with 9.691 billion kWh, and geothermal/other with 0.022 billion kWh. In 2003, electric power output rose to an estimated 177 billion kWh. Demand for electricity in 2002 totaled 149.284 billion kWh. In 2003, consumption rose to an estimated 156 billion kWh. As of January 2005, Ukraine had four nuclear power plants in operation, providing 40% of the country's electric power.

## 28 INDUSTRY

Ukraine, with strong scientific and technological sectors, is a major producer of heavy machinery and industrial equipment for sectors including mining, steelmaking, and chemicals. Significant products also include nonnumerically controlled machine tools, large electrical transformers, and agricultural machinery. Ukraine's industries are important suppliers of products—including automobiles, clothing, foodstuffs, timber, and paper—to other former Soviet republics. Ukraine also retains much of the industry associated with the space program of the former USSR. Industry accounted for 40% of GDP in 2000, and the industrial production growth rate for 2001 was 14.2%. Industrial sectors slated for growth in the early 2000s were food processing and packing, textiles, woodworking, furniture and building materials, automotive parts, pharmaceuticals, medical equipment, and aerospace. The construction sector experienced growth during that period; construction spending grew by 9% in the first quarter of 2001. Ukraine produced 31,824 automobiles in 2001, and 1,417 heavy trucks in 2000, a 74% increase over 1999.

In 2004, the representation of industry in the GDP grew to 45.1%, while its representation in the labor force was 32%; agriculture made up 18% of the economy and 24% of the labor force, while services came in second with a 36.9% representation in the GDP and 44% in the labor force. The industrial production growth rate was 16.5% in 2004, with the fastest growing industries being: machine building (which registered a 30.7% growth as op-

posed to the previous year), construction (23.8%), wood processing, paper and printing (26%), processing industry (15.5%), and light industry (14%).

## 29 SCIENCE AND TECHNOLOGY

The Ukrainian Academy of Sciences, founded in 1919, has sections of physical engineering and mathematical sciences, and chemical engineering and biological sciences; it has 66 scientific and technical research institutes attached to it. The Ukrainian Academy of Agrarian Sciences has 13 research institutes, and the Ukrainian Academy of Medical Sciences has six research institutes. All three academies are headquartered in Kiev. A botanical museum is located in Kiev. Ukraine has 92 universities, polytechnics, and institutes that offer courses in basic and applied sciences. In 1987–97, science and engineering students accounted for 42% of university enrollment. In 2002, research and development (R&D) expenditures totaled \$2,805.687 million, or 1.18% of GDP. Of that amount, government provided the largest portion at 37.4%, followed by the business sector at 33.4%, foreign sources at 26.2%, higher education and private nonprofit organizations at 0.4% each, with 2.3% listed as undistributed. In that same year, there were 1,749 scientists and engineers, and 456 technicians engaged in R&D per million people. High technology exports in 2002 were valued at \$572 million, accounting for 5% of the country's manufactured exports.

## 30 DOMESTIC TRADE

As of 2002, nearly all of the previously state-owned retail establishments have been privatized. Chain stores, supermarkets, and brand-name specialty stores, many of which are owned by Ukrainians, have become more common in major cities. Department stores, smaller grocery and specialty stores, and bazaars are more common since prices at these establishments are more in line with lower and middle-class spending capabilities. About 40–60% of consumer goods are domestically produced. There are some successful foreign franchises, but the practice of franchising has not become widespread. A value-added tax of 20% applies to most goods and services.

## 31 FOREIGN TRADE

Ukraine exports products to 140 countries of the world. Its main export products are ferrous metals and metal products, engines, transport and mechanical equipment, chemicals, and vehicles. Top import items include mineral products, automobiles, transportation equipment, chemicals, and textiles. Ukraine relies heavily on trade, particularly with the other former Soviet republics, although not nearly as much as it had before the breakup. Inter-republic trade accounted for 73% of its total imports in 1988 and 85% of its total exports. In 1991, imports from the other republics equaled 26% of GDP and exports to them amounted to 25% of GDP. However, trade with former USSR states has since rebounded, with Ukraine taking in 59% of its imports from them and selling 33% of its exports to them in 2000.

In 1991/92, inter-republic trade contracted severely, partly due to a breakdown in payment mechanisms, and trade with other countries dropped as well. Much of Ukraine's foreign trade has been carried out in the context of intergovernmental agreements. However, the government has since stabilized its foreign trade. In

2000, total imports were valued at \$14 billion, and total exports at \$14.6 billion. Ukraine trades heavily with the other former Soviet republics, and since 1993 has had extensive trade ties with China.

In 2004, exports totaled \$32.9 billion and imports \$31.4 billion, making Ukraine one of the few countries in the region with a positive trade balance. Export commodities include ferrous and non-ferrous metals, fuel and petroleum products, chemicals, machinery and transport equipment, and food products. The main export partners were Russia (where 18% of all exports went), Germany (5.8%), Turkey (5.7%), Italy (5%), and the United States (4.6%). Imports included energy, chemicals, machinery and equipment, and they mainly came from Russia (41.8%), Germany (9.6%), and Turkmenistan (6.7%). The current account balance in 2004 was \$4.6 billion.

### 3<sup>2</sup> BALANCE OF PAYMENTS

The financial crisis of 1998 caused a large outflow of capital, and reserves fell to less than a third of their level in 1997. Due to a major exchange rate adjustment that made Ukrainian products more competitive in both external and internal markets, reserves recovered somewhat in 1999. From June 2000 to July 2001, reserves increased dramatically, back to pre-1998 levels. This growth is surprising in light of the fact that the country has received almost no external funding since 1998, when foreign investors began avoiding Ukraine. Following the 1998 devaluation of the hryvnia, trade surpluses drove the growth in reserves, and the balance of payments situation improved. Reserve growth also improved due to Ukraine's default on its sovereign debt. As of the early 2000s, Ukraine's balance of payments position was expected to be heavily influenced by its trade with Russia.

The US Central Intelligence Agency (CIA) reported that in 2001 the purchasing power parity of Ukraine's exports was \$17.3 billion while imports totaled \$17.1 billion resulting in a trade surplus of \$200 million. The International Monetary Fund (IMF) reported that in 2001 Ukraine had exports of goods totaling \$17.1 billion and imports totaling \$16.9 billion. The services credit totaled \$4 billion and debit \$3.58 billion.

The exports of good and services increased steadily, growing from \$28.9 billion in 2003, to 39.7 billion in 2004. At the same time, exports managed to stay above the level of imports, establishing Ukraine as one of the few export driven economies in the region. Imports of goods and services totaled 27.6 billion in 2003, and 34.8 billion in 2004, giving Ukraine a positive resource balance in both years: 1.3 billion and 4.9 billion respectively. Its reserves (including gold) grew from 6.9 billion in 2003 to 9.5 billion in 2004, covering almost four months of imports.

### 3<sup>3</sup> BANKING AND SECURITIES

The National Bank of Ukraine (NBU) is the country's national bank and was established in June 1991. It has since assumed the function of a central bank. The commercial banking sector is dominated by the big five banks of Prominvest Bank, Ukrania, Ukreximbank, Eximbank and Oshadbank. Of these, Ukreximbank and Oshadbank remain state controlled. As of 2001, Ukraine had 195 banks, but of these, only 153 remained in operation. Of these banks, approximately a quarter have foreign exchange licenses, and one-third are members of the Ukrainian Interbank Currency Exchange. It is generally acknowledged that Ukraine has too many banks and that there will be numerous mergers and failures in the coming years. In 1995 alone more than 20 banks went out of business, almost 80 changed ownership, and only eight new banks entered the market. Foreign banks, however, have been slow to enter the market.

The NBU implements monetary control through reserve requirements and the interest rates it charges banks on funds transferred from the state savings bank. Before November 1992, the NBU was able to obtain additional rubles by running a surplus on transactions with other republics in the ruble zone. However, with inflation accelerating since early 1991, the supply of rubles proved insufficient to meet the economy's needs, and Ukraine consequently resorted to the use of coupons. The resulting rise in

inflation was the main factor behind Ukraine's enforced departure from the ruble zone in November 1992.

The International Monetary Fund reports that in 2001, currency and demand deposits—an aggregate commonly known as M1—were equal to \$5.5 billion. In that same year, M2—an aggregate equal to M1 plus savings deposits, small time deposits, and money market mutual funds—was \$8.4 billion. The money market rate, the rate at which financial institutions lend to one another in the short term, was 16.57%. The discount rate, the interest rate at which the central bank lends to financial institutions in the short term, was 12.5%.

The Law on Securities and the Stock Exchange came into effect in January 1992. There are seven stock exchanges and seven commodities exchanges, although these are more like the auction houses that sprang up after the collapse of the Soviet Union in 1991 as conduits for goods rather than the securities exchanges found in the West. Capital markets are undeveloped even by the standards of countries such as Russia. The Ukrainian Stock Exchange (USE), established in 1992, acts to coordinate primary and secondary market trading of Ukrainian securities. In 2001, the exchange had 131 companies listed and total market capitalization of \$1.4 billion. Trading value was \$226 million, with a turnover ratio of 13.9%. As of 2004, there were 155 companies listed with the country's First Securities Trading System (PFTS), which had a market capitalization of \$11.778 billion. Trading value in that year totaled \$201 million, with a turnover ratio of 2.5%.

### 3<sup>4</sup> INSURANCE

Among the insurance companies operating in Ukraine in 1997 were: Asko-Kiev Central Insurance Co.; Factotum Joint-Stock Insurance Co., First International Insurance Group; Ometa-Instert Joint-Stock Insurance Co.; Skide Insurance Co.; and Slavia. Beginning in August 1998, the Ukrainian government required that foreign visitors purchase mandatory "emergency medical insurance" from the Ukrainian State Insurance Company. In addition, personal accident insurance is required for all passengers on public transportation. Foreign shareholders in insurance companies may not exceed 49%. In 2003, the value of all direct insurance premiums written totaled \$1.712 billion, of which nonlife premiums accounted for \$1.699 billion. In that same year, Lemma was the top nonlife insurer, with gross written nonlife premiums for direct business only of \$124.8 million, while Grawe Ukraina was the country's leading life insurer, with gross written life insurance premiums of \$4.8 million.

### 3<sup>5</sup> PUBLIC FINANCE

Ukraine has displayed positive growth in recent years, but long term growth will require certain market reforms. The economy is burdened by excessive government regulation, and major sectors such as energy and telecommunications remain to be privatized. Corporate governance is weak, and corruption is rampant. In the early 2000s, the government sought ways to reform the tax code to eliminate corruption and legitimize economic activity. Ukraine receives aid from the IMF, although the relationship between those two entities has not always been successful; Ukraine has had problems adhering to IMF monetary conditions.

The US Central Intelligence Agency (CIA) estimated that in 2005 Ukraine's central government took in revenues of approxi-

mately \$22.9 billion and had expenditures of \$24.4 billion. Revenues minus expenditures totaled approximately -\$1.5 billion. Public debt in 2005 amounted to 20.5% of GDP. Total external debt was \$33.93 billion.

The International Monetary Fund (IMF) reported that in 2002, the most recent year for which it had data, central government revenues were HRN69,252 million and expenditures were HRN69,028 million. The value of revenues was us\$13,001 million and expenditures us\$12,959 million, based on an exchange rate for 2002 of us\$1 = HRN5.3266 as reported by the IMF. Government outlays by function were as follows: general public services, 22.8%; defense, 5.1%; public order and safety, 6.8%; economic affairs, 9.7%; housing and community amenities, 0.1%; health, 3.1%; recreation, culture, and religion, 0.6%; education, 7.2%; and social protection, 44.7%.

**36 TAXATION**

In 1997/98 Ukraine reformed its tax system. As of 2005, the standard corporate tax rate was 25%, although preferential regimes are available for special economic zones. Capital gains for companies are taxed at the corporate rate. Withholding taxes on income from royalties and interest is 15%. Companies distributing dividends to residents and nonresidents are required to pay a 25% advance tax on the dividends. The tax can then be credited against the company's profits.

Personal income is taxed at a flat 13% rate. Capital gains received by individuals are subject to a 13% withholding tax. Dividends received by resident and nonresident individuals are subject to a 15% withholding tax.

The Ukraine's main indirect tax is its value-added tax (VAT), with a standard rate of 20%. A 0% VAT rate applies to exports and international transportation services. Some medicines, baby food, educational, medical and insurance services, and the sale of land are also exempt.

**37 CUSTOMS AND DUTIES**

Import licenses are required for all foreign trade activities in Ukraine. Ukraine has signed trade agreements with the United States, Russia, Iran, Turkmenistan, the United Arab Emirates, and several other former Soviet republics. As of 2002, tariffs on imports range from 0–20%, with the tariff on automobiles being the highest. Preferential tariffs are given to developing countries and privileged tariffs are given to countries that have trade agreements with Ukraine. Other duties include a 20% VAT and excise taxes (up to 300%). In 2000, the number of categories of goods eligible for excise tax was reduced from 20 to five: alcohol, automobiles, jewelry, oil products, and tobacco.

**38 FOREIGN INVESTMENT**

Among the transitional economies of Eastern Europe, nowhere has the gap between economic potential and economic performance been wider than in the Ukraine, and nowhere has the gap been more glaring than in the foreign investment statistics. By 2000, total foreign direct investment (FDI) in the Ukraine was still less than \$4 billion, compared with \$40 billion that had flowed into Poland and \$20 billion into Hungary during the same period.

Independence was first greeted by a rush of inward investment. In 1991, the number of joint ventures operating in Ukraine rose from 76 in October 1990 to 189 in October 1991. Following the enactment in March 1992 of a more favorable foreign investment law, joint ventures jumped to 1,400 early in 1993. Most of these ventures were in industry, with a few engaged in foreign trade. The government's 1993 economic plan included tax incentives and other benefits for investors in specific areas including agro-industrial enterprises, energy, and production of consumer goods. However, by 1996 and 1997, rampant official graft and corruption were crippling foreign investment. Several significant multinational corporations withdrew from Ukraine after government decrees were issued that steered business to state-owned firms in which government officials were stakeholders. This action occurred despite the Foreign Investment Law of 1996, which purported to put foreign investors on an equal footing with Ukrainian nationals, and President Kuchma's pledge to battle corruption. The government had declared a need for \$40 billion in foreign investment, but only \$2.8 billion was invested between 1992 and 1998.

In 1997 the law "On Special (Free) Economic Zones" was adopted, establishing three types of special investment zones: free economic zones (FEZs), territories with a special investment regime (SEZs), and territories of priority development (TPDs). As of 2002, there were nine TPDs and eleven FEZs and SEZs. In 2002, the special zones attracted investment totaling \$909 million, both domestic and foreign, but pressure has been brought by the IMF to either eliminate the special zones or curb their tax and regulatory exemptions.

Annual foreign direct investment (FDI) inflow peaked at \$747 billion in 1998, up from \$623 billion in 1997, before falling to \$471 billion in 1999 in the wake of the Russian financial crisis. FDI inflow recovered to \$593 billion in 2000, but then fell back to \$531 million in the global economic slowdown of 2001. Contrary to the worldwide trend of reduced FDI flow after the 11 September 2001 terrorist attacks, the Ukraine had its best year since independence, with inflow increasing over 15% to an estimated \$738.7 million in

2002. As of October 2002, total FDI since 1992 amounted to almost \$5 billion.

As of 1 October 2002, according the Ukraine State Statistics Committee, FDI had come from 112 countries. The United States remained the largest source of FDI, with \$843 million or 17% of the total. US-based sources were also probably involved in some of the FDI flows from Cyprus (11% of the total) and the British Virgin Islands (6.4%). The United Kingdom accounted for 9.5% of total FDI in the Ukraine since 1992; the Netherlands, 7.8%; the Russian Federation, 6.5%; Germany, 5%; Switzerland, 4.2%; Austria, 3.9%; and Korea, 3.5%. The remaining 24.2% came from 102 other countries. Per capita FDI stock increased from \$78 at the end of 2000 to \$102 at the beginning of October 2002.

In 2004, Ukraine was a much more attractive market for foreign investments, receiving \$1.4 billion of direct FDI—an increase of 22% from the previous year. Most of this investment went to production machinery and equipment, with food processing, agricultural processing, machine building, coal, oil and gas, and light industry being other important recipients of foreign funds. This growth however was well under the potential of the Ukrainian market, especially if one considers that in the same year, its neighbor, Romania, received over 5 billion in direct FDI. At the end of 2004, the level of foreign investment since 1992 rose to 7.7 billion—ten times as low as the same figure in Poland. Major investors in 2004 included: Cyprus (14.1%), the United States (13.6%), the United Kingdom (10.4%), Germany (7.1%), the Netherlands (6.8%), Virgin Islands (6.1%), Russia (5.5%), Switzerland (4.9%), and Austria (4%).

### 3<sup>9</sup> ECONOMIC DEVELOPMENT

In 1993, Ukraine's parliament tentatively approved a new economic reform plan to stabilize the republic's economy, attract more capital from abroad, and lay the groundwork for a market economy. Measures proposed included stricter monetary and banking regulation, and the elimination of monopolies in industries. A privatization program was underway in sectors including retail trade, services, the food industry, agriculture, and housing.

Since the election of President Kuchma in 1994, the government has implemented a far-reaching economic reform program. Almost all price and trade controls have been abolished in an effort to stabilize the new market economy. Privatization began in earnest in 1995, and a new convertible currency was adopted in 1996. In the 1990s, Ukraine continued to register negative growth. By the end of the 1990s, real gross domestic product (GDP) declined to 40% of its pre-independence level. In late 1998, the International Monetary Fund (IMF) loaned Ukraine another \$2.2 billion after Ukraine promised to introduce more fiscal discipline.

The economy started to grow in 2000; GDP growth in 2002 was over 4.5%. Small- and medium-sized enterprises were privatized by 2002, but the energy and telecommunications sectors had yet to be privatized. The government passed a foreign investment law, but bureaucratic hurdles, poor corporate governance, corruption, and the weak enforcement of contract law by courts all hamper investment. At the end of October 2002, total foreign direct investment into the country amounted to around \$4.9 billion, which was one of the lowest figures in the region. In 2002, land reforms were ongoing, supporting growth in the agricultural sector.

The economy took off in 2003 and 2004, and was deemed one of the most dynamic in Europe (the GDP growth rate in 2004 was 12.1%). The election of Viktor Yushchenko at the end of 2004, and the political turmoil that preceded it, hampered this expansive pulse. The new president stated however that the country is on the right path and that the economy will start booming again. Ukraine boasts a highly qualified work force, cheap labor and competitive costs, a relatively well-developed transportation and communications infrastructure, and a strategic geographic location. In addition, the large market—47 million people—makes it a prime location for foreign investment.

### 4<sup>0</sup> SOCIAL DEVELOPMENT

The social security system provides all employees with old age, disability, and survivor's pensions. The program is funded primarily from employer contributions, with a small contribution from employees and government subsidies as needed. Retirement is normally at age 60 for men and 55 for women, although this is reduced by five years for those engaged in arduous work and mothers with five or more children. There is a dual system of medical benefits. Cash benefits for sickness are provided for employed persons, while a universal medical care system exists for all residents. Maternity benefits of 100% of wages for 70 days before and 56 days after the expected date of childbirth are payable to all employed women. Workers' compensation and unemployment benefits are also provided. Special provisions exist for Chernobyl victims. Family allowances are provided to families with large numbers of children.

The law provides women with the same employment rights as men, although they rarely attain high-level managerial or political positions. Women who are employed mostly work in low-paying jobs or in industries that have trouble paying their employees on time. Help wanted ads often specify gender. Violence against women, domestic abuse, and sexual harassment in the workplace are pervasive.

Human rights violations continue. Harassment of racial minorities and religious intolerance are increasing problems. Anti-Semitic incidents and societal discrimination of ethnic minorities are commonplace. The Roma population is subject to abuse by police and general intolerance by the public. Prisoners are mistreated by authorities and live in substandard conditions. The government interferes with freedom of the press and with the electoral process.

### 4<sup>1</sup> HEALTH

Deterioration of the economy and declining living standards have had a negative impact on birth and mortality rates and women's and children's health standards need much improvement. Although safe water was available to 96.5%, proper sanitation was available to only 70% of the urban population and 8% of the rural population in the mid-1990s. Poor nutrition is another major problem in the Ukraine, and a shortage of basic supplies exacerbates the health care situation.

The country has established 156 independent children's hospitals. Altogether there were a total of 700,000 hospital beds. In addition, there were 6,500 outpatient polyclinical institutions. As of 2004, there were an estimated 297 physicians, 766 nurses, and 39 dentists per 100,000 people.

Infant mortality was reported at 10.11 per 1,000 live births in 2005. Life expectancy was 69.68 years in 2005. As of 2002, the crude birth rate and overall mortality rate were estimated at, respectively, 10 and 16 per 1,000 people. Immunization rates for children up to one year old were: tuberculosis, 95%; diphtheria, pertussis, and tetanus, 96%; polio, 97%; and measles, 97%.

The leading causes of death were cardiovascular and respiratory diseases, cancer, traumas, and accidents. The HIV/AIDS prevalence was 1.40 per 100 adults in 2003. As of 2004, there were approximately 360,000 people living with HIV/AIDS in the country. There were an estimated 20,000 deaths from AIDS in 2003.

The likelihood of dying after age 65 of heart disease in Ukraine was below the average for medium human development as defined by the World Bank. In the mid-1990s, that rate exceeded 300 per 1,000 for men and 295 per 1,000 for women. On the other hand, cancer rates for men were higher. Death after age 65 from cancer was 133 per 1,000 people in the mid-1990s.

## 4<sup>2</sup> HOUSING

Before 1994, most housing and utility costs were covered by the government through a policy which was causing major federal debt. Through an IMF approved program of economic reforms put in place in October 1994, residents were asked to contribute a much greater amount toward their own rent and utilities. Unfortunately, many households were unable to do so. An average three-person household, living in a three-room flat of about 500 sq m (5,381.96 sq ft) was charged expenses of about \$30 per month. The average monthly income of such a family was \$50. In 1995, the government put in place a subsidy program to assist low-income families in meeting rising housing costs, but funding for housing continues to be a problem.

At the 2001 census, there were 18,200,567 households counted representing 47,726,518 people. About 44% of all households lived in individual houses; another 44.6% lived in a separate apartment unit. The average amount of living space was 14 sq m (150.69 sq ft) per person.

## 4<sup>3</sup> EDUCATION

Most schools are state run. Education is compulsory for nine years, with students starting at age six or seven. These first nine years are completed through four years of elementary school and five years of lower secondary school. Students may continue in general secondary schools offering two- or three-year courses of study, or a specialized education secondary program of about three years. Vocational programs of four or five years are also available at the secondary level. While Ukrainian is the most commonly taught language and medium of instruction, other languages, such as Russian, Hungarian, Polish, Moldovan, or Crimean-Tatar, are offered based on the ethnic composition of the particular school district. The academic year runs from September to June.

In 2001, about 52% of children between the ages of three and six were enrolled in some type of preschool program. Primary school enrollment in 2003 was estimated at about 84% of age-eligible students. The same year, secondary school enrollment was about 85% of age-eligible students. It is estimated that about 97.6% of all students complete their primary education. The student-to-teacher ratio for primary school was at about 19:1 in 2003; the ratio for secondary school was about 13:1.

There are over 900 colleges, technical schools, vocational schools, universities, and other institutes of higher education. The Kyiv-Mohyla Academy was founded in 1632. Other universities are: Lviv University (1795), Kharkiv University (1804), Taras Shevchenko National University (1834), Odessa University (1868). In 2003, it was estimated that about 62% of the tertiary age population were enrolled in tertiary education programs. The adult literacy rate for 2004 was estimated at about 99.4%.

As of 2003, public expenditure on education was estimated at 5.4% of GDP, or 20.3% of total government expenditures.

## 4<sup>4</sup> LIBRARIES AND MUSEUMS

The largest library in the country is the Vernadsky National Library of Ukraine in Kiev, which holds over 15 million items, including the collection of the Presidents of Ukraine, archive copies of Ukrainian printed documents from 1917, and the archives of the National Academy of Sciences of Ukraine. The National Parliamentary Library of Ukraine in Kiev holds 65,000 volumes. Also in Kiev, the National Library of Ukraine for Children has a collection of over 440,000 volumes. Other large collections include the V.G. Korolenko State Scientific Library with 6.7 million volumes and the libraries at Lviv Polytechnic University (3 million), Franko State University in Lviv (2.5 million), Shevchenko Kiev University (2.7 million), and Kiev Polytechnic Institute (2.5 million). There are reported to be about 21,857 public libraries operating in Ukraine with an overall stock of about 336.7 million books.

Kiev has the Kiev State Museum of Russian Art, the Kiev State Museum of Ukrainian Art, the State Historical Museum, the Museum of Cultural Heritage, the National Museum of Medicine, the State Museum of Ukrainian Decorative Folk Art, and the Soros Center for Contemporary Art. There are also several small house museums in Kiev. There is a Museum of Fine Arts in Lugansk. Lviv houses the State Museum of Ethnography and Arts and Crafts and the Literary Museum of Ivan Franko. Odessa is home to the Odessa Museum of Fine Arts, the Museum of Literature, the Naval Museum, the Odessa Museum of Western and Oriental Art, the Odessa Archaeological Museum, and the Pushkin Museum.

## 4<sup>5</sup> MEDIA

In 2003, there were an estimated 216 mainline telephones for every 1,000 people; over 2 million people were on a waiting list for telephone service installation. The same year, there were approximately 136 mobile phones in use for every 1,000 people.

Most broadcast media is state-owned or controlled by political parties or other powerful business interests. In 2004, there were six national television stations. While there are many privately-owned radio and television stations, they are generally heavily influenced by the government and political parties. In 2000, there were 456 television sets for every 1,000 people. In 2003, there were an estimated 889 radios for every 1,000 people. The same year, there were 19 personal computers for every 1,000 people and 19 of every 1,000 people had access to the Internet. There were 53 secure Internet servers in the country in 2004.

Among the leading newspapers (with 2005 daily circulation) are: *Segodnya* (published in Russian, 849,000 circulation), *Fakty I Commentarii* (published in Russian, 761,000 circulation), *Silski Visti* (Ukrainian, 537,000), *Vecherniye Vesti* (Russian, 500,000),

*Ukrayina Moloda* (Ukrainian, 163,000), and *Den* (Russian and Ukrainian, 62,500).

The constitution and a 1991 law provide for free speech and a free press. Criticism of the government is said to be tolerated, though some journalists practice self-censorship because of occasional pressures from the government.

#### 46 ORGANIZATIONS

The Ukraine Chamber of Commerce and the Congress of Business Circles of Ukraine promotes the commercial and business activities of the country to the rest of the world. Many of Ukraine's trade unions belong to the umbrella organization called the Federation of Independent Trade Unions. Professional associations are active in several different fields. There is an active Ukrainian Consumers' Association.

National cultural organizations include the Ukrainian Cultural Educational Organization and Flamenko, which promotes cultural exchange programs. National youth organizations include the Council of Ukrainian Students, the Ukrainian Fund of International Youth Cooperation, Junior Chamber, Ukrainian Girl Guides and Girls Scouts Association, the Compass Club, and YMCA/YWCA. There are several sports associations promoting amateur competition for athletes of all ages.

National social action organizations include the Ukrainian Center for Human Rights, the Ukrainian Environmental Association, the Ukrainian Legal Foundation, Freedom House (advocating the development of democratic institutions), The Children's Fund, and Zhinocha Hromada, an organization focused on encouraging women to be active in economic and community development. International organizations with national chapters include Caritas, UNICEF, Amnesty International, and the Red Cross.

#### 47 TOURISM, TRAVEL, AND RECREATION

Kiev, Ukraine's major cultural center, is known for its beautiful churches and golden-domed cathedrals, although much of its classic architecture was destroyed or obscured by Communist planners in the 1930s. The cathedral of St. Sophia, built in the 11th century, is one of the finest examples of Russo-Byzantine architecture. Another major tourist attraction is the Golden Gate, an 11th-century fortification restored in 1982. Lviv (formerly Lvov) offers architectural sights ranging from late-13th-century Russian to 16th-century Gothic structures.

In 2003, about 12.5 million visitors arrived in Ukraine, over 5 million of whom came from Russia. There were 32,572 hotel rooms with 86,243 beds and an occupancy rate of 30%. Travelers stayed in Ukraine an average of three nights per trip. Tourism expenditure receipts totaled \$1.2 billion. A valid passport is required for all travelers to enter Ukraine. Visas are not required for citizens of Japan, Canada, Switzerland, Liechtenstein, the United States, and the European Union countries, for stays of up to 90 days. To visit the nation, all other travelers need a visa. Medical insurance which covers Ukraine is required for all US citizens.

According to 2005 estimates from the US Department of State, the cost of staying in Kiev was \$271 per day, other areas were less at \$177 per day.

#### 48 FAMOUS UKRAINIANS

Leonid M. Kravchuk and Vitold P. Fokin were respectively the first president and prime minister of Ukraine. Leonid Brezhnev (Dneprodzershinsk, Ukraine, 1906–82) led the Soviet Union from 1966–82. Outstanding representatives of the culture and literature of Ukraine include poet Taras Shevchenko (1814–61) and the Jewish writer Sholom Aleichem (Solomon Rabinowitz, 1859–1916).

#### 49 DEPENDENCIES

Ukraine has no territories or colonies.

# UNITED KINGDOM

United Kingdom of Great Britain and Northern Ireland

**CAPITAL:** London

**FLAG:** The Union Jack, adopted in 1800, is a combination of the banners of England (St. George's flag: a red cross with extended horizontals on a white field), Scotland (St. Andrew's flag: a white saltire cross on a blue field), and Ireland (St. Patrick's flag: a red saltire cross on a white field). The arms of the saltire crosses do not meet at the center.

**ANTHEM:** *God Save the Queen.*

**MONETARY UNIT:** The pound sterling (£) is a paper currency of 100 pence. Before decimal coinage was introduced on 15 February 1971, the pound had been divided into 20 shillings, each shilling representing 12 pennies (p) or pence; some old-style coins are still in circulation. Under the new system, there are coins of 1, 2, 5, 10, 20, and 50 pence and 1 and 2 pounds, and notes of 5, 10, 20, and 50 pounds. £1 = \$1.85185 (or \$1 = £0.54) as of 2005.

**WEIGHTS AND MEASURES:** Although the traditional imperial system of weights and measures is still in use (sample units: of weight, the stone of 14 pounds equivalent to 6.35 kilograms; of length, the yard equivalent to 0.914 meter; of capacity, a bushel equivalent to 36.37 liters), a changeover to the metric system is in progress.

**HOLIDAYS:** New Year's Day, 1 January; Good Friday; Easter Monday (except Scotland); Late Summer Holiday, last Monday in August or 1st in September (except Scotland); Christmas, 25 December; and Boxing Day, 1st weekday after Christmas. Also observed in Scotland are bank holidays on 2 January and on the 1st Monday in August. Northern Ireland observes St. Patrick's Day, 17 March; and Orangeman's Day, 12 July, commemorating the Battle of the Boyne in 1690.

**TIME:** GMT.

## <sup>1</sup>LOCATION, SIZE, AND EXTENT

The United Kingdom is situated off the northwest coast of Europe between the Atlantic Ocean on the N and NW and the North Sea on the E, separated from the Continent by the Strait of Dover and the English Channel, 34 km (21 mi) wide at its narrowest point, and from the Irish Republic by the Irish Sea and St. George's Channel. Its total area of 244,820 sq km (94,526 sq mi) consists of the island of Great Britain—formed by England, 130,439 sq km (50,363 sq mi); Wales, 20,768 sq km (8,018 sq mi); and Scotland, 78,783 sq km (30,418 sq mi)—and Northern Ireland, 14,120 sq km (5,452 sq mi), on the island of Ireland, separated from Great Britain by the North Channel. Comparatively, the area occupied by the United Kingdom is slightly smaller than the state of Oregon.

There are also several island groups and hundreds of small single islands, most of them administratively part of the mainland units. The United Kingdom extends about 965 km (600 mi) N-S and about 485 km (300 mi) E-W. Its total boundary length is 12,789 km (7,947 mi), of which 12,429 km (7,723 mi) is coastline. The Isle of Man, 588 sq km (227 sq mi), and the Channel Islands, comprising Jersey, Guernsey, Alderney, and Sark, with a combined area of 194 sq km (75 sq mi), are not part of the United Kingdom but are dependencies of the crown. The 0° meridian of longitude passes through the old Royal Observatory, located at Greenwich in Greater London. The United Kingdom's capital city, London, is located in the southeast part of Great Britain.

## <sup>2</sup>TOPOGRAPHY

England is divided into the hill regions of the north, west, and southwest and the rolling downs and low plains of the east and southeast. Running from east to west on the extreme north Scottish border are the Cheviot Hills. The Pennine Range runs north and south from the Scottish border to Derbyshire in central England. The rest of the countryside consists mainly of rich agricultural lands, occasional moors, and plains. South of the Pennines lie the Midlands (East and West), a plains region with low, rolling hills and fertile valleys. The eastern coast is low-lying, much of it less than 5 m (15 ft) above sea level; for centuries parts of it have been protected by embankments against inundation from gales and unusually high tides. Little of the south and east rises to higher than 300 m (1,000 ft).

The highest point in England is Scafell Pike (978 m/3,210 ft) in the famed Lake District of the northwest. The longest of the rivers flowing from the central highlands to the sea are the Severn (about 340 km/210 mi) in the west and the Thames (about 320 km/200 mi) in the southeast. Other rivers include the Humber, the Tees, the Tyne, and the Tweed in the east, the Avon and Exe in the south, and the Mersey in the west.

Scotland has three distinct topographical regions: the Northern Highlands, occupying almost the entire northern half of the country and containing the highest point in the British Isles, Ben Nevis (1,343 m/4,406 ft), as well as Loch Ness, site of a fabled "monster"; the Central Lowlands, with an average elevation of about 150 m

(500 ft) and containing the valleys of the Tay, Forth, and Clyde rivers, as well as Loch Lomond, Scotland's largest lake; and the Southern Uplands, rising to their peak at Merrick (843 m/2,766 ft), with moorland cut by many valleys and rivers.

Wales is largely mountainous and bleak, with much of the land suitable only for pasture. The Cambrian Mountains occupy almost the entire area and include Wales's highest point, Mt. Snowdon (1,086 m/3,563 ft). There are narrow coastal plains in the south and west and small lowland areas in the north, including the valley of the Dee.

Northern Ireland consists mainly of low-lying plateaus and hills, generally about 150 to 180 m (500–600 ft) high. The Mourne Mountains in the southeast include Slieve Donard (852 m/2,796 ft), the highest point in Northern Ireland. In a central depression lies Lough Neagh, the largest lake in the United Kingdom.

The United Kingdom's long and rugged coastline, heavily indented, has towering cliffs and headlands and numerous bays and inlets, among them the deep and narrow lochs and the wide firths of Scotland. Many river estuaries serve as fine harbors.

### 3 CLIMATE

Despite its northern latitude, the United Kingdom generally enjoys a temperate climate, warmed by the North Atlantic Drift, a continuation of the Gulf Stream, and by southwest winds. Mean monthly temperatures range (north to south) from 3°C to 5°C (37–41°F) in winter and from 12°C to 16°C (54–61°F) in summer. The mean annual temperature in the west near sea level ranges from 8°C (46°F) in the Hebrides to 11°C (52°F) in the far southwest of England. Rarely do temperatures rise in summer to over 32°C (90°F) or drop in winter below -10°C (14°F).

Rainfall, averaging more than 100 cm (40 in) throughout the United Kingdom, is heaviest on the western and northern heights (over 380 cm/150 in), lowest along the eastern and southeastern coasts. Fairly even distribution of rain throughout the year, together with the prevalence of mists and fogs, results in scanty sunshine—averaging from half an hour to two hours a day in winter and from five to eight hours in summer.

In the spring of 1997 there was an intense drought in southern and western England; the previous two years were the driest in England and Wales since reliable record-keeping began in 1767.

### 4 FLORA AND FAUNA

With its mild climate and varied soils, the United Kingdom has a diverse pattern of natural vegetation. Originally, oak forests probably covered the lowland, except for the fens and marsh areas, while pine forests and patches of moorland covered the higher or sandy ground. Over the centuries, much of the forest area, especially on the lowlands, was cleared for cultivation. Fairly extensive forests remain in east and north Scotland and in southeast England. Oak, elm, ash, and beech are the most common trees in England. Pine and birch are most common in Scotland. Almost all the lowland outside the industrial centers is farmland, with a varied seminatural vegetation of grasses and flowering plants. Wild vegetation consists of the natural flora of woods, fens and marshes, cliffs, chalk downs, and mountain slopes, the most widespread

being the heather, grasses, gorse, and bracken of the moorlands. There are over 1,600 plant species in the country.

The fauna is similar to that of northwestern continental Europe, although there are fewer species. Some of the larger mammals—wolf, bear, boar, and reindeer—are extinct, but red and roe deer are protected for sport. Common smaller mammals are foxes, hares, hedgehogs, rabbits, weasels, stoats, shrews, rats, and mice; otters are found in many rivers, and seals frequently appear along the coast. There are at least 50 species of mammal native to the region. There are few reptiles and amphibians. Roughly 230 species of birds reside in the United Kingdom, and another 200 are migratory. Most numerous are the chaffinch, blackbird, sparrow, and starling. The number of large birds is declining, however, except for game birds—pheasant, partridge, and red grouse—which are protected. With the reclamation of the marshlands, waterfowl are moving to the many bird sanctuaries. The rivers and lakes abound in salmon, trout, perch, pike, roach, dace, and grayling. There are more than 21,000 species of insects.

### 5 ENVIRONMENT

Government officials and agencies with principal responsibility for environmental protection are the Department of the Environment, the Department of the Environment for Northern Ireland, and the secretaries of state for Scotland and Wales. The National Trust (for Places of Historic Interest or Natural Beauty), an organization of more than 1.3 million members, has acquired some 750 km (466 mi) of coastline in England, Northern Ireland, and Wales. In addition, 127 km (79 mi) of coastline in Scotland are protected under agreement with the National Trust of Scotland. Two countryside commissions, one for England and Wales and one for Scotland, are charged with conserving the beauty and amenities of rural areas. By 1982, the former had designated 10 national parks, covering 13,600 sq km (5,250 sq mi), or 9% of the area of England and Wales. An additional 36 areas of outstanding beauty have been designated, covering 17,000 sq km (6,600 sq mi). Scotland has 40 national scenic areas, with more than 98% of all Scottish lands under the commission's jurisdiction. Northern Ireland has eight designated areas of outstanding natural beauty, seven country parks, and one regional park. There are also seven forest parks in Great Britain and nine in Northern Ireland. England and Wales have 600,000 hectares (1,500,000 acres) of common land, much of which is open to the public. The Nature Conservancy Council manages 214 national nature reserves in Great Britain and 41 in Northern Ireland.

Air pollution is a significant environmental concern for the United Kingdom. In 1992 the nation had the world's eighth-highest level of industrial carbon dioxide emissions, which totaled 566.2 million metric tons, a per capita level of 9.78 metric tons. In 2000, the total of carbon dioxide emissions was at 567.8 million metric tons. In addition, its sulphur contributes to the formation of acid rain in the surrounding countries of Western Europe. Air quality abatement has improved greatly in the United Kingdom as a result of the Control of Pollution Act of 1974 and other legislation. London is no longer densely smog-ridden, and winter sunlight has been increasing in various industrial cities.

Water pollution from agricultural sources is also a problem. The nation has 145 cubic km of water of which 3% of annual withdrawals is used for farming activity and 77% for industrial pur-

LOCATION: 49°56' to 60°50'N; 1°45'E to 8°10'W. BOUNDARY LENGTHS: Total coastline, 12,429 kilometers (7,722 miles), of which Northern Ireland's comprises 375 kilometers (233 miles); Irish Republic, 360 kilometers (225 miles). TERRITORIAL SEA LIMIT: 3 miles.

poses. The United Kingdom's cities produce an average of 22 million tons of solid waste per year. Pollution of the Thames has been reduced to one-quarter of its level in the 1950s, and more than 80% of the population is served by sewage treatment plants.

The Food and Environment Protection Act of 1985 introduced special controls over dumping and marine incineration in-

response to the problems of regulation of oil and gas development and of large-scale dumping at sea.

As of 2003, 20.9% of the United Kingdom's total land area is protected, including 163 Ramsar wetland sites and 5 natural UNESCO World Heritage Sites. According to a 2006 report issued by the International Union for Conservation of Nature and

Natural Resources (IUCN), threatened species included 10 types of mammals, 10 species of birds, 12 species of fish, 2 types of mollusks, 8 species of other invertebrates, and 13 species of plants. The European otter, Atlantic sturgeon, Atlantic ridley, Eskimo curlew, and Spengler's freshwater mussel are classified as endangered. The great auk has become extinct.

## 6 POPULATION

The population of United Kingdom in 2005 was estimated by the United Nations (UN) at 60,068,000, which placed it at number 22 in population among the 193 nations of the world. In 2005, approximately 16% of the population was over 65 years of age, with another 18% of the population under 15 years of age. There were 96 males for every 100 females in the country. According to the UN, the annual population rate of change for 2005–10 was expected to be 0.2%, a rate the government viewed as satisfactory. The projected population for the year 2025 was 64,687,000. The overall population density was 245 per sq km (635 per sq mi); in England there were 371 persons per sq km (961 per sq mi), with 4,233 persons per sq km (10,968 per sq mi) in Greater London.

The UN estimated that 89% of the population lived in urban areas in 2005, and that urban areas were growing at an annual rate of 0.36%. The capital city, London, had a population of 7,619,000 in that year. Other major metropolitan areas in England, with estimated populations, were Birmingham, 2,215,000; Manchester, 2,193,000; Leeds, 1,402,000; and Liverpool, 975,000. Other large English towns include Sheffield, 516,000; Bradford, 478,800; Bristol, 406,500; and Coventry, 300,844. The major cities in Scotland are Glasgow (1,099,400) and Edinburgh (460,000). Belfast, the major city in Northern Ireland, had a population of 287,500; and Cardiff, in Wales, 305,000.

## 7 MIGRATION

From 1815–1930, the balance of migration was markedly outward, and well over 20 million persons left Britain, settling mainly within the British Empire and in the United States. Since 1931, however, the flow has largely been inward. From 1931–40, when emigration was very low, there was extensive immigration from Europe, including a quarter of a million refugees seeking sanctuary; during the 1950s, immigration from the Commonwealth, especially from the Caribbean countries, India, and Pakistan, steadily increased. The net influx of some 388,000 people (chiefly from the Commonwealth) during 1960–62 led to the introduction of the Commonwealth Immigrants Act of 1962, giving the government power to restrict the entry of Commonwealth citizens lacking adequate prospects of employment or means of self-support. Effective 1 January 1983, a new law further restricted entry by creating three categories of citizenship, two of which—citizens of British Dependent Territories and “British overseas citizens”—entail no right to live in the United Kingdom. Those in the last category, consisting of an estimated 1.5 million members of Asian minorities who chose to retain British passports when Malaysia and Britain's East African lands became independent, may not pass their British citizenship to their children without UK government approval.

Immigration is now on a quota basis. From 1986–91, 1,334,000 persons left the United Kingdom to live abroad, and 1,461,000 came from overseas to live in the United Kingdom, resulting in a

net in-migration of 127,000. The total number of foreign residents in the United Kingdom was about 1,875,000 in 1990. Of these, more than one-third were Irish (638,000). Indians were second (155,000) and Americans third (102,000). Between the 1990s and 2002, net migration in the United Kingdom rose from 50,000 per year to 172,000. In spite of guest worker programs, the number of unauthorized foreigners grew to around 500,000 in 2003. In addition to these increases, “failed” asylum seekers who were subject to “removal” were a burden, with estimates at 155,000 to 283,000 in the United Kingdom in 2004. In that same year, Prime Minister Tony Blair declared that immigration had reached a “crunch point.” Migration became a political issue of the 5 May 2005 elections. Conservative Party leader Michael Howard declared that if he were elected the United Kingdom would stop recognizing the 1951 UN Conventions on Refugees and an annual limit of 20,000 would be placed on immigration. The Labour Party stayed in power and Prime Minister Tony Blair proposed a tiered point system to control immigration. In July 2005 the Home Office estimated that there were 570,000 unauthorized foreigners. A five-tiered guest worker system was introduced: tier one, for highly skilled migrants and investors; tier two, for skilled workers in shortage occupations; tier three, for unskilled workers via accredited recruiters, and tier four, for foreign students, and tier five, for cultural exchange workers. After the death of 52 people in the 2 July 2005 bombings in London tubes and buses by British-born South Asians, tension increased and the far-right British National Party called for revamped laws to restrict immigration.

In response to the Kosovo crisis in 1999, the United Kingdom received 4,346 Kosovar refugees from Macedonia under the UN-HCR/IOM Humanitarian Evacuation Programme. As of 1999, the United Kingdom had the second-largest number of asylum applications in Europe, but by 2004 it ranked seventh. In 2004, there were 9,800 asylum seekers. Main countries of origin among 47 countries included Somalia, India, Sri Lanka, Eritrea, Afghanistan, and the DROC. However, in 2004 the United Kingdom hosted refugees in larger numbers, 289,059 refugees from, Iraq, Afghanistan, Somalia, Serbia and Montenegro, Iran, Sri Lanka, Turkey, and DROC. The net migration rate in 2005 was estimated as 2.18 migrants per 1,000 population.

## 8 ETHNIC GROUPS

The present-day English, Welsh, Scots, and Irish are descended from a long succession of early peoples, including Iberians, Celts, Romans, Anglo-Saxons, Danes, and Normans, the last of whom invaded and conquered England in 1066–70. According to the 2001 census, about 83.6% of UK residents are English. The Scottish form about 8.6% of the population, Welsh account for 4.9%, and the Northern Irish make up 2.9%. About 1.8% of the population are Indian, and 1.3% are Pakistani. There are about 300,000 persons who belong to a group known as Travellers, a blend of Roma, Irish, and other ethnic groups who maintain an itinerant lifestyle.

## 9 LANGUAGES

Spoken throughout the United Kingdom and by over 456 million people throughout the world, English is second only to Mandarin Chinese in the number of speakers in the world. It is taught extensively as a second language and is used worldwide as a language of

commerce, diplomacy, and scientific discourse. In northwestern Wales, Welsh, a form of Brythonic Celtic, is the first language of most of the inhabitants.

Approximately 26% of those living in Wales speak Welsh (up from 19% in 1991). Some 60,000 or so persons in western Scotland speak the Scottish form of Gaelic (down from 80,000 in 1991), and a few families in Northern Ireland speak Irish Gaelic. On the Isle of Man, the Manx variety of Celtic is used in official pronouncements; in the Channel Islands some persons still speak a Norman-French dialect. French remains the language of Jersey for official ceremonies.

## 10 RELIGIONS

There is complete religious freedom in the United Kingdom. All churches and religious societies may own property and conduct schools. Established churches are the Church of England (Anglican) and the Church of Scotland (Presbyterian). The former is uniquely related to the crown in that the sovereign must be a member and, on accession, promise to uphold the faith; it is also linked with the state through the House of Lords, where the archbishops of Canterbury and York have seats. The archbishop of Canterbury is primate of all England. The monarch appoints all officials of the Church of England. The established Church of Scotland has a Presbyterian form of government: all ministers are of equal status and each of the congregations is locally governed by its minister and elected elders.

About 71.6% of the population belong to one of the four largest Christian denominations in the country: the Church of England, the Roman Catholic Church, the Church of Scotland, and the Methodist Church in Britain (originally established as a type of revival movement by the Church of England minister John Wesley, 1703–91). Many immigrants have established community religious centers in the United Kingdom. Such Christian groups include Greek, Russian, Polish, Serb-Orthodox, Estonian and Latvian Orthodox, and the Armenian Church; Lutheran churches from various parts of Europe are also represented. A total of about 2% of the population are Jehovah's Witnesses, Mormons, Christian Scientists, or Unitarians. The Anglo-Jewish community, with an estimated 300,000 members, is the second-largest group of Jews in Western Europe. There are also sizable communities of Muslims, Sikhs, Hindus, and Buddhists.

In Northern Ireland, about 53% of the population are nominally Protestants and 44% are nominally Catholics; only about 30–35% of all Northern Irish are active participants in religious services. The Protestants and Catholics in Northern Ireland tend to live in self-segregated communities.

## 11 TRANSPORTATION

In Great Britain, railways, railway-owned steamships, docks, hotels, road transport, canals, and the entire London passenger transport system—the largest urban transport system in the world—were nationalized on 1 January 1948 under the control of the British Transport Commission (BTC). In 1962, the BTC was replaced by the British Railways Board, the London Transport Board, the British Transport Docks Board, and the British Waterways Board. Under the 1968 Transport Act, national transport operations were reorganized, with the creation of the National Freight Corp., the Freight Integration Council, and the National

Bus Co. Organization of public transport in Northern Ireland is autonomous.

In 2003, Great Britain had 392,931 km (244,403 mi) roadway, all of it paved, including 3,431 km (2,134 mi) of express motorways. Licensed motor vehicles in Great Britain numbered 32,576,891 as of 2003, including 29,007,820 passenger cars and 3,569,071 commercial vehicles. The Humber Bridge, the world's longest single-span suspension bridge, with a center span of 1,410 m (4,626 ft), links the city of Hull with a less developed region to the south. Eurotunnel, a British-French consortium, recently built two high-speed 50-km (31-mi) rail tunnels beneath the seabed of the English Channel. The project, referred to as the "Chunnel," links points near Folkestone, England (near Dover), and Calais, France. The Channel Tunnel is the largest privately financed construction project to date, with an estimated cost (in 1991) of \$15 billion; it also has the longest tunnel system (38 km/24 mi) ever built under water. In November 1996, a truck aboard a freighter entering the tunnel caught fire, causing serious damage to the tunnel but no loss of life. Partial operations were resumed within a few weeks, and all repairs were completed by May 1997.

There were 17,274 km (10,727 mi) of standard and narrow gauge railway in Great Britain in 2004, including 5,296 km (3,289 mi) of electrified track. Standard gauge accounts for nearly all of the nation's railway system at 16,814 km (10,441 mi). Underground railway systems operate in London, Glasgow, and Liverpool. In London, the Underground consists of some 3,875 cars that operate over about 408 km (254 mi) of track, 167 km (104 mi) of which is underground. The Underground, the oldest part of which dates to 1863, operates 20 hours per day and is comprised of 248 stations on 11 lines that provide 2.7 million rides per day. In early 1997 the government proposed privatizing London's subway system because of lack of funds needed to restore the aging network. Capital investment has been diminished since the 1960s, resulting in increasing failures of signals and rolling stock and the deterioration of stations and track.

Great Britain has about 3,200 km (1,988 mi) of navigable inland waterways, mainly canals dating back to the pre-railroad age, of which as of 2004, some 620 km (386 mi) are still in commercial use. Great Britain has some 300 ports, including the Port of London, one of the largest in the world. Other major ports are Liverpool, Southampton, Hull, Clydeport (near Glasgow), the inland port of Manchester, and Bristol. The British merchant fleet, privately owned and operated, consists of 429 ships of 1,000 GRT or more, totaled 9,181,284 GRT in 2005. In an effort to curb the flagging of British merchant ships to less regulatory foreign nations, a British offshore registry program was initiated in the late 1980s. Under this program, merchant ships registered to the Isle of Man, Gibraltar, the Cayman Islands, and the Turks and Caicos Islands are entitled to fly the Red Ensign as if under the administration of the United Kingdom.

The Civil Aviation Authority was created in 1971 as an independent body responsible for national airline operations, traffic control, and air safety. In 2004, there were an estimated 471 airports. As of 2005 a total of 334 had paved runways, and there were also 11 heliports. International flights operate from London's Heathrow; Gatwick, London's second airport; Glasgow, in Scotland; Ringway (for Manchester); Aldergrove (for Belfast); and Elmdon (for Birmingham). The two government-owned airlines, Brit-

ish European Airways and British Overseas Airways Corp., were amalgamated in 1974 to form British Airways (BA). In 1984, BA was reestablished as British Airways PLC, a public limited company under government ownership, soon thereafter to be sold wholly to the public. There are a number of privately operated airlines, some of which operate air taxi services. British Caledonian, which maintained scheduled flights on both domestic and international routes, merged with British Airways in 1988. The Concorde, a supersonic jetliner developed jointly in the 1960s by the United Kingdom and France at a cost exceeding £1 billion, entered service between Heathrow and the United States in 1976. In 2003, the United Kingdom's airlines performed 5,251 million freight ton-km of freight service, and carried 76.377 million passengers on domestic and international flights.

## 12 HISTORY

The earliest people to occupy Britain are of unknown origin. Remains of these early inhabitants include the stone circles of Avebury and Stonehenge in Wiltshire. Celtic tribes from the Continent, the first known settlers in historical times, invaded before the 6th century BC. The islands were visited in ancient times by Mediterranean traders seeking jet, gold, pearls, and tin, which were being mined in Cornwall. Julius Caesar invaded in 55 BC but soon withdrew. In the 1st century AD, the Romans occupied most of the present-day area of England, remaining until the 5th century.

With the decline of the Roman Empire and the withdrawal of Roman troops (although many Romans had become Britonized and remained on the islands), Celtic tribes fought among themselves, and Scots and Picts raided from the north and from Ireland. Early raids by Angles, Saxons, and Jutes from the Continent soon swelled into invasions, and the leaders established kingdoms in the conquered territory while the native Celts retreated into the mountains of Wales and Cornwall. Although the Welsh were split into a northern and a southern group, they were not permanently subdued. In the 10th century, a Welsh king, Howel the Good (Hywel Dda), united Wales, codified the laws, and encouraged the Welsh bards.

Among the new English kingdoms, that of the West Saxons (Wessex) became predominant, chiefly through the leadership of Alfred the Great, who also had to fight a new wave of invasions by the Danes and other Norsemen. Alfred's successors were able to unify the country, but eventually the Danes completed their conquest, and King Canute (II) of Denmark became ruler of England by 1017. In 1042, with the expiration of the Scandinavian line, Edward the Confessor of Wessex became king. At his death in 1066, both Harold the Saxon and William, duke of Normandy, claimed the throne. William invaded England and defeated Harold in the Battle of Hastings, beginning the Norman Conquest (1066–70).

William I instituted a strong government, which lasted through the reigns of his sons William II and Henry I. The latter's death in 1135 brought a period of civil war and anarchy, which ended with the accession of Henry II (1154), who instituted notable constitutional and legal reforms. He and succeeding English kings expanded their holdings in France, touching off a long series of struggles between the two countries.

## The Magna Carta

Long-standing conflict between the nobles and the kings reached a climax in the reign of King John with the victory of the barons, who at Runnymede in 1215 compelled the king to grant the Magna Carta. This marked a major advance toward the parliamentary system. Just half a century later, in 1265, Simon de Montfort, earl of Leicester, leader of the barons in their opposition to Henry III, summoned the first Parliament, with representatives not only of the rural nobility but also of the boroughs and towns. In the late 13th century, Edward I expanded the royal courts and reformed the legal system; he also began the first systematic attempts to conquer Wales and Scotland. In 1282, the last Welsh king, Llewellyn ap Gruffydd, was killed in battle, and Edward I completed the conquest of Wales. Two years later, the Statute of Rhuddlan established English rule. The spirit of resistance survived, however, and a last great uprising against England came in the early 15th century, when Owen Glendower (Owain ap Gruffydd) led a briefly successful revolt.

Scotland was inhabited in early historic times by the Picts and by roaming bands of Gaels, or Celts, from Ireland. Before the Romans left Britain in the 5th century, Scotland had been converted to Christianity by St. Ninian and his disciples. By the end of the following century, four separate kingdoms had been established in Scotland. Norsemen raided Scotland from the 8th to the 12th century, and some settled there. Most of the country was unified under Duncan I (r.1034–40). His son, Malcolm III (r.1059–93), who gained the throne after defeating Macbeth, the murderer of his father, married an English princess, Margaret (later sainted), and began to anglicize and modernize the lowlands.

## Scotland United

Under David I (r.1124–53), Scotland was united, responsible government was established, walled towns (known as burghs) were developed, and foreign trade was encouraged. William the Lion (r.1165–1214) was captured by Henry II of England in 1174 and forced to accept the Treaty of Falaise, by which Scotland became an English fief. Although Scotland purchased its freedom from Richard I, the ambiguous wording of the agreement allowed later English kings to revive their claim.

When Alexander III died in 1286, Edward I of England, who claimed overlordship of Scotland, supported the claims of John Baliol, who was crowned in 1293. Edward began a war with Philip of France and demanded Scottish troops, but the Scots allied themselves with Philip, beginning the long relationship with France that distinguishes Scottish history. Edward subdued the Scots, put down an uprising led by William Wallace, executed Wallace in 1305, and established English rule. Baliol's heir was killed by Robert the Bruce, another claimant, who had himself crowned (1309), captured Edinburgh, and defeated Edward II of England decisively at Bannockburn in 1314. In 1328, Edward III signed a treaty acknowledging Scotland's freedom.

Under Edward III, the Hundred Years' War (1337–1453) with France was begun. Notable victories by Edward the Black Prince (son of Edward III), Henry IV, and Henry V led to no permanent gains for England, and ultimately the English were driven out of France. The plague, known as the Black Death, broke out in England in 1348, wiping out a third of the population; it hastened the

breakdown of the feudal system and the rise of towns. The 14th century was for England a time of confusion and change. John Wycliffe led a movement of reform in religion, spreading radical ideas about the need for churchly poverty and criticizing many established doctrines and practices. A peasant rebellion led by Wat Tyler in 1381 demanded the abolition of serfdom, monopolies, and the many restrictions on buying and selling.

In 1399, after 22 years of rule, Richard II was deposed and was succeeded by Henry IV, the first king of the house of Lancaster. The war with France continued, commerce flourished, and the wool trade became important. The Wars of the Roses (1455–85), in which the houses of Lancaster and York fought for the throne, ended with the accession of Henry VII, a member of the Tudor family, marking the beginning of the modern history of England.

### The Tudors

Under the Tudors, commerce was expanded, English seamen ranged far and wide, and clashes with Spain (accelerated by religious differences) intensified. Earlier English dominance had not had much effect on Wales, but the Tudors followed a policy of assimilation, anglicizing Welsh laws and practices. Finally, under Henry VIII, the Act of Union (1536) made English the legal language and abolished all Welsh laws “at variance with those of England.” In 1531, Henry separated the Anglican Church from Rome and proclaimed himself its head. After his death (1547), the succession to the throne became a major issue during the reigns of Edward VI (1547–53), Mary I (1553–58), and Elizabeth I (1558–1603).

In Scotland, James I (r.1406–37) had done much to regulate Scottish law and improve foreign relations. His murder in 1437 began a century of civil conflict. James IV (r.1488–1513) married Margaret Tudor, sister of Henry VII of England, a marriage that was ultimately to unite the crowns of England and Scotland.

French influence in Scotland grew under James V (r.1513–42), who married Mary of Guise, but the Scottish people and nobility became favorably inclined toward the Reformation, championed by John Knox. After James’s death, Mary ruled as regent for her daughter, Mary, Queen of Scots, who had married the dauphin of France, where she lived as dauphiness and later as queen. By the time Mary returned to Scotland (1561), after the death of her husband, most of the Scots were Protestants. A pro-English faction had the support of Queen Elizabeth I against the pro-French faction, and Mary, who claimed the throne of England, was imprisoned and executed (1587) by Elizabeth. Under Elizabeth, England in 1583 acquired its first colony, Newfoundland, and in 1588 defeated the Spanish Armada; it also experienced the beginning of a golden age of drama, literature, and music, among whose towering achievements are the plays of William Shakespeare.

### Oliver Cromwell and the Commonwealth

Elizabeth was succeeded by Mary’s son, James VI of Scotland, who became James I of England (r.1603–25), establishing the Stuart line. Under James and his son, Charles I (r.1625–49), the rising middle classes (mainly Puritan in religion) sought to make Parliament superior to the king. In the English Civil War, which broke out in 1642, Charles was supported by the Welsh, who had remained overwhelmingly Catholic in feeling, but most Scots opposed him. Charles was tried and executed in 1649, and Oliver

Cromwell as Protector ruled the new Commonwealth until his death in 1658. Cromwell ruthlessly crushed uprisings in Ireland and suppressed the Welsh. In 1660, Charles II, eldest son of the executed king, regained the throne. The Restoration was marked by a reaction against Puritanism, by persecution of the Scottish Covenanters (Presbyterians), by increased prosperity, and by intensified political activity; during this period, Parliament managed to maintain many of its gains. Charles II’s younger brother, James II (r.1685–88), who vainly attempted to restore Roman Catholicism, was overthrown in 1688 and was succeeded by his daughter, Mary II, and her Dutch husband, William III, who were invited to rule by Parliament. By this transfer of power, known to English history as the Glorious Revolution, the final supremacy of Parliament was established. Supporters of James II (Jacobites) in Scotland and Ireland, aided by France, sought to restore the deposed Stuart line, but their insurrection was suppressed in 1690 at the Battle of the Boyne, fought on the banks of the Irish river of that name.

In Wales, after Cromwell and the Commonwealth, the people began to turn to Calvinism; dissent grew, and such ministers as Griffith Jones, a pioneer in popular education, became national leaders. Most Welsh were won to the Calvinistic Methodist Church, which played a large part in fostering a nonpolitical Welsh nationalism. A long struggle to disestablish the Church of England in Wales culminated successfully in a 1914 act of Parliament.

### Colonial Expansion

English colonial expansion developed further in the 17th and 18th centuries, in competition with France and the Netherlands, while at the same time the English merchant marine gained commercial supremacy over the Dutch. The wars of the Grand Alliance (1688–97) and of the Spanish Succession (1701–14) consolidated Britain’s overseas possessions. At home, to ensure Scottish allegiance to England and prevent possible alliances with inimical countries, the Act of Union of Scotland and England was voted by the two parliaments in 1707, thereby formally creating the kingdom of Great Britain under one crown and with a single Parliament composed of representatives of both countries. This union held, despite Jacobite uprisings in 1715 and 1745–46, the latter under Prince Charles (Bonnie Prince Charlie, or the Young Pretender, grandson of James II); his defeat at Culloden Moor was the last land battle fought in Great Britain. Scottish affairs eventually became the province of the secretary of state for Scotland, a member of the British cabinet. Nevertheless, a nationalist movement demanding independence for Scotland persists to this day.

The accession of George I of the House of Hanover in 1714 (a great-grandson of James I) saw the beginning of the modern cabinet system, with the king leaving much of the governing to his ministers. The 18th century was a time of rapid colonial and mercantile expansion abroad and internal stability and literary and artistic achievement at home. Britain won control of North America and India in the Seven Years’ War (ended in 1763 by the Treaty of Paris), which also established British supremacy over the seas; however, the American Revolution (1775–83) cost Britain its most important group of colonies. A few years later, British settlement of Australia and then of New Zealand became key elements in the spreading British Empire. Britain increased its power further by

its leading role in the French Revolutionary Wars and in the defeat of Napoleon and French expansionist aims.

### Birth of the United Kingdom

In 1800, with the Act of Union of Great Britain and Ireland, the United Kingdom formally came into being. The conquest of Ireland had never been consolidated; the Act of Union followed an Irish rebellion in 1798 after the failure of a demand for parliamentary reform. But although the act established Irish representation in Parliament, the Irish question continued to cause trouble throughout the 19th century. Absentee landlordism, particularly in the 26 southern counties, fostered poverty and hatred of the English. Moreover, there was a growing division of interest between these counties and the six counties of the north, popularly called Ulster, where, early in the 17th century, Protestant Scots and English had settled on land confiscated by the British crown after a rebellion. While the north gradually became Protestant and industrial, the rest of Ireland remained Catholic and rural. With the introduction of the first Home Rule Bill in 1886, the northern Irish, fearing domination by the southern Catholic majority, began a campaign that ended in the 1920 Government of Ireland Act, which established separate domestic legislatures for the north and south, as well as continued representation in the UK Parliament. The six northern counties accepted the act and became Northern Ireland. The 26 southern counties, however, did not accept it; in 1921, the Anglo-Irish Treaty was signed, by which these counties left the United Kingdom to become the Irish Free State (now the Irish Republic, or Éire), which was officially established in 1922.

### Queen Victoria's Reign

The Industrial Revolution, beginning in the second half of the 18th century, provided the economic underpinning for British colonial and military expansion throughout the 1800s. However, the growth of the factory system and of urbanization also brought grave new social problems. The enclosure of grazing land in the Scottish highlands and the industrialization of southern Wales were accompanied by extensive population shifts and led to large-scale emigration to the United States, Canada, and Australia. Reform legislation came slowly, although the spirit of reform and social justice was in the air. Slavery was abolished throughout the British Empire in 1834. The great Reform Acts of 1832, 1867, and 1884 enfranchised the new middle class and the working class. Factory acts, poor laws, and other humanitarian legislation did away with some of the worst abuses, and pressure mounted for eliminating others. The long reign of Queen Victoria (1837–1901) saw an unprecedented commercial and industrial prosperity. This was a period of great imperial expansion, especially in Africa, where at the end of the century Britain fought settlers of predominantly Dutch origin in the South African (or Boer) War. Toward the end of the century, also, the labor movement grew strong, education was developed along national lines, and a regular civil service was finally established.

### The 20th Century

The vast economic and human losses of World War I, in which nearly 800,000 Britons were killed, brought on serious disturbances in the United Kingdom as elsewhere, and the economic depression of the 1930s resulted in the unemployment of millions of workers. In 1931, the Statute of Westminster granted the status

of equality to the self-governing British dominions and created the concept of a British Commonwealth of Nations. During the late 1930s, the government of Prime Minister Neville Chamberlain sought to avoid war by appeasing Nazi Germany, but after Hitler invaded Poland, the United Kingdom declared war on Germany on 3 September 1939. Prime Minister Winston Churchill led the United Kingdom during World War II in a full mobilization of the population in the armed services, in home defense, and in war production. Although victorious, the United Kingdom suffered much destruction from massive German air attacks, and the military and civilian death toll exceeded 900,000. At war's end, a Labour government was elected; it pledged to carry out a full program of social welfare "from the cradle to the grave," coupled with the nationalization of industry. Medicine was socialized, other social services were expanded, and several industries were put under public ownership. Complete nationalization of industry, however, was halted with the return to power of the Conservatives in 1951. During Labour's subsequent terms in office, from 1964 to 1970 and from 1974 to 1979, little further nationalization was attempted.

### Post-World War II Era

To a large extent, the United Kingdom's postwar history can be characterized as a prolonged effort to put the faltering economy on its feet and to cope with the economic, social, and political consequences of the disbandment of its empire. By early 1988, all that remained of what had been the largest empire in the world were 14 dependencies, many of them small islands with tiny populations and few economic resources. The United Kingdom has remained firmly within the Atlantic alliance since World War II. A founding member of the North Atlantic Treaty Organization (NATO) and European Free Trade Association (EFTA), the United Kingdom overcame years of domestic qualms and French opposition when it entered the European Community (EC) on 1 January 1973. After a Labour government replaced the Conservatives in March 1974, the membership terms were renegotiated, and United Kingdom voters approved continued British participation by a 67.2% majority in an unprecedented national referendum.

The principal domestic problems in the 1970s were rapid inflation, labor disputes, and the protracted conflict in Northern Ireland. Long-smoldering tensions between Protestants and Catholics erupted into open warfare after civil rights protests in 1969 by Catholics claiming discrimination and insufficient representation in the government. The Protestant reaction was violent, and the Irish Republican Army (IRA), seeking the union of Ulster with the Irish Republic, escalated the conflict by committing terrorist acts in both Northern Ireland and England. British troops, first dispatched to Belfast and Londonderry in August 1969, have remained there since.

On 30 March 1972, Northern Ireland's parliament (Stormont) was prorogued, and direct rule was imposed from London. Numerous attempts to devise a new constitution failed, as did other proposals for power sharing. In 1982, legislation establishing a new 78-member Northern Ireland Assembly was enacted. Elections were held that October, but the 19 Catholic members chosen refused to claim their seats. Meanwhile, the violence continued, one of the victims being the British war hero Earl Mountbatten of Burma, who was murdered while vacationing in Ireland on 27 Au-

gust 1979. In October 1980, IRA members imprisoned in Ulster began a series of hunger strikes; by the time the strikes ended the following October 10 men had died. In November 1985, the United Kingdom and the Irish Republic signed an agreement committing both governments to recognition of Northern Ireland as part of the United Kingdom and to cooperation between the two governments by establishing an intergovernmental conference concerned with Northern Ireland and with relations between the two parts of Ireland.

The “Downing Street Declaration” of December 1993 between British Prime Minister John Major and Irish Prime Minister Albert Reynolds over the future of Northern Ireland suggested that undisclosed contacts had been maintained for some time between the Irish Republican Army (IRA), Sinn Fein (the political wing of the IRA), and the British government. Tony Blair, who became prime minister in May 1997, also invested in normalization of relations between Ireland and the United Kingdom and in a long-term solution to the sectarian strife in Northern Ireland. In 1998, Ireland and the United Kingdom signed a peace agreement (Good Friday agreement) in which Ireland pledged to amend Articles 2 and 3 of the Irish constitution, which lay claim to the territory in the North. In return, the United Kingdom promised to amend the Government of Ireland Act.

In 1979, a Conservative government, headed by Margaret Thatcher, came to power with a program of income tax cuts and reduced government spending. Thatcher, who won reelection in 1983 and 1987, embarked on a policy of “privatizing”—selling to the private sector—many of the UK’s nationalized businesses. In foreign policy, the government’s most dramatic action was sending a naval task force to the Falkland Islands following Argentina’s occupation of the islands on 2 April 1982. After intense fighting, British administration was restored to the Falklands on 14 June.

Thatcher’s leadership was challenged by Conservative MPs in November 1990, and she failed to win the necessary absolute majority. Thatcher withdrew and was replaced by John Major. The Conservatives were returned to power in April 1992 with a reduced majority. Major’s government sought to redefine Conservative values with a renewed emphasis on law and order.

Labour Party leader Tony Blair was elected prime minister on 2 May 1997, ending 18 years of Conservative Party rule and signaling a major shift in British domestic policy (he was reelected in 2001 and 2005). Blair, who moved his party to the center of the political spectrum during the campaign, pledged initiatives to modernize Britain’s political structures. To that effect, he organized the creation of regional assemblies for Scotland and Wales and a municipal government for London. The regional parliaments were ratified by a referendum in late 1997 and began their first session in 1998. The city council for greater London came into being in mid-2000 and London’s first mayor in 15 years was Ken Livingstone (reelected 2004), a left-wing Labourite not much liked by the middle-of-the-road Blairites.

As promised, Blair’s government also restructured the House of Lords to do away with the large number of hereditary peers. Only 75 of the 650 hereditary peers now sit in the House of Lords alongside 500 life peers, several senior judges, 26 bishops of the Church of England, and 15 deputy speakers.

The Blair government has also spent much time in tackling the Northern Ireland problem. The Good Friday Accord of 1998 en-

visioned a Catholic-Protestant administration and the gradual decommissioning of the IRA. The power-sharing government came into being in December 1999, but was suspended 11 weeks later because the IRA refused to make any disarmament commitments. A breakthrough occurred in May 2000 when the IRA agreed to allow leading international figures to inspect arms dumps and to begin the process of complete and verifiable disarmament. The Protestant party voted to revive the power-sharing arrangements on 27 May 2000 and the UK government promised to restore substantial authority to the new Northern Irish cabinet (this was accomplished on 29 May). However, decommissioning of the IRA did not progress in early 2001. In October 2002, Sinn Fein’s offices at Stormont (the Northern Ireland Assembly) were raided due to a large police investigation into intelligence-gathering operations on behalf of Irish republicans. On 14 October, devolution was suspended due to the spying allegations and direct rule from London was reimposed on Northern Ireland. Blair announced in May 2003 elections for the National Assembly would be postponed, due to the lack of evidence of peaceful intentions on behalf of the IRA. Elections were held on 26 November 2003, however, with the pro-British Democratic Unionist Party (DUP) and Sinn Fein forming the two largest parties. On 28 July 2005, the IRA announced it would halt its armed campaign to oust British rule. The statement was received with skepticism by the DUP.

Prime Minister Blair offered strong support for the US-led war on terrorism begun after the 11 September 2001 attacks on the United States; British forces took part in the campaign in Afghanistan to oust the Taliban regime. The United Kingdom in 2002–03 also stood with the United States in its diplomatic and military efforts to force Saddam Hussein’s regime in Iraq to disarm itself of any weapons of mass destruction it might possess. The war in Iraq began on 19 March 2003. British forces fought side-by-side with US forces, especially in southern Iraq. In the aftermath of the war, Blair indicated a central role must be played by the UN in the reconstruction of Iraq; in this he stood with other European leaders. In October 2004, the Iraq Survey Group (ISG) concluded there had been no weapons of mass destruction in Iraq for some time before the war. British intelligence withdrew a controversial claim that Saddam Hussein could have used WMD with 45 minutes’ notice. Blair acknowledged that the intelligence had been flawed, but denied having misrepresented it in making the case for war. Another controversy related to the Iraq War was the publication by *The London Times* on 1 May 2005 of a memo (subsequently labeled the “Downing Street memo”) containing an overview of a secret 23 July 2002 meeting among British intelligence, government, and defense leaders discussing the build-up to the Iraq War. The memo included direct reference to classified US policy of the time and indicated that “intelligence and facts were being fixed” around the policy of removing Saddam Hussein from power. This was taken to show that US intelligence prior to the war had been deliberately falsified, and not just mistaken. The memo suggested that the UN weapons inspections that began after 8 November 2002 were manipulated to provide a legal pretext for the war, and that the removal by force of the Iraq regime had been planned prior to the date of the secret British meeting. In the United States, demands for an explanation of the revelations contained in the memo and calls for a formal Congressional inquiry were ignored by the Bush administration.

In mid-2005 the United Kingdom was wracked by terrorist violence. On 7 July 2005 four suicide bombers struck London's transit system, killing 52 people and injuring more than 700. Three underground trains were bombed, as was one double-decker bus. Two weeks later, on 21 July, bombings of three underground trains and one bus were attempted, but the suicide bombers' bombs failed to fully detonate. On 22 July, a Brazilian man, Jean Charles de Menezes, was shot to death at the Stockwell underground station by British police who believed him to be implicated in the bombing attempts. He was found not to have played any role in the 21 July attacks.

The United Kingdom remains one of three European Union (EU) members not adopting European economic and monetary union and embracing the euro as its currency. The other two nations are Denmark and Sweden.

### 13 GOVERNMENT

The United Kingdom is a monarchy in form but a parliamentary democracy in substance. The sovereign—Elizabeth II since 1952—is head of state and as such is head of the legislature, the executive, and the judiciary, commander-in-chief of the armed forces, and temporal head of the established Church of England. In practice, however, gradually evolving restrictions have transmuted the sovereign's legal powers into instruments for affecting the popular will as expressed through Parliament. In the British formulation, the sovereign reigns but does not rule, for the sovereign is under the law and not above it, ruling only by approval of Parliament and acting only on the advice of her ministers.

The United Kingdom is governed, in the name of the sovereign, by Her Majesty's Government—a body of ministers who are the leading members of whichever political party the electorate has voted into office and who are responsible to Parliament. Parliament itself, the supreme legislative authority in the realm, consists of the sovereign, the House of Lords, and the House of Commons. Northern Ireland had its own parliament (Stormont) subordinate to Westminster; however, because of civil strife in Ulster, the Stormont was prorogued on 30 March 1972, and direct rule was imposed from Westminster. After several abortive attempts over the next decade to devise a system of home-rule government acceptable to both Protestant and Catholic leaders, the 78-member Northern Ireland Assembly was established in 1982, but it was dissolved in 1986. As a result of the 1998 "Good Friday Agreement," a Catholic-Protestant power-sharing government came into being in 1999. It was suspended in October 2002, and direct rule from London returned.

In 1979, proposals for the establishment of elected legislatures in Wales and Scotland failed in the former and, though winning a bare plurality, fell short of the required margin for approval (40% of all eligible voters) in the latter. Regional parliaments for Scotland and Wales were ratified by referendum in 1997, however, and they began their first sessions in 1998.

The sovereign formally summons and dissolves Parliament. The House of Lords, whose size has been greatly reduced, used to count about 1,200 peers, including hereditary peers, spiritual peers (archbishops and bishops of the Church of England), and life peers (eminent persons unwilling to accept a hereditary peerage). Over the centuries, its powers have gradually been reduced; today, its main function is to bring the wide experience of its

members into the process of lawmaking. As of 2005, the House of Commons had 646 members. A general election must be held every five years but is often held sooner. All British subjects 18 years old and over may vote in national elections; women won equal franchise with men in 1922. Citizens of Ireland resident in Britain may also vote, as may British subjects abroad for a period of five years after leaving the United Kingdom.

Each Parliament may during its lifetime make or unmake any law. Parliamentary bills may be introduced by either house, unless they deal with finance or representation; these are always introduced in the Commons, which has ultimate authority for lawmaking. The House of Lords may not alter a financial measure or delay for longer than a year any bill passed by the Commons in two successive sessions. Bills passed by both houses receive the traditional royal assent and become law as acts of Parliament; no bill has received a royal veto for more than 200 years. The Speaker of the Parliament is the chief officer of the House of Commons. The Speaker is nonpartisan and functions impartially. The first female Speaker was elected in 1992.

Executive power is vested in the prime minister, who, though nominally appointed by the sovereign, is traditionally the leader of the majority party in Parliament. The prime minister is assisted by ministers, also nominally appointed by the sovereign, who are chosen from the majority party and mostly from the Commons, which must approve the government's general policy and the more important of its specific measures. The most senior ministers, about 20, compose the cabinet, which meets regularly to decide policy on major issues. Ministers are responsible collectively to Parliament for all cabinet decisions; individual ministers are responsible to Parliament for the work of their departments. There are around 30 major central government departments, each staffed by members of the permanent civil service.

The British constitution is made up of parliamentary statutes, common law, and traditional precepts and practices known as conventions, all evolved through the centuries. Largely unwritten, it has never been codified and is constantly evolving.

### 14 POLITICAL PARTIES

UK parliamentary government based on the party system has evolved only during the past 100 years. Although the 18th-century terms "Whig" and "Tory" indicated certain political leanings, there was no clear-cut division in Parliament and no comprehensive party organization. Not until the 19th-century Reform Acts enfranchised millions of new voters did the modern party system develop. The British party system is based on the assumption that there are at least two parties in the Commons, each with a sufficiently united following to be able to form an alternative government at any time. This assumption is recognized in the fact that the largest minority party is officially designated as Her Majesty's Opposition; its leader, who designates a "shadow government," is paid a salary from public funds.

The main political parties represented in Parliament today are the Labour Party, the Conservative Party, and the Liberal Democrats (a coalition of the Liberal and Social Democratic parties, which voted in favor of a formal merger in 1988). From time to time during the past 50 years, other parties have arisen or have splintered off from the main groups, only to disappear or to become reabsorbed. Thus, the Fascists, who were of some signifi-

cance before World War II, no longer put up candidates for elections. The British Communist Party has not elected a candidate to Parliament since 1950.

Since World War I, the Labour Party has replaced the Liberal Party, a major force during the late 19th century, as the official opposition to a Conservative government. Founded in 1900 as the political arm of the already powerful trade union movement, the Labour Party was until 1918 a federation of trade unions and socialist groups and had no individual members. Today, its constituent associations consist of affiliated organizations (such as trade unions, cooperative societies, branches of socialist societies, and trade councils), as well as individual members organized into wards. Its program calls for public ownership of the means of production, improvement of the social and economic conditions of the people, defense of human rights, cooperation with labor and socialist organizations of other countries, and peaceful adjustment of international disputes. Between the world wars, it established two short-lived Labour governments while still a minority party, and then joined Churchill's coalition government in World War II. Returned to power with a huge majority in 1945, Labour instituted a program of full employment through planned production; established social services to provide adequate medical care, old age care, nutrition, and educational opportunities for all; began the nationalization of basic industries; and started to disband the empire by granting independence to India, Pakistan, Ceylon (now Sri Lanka), and Burma (Myanmar).

If the rapid rise of the Labour Party has been an outstanding feature of 20th-century British politics, the continuing vitality and adaptability of the Conservative Party, successor of the 18th-century Tories, has been no less remarkable. In foreign affairs, there has been little difference between the parties since World War II. Both have generally been firm allies of the United States, and both are pledged to the maintenance of NATO. The two parties have also been in general agreement about the country's social and economic needs. They differ mainly on the degree of state control to be applied to industry and commerce and on practical methods of application. Conservative emphasis is on free enterprise, individual initiative, and restraining the power of the unions. Even on these matters, however, pragmatism is the norm. In office, the Conservatives have let stand much of Labour's social program, and Labour, during Britain's economic difficulties in the late 1970s, imposed its own policy of wage restraints.

After World War II, Labour was in power during 1945–51, 1964–70, 1974–79, and since 1997; the Conservatives have held office during 1951–64, 1970–74, and 1979–97. Scottish National Party members were decisive in the fall of the Labour government in March 1979, after Labour was unable to enact its program for limited home rule (including elected legislatures) in Scotland and Wales. In elections of 3 May 1979, after a campaign fought mainly on economic grounds, Conservatives won 339 seats, with 43.9% of the vote, to Labour's 268 seats, with 36.9%, and Margaret Thatcher replaced James Callaghan as prime minister. Amid growing dissension, the Labour Party moved leftward in the early 1980s and broke with the Conservatives over defense policy, committing itself to the removal of all nuclear weapons from the United Kingdom and, in 1986, to the removal of US nuclear bases. The Social Democratic Party, founded in 1981 by moderate former Labour ministers, had by 30 September 1982 obtained 30 seats in Parlia-

ment, 27 of whose occupants were breakaway Labour members. In the elections of 9 June 1983, the Conservatives increased their parliamentary majority, winning 397 seats and about 42% of the vote. The Labour Party captured 209 seats and 28% of the vote, its poorest showing in more than five decades. The Alliance of Liberals and Social Democrats won 25% of the vote but only 23 seats (Liberals 17, Social Democrats 6). Minor parties took 5% of the vote and 21 seats.

In the elections of 11 June 1987, the Conservatives won 376 seats and about 42% of the vote. The Labour Party won 229 seats and 31% of the vote. The Liberal-Social Democratic Alliance won nearly 23% of the vote but only 22 seats (Liberals 17, Social Democrats 5). Minor parties took about 4% of the vote and 23 seats: Ulster Unionist (Northern Ireland), 9; Democratic Unionist (Northern Ireland), 3; Scottish National Party, 3; Plaid Cymru (Welsh Nationalist), 3; Social Democratic and Labour Party (Northern Ireland), 3; Sinn Fein (Northern Ireland), 1; and Popular Unionist (Northern Ireland), 1.

The general election of 9 April 1992 resulted in a continuation of Conservative government under John Major with 42% of the vote and 336 seats. Labour followed with 34% of the vote and 271 seats. The Liberal Democrats took almost 18% of the vote, which netted 20 seats. Minor parties received 3% of the vote and 17 seats.

The Labour Party, under the leadership of Tony Blair, won a landslide victory in the general election of 1 May 1997, restoring it to power for the first time in 18 years. Of 659 possible seats, the Labour Party won 418 (43.1%), gaining 146 seats; the Conservative Party won only 165 seats (30.6%), losing 178 seats. The Liberal Democrats won 46 seats (16.7%), a gain of 26 seats since 1992 and the most seats held by the party since the 1920s. Other parties received 9.6% of vote, with the following representation after the 1997 elections: Ulster Unionist, 10; Scottish National, 6; Plaid Cymru, 4; Social Democrat and Labour, 3; Democratic Unionist, 2; Sinn Fein, 2; Independent, 2; and United Kingdom Unionist, 1.

The June 2001 election was called "the quiet landslide" following the major victory of the Labour Party in the 1997 election. Labour won 40.7% of the vote and secured 413 seats; the Conservative Party gained only one seat (166) and registered 31.7% of the vote. The Liberal Democrats gained six seats (52; 18.3% of the vote) from their historic high in 1997. Other parties received 9.3% of the vote, with the following representation after the 2001 election: Ulster Unionist, 6; Scottish National, 5; Democratic Unionist, 5; Plaid Cymru, 4; Sinn Fein, 4; Social Democrat and Labour, 3; and Independent, 1.

In the general election held on 5 May 2005, Labour lost 47 seats but retained its majority with 356 seats in Parliament (35.3% of the vote); the Conservatives gained 33 seats to end up with 198 (32.3% of the vote). The Liberal Democrats held 62 seats after gaining 11 (22.1% of the vote). Other parties garnered 10.3% of the vote, with the following representation in Parliament after the election: Democratic Unionist Party, 9; Scottish National Party, 6; Sinn Fein, 5; Plaid Cymru, 3; Social Democrat and Labour Party, 3; Ulster Unionist Party, 1; Independent Kidderminster Hospital and Health Concern, 1; and others, 2. The next parliamentary election was to be held in May 2010.

## 15 LOCAL GOVERNMENT

The scope of local governing bodies is defined and limited by acts of Parliament, which also makes certain ministers responsible for the efficient functioning of local services. In England, local government is supervised by the Department of the Environment; the regional parliaments supervise local governments in Wales and Scotland; and Northern Ireland, which was supposed to also have devolved powers, was placed back under the supervision of the Department of the Environment for Northern Ireland.

From 1965 to 1985, Greater London, the nation's largest metropolitan area, was subdivided into 32 London boroughs; the Greater London Council was the chief administrative authority. Under the Local Government Act of 1985, however, the Greater London Council was abolished and its functions were transferred to London borough and metropolitan district councils, excepting certain services (such as police and fire services and public transport) now administered by joint borough and council authorities. The Labour Party government returned local government to London. However, the mayor's office has a limited budget and few policy powers. The mayor's office coordinates relationship among the different boroughs and controls local transport (Underground).

Under the Local Government Act of 1972, the county system that had prevailed throughout the rest of England and Wales was replaced by a two-tier structure of counties and districts. In the 1990s, local governmental structures were reorganized, and single-tier administrations with responsibility for all areas of local government were reestablished. There are currently 46 unitary authorities in England, and 34 shire counties split into 238 non-metropolitan districts. These in turn are subdivided into electoral wards and districts. In 2000, a two-tier structure was reestablished for London; it has 32 boroughs and the City of London. Scotland is subject to the administration of both the UK government in Westminster and the Scottish executive in Edinburgh, and Wales is subject to the administration of Westminster and the National Assembly for Wales in Cardiff. Scotland is divided into 32 council areas, which in turn are divided into electoral wards and communities. Wales is subdivided into 22 unitary authorities, which in turn are divided into electoral divisions and communities. Northern Ireland is subject to the administration of both the UK government and the Northern Ireland Executive in Belfast. It is divided into 26 districts, which in turn are divided into electoral wards. The United Kingdom has more than 10,000 electoral wards/divisions. The minimum voting age in local elections is 18.

## 16 JUDICIAL SYSTEM

The United Kingdom does not have a single body of law applicable throughout the realm. Scotland has its own distinctive system and courts; in Northern Ireland, certain spheres of law differ in substance from those operating in England and Wales. A feature common to all UK legal systems, however—and one that distinguishes them from many continental systems—is the absence of a complete code, since legislation and unwritten or common law are all part of the “constitution.”

The main civil courts in England and Wales are 218 county courts for small cases and the High Court, which is divided into the chancery division, the family division, and the Queen's Bench division (including the maritime and commercial courts), for the

more important cases. Appeals from the county courts may also be heard in the High Court, though the more important ones come before the Court of Appeal; a few appeals are heard before the House of Lords, which is the ultimate court of appeal for civil cases throughout the United Kingdom. In Scotland, civil cases are heard at the sheriff courts (corresponding roughly to the English county courts) and in the Outer House of the Court of Session, which is the supreme civil court in Scotland; appeals are heard by the Inner House of the Court of Session. Trial by jury in civil cases is common in Scotland but rare in the rest of the United Kingdom.

Criminal courts in England and Wales include magistrates' courts, which try less serious offenses (some 96% of all criminal cases) and consist most often of three unpaid magistrates known as justices of the peace, and 78 centers of the Crown Court, presided over by a bench of justices or, in the most serious cases, by a High Court judge sitting alone. All contested cases receive a jury trial. Cases involving persons under 17 years of age are heard by justices of the peace in specially constituted juvenile courts. Appeals may be heard successively by the Crown Court, the High Court, the Court of Criminal Appeal, and in certain cases by the House of Lords. In Scotland, minor criminal cases are tried without jury in the sheriff courts and district courts, and more serious cases with a jury in the sheriff courts. The supreme criminal court is the High Court of the Justiciary, where cases are heard by a judge sitting with a jury; this is also the ultimate appeals court.

All criminal trials are held in open court. In England, Wales, and Northern Ireland, 12-citizen juries must unanimously decide the verdict unless, with no more than two jurors dissenting, the judge directs them to return a majority verdict. Scottish juries of 15 persons are permitted to reach a majority decision and, if warranted, a verdict of “not proven.” Among temporary emergency measures passed with the aim of controlling terrorism in Northern Ireland are those empowering ministers to order the search, arrest, and detention of suspected terrorists and permitting juryless trials for terrorist acts in Northern Ireland.

Central responsibility for the administration of the judicial system lies with the lord chancellor (who heads the judiciary and also serves as a cabinet minister and as speaker of the House of Lords) and the home secretary (and the secretaries of state for Scotland and for Northern Ireland). Judges are appointed by the crown, on the advice of the prime minister, lord chancellor, or the appropriate cabinet ministries.

In 2005 Parliament passed the Constitutional Reform Act of 2005, which provides for a Supreme Court of the United Kingdom to abolish the appellate jurisdiction of the House of Lords and to reduce the role of the lord chancellor, among other changes.

The United Kingdom accepts the compulsory jurisdiction of the International Court of Justice with reservations.

## 17 ARMED FORCES

After the general demobilization that followed World War II, compulsory national service for all eligible males over 19 years of age was introduced. Call-ups of national servicemen ceased in 1960, but those who had been trained formed part of the general reserve until June 1974, when the national service legislation expired. Reserves now form part of the long-term reserve established in 1964, composed of all men under 45 years of age who have served in

the regular army since 28 February 1964, plus the highly trained units of the territorial army volunteer reserve. Home service forces are stationed in Northern Ireland, Gibraltar, and the Falkland Islands.

Total active army strength in 2005 was 116,760. Equipment included 543 main battle tanks, 475 reconnaissance vehicles, 575 armored infantry fighting vehicles, 2,503 armored personnel carriers, and 877 artillery pieces. The navy had 26,430 personnel including 7,000 Royal Marines and 6,200 naval aviation personnel. Major units of the British fleet included 15 nuclear submarines (four SSBNs; 11 SSNs), three aircraft carriers, 11 destroyers, 20 frigates, 24 coastal/patrol, 22 mine warfare, and three amphibious and 26 logistical/support ships. The Royal Air Force had a strength of 48,140 active personnel, with 339 combat capable aircraft, including 128 fighters, 117 strike/fighter ground attack, and 74 pure fighter ground attack aircraft. As of 2005, the United Kingdom's strategic missile force was based on 58 submarine launched ballistic missiles (SLBMs) with fewer than 200 operational warheads.

Basing its defense policy on NATO, the British government in the 1970s reduced its overseas commitments. The defense budget for 2005 was \$51.1 billion. British troops participate in a number of peacekeeping missions. The United States has 9,800 military personnel stationed in the United Kingdom.

## 18 INTERNATIONAL COOPERATION

The United Kingdom became a charter member of the United Nations on 24 October 1945; it participates in the ECE, ECLAC, and ESCAP, as well as in all the nonregional specialized agencies. The United Kingdom is a permanent member of the UN Security Council. The United Kingdom is also a member of the Council of Europe, the European Union, NATO, OECD, OSCE, the African Development Bank, the Asian Development Bank, the Caribbean Development Bank, G-5, G-7, G-8, the Paris Club (G-10), and the WTO. The headquarters of the IMO is in London. The country holds observer status in the OAS.

The Commonwealth of Nations, an organization of 49 states, provides a means for consultation and cooperation, especially on economic matters, between the United Kingdom and its former colonies. Its main coordinating organ is the Commonwealth Secretariat, which was established in London in 1965 and is headed by a secretary-general appointed by the heads of the member governments. The heads of governments hold biennial meetings; meetings also are held by diplomatic representatives known as high commissioners and among other ministers, officials, and experts.

Despite controversy within the nation itself, the United Kingdom has been a strong supporter of the US-led international war on terrorism. The country has support UN missions and operations in Kosovo (est. 1999), Liberia (est. 2003), Sierra Leone (est. 1999), Georgia (est. 1993), the DROC (est. 1999), and Cyprus (est. 1964), among others. The United Kingdom is part of the Australia Group, the Zangger Committee, the European Organization for Nuclear Research (CERN), the Nuclear Suppliers Group (London Group), the Nuclear Energy Agency, and the Organization for the Prohibition of Chemical Weapons. The nation holds guest status in the Nonaligned Movement.

In environmental cooperation, the United Kingdom is part of the Antarctic Treaty; the Basel Convention; Conventions on Biological Diversity, Whaling, and Air Pollution; Ramsar; CITES; the

London Convention; International Tropical Timber Agreements; the Kyoto Protocol; the Montréal Protocol; MARPOL; the Nuclear Test Ban Treaty; and the UN Conventions on the Law of the Sea, Climate Change and Desertification.

## 19 ECONOMY

The United Kingdom—one of the most highly industrialized countries in the world, with the world's fourth-largest economy, and one of four countries in Western Europe with a trillion dollar economy (the others are Germany, France, and Italy)—lives by manufacture, trade, and financial and commercial services. Apart from coal and low-grade iron ore, some timber, building materials, and natural gas and North Sea oil, it has few natural resources. Agriculture provides 60% of the food needed with only about 2% of the labor force. The remainder of the United Kingdom's food supply and most raw materials for its industries have to be imported and paid for largely through exports of manufactures and services. The United Kingdom is in fact one of the world's largest markets for food and agricultural products and the fifth-largest trading nation. Vast quantities of imported wheat, meat, butter, livestock feeds, tea, tobacco, wool, and timber have been balanced by exports of machinery, ships, locomotives, aircraft, and motor vehicles. The pattern of exports is gradually changing, however. Post World War II reduction in output of textiles—once a leading British export—due to competition from Asia, and in coal output, because of competition from oil and mines in Europe, has been offset by industries such as electronics and chemicals. A major source of earnings is the variety of commercial services that stem from the United Kingdom's role as central banker of the sterling area. Shipping, income from overseas investment, insurance, and tourism also make up an important part of the economy.

The British economy is one of the strongest in Europe: as of the early 2000s, inflation, interest rates, and unemployment remained low. Since the 1979–81 recession, the British economy has posted steady gains. Between 1983 and 1990, real GDP increased by nearly 25%. Individual productivity increased by 14% during the 1980–85 period and another 25% during 1985–90. In less than a decade, the United Kingdom went from heavy dependence on imported oil to energy self-sufficiency, but this ended in 1989, although the United Kingdom's dependence on energy imports in the 1990s was far lower than in the past. Inflation fell from 18% in 1980 to an annual rate of 1.9% by July 1987. However, it averaged 6.3% a year during 1988–92 before falling to 1.6% in 1993. From 1994 to 1997, annual growth was over 3% (3.125%), but fell an average 2.5% from 1998 to 1999. An increase to 3.1% in 2000 was slowed to 2% and 1.6% in the global economic slowdown of 2001–03, exacerbated by the high value of the pound and the bursting of the “new economy” bubble, which hurt manufacturing and exports. Inflation, which stood at 2.7% in 1998, had fallen to 2.2% in 2002. After falling to 5.8% in 1990, the unemployment rate crept up to 10.4% in 1993 but declined to 8% in 1995, and 7.5% in 1998. In 2002, recorded unemployment was 5.1%. The estimated unemployment rate in 2004 was 4.8%. Real GDP growth stood at an average 2.3% from 2001–05. Inflation during that period averaged 1.5%. Real GDP grew by 1.8% in 2005, and was forecast to expand by just 1.6% in 2006, before rebounding to 2.1% in 2007.

In the 1980s and 1990s, the government privatized many major companies, as well as a number of subsidiaries of nationalized

industries and other businesses. Among the major companies privatized were British Telecom, British Gas, British Steel, British Airways, British Aerospace, Rolls-Royce, Austin Rover, Cable and Wireless, ICL, British water utilities, British Coal, and British Rail.

## 20 INCOME

The US Central Intelligence Agency (CIA) reports that in 2005 the United Kingdom's gross domestic product (GDP) was estimated at \$1.9 trillion. The CIA defines GDP as the value of all final goods and services produced within a nation in a given year and computed on the basis of purchasing power parity (PPP) rather than value as measured on the basis of the rate of exchange based on current dollars. The per capita GDP was estimated at \$30,900. The annual growth rate of GDP was estimated at 1.8%. The average inflation rate in 2005 was 3.2%. It was estimated that agriculture accounted for 1.1% of GDP, industry 26%, and services 72.9%.

According to the World Bank, in 2003 remittances from citizens working abroad totaled \$5.029 billion or about \$85 per capita and accounted for approximately 0.3% of GDP.

The World Bank reports that in 2003 household consumption in United Kingdom totaled \$1.174 trillion or about \$19,814 per capita based on a GDP of \$1.8 trillion, measured in current dollars rather than PPP. Household consumption includes expenditures of individuals, households, and nongovernmental organizations on goods and services, excluding purchases of dwellings. It was estimated that for the period 1990 to 2003 household consumption grew at an average annual rate of 3.1%. In 2001 it was estimated that approximately 14% of household consumption was spent on food, 9% on fuel, 3% on health care, and 3% on education. It was estimated that in 2002 about 17% of the population had incomes below the poverty line.

## 21 LABOR

The total workforce of the United Kingdom in 2005 was estimated at 30.07 million. As of 2004, the services sector accounted for 79.5% of the labor force, with industry at 19.1% and agriculture only 1.5%. Between 1983 and 1992 there was a substantial shift in employment from previously dominant manufacturing to service industries. Employment in industry, which had been 7,788,000 in 1983, was down to 4,986,000 in 1998. The unemployment rate in 2005 was estimated at 4.7%.

The Employment Relations Act protects union organization, the statutory right to strike, and minimum employment standards. Nearly all trade unions of any size are affiliated with the Trades Union Congress (TUC), the national center of the trade union movement. There is also a separate Scottish Trades Union Congress. The legal status of the trade unions is defined by the Trade Union and Labor Relations Act of 1974. Restrictions on the power of the trade unions are embodied in the Employment Acts of 1980 and 1982 and in the Trade Union Act of 1984. As of 2005, about 29% of Britain's workforce was unionized. In the public sector, 57% of the labor force belongs to a union, while in the private sector only 17% are union members.

The standard workweek is limited to 48 hours, which is averaged over a period of 17 to 26 weeks. Besides the statutory public holidays, most employees have at least four weeks' annual vacation with pay. Children under the age of 16 are not permitted

to work unless it is part of an educational experience. Children under age 13 are prohibited from working in any capacity. As of 2005, the national minimum wage rate varied from \$7.45 per hour to \$8.82 per hour depending upon the employee's age. Although these rates are insufficient to provide a decent living standard, the gap is filled by a range of government benefits, which includes free medical care under the National Health Service.

## 22 AGRICULTURE

Agriculture is intensive and highly mechanized, producing about 60% of the United Kingdom's food needs. Agriculture's importance has declined in recent years; including forestry and fishing, it contributed about 1% to the GDP in 2003, down from 2.3% in 1971. In 2003, agricultural products accounted for 4.9% of exports and there was an agricultural trade deficit of almost \$20.2 billion (second after Japan). Agriculture engages 1% of the labor force.

Nearly 24% of Great Britain's land area was devoted to crops in 2003. There were about 280,600 holdings, down from 422,000 in the late 1960s. In Great Britain roughly 70% of the farms are primarily or entirely owner-occupied, but in Northern Ireland nearly all are.

Most British farms produce a variety of products. The type of farming varies with the soil and climate. The better farming land is generally in the lowlands. The eastern areas are predominantly arable, and the western predominantly for grazing. Chief crops (with estimated 2004 production in tons) were barley, 5,860,000; wheat, 15,706,000; potatoes, 6,000,000; sugar beets, 7,600,000; oats, 652,000; and oilseed rape, 1,600,000. Mechanization and research have greatly increased agricultural productivity; between 1989 and 1999, for example, production of wheat per hectare rose 12%; of barley, 7%; and of sugar beets, 32%. The yield of cereal crops increased by almost 10% between 1992–94 and 2002–04. Consequently, the United Kingdom now produces about 60% of its total food needs, whereas prior to World War II (1939–45), it produced only about 33%, and in 1960, less than half. The estimated number of tractors in the United Kingdom in 2003 was 500,000, as against 55,000 in 1939; some 47,000 combines were also in use.

## 23 ANIMAL HUSBANDRY

Livestock continues to be the largest sector of the farming industry. The United Kingdom raises some of the world's finest pedigreed livestock and is the leading exporter of pedigreed breeding animals. Most of the internationally famous breeds of cattle, sheep, hogs, and farm horses originated in the United Kingdom. In England and Wales, fattening of animals for food is the predominant activity in the southeast, the east, and the Midlands, while stock rearing is widespread in northern England and in Wales. In Scotland, dairying predominates in the southwest, cropping and fattening in the east, and sheep raising in the hilly regions. Northern Ireland's livestock industry provides 90% of its agricultural income.

In 2005, there were about 10,378,000 head of cattle (including two million dairy cows), 35,253,000 sheep and goats, and 4,851,000 hogs. There are also an estimated 157 million chickens. Output of livestock products for 2005 included 747,000 tons of beef and veal, 310,000 tons of mutton and lamb, 704,000 tons of

pork, 1,573,000 tons of poultry, 14,577,000 tons of milk, 133,000 tons of butter, and 399,000 tons of cheese.

The most highly reputed beef breeds are Hereford and Aberdeen Angus; distinguished dairy breeds are Guernsey, Jersey, and Ayrshire. To ensure sound breeding, there is compulsory licensing of bulls. On 20 March 1996 the British government reported concern over a possible link between bovine spongiform encephalopathy (BSE, or the so-called "Mad Cow" disease) in cattle and a new variant of Creutzfeldt-Jakob disease in humans. BSE was first identified in the United Kingdom in 1986. Transmission of BSE to cattle occurs from contaminated meat and bone meal in concentrate feed, with sheep or cattle as the original source. The United Kingdom is the only country with a high incidence of the disease, and the epidemic was mainly due to recycling affected bovine material back to cattle before a ban on ruminant feed began in July 1988. As a result, consumption of beef dropped and many countries banned imports of British cattle and beef.

## 24 FISHING

Lying on the continental shelf, the British Isles are surrounded by waters mainly less than 90 m (300 ft) deep, which serve as excellent fishing grounds and breeding grounds for fish. Small fishing villages are found all along the coast, but the modern large-scale industry is concentrated at Hull, Grimsby, Fleetwood, Yarmouth, and Lowestoft in England. The major herring landings are made at numerous east coast ports of Scotland, notably Aberdeen. The fishing industry has been declining, but it remains important to Scotland, which accounts for 67% by weight of all fish landings in the United Kingdom; England and Wales account for 30% and Northern Ireland for 3%.

The deep-sea fleet has declined in recent years, primarily because the adoption by most nations, including the United Kingdom, of a 200-mi fishery limit decreased the opportunity to fish in distant waters. Some of the larger vessels have, instead, turned to fishing for mackerel and herring off the west coast. The British fishing fleet had a capacity of 223,039 gross tons in 2004, about 12% of EU capacity. Landings of all types of fish by UK fishing vessels totaled 457,712 tons in 2004 (27% shellfish). Leading species caught that year were mackerel (115,299 tons), herring (56,214 tons), and haddock (45,384 tons). The United Kingdom exported \$1,669 million in fishery products in 2003, while imports were valued at \$2,507 million.

Salmon farming takes place primarily in Scotland; total UK production of farmed salmon in 2003 was around 145,600 tons. Domestic demand for seafood grew during the late 1990s due to public concerns over beef tainted by bovine spongiform encephalopathy (BSE, or Mad Cow disease).

## 25 FORESTRY

The estimated total area of woodland in 2002 was 2.8 million hectares (6.89 million acres), or over 10% of Great Britain's land area. Roughly 40% of the area is in England, 49% in Scotland, and 11% in Wales. State-owned forests cover 33% of the forest area, and 67% are in the private sector. The principal species in the forest area are spruces (34%), pines (22%), oak (9%) and larch (8%), with smaller amounts of beech, ash, birch, and fir. The lumber industry employs about 55,000, and supplies the United Kingdom with 13% of its timber demand. Because of the high proportion of unproduc-

tive woodland, largely a legacy of overfelling during the two world wars, major efforts have been directed toward rehabilitation.

The timber cut in 2004 yielded an estimated 8.1 million cu m (286 million cu ft) of roundwood. In 2004, UK sawmills cut 4.93 million cu m (174 million cu ft) of logs to produce 2.76 million cu m (97.4 million cu ft) of sawn lumber. Except for the two wartime periods, home woodlands have made only a limited contribution in this century to the national requirements in wood and wood products, almost 90% of which are met by imports. The United Kingdom imports softwood lumber from Canada, hardwood lumber and softwood plywood from the United States, hardwood veneer from Germany, hardwood plywood from Russia, and particleboard from Belgium.

The Forestry Commission promotes development of afforestation and increased timber production. Clearance of forests for agriculture began in the Neolithic and Bronze Ages, so that by the time of the Domesday survey in 1086, only 15% of England was forested. There was a considerable degree of reforestation in the second half of the 20th century. During 1990–2000, the total forest area increased by 0.6%.

## 26 MINING

Although the United Kingdom had comparatively few mineral resources (except for North Sea oil), it was a significant player in the world mining and mineral-processing industries, because of the extensive range of UK companies that had interests in the international mineral industry. An organized coal-mining industry has been in existence for over 300 years, 200 years longer than in any other country, and has traditionally been by far the most important mineral industry. Mine production of ferrous and nonferrous metals has been declining for more than 30 years, as reserves became depleted, necessitating imports for the large and important metal processing industry. Metals, chemicals, coal, and petroleum were among the country's leading industries in 2003, and fuels and chemicals ranked second and third, respectively, among export commodities. The industrial minerals sector has provided a significant base for expanding the extractive industries, and companies had a substantial interest in the production of domestic and foreign aggregates, ball clay, kaolin (china clay), and gypsum. The United Kingdom was a leading world producer and exporter of ball clay and kaolin; operations were mainly in Dorsetshire and Devonshire.

Other minerals extracted in 2003 included: common sand and gravel, 91 million tons (estimated); crushed limestone, 82 million tons (estimated); crushed dolomite, 12.950 million tons (reported); crushed igneous rock, 50.4 million tons (estimated); china clay kaolin (dry weight sales), 2.097 million tons (reported); ball and pottery clay (dry weight sales), 885,000 tons (reported); potash, 621,000 tons (reported); dimension sandstone, 250,000 tons (estimated); gypsum and anhydrite, 1.7 million tons (estimated); fluorspar (all grades), 56,000 tons (estimated); and crushed chalk, 8.5 million tons (estimated). Lead and hematite iron ore were worked on a small scale. The output of iron ore (gross weight) dropped from an estimated 1,000 metric tons in 1999, to 500 metric tons in 2003. Alumina was produced from imported bauxite. Zinc and tungsten are no longer mined. In 2003, the United Kingdom also produced barite and witherite, bromine, hydraulic cement, clays (including fire clay, fuller's earth, and shale), feldspar

(china stone), quicklime and hydrated lime, nitrogen, rock and brine salt, sodium compounds, slate, sulfur, pyrophyllite and soapstone talc, and titania. Most slate mining was in northern Wales, and the Penrhyn quarry, at Bethesda, was considered the world's largest, and has been in operation for more than 400 years. Small amounts of calcite stone were produced from 1999 through 2003.

Most nonfuel mineral rights in the United Kingdom were privately owned, except gold and silver, the rights to which were vested in the royal family and were known as Crown Rights. Onshore exploration activities were to be directed mainly toward precious metals, mainly gold. In Northern Ireland, the rights to license and to work minerals were vested in the state.

## 27 ENERGY AND POWER

The United Kingdom (UK) is the European Union's (EU) largest petroleum and natural gas producer, thanks to its offshore oil reserves in the North Sea. It is also one of Europe's largest consumers of energy.

The United Kingdom, as of 1 January 2005 had proven oil reserves estimated at 4.49 billion barrels, according to the Oil and Gas Journal. The bulk of these reserves are located in the North Sea, on the UK Continental Shelf. Sizable reserves also are located north of the Shetland Islands, with smaller amounts located in the North Atlantic. The United Kingdom also has Europe's largest onshore oil field, the Wytch Farm field. In 2004, oil production averaged an estimated 2.08 million barrels per day, with domestic consumption that year estimated at 1.86 million barrels per day. Net exports that same year averaged an estimated 0.22 million barrels per day. The United Kingdom's crude oil refining capacity, as of 1 January 2003 totaled an estimated 1.8 million barrels per day. British Petroleum (BP) has the most refining capacity in the United Kingdom, operating a 196,000 barrel-per-day facility in Grangemouth, Scotland, and a 163,000-barrel-per-day facility in Coryton, England. The largest refinery in the United Kingdom is the 321,000 barrel per day Fawley facility, operated by ExxonMobil. The United Kingdom is simultaneously a major importer and exporter of oil. Since North Sea oil is a light, high-quality oil, the United Kingdom exports this oil and imports crude oils of various qualities. In 2002, imports of petroleum, including crude oil, averaged 1,439,900 barrels per day, of which crude oil accounted for 1,060,110 barrels per day. In 2002, imports of dry natural gas totaled 180.11 billion cu ft.

As of 1 January 2005, the United Kingdom's proven natural gas reserves were estimated at 20.8 trillion cu ft. In 2002, natural gas production totaled an estimated 3.6 trillion cu ft, of which an estimated 3.3 trillion cu ft was consumed domestically. Net exports of natural gas that year were estimated at 0.3 trillion cu ft.

The United Kingdom is the fifth-largest producer of coal in the EU. In 2001, the country had recoverable coal reserves estimated at 1.65 billion short tons. According to the UK Department of Trade and Industry (DTI), a total of 31.1 million short tons were produced in 2003. However, this figure is down by 82% from the early 1970s. In addition, demand for coal has also dwindled. In 1970, according to the DTI, consumption fell from 175.9 million short tons to 68.7 million short tons in 2003. Falling domestic demand and a surge in cheap imported coal put coal imports at 35.7 million short tons in 2003. Of that total, 38% came from South Africa, 18% from Australia, and 16% from Russia. Also in

that year, electric power generation accounted for 86% of all coal consumption.

In 2003, according to the DTI, installed electric power generating capacity totaled 78.5 GW, of which conventional thermal plants accounted for 77% of capacity, followed by nuclear at 15%, hydropower at 5%, and 2% from other renewable sources. Electric power output in 2003 totaled 376.8 billion kWh, with consumption that same year at 399.8 billion kWh. Imports that year totaled 5.1 billion kWh, most of which came from France, according to the DTI. The UK electric power sector is privatized and competitive. Distributors and generators of electricity trade power on a wholesale market.

## 28 INDUSTRY

The United Kingdom is one of the most highly industrialized countries in the world. The industrial sector of the economy declined in relative importance after 1973, because of the worldwide economic slowdown; however, output rose in 1983 and 1984 and in 1985 was growing at an annual rate of 3%. Manufacturing accounted for 25.1% of GDP in 1985, 22.3% in 1992, and 26.3% in 2004. Since World War II, some traditional industries have markedly declined—e.g., cotton textiles, steel, shipbuilding, locomotives—and their place has been taken by newer industries, such as electronics, offshore oil and gas products, and synthetic fibers. The United Kingdom had a total oil refining capacity of 1.8 million barrels per day in 2005. In the chemicals industry, plastics and pharmaceuticals have registered the most significant growth.

The pattern of ownership, organization, and control of industry is varied: public, private, and cooperative enterprises are all important. The public sector plays a significant role; however, since 1979 the government has sold off a number of companies and most manufacturing is conducted by private enterprise. Although the average firm is still fairly small, there has been a trend in recent years toward the creation of larger enterprises.

Metals, engineering, and allied industries—including steel, nonferrous metals, vehicles, and machinery—employ nearly half of all workers in manufacturing. The United Kingdom's automotive industry produced 1.75 million automobiles in 2002. It also produced 14,682 heavy trucks in 2000. Britain's aerospace industry is among the world's foremost. Rolls-Royce, which was privatized in 1987, is one of the principal aero-engine manufacturers in the world. British Aerospace, nationalized during 1978–80 but now privately owned again, manufactures civil aircraft, such military aircraft as the Harrier and the Hawk advanced trainer, and guided weapons, including the Rapier ground-to-air missile.

While the relative importance of the textile and clothing industries has declined considerably since World War II, the United Kingdom continues to produce high-quality woolen textiles. Nevertheless, foreign competition has significantly cut into the textile industry. Following the expiration of the World Trade Organization's longstanding system of textile quotas at the beginning of 2005, the EU signed an agreement with China in June 2005, imposing new quotas on 10 categories of textile goods, limiting growth in those categories to between 8% and 12.5% a year. The agreement runs until 2007, and was designed to give European textile manufacturers time to adjust to a world of unfettered competition. However, barely a month after the EU-China agreement was signed, China reached its quotas for sweaters, followed soon

after by blouses, bras, T-shirts, and flax yarn. Tens of millions of garments piled up in warehouses and customs checkpoints, which affected both retailers and consumers.

Certain smaller industries in the United Kingdom are noted for the quality of their craftsmanship—e.g., pottery, jewelry, goldware, and silverware. Other sectors are the cement industry (which focuses on the manufacture of Portland cement, a British invention); the rubber industry, the world's oldest; paper industries; and leather and footwear. The industrial sector's 26.3% share of GDP in 2004 continues to demonstrate the importance of industry to the development of the British economy. The industrial production growth rate declined in 2004, however, to 0.9%. Industrial production was forecast to contract by 1.3% in 2005.

## 29 SCIENCE AND TECHNOLOGY

Great Britain, preeminent in the Industrial Revolution from the mid-18th to the mid-19th century, has a long tradition of technological ingenuity and scientific achievement. It was in the United Kingdom that the steam engine, spinning jenny, and power loom were developed and the first steam-powered passenger railway entered service. To British inventors also belongs credit for the miner's safety lamp, the friction match, the cathode ray tube, stainless steel, and the first calculating machine. One of the most famous scientific discoveries of the 20th century, the determination of the double-helix structure of the deoxyribonucleic acid (DNA) molecule, took place at the Laboratory of Molecular Biology at Cambridge University. In February 1997 the first successful cloning of an animal from an adult (resulting in "Dolly" the lamb) was performed at the Roslin Institute near Edinburgh, Scotland's leading animal research laboratory. The United Kingdom is also in the forefront of research in radio astronomy, laser holography, and superconductivity.

The total national expenditure for research and development (R&D) in 2002 was \$29.06 billion, or 1.88% of GDP. Of that amount, the business sector provided the largest portion at 46.7%, followed by the government at 26.9%. Foreign sources accounted for 20.5%, with higher education and private nonprofit organizations providing 1% and 4.9%, respectively. In 1998 (the latest year for which data was available) there were 2,691 scientists and engineers that were engaged in research and development per one million people. In 2002, of all bachelor's degrees awarded, 31.4% were in the sciences (natural, mathematics and computers, engineering).

The leading government agency for supporting science and technology is the Ministry of Defense, which plays an important role in both the United Kingdom's national security and its role in NATO. In addition, government-industry cooperation in aerospace, biotechnology and electronics have opened new frontiers in science. In 2002, high-tech exports were valued at \$71.481 billion and accounted for 31% of manufactured exports.

The largest issue facing British scientists, engineers and technicians is the challenge of providing new technological innovations in the global economy. In 1993, a government white paper, *Realizing our Potential*, called for the most sweeping changes in British science and technology since World War II. Among the changes called for in this white paper is the creation of a "technology forecasting program" which will allow scientists and engineers from all over Great Britain to have a more direct say in setting national

science and technology priorities. It is likely that many of the recommendations from the white paper will be incorporated into national science and technology priorities, including the technology forecasting program, over time.

The most prestigious scientific institution in the United Kingdom is the Royal Society, founded in 1660 in London. The British Association for the Advancement of Science, headquartered in London, promotes public understanding of science and technology.

## 30 DOMESTIC TRADE

London is the leading wholesale and importing center, accounting for more than half the total wholesale turnover. Other important distribution centers are Liverpool, Manchester, Bristol, Glasgow, and Hull.

Supermarkets have hurried to diversify into other businesses recently because of competition, falling prices, and a mature domestic market. As of 2005, the franchise industry was worth over £9 billion per year in the United Kingdom alone: the industry employs some 330,000 people, with more than 31,000 franchisees operating their own franchised business. Direct marketing is common. A value-added tax of 17.5% applies to most goods and services.

Normal banking hours are 9 AM to 5 PM, Monday through Friday, but this may vary in country areas. Business hours in London are 9 AM to 5:30 PM, Monday through Friday; shops in certain areas may be open to 7:30 one night a week, usually Wednesday or Thursday. Outside of London, the shops of each town or village may close for a half or full day at midweek. Saturday shopping hours are 9 AM to 5:30 PM. Sunday shopping is becoming increasingly available, from 10 AM to 4 PM.

## 31 FOREIGN TRADE

The United Kingdom—the world's fifth-largest trading nation, the fifth-largest exporter of goods, and the second-largest exporter of services—is highly dependent on foreign trade. It must import almost all its copper, ferrous metals, lead, zinc, rubber, and raw cot-

ton; most of its tin, raw wool, hides and skins, and many other raw materials; and about one-third of its food.

The United Kingdom's major export commodities are manufactured items, crude petroleum, chemicals, food, beverages, and tobacco. As of 2005, the top 14 best prospect sectors for trade and investment in the United Kingdom were aircraft and parts, apparel, automotive parts and service equipment, computers and peripherals, cosmetics and toiletries, drugs and pharmaceuticals, education and training, furniture, medical equipment, pollution control, renewable energy equipment, safety and security equipment, telecommunications equipment, and travel and tourism.

In 2004, the United Kingdom's major exports were finished manufactures (53% of total exports), semi-manufactures (29.6%), and oils and other fuels (9.4%). Major imports were finished manufactures (56.9% of all imports), semi-manufactures (24.2%), and food, beverages, and tobacco (8.9%). The United Kingdom's leading markets in 2004 were the United States (15% of all exports), Germany (11.5%), France (9.8%), and Ireland (7%). Leading suppliers were Germany (13.9% of all imports), the United States (8.8%), France (8%), and the Netherlands (7.2%). Exports of goods totaled \$349.6 billion in 2004, and imports totaled \$456.9 billion, resulting in a trade deficit of \$107.3 billion.

### 3<sup>2</sup> BALANCE OF PAYMENTS

Throughout the 1960s, revaluations of other currencies adversely affected the pound sterling. Large deficits in the balance of payments appeared in 1964 and 1967, leading to devaluation in November 1967. Another run on sterling prompted a decision to let the pound float on 23 June 1972. The pound then declined steadily, dropping below a value of \$2.00 for the first time on 9 March 1976. The oil crisis and the rise in commodity prices in 1974 were even harsher blows to the UK economy. Increasing unemployment, the worldwide recession, and a large budgetary deficit placed the government in an extremely difficult position, since replenishment

of currency reserves cost more in terms of sterling, and the need to curb inflation prevented expansion in the economy. Borrowing from the oil-producing states and the EU helped finance the deficits, but a further approach to the IMF became necessary. During the late 1970s, the United Kingdom's visible trade balance was generally negative, although surpluses on invisibles sometimes were sufficient to produce a surplus in the current account.

Increased North Sea oil exports helped produce substantial trade surpluses in 1980–82. The United Kingdom has run a deficit in visible trade since 1983, reaching a peak of \$47 billion in 1989, as consumer demand for imported goods ballooned. As recession took hold, imports fell, reducing the visible trade deficit dramatically in 1991. The devaluation of the pound, following the United Kingdom's late 1992 withdrawal from the EU's Exchange Rate Mechanism, increased the cost of imports at the end of 1992. However, the sterling's trade-weighted exchange rate index stabilized by 1995. In recent years, the export-oriented manufacturing sector has been challenged by an overvalued exchange rate. The United Kingdom is a major overseas investor (especially in the United States) and has an extremely important service sector, dominated by banking and insurance, which consistently generates invisible trade credits.

In 2002, the United Kingdom's current account balance was -\$13 billion, or -0.8% of GDP. The current account balance in 2003 was -1.6% of GDP. Exports of goods totaled \$349.6 billion in 2004, and imports totaled \$456.9 billion, resulting in a trade deficit of \$107.3 billion. The current account balance in 2004 was -\$33.46 billion.

### 3<sup>3</sup> BANKING AND SECURITIES

The United Kingdom is known throughout the world for its expertise in the field of banking, ranking third in the world after New York and Tokyo. Most activity takes place in the City of London, which has the greatest concentration of banks and the largest insurance market in the world. Until the Labour government of Tony Blair disengaged it from the Treasury, the Bank of England, established in 1694 as a corporate body and nationalized in 1946, held the main government accounts, acted as government agent for the issue and registration of government loans and other financial operations, and was the central note-issuing authority, with the sole right to issue bank notes in England and Wales (some banks in Scotland and Northern Ireland have limited note-issuing rights). It administered exchange control for the Treasury and is responsible for the application of the government's monetary policy to other banks and financial institutions. After its separation from the Treasury, the Bank of England retained the power to establish interest rates, while the Treasury continued to reign in public spending.

The banks handling most domestic business are mainly limited liability companies. The four major clearing commercial banking groups are Barclays, Lloyds, Midland, and National Westminster. These banks carry out most of the commercial banking in England and Wales. In Scotland, which has its own clearing system, there are three clearing banks: the Bank of Scotland, the Clydesdale Bank, and the Royal Bank of Scotland. Other institutions, notably the building societies, have begun to compete with the clearing banks by providing current and deposit account facilities.

SOURCE: *Balance of Payment Statistics Yearbook 2004*, Washington, DC: International Monetary Fund, 2004.

There are concerns that Frankfurt, Germany, will develop as the major financial center in the EU. The City of London's role in this context is under threat mainly because Frankfurt is the site of the European Central Bank, which controls monetary policy for the euro-area EU states.

The National Savings Movement, started in 1916, encourages widespread savings investment by small depositors in trustee savings banks and the National Savings Bank (formerly known as the Post Office Savings Bank), the largest organization of its kind in the world, with about 20,000 in post offices. Merchant banks are of great importance in the financing of trade, both domestic and overseas. In addition, about 275 overseas banks are directly represented in London.

After the "Big Bang"—the deregulation of the United Kingdom's financial markets—the Financial Services Act, which became law in November 1986, set out a system of self-regulating organizations (SROs) to oversee operations in different markets under the overall control of an umbrella body, the Securities and Investment Board (SIB). In 1996 there were five SROs covering the main financial activities, and since April 1988 any firm conducting investment business must have authorization to do so from the appropriate SRO. The International Monetary Fund reports that in 2001, M2—an aggregate equal to currency and demand deposits plus savings deposits, small time deposits, and money market mutual funds—was \$1.63 trillion. The money market rate, the rate at which financial institutions lend to one another in the short term, was 5.08%.

In 1762, a club of securities dealers was formed in London to fix rules for market transactions, and in 1773 the first stock exchange was opened in London. In 1801, the London Stock Exchange was constructed on part of its present site. Since that time, it has provided a market for the purchase and sale of securities and has played an important part in providing new capital for industry. The Stock Exchange opened to international competition in October 1986, permitting wider ownership of member firms. Minimum rates of commission on stock sales were abolished. In April 1982, the London Gold Futures Market began operations; it is the only market in Europe making possible worldwide, round-the-clock futures dealings in the metal. As of 2004, a total of 2,486 companies were listed on the London Stock Exchange, which had a market capitalization of £1.47 trillion.

### 34 INSURANCE

London is the leading international insurance center. Lloyd's, the world-famous society of private insurers, was originally established in the 17th century as a center for marine insurance but has since built up a worldwide market for other types of insurance.

The Central Statistical Office (CSO) recently compiled information on institutions whose primary business is the long-term investment of funds in the securities markets. It covers pension funds, insurance companies, investment trusts, unit trusts, and property trusts. Total net investment by institutions in 1994 was £45.4 billion (\$69.6 billion), down from the record £51.6 billion in 1993. The biggest net investment by an institutional group was that of the long-term insurance companies, with £24.2 billion of this total.

In the mid-1990s, total life insurance in force came to £1.04 trillion. In the United Kingdom, third-party automobile liability, em-

ployers' liability, nuclear facility liability, oil pollution liability, aircraft operators' liability and professional liability is compulsory, with the government having a monopoly on workers' compensation. In 2003, the value of all direct insurance premiums written totaled \$246.733 billion, of which life insurance premiums accounted for \$154.842 billion. For that same year, the top nonlife insurer was Norwich Union, with net written nonlife premiums of £5 billion, while the nations leading life insurer had gross written life insurance premiums of £8.148 billion.

### 35 PUBLIC FINANCE

The onset of recession in 1990 led to an increased level of public borrowing—about £14 billion in 1991–92, or 2.25% of GDP. By 1993–94, the public sector borrowing requirement had risen to £50 billion, or 8.1% of GDP. In 1994 the government initiated a series of stringent fiscal measures designed to curb the spiraling public sector borrowing requirement (PSBR). Since 1998, the United Kingdom has taken aggressive steps to reform its public spending activities. Reforms included limits on expenditures, higher governmental accountability regarding spending, better resource budgeting, and improved spending flexibility.

The US Central Intelligence Agency (CIA) estimated that in 2005 the United Kingdom's central government took in revenues of approximately \$881.4 billion and had expenditures of \$951 billion. Revenues minus expenditures totaled approximately -\$69.6 billion. Public debt in 2005 amounted to 42.2% of GDP. Total external debt was \$7.107 trillion.

The International Monetary Fund (IMF) reported that in 2003, the most recent year for which it had data, general government revenues were £441,048 million and expenditures were £478,748 million. The value of revenues was us\$720,078 million and expenditures us\$771,339 million, based on a market exchange rate for 2003 of us\$1 = £.6125 as reported by the IMF. Government outlays by function were as follows: general public services, 6.3%; defense,

6.9%; public order and safety, 5.2%; economic affairs, 7.9%; environmental protection, 1.3%; housing and community amenities, 1.9%; health, 17.0%; recreation, culture, and religion, 1.3%; education, 12.5%; and social protection, 39.8%.

### 36 TAXATION

Taxes on income include a graduated individual income tax and a corporation tax. Although personal income taxes are still high, they have been reduced several times since 1980.

As of 1 April 2004 the United Kingdom (UK) imposed a standard 30% corporate profits income tax rate. However, for companies with profits under £300,000, the rate was 19%. For companies with profits under £10,000, the rate was 0%. In addition, companies having profits up to £1.5 million, marginal relief was available. There is a 50% petroleum tax assessed on profits from all exploration and production which is deductible from other corporate tax. Capital gains are taxed at the standard corporate rate, but nonresidents companies are generally not taxed on capital gains derived from the sale of shares in a resident subsidiary company. However, companies that derive capital gains from the sale of assets that are located in and are used to carry on business activity in the United Kingdom are subject to the capital gains tax. Dividends are not taxed. Income from interest and royalties are subject to withholding taxes of 20% and 22%, respectively.

Income tax is charged on all income that has its origin in Britain and on all income arising abroad of persons resident in Britain. However, the United Kingdom has entered into agreements with many countries to provide relief from double taxation. Generally, the United Kingdom has a progressive personal income tax structure with a top rate of 40%. For the 2005/2006 fiscal year, a 10% rate was applied to taxable income up to £2,090. A 22% rate was applied on income up to £32,400, with a 40% rate on income above that amount. Inheritance taxes are 40%. Each taxpayer's marginal rate applies to capital gains in excess of £8,500. The main local taxes are land assessments, or "rates."

In January 1973, a value-added tax (VAT) was introduced with a standard rate of 10%, replacing the purchase tax, and bringing the UK's tax policy into harmony with the EU. In 1991, the standard rate was increased to 17.5% and in 1997, the reduced rate, applied to some medicines, medical equipment, heating oil, gas, electricity, small service businesses and some transportation services, was lowered from 8% to 5%. A zero rate applies to most foods, books, newspapers and periodicals, and certain other goods. Services such as insurance, health, education, and land and rents are also exempt. Other taxes are levied on petroleum products, tobacco, and alcoholic drinks. There are also various stamp duties.

### 37 CUSTOMS AND DUTIES

Import licensing and quotas were the general rule in the United Kingdom between 1939 and 1959. For specified items from specified countries or groups of countries, an individual license was required for each import. In June 1959, however, the United Kingdom began to remove important controls on virtually all raw materials and basic foodstuffs and on some machinery imported from the United States. With UK entry into the free trade area of the EU, a tariff-free area has been created. In addition, the United Kingdom uses the EU's common external tariff for non-EU imports. Rates range from 2–14% on most goods. The four princi-

pal types of import charges are customs duties, agricultural levies, value-added taxes, and excise duties on goods such as alcohol, tobacco, and tobacco products. The United Kingdom also levies a VAT on imports with a standard rate of 17.5%, with reduced rates ranging from 0–5%.

### 38 FOREIGN INVESTMENT

London is considered to be Europe's top financial and business center. London is the headquarters for some 130 of the top 500 global companies. With few exceptions, the United Kingdom does not discriminate between nationals and foreign individuals, and imposes few impediments to foreign ownership. Public-sector procurement policies seek best value and best practice regardless of national origin. The privatization of state-owned utilities is ongoing, and offers additional opportunities for foreign investment. The tax rate on the profits of large companies is 30%, but the effective tax burden is higher; it rose markedly after the Labour government assumed office in 1997.

Over the 10-year period 1992 to 2002, foreign direct investment (FDI) inflow totaled \$484.5 billion, the second highest in the world (after the United States by some distance: the United States' 10-year total was \$1.3 trillion). In 1997, FDI inflow rose 60% over 1996 to \$33.3 billion, placing the United Kingdom third in the world, behind the United States and China. FDI inflow peaked in 2000 at \$116.6 billion (a fourth-place finish, behind the United States, Belgium-Luxembourg, and Germany), and then fell to \$62 billion in the economic slowdown of 2001. The stock of inward FDI by yearend 2003 was \$672 billion. Direct investment inflows in 2003 were \$14.5 billion, down from \$27.8 billion in 2002. From 2001–05, FDI inflows averaged 2.9% of GDP.

The United Kingdom's outward FDI has normally exceeded its inward flow. Before World War I, British overseas investments were valued at more than \$30 billion (adjusted into 1960 dollars). Even in the period between the two world wars, British foreign investments remained remarkably high. After World War II, the United Kingdom, having given up many of its overseas dependencies and having incurred enormous foreign debts to wage the war, had to liquidate a large part of its overseas holdings. As its economy recovered, the United Kingdom again began to invest overseas. From 1955 to 1964, gross total private capital outflow was at an annual average of £300 million. The abolition of exchange controls in 1979 also encouraged overseas investment. By 1985, private British investment overseas (direct and portfolio) had risen to £76.7 billion (\$101 billion). In 1994, outward FDI amounted to £100 billion (\$154 billion). In 1997, the outflow was \$43.7 billion. By yearend 2003, the stock of outward UK FDI investment totaled \$1.129 billion. FDI outflows in 2003 totaled \$55.1 billion, up from \$35.2 billion in 2002.

The United States and the United Kingdom are the largest foreign investors in each other's country. By the end of 2003, the United States had invested \$273 billion (historical cost) in the United Kingdom. After the United States, the most popular destinations for outward UK FDI in 2003 were France and Canada. For inward FDI, the Netherlands was the largest overall investor in the United Kingdom in 2003, followed by the United States and Germany.

The United Kingdom is the most favored inward investment location in Europe, attracting over 40% of all direct investment in the EU.

### 39 ECONOMIC DEVELOPMENT

Like many other industrialized nations of the West, the United Kingdom has sought to combine steady economic growth with a high level of employment, increased productivity, and continuing improvement in living standards. Attainment of these basic objectives, however, had been hindered after World War II by recurrent deficits in the balance of payments and by severe inflationary pressures. As a result, economic policy has chiefly had to be directed toward correcting these two underlying weaknesses in the economy. When crises have arisen, emergency measures have often conflicted with long-term objectives. In 1967, for example, the government devalued the pound by 14% in order to improve the balance-of-payments position, but simultaneously increased taxes and reduced the growth rate of public expenditures in order to restrain home demand in both public and private sectors. Since the almost uninterrupted upward trend in prices resulted principally from the tendency for money income to rise faster than the volume of production, the government sought to institute a policy designed to align the rise in money income with increases in productivity.

Various bodies have been set up to foster economic development and improve industrial efficiency, notably the National Economic Development Council, established in 1962 but abolished in 1992, was responsible for the coordination of industry. Another important body, created in 1974, the National Enterprise Board, was set up to help plan industrial investment, particularly in manufacturing and export industries; the NEB was combined with the National Research and Development Corp. in 1981 to form the British Technology Group, which was privatized in 1991. The Labour government in the 1970s began to de-emphasize increased social services and government participation in the economy and to stress increased incentives for private investment. (A notable exception was in the exploitation of North Sea oil resources.) General investment incentives included tax allowances on new buildings, plants, and machinery. The Conservative government elected in 1979 sought to reduce the role of government in the economy by improving incentives, removing controls, reducing taxes, moderating the money supply, and privatizing several large state-owned companies. This policy was continued by succeeding Conservative governments into the 1990s. The election of a Labour government in 1997 did not reverse this trend. Indeed, privatization is now widely accepted by most of the Labour Party (with the exception of the dwindling numbers of the wing of the party with strong ties to trade unions).

The United Kingdom has long been a major source of both bilateral aid (direct loans and grants) and multilateral aid (contributions to international agencies) to developing countries. To coordinate the overall aid program and its proportions of bilateral and multilateral aid, capital aid, and technical assistance, the Ministry of Overseas Development was set up in 1962. Its functions were subsequently taken over by the Overseas Development Administration (ODA) and are now administered by the Department for International Development (DFID). Since 1958, the terms for development loans have progressively softened, and a policy of interest-free loans for the poorest developing countries was introduced in 1965. Unlike other donors, the United Kingdom provides funds to the recipient governments, rather than funding individual projects. The United Kingdom made a commitment to increase its of-

ficial development assistance (ODA) from 0.26% of GNP in 1997 to 0.33% in 2003–04 (the UN's target for donor countries' development aid is 0.7% of GNP). In 2004, the United Kingdom actually donated 0.34% of its GNP for development aid, or \$7.836 billion. The United Kingdom's aid budget was set to increase to over \$8.2 billion for 2005–06, and to \$10.6 billion by 2008.

The most important issue facing Britain in the early 2000s was membership in the Economic and Monetary Union (EMU). Labour Prime Minister Tony Blair decided to opt out of EMU at its inception in 1998 and promised a referendum on British membership. By 2005, however, there was little or no prospect of the United Kingdom holding a referendum on joining the EMU over the succeeding five years. The opposition Conservatives oppose abandoning the pound and have the support of a majority of the British population on the issue. The government in 2005 devoted its attention on the domestic front to improving such public services as health, education, and transportation. Large increases in public spending have been set aside for this purpose, but public finances have deteriorated to an extent due to lowered tax receipts. An additional long-term priority for the Labour government in 2005 was to implement reforms to raise the country's productivity performance, which remains below the OECD average.

Another long-term economic problem facing the United Kingdom is the aging of its population and the pressures this phenomenon will place on its pension system. By 2035 the number of pensioners in the United Kingdom will rise by 45% as the postwar baby boomer generation retires; by 2050 the increase will reach 55%. If these people are to maintain their standards of living in relation to the rest of society, the share of GDP transferred to them will have to rise sharply, from 9.4% in 2005 to 14.5% in 2050. One option is to raise the state pension age, which was 65 for men and 60 for women in 2005; the government's Pensions Commission proposes a yearly rise in the retirement age per decade, so that it would reach 68 by 2050. Higher public spending on pensions is another option, but that will mean workers will have to pay more taxes to support the aging population.

### 40 SOCIAL DEVELOPMENT

A gradually evolved system of social security, placed in full operation in 1948, provides national insurance, industrial injuries insurance, family allowances, and national assistance throughout the United Kingdom. The National Insurance scheme provides benefits for sickness, unemployment, maternity, and widowhood, as well as guardian's allowances, retirement pensions, and death grants. The program is financed by contributions from employees, employers, and the government. A percentage of these contributions are allocated to the National Health Service which provides extensive benefits to workers and their families. Retirement pensions cover men at 65 and women at 60, and benefits increase annually to adjust for cost of living. The first work injury law was instituted in 1897, and currently covers all employees with the exception of the self-employed. There is a universal child benefit and tax credit to residents with one or more children, funded by the government.

Financial assistance for the poor is provided through a system of benefits in the form of a supplementary pension for those over statutory retirement age and a supplementary allowance for others. It also provides temporary accommodation for the homeless

in specially designated reception centers. For poverty-stricken families in which the head of the household is in full-time employment, a family income supplement is paid. Maternity benefits cover women who have been employed for 26 weeks.

Equal opportunity between the sexes is provided for by law, although some discrimination against women continues. Sexual harassment is a problem in the workplace and women on average earn 18% less than men. Violence against women persists, however there are many laws providing protection and the substantial penalties are strictly enforced. In 2004 domestic violence accounted for one-fourth of all violent crime. The government is committed to children's rights and welfare.

Although racial discrimination is prohibited by law, people of Asian and African origin are subject to discrimination and harassment. Ethnic minorities are also more likely to be stopped and searched by police. The government at all levels fully respects the legal right to freedom of religion. Human rights organizations have criticized legislation in Northern Ireland which denies suspects the right to immediate legal counsel and the right to silence. There are also some security-related restrictions on the freedoms of assembly and association in Northern Ireland.

#### 41 HEALTH

Life expectancy has increased from 50 years at birth in 1900 to 78.38 years in 2005. Rising living standards, medical advances, the growth of medical facilities and their general availability, and the smaller size of the family are some factors in the improved health of the British people. Deaths from infectious diseases have been greatly reduced, although the proportion of deaths from circulatory diseases—including heart attacks and strokes—and cancer has risen. Infant mortality has decreased from 142 per 1,000 live births in 1900–02 to 5.16 in 2005. As of 2002, the crude birth rate and overall mortality rate were estimated at, respectively, 11.3 and 10 per 1,000 people. A high portion of women aged 15–44 used birth control in the mid-1990s (82%).

A comprehensive National Health Service (NHS), established in 1948, provides full medical care to all residents of the United Kingdom. NHS delivers health care through 129 health authorities, each of which receives money from the government and then purchases a preset amount of treatment each year from hospitals. Included are general medical, dental, pharmaceutical, and optical services; hospital and specialist services (in patients' homes when necessary) for physical and mental illnesses; and local health authority services (maternity and child welfare, vaccination, prevention of illness, health visiting, home nursing, and other services). The patient is free to choose a family doctor from any in the service, subject to the physician's acceptance. General tax revenues meet most of the cost of the NHS; the remainder is paid through National Health Insurance contributions and charges for certain items, including eyeglasses and prescription drugs. Compared with other OECD countries, the United Kingdom's per capita expenditure on health care is low. In the United Kingdom, 6.9% of the GDP went to health expenditures.

All specialist and auxiliary health services in England are the direct responsibility of the secretary of state for social services. In Wales, Scotland, and Northern Ireland the corresponding services and administrative bodies are under the respective secretaries of state. All hospitals, except a few run mostly by religious orders, are

also in the NHS. In 1991, the United Kingdom implemented major reforms in its health care services, including improvements in virtually all facets of the program. Areas of concern included incidence of coronary/stroke, cancer, accidents, mental illness, and HIV/AIDS. Smoking prevalence was similar between men (28%) and women (26%) over 15 years old. Half the British population is currently overweight. These high rates have been attributed to a sedentary lifestyle during leisure time.

The NHS has been undergoing restructuring; increased numbers of NHS hospitals are being decentralized by conversion to NHS Trust, established in 1991. NHS costs Britain's taxpayers more than \$73 billion per year. An aging population, costlier treatments, and a budget crisis have forced the cancellation of nonemergency treatment at some centers. The number of beds available is below the level of demand, causing long waits for treatment.

As of 2004, there were an estimated 166 physicians, 497 nurses, 40 dentists, 59 pharmacists and 43 midwives per 100,000 people. The immunization rates for children under one year of age were as follows: diphtheria, pertussis, and tetanus, 92%; polio, 94%; measles, 92%; and tuberculosis, 75%. The rates for DPT and measles were, respectively, 93% and 91%. Since 1982, to help control the spread of AIDS, the government has funded and implemented measures for blood testing, research, public education, and other social services relating to the disease. The HIV/AIDS prevalence was 0.20 per 100 adults in 2003. As of 2004, there were approximately 51,000 people living with HIV/AIDS in the country. There were an estimated 500 deaths from AIDS in 2003.

#### 42 HOUSING

At the 2001 census, there were about 25,456,000 dwellings in the United Kingdom. Of these, 21,207,000 were in England, 2,345,000 in Scotland, 1,274,000 in Wales, and 649,000 in Northern Ireland.

In England, 79.9% of all households lived in detached houses or bungalows and 19.7% lived in flats, maisonettes, or apartments. About 68% of all homes were owner occupied; 19% of households were renting from a social landlord (defined as a Council, Housing Association, or registered Social Landlord), and 12% were renting from a private owner. The average number of rooms per household was 5.33. In 2003, the estimated dwelling stock was at 21,464,000.

In Wales at the 2001 census, 88.2% of all households lived in houses or bungalows and 11.4% lived in flats, maisonettes, or apartments. About 71% of all homes were owner occupied; 18% were rented from social landlords and 11% were rented from private owners. The average number of rooms per household was 5.59. It was estimated that about 1.5 million households in England and Wales were overcrowded. The highest percentage was found in London, with about 17% of households overcrowded. In Wales, only about 4% of all households were overcrowded. Even so, the degree of overcrowding in the United Kingdom is lower than in most European countries.

In Scotland in 2001, 20% of all housing was in the form of detached homes, 20% were semidetached, 22% were terraced homes, and 8% were flats or maisonettes, and 4% other. The same year in Northern Ireland, 34% of dwellings were detached homes, 23% were semidetached homes, 35% were terraced homes, and 7% were flats or maisonettes, and 2% other. The 2003 estimate of dwelling stock for Northern Ireland was 669,000 dwellings.

Over 50% of families now live in a post-1945 dwelling, usually a two-story house with a garden. Most homeowners finance their purchase through a home mortgage loan from a building society, bank, insurance company, or other financial institution. New houses are built by both the public and private sectors, but most are built by the private sector for sale to owner-occupiers. The main providers of new subsidized housing are housing associations, which own, manage, and maintain over 600,000 homes in England alone and completed over nearly 30,000 new homes for rent or shared ownership per year in the mid-1990s. Local housing authorities were in the past primarily concerned with slum clearance; however, large-scale clearance virtually ended in the mid-1980s, with emphasis shifting to modernization of substandard homes and community improvement.

### 43 EDUCATION

Although responsibility for education in the United Kingdom rests with the central government, schools are mainly administered by local education authorities. The majority of primary students attend state schools that are owned and maintained by local education authorities. A small minority attend voluntary schools mostly run by the churches and also financed by the local authorities.

Education is compulsory for all children between the ages of 5 and 16. Since 1989, the government has introduced a "National School Curriculum" in England and Wales comprised of four key stages: five to seven (infants); 7 to 11 (juniors); 11 to 14 (pre-GCSE); and 14 to 16 (GCSE). Similar reforms are being introduced in Scotland and Northern Ireland. The main school examination, the General Certificate of Secondary Education (GCSE) is taken in England, Wales, and Northern Ireland at around the age of 16. A separate exam system exists in Scotland. Of the 2,500 registered independent schools, the largest and most important (Winchester, Eton, Harrow, and others) are known in England as "public schools." Many have centuries of tradition behind them and are world famous. The academic year runs from September to July.

In 2001, about 83% of children between the ages of three and four were enrolled in some type of preschool program. Primary school enrollment in 2003 was estimated at about 100% of age-eligible students. The same year, secondary school enrollment was about 95% of age-eligible students. Most students complete their primary education. The student-to-teacher ratio for primary school was at about 17:1 in 2003; the ratio for secondary school was about 19:1. In 2003, private schools accounted for about 4.9% of primary school enrollment and 55.8% of secondary enrollment.

Including the Open University, a nonresidential institution whose courses are conducted by television and radio broadcasts and correspondence texts, Britain had 47 universities in the 1990s (compared with 17 in 1945). As a result of legislation, nearly all polytechnics have become universities and started awarding their own degrees in 1993. The Universities of Oxford and Cambridge date from the 12th and 13th centuries, respectively; the Scottish universities of St. Andrews, Glasgow, Aberdeen, and Edinburgh from the 15th and 16th centuries. Besides the universities, there are more than 800 other institutions of higher education, including technical, art, and commercial colleges run by local authorities.

National policy stipulates that no person should be excluded from higher education by lack of means. More than 90% of stu-

dents in higher education hold awards from public or private funds. In 1997, the government began to reconsider its policy of cost-free tuition by announcing that students would become responsible for some of the expense. In 2003, it was estimated that about 64% of the tertiary age population were enrolled in tertiary education programs. The adult literacy rate has been estimated at about 99%.

As of 2003, public expenditure on education was estimated at 5.3% of GDP, or 11.5% of total government expenditures.

### 44 LIBRARIES AND MUSEUMS

London has more than 500 libraries, among them the British Library, which is the national library and the largest library in the United Kingdom, with about 150 million items in 2005 and an average acquisition rate of about 3 million items per year. Special collections and treasures include the Magna Carta, a notebook of Leonardo da Vinci, original manuscripts of Jane Austen and James Joyce (among others), and musical manuscripts of G.F. Handel and the Beatles (among others). There is a branch location of the British Library at Boston Spa, West Yorkshire. The National Library of Scotland, with about seven million volumes, is in Edinburgh, and the National Library of Wales, with some four million volumes, in Aberystwyth. Each of these is a copyright library, entitled to receive a copy of every new book published in the United Kingdom. The Bodleian Library at Oxford University is also a copyright library with about 6.7 million volumes; there are nine branch locations of the Bodleian in Oxford. Oxford University sponsors over 100 departmental libraries. The Cambridge University Library, also a copyright library, has 5.9 million volumes throughout five locations.

Other major libraries in London include the University of London Central Library (two million), the London Library (the largest public subscription library), the Science Museum Library (600,000), the Victoria and Albert Museum Art Library, the Public Record Office (containing such national historical treasures as the Domesday Book), and the libraries of such institutions as the Royal Institute of International Affairs (140,000), the Royal Commonwealth Society (150,000), the Royal Geographical Society (150,000), the Royal Academy of Arts (22,000), and the National Library for the Blind. In 2002 a Women's Library opened in London giving a home to publications documenting women's lives in Britain.

There are major libraries at the Universities of Edinburgh (2.4 million), Glasgow (1.4 million), Queen's University in Belfast (1.1 million), and St. Andrew's (920,000). Manchester Metropolitan University has one million volumes.

London has about 395 public libraries. The South Western Regional Library System links the public libraries of Bristol, Devon, Foursite (Somerset, South Gloucestershire, North Somerset, Bath and North East Somerset), Gloucestershire, Swindon, and Wiltshire. The Edinburgh City Libraries maintain a central library and 25 branch libraries, as well as a mobile unit and two lending locations, plus several hospitals. Over 50 public libraries in Scotland were established through the assistance of the industrialist Andrew Carnegie. Nearly all of the public libraries in Scotland are linked via the Internet. Public libraries in Northern Ireland are managed by five regional Education and Library Boards. The Belfast Education and Library Board maintains the Belfast Central

Library and 20 community public libraries, as well as two mobile libraries.

The United Kingdom is a museum-lover's dream. Almost every city and large town has museums of art, archaeology, and natural history. There are more than 1,000 museums and art galleries, ranging from nearly two dozen great national institutions to small collections housed in a few rooms. London has the British Museum (founded 1759), with its vast collections of archaeological and ethnographic material from all over the world, and the Victoria and Albert Museum, including extensive collections of works of fine and applied arts. In the late 1990s, the British Museum was struggling financially; trustees rejected admission fees, and a multimillion-dollar deficit was projected when the government, which had funded most of the \$84.5 million budget through the National Lottery, began reducing contributions. The National Gallery, the Tate Gallery, and the National Portrait Gallery are among other prestigious London art museums. Other museums located in London include the London Transport Museum (founded 1978), the National Maritime Museum (1934), the Natural History Museum (1963), and the Science Museum (1857). There is also a collection of royal ceremonial dress at Kensington Palace, and the Sherlock Holmes Museum, featuring Victorian memorabilia, opened in 1990. The Tate Gallery of Modern Art, featuring rotating exhibits arranged by theme, opened in May 2000. There are important museums and art galleries in Liverpool, Manchester, Leicester, Birmingham, Bristol, Norwich, Southampton, York, Glasgow, Leeds, and other cities. Oxford and Cambridge each have many museums, and several other universities also have important collections. Private art collections in historic family mansions are open to the public at specified times.

The National Museum and Gallery of Wales and the Museum of Welsh Life are in Cardiff. There is also a Welsh State Museum in Llanberis. The national museums of Scotland include the Royal Museum, the Museum of Scotland, and the National War Museum of Scotland, all in Edinburgh. The Museum of Scottish Country Life is in East Kilbride. There are at least three museums in Scotland that celebrate the life and work of native poet Robert Burns. The Ulster Museums and the Northern Irish Folk Museum are in Belfast.

## 45 MEDIA

The Post Office, founded in 1635, was the first in the world to institute adhesive stamps as proof of payment for mail. It now operates nearly all postal services. As authorized by 1981 legislation, the Thatcher government relaxed postal and telecommunications monopolies in some areas. The Telecommunications Act of 1984 further promoted competition and denationalized British Telecommunications (Telecom). In 2003, there were an estimated 591 mainline telephones for every 1,000 people. The same year, there were approximately 841 mobile phones in use for every 1,000 people.

Radio and television broadcasting services are provided by the British Broadcasting Corp. (BBC), which was established as a public corporation in 1927, and by the Independent Television Commission (ITC) and the Radio Authority, commercial concerns whose powers are defined in the Independent Broadcasting Authority Act of 1973. The BBC broadcasts on two television channels and the Independent Television Commission broadcasts

on ITV and Channel Four, which began operating in 1982. BBC Radio offers five national radio networks in the medium- and long-wave bands, as well as FM programming and an overseas service in 37 languages. Both the BBC and IBA operate local radio services; the BBC has 39 local stations (including 2 for the Channel Islands). In September of 1992, the first national commercial radio station, Classic FM, was inaugurated. Since then, several commercial stations have entered the market. As of 1999, there were 225 AM and 525 (mostly repeater) FM radio stations and 78 television stations. In 2003, there were an estimated 1,445 radios and 950 television sets for every 1,000 people. About 57.2 of every 1,000 people were cable subscribers. Also in 2003, there were 405.7 personal computers for every 1,000 people and 423 of every 1,000 people had access to the Internet. There were 21,034 secure Internet servers in the country in 2004.

There are over 100 daily and Sunday newspapers, some 2,000 weekly papers, numerous specialized papers, and about 7,000 periodicals in circulation throughout the United Kingdom. Nine Sunday papers and 12 daily morning papers are "national" in the sense of circulating throughout Britain. National dailies, with their political tendencies and their average daily circulations in 2004 (as available), are: *The Sun*, left of center, 3,301,223; *Daily Mail*, independent conservative, 2,403,528; *Daily Mirror*, independent left-wing, 1,777,408; *Daily Telegraph*, independent conservative, 907,048; *Daily Express*, independent conservative, 929,323; *Daily Star*, independent, 882,709; *The Times*, independent, 658,182; *The Observer*, 433,934; *Financial Times*, independent, 426,369; *The Guardian*, independent, 371,494; and *Evening Standard*, independent, 361,340. Of these, *The Times* was the only paper that showed an increase (of 4.3%) in sales from 2003, all others saw a decline in circulation.

In 2004, the newspaper with the highest circulation was the tabloid *News of the World*, which distributes over 3.7 million papers per week. Six other Sunday papers have circulations in the millions. The provincial press included more than 100 daily and Sunday newspapers and some 1,600 weeklies in 2004.

In 2004, major papers outside of London included: *The Express and Star*, Wolverhampton (162,509); *Manchester Evening News*, Manchester (148,094); *Liverpool Echo*, Liverpool (135,273); *Evening Mail*, Birmingham (104,219); *Evening Chronicle*, Newcastle-Upon-Tyne (91,523); the *Yorkshire Evening Post*, Leeds (81,804); and *Sunday Mercury*, Birmingham (79,527). The weekly *Berrow's Worcester Journal*, founded in 1690, claims to be the world's oldest continuously circulating newspaper.

Wales has five daily newspapers: *South Wales Echo* (in Cardiff, 59,200 circulation in 2004), *South Wales Evening Post* (West Glamorgan, 58,269), *Western Mail* (Cardiff, 44,470), *South Wales Argus* (Gwent, 31,803), and *Evening Leader* (Clwyd, 26,968).

Scotland has six morning, five evening, and four Sunday papers, plus the Scottish editions of the *Daily Mail* and the *Sunday Express*. The *Glasgow Herald* (2004 circulation 78,746) and *The Scotsman* (68,408), an Edinburgh paper, are the most influential. Others include: *Sunday Mail* (in Glasgow, 584,671 circulation in 2004), *Daily Record* (Glasgow, 478,980), *Evening Times* (Glasgow, 95,126), *The Press and Journal* (Aberdeen, 88,599), *Courier and Advertiser* (Dundee, 83,186), and *Evening News* (Edinburgh, 68,479). About 120 weekly papers are published in Scottish towns.

Northern Ireland has two morning papers, one evening paper, and one Sunday paper, all published in Belfast, plus a number of weeklies. The largest is the evening paper, *Belfast Telegraph* (circulation 94,602).

Britain's ethnic minorities publish over 60 newspapers and magazines, most of them weekly, fortnightly or monthly. These include the Chinese *Sing Tao* and *Wen Wei Po*, the Urdu *Daily Jang*, and the Arabic *Al-Arab* (the foregoing are all dailies), as well as newspapers in Gujarati, Bengali, Hindi and Punjabi. The *Weekly Journal*, aimed at Britain's black community, was begun in 1992.

The over 7,000 periodicals published weekly, monthly, or quarterly cover a huge range of special interests. Leading opinion journals are *New Statesman*, *The Economist*, and *Spectator*. The *Times Literary Supplement* is highly influential in cultural affairs. The chief news agency is Reuters, a worldwide organization servicing British papers with foreign and Commonwealth news and the world press with British and foreign news.

Although there is no government censorship of news or opinion, the Official Secrets Act, stringent libel and slander laws, and restrictions governing the disclosure of court proceedings do impose limitations on press freedom. In addition, the press regulates itself through the Press Council, which adjudicates complaints about newspaper practices from local officials and the public. Views critical of the government are well established.

#### 46 ORGANIZATIONS

The national body representing British industry is the Confederation of British Industry, incorporated in 1965 and directly or indirectly representing about 250,000 companies. The Association of British Chambers of Commerce (founded in 1860) has 240 affiliated UK chambers. Agricultural organizations include the National Farmers' Union, agricultural cooperative societies, and other specialized associations. There are numerous professional associations for nearly every occupation. While some of these include members from all of the United Kingdom, there are also several associations particularly for Scottish businesses and professionals.

A vast number of organizations in the United Kingdom carry on programs in every phase of human activity. Voluntary social service organizations number in the thousands. Social work on a national scale is carried out largely under religious sponsorship. Cooperation between Protestant churches is fostered by the British Council of Churches. The Council of Christians and Jews works for cooperation between these faiths. The principal coordinating body in general social service is the National Council of Social Service. There are national chapters of the Red Cross Society, Amnesty International, Greenpeace, Habitat for Humanity, and other major international organizations.

The British Council promotes a wider knowledge of the United Kingdom and its people abroad and develops cultural relations with other countries. There are more than 300 learned societies. The Arts Council of Great Britain (founded in 1946) promotes the fine arts and higher artistic standards, and advises government bodies on artistic matters. The Royal Academy and the Royal Scottish Academy are other leading bodies in the arts. The National Book League, the Royal Society of Literature, the British Academy, the English Association, the Bibliographical Society, and other groups foster interest in literature, language, and schol-

arship. There are also numerous clubs for hobbyists, enthusiasts, and fans with a wide variety of interests.

The Arts Council of Wales was established in 1967. Arts and Cultural organizations in Scotland include the Royal Scottish Academy of Music and Drama; the Royal Celtic Society; the Royal Scottish Academy of Painting, Sculpture and Architecture; the Royal Scottish Country Dance Society; the Scottish Arts Council; and the Scottish Games Association. Clan associations are also popular in Scotland, with many providing genealogical research and social events and contact. The Ulster Historical Foundation in Belfast is a prominent genealogical research group.

The National Council for Voluntary Youth Services includes most of the largest youth groups. The leading political parties, major religious denominations, and some adult voluntary organizations, such as the Red Cross, maintain youth organizations. There are also a Scouts Association and a Girl Guides Association. There are numerous sports associations for participants of all ages. The Scottish Games Association specifically promotes traditional Highland games.

#### 47 TOURISM, TRAVEL, AND RECREATION

The United Kingdom is a popular tourist destination, rich in natural as well as cultural attractions. Landscapes range from farmlands and gardens to sandy beaches, moors, and rocky coasts. Architectural sights include stone and thatched cottages, stately country houses, mansions, and castles. Among the many historic dwellings open to the public are the Welsh castles Cilgerran (11th century), Dolbadarn (12th century), and Conway and Caernarvon (both 13th century); the 10-century-old Traquair House near Peebles, the oldest continuously inhabited house in Scotland, and the Palace of Holyroodhouse in Edinburgh; and Warwick Castle, near Stratford-upon-Avon, the birthplace of William Shakespeare. Distinguished cathedrals include St. Paul's in London and those in Canterbury, Exeter, Norwich, Winchester, and York. At Bushmills, in Northern Ireland, the oldest distillery in the world may be visited, and some of Scotland's 100 malt whiskey distilleries also offer tours.

Among London's extraordinary attractions are Buckingham Palace, the Tower of London, and Westminster Abbey. Of the wide range of entertainment available, London is particularly noted for its theater, including the Royal Shakespeare Company. Folk music may be heard throughout the United Kingdom; traditional community gatherings for music and dancing, called ceilidhs, are held in Scotland, often in pubs, and Edinburgh is the site of one of the world's largest folk festivals, as well as an annual festival of classical music and other performing arts.

Scotland, where golf developed in the 15th century, has many superb golf courses, as does the rest of the United Kingdom; some 70 Highland Games and Gatherings take place in Scotland from May to September. Other popular sports include fishing, riding, sailing, rugby, cricket, and football (soccer). Wimbledon is the site of perhaps the world's most prestigious tennis competition. London hosted the summer Olympics in 1908 and 1948, and is scheduled to host again in 2012. England hosted and won the World Cup soccer championship in 1966.

In principle, foreigners entering the United Kingdom must have a valid passport and a visa issued by British consular authorities

abroad. However, citizens of Ireland do not need a passport, and citizens of OECD, Commonwealth, and Latin American countries, among others, need no visa. There were 24,715,000 visitors who arrived in the United Kingdom in 2003. Tourism receipts totaled \$30.6 billion that year.

In 2005, the US Department of State estimated the daily cost of staying in London at \$410. Other areas averaged \$342 per day.

## 48 FAMOUS BRITONS

### Rulers and Statesmen

English rulers of renown include Alfred the Great (849–99), king of the West Saxons, who defeated and held off the Danish invaders; William I (the Conqueror, 1027–87), duke of Normandy, who conquered England (1066–70) and instituted many changes in the structure of English government and society; Henry II (1133–89), who centralized the power of the royal government, and his sons Richard I (the Lion-Hearted, 1157–99), leader of the Third Crusade, and John (1167?–1216), from whom the barons wrested the Magna Carta; Edward I (1239–1307), who subdued Wales and established the parliamentary system; Edward III (1312–77), who for a time conquered part of France, and did much to promote English commerce; Henry VIII (1491–1547), who separated the Anglican Church from the Roman Catholic Church and centralized administrative power; Elizabeth I (1533–1603), during whose reign, begun in 1558, England achieved great commercial, industrial, and political power, and the arts flourished; and Victoria (1819–1901), under whom Britain attained unprecedented prosperity and empire.

Among the statesmen distinguished in English history are Thomas à Becket (1118?–70), archbishop of Canterbury, who defended the rights of the church against the crown; Simon de Montfort, earl of Leicester (1208?–65), who in 1265 summoned the first Parliament; and Thomas Wolsey (1475?–1530), cardinal, archbishop of York, and Henry VIII's brilliant lord chancellor. Oliver Cromwell (1599–1658) established a republican and Puritan Commonwealth. Sir Robert Walpole, first earl of Oxford (1676–1745), unified cabinet government in the person of the prime minister and laid the foundations for free trade and a modern colonial policy. As England moved increasingly toward democratic government, important progress was achieved under the liberal statesmen William Pitt, first earl of Chatham (1708–78); his son William Pitt (1759–1806); and Charles James Fox (1749–1806). Outstanding statesmen of the 19th century were William Wilberforce (1759–1833); Henry John Temple, third Viscount Palmerston (1784–1865); Sir Robert Peel (1788–1850); Benjamin Disraeli, earl of Beaconsfield (1804–81); and William Ewart Gladstone (1809–98). Twentieth-century leaders include David Lloyd George, first earl of Dwyfor (1863–1945), prime minister during World War I; and Sir Winston Leonard Spencer Churchill (1874–1965), prime minister during World War II, historian, and winner of the Nobel Prize for literature in 1953. In 1979, Margaret (Hilda Roberts) Thatcher (b.1925) became the nation's first woman prime minister. The reigning monarch since 1952 has been Queen Elizabeth II (b.1926). The heir to the throne is Charles, prince of Wales (b.1948), whose marriage on 29 July 1981 to Lady Diana Frances Spencer (1961–1997; at marriage, Diana, princess of Wales) was seen by a worldwide television audience of 750 million people.

### Explorers and Navigators

British explorers and navigators played an important part in charting the course of empire. Sir Martin Frobisher (1535?–94), who set sail from England in search of the Northwest Passage, reached Canada in 1576. Sir Francis Drake (1545?–96) was the first Englishman to sail around the world. John Davis (1550?–1605) explored the Arctic and Antarctic, sailed to the South Seas, and discovered the Falkland Islands. Henry Hudson (d.1611) explored the Arctic regions and North America. Sir Walter Raleigh (1552?–1618) was a historian and poet, as well as a navigator and colonizer of the New World. James Cook (1728–79) charted the coasts of Australia and New Zealand. Scottish-born David Livingstone (1813–73) explored central Africa while doing missionary work. Welsh-born Henry Morton Stanley (John Rowlands, 1841–1904) was sent by a US newspaper to find Livingstone in 1871 and, having done so, returned for further exploration of Africa. Sir Richard Francis Burton (1821–90), an Orientalist known for his translation of the *Arabian Nights*, and John Hanning Speke (1827–64) explored central Africa while searching for the source of the Nile.

Great British military figures include John Churchill, first duke of Marlborough (1650–1722), who attained many victories in the War of the Spanish Succession and in later campaigns against the French; Horatio, Viscount Nelson (1758–1805), the foremost British naval hero, whose career was climaxed by victory and death at Trafalgar; the Irish-born soldier-statesman Arthur Wellesley, first Duke of Wellington (1769–1852), whose brilliant campaigns culminated in the defeat of Napoleon at Waterloo; General Charles George Gordon (1833–85), who gained victories in China, acquiring the nickname “Chinese,” and died while fighting against the Mahdi in Khartoum; Field Marshal Viscount Montgomery (Bernard Law Montgomery, 1887–1976), British military leader during World War II; Welsh-born Thomas Edward Lawrence (1888–1935), known as “Lawrence of Arabia,” who led the Arabs in uprisings against the Turks during World War I; and Lord Mountbatten of Burma (Louis Battenberg, 1900–1979), supreme Allied commander in Southeast Asia (1943–46) and last viceroy and first governor-general of India (1946–48).

### Philosophers and Legal Scholars

Sir Thomas Littleton (1407?–81) wrote *Tenures*, a comprehensive work on English land law that was used as a textbook for over three centuries. Sir Edward Coke (1552–1634), a champion of the common law, wrote the *Institutes of the Laws of England*, popularly known as *Coke on Littleton*. Sir William Blackstone (1723–80) wrote *Commentaries on the Laws of England*, which became a basic text in modern legal education and strongly influenced the evolution of jurisprudence in the United States as well as in Britain. The jurist-philosopher Jeremy Bentham (1748–1832) championed liberal law reform.

Roger Bacon (1214?–92), philosopher and scientist, wrote treatises ranging over the whole field of human knowledge. John Duns Scotus (1265?–1308) was a Scottish-born dialectician and theologian. William of Ockham (1300?–1349) laid the foundation of the modern theory of the separation of church and state. John Wesley (1703–91) was the founder of Methodism. Chief among modern philosophers are Thomas Hobbes (1588–1679), John Locke (1632–1704), the Irish-born bishop and idealist thinker George Berkeley (1685–1753), John Stuart Mill (1806–73), Alfred North Whitehead (1861–1947), George Edward Moore (1873–1958),

Ludwig Joseph Johann Wittgenstein (b.Austria, 1889–1951), and Sir Alfred Jules Ayer (b.1910–1989). A philosopher and mathematician who widely influenced contemporary social thought was Bertrand Arthur William Russell, third Earl Russell (1872–1970).

#### Historians and Economists

Noted historians include Raphael Holinshed (d.1580?), Edward Gibbon (1737–94), John Emerich Edward Dalberg-Acton, first Baron Acton (1834–92), William Edward Hartpole Lecky (1836–1903), John Richard Green (1837–83), Frederic William Maitland (1850–1906), George Macaulay Trevelyan (1876–1962), Giles Lytton Strachey (1880–1932), Sir Lewis Bernstein Namier (1880–1960), Arnold Joseph Toynbee (1889–1975), and Edward Hallett Carr (1892–1982).

Thomas Robert Malthus (1766–1834) and David Ricardo (1772–1823) were among the first modern economists. Robert Owen (1771–1858) was an influential Welsh-born socialist, industrial reformer, and philanthropist. Walter Bagehot (1826–77) was a distinguished critic and social scientist. The theories of John Maynard Keynes (Baron Keynes, 1883–1946) have strongly influenced the economic practices of many governments in recent years. Sir James George Frazer (1854–1941), a Scottish-born anthropologist and author of *The Golden Bough*, was a pioneer in the fields of comparative religion and comparative mythology. Herbert Spencer (1820–1903) was an influential economic and social philosopher. Sir Arthur John Evans (1851–1941) was an archaeologist who explored the ruins of ancient Crete. Anna Freud (b.Austria, 1895–1982), daughter of Sigmund Freud, and Melanie Klein (b.Austria, 1882–1960) were psychoanalysts influential in the study of child development. Noted anthropologists include Sir Edward Burnett Tylor (1832–1917); Polish-born Bronislaw Kasper Malinowski (1884–1942); Louis Seymour Bazett Leakey (1903–72) and his wife, Mary Leakey (1913–96), who discovered important fossil remains of early hominids in Tanzania; and Ashley Montagu (1905–1999).

#### Scientists

Present-day concepts of the universe largely derive from the theories of the astronomer and physicist Sir James Hopwood Jeans (1877–1946), the astronomers Sir Arthur Stanley Eddington (1882–1946) and Sir Fred Hoyle (1915–2001), and the radio astronomers Sir Martin Ryle (1918–84) and Anthony Hewish (b.1924), who shared the Nobel Prize for physics in 1974. Other British scientists and inventors who won fame for major contributions to knowledge include William Harvey (1578–1657), physician and anatomist, who discovered the circulation of the blood; Irish-born Robert Boyle (1627–91), physicist and chemist, who investigated the properties of gases; Sir Isaac Newton (1642–1727), natural philosopher and mathematician, who discovered gravity and made important advances in calculus and optics; German-born physicist Gabriel Daniel Fahrenheit (1686–1736), who introduced the temperature scale named after him; James Watt (1736–1819), the Scottish-born engineer who invented the modern condensing steam engine; Edward Jenner (1749–1823), who discovered the principle of vaccination; the great chemists John Dalton (1766–1844), who advanced the atomic theory, and Sir Humphry Davy (1778–1829); George Stephenson (1781–1848), inventor of the locomotive steam engine; Michael Faraday (1791–1867), a chemist and physicist noted for his experiments in electricity; Scottish-born geologist Sir Charles Lyell (1797–1875), the

father of modern geology; Charles Darwin (1809–82), the great naturalist who advanced the theory of evolution; James Prescott Joule (1818–89), a physicist who studied heat and electrical energy; Thomas Henry Huxley (1825–95), a biologist who championed Darwin's theory; James Clerk Maxwell (1831–79), the Scottish-born physicist who developed the hypothesis that light and electromagnetism are fundamentally of the same nature; Sir Alexander Fleming (1881–1955), bacteriologist, who received the 1945 Nobel Prize for medicine for the discovery of penicillin in 1928; and Francis Harry Compton Crick (1916–2004) and Maurice Hugh Frederick Wilkins (New Zealand, 1916–2004), two of the three winners of the 1962 Nobel Prize in physiology or medicine for their research into the structure of the DNA molecule.

#### Literature and the Arts

Geoffrey Chaucer (1340?–1400) wrote the *Canterbury Tales* and other works that marked the height of medieval English poetry. Other major medieval poets were John Gower (1325?–1408) and William Langland (1332?–1400?). William Caxton (1422–91) was the first English printer. Sir Thomas Malory (fl.1470) derived from French and earlier English sources the English prose epic traditionally known as *Morte d'Arthur*. Two religious reformers who translated the Bible into English, making it accessible to the common people, were John Wycliffe (1320?–84), who made the first complete translation, and William Tyndale (1492?–1536), who made the first translation from the original languages instead of Latin.

During the reign of Elizabeth I, England's golden age, emerged the dramatist and poet William Shakespeare (1564–1616), a giant of English and world literature, and a galaxy of other fine poets and playwrights. Among them were Edmund Spenser (1552?–99), Irish-born author of the *Faerie Queene*; the poet and soldier Sir Philip Sidney (1554–86); and the dramatists Christopher Marlowe (1564–93) and Ben Jonson (1572–1637). Outstanding writers of the Stuart period include the philosopher, scientist, and essayist Francis Bacon (1561–1626), first Baron Verulam Viscount St. Albans; John Donne (1572–1631), the greatest of the metaphysical poets; the lyric poet Robert Herrick (1591–1674); John Milton (1608–74), author of *Paradise Lost* and other poems and political essays; John Bunyan (1628–88), who created the classic allegory *Pilgrim's Progress*; and the poet, playwright, and critic John Dryden (1631–1700). The greatest Restoration dramatists were William Wycherley (1640–1716) and William Congreve (1670–1729). Two authors of famous diaries mirroring the society of their time were John Evelyn (1620–1706) and Samuel Pepys (1633–1703).

Distinguished writers of the 18th century include the Irish-born satirist Jonathan Swift (1667–1745), author of *Gulliver's Travels*; the essayists Joseph Addison (1672–1719) and Sir Richard Steele (1672–1729), whose journals were the prototypes of modern magazines; the poets Alexander Pope (1688–1744) and Thomas Gray (1716–71); the critic, biographer, and lexicographer Samuel Johnson (1709–84); and the Irish-born playwrights Oliver Goldsmith (1730?–74), also a poet and novelist, and Richard Brinsley Sheridan (1751–1816). The poet and artist William Blake (1757–1827) worked in a unique mystical vein.

The English Romantic movement produced a group of major poets, including William Wordsworth (1770–1850); Samuel Taylor Coleridge (1772–1834); George Noel Gordon Byron, sixth Lord Byron (1788–1824); Percy Bysshe Shelley (1792–1822); and

John Keats (1795–1821). Victorian poets of note included Alfred, Lord Tennyson (1809–92); Elizabeth Barrett Browning (1806–61); her husband, Robert Browning (1812–89); Dante Gabriel Rossetti (1822–82); his sister, Christina Georgina Rossetti (1830–94); Algernon Charles Swinburne (1837–1909); and Gerard Manley Hopkins (1844–89). Edward FitzGerald (1809–83) is famous for his free translations of Omar Khayyam's *Rubáiyát*. Matthew Arnold (1822–88) was a noted poet and critic. Other prominent critics and essayists include Charles Lamb (1775–1834), William Hazlitt (1778–1830), Thomas De Quincey (1785–1859), John Ruskin (1819–1900), Leslie Stephen (1832–1904), and William Morris (1834–96). Thomas Babington Macaulay (1800–1859) was a distinguished statesman, essayist, and historian. John Henry Cardinal Newman (1801–90) was an outstanding Roman Catholic theologian. Irish-born Oscar Fingal O'Flahertie Wills Wilde (1854–1900) was famous as a playwright, novelist, poet, and wit.

Major poets of the 20th century include Alfred Edward Woodman (1859–1936); Walter John de la Mare (1873–1956); Dame Edith Sitwell (1887–1964); US-born Thomas Stearns Eliot (1888–1965), winner of the Nobel Prize in 1949; Wystan Hugh Auden (1907–73); Welsh-born Dylan Thomas (1914–53); Philip Larkin (1922–85); and Ted Hughes (1930–98). Prominent critics include Frank Raymond Leavis (1895–1978) and Sir William Empson (1906–84).

The English novel's distinguished history began with Daniel Defoe (1660–1731), Samuel Richardson (1689–1761), Henry Fielding (1707–54), and Laurence Sterne (1713–68). It was carried forward in the 19th century by Jane Austen (1775–1817), William Makepeace Thackeray (1811–63), Charles Dickens (1812–70), Charles Reade (1814–84), Anthony Trollope (1815–82), the Brontë Sisters—Charlotte (1816–55) and Emily (1818–48)—George Eliot (Mary Ann Evans, 1819–80), George Meredith (1828–1909), Samuel Butler (1835–1902), and Thomas Hardy (1840–1928), who was also a poet. The mathematician Lewis Carroll (Charles Lutwidge Dodgson, 1832–98) became world-famous for two children's books, *Alice in Wonderland* and *Through the Looking Glass*. Rudyard Kipling (1865–1936), author of novels, stories, and poems, received the Nobel Prize for literature in 1907. Sir Arthur Conan Doyle (1859–1930) is known throughout the world as the creator of Sherlock Holmes.

Twentieth-century fiction writers of note include the Polish-born Joseph Conrad (Teodor Józef Konrad Korzeniowski, 1857–1924); Herbert George Wells (1866–1946), who was also a popular historian and a social reformer; Arnold Bennett (1867–1931); John Galsworthy (1867–1933), also a playwright, who received the Nobel Prize in 1932; William Somerset Maugham (1874–1965), also a playwright; Edward Morgan Forster (1879–1970); Virginia Woolf (1882–1941); David Herbert Lawrence (1885–1930); Joyce Cary (1888–1957); Katherine Mansfield (b.New Zealand, 1888–1923); Dame Agatha Christie (1881–1976), also a playwright; Dame Ivy Compton-Burnett (1892–1969); Dame Rebecca West (b.Ireland, 1892–1983), also known for her political writings and as an active feminist; Aldous Huxley (1894–1963); John Boynton Priestley (1894–1984), also a playwright; Irish-born Robert Ranke Graves (1895–1985), also a poet, novelist, scholar, and critic; George Orwell (Eric Blair, 1903–50), also a journalist and essayist; Evelyn Waugh (1903–66); Graham Greene (1904–91); Anthony Dymoke Powell (1905–2000); Henry Green (Henry Vincent Yorke, 1905–74); Charles Percy Snow (Baron Snow, 1905–80), also an essayist

and a physicist; William Golding (1911–93), Nobel Prize winner in 1983; Lawrence George Durrell (b.India, 1912–90); Anthony Burgess (1917–93); Doris Lessing (b.Iran, 1919); John Le Carré (David John Moore Cornwell, b.1931), and Ian McEwan (b.1948). The dominant literary figure of the 20th century was George Bernard Shaw (1856–1950), Dublin-born playwright, essayist, critic, and wit. Sir Kingsley William Amis (1922–1995) was a novelist, poet, critic, and teacher; his son Martin Amis (b.1949) became a novelist as well. Dame Antonia Susan "A.S." Byatt (b.1936) has been hailed by some as one of the great postmodern novelists in England. Byatt's younger sister Margaret Drabble (b.1939) is a novelist as well. Fay Weldon (b.1931) is a novelist, short story writer, playwright and essayist whose work has been associated with feminism. Hanif Kureishi (b.1954) is a Pakistani-British playwright, author, and director. Kazuo Ishiguro (b.1954) is a British author of Japanese origin. Joanne "J.K." Rowling (b.1965) is most famous as author of the Harry Potter fantasy series. Zadie Smith (b.1975) has been celebrated as one of Britain's most talented young authors. The playwright-composer-lyricist Sir Noel Coward (1899–1973) directed and starred in many of his sophisticated comedies. Harold Pinter (b.1930) has been a highly influential playwright; he was awarded the Nobel Prize for literature in 2005.

#### Actors and Actresses

The British stage tradition dates back to Richard Burbage (d.1619), the greatest actor of Shakespeare's time, and Edmund Kean (1787–1833), the greatest tragedian of the Romantic era. Luminaries of the modern theater are Dame Ellen Alicia Terry (1848–1928), Dame Sybil Thorndike (1882–1976), Dame Edith Evans (1888–1976), Sir Ralph Richardson (1902–83), Sir John Gielgud (1904–2000), Laurence Olivier (Baron Olivier of Brighton, 1907–1989), Sir Michael Redgrave (1908–85), and Derek George Jacobi (b.1938). Prominent stage directors are Peter Stephen Paul Brook (b.1925) and Sir Peter Reginald Frederick Hall (b.1930). Major contributors to the cinema have included the comic actor and director Charlie (Sir Charles Spencer) Chaplin (1889–1977); the directors Sir Alexander Korda (Sandor Corda, b.Hungary, 1893–1956), Sir Alfred Hitchcock (1899–1980), Sir Carol Reed (1906–76), Sir David Lean (1908–91), Sir Richard Attenborough (b.1923), and Stephen Frears (b.1941); and actors Cary Grant (Archibald Alexander Leach, 1904–86), Sir Alec Guinness (1914–2000), Deborah Kerr (b.1921), Welsh-born Richard Burton (1925–84), Belgian-born Audrey Hepburn (1929–1993), Irish-born Peter O'Toole (b.1932), Dame Elizabeth Taylor (b.1932), Dame Maggie Natalie Smith (b.1934), Dame Judi Dench (b.1934), Vanessa Redgrave (b.1937), Glenda Jackson (b.1936), Jacqueline Bisset (b.1944), Sir Michael Caine (b.1933), Albert Finney (b.1936), Ralph Fiennes (b.1962), Miranda Richardson (b.1958), Rachel Weisz (b.1971), Tilda Swinton (b.1960), and Kate Winslet (b.1975).

#### Architects

Great English architects were Inigo Jones (1573–1652) and Sir Christopher Wren (1632–1723). Famous artists include William Hogarth (1697–1764), Sir Joshua Reynolds (1723–92), Thomas Gainsborough (1727–88), Joseph Mallord William Turner (1775–1851), John Constable (1776–1837), the illustrator Aubrey Beardsley (1872–98), Graham Sutherland (1903–80), Francis Bacon (b.Ireland, 1910–92), and David Hockney (b.1937). Roger Eliot Fry (1866–1934) and Kenneth Mackenzie Clark (Lord Clark, 1903–83) were influential art critics. Sir Jacob Epstein (b.US,

1880–1959), Henry Moore (1898–1986), and Dame Barbara Hepworth (1903–75) are world-famous British sculptors. The most famous British potter was Josiah Wedgwood (1730–95).

### Composers

English composers of note include John Dunstable (1370?–1453), whose works exerted a profound influence on continental musicians; William Byrd (1543–1623) and Orlando Gibbons (1583–1625), who were proficient in both sacred and secular music; the great lutenist and songwriter John Dowland (1563–1626); the madrigalists John Wilbye (1574–1638) and Thomas Weelkes (1575?–1623); Henry Purcell (1659?–95), a brilliant creator of vocal and chamber works; German-born George Frederick Handel (Georg Friedrich Händel, 1685–1759), a master of baroque operas, oratorios, and concerti; and Sir Arthur Seymour Sullivan (1842–1900), whose musical settings of the librettos of Sir William Schwenk Gilbert (1836–1911) are among the most popular comic operas of all time. Significant 20th-century figures include Sir Edward Elgar (1857–1934), Frederick Delius (1862–1934), Ralph Vaughan Williams (1872–1958), Sir William Walton (1902–83), Sir Michael Kemp Tippett (1905–98), Edward Benjamin Britten (Baron Britten, 1913–76), Peter Maxwell Davies (b.1934), and, in popular music, John Winston Lennon (1940–80) and James Paul McCartney (b.1942) of the Beatles. Notable performers include pianists Dame Myra Hess (1890–1965) and Sir Clifford Curzon (1907–82), violinist Sir Yehudi Menuhin (1916–1999), guitarist-lutenist Julian Bream (b.1933), singers Sir Peter Pears (1910–86) and Dame Janet Baker (b.1933), and conductors Sir Thomas Beecham (1879–1961), Sir Adrian Boult (1889–1983), Sir John Barbirolli (1899–1970), Sir Georg Solti (b.Hungary, 1912–1997), and Sir Colin Davis (b.1927).

### Athletes

Notable British athletes include Sir Roger Bannister (b.1929), who on 6 May 1954 became the first person to run a mile in under four minutes; golfer Tony Jacklin (b.1944), winner of the British Open in 1969 and the US Open in 1970; three-time world champion John Young “Jackie” Stewart (b.1939), a Scottish race-car driver; and the yachtsman Sir Francis Chichester (1901–72), winner of the first single-handed transatlantic race (1970) and the first sailor to make a solo circumnavigation of the globe (1966–67). Tennis player Sarah Virginia Wade (b.1945) won three Grand Slam singles titles and five Grand Slam doubles titles; she is particularly remembered for winning the women’s singles title at Wimbledon in the championship’s centenary year in 1977.

### Natives of Scotland and Wales

Duncan I (r.1034–40) was the first ruler of the historical kingdom of Scotland. Macbeth (r.1040–57), who killed Duncan and seized the throne, furnished the subject of one of Shakespeare’s greatest plays. Margaret (d.1093), Duncan’s daughter-in-law, reformed the Church, won fame for piety and charity, and was made a saint. William Wallace (1272?–1306) led a rebellion against the English occupation. Robert the Bruce (1274–1329), ruler of Scotland (1306–29), won its independence from England. Mary, Queen of Scots (Mary Stuart, 1542–87), a romantic historical figure, is the subject of many plays and novels. Her son James VI (1566–1625) became England’s King James I.

Before the union with England, outstanding poets writing in Scottish include Robert Henryson (1425?–1500?), William Dun-

bar (1460?–1520?), Gavin Douglas (1474–1522), and Sir David Lindsay (1490?–1555). One of the finest Scottish poets was William Drummond (1585–1649). Sir Thomas Urquhart (1611–60) produced a noted translation of Rabelais. John Knox (1514?–72) was the founder of Presbyterianism. David Hume (1711–76) was an outstanding philosopher and historian. Economist and philosopher Adam Smith (1723–90) influenced the development of world economy and politics. James Boswell (1740–95) wrote the brilliant *Life of Samuel Johnson*. The 18th century produced several important poets, notably Allan Ramsay (1686–1758), James Thomson (1700–48), James Macpherson (1736–96), and the national poet of Scotland, Robert Burns (1759–96). A major 19th-century essayist and social critic was Thomas Carlyle (1795–1881). Scottish novelists of prominence include Tobias George Smollett (1721–71); Sir Walter Scott (1771–1832); Robert Louis Stevenson (1850–94), also a poet; John Buchan, first Lord Tweedsmuir (1875–1940); and Sir James Matthew Barrie (1860–1937), who also wrote popular plays.

Distinguished figures who were active primarily in Wales include the 6th-century monk Dewi (d.588?), who became St. David, the patron saint of Wales; Rhodri the Great (844–77), who attained rule over most of Wales and founded two great ruling houses; Howel the Good (Hywel Dda, 910–50), whose reformed legal code became the standard of Welsh law for centuries; the Lord Rhys ap Gruffydd (1155–97), ruler of southern Wales, who founded the national Eisteddfod; Dafydd ap Gwilym (fl.1340–70), a remarkable poet; and Owen Glendower (Owain ap Gruffydd, 1359?–1416), the national hero of Wales, who led a rebellion against English rule. Bishop William Morgan (1541?–1604) made a Welsh translation of the Bible which, with revisions, is still in use. Among literary figures are Ellis Wynne (1671–1734), Daniel Owen (1836–95), and Sir Owen Morgan Edwards (1858–1920).

Two natives of Northern Ireland—Betty Williams (b.1943), a Protestant, and Mairead Corrigan (b.1944), a Roman Catholic—received the Nobel Peace Prize (awarded in 1977) for their leadership of a peace movement in Ulster.

## 49 DEPENDENCIES

British overseas dependencies include the British Indian Ocean Territory and St. Helena (described in the *Africa* volume under UK African Dependencies); and Bermuda, the British Antarctic Territory, the British Virgin Islands, the Cayman Islands, the Falkland Islands, The Turks and Caicos Islands, Anguilla and Montserrat (described in the *Americas* volume under UK American Dependencies).

### Gibraltar

The colony of Gibraltar (5.83 sq km/2.25 sq mi in area), the smallest UK dependency, is a narrow peninsula connected to the southwest coast of Spain. From a low, sandy plain in the north, it rises sharply in the 430-m (1,400-ft) Rock of Gibraltar, a shrub-covered mass of limestone, with huge caves. Gibraltar has a pleasantly temperate climate, except for occasional hot summers. Average annual rainfall is 89 cm (35 in). There is a rainy season from December to May. The resident civilian population, almost entirely of European origin, was estimated at 27,714 in mid-2002. Gibraltar is an important port of call for cargo and passenger ships. There is a naval base at the northeast gate of the Strait of Gibraltar and a military airfield that is used by private companies. Telegraph, ra-

dio, and television are privately operated. The telephone system is government owned.

Known as Calpe in ancient times, Gibraltar was successively occupied by Phoenicians, Carthaginians, Romans, and Visigoths. Its strategic value was recognized early. In AD 711, it was captured by Moors under Tariq, and since then it has been known as Jabal Tariq or Gibraltar. It remained in Moor hands, except for short periods, until Spain took it in 1462. In 1704, a combined English-Dutch fleet captured Gibraltar, and it was officially transferred to Britain by the Treaty of Utrecht in 1713. Since 1964, Spain has tried to negotiate the return of Gibraltar to Spanish control. However, in a referendum held in 1967, Gibraltarians voted overwhelmingly (12,138 to 44) to retain their link with Britain. Since then, Spain has continued to raise the issue at the UN and put direct pressure on the Gibraltarians by closing the land frontier between the peninsula and the Spanish mainland and suspending the ferry service between Gibraltar and Algeciras; the border was reopened to limited pedestrian traffic in December 1982 and fully reopened in February 1985.

Under the 1969 constitution, Gibraltar is governed by a House of Assembly with 18 members, 15 of whom are elected by popular vote. The governor (who is also commander of the fortress) retains direct responsibility for defense and external affairs and can intervene in domestic affairs.

Gibraltar was once largely dependent on British subsidies, but in the late 1990s had made the transition to private sector industry. Tourism (with about six million visitors annually), reexports (largely fuel for shipping), shipping services, and duties on consumer goods contribute to the economy. Local industries are tobacco and coffee processing. The Gibraltar pound is at par with the British pound. The financial sector accounts for about 15% of GDP. Exports in 1998 (mainly reexports of petroleum and petroleum products) totaled an estimated us\$81.1 million, and imports us\$492 million. There is an income tax and an estate duty.

Illiteracy is negligible. Education is compulsory between the ages of 5 and 15. There are 12 primary schools, two single-sex comprehensive secondary schools, and the College of Further Education. The armed forces have their own schools; attendance by civilian children is available. Language spoken at home include Spanish, Italian, and Portuguese, but the language of business and schools is English. The colony has a serious housing shortage.

#### Pitcairn Island

Pitcairn is a mountainous island of volcanic origin about 4.5 sq km (1.75 sq mi) in area, in the South Pacific at 25°4' s and 130°6' w. Three smaller islands (Henderson, Ducie, and Oeno) associated with Pitcairn are uninhabited. Pitcairn Island was discovered in 1767 by the British and settled in 1790 by H.M.S. *Bounty* mutineers and the Polynesian women who accompanied them from Tahiti. The population, mainly descendants of the *Bounty* mutineers, after reaching a peak of 233 in 1937, decreased to 120 in 1962 and to about 52 in 1992 to 47 in 2002. Most of the younger members of the community have migrated to New Zealand. The climate is warm, with very little change throughout the year.

There is one village, Adamstown. Pitcairn is administered, together with the three other small islands, as a UK colony by the UK high commissioner in New Zealand. The local government consists of an island magistrate and a 10-member Island Council.

Six of the Council's members are elected. New Zealand dollars (NZ\$) are used locally; NZ\$1 = us\$0.5132 (or us\$1 = NZ\$1.9486). There is no port or harbor; goods from ships are conveyed ashore in longboats. Cargo ships plying the route between Panama and New Zealand call periodically.

The main occupation is subsistence agriculture. A small surplus of fresh fruit and vegetables is sold to passing ships. Fish are abundant. Imports, mainly food, come from New Zealand. Fruit, woven baskets, carved curios, and stamps are sold to ships' passengers.

# VATICAN

The Holy See (State of the Vatican City)  
*Santa Sede (Stato della Città del Vaticano)*

**CAPITAL:** Vatican City

**FLAG:** The flag consists of two vertical stripes, yellow at the hoist and white at the fly. On the white field, in yellow, are the crossed keys of St. Peter, the first pope, surmounted by the papal tiara (triple crown).

**ANTHEM:** *Pontifical March* (no words).

**MONETARY UNIT:** In 1930, after a lapse of 60 years, the Vatican resumed issuance of its own coinage—the lira (L)—but it agreed to issue no more than 300 million lire in any year. There are coins of 10, 20, 50, 100, and 500 lire. Both Italy and the Vatican adopted the euro as official currency in 2002. The euro is divided into 100 cents. There are coins in denominations of 1, 2, 5, 10, 20, and 50 cents and 1 euro and 2 euros. There are notes of 5, 10, 20, 50, 100, 200, and 500 euros. The Vatican lira is fixed at 1,936.17 lire per euro. €1 = \$1.25475 (or \$1 = €0.79697) as of 2005.

**WEIGHTS AND MEASURES:** The metric system is in use.

**HOLIDAYS:** Roman Catholic religious holidays; the coronation day of the reigning pope; days when public consistory is held.

**TIME:** 1 PM = noon GMT.

## <sup>1</sup>LOCATION, SIZE, AND EXTENT

Located within Rome, Vatican City is the smallest state in Europe and in the world. It is a roughly triangular area of 0.44 sq km (0.17 sq mi) lying near the west bank of the Tiber River and to the west of the Castel Sant'Angelo. On the west and south it is bounded by the Leonine Wall. The Vatican area comprises the following: St. Peter's Square, enclosed by Giovanni Lorenzo Bernini's quadruple colonnade; St. Peter's Basilica, the largest Christian church in the world, to which the square serves as an entrance; a quadrangular area north of the square in which there are administrative buildings and Belvedere Park; the pontifical palaces, or the Vatican proper, lying west of Belvedere Park; and the Vatican Gardens, which occupy about half the acreage.

Outside Vatican City itself, extraterritoriality is exercised over a number of churches and palaces in Rome, notably the Lateran Basilica and Palace in the Piazza San Giovanni, the Palace of San Callisto at the foot of the Janiculum hill, and the basilicas of Santa Maria Maggiore and San Paolo fuori le Mura. Extraterritoriality outside the city of Rome extends to the papal villa and its environs (almost 40 hectares/100 acres) at Castel Gandolfo, 24 km (15 mi) SE of Rome, and to the area (about 420 hectares/1,040 acres) at Santa Maria di Galeria, some 19 km (12 mi) N of Rome, where a Vatican radio station was established in 1957.

## <sup>2</sup>TOPOGRAPHY

Vatican City lies on a slight hill not far from the Tiber River.

## <sup>3</sup>CLIMATE

Winters are mild, and although summer temperatures are high during the day, the evenings are cold. Temperatures in January av-

erage 7°C (45°F); in July, 24°C (75°F). There is little rain from May to September; October and November are the wettest months.

## <sup>4</sup>FLORA AND FAUNA

The gardens are famous for their fine collection of orchids and other exotic flora. Vatican City, being entirely urban, does not have a distinctive fauna.

## <sup>5</sup>ENVIRONMENT

The environment of Vatican City is similar to that of Rome (see Italy). Though there are no specific endangered species, according to a 2006 report issued by the International Union for Conservation of Nature and Natural Resources (IUCN) there are five species with minimal or least concern. These are the long-tailed field mouse, the European water vole, the Crucian carp, the bank vole, and the red fox.

## <sup>6</sup>POPULATION

The population of Holy See in 2005 was estimated by the United Nations (UN) at 798, which placed it at number 193 in population among the 193 nations of the world. According to the UN, the annual population rate of change for 2005–10 was expected to be -0.9%, a rate the government viewed as satisfactory. The projected population for the year 2025 was 1,000. The population density was 2273 per sq km (5887 per sq mi).

## <sup>7</sup>MIGRATION

Does not apply.

## <sup>8</sup>ETHNIC GROUPS

Although the citizenry of the Vatican includes cardinals and other clergymen from all parts of the world, most of the inhabitants are

Italian. The members of the Swiss Guard are a notable exception. Pope Benedict XVI is German.

## **9** LANGUAGES

Italian is the official language of Vatican City, but Latin is the official language of the Holy See (the seat of jurisdiction of the pope as spiritual leader) and is employed for most papal encyclicals and other formal pronouncements. As the ordinary working language, Italian is in greater use. French, German, and other languages are used.

## **10** RELIGIONS

Vatican City is the center of the worldwide organization of the Roman Catholic Church and the seat of the pope. Roman Catholicism is the official religion and the primary business of the state itself.

## **11** TRANSPORTATION

Vatican City is easily reached by the public transportation system of Rome. It has its own railroad station, with 862 m (2,828 ft) of track, which connect to Italy's network at Rome's Saint Peter's station. Vatican City also has a helicopter landing pad.

## **12** HISTORY

Since the time of St. Peter, regarded by the Church as the first pope, Rome has been the seat of the popes, except in periods of great turbulence, when the pontiffs were forced to take refuge elsewhere, most notably in Avignon, France, from 1309 to 1377. The Roman papal residence before modern times was usually in the Lateran or Quirinal rather than in the Vatican Palace.

The Vatican City State and the places over which the Vatican now exercises jurisdiction are the sole remnants of the States of the Church, or Papal States, which at various times, beginning in 755, included large areas in Italy and, until the French Revolution, even parts of southern France. Most of the papal domain fell into the hands of King Victor Emmanuel II in 1860 in the course of the unification of Italy. By 1870, Pope Pius IX, supported by a garrison of French troops, retained rule over only the besieged city of Rome and a small territory surrounding it. Upon the withdrawal of the French garrison to take part in the Franco-Prussian War, the walls of Rome were breached by the besieging forces on 20 September, and the city fell. On 2 October, following a plebiscite, the city was annexed to the kingdom of Italy and made the national capital.

In May 1871, the Italian government promulgated a Law of Guarantees, which purported to establish the relations between the Italian kingdom and the papacy. The enactment declared the person of the pope to be inviolate, guaranteed him full liberty in his religious functions and in the conduct of diplomatic relations, awarded an annual indemnity in lieu of the income lost when the Papal States were annexed, and provided the right of extraterritoriality over the Vatican and the papal palaces. Pius IX refused to accept the law or the money allowance; he and his successors chose to become "prisoners of the Vatican." Until 1919, Roman Catholics were prohibited by the papacy from participating in the Italian government.

The so-called Roman Question was brought to an end by the conclusion on 11 February 1929 of three Lateran treaties between

the Vatican and Italy. One treaty recognized the full sovereignty of the Vatican and established its territorial extent. Another treaty was a concordat establishing the Roman Catholic Church as the state church of Italy. The remaining treaty awarded the Vatican 750 million old lire in cash and one billion old lire in interest-bearing state bonds in lieu of all financial claims against Italy for annexing the Papal States. The constitution of the Italian Republic, adopted in 1947, substantially embodies the terms of the Lateran treaties. In 1962–65, the Vatican was the site of the Second Vatican Council, the first worldwide council in almost a century. Convened by Pope John XXIII and continued under Paul VI, the Council resulted in modernization of the Church's role in spiritual and social matters.

Ecumenism was the hallmark of the reign (1963–78) of Pope Paul VI. In a move to further Christian unity, he met with Athanasios, the ecumenical patriarch of the Eastern Orthodox Church, in Jerusalem in 1964. In 1973, Paul VI conferred with the Coptic Orthodox patriarch of Alexandria; later in that same year, he met the exiled Dalai Lama, the first such meeting between a pope and a Buddhist leader. Steps were also taken to improve Roman Catholic-Jewish relations, including a 1965 declaration that Jews are not to be held collectively guilty of the death of Jesus. On doctrinal questions Pope Paul VI was generally conservative, reaffirming papal infallibility, disciplining dissident priests, and reiterating traditional Church opposition to all "artificial" methods of contraception, including abortion and sterilization. In September 1972, the concept of an all-male celibate priesthood was upheld.

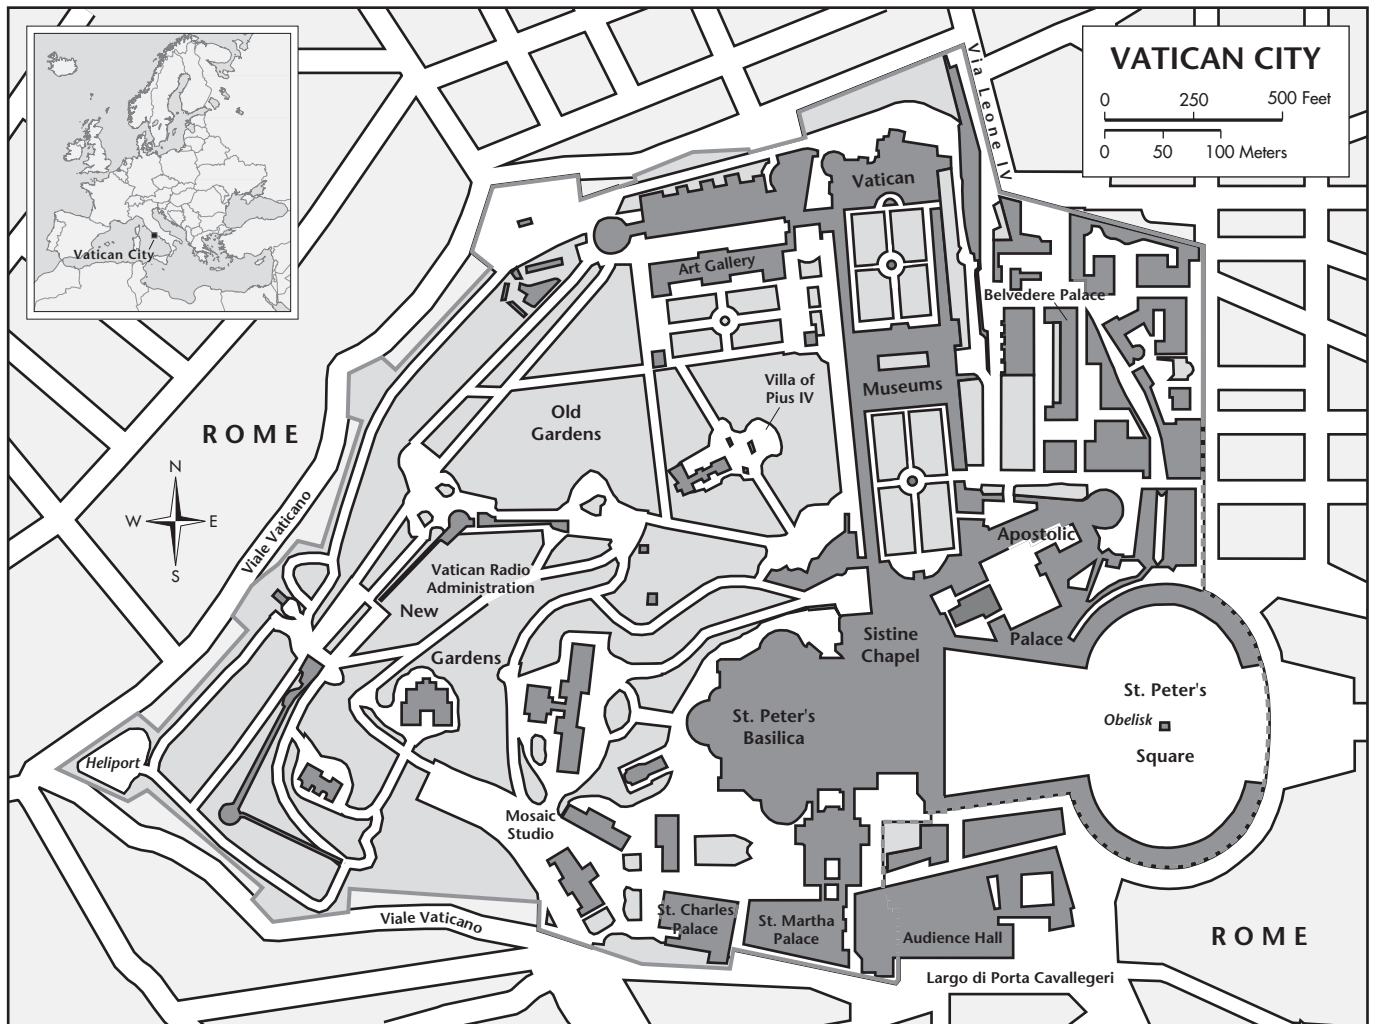

Pope Paul VI was succeeded by Pope John Paul I, who reigned for only 34 days. John Paul I's sudden death, on 28 September 1978, brought about the election of Polish Cardinal Karol Wojtyła as John Paul II, the first non-Italian pontiff elected in over 450 years. On 13 May 1981, John Paul II was wounded in Vatican Square by a Turkish gunman, who is serving a life sentence. The alleged accomplices, three Bulgarians and three Turks, were acquitted of conspiracy in the assassination attempt on 29 March 1986 because of lack of evidence.

During his reign (1978–2005), John Paul II traveled widely, a practice begun by Paul VI. He also established himself as a conservative in doctrinal matters, as indicated in 1982 by his elevation to the status of personal prelate of Opus Dei, an international organization of 72,000 laity and priests known for its doctrinal fidelity. He spent much of his papacy railing against materialism and moral laxity. During John Paul II's papacy, the Lateran treaties of 1929 were superseded in 1984 by a new concordat under which the pope retained temporal authority over Vatican City but Roman Catholicism was no longer Italy's state religion.

Throughout the 1990s, John Paul tried to build bridges to the Islamic world. Iran's president visited the Vatican in 1999 and a controversial trip to Iraq to talk to Saddam Hussein was cancelled that same year. He also traveled to Israel in March 2000 where he visited different Holocaust memorials during this trip and went to Bethlehem to reaffirm the Holy See's support for an independent Palestinian homeland.

John Paul II came out against embryonic or stem-cell research in 2001, stating it would lead to other evils such as "euthanasia and infanticide." Following the 11 September 2001 terrorist attacks on the United States, John Paul II urged harmony between Christians and Muslims. He initially stated that conflicts must

BOUNDARY LENGTHS: Italy, 3.2 kilometers (2 miles).

not be resolved by force, but by peaceful negotiation; however, he subsequently indicated the United States might need to use force against terrorists in the name of self-defense. When the Al Aqsa intifada—began in September 2000 in Israel and the West Bank and Gaza Strip—intensified in the spring of 2002, John Paul II appealed for peace in the region, saying “nothing is resolved by war.” He also reassured his firm belief in peace over the use of force during the 2002–03 diplomatic and military crisis in Iraq. Nevertheless, his criticism of the conflict did not prevent war. Following the defeat of the Saddam Hussein regime in April 2003, John Paul II stated the Iraqi people should be responsible for the rebuilding of Iraq, while working closely with the international community, meaning the UN.

The Vatican announced in December 2002 it would open its archives relating to interactions with Nazi Germany from 1922–39 to scholars. The Catholic Church has been criticized for not doing enough to stop the persecution of Jews during the Holocaust.

Following the eruption of sex scandals in the United States regarding pedophile priests, John Paul II called for an emergency meeting with US cardinals in April 2002. US bishops had approved a “zero tolerance” policy on priests accused of sexual abuse, which would have priests suspended immediately following an accusa-

tion of abuse, but the Vatican demanded certain protections for the rights of priests.

In May 2003, the Vatican officially confirmed the pope suffered from Parkinson’s disease. Despite his illness and his suffering from severe arthritis, John Paul II continued to travel exhaustively until his death on 2 April 2005.

Cardinal Joseph Ratzinger, a close confidante of John Paul II, was chosen on 19 April 2005 as the next pope, and was given the name Pope Benedict XVI. Ratzinger, originally from Cologne, Germany, was 78 years old at the time of his election; this made him the oldest pope ever elected. He predicted that his tenure would be short and that his primary purpose would be to complete John Paul II’s work. He was formally installed as pope on 24 April 2005. As a cardinal, Ratzinger was known as a hard-line advocate of Vatican orthodoxy. He strongly opposed abortion, homosexuality, and religious pluralism. A long-time friend and ally of John Paul II, Ratzinger’s selection as pope was greeted with dismay by more liberal factions within the Catholic Church. Many feared that he would divide, rather than unite, Catholics worldwide. In the early months of his papacy, Pope Benedict XVI supported the conservative stance of his predecessor. In May 2005, Benedict XVI called on voters in Italy to boycott a referendum

that would repeal restrictions on artificial insemination and embryonic research. However, in October 2005, the Vatican completed a document that appeared to relax its stance against homosexuality somewhat. A change in policy on those entering the priesthood suggested that gay men who had lived a chaste life for at least three years prior to their admission to a seminary would be eligible. Previously, the Vatican banned homosexuals from priesthood, regardless of their status.

### **13 GOVERNMENT**

The pope is simultaneously the absolute sovereign of the Vatican City State and the head of the Roman Catholic Church throughout the world. Since 1984, the pope has been represented by the cardinal secretary of state in the civil governance of Vatican City. In administering the government of the Vatican, the pope is assisted by the Pontifical Commission for the Vatican City State. Religious affairs are governed under the pope's direction by a number of ecclesiastical bodies known collectively as the Roman Curia.

The Pontifical Commission consists of seven cardinals and a lay special delegate, assisted since 1968 by a board of 21 lay advisers. Under the commission are the following: a central council (heading various administrative offices); the directorships of museums, technical services, economic services (including the postal and telegraph systems), and medical services; the guard; the Vatican radio system and television center; the Vatican observatory; and the directorship of the villa at Castel Gandolfo, the traditional summer residence of popes.

Much of the work of the Roman Curia is conducted by offices called sacred congregations, each headed by a cardinal appointed for a five-year period. These are the Sacred Congregation for the Doctrine of the Faith (responsible for faith and morals, including the examination and, if necessary, prohibition of books and other writings), the Sacred Congregation for Bishops (diocesan affairs), the Sacred Congregation for the Eastern Churches (relations between Eastern and Latin Rites), the Sacred Congregation for the Sacraments, the Sacred Congregation for Divine Worship, the Sacred Congregation for the Clergy, the Sacred Congregation for Religious Orders and Secular Institutes (monastic and lay communities), the Sacred Congregation for the Evangelization of Peoples (missions), the Sacred Congregation for the Causes of Saints (beatification and canonization), and the Sacred Congregation for Catholic Education (seminaries and religious schools). There are also secretariats for Christian unity, non-Christians, and non-believers, and there are permanent and temporary councils and commissions for various other functions.

A pope serves from his election until death. On his decease, the College of Cardinals is called into conclave to choose a successor from their number. The usual method is to vote on the succession; in this case, the cardinal who receives two-thirds plus one of the votes of those present is declared elected. Pending the election, most Vatican business is held in abeyance.

Before the reign of Pope John XXIII, the size of the College of Cardinals was limited to 70. Pope John raised the membership to 88, and his successor, Pope Paul VI, increased the number to 136. Paul VI also decreed that as of 1 January 1971, cardinals would cease to be members of departments of the Curia upon reaching the age of 80 and would lose the right to participate in the election

of a pope. In 2001, Pope John Paul II created 44 new cardinals, and the number of cardinals in the college at that time was 184, representing 68 countries. The 2005 conclave to select John Paul II's successor included 117 cardinals.

### **14 POLITICAL PARTIES**

Does not apply.

### **15 LOCAL GOVERNMENT**

Does not apply.

### **16 JUDICIAL SYSTEM**

For ordinary legal matters occurring within Vatican territory, there is a tribunal of first instance. Criminal cases are tried in Italian courts. There are three tribunals at the Vatican for religious cases. The Apostolic Penitentiary determines questions of penance and absolution from sin. The Roman Rota deals principally with marital issues but is also competent to handle appeals from any decisions of lower ecclesiastical courts. In exceptional cases, the Supreme Tribunal of the Apostolic Signature hears appeals from the Rota, which ordinarily is the court of last resort.

New codes of canon law for the government of the Latin Rite churches and the administration of the Curia were promulgated in 1918 and 1983. Eastern Rite churches have their own canon law.

### **17 ARMED FORCES**

The papal patrol force now consists only of the Swiss Guard, who, sometimes armed with such ceremonial weapons as halberds, walk their posts in picturesque striped uniforms supposedly designed by Michelangelo. The force was founded in 1506 and is recruited from several Roman Catholic cantons of Switzerland. It now numbers approximately 100 members. There is also a civilian security force, responsible to the Central Office of Security, which protects Vatican personnel and property, and the art treasures owned by the Church. The Vatican maintains its own jail.

### **18 INTERNATIONAL COOPERATION**

Vatican City's diplomatic relations are conducted by its secretariat of state and the Council for Public Affairs of the Church. The Vatican holds permanent observer status in the United Nations and several specialized agencies, such as UNESCO, IAEA, UNEP, WHO, the World Food Program (WFP), United Nations Center for Human Settlements (UNCHS), and the FAO. The Vatican is also an observer with the African Union and the WTO. It is a member of the OSCE, holds a guest seat in the Nonaligned Movement, and participates in the Organization for the Prohibition of Chemical Weapons (OPCW).

### **19 ECONOMY**

The Vatican, being essentially an administrative center, is dependent for its support on the receipt of charitable contributions, the fees charged those able to pay for the services of the congregations and other ecclesiastical bodies, and interest on investments. Funds are also raised from the sale of stamps, religious literature, and

mementos and from museum admissions. Vatican City's economy is not commercial in the usual sense.

The labor force is small and is primarily employed in services and small industry. Most of the people working in the Vatican (dignitaries, priests, nuns, guards, and 3,000 lay workers) live outside the city.

In 2002, the city budget totaled \$245.2 million, while expenditures reached \$260.4 million.

## **20** INCOME

Does not apply.

## **21** LABOR

The labor force consists mainly of priests and other ecclesiastics, who serve as consultants or councilors; about 3,000 laborers, who live outside the Vatican; the guards; the nuns, who do the cooking, cleaning, laundering, and tapestry repair; and the cardinals, archbishops, bishops, and other higher dignitaries. Some ecclesiastical officials live outside Vatican City and commute from the secular city. The Association of Vatican Lay Workers, a trade union, has 1,800 members.

Lay employees of the Vatican have always had to be Roman Catholics and swear loyalty to the Pope. Under a new set of rules of conduct implemented in October 1995, new employees have to sign a statement binding them to observe the moral doctrines of the Roman Catholic Church.

## **22** AGRICULTURE

Does not apply.

## **23** ANIMAL HUSBANDRY

Does not apply.

## **24** FISHING

Does not apply.

## **25** FORESTRY

Does not apply.

## **26** MINING

Does not apply.

## **27** ENERGY AND POWER

As of 1 November 2005, all electric power was supplied by Italy, but the Vatican's generating plant had a capacity of 5,000 kW in 1990.

## **28** INDUSTRY

A studio in the Vatican produces mosaic work, and a sewing establishment produces uniforms. There is a large printing plant, the Vatican Polyglot Press, which produces coins, medals, and postage stamps.

## **29** SCIENCE AND TECHNOLOGY

The Vatican promotes the study of science and mathematics through the Pontifical Academy of Sciences, which dates from

1603. The Vatican Observatory was begun by Pope Gregory XIII. It has modern instruments, an astrophysics laboratory, and a 33,000-volume library.

## **30** DOMESTIC TRADE

The Vatican is basically a noncommercial economy, with no major imports or exports. Primary domestic industries include printing, mosaics, and staff uniforms. Products for retail sale are primarily postage stamps, tourist souvenirs, and publications.

## **31** FOREIGN TRADE

Does not apply, as the Vatican does not really have foreign trade. Its entire economy is based on tourism and donations (known as Peter's Pence) from Catholics around the world. However, the Vatican remains extremely wealthy despite its complete lack of natural resources because of the priceless artwork it possesses.

## **32** BALANCE OF PAYMENTS

Does not apply.

## **33** BANKING AND SECURITIES

The Vatican bank, known as the Institute for Religious Works (Istituto per le Opere di Religione—IOR), was founded in 1942. It carries out fiscal operations and invests and transfers the funds of the Vatican and of Roman Catholic religious communities throughout the world. The Administration of the Patrimony of the Holy See manages the Vatican's capital assets.

## **34** INSURANCE

Does not apply.

## **35** PUBLIC FINANCE

State income is derived from fees paid by the public for visiting the art galleries and from the sale of Vatican City postage stamps, tourist mementos, and publications. The Vatican also receives income in the form of voluntary contributions (Peter's pence) from all over the world and from interest on investments. The Prefecture for Economic Affairs coordinates Vatican finances.

The US Central Intelligence Agency (CIA) estimated that in 2002 the Holy See's central government took in revenues of approximately \$245.2 million and had expenditures of \$260.4 million. Revenues minus expenditures totaled approximately -\$15.2 million.

## **36** TAXATION

Residents of Vatican City pay no taxes.

## **37** CUSTOMS AND DUTIES

Vatican City imposes no customs tariffs.

## **38** FOREIGN INVESTMENT

No recent figures are available.

## **39** ECONOMIC DEVELOPMENT

The Vatican administers industrial, real estate, and artistic holdings valued in the hundreds of millions of dollars. Investments

have been in a wide range of enterprises, with makers of contraceptives and munitions specifically excepted.

#### 40 SOCIAL DEVELOPMENT

Celibacy is required of all Roman Catholic clergy, except permanent deacons. The Church upholds the concept of family planning through such traditional methods as rhythm and abstinence but resolutely opposes such “artificial methods” as contraceptive pills and devices, as well as abortion and sterilization. Five important papal encyclicals—*Rerum Novarum* (1870), *Quadragesimo Anno* (1931), *Mater et Magistra* (1961), *Pacem in Terris* (1963), and *Laborem Exercens* (1981)—have enunciated the Church position on matters of workers’ rights and social and international justice.

#### 41 HEALTH

The health services directorate, under the Pontifical Commission for the Vatican City State, is responsible for health matters.

#### 42 HOUSING

A small portion of the Vatican Palace (about 200 out of 1,000 rooms) serve as the residence for the pope, the secretary of state, high court officials, high officials in close attendance to the pope, and some administrative and scientific officials. Quarters for the Swiss Guard and the gendarmes are also located in the palace. Some officials and visitors find housing in Italy just outside of the Vatican borders. There is no information available on other housing within the state itself.

#### 43 EDUCATION

The Vatican is a major center for higher education for Roman Catholic clergy, particularly those being trained for upper level church positions. Adult literacy is 100%. About 65 papal educational institutions are scattered throughout Rome; some of the more important (all prefixed by the word “Pontifical”) are the Gregorian University, the Biblical Institute, the Institute of Oriental Studies, the Lateran Athenaeum, the Institute of Christian Archaeology, and the Institute of Sacred Music. There were a total of 14,403 students in 1996 with 1,872 teaching staff in all higher-level institutions.

#### 44 LIBRARIES AND MUSEUMS

The Apostolic Library of the Vatican is one of the most famous in the world. Founded in 1450 by Pope Nicholas V, the collection includes more than 1.1 million books, 72,000 manuscripts, 8,300 incunabula, 80,000 archival files, and 100,000 engravings. The Vatican Secret Archives, so called because originally they were strictly private records of the Vatican affairs, were opened to students in 1880. Literary scholars come from all over the world to study the collection of manuscripts. In 1994, librarians began entering the entire card catalogue of printed books into a computerized file accessible via the Internet.

Besides over a dozen museums, some of which figure among the greatest in the world, Vatican City includes as part of its decoration frescoes painted by Raphael (in the Stanze), Michelangelo (in the Sistine and Pauline Chapels), and other great Renaissance artists. In April 1994, after more than 14 years of careful cleaning, Michelangelo’s frescoes became fully visible again. Among the museums in the Vatican are the Pius Clementine, the Chiaramon-

ti, and New Wing (exhibiting antique sculpture); the Gregorian Etruscan and the Gregorian Egyptian museums; the Pinacoteca (paintings); the Collection of Modern Religious Art; the frescoed chapels, rooms, and galleries; and the Sacred and the Profane museums, which are administered by the Vatican Library.

#### 45 MEDIA

The state maintains its own telegraph and postal facilities and has a 2,000-line automatic telephone exchange tied into the Italian system. Radio Vatican, founded in 1931, comprises two facilities, one in Vatican City proper and the other outside Rome at Santa Maria di Galeria. There are 3 AM and 4 FM stations; in addition, shortwave broadcasts can reach the entire world. Programs in 34 languages are broadcast regularly. There is also one television station. The Vatican Television Center, founded in 1983, produces and distributes religious programs. Agenzia Fides and Missionary Service News Agency are the primary news agencies.

Vatican City is an important center for publishing. A semiofficial newspaper of wide fame, *L’Osservatore Romano*, founded in 1861, is published daily, with an estimated 2002 circulation of 70,000 copies. Since 1934, the Vatican has also published *L’Osservatore della Domenica*, an illustrated weekly. The *Acta Apostolicae Sedis* (Record of the Apostolic See) appears regularly on a monthly basis and occasionally at other times; it publishes papal encyclicals and other official papers. An annual, the *Annuario Pontificio*, is issued as a record of the Vatican and the Roman Catholic hierarchy. The International Religious Press Service (Agenzia Internazionale Fides—AIF), founded in 1927, distributes news of missionary activity and publishes *Information* (weekly, in various languages, including English), *Documentation* (irregular), and *Photographic Service* (weekly).

In the mid-1990s, nearly 50 periodicals were published, with a total circulation of almost 60,000. The book publishers for the Vatican are the Vatican Editions (Libreria Editrice Vaticana), the Vatican Apostolic Library (Biblioteca Apostolica Vaticana), and the Vatican Polyglot Press (Tipografia Poliglotta Vaticana).

#### 46 ORGANIZATIONS

The organizations at the Vatican are chiefly learned societies devoted to theology, science, archaeology, liturgy, and martyrdom. The Pontifical Academy of Sciences promotes study in mathematics and the physical and natural sciences. The Pontifical Council for Culture, founded in 1982, focuses on the study of unbelief and religious indifference, particularly concerning the cause and effect of nonreligious or antireligious attitudes in various cultures. The Apostleship of the Sea, based in the Vatican, is an organization of ship, port, and nautical school chaplains (and other sailors) who offer a wide variety of support to maritime workers and their families. Caritas International, representing social service organizations in 200 countries, is based in the Vatican. The World Federation of Catholic Medical Associations is also based in the Vatican.

#### 47 TOURISM, TRAVEL, AND RECREATION

The Vatican is regularly visited by tourists in Rome, by pilgrims attracted by the jubilees proclaimed by the pope every 25 years, and by other special occasions. While there are no public accommodations in the Vatican, special inexpensive facilities are often

arranged in Rome for pilgrims. No passport or identification is usually needed for admission to the public parts of the Vatican.

In 2005, the US Department of State estimated the average daily spending in the Vatican at \$490.

#### 48 FAMOUS POPES

By virtue of their position of world importance, many popes are persons of fame. Among those who greatly increased the secular power of the papacy were St. Gregory I (the Great, 540?–604), pope from 590 to 604, who also was influential in matters of doctrine, liturgy, and missionary work; St. Gregory VII (Hildebrand, 1020?–1085), pope from 1073 to 1085, who engaged in conflict with Holy Roman Emperor Henry IV, forcing him to do public penance at the village of Canossa, and later was driven from Rome by him; and Alexander VI (Rodrigo Lanzol y Borja, b. Spain, 1431?–1503), pope from 1492 to 1503, who also divided colonial territories in the New World between Spain and Portugal.

The most significant 19th-century pope was Pius IX (Giovanni Maria Mastai-Ferretti, 1792–1878), pope from 1846 to 1878, who lost the Papal States to the kingdom of Italy and convened the First Vatican Council (1869–70), which established the doctrine of papal infallibility in matters of faith and morals. The first popes who reigned since the establishment of the Vatican City State in 1929 were Pius XI (Achille Damiano Ratti, 1857–1939), from 1922 to 1939, and Pius XII (Eugenio Pacelli, 1876–1958), from 1939 to 1958.

John XXIII (Angelo Giuseppe Roncalli, 1881–1963), pope from 1958 to 1963, made history by convening the Second Vatican Council (1962–65), by altering the text of the canon of the mass for the first time since the 7th century, and by strongly defining the position of the Church on problems of labor and social progress (in his encyclical *Mater et Magistra* of June 1961). His greatest achievement was generally considered to be his eighth encyclical, *Pacem in Terris* (issued on 10 April 1963), a profound plea for peace, in which he hailed the UN as a defender of human rights.

Paul VI (Giovanni Battista Montini, 1897–1978), pope from 1963 to 1978, continued Pope John's effort to attain unity of the Christian world. On 4 October 1965, he addressed the UN General Assembly, appealing for world peace and international cooperation. He presided over the concluding sessions of the Second

Vatican Council and traveled to many places, including the Holy Land.

Albino Luciani (1912–78), patriarch of Venice, was elected pope on 26 August 1978 and took the name John Paul I. He died on 28 September after a reign of only 34 days. His successor, John Paul II (Karol Wojtyła, 1920–2005), was elevated to the papacy on 16 October 1978. This former archbishop of Cracow was not only the first Polish pope but also the first non-Italian pope since the Renaissance. Despite suffering severe wounds in a 1981 assassination attempt, John Paul II continued to travel widely. To the dismay of Jewish and other leaders, John Paul II granted Austrian President Kurt Waldheim (b.1918) an audience in June 1987, despite accusations that Waldheim had taken part in war crimes during World War II when he was an officer in the German army. John Paul opposed abortion, contraception, homosexuality, divorce, the ordination of women, capital punishment, embryonic stem cell research, euthanasia, and war. He died on 2 April 2005.

A German pope, Pope Benedict XVI (Joseph Alois Ratzinger, b.1927) succeeded John Paul II in 2005, and continued the traditional Catholic doctrines mapped out by his predecessor.

#### 49 DEPENDENCIES

The Vatican has no territories or colonies.

# INDEX TO COUNTRIES AND TERRITORIES

This alphabetical list includes countries and dependencies (colonies, protectorates, and other territories) described in the encyclopedia. Countries and territories described in their own articles are followed by the continental volume (printed in *italics*) in which each appears. Country articles are arranged alphabetically in each volume. For example, Argentina, which appears in *Americas*, is listed this way: Argentina—*Americas*. Dependencies are listed here with the title of the volume in which they are treated, followed by the name of the article in which they are dealt with. In a few cases, an alternative name for the same place is given in parentheses at the end of the entry. The name of the volume *Asia and Oceania* is abbreviated in this list to *Asia*.
