Pausing to regroup, the Mongols launched a massive and well-coordinated invasion of eastern Europe, masterminded by the Mongolian general SUBOTAI. Only the sudden death of OGOTAI KHAN (r. 1229–41) stopped the advance, as the interested parties prepared for the power struggle that would accompany the election of a new supreme khan. The election of MONGKE KHAN (r. 1251–59) quieted things for a while. After his death the Mongols of Russia, known as the Golden Horde, split off permanently from Russia as various parties duelled for supremacy. At the point that Alexander defeated the invading Teutonic Knights and thereby established, again, his reputation in Russia, the Mongols appeared to be more and more disunited. Alexander was both a mediator and a mitigator, where he could, of the worst abuses of Mongol control.

During the 1240s and early 1250s Alexander, who took his father's oath of submission seriously, made efforts to appear a loyal vassal of the Mongols and formally acknowledged their power. He continued to enjoy influence with the Mongols and within Russia, one of the reasons he was appointed grand prince in 1252, after the Mongols had deposed his predecessor. At that time Russia was divided into territories where there was a direct Mongol presence, usually located on the fringes of the Russian cultural area and close to the steppe zone, and territories controlled indirectly by the conquerors. This included Novgorod controlled by Alexander.

It was the Mongol custom to send out tax collectors and other emissaries to canvass the wealth of their territories. First came a census, then generally the appointment of a direct Mongol representative, a *basqaq*, "the one pressing down," and finally tax collectors. It was the presence of these Mongol officers, more than attacks by Mongol armies, that plagued Mongol subordinates in Russia and provoked continued unrest and even outright opposition and rebellion, which always provoked a powerful military response.

During the late 1250s it was Novgorod, still proud from its 1242 victory led by Alexander against the Teutonic Knights, and until then left unassaulted by the Mongols, that was the source of discontent. Alexander's actions in quieting it make clear the role he had chosen in Mongol Russia. He made sure that opposition to the Mongols was suppressed, and then Alexander personally sponsored the census taking in Novgorod. Novgorod paid, and had its pride humbled, but it survived intact (1259). Alexander is also said to have intervened on behalf of the Orthodox Church, to secure its privileges and help prevent Mongol attacks on other cities. At the time of his death, in 1263, he was still actively engaged in such activities. He was rewarded with sainthood. After Alexander's death a considerable legend formed, fueled by a vita that presents Alexander as a saintly protector of Russia against the Mongols. He was also associated with some popular uprisings.

PAUL D. BUELL

Nicaea, Second Council of

In the era of the early church, the artistic portrayal of biblical characters, or iconography, served to teach biblical lessons and church history to the illiterate masses. Churches often displayed biblical scenes or depictions of saints' lives, but charges of idolatry from Muslims (who opposed the depiction of the human form) and the Jews (citing the Torah's prohibition against the worship of any graven image) served to bring about the imperial decrees to destroy any pictorial or symbolic representations of scenes from the scriptures or the saints.

Biblical passages about the nature, practice, and consequences of idolatry abound in Holy Writ; indeed, devotion to icons had risen in intensity among the Byzantines, as well as a great deal of religious superstition related to their use. Emperor Leo III (717–741), the Isaurian, believed the only hope of converting Muslims and Jews was to abandon the use of icons. In 726 he issued an imperial decree ordering the destruction of icons and relics, and his successor, his son, Constantine

V, upheld his father's edict in 753. A synod at Hieria met in 754 and upheld ICONOCLASM. The iconodules, or churchmen and monks defending the use of icons, fought against the destruction of the images, often at the cost of their lives.

Convoked at the behest of the empress IRENE in 786, the imperial government called for the council to decide the issue. Though dominated by over 300 Byzantine clerics, Pope Hadrian I (772–795) sent two representatives to the gathering who carried with them a treatise from the pope justifying the veneration of images. The first session, meeting at Constantinople, came under attack by soldiers committed to iconoclasm; therefore it was decided to move the meeting to Nicaea in Bithynia (now Inzik, Turkey), where the council opened on September 24, 787. The council met for eight sessions conducted over a period of three weeks. Tarasius, patriarch of Constantinople, presided over the first seven sessions, and the empress Irene led the final meeting of the council at Constantinople.

The first session dealt with the issue of what to do with the iconoclast bishops, many of whom attended the gathering. Once the wayward bishops recanted of their "error" and begged forgiveness from the conclave, the clerics received restoration among the ecclesiastical fellowship. During the second session, the papal legates sent by the Holy See read aloud the letter sent by Pope Hadrian I to the assembly in which the pope urged the restoration of the icons. The third session, September 28 or 29, bishops who recanted their iconoclastic pronouncements received permission to take seats on the council.

The fourth session, held on October 1, consisted of readings of long passages from the Bible and the church fathers that favored the veneration of images, and the session closed after a decree was signed by all present that the participants were ready to receive in fellowship all those who would openly abandon the iconoclastic position. During the fifth session, on October 4, the gathering heard the oral readings of the church fathers opposed to icon use, but the council chose not to read all of the anti-icon writings and voted in favor of image veneration. The fifth session closed with the formal display of an image in the meeting place of the council. The sixth session, which met October 6, the iconoclastic decision of the council held at Hieria in 753 received the formal condemnation.

The dogmatic decision of the council, read at the seventh and final session at Nicaea on October 13, formalized the veneration of images. The final session, led by the empress and her son at the Magnuara palace

in Constantinople on October 23, resulted in the two monarchs and the clerics signing the *Acta* of the council making the canons decided upon by the gathering the law of the church and the Byzantine Empire. In the end, the council promulgated 22 canons. The ninth canon demanded the surrender of writings against images, and the remaining canons consisted of matters related to clerical ethics, practice, and discipline. The council did not end the controversy; it persisted for another generation, but it did provide for the formal recognition of icon veneration, defined as a matter of respect and honor, and not idol worship or pagan practice.

JAMES S. BAUGESS

Nicheren

(b. 1222) *religious leader*

Nicheren (or Nichiren) Buddhism was a sect unique to Japan that challenged the existing notions of Buddhism as part of a societywide upheaval of intellectual and religious understanding. The essence of Nichiren Buddhism is the reversal of the original message of Gautama Buddha, which Nichiren considered to have been used to exalt and protect the state to the detriment of individuals. Instead, people should study ways of achieving material and physical security and ease by following the Lotus Sutra (*Saddharmapundarika-sutra*).

Nicheren (originally Zennichi and also known as Zenshobo Rencho) was the son of a poor fisherman from the Awa province. He studied various forms of Buddhism over a 10-year period before concluding that all were false or otherwise unhelpful. This was a period of Japanese history that was characterized by considerable turmoil. The huge distance between the court and the people was crumbling, and the intellectual landscape was threatened by social change and by external threats, notably the Mongol conquests. Religious reformers traveled from the court to try to learn from the common

people, who were almost completely alien to them. Radical schools of thought were widespread across the land and were represented by monks and scholars including Chomei, Jien, Honen, and SHINRAN. The latter two were largely responsible for the spread of Amidist Buddhism, which abandoned all hope in the present world, which was doomed. Only faith in a future act of transcendence or salvation was of any value.

In response orthodox Buddhists sought to reinstate traditional monkish asceticism and reliance on good works. Nicheren ultimately rejected both Amidism and the orthodox Buddhist response as being inadequate to respond to the world as it stood, particularly the very real possibility of Mongol invasion, which threatened the existence of the Japanese culture altogether. He believed that Japan was suffering the period of the degradation of the law of dharma known as *mappo* and that he was the embodiment of the bodhisattva Jogyo, whose task was to rescue his people and nation during their time of tribulation.

He came to believe that this could be accomplished through recognizing the threefold nature of the Lotus Sutra, which was the culmination of Sakyamuni Buddha's final teaching and that Sakyamuni was to be identified with the eternal Buddha. This was composed of the *dharmakaya* (the universal body), the *sambhogakaya* (enjoyment body), and the *nirmanakaya* (phenomenal body). This gave rise to three great secret laws that Nicheren taught were the *honzon*, which focused on the ritual drawing of the Lotus Sutra, the *daimoku*, which featured ritual chanting of the name of the Sutra, and the *kaidan*, which was related to the place of ordination. Only by following these teachings, according to Nicheren, would Japanese people and society develop sufficient strength and the power to resist the troublesome times afflicting them. This is considered to be the opposite of Buddhism, which preaches the need to escape from the physical world of suffering by relinquishing desire in all its forms.

Nicheren selected six disciples to continue his work after his death but they were unable to prevent the multiplication of sects associated with his teaching. In the modern world, nearly 40 million Japanese profess beliefs that derive from Nicheren's teachings, which have had considerable importance in shaping the spiritual and intellectual nature of Japanese society. Nevertheless, his standing remains controversial.

JOHN WALSH

Nicholas I

(d. 867) *pope*

Nicholas I was the second pope known as "the Great" (the first was Leo the Great). Nicholas was the son of a Roman nobleman and received a classical education as a youth. He entered the clerical service as a young man and was ordained a deacon by Pope Leo IV (847–855). Under the influence of Emperor Louis II, Nicholas was elected pope on April 24, 855.

Ninth-century Christianity was fragmented. Bishops sought worldly power in their particular dioceses and ignored the decrees of the Roman pontiff. Previous popes had weakened the office of the papacy, and the primacy of the pope over other bishops had also been weakened. Nicholas changed this, in part, by his treatment of Archbishop John of Ravenna. John battled with the pope over lands controlled by the papacy. He imprisoned priests who disagreed with his policies and bullied his bishops. John mistreated the diplomatic representatives of the popes, who sought to bring him to justice at the papal tribunal. Pope Nicholas excommunicated John because of his refusal to come before the tribunal. John reconciled, and then was excommunicated again for his dealings with other excommunicated archbishops.

The episode with Archbishop John of Ravenna and another with Archbishop Hincmar of Reims solidified the primacy of the papacy in matters attaining to the role of the pope in the hierarchy of the church and his control over his bishops. Hincmar opposed the right of appeal to the pope in matters of ecclesiastical succession but eventually recognized this legal power of the papacy.

Nicholas also strengthened the authority of the papacy over the marriage laws of the church. Lothair II of Lorraine had left his wife to marry another woman. At the Synod of Aachen in 862, the bishops of Lorraine approved of the conduct of Lothair. Another synod, held in Metz in 863, condemned Lothair for abandoning his lawful wife. Pope Nicholas, aware of the conflicting decisions of the two synods, brought the archbishops who certified the two decisions before him. The disagreement led to excommunication for both archbishops and intervention of Emperor Louis II, who imprisoned Nicholas

in St. Peter's Basilica for two days. Nicholas worked hard to reconcile Lothair and his wife, to no avail.

Perhaps Pope Nicholas's greatest legacy to history was his establishment of primacy over the patriarchs of Constantinople and the church of the East. Patriarch Ignatius was deposed in 857 in violation of ecclesiastical law. He excommunicated Ignatius's unlawful successor, Photius, and led the bishops of the East to reconcile with Ignatius. The eastern bishops thus legally accepted that the pope was "first among equals." Papal primacy in church doctrine was solidified in Nicholas's famous letter *Responsa Nicolai ad consulta Bulgarorum*. Greek missionaries had recently converted Bulgaria. Bulgaria's ruler Prince Boris appealed to the pope in 863 to answer 106 questions on the teachings of the church. Nicholas answered the questions and, as some of his predecessors, set the trend for doctrinal questions to be answered by the pope, not by local bishops and clergy.

RUSSELL JAMES

Nicholas V

See ROME, PAPACY IN RENAISSANCE.

Norman and Plantagenet kings of England

The conquest of England in 1066 brought with it a completely new ruling dynasty. The Norman kings, beginning with William I, began a social and legal revolution in England. They also succeeded in unifying England and blurred the lines between Saxons and Normans. The Plantagenet kings composed a long dynasty that included the related families of Anjou, Lancaster, and York. However, most historians seclude the Angevins from the Lancastrians and the Yorkists because of the historical development of the Wars of the Roses.

The Norman kings included the following rulers:

- William I (the Conqueror): 1066–1087
- William II (Rufus): 1087–1100
- Henry I (Beauclerc): 1100–1135
- Stephen: 1135–1154
- Matilda (Maude): 1141

The Plantagenet rulers were

- HENRY II: 1154–1189
- RICHARD I (Lionheart): 1189–1199
- John: 1199–1216
- Henry III: 1216–1272
- EDWARD I (Longshanks): 1272–1307
- EDWARD II: 1307–1327
- Edward III: 1327–1377
- Richard II: 1377–1399

William I, originally the duke of Normandy and the second cousin of Edward the Confessor, emerged victorious from the NORMAN CONQUEST OF ENGLAND and seized control of the English throne on Christmas Day, 1066. Within five years William I contained numerous rebellions and subdued the country. His reign was highlighted with the creation of the *Domesday Book*, a survey of landownership used to collect taxes and the most comprehensive and detailed record of a country's physical resources produced in Europe during the Middle Ages. William I died on September 9, 1087, from complications of a wound received in battle.

William II, or Rufus, was the second son of William I. He received England upon the death of his father. William I's eldest son, Robert, received Normandy. William Rufus's rule was categorized by heavy taxes and animosity between Crown and clergy. On August 2, 1100 William II was shot in the eye with an arrow while on a hunting expedition and died childless and unmarried. Because of his unpopular reign, many historians believe his death was not an accident.

Henry I, brother of William Rufus and the youngest son of Edward I, ascended the throne of England upon the death of his brother. He was nicknamed Beauclerc (fine scholar) because of his educational background. Through his skilled use of court politics, he established the exchequer, or the royal treasury, during his reign. Henry I had hoped to leave his throne to his only surviving daughter, Matilda, but upon his death the throne was offered to Stephen of Blois.

Stephen, Henry I's nephew and grandson of William the Conqueror, was ill equipped to respond to the demands of the monarchy and his lack of authority over the quarreling and power hungry English barons erupted into civil war and strife during 1135–54. The government that Henry I had constructed was in jeopardy of collapse, and the church and Crown continued their deepening animosity. He was briefly overthrown in 1141 when Matilda (known also as Maude) and her husband, Geoffrey of Anjou, entered London and claimed the throne. She ruled briefly but was removed from the throne by

Stephen's rallying troops. Questions of succession continued until the Treaty of Wallingford was signed. Under this agreement, Stephen would rule unopposed until his death, at which time the throne would pass to Matilda's son, Henry of Anjou.

Henry Plantagenet, count of Anjou, succeeded Stephen as Henry II in 1154. As the first of the Angevin kings, Henry II was a European ruler rather than an English king because of the size of his empire and the fact that he was the richest prince in Europe at the time of his ascension to the throne. Henry II's rule is often remembered as one of the most effective of English monarchs'. Most important at this time were the revival of royal justice and the foundation of ENGLISH COMMON LAW applicable to all of England. Henry's reign also included his quarrel regarding the power of church courts with THOMAS BECKET, Henry's former chancellor and archbishop of Canterbury, which led to the latter's martyrdom at Canterbury cathedral in 1170. The latter years of Henry II's reign included several rebellions ignited by his sons, backed by the kings of France and SCOTLAND and encouraged by ELEANOR OF AQUITAINE Henry's vivacious wife.

Richard I ascended the throne in 1189 but only lived in England for less than a year of his entire reign. Instead, he fought in the CRUSADES, fell captive to the Holy Roman Emperor Henry VI in Germany, and continued to fight for lands lost in France. While he was away, the government built by Henry II continued to collect taxes and survive. He died from battle wounds in April 1199, leaving no heirs. John, the fourth son of Henry II, ruled England in 1199 after many years of trying to steal the throne from his brother Richard. Nicknamed Lackland, John was the stereotypical wicked king; he taxed the English system in every possible manner. During his reign England lost her French possessions, Pope Innocent III excommunicated John from the church for refusing to install Stephen Langton as the archbishop of Canterbury, and taxes consistently increased. The barons, led by Langton, confronted John at Runnymede and forced him to accept the MAGNA CARTA, or Great Charter, in 1215. The document confirmed popular liberties and restated the rights of the church and the English people.

When John died in 1216, his nine-year-old son, Henry, was accepted as king of England. He assumed the role of king in 1234 and confirmed the Magna Carta. However Henry III was an inept king who engaged in costly wars in an attempt to replenish his impoverished treasury, refused to defy papal decree, and provided appointments to foreigners rather than the English

nobility. This approach to government fueled antipapal sentiment and laid the foundation for the Reformation. It also provided opportunity for the rise of English nationalism. As English barons became more frustrated with Henry III's choices and costly wars, they revolted and threw England into a period of civil war. At one point Simon de Montfort briefly held power in 1264; however, he was killed in battle and power returned to Henry III and his son, Edward. There were some positive aspects of Henry III's reign. The population of London and the country rose substantially, the universities of Oxford and Cambridge were established, and the economy improved with the increase of agriculture. By the time Henry III died in 1272, he was monarch in name only, as the true power had already been transferred to Edward.

Edward I, known as Longshanks because of his height, was an accomplished soldier, statesman, and perhaps the most successful medieval monarch. Through his reign England recognized and retained many aspects of society, law, and government that survived centuries, civil war, and international conflict. Although Edward I could be considered ruthless and aggressive in many situations, he understood the delicate balance in which a monarch functioned. He is credited with the creation of the modern-day Parliament. In 1295 Edward I summoned various representatives to his Model Parliament in order to raise more revenue. To this end parliament was used to conduct national business. Edward I also supplied the courts of King's Bench, Exchequer, and Common Pleas with judges; established a Court of Equity; and created a Chancery Court to provide redress in situations where other courts could not intervene. Edward accepted the Confirmation of Charters in 1297, which stated that taxes must have the assent of the realm.

Edward I also lived up to his ancestors' attempts to expand the English empire. He conquered Wales in 1284 and chose to name his eldest son Prince of Wales in 1301, a title that has been bestowed upon the all first-born male heirs to the present day. Scotland proved to be a tougher conquest. Edward attempted to lay claim to Scottish lands by having his son marry Margaret, the legitimate heir to the Scottish Crown. However she died en route to England, and Edward I invaded Scotland in 1296, defeated them, and was paid homage by the Scottish barons. William Wallace incited a riot against the English king in 1297, defeated the English army at Stirling, and continued to be a thorn in Edward I's side until his capture and execution in 1304. Robert Bruce, a distant claimant to the Scottish throne, continued to harass

Edward I and his armies. The English were eventually defeated at Bannockburn under Edward II, but the animosity between the two nations continued for centuries.

Edward I's biggest failure came in the form of his son, Edward II, who was feeble, lazy, and incompetent. Edward II also had a penchant for surrounding himself with foreigners, a trait that the English barons loathed. He carried on a homosexual affair with Piers Gaveston, which led to Gaveston's exile and murder. Eventually Edward II's wife, Isabella, and her lover, Roger Mortimer, invaded England from France, forced Edward II to abdicate in favor of his son, and murdered him. Once his wife and her lover deposed Edward II, Edward III ascended the throne in 1327. He quickly arrested and hanged Mortimer while imprisoning his mother for the last few decades of her life. Edward III was responsible for the beginning of the HUNDRED YEARS' WAR with France in 1337 allegedly to support his claim to the French throne. Initially England saw victories at Sluys (1340), Crécy (1346), and Calais (1347), giving them control of the Channel and the land. The bubonic plague, or BLACK DEATH, provided a short break from hostilities, but England resumed the fight with an invasion of France in 1355. Edward, the "Black Prince" and eldest son of Edward III, found success at Poitiers (1356). The Treaty of Brétigny (1360) brought this phase of the Hundred Years' War to a close. However, John of Gaunt, Edward's third son, resumed the battle in 1369 when he invaded France again.

Under Edward III, English social life and economic history changed. He experienced relatively peaceful relations with the noble classes. Mercantilism began to replace feudalism. The taxation system was supported by commerce rather than land taxes. Parliament found a bicameral cohesion as it divided into two houses representing the nobility and clergy, and the middle classes. In 1362 English replaced French as the national language of the realm. Treason was defined in 1352, and the office of justice of the peace was created (1361) to assist the sheriffs. Unfortunately Edward III's final years were marked by increasing senility, the death of the Black Prince, and disintegrating relations between the Crown and his subjects, due in part to Edward's mistress, Alice Perrers.

Richard II, son of the Black Prince and grandson of Edward III, ascended the throne in 1377 at the age of 10. His rule was highlighted by his marriage to Isabella of Valois, daughter of Charles VI of France, in order to end further conflict with France. He also subdued a PEASANTS' REVOLT in 1381 that resulted from the effects of the Black Plague's strain on the economy. Rival fac-

tions continued to fight for governmental control, and in 1397, Richard II became embroiled in a struggle with some of the nobles for control. First John of Gaunt, then his son, Henry Bolingbroke (Henry IV), attempted to take the throne. Richard was usurped in 1399, imprisoned, and murdered. The Wars of the Roses had claimed their first victim in the former king.

JENNIFER HUDSON ALLEN

Norman Conquest of England

The Norman Conquest is the period of English history that followed William the Conqueror's defeat of King Harold at the Battle of Hastings in October 1066. Although Hastings was the turning point of the conquest, it actually took William about six years to put down all Saxon opposition. The political personalities changed and Britain became less isolated. Along with the Anglo-Saxon king, most members of the nobility were killed at Hastings or during the ensuing insurrections. Those who survived had their lands taken from them. These landholdings became the possessions of William and his followers, thus imposing a Norman aristocracy on the English people.

Recognizing that relatively few Normans were ruling the masses of Englishmen, William utilized the Anglo-Saxon idea of a centralized monarchy to stabilize and consolidate his power. Other political and legal institutions he established borrowed heavily from English tradition. In this feature, English feudalism differed from that found on the Continent. To strengthen his position of power, William had himself crowned William I, king of England, by the archbishop of Canterbury on Christmas Day 1066. To guarantee further his sovereignty,

A portion of the Bayeux Tapestry, depicting the Battle of Hastings and the events leading up to it. The tapestry, or embroidery, has been housed in Bayeux, France, at least since 1476, and possibly since shortly after its creation in the 1070s.

William began an extensive building program, erecting castles and garrisons at strategic points throughout the Isles. Placing each of these tactical locations under the control of one of his most trusted nobles, William was able to tighten his control over the entire nation. Castles, which were rare in the British Isles before 1066, became a familiar feature of the landscape.

Construction of castles also made it easier for William to introduce the feudal system to England. William divided his territory among his favorites in return for their pledge to feed, house, and equip knights for the king. From the castles lords could effectively administer large areas of land for the king. With the Oath of

Salisbury in 1086, William established the precedence of loyalty to the king as more important than loyalty to lesser lords. This highly organized system of obligations among knights, lords, and the king was far removed from Anglo-Saxon ideas of kingship.

WILLIAM THE CONQUEROR

William was the illegitimate son of Robert I, duke of Normandy, and the daughter of a local craftsman. Sometimes called William the Bastard, William nevertheless inherited his father's lands when the duke died in 1035. Constant rebellions during William's minority kept him and his guardians in frequent danger. William

was able to defeat the invading army of the king of France and to put down opposition among his nobles. With his power established in Normandy, William visited England in 1051 or 1052, when he received the promise of his cousin Edward the Confessor that he would name William as his successor. William further improved his position through marriage to Matilda of Flanders, a descendant of ALFRED THE GREAT. Later Harold, earl of Wessex and also in line for the English throne, was shipwrecked off the coast of France. Harold found himself under William's authority and, likely in exchange for his freedom, promised to support William's claim to England. In 1066 when word reached France that Harold had been crowned king of England, William immediately appealed to the pope, who gave him sanction to raise an army and invade England.

BATTLE OF HASTINGS

Although some Norman barons did not give wholehearted support to the mission, William brought them in line through bribes and threats. In September 1066 William sailed for England with an amassed army of approximately 30,000 troops, including mercenaries and men attracted by the possibility of plunder. Harold II was already under attack from Harald Hardrada, king of Norway, and Harold's exiled brother Tostig, whom he was able to defeat on September 25. William landed at Pevensey in Sussex on September 28.

Even though Harold's troops were tired and William had superior numbers and equipment, Harold was able to keep William at bay when they first met at Hastings. At one point, William had to rally his troops and lead a counterattack on the Saxons. Tradition, including the Bayeux Tapestry, shows that Harold received an arrow in his eye during the battle, causing his troops to act in confusion; some fled; some stayed to fight to the end. After this battle, William's advance to London was uneventful, and he was able to proclaim himself king of England. Despite uprisings from the Saxons during the next six years, William's takeover had been accomplished.

BAYEUX TAPESTRY

The Bayeux Tapestry tells the story of the Battle of Hastings and the events leading up to it on a linen background more than 7 meters long and half a meter wide (20 by 230 feet). Most scholars agree that this is not the total tapestry, that some pieces of the embroidered cloth have not survived the years. Bishop Odo, William's half brother, whom William named earl of Kent, may have commissioned it. There are flattering images of Odo, and only he and one other of William's companions are named on

the tapestry. The origin of the labor is highly disputed among the English and French, each insisting the massive work was done in their homeland. The tapestry has been housed in Bayeux, France, at least since 1476, and possibly since shortly after its creation in the 1070s.

RELIGIOUS REFORM

William was a ferocious opponent and could be quite brutal in putting down opposition, yet in many ways he was also a very spiritual man. Another significant part of his conquest agenda was reform of the church. In 1070 William arranged for his longtime friend Lanfranc to be named archbishop of Canterbury. Lanfranc's primary responsibility was to facilitate the reforms William wanted, including appointing foreign prelates to replace Saxon clergy and enforcing discipline in monasteries. King and archbishop also instigated a canonical court, removing church-related cases from the secular legal system. William asserted his power to name bishops and to approve or disapprove of church doctrine and decrees without opposition from Lanfranc and the church.

DOMESDAY BOOK

Always cognizant of the fragility of his hold over the English, William constantly sought better means to solidify his power and manage his finances. To that end, he ordered that the *Domesday Book* be assembled. The title is a variation of *doomsday*, or "day of judgment," and probably is linked to the fact that the book became the final authority in many property disputes. This remarkable compilation, completed between 1085 and 1086, is a detailed accounting of the wealth of England, listing personages and their holdings in land and livestock, the numbers of tenants on the land, buildings, mills, and other sources of wealth. The Domesday commissioners also noted the devastation that England had undergone as a result of William's expeditions to put down opposition. In fact in some areas, they released individuals from their taxes because of the poverty they found in areas where William's troops had been especially destructive. The *Domesday Book* was the basis for tax assessments until 1522.

A CHANGED LANGUAGE

One of the most significant influences of the Norman Conquest was on the English language. The conquering French imposed their native tongue as the language of the upper classes, literature, and the court, considering Anglo-Saxon speech crude. However the English never abandoned their language, forcing the upper class to accept much of the language of the lower classes. As the

Norman and Saxon languages fused over the decades, Middle English, the language of GEOFFREY CHAUCER, emerged, still primarily Anglo-Saxon, but much enriched by French and Latin additions. Parliament was opened in English for the first time in 1352.

William I died as the result of a riding accident in 1087. He bequeathed his Norman territory to his son Robert II and his English lands to his son William II, a decision that was later to shape the events of the HUNDRED YEARS' WAR. Henry I and King Stephen followed William II. The end of the Norman period is usually considered as 1154 when HENRY II, a Plantagenet, came to power.

JEAN SHEPHERD HAMM

Norman kingdoms of Italy and Sicily

Described by some sources as bloodthirsty brigands, the first Norman warriors arrived in Italy from Normandy, France, in search of adventure, land, and wealth. As foreigners to the fragmented lands of Lombard, Italy, and Sicily, the first Normans were able to take advantage of disputes between the pope, the BYZANTINE EMPIRE, the Lombard lords, and the Muslims of Sicily to forge a united kingdom out of fractious, petty states. The Normans assured stability with a strong bureaucracy based on Arab, Greek, and Latin models. The largely tolerant and synergetic culture of Norman Sicily was embodied in the fusion of Arab, Berber, Greek, and western traditions in their architecture, art, and literature. The Normans epitomized Mediterranean culture and trade, knitting a kingdom that, as the Mediterranean itself, connected Africa, Europe, and the East. At its height the civilization of Norman Italy and Sicily was a remarkable combination of Greek, Arab, and Latin cultures.

Robert Guiscard and his brother Roger I were two of the first Norman warriors to attack Byzantine possessions in southern Italy. They even captured Pope Leo IX in 1053. He was not released from captivity until he recognized the authority and legitimacy of the

Normans. The papacy and the Normans were reconciled after Pope Nicholas II gave Guiscard authority over Apulia, Calabria, and Sicily even as these regions were still occupied by Byzantium and the Muslims of Sicily. Ibn al Thumma, an Arab from Sicily, offered the entire island to Roger I if he agreed to help establish stability on the island. By 1072 the Normans had conquered Palermo. Despite their thirst for booty, the Normans guaranteed the protection of religion and local laws. In 1091 Roger I had effectively conquered the entire island, respecting the local laws and beliefs as promised. His feudal system simply copied the Muslim military districts, Muslims were a large part of his army, and Muslim eunuchs took over many bureaucratic tasks.

Roger II, son of Roger I, was probably the most famous Norman ruler. His reign of more than four decades (1111–54) saw the birth of a great trading empire. Recognizing the importance of North African trade, he conquered several cities on the coastline of modern-day Tunisia and challenged the naval supremacy of the North African, Muslim states in the Mediterranean.

This opened the rich African gold and Oriental spice market to European traders, creating an economic boon for the Normans, the new masters of the Mediterranean. As a statesman Roger II reformed the judicial system and maintained order among the different religious and ethnic communities of the region. In addition to Greek scholars and ministers, his court included a harem, and a cohort of Muslim slaves, eunuchs, and administrators. Some Muslim scholars were so impressed by his tolerance and kindness that they claimed he was a Muslim in disguise.

The Palatine Chapel in Palermo, considered the finest example of Norman medieval architecture, exemplified the Norman use of the best Byzantine mosaics, Arab plaster decoration, and Latin painting, creating a magnificent jewel of medieval and intercultural unity even as the rest of Europe was rocked by war and conflict. Greek, Latin, and Arabic were all official languages of the Norman court. A cadre of religious scholars and poets from the FATIMID DYNASTY in Egypt, Byzantium, North Africa, Italy, and Spain engaged in free and open debates about the nature of God, faith, and fate, answering difficult theological questions asked by Roger II. Al-Idrisi, the Arab Sicilian geographer, called his carefully constructed map and description of the world the *Book of Roger*. A book used by European explorers, the *Book of Roger* drastically increased western and Latin knowledge of world geography.

Faced with the reconquest of North Africa by the Almohads and other threats to his power, Roger II gradually became less tolerant to the Muslims of Sicily. Norman power began to wane under William, Roger's successor. He did not have the same energy for statecraft as his father. Even as the first stage of Norman rule went into decline, a new leader soon emerged from a marriage between a Sicilian and the ruler of Germany, a leader who would bring Sicily and Italy back into an age of cultural brilliance.

Frederick II (1194–1250) ushered in the next great era of southern Italian history. As son of Constance of Sicily, he had Norman blood. He was also son of HENRY IV, a German king and Roman emperor. As the Normans before him, he had a difficult relationship with the church. Despite his strong crusading spirit, he was excommunicated by a papacy concerned about the unification of Italy and threats to the PAPAL STATES. He was crowned emperor of Jerusalem in 1229, establishing a state that was largely tolerant of different religious faiths.

Inspired by the multireligious culture of Sicily, he created a rare and brilliant era of peace in Jerusalem.

Like his Norman predecessors Frederick was very much a man of the Mediterranean. Far from a provincial German ruler, or a Norman barbarian, he was steeped in the international cultures of ISLAM, Judaism, and the Greek church as well as the Roman church. It could easily be argued that the cultural patronage and openness of the Norman kings and their defiance of papal authority helped build the foundations of the ITALIAN RENAISSANCE and the birth of humanism.

ALLEN FROMHERZ

Ogotai Khan

(1185–1241) *Mongol leader*

Ogotai Khan was the third son of GENGHIS KHAN and spent most of his early life campaigning. Realizing the implacable enmity between his first and second sons, Juji and CHAGATAI KHAN, Genghis decided in 1219 to bypass both for supreme leadership of the Mongols after his own death in favor of Ogotai. He reconfirmed this decision before his death in 1227. Ogotai was confirmed as the Mongols' second khaghan (grand khan) by the *khuriltai* of Mongol leaders in 1229 and established Karakorum on the upper reaches of the Orkhon River as his capital, surrounding it with a defensive wall.

True to his martial heritage Ogotai began his reign with massive campaigns to expand the Mongol empire, amassing four armies. One marched westward to conquer the steppelands of central Eurasia and the Russian principalities, across the Ural Mountains, and the Volga River. Led by the old warrior SUBOTAI and Batu (Juji's son), its goal was to secure and enlarge the inheritance of the sons of Juji (who had predeceased Genghis Khan). A second army's goal was to complete the conquest of Khwarazm, which includes modern Iran, then onto the Middle East and Asia Minor. A third army took on Korea, which had been conquered earlier but had revolted against the unbearable conditions of Mongol rule. Finally Ogotai and his younger brother TULUI KHAN led a force to finish the conquest of the JIN (CHIN) DYNASTY in northern China. They

took the Jin capital KAIFENG (K'AI-FENG) in 1233; the last Jin emperor committed suicide in 1234 and all northern China came under Mongol rule. Subotai's army had the most spectacular success, conquering the Turkish tribes of the Russian steppes, all the Russian principalities except Novgorod, the Ukraine, Poland, MORAVIA, and Hungary. They were at the gates of Vienna before withdrawing in 1241 on the news of Ogotai's death. The army sent to conquer the Middle East added western Persia and the Caucasus to Mongol control. Korea submitted in 1259. Ogotai also made administrative reforms to centralize the administration to ensure his control over the Mongol lords and the efficient gathering of taxes and tribute from his sedentary subjects. Thanks to a remarkable non-Mongol adviser YELU CHUCAI (Yeh-lu Ch'u-ts'ai) reforms were begun in northern China that ended the brutal looting and massacre of the population on the premise that working people paid more taxes than expeditions could gather.

After the campaign against Jin, Ogotai returned to Karakorum and abandoned himself to a life of pleasure, hunting and drinking so heavily that an official was appointed to count the amount of wine he drank daily. His second wife, Toregene, moved quickly to consolidate her authority even before he died while on a hunting trip; he was buried in Jungaria in his personal *appanage* (fief). According to Mongol custom his widow, Toregene, became regent until the *khuriltai* elected a new ruler. Her goal was to ensure the election of her son Guyug as the next khaghan, despite much opposition by other

branches of the Mongol royal house. After four and half years she succeeded.

JIU-HWA LO UPSHUR

Olaf I

(969–1000) *Norwegian king*

Olaf Tryggvason ruled the kingdom of Norway as Olaf I. He was the son of King Tryggve Olafsson but was forced to flee when Eric Bloodaxe killed his father and purged the royal family. Olaf finally found refuge in Novgorod, where the Vikings had opened up settlements. Their renown as warriors made them prized mercenary soldiers throughout eastern Europe; as many Vikings went east as those who made the more familiar inroads into western Europe.

Their fighting prowess was so well regarded that the emperors of the eastern Roman or BYZANTINE EMPIRE made them among their prize troops as the Varangian Bodyguard. The huge axes they carried as their main weapons earned them fear and respect from their enemies. Olaf served in Novgorod under VLADIMIR I (VLADIMIR THE GREAT) (c. 958–1015), who converted the RUS, the ancestors of today's Russians, to Christianity in his principality of Kievan Rus. Olaf also saw service as a mercenary under the Holy Roman Emperor Otto III (960–1002). After his sojourn in eastern Europe where he married a Polish princess, he became involved in the Viking raids on England and France. After the death of his Polish wife, he wed Gyda, who was the sister of Olaf Kvaran, the Viking king of Dublin. Ireland, as England, suffered greatly from Viking incursions from Scandinavia.

But as in France and England the Vikings created permanent settlements and Dublin traces its origin to the Viking settlement. Dublin on the river Liffey would have proved an excellent and protected anchorage for

the Viking long ships. It would not be until 1014 that the Irish High King Brian Boru would defeat the Vikings at Clontarf, effectively restoring much of Ireland to native Irish rule. However, Brian was killed toward the end of the battle.

Olaf learned of the dissatisfaction of the Norwegians with the rule of the earl Haakon. He decided to make a dramatic bid for his father's throne. The people welcomed him as the rightful king and he swiftly became established as ruler of the kingdom. Johannes Brondsted writes in *The Vikings* that Haakon "was murdered by one of his own servants." However, in c. 995 Olaf converted to Christianity and, as was the custom of the times, caused his people to convert with him. During the conversion of Norway, he had the shamans who opposed him drowned at high tide. Once he had made his conversion, Olaf ceased raiding Christian countries and turned his considerable energies to raiding pagan countries.

The date of Olaf's conversion to Christianity is disputed. Johannes Brondsted in *The Vikings* remarks how Olaf raided England in 991. In 994 he participated in a massive raid on London with the Danish king Sweyn (Swen) Forkbeard. Brondsted notes that Olaf had already been converted to Christianity. The raid was a large undertaking, according to Brondsted, "with a joint fleet of about a hundred longships, and presumably at least two thousand men, they attacked London; but the city beat off the assault, and the Vikings had to be content with plundering southeast England and finally accepting 16,000 pounds of silver to leave. Olaf Tryggvason left for good to take up the task of conquering Norway." At the time, Ethelred was the king of England. Olaf made his capital at Nidaros, now known as Trondheim, when he took the Norwegian throne.

Upon taking the throne in 995 Olaf enforced Christianity among the general population, but his rule was only certain in the north around Trondelag. His former ally Sweyn Forkbeard of Denmark claimed the southern part of Norway. While Olaf tried to consolidate his rule in Norway, he also controlled Iceland. He made a strong effort to convert the inhabitants of Iceland from their pagan ways. While the first missionaries, Brondsted notes, were sent in 987, their journey ended in failure. Around 997, however, Olaf's efforts met with success and Christianity was proclaimed at the Icelandic Thing, perhaps the closest to a true democratic assembly then in existence in northern Europe.

Meanwhile Olaf's attempt at consolidation was bringing him nearer to a confrontation with Sweyn Forkbeard of Denmark. Sweyn, seeing a conflict ahead, carefully wove a web of alliances around Olaf. Sweyn married the

mother of the king of Sweden, Olaf Skotkönung. He was careful to include the sons of Earl Haakon in his marital alliances as well. One son, Swen, was married to Skotkönung's sister, while the other, as Brondsted notes, was wed to Sweyn Forkbeard's own daughter.

In 1000 Olaf met his enemies at a naval battle off the island of Svold, near Rugen. Olaf was greatly outnumbered by the fleets of Denmark and Sweden, in addition to those Norwegians who followed the two sons of Earl Haakon. Moreover, as Brondsted writes, the Viking fighters known as the Joms-vikings also betrayed him. Olaf fought bravely from the deck of his ship *Long Dragon*, which was reputedly the largest warship yet seen in Scandinavian waters. The rowers of Viking longships, it should be noted, were warriors as well and not slaves as they were on the galleys of the ancient Greeks and Romans. When the ships came in close contact, sometimes efforts were made to ram an enemy's ship. But, as with the Romans, battle was decided by an armed conflict among the warriors, who would attack an enemy vessel and seek to overpower the crew. Destroying a longship was never a real tactical goal, since the attackers usually sought to take it intact and add to their fleet. This certainly would have been the case with Olaf's *Long Dragon*. After his death, Olaf remained the hero of his people, who whispered that he was still alive and waited for his return in vain.

JOHN F. MURPHY, JR.

Omar Khayyam

(1048–1131) *Persian poet and astronomer*

Omar Khayyam was born in Nishapur, Persia (present-day Iran); his name means “tent maker,” the likely profession of his father. During his lifetime he was known, not as a poet, but as a mathematician and astronomer. He studied philosophy as well as science. As all artists and scientists of the age Omar Khayyam was dependent upon the patronage of the local rulers or persons of wealth for his livelihood. As a young man he worked in SAMARKAND under the patronage of the Seljuk ruler, Malik Shah, during which time he wrote the *Treatise*

on Demonstration of Problems of Algebra. The treatise was a groundbreaking mathematical work; he also listed astronomical tables and, with other scientists, worked to reform the calendar. After the death of Malik Shah and a change in political fortunes, Omar Khayyam moved to the great center of Islamic scientific study at Merv (in present-day Turkmenistan), where he wrote critical analyses of Greek astronomical and mathematical thought. He also traveled to Mecca and BAGHDAD, other centers for scientific thought. In his old age he moved back to Nishapur, where he died in 1131.

In the west Omar Khayyam's *Rubaiyat*, a series of almost 600 rhymed four-line quatrains, was popularized by Edward Fitzgerald's 1859 translation. Fitzgerald took extensive liberties with the text and it is thought the Omar Khayyam probably wrote only about 200 of the quatrains. The *Rubaiyat* reflects Omar Khayyam's romantic as well as pragmatic nature and covers a wide range of topics including love and death. The poem takes an open view to sensuality, wine, women, and song with verses like

Whether at Naishapur or Babylon,
Whether the Cup with sweet or bitter run,
The Wine of Life keeps oozing drop by drop,
The Leaves of Life keep falling one by one.

Omar Khayyam's liberal views were attacked by more puritanical Muslims, as well as by mystical Persian poets who objected to his pessimism and outlook on life.

JANICE J. TERRY

Onin War in Japan

The Onin War came about directly as a result of the declining power of the ASHIKAGA SHOGUNATE. The Ashikaga Shogunate, or military government, had been founded in 1336–37, by the astute Ashikaga Takauji. Takauji had been sent by the Hojo shoguns to put down the rebellion of the emperor Go-Daigo. Go-Daigo was determined to throw off the rule of the military shoguns that had existed since the first true

shogun, Minamoto Yoritomo, in 1192. Go-Daigo's first rebellion was in 1331 but was suppressed by the Hojo shogun Hojo Moritoki. When Go-Daigo rebelled a second time, Ashikaga Takauji was sent to lead the Hojo army against him. But Takauji switched sides and ensured Go-Daigo's victory. He accompanied Go-Daigo into the imperial capital of Kyoto. However, it was clear that he had only used Go-Daigo as a Trojan horse for his own ambitions and in 1337, Go-Daigo was forced to flee the capital as Ashikaga Takauji became shogun in his own right.

Although at first perceived as another military rule, the Ashikaga shoguns considered themselves true aristocrats of the Northern Court in Kyoto. Rather than the countrified shoguns at Kamakura, the Ashikagas considered themselves to be patrons of the arts. The Ashikaga shoguns were such patrons of the arts that the style of the period derives its name from the Muromachi District in Kyoto where they established their mansion. They also patronized the *o-chanoyu*, the ceremony performed with Japanese green tea, which became a centerpiece in the life of any cultivated daimyo, or noble, family of the era.

With each generation the Ashikagas became more imperial courtiers and less military shoguns. The now courtly Ashikaga shoguns began to face challenges from another generation of countrified daimyo in the more remote provinces. Increasingly the shogunate was unable to control these militaristic daimyo, and their failure to do so brought their demise. The climax came during the reign of the eighth Ashikaga shogun Yoshimasa, who began his rule in 1449. For all of his architectural and cultural accomplishments, Yoshimasa did little to strengthen the military of the shogunate.

The Onin War itself began as a struggle over who would lead two Echizen province daimyo families, the Hatekeyama and the Shiba clans. The Hatekeyama called on the mightier Yamana and Hosokawa clans. The conflict ultimately drew in Yamana Sozen and Hosokawa Katsumoto, two far more powerful warrior daimyo. Yamana Sozen was known as the Red Monk, because he had taken a monk's vows but still functioned as a warlord, as did Uesugi Kenshi, the great rival of Takeda Shingen.

ABDICATION

Faced with what would prove to be a very bloody provincial struggle and unwilling to enter it, Ashikaga Yoshimasa announced in 1464 his intention to abdicate as shogun. Before he resigned he had to choose

a successor in the Ashikaga Shogunate. In one of the great ironies of Japanese history, his choice deprived him of the very life of peace he sought. He chose his brother, but his wife, Tomi-ko, wanted the next shogun to be their son. Tomi-ko secured the support of Yamana Sozen for her son's candidacy, which inevitably brought Hosokawa Katsumoto to champion the cause of the emperor.

The Onin War, unlike other struggles, was to be fought out in the streets of the imperial capital of Kyoto. The main theater would be the stylish Muromachi District, which, since it served as the headquarters for Ashikaga rule, was where the families of the powerful daimyo had built their mansions to house them when business brought them to Kyoto.

By 1467 the Yamana and Hosokawa factions were waiting for the hostilities that both sides realized would soon begin. To his credit Yoshimasa remained shogun and tried to avert the breakout of war. He declared that whoever began the fighting would be branded a rebel, which meant execution and confiscation of all property. In April 1467 fighting began when the first decisive move was struck by the Red Monk. To show his contempt for the emperor, he captured the imperial palace in Kyoto in one of his first attacks. But Yamana's impetuous action backfired as he found it increasingly difficult to keep supporters. In 1471 Yamana was so desperate that he attempted to revive the old Southern Court, but he could find no claimants to the throne, since the Ashikagas had influenced the members of the Southern Court to return to Kyoto in 1392 after the emperor abdicated.

Meanwhile the Hosokawas and the Yamanas attempted to gain strength from the countryside. Both sides received help from their retainers outside the capital, but none were able to gain military superiority in the battles that now raged in the capital city of Kyoto. As a result a bloody stalemate settled down in Kyoto, as the entire city was slowly devastated by the continual fighting.

The warring in Kyoto acquired a lethal momentum of its own. Even the deaths of both Yamana Sozen and Hosokawa Katsumoto in 1473 did not slow the bloodshed. Fighting spread to the provinces, where peasants staged *ikko* uprisings and provincial daimyo fought over land claims, knowing that the Ashikaga Shogunate was powerless to intervene in the growing anarchy.

The shogunate was still embroiled in the very succession crisis that had precipitated the Onin War. Yoshimasa finally gave in to his wife, Tomi-ko, in 1474, and appointed his son Yoshihisa to be his successor.

Ten years later, Yoshimasa finally achieved his dream of leaving the shogunate. Yoshihisa would rule until 1489. Nevertheless, the Onin War continued to devastate Kyoto. In December 1477 Ouchi Masahiro, who had spent a decade fighting for the Yamanas, finally grew disgusted with the fighting and left the city, leaving the empty victory to the Hosokawas. The power of the Ashikaga Shogunate was effectively broken by the long conflict. Although the family would continue to govern, the center of gravity decisively shifted to the daimyo in the provinces. In 1573 almost exactly a century after Yoshimasa abdicated, the daimyo Oda Nobunaga would depose the 15th Ashikaga shogun Yoshiaki, bringing the Ashikaga Shogunate to an end.

JOHN MURPHY

Ottoman Empire: 1299–1453

In the 13th century a nomadic Turkish tribesman named Ertogrul established control over large parts of northwest Anatolia. The Ottoman Empire took its name from his son Osman (r. 1280–1324); *Ottoman* was an Italian corruption of *Osmanli*. As the SELJUK DYNASTY and other Turkish dynasties, the Ottoman Empire relied on *ghazi* warriors as the foundation of its military power. The Ghazi warriors were an egalitarian society in which leadership was earned through bravery and feats in battle.

They practiced a code of conduct (*futuwwa*) analogous to the code of chivalry among western medieval knights. Converts to Sunni Islam, the Ottomans viewed themselves as protectors of ISLAM. Osman married the daughter of a Sufi *shaykh* who was the master of one of the numerous Sufi orders that had been established in Asia Minor. Sufi *shaykhs* often became the spiritual leaders in Ottoman society.

The tombs of Sultans Orhan and Osman are located in Bursa, Turkey. Osman and his son Orhan were able military leaders.

Like all early Ottoman leaders Osman and his son Orhan (r. 1324–c. 1359) were able military leaders who personally led their troops into battle. Both expanded Ottoman territories and, with the conquest of Gallipoli, Orhan extended Ottoman lands into Europe. Murad I (r. 1360–89) took the title of sultan and continued Ottoman expansion into the Balkans and Anatolia, taking Adrianople and Ankara. Ottoman victories further diminished the territories under the Byzantine Empire. The Ottoman victory at the BATTLE OF KOSOVO in 1389 was a major defeat for the Serbians and began a long period of Ottoman domination over most of the Balkans.

The first 10 Ottoman sultans were men of strong personalities with remarkable abilities. The position of sultan was the only role reserved for the heirs of the house of Osman; otherwise, the Ottoman Empire fostered remarkable upward mobility for its conquered peoples, who could, and often did, rise to the highest military, political, and economic positions within the empire. Following Muslim precepts the Ottomans were also tolerant of religious minorities and often intermarried with the different religious and ethnic groups within the empire. However a Turkish-speaking elite dominated the ruling class.

In Europe the early Ottomans ruled from Edirne (Adrianople), while Bursa served as the capital of the empire. The relative stability of Ottoman rule attracted scholars and merchants to Bursa. Merchants and skilled craftsmen formed guilds of *ahki* or cooperatives that contributed to the economic prosperity of the empire. The control of major trade routes also financially

benefited the Ottomans. Charitable foundations (*awqaf*) provided extensive social services. An Islamic legal system with trained *qadis* (judges) provided an overall judicial framework for the empire.

Under Murad I landownership was registered and a more centralized government emerged. The grand vizier served as the chief minister and key administrator after the sultan. Although the Turkish tribal families resented the loss of their traditional autonomy, the Ottoman army and administration were strong enough to prevent major rebellions.

BAYEZID I (r. 1389–1402) became sultan after the death of his father, Murad I, at the Battle of Kosovo. To ensure his succession Bayezid had his brother killed; subsequent Ottoman sultans often sanctioned fratricide or the imprisonment of family members to prevent rebellions or divisions over succession. Although Bayezid won a number of battles in the Balkans and Anatolia, he also adopted a number of Byzantine or Balkan social customs.

Under his sultanate a lavish royal court emerged. Ottoman sultans frequently married non-Turkish women. The harem, composed of the sultan's mother, wives, former wives, and concubines, grew in size and importance. The mothers and wives of the sultans became powers in their own right and frequently

intrigued to secure the succession of their favorite sons to the sultanate.

TIMURLANE (TAMERLANE) stopped Ottoman territorial expansion. At the Battle of Ankara in 1402 he captured Bayezid and subsequently had him killed. Timurlane dismembered Ottoman territory, dividing it among separate rulers. However, following a struggle with his brothers, MEHMED I (r. 1413–21) presided over a remarkable revival of the empire, which emerged stronger and more powerful than previously. Murad II (r. 1421–44; 1446–51) resumed the expansion and control over the Balkans and moved into Hungary. Although he besieged Constantinople he failed to take the city. The victory in 1444 at the Battle of Varna marked the consolidation of Ottoman rule over the Balkans. Within a decade the Ottomans would achieve a final victory over the failing Byzantine Empire.

JANICE J. TERRY

Pallava kingdom

Pallava was a state based in Southeast India that flourished between approximately the fourth and the ninth centuries C.E. The Pallava dynasty was Hindu but also supported Buddhism and Brahmanism and was known as a patron of the arts. Under its rule, trade grew with Sri Lanka and with Southeast Asia and the state appears, so far as can be determined, to have been quite prosperous. It established its capital at Kanchi, close to modern Chennai (previously known as Madras). Tamil influences and cultural institutions grew in importance throughout the course of the Pallava dynasty and continued with its Chola successors.

Various theories have been put forward for both the origin and the demise of the Pallava state. The Pallava people may have been a part of the Parthians, the Dravidians, the Cholas, or several other distinct ethnic groups. It is most likely that the majority of the people were a mixture of different ethnic groups interacting together within a common territory. Migration was a notable feature of the ancient world and even if social mobility was rendered very difficult by the caste system, geographical mobility was often possible on either an individual or a group basis.

The first named Pallava ruler was King Visnugopa, who appears in local records in the common Prakrit version of Sanskrit. Other kings and rulers appear in subsequent records but few meaningful details are available beyond their names. The lives of ordinary people can only be reconstructed from archaeological excavation.

Pallava rulers appear to have expanded their territories in the early centuries of their existence, but it is possible that this expansion was the discovery of other peoples involved in similar cultural practices and not the result of conquest at all. However, territorial expansion ended and subsequent Pallava rulers were persistently harried by the Chola feudatory allies of the Calukya dynasty to the west. Chola rulers gradually supplanted Pallava influence throughout its territory and gradually brought its rule to an end. It is difficult to determine whether this change of rulership made any real difference to the lives of the mass of the common people.

The sculptures and inscriptions of the Pallava state are notable in the development of the Indian artistic tradition. One of the centerpieces of this architecture may be found at the Shore Temple located at Mahabalipuram. This combines Dravidian styles with other influences and was formerly a port. Ports are notable for the ways in which cultural institutions of various ethnicities interact and interrelate, sometimes creating entirely new combinations.

JOHN WALSH

Papal States

The Papal States were originally private property, owned and controlled by the popes in Rome. After the eighth century the term was applied to the duchy of Rome and surrounding feudal estates. Constantine the Great, the first Holy Roman Emperor, declared that the Christian Church was a legal entity in the empire. Included in this declaration were the rights of the church to own and administer landed possessions. Constantine set the example for this civil doctrine by gifting the Lateran Palace to the church. Many noble Roman families, some with a millennium of pedigree, followed suit and donated land to the church. Some of these properties still bear the name of the family who donated them. Donation of large estates ended in the early seventh century.

During the early centuries of the papal estates, lands in the provinces of Gaul and Africa were included, but this practice stopped as non-Christian Germanic tribes conquered these areas. Most of these properties were lost in the early eighth century and by the end of that century the German invaders also confiscated the properties in Italian sectors outside Rome. All that remained were the lands in and around Rome, which were then owned not by the church, but by the pope. The pope thus became the largest landowner in Italy. The revenues of the papal estates supported the church in Rome and the many monasteries, convents, hospitals, orphanages, and poorhouses in the area. In times of famine it was the pope, not the emperor, who had the responsibility of providing Roman citizens with food and water. Thus the emperor could fend off political scrutiny in regard to agriculture disasters or epidemics by saying the pope was responsible for the evils visited upon the capital city.

As the number of lands under control of the papacy increased after the ninth century, the temporal power of the popes increased in proportion. In time all other rulers on the Italian peninsula had to contend with and gain the support of the popes for their social, economic, political, and military campaigns. After the fall of the Western Roman Empire, the pope became the most powerful leader in Italy and in all of western Europe. Even during the Ostrogothic occupation, the pope was given control over temporal affairs in the region. In 554 Emperor Justinian I issued the Pragmatic Sanction, which entrusted the pope and the Roman senate with control of weights and measures in the area, granting them indispensable powers in the region and ensuring loyal support from the region's rulers for the government in Byzantium. This loyalty was felt most bitterly among the Roman populace, whose only recourse

to excess taxation and conscription by the Byzantine authorities was the Roman court system, which most often sided with the emperor. Election of the pope by the people of Rome, the practice of the time, did not deter the popes from choosing the emperor over the Roman citizenry.

As the Lombards began sacking Italian cities in the north, the papacy was in danger and an appeal was made to the emperor at Byzantium. But the Lombards conquered Italy, including the papal estates, in the eighth century. In 754 Pepin, king of the Franks, agreed to fight the Lombards and return the papal estates to the church, the first valid documents to give credence to the papal estates. CHARLEMAGNE and his armies would later protect these lands from Lombard domination. But Charlemagne exerted so much control over these lands that tensions rose between the church and the Frankish court. The Frankish kings also maintained control over papal elections, only rarely actually dictating the outcome, but more commonly guaranteeing the elections' taking place through the Constitution of Lothair, a legal document that kept the protection of the pope by the emperor.

In the ninth and 10th centuries the control of the papal estates came under great influence by various Italian kings and their families, including the many counts of Tusculum. The area controlled by the popes of this time had dwindled to that of the areas around the duchy of Rome. Under the Holy Roman Emperors Otto I and Otto II, the pope was often in exile, having his allegiance to the emperors as the primary reason. Only conquest by Otto III helped return the popes to Rome. In the 11th century the naming of popes and antipopes confused the relations of the church with the people in the papal estates. In 1059 Pope Nicholas II sought to free the papacy from the control of the HOLY ROMAN EMPIRE. New regulations for electing the pope were enacted, removing the choice from the hands of the emperor.

Various Norman and Italian nobles added more land to the papal estates in the 12th and 13th centuries. When Emperor Frederick II and the Roman curia quarreled in the early 13th century, the lands were again placed in jeopardy. Many conflicts and wars in northern Italy led to French control over the papal estates. During the Avignon exile of the popes in the 14th century, France controlled not only the election of the pope, but also the papal estates. This period saw the decline in the influence of the pope in the papal estates and the rise of the control of the region in the hands of the Colonna and Orsini families. Certain regions of the estates revolted and a near anarchy resulted in some regions. In

1353 Cardinal Albornoz brought the area again under subjection to the pope, a state that would remain in force until 1816.

RUSSELL JAMES

Peasants' Revolt

In the early summer of 1381 a series of protests and revolts erupted across England. Peasants and townspeople rose against royal agents in opposition to a poll tax the royal government had levied upon them. While the poll tax was the immediate cause of the rebellion, it was the focal point for a litany of complaints about the economic oppression the landholders and government had forced upon working people since the BLACK DEATH.

In the three decades following the Black Death landlords and peasants struggled over customary obligations and duties. The plague created a labor shortage and an increased availability of land, and many peasants saw an opportunity for economic gain, but the landholders saw the potential for their own economic ruin. The lords attempted to solve the problem using legal means, establishing laws such as the Statute of Laborers (1351), which fixed all wages at the levels of 1346, before the plague. Peasants who profited from higher wages received fines. Enforcement proved difficult since manorial lords, lesser gentry, wealthy peasants, and towns all competed for the smaller labor supply, but attempts to enforce the law nevertheless occurred, making lawyers and government officials the objects of resentment while driving rural village leaders and urban labor leaders into alliance. A collapse in grain prices in the mid-1370s intensified the economic tension.

To compound the commoners' tax burden, the Crown's extended military campaigns had proved extremely costly. To pay off debt from previous adventures, as well as to fund new military activity in France, in 1371 the Crown undertook a program of increasingly intense taxation. Labor laws and landlords attempting to revive their manorial rights never provoked anything

beyond local protest and passive resistance, but new taxes introduced in 1371 differed remarkably from traditional forms of taxation. The taxes on parishes of 1371 and the poll taxes of 1377, 1379, and 1381 taxed people rather than possessions or land, and they hit hardest in the populous areas of East Anglia.

With taxation at an all-time high in 1381, the Crown levied a poll tax to raise £66,666 for the duke of Buckingham's campaign in Brittany. The tax was three times what it had been in 1377. However the collectors's preliminary returns indicated a nationwide shortfall in revenue. One-third of the people who paid the tax in 1377 were missing—nearly half a million taxpayers. Faced with a potential shortfall of one-third of its poll tax revenue, the government ordered the tax assessors back into the field and appointed commissions composed of local landholders and lawyers to investigate instances of evasion and collect delinquent taxes.

On May 30 an angry group of men, insisting that they had already paid their taxes, attacked two tax commissioners at Brentwood. The commissioners fled, and villagers, fearing government retribution, banded together with men from nearby villages. On June 2 they gathered at Bocking, swearing to destroy the king's agents, his laws, all forms of lordship, and to live only by their own laws. The protestors sent word to Kent, where another rising had occurred, appealing for support. The rising spread to central Essex, where rebels murdered the escheator and destroyed the houses of Sir Robert Hales, the king's treasurer, and Sir John Sewale, the sheriff. Rebels burned the sheriff's financial records in Chelmsford on June 11, and throughout the county peasants burned manorial records, destroying proof of their landlords' claims over them. The peasants directed most of their violence against records rather than landholders, but some died, mostly sheriffs, justices, and tax collectors who represented the Crown and the magistracy.

The rebels vowed to destroy the institution of lordship yet fully supported their 14-year-old king, Richard II (1377–99), who nevertheless was wary. On June 11 he rode to the Tower of London with his bodyguard and the earls of Salisbury, Warwick, and Oxford. His mother; his chancellor, Archbishop Sudbury; his treasurer, Hales; and William Walworth, mayor of London, also retreated to the Tower for protection. The next day the bands from Essex converged at Mile End and those from Kent met at Blackheath. Several leaders emerged, including Wat Tyler and Jack Straw. Richard sailed down the Thames to Greenwich to meet the rebels but with no way to ensure the king's safety, Richard's party concluded that landing would be too hazardous.

King Richard II and his party retreated to the Tower of London, where they were safe from the mob of rebels but were trapped.

On Thursday morning, June 13, the mob arrived at the gates of London, and the city admitted them. The exact number of rebels that day is unknown. Once inside the gates, they released prisoners from the Fleet, Newgate, and the Marshalsea; burned the Savoy palace owned by the king's uncle; and murdered foreigners, notably the Flemish and Italians. The royal party soon realized it was trapped. Though safe in the impregnable Tower, they were too few in number to break out. Their only hope was negotiation. The king agreed to meet the rebels on June 14 at Mile End.

Friday morning Richard and his bodyguard of lords and knights rode out to talk with the mob. The king had to grant pardons and give charters of freedom to the rebels. Furthermore they demanded abolition of serfdom, rent of servile land of 4*d.* per acre, freedom to buy and sell in markets of their choice, and the right to enter service contracts of their own free will. Finally the rebels made Richard promise to punish traitors. He conceded and the mob dragged Hales and Sudbury from the Tower and executed them summarily. By this point most of the rebels had grown tired and hungry from their long adventure, and many had received what they had wanted. Charters in hand, they began to disperse homeward. However a large contingent of the most dedicated and radical remained, buoyed by the day's successes. They wanted more from the young king, and Richard agreed to meet them again on Saturday. While the king prayed

at Westminster, his nobles and the mayor mustered the London militia. The next day the rebels stood defiant, bearing a royal standard and a banner of St. George. Richard and a small retinue rode out to meet Wat Tyler.

Tyler built on the rebels' previous demands, including abolition of serfdom and all of lordship but the king's, and disendowment of the church and dismantling of its hierarchy. He also asked for the annulment of all law except the law of Winchester, which granted responsibility for peacekeeping to local authorities. As unrealistic as the demands were, Richard conceded everything except his regality and demanded that the rebels disperse.

The peasants seemed satisfied, but then someone in the king's retinue provoked Tyler, who then attacked the armored man with his knife, not harming him. Walworth ordered his arrest and when Tyler resisted the mayor struck him twice with his sword, and then a member of the king's household ran him through two or three times. Tyler fell mortally wounded. The crowd became agitated and the young king rode toward the crowd to calm the rebels while his retinue sent for the militia. Sources suggest that the royal party had acted deliberately, but whatever the case the revolt collapsed and the rebels returned home under guard. Tyler's vision of a self-governing countryside died with him, but the peasants carried home their charters of freedom, which they would use to challenge lordship for years to come.

Widespread uprisings included attacks on abbeys and the magistracy, and the burning of manorial records after the rebellion in Essex during mid-June. The uprisings occurred in at least 240 places around England and participants included wealthier peasants, as well as laborers and craftsmen. Often townspeople and peasants coordinated their efforts, but in some areas, such as York, Beverley, and Scarborough in Yorkshire, the protests drew little or no rural support; nor did they necessarily call for a reordering of society. However all wished to reduce or remove the power that their lords held over their lands or property. The young king was not happy. Despite their ample willingness to recognize him as their only lord, Richard felt angry that his kingdom had come so close to destruction. He rode with a strong force into Essex, executing a "bloody assize," and brutally suppressed the revolts. He revoked the charters on July 2, warning the peasants that they remained in bondage, and that things were going to get worse.

The gentry and officials who ran the counties did not like these harsh tactics. In Kent and Hertfordshire, the gentry did not desire brutal punishment; nor did

they appreciate royal justices whose visitations overrode their own authority. While the local administrators did not understand the peasants' hatred of servitude, they were more humane in their treatment of protestors than royal officials. In October the speaker from Essex told Parliament that the villains should be put in place, their charters revoked, and their leaders punished, but he said that followers should be handled leniently. Few could deny that the revolt showed a need for reform, and that justice and taxation had been handled unfairly. Some executions occurred, but most rebels received fines as punishment.

It is easy to blame the Peasants' Revolt on the poll tax of 1381, but in his work on the period, Gerald Harriss notes the complex picture leading up to the revolt. The village was the center of the peasants' economic and political world. In the years following the Black Death, anger increased as peasants saw the institution of lordship blocking opportunity for economic gain and personal freedom. Commercial areas, such as East Anglia and Kent, felt anger toward the Statute of Laborers. Likewise the Black Death had changed the relationship between countryside and town and more interaction occurred than before 1348.

In the wake of the plague peasants moved into towns, townspeople acquired land in the countryside, and the two economies, always interdependent, became permanently intertwined. Peasants and townspeople saw themselves as the true commons of the land, not the members of Parliament, and they saw no need for layers of lordship between themselves and the king. To villagers royal officials represented a false structure, imposed from the outside and unneeded.

Tension caused by these factors had not gone unnoticed prior to the revolt. The House of Commons had expressed its concern about conspiracies in the years leading up to the revolt. The poll tax dumped the government and the nobility military failures onto the backs of the lowest order of society. The fact that the tax assessors were outsiders made matters worse, because it confirmed the ill will the peasants already bore toward the nobility and prevented wealthier peasants from charitably paying a larger share to relieve the burden on their poorer neighbors, as had happened in the past. The poll tax served as a spark to set off the explosive Peasants' Revolt.

KEVIN D. HILL

Pepin, Donation of

The Donation of Pepin was one of the most important historical events of the early Middle Ages. The Byzantine Empire, the papacy, the Franks, and the Lombards were all involved in what became Pepin's donation. It marked a change in the nature of political authority across the former Roman Empire, and what would become the medieval states in western Europe.

Following the decline of Roman political authority in western Europe, a difficult situation emerged. While in 476 the western emperor Romulus Augustulus abdicated, the empire did not collapse. The symbols of western authority were returned to the East. From the eastern, or Byzantine, emperor's perspective, the authority of Constantinople over Italy and other western provinces remained as legal as Constantine the Great's authority 200 years earlier. What the Byzantine emperor of the eighth century lacked was military power, and the ability to project his authority over the western Roman provinces. This power fell to three newer groups in the area: the Lombards, the Franks, and the papacy.

As the middle of the eighth century dawned, Constantinople's position in Italy was weak. Real Byzantine authority was limited to particular cities and a narrow strip running from the former imperial capital of Ravenna to Rome. This created an opening for one of the newer groups in the area, the Lombards. In northern Italy, the Lombards were able to assert their dominance and independence from the Byzantine imperial authority. In doing this they created for themselves a powerful kingdom in northern Italy, and this threatened the papacy.

The papacy in Rome had for some time been trying to assert its spiritual authority over the other bishops in Christendom. This put the popes at odds with the imperial authority in Constantinople, imperial authority that would be weakened if the patriarch of Constantinople lost equality with the pope. What put them into further conflict was the lack of Byzantine civil authority on the ground in central Italy. The Byzantine government could neither protect the papacy from the Lombards nor

perform even the most minor governmental functions. More and more, these functions fell to the pope as the largest landowner in the area. This left the pope as the de facto ruler of central Italy, while on parchment, the eastern emperor remained in control of the territory.

The final group in the area was the Franks, located in what today is France and western Germany. The Franks had moved into the area shortly after 476. From this time onward, the Franks had been growing in political and military might. Early in the eighth century Frankish lead armies had turned back a Muslim invasion of western Europe, an invasion that had captured most of Byzantine North Africa and Spain. By 751 the Lombards had defeated even the pretense of Byzantine authority in northern Italy, and Pope Stephen III sought alliance with the Frankish ruler Pepin the Short.

Pepin wanted to be king of the Franks, while the church sought political and military protection from the Lombards, to say nothing of a possible political separation from the Eastern Church and Constantinople. Stephen granted religious sanction for Pepin to depose the Frankish king and to assume the throne. In return, Pepin marched an army to defeat the Lombards in northern and central Italy. Pepin then gave this land to the pope to administer as a prince. For the first time the pope was more than a temporal ruler, and it is this action that is referred to as the Donation of Pepin.

Fifty years later, Pope Leo III crowned the successor to Pepin Emperor Romanorum, emperor of the Romans. This man was CHARLEMANGE, the first western Roman emperor since Romulus Augustulus. This marked the high point of Frankish-papal cooperation. Charlemagne codified the actions of Pepin and confirmed the independence of the PAPAL STATES and the Donation of Pepin. The donation led to the crowning of a western Roman emperor, the first to claim political equality with the East since 476. This meant an end of Byzantine claims to the western territories of the Roman Empire. The eastern emperor would accept this, and the split also helped to cement the political separation of the eastern and western Christian churches.

Petrarch (Francesco Petrarca)

(1304–1374) *Renaissance humanist, historian, and poet*

Petrarch regarded his own era as an age of decadence and darkness. He yearned for a better future and turned to the study of classical antiquity for consolation and intellectual enlightenment. His enthusiasm for antiquity and his Latin writings made him the central figure in the classical revival that began in 14th-century Italy and laid the foundation for Renaissance humanism. Petrarch's humanism was a blend of the ethical teachings of pagan writers and the moral and spiritual works of the church fathers. He was crowned poet laureate in Rome in 1341 for his achievements in Latin literature. His vernacular poems, often expressed in sonnets, also won him acclaim and were emulated by other poets.

Petrarch was born in Arezzo, Italy, on July 20, 1304, to parents exiled from Florence for political reasons. The family moved to Carpentras near Avignon, the seat of the papacy, where his father was employed in the papal curia. In his early years, Petrarch was educated in Latin grammar and rhetoric and in touch with the cultural life of Avignon. He studied law at Montpellier and Bologna but rejected law after his father's death. Petrarch turned to his true interests, the literature of classical antiquity and patristic Christianity. Peripatetic by nature, he traveled extensively in Europe but often returned to Avignon and nearby Vaucluse. While on these excursions, he recovered several of Cicero's orations and a number of his letters. A visit to Rome and its ruins energized his interest in the revival of antiquity and he envisioned Rome as the cultural and spiritual center of a renewed Italy. He expressed these thoughts in his vernacular poem, *Italia mia*. As Petrarch gained in stature from his writings and his study of antiquity, he was welcomed by secular and religious leaders and was sustained by their patronage. He left Avignon and Vaucluse in 1353 and resided for several years at Milan before moving on to Venice and Padua. He died and was buried in 1374 in Arquà, a village south of Padua.

Petrarch's Latin works deal with a number of themes pertinent to an understanding of the nature of his humanism. His epic poem, *Africa*, narrates the victory of Scipio Africanus over Hannibal. *De viris illustribus* is a study of famous men. *Secretum* consists of three imaginary dialogues between Petrarch and Saint Augustine. They demonstrate Petrarch's struggle to maintain a balance between his temporal and spiritual interests. *De otio religioso* justifies monastic solitude and *De vita solitaria* defends a life of contemplation for the scholar. Many of his letters to contemporaries

as well as those to Livy and his autobiographical *Letter to Posterity* express his discontent with his own age. Petrarch's vernacular works have outlasted those in Latin. His *Canzoniere*, a collection of 366 poems, mainly sonnets, focus on his unrequited love for Laura, a woman he met in Avignon whose allure haunted him throughout his life. In *Trionfi*, figures from legend and history encounter the allegorical forms of Love, Chastity, Death, Fame, Time, and Eternity.

LOUIS B. GIMELLI

Philip II Augustus (Philip Augustus)

(1165–1223) *king of France*

Philip II Augustus, king of France (r. 1180–1223), was, born in 1165, to Louis VII (1137–80) and his third wife, Adèle of Champagne, near Paris. Following the custom of the Capetian dynasty, Louis had young Philip crowned at Reims cathedral as his successor while he was still alive on November 1, 1179. With the old king's health quickly declining, the young crowned prince assumed much of the responsibility of running the royal government. In September of the following year when Louis died, Philip became king in his own right.

Philip faced formidable obstacles to his authority in France. His father had been dominated at court by his wife, Adèle, and her three powerful brothers, the counts of Blois and Champagne, and the archbishop of Reims. Moreover the basis for power in 12th century feudal France was land, and the territory of the Capetian monarchy was limited to a number of modest holdings around the region of the ÎLE-DE-FRANCE, which centered on Paris. But those of Philip's most powerful vassal, Henry Plantagenet, included the duchies of Normandy, Maine, Anjou, and Brittany. Through his wife, ELEANOR OF AQUITAINE, Henry also held the duchy of Aquitaine as well as Tourraine and Gascony. Together, they made up more than half of the territory of medieval France and far outstripped the holdings of the French king. The fact that Henry was also king of England (1154–89) further diminished the ability of either Louis or Philip to exercise meaningful control over Henry as lord of his

French holdings. Philip began to lay the groundwork for the resurgence of royal power in France through his marriage to Isabelle d'Hainault in April 1180, through which he acquired the wealthy county of Artois, near Flanders. Through Isabelle he was able to lay further claims to lands and towns in northeastern France. By 1186 Philip had rid himself of his troublesome uncles and secured control over a widening area of royal lands.

However his most obstreperous vassal remained HENRY II of England with his vast territorial holdings in western France. From 1186 to 1188 Philip achieved little success on the battlefield against Henry but was more successful when allied with Henry's two sons, Richard and John, in their revolt against the king in 1189. Defeated shortly before his death in July 1189, Henry made several minor territorial concessions to Philip. Inheriting his father's lands in France upon becoming king of England RICHARD I (r. 1189–99) proved as intractable a foe as had Henry II. The lengths to which Philip would go to defeat his antagonist are revealed by his behavior during and after the Third Crusade, in which both he and Richard participated. Leaving France together in 1190, the two quarreled along the way and proved uneasy allies during the siege of Acre. After the city fell in July 1191, Philip quickly abandoned Richard and headed home. Returning to France, he intrigued against the English king and was instrumental in having Richard held captive by the German Emperor HENRY IV when he fell into the emperor's hands while returning from the crusade. Outright hostilities between the two recommenced upon Richard's release in 1194.

With the ascension of John I to the English throne (1189–1216) Philip's fortune improved dramatically. By 1206 he had succeeded in wresting control of Normandy, Maine, Tourraine, Anjou, Poitou, and Brittany from John, leaving him only in possession of Aquitaine. A major attempt by John to recapture his lost territories with the German Emperor Otto IV as ally was repulsed in 1214, ensuring Philip's position as the dominant feudal lord and most powerful landholder in France.

Philip showed a keen disposition for administrative affairs. He created a new class of royal officials, the *baillis*, who collected taxes and administered royal justice in his newly acquired lands. To ensure loyalty these officials were recruited from the townsmen and lower nobles of the realm and were paid a salary. In the south these officials were called *seneschals*, and because they wielded military powers, they came from the nobility. Philip further developed the royal administration by giving it a permanent home in Paris and having his treasury perform an annual audit on the *baillis*. Crucial in Philip's

ability to control his vassals was his growing alliance with the burghers, whose talent and taxes he exploited. The growth in royal revenues enabled the king to employ mercenaries in place of the feudal levy, further diminishing his reliance upon the nobles. Taken together Philip's actions turned the Capetian ruler into the most powerful feudal monarch of his day and laid the framework for the future growth of royal power.

RONALD K. DELPH

Philip IV

(1268–1314) *king of France*

Philip IV, also known as “Philip the Fair,” was born in 1268 to Philip III and Isabel of Aragon and succeeded his father as king of France upon the latter's death in October 1285. As earlier Capetian monarchs, Philip enhanced the size of royal territory, adding the lands of Champagne and Brie through his marriage to Jeanne of Navarre in 1284, and forcibly subjecting much of Flanders to French suzerainty in 1305. In his endeavor

Philip IV established a royal treasury and developed the royal court known as the Parlement, making justice available to all.

to wrestle control of the duchy of Gascony away from the English King Edward I (1272–1307), Philip clashed with the medieval papacy over the issue of royal authority in France. Philip provoked hostilities with Edward in 1296 when he seized much of Gascony. Preparing to repulse Edward's invasion of France, Philip levied a tax on the French clergy in order to pay for the war. Pope Boniface VIII (1294–1303) vehemently objected to Philip's actions, holding that by canon law kings could only tax clergy in consultation with the pope. His bull *Clericis laicos* (1296) asserted this position and threatened excommunication to any ruler who attempted to tax the clergy of his land without papal approval. In retaliation Philip halted all revenues from France to Rome, forcing Boniface to relent and acknowledge that Philip had the right freely to tax the clergy of France for the defense of the realm.

The two rulers clashed again over royal authority in 1301 when Philip's officials, ignoring the practice of clerical immunity from secular courts, arrested the French bishop Bernard Saisset on charges of treason and prepared to try him in a royal court. Defying Boniface's order to shift the trial to Rome and the pope's subsequent threats, Philip convened the first meeting of the Estates General in France (1302–03), to gain the backing of the nobles, clergy, and burghers in his quarrel with the pope. In 1302 Boniface issued the bull *Unam sanctam*, which asserted the most extensive claims of the papacy to intervene in secular affairs ever voiced in the Middle Ages. With Philip still in defiance, in 1303 Boniface prepared to excommunicate the king, but Philip struck first. His agents attempted to kidnap the pontiff from his summer palace in Anagni, south of Rome, and bring him back to France to stand trial as a heretic and schismatic. While the attempt failed, the aged pontiff was so unsettled that he died shortly thereafter. Following the brief pontificate of Benedict XI (1303–04), Philip pressured the college of cardinals to elect the bishop of Bordeaux pope, who took the name Clement V (1305–14). Clement moved the papacy to Avignon in southern France, thus beginning the era of the “Babylonian Captivity” of the church.

Philip's ruthlessness and ambition, clearly evident in his handling of Boniface VIII, were fueled by lawyers and other advisers who implemented his policy. Unscrupulous and apparently unfettered by morality, men such as Guillaume de Nogaret championed a view of royal power and authority that left no room for rivals. We need look no further than Philip's treatment of the Jews or of the order of the Knights Templar in France. Running short of money to finance his wars,

in 1306 Philip ordered the Jews out of France, confiscated their property, and took over the collection of all the debts owed to them. The following year he set about systematically destroying the wealthy and powerful Templars, who had become large financiers of the royal debt. By 1312 Philip, backed by Clement V in Avignon, had destroyed this once proud military order in France, executing many of its members on charges of heresy and confiscating their wealth for the royal coffers.

Both the reach and efficiency of royal government grew under Philip. He showed great acumen in developing the tools of government that enabled him to rule efficiently. He established the *Chambre des Comptes*, or the royal treasury, and developed the royal court known as the *Parlement*, which made royal justice available to nobles and burghers alike. Collectively Philip's rule marked the apogee of the late medieval monarchy in France.

RONALD K. DELPH

Pico della Mirandola

(1463–1494) *humanist and philosopher*

Pico della Mirandola was born to wealth and nobility in Mirandola, Italy, on February 24, 1463. After receiving a humanistic education at Mirandola, he studied canon law at Bologna. Dissatisfied with his studies, he left Bologna to pursue his lifelong interest, philosophy, at Ferrara, Padua, and Paris. Pico's desire to establish concordance among the major philosophies led him to explore Greek, Latin, Averroist, and Hebrew thought, including Kabbalah. His knowledge of Kabbalah, an esoteric and mystical form of Judaism, came largely from his associations with Renaissance Jews and recent converts to Christianity from Judaism. Pico's ardent interest in Kabbalah and his casting of it as a harbinger of Christianity have led some scholars to consider him the first Christian Kabbalist of the ITALIAN RENAISSANCE.

He was also versed in the symbolic use of numbers and magic, although he was careful to distinguish between natural magic, which he espoused, and its demonic form. Unlike some of his contemporaries,

Pico found aspects of medieval SCHOLASTICISM compatible with his philosophical outlook. Pico was a participant in Lorenzo de' Medici's Platonic Academy, an informal conversation circle in Florence that was led by the Neoplatonist MARSILIO FICINO. In his last years he was a convert to the teachings of the Dominican friar Girolamo Savonarola, the self-styled messenger of God whose moral fervor held sway over the Florentine populace and its government in the latter part of the 15th century.

Pico's writings are extensive. Among them are Italian love sonnets, Latin poems, a commentary on Genesis, and a treatise against astrology. Pico wrote a critique of Girolamo Benivieni's *On Heavenly Love* in which he distinguished between earthly physical love and heavenly chaste love. Another treatise deals with the philosophies of Plato and Aristotle. His most famous works are his 900 *Conclusions* and his *Oration on the Dignity of Man*. The *Conclusions* were meant to be the centerpiece for a colloquium in Rome. They consist of 900 theses that embody much of his philosophical and religious thought and include propositions on Kabbalah. The conference was never held. Innocent VIII condemned the propositions and Pico was forced to flee to France, where he was jailed for a short time.

He was freed through the intercession of Lorenzo de' Medici and later exonerated by Alexander VI. Pico's *Oration* was intended to be the introduction to his *Conclusions*. The *Oration* asserts that at the time of creation, God had utilized all the attributes at his command to form the heavens, the earth, and the animals. Having nothing left, God gave to humans the power to create their own nature. They could descend to the level of a beast or ascend to the divine.

The *Oration* is acclaimed for its affirmation of human potential and is regarded by many scholars as the epitome of Renaissance humanism. Pico was working on a critique of astrology shortly before his death in Florence on November 17, 1494. Pico is buried in the church of San Marco in Florence.

Pizan, Christine de

(1365–1430) *author*

Christine de Pizan is one of the few women who had prominence as a secular writer during a time when women were neither educated nor independent. If a woman was literate, she participated in a religious order either as a nun, anchoress, or Beguine. Christine was born in VENICE to parents who had both been educated at Bologna. When she was five her family moved to France so that her father, Tommaso di Benvenuto da Pizzano, a physician and astrologer, could work as a councilor to King Charles V. In Paris they changed their name to the French, *Pizan*. Her mother wanted her to learn domestic skills but her father believed that it would benefit her to learn how to read and write. In the milieu of a court that had an immense library, she learned Italian, French, and some Latin.

When she was 15 years old, she married Étienne du Castel, a nobleman and courtier who became the king's secretary. But that same year Charles V died and her father lost his position, and with it the high income. Her father died in 1387 and three years later her husband died, leaving her with the burden of three small children. Instead of remarrying, she decided to enlarge upon her studies. Fortunately she was allowed access to the libraries of the courts. In 1394 she began to write and sell her poems and receive commissions by patrons of the court. Since she worked where manuscripts were prepared, her contacts were through the court of the duke Louis d'Orléans. She embarked on a quest to learn both literary and practical matters, enough to protect herself financially from predatory creditors. Her widowed mother, also dependent on her, cared for her children while she threw herself into literature, philosophy, and anything she could learn. In 1397 her daughter, Marie, went to the Abbey of Poissy to live as a companion to the daughter of Charles VI.

In 1402 she wrote *The Tale of the Rose*, a poem that challenged the negative attitudes toward women in a book with a similar title, *The Romance of the Rose*. As Christine continued to write poetry and prose, a feminist voice emerged. In *Epistle to the God of Love* (*Epistre au dieu d'Amours*), she rebutted the traditional negative beliefs and ideas about women by writing that the evils attributed to women were a product of men's minds, not reality. In *The Book of the City of Ladies*

(*Livre de la cité des dames*)(1404) she created a utopian world where women had power and control and proved by logic that many of the negative myths regarding the female sex were false. Its sequel, *The Treasure of the City of Ladies*, was different, written specifically for upper-class women and members of the court, to give them advice on managing their homes during their husbands' absences. In this book she cautioned against dishonest governors and protecting one's rights as a landowner so that unscrupulous agents would not take advantage of a woman's status.

She was knowledgeable in farming and spoke to the role of women as housekeepers in a time when their domain included fields, crops, laborers, and maids. She gave advice on the psychology of hiring people to work in the vineyards. She stressed self-discipline in managing the laborers by rising as early as they did and watching how they worked. "The good housekeeper must keep her eyes wide open." Christine was well acquainted with the chores involved in livestock maintenance, as well as agriculture. Every detail of the work involved in a responsible woman's life was spelled out. The animals on the farm required maids to milk them and care for the milk. Those women also took care of the kitchen, preparing meals for the other help, cleaning and weeding the garden, gathering herbs, and cooking for the other workers. She stressed that the mistress of a domestic enterprise should constantly be watchful.

At about the same time Philip the Bold, duke of Burgundy, asked her to write the official posthumous biography of Charles V. On November 30, 1404, she finished the work, which was entitled *Le livre des fais et bonniers meurs du sage roy Charles V*. Between the writing of his biography and 1415, she wrote on a variety of subjects, including warfare and the military. In 1410, she wrote *Lamentations on the Civil War*, and in 1413, the *Book of Peace*, imploring the people to forget war and bond in friendship. The Battle of Agincourt (1415) was particularly devastating and probably influenced her decision to enter a nunnery. One of her last efforts was a writing inspired by the heroic deeds of JOAN OF ARC. In 1418 she entered a Dominican convent at Poissy and spent the rest of her life there, continuing to write.

LANA THOMPSON

Poland

The history of the kingdom of Poland is traditionally dated from 966, when the 31-year-old Mieszko I, of the Piast dynasty of the Polans tribe, was baptized into Christianity. The country derived its name from his tribe. He was married to Dobrawa, the daughter of Bolesław (Boleslas) I of BOHEMIA, a strategic nuptial alliance that brought him a relationship with the HOLY ROMAN EMPIRE in his feuding with the Wieletes and Volinians. Wichman, count of Saxony, who was also a noble of the empire, backed them. Thus Mieszko's marriage gave him a strong counterweight to his enemies. Most likely his conversion to Christianity was a prerequisite to the marriage.

In a move designed to cement his diplomatic position, Mieszko I also swore allegiance to Emperor Otto I the Great. This was essential to his plans for expansion of Piast lands. In 955, 10 years before Mieszko I's conversion, Otto had cemented his primacy throughout central and eastern Europe. In 955 he decisively defeated the invading Magyar tribe at the Battle of the Lechfeld, near Aubsburg in Bohemia. As David Eggenberger writes in *An Encyclopedia of Battles*, "the Germans crushed the Magyars with heavy losses in a ten-hour battle. The decimated barbarians fell back across modern Austria."

They settled in what became Hungary, which still recalls its heritage on its postage stamps with the inscription *Magyar Posta*. By his death in 992 Mieszko I had considerably expanded his realm, including not only what was then known as Little and Greater Poland, but also Pomerania and Silesia. Throughout his reign, he assured himself of at least the quiet complicity of the Holy Roman Empire, by swearing allegiance, after Otto I, to the emperors Otto II and III. As a loyal vassal he supplied troops to Otto III in his campaign against the Polabians, Slavic tribesmen who lived along the Elbe River.

Mieszko I was succeeded by his son Bolesław the Brave, his son by Dobrawa. (He also had children by his second consort, Oda, three sons: Mieszko, Lambert, and Swietopełk.) Bolesław continued his father's wars for Piast aggrandizement. In 999 he seized MORAVIA and next conquered Slovakia. When in 1002 Otto III died

prematurely at the age of 22, Boleslas took the ultimate gamble and attacked the Holy Roman Empire while it was in a succession crisis for the throne. Emperor Henry II, duke of Bavaria, was ultimately crowned emperor in the place of his deceased cousin in June 1002.

Bolesław's aggression against the empire set off a series of struggles between him and Henry II, which would eventually lead to a compromise peace in 1018. Bolesław was compelled to return Bohemia to the empire, although the empire was recognizing Bolesław's strength, and Henry did not contest Bolesław's keeping Lusatia and Misnia. He wisely pledged allegiance to the emperor. But in 1025 a year after Henry II's death, Bolesław crowned himself the first king of Poland and freed himself of any feudal obligation to serve the emperor.

His son Mieszko II, who had already gained experience by ruling the city of Kraków for his father, succeeded Bolesław. Mieszko II, seven years after he became king of Poland, resumed his father's assault on the empire. The duchy of Kiev, under YAROSLAV THE WISE, not forgetting Bolesław's intervention, made common cause with the Emperor Conrad II, so that Poland was invaded from both the east and west. First forced to flee to Bohemia, Mieszko II eventually reconquered his kingdom and, after swearing allegiance to Conrad, was able to resume the kingship. He was assassinated in 1034, most likely the victim of a plot by the Polish nobility.

Casimir (Kazimierz) I succeeded his father as king and, unlike his father and grandson, followed a policy of peace and reconciliation. A peasant revolt followed the murder of his father and, taking advantage of the turmoil, the Czechs invaded in the south. What was then known as Greater Poland was so devastated that the royal capital became Kraków in Little Poland, which apparently was considered loyal to Casimir and to his father before him. Prior to the choice of Kraków, the kingdom had had no real center of administration. The new Emperor Henry III, however, feared the growing anarchy in Poland and eastern Europe, concerned that the unrest could spread to Imperial lands. Consequently he negotiated a peace among the belligerents, which confirmed Casimir as king of Poland in the first year of his reign, 1046. Confirmed by the emperor, Casimir served as king of Poland until 1058.

Upon the death of Casimir, Poland entered a period of instability, a condition that would appear throughout much of the country's history. Casimir's son Bolesław II ruled as duke from 1058 and was only crowned king in 1076. Three years later he was forced into exile. His brother Ladislas (Władysław) I Herman succeeded him; however he soon resigned the kingship. Bolesław III, the

son of Ladislas, was able to restore the royal authority in Poland, and effective government was restored. Boleslaw III reigned from 1102 to 1138 and even succeeded in defeating the Holy Roman Emperor Henry V twice in battle. However out of diplomatic expediency, he later swore allegiance to the Emperor Lothair II, Henry's son.

MONGOL INVASIONS

The death of Boleslaw in 1138 signaled the beginning of almost 200 years of domestic strife, as rival members of the Piast dynasty struggled for supremacy. Poland, which under Miesko I had been a dominant power in eastern Europe, was reduced to a small player in international affairs. The explosion of the Mongols into Europe in 1240 destroyed the entire strategic balance in eastern and central Europe. In 1223 during the reign of GENGHIS KHAN, the Mongol warlord SUBOTAI had smashed the Kievan army in the Battle of the Kalka River. In December 1237 the Mongols took Riazan and began a systematic campaign of crushing the Russian city-states. On December 6, 1240, according to Eggenberger, the Mongols stormed into Kiev, "plundering and killing at will. Kiev was burned to the ground." This time, rather than making a large raid as the invasion of 1223 really had been, the Mongols had come to stay. While Subotai and Batu Khan continued west, directly threatening weakened Poland, the khanate of the Golden Horde was established on the "lower Volga," according to Eggenberger. "For most of two centuries, most of Russia south of Novgorod lay under Asiatic suzerainty."

After the conquest of Russia Subotai and Batu headed directly into Poland and Hungary, having divided their army into three parts. Fighting for OGOTAI KHAN, who had succeeded Genghis Khan in 1227 as the great khan in 1241, the Mongols virtually crushed the military power of eastern Europe, leaving Piast Poland in serious jeopardy. During the Mongol (or Tatar) assault on Poland, they headed toward the city of Kraków. There one of the truly heroic episodes of military history took place. On the Rynek Główny, or Main Market Square, stood St. Mary's Church. According to Polish legend, an elderly watchman saw the Mongols approaching and sounded the trumpet call of the *Hejnal* to alert the town. Since the trumpet was played regularly, nobody was alarmed at first. But when he played it over and over, the townspeople became alarmed. Suddenly, the trumpeter stopped playing. They saw the Mongols coming closer, and volleys of arrows from Polish archers drove them back. After the battle, somebody climbed up to the tower and found the old watchman dead, a Mongol

arrow through his throat. In honor of his saving the city, the *Hejnal* is played every hour.

THE ORDER OF TEUTONIC KNIGHTS

The power vacuum created by the implosion of Piast Poland also faced another threat from the west, a condition that would mark Polish history. In 1190 the Teutonic Knights, an order of crusaders, was established. Pope Celestine III confirmed the order as a religious order of knights in 1196, as did Innocent III in 1199. Yet unlike the Knights Templars and the Knights Hospitallers, the Teutonic Knights would not make a name for themselves in the Holy Land. Instead, as H. W. Koch writes in *Medieval Warfare*, the Teutonic Knights "remained a purely German movement . . . particularly in the context of its long-term development of the German east." The Teutonic Knights' drive to the east became a permanent threat to the stability of Poland and the Lithuanian princes to the east.

Conrad (Konrad) of Masovia, son of Casimir II of Poland, asked the Teutonic Knights for their aid against the fierce and pagan Prussian tribes. In order to bring the Teutonic Knights to accept his offer, he ceded to them Polish territory around Kulm on the Vistula River. As crusaders, the order was happy enough to take on the Prussians at the request of the Polish ruler. Pope Honorius III in 1226 issued the Bull of Rimini to give papal backing to the coming war against the Prussians, in fact raising it to the status of a crusade. But, along with the crusade against the Prussians, the Bull of Rimini gave the order rights to make its first expansion into Polish territory. The land around Lobau and Kulm was speedily converted by 1230, and Conrad of Masovia, apparently seeing no threat to Polish sovereignty, obligingly handed it over to the Teutonic Knights. By the time that the grand master of the order, Hermann von Salza, died in 1239, Koch notes, "the Order controlled more than a hundred miles of the Baltic coast."

A Prussian uprising took the order by surprise in 1261, and it was not until 1271 that the order gained the upper hand. But when it did, the Teutonic Knights again focused on their expansion eastward. Danzig became part of the realm of the knights, and in 1309 Grand Master Siegfried von Feuchtwangen made the expansion a definite war aim of the Teutonic Order, while Ladislas Łokietek (Elbow-high) was the king of Poland. Ironically it was under Wladyslaw that Poland began to regain its unity and strength. The first open clash between the Poles and the order came in 1311, when the order supported John of Luxembourg, the king of Bohemia, in his bid for the crown against Ladislas. John and

the order were defeated, but the war marked the onset of almost a constant state of tension and intermittent fighting between the Teutonic Order, the Ordenstaat, and the Polish monarchy. Casimir III of Poland began to rebuild his country's military position in the 1340s for what began to look like an ultimate reckoning with the Teutonic Knights.

In 1385 Jogaila (Jagiello), the grand duke of Lithuania, married Queen Jadwiga of Poland, converting to Christianity. He ruled Poland as Ladislas (Władysław) II. In 1226 Lithuania had become united when the Lithuanians under their leader, Mindaugas, had defeated the Livonian Knights of the Sword (allies of the Teutonic Knights), at Siaulai. This marriage, the result of the Union of Krewo, established the Jagiello dynasty and became the foundation of Polish resistance to the territorial expansion of the order. Meanwhile the rule of the order had grown more oppressive, through both taxation and demands on military service, to persecute the war against the Poles and their Lithuanian allies. Both Prussians and Pomeranians looked to their former enemies, the now united Poles and Lithuanians, for relief against the Ordenstaat.

In 1407 his brother Ulrich, who showed contempt for the abilities of the Poles and Lithuanians to confront the Ordenstaat, succeeded Grand Master Konrad von Jungingen. In 1410 the order's grand master Ulrich von Jungingen decided to force the issue before Wladislaus II and a Polish-Lithuanian force could reach the order's headquarters at Marienberg in Prussia. On July 15 the Teutonic Knights met the combined Polish and Lithuanian forces at Tannenberg, or Grunwald. Wladislaus's cousin, the grand duke Vytautas of Lithuania, commanded the actual Polish field army. In the fierce combat that followed, as Koch writes in *Medieval Warfare*, "the Poles concentrated their attack at one point of the German front, broke through and then with their numerical superiority of 3:1 engulfed the army of the Teutonic Order and defeated it."

Although Tannenberg was the decisive battle of the war, the knights did not surrender or cede their territory, and the struggle was continued by Ulrich's successor Heinrich von Plauen, the 24th grand master of the Teutonic Order. For over 50 years hostilities continued between Poland and the order. At the same time among the Prussians and Pomeranians, resentment continued against the exactions of the Ordenstaat. Finally the situation became untenable for the Teutonic Knights. In 1454 the Prussians directly approached King Casimir IV of Poland for aid in throwing off the order's rule.

In what became known as the Thirteen Years' War, the Prussian Confederation fought with Casimir IV

against the Teutonic Order. Lithuania, the ally of Tannenberg, was also at war with Poland but did not side with the order. In one of the first battles of the war at Chojnice in April 1454, Casimir IV was defeated in his attempt to take the city by the order and mercenaries under Bernard Szumborski in its pay. Eventually, however, the prolonged struggle outstripped the ability of the order to continue the fight. Pope Paul II, with both warring parties being Roman Catholics, stepped in to help negotiate a settlement. By the terms of the Treaty of Thorun in 1466, the order ceded control of Prussia. Prussia became a vassal state of the Polish Crown under King Casimir IV, who now ruled a unified Poland, which would emerge as the strongest state in eastern Europe.

JOHN F. MURPHY, JR.

Polo, Marco

(1254–c. 1323) *explorer and author*

Marco Polo, a Venetian merchant, lived for many years in Mongol-ruled China and wrote about what he witnessed there. He is the best known of the many medieval European traders and priests who traveled in Asia beyond its Mediterranean and Black Sea ports.

When he was a child, his father and an uncle visited China. They returned with a letter from the emperor to the pope. When the two Polo brothers made a second journey to China, they took Marco with them, then in his teens. He spent nearly two decades, from the early 1270s to the early 1290s, in China, where he became a favorite of KUBILAI KHAN, of the Mongol YUAN DYNASTY (1279–1368). After Marco Polo returned to Italy, he introduced Europe to the wonders of Cathay, his name for China. Using notes as well as memory, he described what he had learned in a book written in collaboration with an experienced writer, Rustichello of Pisa, while both men were prisoners of war in Genoa. Writing in a French-Italian dialect, Rustichello adapted Polo's story to the fashionable genre of chivalric romance. Immediately popular, the book was translated into Latin and several vernacular languages during Polo's lifetime.

Marco Polo sets out from Venice for the Far East with his father and an uncle. In the foreground are depictions of the lands they will visit. An illustration reproduced from a 14th-century manuscript.

In some ways the book written by Polo with Rustichello is not as informative as another well-known book by a medieval traveler, IBN BATUTA. It is a frustratingly impersonal book. Despite the title *Travels of Marco Polo*, it offers few details about the routes by which Polo traveled to China and back to Europe, or the dangers and discomforts that he experienced. Probably the claim that each of the journeys took several years is a literary device to emphasize how distant China was from Europe.

If someone traveled continuously, such a journey probably took about nine months. In the book there is a bit of ethnography (for instance, religions practiced) and economics (such as the use of paper money), but most of its pages comprise a geographical map of China,

especially its rich cities. Europeans learned from Polo that, compared with their own societies, China was an enormous country, much more wealthy and much more advanced in methods of technology, government, and warfare. Although inaccurate in what he said about Japan, Polo was the first European to mention the existence of the island country.

Scholars have sometimes doubted that Polo traveled farther east than Persia, where he could have obtained secondhand news about China. He ignored topics that modern readers would expect, such as the Great Wall of China, foot binding, tea drinking, and the Chinese method of writing. Although he claimed to have been a great favorite of the emperor, Chinese governmental records say nothing about him. Polo provided Per-

sian names for Chinese places, not Chinese names. On balance the evidence supports the truthfulness of the book, although a few passages are inventions, perhaps attempts by Rustichello to add interest to what otherwise could have been dull lists of facts. Although Polo spoke and read several languages, he did not know Chinese or, for that matter, Latin.

He mostly lived at the Mongol court in northern China, where Persian was widely used, and where the Mongol emperor often trusted foreign adventurers more than he did his Chinese subjects. When Polo died, he left mementos of his travels, including the gold tablet that served as a kind of pass from the emperor or great khan to help the Polo family in their westward journey.

DAVID M. FAHEY

Portugal

Were it not for the tireless efforts of the Portuguese throughout the 15th century in exploring the West African coast, the history of Europe, and the world, might have been discernibly different. The Portuguese impulse to explore and trade led eventually to the rounding of the African horn, or Cape of Good Hope, by Bartolomeu Diás in 1488, and the epoch-making voyage to India by Vasco da Gama from 1497 to 1499. These voyages and discoveries gave Europeans direct access to the spice market of Asia and dealt a serious economic blow to Europe's enemies, the Muslims. In seeking "Christians and spices" in Africa and Asia the Portuguese hoped to find allies against their centuries-old foes and to deprive the Muslims of the wealth made possible by these much sought after commodities. All of this occurred in the 15th and 16th centuries when Portugal was able to use its early penetration of the Asian market to their great advantage. They did this while Spain, England, France, and the future Dutch Republic were variously occupied with either independence or dominance in Europe.

The area now known as Portugal has been inhabited for as long as the Neanderthals are known to have lived in Europe, some 500,000 years ago. Settled by

the Phoenicians during the Iron Age, this area of the Iberian Peninsula was taken by the Romans from the Carthaginians in the third century B.C.E., during the Second Punic War. In 194 B.C.E. a rebellion broke out against the Romans led by one Viriathus, the leader of the Lusitanians, and other native tribes. Viriathus's assassination by his own ambassador to the Romans eventually quelled the rebellion, and the Romans then made Lusitania into a Roman colony that prospered for centuries. In the fifth century C.E. the Germanic tribes that were harassing all of Europe also invaded the Iberian Peninsula. The Suevi, the Vandals, and the Alans made up the first wave of Germanic invasion into Lusitania. In the sixth century C.E. the Visigoths, another German tribe, defeated the Suevi and captured its capital of Bracara (modern-day Braga). The previous German invaders were either expelled or integrated into the Visigothic culture and hierarchy.

In 711 Islamic forces from North Africa conquered the Visigothic kingdom, forcing the Visigoths to the far north. For the next five centuries the nascent Portuguese nation would struggle to regain this area of the peninsula, a struggle that is commonly known as the *reconquista*. The papacy recognized Portugal as an independent kingdom in 1143. Then in 1179 the pope declared Afonso I king of Portugal. Finally in c. 1249 the southernmost area of present-day Portugal, known as the Algarve, was recovered from the Moors. In 1255 the capital of Portugal was moved to Lisbon, its present-day capital. After the era of exploration and discovery in the 15th and 16th centuries, the Portuguese entered a period of decline, or *decadência*, in the 17th century.

There were many factors to explain this perceived decline, such as Spanish rule over Portugal from 1580 to 1640, diminishing returns from their colonies around the world, and the increased competition of Portugal's European neighbors for dominance over these colonies. Portugal never again achieved the imperial heights it possessed in the 15th and 16th centuries.

JEFFERY L. IRVIN, JR.

Printing, invention in China

Paper and printing were both invented by the Chinese, with immense importance for the advancement of civilization in China and worldwide. Papermaking was invented in China around 100 C.E.. The technology spread to the Muslim world in the eighth century by Chinese papermakers taken prisoners by Muslims in Central Asia; it spread to Spain by the Moors in the 12th century. In 175 leaders of the Han dynasty (202 B.C.E.–220 C.E.) ordered that the Confucian classics be engraved on stone slabs to ensure their correct transmission. Scholars began to make rubbings from the stones with paper; copies made from rubbings were the precursors of block printing.

The popularity of Buddhism in China in the post-Han centuries created a demand for printed charms, holy pictures, and religious texts by the pious. The earliest printed books were made during the TANG (T'ANG) DYNASTY (618–909). They were Buddhist texts carved onto pear-wood blocks, which were inked with India ink (made with soot from oil lamps). A sheet of paper was pressed over the block, which became a printed page. Some Tang era printed texts (including a copy of the *Diamond Sutra* printed in 868) have been preserved in the caves in Dunhuang (Tun-huang), an important early center of Chinese Buddhism in northwestern China.

Feng Dao (Feng Tao) is regarded in China as the publisher of the first books. He lived in the 10th century in Chengdu (Chengtú) in Sichuan (Szechwan) province, then a center of the printing industry. He received a commission from the government and spent 21 years between 932 and 953 editing and printing a set of the Confucian classics. Since Confucianism was China's state ideology and school curriculum and the state examinations were based on the Confucian canons, it was important for the government to issue a definitive text. The technology quickly spread to Korea and Japan. Private printers were soon printing histories, Buddhist and Daoist (Taoist) treatises, and other works, using both wood and metal blocks. Under the SONG (SUNG) DYNASTY (960–1279) Chinese printed books reached their high point. The next step in printing was development of the movable type, which a contemporary work credits to a man named Bi Sheng (Pi Sheng), who experimented with movable fonts made of iron during the 1040s. This invention made books more available and cheaper.

In 970 the printing press in China began to print money, the first country to use paper currency. Paper cur-

rency was common during the following YUAN DYNASTY (1279–1368), and it was one of the marvels MARCO POLO described in the book of his travels. Papermaking spread from China westward via the Silk Road, to the Arabs in the eighth century, and the Arabs spread the technology to Europe. The first paper mill in Europe was built in France in 1189. Printing also spread westward from China during the 13th century when China met Europe under the Mongol empire.

JIU-HWA LO UPSHUR

Puranas

The *puranas* (ancient lore) are a genre of the religious literature of India. They were the scriptural basis for the development of many of the Hindu sects. The name *purana* is derived from a Sanskrit word meaning “old stories.” There are a great many *puranas*, but only 18 are considered as the authoritative core of the form of Hindu sacred writing, known as the Puranas. They developed into the popular literature about gods and goddesses (such as Sati and Parvati) to which the people even of the lowest castes could become devoted (*bhakti*). The Puranas are *smriti* (remembered) texts. The Vedas, in contrast, were *shruti* (heard) by the ancient *rishis* (holy men). The Vedas were for the “twice born” of the highest caste and were felt to not be for the lower castes. The Puranas became the sacred literature of many of the lower castes for whom the Vedas were a closed book.

Tradition set the main Puranas as the great 18 (*mahapurana*). There are an enormous number of *upapuranas* (secondary or smaller *puranas*). Eighteen *upapuranas* were chosen to be the Upa-Paranas, which attached “beneath” their respective *purana*. The vast body of writings that became the Puranas began as a body of oral traditions. Since they were not the exclusive preserve of a priestly class they enjoyed wide circulation. As a result there are many versions and variants of the Puranas. Some of these can be traced to the Mauryan dynasty. However, the Puranas are only clearly known historically from the Gupta dynasty (c. 320–500) and beyond.

The Puranas tell about the gods and goddesses of India. They are chiefly concerned with the divine order of the world, which is told in stories. These stories are often theogonies, cosmogonies, and cosmologies that explain the origin of the gods and the world. They also include legends about ancient kings, saints, and royal dynasties. Some sections are devoted to law, science, history, medicine, dance, and religious discussions on iconography and astrology. They form the basis of Hindu mythology.

The Puranas are central to *bhakti* (devotion) in Hindu religious development and practice. They are the central scriptures for the worshipers of Brahma, Vishnu, and SHIVA (Siva). The Puranas have been organized into Bhramana-Puranas, Vishnava-Puranas, and Shaiva-Puranas. In the Puranas the Trimurti (three modes of the one ultimate) of Brahma (creator), Vishnu (preserver), and Shiva (destroyer) are presented in ways that related to the common people. This enabled them to develop a vital spirituality.

There are six Brahmana-Puranas: Brahma-Purana, Brahmavaivarta-Purana, Vamana-Purana, Brahmada-Purana, Markandeya-Purana and Bhavishya-Purana. The six Vaishnava-Puranas are Vishnu-Purana, Bhagavata-Purana, Padma-Purana, Narada-Purana, Garuda-Purana, and Varaha-Purana.

The six Shaiva-Puranas are Matsya-Purana, Linga-Purana, Skanda-Purana, Kurma-Purana, Shiva-Purana, and Agni-Purana. The devotees of each of the three Trimurti separated themselves into sects of Brahma, Vishnu, and Shiva. However, almost everyone who became a devotee chose either Vishnu or Shiva. The oldest Purana is the Vayu-Purana. Some scholars believe that it originated in the 500s. Most Puranas developed between the 500s to the 1300s. The Vayu-Purana is substituted for the Agni-Purana on occasions. The most famous of the Puranas are the Vishnu-Purana and the

Bhagavata-Purana. The Bhagavata-Purana (10th century) was written in south India. It tells the story of Krishna. In it he declares that devoted hearts move him more than yoga, brilliant logic, Vedic chanting, ascetic practices, or brilliant logic. It has been of enormous importance in the religious development of India.

The Puranas are set in the Kali Yuga or post-Vedic age, tradition said began in 3102 B.C.E. The Puranas assume that it is a period of degeneration. Human spirituality has reached a low ebb; however, the gods (*devas*) give mercy to humanity through devotion (*bhakti*). Most of the Puranas have five characteristics (*pancha-lakshana*) or themes. The themes are creation, destruction, and renewal of the world; genealogies of gods and heroes (*vamsa*); the deeds of various gods and heroes (*vamsyanucarita*); the rule of the various Manus during the various stages of human development, and the life and works of the descendants of the Manus (*manvantara*). Some Puranas, however, do not carry this form. Many of them are like encyclopedias—filled with a mass of material on a variety of subjects.

In addition to the Puranas and the Upa-Puranas there are a number of Sthala-Puranas. The Sthala-Puranas are associated with the history and spiritual power of sacred sites (*sthalas*).

ANDREW J. WASKEY

Quetzalcoatl

Quetzalcoatl evokes one of the great tales of Middle American (Mesoamerican) mythology. In Nahuatl, the language of the Aztecs of Mexico, the name *Quetzalcoatl* can be translated as “feathered serpent.” There is in fact a quetzal bird, prized for its plumage and highly priced on the international bird market. However the figure of Quetzalcoatl is not just confined to Mexico, where the Spanish under Hernán Cortés overwhelmed the Aztecs in 1521. The Maya of Mexico’s Yucatán Peninsula know Quetzalcoatl as Kukulcán, and their cousins the Quiché Maya of Guatemala know Quetzalcoatl as Gugumatz. There are three main interpretations to this profound myth. They are that Quetzalcoatl appears as the creator god, a civilizer coming from the east, and the last king of the Toltecs, the greatest warrior race in Mexico, before the advent of the Aztecs in Mexico in about 1100.

The *Codex Vaticano*, one of the few surviving Aztec documents (most were destroyed by zealous Spanish priests and friars), remarks that the supreme god Tona-catecutli created Quetzalcoatl. The description of Quetzalcoatl is remarkably similar to that of the story of Christ in the New Testament, and one cannot discount that fact the friars or priests may have added to the *Codex Vaticano* their own interpretation in order to make Christianity more palatable to the Aztec people. The *Codex Vaticano* notes that Quetzalcoatl was “sent as an ambassador and announced this to a [virgin, much like the visit of the archangel Gabriel to Mary,

announcing she would give birth to Jesus] in Tula. He said that he was sent to save the world with penance [for the people] since his father had created the world but all humanity had fallen into sin. And that Tona-catecutli (known also by the name of Citinatonali) had sent his son to save the world.”

The idea of god-kings was as common among the Aztecs and Mayas as it had been earlier with the Egyptians and their pharaohs. Therefore the people of Middle America very easily accepted the idea that Quetzalcoatl could become king of Tula, a Toltec city. The Aztec emperors presided over the massive human sacrifices of their empire as the direct representative of the people with their gods. Mayan god-kings would shed their own blood by passing thorny twigs through their tongues in order to connect their people to the earth and the gods in the heavens by the sacrifice of their own blood. In Yucatán the pyramid dedicated to Quetzalcoatl, or Kukulcán, at the sacred site of Chichen Itza dominates the landscape.

The most intriguing part of the legend of Quetzalcoatl is its ending. The people and priests turned against their god-king because of his attempts at reformation. Most of all, Quetzalcoatl had forbidden the practice of human sacrifice. (In the legends, he appears as a tall, white man, much different from the Indians of Middle America.) In the end his own people force him into exile and he leaves across the ocean to the east on a raft of his serpents, promising to return. When Hernán Cortés arrived at what is now Veracruz in Mexico in 1519, Moctezuma II’s scouts rapidly bore word of the

appearance of this strange man—a white man—from the east. Moctezuma may have been reluctant to use force against the small band of Spanish adventurers because he thought that Cortés was Quetzalcoatl.

Quiché Maya

Today's Quiché Maya live in Chichicastenango, Chichi for short, in the part of Quiché located in the Western Highlands of Guatemala. They survive as one of Mesoamerica's (Middle America's) earliest developed cultures, the Maya. According to Michael D. Coe in *The Maya*, the first organized agriculture in the Ma-

yan region “was an innovation of the Preclassic period, which lasted from about 1800 B.C.E. to about 250 C.E.” Mayan culture would grow to encompass the Yucatán and Chiapas regions of Mexico, Guatemala, and even parts of El Salvador. The total area once occupied by the Maya was around 400,000 to 500,000 square kilometers and is referred to collectively as El Mundo Maya or in Spanish “the Maya World.”

The Mayas, as with the later Aztecs, developed their own writing. This is in stark contrast to the earlier Olmec, from whom the Mayas may have been descended. Aside from their enigmatic monumental stone sculptures, with apparently African faces, little has been found to document the Olmec civilization. Unfortunately, as with the Aztecs, few of the Mayan written records, in books called codices, which were often made from deerskin or tree bark, survived the Spanish conquest. Only four known Mayan codices are known to have survived the Spanish destruction, the Dresden Codex, the Madud Codex, the Paris Codex, and the Grolier Codex. More permanent records were kept in the elegant stone hieroglyphic writing, featured on almost every public building, which defied Spanish efforts to destroy it.

Today's Quiché Maya in Guatemala occupy a land that before the Spanish conquest of the Mayas in about 1524 was the home to “by well over 25 different tribes or clans of natives who were direct descendants of the original ancient Maya. The most numerous, largest, and most influential of these tribes was the Quiché and the Cakchiquel (meaning ‘those from the red tree’).” As the Public Broadcasting System writes in *Hernán Cortés Arrives in Mexico*, “The first land Cortés and his crew spotted was the coast of Yucatán, at one time the central nervous system of the Mayan empire. Although never a fully unified empire, distinct groups of Mayans occupied these areas, all sharing cultural characteristics such as a highly developed calendar, a complex writing system, and sophisticated mathematics. Even today, the Maya occupy some of these same lands and heartily preserve their significant cultures and languages. Meanwhile, General Alvarado, one of Cortés's men who had traveled ahead, attacked a Maya temple. Cortés reprimanded the general: it was impetuous aggression like this that could bring their expedition to a disastrous and quick end. At Punta Catoche, Cortés came across Aguilar, a man who had survived a shipwreck and spent nine years as a slave to a warlord. Cortés enlisted the man; his knowledge of Maya would be invaluable to the explorer.”

Pedro de Alvarado destroyed the Quiché capital city of Uatlán. Indeed, Alvarado was perhaps the most homicidal of Cortés's “great captains.” While Cortés

Researchers examine a Mayan artifact. Mayan culture encompassed regions of Mexico, Guatemala, and parts of El Salvador.

was off in June 1520 to confront Pánfilo de Narváez, who had been sent to capture Cortés, Alvarado carried out the massacre in the Aztec capital of Tenochtitlán, the site of today's Mexico City. The massacre led to a full Aztec revolt, which almost led to the destruction of Cortés and his entire army in La Noche Triste, "The Sad Night," of July 1, 1520.

The main source on Quiché history and culture is their book, the *Popol Vuh*. The author came from the Quiché Mayas, who were among those educated by the priests and friars who accompanied the Spanish. As with those who faced the Aztecs, some of them realized the value of the indigenous Middle American cultures they had encountered and dedicated their lives to preserving what had been spared in the wreckage that accompanied the conquest and its immediate aftermath.

Qur'an

The Qur'an, the holy book of ISLAM, contains the revelations from Allah to the prophet MUHAMMAD. The Qur'an was revealed in Arabic, a language that therefore holds a special place of respect and admiration for all Muslims. The Qur'an contains instructions for governing every aspect of human life. Under the caliph Omar the suras, or verses, were codified and arranged in order of ascending length with the shortest first. The longer ones, usually revealed in Medina, tend to pertain to matters of civil government and law; thus the Qur'an does not separate matters of religion from those of the state. The Qur'an's main focal point is the existence of one God who is omnipotent. Muslims accept all of the prophets of the Old and New Testaments with Muhammad as the last and greatest of the prophets.

Qur'anic injunctions are a combination of forgiveness and obedience. The Qur'an deals with proper modes

of behavior for all humankind including dietary laws (pork and alcohol are forbidden), adultery (four witnesses are necessary), and slavery (Muslims are to treat slaves kindly and laws are set down for the manumission of slaves). Women are given specific rights, including the right to own and inherit property, rights that women did not achieve in the West for many centuries. Although women are not considered as equals to men in matters of property or divorce, Islam improved the lot and rights of women from those of the era.

The caliph Uthman declared one text of the Qur'an as the one and only definitive copy and all others were suppressed; because of both Omar and Uthman there is therefore only one accepted text of the Qur'an, unlike the numerous texts of the Bible. For millions of Arabic speakers, Muslims and non-Muslims alike, the language of the Qur'an remains the model for grammar, syntax, and literary beauty.

Muslims also consider the Sunna, the collection of the customs of the Prophet, as guidelines for proper behavior. The Hadith, the collection of sayings and traditions of the prophet Muhammad, is another guideline for the community. Several different texts of the Hadith exist. Some hadiths are considered more reliable than others. Reliability is gauged by who transmitted the saying or deed of the Prophet and his companions. First-hand accounts are considered more valid than those passed on by third or fourth parties or by those whose veracity is held in doubt. The chain of transmission is known as *isnad*. In general, the Shi'i criteria for validating hadith are somewhat more flexible and broader than those of the majority, orthodox Sunnis. Muslim scholars have produced massive volumes on the Hadith with various interpretations of given sayings and traditions.

R

Rajput confederacies

Rajputs were members of the approximately 12 million landowners of northern India who claimed to be descended from the Kshatriya warrior caste. The name derives from the Sanskrit term *Raja-putra*, or “son of the king.”

Rajputs were particularly strong in Rajputana. However any ruler who could attain temporal status in central or northern India might be liable to claim Rajput status, since there were no defining tests of ethnicity and status. Rajput confederacies were any of a variety of more or less loosely joined alliances aimed at offensive or defensive military actions under the command of Rajput leaders.

Rajput leaders became more prominent during periods of political upheaval, when central states were unable to maintain control over geographically remote areas and local warlords could enforce autonomy for some period. The ruggedness of the terrain was a considerable advantage in warfare and enabled, for example, the Gurjara-Pratiharas Confederacy to maintain independence from the Arab conquest of Sind. Bhoja I (836–885) extended Rajput territory until it reached the Himalayas, Sind, and the Ganges Valley. This empire dissolved within two centuries, at which time princes rose in what is now Rajasthan to seize their chance for power. A number of independent states flourished across northern India, including the Guhilas, whose territory was centered on Mewar; the Cauhans at Ajmer; and the Bhattis and Rachors.

This period of independence was brought to an effective end by the victory of MUHAMMAD OF GHUR over Prthviraj III at the second Battle of Tarain in 1192, after which northern India was gradually brought into the Muslim sphere of influence. The fiercely independent Rajputs were able to use their terrain to resist absolute control, although their influence was greatly reduced as they became surrounded. This period gave rise to the romantic conception of the noble and valiant Rajput warrior defending home and heartland against the foreign Muslim invaders. The Mughal prince Babur conquered the Rajputs in the 15th century; consequently Rajput power waned.

The Rajput romances feature such elements as wives jumping into the burning funeral pyres of their husbands and desperate attempts to obtain access to beautiful princesses cloistered in remote mountainous fortresses. These romances reveal something of the nature of life for women and the less privileged in this northern Indian society. Artistic expression in various forms reached a high point during the Rajput confederacies.

JOHN WALSH

Reconquest of Spain

In the decades after the prophet MUHAMMAD's death in 632 C.E., ISLAM spread rapidly across North Africa, and within a century was knocking on the doors of Europe. In 711 an invading Muslim army crossed the Straits of Gibraltar into Iberia, and by 718 had conquered most of the peninsula. For the next eight centuries, a complex struggle developed between Iberia's Islamic caliphate and the surviving Christian kingdoms: tiny Navarre in the Pyrenees, Portugal on the Atlantic seaboard, Castile in the broad central plateau, and Aragon in the northeast. In the West and among Christians, this 774-year-long process of struggle and accommodation came to be known simply as the Reconquista, or Reconquest (718–1492)—a term that obscures as much as it reveals about this fascinating period.

The Spanish Christian narrative tends to portray the Reconquest as a period of more or less constant warfare, resulting in a gradual rollback over the course of nearly eight centuries. The realities were far more complex. Christians and Jews living under Islamic (or Moorish) rule were generally allowed to retain their religion, language, and customs, while a great deal of cultural borrowing and intermingling, as well as violence and conflict, marked the centuries of Muslim-Christian-Jewish coexistence.

Around the year 1100 the four Christian kingdoms intensified their efforts to defeat the Moorish polity and expel its inhabitants from Iberia. Portugal gained its independence in 1139, while by the mid-1100s Castile and Aragon had regained many of the lands lost in the initial Islamic invasions. In the Battle of Las Navas de Tolosa in Andalusia in the year 1212, a combined Castilian-Aragonese army inflicted a decisive defeat of the Muslim forces. By the late 1200s the Moorish domains had been substantially reduced, limited mainly to Granada in the far south, which remained a tribute-paying caliphate from 1275 until its final defeat in 1492.

On October 19, 1469, the marriage of Isabella of Castile and Ferdinand of Aragon marked the dynastic union of the two largest and most powerful Christian kingdoms, setting the stage for the consolidation and centralization of state power; the end of the civil wars that wracked Iberia's Christian kingdoms in the late 15th century; the creation of the Spanish Inquisition (1478) to forge religious uniformity across the realm; the expulsion of the Jews; and the final Moorish defeat. Castile was by far the larger and more populous of the two kingdoms, with three times more territory than Aragon (which also included Catalonia and Valencia in

the east), and around 6 million of the two kingdoms' combined 7 million inhabitants. It was thus poised to play the leading role in the conquest and colonization of the Americas after 1492. The year 1492 also saw the forced expulsion of some 150,000 Jews from Castile and Aragon for their refusal to convert to Christianity, and the final defeat of Granada, the last remaining Moorish territory in Iberia, thus marking the end of nearly eight centuries of Reconquest.

Overall these eight centuries produced among Iberia's Christians a highly militarized, zealous, and intolerant form of Christianity; a dense intermingling of church and state; a highly hierarchical and rigid class structure; an ethos of territorial expansionism; and a series of practical templates for the conquest and subjugation of foreign lands and peoples. All of these broad themes would prove crucial in Spain's conquest and colonization of the Americas in the years after 1492.

MICHAEL J. SCHROEDER

Richard I

(1157–1199) *king of England*

Richard I (r. 1189–1199) was the third son of King HENRY II of England and ELEANOR OF AQUITAINE. Known as “the Lionhearted” because of his numerous military exploits, Richard became king of England and Normandy when Henry II died in 1183. Within a year he was leading forces on the Third Crusade. His goal was to return Jerusalem to Christian rule. Richard's quest almost bankrupted the English treasury and led to increased taxes to pay for the expedition. Arriving in Sicily Richard attacked Messina and after capturing the city, looted and burned it to the ground. He sailed to Rhodes, part of the BYZANTINE EMPIRE, and traveled to the island of Cyprus. Richard's larger and better-equipped army soon defeated the rulers of Cyprus. The crusaders then looted the island and massacred their opponents. While in Cyprus, Richard married his fiancée, Berengaria of Navarre. By his own choice Richard was frequently estranged from Berengaria and the marriage produced no children. Richard left no legitimate heir to the throne.

In the summer of 1191 Richard arrived at Acre to assist French and Austrian crusaders in their two-year siege of the city. He soon quarreled with the French King PHILIP II AUGUSTUS and after the city fell Philip returned to France. Following their earlier pattern of conquest, Richard's forces looted the city and killed many prisoners. However Richard was badly isolated and the strategy of "scorched earth" of SALADIN (SALAH AD DIN, YUSUF) left his army short of supplies. Richard and Saladin, both keen military strategists, maneuvered over territories around Jerusalem and developed mutual respect for the other's abilities. Recognizing that he would be unable to hold Jerusalem militarily, Richard agreed to a negotiated settlement in 1192 whereby the crusaders kept Acre and the Muslims kept Jerusalem. Christian pilgrims were allowed access to the holy sites in the city. Eager to return to England, where rivals threatened his throne, Richard set sail for Europe but was shipwrecked off the coast of Venice. He was captured and held hostage by Leopold of Austria and was only released in 1194 after the payment of an enormous ransom. He died from an arrow wound to the shoulder while fighting in Normandy in 1199.

JANICE J. TERRY

Roland, Song of

The anonymous *Song of Roland* is the most famous Old French epic, or *chanson de geste*. It was composed c. 1090 but was not committed to writing until nearly 100 years later. The oldest written copy, discovered by Francisque Michel in 1835, survives in Oxford Bodleian MS Digby 23. As all *chansons de geste*, the *Song of Roland* was performed aloud in front of an audience by a minstrel (or *jongleur*). It is unlikely the whole poem was recited in one sitting: It consists in some 4,000 decasyllabic lines, assembled into 291 *laissez* or verses.

The *Song of Roland* is loosely based on historical events narrated by Einhard in his ninth century *Vita Karoli*. CHARLEMAGNE, the Holy Roman Emperor, invaded Spain in 778 to free the country from the impending Muslim threat. A stained-glass window in Chartres cathedral suggests the emperor had a vision of St. James, whose body is buried at Compostela in western Spain.

James asked Charlemagne to liberate his home from the pagans. Returning from battle, the Frankish army marched through the Pyrenees. Without warning, the Basques attacked the rear guard at Roncevaux and brutally killed everyone. The author of the *Song of Roland* substitutes the Saracens for the Basques, making the epic about the religious war between the Christians and the infidels.

The *Song of Roland* is divided into two distinct parts. The first recounts the death of Roland and his men. The second describes the revenge of Charlemagne. When the poem begins, the emperor has been fighting in Spain for seven years. The Frankish army has conquered the whole country with the exception of one city: Saragossa, ruled by King Marsile and Queen Bramimonde. Following the advice of the Saracen lord Blancadrin, Marsile sends a message to Charlemagne announcing his intent to become the emperor's vassal and to convert to Christianity. Charlemagne accepts the offer and must choose an envoy to send to Marsile's court. Roland—Charlemagne's best knight—nominates his stepfather, Ganelon. Erroneously believing Roland has selected him for this dangerous mission out of spite, Ganelon conspires against Charlemagne with the pagans. He tells Marsile that Charlemagne will not continue fighting if the Saracens kill Roland, who will probably lead the rear guard as the Franks march over the Pyrenees. He and his men will be the most vulnerable in the narrow and treacherous pass at Roncevaux.

Ganelon returns to Charlemagne and falsely attests to Marsile's good intentions. As predicted Roland volunteers to lead the rear guard, and Charlemagne's strongest vassals, the "twelve peers," go with him, including Olivier (Roland's best friend) and the archbishop Turpin. At Roncevaux, they are attacked by the Saracens, who vastly outnumber them. Olivier (characterized as wise) advises Roland to sound his horn and call Charlemagne back to fight. But Roland (characterized as proud, brave, and dutiful) refuses; to do so would demonstrate weakness and might place the life of the emperor in jeopardy. The rear guard fights bravely and kills a great number of the enemy. Eventually Olivier, Turpin, and all of the Frankish soldiers lie dead. Roland blows his horn (or *oliphant*) until his temples burst, signaling to Charlemagne his defeat. Before dying he attempts to break his sword, Durendal, on the surrounding black rock so that it does not fall into the hands of the pagans (a gap in the rock along the border between France and Spain is known as the Brèche de Roland). Roland dies a hero's death: He lies down facing the enemy's land and angels and saints escort his soul into heaven.

Charlemagne arrives with the rest of the Frankish army. Overwhelmed with grief, he resolves to avenge the death of his men. God miraculously ensures the sun remains high in the sky so that the enemy cannot flee under the cover of night. The Franks kill the remaining Saracens by forcing them into the river Ebro; thousands drown. King Marsile escapes to discover that Baligant, the emir of Babylon, has arrived to help the Saracens in the war. Baligant rides with his men to Roncevaux, where the Franks are burying the dead. A great battle ensues. When Charlemagne slays Baligant, the remaining Saracens flee; the Franks march on Saragossa and finally take the city. Angry with the Saracen god for abandoning her people, Queen Bramimonde accompanies Charlemagne back to France. By the end of the poem she converts to Christianity of her own free will.

When the Frankish army arrives in Aix (Charlemagne's capital), the emperor informs Roland's fiancée, Aude, of the deaths of Olivier and Roland. Charlemagne offers to her his son as a substitute. Out of grief for Roland, Aude swoons and falls dead and is buried in great honor. Meanwhile Ganelon awaits trial for treason. His kinsman, Pinabel, defends his honor during a duel with Roland's friend, Thierry. Thierry, who is by far the weaker knight, overcomes his formidable adversary. The Franks interpret this as a sign that God has revealed the guilt of Ganelon. They sentence Ganelon to death by dismemberment. For good measure, they also condemn 30 of his relatives to be hanged. The war is finally over and the Franks prepare to rest. But that night as he sleeps, Charlemagne has a vision of the angel Gabriel, revealing that the Franks must depart on a new crusade. Weary from battle Charlemagne nonetheless obediently vows to do God's will.

The *Song of Roland* was composed around the same time as the Council of Clermont (1095), at which Pope URBAN II exhorted all Christians to fight in the CRUSADES in order to recapture the Holy Land. The poem became a testimony to the virtuous courage of Western Christendom in the fight against the pagans. It is also an intensely nationalistic work. In the *De gestis Anglorum* (1125), William of Malmesbury writes that Roland's tale is sung before the Battle of Hastings to give strength to the French soldiers who are about to fight.

K. SARAH-JANE MURRAY

Rome, medieval

Medieval Rome lacked the structured government that was the norm in other Italian cities. The presence of the pope and the attending church bureaucracy meant a sometimes-uneasy relationship between the church and the state. What organized government that existed was centered on the senate. The number of senators fluctuated from as few as one to as many as 56. The length of a senatorial term was equally flexible. An 1188 treaty signed by Pope Clement III between the city of Rome and the papacy provided official papal recognition of the senate in exchange for senatorial allegiance to the pope. The pope also promised some financial support to the senate and aid in the maintenance of the city's defensive walls. The papal signor appointed by the pope, who usually represented the interests of one or more Roman families, ruled Rome.

Rome was divided into a series of neighborhoods that were associated with a particular craft. These neighborhoods were also associated with noble families who dominated the area with their family-controlled towers. The towers were defensive structures where families would retreat during times of conflict. The 13th century in Rome was a period especially noted for the tower wars between prominent noble families as they fought for control of the city. Often these wars were an outcome of the rivalry between the Guelf, or papal party, and those who supported the Ghibelline, or Imperial party. Two of the most prominent families of this era were the Orsini (Guelf) and Colonna (Ghibelline) families.

Orsini family legend dates their arrival in Rome to 425. They claimed to be descended from a lost boy who was nursed by a bear; *orso* is the Italian word for "bear," the symbol of the Orsini family. The Orsini's claimed Pope Stephen II, Pope Paul I, St. Benedict, St. Scholastica, and the brothers S.S. John and Paul as part of their family lineage. In contrast the Colonna family did not subscribe to as ancient or colorful family legend regarding their origins. Records indicate the first individual to use the name of Colonna was Pietro de Colonna (1064–

c. 1118), yet the origin of the name remains a mystery. Family lore draws some connection to the Italian word for column with the story that early in the 13th century, Cardinal Giovanni Colonna returned from the east with the very column used during the scourging of Christ and placed the column in the Santa Prassede.

Orsini dominance of Rome lasted from the middle of the 12th century until late in the 13th century. Family dominance of Rome, whether by the Orsini or Colonna, was typically won through membership in the college of cardinals or the papacy, which led to the granting of prosperous fiefs to other family members. The rise of the Colonna family to predominance and the beginning of a back-and-forth battle between the two families can be dated to the election of Nicholas IV (1288–92), a Colonna supporter, to the papacy.

The rise and fall of family fortunes were largely tied to control of the papacy and papal curia. The battle between the Orsini and Colonna families took a particularly vicious turn when the Colonna family supported the attack on Boniface VIII in September 1303 at Anagni, while the Orsini family continued their pro-Guelf tendencies and supported him. Boniface responded by destroying Colonna holdings in and around Rome. Fortunes were often in the balance even when the occupant of the papal throne was from neither family. The Orsini would attempt to enlist the support of the pope against their Colonna rivals, such as being granted the use of papal troops against the Colonna by Sixtus IV. The result of this aggressive pursuit of the papacy was 22 cardinals and three popes for the Orsini family between 1144 and 1562 versus 11 cardinals and one pope for the Colonna family. In the end both families were named as princes entitled to attend to the papal throne.

Yet the rivalry among noble families was not so intense that rivals removed one key tool for advancement from consideration—marriage. Saint Margherita Colonna (d. 1280) was the product of a Colonna-Orsini marriage. Lorenzo de' Medici (Florence) and his son Piero both took Orsini wives. Family ties and rivalries dominated medieval Rome, her government, and her daily life.

ABBE ALLEN DEBOLT

Rome, papacy in Renaissance

The Renaissance popes comprise the series of Roman bishops between 1447 and 1484, best exemplified by Nicholas V (r. 1447–55), Pius II (r. 1459–64), and Sixtus IV (r. 1471–84), who ruled the Western Church according to the spirit of Renaissance literary culture. They have often faced criticism by biographers, both contemporaneous and modern, for subordinating their ecclesiastical responsibilities to personal ambition.

NICHOLAS V

Nicholas, born Thomas Parentucelli in 1397, was a humanist who rose through the ecclesiastical ranks until he became pope. A man of tremendous intellectual endowments, tact, and courtesies of manner, Thomas was educated at Bologna, where he became archbishop in 1444, and on his return from Germany as papal legate, he was appointed cardinal in 1446. Four months later he was elected unanimously to the papal throne, and his interest in the classical world led him to repair the buildings, bridges, aqueducts, and great churches of Rome. Nicholas proclaimed 1450 a Jubilee Year to rebind the European nations closely to Rome and to reignite the fires of devotion that languished during the Babylonian Captivity (1309–77) and Great Western Schism (1378–1415).

Forty thousand pilgrims traveled to Rome, where relics were displayed throughout the city, featuring the supposed heads of Peter and Paul every Saturday and the handkerchief of St. Veronica—which allegedly bore the outline of Christ's face—each Sunday. Nicholas was both diplomatic and successful in his administration of the properties of the Holy See. He expanded the borders of the PAPAL STATES farther than their perimeter before the Babylonian Captivity by regaining Bolsena and the castle of Spoleto and procuring the submission of Bologna, to which he dispatched Bessarion as papal legate. To underscore the supremacy of his spiritual power to even the highest temporal authority, Nicholas crowned the German Frederick III as Holy Roman Emperor in 1452, the last emperor to be so installed in the history of the empire. When Stephen Porcaro attempted to seize the papal throne in 1453, Nicholas quickly suppressed the conspiracy. He proved judicious in his selection of cardinals, including the prominent dialectical theologian Nicholas of Cusa.

Despite his successes in the west Nicholas suffered the most notable failure of his reign when he unsuccessfully attempted to prevent the fall of Constantinople into the hands of the Ottoman Turks, which transpired on

May 29, 1453. His impotence was due in large part to his insisting that the Eastern Orthodox Church first come to terms with the Roman Church, from which it had been separated for four centuries, before he would furnish military support. The Greek people violently resisted union with Rome, even to the point that Lucas Notaras, the most powerful man in the BYZANTINE EMPIRE, announced his preference for ISLAM over Catholicism.

More than a year elapsed before the Greeks, faced with too imminent danger to reject the papal condition, acquiesced by ratifying the Ferrara Articles of Union between the Greek and Latin confessions. Although Nicholas responded in April 1453 by sending ships from Naples, Venice, and Genoa along with a guard of 200 troops, by this time it was too late to stop the Turkish conquest. Rightly perceiving that this catastrophe would be regarded by future generations as a blot upon his pontificate, Nicholas summoned the Christian nations to a crusade for the recovery of Constantinople, identified the Ottoman leader Mohammed II as the dragon depicted in the book of Revelation, and offered absolution to anyone who would spend six months in the enterprise or maintain a representative for that length of time. However Europe repudiated the papal order at the 1454 Councils of Regensburg and Frankfurt, as the time of crusading enthusiasm had passed and the Turks were universally feared. While Nicholas died a year later, his fame abides as the erudite and genial patron of the arts and letters.

PIUS II

Pius II ranks as one of the most conspicuous figures of the 15th century by virtue of his diplomatic shrewdness and his constant yet successful seeking of personal interests. Born Aeneas Sylvius de' Piccolomini in 1405 as one of 18 children, he enrolled in the University of Siena at the age of 18, when he was captivated by the spellbinding preacher Bernardino and proceeded to study Greek in Florence. After completing his studies Aeneas successively served as secretary to Cardinal Capricana, the bishop of Navaro, and Cardinal Albercati, which enabled him to embark on a tour of the major cities of the Continent, England, and Scotland. Aeneas then settled in Basel, where he became the leading figure in the city council and was repeatedly dispatched as ambassador to Frankfurt, Trent, and Rome. His political ambition led him to ingratiate himself to Emperor Frederick III, and his creative brilliance, displayed in his Latin epigrams and verses, soon won him the appointment of poet laureate.

Upon proving his usefulness to the pope he was appointed papal secretary in 1447 by Nicholas V, who

awarded him the bishoprics of Trieste and Siena and promoted him to the college of cardinals. Rising by tact and an accurate knowledge of European affairs, Aeneas was elected as pope at the age of 53. Contemporary biographers described him as a thorough man of the world capable of grasping any situation at a glance. Moreover Pius lived in moral profligacy, engaged in many love affairs, and fathered at least two illegitimate children, thus bringing disgrace upon the papacy and fanning the flames of anticlericalism among the European populace. Pius also wrote tales of erotic adventures, and his *History of Frederick III* contains graphic details that even many modern authors would deem inappropriate.

Pius's most enduring theological contribution to the church lay in his denunciation of conciliarism, or the position that final ecclesiastical authority resides in general councils, in favor of papal supremacy over councils. In his famous 1460 bull *Execrabilis*, Pius declared it an unthinkable abuse to make appeal for a council to overturn a decision of the pope. To safeguard the church from any such future attempts, Pius anathematized anyone who would make such an appeal, which condemnation could not be absolved except by the pope himself and in the article of death. He proclaimed the divine origin of the monarchical form of church government (Latin *monarchicum regimen*), in which the militant church has in the Vicar of Christ one who is moderator and arbiter of all.

For Pius the pope receives his authority directly from Christ without mediation and constitutes the prince (Latin *praesul*) of all the bishops, the heir of the apostles, and stems from the priestly line of Abel and Melchizedek. Concerning the recent COUNCIL OF CONSTANCE (1414–18), which ended the Great Western Schism, Pius expressed his regard for its decrees only insofar as they were approved by his predecessors, contending that the decisions of general councils are subject to the sanction of the supreme pontiff, Peter's successor. Pius foreshadowed the later doctrine of papal infallibility in his claim that while his theological reflections prior to his elevation lacked binding power, his decisions from Peter's chair on matters of faith must be obeyed (Latin *Aeneam rejicite, Pium recipite*—"Reject Aeneas and follow Pius"). Pius's treatises contributed greatly to the final triumph of papal authority over conciliarism at the Council of Trent (1545–63). Pius died in 1464.

SIXTUS IV

Although he was a leader of great decision and ability, a renowned scholar, and a benefactor of the fine arts,

the reign of Sixtus IV, the last of the Renaissance popes, is best characterized by the insolent rule of his numerous nephews and their wars with the Italian states in which their intrigues and ambitions involved their uncle. Notorious for his nepotism Sixtus unblushingly promoted the interests of his relatives, many of whom displayed incompetence, such that the avenues of the Vatican were filled with upstarts whose lineage served as their only claim to recognition.

At the time of his election to the papacy Francesco Rovere, born 1414, was general of the order of the Franciscans. Rising to academic stardom from humble stock, Francesco, whose father was a fisherman near Savona, earned the doctor of theology degree at the University of Padua and served as professor successively at the universities of Bologna, Pavia, Siena, Florence, and Perugia. His predecessor Paul II (r. 1464–71) appointed him cardinal, and strong support came to him in the conclave because of the influence of his nephew, Peter Riario, who made substantial promises in exchange for votes. Sixtus's relatives soon became the leading figures in Rome, and in wealth and pomp they soon rivaled or eclipsed the old Roman noble families and the leading members of the college of cardinals. Sixtus appointed eight of his nephews to the college of cardinals, and two nephews in sequence as prefects of Rome. In addition, Sixtus heaped benefice after benefice upon Peter Riario and Julian Rovere, the latter of whom was elected to the papacy as Julius II (r. 1503–13).

When Peter died in 1474, his brother Jerome, who came into great favor with Sixtus, became engrossed in feuds against Florence and Ferrara and organized a conspiracy to seize the former from the outstanding Medici banking family by assassinating its ruler, Lorenzo the Magnificent. While he may not have consented to murder, Sixtus fully approved of the plot to seize Lorenzo and overthrow the republic. After the bloody deed was enacted by two mercenary priests during mass in the cathedral of Florence on April 26, 1478, the citizens of Florence demonstrated their fidelity to the Medicis by executing the two priests and hanging the president, Archbishop Salviati, from the signoria window.

Furious over the death of his archbishop, Sixtus placed Florence under interdict, deemed Lorenzo as the son of iniquity and the ward of perdition (Latin *iniquitatis filius et perditionis alumnus*), and entered into an alliance with Naples against Florence. Only after King Louis XI of France, along with the rulers of Venice and several other Italian states, took up the cause of Florence did Sixtus lift the interdict and dissolve the alliance. Again in the interest of Jerome, Sixtus seized Ferrara

and its ally Forli, sparking a war in which all Italy became engrossed. Although surpassed by his readiness to enjoin violence in support of his kin, Sixtus's place as both patron of ancient Roman culture and theologian should not be overlooked. He was responsible for cataloging the archives of the Vatican in four volumes, and he officially extended the efficacy of indulgences to souls in purgatory. Sixtus died in 1484.

KIRK R. MACGREGOR

Rus (also Rus')

Kievan Rus (860s–1238), the first state of the Eastern Slavs, received its name from its capital city Kiev, located along the middle Dniepr River (modern Ukraine). Founded and ruled by the Rurikid princes, during its height in the 11th and 12th centuries Kievan Rus spanned most of modern Belarus and Ukraine, extending northward to the Republic of Novgorod, which controlled lands extending from the Baltic to the White Seas and the northern Ural Mountains. The medieval state stretched across four latitudinal landscape zones, each favorable for different forms of economic exploitation: tundra (hunting-gathering), boreal forest and intermediate forest-steppe (hunting-gathering and agriculture), and the steppe (pastoral nomadism). The Western Dvina, Volkhov-Lovat, Dniepr, and Volga river systems linked these diverse resource zones. It was the economic and political unification of these territories that made Kievan Rus one of the wealthiest and most cosmopolitan kingdoms in medieval Europe during the 11th and 12th centuries.

The history of Kievan Rus is best divided into three developmental periods: foundation period (750s–988), the golden age (988–1050s), and fragmentation into

principalities (1050s–1238). Mongol armies under Batu Khan brought the period to its end with the destruction of Kiev, Riazan, Vladimir, and many other towns from 1237 to 1239.

FOUNDATION PERIOD

The main written account for the foundation period is the *Russian Primary Chronicle*, compiled by monks at the Kievan Caves Monastery in the early 12th century. Archaeological and numismatic evidence serves as a supplement and corrective to this problematic account. These sources trace the early formation of the Rus lands to the Volkhov-Il'men river basin of northwestern Russia. Finno-Baltic hunter-gatherers inhabited this densely forested marshy region. In the mid-eighth century Slavic agriculturalists began migrating to the area from the south. At the same time Scandinavians began small-scale raiding/trading expeditions to the region. The convergence of these groups served as the

initial catalyst for the development of a new political-commercial community.

Forces at play in both northwestern Europe and the Middle East explain Scandinavian movement into Russia. Lacking locally exploitable sources of silver, which was needed for northwestern European political and commercial expansion, the early medieval kingdoms of the Anglo-Saxons and Franks looked to the Near and Middle East, where, from the mid-eighth century, the Abbasid Caliphate centered in BAGHDAD minted millions of silver coins (*dirhams*) annually. The Vikings acted as the middlemen for this trade. Beginning sometime in the mid- to late-eighth century, small groups of Vikings set up way stations in the Volkhov-Il'men and Upper Volga basins. They collected furs from the Finno-Balts and Slavs in northwestern Russia and sailed south to trading ports on the Volga River and Caspian Sea, where they would exchange furs, Frankish swords, and walrus ivory for eastern luxury items, especially silver.

Yaroslav the Wise sponsored major building campaigns in Kiev, which imitated the architecture of Constantinople. He imported Byzantine master builders to construct the Church of St. Sophia (which was also decorated by Byzantine mosaicists).

According to the *Chronicle*, in 859 the Vikings were expelled from Russia by the local tribes, probably for taking excessive tribute, but three years later in 862 a confederation of Slavs and Finns invited the Viking Riurik and his clan “to come and rule over them.” Establishing a base first at Staraja Ladoga and then Riurikovo Gorodishche, Riurik proceeded to create tributaries of the Slavic tribes to the west, in Pskov, and to the northeast in Beloozero. After his death in 879 his kinsman Oleg seized Kiev, thereby assuming control over the tributary relationships with nearby tribes previously exploited by the Khazar empire. By the late 10th century the Riurikid clan, which had become increasingly Slavized through marriage, had subjected all of the Slavic and Finnic tribes to their rule.

The foreign policy of the Riurikids was directed toward creating stable commercial relations with one of the largest markets in the known world, the Byzantine Empire. From 860 to 1043 the Vikings (and later Slavized Riurikids) attacked the Byzantine Empire six times (860, 907, 941, 944, 971, and 1043). Most of the campaigns resulted in commercial treaties regularizing trade between Kievan Rus and Constantinople. Each year the Riurikids spent the winter collecting tribute from subject tribes, and in the spring the commercial delegation sailed to Constantinople, where it spent the summer trading their furs, honey, wax, and slaves for Byzantine finery (glass, jewelry, hazelnuts, spices). Commercial contact with the Greek empire via the so-called road from the Varangians to the Greeks helped introduce the Eastern Slavs to Greek culture, diplomacy, and religion.

In 955 Grand Princess Olga converted to Byzantine Christianity. Her son, SVIATOSLAV (d. 972), a committed pagan who was more interested in war than diplomacy, waged an unsuccessful campaign to capture Byzantine Bulgaria and was killed by nomadic Pechenegs in the Byzantine hire. His son, VLADIMIR I (VLADIMIR THE GREAT) (d. 1015), was a champion of Slavic paganism as well, but he recognized the problems inherent in Kiev’s increasing religious isolation from its neighbors. While the Rus considered converting to ISLAM, they chose instead Byzantine Christianity. Vladimir was baptized in 988 and married the sister to the Byzantine emperor, Anna, an incredible honor for a “barbarian” from the north. This move forged an enduring relationship between the Eastern Slavs and Byzantines, with Rus princes providing goods of the north and military assistance to Constantinople in exchange for Greek cultural and religious knowledge, including a written script (Cyrillic), church architects, clergy, and craftsmen (mosaicists, glassmakers, icon painters, manuscript copyists).

GOLDEN AGE

Vladimir’s son, YAROSLAV THE WISE (c. 980–1054), is credited with the golden age of Kievan Rus. He created foreign alliances by marrying Ingegerd, the daughter of the Swedish king, and marrying his daughters to German and French kings. Under his reign Kiev’s buffer zone separating it from the Pechenegs expanded from a one- to a two-day march. Yaroslav sponsored major building campaigns in Kiev, which imitated the architecture of Constantinople. He imported Byzantine master builders who constructed the Church of St. Sophia of Kiev (which was decorated by Byzantine mosaicists), the Golden Gates, a palace, and a massive defense works surrounding the capital. In order to support Kiev’s new religion, Yaroslav founded monasteries and invited Greek clergy to Kiev, who taught Byzantine religious practices to the native and often illiterate clergy. In 1051 Yaroslav appointed the first native metropolitan, which helped establish the Russian church’s autonomy from Constantinople. He also commissioned the first Church Statute and the first Russian law code, the *Russkaia Pravda*.

In a testament left to his sons, Yaroslav tried to establish an order of succession, with the oldest son, Iziaslav, ruling Kiev, and the younger sons appointed to cities of importance commensurate to their place in the line of succession. When an older prince died, the younger moved up the line of succession and to larger and more lucrative towns. The inheritance tradition of Kievan Rus was one of lateral succession, with brother succeeding brother. The system, however, promoted acrimony during the lifetimes of Yaroslav’s sons, and the problem increased as family lines multiplied. Vladimir Monomakh (1053–1125), the grandson of Yaroslav the Wise, was the last Kievan monarch to exercise any real authority over much of Kievan Rus. Vladimir derived much of his authority from his ability to lead his cousins in several successful campaigns against the Polovtsian nomads, who had terrorized the kingdom’s southern frontier, including Kiev itself, from the second quarter of the 11th century.

FRAGMENTATION INTO PRINCIPALITIES

Evidence suggests that during the 12th century, Kiev entered a period of decline, a theory that is contradicted by archaeological evidence of burgeoning industrial production and continued commercial relations with Constantinople. However Kiev’s political sway over the kingdom dissipated with the growth of other Rus towns. The towns of Vladimir-Suzdal, Polotsk, Pskov, Smolensk, Pereiaslavl, Turov, and Chernigov were ruled by branches of the Riurikid family who had come to

view these towns and their hinterlands as their patrimonies absolutely independent from Kiev. To promote their legitimacy, the rulers of these towns built stone churches and palaces modeled after those in Kiev. They sponsored the foundation of monasteries and commissioned the monks to write detailed chronicles of their family's branch of the Riurikid dynasty and the history of their town. In addition to master builders they imported master craftsmen from Kiev, who established workshops in their new towns specializing in the manufacture of glass bracelets, jewelry, textiles, and other Kievan-Byzantine luxuries. In this way Kievan-Byzantine culture came to dominate throughout much of the Rus principalities, homogenizing the Eastern Slavic lands by spreading an elite culture through its cities. Local cultural forms developed as well during this period, with icon painting schools emerging in Pskov, Novgorod, and Vladimir-Suzdal.

An alternative to the pattern of centralized princely rule established in Kiev and followed by the independent principalities was the city-state of Novgorod. Founded in the mid-10th century, Novgorod was the second largest city of Kievan Rus, and possibly wealthier, because of its importance as medieval Europe's key source of furs. Because of its wealth and status, the Kievan princes treated Novgorod in a special manner, appointing their eldest sons or close associates to rule the town. In 1136 Novgorod's population expelled their prince and claimed the right to choose from any branch of the Riurikid clan. The prince protected the town and received revenues from its trade but had to reside beyond the town walls. The town assembly (*veche*), governor (*posadnik*), and archbishop became major determinants in Novgorod's administration. These principal actors in Novgorodian politics had the power to remove the prince. Because it was located so far to the northwest, Novgorod was one of the few towns not touched by the Mongol invasion. In the 14th and 15th centuries Novgorod became one of the most powerful states in Europe, serving as one of the Hanseatic *kontor*. In 1478 the grand prince of Moscow annexed Novgorod and cut one of the main sources of its revenue when, in 1494, he closed Peterhof.

Although Kievan Rus comes to its official close in 1237–39 with the Mongol invasion, there were signs of weakening beforehand. Already in the early 12th century, the Swedish kingdom began militarily driven efforts to convert the Eastern Slavs in the Novgorod lands to Latin Christianity. Crusading campaigns fought by German knights gained momentum during the 13th century under the organization of the Teutonic Order in Livonia. Although not in danger from the northern crusades, Kiev became the victim of the southern crusades when, in 1204, an army of crusaders seized and sacked Constantinople, holding the Byzantine capital until 1261.

Heavily dependent on trade with Constantinople, Kiev entered upon a long period of economic depression, which contributed to its weakened defenses, which were ill equipped to organize a resistance the Mongol army in 1238. In 1223 several Rus princes fought a small Mongol army, which turned out to be a scouting party, on the river Kalka. While the Russian sources attribute the Rus princes' inability to defend Rus in the late 1230s to political infighting and lack of Christian brotherhood, it is doubtful that even an army united under all of the surviving Riurikids could have defeated Batu Khan's army of more than 150,000 horsemen.

HEIDI M. SHERMAN

Saladin (Salah ad Din, Yusuf)

(c. 1137–1193) *Muslim leader*

Of Kurdish ethnicity, Saladin was born in Tikrit, Iraq, and was raised in northern Syria. After a religious education, he served with his uncle, Asad ad Din Shirkuh, for Abu al-Qasim Nur ad Din (1118–74), who had inherited rule over Syria from his father, Imad al-Din Zangi (1084–1146), founder of the Zangid dynasty. After military successes in repelling Crusader States in Syria and acting on Shirkuh's advice, Nur ad Din extended his control into Egypt. After Shirkuh's death his nephew Saladin was appointed vizier over Egypt. Saladin quickly moved to eradicate Fatimid control over Egypt. In 1171 he abolished the Shi'i Fatimid Caliphate and returned Egypt to orthodox Sunni rule.

Saladin then established the Ayyubid dynasty in Egypt and joined with the weakened Abbasid Caliphate based in BAGHDAD. After Nur ad Din's death, Saladin, using Egypt as his base of support, extended his control over Syria, Palestine, and northern Iraq and established Damascus as his capital. Recognizing that warring local rulers and political forces had enabled the crusaders to establish control over the coastal areas of the eastern Mediterranean and Palestine, Saladin sought to unify Iraq, Syria, and Egypt under his control. He established new religious schools and mosques as a means to encourage the regeneration of ISLAM.

By 1187 he was strong enough to attack the crusaders and to win a major military victory at the BATTLE OF THE HORNS OF HATTIN. He then quickly moved to take

Jerusalem after over 80 years of Christian rule. However, in notable contrast to the bloody massacres inflicted on Jerusalem's inhabitants by the crusaders, Saladin was magnanimous in victory and even the Church of the Holy Sepulchre was left untouched. His tolerance and diplomacy earned him the praise of Muslim and Christian envoys alike.

To wrest Jerusalem away from Muslim control, a Third Crusade under King PHILIP II AUGUSTUS of France and RICHARD I of England, the Lion Hearted, was mounted. The two monarchs soon quarreled but Richard successfully enlarged crusader control over the coastal areas. The battle between Richard I and Saladin's forces for control over Jerusalem resulted in a stand-off. Tired of the battle and recognizing the balance of power in the region, Richard I negotiated an agreement, the Peace of Ramla, with Saladin in 1192. Under this agreement the coastal area of Palestine remained under Christian dominance but Muslims retained control of Jerusalem. Saladin returned to Damascus, where he died shortly thereafter. His family continued the Ayyubid dynastic control over Egypt until 1250, when it fell to the Mamluks.

JANICE J. TERRY

Salutati, Coluccio

(1331–1406) *humanist scholar and civic leader*

Salutati was born in Stignano, a village northwest of Florence. Educated in Latin grammar and rhetoric and certified as a notary, he was employed in secretarial and notarial duties in several communities in Italy and was a secretary in the papal curia in Rome. Access to PETRARCH's works at Rome strengthened Salutati's study of antiquity and influenced the nature of his humanism. In 1375, he was appointed to the post of chancellor of the Republic of Florence, a position he held until his death in 1406.

As chancellor, Salutati was responsible for the official correspondence of the republic. He was recognized in his own lifetime for the persuasive power of his rhetoric and for his ability to utilize examples from the literature and history of ancient Rome to bolster support for Florence in its conflicts with the papacy and the Visconti rulers of Milan. Salutati identified Florence as the defender of liberty, praised it for its republican institutions, and traced its origins to republican Rome. In doing so, he laid the groundwork for the laudatory writings of LEONARDO BRUNI and other Florentine humanists.

In his public career Salutati demonstrated that it was possible for a humanist to combine a scholarly interest in antiquity with the pursuit of a civic career. He firmly believed that the scholar had an obligation to use his knowledge for the benefit of society. Salutati encouraged budding humanists and opened his library to them.

Although his knowledge of Greek was minimal, he encouraged its study and was instrumental in inducing MANUEL CHRYSOLORAS, a Byzantine scholar from Constantinople, to institute Greek studies in Florence. In a controversy over the use of pagan literature in the grammar schools of Florence, he sided with the humanist innovators in opposition to the traditionalists, but with a strong caveat that pagan literature should only be used to bolster Christian belief.

Salutati's writings demonstrate that his humanism was, like that of his idol Petrarch, a blend of pagan ethics and Christian piety. However he did not have Petrarch's aversion to Scholastic thought.

Several of Salutati's treatises are worthy of mention. *On the Secular and the Religious* contrasts the active life with the monastic and makes a strong case for the latter. *On Fate and Fortune* focuses on God's providence, free will, and chance. *On Shame* examines whether shame is a virtue or a vice. *On the Nobility of Law and Medicine* favors law over medicine and the active life over the contemplative. The controversial *On Tyranny* makes a strong case for monarchy in certain circumstances. In his last years, Salutati was working on his unfinished *On the Labors of Hercules*, a work that stresses the allegorical use of pagan poetry for Christian purposes. Salutati also wrote poetry in Latin and in Italian vernacular. His private letters were often consolatory, advisory, and even remonstrative. Eulogized when he died, Salutati continues to be revered in Italy for his achievements and for his making Florence the locus of humanism.

LOUIS B. GIMELLI

Samarkand

Samarkand and the neighboring city Bukhara were oases along the valley of the Zeravshan River. Agriculture thrived in the region from the eighth century B.C.E. Formerly known as ancient Afrasiab, the city was founded during the seventh century B.C.E. Samarkand was surrounded by walls and was famous for its opulent architecture. Its strategic location along the Silk Road, which spanned China and Europe, contributed to its economic success and cultural vibrancy. One route along the Silk Road known as the Golden Road was of particular importance to the rise of Samarkand and Bukhara as key trading hubs. The Golden Road passed through the principal cities of Mesopotamia and was extremely busy, frequented by many traders.

Samarkand became a cosmopolitan center of science and art, as new scientific and artistic ideas were transmitted rapidly along the Silk Road. For most of its history, the Achaemenid Persians made Samarkand the capital of their empire. Alexander the Great conquered Samarkand (or Marcanda, as it was then known) in 329 B.C.E. after overthrowing the Persians.

By the eighth century trade and culture flourished in the city. An Arab chieftain, Qutaiba ibn Muslim, the governor of Khurasan, invaded Samarkand in 712 C.E. Qutayba's alliance with local Khwarazmians (who supplied him with knowledge of the surroundings as well as use of new technology in the form of *mangonels*, a heavy war engine for hurling large stones and other missiles) enabled his forces successfully to invade the city. Qutayba reneged on his promise to the Khawarazmians and expelled non-Muslims from the city. From the eighth century, Samarkand became the center of the Umayyad Dynasty. It was during this period that Samarkand was established as the center of Islamic civilization. In the ninth and 10th centuries Samarkand was ruled by the Abbasid Dynasty and continued to be a major center of Islamic civilization. The city retained its prominence as the capital of the Samanid dynasty and later, of the Seljuks (Turks) Empire. Sometime during the 13th century, the Venetian traveler Marco Polo reached Samarkand, and he described it as "very large and splendid."

In 1220 the Mongols led by the powerful ruler Genghis Khan attacked the city. The destructive siege left Samarkand devastated. The city was left in ruins, but it did not experience total destruction for the Arab traveler Ibn Batuta recorded his observations of Samarkand as "one of the largest and most perfectly beautiful cities of the world," supporting the view that certain vestiges of the city were still standing.

Among all its conquerors the fourth one, Timurlane (Tamerlane), a nobleman originally from a little-known Turkic tribe, made the biggest impact on Samarkand. The despotic ruler made Samarkand the capital of his empire and rebuilt it in 1370 south of the old site. By sparing all master craftsmen, including architects, from death upon his invasions, he was able to employ them in his service. Samarkand developed into a well-planned urban civilization. Timurlane's patronage led to the construction of many religious schools known as *madrassas*, grand mosques, mausoleums, and palaces. Timurlane also made popular the use of turquoise ceramic. The enormous Bibi Khanum mosque added to the splendor of the city. Upon returning from his victory in India, Timurlane built the Bibi Khanum mosque in honor of his consort, Saray Mulk Khanum.

The Timurid phase occupies a distinct place in Islamic architecture, because of the wide use of ceramics. Building materials were not found in Samarkand and builders made mud bricks (out of clay, chopped straw, and camel urine) that were faced in glazed tiles in blue (Timurlane's favorite color). These were then fashioned into minarets, portals, and domes. The new

Looking to make Samarkand a center of learning, Timurlane's grandson Ulugh Beg built two madrassas, including the Shir Dar.

city of Samarkand built by Timurlane was vastly different from the old city and was based on the Tatar concept. Under Timurlane, the city of Samarkand was home to Arabs, Persians, Turks, and North Africans of diverse sects as well as Christians, Greeks, and Armenians. Timurlane's grandson Ulugh Beg succeeded him, making Samarkand a major scientific hub by building an observatory. In his zeal to make Samarkand a center of learning Ulugh Beg also built two *madrassas* in the neo-Persian style, the Shir Dar and the Tilla Kari.

samurai

The originally Chinese term *samurai* means “a person who serves in close attendance to nobility.” Its original pronunciation was *saburau*, which later became *saburai*. Warriors known as *bushi* or samurai dominated the Japanese landscape from roughly the sixth century to the end of the 19th century. *Samurai* literally means “to serve,” which they did with a loyalty, bravery, and honor that have made the samurai one of the best-known icons of Japanese history. Samurai rule ended in 1868 with the arrival of Commodore William Perry and American gunships. The Meiji Restoration of the same year abolished the samurai class and opened Japan to the rest of the world. The samurai are symbols of Japan’s feudal past before the rapid modernization that began immediately after Japan’s doors were forced open.

The rise of the warrior class in Japan was not a result of dramatic revolution, but rather a gradual evolution. Around the turn of the eighth century the imperial house and its supporters secured their position at the apex of Japan’s sociopolitical hierarchy with the introduction of several governing institutions modeled largely on those of the TANG (T’ANG) DYNASTY in China but adapted to meet Japanese requirements. The system had many flaws and by the mid-700s, the court began to reevaluate its military needs and to restructure its armed forces. A new utilizable system was established around the late 10th century placing the warriors as guards at the imperial court in Kyoto and as members of private militias employed by provincial lords known as *daimyo*. Attempts by the imperial court to create a conscript army out of peasants and small landowners had failed. In response nobles in the capital and wealthy landowners created their own military forces composed of young members of the gentry who were skilled in the martial arts. The first samurai were thus mercenaries, privately trained and equipped. The result of these developments was the emergence of a group of professional soldiers known as *bushi*.

The word *bushi* first appears in an early history of Japan called *Shoku Nihongi*, which is written in the eighth century. Some of *bushi* were originally farmers who had been armed to protect themselves from the imperially appointed magistrates sent to govern their lands and collect taxes. *Bushi* class-consciousness—a sense of the warrior class as a separate entity—did not materialize until the 13th century when the KAMAKURA SHOGUNATE (ruled by a military generalissimo) took power. The new institution created a new category of shogunal retainer who held special privileges and responsibilities

and narrowed the scope of social classes from which the *bushi* class was composed. Its founder, Minamoto Yoritomo, consciously helped foster this new warrior ethos by holding hunts and archery competitions that helped to solidify the warrior identity. With promising protection and gaining political power through political marriages, they surpassed the ruling aristocrats.

Gradually the warrior code, or *bushido*, evolved as the ethical guidelines for the samurai class. The samurai mentality or ethos put honor as the most important trait of the samurai. *Seppuku*, ritual suicide by disembowelment, became the dominant alternative to dishonor or capture. Splitting open the belly with the short sword was so painful that the ritual was eventually modified to allow a second person to cut off the head of the person committing seppuku once he had started the cut to the abdomen. This became the general practice instead of allowing the person to die slowly.

Bushido was strongly influenced by the philosophies of Gautama Buddha, ZEN (OR CH’AN) BUDDHISM, Shintoism, and Confucius. For samurai Zen was a means to reach calmness, Buddhism a way to reincarnation and rebirth, Shinto a way to connect his soul to the surrounding nature, and Confucianism a way to reach order and organization. A samurai was not just a warrior; he should be able to read, write, and even know some mathematics and have interests in Japanese arts as dance, poetry, Go, and the tea ceremony.

Easily identified by their two swords—the longsword or *katana* and the short sword the *wakazashi*—the samurai could be seen wearing *kimono* over flowing, skirtlike trousers, known as *hakama*, and a short loose jacket. The samurai’s hair was shaved on top with the sides pulled into a neat topknot. The samurai could often be seen on horseback, poised for battle.

Battle for the samurai was also a ritualistic affair. In early medieval days combatants faced off in a structured, well-mannered style. Early samurai idealized single combat, preferably fought on horseback with bow and arrow. A warrior in search of a worthy opponent would gallop to the front lines and call out his ancestry and a list of his accomplishments. Once introductions were complete archers fired their arrows and samurai with swords and lances charged their adversaries. The personal and individual combat on the battlefield gradually disappeared as samurai armies grew in size and footsoldiers began to outnumber those on horseback. However combat remained a ritualistic event and the source of honor and pride for the warrior class, who were willing, and at times almost eager, to give their lives for their liege lord.

Even today the samurai is a prevalent image associated with Japan and the subject of movies and television dramas, in Japan and abroad. Bushido has been given credit for the loyal and hard-working Japanese businessmen who have made the Japanese economy one of the largest in the world. The samurai may be extinct, but the warrior spirit lives on.

MOHAMMAD GHARIPOUR AND ETHAN SAVAGE

Schism of 1054

The Schism of 1054 marks the official breach that separated Roman Catholic Christianity from Orthodox Christianity. It occurred when delegates of Pope Leo IX (1049–54) excommunicated Michael Keroularios, patriarch of Constantinople (1043–58), and his associates. The patriarch, in turn, excommunicated the papal delegates. These mutual condemnations tore Christendom into its Catholic and Orthodox branches. The ecclesiastical division became permanent in the following decades, particularly because of the effect of the CRUSADES and their impact on Orthodox-Catholic relations.

The quarrel that led to these events surfaced by the ninth century when Byzantium was emerging from the long controversy called ICONOCLASM and was engaging in a new period of missionary activity in eastern Europe (and elsewhere). At the same time Western Christians were expanding, moving Latin Christianity farther east into the Slavic kingdoms of eastern Europe. Missionaries bearing their respective forms of Christianity (Greek and Latin) met in the kingdoms of MORAVIA and Bulgaria. During this interaction certain differences in practice became evident. The two forms of Christianity used different languages in their liturgy (Latin in the West and Greek in the East, though the Eastern Christians also supported the use of native languages for worship and Scripture and developed the Cyrillic alphabet for this purpose among the Slavs); they had different rules on fasting; they differed in their eucharistic prac-

tice with leavened bread used by Eastern Christians and unleavened by Western. Another distinction was the official acceptance of married priests among the Eastern Christians, though bishops could not be married.

Furthermore the two forms of Christianity were at odds over their understanding of papal leadership. From the Eastern perspective the pope received the primacy of honor among the bishops, since his was the church diocese of St. Peter, but he was simply one of the five great regional leaders called patriarchs who were all needed to hold an ecumenical council (churchwide) to decide doctrine. From the Western perspective, however, the bishop of Rome was also the heir of St. Peter, and the supreme voice in Christendom. Finally another important distinction was a small difference in the profession of the Nicene Creed by Western Christians. This creed was established by the First Ecumenical Council of Nicaea in 325 and augmented by the Second Ecumenical Council in 787.

This creed was used as a simple definition of faith, professing belief in the Father, the Son, and the Holy Spirit, "which proceeds from the Father." In the West the term *filioque* (and the son) was added to the latter phrase to exclude heretics from professing it. This addition received official sanction by the papacy in the early 11th century. Eastern Christians viewed this as a mistake both theologically (arguing that it confuses the proper understanding of the Trinity) and ecclesiastically (arguing that only an ecumenical council could change the creed).

In addition to these matters the breach in 1054 is connected to other historical developments in the 11th century. This period witnessed the development of the papacy as an institutional entity freed from lay control and able to assert its authority in Italy and abroad. One 11th-century pope, for example, asserted that he had the power to depose and reinstate bishops and emperors and that he was above any earthly judge. At the same time, the Byzantine Empire had reached its political apogee and its church was led by one of its strongest-willed patriarchs, Michael Keroularios. The revived papacy and the powerful patriarchate crashed together in the summer of 1054.

A final factor influencing the breach was the arrival of the Normans in Italy in the 11th century. The Normans (from Normandy in France) passed through Italy en route to the Holy Land for pilgrimage and, because of their renowned military skills, were hired as mercenaries by rulers in southern Italy. The Normans soon took advantage of this situation and seized southern Italy. This brought them into conflict with both the

papacy, whose lands were threatened, and Byzantium, which also had holdings in southern Italy. The Byzantine emperor wanted to maintain good relations with the papacy to ensure an alliance against the Normans, but the patriarch of Constantinople was little concerned with this political perspective. Furthermore the Normans closed churches in their territory that used the Greek ritual, while the patriarch of Constantinople did likewise for those of non-Greek ritual in his territory.

When the legates of Pope Leo IX arrived in Constantinople in 1054, they demanded that the Eastern Church accept the Western view on the papacy and certain other practices. When this failed, they excommunicated (cut off from communion) the patriarch and his associates. Keroularios, in turn, anathematized (condemned) the authors of the excommunication. There had been numerous schisms before between Constantinople and Rome that had been mended afterward, but the Schism of 1054 became permanent.

Historical circumstances in the following decades transformed the theological condemnations into a seemingly permanent cultural divide between Catholic and Orthodox. The first change occurred shortly after the schism when the papacy shifted its policy toward the Normans from one of hostility to one of support. The Normans now acted with the support of the papacy as they finished off the Byzantine possessions in southern Italy and seized Sicily. With these positions the Normans began to eye the Byzantine Empire as their next goal for conquest.

This threat to the Orthodox empire was augmented by new challenges from the north (a pagan, Turkic tribe called the Pechenegs) and a massive challenge from the east in the Muslim SELJUK DYNASTY, who took control of Anatolia as well as much of the Muslim world. The emperor Alexios I Komennos (1081–1118) appealed to Pope URBAN II for military assistance. Pope Urban called for a massive undertaking, not simply to assist Byzantium, but to recover the Holy Land from the Muslims. Thus the First Crusade was born. Tens of thousands of Western soldiers as well as clerics passed through Byzantium. This movement of Westerners, including the Normans who were already actively hostile to Byzantium, increased tension between Orthodox and Catholic.

The emperors were concerned that crusaders might not simply move through the empire, but conquer parts of it. This fear greatly increased during the Second and Third Crusades in the 12th century and was fully realized when the Fourth Crusade was diverted to Con-

stantinople. In 1204 Western crusaders sacked this city and conquered the Byzantine Empire. A Catholic patriarch was installed at Constantinople (until 1261). These events, most particularly the last, transformed the Schism of 1054 from a theological dispute to a near permanent cultural divide between East and West, Orthodox and Catholic.

MATTHEW HERBST

Scholasticism

Scholasticism is the system of education, especially in theology and philosophy, that dominated European schools and universities from the ninth to the 15th century. These institutions blossomed in the High Middle Ages of the 12th century. It was at this time that the MENDICANTS, or begging orders, arose in the midst of a wider wave of religious revival. They aimed to foster religious renewal among the urban populations and counter heretical movements. The two pioneering mendicant orders, the Franciscans and the Dominicans, opened schools that combined to create the first universities.

Scholasticism was marked by formal and material characteristics. The first formal element was the application of the rules of Latin grammar to all kinds of problems, on the assumption that the laws of language correspond to the laws of thought. Thus analysis of language was prominent. Second was the use of dialectic, or disputation. This lies at the heart of the *quaestio*, the most typical literary form of Scholastic thinking, in which an issue is set, for example, the question of whether or not God exists. The question is then settled by setting out objections to the proposition one intends to defend, stating a contrary position to that of the objector, and finally offering counterarguments to the objections. Despite limitations dialectic could produce rigorous critical thinking and encourage consideration of all sides of a question.

SCHOLASTIC AUTHORITIES

The material characteristic of Scholasticism was its use of authorities, texts that were consciously and deliberately treated with deference. A large part of Scholastic education consisted of commentary on such texts. Authorities were commonly cited to back up a position in debate. Yet authorities were not treated uniformly. The Bible held a unique position as unerringly teaching the truth; disputes arose over its interpretation. The great teachers of the first eight centuries of Christian theology held the next place, though the best Scholastic thinkers did not pretend that their authority extended to, say, medicine or natural philosophy. By far the most important of these authors was Augustine of Hippo, whose thought was the subject of constant discussion.

Next most important was Aristotle, though his acceptability at times was a matter for intense debate. His thought arrived in Europe in three stages. From the beginning of the Scholastic period his *Categories* and *On Interpretation* were known and used. These works treat the interpretation of texts and the categorization of entities, such as man or horse, and their characteristics, such as quantity and color. The second entry, in the 12th century, was the discovery, through contact with Arab civilization, of Aristotle's works on the nature of reasoning. From this time the *quaestio* becomes the dominant form of thought and expression in theology and philosophy. Finally in the later 12th and early 13th centuries, Aristotle's works of natural philosophy (what we would call natural science), anthropology, and metaphysics—the study of the principles common to all entities—came into the hands of the West. Much of the Aristotle the Europeans encountered in this phase was laced with the Neoplatonist philosophy of Arab commentators. In addition the works of Pseudo-Dionysius enjoyed great prestige. Pseudo-Dionysius was thought to be a direct disciple of St. Paul but was actually a fifth century Christian who espoused a Christian form of Neoplatonist philosophy.

GREAT SCHOLASTICISTS

The medievals' genius lay in synthesizing and reworking these material elements in new and subtle ways. Four of the most important thinkers of this epoch were Albertus Magnus, THOMAS AQUINAS, John Duns Scotus, and William of Ockham. Albertus, born near the end of the 12th century, probably in southern Germany, entered the Dominicans in 1229. He studied in Cologne and elsewhere and became a master of theology at Paris in 1245, where Thomas Aquinas was his pupil. Albertus returned to Cologne to found a Domin-

ican house of studies in 1248, taking Thomas with him. Thereafter he devoted himself to a mixture of study and pastoral and diplomatic work, including brief service as a bishop. In addition to commentaries on the Bible and Pseudo-Dionysius, Albertus produced a corpus of commentaries and paraphrases on the works of Aristotle, taking a special interest in his newly discovered natural philosophy, which he was instrumental in defending to church authorities. His enormous output included works of botany, zoology, cosmology, psychology, logic, metaphysics, ethics, semantics, and, above all, theology. Albertus advocated the use of the full range of available learning in Dominican houses of study and championed the Dominican commitment to the serious study of philosophy.

The towering figure of Scholastic thought is Thomas Aquinas. Born in 1224 or 1225, he was educated at the Benedictine abbey of Monte Cassino, then at the University of Naples, where he entered the Dominican order in 1244. After studying in Paris and Cologne with Albertus, Thomas returned to Paris in 1252, received his license in theology in 1256, and lectured there until 1259. He also taught in the papal court and later established a Dominican house of studies in Naples. At the end of his life, he abandoned writing without completing his great *Summa theologiae*, and died several months later, in 1274. Thomas produced voluminous biblical commentaries and commented on most of Aristotle's works. He wrote two *summae*, vast guides to theology intended to equip his fellow Dominicans for pastoral and missionary work, as well as a smaller, more popular compendium of theology. His other works range from hymns to polemical essays. Altogether, he wrote some 10 million words.

Thomas is best known for his understanding of God as the completely indivisible and self-existent creator, the source of all being. God not only is the origin of creation, but all beings continually depend on him for their existence; their being is a participation in the being of God. Similarly God is the source of all goodness, and so for Thomas, knowledge of God is the goal and the final happiness of all rational creatures. In keeping with that principle, he reworks the Aristotelian ethical theory of virtues to cohere with the Christian doctrines of creation, sin, and grace: Human beings come from God, have fallen away from God, and in Christ return to him and to the perfection of their own being. Thomas's thought, far from a closed system, is marked by openness to ever-deeper, more refined understanding. The variety of the schools of interpretation of his thought testifies to its intrinsic vitality.

John Duns Scotus was born around 1265 in southern SCOTLAND. He joined the Franciscans and was ordained a priest in 1291. He studied theology in Oxford until 1301, and then lectured in Paris and Cologne, where he died in 1308. Scotus and Thomas agree that God can be known as the cause of all things by observing his effects, creatures. Similarly they agree that we cannot know God's essence in this life. Yet Thomas held that our language about God, which always derives from our sense-based knowledge of creaturely things, has a different sense when applied to God; we can truly say God is wise, because he is the cause of whatever is called wise in creatures, but wisdom in God means something beyond our grasp. To say God is wise—or even that God is—is only analogous to what we mean in saying creatures are, or are wise. The analogy allows us to think and speak logically of God, but the meaning finally remains shrouded in mystery. Scotus, on the other hand, asserted that we can and must be able to speak of God as wise. The difference is that God's wisdom and being are infinite, but that of creatures is finite.

William of Ockham (1280–1349), a Franciscan, studied at Oxford and Paris, where he taught from 1315 to 1320. Probably a student of Duns Scotus, he developed a number of Scotus's leading ideas, some of them in a sharply different direction. He is best known as the father of nominalism. Scotus believed that universal concepts, such as human nature, have a formal existence.

They exist, but always concretized in an individual. Ockham held that universals, such as human nature, exist only in the mind, or nominally, by abstracting from individual examples those elements they have in common. Universals do not exist apart from our thinking them. This rejection of the real existence of universals, in favor of taking such ideas as nature or being, to be the products of mental acts, fueled the increasing concentration of late Scholasticism on analysis of concepts and mental acts.

JOHN P. YOCUM

Scotland

Scotland is a European country located in the northern part of the island of Great Britain, off the coast of northwestern Europe. Scottish territories have sea borders; the only land border is with England on the southern part of the island. The geographical union of these two countries has historically brought many disputes between the cultural inhabitants of Great Britain regarding borders and political, economic, religious, and cultural affairs.

During the early times of the Roman Empire (c. 27 B.C.E.–395 C.E.), the south of Great Britain was invaded and conquered by Roman military forces. Despite Roman efforts to conquer the northern part of the island, named Caledonia by the Romans, the Picts, a fierce and warlike people settled in the north, successfully resisted for hundreds of years. After some victories but many lost battles, the Romans decided to keep the southern part and established the Hadrian and Antonine Walls to set a physical border between their domains and the Picts'. After the Roman withdrawal from Britain in 409, the Picts systematically started to invade the territories of their southern neighbors. During the fifth and sixth centuries several kingdoms struggled to gain power over a larger area of the island. In this period Scotland was divided into four kingdoms: Pictavia, Dalriada, Gododdin (later Northumbria), and Strathclyde.

Pictavia was the last stronghold of the Picts, the original inhabitants of the lands north of Hadrian's Wall. Of the four kingdoms, Pictavia's inhabitants were the most powerful and the ones that would leave the largest cultural impact. In the Viking age (793–1066) Norse (Norwegian people) invaders conquered much of northern Pictland—Caithness, Sutherland, the Western Isles, and Ross—leaving long-lasting footprints in their culture. A legend states that they were “the painted people,” as the name *Pict* probably derives from the Latin word *Picti* meaning “painted folk” or possibly “tattooed people.” This refers to the dark blue color they painted on their bodies and faces to have a more terrifying look in battle in the face of their enemies. Influences also came from the Christian missionaries who converted many Picts to Christianity. St. Columba, an Irish missionary who came to Dalriada from Northern Ireland in 563, disseminated the Christian faith among the Picts. The missions came to an end in the seventh century.

The Scots occupied the adjacent region to Pictavia in the north toward the beginning of the sixth century. They were a Celtic people from northern Ireland who established a kingdom called Dalriada. It was associated with Irishmen who would later call themselves Scots

and rule all of Scotland. Having a strong devotion for the sea, Scotland's kings built and maintained a strong navy and waged aggressive war. They also managed a large fleet to capture fish and sea-based resources that were the basis of their economy and culture.

Strathclyde was the third kingdom, populated by native Welsh. Bordered on the south by the English, their culture was not as separate as the Picts and Scots—they were strongly influenced by the Viking invasion in the ninth century. This cultural mixture remained for centuries with influence seen in their language, shipping activities, religion, and warrior spirit.

The fourth was the kingdom of Northumbria. It was famous as a center of religious learning and arts. Initially monks from the Celtic Church Christianized Northumbria, and this led to a flowering of monastic life, with a unique style of religious art that combined Anglo-Saxon and Celtic influences. Between 655 and 664 Scottish missionaries were active in Northumbria. Apart from standard English, Northumbria had a series of closely related but distinctive dialects, descended from the early Germanic languages of the Angles and Vikings, and of the Celtic Romano-British tribes.

THE KINGDOM OF ALBA

In 843 the Picts and Scots united to form the kingdom of Alba, a term used by the Gaels, a linguistic group speaking Gaelic, to refer to the island. Tradition says Dalriadan Kenneth MacAlpin, who is today known as the first king of Scotland, unified the tribes. In 1034 Strathclyde began its gradual incorporation into the kingdom of Alba, as did Northumbria around 1100 after William the Conqueror and his son, William Rufus, invaded. From the middle of the 11th century Alba, which later became the kingdom of Scotland, received strong cultural influences from the Normans and Vikings, especially because of the establishment of a Norman reign in England with William the Conqueror in 1066.

In Scotland this period is sometimes referred to as the “Anglicization of Scotland,” meaning the expansion of the Angles’ culture in most of Scotland. During the 11th and 12th centuries the Anglo-Norman feudal system was established in Scotland. The reorganization was confined at first to ecclesiastical reforms but gradually affected all sectors of Scottish life. For instance Celtic religious orders were suppressed, English ecclesiastics replaced Scottish monks, several monasteries were founded, and the Celtic church was remodeled in agreement with Catholic practice. Norman French supplanted Gaelic language in court circles, while English was spoken in the border areas and many parts of the Lowlands. The

traditional system of tribal land tenure was abolished. David I (king from 1124 to 1153) also instituted various judicial, legislative, and administrative reforms, all based on English models; encouraged the development of commerce with England; and granted extensive privileges to the Scottish towns or “burghs.”

The Normans militarized large sections of Scotland, building strong stone castles and establishing the feudal system upon the peasantry; they came into frequent conflict with the native nobility. The concentration of the population was in burghs, later colonized by Normans, Flemish merchants, and Englishmen. The burghs were an autonomous unit of local government with rights to representation in the parliament of Scotland. They were in use from at least the ninth century until their abolition in 1975 when a new regional structure of local government was introduced across Scotland. The word *burgh* is related to the well-known English *borough*.

WARS OF SCOTTISH INDEPENDENCE AND THE STUART DYNASTY

In the late 13th and early 14th centuries there were a series of military campaigns fought between Scotland and England known as the Wars of Scottish Independence. The First War (1296–1328) began with the English invasion of Scotland in 1296, and ended with the signing of the Treaty of Edinburgh-Northampton in 1328. The Scottish struggle against England was mainly encouraged by patriot Sir William Wallace recruiting from all sections of the nation. Although Wallace had a heroic sense of freedom and won many battles, in 1305 Wallace was betrayed to the English, convicted of treason, and executed. After his death Robert de Bruce assumed the leadership of the resistance movement, which ended victoriously in 1328 when the regents of the young Edward III of England approved the Treaty of Northampton. By the terms of this document, Scotland obtained recognition as an independent kingdom. The Second War of Independence (1332–57) began with the English supported invasion of Edward Balliol and the “Disinherited” in 1332, and ended around 1357 with the signing of the Treaty of Berwick, through which Scotland retained independence.

Under the first two kings of the Stuart dynasty, Robert II (r. 1371–90) and Robert III (r. 1390–1406), the country was further devastated by the war with England, and royal authority was weak. James I (r. 1406–37) attempted to restore order in the country. To do so James imposed various curbs on the nobility and secured parliamentary approval of many legislative reforms. But without the cooperation of the feudal

David I established a priory on an island in the Firth of Forth, which became the Augustinian Inchcolm Abbey in 1235. It is now the best-preserved group of monastic buildings in Scotland and was used as a defense in both world wars.

barons, however, these reforms were unenforceable. James I was murdered in 1437.

SOCIETY, LAW, AND SCOTTISH PARLIAMENT

From the time of Kenneth I (Kenneth MacAlpin), the Scottish kingdom of Alba was ruled by chieftains and petty kings under the control (technically the *suzerainty*) of a high king, all offices being filled through selection by an assembly under a system known as *tanistry*, which combined a hereditary element with the consent of those ruled. After 1057 the influence of Norman settlers in Scotland saw primogeniture adopted as the means of succession in Scotland as in much of western Europe. These early assemblies cannot be considered parliaments in the later sense of the word and were entirely separate from the later, Norman-influenced, institution.

The Scottish parliament evolved during the Middle Ages from the King's Council of Bishops and Earls. It is perhaps first identifiable as a parliament in 1235, described as a colloquium and already with a political and judicial role. By the early 14th century the attendance of knights and freeholders had become important, and from 1326 burgh commissioners attended. Consisting of the Three Estates, of clerics, lay tenants in chief, and burgh commissioners sitting in a single chamber, the Scottish parliament acquired significant powers over par-

ticular issues. Most obviously it was needed for consent for taxation but it also had a strong influence over justice, foreign policy, war, and all manner of other legislation, whether political, ecclesiastical, social, or economic.

The parliament had a judicial and political role that was well established by the end of the 13th century. By the late 11th century Celtic law was applied over most of Scotland, with Old Norse law covering the areas under Viking control. In following centuries as Norman influence grew and more feudal relationships of government were introduced, Scot-Norman law developed, which was initially similar to Anglo-Norman law, but over time differences evolved. Early in this process David I of Scotland (r. 1124–53) established the office of sheriff with civil and criminal jurisdictions as well as military and administrative functions. At the same time burgh courts emerged dealing with civil and criminal matters, developing law on an English model, and the Dean of Guild courts were developed to deal with building and public safety.

EDUCATION

During 600–1450 the kingdom of Scotland followed the typical pattern of European education with the Roman Catholic Church organizing schooling. Church choir schools and grammar schools were founded in all the

main burghs and some small towns; early examples include the high school of Glasgow in 1124. The Education Act of 1496 introduced compulsory education for the eldest sons of nobles—a first in Scotland since it forced all nobles and freeholders to educate their eldest sons in Latin, followed by the arts and Scots law. The children were sent to a grammar school to be taught Latin when they reached the age of eight or nine. Once they had learned Latin, they had to attend a school of art or of law for a minimum of three years. After that basic education, the children of the nobles could attend university. The first universities in Scotland, all ecclesiastical foundations, were built during the 15th century imitating the cultural development of England, which already had the universities of Cambridge and Oxford since the 11th century.

Saint Andrew's University was founded in 1410 when a charter of incorporation was bestowed upon the Augustinian priory of Saint Andrew's Cathedral. At this time much of the teaching was of a religious nature and was conducted by clerics associated with the cathedral.

CULTURAL DEVELOPMENTS

During 600–1450 the Scottish people introduced several music instruments, the most important the harp and the bagpipe. The harp, also called *clarsach*, is an instrument with a long history in Scotland, rivaling even bagpipes for the position of national instrument. Triangular harps were known as far back as the 10th century, when they appeared on Pictish carvings, and harp compositions may have even formed the basis for the *pibroch*, an unusual type of music used to inspire Scottish soldiers before a battle. Besides harps, bagpipes (wind instruments consisting of one or more musical pipes, which are fed continuously by a reservoir of air in a bag) became a usual and typical instrument in Scotland. However bagpipes are not unique or indigenous to Scotland. It is unknown when this instrument was first imported to Scotland, but assumptions date it back to the 10th century. It is known that there was an explosion of its popularity around 1000. Bagpipes were also used to encourage the spirit of fighters during military campaign marches. Besides musical instruments, this period (600–1450) was already rich in developments in the Scottish literature. Since Scotland received influence from different tribes and peoples (Irish, Gaelic, Norman, Picts, Scots, and Roman) its literature has accordingly been written in many languages, such as English, Scottish Gaelic, Scots, Brythonic, French, and Latin.

Most literary works in this period consisted of Gaelic literature, in the ethnic language of the Scots.

Between c. 1200 and c. 1700 the learned Gaelic elite of both Scotland and Ireland shared a literary form of Gaelic. Gaelic literature written in Scotland before the 14th century includes the *Lebor Bretnach*, the product of a flourishing Gaelic literary establishment at the monastery of Abernethy. This book is the Irish translation of the *Historia Brittonum*, meaning the *History of the British*, as it was perceived in the ninth century.

The earliest literature known to have been composed in Scotland includes the following:

- In Brythonic language (Old Welsh): the *Gododdin*, attributed to Aneirin, and the *Battle of Gwen Ystrad*, attributed to Taliesin, both dating back to the sixth century.
- In Gaelic language: *Elegy for Saint Columba*, by Dallan Forgaill, c. 597, and *In Praise of Saint Columba* by Beccan mac Luigdech of Rum, both about the Irish missionary monk who reintroduced Christianity to Scotland north of England during medieval times.
- In Latin: *Prayer for Protection*, attributed to Saint Mugint, c. 650, and *Altus Prosator, The High Creator*, attributed to Saint Columba, c. 597.
- In Old English and c. 700: the *Dream of the Rood*, one of the earliest Christian poems, where the poet describes his dream of a conversation with the wood of the Christian Cross.

During the 13th century French flourished as a literary language and produced the famous *Roman de Ferigus*, the earliest piece of non-Celtic literature to come from Scotland. In addition to French, Latin was also a literary language. Famous examples would be the *Inchcolm Antiphoner* and the *Carmen de morte Sumnerledi*, a poem that exults triumphantly the victory of the citizens of Glasgow over Somairle mac Gilla Brigte. The most important medieval work written in Scotland, the *Vita Columbae*, was also written in Latin. The earliest Middle English or Scots literature includes John Barbour's *Brus* (14th century), Whyntoun's *Kronykil*, and Blind Harry's *Wallace* in the 15th century telling the story of the rebel patriot during the First War of Scottish Independence. Other important authors were William Dunbar and Robert Henryson.

DIEGO I. MURGUÍA

Sejong

(1397–1450) *Korean king*

The fourth king of the Yi dynasty of Korea, King Sejong, ruled from 1418 until his death in 1450 was one of the most famous rulers in Korean history, and one of only two to have the title “the Great.” During his reign there was stability in Korea, and also major advances in literature and the arts, in particular the introduction of a new script.

King Sejong was born on May 6, 1397, the third son of King Taejong (r. 1400–18). When he was 10 years old, he gained the title Grand Prince Chunghyeong. He ascended the throne in 1418, at the age of 21, and his oldest brother, Prince Yangnyong Taegun, was overlooked to become king because the royal family regarded him as too headstrong and impetuous and the second brother had predeceased his father. One of King Sejong’s first moves was to secure the southern parts of Korea against attacks by Japanese pirates who were launching raids on Korean coastal villages. He did this by sending soldiers to Tsushima, where they fended off seaborne attacks. In the north, Sejong oversaw the building of four castles and six military posts, which were built to prevent problems with the new MING DYNASTY in China. He also encouraged many people from central Korea to move to the north to help build the economy of the region and ensure continued stability.

King Sejong’s greatest legacy to Korea was his introduction of the Han’gul script. The Chiphyonjon, a royal institute that conducted research on behalf of the king, introduced this new script. The institute compiled a long series of official histories of Korea and treatises on Confucian ideas and also organized many history talks increasing the knowledge of the royal family and the nobility in the history of Korea. With no suitable Korean script, the Koreans had been using Chinese charac-

ters or Hanja to express their language. With Han’gul, although many Chinese words remained, it was possible to have new characters that better reflected Korean pronunciation and inflexions. The new script was purely phonetic and is believed to have developed from Sanskrit, or even Tibetan. Sejong would have likely come across these scripts while reading religious books. The new script was a move heavily opposed by many scholars, but Sejong, a linguist and an autocrat, pushed for Han’gul to become accepted. This gained Sejong the title “the alphabet king.” A dictionary was published soon afterward.

In 1420 after only two years on the throne, Sejong had established the Jiphyeonjeon or “Hall of Worthies” in the royal palace in Seoul, where he persuaded many visiting scholars to remain. During his reign scholars compiled 20 major works on Korean agriculture, astronomy, history, geography, mathematics, military history, science, pharmacology, and philosophy. Of particular note were encyclopedias of Chinese and Korean medicine. During the 1440s King Sejong himself wrote a number of books. *Yongbi Eocheon Ga* (Songs of flying dragons) was written in 1445 and followed two years later by *Seokbo Sangjeol* (Episodes from the life of Buddha). In June 1447 he wrote *Worin Cheon-gang Jigok* (Songs of the moon shining on a thousand rivers), a series of poems praising Lord Buddha, and in September of that year helped with the compilation of *Dongguk Jeong-un* (Dictionary of correct Sino-Korean pronunciation).

In terms of justice Sejong started a process of codifying the laws. He massively reduced the amount of corporal punishment that could be inflicted and established two levels of courts of appeal by which people under sentence of death could have evidence in their trial tested before further judges, and available for inspection by the king, prior to sentencing and execution. Sejong is also credited with the invention of the rain gauge, self-striking water clock, and the sundial. Critics of Sejong point out the pervasive nature of slavery during his reign and that he did little (if anything) to help slaves. Some had been sentenced to slavery for criminal actions, but most had been born into slavery and lived their lives in terrible conditions either as domestic hands in the cities or as farm laborers in the countryside. In addition, Sejong continued the system of court eunuchs, who wielded much power in the extravagant court.

King Sejong married Sim On (1395–1446) of Cheongsong, later awarded the title Princess Consort Soheon (or Sohon Shimn). They had eight sons and two daughters—the first son, Munjong, would succeed, followed by his son, Tanjong, and then the second son, Sejo.

Sejong and his first concubine, Kim Shinbin (1406–65), had six more sons. With his second concubine, Yang Hyebin, he had three further sons. His third concubine gave him another son, and his fourth and fifth concubines, another two daughters. King Sejong died in 1450 and was buried at Yong Nung. His son Munjong succeeded him. A street in central Seoul is named after King Sejong, as is the Sejong Center for the Performing Arts. He also appears on the South Korean 10,000 won banknote. From King Sejong's older brother descend the family of Syngman Rhee, who became president of South Korea from 1948 until 1960.

JUSTIN CORFIELD

Seljuk dynasty

In the 10th century Seljuk Turks migrated from territory around the Aral Sea into Transoxiana. Taking their name from Seljuk ibn Yakak, the Seljuks were Turkish nomadic people. They came to power following the collapse of the **ABBASID DYNASTY** when the **FATIMID DYNASTY** in Cairo and other ruling families in Spain and North Africa had already established separate ruling dynasties.

Converts to **SUNNI ISLAM**, the Seljuks based their authority on their military prowess. The Seljuk leader Tughril (d. 1063) crossed into Iran by 1043 and in 1055 entered **BAGHDAD** as the new ruling sultan.

Tughril immediately faced revolts by his brothers and Shi'i rebels; after successfully crushing both threats to his authority, Tughril persecuted the Shi'i population and created a Sunni dominated empire. After Tughril's death, his son, Alp Arslan (r. 1063–73), succeeded to the sultanate. A military leader, Arslan left the administration of the Seljuk territories to Nizam al-Mulk, who governed from Isfahan. The Seljuk sultanate consisted of a highly decentralized collection of tribal families. At the height of their power the Seljuks ruled territory from the Danube to the Ganges River.

The Seljuks referred to the Byzantine Empire as *al-Rum* (from Rome). Although Arslan was not interested in actually taking over the Byzantine Empire, he permitted Turkish families to raid and loot Byzantine holdings

in Asia Minor as well as into Armenian territory. Tiring of the Seljuk threats, Emperor Romanos IV Diogenes was determined to confront Arslan. The Byzantine army consisted of Greek soldiers as well as mercenaries from France and the Balkans. In the ensuing battle the latter proved to be less than loyal to their paymasters. Unbeknown to Romanos IV, Arslan was waiting in Armenia with a large number of well-trained and loyal cavalry forces. In addition, Arslan's agents followed the progress of the Byzantines as they crossed the Anatolian Peninsula. The Byzantine forces engaged the Seljuks at the Battle of Manzikert near Lake Van in the summer of 1071.

Large numbers of mercenaries deserted before the battle, which was a disastrous defeat for the Byzantine Empire. The emperor was wounded and taken prisoner by the Seljuks, who then moved in increasing numbers into Asia Minor. Although the Byzantine Empire survived into the 15th century, the Turkish population in Asia Minor would ultimately outnumber the Greeks. After the Byzantine defeat at Manzikert, western rulers, including the pope, realized that the Byzantine Empire was not strong enough to protect Christians in the east. Seljuk control over the Christian holy sites would be a major contributing factor to the **CRUSADES** at the end of the 11th century.

After the Byzantine Empire called on the Seljuks for help against European rivals, they were rewarded with the city of Nicaea (Iznik), which became the capital of the sultanate of Rum. Malik Shah (r. 1073–92) succeeded his father as the Seljuk sultan. Malik's name, taken from Persian not Turkish sources, indicated the extent of Persian influences within the Seljuk empire. With the exception of a few coastal cities such as Acre in the eastern Mediterranean, Malik Shah's territories extended from Syria to Yemen to the Persian Gulf. With no clear successor Malik Shah's death marked the end of the unified Seljuk empire, which soon fractured into a number of separate territories ruled by rival factions. The lack of political and military unity was a major factor in the Muslim losses to the crusaders. The last of the Seljuk territories fell to the Ottomans in 1300.

JANICE J. TERRY

Shahnamah

The *Shahnamah* (various spellings) is a central epic of Persian literature written by the poet FIRDAWSI (various spellings) in approximately the year 1010. It is an epic poem of considerable length, which aims to recount the history and achievements of the Persian people and their kings. Using the earlier *Khvatay-namak*, which was a prose epic covering the Persian people from the mythic past to the seventh century, Firdawsi rewrote the prose in verse form and extended the tale to include the Sassanid period. He wrote this under the sponsorship of Sultan MAHMUD of GHAZNI and it endures as a central part of modern Persian culture, extending beyond modern Iran into Central Asia and the Indian subcontinent.

Firdawsi wrote his epic, which is known in English as the *Epic of Kings*, in a form of verse couplets known as *masnavi*. The effect of the epic was to Persianize the people within the territories claimed by Persian kings, irrespective of their original ethnic and religious affiliations. Because of the Islamization of Persia, the *Shahnamah* has been cast within a worldview strongly influenced by Islamic thought. The Persian heroes, such as Rustam, were recreated within this context. Just as in the case of Jewish verse histories, a number of which cover apparently the same incidents from a different perspective, the *Shahnamah* acts to provide a centralizing narrative, which was used by state builders to help integrate a set of diverse peoples into a single nation.

The story itself covers a bewildering variety of individuals, kings, heroes, and notable people of the past, as well as the defining events of their lives. Although the majority of individuals disappear from the narrative quickly, many have distinctive characteristics and are comparatively sophisticated in terms of characterization. Both good and evil appear to be combined in the characters. Previous religious beliefs, notably Zoroastrianism, are presented as having been defeated by the newly arrived faith. However the more than 60 stories and 60,000 couplets allow for considerable latitude in interpretation. The material is deliberately composed in such a way as to invite the reader to ponder on the events of the past and to seek the moral lessons to be learned from them. Misunderstandings, unrequited love, hubris, and jealousy are all present. The epic serves jointly as a history and a repository of moral and religious truths, and an artistic masterpiece in its own right.

JOHN WALSH

Shi'ism

Shi'ism is the belief that Ali and his descendants are the rightful Muslim leaders. Over the centuries a separate body of Shi'i law and practices has also developed. The Shi'i argued that Ali should have been selected as the first caliph following the prophet MUHAMMAD's death. After having been rejected as caliph three times, Ali finally became the caliph only to have his claim immediately questioned by Muaw'iyah, the governor of the powerful and wealthy Syrian province, his family the Umayyads, A'ISHA (the Prophet's widow), and many other Muslims. Mediation failed to resolve the dispute and for a time there were two claimants to the caliphate. After Ali's death in 661, his son Hasan renounced any claim to the caliphate and Muaw'iyah became the undisputed leader. However after Muaw'iyah's death in 680, Ali's younger son Husayn claimed he was the legitimate caliph not Yazid, Muaw'iyah's son.

As Husayn and his supporters were moving to confront Yazid, they were attacked by a far bigger force at Karbala in present-day Iraq. Vastly outnumbered and taken by surprise, Husayn and his men were killed and their heads were severed and presented to Yazid. However several of Husayn's children managed to survive and carried on the family claim to leadership. Husayn and his followers became martyrs in Shi'i tradition and their deaths are mourned and commemorated with displays of self-flagellation and passion plays on the day of Ashura during the month of Muharram. Husayn's tomb in Karbala became a major Shi'i site of pilgrimage and his memory elicited profound sadness over the believers' failure to save him.

However subsequent disputes over the rightful imam or heir to Husayn and his family led to the creation of a number of different sects among Shi'i followers.

Twelver Shi'i accepted the line of rule from Ali to Muhammad al-Muntazar al-Mahdi. He died in 878 but Shi'i believed he merely disappeared into "occultation" where he observed life but was invisible to humans. Twelvers believed that he would return as the Mahdi, or "rightly guided one," to announce the Day of Judgment. He continued to communicate through ayatollahs, who became the intercessors between the

imam and the believers. In the contemporary era, Iran remained a Twelver Shi'i nation and large numbers of Twelvers lived in Iraq, Lebanon, and Bahrain.

Zaydi Shi'is were also known as Fivers, who split off in the eighth century. They supported Zayd, the grandson of Husayn, as the rightful imam. In the late ninth century, the Zaydis founded a kingdom in Yemen where they ruled from safe-holds in remote mountainous regions. In 1891 Imam Muhammad ibn Yahya Hamid ad Din established a hereditary Zaydi dynasty that lasted until the 1962 revolution in Yemen.

The ISMA'ILIS, established in 765, were another offshoot of Shi'ism. They established the FATIMID DYNASTY in Egypt and survived in India and scattered elsewhere around the world. In the contemporary age, they were led by the Aga Khan, a hereditary position. The Alawites broke off from the Twelvers in the ninth century, following the eleventh imam, Hasan al Askari (d. 873), and his student Ibn Nusayr (d. 868). They were sometimes, rather pejoratively, referred to as Nusayris. The Alawites venerated Ali as an incarnation of God and also assimilated a number of Christian influences. Alawites ruled Aleppo in northern Syria for a short period but were attacked by both the Isma'ilis and ethnic Kurds and were persecuted as a religious minority by the Mamluks and Ottomans.

Alawite practices seemed to deviate so far from orthodox Sunni practice that some Muslims claimed they were not true believers. Under the Ottomans they were disaffected socially and economically. The coastal area of northern Syria around Latakia remained an Alawite region and in the second half of the 20th century they used positions in key army posts to become the long-term rulers of Syria.

The Druze were another Shi'i splinter group, who broke off under the Fatimid caliph al-Hakim in the 11th century. Some of al-Hakim's supporters, including Muhammad al-Darazi, taught that he was the incarnation of God. Al-Darazi was assassinated in 1019 and his followers became known as the Druze. Al-Hakim disappeared in 1021 and the Druze took refuge in the remote mountains of Lebanon. They developed an elaborate secret ritual and belief system known only to adult male members of the sect. The secrecy surrounding Druze beliefs gave rise to numerous speculations about their practices. Although the Druze are historically an offshoot of Islam, their belief system seemed so far from general Muslim practice that they were generally considered to practice a separate religion. Tight knit Druze communities and their reputation for military prowess, coupled with the fragile confessional nature of the

modern Lebanese state, enabled the Druze to exercise political power in excess of their actual population in the contemporary era. Small Druze populations are also found in modern-day Syria and Israel.

The Shi'i often composed the lower social and economic strata in Muslim states. Throughout most of Muslim history, the rulers have generally been orthodox Sunnis, even in areas such as Iraq or Bahrain where the Shi'i made up a large part or even the majority of the population. After the 1979 revolution in Iran there was a resurgence of Shi'i activism that spread throughout much of the Muslim world.

JANICE J. TERRY

Shinran

(1173–1263) *Buddhist philosopher*

Shinran was a Japanese Buddhist philosopher who was primarily concerned with the fate of the mass of the people who would be unable to achieve enlightenment through their own efforts. He emphasized the role of faith as a means of salvation and placed it in the context of action and attainment of enlightenment. His school of Buddhism was called the Jodo Shinsu (the True Pure Land), and it has become one of the largest such schools in modern Japan.

Shinran became a monk at childhood after the deaths of his parents and he studied at the Tendai school on Mount Hiei. He underwent a process of asceticism in the search for enlightenment but failed to achieve his goal in this way. Granted a short sabbatical in the Rokkaku-do (Hexagonal Temple in Kyoto), he encountered Honen and was inspired to follow his Pure Land Buddhist form of belief, which held that calling out the name of the Buddha in true faith would be sufficient for people to achieve enlightenment in the practice known as nembutsu. Shinran abandoned his

previous asceticism and became an advocate of *nembutsu*. When this was outlawed in 1209, he was exiled. He subsequently married, despite the requirement for monks to remain celibate. His son, Zenran, followed him into the religious life but this led to conflict later when Shinran felt compelled to disown Zenran on the basis of the young man's different (and hence heretical) religious beliefs.

Shinran spent around 20 years in Kanto after his exile, where he continued his studies, wrote extensive tracts, and attempted to convert the local people. After the Kanto years, Shinran returned to Kyoto, where he then had a confrontation with his son, who had been leading followers in the absence of his father. Shinran died in Kyoto at the age of 90. His followers commemorated his life, in part with the creation of an organized form of his religious beliefs.

True Pure Land Buddhism focuses on the worship of Amitabha Buddha and anticipation of paradise lands to the west, where those saved by their worship will make their perpetual home. Worshipping the Buddha as an individual is contrary to the Buddha's own intention, since he considered that he had successfully eradicated his own ego and, therefore, there was nothing left to worship. Further the Buddha stressed the need for all people to search for and evaluate all stages on the road to enlightenment individually and systematically. True Pure Land Buddhism, therefore, was far more democratic than the Buddhism of the Buddha himself and offered happiness in the next world to a much larger group of people. It could be used, therefore, as a powerful force for modernization and social reform.

JOHN WALSH

Shiva

Shiva (Siva), along with Vishnu and BRAHMA, is one of the Trimurti deities of Hinduism. He is worshipped throughout the Hindu world. His beautiful consort Parvati usually accompanies him. Her avatars are Uma,

Durga, or Kali. Shiva's sons are Skanda (six-faced) and the elephant-headed Ganesha.

Shiva is depicted in the *Vedas* as Rudra (the Howler). Rudra was described as the destructive power of rainstorms. With a red face, a blue neck, matted hair locks, and his body smeared with ashes, he dwelled in the Himalayas, where his servants were thieves and ghosts. He wore an animal skin, a cobra as a garland, and a crescent moon as a hair ornament. He carried a trident and used arrows and thunderbolts. He was worshipped in fear without the assurance that worshipping would provide protection. Other weapons used by Rudra included fever, coughs, and poisons. However, he was also a sustainer of life because he had 1,000 remedies for diseases and poisons. In the *Svetasvatara Upanisad*, Rudra and Shiva were identified as one and the same.

During the 100s B.C.E. shrines to Shiva were built, which included phallic symbols. Eventually these developed into a symbolic phallic *lingam*. Sometimes there would be four faces depicted on the sides of the symbol. These were representative of the omniscient character of the deity. In the development of Shiva worship the *lingam* was eventually seated in a shallow dish with a symbolic *yoni* representing a vulva. These were representative of Shiva's *sakti* (female reproductive power). As a symbol of Shiva's potency as a power for generating life the *lingam* and *yoni* were interpreted as symbols of creative power. Sometimes Shiva has been represented as half male and half female (Lord Ardhanarisvara).

In epic poems and in the PURANAS, Shiva's destructive side was modified by the development of a kinder, gentler side. In myths and in art Shiva (Rudra) was represented as the great *yogin*. Seated on Mount Kailas in Tibet he would meditate and thereby sustain the world. He was Parvati's lover, and the "lord of the dance," who trampled on time and enacted the destiny of the universe. Philosophical interpretations of Saivism interpreted him as the Great God or as the timeless, absolute consciousness that underlies the cosmos. In other myths Shiva was presented as an uncouth ascetic. Dwelling in cemeteries and on cremation grounds, he would smear his body with the ashes of the dead, or mark his forehead with three horizontal stripes of white ash. Myths told of the destructive power of Shiva declared that he wore a necklace of the skulls of deities he had outlived or had killed. As Shiva theology slowly expanded, he became a universal preserver or protector of life.

Eventually Shiva devotees (Saivas) organized themselves into orders. Some engaged in shocking behaviors—living in cremation grounds, using skulls as alms bowls, and practicing bloodletting rituals and sacrifices.

In the 400s several sects of Saivism developed, and Sanskrit manuals (*agamas*) were written by some sects. The *agamas* described beliefs and gave directions for building temples, carving images, and for practicing sect rituals. The sects were generally ascetics who also had a lay following. Among these sects were the Pasupatas founded by Lakulisa, the Kalamukhas, Kapalikas, Trikas, and Kashmiris.

In the 700s the Saivas sect developed the Saiva Siddhanta theological tradition in South India. The Saivas used the Sanskrit word for wisdom (*siddhanta*) to expound the wisdom of Shiva as the supreme lord. The Saiva Siddhanta taught that souls and matter are created by the power that comes from Brahman (*maya*) and that they do really exist. Souls were in bondage to karma but could be delivered from their ignorance by the liberating power of Shiva. Spiritual power can be acquired from an authentic guru who serves as a spiritual director.

In the 600s Saivite religion was promoted by a series of talented religious poets who wrote in the South Indian language of Tamil. Within 100 years religious poetry was set to music and sung over wide areas. The music invited a mystical union with the deity. However the union was not like that of Indian mystics, because the Saivite mystical union was not one of absorption into the divine; nor was there a loss of personality. Nonbelievers challenged the theology of the early Tamil poets. The philosopher Sankara developed arguments for the impersonal power of Brahman.

The Saivasiddhanta theologians defended Saivite beliefs against opponents by stressing the protective role of Shiva. Meykandar and his disciple Arulnandi, both Saivasiddhanta theologians of the 1200s, called Shiva Siva Pasupati, or “the Lord of Cattle” (like a “good shepherd”) who cared for the cattle. Saiva theology taught that ignorance kept souls from knowing their real nature. Ignorance made them blind to spiritual realities and to Shiva’s helping powers. Consequently they remained bound to the sufferings of this world by three ropes: the rope of ignorance, the rope of the penalties of karma, and the rope of *maya* (illusions about this world). Shiva came to be addressed as *pati*, or Lord, because he offered many spiritual aids that could be used by people to gain liberation from the three bonds.

ANDREW J. WASKEY

Shona

The Shona is the name used to describe a number of tribes with similar cultures who have lived in the eastern part of Zimbabwe. The main tribes are the Zezuru, the Karanga, the Manyika, the Tonga-Korekore, and the Ndau. All speak Bantu and have survived in farming communities. They made up some 80 percent of the population of Zimbabwe in the year 2006, with the president of Zimbabwe, Robert Mugabe (prime minister 1980–87, president from 1987), being from the Shona, as was the prime minister of Zimbabwe-Rhodesia, Bishop Abel Muzorewa. There are also many Shona in neighboring countries: Botswana, Mozambique, South Africa, and Zambia. Some also lived in the short-lived Republic of Venda, one of South Africa’s homelands or “bantustans,” established 1979–94.

Traditionally the Shona were farmers of millet, sorghum, and maize, the last being their major staple food. They currently grow many other crops, including beans, groundnuts (peanuts), rice, and sweet potatoes. For meat, the Shona hunt animals. Cattle are raised—not for beef but for milk, and also for a measure of wealth, especially for paying dowries. The main migration of the Shona to modern-day Zimbabwe was largely associated with finding grazing land for their cattle. Living conditions largely consist of villages that involve clusters of huts around a central area where granaries and common cattle pens are located. Huts are made from mud and wattle, with thatched roofs, and generally accommodate extended families. The kinship system involves exogamous clans, with family trees and traditions, succession, and inheritance generally following the male line, although a few groups of Shona in the north of the country are matrilineal. Chiefs who inherit their position in the male line run the villages.

In the ninth century the Shona built the great stone buildings of Great Zimbabwe, one of the most important archaeological sites in southern Africa. The word *Zimbabwe*, which became the name of the country, means “royal court,” and they were the centers of power in the land. There are three sections that make up Great Zimbabwe: the Hill Complex, the Great Enclosure, and the Valley Complex. The Hill Complex has been called

In the ninth century the Shona built the stone buildings of Great Zimbabwe, with towers that may have been used for keeping watch.

the Acropolis by some historians and was the center of royal events in the whole site. Although it has a number of enclosures, they were probably for animals rather than for protection. Archaeologists have been able to show that it was built in a number of stages, and modified at different times. Some of the buildings collapsed, and the site was then leveled before new building work was started. The eastern section is known as the “ritual enclosure” and is connected with ceremonies involving Shona chiefs. Large statues of carved soapstone birds looked over the site but were removed long ago. There is also some evidence of gold smelting in one section nearby. There are various theories for the small towers, with some scholars suggesting religious purposes, and others that they provided lookout positions.

The most famous part of Great Zimbabwe is the Great Enclosure, which is one of the most regularly photographed parts of the entire area, appearing regularly in books and on Rhodesian and Zimbabwe postage stamps. Nearly 255 meters in circumference and 100 meters across, it remains the largest surviving ancient structure in sub-Saharan Africa.

Scholars have long surmised it was a royal compound where the king’s mother and his main wives would reside. There was a belief that the large conical tower on the site held treasure, and it was marked on some plans as being the site of the royal treasury. Many people have dug in the hope of finding gold, but it is also believed that it was the grain store for the king. The Valley Enclosures date from the 13th century and have yielded the largest

amount of archaeological finds. There was much speculation on whether the Shona actually built the enclosures at Great Zimbabwe, with some writers surmising that they were Arab, Egyptian, Ethiopian, Greek, Jewish, or Phoenician in origins. Some have sought to link them to the queen of Sheba or the legendary Prester John. Others have seen connections with the famed King Solomon’s mines. However not a single archaeological link connects the ruins with any of these. Some Chinese porcelain, Persian crockery, and beads and a few trinkets from India were found, indicating that the people at Great Zimbabwe traded, probably through intermediaries such as the Arabs, with peoples in the Indian Ocean.

The first Caucasian to see Great Zimbabwe was Adam Renders, an American sailor, who arrived in the area in 1867. He married the daughter of an African chief and remained nearby until his death in 1881. The first to write an account of the ruins was Carl Mauch, a German who came to Great Zimbabwe in September 1871. Subsequent travelers started taking pieces of the ruin away with them. British archaeologist Gertrude Caton-Thompson spent three years working at the site in the 1930s and concluded that they were Bantu in style, and part of the legendary Shona civilization. Great Zimbabwe remains the second most important tourist site in Zimbabwe, after Victoria Falls. In recent years Shona culture and customs has been revived with an interest in Shona wood and stone carving, and music.

JUSTIN CORFIELD

Shotoku Taishi

(574–622) *Japanese political leader*

Prince Shotoku Taishi was crown prince and regent of Japan between 592 and 622. His rule opened an era of great reforms that advanced Buddhism and Chinese political and cultural influence in Japan. For his role he is called the Great Civilizer.

Up to the sixth century Chinese cultural influence had grown gradually in Japan. After the mid-sixth century the process quickened. One reason was the gradual

strength and reach of the Yamato state, which required more complex institutions than the clan government of Japan had provided. Second, China became unified in 589 under the SUI DYNASTY after three and half centuries of division. The great TANG (T'ANG) DYNASTY followed, one of the greatest in China's imperial history and worthy of emulation. The third factor was the introduction of Buddhism to Japan from China via Korea (the southern Korean state Paekche had a very close relationship with Japan) in 552.

Buddhism was attractive to many Japanese but was also resented because it was foreign and not associated with Japanese mythology and the shamanistic practices of its native Shintoism. In 587 the Soga clan won ascendancy at the Yamato court; the chief's niece, Suiko, became empress, and her nephew Shotoku, descended from both the imperial and Soga clans, became her regent. Shotoku began a great era of reforms that would advance Japanese civilization in the pattern of China. He was a devout Buddhist; in fact a legend has him clutching a statuette of the Buddha at his birth. He proclaimed Buddhism the preferred state religion, promoted the building of temples, welcomed monks and missionaries from China and Korea, lectured on Buddhist teachings, and wrote commentaries on three Buddhist *sutras*. Thus Buddhism became the most important vehicle for the advancement of Chinese culture. However Buddhism did not provide a structure for the organization of government and society, and for those he turned to the imperial structure of China of the Sui-Tang dynasties.

In 604 Prince Shotoku promulgated the Seventeen Article Constitution (or Injunctions). Article II promoted Buddhism stating: "Sincerely revere the three treasures, viz. Buddha, the Law and the Priesthood, are the final refuge of the four generated beings, and are the supreme object of faith in all countries. Any person of any age should revere Buddhist law. Few persons are really bad. If they are taught well, they will be obedient. But if they are not converted [to the truth of] the Three Treasures, how can their wrongs be corrected?" The other 16 articles promoted Confucian precepts such as the supremacy of the ruler, a centralized government, a bureaucracy based on merit and correct principles, and social relationships that promoted harmony. In the same year Prince Shotoku also adopted the Chinese calendar, thereby accepting the Chinese view of world order. China required its tributary states to adopt the Chinese calendar as sign of vassalage. Japan adopted it voluntarily and did not become a Chinese vassal state. He also adopted major features of a Chinese style bureaucratic rule and system of court ranks for officials.

In 607 Shotoku broke new ground by sending an official embassy to the Chinese court. He would send a total of three, the two subsequent ones in 608 and 614, but the embassies would continue until the mid-ninth century, long after Shotoku's reign had ended. Each of the later ones had a contingent of four ships with between 500 and 600 students, some staying in China for up to 10 years. After returning to Japan the students, including government officials, monks, musicians, painters, and scholars, became transmitters of what they had learned to the wider society. His initiative resulted in one of the greatest technology transfers in premodern times. In addition to government-sponsored students, private individuals also began to travel to China to study, and trade also increased between the two countries. Educated Japanese read Chinese books and wrote in Chinese. The common written script came to unite Chinese, Koreans, and Japanese in a common literary heritage and a shared moral and historical tradition. Many Chinese and Koreans immigrated to Japan during this period, which accelerated the spread of Chinese culture.

The Soga clan continued to dominate the Japanese court after Shotoku's death. His opponents had feared that he sought the throne. But his son Prince Yamashiro refused to press his candidacy for the throne when Empress Suiko died in 628. In 645 the Soga clan was defeated and lost its influence at court. However Prince Shotoku's legacy continued, and even accelerated, during the next century as Japan continued to catapult forward in adopting Chinese culture and institutions.

JIU-HWA LO UPSHUR

Siamese invasion of the Khmer kingdom

The emergence of Thai kingdoms in the 13th century changed the power configuration of mainland Southeast Asia. Angkor and Pagan both felt their military might. The conquest of Nan Chao by the Mongols accelerated the process of Thai migration. The kingdoms emerged from alliances between the leaders of *muangs* (unit of cluster of villages). Prince Mengrai (1239–1317) had

established the kingdom of Lanna. In 1281 he conquered the kingdom of Haripunjaya and crushed the Mon-Khmer outpost of the area. The founder of SUKHOTHAI, Sri Indraditya (r. 1238–70), overthrew the Khmer overlordship in Thailand. Rama Khamheng (1239–98), the third ruler, carved out a vast empire ruling over ethnic groups like the Burmese, MON, Lao, and Khmers. After the emergence of Ayutthaya, the tables were turned and the Siamese attacked the Khmers.

In 1350, Rama Tibodi I (1312–69) founded the kingdom of Ayutthaya, which dominated Siamese history for four centuries. A new capital city was established and Tibodi named the capital after Rama, the hero of the *Ramayana*, an important Indian epic. The strategic location of the capital city facilitated attacking the Khmers. Tibodi was bent upon claiming overlordship of the region. The first Siamese invasion began in the year 1352 under the command of Prince Ramesuan (r. 1369–70 and 1388–95). The Khmer ruler Jayavarman Paramesvar (r. 1327–52) became a vassal of Ayutthaya. However, control of Ayutthaya did not last long and the Khmer ruler Kambujadhiraj (r. 1377–83) recovered Angkor.

Among the rulers of Ayutthaya, two different policies alternated. The Lopburi faction wanted to establish Siamese hegemony over the Khmers. But the Suphanburi faction was interested in subduing the Thai kingdoms and visualized Sukhothai, rather than Angkor, as a rival. Borommaracha I (r. 1370–88), who was from Suphoburi, did not follow an active policy toward the Khmers and concentrated his energy in subduing Sukhothai. Tibodi and his son Ramesuan along with grandson Ramatacha (1395–1404) were from Lopburi and perceived the threat from Angkor as greater than that of Sukhothai. Ramesuan attacked the Khmers for the second time in 1389. The immediate result of the invasion was the capture of Chonburi and Chantaburi by the Khmer ruler Dharmasokaraj (r. 1383–89), who also captured the majority of the population.

The troops of Ayutthaya seized Angkor for seven months and took 90,000 Cambodians as prisoners. In 1431 the Ayutthaya King Borommaracha II (r. 1424–48) invaded Angkor again, killing the ruler Srey (sometimes called Tammasok). Prince Intaburi, son of Borommaracha I, was installed as the new king. But Intaburi's reign was short-lived and after his death, Angkor again became independent. The Khmers shifted their capital to Phnom Penh in 1432 and their domain was confined to a small area. The objective of making Angkor a vassal state was not realized. Trailok (r. 1448–88), the eldest son of King Boromaraja II, was one of the

greatest Thai monarchs and reformers. He did not pay attention to Angkor and was involved in continuous war with Chieng Mai.

The Siamese attack against the Khmers did not result in Angkor's becoming a part of Audhya for a long time. After the attack was over and Thai forces retreated back to Ayutthaya, the Khmers reasserted their independence. The sacking of their capital incurred heavy losses in terms of men and material. From the Siamese viewpoint, they had gained the upper hand and Ayutthaya was safe from attack by the Khmers. The domination of Cambodia over Thailand was a thing of the past. A general pattern was also emerging in the internecine wars of the Burmese, Khmers, and Thais. Apart from ransacking the towns and imposing tributes, the victorious power was taking much of the population to make up for those killed in the wars. The result was an ethnic mix in mainland Southeast Asia. The Angkorean features in both the social and cultural domain percolated to Siamese society. The Thais were influenced by the Khmer concept of monarchy, and the system of slavery.

PATIT PABAN MISHRA

Silla dynasty

The Silla dynasty was a Korean kingdom with origins in the southeast of the country, in the area around modern-day Pusan (Busan). It is said to have begun in about 57 B.C.E. when the Saro tribe and its allies in that region established a confederation of the tribes, led by Pak Hyeokgeose. However many historians feel that date was the invention of 12th-century Korean historians, as found in the *Samguk Sagi*, written by Kim Bu-sik, to try to show that the Silla predated their main rivals. The early years

of Silla saw a rotated monarchy with members of the Pak, Kim, and Sok families sharing the title of ruler, although not using the title of king until later.

As the kingdom of Koguryo was emerging as a major power in northern and central Korea, Silla was taking over tribes in the south. Originally they only targeted the Saro tribe, taking tribute to the Mahan confederation as their vassal in 19 B.C.E. However Silla grew dramatically in prosperity and many historians have seen this as the influence of many Chinese merchants who came to settle in the area and brought with them much resultant trade. There were also influences from Japan—the envoy that took the tribute to Mahan in 19 B.C.E. was of Japanese ancestry. In the year after this mission, the king of Mahan died and although Silla sent over a delegation for the funeral, they rapidly drew up plans to take land from Mahan and enlarge their area. In 250 C.E. the Mahan confederacy, which had controlled much of central southern Korea, was finally absorbed, not by Silla, but by the kingdom of Paekche (Baekje), which had a common border with Silla. This was initially thought to be dangerous as it left the Korean Peninsula under the control of three kingdoms, Silla, Paekche, and Koguryo, with little in the way of buffer states that had existed beforehand. Silla and Paekche feared invasion from the emerging power of Koguryo, which had ejected the last Chinese base in 313.

To counter this threat, Kim Naemul (356–401) of Silla assumed the title of *maripkan* or king ensured that the succession to the throne was hereditary. The end of the rotating monarchy resulted in the ability to establish a more centralized administration, which adopted many of their methods of government, customs, and some Chinese culture. Initially Silla sided with Koguryo to attack Paekche, which had been aiding Japanese pirates. However when Koguryo moved its capital south to Pyongyang in 427, and its focus also moved south, Koguryo and Silla had to form an alliance. Silla also built up trade ties with Japan.

King Peopheung (r. 514–540) established Buddhism as the state religion of the kingdom of Silla and embarked on military expeditions that eroded the power of the nonaligned tribes in the region. His successor, King Jinheung (r. 540–576), enlarged the army and used it to help Paekche take lands around modern-day Seoul. However in 553 he decided that his forces were strong enough to seize the whole area for itself, ending the 120-year alliance of convenience between Silla and Paekche.

The war in 553–555 led to Silla's massively enlarging its landholdings, with Paekche forced to cede over half of its territory. This was followed by a long period of peace

when scholars in Silla devoted much time to Buddhism. King Pak-jong, who ascended the throne in 576, abdicated to become a monk and his wife became a nun. A considerable part of the wealth of the country was sent in missions of tribute to China, which weakened Silla economically but bought them a firm alliance.

Gradually Silla came to ally itself militarily with Tang China and in a series of lightning military campaigns, King Muyeol (r. 654–661) managed to capture most of Paekche just before his death, even though the Japanese sent a fleet bringing an expeditionary force with them to help Paekche in 662 and again in 663. The war ended with Silla's being victorious and immediately accepting Chinese overlordship. Silla then persuaded China that Koguryo should be the next target, and Silla sent General Kim Yu-shin to attack Koguryo. It took 10–12 years to defeat and destroy the kingdom of Koguryo, and by 668 Silla was in control of Koguryo, and this resulted in the whole of the Korean Peninsula's being unified under the Silla, the period being known as that of the "Unified Silla."

Confident in the superiority of their soldiers after these wars, the kings of Silla became ambitious and decided to attack the Chinese soldiers on the Korean Peninsula and stop paying tribute to the Tang. The first attack on the Chinese was in 671 and the Chinese responded three years later by sending in more soldiers, but the Silla not only were able to withstand the attacks, but also defeated the Chinese at Maechosong, near Yangju, and at Chonsong near the mouth of the Yseong River. The Silla were also able to drive the Chinese garrison out of Pyongyang and force the Chinese soldiers to be pulled back to Liaoting. Although China protested that some of the land of Paekche and Koguryo belonged to them, because of the increasing weakness at the Tang court, it was impossible to press these claims, and in 735 the Chinese formally acknowledged Silla as an independent kingdom with the rights to all the lands south of the Taedong River.

During the reign of King Kyongdok (r. 742–764), Silla was at the peak of its power, but the Unified Silla period did not last long. Initially its power was eroded by dynastic struggles. King Hyegeong succeeded King Kyongdok. Kim Yang-seng, who made himself King Sondok, assassinated King Hyegeong. He ruled for four years and then was deposed by King Wonsong. Violent court struggles and intrigue wrought havoc at the Silla court and when Sinmu became king in 839, the authority of the king had been destroyed with much of the country in the hands of nobles who formed alliances to attack other aristocrats. There were many local lords

who started to plot against the central authority and rebellions were followed by civil wars, and a large peasant rebellion.

Kyon Hwon (Gyeon Hwon) attacked the royal capital and killed the king, Kyong-ae, proclaiming his Later Paekche Kingdom at Wansanju (Chonju) in 900. In the following year Kung Ye (Gung Ye), in central Korea, captured the city of Kaesong (Songak) and made it the capital for his Later Kingdom of Koguryo. Near Kaesong, another rebel leader, Wang Kon, joined Kung Ye and was made the prime minister in Kung Ye's government. In 918 he overthrew Kung Ye and made himself ruler of the Later Kingdom of Koguryo. With these two new kingdoms established, it was not long before Silla was totally overthrown. It could no longer call on China for help, and with the overthrow of the TANG (T'ANG) DYNASTY in 908, Silla was totally isolated. The Later Kingdom of Koguryo emerged as the new KORYO DYNASTY of Korea. The system of government of Silla relied heavily on the king and the royal family. Outside the royal family were the nobility, who each controlled parts of the country. The system of exerting control over the people was similar to that in China, with up to a quarter of the population being slaves.

The capital of the kingdom of Silla was at Gyeongju (Kyongju), which had, at its height, a population of about 1 million, making it one of the larger cities in the world at that time. Many remains of Silla can still be seen in the city, the center of which is called Tumuli Park because of the 23 burial mounds that have survived. These were for members of the Silla royal family and were designed to prevent tomb robbery. A large round hole was dug, and lined with gravel and then stone slabs, then a wooden chamber was constructed, and the deceased was interred. After this chamber was sealed, the whole structure was covered with heavy stones, then with earth, and the area covered in turf. As a result jewelry and other artifacts have been found in many of these graves, which have helped historians reconstruct aspects of life in the Silla court. The amount of gold found has shown the wealth of the kingdom, being used for jewelry and foil worked into pots, utensils, and weapons.

Also at Gyeongju, along with places such as the Bunhwangsa pagoda, there is the oldest surviving astronomical observatory in East Asia, the Cheomseongdae, which was built between 632 and 646 when Unified Silla was at its height. Although the building looks simple, it was set on 12 rectangular stone bases (one for each month) and set in such a way for astronomers easily to work out the relative positions of different stars. Gyeongju was sacked in 935 and many of the old

wooden buildings were destroyed, and the large gardens in the center of the city that commemorated the unification of Korea were wrecked.

In 1975 archaeological work on the site of the gardens unearthed many wooden objects from the Anapji Pond. In the area around Gyeongju, there are dozens of temples, and also the burial sites of King Muyeol and General Kim Yu-shin, the two men who established Unified Silla. Many tourists visit the Seokguram Grotto, a site on the UNESCO World Cultural Heritage List, to the southeast of Gyeongju, where a statue of the Buddha, surrounded by guardians and some deities, was constructed during the late Silla period in the mid-eighth century. The statue of Buddha is carved out of a large granite block that was quarried north of the capital and then carried up the mountainside to its present position.

JUSTIN CORFIELD

Sind, Arab conquest of

Sind (or Sindh) is a province of modern-day Pakistan. It is bounded by the Thar Desert to the east, the Kirthar Mountains to the west, and the Arabian Sea to the south. The Indus River passes through Sind and its irrigation was a major source of food and revenue for Sindh people. Buddhism was established in the area during the reign of King Ashoka, and adherence strengthened over the years. Influence was exerted over the region by many different peoples, including the Scythians, Huns, Persians, Greco-Bactrians, and Mauryans. Chief Minister Chach seized the throne of Sind in 622 and established an unpopular dynasty that commanded little loyalty from the people or government officials.

Arabs had enjoyed a long and mostly untroubled relationship with Sind and its neighbors based mostly on shared commercial interests. Traders shipped goods from the Indian subcontinent and Southeast Asia westward to the Mediterranean. This continued after the Arabs embraced ISLAM, but in 711 a dispute broke out following the attack on and enslavement of a group of women and children who were traveling to Arabia. Hajjaj, the governor of the eastern provinces of

the Umayyad Caliphate, complained but was unable to receive justice to his satisfaction and prepared for a military campaign. Two initial forays were repulsed but a third, led by Muhammad ibn Qasim, was more successful. A force of 6,000 camels, 6,000 cavalry, and accompanying infantry and baggage train was dispatched and managed first to capture the coastal town of Dehul and then defeat the troops of King Dahar in battle, after a number of travails. The Arabs were assisted by the voluntary surrender of large numbers of Sindhi people and officials, whose loyalty to Dahar was very limited. Muhammad ibn Qasim was able to establish control over the whole of Sind, which was subsequently integrated into the Umayyad Caliphate, where it remained during the succeeding ABBASID DYNASTY until central power loosened and it became possible to establish local dynasties. The Abbasid governor, Hisham, who arrived in 757, undertook military expeditions against neighboring states, but there were no further territorial expansions throughout Arab rule.

Arab rule of Sind followed a similar pattern to that employed elsewhere, with most official posts remaining in local hands while an Arab governor administered the area with the assistance of troops who garrisoned the major towns and cities. Some people converted to Islam but comparatively few, and there was little effort expended on forcing people to change their religion at that time. The Arab period of rule led to the creation of a fusion of cultures that have helped to characterize subsequent Sindhi society. The city of Mansura was established as the capital and its people benefited from Arab learning and knowledge.

JOHN WALSH

Sixtus IV

See ROME, PAPACY IN RENAISSANCE.

Song (Sung) dynasty

The Song dynasty (960–1279) was founded by ZHAO KUANGYIN (CHAO K'UANG-YIN), r. 960–976, and is known posthumously as Song Taizu (Song T'ai-tsu) or Grand Ancestor of Song. After the fall of the TANG (T'ANG) DY-

NASTY in 907 China had been divided with the northern part ruled by a succession of short-lived regimes called the FIVE DYNASTIES OF CHINA, while southern China was divided between 10 province-sized minor ruling houses. Zhao Kuangyin was an important general serving the last of the Five Dynasties, the Later Zhou. He became emperor as a result of a mutiny conducted by his troops. Fearful that the same soldiers and their officers could depose him as easily as they had raised him to the throne, he immediately set out to persuade the leading generals to retire on generous pensions, replacing them with junior officers loyal to him. In forming his new government Taizu made the military subordinate to civilians and rotated commanders and garrisons to discourage the formation of strong bonds between them. He also made the army a professional one based on long-term enlistment and fostered policies that discouraged martial pursuits. According to a popular saying, "Good iron is not used to make nails; good men do not become soldiers." No military uprisings or significant domestic revolts troubled the dynasty.

NORTHERN SONG, 960–1127

Taizu used a combination of persuasion and military action to annex the 10 states in the south. However he did not take on two border states: Liao in the northeast, ruled by nomadic people called Khitan, and XIXIA (HSI HSIA) in the northwest, ruled by seminomads called Tangut, even though they occupied territories that had been part of the Tang empire. To prevent a repetition of the Song dynasty's falling after Taizu's death because of no able heir to take over, Taizu's mother made him promise to make his younger brother his heir, rather than his young son, when she lay dying in 961. The younger brother, who was already a seasoned general, succeeded in 977 and reigned until 997 as TAIZONG (T'ANG-TSUNG). When Taizong died the Song dynasty had been in power for almost four decades and was well established.

Taizong twice attempted to recover lands inside the Great Wall that Liao had seized; they totaled 16 prefectures and included an important city that is today called Beijing. He failed both times. In 1004 Liao and Song concluded the Treaty of Sangyuan, which defined the boundary, established frontier markets, and stipulated annual payment by Song to Liao of 100,000 ounces of silver and 200,000 bolts of silk (the amount was increased by 100,000 units each later) that Song called gifts and Liao called tribute. Except for minor wars the two sides lived in peace for a century. Song also fought an inconclusive war against Xixia between 1040 and 1044, which ended when Song agreed to give Xixia annual gifts of 200,000

ounces of silver and 200,000 bolts of silk. Song was willing to buy peace rather than fight, arguing that the total gifts amounted to no more than 2 percent of its annual income. The Song government focused on defense, rebuilding sections of the Great Wall, fortifying frontier towns, and deploying a large army of 1,250,000 men. Finding good horses for a cavalry was a problem because Song had inadequate horse breeding lands and Liao and Xixia, which did, would not sell horses to Song. An alternate policy of subsidizing farmers to raise horses, which the government could requisition in war, failed.

Taizu and his successors strengthened the central government by expanding the school and examination systems from which the bulk of civil servants were recruited. Advancement in printing and a fast growing economy produced a large and prosperous middle class whose educated sons found honor in serving the government. A Confucian revival that began in the late Tang dynasty gained dynamism under Song. Confucian scholar-officials reinterpreted the teachings of Confucius and his early followers that successfully challenged Buddhist teachings. Cut off from contact with India, Buddhism's original home, by Muslims and others who ruled Central Asia, Chinese Buddhism lost its vitality during the Song era. The reinterpreted Confucianism that matured during Song is called NEO-CONFUCIANISM and was accepted as orthodox in China, Korea, and Japan until the 20th century. Song scholar-officials formed two parties called Conservatives and Innovators that debated each other on taxation and other government policies. Each party implemented policies according to its ideals when in ascendancy.

At its height around 1100 the Song population totaled around 100 million, more than that of the larger earlier Han and Tang empires. Urban centers flourished, a national market system boosted trade, new seeds and crops increased food production, and many crafts provided a wide range of products. True porcelain was produced for the first time in the world with high temperature kilns; the products of the many kilns were exported by land and sea throughout Japan, Southeast Asia, the Middle East, and Egypt. The many craftsmen required in producing the ceramic wares worked in a fashion that resembled the division of labor of modern assembly lines. Song is also famous for literature of many forms and paintings; they reached their zenith under the eighth emperor, HUIZONG (HUI-TSUNG), who reigned between 1101 and 1125.

Huizong's extravagant patronage of the arts and lavish spending on palaces and gardens strained the trea-

sury, and his neglect of governing resulted in factional conflicts. Finally his disastrous foreign policy almost ended the dynasty. Huizong stopped appeasing Liao and made an alliance with a new nomadic people called Jurchen in northern Manchuria who had newly established a state called Jin (Chin). Their common goal was to destroy Liao by a pincer attack and to share the spoils. The war fought between 1118 and 1125 destroyed Liao but the alliance collapsed, and Jin then marched on the Song capital, KAIFENG (KAI-FENG).

Ill prepared, Huizong abdicated, leaving his son Qinzong (Ch'in-tsung) to face the consequences. An abortive peace ended when Jin renewed its attack, capturing Kaifeng, then called Bian (Pien), in 1127 and taking both Song rulers and 3,000 members of their family and court to captivity in Manchuria. In retrospect the period 960–1127 is called Northern Song.

SOUTHERN SONG

The period 1127–1289 is called Southern Song. A younger son of Huizong eluded capture, rallied Song troops, and continued fighting until a peace treaty was signed in 1142 when Jin realized it could not conquer southern China; the new Song ruler, Gaozong (Kaotsung), r. 1127–1162, was resigned to losing northern China. The most important military hero of the Song era, General YUE FEI (YUEH FEI), had been signally successful in resisting Jin forces and had advanced to the Yellow River valley.

But Song appeasers led by Qin Gui (Ch'in K'uei) had General Yue imprisoned on false charges and murdered in jail, perhaps as a peace offering to Jin. Yue became a great Chinese hero, admired and venerated in popular religion for his patriotism, while Qin has been despised for his treachery.

There were two revisions of the Song-Jin treaty, each adjusting the payment Song made to Jin. Gaozong is regarded as a second dynastic founder; he salvaged a desperate situation and gave the Song another lease on life, albeit in a smaller territory. Most of his successors were undistinguished and relied on powerful chancellors and ministers.

The capital of Southern Song was HANGZHOU (HANGCHOU), once called Linan, near the coast south of the Yangzi (Yangtze) River. The Huai River became the boundary between Jin and Southern Song. Southern Song was required to recognize Jin as a superior state and became its vassal and paid it an annual tribute of 200,000 ounces of silver and 200,000 bolts of silk. Southern Song prospered and Hangzhou became a great metropolis, surpassing Kaifeng. Learning flourished, and

southern China flourished as never before. Many great seaports grew along the southern coast because seaborne trade replaced land trade along the Silk Road (now traversing lands beyond Southern Song control).

Chinese ships, navigated by the compass (first used by Chinese navigators around 1100), with capacity between 200 and 600 tons, dominated the seas, carrying Chinese ceramics and other goods to Japan, Southeast Asia, and southern Asia. Taxes on trade produced the revenues needed to pay the annual tribute to Jin and to pay for the army.

Around 1200 the situation in northern China was dramatically changed by the rise of Mongols under GENGHIS KHAN. After uniting the Mongol tribes under him, Genghis began attacking Jin in 1210. His forces took and destroyed Jin Central Capital (modern Beijing) in 1215 and many other cities in northern China. Genghis left the Jin campaign unfinished to turn westward, destroying Xixia in 1227. In 1232 Song repeated the mistake that Huizong had made in 1118 when he made a treaty with Jin against Liao—it made an alliance with the Mongols against Jin, which was destroyed in 1234. However instead of regaining parts of northern China, Song was faced with the formidable Mongols in 1245. Song forces resisted desperately, both sides using gunpowder and firearms.

Mongol forces were initially stymied by the strongly fortified Song cities and had problems fighting in the river- and canal-intersected terrain of southern China. The great Song fortress Xiangyang (Hsiang-yang) in modern Hubei (Hupei) province north of the central Yangzi valley held up for four years in 1273. Finally Persian siege engineers and starvation forced Xiangyang's surrender, which opened up the route to conquer the south. The Mongols also built a navy. The last adult Song emperor died in 1274; two years later Hangzhou surrendered without a fight. Three infant emperors succeeded one another until 1279 when the last one drowned near Guangzhou (Canton) in 1279 as his remnant navy was overwhelmed by the Mongol fleet.

JIU-HWA LO UP SHUR

Srivijaya kingdom

The Sailendra dynasty was based in the Kedu plain in Java. They first appeared in the sixth century, around 570. The name *Sailendra* means “lord of the mountain,” a title derived from the Funanese kings, from whom they claimed descent. By the middle of the eighth century the Buddhist dynasty had consolidated its territory in Java, ruling about two-thirds of its eastern area. Bali, Lombok, coastal areas of Kalimantan, and southern Sulawesi fell under Sailendra control. Their sphere of influence extended to the Malay Peninsula and parts of Siam as well. Their greatest feat was building the BOROBUDUR temple. Prince Patapan cut their prosperity short; the neighboring Sanjaya dynasty usurped the throne in 832, forcing the Sailendra prince to hide in the forest. The latter returned in 850 but was defeated and fled to the Srivijaya kingdom.

The Buddhist kingdom of Srivijaya was located on the large island of Sumatra. The name *Srivijaya* means “great victory.” Most likely the Srivijaya kingdom was on the southeastern coast of Sumatra, including Palembang, another city farther inland along the Musi River. Palembang was probably the center of the ancient Malay kingdom. Evidence supporting this view includes a rectangular enclosure encircled by a moat, forming a fort known as Bamboo Fort. Chinese porcelain shards were discovered in the settlement along the coast. According to a stone inscription dated 683, the founder of the kingdom was a Malay war chief who lived along the river. He waged war against his rival, the Jambi-Melayu, and emerged victorious. The ruler managed to gather support from neighboring polities along the Musi River, which led to the formation of the Srivijaya kingdom, with Palembang as the core area. The Srivijaya kingdom achieved commercial dominance as a maritime power because the mouth of the river Musi was rich with silt and therefore very fertile for the cultivation of crops, including rice.

The ancient Malay polity was a coastal power that controlled the Malacca Straits as well as the Sunda Straits, from the late seventh century to the 12th century, though the kingdom might have been in existence since the third century. The straits were busy routes as ships often passed through them as they traveled between China and India. Among the many ports in the area, Srivijaya was the most powerful. It ruled over the coasts of the Malay Peninsula, Sumatra, western Kalimantan, western Java, and the Isthmus of Kra. Srivijaya was mainly a maritime power; its control did not extend to territories far inland. Because of its widespread dominion, Srivijaya, together

By the middle of the eighth century the Buddhist dynasty consolidated its territory in Java and built the Borobudur temple.

with its rival, the kingdom of Jambi, was able to spread Malay culture throughout the Malay Archipelago in the Malay Peninsula, Java, Sumatra, and Borneo. Srivijaya consisted of three main zones—the estuarine region of the capital city Palembang, the hinterland formed by the Musi River basin that maintained a relative amount of independence but with loyal pledges to the Srivijaya ruler, and former rival estuarine zones.

The Buddhist king built monasteries, visited them often, and gave money to Buddhist monks traveling to India who frequently stopped in the fortified city. A trunk of a large statue of Buddha, remains of a stupa, old bricks, and other Buddhist statues from the late seventh to eighth centuries have been found on the slope of a hill about 100 feet high, known as Bukit Seguntang. A Chinese monk, I Ching, who visited Srivijaya in 689, wrote that many Chinese monks stayed in the monasteries of Srivijaya long enough to learn the Malay and Sanskrit languages, before continuing their journey to India.

Srivijaya was sometimes referred to as Jinzhou, or the “Gold Coast.” This was because Srivijaya’s wealth and fame were mainly due to the reserves of gold found within its kingdom.

Srivijaya influence began to decline in the 11th century, weakened by attacks from the Javanese, and the

Singhasari dynasty was followed by the powerful Majapahit dynasty. Aceh achieved prominence in the region as a center of ISLAM, as it was one of the first ports frequented by Indian Muslim and Arab merchants. The spread of Islam undermined Srivijaya authority in the region. Finally in 1414 the last Srivijaya ruler, Parameswara, became a Muslim. He founded a sultanate in Malacca, a coastal town on the western coast of the Malay Peninsula, and it thrived as an important port.

NURFADZILAH YAHAYA

Stephen I

(1096–1154) *English king*

Stephen I of England was born to Stephen, count of Blois and Chartres, and Adela, daughter of William the Conqueror, in 1096. The exact date of Stephen’s birth is not known; he had four brothers and three sisters. Stephen’s father died while taking part in the First Crusade. In 1113 while he was still quite young, Stephen’s mother, Adela, sent him to make his fortunes at the court of her brother, Henry I, king of England and duke of Normandy. Stephen’s uncle warmly received his nephew. Henry quickly bestowed upon Stephen many honors including lands in England and Normandy, as well as the title of count of Mortain. In 1125 Henry orchestrated Stephen’s marriage to a wealthy heiress, Matilda of Boulogne.

In December 1120 Henry I’s only surviving legitimate son, William the Aethling, drowned when the *White Ship* capsized in the English Channel. After his son’s death, Henry I became very concerned about the succession. As his first wife had died in 1118, Henry quickly remarried with the hopes of fathering a new male heir. Despite the fact that Henry was the father of several bastard sons by various mistresses, when it became clear that his second marriage would not produce any issue, Henry was faced with a difficult decision in regard to whom he should name as his heir. The most prominent contenders for the honor included Henry’s only surviving, legitimate child, Maude (also known by the Latinized version of her name, *Matilda*); his bastard son, Robert of Gloucester; and Stephen, his nephew. Among Henry’s magnates, Stephen was the most popular

choice given his gender and his legitimacy. Stephen was well liked for his bravery and skill in battle, his easygoing disposition, and his kind nature.

However instead of Stephen, Henry named his daughter Maude as his heir. Henry argued that, despite her gender, Maude held the best hereditary claim to the throne of England. In December 1126 Henry insisted that all of his magnates, including Stephen, swear an oath of loyalty to Maude as his heir. In 1128 Henry negotiated the widely unpopular marriage of Maude to Geoffrey la Belle, count of Anjou and Maine. However Henry was quite pleased with the marriage, and Maude further secured her father's favor when she produced a son in 1133. The baby was named Henry in the king's honor.

Henry I died on December 1, 1135, while in Normandy. As soon as word reached Stephen of his uncle's death, he set sail from Boulogne for England. Securing the royal treasury at Winchester, Stephen immediately proclaimed himself king. Stephen claimed that upon his deathbed, Henry I had renounced his support of Maude as his heir in favor of Stephen. He also asserted that the oaths of loyalty he had pledged to Maude were null and void, as his uncle had forced him to swear fealty under duress. On December 26, 1135, Stephen was crowned and anointed by William de Corbeil, archbishop of Canterbury. As soon as word reached Maude that Stephen had usurped the English throne, she immediately made plans to fight her cousin for the succession. She first appealed to Pope Innocent II for support despite the fact that Innocent had already declared Stephen as the rightful heir to Henry's throne. When the pope failed to grant Maude any political support, she chose to undertake a military solution.

Between 1139 and 1153 civil war raged in England. One monk noted in *The Anglo-Saxon Chronicle* that the anarchy of Stephen's reign was a time when "men said openly that Christ and His angels slept." Maude initially waged a successful war against Stephen. She captured Stephen on February 2, 1141, at the Battle of Lincoln. Proclaiming herself Anglorum Domina or "Lady of the English," Maude made ready to be crowned queen in London. However several unpopular political decisions resulted in rebellion against Maude. Fighting soon resumed under the command of Stephen's wife, Matilda of Boulogne. In September 1141, Matilda's forces captured Robert of Gloucester. Maude was forced to agree to a prisoner exchange—Stephen for Robert. Stephen's restoration and Maude's retreat to Robert's stronghold at Bristol marked the end of the first phase of the civil war.

The second phase of the civil war began in 1148. Maude left the fighting in England to her eldest son,

Henry. Known as Henry FitzEmpress, Henry had a rise to power that was amazingly swift. He acceded to the dukedom of Normandy in 1151, became count of Anjou and Maine upon his father's unexpected death later that year, and consolidated his power base by marrying ELEANOR OF AQUITAINE in 1152. Eleanor's wealth provided the money and soldiers that Henry needed if he were going to successfully take up his mother's claims to the English Crown. Fearful of Henry's growing power, Stephen wished to ensure that his eldest surviving son, Eustace, would succeed him as king of England. In 1150 Stephen took steps to solidify Eustace's position as his heir by having him crowned and consecrated as king during Stephen's own lifetime. Pope Celestine II refused to comply with Stephen's request.

On August 17, 1153, Stephen's main impediment to peace with Duke Henry was removed when Eustace suddenly died. Shortly thereafter, Stephen's leading magnates, tired of the fighting, forced a peace settlement upon Stephen and Duke Henry. In the Treaty of Westminster, Henry agreed to allow Stephen to rule as king for the remainder of his lifetime. In return, Stephen adopted Henry as his son and named him as heir to the throne of England. Sick and worn out from years of fighting, Stephen died on October 25, 1154. He was buried next to his wife, Matilda, at Faversham Abbey in Kent, having ruled as the last of the Norman monarchs in England.

DEBORAH L. BAUER

Su Shi (Su Shih)

(1037–1101) *Chinese poet*

One of the most famous and easily recognizable voices in China's 3,000-year-old history, the great poet Su Shi left behind an impressive body of writing that underscores

the major themes of Chinese civilization. In Su Shi's poetry, the reader encounters traditional Chinese values such as the appreciation of others, friendship, fraternal harmony, reverence for nature, and the preoccupation with time—all addressed in a special, elevated mode of feeling, tone, and expression that the Chinese would term *shiqing*, or lyricism.

In the Chinese tradition this elevated mode of expression is akin to what in the Judaeo-Christian tradition is ordinarily understood as religious sentiment and the expression of religious feeling.

For the Chinese people literature and culture (*wen*), especially poetry, were experienced as a religious engagement, a spiritual exercise. Thus when Su Shi in his most characteristic poems, such as the "Rhapsody on the Red Cliffs" (I and II), expresses sadness over the Chinese collective memory of great heroes and ages gone by, the poet is partaking in what the Chinese believed was a most exalted vocation; he serves as a bridge between the past and the present, ensuring the continuity of culture.

To the Chinese people, to participate in the preservation and creative transformation of culture over time was to help ensure that Chinese culture attained the same divine immortality as nature.

The Chinese ascribed to nature and her aspirant, culture, a kind of basic tendency toward the good, the nurturing, and the generally positive qualities of existence that many Westerners would tend to find somewhat naïve. While it is true that Chinese culture places far greater emphasis on the lighter, more optimistic, side of existence, the Chinese were hardly immune from suffering. The life of the poet Su Shi is a case in point. Su Shi's career as a high official in Chinese government was full of unpredictable turns. He was exiled from the capital to two of the harshest backward regions of his day.

One of them, Hainan Island, was a kind of tropical version of Siberia. In Su Shi's writings it may at first glance seem as if none of these harsh experiences had registered in his mind at all. Yet that is only the case because of the different aesthetic and cultural demands for poets to submit their voices to standards of restraint, moderation, and, in cases of taboo subjects or very negative experiences, omission.

Given Chinese culture's tendency to shy away from the darker side of experience, the true legacy of a great Chinese poet like Su Shi is the expression of sadness over the passing of time, as seen in the perennial theme of the gap between human mortality and the immortality of nature in Chinese poetry. Because of the Chinese reverence for nature and belief in nature's propensity

to goodness, the true source of tragedy in Chinese existence is the gap between the human and cosmic scales of time, the recognition that no matter how great the man or woman, how significant that person's contributions to culture, humanity, and the world, the person must ultimately pass away, whereas nature, quite oblivious to the fact, simply continues. Because this discrepancy between human and cosmic time is the main source of tragedy in Chinese conceptions of life, the result is that in lyric expression, the poets mostly hold to the old Chinese ideal of "joy without excess, sorrow without pain," as in one of Su Shi's celebrated poems, "Harmonizing with Qin Guan's (Ch'in Kuan) Poem on Plum Blossoms":

Ten thousand miles of spring scenery follow the traveler,
Ten years of flowering blossoms send the beauty to her
old age.

Last year when the flowers bloomed I was already ill,
This year facing the flowers I am still a mess.

Who knows when the winds and rains will send spring
home,

When I will collect the leftover fragrance and return it
to Heaven.

MAGGIE CHIANG

Subotai

(1176–1248) Mongol general

Subotai was probably the greatest Mongolian general of the period of Mongolian empire and played an important role in its establishment and expansion. He was likely from Uriyangqai, the region lying between the Onon and Kerulen Rivers, and came into the service of the young

Mongol chieftain GENGHIS KHAN (r. 1206–27) primarily through a long-term family association. Subotai was an important member of Genghis Khan's guards by the early part of the 13th century and had already distinguished himself in the latter's service.

In 1204 Genghis Khan defeated the league formed against him by Tayang-qan of the Naiman, with the active participation of Subotai. The future khan's enemies were now defeated or dead or had migrated out of Mongolia to flee his wrath. Among those fleeing were a group of Naiman survivors led by Gücülük, and another group of Merkit led by their chief Toqto'a-beki. Since such groups could recuperate quickly, ally with others, and constitute a major threat to Genghis Khan's new regime, it was vital to pursue them. Charged with the task, among others, were Jebe, another talented Mongolian general, and Subotai, initiating at first a general reconnaissance, then an advance west, extending over a decade and a half.

In 1208 Juji, the oldest son of Genghis Khan, defeated the Merkit group in a great battle on the Irtys River. Toqto'a-beki was killed but his sons, led by Qudu, took their father's head with them and fled south into Uighur domains. Sent in pursuit were Jebe and Subotai, securing the submission of the Bešbaliq Uighurs on the way, who participated in a battle against Qudu, who was weakened but escaped, on the banks of the Djem or Cem River (1209). By that time the situation in eastern Turkistan, long ruled by the Qara-Khitans, was in flux, and the appearance of the Naiman Gücülük further unsettled things. He eventually seized power but even as a refugee constituted a major threat to the new Mongol regime.

Faced with a situation beyond their resources, Jebe and Subotai did what good Mongol commanders almost always did: They concentrated against the enemy more easily dealt with, Qudu, and kept the other under close supervision. Subotai went after Qudu, and Jebe pursued Gücülük as far as he could into Qara-Khitans territory, without coming into conflict with the still powerful Qara-Khitans ruler. Satisfied that his enemy was no longer an immediate threat, Jebe then joined with Subotai to defeat the Merkit survivors once and for all. By this time the Merkit were allied with a group of Qangli, a Turkic people, but they were all but destroyed in the battle (1209) at a site called Jade Valley, in the Chinese sources. Unfortunately before they could return home, mission accomplished, the two Mongol generals encountered a new, unexpected enemy, the Khwarazmshah Muhammad, and engaged in a clash with him, which was indecisive. The Mongols withdrew after kindling fake campfires to mask their movements. In the

wake of the advances of Jebe and Subotai, the Qangli and Qarluq, another Turkic people, submitted.

Recalled home, both Jebe and Subotai participated in the general assault on the JIN (CHIN) DYNASTY (1125–1234) in China, leading to the fall of the Jin central capital of Zhongdu (Chungtu) in 1215, the real beginning of Mongolian control in China. Sent west again, the two Mongol generals protected Mongol interests there and participated in the final pursuit of Gücülük, leading to his death in 1218. Eastern Turkistan and large chunks of southern Siberia were under Mongol control, making the latter a serious threat to the Khwarazmshah Muhammad. War came soon after the famous Otrar Incident (1218), in which some merchants under the protection of the Mongol ruler were massacred at the orders of a local Khwarazmian official. Faced with a general assault from, as was the Mongol custom, as many directions at once as possible, the Khwarazmian empire crumbled and the Khwarazmshah, now a refugee, died on an island in the Caspian in 1220. At the suggestion of Subotai, who with Jebe had actively participated in the campaign, the Mongols launched the greatest reconnaissance in force in history, an expedition through northern Iran, into the Caucasus, and then across the south Russian steppe, to link up again with other Mongol armies. The expedition was a success, although Jebe died. On June 16, 1223, the two generals defeated a Russian allied force on the Kalkha River, the Mongols' first encounter with a western power. Subotai participated as a senior commander in the final subjugation of Jin (by 1234).

Although already an old man by 1235, about 59, Subotai was now tapped for his greatest role of all, that of strategic commander for a generalized Mongol advance to secure the patrimony of Juji's sons, who by tradition, were to receive the most distant pastures of his father in the extreme west of the Mongolian world. As part of this advance, Subotai participated in the Mongol destruction of Kievan Russia (1237–40) and then was called upon to plan an even larger assault, on eastern Europe, during 1241. Advancing along multiple lines, with coordinated columns, the Mongols overwhelmed all their opponents although the Hungarians proved somewhat tougher than expected, even though the latter were only partially mobilized. Only the death of OGOTAI KHAN (r. 1229–41), the successor of Genghis Khan, seems to have prevented an even wider advance. Returning home, Subotai spent his last years either in the Mongolian homeland or on the borders of China. His sons and grandsons continued to serve Mongol rulers, including those of China.

PAUL D. BUELL

Sufism

Sufism is Islamic mysticism. The word derives from the Arabic *tasawwuf* meaning "to wear wool" or "to seek purification." Early Sufis, or practitioners of Sufism, often wore simple wool capes and sought knowledge of the higher being using both their bodies and minds. Sufism is in the same tradition as Christian and Hindu mysticism. Many became ascetics and developed a number of different rituals to achieve closeness or unity with God. These included the use of prayer beads, similar to a rosary in Catholicism, and fasting, chanting, and dance. The most famous of those using dance were known in the West as the whirling dervishes, an order of Sufis founded by Jalal al-Din Rumi. The dance involved the acolytes spinning in circles around the master much as the planets revolve around the Sun.

The *ulema* were highly skeptical of Sufi practices and often persecuted Sufi followers. Seeking to bridge the gap between the religious formalism of the *ulema* and Sufi practices, the philosopher al-GHAZZALI argued that the two were not irreconcilable. Muhyiddin ibn 'Arabi (1165–1240), who was born in Andalusia and died in Damascus, was another Muslim scholar who wrote on Sufism.

A master or *shaykh* mentored students of the Sufi orders. Much like fraternal orders, the Sufis were open to all; however, initiates often had to give up their personal property and pledge obedience to the *shaykh*. They then embarked on a journey or road through various stages of membership. Religious endowments enabled some Sufi orders to establish their own complexes with a mosque, school, kitchens, and social welfare programs. Sufi complexes were established in BAGHDAD by the 12th century. These were often built around the tomb of the founder of the order and the tombs of Sufi *shaykhs* often became sites of pilgrimage and veneration among both the Sunni and Shi'i.

Many Sufis were prolific poets as well as musicians and made major contributions to Islamic literature as well to classical Islamic music. HAFIZ and al-Rumi were among the most well known and beloved of the Sufi poets. Sufis also traveled across the Muslim world as teachers and missionaries and were instrumental in the spread of ISLAM, especially in Africa.

JANICE J. TERRY

Sui dynasty

This short-lived dynasty (581–618) is enormously important in Chinese history because it restored unity to a country that had been divided since the fall of the Han dynasty in 220. For 300 years before its creation China had moreover been divided between the Turkic tribal people called the Toba (T'o-pa) and Xianbi (Hsien-pi) who ruled the north and Chinese, many descended from refugees who had fled the nomadic invaders, who ruled the south. As the short-lived Qin (Chin) dynasty (220–206 B.C.E.) that it has been compared to, the Sui heralded China's second great imperial age under its successor, the TANG (T'ANG) DYNASTY. The last of a succession of mostly short-lived states of northern China ruled by Turkic tribal people was called the Northern Zhou (Chou). The second Northern Zhou ruler was married to the daughter of a powerful nobleman named Yang Jian (Yang Chien), the duke of Sui. When he died leaving a six-year-old son as successor, grandfather Yang became regent and soon seized power and founded a new dynasty named the Sui, in 581.

SUI WENDI

Yang Jian (r. 581–603) is known by his reign title *Sui Wendi* (Wen-ti), meaning "literary emperor of the Sui." Of mixed Chinese and Turkic descent, he was a prudent, hardworking, and wise ruler and was assisted by his capable Turkic wife, Empress Wenxian (Wen-hsian). He established his capital in Chang'an (Ch'ang-an), which had been capital city of the Han dynasty, symbolizing

his goal of restoring its institutions and glories. Between 587 and 589 he subdued southern China, reunifying the country. Though a devout Buddhist, he used Buddhism, Daoism (Taoism), and Confucianism to win support and to establish a common cultural base for the country. Wendi curtailed the power of the great landed families by vesting in the central government the power to appoint all officials throughout the land and laid the foundations for personnel recruitment through a nationwide examination for which the successor Tang (T'ang) dynasty is usually given credit.

Wendi also began a nationwide land allocation system for farmers and a militia system in which all male farmers who had been given land were obliged to serve. These policies were also fully realized under the succeeding Tang dynasty. Wendi waged inconclusive campaigns against the northern Turkic tribes and the newly formed state that occupied northern Korea and southern Manchuria called Koguryo. He also rebuilt sections of the Great Wall.

Wendi was frugal in private life and worked to improve the economy by rebuilding old canals to link Chang'an with the Yellow River and expanding the waterways to link up with the waterways of central China and the Yangzi (Yangtze) River. His son and successor later expanded on the waterways, known as the GRAND CANAL, in the north to Luoyang (Loyang) with a branch to present day Beijing, and in the south to HANGZHOU (HANGCHOU) on the coast, via Yangzhou (Yangchou) on the Yangzi River. Its total length was 1,250 miles, the longest canal system in the world and a huge engineering feat.

This grand project was completed by corvee labor and at great human cost, which generated popular discontent against the dynasty. Its completion was of immense importance because the system linked the rich and growing economy of the south to the heart of the empire in the north to support the needs of defending the empire. The Grand Canal also aided in the reintegration of the long divided empire.

Wendi and his empress had five sons. The second son, Yang Guang (Kuang), known to history as Yangdi (Yang-Ti), was born in 569. Talented and well educated, Yang Guang was married to a woman from the royal family of the former Liang dynasty of southern China and appointed viceroy of the newly pacified southern provinces in 589, where he remained for 10 years. He ruled from Yangzhou, which flourished as the junction that connected the Yangzi River with prosperous Hangzhou on the coast. In a series of murky events that might have implicated Yang Guang, his elder brother

the crown prince was demoted, he was elevated to that position, followed shortly by Wendi's death.

YANGDI (YANG-TI)

Yang Guang reigned as Yangdi (Emperor Yang) from 604 to 617. Historians have accused him of megalomania and extravagance that brought down the Sui dynasty. His grand vision led to the simultaneous launching of huge projects that include the building of a second capital in the east, at the site of the former Han capital of Luoyang that had been sacked by the Xiongnu (Hsiungnu) 300 years before.

He further expanded the Grand Canal begun by his father, building an eastern branch to modern Beijing. Yangdi also lived extravagantly and traveled extensively along the canals and rivers in a grand flotilla of pleasure boats and held elaborate entertainments in his lavish palaces. His downfall was however triggered by his ambitious foreign policy and disastrous wars.

In the south Wendi had restored Chinese power in present-day northern Vietnam, which had been annexed under the Han dynasty but had broken away from the control of the weak southern dynasties in the era of division. Yangdi invaded the CHAMPA KINGDOM in present-day central and southern Vietnam, which won acknowledgment of Sui overlordship by the local ruler after a costly campaign. A naval expedition was sent in 610 to pacify islands in the East China Sea, generally assumed to be Taiwan, but formed no permanent settlements there. Chinese ships had sailed to Japan since the Han dynasty, where Chinese cultural influence, brought via Korea, had been growing.

The first Japanese embassy arrived in Yangdi's court in 607 and addressed him as "the Bodhisattva Son of Heaven who gives the full weight of his support of Buddhist teachings." It included Japanese Buddhist monks, who sought permission to study Buddhism in China. Yangdi sent an emissary to Japan in 608 that brought back more information about that country. Thus opened a two-century-long era when 17 Japanese embassies, each with hundreds of students, arrived to study in China, with great significance for Japan's development.

In the north Yangdi, too, had to deal with the Turks. To keep them in check he rebuilt and extended sections of the Great Wall. He also resorted to traditional stratagems such as keeping sons of the Turkish khans in the Sui capitals to ensure their fathers' good behavior, conferring Sui princesses in marriages with the khans, trade and gifts (Chinese silks for Turkish horses), and Chinese titles for Turkish rulers. His

diplomats also fomented dissension among the Turkish tribes to prevent them from coalescing or forming coalitions against China. When necessary Chinese armies overawed and defeated hostile tribes. The Sui maintained dominance over the Turkic tribes and kept open trade routes between China and the west.

In the northeast in lands where the Han had established several commanderies, a state called Koguryo had formed early in the seventh century, with its capital at modern Pyongyang and that incorporated lands of modern northern Korea and Manchuria east of the Liao River. Koguryo was militarily strong and could menace China, especially if it acted in concert with Tungusic tribal people farther north and Turkic people to the west. Wendi had attempted to subdue Koguryo, without success. In 612, 613, and 614 Yangdi launched three major campaigns against Koguryo with crippling losses of life and at huge economic costs.

The Korean campaigns and natural disasters added to the economic distress and widespread revolts broke out. Ultimately the Sui were defeated by the difficult terrain and the climate, which favored the defenders; the great distance of the campaign from the heartland of China (about a thousand miles); and the weak coordination between the Sui army and navy. With the empire collapsing Yangdi left his capital for the south via the Grand Canal. Two years later he was murdered in his bath and the Sui dynasty ended.

INFLUENCE OF THE SUI DYNASTY

Historians have judged Yangdi harshly for his personal debauchery and as a tyrant who brought down the dynasty his father founded.

However the debacle his policies brought and the civil war that ensued did not last long and China would enter its second imperial age under the successor Tang dynasty. The glories of the Tang dynasty have overshadowed the contributions of the Sui. They include:

1. The sweeping away of the regional regimes and their institutions that had divided China in the preceding three centuries. It built new institutions that would ensure future political and cultural unity in a sub-continental sized nation that stretched from Beijing to Hanoi and from the East China Sea to the gates of Central Asia. At the height of Yangdi's reign the Chinese empire governed about 50 million people.
2. The modeling of a reunified China on the Han by reviving and expanding institutions such as the examination system based on the Confucian classics

and the Han tradition of codified laws (the Sui code became the bases of the Tang and later codes).

3. A land tenure and militia system that would be maintained by the Tang for a century and half, which was key to its success and was copied by Japan and has inspired later Chinese governments because they were just and equitable.

The Sui succeeded in reunifying China because of the wise policies of its founder but also because despite partition, the Chinese shared a common written language, common ideology and moral values in Confucianism, and by now a religion that was deeply embedded throughout the land: Buddhism.

JIU-HWA LO UPSHUR

Sukhothai

The Sukhothai was an early kingdom in the area around the city of Sukhothai, in north central Thailand. It existed from 1238 to 1438.

Thailand was under the Funan and Srivijaya Kingdoms before the migration of Thai people because of pressure from the Mongols. They were compelled to leave Nan Chao in Yunan. The formative stage of Thailand's history began with powerful monarchs operating from Sukhothai on the banks of the Mae Nam Yom River. The kingdom of Sukhothai's predominance was due to the fact that it had tremendous potential for agricultural production. It controlled water resources for the entire Menam Basin as it was situated at top of the main flood basin. A surplus of food made it possible to have a large army. Sukhothai was one of the early kingdoms that emerged in Thailand and Laos integrating the traditional *muang* administration with the Indian *mandala* concept of a centralized state. It borrowed art forms and administrative structure from the Khmers. Mongol influence was evident in military units. Legal traditions came from the Mons. In spite of influences from India, Sri Lanka, and neighboring

regions, Sukhothai evolved its own cultural pattern, maintaining its identity. The legacy of Sukhothai was their language, script, and religion, which became an essential part of Thai culture.

The local Thai princes Pho Khun Bang Klang and Pho Khun Pha Muang revolted against Khmer rule, establishing independent regimes. Klang became the king of Sukhothai with title of Sri Indraditya (r. 1238–70) and was succeeded by his son Pho Khun Ban Muang (r. 1270–77). The regime expanded under the younger brother of Rama Khamheng (1239–1298), who ruled from 1277 until 1298. Rama Khamheng or Rama the Great was one of the greatest monarchs of Thailand and at the time of his death left a vast kingdom. He adopted both diplomacy and warfare to expand Sukhothai's domain. Their stability was assured by a friendship with China. Many important facets of Thai culture developed under his reign. The Mons, Khmers, Indians, and Sri Lankans had close cultural contact with Sukhothai.

The Sri Lankan variety of Buddhism (Theravada Buddhism, also known as Lankavong) became predominant in Thailand. In continuity with the indigenous tradition of worshipping spirits, Rama Khamheng continued to make offerings to Phra Khaphung, the spirit deity located on a hill south of Sukhothai, even after adopting Theravada Buddhism. Thus two religious traditions were merged.

Rama Khamheng was the originator of Thai script. The Thai alphabets invented by him are basically still in use, with modifications. The reign of Rama Khamheng, the warrior and benevolent monarch, is rightly called the golden period in Thai history.

After the death of Rama Khamheng, his son Lao Thai (r. 1298–1346) ascended the throne. The kingdom of Sukhothai faced challenges from rising Thai states and Lao Thai was not very successful. Decline of the kingdom began and later rulers could not check the process of disintegration. There was a struggle for power after the death of Lao Thai and Nguanamthom ruled for some months. Lao Thai's son Luthai ultimately became the ruler with title of Mahathammaracha I (r. 1346–68). A great scholar and patron of Theravada Buddhism, he was more involved in religious affairs. He did not pay much attention to the affairs of the state.

The emergence of the powerful Lan Xang kingdom in Laos and Ayutthaya in southern Thailand resulted in loss of sizable territory of Sukhothai. Fa Nagum established the first unified state of Lan Xang in 1353. The kingdom of Ayutthaya, founded by Rama Tibodi in 1350, dominated Thai power and culture for four centuries. Neither Mahathammaracha I nor his suc-

cessor Mahathammaracha II (r. 1368–98) could check acquisition of Sukhothai territory by Lan Xang and Ayutthaya.

In 1371 Borommaracha I (r. 1370–88) of Ayutthaya, bent upon a policy of doing away with his Thai rivals, invaded Sukhothai and captured several towns. Four years afterward, the important town of Phitsanulok fell to the Ayutthaya king's army. Sukhothai became a vassal state of Audhya in 1378 after 140 years of independent existence. In 1400 there was a flicker of hope for Sukhothai, when Mahathammaracha III (r. 1398–1419) declared independence from Ayutthaya's subjugation. It was suppressed and Ayutthaya installed a new king, Mahathammaracha IV (r. 1419–38). Phitsanulok was the new capital of a much smaller Sukhothai. It became a province of Ayutthaya after the king's death. The princes of royal families generally became the administrators of the Sukhothai region.

PATIT PABAN MISHRA

Sundiata

(c. 1190–1255) *king of Mali*

Sundiata is remembered as the first of the kings of Mali. A mythic figure in West African history, he is known as the Lion King. He was born to a Mandingo chief, Nara Fe Maghan, and his second wife, Sogolon. After the death of his father, he and his mother had to flee because his 11 other brothers were jealous of the love his father had shown him and were a threat to his life.

The death of Nara Fe Maghan came at a bad time for the Malinke people, for at this time Sumanguru was trying to revive the kingdom of Ghana. Sumanguru killed Sundiata's 11 brothers but either did not find Sundiata or dismissed him as a threat because the boy was lame. Sundiata gradually built up his own state of Kangaba,

without attracting much notice from his father's killer. In 1235 Sundiata challenged Sumanguru at Kirina, in a largely cavalry battle, with both armies mounted on horses and camels. The warriors would have worn heavily padded cloth coats of armor, although perhaps the more wealthy ones like Sundiata would have had chain mail and helmets imported from North Africa by the Arabs. Sundiata won by a decisive cavalry charge, which left Sumanguru dead, either killed in the fighting or executed after. With the death of Sumanguru, Sundiata became the mansa, or chief, of a federation in western Niger, with his new capital at Niani. Sundiata carefully organized his new realm. According to *Ancient African Civilizations*, Sundiata's "division of the world assigned specific occupations—warrior, ironsmith, *djeli* (storyteller), and so on—to designated kin groups, reserving the office of mansa for Sundiata's own dynasty, that of the Keita. Sundiata also set up an administrative system based on provinces, which accommodated regional desires for a degree of self-government while allowing the mansa to retain ultimate control over what was fast becoming the empire of Mali."

Sundiata himself converted to ISLAM but did not compel his people to become Muslims. His conversion was a pragmatic act of statecraft, in order to gain a better position with the Arabs, who held much of the trade of western Africa, as they would until the coming of the Europeans in the 15th century with the advent of the Portuguese. Following the death of Sundiata, the kingdom that would be known as Mali continued to expand during the reign of his son Uli (1250–70). There was a period of strife when a general named Sakura seized power. Sakura decided to fulfill the Islamic vow of the hajj and make a pilgrimage from Mali to Mecca. On the return journey he died, and power reverted to the family of Sundiata, and "the title of mansa returned to the Keita family, passing in 1307 to Kankan Musa, a son of Sundiata's brother Manding Bory."

Under Kankan Musa, also known as Mansa Musa, Mali reached its apex. Kankan Musa (reigned 1307–37) also made the hajj, the pilgrimage to Mecca, in 1324 and returned safely. But with him on his return, Kankan also brought Islamic scholars from Mecca. With them he established centers of learning in Timbuktu, Jenne (or Djenne), and Gao. A huge mud brick mosque in Jenne would later be restored in 1907, when Moulay Hafid ruled as sultan of Morocco. IBN BATUTA, the great Arab traveler, came to Mansa Musa's kingdom on his tour of Islamic Africa. Mansa Musa also introduced Islamic architecture to West Africa with the arrival of Ishak as-

Sahili, who built a series of mosques. His development of Mali was made possible by the great wealth in gold at his disposal. According to Joseph E. Harris in *Africans and Their History*, a European atlas would chronicle that "this Negro Lord is called Mansa Musa, Lord of the Negroes of Guinea. So abundant is the gold which is found in his country that he is the richest and most noble king in all the land." Under Mansa Musa, the kingdom of Mali, the creation of Sundiata, enjoyed—in all senses of the word—a true golden age.

JOHN F. MURPHY, JR.

Sviatoslav

(c. 930–972) *king of Russia*

Sviatoslav ruled over the Rus with the capital in Kiev c. 969–972. He was the son of Kiev's Prince Igor (r. 912–945) and Princess Olga (who ruled as Sviatoslav's regent in 945–969 after Igor's death), known in history as the first Christian princess of Rus. In historical literature Sviatoslav is often called the last Viking, the main goal of whose rule was the permanent and sometimes senseless war campaigns against the neighbors of Rus.

Olga's 25-year rule resulted in Sviatoslav's disinterest in internal state affairs, so he found a new field of activity—war campaigns in remote territories. The formal beginning of Sviatoslav's rule is dated at 964 (his first war campaign), but in fact he only minimally influenced Kievan life until Olga's death in 969. In spite of the influence of his tutor Asmoud and the military governor (*voyevoda*) Sveneld, he neglected Kiev and felt himself free from any obligations toward its population. He even announced his desire to live in another city, founded by him in Pereyaslav-on-Danube. As prominent Ukrainian historians Olexiy and Petro Tolochko state, Sviatoslav's mode of life was motivated exclusively by searches for battle and by mercantile gains from the campaigns often financed by Byzantine diplomacy. Sviatoslav's campaigns reached into the east. In 964–966 Sviatoslav was at war

with the Khazars for power of the Vyatichi Slavonic tribe. This campaign resulted in the crushing defeat of the Khazar *kaganat* (principdom) and destruction of its capital Itil and the fortresses of Sarkel and Semender. At the same time he defeated the Volga Bolgars and took their capital Bolgar. In the northern Caucasus he displayed himself in his victory over tribes of Yasy and Kasogi. Soon Volyn and the Carpathian regions had entered into the sphere of Sviatoslav's attention, and his first squads were sent there, marking the beginnings of this region's exploration, finished by his sons.

The most striking trend of Sviatoslav's wars is connected with the Danubian or Balkan region. In 967 Byzantine emperor Nikephoros II promised Sviatoslav 455 kilos of gold for his campaign. Most researchers believe that Sviatoslav also had his own interests there, so in August 968, his fleet with 60,000 troops gained victory over Bulgarian king Peter and gained control over 80 settlements on the Danube.

This campaign was interrupted by the Pecheneg siege of Kiev (968). Destruction of the Khazar principdom by Sviatoslav eliminated obstacles for their penetration into the inner Rus lands. The consequences of his war campaign caused the deep dissatisfaction of the local population. This did not worry the prince, since he was planning to transfer his capital to Bulgarian lands, and soon after Olga's death Sviatoslav started the second Balkan campaign (autumn 969), having sectioned control over major Rus lands among his three sons.

His successes in 970 and tendency to conduct independent policy in the Danubian region forced the Byzantine emperor to start his expulsion, and the spring of 971 was marked by the taking of the Bulgarian capital of Preslav (the contemporary location is unknown). Sviatoslav was in a two-month siege in Dorostol (modern Silistra), which resulted in a bloody battle and subsequent treaty with Byzantium (972), which Sviatoslav refused because of his claims on Crimea. He went home with his army. On his way near the Dnipro Rapids he was met by Pechenegs, informed by the Byzantines about his trip, which weakened his forces in numerous battles. Trying to break through the nomads, Sviatoslav died in the early spring of 972.

OLENA V. SMYNTYNA

Sylvester II

(c. 940–1003) *pope*

As a young man, Gerbert of Aurellac became a monk in Gaul and later studied in Spain at Barcelona, and under Islamic teachers at Seville and Córdoba. He was particularly skilled in the natural sciences and arithmetic. After completing his education under Bishop Hatto of Vichy, he traveled with the bishop to Rome and won the support of Pope John XIII. Upon a recommendation of the pope, Emperor Otto I sent Gerbert to Reims, where he was given a position as an instructor in the cathedral school under Archdeacon Gerannus. He was highly skilled in oratory and debated Ortricus of Magdeburg before Emperor Otto II on many theological matters. He was bestowed the abbey of Bobbio by the emperor but returned instead to Reims. He was partially responsible for the rise of HUGH CAPET. Gerbert was elected archbishop of Reims in 991 by a synod of bishops. This elevation to the See of Reims was later declared invalid. Gerbert argued against the primacy of the pope in settling disputes of ecclesiastical office.

Not being able to counteract this decision Gerbert chose another path and went to the court of Otto II, where he became the emperor's teacher. Gerbert accompanied Otto to Italy and in 998 Pope Gregory V appointed him archbishop of Ravenna. Shortly thereafter, the pope died and Gerbert was elected to the Chair of Peter on February 18, 999, and took the name of Sylvester, becoming the first pope from France. He reigned until his death in 1003.

Sylvester's greatest accomplishment as pope was to fight the abuses of the bishops in regard to simony and concubinage. He argued vehemently that all men who rose to the episcopate should be innocent of sin. He became friends with Emperor Otto III and was exiled with the emperor after a Roman revolt against the politics of the emperor. He remained in exile for years. Abandoning his previous beliefs that the pope could not settle ecclesiastical disputes, Sylvester declared his

former opponent for the See at Reims, Arnulph, as the rightful archbishop. His reputation suffered some criticism from historians for this change in policy.

After the death of Emperor Otto III, Sylvester returned to Rome, though he gained no temporal power from the competing factions of the city. He established metropolitanates in Poland and Hungary and declared the ruler of Hungary to be a king and papal representative. Sylvester wrote many works on mathematics and the physical sciences. The people of Rome held him in high esteem as an exorcisor of the devil and a miracle worker. Some historians claim he introduced Arabic

numbers into the West and was the inventor of the pendulum clock.

RUSSELL JAMES

Taiho Code

The Taiho Code went into effect in 702. It symbolized the advances Japan had made since the sixth century in the establishing of a state in the Chinese style.

Prince SHOTOKU TAISHI had begun the practice of sending Japanese students to China in the early seventh century, a practice that continued long after his death. The returned students understood that laws, especially administrative laws, were a crucial component of the strength of the Chinese empire, because they defined the forms and function of the bureaucracy, the collection of taxes, and performance of services and justified the secular and ritual role of the emperor. Emperor TENCHI (TENJI) (r. 661–672) had ordered the compilation of an administrative code, reputedly 22 volumes long, but it has not survived. His brother and successor Temmu had ordered a reform of the laws promulgated under Tenchi, which supposedly was based on the Tang (T'ang) code of 651. Temmu's code also no longer exists.

Then came the Taiho (meaning "great precious") penal and administrative code of 702. Fragments of this code survive and more can be extrapolated from commentaries and the Yoro Code derived from it that followed in 718. It consists of several important component parts. First, it provided for a system of household registration used for assessing taxes for land and labor services from the people. A complex system of land allocation based on Tang China's equal field system was put into effect. Second, it stipulated the collection of taxes, based on individuals and not households. Third, it defined the administra-

tion of local areas: Japan was divided into 60 provinces, each containing districts and villages. They had been administered under local chieftains, which were switched to Crown appointees. Fourth, it covered the administration of the central government, which the code put under councils and ministries in the Chinese model. Fifth, it involved administration of military affairs. Another entire section stipulated state control of Buddhist monks and nuns, their training, ordination, residence, activities, and responsibilities under canon and civil law. This too was taken from the Chinese model under the TANG (T'ANG) DYNASTY.

The promulgation of the Taiho Code was shortly followed by the building of a permanent capital called NARA on a reduced scale of the great Tang capital Chang'an (Ch'ang-an). Until now there had been no permanent capital in Japan. Each reigning emperor or empress had used his/her residence as the administrative center of the state, which changed as each reign came to an end. This impermanence was due to the simple structure of early Japanese government and the belief of ritual pollution associated with a place where the sovereign had died under indigenous Shinto belief. The change to permanent capitals was predicated on new ideals from China and the increasing complexity of Japan's government.

The Taiho Code was an ambitious attempt by Japanese leaders to implement a complex legal system on the Chinese model where the state had much greater resources and history of administration. It was well enforced during the first half of the eighth century. But

it became less effective as changing social and economic conditions weakened the imperial court's control over the land and people.

JIU-HWA LO UPSHUR

Taika Reforms

Taika means “great change.” It was adopted as the name of a “year period” in Japanese history (after the Chinese custom of designating the entire period or a portion of a monarch's reign with a name to signify the intentions of the ruler) starting in 645. The reforms that were made in the years following 645 were thus called the Taika Reforms. They continued and accelerated the adoption of Chinese institutions begun by Prince SHOTOKU TAISHI.

Prince Shotoku died in 622, followed by Empress Suiko, who died in 628. A succession dispute followed because of resentment of the Soga clan by rival clans. It culminated in a coup d'état in 645 led by a prince who became Emperor TENCHI (TENJI) (r. 668–671) and a nobleman, who was given a new family name as reward for his services to Tenchi. That family name was *Fujiwara* and the nobleman, Fujiwara Kamatari, became the progenitor of the FUJIWARA CLAN that would dominate Japanese politics for many centuries.

Tenchi and Kamatari began a new wave of reforms based on the Chinese model. They had the advantage of many students sent to study in China earlier who had returned with newly gained knowledge. Five more embassies were sent to China between 653 and 669. The China specialists were appointed as state scholars. The first reforms were aimed at strengthening the government's control over the provinces and instituting a Chinese-style centralized taxation system. A census was taken. Adopting the Chinese concept that all land belonged to the throne, a land survey was made by imperial messengers to facilitate the collection of taxes. It started with areas around the capital city, later fanning out to outlying areas. A first attempt was made to establish a Chinese style capital city at Naniwa (near present-day Osaka) where central government minis-

tries were set up. The ministries and officials all had names and ranks fashioned after those of China. A law code copied from the Chinese code of the TANG (T'ANG) DYNASTY was promulgated. The Taika Reforms were a very ambitious attempt to introduce the highly advanced system of government in China to Japan, where conditions were more primitive. Many of the new concepts could not be realized and compromises had to be struck. For example, the emperor did not have the power to deprive the clan chiefs of their land, nor to appoint all local officials. In reality the clan chiefs and local magnates were given official posts and ranks that confirmed them in control of their traditional landholdings.

Shotoku had begun a wave of reforms patterned after Chinese concepts and institutions. Tenchi followed in his footsteps and expanded upon them and his successors continued, making pragmatic compromises as Japanese conditions demanded. All the reforms were synthesized into law as the TAIHO CODE, which went into effect in 702. Thus the Taika Reforms were an important step in Japan's absorption of Chinese culture.

JIU-HWA LO UPSHUR

Taira-Minamoto wars

The Taira-Minamoto wars, which led to the firm establishment of the shogunate as Japan's military government, began in the middle of the 12th century. At this time power in Japan was almost evenly divided between two families of feudal nobility, or the *daimyo* class, the Taira and the Minamoto. Save for an allegiance to the emperor, more often acknowledged tacitly rather than in reality, both families began to see Japan as a prize to be fought over. The FUJIWARA CLAN, whom both the Taira and Minamoto sought to replace, had been a power in Japan since the seventh century, serving as regents for the imperial dynasty.

Sensing a waning of the Fujiwara's ability to rule, the Taira and Minamoto mustered their forces. The Taira and Minamotos had one qualitative edge: Whereas the Fujiwaras were largely cultivated court nobles, the Taira and Minamoto were *daimyo* from the rough SAMURAI

military class, the professional warriors of Japan, who followed “the Way of the Horse and the Bow.” In 1156, the first skirmishes took place in the Taira-Minamoto struggle when the clans fought in both sides of an imperial succession dispute known as the Hogen incident, named for the year it took place. The side led by Taira Kiyomori won out. Ironically he owed his place of power to Minamoto Yoshitomo, who lost his father and brother on the opposing side against the Tairas. The grief-stricken Yoshitomo declared, “A man could not live under the same heaven as the murderer of his father.”

In 1160 in the Heiji rebellion, named again for the year it took place, Minamoto Yoshitomo gathered his knights, his samurai, and his footsoldiers, or *ashigaru*. The fighting raged in the imperial capital of Kyoto and featured some of the most brutal warfare yet seen among the Japanese. The entire capital became a battleground, in which the highlight was the Minamoto’s assault on the Sanjo Palace. In one such battle, “wild flames filled the heavens, and a tempestuous wind swept up clouds of smoke. The nobles, courtiers, and even the ladies in waiting of the women’s quarters were shot down [by arrows] or slashed to death.” Taira Kiyomori gained the upper hand, and the bloodied Minamoto retreated east to the region around Edo, modern Tokyo.

Taira Kiyomori began a purge of the Minamoto, hoping to kill off the opposing clan. However he left, as Stephen R. Turnbull writes in *The Book of the Samurai*, “a few young boys and an aging courtier, Minamoto Yorimasa,” alive. These would prove the undoing of the Taira clan. With the Heiji uprising thwarted, Taira Kiyomori took up residence in the capital at Kyoto. Soon the Taira lost their combative edge and evolved into effete courtiers like the Fujiwara. Kiyomori even married into the imperial family. However the Minamoto had only been biding their time. In 1180 Emperor Takakura abdicated and Kitomori put his grandson Antonoku forward as the next emperor. However the rightful heir, Prince Mochito, issued a call to arms to support his claim to the throne. Minamoto Yorimasa rose in revolt against the Taira clan. A large Taira force along the Uji River confronted Minamoto Yorimasa in the GEMPEI WAR. In an overwhelming charge, the Taira cavalry forded the river and Yorimasa faced defeat. Rather than surrender to the enemy, Yorimasa committed ritual suicide as his sons held off the enemy.

Yet the Minamoto, once up in arms against their old foes, would not back down. Although Yoritomo had as yet no army to support him, his plan of action offered great booty, always an inducement to the samurai class, to any who would join him in the eastern part

of the country. When Taira Kiyomori died in 1181, the hold of his clan on the country began to weaken. Two years later Yoritomo saw his chance. In 1183 he attacked. His cousin, Minamoto Yoshinaka, defeated the Taira forces at Kurikawa and again at Shinohara. In August the Minamoto forces entered Kyoto and an agreement was reached with the retired emperor Go-Shirakawa. While the compact allowed the young Emperor Go-Toba to rule, it signaled an alliance between the imperial dynasty and the Minamoto clan.

With the Taira in full retreat under Taira Munemori, Yoritomo ordered a full pursuit: He intended a complete and decisive victory. Yoritomo’s brother Yoshitsune was given the orders to finish the Taira. The Taira sought refuge in a cliff fortress at Ichi-no-tani near Kobe. However in a daring nighttime attack, Yoshitsune and 150 men climbed down the cliff to surprise and rout the Taira army. The Taira force was driven back to the safety of

In a daring nighttime attack Minamoto Yoshitsune and 150 men surprised and routed the Taira army.

their fleet. There they sought refuge on the small island of Yashima, located off the island of Shikoku.

On April 24, 1185, in one of the few decisive naval battles in Japanese history, the Minamoto and Taira fleets met off the Dan-no-Ura peninsula, where the Strait of Shimonoseki separates the islands of Honshu and Kyushu. The battle began auspiciously for the Taira as, using the tide as a weapon, they attempted to surround the Minamoto ships. But during the battle, some of the Taira captains switched sides as Miura Yoshizumi attacked the Taira ships from the rear, and the Taira navy was defeated. Taira Kiyomori's widow grabbed her grandson, the young Emperor Antoku, and plunged into the water. Both were drowned. Taira *daimyo* followed their example, choosing death by drowning to surrender. Antoku's mother, who also attempted *seppuku* by drowning, was rescued. She was permitted to live out her life as a nun and died in 1191 at the age of 36. With the decisive defeat of the Taira, Emperor Go-Shirakawa appointed Yoritomo as shogun, the military dictator of Japan.

JOHN F. MURPHY, JR.

Taizong (T'ang-tsung)

(599–649) *Chinese emperor*

Tang Taizong (T'ang T'ai-tsung), meaning "Grand Ancestor of the Tang," is the title of the second ruler and real founder of the TANG (T'ANG) DYNASTY in China (618–909). Born Li Shimin (Li Shih-min), he was the second son of Li Yuan, the duke of Tang, who was an important governor under the SUI DYNASTY. Taizong's achievements and the policies that he laid down would make the dynasty the most powerful, successful, and prosperous since the Han dynasty. The Li family was descended from Li Guangli (Li Kuang-li), a famous general under Emperor Wu of the Han dynasty. As most aristocratic families in northern China, it had intermarried with nomads who had settled in the region; Taizong's mother, the empress Dou (Tou), came from a powerful Turkic clan.

In 617 the Sui dynasty was collapsing and revolts were widespread. Eighteen-year-old Li Shimin maneuvered his father to revolt and played a leading part in defeating numerous other contenders to establish him on the throne of the new Tang dynasty in 618. Li Yuan is known in history as Tang Gaozu (T'ang Kao-tsu), meaning "High Ancestor of the Tang." As second son, Shimin was the object of jealousy of his older brother, the crown prince, who planned to murder him. In a final showdown in 624 the crown prince was killed, Shimin became crown prince and de facto ruler, and two years later Gaozu retired and Shimin ascended the throne.

Brilliant and precocious, he had by his late teens mastered the Confucian Classics and literature, had gained experience in administration and martial skills, and had led men into battle. A dashing and fearless leader who placed himself at the forefront of cavalry charges and who excelled in hand-to-hand combat, he boasted that he had personally killed over 1,000 enemies before taking the throne. Taizong was immediately confronted with a crisis along the northern frontier. Taking advantage of China's internal chaos the Eastern Turks had launched massive annual expeditions along the borders beginning in 623, to plunder and also to instigate revolts against the new dynasty. The one in 626 reached within a few miles of the capital Chang'an (Ch'ang-an). Only three weeks on the throne Taizong, who was a man of imperial and intimidating bearing, led his men to confront the enemy and secured their retreat with a combination of bravado and bribes. His long-term response was to train and bolster his army, which allowed him to launch a massive six-pronged offensive with 720 miles separating the easternmost and westernmost columns in 629.

A combination of superior Tang tactics and internal disaffection among the Turkic tribes resulted in a one-sided Tang victory at the battle at Iron Mountain in which some 10,000 nomads were killed and more than 100,000 surrendered. This campaign ended the Eastern Turkish Khanate and established Chinese dominion over the Mongolian steppes. Taizong was acknowledged "Heavenly Khan" by the Turks, the first Chinese ruler to hold that title. The surrendered Turks were treated with kindness; many were settled along the Ordos region of the Yellow River and other borderland areas. Thousands of others settled in Chang'an and served the dynasty. Peace would reign in the northern borders for 100 years.

Other campaigns broke the power of the Western Turks; established Chinese power throughout Chinese Turkistan, across the Pamirs into Afghanistan to the bor-

der of Persia; and also brought Tibet under Chinese suzerainty. The marriage of a Tang princess to the Tibetan ruler, the first of several throughout the dynasty, would bring Chinese culture to that land. In 648 a Chinese force, with Tibetan assistance, crossed into India and brought an Indian rebel who had assassinated King HARSHA VARDHANA of India (Taizong and Harsha had diplomatic exchanges thanks to the Chinese Buddhist monk XUANZANG's [HSUAN-TSANG's] journey to India) to Chang'an for punishment. Taizong also sent two expeditions to Korea in the 640s but failed to bring the king of Koguryo to heel. Taizong rode six horses to battle. Relief carvings of all six, with accompanying inscriptions detailing their names and deeds, decorate the entrance to his mausoleum.

Taizong was a rationalist and believed that men, not heaven, determined the course of history. He was conscientious and hardworking, was concerned with the welfare of the people, and respected the opinion and sought the criticism of his advisers. He surrounded himself with able ministers. Wei Cheng was the most fearless of his critics, yet never suffered from his blunt rebukes of the emperor. Taizong called Wei his mirror for showing up all his blemishes and mourned Wei's death as a great loss to good government. Because the basic institutions of the Tang were already in place when he ascended the throne, Taizong's task was to consolidate, rationalize, and improve where necessary.

He halted the growth of the bureaucracy, redrew the empire's administrative units, and continued the codification of the laws but lightened many punishments. His economic policies led to recovery and prosperity after the wars that marked the end of the Sui dynasty and led to surpluses that financed his military expansion. He established a network of granaries that provided against natural disasters and stabilized the prices. He also extended and improved the militia system begun by his father.

Taizong's last years were marred by poor health; the death of his wife, the Empress Zhangsun (Chang-sun), who had been his wise and able adviser; the demotion of his heir for plotting against him; and rivalry among his other sons for the succession. He finally settled on a younger son by the empress, who would be known as Emperor Gaozong (Kao-tsung). But in death his reputation would grow and he would be acknowledged one of the greatest rulers of all Chinese history. His reign came to represent exemplary civil government, unrivaled military might, and unmatched cultural brilliance.

Taizu (T'ai-Tsu)

(1328–1398) *Chinese emperor*

Ming Taizu means “Grand Progenitor of the Ming”; this was the posthumous title for Zhu Yuanzhang (Chu Yuan-chang), who founded the MING DYNASTY (1368–1644) in China. He was the second commoner to found a Chinese dynasty, the first being Liu Bang (Liu Pang), founder of the Han dynasty (220 B.C.E.–220 C.E.). The Ming founder drove out the Mongols who had ruled China oppressively for a century and restored Chinese self-confidence, economic prosperity, and international prestige that equaled that of the previous great Han dynasty and TANG (T'ANG) DYNASTY (618–909).

Zhu Yuanzhang was the son of poor tenant farmers from Anhui province in southern China. Mongol misrule and natural disasters reduced the area to penury and a plague killed most of his family. Left an orphan he joined a Buddhist monastery, and when the monastery ran out of food, he went out begging, then joined a rebel movement called the Red Turbans, one of many that emerged in southern China as Mongol power disintegrated. His ability led to quick promotions and marriage to the leader's daughter (née Ma). She became his key adviser and mother to his successors.

While other rebels looted, Zhu captured Nanjing (Nanking), a key city south of the Yangzi (Yangtze) River in 1356; set up a rudimentary government; and then subdued the entire Yangzi valley by 1367. Marching north he captured the Yuan capital Dadu (T'a-tu) in 1368, ending the YUAN DYNASTY (1279–1368). Zhu assumed the reign name of Emperor Hongwu (Hung-wu), which means “bounteous martial emperor” (r. 1368–98). By 1388 Ming forces had conquered all southern and southwestern China, Inner Mongolia, Manchuria, and Xinjiang (Sinkiang). Remnant Mongols were driven beyond Karakorum to the shores of Lake Baikal. Korea, many oasis states in Central Asia, and some Southeast Asian states submitted as vassals.

Taizu built up a new centralized government on the Tang model, reestablished the examination system to recruit officials, and encouraged and subsidized local education to nurture talented young men for government

service. He also proscribed eunuchs' gaining political influence. He earned popular gratitude by freeing millions of Chinese enslaved by Mongols, confiscating large estates belonging to Mongols and their collaborators, and granting land to the landless. The people were also given free tools and seeds and tax remission to rebuild a neglected rural economy, especially in devastated northern China.

Taizu was also suspicious and insecure, and after Empress Ma's death in 1382, increasingly paranoid and cruel. He ruthlessly persecuted and purged many officials who had helped him gain power. Taizu was predeceased by his eldest son and crown prince, and according to Chinese practice, passed the throne to a youth, the son of the crown prince. This action would trigger a war of succession.

Talas River, Battle of

In 751 a TANG (T'ANG) DYNASTY army commanded by Gao Xianzhi (Kao Hsien-chih), military governor of Anxi (An-hsi) in the Western Regions, met an Arab army in battle at Talas River near SAMARKAND. The Chinese were defeated. Although this was not a major military confrontation, it had great consequences.

Tang power and prestige stood at their zenith up to 750. Tang military forces had scored major successes and secured the frontiers from Tibet to Central Asia; the northern steppes were under a friendly semisedentary people called Uighurs, while the Khitans in the northeast and the XIXIA (HSI HSIA) in the southwest were contained. International trade flourished by land along the Silk Road, and by sea routes. However soon all would change. The aging Emperor XUANZONG (HSUAN-TSUNG), infatuated with a young concubine, the Lady Yang (Yang Guifei), had been neglecting his duties while her corrupt family and favorites dominated the government. The military system that had made the empire strong during the previous 100 years was deteriorating. Many of the frontier garrisons were manned by nomadic mercenaries

and commanded by non-Chinese generals. Meanwhile Muslim Arab power had been expanding eastward.

The conflict began as one between two local states, Ferghana, a Chinese client state, and Tashkent. It led to battle between Ziyad bin Salih, governor of Samarkand under the Umayyad Caliphate, assisting Tashkent, and General Gao Xianzhi and his Chinese forces. Gao was badly defeated when his ally the Western Turks defected to the Arabs and retreated across the Pamir Mountains. The battle was not significant in the short term, because the Arabs did not press eastward to threaten China, but because of what followed in the long term. In the same year, nearer to home, the aborigines in Yunnan in southwestern China revolted and declared independence, creating a state called Nanzhao (Nan-chao).

Finally in 755 the Turkic general and once imperial favorite AN LUSHAN (AN LU-SHAN) began a rebellion that captured both Tang capital cities and threatened the throne. The immediate result of events in 755 was the recall of Chinese forces from Central Asia, creating a political vacuum. That left the Arabs in a strong position. Likewise the power vacuum enabled the Tibetans and the Xixia people to expand their power at China's expense. Even as an ally the Uighurs expanded their power at the Tang's expense. Without Chinese military protection the Buddhist states in Central Asia would fall to the rising power of ISLAM. Chinese power would not return to the region for another 600 years.

Tamil culture

Tamil is a Dravidian language group that originated in southern India and is not linked to the northern Aryan language group. Tamil speakers are found in Tamilnadu, the region surrounded by Kerela, Karnataka, and Pradesh and parts of present-day Sri Lanka. Historically, the two largest and most influential Tamil cities were Madras and Madura. Intense trade and military expansion resulted in Tamil cultural expansion from

the second century to the 10th century. At the core of Tamil cultural identity is the Tamil language. As early as the end of the third century, Tamil script and Tamil as a distinct Dravidian language are documented. Thus literature and poetry are at the core of culture in this period. However religion, another important aspect of Tamil culture, informed art in the form of painting, sculpture, and architecture.

The fourth century began after the end of the classical period in Tamil literature and was also the beginning of the rule of Pallavas, which would dominate until the 10th century. While this dynasty is not of Tamil origin, the integration of this dynasty into Tamil society transformed the cultural identity. Pallavas encouraged the worship of SHIVA and Vishnu and built lavish temples to honor them. They modeled their society after the great Aryan northern dynasties, the Mauras and Guptas. The PALLAVA KINGDOM marked the beginning of the Bakthi poetry movement. The greatest collection of religious poetry that is indicative of this movement is the *Thirumurai*, which includes hymns of Appar, Sampanthar, Suntharar, and Manikkavasagar's mystical poem *Thiruvacagam*.

The CHOLA KINGDOM (c.985–1300) began with ascension of Raja Raja I (985–1014) and the installation of his son Rajendra I. Their power and the crystallization of Tamil cultural identity provided a rich environment to facilitate cultural output. The Cholas were able to conquer vast amounts of territory as far as Malaysia. As they conquered these lands they erected glorious temples and statues including bronzes of the dancing Lord Natarajan. By the 10th century the Cholas had a well-established trade relationship with China, which aided in enriching cultural connections. Under the Cholas, epic poetry was written by three great poets: Kampan, Ottakkootar, and Pukalenti. The masterpiece of Tamil literature from this period was poetry created from stories written by Kampan. *Ramayanam* (epics) were told in temples and were a part of worship. These were episodic public works performed in the temple, and in many ways were a reaction to the Bakthi movement. Avvaiyar was a popular Tamil female poet, whose canon of expansive work spanned many topics, including spirituality and wisdom, which was largely popular among the people.

By the 13th century the Pandyas grew in political importance and displaced the Cholas as the dominant power. The Pandyas were highly proficient in trade and education. They controlled the pearl fisheries between the southeastern India coast and Sri Lanka, which produced the finest quality of pearls. The Pandyas kings were known as far as Syria. The Nayaka peri-

The rule of Pallavas encouraged the worship of Shiva and Vishnu and they had temples such as these built to honor them.

od (c. 1336) was the instillation of the Nayaks of the Vijayanagar empire after the gradual spread of Muslim political authority in South Asia beginning in 711 with the Arabs and later, Turko-Afghans and Persians. The decline of Tamil literature ends with the Nayaka Viceroy period under the hegemony of Sanskrit and Tugulu languages. However there was resurgence in Tamil literature in the 16th and 17th centuries. Tamil culture from the seventh century until the mid-15th century was influenced heavily by religious devotion in the form of art, architecture, and sculpture. It was also in this period that Tamil literature underwent many transformations. This period provided the foundation for later articulations of Tamil identity.

STEFANY ANNE BOYLE

Tang (T'ang) dynasty

The Tang dynasty (618–907) brought three centuries of greatness to China, called the second imperial age, continuing and consolidating the unification of China that the preceding SUI DYNASTY (581–618) had begun. Its formal founder was Li Yuan, the duke of Tang, a provincial governor under the Sui dynasty. The Li clan

was descended from a celebrated general of the Han dynasty (202 B.C.E.–220 C.E.) and from Turkic aristocratic clans. But it was his 17-year-old second son, Li Shimin (Li Shih-min), who actually engineered the revolt and who led the campaigns that wrested power from the collapsing Sui dynasty and numerous other contenders and nomadic invaders after seven years of hard campaigning. Three great rulers made the dynasty militarily strong, territorially great, economically prosperous, and culturally brilliant. They were Li Shimin (r. 626–649), whose posthumous title is TAIZONG (T'ANG-TSUNG); Empress WU ZHAO (WU CHAO), who formally reigned between 690 and 705 but actually held power from 660; and Minghuang, whose posthumous title is XUANZANG (HSUAN-TSANG) (r. 712–756).

MILITARY EXPLOITS

Taizong was both a brilliant strategist and an unmatched warrior and was helped by outstanding generals. Their feats have become legend. Under Taizong the Eastern and Western Turks were soundly defeated. In submission they became vassals and proclaimed Taizong their heavenly khan, the first Chinese ruler to be so recognized. Under him Chinese power extended throughout Chinese Turkistan, across the Pamir Mountains into Afghanistan, and Central Asia, establishing a chain of client states, and for the first time Tibet came under Chinese suzerainty. In 648 a Tang force crossed into northern India and brought an offending local ruler to the Chinese capital Chang'an (Ch'ang-an) for punishment. After several invasions of Chinese forces into Korea (they had contributed to the downfall of the Sui) Empress Wu reached a compromise under which the new Korean SILLA DYNASTY acknowledged Chinese overlordship. With Tang power supreme, a new era of peace, the Pax Sinica, made travel and trade safe.

Four embassies from the BYZANTINE EMPIRE (called *Fu Lin* by the Chinese) came to Chang'an between 643 and 719, probably to enlist Chinese aid against the attacks of Islamic forces. In 638 the Sassanian king of Persia also sent an embassy to Chang'an, to enlist aid against the advancing Arabs. China did not intervene in either case but gave refuge to the fleeing Persians, including Firuz, son of the last Persian king, who was made a general in the Tang army. Persian refugees were allowed to build temples in Chang'an and other cities and practice their faith, Zoroastrianism. In 713 Minghuang received from SAMARKAND and Bokhara in Central Asia appeals for help against the advancing Arab armies, and an embassy from the caliph. Minghuang did not intervene in Central Asia. Chinese and Islamic

forces fought in 751, in a minor battle with big consequences. The Tang army, without court authorization, clashed with them and was defeated at the BATTLE OF TALAS RIVER. With the outbreak of the AN LUSHAN (AN LU-SHAN) REBELLION in 756 Tang garrisons in Central Asia were recalled, making the advance of ISLAM in this until now Buddhist region unopposed. Tang power never fully recovered even after the defeat of An Lushan and his supporters. Under warlike leaders the Tibetans would establish their power across northwestern China and dominate international trade.

POLITICAL INSTITUTIONS

The Tang government was modeled after that of the Han dynasty, with refinements. It consisted of the general administration, the censorate, and the military; the head of each division met the emperor daily. The general administration consisted of six ministries, with different responsibilities in supervising the local governments, receiving reports, and transmitting orders. There were 10 provinces whose borders accorded with geographic divisions; each was subdivided into counties that tied in number—there were 1,538 counties in 754.

Civil servants were increasingly selected through an examination system that began with triennial county exams; passing candidates would be eligible for provincial level exams; the successful ones could sit for the highest level exams, equivalent to a modern doctorate, held at the capital city. Those who passed were then tested on calligraphy, had their background checked for morals, and then took an oral exam to determine their ability to handle problems of administration and were checked for their appearance and speaking abilities. Successful candidates received the most coveted jobs, working for the government, where they were evaluated every three years for promotion and possible transfer. All officials received a salary.

The widespread use of paper made books more available and opened up educational opportunities for more people. The rigorous educational and examination systems were based on the Confucian Classics. China was the first civilization to develop a professional bureaucracy determined primarily by merit. The Tang legal code was based on the Han code; regular government officials administered the laws with the assistance of legal aids. The Tang legal code became the model for later Chinese codes and was copied almost verbatim by Japan in the mid-eighth century. Whereas feudal institutions remained in part under the Han, they had totally disappeared by the Tang. Noble ranks were awarded to members of the imperial family, the families

of the empress and consorts of the emperor, and meritorious officials. But the nobles were not granted land; instead they were supported by state stipends that varied according to rank.

Censors were unique to the Chinese political system. The most promising officials were regularly rotated to become censors and each government unit had censors among the officials. Censors were responsible for ferreting out abuses of power and misgovernment and could reprimand the emperor and even impeach members of the imperial family. Censors also acted as modern ombudsmen on behalf of ordinary people and could protect low-ranking officials from their superiors.

The military during the early Tang was called the *fubing* (*fu-ping*), or militia system, which young men from good families at age 21 vied to join, for glory and promotion. They became elite professional soldiers, serving in 600 garrisons that rotated between the capitals (Luoyang served as secondary capital) and the northern frontier, and were given land to cultivate to help support themselves, until retirement at 60. The Tang empire remained strong so long as the *fubing* system remained prestigious. However by the mid-eighth century martial spirit had declined; the militia could no longer rely on good quality soldiers and thus had to resort to mercenaries, and finally nomadic mercenaries recruited from among frontier tribes, commanded by their own officers. This state of affairs set the stage for the An Lushan (An Lu-Shan) Rebellion.

ECONOMIC AND SOCIAL SYSTEMS

The government took censuses at regular intervals. Government land distribution, taxes, and corvee labor assessments were based on census figures. At its height in 754 the census reported 9,069,154 households, equaling almost 53 million persons. This reflected not the total population, but the total taxpaying population, because nobles and officials were tax exempt, as were clergy, minorities (nomads and aboriginal peoples), and the poor, who were not included in census counts. Taxes were assessed in kind—grain and cloth (silk or hemp depending on location), and each able-bodied male was liable for 20 days a year of corvee labor (unpaid) on public works projects. The land tenure system in effect until the An Lushan Rebellion was called the “equal field system,” loosely based on the well-field system, supposedly created by the duke of Zhou (Chou) for the new Zhou dynasty in the 11th century B.C.E. Under the Tang system all land technically belonged to the state. At age 16 each male received 80 *mou* of land (about seven *mou* equal an acre) from the state

and could inherit another 20 *mou* on which he paid taxes and owed the state corvee service. At 60 years old his allotment fell to 40 *mou* and he was exempted from taxes. A widow was allotted 30 *mou* and 50 *mou* if she headed a family, and she was exempted from taxes. The equal field system was fairly well enforced on a large scale until the mid-eighth century, which brought domestic peace and presumed a very efficient bureaucracy. This system was also emulated in eighth century Japan. Improvements in agriculture, which included breast strip harnesses and draft horses, oxen-drawn plows, water-powered mills, and crude sowing machines among others, increased yield and raised the economy.

Domestic and international commerce increased. By the late Tang era merchants were using bills of credit and deposit that were the precursor of paper money. Confident and powerful, the Tang was the most cosmopolitan era in Chinese history. Chang'an was the largest city in the world with over 2 million people within a 36 square-mile walled city and beyond. Luoyang, Daming (Ta-ming), and Chengdu (Chengtu) each had around a million people. Peoples from many lands mingled in the great metropolises, worshipping in Buddhist, Daoist (Taoist), Nestorian Christian, Zoroastrian, and Manichean temples. Clothing and hairstyles from many lands were emulated by the fashion conscious. The Tang was also the golden age of poetry. In addition painting and sculpture flourished.

The Tang government never fully recovered from the An Lushan Rebellion. Few late Tang emperors were capable, and those who were did not reign long enough to assert their authority over powerful provincial leaders. The final collapse was brought about by another rebellion, lasting from 875 to 884. From that time until 907 Tang emperors were the puppets of powerful warlords, one of whom forced his captive emperor to abdicate in 907, ending the dynasty.

Tarascans

The Tarascans, like the MIXTEC AND ZAPOTEC, were non-Aztec, non-Maya Native Americans who lived in the area of west Mexico in what is now the state of Michoacán. The Spanish conquistadors referred to the people as Tarascans, which was actually a derogatory term that the indigenous Purépecha used for the Spaniards. In Nahuatl, a Mesoamerican language spoken by the Aztecs (their contemporary and antagonistic neighbors), Tarascan territory was called *Michoaque* (those-who-have-fish). One of the challenges to linguists is to understand the origin of the Tarascan language. It was unique, unrelated to Mayan, Zuni, or Quechua.

From the late Postclassic period until the conquest (1200–1524), these people inhabited an area of Mexico bounded on the south and west by Aztec-controlled lands and on the north by the Chichimecs, a group of roving Native Americans, inimical to whomever they encountered. The term *Chichimecs* does not refer to a specific group but a general term applied to a raiding people who varied in time and space with regard to their ethnic homogeneity, incorporating others as they traveled. The Tarascans themselves had incorporated so many Chichimecs that only about 10 percent of the Tarascans were not ethnically mixed.

At the height of the Tarascan empire, in 1450, their kingdom encompassed a huge area. Its former capital, Pátzcuaro, a group of islands in a lake of the same name (established in 1325), was moved to a larger area, Tzintzuntzan, which means “place of the hummingbirds.” Consistently with other Mesoamerican sites, there were pyramids with platforms and tombs. However, a distinctive structure unlike most pyramids was built on this site. The Tarascan pyramid called a *yácata* was round, rather than rectangular, and connected to a traditionally shaped pyramid by a passageway. Kings and royalty were buried inside. When a king or ruler died, many of his servants and family were killed so that he would not be alone in his journey to the world of the dead. Their skeletons have been found near his grave goods.

The social structure was complex with a hierarchy ruling various administrative centers, and various groups of crafts people and artisans. There were masons for stonework, musical instrument makers, *curanderos* (doctors), knife makers, silversmiths, and potters. They wore ear decorations called ear spools, some made of ultra thin sliced pieces of obsidian with inlaid sheet gold and turquoise. Although Europeans looted the metallic gold and silver riches of indigenous Mexicans, the natives valued turquoise more highly than either gold or silver.

Religious leaders identified themselves by wearing a gourd container for tobacco that was carried as a backpack. Tobacco played an important part in religious and healing rituals as it did in most New World cultures. Unlike in modern medicine, the doctor (rather than the patient) took the medicine to enter the world of the supernatural and consult with spirits to find a cure for the ill person. Tobacco prepared in strong quantities caused a trancelike state, which was necessary in order to reach the world of the spirits. Hallucinations and foaming at the mouth demonstrated that the shaman (doctor) had reached such a state.

When the ruling Aztec lord, Axayacatl, invaded Tarascan territory in 1478, the Tarascan soldiers outnumbered his 24,000 troops. The Aztecs were gravely injured and were forced to retreat. Although the Aztecs tried many times to conquer the Tarascans, it was not until the arrival of Hernán Cortés and the conquistadors that both the Aztec and the Tarascan cultures were destroyed. Perhaps history would have taken a different turn if the Tarascans had aided the Aztecs upon learning of the arrival of the Spanish in 1519. Instead, the Aztec messengers sent to warn the Tarascans from Tenochtitlán were killed. The last king, Tangaxoan II, gave up when confronted with the power of the European invaders. After he surrendered, the surrounding areas followed without resistance, many already weakened by the ravages of microbes introduced by the Spanish.

Tenchi (Tenji)

(626–672) *Japanese emperor*

The man who later became Emperor Tenchi played a major role in the coup d'état that ousted the Soga clan from power in Japan in 645. His reign was remarkable for the many steps taken to advance Japan by implementing reforms modeled on China. Three men ruled as emperor after the coup d'état until 661, when Emperor Tenchi ascended the throne. He was not formally enthroned until 668, probably because he was preoc-

cupied with a great fear regarding China's intentions toward his country.

The TANG (T'ANG) DYNASTY in China that Japan so admired and wished to emulate was at its zenith. It had sent strong forces against the states in Korea, subduing Paekche and threatening Koguryo and SILLA. Tenchi feared the resurgence of Chinese power in Korea and the impact that might have on Japan.

Even though the Soga clan had been ousted from power, the reforms that Prince SHOTOKU TAISHI, the great Soga regent, had begun were continued after 645. The decades after 645 were called the era of Taika or Great Reforms era, when intense attempts were made to move toward Chinese institutions of government and law. In 645 the future emperor, Tenchi handed over 81 estates and 524 artisans to the emperor, signifying his support of the central government claim that all land belonged to the emperor, as was the practice in China.

Perhaps because of fear of a Chinese invasion Tenchi ordered his brother, the crown prince (later to become Emperor Temmu), to take measures to tighten the central government's control over the administration and strengthen the army. He also built Chinese-style palaces for his administration at Otsu, perhaps to be safe in case of a Chinese invasion because Naniwa, the previous administrative center, was near the coast. There are accounts of Tenchi and his courtiers holding Chinese poetry parties at his palace, but none of their works have survived. Writing poetry in Chinese had become an honored cultural activity. In 668 he ordered his ally in the coup, Fujiwara Katamari, to head a board to compile a set of administrative laws and ceremonial regulations. Later accounts say that the completed administrative code consisted of 22 volumes, but they have not survived. In 671 he also promulgated a system of ranking for bureaucrats called "cap ranks."

Other measures Tenchi took to strengthen the authority of the central government included state control of Buddhist priests and temples. Emperor Tenchi's reign is significant in Japanese history because it represented further advances in Japanese government and culture based on the Chinese model.

Tibetan kingdom

The Tibetan kingdom was at its height during the seventh and eighth centuries. After 842 a schism in the ruling lineage led to decline, decentralization, and civil wars. The Tibetan kingdom submitted to GENGHIS KHAN in the early 13th century and formally acknowledged Mongol overlordship in 1247. Records of the Shang dynasty in China (ended c. 1122 B.C.E.) mention a tribal people called the Qiang (Ch'iang) living in the borderlands of western China. They later moved westward into the Tibetan highlands. Early Tibetan history is mostly gleaned from Chinese historical records, most notably the *Dunhuang Records* (Tun-huang Records). The rise of the Tibetan Kingdom was contemporaneous with the rise of the TANG (T'ANG) DYNASTY in China; its capital city was called Ra-sa (later Lhasa). In 641 Emperor TAIZONG (T'ANG-TSUNG) of the Tang dynasty agreed to marry his kinswomen Princess Wenzheng (Wen-ch'eng) to the Tibetan ruler. She went with a huge entourage of attendants and Chinese artisans and introduced many aspects of Chinese civilization, such as paper and tea, to Tibet.

During the same period Tibetan rulers sent representatives to India to learn about Buddhism; they introduced to Tibet a written script derived from Sanskrit. Tantric or Vajrayana Buddhism from northeastern India was introduced to Tibet; it replaced and assimilated Tibetan shamanistic beliefs called Bon. In 779 Buddhism became Tibet's state religion, monastic lands became tax-free, and monks enjoyed the same status as nobles, both groups owning the serfs who tilled the land.

The Tibetan kingdom reached its zenith between 755 and 797. Its ascendancy coincided with the AN LUSHAN (AN LU-SHAN) REBELLION that rocked the Tang dynasty in the mid-eighth century, and its aftermath when Chinese power was reduced. The rebellion compelled the withdrawal of Chinese garrisons from Central Asia, leading to the submission of some of the minor states in the region to Tibetan hegemony. Tibetan power penetrated into Gansu (Kansu) province in northwestern China and threatened both the strategic Chinese outpost at Dunhuang and Hami and even the Chinese capital Chang'an (Ch'ang-an).

To contain Tibet, Tang China made peace with its other neighbors, the UIGHUR EMPIRE in the north, the Arabs in the west, and the Nanzhao (Nanchao) in the south, after 787. In 792 the Tibetan army was badly defeated by the Uighurs. In 821–822 Tibet made peace with both China and the Uighurs. By the mid-ninth century civil wars within the royal family and wars between powerful nobles and monks had fractured the Tibetan kingdom.

In the early 13th century Tibet surrendered to Genghis Khan and was thus spared Mongol invasion. In 1247 it acknowledged Mongol overlordship and paid taxes to the Mongol court but was not subjected to a Mongol occupation force. KUBILAI KHAN converted to Tibetan Buddhism, greatly favored Tibetan monks, and encouraged his followers to convert. A Tibetan monk gave the Mongols a new written script called the Phagspa script named after its inventor; it replaced the earlier script based on Uighur.

JIU-HWA LO UPSHUR

Timurlane (Tamerlane)

(1336–1405) ruler of Central and Southwest Asia

Timurlane, or Timur the Lame, was the founder of the Timurid dynasty that lasted until 1506. Under the reign of the Timurid dynasty, culture, art, and trade experienced a successful revival and flourished in the region now known as Central Asia. During his military career of about 50 years cut short by his death by pneumonia in 1405, Timurlane's empire spanned most of Central and Southwest Asia, from the Indus River valley to the Black Sea.

On April 11, 1336, Timurlane, also known as Tamerlane, Timur Leng (Persian), or Tamarlang (Arabic), was born in Kesh, also known as Shahr-e-Sabz, situated at the edge of the mountains just south of SAMARKAND, which would be the future capital of his empire. He was the son of a Turco-Mongol tribal leader of Barlas. His father was the first of his tribesmen to convert to ISLAM, and the young Timurlane, a Sunni Muslim, learned how

to read the QUR'AN. In fact Timurlane often attacked the lands of infidels or other erring Muslims under the pretext of Islam, but this was only to justify his excesses. Similarly he maintained good relations with other Muslims for purely political reasons. His treatment of Muslims and non-Muslims who opposed him was similarly pitiless and brutal.

He earned the title Timur the Lame because of an injury in the leg sustained early in his life, either during a local rebellion, or by an arrow in the thigh shot by a farmer whose sheep Timur had stolen. Timurlane was very much inspired by another great leader and conqueror, GENGHIS KHAN, the great Mongol conqueror of the 12th and 13th centuries. Timurlane even claimed direct descent from Genghis Khan, although this has never been proved. Timur embarked on his grand quest to take over the world when he was only 21 years old. By 1358 he had already established himself as a military leader.

Timurlane's army consisted mainly of Turks and Turkic-speaking Mongols. He began his campaign by subduing rival forces in Turkistan. By 1370 both Turkistan and Samarkand were under his control. He established a stronghold in Samarkand, the capital city, in the form of a citadel in the western section with deep ravines around it. Samarkand became his favorite city, which he rebuilt into an opulent city with magnificent architecture in order to project himself as a wealthy and powerful ruler. He valued opulence so much that master craftsmen and artisans in each defeated country were spared from death. Instead Timurlane would employ them in order to build grand, imposing architectural structures in the lands that he conquered to reflect the grandeur and luxury of his empire. From his military base in the city, Timur launched attacks on neighboring lands. His objective was to conquer as many countries as possible in order to gain taxable domains.

Timurlane and his ally Mir Hussain conquered Transoxania in 1364 by driving out the Chaqatai (Jagatai) khans. Breaking away from Mir Hussain, Timur marched onward to Khwarazm, a fertile zone lying on the southern shore of the Aral Sea, in 1371, where war was to last another eight years resulting in a victory for Timurlane. Timurlane crushed the Chagatai khans and annexed territory in the Tian Shan (T'ien-shan) mountains after three years of warfare there.

Timurlane continued to conquer land westward until he reached Herat (present-day Afghanistan) in 1381, the land of Toqtamish Khan of the Golden Horde, a successor of Genghis Khan's world empire whom Timur had helped to conquer the White Horde. In 1386 Timur invaded western Iran, Iraq, and Georgia. The

Timurlane attacking the Knights of St. John at Smyrna. Miniature created by Bihzad, 1467.

method of massacre this time around was pushing men off the cliffs. In 1391 he took on Toqtamish. Toqtamish retreated, even though his forces were greater in number than those of Timurlane; as the morale of his forces dipped, Timur seized his land, harem, and treasures. Georgia was again attacked by Timurlane in 1399 and was defeated. In 1400 Timurlane advanced into Anatolia, which had recently become part of the OTTOMAN EMPIRE. Finally after taking Damascus and Aleppo, Timur faced his most formidable adversary, BAYEZID I, the Ottoman sultan. In 1402 Timur besieged Ankara and after a grueling battle Bayezid was defeated.

Timur was also known for his sadistic cruelty in dealing with those who stood in his way during his conquests. He often launched savage massacres of his enemies and resisters such as in Delhi, where he slaughtered 80,000 individuals and built grisly pyramids of their skulls to commemorate his victory. The same piling of skulls occurred earlier in Aleppo. In the late 1380s after a military rampage across the Middle East in Sistan, 2,000 people were laid in wet plaster and built into a briefly living tower. By the time he died, Timurlane had conquered expansive regions in Russia, Iran, India, and Central Asia. Most historians agree that if not for his death, he would have attempted to conquer China as well. Timur is buried in the ostentatious Gur Emir mausoleum, covered in gold leaf and lapis blue. His tomb is made of nephrite jade; in contrast his other family members were buried in marble tombs around him.

NURFADZILAH YAHAYA

Toghon Temur Khan

(1320–1370) *last Mongol ruler of China*

Toghon Temur Khan was the last ruler of the Mongol YUAN DYNASTY (1279–1368). He ascended the throne at age 13 in 1333 and ruled until 1368 when his dynasty collapsed. His Chinese reign name was Shundi (Shun-ti). KUBILAI KHAN, founder of the Yuan dynasty, ruled between 1279 and 1294. His son and heir predeceased him, and he appointed a grandson his successor, Temur Oljeitu, who ruled 1294–1307 and died without sons. The throne then became disputed, with short-reigned rulers being deposed, murdered, or dying young from lives filled with alcohol and dissipation. Because of his youth Toghon Temur's early years as emperor saw court intrigues and struggles for power. The most powerful man during 1333–40 was his chancellor Bayan. Bayan's goal was to restore the Yuan dynasty to its early glory by drawing a sharp line between Mongols and Chinese by forbidding Chinese to learn the Mongol language and banning intermarriages. He also banned Chinese from owning horses and iron tools, and, to combat opposition, he even proposed killing all Chinese bearing the five most common surnames. Fortunately, by this time the government had

insufficient resources to murder 90 percent of the total population who bore those surnames. In 1340 Bayan was ousted in a coup engineered by his nephew Toghto, who became chancellor.

Although now a grown man, Toghon Temur showed no interest in government, spending his time indulging in bizarre Lamaist Buddhist practices and general debauchery. Faced with a shortage of revenue he ordered printed huge amounts of inadequately backed paper money. By the 1350s natural disasters combined with massive mismanagement had led to nationwide general uprisings as bandits, religious sectarians, and other dissidents ran amok, which the by now decadent Mongol military could not suppress. The Yangzi (Yangtze) River valley first became the battleground of several Chinese rebel groups. Among them one leader of very humble origins, Zhu Yuanzhang (Chu Yuan-chang), emerged as a man of vision. In 1356 he seized NANJING (NANKING) from the Mongols and made it his capital.

While this was taking place Toghon Temur continued his life of debauchery as Mongol princes intrigued and fought one another in northern China for control. Zhu left Nanjing in August 1368 heading north at the head of his army. Toghon Temur fled his capital Dadu (T'a-tu) on September 10, back to the steppes of Mongolia, and died two years later, in 1370. Among his last recorded words were "My great city of Dadu, adorned with varied splendor; Shangdu [Shang-tu], my delectable cool summer retreat; and those yellowing plains, the delight and refreshment of my divine ancestors! What evil I have committed to lose my empire thus!"

JIU-HWA LO UP SHUR

Tours, Battle of

The first wave of Muslim expansion into Iberia, present-day Spain and PORTUGAL, began in 711 during the

reign of the Umayyad caliph Abd al-Malik. Led by a Berber commander, Tariq ibn al-Ziyad, this expedition landed in Gibraltar and was followed by further Muslim expansion and the foundation of an Umayyad dominion in Iberia, centered in the city of Córdoba. The Muslims were able to overcome the small states that existed in Iberia because of the fractured nature of Iberian Christendom. In 730 the Umayyad caliph Hisham ibn Abd al-Malik appointed a new governor, Abd al-Rahman al-Ghafiqi, of the Iberian Muslim state, known in Arabic as *al-Andalus*.

Despite their religious differences, some Muslim and Christian rulers signed treaties with one another and formed alliances in order to further their political goals. In 721 the army of Eudes, Christian duke of Aquitaine, defeated an Umayyad invasion force at Toulouse. However Muslim incursions into France continued, reaching as far north as the province of Burgundy by the mid-720s. Eudes formed an alliance with Uthman ibn Naissa, the Berber ruler of Catalonia, and when Uthman rebelled against Abd al-Rahman, he was dragged into a conflict with the Umayyads. After defeating Uthman's forces, Abd al-Rahman began to campaign against Eudes, defeating him in a fierce battle near the city of Bordeaux and the Garonne River.

Desperate for aid, Eudes turned toward the Carolingian Frankish ruler Charles Martel, agreeing to submit to his authority. Charles, son of Pippin the Middle and mayor of the Palace and ruler of the Frankish realms of Austrasia, moved his infantry army south to intercept Abd al-Rahman and tens of thousands of Muslim cavalymen heading toward the monastery of St. Martin in Tours.

In October 732 Charles positioned the Frankish army, which was made up entirely of armored infantrymen equipped with heavy shields and long spears, between the Muslim invasion force and the monastery of St. Martin. Abd al-Rahman's army, which was made up entirely of Arab and Berber cavalry, met the Franks near Tours and the two sides scouted one another's positions and skirmished for nearly a week before commencing battle on the seventh day. Abd al-Rahman's army was the larger of the two. The Frankish infantry formed into a tightly grouped phalanx and managed to repel successive Muslim cavalry charges throughout the day. Late in the battle Abd al-Rahman was killed while trying to rally waning Muslim forces and his army halted their attacks. With a substantial amount of captured treasure from their campaign in southern France, the Muslims decided to withdraw south back toward Ibe-

ria. In later campaigns, Charles continued to push the Iberian Muslims back across the Pyrenees Mountains and out of France.

Scholars, including the 18th century English historian Edward Gibbon, saw Charles's victory as a landmark moment in history when a Christian ruler halted Muslim forces from advancing farther into western Europe and establishing an Islamic state there. Because of his defeat of a much larger Muslim force, Charles was given the nickname *Martel* or "The Hammer" and continued to expand Carolingian power throughout France and Germany. His grandson CHARLEMAGNE would rule over a Frankish empire as one of the most powerful Christian rulers in Europe.

CHRISTOPHER ANZALONE

Truce and Peace of God

The Truce and Peace of God was an effort or movement by the Roman Catholic Church that applied spiritual sanctions to limit the violence of private war in feudal society.

The year 1000 was a fundamental turning point in European history. The feudal system as it had evolved since the CAROLINGIAN DYNASTY was undergoing change because of economic, political, and religious factors. European leaders began to cultivate imperial endeavors and were competing for natural resources and labor in order to expand their markets and acquire territories. The Truce of God was the solution to the problem of military groups taking the law into their own hands, prosecuting their own disputes without recognizing any authority, and confiscating lands. Prior to the development of the Truce of God, nobles became more powerful and contested monarchical authority,

especially in France. Villagers became victims of incessant warfare, and they were subjected to the claimed authority of military lords who promised to defend the weak in return for the fruits and produce of servile labor. People turned to religious authorities for protection. The Truce of God was therefore a political and religious response to the competitiveness of feudal society.

On the religious plane, the truce was a large peace movement spiritually connected to the millennial anniversary of Christ's life on Earth. The primary goal of the Truce of God was to protect church lands and rights. Church and municipal organizations cooperated to deal with violence and used religious and spiritual techniques to counter the aggression of armed knights. Churchmen were particularly interested in defending their properties because they were the largest landowners in medieval society.

While the Truce of God was a temporary suspension of hostilities, the Peace of God was considered perpetual. The Peace of God included only the clergy but eventually incorporated the poor, pilgrims, and crusaders. Although the Peace of God developed to include the laity (when they suspended judicial and military disputes), spiritual leaders expanded the Peace of God platform to establish sharp distinctions between the laity and the clergy, between the sacred and the secular. As the clerical establishment set limits to internal Christian warfare and sanctified violence against the enemies of Europe, in particular Muslims, the Peace of God spread from France to the German empire. Warfare against the enemies of God and the enforcement of the division between spiritual and physical authority were both concepts and agendas that united diverse Christian societies in Europe.

The popularity of the Truce of God was in part due to ancient devotions and the cult of the saints. Tradition supported new ideas and practices. Bishops and monks relied on saints and the relics of the saints to defend themselves. Churchmen convoked peace councils in order to convince warrior elites to take up the cross and oaths of peace. Churchmen reminded their flocks of the great martyrs and saints who endured torture and loss of property in return for divine favor. The memory of the sacrifices of the saints and martyrs inspired Christians to make sacrifices such as the cessation of hostilities.

These peace councils were first held in Aquitaine and Burgundy. In 975 Bishop Guy Le Puy called upon his community to protect the church from pillagers. Clerics across France formulated peace canons, and territorial

princes formed peace movements centered on the cult of local saints and shrines containing relics. Prelates organized peace militia that protected monastic holdings and persecuted heretical groups.

At the Synod of Arles in 1041, clerics, especially Cluniac monks, banned the shedding of Christian blood and suggested that Christians could not fight other Christians from Thursday to Monday morning (in commemoration of Christ's passion), and important feast days such as Lent.

Christian leaders encouraged military elites to divert their aggression toward the non-Christian, thus preparing a crusading spirit, which would manifest itself in the First Crusade in 1095. In 1095 Pope URBAN II authorized the war against Muslims in the Holy Land on the basis that God would approve such noble efforts. Church leaders also encouraged powerful lords to centralize their government, redirecting the military power of the knights against the infidel. The most powerful lords were the kings, who by the 12th century began to enforce their own programs of national peace, monopolizing violence against infidels and heretics. The struggle for power among the nobility resulted in new feudal relationships as new families came to prominence. Noble families fortified their holdings by establishing primogeniture.

With the consolidation of principalities and kingdoms and the stabilization of society by means of the implementation of the Peace and Truce of God, Europe became imperialistic and developed colonial projects. The European economy expanded because of higher agricultural yields, commercial development, demographic growth, the establishment of universities, and the implementation of reform programs that converged with the rise of the papal monarchy, the enforcement of disciplinary mechanisms, and the execution of policies of conquest.

AURELIO ESPINOSA

Tughlaq dynasty

The Tughlaq dynasty was one of the dynasties ruling India collectively referred to as the DELHI SULTANATE. Most historians mark the years of Tughlaq dynasty from 1321 to 1414. The Tughluq family was a Muslim clan that originated in Turkey. A number of alliances with Turks, Afghans, and other Asian Muslims characterized most of the Tughluq rule.

In 1320 the last ruler of the Khilji dynasty, Nasir-ud-Din Khusro, confronted the governor of Punjab, Ghazi Malik, in a battle near Delhi. Khusro, a Hindu who had converted to ISLAM, began a purge of Muslim military officers while appointing Hindus in their place. This created a great deal of unrest throughout India. Ghazi Malik and his forces were victorious in the battle and he proclaimed himself king of Delhi. Malik followed with an attempt to locate a rightful successor to the Khalji dynasty. A successor could not be found and sentiment grew for Malik to follow Khusro. Soon after, Ghazi Malik changed his name to *Ghiyas-ud-Din Tughluq*. Ghazi Malik's ascension to power was the beginning of the Tughlaq dynasty.

Upon taking power, Tughluq commenced a policy of exterminating the former allies of Khusro. In addition, Tughluq introduced a series of administrative reforms in order to restore order throughout the kingdom. In 1325 Ghiyas-ud-Din Tughluq viewed a parade of elephants captured during the conquest of Bengal while sitting in a specially constructed pavilion. The elephants caused the viewing pavilion to collapse, causing the death of both Ghiyas-ud-Din Tughluq and his son, Prince Mahmud Khan. Some experts suggest that the incident was not an accident, but a plot to end Ghiyas-ud-Din's regime. Another son of Ghiyas-ud-Din, Muhammad bin Tughluq, followed as ruler. Muhammad introduced a number of experimental reforms.

Most notably Muhammad transferred the capital and all government officials, army, servants, and a number of citizens from Delhi to Daulatbad. In addition Muhammad allowed the production of copper coinage, which, ultimately, led to severe devaluation of local currencies. Muhammad bin Tughluq's reign included a number of internal revolts as well as incursions from Mongol invaders. The most significant development during Muhammad's rule was the 1328 invasion by Mongols. In 1350 Muhammad died and was followed by his cousin Firuz Tughlaq.

Firuz Tughlaq assumed the role of sultan in 1351. Militarily, his reign resulted in a loss of territory while his

financial policies brought economic successes. Firuz supported a number of improvements in the infrastructure—including irrigation and construction projects. In 1351 the Hindu region of the south regained its independence.

Upon Firuz's death, the Tughlaq dynasty began to disintegrate even more. Ghias-ud-din Tughlaq II reigned from 1388 until his murder in 1389 and was followed by Abu Baker. Abu Baker fell to the youngest son of Firuz Tughlaq, Naser-ud-din Muhammad, who ruled from 1390 to 1394. Humayun followed for one year. In 1395 the last of the Tughlaq dynasty, Mahmud Nasir-ud-din, grabbed power until 1413. TIMURLANE'S (TAMURLANE'S) invasion of the subcontinent from Central Asia ultimately brought a final chapter to the Tughlaq monarchy, which had been slowly disintegrating from within.

MATTHEW H. WAHLERT

Tului Khan

(c. 1190–c. 1231) *Mongol leader*

Tului (or Tolui) Khan was the fourth son of GENGHIS KHAN and his principal wife, Borte. He was a warrior and a heavy drinker and as his brothers he accompanied his father on campaigns and also commanded troops. To minimize tensions among them Genghis had divided his empire among his sons shortly before his death in 1227. According to Mongol custom the oldest son is assigned lands farthest away from the paternal homeland. Since the eldest son, Juji, died six months before his death, Genghis gave Batu, eldest son of Juji, the westernmost conquest, which included Russia, called the khanate of the Golden Horde. His second son, CHAGATAI KHAN, received most of Central Asia. His third son, OGOTAI KHAN, received western China and parts of Central Asia and was nominated (subject to confirmation by the Mongol council, or *kuriltai*) *khaghan*, or khan of khans. Tului was given the homeland, Mongolia (Mongol custom gave the youngest the paternal homeland)

plus northern China and the bulk of the main Mongol military forces of over 100,000 men. His control of this force would greatly benefit the fortune of his sons as they competed for control of the inheritance of Genghis Khan.

In 1203 after defeating his former ally the Kerait confederation (another nomad group), Genghis took its leader Ong Khan's two nieces as war booty. He kept one as a minor wife for himself and wed the other, Sorghaghtani Beki, to Tului. She and Tului had four sons, MONGKE KHAN, KUBILAI KHAN, HULAGU KHAN, and Arik Boke. Since Tului was away campaigning much of the time and died young of alcoholism, his wife was influential in raising her sons. She is credited with raising them not only to be hunters and warriors as Mongol tradition dictated, but also to read Mongol in the newly created Uighur script, to be religiously tolerant (she was a Nestorian Christian because of her Kerait heritage), and to attend to administration.

After Tului died Ogotai Khaghan attempted to marry Sorghaghtani Beki or have his son marry her (under Mongol custom), thus uniting the two branches of the family. She was able to avoid marrying them, with the plea that she had to raise her sons. She also obtained an appanage, or fief, in northern China in present-day southwestern Hebei (Hopei) province, which she supervised conscientiously. Her second son, Kubilai, also received an appanage, which he first entrusted to alien managers who abused the population. Later under Sorghaghtani Beki's influence, he took a personal interest in it and improved its administration.

Ogotai died in 1241. His powerful widow became regent and maneuvered the Mongol leaders to elect her son Guyuk as the third khaghan in 1246. Guyuk died in 1248. In a succession struggle that followed Sorghaghtani Beki, with the support of Batu Khan of the Golden Horde, won election for her oldest son, Mongke, in 1251. Mongke raised Tului posthumously to the position of *khaghan* and buried him next to Genghis Khan; he also ordered the official worship of Genghis Khan and the veneration of his father, Tului Khan. His younger brother, Kubilai Khan, followed Mongke as *khaghan*.

Uighur Empire

From the fifth century Turkic tribal groups under various names were found living beyond China's northern borders from Korea to Central Asia. With China divided the Turks first preyed on, then conquered and ruled parts of northern China in many short lived dynasties. With the rise of the TANG (T'ANG) DYNASTY (618–909), the tables turned. TAIZONG (T'AI-TSUNG, r. 626–649) defeated both the Eastern and Western Turks, accepted their vassalage, and was proclaimed their heavenly khan.

The Uighurs were a branch of Turks organized into 10 clans and lived primarily a nomadic life in the steppes of Mongolia north of China. In the mid-eighth century they became the most powerful nomads in the region, and under Kaghan Ku-li p'ei-lo established an Uighur Empire, which was a client state of the Tang. This ambiguity of status is apparent from the kaghans' claim that they were appointed by heaven, though they simultaneously sought and received appointment to their positions from the Tang court. A permanent capital was established at Karabalghasan in Mongolia but the Uighurs continued to live in tents and the kaghan's palace was a large golden tent that could hold 100 people. The Uighur state prospered under Ku-li, his son Mo-yen-ch'o (r. 747–759), and his son Mo-yu. The AN LUSHAN (An Lu-Shan) REBELLION (755–763) elevated the Uighurs from being vassals to useful and difficult allies of the Tang. Kaghan Mo-ye-ch'o answered Suzong's (Su-tsung, successor to Ming Huang, who abdicated in disgrace in 755) call for help. In 757 the Uighur cavalry arrived from Mongolia

and helped recapture the Tang eastern capital Luoyang (Loyang) from the rebels. The Tang had to pay a high price for the assistance—as agreed to beforehand the Uighurs were allowed to loot Luoyang for three days. Later in the rebellion in 762, a Sino-Uighur force retook Luoyang. Again the Uighurs looted the city, including the palaces; massacred thousands; burned down Buddhist temples; and committed other acts of cruelty. Many other cities in northern China also suffered destruction and looting by the Uighur “allies.”

Another result of Uighur military assistance was a series of marriages between members of the two ruling houses: Members of the Li imperial clan married Uighur princesses and a total of seven principal wives (out of 13) of Uighur kaghans were Tang princesses, including three who were daughters of reigning Tang emperors (others were adopted daughters). Uighurs continued to demand and receive costly gifts from the Tang court after the end of the rebellion and also enjoyed favorable terms of trade with the Chinese, for example receiving 40–50 bolts of silk for each horse, which was far above the fair value. The decline of Tang power in the Western Regions also profited the Uighurs, who charged high tolls for trade goods in transit. The year 790 was the last time the Tang and Uighur armies campaigned together, against the TIBETAN KINGDOM, which had also grown powerful as a result of the An Lushan Rebellion.

While in Luoyang in 762 the Uighur *kaghan* Mou-yu converted to Manicheism, choosing it over Buddhism and Nestorian Christianity. As a result Manicheism became the official religion of the Uighur state. This move

was welcomed by the Tang court, which hoped that the adopting of this peaceful religion would make the Uighurs less violent. At the kaghan's request China allowed the building of Manichean temples in Louyang and several additional important cities. Because the Sogdians were responsible for converting the Uighurs to their religion, Sogdian influence over the Uighurs was enhanced. An alphabet, based on the Sogdian script, was created for writing Uighur, which until then had no written language.

Until this time all contemporary written knowledge about the nomads in contact with China came from Chinese sources. Many Tang government bureaus, such as the ministry of war, court of diplomatic reception, and provincial officials, gathered and kept records on the geography, customs, clothes, and products of the Uighurs and other border peoples. Naturally they focused on how the nomads impacted on China and reflected the Chinese perspective. In the 20th century archaeologists discovered two steles in Karabalghasan and in northern Mongolia with inscriptions in three languages: Chinese, Sogdian, and Uighur. Some documents in the Uighur language have also survived, preserved in the caves of Dunhuang (Tunhuang) in western China.

Two dynasties and 13 kaghans presided over the Uighurs during their century of power; five were assassinated; several others were overthrown. Uighur politics was unstable because of tribal politics and much depended on the ability of the kaghan to maintain control over autonomous chiefs. Social changes that resulted from increased wealth and power after the mid-eighth century undermined traditional Uighur society and economy, from nomadic to semiagricultural, and subsistence to dependence on imported luxuries. The new religion created tensions between traditionalists and Manichean converts; Manicheanism also made the Uighurs less warlike. Aggressive neighbors, Tibetans, and especially the appearance of another group of warlike nomads called Kirghiz began to encroach on Uighur territory. In 839 a famine and pestilence hit. By 844 the Uighur state had collapsed, never to rise again.

Umayyad dynasty

After Ali's death and his son Hasan's renunciation of the caliphate, Muaw'iyah became the undisputed caliph of the Muslim world in 661. He established a hereditary dynasty with Damascus as its capital. However, unlike in most western monarchies, succession was not based on primogeniture; the ruler selected anyone within his family as the chosen heir. However, the undisputed claim of the Umayyad family to the caliphate was short lived.

When Muaw'iyah died in 680, his son Yazid's claim to the position was immediately challenged by Ali's younger son Husayn. Yazid's forces inflicted a stunning defeat over Husayn and his Shi'i followers at the Battle of Kerbala but the victory was bittersweet as it resulted in the permanent division of the Muslim community into the orthodox, majority Sunnis, who accepted the legality of the Umayyad rule, and the Shi'i, who did not. Internal divisions, especially from Iraq and Khurasan, an eastern province of the old Sassanid empire in Persia, were persistent problems during the Umayyad reign. The Umayyads appointed Hajjah ibn Yusuf al-Thaqafi to control the rebellious provinces of Iraq and he was fairly successful in putting down the sporadic, but persistent rebellions. He was responsible for appointing governors for Khurasan as well.

In the first years of the empire the administration was fairly decentralized and Greeks and Copts held many major bureaucratic positions. Muslim judges (*qadis*) were appointed but they dealt only with the Muslim population. The majority non-Muslim population retained their own communal systems. Under Abd al-Malik (r. 685–705), the Umayyad empire became more highly centralized. He established a national mint and the process of Arabization of the vast Umayyad territory spread as Arabic became the lingua franca of the empire. Arabic became the language not only of ISLAM but of trade and government. Provincial governors were appointed to administer the far-flung territories but when the caliphs were weak and central control lessened, these governors often became political powers in their own right.

The boundaries of the empire continued to widen as Abd al-Malik personally led his troops into battle. His able commander Hasan ibn Nu'man took Tunis in North Africa in 693; the Berber population subsequently converted to Islam and was largely responsible for the spread of the faith into Spain.

Abd al-Malik also paid for the construction of the Dome of the Rock mosque in Jerusalem. Built on the site where Abraham was willing to sacrifice his son

Isaac, it was also the site of Solomon's temple and the prophet MUHAMMAD's miraculous ascent into the heavens. Muslims referred to the site as the Haram as-Sharif (Sacred Mount), while it was known as the Temple Mount to Jews. Thus the site had holy meaning for all three great monotheistic religions. Completed in 692 the Dome of the Rock remains one of the most notable architectural achievements of the Arab/Islamic empire. The great Umayyad Mosque in Damascus was completed in 705. Essentially secular rulers the Umayyads also built numerous fortresses and hunting palaces.

The Umayyad empire reached its furthest geographic limits under Caliph al-Walid (r. 705–715). The Berber commander al Tariq led Muslim forces across into Spain in 711 and established a foothold at Jabal Tariq or Gibraltar. To the Arabs, the Spanish province was known as *al-Andalus*, or land of the Vandals. Within a few years Muslim armies had moved across the Pyrenees into France. Muslim armies were halted in 732–733 by Charles Martel at the BATTLE OF TOURS, marking the farthest point of Muslim conquests in western Europe. In the east, Muslim armies conquered Afghanistan and territory across the Indus River deep into India, where they made numerous converts among the Buddhist population. Attempts in 670 and subsequently to take the Byzantine capital Constantinople all failed and the Byzantine Empire was able to survive until the 15th century.

In contrast to his predecessors, Caliph Umar II (r. 717–720) was known for his religious piety. He proclaimed the equality of all his subjects, Muslims, Arabs, or non-Muslims, but he also established some differentiations based on dress whereby Christians were forbidden to wear silk garments or turbans in public. The collection and distribution of tax revenues were a perennial problem for the Umayyads. Provincial governors were often reluctant to send monies to the state, preferring to spend revenues in their own localities. The Umayyads never established an effective centralized means of fiscal control. Under ISLAMIC LAW the non-Muslim population had not been forced to convert and non-Muslims or Dhimmis remained the majority of the population throughout most of the empire. Dhimmis paid land tax in addition to a poll tax from which Arab Muslims, the original conquerors, were exempt. In addition Muslim Arabs also received a state stipend.

As more non-Arab subjects converted to Islam, revenues flowing into the central treasury decreased. The Umayyads attempted to replenish revenues with ambitious land reclamation and irrigation schemes to increase agricultural productivity. The revenues from these projects went to the state. Under Caliph Hisham (r. 724–743)

Abd al-Malik paid for the construction of the Dome of the Rock mosque in Jerusalem, completed in 692.

land tax was to be paid whether one had converted or not, although converts did become exempt from the poll tax. The non-Arab Muslim population was gradually absorbed into society although the social cleavages between the elite Arab population, represented by the Umayyads, and more recent converts remained. Slaves were at the bottom rung of the social and economic strata. Most slaves were acquired as property in wars, but some were purchased through slave trading.

By the eighth century the Umayyads faced mounting economic problems. Revenues for the state and its huge army declined as conquests largely ceased. Unpaid soldiers posed a constant problem of rebellions in the provinces. In its final years the Umayyad Empire was also plagued with internal problems over succession to the caliphate. In 750 the Umayyads lost a major battle to the rebellious Abbasids, who enjoyed support from the Khurasan province. The caliph Marwan fled to Egypt but was pursued and killed. Except for Abd al-Rahman most of the Umayyad family was also assassinated. Abd al-Rahman managed to escape and established an Umayyad dynasty in Córdoba, Spain. With the end of the Umayyad dynasty a new Muslim elite of Persian and then Turkish origins emerged under the Abbasid empire.

Although it had been built on Islamic conquests, the Umayyad Empire was essentially a secular dynasty. Umayyad rulers, with the exception of the pious Umar II, were known for their lavish secular lifestyles and sumptuous courts. They were pragmatic rulers who opposed those who wanted to establish a religious state.

Under the Umayyads, Dar al-Islam (House of Islam) was a confident, largely self-sufficient empire that covered vast territories made up of many diverse peoples.

JANICE J. TERRY

universities, European

The first medieval universities grew up in Italy, France, and England, beginning in the late 11th century. At that time Europe began to undergo the commercial revolution. More people made their living by manufacture of goods and trade, and currency started to develop. The commercial centers of Europe, towns, increasingly became the centers of political and cultural life. As the merchants and craftsmen organized themselves into guilds, in order to regulate and promote the interests of their trade, professional teachers, or masters, also organized themselves into institutions that had a corporate legal identity and inter-

The date of the founding of the university of Oxford is uncertain, but the pope sanctioned degrees from there in 1254.

nal standards and practices. The universities emerged in an era of increasing mobility, growing social and cultural unity, and great intellectual energy in western Europe, both manifesting and contributing to those trends.

Up to the time of CHARLEMAGNE (c. 800) education took place primarily in the monasteries, and its aim was fundamentally the development and transmission of religious knowledge and the training of monks. From the seventh century, cathedral schools developed under the direction of masters, to train clerics, princes, and nobles outside the monasteries in western Europe, but often this education covered only the most basic intellectual skills. The schools multiplied and grew in depth and importance under the reign of Charlemagne, who sought to raise the level of culture in his empire and to cultivate competent church officials and civil administrators. Intended as centers of culture in the new empire of the Franks, schools now were connected with the royal court and cathedrals, as well as with the monasteries.

Under Charlemagne and more particularly under the direction of his administrator, ALCUIN of York, the basic medieval curriculum was developed, consisting of the seven liberal arts, subdivided into the trivium (logic or dialectic, grammar, and rhetoric) and the quadrivium (arithmetic, music, geometry, and astronomy). The higher fields of learning were law, theology, and medicine. Emphasis on one or another of the liberal arts varied during the medieval period and is a good index of the prevailing mode of intellectual activity in a given time and place. In France and England the new schools soon joined together to form universities of studies, corporate societies representing the teaching profession, which were modeled on the guilds of skilled tradesmen. The universities held juridical status, with legal rights and privileges, including the right to organize their own affairs, and even to keep their own police force to maintain order in the sections of the cities where the schools had come together. In Italy the roots of the university lay in the gathering of students around experts in Roman law, who contributed to the ordering of the complex mass of canonical and civil laws developed in the early Middle Ages.

Undergraduate instruction involved lectures and disputations. The basis for both was a collection of classical texts from the area under study. The disputations dealt with questions raised by the text, attempting to resolve them through a counterplay of arguments. The basic degree conferred by the university was the baccalaureate, which followed the completion of a course of studies. Examination requirements varied from university to university. In some universities, especially in Italy,

attendance at lectures was sufficient; at others students had to demonstrate their skill in a disputation. Students who continued went on for their license to teach at the university level and eventually for the highest degree offered, that of a master, or doctor.

The first of the medieval universities developed within a fairly short span of time across a wide geographical expanse. The universities of Paris and Bologna both have laid claim to being the first western European university, with their foundations dated to sometime in the late-11th to mid-12th centuries. The date of the founding of the university of Oxford is uncertain, but the pope sanctioned degrees from there in 1254. There were differences between the Italian and northern European and Spanish universities. The Italian universities, rooted in associations of teachers of Roman law, concentrated on law and medicine and gave less emphasis to theology and arts. Italian universities awarded doctorates, but almost never baccalaureates. Their students were usually 18–25 years old, somewhat older than at the northern universities. In Italy the majority of professors were married laymen, while in the north and Spain most were clergy. Instruction in Italy was through public lectures, and at Paris and Oxford teaching mainly took place in residential colleges. In Italy, there were no teaching colleges.

The development of the universities was perhaps the chief social and cultural achievement of the Middle Ages. All the medieval universities had some regulations for the awarding of degrees, and thus served to institutionalize research and education. Of the 81 universities established by the time of the Reformation, 33 had a papal charter, 15 a government sanction, 20 both, and 13 none. They reflected and contributed to the growth of European social and cultural unity; the teachers and students in the more prominent universities were drawn from a wide variety of places. Above all the universities fueled and channeled the intellectual energy of their social milieu. Though often caricatured and sometimes ridiculed, they promoted serious research and sponsored the audacious project of attempting to integrate the whole of human knowledge.

JOHN P. YOCUM

Urban II

(c. 1035–1099) *pope*

Born in France to a noble family, Urban II was elected pope in 1088 when the papacy was still in exile from Rome. He did not enter Rome as pope until 1094. Urban had been educated in church doctrine and had served the church in France and Germany as a papal legate. Urban supported reforms to draw the clergy away from worldly pursuits and toward monasticism.

When Alexios I Komnenos, the emperor of the BYZANTINE EMPIRE based in Constantinople, sent an urgent plea for military help in fighting the Seljuk Turks who had taken the holy sites in Jerusalem, Urban responded with a rousing speech at the Council of Clermont I 1095. Addressing his audience in French, Urban called for the Franks, a “race chosen and beloved by God,” to take arms against the Muslim infidels. Urban directed his request to French Christians; Spanish Christians were expected to fight in Spain against Muslim control of the Iberian Peninsula.

Urban promised immediate remission of sins to all those who fought on the land or sea against “the pagans.” Reflecting the religious intolerance of the time, Urban cursed the Muslims as “a despised and base race, which worships demons” and urged those “who have been fighting against their brothers and relatives now to fight in a proper way against the barbarians.”

Thus Urban II launched the first of many Christian crusades against Muslim control over Palestine and the holy sites and set in motion a protracted period of conflict and, ironically, trade and transmission of ideas and culture, between Christian Europe and the mainly Muslim east.

JANICE J. TERRY

Urbino

The origins of the city of Urbino in northern Italy begin with the Roman city of Urvinum Mataurense (the little city on the river Metaurus). The region is rich in Roman history. During the Second Punic War, during Hannibal the Carthaginian's invasion of Italy, his brother Hasdrubal followed him with another army. However lacking the military skill of his sibling, Hasdrubal faced the Romans under the consuls Livius Salinator and Claudius Nero in battle on the banks of the Metaurus River in 207 B.C.E. Hasdrubal was defeated, and his severed head flung into Hannibal's camp.

Urbino was one of the battlegrounds after the fall of the Western Roman Empire in 476. During the efforts of the Eastern Roman emperor Justinian I (r. 527–565) to win back imperial territory in Italy, Urbino figured in the campaigns of the emperor's great warlord, Count Belisarius. In 538 Belisarius seized Urbino from the Ostrogoths, but he was forced to confront an attack by the Persian Empire in the east before the reconquest of Italy was complete. Justinian's other great general, Narses, achieved this by 552. Thus, for a time at least, Justinian succeeded in recreating a unified Roman Empire through the successes of his two great commanders.

However the eastern empire was unable to maintain its hold on Italy. With the collapse of the Ostrogoths, the Lombards became the dominant power in Italy. They would rule until the eighth century, when in 774 their realm fell to the future emperor CHARLEMAGNE. In 800 Charlemagne became emperor of the new HOLY ROMAN EMPIRE, reigning until his death in 814. His empire fractured after his death amid dynastic squabbles among his sons. Finally in 839 Louis II, as Holy Roman Emperor, became supreme in northern Italy.

During the Middle Ages, with the decline of the Holy Roman Empire in Italy, Urbino became involved in the wars of the ITALIAN CITY-STATES. In 1200 Urbino came under the power of the local lords of Montefeltro, with Bonconte de Montefeltro becoming the effective ruler. Although Urbino rebelled against the Montefeltros in 1228, the family restored their rule by 1234. While Italy

was riven by the struggle between the Guelfs, who supported the papacy, and the Ghibellines, who sided with the Holy Roman Emperors, the Montefeltros generally supported the Imperial Hohenstaufen dynasty.

At the dawn of the ITALIAN RENAISSANCE great cultural activity occurred in the same time as civil strife. Federico of Montefeltro, who reigned in Urbino from 1444 to 1482, established a court that could give him claim to being one of the first great princes of the Italian Renaissance. He was a successful *condottiere*, or mercenary captain, and lavished the riches he gained on his court. Piero della Francesca studied art with the precision of a mathematician, doing ground-breaking work in the application of perspective to the emerging Italian art. Federico's court was centered on the grand Palazzo Ducale in Urbino, which was built over a period of 30 years.

Northern Italy at this period also benefited from economic prosperity. Commercial elites from the middle class grew wealthy on trade and sometimes were the equals of Italian nobility through their trade, which literally moved through much of the known world. Sometimes Italian nobles who had fallen on hard times would marry daughters of the emerging mercantile class. This not only meant a needed infusion of wealth into their depleted coffers, but also added the cachet of nobility to the merchant families involved in these marriages.

The Renaissance was marked by a rediscovery of the knowledge of the ancient world, which the Eastern Roman, or Byzantine, Empire had kept alive for over 1,000 years since the fall of the western half in 476. Byzantine scholars like Georgius Gemisthos Pletho and his student MANUEL CHRYSOLORAS brought learning to Florence; from there they spread it throughout Italy. When Constantinople fell to the Ottoman Turks under Sultan Mehmed II in 1453, while Federico ruled in Urbino, many refugees including scholars fled to Italy. The Montefeltro dynasty and Urbino as a vibrant city-state ended in 1502. In that year the murderous Cesare Borgia deposed Guidobaldo da Montefeltro, duke of Urbino. Thereafter Urbino became part of the PAPAL STATES.

JOHN F. MURPHY, JR.

Valla, Lorenzo

(1407–1457) *humanist and grammarian*

Erudite and unmatched in his pursuit of scholarly activities, Valla is regarded by many historians to be the outstanding humanist scholar of the 15th century. His criticisms of sacred documents, coupled with his acerbic style and his arrogance, gained him the enmity of fellow humanists and religious officials. Nevertheless he managed to survive inquisitorial investigations and charges of heresy. The impact of his writings reverberated into the next century. They continued to anger church officials but had a positive influence on humanists such as Erasmus and gained acceptance in Protestant circles. Valla received a humanistic education in the Rome of his birth and was well versed in Greek and classical Latin.

He was familiar with the works of Cicero and Quintilian but preferred the Latin style of the latter. Denied employment in the papal curia, he accepted a position in rhetoric at the university of Pavia. Because of controversy over his critique of Scholastic thought, he resigned after two years. From there, he moved to the court of King Alfonso the Magnanimous of Naples, at that time a budding center of humanism. Valla was at the king's Neapolitan court for several years, where he served as secretary and historian to Alfonso. He participated in humanistic discussions and literary disputes while working on a number of his most important treatises. He moved to Rome at the invitation of the humanist pope Nicholas V in 1448. In Rome he presented the

pope with Latin translations of Herodotus and Thucydides, continued his writing, and taught rhetoric. Valla ended his career in the service of Pope Calixtus III.

Several of his works demonstrate the range of his scholarship. *On Pleasure*, 1431, later amended and retitled *On the True and False Good*, contrasts Stoic, Christian, and Epicurean views on pleasure. A controversial work when it was written, it continues to arouse disagreement among historians. His *Elegances of the Latin Language* extols the virtues of classical Latin and condemns medieval Latin as barbaric in grammar and style and unfit for use. The *Elegances* influenced the content of Renaissance Latin grammar manuals and helped to shape the nature of the *studia humanitatis*, the liberal arts curriculum of the Renaissance. It is recognized as a precursor of modern-day linguistic studies. From the perspective of historical criticism, Valla's most important treatise is his critique of the *Donation of Constantine*, a document that was supposedly issued by the Roman emperor Constantine that allegedly transferred temporal authority in the European west to the papacy.

Valla utilized his knowledge of history, geography, and Latin to demonstrate the existence of anachronisms in the document and declared it to be a forgery. He criticized other hallowed documents, including St. Jerome's Latin Vulgate and the Apostles' Creed, which, he argued, had not been composed by the apostles. Valla also wrote a history of Alfonso's father, King Ferdinand of Aragon. Shortly before his death in 1457, he composed an *Encomium on St. Thomas Aquinas*.

LOUIS B. GIMELLI

Venice

The city of Venice with its famous canals traces its origins back to a small settlement in the Venetian lagoon where St. Mark, one of the authors of the Gospels and a friend of St. Paul, landed on his way to Rome. With the collapse of the Roman Empire, and the sacking of Rome by Alaric and the Visigoths in 410, many people fled into remote parts of the countryside, and some found refuge in the islands in the lagoon. This led to the founding of Venice in 452. It and neighboring settlements grew,

and by the sixth century there was a type of federation formed by which the communities elected a regional authority. In 697 Paolo Zucio Anafesto was elected as the first doge, and he ruled the area under the nominal control of the Byzantine Empire. In 726 Venice founded its navy under Doge Oro Ipato, and in 787 this navy helped in the overthrow of the Lombards. In 810 at the peace of Aix-la-Chapelle, the Holy Roman Emperor CHARLEMAGNE ceded the control over Venice to Byzantium, and in the following year the seat of government in Venice was moved from Malamocco to the Rialto.

The main church in Venice, St. Mark's Basilica, was originally built in 828 after the body of St. Mark was taken to Venice from Alexandria. It was said that an angel had foretold that the saint would be buried in the place he had landed when he was brought to Italy. The doge who was responsible for the first basilica was Giustiniano Participazio, and the building was consecrated in 832. However this structure was destroyed by fire in 976, in an uprising against the doge.

The rebuilt basilica was demolished in 1063 and Doge Domenico Contarini had a much larger one constructed. This was finally consecrated in 1094 and was officially the private chapel of the doge until 1807, when it became the city's cathedral.

Venice's famous St. Mark's Basilica was built in 828 after the body of St. Mark was taken to Venice. It was said that an angel had foretold that the saint would be buried in the place he had landed when he was brought to Italy.

Venice grew as a naval power but in 839 was defeated by the Turks at the Battle of Taranto. In 932–939 they managed to conquer lands in Istria, and in 999–1000, the doge Pietro Orseolo II conquered Dalmatia (modern-day Croatia). In 1081 Byzantium was forced to cede sovereignty over Venice with the signing of a commercial and political treaty. The next threat to Venice came from the Normans, but the Venetians were able to defeat them at Butrint in modern-day Albania in 1085. By the 10th and 11th centuries Venice had emerged as an important trading port, prospering greatly during the First Crusade of 1095. Further crusades and trade with the Holy Land led to massive wealth flowing to the merchants of Venice, who had gained exemption from tolls from the Byzantines. The city was rapidly emerging as a challenge to the authority of Constantinople. In 1124 the Venetians took the city of Tyre, a port in the Holy Land.

Doge Enrico Dandolo persuaded the crusaders of the Fourth Crusade to attack Constantinople, and they captured the city in April 1204. Many great treasures and pieces of art were brought back to Venice, including the four horses that have been displayed in St. Mark's Square, with the exception of the period when Napoleon Bonaparte took them to Paris. Much of the Byzantine lands was occupied by Venice, which established an empire occupying the eastern coast of the Adriatic—modern-day Slovenia, Croatia, Montenegro, Albania, as well as parts of Greece. Venetian castles built during this period can still be seen on Corfu, along the coast of modern-day Croatia, at Durrës (Albania), and at Iraklion, Crete. Venetian merchants also opened up trade with the Turks, and in 1271 MARCO POLO set off from Venice to China, returning 20 years later. Venetian ambassadors were prominent at the court of many kings and rulers throughout Europe. In several cases their reports provide extensive accounts of life in those countries.

Although the doge of Venice was elected, ruling through the Consiglio dei Dieci (Council of Ten)—introduced as an emergency measure, and then made permanent in 1334—control of the city ended up with a handful of families who made up a formidable oligarchy. This was confirmed by a decree in 1297 that limited membership of the Maggior Consiglio (Great Council) to those whose births and marriages were recorded in the Venetian *Libro d'oro* (Golden book), which was held at the Palazzo Ducale. The wealth of the city was measured in gold coins known as sequins, first minted in 1284 and quickly recognized as a mode of exchange throughout the Mediterranean.

During the 13th and 14th centuries Venice was involved in battles with GENOA for control of trade in

the Mediterranean. The Venetians destroyed the Genoese fleet at the Battle of Chioggia in 1380, giving them supremacy for the next 100 years. At this point the Venetians turned their attention to establishing a greater presence in the north of the Italian peninsula, taking Lombardy and Emilia-Romagna. In 1406 the Venetians captured Padua, and in 1441 controlled Ravenna.

It was the Ottoman Turks who finally led to the decline of Venice. In 1453 they captured Constantinople and closed off Venetian access to the east, in order to lead Portuguese sea expeditions around the coast of Africa, in search of spices previously obtained by the Venetians. In 1470 the Venetians lost control of Negropont (Euboea) in Greece, to the Turks. In 1499 the Turks captured Morea in Greece from the Venetians, and this gave them control of the southern Adriatic. Although Venice started to decline as a maritime power, it remained a formidable political power during the ITALIAN RENAISSANCE.

JUSTIN CORFIELD

Verdun, Treaty of

The Treaty of Verdun, which was signed in 843, was the second step toward the dissolution of the CAROLINGIAN DYNASTY. It created the idea of nation-states. After Emperor CHARLEMAGNE died in 814 his sole surviving legitimate son Louis I the Pious (778–840) inherited his vast empire and became emperor of the west. Louis had three sons by his wife, Ermengarde (778–818): Lothair (795–855), Pepin (797–838), and Louis (804–876). None of Charlemagne's heirs possessed the leadership qualities of their grandfather. Lothair, as the eldest, was named coemperor and became the primary heir of Louis at the Assembly of Aachen in 817. Louis I named Pepin I as the king of the Aquitaine and Louis as king of Bavaria, believing this would provide an orderly succession.

The succession evolved into a dynastic crisis when Louis I married Judith of Bavaria in 820 and they had a son, Charles the Bald (823–877). Louis I wished to change the dynastic succession to favor Charles and in 830 granted Charles some of the lands that had been

part of the inheritance of Lothair and Pepin, who now felt threatened. In 830 Lothair revolted and became sole ruler of his father's empire. Fearing Lothair's overlordship, Pepin and Louis restored their father to power. In 833 Louis met Lothair on the Field of Lies near Colmar, Alsace, to arrange a settlement. However all three sons met him and Louis once again was deposed. Pepin and Louis I again allied against Lothair and restored their father to power in 834.

The inheritance issue remained problematic for the last few years of the lengthy reign of Louis. Soon before Pepin died, Louis proposed another partition in 837 and gave the Aquitaine, present-day southern France, to Charles. Pepin's son, Pepin II; Lothair; and Louis rejected this decision. When Louis died in 840 the inheritance issue remained unresolved. Civil war ensued among the brothers and severely weakened the prestige of both Crown and empire; consequently the aristocracy gained greater power. The agreement finally to settle the issue militarily at Fontenoy-en-Puisaye, near Autun in Burgundy, in 842 led Louis and Charles to ally against Lothair and Pepin II, who decisively lost the battle. The outcome was the Oath of Strasbourg in 842 in which Charles and Louis once again allied against Lothair.

After much consideration the Treaty of Verdun on the Meuse was signed in August 843. The treaty partitioned the empire for the second time. Lothair retained his imperial title and received a long strip of land in the middle of Charlemagne's empire known as Francia Media, extending from the North Sea to the Mediterranean, including present-day Lorraine, Provence, Burgundy, and the northern half of Italy. Louis received Francia Orientalis, the eastern part of the empire, now Germany, and he became known as Louis the German—many historians consider him the founder of the German nation. Charles received Francia Occidentalis, most of present-day France.

The Treaty of Verdun represented the Frankish practice of divisible inheritance rather than the primogeniture inheritance practiced elsewhere. The Treaty of Mersen in 870 further divided Lothair's lands among Charles the Bald, Louis the German, and his son, Louis II. This last treaty completely dissolved Charlemagne's hard-won kingdom.

ANNETTE RICHARDSON

Vijayanagara Empire

The Vijayanagara Empire flourished in southern India from 1336 to 1565. It was a Hindu kingdom that left as its legacy a number of small, independent states that survived until colonial times. The city of Vijayanagara (or Vijayanagar), which means “City of Victory,” is located in modern day Karnataka.

The brothers Harihara and Bukka founded the Vijayanagara state at a time when Muslim rulers were striving to enforce their will and control on Indian people attached to their own religious beliefs and cultural loyalties. The Deccan Muslim states to the north made various attempts to expand their territories to Vijayanagara to the south. The two brothers were originally Muslims and had served in the administrations of Islamic states.

However when their early military campaigns failed, they changed their religion to Hinduism to achieve greater levels of support from the people they ruled. In 1565 an enemy alliance defeated the Vijayanagan army and occupied and largely destroyed the city, which has never been fully rebuilt. The state persisted in some of its outlying regions for another century.

The city of Vijayanagara contains elements from various religious traditions. Its earliest deity protectress was Pampa, who was integrated into the Hindu pantheon through her marriage to Virupaksha, a form of SHIVA. Other religious elements accumulated over the years. The cave home of the monkey king of the Ramayana is rumored to exist within the city limits. Jainist and Islamic cultural elements were also introduced through the proximity of believers trading with neighboring states.

The people of southern India were divided into numerous caste and occupation groups, which also depended on where they lived. Consequently it required considerable efforts for rulers to be able to demonstrate legitimacy to rule and also maintain a pluralist polity that would not be too divisive to maintain. Through the seaports of Calcutta and Basrur, Vijayanagara came into contact with numerous international states and their influences were also represented in southern India and contributed to the quality of life through provision of consumer products and intellectual property.

JOHN WALSH

Vikings: Iceland, Icelandic sagas

Norse immigrants from western Norway discovered and settled Iceland in the late ninth century. Servants and slaves accompanied these families; many of the indentured were Celts from Scotland and Ireland. Much of the history of Norse settlement in Iceland is derived from two Icelandic sagas. The *Book of Icelanders*, written by Ari Thorhildsson the Wise in the 10th century, tells of Iceland’s history for the first 250 years after its settlement. The *Book of Settlement* tells of the founding of Iceland and where they settled.

A Norwegian sailor named Naddodd is said to be the first Viking to discover Iceland. On a seaborne expedition from Norway to the Faeroe Islands in the ninth century, he and his men lost their way and found a new land much farther northwest. Seeing no sign of human habitation, Naddodd sailed back east, but upon seeing snow fall on the mountains of this new land, decided to name this territory Snowland. Gardar Svansson, a Swedish Viking, made the next voyage to Iceland. He circumnavigated the entire island, discovered that it was large and ripe for settlement, and decided to build houses in the northern part of the country in an area now called House Bay, where a village still stands. Gardar renamed Snowland as Gardar’s Island. Flóki Vilgerdason, another Norwegian Viking, led the next voyage. He took his family, household, and friends with him and established a second settlement in a fjord in the northwest part of the island. Flóki noticed that a neighboring fjord was full of ice, so he again renamed the island Iceland, the name it has carried ever since.

The *Book of Icelanders* describes much of the subsequent development of Iceland. Additional settlers arrived in an exodus from Scandinavia, encouraged by the Norse custom of a father’s passing all lands only to his firstborn son. Because of the general isolation of Icelanders and the lack of native cultures of Iceland, the Norse settlers

held on to traditional Viking ways much longer than the Norse in mainland Europe. Icelanders, including Erik the Red, later traveled farther west and settled GREENLAND.

According to Ari the Wise, the creation of the Althing or General Assembly in 930, which marked the beginning of the Icelandic Commonwealth, created a system of laws in the new country. Iceland was divided into four administrative districts with representatives chosen from each district to create a national legislative body. Yearly meetings of these representatives at the Althing further refined the laws of the new Icelandic nation. Iceland remained fairly independent from the kingdom of Norway until 1262, when it became a Norwegian Crown colony. From 1387 until 1944 Denmark ruled Iceland following the union of the two kingdoms.

Some of the greatest cultural contributions made by Icelanders were the Icelandic sagas—stories about migration to Iceland, feuds between Icelandic families, ancient Germanic and Scandinavian history, and other Norse voyages—and were written in Old Norse. Most Icelandic sagas were written in the 12th to 14th centuries but discuss events in the period between 930 and 1030, a period referred to as the Age of Sagas. The word *saga* literally means “what is said,” which is derived from the Norse people’s oral tradition of storytelling. The texts tend to have an epic quality and are written largely in prose but with poetry embedded within the main text. Sagas often focus on heroic deeds performed by worthy men and women, who were usually Vikings. The majority of sagas focused on actual events but many detail legends, the mythic powers of saints and holy men, and other fictitious proceedings. All sagas are stylistically linked through their common emphasis on the basic humanity, for good and ill, of the characters in the stories. For their often-fantastic subject matter, historians have fiercely disputed the accuracy of sagas. For instance the sagas detailing Norse voyages to North America in the year 1000 were only authenticated in the 20th century.

SCOTT FITZSIMMONS

Vikings: North America

With the discovery in 1960–61 of artifacts and the ruins of eight buildings at L'Anse aux Meadows in Canada's Newfoundland province, archaeologists and historians could at last replace centuries of fable and myth with hard evidence of Viking settlement in what, a half-millennium later, other Europeans would call the New World. Excavations at the remote site, begun by husband-and-wife team Helge and Anne Stine Ingstad, revealed a web of connections between GREENLAND and Iceland's people of Norse heritage and Vinland. *Vinland* was the Viking name for a western land rich in prized grapes and butternuts, lumber and fish, located in what today is eastern Canada and the extreme northeastern United States.

Evidence found since then has enabled historians to link Viking activity in the New World to often-inconsistent tales of exploration and conquest found in ancient Norse sagas. L'Anse is now believed to have been a base camp for Norse chieftain LEIF ERICSON and others during the so-called Medieval Warm Period: several centuries of milder weather that permitted vigorous Norse exploration of sub-Arctic regions in both northern Europe and eastern Canada. During a three-year sojourn in Vinland, Ericson's former sister-in-law, Gudrid, then married to rival chieftain Karlsefni, gave birth to a son, Snorri, the first European known to be born in the Americas.

Established sometime between 990 and 1030 and abandoned after just a few years, L'Anse provided access to Vinland and was a landmark for sailors from Greenland and other Norse settlements. Although it seems that some women were among about 100 people housed in eight sturdy wood and sod structures, L'Anse was less a colony than a gateway to southern Vinland's richer resources.

It was also a workshop where Norse traders could find provisions and repair their ships and weapons. Slaves, probably of Scots or German origin, and sailors visiting L'Anse manned labor crews and ran a small iron-making operation, the first known in North America.

Indigenous people, dismissively called *skraeling* by the Vikings, had often successfully confronted Norse invaders in other parts of Vinland but were not then living on the grassy peninsula where L'Anse was built. Nevertheless, residents soon abandoned the site, carefully removing useful goods and possibly setting fire to the largest dwelling halls. They may have feared new indigenous attacks, or perhaps Vinland was not producing enough desirable resources and trade items to make the difficulties of living there preferable to longer-settled Greenland and Iceland.

In 1497 five years after Christopher Columbus's first voyage to what he believed to be Asia, Venetian John Cabot, sailing for England, "discovered" a "new isle," soon named Newfoundland. Historians continue to argue whether other Europeans ever knew of Viking incursions into this western land or had forgotten that knowledge over the centuries. In any case, interest in Viking deeds, possibly including discovery of the New World, would become, especially for Scandinavian immigrants to America, a source of pride and fascination. In 1837 a Danish scholar translated parts of the Vinland sagas into English and argued for Norse presence in America. His research helped spawn various hoaxes and fantasies of America's Viking past.

In 2000 the Smithsonian Institution's National Museum of Natural History celebrated the millennium of the first European contact with North America. L'Anse is a Canadian National Historic Site, a UNESCO World Heritage Site, and a tourist attraction. During its brief summer season, costumed reenactors show and tell visitors about America's Viking past.

MARSHA E. ACKERMANN

Vikings: Norway, Sweden, and Denmark

Vikings were peoples of Scandinavia who raided, conquered, and colonized parts of Europe from the end of the eighth century to the 11th century. Their homeland was in the three modern Scandinavian countries: Denmark, Norway, and Sweden. The climate there caused poor soil conditions, necessitating seafaring, fishing, and hunting in addition to agriculture. This sparsely populated region was surrounded by water, and various natural resources encouraged trade and contacts; therefore by the Viking age, Scandinavians, apart from Finland and the Sami territories, shared a common culture. By trading and traveling, Scandinavians were fast in adopting innovations and technologies; therefore their culture was rich and vibrant by the eighth century. Main sources of the history of Vikings are archaeological findings and written records.

Most of these texts were written long after the Viking period; therefore their reliability is debated.

The migration period was a time of political, economic, and social change in Scandinavia. At the sites of Helgö or Lake Mälaren, exotic imports appeared, such as gold coins from the Eastern Roman Empire and a figurine of Buddha from northern India. The last phase of the Iron Age, the Vendel period (seventh–eighth centuries), was the advent of Viking culture; regional centers of power emerged in Scandinavia at this time. This led to the establishment of the market and craft working centers of Ribe in Denmark and Åhus in Sweden. Christian continental Europe underwent great changes in the eighth century. Social, economic, and political development resulted at first in raids on the monastery of Lindisfarne in the British Isles, and then led to Viking conquests and colonization in various parts of Europe.

VIKING ENTERPRISE AND SOCIETY

Advanced sailing was a prerequisite of Viking age raids and trades. The importance of ships is further demonstrated in their poetry, religion, art, and burial practices. It was not until the eighth century that large Scandinavian vessels were developed. The oldest known sailing and rowing ship was built around 820 in Oslofjord. Ships were double-ended, with the bow and stern built in the same way. Timber of the smallest possible width was chosen for vessels. This advanced technique resulted in light and seaworthy ships. Cargo ships were shorter and wider and had heavier hulls than warships. The seagoing trade ship, known as the *knarr*, relied only on sailing and therefore worked with a small crew. For example a 54-foot-long vessel from Skuldelev could carry as much as 25 tons of cargo. Other cargo ships were excavated in Oslofjord, Göteborg, and Klåstad. Local trade was carried on smaller ships with limited cargo capacity.

Most Scandinavians of the Viking age lived in rural settlements. The main farming activity was animal husbandry; cattle, pigs, sheep, and goats were the most common domesticated species. In the arable lands of southern Sweden and Denmark, barley, rye, oats, peas, beans, and cabbage were cultivated. In Norway, the geographical features of the land led to isolated farm settlements. Beside the fertile regions of Uppland and Västergötland, a similar pattern could be observed in Sweden. In contrast, small villages were the dominant form of settlements in Denmark. Typically Viking houses were long and accommodated people and animals under the same roof. Scandinavia did not have real towns before the Viking period, but as a result of accelerating trade and wealth, fairly large and densely populated permanent settlements

were created by the 10th century. These settlements had some centralized functions, such as markets, religious and administrative centers, or a mint. Major sources of income were trading and crafting.

Hebedy was one of Scandinavia's southernmost towns on the eastern side of Jutland. Thanks to the risen water level in the area, which preserved wood and other organic materials, far more is known about this center than any other Viking settlements. The layout of Hebedy's wooden-paved streets and fenced plots can be traced in great detail. A semicircular fortified wall protected the town, while protective piles and jetties were found around the harbor as well. Some 350,000 objects were found here, including locally minted coins, leather footwear, glass beads, and jewelry. Although there is not clear evidence of a royal presence, cemeteries show that there were great class differences in Hebedy. According to written sources the town was destroyed several times in the mid-11th century when the settlement was deserted.

Other towns such as Birka in Sweden or Kaupang in Norway show similar features to Hebedy. In the graves of Birka, the richest graves contained oriental textiles, vessels from the British Isles, and several other luxurious items mainly from the east. Although Kaupang never became a fortified town with large permanent population, it was an important trading post with busy seasonal markets, having regular contacts with Denmark and western Europe.

Scandinavian women played an important role in Viking society and the gender equality of the present-day Scandinavia may originate from those times. Written sources and archaeological findings suggest that women accompanied men in voyages of explorations to Iceland, GREENLAND, and North America. They also went on continental raids and other travels. There is no clear evidence that women ever fought as warriors alongside men. Accompanying women would give useful support for the army, by cooking and nursing the sick and wounded. The graves of aristocratic women usually contained clothes, jewelry, and domestic implements. When their husbands were away, they had full responsibility of running the house and the farm. Therefore Scandinavian women, especially wealthy ones, exercised great authority over dependents and slaves.

VIKING LITERATURE AND ART

Scandinavia's own script, the runes, originated from the first or second century. The origin of this writing system is debated, but it is related to Mediterranean alphabets, especially to Roman. The runic alphabet,

fupark, originally had 24 characters that were reduced to 16 during the eighth century. The oldest surviving texts were found on jewelry and weapons. Later on the custom of erecting runic stones prevailed to commemorate the dead. Runic scripts often ended with a curse on anyone who moves or destroys the stone.

Viking gods and their power influenced different aspects of Scandinavian life. Religion was also associated with secular leaders. In Scandinavian mythology, there were two families of gods, the *æsir* and the *vanir*. The first included Odin and Thor and the latter Njord and his son Freyr. Freyr's sister, Freja, was associated with sexuality and fertility. Other gods and goddesses appear in mythology mostly in groups, such as the Valkyries, who were Odin's servants. Religious feasts were held in autumn and spring, and according to later textual sources, animals were sacrificed and ale was drunk. Main sources of Scandinavian myths are the medieval copies of Eddic poems, Snorri Sturluson's *Edda*, and some of the contemporary stone carvings.

These myths help to encode moral life, which was significantly different from the Christian one. All people were free, unless they were enslaved and considered to be the property of others. Viking freedom meant self-determination within the community and encouraged a very important feature of contemporary Scandinavian societies: honor. This was respected by others and maintained peace in a community with limited central power. Vengeance had a function of balance in Viking society. It was the answer to all kinds of offenses, from killing and rape, to wounds. Death, as a punishment, was the same for all and encouraged peace in a society with uneven distribution of wealth.

Viking poetry was essentially oral, but numerous written poems remain and can be divided to three groups: rune poems, eddaic poems, and scaldic verse. Rune poems are brief, written in simple style and meters, praising the dead on rune stones. They date from the end of the 10th century to the 12th century. Eddaic poems were written in 13th–14th century Iceland and their anonymous authors tell about pagan gods and Scandinavian heroes. Most scaldic poems were carried on through the Icelandic sagas, written down in the 12th–13th centuries. The main theme is to praise certain kings and chieftains on specific occasions.

Scandinavian art used high-quality ornamentation and a great variety of colors. Ornamentation has survived mainly on functional objects, such as clothes, weapons, and ships. The head was a popular motif of sculpting. Gold, silver, and bronze were used to make jewelry for high members of society. Neck and arm rings

were made of gold, while silver was used primarily to inlay patterns of other metals, such as iron. Gold and silver were brought to Scandinavia, usually in the form of coins, from as far as present-day Iraq or the Volga region of Russia. Below the upper class, women and men wore baser materials such as bronze.

RAIDS ON EUROPE AND THE MEDITERRANEAN

From the end of the eighth century Scandinavians pirated, conquered, and colonized western Europe for 300 years. After the early raids on the monasteries of the British Isles, the first recorded attack took place on continental Europe on the island monastery of St. Philibert's, close to the mouth of Loire, in 799. The nuisance of Scandinavian pirates became serious on both sides of the English Channel and rulers took action against them by the last decade of the eighth century. The Anglo-Saxons blocked rivers and the Frankish emperor CHARLEMAGNE stationed guards on the coasts to prevent Viking upriver attacks. After Charlemagne's death the empire was driven by internal conflicts and defense weakened. The Vikings exploited this political weakness quickly, especially after the death of Louis the Pious in 840, and they sailed upriver to penetrate the heart of Francia, sacking major towns, ports, and monasteries. Both Lothair's and Charles the Bald's kingdoms were severely attacked by pirates.

In 844 Viking fleets raided Iberia from their first continental base at the mouth of Loire and sacked Lisbon, Cádiz, and Seville. Later on under Hastein and Bjorn Ironsides, they spent the years of 859–862 in the Mediterranean attacking Narbonne, Arles, Pisa, and other towns. Movements after 860 remain uncertain, but in 861 the Muslim fleet off Spain defeated them. The Vikings sailed to the Loire base and never returned to the western Mediterranean. After 859 Charles the Bald, the king of West Francia, could turn his attention to Vikings; therefore town walls were restored and bridges were fortified. He hired the chief of Somme, Weland, to attack the Seine Vikings in 860. Local leaders could react more quickly than the king; therefore they became the basis of Frankish defense.

These changes turned many Vikings to England, which was divided into small kingdoms with limited cooperation in the ninth century. In 865 a Danish fleet landed in East Anglia and by joining others formed the Great Army. By 870 Vikings controlled much of eastern England and tried to conquer the last remaining independent kingdom of Wessex. Norse colonists of Anglia had a significant impact on language such as dialects, placenames, and farming vocabulary. The breakup of the Great Army after its failure to conquer

Wessex was followed by the renewed attacks against Francia. Occasionally uniting Viking forces raided the Continent and concentrated on the nonfortified area of the Rhine. Building fortifications was a successful defense strategy and prevented Vikings from invading Rochester and Paris. Although these measures did not hinder invaders from raiding farther inland, numerous captives and huge quantities of plunder and tribute were taken.

After the defeat of 891 near Louvain, Vikings attempted to conquer West Saxony again without success. This lesson was learned in the British Isles as well. In 896 the Vikings failed to conquer the areas of England not already under their control because more and more fortifications were constructed. In the 10th century possibilities were limited for Vikings in the British Isles. Wessex was still on the defense in the beginning of the ninth century, but later on, the Vikings experienced defeat after defeat. At that time York was the center of the Scandinavians, but by the 940s the English were severely attacking the lands of the newcomers and took over York in 954.

In Ireland five high kingdoms and several subkingdoms were competing at the beginning of the ninth century. By the 830s raids became much more frequent and a decade later Vikings turned into a permanent presence. One of the most important new centers was Dublin, a fortified enclosure that became a prosperous merchant and manufacturing town by the 10th century. When Norwegians and Danes settled, they became more vulnerable to counterattack; therefore after the major attacks of 847, many moved to Francia. After a 40-year resting period Viking activity renewed and soon reached its peak. However Vikings settlements did not live long in Ireland under the constant pressure of the kings of Munster and kings of Meath and the Norse population started to decline by the late 10th century.

RETURN TO ENGLAND, AND CHRISTIANIZATION

By the end of the 10th century Scandinavian raids renewed on western Europe, especially in England. Under the king Ethelred, the English were able to pay large sums to the Vikings, because the country had a significant quantity of high quality silver coins. In 1013 Sweyn decided to conquer England and finished the campaign by the end of the year, probably to prevent the challenge of Thorkell. He was acknowledged as a king but died a few weeks later. The English recalled Ethelred, but Sweyn's son, CANUTE, returned in 1015 and was the king of English, Danes, and Norwegians until his death in 1035. After the successors of Canute died in 1042 Ethelred's son Edward became the king. He died childless in 1066

and his successor, Harold Godwinson, was challenged by the Norwegian king, Harald Hardrada. After the fights of the following decades for the Crown, England never again suffered serious Viking attacks. Some Scandinavian raids did continue; however, pirates became more often the victims of such attacks. The Danes especially suffered from serious Slavic raids by the 11th century.

Christianity became more and more important in Scandinavia. Paganism remained strong in Sweden, but by the end of the 12th century all Scandinavian nations were Christianized. Nordic merchants and pirates were amazed by the wealth of the British Isles and Francia. First conversions were often temporary, but by the 10th century most Norsemen who had settled in Europe were Christians. At the same time missions became more and more frequent to Scandinavia and all these changes led to the acceptance of Christianity in Nordic societies. By the help of religion Scandinavians integrated to Christian Europe and new political organizations were established, based on written law and royal diplomas. Therefore the Viking raids ended and Scandinavian kings gained more and more power by the 11th century.

VIKTOR PAL

Vikings: Russia

Vikings (*Rus* in the Arabic and *Varangians* in the Greek sources), primarily from central Sweden and the Isle of Gotland, first entered northwestern Russia by way of the Gulf of Finland, the Neva River, and Lake Ladoga, in small exploratory groups in the mid-eighth century. By c. 850 the Vikings had established a complex commercial network stretching from Lake Ladoga to the Islamic

caliphate and, by the early 10th century, had already extended their reach southward to the Byzantine Empire via Kiev, and east through intermediaries along the middle Volga in Bulgaria. From this tribute-taking merchant diaspora emerged a core group that settled permanently in places such as Novgorod and Kiev, gradually became acculturated with the Slavs, and helped found the first East Slavic kingdom, Kievan Rus, in the 10th century.

The main source for the Vikings in Russia, *The Russian Primary Chronicle*, tells that in 862 the Viking Riurik and his kin were invited by Slavic and Finnic tribes to come and rule over them, developing a tributary tax system stretching from northwestern Russia to the upper and middle Dnieper River regions. The chronicle's account is substantiated by finds of Scandinavian-style artifacts (tortoiseshell brooches, Thor's hammer pendants, wooden idols, weapons) and, in some cases graves, located at the tribal centers and riverside way stations of Staraia Ladoga, Riurikovo Gorodishche, Siaskoe Gorodishche, Timerevo, and Gnezdovo. The Volkhov-Ilmen-Dnieper river route, which linked the eastern Baltic with the Byzantine Empire, is known as "the Route from the Varangians to the Greeks."

In contrast to Viking activity in the west, which was characterized primarily by raiding and large-scale colonization, the Rus town network and subsequent tribal organization were designed for trade. Subject tribes living along river systems supplied the Rus with the furs, wax, honey, and slaves that they would further exchange for Islamic silver coins (*dirhams*), glass beads, silks, and spices in southern markets.

The Rus expansion into Byzantine markets began in earnest in the early 10th century, with Rus attacks on Constantinople in 907, 911, and 944, resulting in trade agreements. By the end of the century, c. 988, VLADIMIR I (VLADIMIR THE GREAT) (980–1015), a quarter Viking through his father SVIATOSLAV, had married into the Byzantine royal family and converted to Byzantine Christianity, thereby laying the foundation for the Eastern Slavic relationship with the Greek world.

The 10th century marked the high point of Viking involvement in the east. Much of the Scandinavian-style jewelry found in European Russia and a majority of the Scandinavian-style graves date to the second and third quarters of the 10th century. Vladimir I and his son YAROSLAV THE WISE (1019–54) enlisted Viking mercenary soldiers such as Harald Hardrada in internecine dynastic wars. In the 11th century, however, the Viking footsoldier armies had become obsolete as the Rus princes were forced to adapt to another enemy in the south, the Turkic nomads who fought on horseback. A

nomadic army on horseback defeated Yaroslav's Viking mercenaries at the Battle of Listven (1024).

HEIDI M. SHERMAN

Vladimir I (Vladimir the Great)

(956–1015) *prince and saint*

Vladimir was a descendant of the ninth century Scandinavian chieftain Rurik, whose successors established control along the Dnieper and other river routes that connected Scandinavia to the Black Sea. Kiev became the political and cultural center of the new principality that was ruled by the descendants of Rurik, known as the RUS, through the 16th century. This land eventually became known as Russia. Vladimir's father, SVIATOSLAV, appointed him prince of the northern city of Novgorod in 970. Upon his death in 972, civil strife emerged and Vladimir fled to Scandinavia. Returning in 980, he defeated his brother and gained control of the Kievan state. Vladimir expanded the kingdom's power by waging wars with neighboring peoples, including the Poles and Volga Bulgars.

Vladimir is remembered as the Constantine the Great of Russia because his reign marked the transition of Kiev from a pagan to a Christian state. Christianity had already made inroads from Byzantium and the Slavs of southeastern Europe. After a Rus attack on Constantinople in 860, the Byzantines had sent missionaries to draw its neighbor into the Eastern Christian orbit. At the same time, Christianity gained strength from the work of missionaries among the Slavs like CYRIL AND METHODIOS and their disciples. They invented a script for Slavonic (the ancestor of modern Slavic languages) called Cyrillic, which is still in use today among Russians, Bulgarians, and Serbs. They also translated Christian literature into Slavonic. This work was extremely useful to Vladimir. Vladimir's grandmother, Olga, had accepted baptism at Constantinople in the 950s, but this was only a personal conversion.

According to one story in *The Russian Primary Chronicle*, Vladimir sent emissaries to examine the religions of neighboring peoples. He was unimpressed by the Christianity practiced by the Latin West, and he could not accept the ISLAM of the Volga Bulgars (since alcohol was prohibited), and the Judaism of the Khazars failed to convince him. When his emissaries reached Constantinople, however, they were mesmerized by the experience of worship in the great Church of Hagia Sophia (Holy Wisdom), which was so magnificent that they were not sure whether they were in heaven or on earth.

The lure of Byzantine culture drew Vladimir south. Fortuitously, the eyes of the Emperor Basil II turned north when he was in need of help during the Civil War of 987–989. Vladimir sent several thousand soldiers with whom the emperor triumphed. The price of Vladimir's help was an imperial bride. For this, Vladimir agreed to be baptized. When the emperor delayed, Vladimir attacked the Byzantine city of Cherson to force

the emperor's hand. Vladimir was baptized in 988 and married Anna, the emperor's sister. Vladimir then oversaw the Christianization of his land. Kiev received an archbishop, appointed from Constantinople, to which the Russian church remained dependent until the 15th century. Vladimir began a campaign of church building, training of clergy (using the Cyrillic script and translated Slavonic books), philanthropic activity and social service, and the destruction of pagan temples. Today, Vladimir is recognized as a saint in both the Western and Eastern Churches.

MATTHEW HERBST

Wales, English conquest of

By 1276 and prior to the invasion undertaken under the reign of Edward I, Wales was divided into three separate zones. Despite the opposition of the Welsh to the presence of the Angevin kings (those who had entered Wales during the **NORMAN CONQUEST OF ENGLAND**), they remained powerful in central Wales, while the Welsh monarchy, which had been in place since the 10th century, remained the powerful force in rural areas. The Angevin kings were Norman, although the settlers were Saxon English. This inevitably led to settlers bringing the English language with them into Wales, but this brought a negligible threat to the survival of the Welsh language.

The first zone applied to the areas located nearest the English border, belonging to the Marcher lords, who were the descendants of the first advancing Norman lords who accompanied William the Conqueror in the early 11th century. Furthermore these were considered as the first line of defense against the counterinvasion of England by Wales. However, they managed to establish their own authority and exercised their own legal system for numerous generations. The two remaining zones were divided between those who remained politically independent and those under the rule of the Welsh princes. The only hope for the resurgence of the Welsh princes' power largely rested with the possibility that a weak monarch would once again lead Britain. However the prevailing power of the monarch meant that the princes were largely confined to their traditional sphere of influence in the small area of Gwynedd, and in the

northern section of the country, in areas such as Anglesey and Snowdonia, and it was in these areas that the traditional Welsh laws and customs prevailed. A prominent Welsh prince, Llywelyn, planned a revolt against their dominance. Through the support of his followers, he gained more land, defeated the incumbent royal armies, established links with Scotland, and declared himself the first and last native prince of Wales.

Llywelyn's alliance began with Simon de Montfort, the last baron who stood against King Henry III. De Montfort had defeated the king at the Battle of Lewes in 1264, which consequently gave official recognition to Llywelyn's title of prince of Wales. This was still subject to a payment of £20,000 to the king. The Treaty of Montgomery, signed in 1267 by the restored Henry III, signaled the peak of Llywelyn's power and gave Wales its status as a principality. Wales now had a constitutional right to possess its own characteristics as a state.

However Llywelyn was faced with the problem of having no heir to his throne. Furthermore his rival brothers were lodging a claim for the inheritance of his estate, to which they were entitled to an equal share. Llywelyn lacked the funds to settle a debt he owed to Henry III. Consequently Llywelyn imposed higher taxes on the people, which created considerable resentment but was considered an essential to establish Wales as a nation independent of English rule. He took practical steps to facilitate this aim, attacked the Marchers' fortresses built in South Wales as a preventative measure against the native Welsh reaching the English border, and in turn claimed power over three-quarters of Wales.

King Edward established towns in Wales and constructed more castles, such as Conwy Castle in Gwynedd, Wales.

By 1282 the Welsh had become increasingly unhappy at the powers exerted over them by English lordship, and consequently rebelled. Llywelyn led the rebellion, captured castles, and defeated the royal army. The king's response was to lead a large army into Wales, which further antagonized the population. Intervention came from the archbishop of Canterbury, John Peckham, who tried to bring agreement to the both sides. Peckham suggested that Llywelyn would be offered land and titles in England if he abdicated his position as prince of Wales. This provoked outrage, with the Welsh council arguing that Edward I ruled over Wales by tyranny, and further solidified the campaign for Welsh independence.

Llywelyn branded the English invasion of Wales and their fight against it as a “war of national liberation.” The Welsh attacked the English knights and made use of the varied Welsh terrain, with which the English were unfamiliar. However their optimism was quickly extinguished by the death of Llywelyn in a fight with an English soldier. Llywelyn's head was dismembered and sent to London and carried through the streets as proof of the prince's death. Despite Llywelyn's death, the revolt continued for a short time and eventually ended in 1284, with the Welsh conceding defeat.

In victory King Edward established towns in Wales, constructed more castles, encouraged movement into Wales from England, and established and preserved English-run institutions in Wales. This position received statutory recognition through the Royal Assent provided to the Statute of Rhuddlan, passed in 1284, which ultimately led to the imposition of the ENGLISH COMMON LAW in Wales and covered all matters, except land claims. The Welsh language remained in Wales, although the daily business in the country was now

conducted through the medium of English. The tax system imposed on the country hit the poorest the hardest and drove them further into destitution.

MARK J. CROWLEY

Wang Anshi (Wang An-shih)

(1021–1086) *Chinese statesman and reformer*

Wang Anshi was a well-known reformer and statesman of the Chinese SONG (SUNG) DYNASTY that ruled from 960 to 1279. Wang Anshi was a Renaissance man, who was equally at home in statecraft and in poetry. Wang was born into a landlord family in Linchuan, Jiangxi (Kiangsi) Province. After he passed the stringent imperial civil service exams, he became an official. Involved initially in government at the local level, he saw the hardships of the Chinese peasantry, and the exactions of the landlords who controlled their lives. Wang's exposure to the life of the peasants had a profound influence upon his life.

Wang participated in the debate among Song scholar-officials on the application of Confucianism in the ordering of society and as instrument of political reform that had begun earlier in the Song dynasty. He believed that the state existed in large measure to serve the needs of its citizens. He said, “The state should take the entire management of commerce, industry, and agriculture into its own hands, with a view to succoring the working classes and preventing them from being ground into the dust by the rich.” In 1058 Wang took the momentous step of writing a memorial to the emperor to present his views. Unfortunately, the emperor at that time, Kenzong (Jen Tsung), was not interested in reforms.

Yingzong (Ying Tsung, r. 1063–67), the next Song ruler, was more receptive. The new emperor was intent on making reforms and made Wang his chief minister. Wang and a few other officials enacted the New Laws during the 15 years they were in power, aimed to encourage agricultural production by reducing the burdens of the common people. Their New Laws also limited the privileges of high-ranking officials and landlords, who naturally hated the reforms. He realized that the

landowning classes were shirking their fair burden of taxation, which was falling almost entirely upon the peasantry. Also when peasant farmers needed seed or agricultural implements, they had to turn to moneylenders, who charged them usurious rates of interest. With Wang's reforms, they were able to apply to the central government instead for agricultural loans. The officials' ultimate goal was to make the government more efficient and effective to face the northern nomads.

Wang reinterpreted the Confucian Classics to support their program of an activist and interventionist state. The reformist credo was "The true scholar should be the first to become anxious of the world's troubles and the last to enjoy its happiness." Their controversial reforms were opposed by the conservative Confucians, who accused them of being Legalists in disguise. Wang's tactlessness as well as his policies contributed to his downfall. His ideas enjoyed favor again after his death under HUIZONG (HUI-TSUNG) (r. 1110–25). However Huizong's disastrous domestic and foreign policies would culminate in the fall of the Northern Song in 1127 and with it an era of vigorous policy debates in the Song court.

When Yingzong died in 1067, his successor, Shenzong (Shen-tsung), continued to support Wang and his reforming allies. However they had made important enemies, both in the country and at the imperial court, among conservatives and among the landowners. Eventually Shenzong succumbed to the conservatives and removed Wang as prime minister in 1074. Sima Qian (Ssu-ma Chien), a renowned historian, became prime minister in his place and ended the reforms. Shenzong returned Wang to power in 1075, but by then his supporters had begun to desert him. In 1076 Shenzong dismissed Wang again, and he never returned to government service.

JOHN F. MURPHY, JR.

Wang Yangming (Wang Yang-ming)

(1472–1528) *Chinese scholar*

Wang Yangming was an influential scholar during the era of the MING DYNASTY in China, the last native Chinese dynasty. In 1644 invaders from Manchuria would

overthrow the Ming, beginning the Qing (Ching) dynasty. The Qing dynasty would rule until the collapse of the Chinese empire in the revolution of 1912.

Wang developed a philosophy that would have a dramatic effect not only on China but also on Japan and Korea, both of whose cultures were influenced by China. His teaching would be perpetuated through schools of philosophy during much of the 16th century. Jacques Gernet wrote in *A History of Chinese Civilization* that "the central notion of his philosophy is that of 'innate moral knowledge,' (liang-chih), (the term is borrowed from Mencius), a principle of good which is inherent in the mind before any contamination by egoistic thoughts and desires, and which one must try to rediscover in oneself."

Following Mencius, instead of Confucius, Wang Yangming aroused much controversy in Ming philosophical circles and the imperial government, since Confucian thought was at the bottom of the entire Chinese imperial system. There is much of his system that is Buddhist, especially that of the Chan school, carried by the monk Bodhidharma to China, that emphasized intuitive knowing. Wang Yangming's idea that objects do not exist entirely apart from the mind because the mind shapes them stems from this. Here, Wang Yangming closely follows the Buddhist idea that the entire world is made up of *maya*, and thus is not entirely or truly real.

Mencius's teaching had a warmth and intimacy that were lacking in Confucian thought. Mencius said, "Everyone has a heart that is sensitive to the sufferings of others. The great kings of the past had this sort of sensitive heart and thus adopted compassionate policies. Bringing order to the realm is as easy as moving an object in your palm when you have a sensitive heart and put into practice compassionate policies."

Wang Yangming made an estimable contribution to Chinese philosophy, especially in his insistence on "the unity of knowledge and action." A moderate individualist, he taught that knowledge should be the guide to proper conduct and that proper conduct thus is the fulfillment of knowledge.

JOHN F. MURPHY, JR.

Worms, Concordat of

A concordat is a formal agreement between the pope acting in his spiritual function and a state. It is a legal contract between church and state, recognized as a treaty under international law. The antithesis between temporal and spiritual authority was particularly pronounced in the medieval quarrels leading to the practice of agreeing to concordats such as the Concordat of Worms. A similar compromise, the Concordat of London, in 1107 had resolved the investiture conflict between the pope and the king of England, providing the basis for the Concordat of Worms. On September 23, 1122, Pope Calixtus II (d. 1124) and Holy Roman Emperor Henry V (1086–1125) agreed under the Concordat of Worms, the *Pactum Calixtinum*, to end their battle over investiture, the power to appoint to church offices.

The struggle over control over church offices had begun during the time of HENRY IV (1050–1106) and Pope Gregory VII (1020–85.) Before the 10th century investiture of church leaders was a church prerogative in practice, but it was often done by kings. It gave rise to the practice of simony, or the sale of church offices; this was a sin according to the church, but a profitable practice for monarchs. It also created a clergy that was more loyal to the king than to the pope. The emperor had the power to appoint the pope, who had the power to appoint the emperor. Gregorian reformers in the church wanted to end the practice of simony, but they needed to break the appointment tie, which they did in the reign of young Henry IV in 1059.

The reformers created the college of cardinals to replace the emperor as selector of future popes. In 1075 Gregory VII decreed that the church alone had the power over appointments. Henry IV removed the pope, and Gregory retaliated by excommunicating Henry. The struggle between emperor and pope gave Henry's nobles the opportunity they sought; they rose against him. In 1077 Henry apologized, wearing a hair shirt to Canossa and receiving papal forgiveness. After crushing his rebellious nobles, he turned to replacing the pope with a more pliable one. The investiture controversy continued into the next generation of pope and emperor.

Henry V agreed to bar bribery and allow free election of bishops and abbots, renouncing his right to invest them with the symbols of their office. The pope in return allowed Henry to attend elections in Germany and to invest the elected with their lay rights and obligations before they were consecrated. Generally, the clergy chose bishops and abbots, but the emperor decided

contested elections. The emperor invested the elected person with regalia, powers, privileges, and lands pertaining to his role as vassal. After he paid homage to his emperor, he would be invested with the *spiritualia*, ecclesiastical powers and lands, as symbolized by the ring and crosier, by his ecclesiastical superior.

This compromise provided the basis for relations between popes and Holy Roman Emperors thereafter. The concordat came about as a result of the efforts of Lamberto Scannabecchi (later Pope Honorius II) and the Diet of Wurzburg (1121). Confirmation of the concordat came at the First Lateran Council in 1123. Later concordats in France included the Concordat of 1516, which gave the king the right to nominate bishops, abbots, and priors, with the pope reserving the rights to confirm and appoint in special circumstances. After the Estates General of Orléans revoked the right in 1561, conflict continued until the French Revolution.

JOHN H. BARNHILL

Wu Zhao (Wu Chao)

(627–705) *Chinese empress*

Wu Zhao or Zetia (Tse-tien) is famous in Chinese history because she was the only woman who ruled in her own name. Daughter of an official of the recently founded TANG (T'ANG) DYNASTY she was selected to join the harem of the emperor TAIZONG (T'ANG-TSUNG) at age 15 with the rank of fifth grade concubine. She bore him no children and as all other childless concubines she retired to a Buddhist convent in 649 when Taizong died.

On the first anniversary of Taizong's death his son and successor Gaozong (Kao-tsung) attended a commemorative service at the Buddhist temple where Wu resided and took her back to the palace when he returned, and she became his concubine. Her intrigues caused the fall and death of Gaozong's wife, the empress Wang, and

the consort Xiao (Hsiao), mother of the crown prince. Installed empress in 656 she bore Gaozong four sons and a daughter. Her eldest son became crown prince. Energetic and ambitious she assisted her weak-willed and vacillating husband in administration, especially after he suffered a major illness, perhaps a stroke, in 660. Gaozong's deteriorating health led the court to suggest the installation of Crown Prince Li Hong (Wu's eldest son), already 24 and an able young man, as regent. In 675 while visiting his parents Li Hong suddenly died. His standing up to her earlier over her treatment of her opponents has led to speculation that he had been poisoned by his mother.

Gaozong died in 683. He was succeeded by his and Empress Wu's second son, then aged 27, under the reign name Zhongzong (Chung-tsung) with his mother as regent, as stipulated in Gaozong's will. The hapless new emperor was soon demoted to the rank of prince and exiled with his wife and children. Empress Wu then installed another son on the throne, Ruizong (Jui-tsung); pronounced him unable to rule; became regent; and promoted her brother's son to the title of "emperor expectant." In 689 Wu Zhao held a magnificent festival in which she assumed the title of "Sage Mother, Divine Sovereign." In 690 she proclaimed the founding of a new Zhou (Chou) dynasty, took the title "Holy and Divine Emperor," and moved the capital city from Chang'an (Ch'ang-an) to Luoyang (Loyang). She then began a reign of terror against all members of her husband's family and Tang officials opposed to her usurpation, during which thousands were brutally killed or exiled. Revolts were put down ruthlessly. Those of the Li family who survived, including her sons, lived under house arrest.

While many strong women ruled behind the throne as wives, mothers, and grandmothers of male rulers, Wu Zhao was the only woman to rule in her own right. She was hardworking and capable and the empire prospered under her rule. She expanded the examination system of recruiting civil officials on the basis of ability and initiated the personal examination of candidates by the monarch. In 693 she even added a work that she wrote, titled "Rules for Officials," as a compulsory text for the exams. It expressed her political philosophy based on selected passages from Confucian and Daoist (Taoist) canons.

Wu's foreign relations mainly were involved with the TIBETAN KINGDOM in the west and Turkic and Khitan tribes in the north. In 692 Chinese armies crushed the Tibetans and reestablished protectorates among the oasis states along the Silk Road. Bribes of expensive goods of Chinese manufacture, marriage alliances, and

military actions also ensured peace between the Turkic and Khitan tribes.

Empress Wu's reign became adversely affected by her scandalous personal life, which became more bizarre as she aged. Her successive lowborn and little educated favorites were given enormous state powers, which they abused. They included a peddler of cosmetics and aphrodisiacs whom she installed as abbot of the White Horse Monastery, the oldest Buddhist establishment in Luoyang. He pleased her by supervising the building of a sumptuous ceremonial hall, called the Mingtang, that was 294 feet high, topped by a gold-clad phoenix 10 feet tall, but she had him killed when she tired of his corruption and arrogance. Her final and most scandalous favorites were a pair of young entertainers, the Zhang (Chang) brothers, who grew fabulously rich on bribes because of her favor. When her grandson, her granddaughter, and her husband reportedly criticized her behavior and their conversation was reported to her, Empress Wu had all three young people killed in 701.

Although she had proclaimed a new dynasty and had proclaimed her nephew (her brother's son) heir, Empress Wu did not finally settle the succession, perhaps torn between the claims of her own clan and those of her sons. The fact that her nephews were unworthy men might have added to her problems. In the end, Di Renjie (Ti Jeh-chieh), a senior statesman in her administration who had served both her and the Tang sovereigns loyally, won the argument in favor of the Tang claim. He convinced her that only her son could properly perform the ancestral sacrifices to her spirit when she died. By 705 Empress Wu was often ill and rarely attended to business.

Many courtiers feared that the Zhang brothers, who had constant access to her, might attempt a coup if she should suddenly die. In 705 they entered the palace with an armed escort and with the deposed Zhongzong in tow seized and executed the Zhang brothers. Empress Wu then formally abdicated and Zhongzong ascended the throne as emperor. The Tang dynasty was restored, surviving members of the Li clan were restored to their titles and ranks, and those who had not were given posthumous honors. Empress Wu was given her own palace in the imperial complex in Luoyang, where she lived with all honors until her death later in that year.

JIU-HWA LO UPSHUR

Wycliffe, John

(1330–1384) *church leader*

Theology and ecclesiastical affairs had been in ferment for some time before the 16th-century upheavals now known as the Protestant Reformation, which left behind enduring divisions among Western Christian churches. For at least three centuries theologians had held divergent opinions on the possibility of conflict between the Bible and its interpretation by official teachers in the church. These disagreements grew in heat and importance as calls for reform in the moral and institutional life of the church increased. Two of the most important figures in the tumultuous movements in theology and church life in the two centuries prior to the Reformation are John Wycliffe and JOHN HUSS.

John Wycliffe was born in Yorkshire, England, around 1330. He arrived in Oxford in the 1350s, at a time when the influence of the holistic approach to teaching theology that characterized late SCHOLASTICISM was on the wane. Scholarly interest now centered on particular problems in theology, and the application of logic and terminological reflection to treating those problems. After Wycliffe had become a doctor of divinity and master of Balliol College, Oxford, the duke of Lancaster recruited him into his service and Wycliffe later represented King Edward III of England on a committee negotiating with papal officials in Bruges over the jurisdictions of the king and the pope. He soon decided to focus more keenly on matters of church reform. Wycliffe's philosophical and methodological ideas supported and reinforced his ideas on church reform. He stood for a radically biblical theology, taking the Bible as "an emanation of the supreme being transposed into writing," denying that its authoritative interpretation rests with the bishops of the church, and calling for its translation into the vernacular.

Wycliffe's doctrine of predestination held that God knows all the elect from all eternity, and that it is because God knows them to be elect that they are elect, and so members of the church. Therefore those who act in a way that is not in keeping with God's law show themselves to be impostors, and if holders of office in the church, they forfeit their legitimacy as leaders. Simi-

larly Wycliffe denied the existence of a right to private property, seeing such a supposed right as mark of the church's decline from a period of purity prior to the Middle Ages. The denial of a right to exclusive property and his radical theology of the Eucharist drew the most passionate reactions to any of Wycliffe's doctrines. Wycliffe denied that in the Eucharist the bread and wine change into the substance of Christ's body and blood, though he claimed the body and blood of Christ are also present with the bread and wine. All 24 propositions of Wycliffe's theology were condemned in 1382, but the protection of the duke of Lancaster saved him. He died of natural causes in 1384.

In 1415, however, the COUNCIL OF CONSTANCE condemned Wycliffe as a heretic. That same council condemned and burned John Huss, the leader of a dissenting movement in Prague, in what is now the Czech Republic, for holding Wycliffe's opinions. Since Wycliffe's views were more radical and inspired greater passion, the council convicted Huss, not very accurately, of holding Wycliffite views, and thereby justified his capital punishment. In fact he held similar ideas to Wycliffe's, though generally in a more moderate form. Huss stood in the line of movement for reform that predated Wycliffe. He held that one could appeal to Scripture to oppose canon law or even councils. While wicked prelates do not lose their title to office, Huss claimed that the members of the church owe them no obedience. Unlike Wycliffe, however, Huss held that bread and wine do change into the body and blood of Christ in the Eucharist.

The Lollards were a popular English movement that drew deeply on Wycliffe's theology. The movement began in Oxford around 1378. It posed a great enough threat to the government that in 1401 membership in the movement could bring punishment by death. By 1415 after a failed attempt to oust HENRY V and the condemnation of Wycliffe at the Council of Constance, Lollardy went underground and lasted mainly as a movement in northern England, inspiring various reform-minded preachers and social activists.

JOHN YOCUM

Xixia (Hsi Hsia)

As the TANG (T'ANG) DYNASTY (618–907) was crumbling, several regional states came into being that occupied outlying areas of the once great empire. One of them was called Xixia or Western Xia (982–1127). Although it included several ethnic groups, among them many Han Chinese, the ruling dynasty and dominant ethnic group of Xixia was called Tangut, who were related to Tibetans.

The Tangut first entered Chinese history during the Tang dynasty when they were invited to settle in frontier regions in present day Sichuan (Szechwan), Qinghai (Ch'inghai), and Gansu (Kansu) Provinces as a bulwark against Tibetan tribes. The most important prefecture they settled in was Xia (Hsia), the name of China's first dynasty and a hallowed name to the Chinese. In 893 the Tang court appointed a Tangut chief military governor of the region, gave him the title duke of Xia, and also conferred on him the surname Li of the Tang imperial house. His descendants continued to use it after the Tang fell. This is the origin of the name *Xixia* for the Tangut state. Later the SONG (SUNG) DYNASTY also conferred its ruler's surname, *Zhao (Chao)*, on the Xixia rulers and gave them the title king of Xia, but they continued to use *Li* as their surname until the 11th century.

A written script for Tangut was created in 1037 under a ruler named Li Yuanhao (Li Yuen-hao). It had about 6,000 characters and was based on the Chinese script, possibly because like Chinese, Tangut was monosyllabic and tonal, but the two are not mutu-

ally intelligible. During the next two centuries written Tangut was widely used, much more so than Khitan was used by the LIAO DYNASTY, or Jurchen was by the JIN (CHIN) DYNASTY. This was so despite the fact that many Tangut officials of Xixia were bilingual and fluent in written Chinese. Li Yuanhao's order to invent a Tangut script is interpreted as an assertion of his native culture as opposed to the Chinese. (He also dropped his Chinese surname *Li* and substituted it with a Tangut one.) However Xixia was so thoroughly destroyed by the Mongol forces of GENGHIS KHAN that the language became forgotten until scholars in the mid-20th century began to study it from dual language (Chinese and Tangut) inscriptions on surviving stones and from documents recently excavated.

There was no Xixia history written by its own people. Later when the rulers of the Mongol YUAN DYNASTY (1279–1368) in China ordered dynastic histories for its immediate predecessors compiled, the board entrusted to do so acknowledged the Song, Liao, and Jin dynasties as legitimate ruling houses of China and wrote extensive and detailed histories of each. However they did not acknowledge Xixia as a dynasty. Therefore there is no Chinese dynastic history of Xixia, only chapters about them in other historical works.

In 1038 Yuanhao proclaimed himself emperor of a new dynasty called Da Xia (Ta Hsia), meaning "Great Xia." It is reminiscent of the Khitan's creation of an imperial state in 916 with Chinese trappings. At its maximum extent at the end of the 11th century Xixia measured over 800 miles from east to west and over 500

miles from north to south. It bordered the Gobi Desert in the north and included the Gansu Corridor in the west, which was important because that was the route of trans-Eurasian trade from which it received much revenue. The core of the state was the Xia area, which contained extensive irrigation works originating from the Han dynasty (202 B.C.E.–200 C.E.) that sustained a mixed agricultural and pastoral economy. Beyond the agricultural core much of the land was desert. Xixia had two capital cities, Xiping (Hsi-p'ing) on the east side of the Yellow River and Xingqing (Hsing-ching) on the west side near present-day Ningxia (Ning-hsia); a royal cemetery was located nearby with tombs built on the Song model. At the height of its power under Yuanhao, Xixia defeated the Song and under a peace signed between the two states, Song gave large annual gifts of silk and silver to Xixia.

As with the Song, Xixia adopted Confucianism as state ideology, shrines were built in the capital to honor Confucius, schools were established in cities to teach the Confucian Classics, and a national academy was established to train advisers to the rulers. As the dynasty progressed, the trend toward Sinicization in philosophy, arts, ritual, and even fashion grew. Several among the nine Xixia rulers had Chinese mothers and wives. To the Xixia elite Chinese things represented sophistication, and they became more assimilated to Chinese values than their contemporary Khitan nobles in the Liao dynasty were. This trend also produced tension and division because some Tangut continued to honor their traditional tribal values; these conflicts were never resolved. Although Daoism (Taoism) was patronized and Nestorian Christianity and Manicheism had adherents, most Tangut followed the Tibetan model of Buddhism, deviating from the Chinese. Many Buddhist texts were translated to Tangut and printed from carved wood blocks.

Xixia existed internationally in complex relationships with the Song, Liao, and Jin dynasties in shifting alliances, war, and peace, until the rise of the Mongols. The first Mongol attack occurred in 1205; Temujin, who became Genghis Khan one year later, led it. A request for aid from Jin (who would later be a Mongol victim also) was refused. Xixia sued for peace and became a subject ally of the Mongols under very oppressive terms. When Xixia revolted later, their doom was sealed. In 1226 Genghis Khan personally led an army to destroy Xixia, which they did systematically and continued even after Genghis died in 1227. When the capital surrendered every inhabitant was killed and the royal cemetery was plundered. The state and dynasty, which had produced

nine rulers, disappeared. It is unclear what happened to the survivors. There is evidence that some of the ruling clan members and followers fled to the upper reaches of the Yarlung River in present day western Sichuan province. Other small groups fled to northeastern China, where fragments of their culture survived for some time.

Xuanzang (Hsuan-tsang)

(c. 600–664) *Chinese Buddhist monk*

Xuanzang was a Chinese monk who journeyed to India to study Buddhism. He was preceded by others, among them Fa Xian (Fa-hsien), but was surpassed by none. Together the pilgrims' translations and other writings enhanced China's knowledge of many lands and added to the understanding of Buddhism.

A precocious boy from a literati family, he followed his elder brother to pursue a monastic life at 12 and was given the religious name *Xuanzang* upon ordination at age 20. In 629 he embarked on a 16-year journey to India, leaving China at night and in secret because Emperor TAIZONG (T'ANG-TSUNG, r. 626–649) of the newly founded TANG (T'ANG) DYNASTY had forbidden his subjects to leave the country. His journey involved crossing formidable deserts and high mountains, with rest periods among monastic communities and as guest of rulers in the oasis towns, across modern Afghanistan, down the Indus River valley, across Kashmir, to the Ganges valley.

In India he studied, lectured, and debated with Buddhist scholars and teachers of other religions and was entertained and honored by kings. Twice he was the guest of King HARSHA VARDHANA, the powerful ruler of northern India. Xuanzang traveled widely throughout the subcontinent except the southern tip. He studied and lectured at Nalanda, where Buddhist scholars from many Asian lands studied at the famous university. He also visited holy sites such as Bodhi Gaya and Sarnath that were associated with Gautama Buddha's life and

famous Buddhist monuments at Ajanta and Pataliputra. He also collected manuscripts and relics.

In 643 Xuanzang participated in a five-day-long religious debate among leaders of different schools sponsored by King Harsha and witnessed a spectacular almsgiving ceremony during which Harsha gave away all his wealth except his warhorses and elephants. Finally and reluctantly Harsha granted him permission to return to China and provided him with a military escort to the border of his kingdom, money for the trip, and beasts of burden to carry the manuscripts. Following the southern Silk Road and after many perils Xuanzang arrived home after 16 years and having traveled 10,000 miles. News of his arrival preceded him and he entered Chang'an a national hero in 645.

Taizong, who had meantime gained the reputation as a heroic warrior and wise ruler, welcomed him to court in a special audience and eagerly listened to his reports of lands, rulers, and peoples he had seen. Taizong also asked Xuanzang to join his government as a minister, unsuccessfully. The monk did however agree to write an account of his travels, titled *Record of Western Regions*. Xuanzang lived in Chang'an for the rest of his life. Under the emperor's patronage he headed a team of monks that translated a prodigious quantity of Buddhist texts to Chinese (73 works, and over 1,000 scrolls). His *Record of Western Regions* remains important in aiding archaeologists' work from China through Central Asia to India. Another result of his journey was an exchange of ambassadors between Taizong and Harsha. The third Chinese embassy to India found Harsha assassinated, whereupon the ambassador gathered an army aided by the Tang tributary state Tibet, captured the usurping assassin, and brought him to China for punishment. The effort, however, could not save Harsha's kingdom.

Xuanzong (Hsuan-tsung)

(685–762) *Chinese emperor*

Li Longji (Li Lung-chi) reigned 712–756 as Minghuang (*Ming-huang* means Brilliant Emperor; *Xuanzong* was his posthumous title). He was the grandson

of Empress Wu ZHAO and son of Ruizong (Jui-tsung, r. 710–712), who abdicated in his favor. His youth was spent under house arrest in his grandmother's court. His reign marked the zenith of the TANG (T'ANG) DYNASTY, the first 40 years of which were of peace and prosperity. His court was brilliant and elegant, with 2 million people living within and outside the walls of his capital city, Chang'an (Ch'ang-an), then the largest and most cosmopolitan city in the world. His reign inaugurated the GOLDEN AGE OF CHINESE POETRY; the works of the great poets Li Bo (Li Po), Du Fu (Tu Fu), and others are still celebrated in China and Japan. A patron of the arts, he set up the Hanlin Academy at court, where the best scholars, writers, and artists were nurtured.

Minghuang began his reign by sweeping away the favorites and corrupt officials who had been allowed to flourish during Empress Wu's last years and during the ineffective reigns of her two sons, Minghuang's uncle and father. He was a conscientious ruler who worked hard in administration, kept himself informed of the conditions of his people, kept down court extravagance, abolished capital punishment, and pursued a vigorous foreign policy that kept peace along the borders.

Minghuang however lived too long for his and the dynasty's good. At age 60 he fell in love with Lady Yang, concubine of one of his sons. He forced his son to divorce her and brought her to his own court with the rank of Guifei or Exalted Consort. She was famous for her obesity and made being fat fashionable. Doting on her, he abandoned his responsibilities and settled to a life of luxurious indulgence with her, while ennobling her sisters and other relatives and making her brother Yang Guozhong (Yang Kuo-chung) chief minister. Under the Yang family's dominance honest officials lost all influence. Yang Guifei's scandalous behavior included "adopting" the clownish and scheming Turkic general An Lushan (An Lu-Shan) as her son and promoting him to the rank of prince.

An rose to be commanding general of over 150,000 of the empire's best troops stationed in the north. In 755 An rose in rebellion, captured the eastern capital Luoyang (Loyang), proclaimed himself emperor, then marched on Chang'an. Minghuang and the court fled the capital and headed southward, seeking refuge in Sichuan (Szechwan) province.

However his guards refused to fight until they had killed Yang Guozhong. They then forced him to hand over Yang Guifei and strangled her. Minghuang abdicated in shame and grief in 756. It fell to Minghuang's

son and successor Suzong (Su-tsung) to quell the rebellion, at great cost, in 763.

The Tang dynasty never recovered from its consequences. The tragic end of Minghuang and Yang Guifei's love has inspired great poetry and became the subject of famous paintings.

Yarmuk, Battle of

The Battle of Yarmuk (a tributary of the Jordan River), close to the present-day border of Syria and Jordan, was a decisive battle between the Byzantine Empire and the rapidly expanding Arab Islamic empire. In the 630s as Arab forces advanced out of the Arabian Peninsula into Iraq in the east and greater Syria in the northeast they encroached deep inside Byzantine territory. When they lay siege to Damascus and other major cities, the Byzantine emperor Heraclius (r. 610–641) grew alarmed and raised a large army of Greek and native Arabs in the eastern Mediterranean to defeat the Muslim army. However the Arab Islamic forces of Bedu tribespeople were often joined by Arab volunteers, many of them Christians, who had become disaffected by Byzantine policies and high taxation.

The able Arab commander Khalid ibn al-Walid had already achieved major military victories in the Arabian Peninsula and was a keen strategist. The Arabs also enjoyed the advantages of a new dynamic religious faith, mobility, and a willingness to fight in the heat of the midday with scant water supplies. The Arab forces only numbered about 25,000; although the commonly given number of 90,000 Byzantine troops is an exaggeration, the Byzantines clearly outnumbered the Arabs. In August 636, when the Arab and Byzantine forces met along the Yarmuk River, which is traversed by deep ravines, the forces were spread out over several kilometers. The fighting lasted for six days and several times seemed to shift in favor of the Byzantines.

In keeping with Arab tradition, women and children accompanied the forces in wartime and on several well-documented occasions the women urged the men forward and even marched toward the Greeks armed with swords and tent posts. Fifty-year-old Hind Bint Utba, who had already earned a reputation as a formidable force in the Islamic community, marshaled troops in defense of their positions. Allegedly, the Greeks were so startled by the sight of armed women that some jumped over a cliff at the edge of the battlefield. By the end of the sixth day of fighting the Arabs were clearly victorious and, with no backup plans, the Byzantine forces retreated into the Anatolian Peninsula.

The victory at Yarmuk paved the way for the conquest of Damascus and then Jerusalem in 638. The inhabitants of Jerusalem handed the city, considered sacred to Jews, Christians, and Muslims, directly to Caliph Omar. The newly gained territories of the eastern Mediterranean were consolidated under the Umayyad Caliphate led by Caliph Muaw'iyah, Hind's son, and Damascus was made the new capital. Arab forces also went on to conquer Egypt and North Africa. The new Arab Islamic empire assimilated many Byzantine cultural and architectural styles and many of the Arab Christians, who were not forced to convert, gradually adopted Arabic as the primary language.

Yaroslav the Wise

(c. 978–1054) *grand prince of Novgorod and Kiev*

Also called *Iaroslav*, or *Yaroslav Mudryi* in Russian, Yaroslav the Wise was grand prince of Kiev from 1019 to 1054, one of the brightest representatives of the Riurykide (Rurikovich) dynasty, who was best known in eastern European history as a powerful leader of the early centralized Kievan Rus state. He was the son of Grand Prince VLADIMIR I (Volodymyr) (VLADIMIR THE GREAT). He is also recognized as a skillful administrator, military leader, and diplomat who put the Kievan Rus state on the political map of medieval Europe as one of the important powers of his era. At the end of Yaroslav's rule in Rostov (c. 988–c. 1010) the new city of Yaroslav (about 100 miles from Rostov) was established in his honor. He was then sent to rule the city of Novgorod in the northern part of Kievan Rus. Yaroslav preferred to use Viking (Varangian) mercenaries in Novgorod (the Riurykide dynasty, in fact, was of Viking descent). The Vikings, the privileged and favorites of the prince, were cruel and violent toward locals. In 1014 Yaroslav decided not to pay tribute to his father, Grand Prince Vladimir. The angry father prepared to fight his son but soon died of illness.

After the death of Vladimir, his eldest son, Svyatopolk, decided to win the throne of Kiev. To prevent his brothers from ascension to the throne, Svyatopolk killed Boris, Gleb, and Svyatoslav and acquired the throne. Svyatopolk, who became known as the Accursed (*Okayannyi* in Russian) for killing his own brothers, was very unpopular among ordinary citizens, soldiers, and the nobility in Kiev. Yaroslav, whose life was spared by the distance between Kiev and Novgorod, challenged Svyatopolk. He relied greatly on the help of Viking mercenaries as well as on citizens of Novgorod who were more than happy to assist him in his battle against Svyatopolk the Accursed. After a long battle with Svyatopolk, Yaroslav defeated him and seized power in 1016. Svyatopolk escaped to Poland. The Polish king Boleslas, interested in helping Svyatopolk in exchange for territorial concessions, sent his troops to Kiev. Yaroslav was defeated in a bitter battle in 1017 and escaped to Novgorod. By 1019 he gathered more troops from Novgorod. In a decisive battle he defeated his brother and became the grand prince of Kievan Rus.

It took him about two decades to assert his authority over some remote parts of his country, since he fought with another brother, Mstislav. From 1036 Yaroslav was the sole ruler of Kievan Rus.

Yaroslav ruled Kievan Rus for about 35 years, consolidating political and economic power and making the city of Kiev one of the greatest cultural centers in eastern Europe. He was notable for his military achievements, as he defeated the powerful and destructive nomadic Pechenegs on the Kievan southern frontier in 1036–37. In a series of campaigns on the western frontier in the 1030s and 1040s he weakened the Polish state, won the province of Galicia from POLAND, and expanded his possessions in the Baltic region by subduing Estonians, Lithuanians, and other tribal confederations. He also attempted to challenge the political dominance of the Byzantine Empire in southeastern Europe but was defeated at Constantinople in 1043.

The cultural and religious development of Kievan Rus was greatly advanced by Yaroslav during his rule. He promoted the spread of Christianity, which was formally introduced by his father, Vladimir, in 988. A considerable number of religious and some secular books were brought from the Byzantine Empire and were translated from Greek to the Old Slavonic and Old Church Slavonic languages. It is important to highlight that the close religious ties of Yaroslav with the Byzantine Church contributed to the future isolation of Russia from the Roman Catholic Church and consequently from Latin civilization. Yaroslav understood the significance of art. He encouraged Byzantine artists and artisans, especially architects, to settle in his capital.

New churches were built, and the first Russian monasteries were established during the reign of Yaroslav to signify the central role of the Christian church in the state. The monumental cathedral of St. Sophia and the Golden Gate of the Kievan Fortress became the most famous examples of the Kievan architecture. Under the order of Yaroslav, the country's legal system was codified and completed with publication of the legal code called *Yaroslav's Justice* (*Pravda Yaroslava* in Slavic).

Yaroslav was continuously replacing tribal leaders with his own associates and vigorously persecuting pagan leaders and suppressing paganism. These actions further contributed to transformation of the East Slavic tribal confederations into a dynamic feudal state and strengthened positions of the religious clergy in the political affairs. In 1051 Yaroslav appointed the local metropolitan Illarion for the first time without the participation of Constantinople.

Yaroslav pursued a very active foreign policy; he supported and promoted international trade. Russian merchants successfully traded as far as the Byzantine Empire, France, Hungary, Norway, and Persia. He built alliances with several central European and western powers through dynastic marriages, as his daughter Elizabeth was married to Harald III of Norway, daughter Anna to Henry I of France, and Anastasia to Andrew I of Hungary. Yaroslav was married to a Swedish princess and his sister married a Byzantine prince. This cemented the high prestige of the Kievan Rus state, and Yaroslav's dynasty in Europe. Yaroslav died in 1054, respected as a successful builder of the centralized Kievan Rus state. In his will he divided his domain among his five sons, entrusting the Kievan throne to his eldest son, Izaslav. However the state was ripped apart very soon after Yaroslav's death by his ambitious, but not farsighted sons.

RAFIS ABAZOV

Yelu Chucai

(1189–1243) *Chinese statesman*

Yelu Chucai belonged to the Yelu clan of the Khitan LIAO DYNASTY, which ruled northeastern China 916–1125. After the fall of Liao his branch of the family remained in northern China and served the JIN (CHIN) DYNASTY (1115–1234) that had destroyed Liao. He was thoroughly Sinicized, a follower of Confucian philosophy, and also practiced Buddhism. The Mongol army captured him in 1215 and three years later he was sent to Mongolia. He so impressed GENGHIS KHAN in an interview that Genghis appointed him scribe and court astrologer; he accompanied Genghis on campaigns to Central Asia between 1216 and 1219.

When OGOTAI KHAN succeeded his father as grand khan in 1229, a debate ensued among his advisers on the general policy directions. The extreme faction advocated the extermination of the agricultural population of northern China and use of the land for pasturage. Yelu Chucai argued forcibly in favor of letting the people live and taxing them, which would generate more revenue and benefit the imperial treasury in the long run. Ogotai decided to give Yelu Chucai's proposal a one-year trial period. Yelu Chucai devised a plan that assessed every adult a fixed tribute paid in silk yarn or silver, and every farming family a set grain tax. This fixed and predictable tax that everyone had to pay was preferable to the random and ruthless looting up to that time, and for the Mongol government resulted in increased revenue.

As a result Ogotai appointed Yelu Chucai head of his secretariat that oversaw the administration for North China; he would use his position to push for more reforms. One was to take a census for more accurate tax assessment. Another was to apply the Jin code for administration of laws for the Chinese population because the Mongol code was unsuitable for a sedentary culture. In 1238 he was able to hold examinations for the Chinese population across North China. A quarter of the candidates still had the status of prisoners of war or slaves of the Mongols. The exams were based on the Confucian Classics, and over 4,000 men passed. However Ogotai employed few of those who passed and only in very lowly posts. This was because the Mongol rulers had no intention of sharing power with their Chinese subjects.

Yelu Chucai also had limited success in his tax reforms because of Ogotai's constant demand for more revenue and orders to increase taxes at will. He turned to a system of tax farming relying on his Central Asian supporters to collect taxes and keeping a portion for themselves. Central Asians were also favored as moneylenders, who loaned money to farmers to pay their taxes and charged over 100 percent per year in interest. Ogotai also created numerous *appanages* (fiefs) for his relatives and supporters, who were able to mistreat the people under their control without government interference. Yelu Chucai died in 1243 in Karakorum. His great contribution was to persuade Ogotai not to exterminate the conquered northern Chinese population. His reforms were largely put aside in favor of Mongol policy interests.

JIU-HWA LO UPSHUR

Yongle (Yung-lo)

(1360–1424) *Chinese emperor*

The man who became the third ruler of China's MING DYNASTY (1368–1644) as Emperor Yongle (Yung-lo) (meaning "lasting joy") was the fourth son of Zhu Yuanzhang (Chu Yuan-chang), the dynastic founder. His personal name was *Zhu Di* (*Chu Ti*). Well grounded in Confucian studies and also a proven military commander, he personally led expeditions deep into Mongolia. Granted the title prince of Yan (Yen) by his father, he was also appointed commander of a large garrison that guarded Yan and the former YUAN DYNASTY (1279–1368) capital Dadu (T'a-tu). Zhu Yuanzhang, who is known as Emperor Hongwu (Hung-wu) and posthumously as TAIZU (T'AI-TSU), appointed his eldest son the crown prince, and the crown prince's eldest son as his heir when the crown prince died before him.

Taizu died in 1398 and his 20-year-old grandson succeeded as Emperor Jianwen (Chien-wen). The young emperor and his advisers at once made political changes that included purging his uncles (sons of Taizu), some of whom commanded troops guarding against Mongol invasions. These provoked a crisis and war when Jianwen seized two of the prince of Yan's officials and carried them off to NANJING (NANKING), the then Ming capital, for execution. As the eldest surviving son of Taizu the prince of Yan accused his nephew of persecuting the princes and wrongfully changing the direction set by the dynastic founder.

Hostilities began in 1399 with an attack by the emperor's forces. The prince, who was a superb commander and strategist, had about 100,000 troops. The emperor had over 300,000 men but they were less well led. After a hard campaign the gates of Nanjing were opened to the prince's army on July 13, 1402. In the melee the palace caught fire and when the fire died out three badly burned bodies were found and declared to be those of Jianwen, his empress, and their eldest son (his second son was two years old and lived for many years in protective custody). Because there was no proof of the authenticity of the corpses, searches for Jianwen continued for many years and legends proliferated about what had happened to him. (Many years later he was found and identified by a birthmark, living as a Buddhist monk, and was allowed to live out his life.) Zhu Di thus became emperor, not the successor of his nephew, but of his father. He chose the reign name *Emperor Yongle*. Jianwen's supporters were purged.

Emperor Yongle is regarded as the second founder of the Ming dynasty because of his numerous accomplishments and the expansion of the empire under his rule. A professional soldier, he took great interest in military affairs. To prevent a recurrence of his own rebellion against the reigning emperor, he removed his brothers and younger sons from active command, reorganized the army, and rotated provincial units to frontier duty and campaigns. Since the northern frontier remained vulnerable, and since his new capital Beijing (Peking) was close to the borderland, he emphasized defenses in the north, taking measures to ensure good communications, grain transport, and logistical support for the troops and settling many on the frontiers as soldier-farmers.

He used both diplomacy and military action in relationships with the nomads to ensure Chinese interests and to prevent them from becoming allies of the Mongols in the northwest. Likewise he conciliated the various Jurchen tribes in Manchuria to gain their submission as vassals. Over a century earlier the first Yuan ruler, KUBILAI KHAN, had obtained control over Tibet. As Mongol power collapsed, Tibet went its own way under a fractured political-religious system. Yongle did not attempt to gain political control over Tibet and treated its top clergy with respect and lavished gifts on them when they visited, happy that they were not united, and therefore could not threaten his borders. His main concern was over the Mongols. Between 1410 and 1424 he personally led five campaigns into Mongolia, each with over 250,000 troops, falling ill and dying during the last one. His goal was to forestall the formation of Mongol alliances and while he scored victories each time, he could not destroy them or prevent them from coalescing again. Following his death Ming strategy changed to a defensive one.

To secure China's primacy in the Asian world Taizu had obtained Korea's vassalage (following the fall of the Yuan dynasty Koreans too threw out the Mongols. A new dynasty, called Yi or Choson, was established in 1392). In 1407 Yongle sent an army to conquer Annam (modern North Vietnam), a vassal state, because of involvement in local politics. The Chinese army crushed the Annamese army in battle and annexed the region as Chinese provinces. The Annamese, however, waged

a guerrilla war of resistance that was costly to China. Finally, in 1427, three years after Yongle's death, a peace agreement was reached whereby Annam ruled itself but acknowledged Chinese overlordship. Between 1405 and 1422 Yongle sent six huge naval expeditions under a eunuch admiral named ZHENG HE (Cheng Ho) that showed the Chinese flag from Southeast Asia, across the Indian Ocean, Persian Gulf, to East Africa and brought about trade and acknowledgment of Chinese overlordship from numerous small states throughout the region.

Nanjing was an unpleasant memory to Yongle, who rebuilt the Yuan capital Dadu (T'a-tu); named it Beijing (Peking), meaning Northern Capital; and moved his government there in 1421. He built its imposing city wall, the imperial palace (residence and office) of over 9,000 rooms, the Temple of Heaven, many temples, and a huge mausoleum for himself outside the city.

In government he continued and expanded institutions and practices begun by his father, which became the fixed pattern of administration through the dynasty. The examination system continued to produce talented men for the government, the best among whom were recruited to the Hanlin Academy, which helped the monarch to draft laws, process documents, and deal with problems. Highly educated and author of philosophical essays, he gathered more than 2,000 scholars who worked for five years to produce a work called the *Yongle Dadian* (*Yung-lo t'a-tien*) comprising 11,469 large volumes and over 50 million words. It was an encyclopedia of knowledge in all fields. His sponsorship of intellectual life resulted in many other literary projects and publications, printed in large numbers and widely distributed, this half a century before JOHANN GUTENBERG's first printed book. Yongle's accomplishments earned for him the posthumous title on Chengzu (Ch'eng-tsu), which means "successful progenitor."

JIU-HWA LO UPSHUR

Yuan dynasty

Yuan was the first non-Chinese dynasty to rule the entire area of the Chinese civilization (1279–1368).

KUBILAI KHAN (grandson of GENGHIS KHAN) proclaimed this rule in 1271, but because South China was not then under his control, historians did not formally recognize it as the ruling dynasty of China until the Southern SONG (SUNG) DYNASTY was destroyed in 1279. Up to this time all dynasties had taken the name of the geographic region of its founder's family. Since Mongolia was not part of China culturally, Kubilai chose *Yuan* (Great Originator), a word from the Chinese classic the *Book of Changes*.

Kubilai Khan (r. 1260–94) was the fifth grand khan of the Mongol empire, but his election was disputed and despite victory over his challengers, his leadership was never fully recognized, and he spent years fighting wars with his kinsmen. Kubilai Khan, the greatest Yuan ruler, fought wars to enlarge his empire, unsuccessfully only against Japan and Java. He and his successors ruled directly over Mongolia, China (including Manchuria and Tibet), and indirectly over vassal states that included Korea, Burma, Siam, Annam (North Vietnam), and Champa (South Vietnam).

MONGOL CASTE SYSTEM AND SOCIAL ORGANIZATION

Although Kubilai had a much greater appreciation of Chinese culture than his predecessors and many of his contemporaries in the clan of Genghis Khan, he did not read or write Chinese. Even though his conquest of Southern Song did not feature the wholesale massacres practiced by his predecessors, his regime was nevertheless one of military occupation with Mongols the chief beneficiaries.

The Mongol government divided the people into four castes or categories as follows: The first caste were Mongols, who enjoyed the highest positions and most privileges; the second caste were called *se-mu* (light-eyed) people, who were Middle Easterners, and other non-Chinese including Europeans such as MARCO POLO; the third caste were northern Chinese and assimilated nomads; and the fourth and lowest were southern Chinese from the conquered Southern Song lands (who were the most numerous group).

The Mongol rulers trusted their non-Chinese subjects precisely because they were not Chinese and were therefore unconditionally loyal; many served the Mongol masters as ruthless tax collectors and moneylenders. The most numerous group, the southern Chinese, were most distrusted and exploited.

Mongols strenuously resisted assimilation to Chinese culture. Many preferred to live in yurts (tents), even in the capital palace grounds, and trekked to Mongolia to

hunt annually. Their love of hunting and riding resulted in huge areas throughout China being turned into pastures and hunting parks, their previous owners being evicted or enslaved. Mongol cuisine consisted mainly of boiled or roasted mutton, washed down with huge quantities of koumiss (fermented mare's milk). Alcoholism killed many in the ruling house prematurely.

The fate of the Yuan dynasty was closely tied to the effectiveness of its military. Mongols and their nomadic allies formed the elite cavalry, which was supported by land granted to the hereditary heads of the units. But because Mongols lacked managerial skills and abused the Chinese farmers, many fled, causing a drop in production, hence income. Chinese formed the infantry units, which were distrusted; for example, Chinese units had to turn in their weapons after maneuvers. As Mongol military effectiveness declined, the accumulated grievances of the subject people led to widespread rebellions.

The official language of the Yuan government was Mongolian. A written script had been created for writing down spoken Mongol under Genghis Khan; it used the Uighur script. Early Mongols practiced shamanism, but Kubilai Khan became interested in Chan (Ch'an) Buddhism in his youth and then turned to Tibetan Lamaist Buddhism after he took over Tibet and came under the influence of a religious leader called Phagspa. Phagspa was called on to create a new script for writing Mongol, called the Phagspa script, which is still in use. Kubilai's adherence and patronage also led to the conversion of Mongols in Mongolia and China to become Buddhists of the Tibetan school. Kubilai and his successors also granted enormous favors and huge sums to Tibetan clergymen, who became widely hated by the Chinese for their abuse of power.

Kubilai and his successors gradually allowed their Chinese subjects to add Chinese-style government offices, modified from the Tang (T'ang) and Song model, though under Mongol supervision. In 1315 the examination system was even reinstated, but with a quota system that gave half of the doctoral degrees to Mongol and *se-mu* candidates regardless of qualification; the number of officials who had passed the examinations never exceeded 4 percent. Chinese were restricted to low, mainly clerical posts and received few promotions. For committing the same crimes, Chinese were punished more severely, and Mongols were given light punishment for crimes against Chinese. Some of Kubilai Khan's successors patronized Chinese arts and culture, became collectors of Chinese art, and endorsed the writing of the official histories of all three preceding dynasties, the Song, Liao, and Jin, as the Yuan's legiti-

mate predecessors. However, by and large the Mongols left Chinese intellectual life alone. This allowed private academies to continue teaching NEO-CONFUCIANISM. A number of notable painters also continued along earlier traditions. Because few intellectuals found opportunities under the Yuan government, some took up unorthodox professions such as medicine, fortune telling, writing fiction, and developing operatic drama.

ECONOMIC RECOVERY AND THE LUXURY TRADE

Kubilai Khan began measures to restore aspects of the damaged economy and fostered trade. Thus he had the GRAND CANAL repaired and built and maintained roads. These measures were necessary to transport food and luxuries from southern China to supply his court in Dadu (T'a-tu), which had been capital city of the LIAO DYNASTY and JIN (CHIN) DYNASTY, which had been destroyed by earlier Mongol armies and he had rebuilt.

He also maintained a second capital, his headquarters from the days before becoming emperor. It was called Shangdu (Shang-tu), located 200 miles north of Dadu and close to the Mongolian steppes. The annual trek of the court from one capital to the other, which was continued throughout the dynasty, was costly. Kubilai also established a postal service with 1,400 stations, 4,000 carts, 6,000 boats, and 50,000 horses.

The international luxury trade prospered because the different branches of Genghis Khan's family ruled from Korea to eastern Europe and imposed conditions that made travel and trade safe—historians call this the Pax Tatarica (Tatar Peace). For example Chinese porcelain makers produced beautiful underglazed blue wares from the fine cobalt that was mined in Persia (Persia was ruled by the descendants of Kubilai Khan's younger brother HULAGU KHAN).

Sorghum, a new crop, was introduced and became an important food source for North China. However the prosperity under the Yuan government was spotty and largely superficial. Ineptitude and rampant inflation from fiscal irresponsibility and currency manipulation caused great harm to the economy and general impoverishment. Mongol and *se-mu* owned vast tracts of land, granted as *appanage* (fief) by Mongol rulers to their favorites, and reduced the people who worked for them to slavery.

DECLINE AND COLLAPSE

Kubilai died in 1294. He was predeceased by his heir and appointed a grandson his successor, called Temur Oljeitu, r. 1294–1307. There were no external wars

during the ensuing 40 years, the mid-Yuan era. However instead of consolidation bitter succession conflicts destabilized the dynasty. Nine emperors followed one another in 39 years, most coming to power under dispute, and after armed conflicts. Two were murdered while on the throne. Furthermore each change in ruler also resulted in bloody purges and policy reversals. Many of the disputes involved ethnic policy, whether to remain true to the nomadic heritage versus Sinicization, and relationship with the Chinese. Most of the short-reigning emperors were weak; several of them were children.

TOGHON TEMUR KHAN (r. 1333–68) was the last and longest reigning Mongol emperor, who assumed the throne at age 13. He was dogged throughout his reign by his disputed paternity, which cast doubt on his legitimacy. He relied on powerful ministers, the first of whom was called Bayan. Bayan was anti-Chinese and sought to reassert Mongol authority by imposing strict segregation between Mongols and Chinese. He forbade Chinese to learn Mongol; confiscated their weapons, iron tools, and horses, in an attempt to forestall revolts; and forbade the performance of Chinese operas. Finally he proposed solving the ethnic problem by killing all Chinese with the five most popular surnames; that would have accounted for 90 percent of the population. Luckily by then the government had no ability to carry it out.

Floods, droughts, and plagues (possibly the **BLACK DEATH** brought to China by Mongol garrisons in the Middle East) overwhelmed the crumbling administration. Toghon Temur abandoned participation in the government, giving himself over to Lama Buddhist practices and debauchery. In 1368 a successful Chinese rebel leader, Zhu Yuanzhang (Chu Yuan-chang), who had already established his headquarters and an administration in **NANJING (NANKING)** south of the Yangzi (Yangtze) River, took Dadu. Before that Toghon Temur and his remaining court had fled to Mongolia, where he died two years later. Zhu became the founding emperor of the **MING DYNASTY**.

JIU-HWA LO UPSHUR

Yue Fei (Yueh Fei)

(1103–1142) *Chinese general*

Yue Fei is one of the most famous and admired figures in Chinese history. His parents were farmers in present day Henan (Honan) province. Growing up he was acutely aware of the brutal power of the nomadic Jurchens, who frequently raided his region. In 1122 he joined a daredevil corps of the army.

In 1127 the Jurchen **JIN (CHIN) DYNASTY** sacked **KAI-FENG (K'AI-FENG)**, the **SONG (SUNG) DYNASTY** capital, carrying off to the wilds of Manchuria Song; **HUIZONG (HUI-TSUNG)**, his heir; and 3,000 members of his family and court. One of Huizong's younger sons escaped capture and rallied loyalists in resistance against the Jurchens, retreating to South China, until they established a government in Hangzhou (Hangchou) near the coast in modern Zhejiang (Chekiang) province 10 years later. That prince reigned as **Gaozong (Kao-tsung)** of the Southern Song dynasty. Yue Fei was the most courageous, popular, and successful general, who trained and led a well-disciplined army of over 100,000 men. Volunteers flocked to join his ranks, his soldiers calling themselves the "Yue Family Army." They campaigned against local bandits who had risen in the wake of the collapse of central authority, earning gratitude of people in affected areas. They also took the offensive aggressively against Jin troops, recovering lost territory into the Yellow River valley, raising morale among the Chinese and hope of recovering lost lands.

Yue's actions and popularity did not suit Gaozong and his chief councilor Qin Gui (Ch'in Kuei), who secretly began peace negotiations with the Jin in 1138,

Lingyin Temple in Hangzhou was founded in 326 C.E.. The temple has been destroyed and restored at least 16 times over its history.

because his successes stood in their path. Gaozong might have been genuinely doubtful of ultimate success in war. He also stood to lose personally if Yue defeated the Jin and forced them to return the captive Huizong and his heir (who was Gaozong's elder brother, and therefore the rightful ruler). Qin Gui was by all accounts a power-hungry politician who staked his future on peace with the Jin, who may have demanded Yue's elimination as their condition for peace. In 1141 Yue was relieved of his command (as were several other successful anti-Jin generals) and jailed for insubordination and malfeasance. No credible evidence could be produced against him, so Qin Gui gave an order to have him poisoned in jail, and his eldest son, a promising young officer and a key lieutenant, was executed. His widow and remaining children were sent to harsh exile. The Song government destroyed most documents concerning his official career.

Qin Gui retained power until he died in 1155. In 1661 changes in court politics led to the total rehabilitation of Yue Fei and surviving members of his family

returned from exile. Yue's body, secretly taken from the prison by sympathetic jailers, was exhumed and buried with honor.

Thus began the cult of Yue Fei, as a great patriot and a rallying hero of Chinese nationalism. His mother was also honored as an unselfish role model; she had tattooed four characters on his back that read, "Requite the state to the limits of loyalty." His wife was also admired for helping the families of those who served under him, and for keeping the family together after the tragedy of his death. Popular opinion made Yue a semimythical figure, Gaozong less than a filial son and courageous leader, and Qin Gui and his powerful wife despicable moral cowards.

Zen (Ch'an) Buddhism

Zen is a form of Buddhism that concentrates on calm, reflective forms of meditation in the quest for enlightenment. The word *Zen*, by which the school is known in Japan, derives from the Sanskrit word *dhyana*, which means “meditation.” *Dhyana* took root in China and was translated into the Chinese character *ch'an*. Zen is the Japanese pronunciation of *ch'an*, while it is also known in Korean as *Seon* and in Vietnamese as *Thien*. The same basic principles and provenance of the school apply to each country where Zen Buddhism has come to be practiced, although it has developed slightly differently in each country over the years. The essence of Zen Buddhism is that the capability to attain the Buddhahood—to recreate the enlightenment of Gautama Buddha—exists within all people but remains latent because of ignorance of its presence. It is, consequently, a branch of Mahayana Buddhism.

To liberate the potential for enlightenment, the best method is to penetrate mundane, rational thought to achieve a sudden transcendent understanding. Training in the way to achieve this should be transmitted from a Zen master to a student individually and is known as *satori*. All other activities, such as studying scriptures, proper behavior, and charitable works, prescribed by different schools of Buddhist thought are held to be less valuable approaches to enlightenment and may in fact be worthless.

The originator of Zen Buddhism is believed to be the Indian monk Bodhidharma, who resided in China

in the sixth century. Bodhidharma is said to be the 28th patriarch of the Indian meditation school that was founded by the monk Kasyapa, to whom the lord Buddha revealed his enlightened nature directly. Bodhidharma continued the practice of passing authority over the school through subsequent patriarchs, the first of whom was Hui-ko. By the end of the reign of the fifth patriarch, the school began to suffer from schisms and it was a branch of the so-called Southern school that took root in Japan. This featured students' concentrating on koan (or *kung-an* in Chinese), which are apparently contradictory aphorisms, which, when resolved, can lead the mind to sudden enlightenment. In some schools, the focus on koan was assisted by the Zen master's slapping the face of the student or emitting unexpected shouts to help intensify the mind's activity. Other schools favored the *zazen* method of sitting quietly.

Zen spread slowly from China and was established in Japan in the 12th century. Many of the warrior class practiced Zen and lent their support to its protection. The monk Dogen, who founded his own temple in Japan after having achieved enlightenment in China while in the *zazen* position, led further development.

JOHN WALSH

Zhao Kuangyin (Chao K'uang-yin)

(928–976) *Chinese emperor*

Zhao Kuangyin, founder of the SONG (SUNG) DYNASTY (960–1289), is better known by his posthumous title *Song Taizu* (*T'ai-tsu*), which means “Grand Progenitor of the Song.” China was plunged into half a century of turmoil after the fall of the TANG (T'ANG) DYNASTY in 909. From 909 to 960 five ephemeral dynasties contended for power in North China while 10 regional kingdoms struggled with one another in the south.

The last of the five dynasties was called the Later Zhou (Chou); it only lasted for 10 years (951–960) because when the founder died, he left the throne to his young son under the boy's mother as regent. When a nomadic people called Khitan invaded, she ordered General Zhao Kuangyin commander of troops to battle against them. After one day on the march the troops mutinied and demanded that Zhao become emperor. He agreed on condition that they did not harm the Later Zhou royal family, then they marched back to the capital city KAIFENG (K'AI-FENG) and Zhao was proclaimed emperor of the Song dynasty.

Taizu was a military commander and understood that he owed his throne to his officers, who could just as easily unseat him. He also understood that he needed the army to reunify China because parts of the north and the entire south were not under his control. He took care of his dual problem immediately in the following way.

He held a banquet for his top officers and, after much drinking, persuaded them to hand over their commands in return for retirement on generous pensions. After securing their agreement he allowed them to build lavish mansions in the capital (where they were under surveillance) and ensured their continued allegiance by intermarriages among their respective families. He promoted loyal junior officers to command, rotated units to secure imperial control, and proceeded to reunify China with relatively little bloodshed. Taizu's mother was a wise woman.

She feared overthrow of the new Song dynasty should Taizu (who was only 32 when he became emperor) die and be followed by a young and inexperienced son, as had happened to the Later Zhou. Therefore she made her family agree to her plans on the succession on her deathbed in 961—that Taizu would be succeeded by his younger brother, who was also an experienced general. By the time the younger brother, who ruled as TAIZONG (T'ANG-TSUNG), died in 997, the Song dynasty was well established.

The brothers were able administrators who worked to centralize the administration and to establish civilian control over the military. They expanded the examination system and recruited civil officials down to the county level from those who had passed the exams, which were based on the Confucian Classics. Taizu was content not to attempt the reconquest of northeastern and northwestern China, which had been under the Tang empire, but were then ruled by nomad states. The institutions and the tone of government set by the Taizu would endure through the Song dynasty.

Zheng He (Cheng Ho)

(1371–1434) *Chinese explorer*

Zheng He was born into a Muslim family named Ma in Kunying, Yunnan province. At the beginning of the MING DYNASTY (1368–1644), a number of generals fighting on the frontiers were put in charge of recruiting eunuchs for the court. When Yunnan was pacified in 1381, Zheng He, then aged around 10, was castrated and assigned to the retinue of Prince Zhu Di (Chi Ti) in Beijing (Peking).

As a young man, Zheng He accompanied Zhu Di and distinguished himself in a series of military campaigns against the Mongols. During the rebellion (1399–1402) by means of which the prince usurped the throne, Zheng He played an important role, culminating in the capture of the capital city NANJING (NANKING). Amid the conflagration, the dethroned emperor Zhu Yunwen (Chu Yun-wen) reportedly escaped. The suspicion that he might have been wandering abroad became one of the reasons Zhu Di, now Emperor YONGLE (YUNG-LO), launched a number of maritime expeditions led by his trusted eunuch, who was given the surname *Zheng* in 1404.

Preparations for the first voyage included the construction of oceangoing vessels of various sizes and the recruitment and training of the crew and staff of spe-

cialists. In 1405 more than 300 vessels and a crew of 27,800 men set out from the lower Yangzi (Yangtze) estuary and headed south along the coastal waters of Southeast Asia. After pacifying the troubled waters of the Malacca Strait, the fleet crossed the Indian Ocean and reached the port of Calicut on the Malabar coast of southern India. The second expedition (1407–09) followed the same route as the first, adding visits to several states along the coasts of Vietnam, Thailand, Java, and the nearby islands as well as Ceylon (Sri Lanka). The third expedition (1409–11) explored the Ryukyu Islands, Taiwan, the Sulu Archipelago, and Borneo before reaching the same destinations as the previous voyage.

The fourth voyage (1413–15) expanded its reach to include the Maldives, Hormuz, the Hadramaut coast, and Aden. During the fifth voyage (1417–19), Mogadishu, Brawa, and Malindi in East Africa were added to the itinerary, and many rare species of plants and animals were brought back to the capital Beijing. The sixth voyage (1421–22) ventured south along the East African coast with visits to Zanzibar and probably Kilwa, located below the equator.

In 1424 Emperor Yongle died and criticism of the expensive voyages grew louder in the court. However, the new emperor, Xuande (Hsuan-te), wanted to launch yet another expedition in order to revive China's tributary relations with the many states established heretofore. After many delays, Zheng He departed on his seventh and last voyage in 1431. His death in Calicut in 1434 ended the whole enterprise.

During a period of 28 years, China displayed a remarkably advanced maritime technology, which led to increased contact with scores of states and regions from the Malay Archipelago in the east to East Africa in the west. Besides establishing diplomatic relations through the exchange of gifts and visits by foreign rulers to the Chinese capital, more markets were opened up for Chinese products, especially silks and porcelains. A brilliant commander, diplomat, and explorer, Zheng He made voyages that broadened China's geographical horizons, and the maritime trade enriched its domestic economy during the heyday of the Ming dynasty

Zhu Xi (Chu Hsi)

(1130–1200) *Chinese scholar*

Zhu Xi was a prominent SONG (SUNG) DYNASTY Neo-Confucian scholar who taught at the White Deer Grotto Academy and, by completing the second wave of canonizing Confucian learning, created a program of education and self-cultivation that became the official standard for the Chinese civil service examinations from 1313 until 1905. The son of a Confucian scholar-administrator, Zhu proved a highly precocious youth who in his teens was attracted to ZEN (CH'AN) BUDDHISM, while concurrently preparing himself for the civil service examinations. Passing the highest regular examination (*jinsshi*) at the age of 18, he embarked on a career combining periods of official service with longer periods of teaching and writing.

Zhu's greatness consisted in his ability to formulate a unified system of thought integrating both the contributions of his Song predecessors and the popular Buddhist and Taoist principles that had made significant inroads into China with the long line of traditional Confucian teachings. Moreover Zhu codified as basic texts of the Confucian school the *Four Books*—the *Meng-Zi*, *Daxue* (*Great Learning*), *Zhong Yong* (*Doctrine of the Mean*), and the *Analects*—and wrote exhaustive interpretations of every sentence in the *Four Books*, called the *Annotations*. His philosophy, often identified as the Cheng-Zhu school (since his most influential predecessor was Cheng Yi), emphasizes the doctrines of *li* (principle), *qi* (vital force), *Xing* or *hsing* (the nature of all things), *xin* or *hsin* (the human heart-mind), and *Tai-Qi* (*tai-chi* or the *Great Ultimate*) in an attempt to reorient education toward moral practice.

Zhu argued that *li* is the unchanging and eternal principle of being, order, and pattern (encompassing both universal and particular elements) that brings all essences into being and comprises the moral structure of the universe. These essences are actualized by *qi*, the psychophysical vital force or simultaneously material and immaterial substance of the universe, which animates or fills out the individual patterns created by *li*. The source and sum of these two universal elements (*li* and *qi*) is the *tai-qi*, which also causes *qi* to move and change in the physical world, resulting in the division of the world into the two energy modes (yin and yang) and the five elements (fire, water, wood, metal, and earth). Hence *qi* is not found equally in all things (including humans), and the fact that people have various endowments of *qi* accounts for their ethical differences (for example, some understand and follow morality easily, while others must strive to realize moral principles).

Zhu's system is a modified dualism because *li* and *ch'i* are interdependent, where a symbiotic relationship between the two furnishes the constitution of human beings. By defining humanity as the conjunction of Mencius's concepts *hsin* and *hsing*, or the original heart-mind, and then identifying *hsin-hsing* with *li*, Zhu rendered human nature as intrinsically good, yielding the four moral sprouts of loyalty, respect, obedience, and honesty, and a microcosm of the supreme ordering principle resident throughout the universe. Resembling the idea of a Buddha-mind, Zhu claimed, all humans have the potential for perfection, but evil arises through the clouding effect of *li* being shrouded by *ch'i*.

For Zhu the mind of every person contains two dimensions: the mind of the Way, or the original intrinsic principled goodness that links the person directly with the *tai-qi*, and the human mind, or the *ch'i*-filled arena, where conflict arises between *hsin-hsing* (the original mind) and carnal desires. Zhu's method for overcoming this psychophysical imbalance consisted in the investigation of things and internal cultivation. Following the *Daxue*, Zhu held that the investigation of things was a fourfold process. First one must apprehend the principles of things, or affairs such as matters of conduct, human relations, and political problems, that makes them one. Second one must read and reflect on the literature in which such principles are revealed, including the 13 Confucian Classics, and live according to an active ethical regimen that could develop to the fullest the virtue of humaneness, or *jen*. It is through *jen* that one overcomes selfishness and partiality, enters into all things in such a way as to identify oneself fully with them, and thus unites oneself with the Mind of the universe, which is love and creativity itself. Through his discussion of the traditionally impersonal T'ien, or heaven, as an intelligent Mind or ordering will behind the universe, Zhu introduced a quasi-theistic tendency within Confucianism.

Third, one must become a lover of learning and study history; here we see in Zhu a kind of positivism that affirms, contra Buddhism, the reality of things and reinforces the traditional Confucian emphasis upon the objective validity of scholarship. Fourth, one must study one's own experience, or perform an "exegesis of one's life," by making oneself aware of the principles that cause things to happen. By internal cultivation, Zhu meant that one must spend part of each day in contemplation and self-reflection upon one's daily behavior in light of what one learned from the Classics, and that one must develop a reverence or sense of awe toward the universe and an inner-mental attentiveness

through the technique of quiet sitting (reaching stillness of thought through meditation).

Although Zhu's service at the royal court was brief, with much of it limited to lectures and memorials conveying the most general sort of advice to the emperor, he spent considerable time in local administration as a social reformer. His work included the improvement of agricultural methods and schools, the establishment of charitable granaries, famine relief, and community organizations, and the rehabilitation of local academies. As a result, Zhu suffered severe political persecution from the more conservative authorities, such that the canonical status of his teachings, albeit widely accepted by contemporary scholars, would not be officially certified for some years later. In the 14th century Zhu's teachings became the official orthodoxy of China (an assessment lasting until the early 20th century) and likewise became accepted in Japan and Korea as the most complete and authoritative exposition of Confucianism. Therefore, they exerted a profound influence on the whole cultural development of East Asia well into the modern period.

KIRK R. MACGREGOR

Zimbabwe

As with much of southern Africa, the earliest inhabitants of what is now the country of Zimbabwe were the nomadic San peoples, who led a life in search of game and edible vegetation about 20,000 years ago. Later the Khoi-Khoi people, pastoralists with herds, entered the region. The two cultures fused into the Khoisan people, who have shown an amazing degree of adaptation to one of the world's most forbidding climates: the Kalahari Desert. By approximately 500 the BANTU arrived

as the Gokomere people, climaxing the long Bantu migration from the central Sahara, which was most likely caused by the country's turning into desert and driving out the livestock-herding Bantus. Whether this was the cause of overgrazing or an early example of global climate change is unclear.

The settlements at Mapungubwe in the Limpopo River valley date from the 10th century, although archaeologists have found evidence from as remote as the third century. By 1175 Mapungubwe had become the center of a small kingdom whose population was devoted to raising livestock. Gold, however, is what drew Arab traders originally to the region. The region became involved in trade throughout the world, as John Reader notes in *Africa: A Biography of the Continent*, "glass beads made in India and Egypt testify to the community's involvement in long-distance trade."

Sometime during this era of Bantu migration to the region, the great stone, cyclopean structures of Zimbabwe, Khami, and Dhlo-Dhlo were built, the Stonehenges of southern Africa. It was buildings like these, and the legends that grew up around them, that led Victorian author H. Rider Haggard to write his classic adventure novels *She*, *King Solomon's Mines*, and *Allan Quartermain*. John Reader writes, "At the time of its pre-eminence in the fifteenth century, at least 11,000 and as many as 18,000 people are said to have lived at Great Zimbabwe." Reader notes that Zimbabwe was built between 1275 and 1550.

By the 14th century the Bantus had created the Mutapa empire, which would reach to the East African coast at Mozambique. Even before this, Arab merchants

were in large numbers in the coastal cities, creating an oceanic trade with what are now Saudi Arabia, Yemen, and east to India in their sailing ships, or dhows. Their voyages would be expertly timed with the monsoon seasons, which still dominate the region today.

By the 16th century the Portuguese, with their far more heavily armed caravels, dominated the trade on both coasts of Africa, building castles to protect their trading interests from the African chiefs and Arabs with whom they were in competition. In 1498 Vasco da Gama reached India, thus making PORTUGAL the first of the European maritime trading empires. On his voyage down the West African coast, he had seen Arab dhows picking up the vast amount of gold that the Mutapa empire and the Shonas sent to the coast, a product of the rich gold mining that was the greatest heritage of old Zimbabwe.

ABOUT THE EDITORS

Marsha E. Ackermann received a Ph.D. in American culture from the University of Michigan. She is the author of the award-winning book *Cool Comfort: America's Romance with Air-Conditioning* and has taught U.S. history and related topics at the University of Michigan, Michigan State University, and Eastern Michigan University.

Michael J. Schroeder received a Ph.D. in history from the University of Michigan and currently teaches at Eastern Michigan University. Author of the textbook *The New Immigrants: Mexican Americans*, he has published numerous articles on Latin American history.

Janice J. Terry received a Ph.D. from the School of Oriental and African Studies, University of London, and is professor emeritus of Middle East history at Eastern Michigan University. Her latest book is *U.S. Foreign Policy in the Middle East: The Role of Lobbies and Special Interest Groups*. She is also a coauthor of the world history textbooks *The 20th Century: A Brief Global History* and *World History*.

Jiu-Hwa Lo Upshur received a Ph.D. from the University of Michigan and is professor emeritus of Chinese history at Eastern Michigan University. She is a coauthor of the world history textbooks *The 20th Century: A Brief Global History* and *World History*.

Mark F. Whitters received a Ph.D. in religion and history from The Catholic University of America and currently teaches at Eastern Michigan University. His publications include *The Epistle of Second Baruch: A Study in Form and Message*.

FOREWORD

The seven-volume *Encyclopedia of World History* is a comprehensive reference to the most important events, themes, and personalities in world history. The encyclopedia covers the entire range of human history in chronological order—from the prehistoric eras and early civilizations to our contemporary age—using six time periods that will be familiar to students and teachers of world history. This reference work provides a resource for students—and the general public—with content that is closely aligned to the *National Standards for World History* and the College Board’s Advanced Placement World History course, both of which have been widely adopted by states and school districts.

This encyclopedia is one of the first to offer a balanced presentation of human history for a truly global perspective of the past. Each of the six chronological volumes begins with an in-depth essay that covers five themes common to all periods of world history. They discuss such important issues as technological progress, agriculture and food production, warfare, trade and cultural interactions, and social and class relationships. These major themes allow the reader to follow the development of the world’s major regions and civilizations and make comparisons across time and place.

The encyclopedia was edited by a team of five accomplished historians chosen because they are specialists in different areas and eras of world history, as well as having taught world history in the classroom. They and many other experts are responsible for writing the approximately 2,000 signed entries based on the latest scholarship. Additionally each article is cross-referenced with relevant other ones in that volume. A chronology is included to provide students with a chronological reference to major events in the given era. In each volume an array of full-color maps provides geographic context, while numerous illustrations provide visual contexts to the material. Each article also concludes with a bibliography of several readily available pertinent reference works in English. Historical documents included in the seventh volume provide the reader with primary sources, a feature that is especially important for students. Each volume also includes its own index, while the seventh volume contains a master index for the set.

CHRONOLOGY

1453 Constantinople Falls to Mehmed II

The Byzantine Empire comes to an end when the forces of Mehmed II capture Constantinople, which becomes capital of the Ottoman Empire.

1455–1487 War of the Roses in England

A civil war between the Houses of Lancaster and York. The war is limited to English nobility and involves few of the populace.

1467–1477 Onin Wars

These wars in Japan show the Ashikaga Shogunate in terminal decline.

1480 Treaty of Constantinople

The 15-year war between the Ottoman Empire and Venice ends with this treaty. Under its terms Venice cedes cities along the Albanian coast to the Ottomans.

1487 Dias Circles South Africa

Bartolomeu Dias, the Portuguese explorer, sails around the Cape of Good Hope. He is the first European explorer to round southern Africa.

1492 Columbus Sets Sail for the New World

Queen Isabella of Spain finances the explorations of

Christopher Columbus, whose goal is to find a sea route to Asia by sailing westward. He departs on August 3 with three ships and 52 men. On October 12, 1492, land is sighted on an island in the Bahamas that Columbus names San Salvador, though the natives call it Guanahani.

1492 Jews Are Expelled from Spain

The Jews of Spain are expelled by the government. Some convert and stay, while over 100,000 leave Spain. Many travel to the Ottoman Empire, while some settle in Portugal.

1494 Treaty of Tordesillas

This treaty between Spain and Portugal grants most of the New World to Spain.

1498 Cabot Claims North America

On June 24, John Cabot, sailing on behalf of King Henry VII of England, sights the coast of modern-day Canada and maps the coast from Nova Scotia to Newfoundland. He claims the land for England.

1498 Vasco da Gama Reaches India

Portuguese explorer Vasco da Gama reaches India by sailing around the coast of Africa.

- 1501 Battle of Shurer**
Shi'i rule of Iran is consolidated when Ismail I of Arabadil defeats the leader of the White Sheep dynasty at the Battle of Shurer.
- 1502 Slavery in the New World**
First African slaves are transported to the West Indies.
- 1502 Aztec Emperor Is Chosen**
Moctezuma II is selected as the emperor of the Aztecs.
- 1503 Da Vinci Finishes Masterpiece**
Leonardo da Vinci completes his painting the Mona Lisa.
- 1504 Ferdinand of Aragon Conquers Naples**
On January 1, Ferdinand of Aragon completes the conquest of Naples when French forces at Gaeta surrender.
- 1508 Michelangelo Paints the Sistine Chapel Ceiling**
Michelangelo spends four years painting the ceiling of the Sistine Chapel.
- 1510 Portugal in India**
Portugal establishes a settlement in Goa, on the west coast of India, which becomes the center of the Indian trade.
- 1511 Portugal in Southeast Asia**
Portugal establishes a trading base at Malacca and retains control for 130 years.
- 1513 Balboa Reaches the Pacific**
Spanish explorer Vasco Núñez de Balboa crosses the isthmus of Panama and discovers and names the Pacific Ocean.
- 1514 War between Ottomans and Persians**
The Ottomans, who are Sunni Muslims, attack the Shi'i Persians. They defeat the Persian army at the Battle of Chaldiran on August 23, 1513.
- 1517 Martin Luther Breaks with Church**
The Protestant Reformation begins when Martin Luther nails his criticism of the Catholic Church on the door of the Wittenberg Cathedral.
- 1517 Cabot Discovers Hudson Bay**
Sebastian Cabot discovers the entrance to Hudson Bay in 1517.
- 1519 Cortés Enters Tenochtitlán**
Spanish conqueror Hernán Cortés enters the Aztec capital of Tenochtitlán and captures Moctezuma II.
- 1519 Ferdinand Magellan Sets Sail around the World**
On August 10 Portuguese navigator Magellan leaves Seville with a fleet of five ships. He finds a route around South America through the straits that now bears his name.
- 1520 Suleiman the Magnificent Is Crowned**
Selim, the Ottoman sultan, dies and is succeeded by his son Suleiman I. Suleiman becomes known as Suleiman the Magnificent.
- 1524 German Peasants' Rebellion**
Peasants in southern Germany take heed of Luther's call for religious reform and extend it to include a call for social reform as well. The peasants overthrow the local government in Muhlhausen and demand an end to serfdom, feudal dues, and tithes.
- 1524 Verazzano Discovers New York Bay**
Sailing under a French flag, Giovanni da Verrazano discovers New York Bay on April 17.
- 1526 Babur Wins First Battle of Panipat**
Babur leads an army across the Kybur Pass and defeats Ibrahim Lodi at the first Battle of Panipat, resulting in the founding of the Mughal dynasty in India.
- 1527 Guatemala City Is Founded**
The Spanish found Guatemala City and create the Spanish Captaincy General of Guatemala.
- 1529 Algeria Expels Spain**
The Ottomans expel Spain from Algeria with the help of the pirate Barbarossa II. Algeria becomes a vassal state of the Ottomans.
- 1529 Treaty of Cambrai**
After a failed war in Italy, France agrees to renew the Treaty of Madrid.
- 1531 Pizarro Conquers Peru**
In 1531 Pizarro begins his conquest of Peru. He arrives from Panama with 300 men and 100 horses. By August 1533 Pizarro completes his conquest of the Incas.
- 1532 Ottomans Invade Hungary**
The Ottoman army led by Suleiman II invades Hungary

- and march toward Vienna. He is stopped by the forces of Charles V and the Protestant League. Peace is concluded in 1533.
- 1534 Portuguese Traders Reach Japan**
First Portuguese trading ship arrives in Japan, beginning a century of trading and missionary activity.
- 1534 England Breaks with Church in Rome**
After the Church of Rome cancels his annulment to Catherine, and has Henry VIII excommunicated for marrying Anne Boleyn, Henry breaks with Rome. He has the parliament pass the Act of Supremacy, which states that the king is the supreme head of the English Church, and he is the one to appoint all clergy.
- 1534 Cartier Claims Canada**
Jacques Cartier, sailing under the patronage of King Francis I of France, arrives at the mouth of the St. Lawrence River. After exploring the area, he claims the area for France.
- 1535 Portugal and Macao**
Portugal establishes a trading station at Macao in agreement with the Ming government of China.
- 1536 Calvin Publishes *Institution Chrétienne***
John Calvin publishes his treatise Institutes of Christian Religion. The book becomes a roadmap of Protestant thought.
- 1540 First Known Native American Composition**
A Native American singer from the city of Tlaxcala, Mexico, composes a mass.
- 1541 De Soto Explores Mississippi River**
Spanish explorer Hernando de Soto discovers the Mississippi River.
- 1542 Westerners in Japan**
The first European visitors arrive in Japan aboard a shipwrecked Chinese ship.
- 1543 Copernicus Claims Earth Circles the Sun**
Nicolaus Copernicus publishes *De revolutionbu orbium coelestium*. This work proves that Earth and the other planets circle around the Sun.
- 1545 Silver in Peru**
Spanish begin mining silver at Potosí in Peru.
- 1547 Ivan the Terrible Becomes Czar**
On January 17 Ivan IV has himself crowned the czar of all the Russias.
- 1549 Jesuits Arrive in Japan**
Jesuit missionary Francis Xavier arrives in Japan, beginning a century of successful Christian missionary work.
- 1549 New Granada Is Created**
The Spanish viceroyalty of New Granada is created, comprising South America east of the Andes and north of the Amazon River.
- 1552 Treaty of Passau**
The Holy Roman Emperor Charles V attempts to force the Protestant princes of southern Germany to return to Catholicism. Prince Henry II of France takes advantage of the situation by allying himself with the Protestants and seizes Metz, Toul, and Verdun. Charles is forced to leave Germany and sign the Treaty of Passau, granting the Protestants religious liberty.
- 1555 Jews Are Restricted to Ghettos in Italy**
Pope Paul IV issues his bull *Cum nimis absrudam*. Under its terms, Jews in the cities are restricted at night to their own quarters.
- 1555 Treaty of Amasya**
In 1555 the Treaty of Amasya is signed between the Ottoman Empire and Persia, bringing the war between the parties to an end.
- 1555 Akbar the Great**
Akbar becomes third ruler of Mughal Empire in India.
- 1556 First Music Book Printed in the New World**
An *Ordinarium* is published on a printing press in Mexico.
- 1556 Second Battle of Panipat**
Jala-ud-Din returns from exile after his father, Humayun, the Mughal emperor, dies. He defeats Hindu forces at the Battle of Panipat on November 5.
- 1558 Elizabethan Age Begins**
The Elizabethan age in England begins with the death of Queen Mary and the ascension to the throne of Elizabeth, the daughter of Henry VIII by Anne Boleyn.

1560 Treaty of Edinburgh

Mary, Queen of Scots declares herself Queen of England in 1559. The next year French troops in Scotland try to assert the claim of Mary against Elizabeth, who the Catholics claimed was illegitimate. The French troops are besieged at Leith, and the French are forced to sign the Treaty of Edinburgh, ceasing their interference in the affairs of Scotland.

1562 First French War of Religion

France becomes embroiled in a religious war between the Huguenots and Catholics. The war is touched off by the massacre of Huguenots at Vassy on March 1.

1565 Spain in the Philippines

Spain establishes the first permanent settlement in the Philippines.

1568 Eighty Years' War Begins

A war that lasted for 80 years breaks out when Flemish opponents to the Spanish Inquisition are beheaded. The Flemish and Dutch then begin a rebellion against Spanish rule.

1569 Northern Rebellion

Dukes of northern England stage an unsuccessful revolt against Queen Elizabeth in order to restore Catholicism to England. The rebels hope to free Mary, Queen of Scots from captivity.

1571 Battle of Lepanto

On October 7 the Ottoman fleet of 240 galleys is defeated by a fleet from the Maritime League. The league's fleet consists of ships from Spain, Malta, Genoa and Venice.

1571 Manila Is Founded

Miguel López de Legazpe, leading a Spanish force, subjugates the Philippine natives. He goes on to found Manila.

1573 Ashikaga Shogunate Ends

The Ashikaga Shogunate in Japan, long in decline, is ended by Oda Nobunaga.

1574 Tunis Is Annexed by Ottomans

An Ottoman army under the command of Sinan Pasha retakes Tunisia.

1578 Portuguese Army Is Defeated in Morocco

Sebastian, the king of Portugal, leads an army to restore

the deposed sultan of Morocco. Moroccans at the Battle of Alcazarquivir annihilate the Portuguese army.

1581 Battle of Pskov

Stephen Bathory leads the Poles to a victory over the forces of Ivan the Terrible at the Battle of Pskov.

1581 Tartar Khanate of Siberia

The Russians double the size of their country by taking control of the Tartar Khanate of Siberia.

1582 Jesuits in China

Matteo Ricci is the first Jesuit missionary to reach China, beginning a long cultural relationship between China and Europe.

1585 Roanoke Is Founded

Walter Raleigh establishes a colony on Roanoke Island off the coast of present-day Virginia, but it soon fails.

1585 Eighth War of Religion

The Eighth Religious War, otherwise known as the War of the Three Henrys, begins when the Holy League vows to deny Henry of Navarre the French throne.

1587 Drake Attacks Spanish Court of Cádiz

The Spanish plans under Philip II to invade England are delayed when Sir Francis Drake attacks the Bay of Cádiz. Drake destroys 10,000 tons of Spanish shipping and delays the Spanish assault for a year.

1588 Spanish Armada

The Spanish fleet sets sail on July 12. It consists of 128 ships carrying 29,522 sailors. The British fleet consists of 116 large ships and numerous coastal vessels. On the morning of the 21st, elements of the British fleet attack the superior Spanish. The fight continues on and off for five days. There are no decisive battles, just continued engagements in which the English consistently achieve the upper hand, at which point the Spanish withdraw.

1590 Japan Is Unified

Japan is unified by Toyotomi Hideyoshi. A series of military campaigns together with his vassal Tokugawa Ieyasu lead to a single unified government.

1592 Japan Invades Korea

Toyotomi Hideyoshi, a Japanese lord, invades Korea as a first step to invading China. It is defeated by Chinese intervention.

- 1595 Battle of Fontaine-Française**
The French House of Bourbon is officially established on February 27, 1594. The next year Henry IV declares war on Spain. He wins an important battle at Fontaine-Française near Dijon.
- 1597 Shakespeare's Career Begins**
Love's Labour's Lost, the first play under William Shakespeare's name, is published.
- 1598 Edict of Nantes**
Henry IV, king of France, issues the Edict of Nantes on April 13. The edict gives full civil rights to Protestants in France.
- 1600 Battle of Nieuwport**
On July 2 the combined forces of the Dutch and English defeats the Spanish Habsburgs at the Battle of Nieuwport. The Habsburg defeat secures the independence of the Netherlands.
- 1600 East India Company**
The English East India Company is formed to trade in Asia.
- 1600 Battle of Sekigahara**
Japanese general Tokugawa Ieysasu is victorious in the Battle of Sekigahara against the other contenders for power in Japan.
- 1602 Dutch East India Company**
The Dutch East India Company is founded and becomes the premier trading company of the Netherlands.
- 1603 Tokugawa Shogunate**
Tokugawa Ieysasu is appointed shogun by the Japanese emperor, beginning the Tokugawa Shogunate.
- 1604 Time of Troubles Begin in Russia**
The Russian Time of Troubles begins with the appearance of a false Dimitri—a pretender to the Russian throne. He gains support from the Poles and the Cossacks. For a period of nine years, virtual anarchy reigns in Russia, as the various parties fight over rule.
- 1605 Gunpowder Plot**
On November 5 the Gunpowder Plot is discovered. The planners of the plot, Guy Fawkes, Thomas Percy, and Thomas Winter English, are all Catholics who plan to assassinate King James I and blow up Parliament.
- 1607 Jamestown Is Established**
King James I of England grants the London Company a charter to settle the southern part of English North America. The settlers endure many trials but establish the first permanent English settlement in North America.
- 1610 Galileo Proves Copernican System Correct**
In 1610 Galileo Galilei publishes the results of his telescopic observations in *Sidereus nuncius*. Galileo shows that the Copernican system in which the planets circle the Sun is correct.
- 1610 Sante Fe Is Founded**
The Spanish government establishes Santa Fe as the capital of New Mexico in December 1610.
- 1613 Romanov Dynasty**
On March 3 Michael Romanov, then 17, is elected czar of Russia. Thus begins the Romanov dynasty, which lasts until being overthrown by Vladimir Lenin in 1917.
- 1614 Christians Are Ordered Out of Japan**
The Japanese shogun orders the immediate expulsion of all Christian missionaries. He begins to persecute all Christians in Japan.
- 1616 Rise of the Qing**
Nurhaci begins laying the foundations of a state that would rule all of China as the Qing (Ch'ing) dynasty.
- 1618 Thirty Years' War Begins**
The Thirty Years' War begins when two Catholic members of the Prague Diet are thrown out of a window by Protestants.
- 1620 *Mayflower* Lands at Plymouth**
One hundred and two individuals, most of whom are Puritans, receive a grant of land on which to set up their own colony. They set sail from England on the *Mayflower*, arriving in Massachusetts in December.
- 1628 Petition of Rights**
The English parliament passes the Petition of Rights. Under its terms the king cannot levy any new taxes without the consent of Parliament.
- 1630 Massachusetts Bay Colony**
On June 12 the flagship of the Massachusetts Bay Company arrives in Salem to officially found the new colony.

1631 Taj Mahal Construction Begins

Shah Jahah, Mughal Emperor of India, begins to build the Taj Mahal, a mausoleum for his wife. It takes 17 years to complete.

1635 Shimabara Uprising

Persecuted Christian peasants in Japan rebel, but they are cruelly put down.

1635 Roger Williams Founds Rhode Island

Roger Williams, a Puritan clergyman in Massachusetts, is banished for his religious beliefs and flees to Rhode Island, where he establishes his own colony. This colony provides complete religious freedom for all people.

1636 Exclusion Laws in Japan

Exclusion laws in Japan outlaw all contact with Europeans until 1854.

1637 Settlers Kill 500 Native Americans

On June 5, some 500 Indians (men, women, and children) are killed, thus ending the Pequot War.

1640 Triennial Act

In April the English parliament meets for the first time in 11 years. This meeting, which lasts four years, becomes known as the Long Parliament.

1642 New Zealand Is Discovered by Dutch

On December 13 Abel Janszoon Tasman discovers New Zealand. He sails on commission of the Dutch East Indies Company.

1642 English Civil War Begins

Disputes lead to civil war between Parliament and the king. Oliver Cromwell leads the Roundheads against the Royalists.

1644 End of the Ming

The Qing, or Manchu, dynasty replaces the Ming.

1648 Treaty of Westphalia

The Treaty of Westphalia is signed at Münster on October 24, bringing to an end the Thirty Years' War.

1651 Charles II Is Defeated, Flees to France

Charles II arrives in Scotland from France and is proclaimed king of Scotland and England. He is defeated in September 1650 at the Battle of Dunbar by Oliver Cromwell.

1652 Cape Town Is Founded

Cape Town, South Africa, is founded by the surgeon of a Dutch ship, Jan van Riebeeck. He goes ashore with 70 men.

1658 Last Mughal Emperor

Aurangzeb seizes the throne of India and reigns until 1707 as the last great Mughal emperor.

1660 Peace of Breda

Charles II, in exile in France, issues the Declaration of Breda in which he offers to reconcile with the English parliament, which meets after the death of Oliver Cromwell. Parliament accepts his declaration, and Charles returns to England.

1664 New York

Peter Stuyvesant reluctantly surrenders New Amsterdam to the English, and the city becomes known as New York.

1664 French East India Company

France establishes the French East India Company to trade in Asia.

1672 Newton Founds Study of Mechanics

Isaac Newton founds the study of mechanics. The underlying basis is Newton's three laws of motion.

1673 Mississippi River Is Explored

French priests Jacques Marquette and Louis Joliet explore the upper reaches of the Mississippi River.

1674 Hudson's Bay Is Established

English establish the Hudson's Bay trading post.

1675–1676 King Philip's War

English colonists fight King Philip's War against a Wampanoag-led alliance of Indians in southern New England.

1679 Habeas Corpus Act Is Passed

The English parliament passes the Habeas Corpus Act. The act requires judges to present a writ of Habeas Corpus which demands that a jailer produce a prisoner and show cause why the prisoner is being held.

1681 Pennsylvania Founded

William Penn, who had embraced Quakerism as an adult, obtains a land grant from the king of England.

- Penn receives the grant in lieu of money owed to his dead father. The land is called Pennsylvania.
- 1681 Qing Triumphant**
The rebellion of the Three Feudatories ends, consolidating the Qing dynasty in China.
- 1682 Louisiana Territory Is Claimed**
French explorer Robert de La Salle reaches the mouth of the Mississippi and claims the Louisiana Territory for France.
- 1683 Turkish Siege of Vienna**
The Ottomans, under Grand Vizier Kara Mustafa, begin a siege of Vienna in July. The siege is lifted in September by a combined German and Polish army.
- 1683 Last of the Ming**
The Qing dynasty defeats the last Ming loyalist forces on Taiwan.
- 1685 Edict of Nantes Is Revoked**
King Louis XIV of France revokes the Edict of Nantes, which guarantees religious freedom in France.
- 1686 New England Unites**
English colonies in North America are organized into the Dominion of New England.
- 1688 The Glorious Revolution**
The Glorious Revolution ends four years of Catholic rule in England.
- 1689 War of the Grand Alliance Begins**
The League of Augsburg, which combines Spain, Sweden, Bavaria, Saxony, and the Palatinate, begins a war against France.
- 1689 Treaty of Nerchinsk**
This treaty between China and Russia demarcates the borders shared by the two nations.
- 1690 Battle of the Boyne River**
The Protestants complete their conquest of Ireland when England's William III defeats the Catholic pretender James II at the Battle of the Boyne.
- 1690 British Establish Fort at Calcutta**
The British East India Company founds Calcutta. Leading the effort is John Charnock.
- 1690 John Locke**
John Locke, the English philosopher, publishes the *Two Treatises of Civil Government*. The book presents the theory of a limited monarchy.
- 1692 Witchcraft Trials**
Witchcraft trials are held in Salem, Massachusetts.
- 1697 Battle of Zenta**
The Ottomans suffer an overwhelming defeat at the Battle of Zenta on September 11. After the battle, the Treaty of Karlowitz is signed. The Ottomans are forced to cede Croatia, Hungary, Transylvania, and Slovenia to Austria.
- 1697 Russian Czar Visits Western Europe**
Czar Peter becomes the first Russian leader to leave his country. Peter returns to Russia determined to Westernize the society.
- 1697 Treaty of Ryswick**
The Treaty of Ryswick ends the 11-year War of the League of Augsburg. All of Spanish lands conquered by France are returned to Spain.
- 1700 Great Northern War**
A war breaks out that becomes known as the Great Northern War. Russia, Poland, and Denmark join forces to oppose Sweden.
- 1701 War of the Spanish Succession Begins**
The War of the Spanish Succession begins when Charles II dies and names the grandson of Louis IV, Phillip V, king of France.
- 1704 Battle of Blenheim**
The English and the Dutch win a stunning victory over French and Bavarian forces in the Battle of Blenheim on August 13. The French and their allies lose 4,500 dead and 11,000 wounded. The British capture 11,000 prisoners. They suffer 670 dead and 1,500 wounded.
- 1704 Newton Publishes *Optick***
Isaac Newton publishes his work *Optick*. This is the result of Newton's work on reflection, refraction, diffraction, and the spectra of light.
- 1706 The Act of Union**
Great Britain comes into being with the union of England and Scotland.

1709 Battle of Poltava

The Russians, under Peter the Great, are victorious at the Battle of Poltava in the Ukraine. The Russian victory is so decisive that it makes Russia the dominant power in northern Europe.

1712 Treaty of Aargau

The Protestant victory over Catholic forces in the Battle of Villmergen leads to the peace Treaty of Aargau. This treaty establishes Protestant dominance in Switzerland while protecting the rights of the Catholics.

1713 Peace of Utrecht

The War of the Spanish Succession comes to an end with the Peace of Utrecht. Under its terms Philip V from the Bourbon House of France is officially recognized as the king of Spain.

1716 Battle of Peterwardein

The Austrians declare war on the Ottoman Empire on April 13. On August 5, they defeat the Ottomans at the Battle of Peterwardein.

1718 Treaty of Passarowitz

The Austrians and the Ottomans sign the Treaty of Passarowitz. The treaty establishes the Danube River as the border between the Islamic Ottoman Empire and Western Christian states.

1720 Chinese Assault Tibet

The Chinese Emperor Kangxi attacks Tibet and drives off the final Mongol influence on China. A pro-Chinese Dalai Lama is installed to rule Tibet.

1720 Treaty of the Hague

The Treaty of Hague is signed between Spain and the Quadruple Alliance made up of Britain, France, Holland, and Austria.

1721 Treaty of Nystad

Under the Treaty of Nystad, Russia receives Estonia, Livonia, and parts of the Baltic Islands. This brings the Great Northern War to an end.

1724 Treaty of Constantinople

The Ottomans and the Russians sign the Treaty of Constantinople on June 23. The treaty partitions Persia between the Ottoman Empire and Russia.

1730 End of Safavid Dynasty

The Safavid dynasty, which ruled Persia since 1502, comes to an end when Abbas III, the four-year-old shah, dies.

1733 War of Polish Succession Begins

With the death of Poland's King Augustus II a war breaks out to determine who will succeed him.

1737 Treaty of Kaikhta

This treaty between China and Russia defines the far eastern boundary between them.

1739 War of Jenkins' Ear

The War of Jenkins' Ear begins between England and Spain, when the Glasgow brig *Rebecca* is boarded by a Spanish man-of-war.

1740 The First Silesian War

The First Silesian War occurs when Frederick II, the son of Frederick William, comes to power in Prussia on the death of his father and seizes Silesia from the Austrians.

1740 The War of the Austrian Succession Begins

The death of the Holy Roman Emperor Charles VI on October 20 begins a contest of succession.

1741 Handel Composes *The Messiah*

George Frideric Handel composes the oratorio *Messiah* in London, England.

1742 Chinese Rites

The papacy rules against Chinese rites that had been advocated by Jesuit missionaries.

1743 King George's War

Hostilities between Britain and Spain become absorbed into King George's War, the American phase of the War of the Austrian Succession.

1743 Treaty of Åbo

The Treaty of Åbo is signed between Russia and Sweden. Under its terms, Sweden maintains part of Finland, but accedes to having Russia's candidate become the king of Sweden.

1748 Treaty of Aix-la-Chapelle

The War of the Austrian Succession comes to an end with the Treaty of Aix-la-Chapelle.

MAJOR THEMES

1450 to 1750

FOOD PRODUCTION

For the vast majority of the world's inhabitants during this period, technologies of food production changed slowly and haltingly, if at all. Most people farmed in the way of their ancestors, using mostly human and animal labor and simple tools to produce enough for their own subsistence and, in class-based societies governed by states (the domain of most agriculturalists), to pay taxes. The “agricultural revolution” in technology associated with the Industrial Revolution was just beginning at the end of the period under discussion here, and only on a tiny fraction of the globe's cultivated lands.

Yet despite this slow pace of change in farming technologies, the early modern period also saw the world's population more than double, from 250–350 million to 850–1,200 million (all figures are estimates for the period 1500–1800). Some areas saw spectacular growth, especially China (from less than 100 million to more than 300 million) and Europe (from 70 million to 190 million). Other areas saw even more spectacular declines, most notably the indigenous populations of the Americas, especially the Caribbean (from 3 million to 5 million to virtually zero) and Mesoamerica (Mexico and Central America, from 25 million to 1 million). Some areas saw demographic stagnation or declines, especially Africa (around 100 million throughout this period). Despite these uneven demographic patterns, the overall global trend was clearly toward rapidly rising world populations. The explanation lies not in technology but in the social relations governing the production and distribution of foods.

In other words, while farming technologies for most of the world's people changed little during the early modern period, the politics and social relations of food production, exchange, and consumption changed dramatically. These changes were rooted in the birth and expansion of a genuinely global economy from the 1490s in consequence of the formation of western European empires in Asia and Latin America, empires that also encompassed Africa as a source of slaves for New World plantation agriculture. Related developments in science, technology, commerce, and empire-building in the 1600s and 1700s laid the groundwork for the dramatic transformations in agricultural technologies that accompanied the Industrial Revolution. Indeed, it was western

European's quest for foods—in the form of spices and flavorings—that lay at the root of their search for a sea route to Asia, which in turn led to their “discovery” of the Americas, their formation of overseas empires, and major transformations in global markets, commercial relations, and relations of power and privilege. Similarly, the western European quest for sweets—most tangibly represented in sugar—led to the establishment of expansive sugar plantations in the Caribbean and Brazil, the enslavement and subsequent annihilation of the Caribbean's indigenous inhabitants, the transatlantic slave trade, race-based chattel slavery, and the largest forced migration in world history. Other “drug foods,” which were made into drinks to be consumed by themselves or with other foods—especially tea, coffee, and cocoa—or smoked, in the case of tobacco—became integral to the growth and expansion of empires. In short, to trace the manifold changes in the production, exchange, and consumption of various types of foods in the early modern period would be to go a long way toward tracing the principal forces transforming the planet.

The most important shifts in food production, exchange, and consumption during this period were associated with the Columbian Exchange, in which certain plants indigenous to the Americas were spread to the rest of the world, and plants and animals from the rest of the world were introduced into the Americas. The resultant dietary improvements led to substantial population increases in many parts of the globe, especially in Europe and Asia. China under the Ming dynasty (1368–1644) saw dramatic increases in food production as a consequence of an aggressive government policy of land rehabilitation following the destruction of agricultural land and neglect of irrigation under the previous Mongol rule. The introduction of crops from the Americas via the Spanish Philippines—especially maize, peanuts, and sweet potatoes—resulted in huge increases in food production and substantial population increases (populations had plummeted by an estimated 40 percent under the Mongols). The construction of an extensive seawall on the coast of the Yangzi (Yangtze) Delta and points south prevented flooding and tidal surges that in the past had devastated rich agricultural lands. Improvements in transportation also facilitated more efficient food distribution. Thanks to these and related developments, in the 16th and 17th centuries, the Chinese under the Ming ranked among the best fed people in the world. Populations soared.

India and Japan. In India and Japan, cultivators also adopted a diversity of New World foods, though India's Mughal government did not actively promote irrigation or flood-control measures, leaving many cultivators vulnerable to the region's frequent cycles of drought and flooding. In Champa (South Vietnam) and elsewhere in Southeast Asia and Indonesia, the introduction of early ripening rice strains began around 1450 and became more widespread in subsequent decades, permitting a double cropping of rice in many areas, further increasing food supply. The generally improving conditions across much of Southeast Asia from the mid-1400s gave way in the 1600s to generalized political and economic crisis, as the Portuguese, Spanish, and especially the Dutch waged wars of conquest, burning cities and towns and reconfiguring production and trade relations in order to supply more effectively European markets with nutmeg, cloves, peppers, and other prized commodities.

Europe. In Europe, the early modern period was marked by a growing divergence between different types of agricultural regimes and peasant-landlord relations. These changes unfolded in the aftermath of Europe's “calamitous 14th century,” a period marked by wars, plague, the Black Death, and steep population declines across most of the continent. By the mid-15th century, many areas had begun to recover from the devastation and turmoil of the preceding century, permitting populations to expand and unused or abandoned lands to be brought under the plough. Different regions experienced different trajectories of agricultural recovery, depending on a multitude of factors, especially the nature of the state and the dominant social relations in land and labor among peasants and landlords.

In England, the enclosure of open fields and commons, beginning in the 1400s and continuing through the 1700s, concentrated land ownership in fewer hands, creating a large rural wage labor force and landless population and swelling the cities with paupers and the unemployed. The first enclosures were sparked especially by growing demand for wool, which prompted many landlords

to fence off (enclose) sheep meadows from common pastures and peasant grain fields. Much of the migration to British North America from the 1630s was undertaken by men, women, and families who had been dispossessed of their lands and forced to migrate to urban areas in consequence of the enclosures. The enclosures caused growing landlessness, the spread of wage labor, concentration of landownership, differentiation of the peasantry into rich and poor classes, production geared less toward subsistence and more toward the market, and increased migration to the major cities, which provided a low-wage labor force for the growing factory system.

Since the writings of Adam Smith (*Wealth of Nations*, 1776), scholars have debated the question of Europe's transition from feudalism to capitalism. Much of that discussion has focused on England: the rise of its overseas empire; the rise of its factory system; its central role in the Scientific Revolution, Enlightenment, and transatlantic slave trade; and the role of enclosures in propelling these changes forward. One influential school of thought holds that the seeds of global capitalism lie in the English countryside, where rural capitalist social relations first developed through the separation of direct producers (peasants) from the means of production (land), thus creating a large urban wage labor force for the emergent factory economy. Other scholars offer competing accounts of the origins of capitalism in Europe, stressing the rise of cities and towns, growing accumulations of capital among merchants, and increasing monetarization of local and regional economies.

One result of increasingly market-oriented production in England was a broad movement in many areas toward "scientific farming," especially after around 1700. Landlords introduced new crops and farming techniques to increase efficiency, reduce fallow periods, and increase yields, and, thus, profits. Exemplifying this trend was the English agricultural innovator Jethro Tull (1674–1741), who advocated such techniques as soil pulverization, more thorough tilling, mechanized seed drills, selective plant and animal breeding, and integration of crop and livestock production, especially through intensified use of manure as fertilizer. Such innovations were the exception, however. Across most of the British Isles the pace of change was slower, though many cultivators did adopt a number of New World crops—especially corn (maize) and potatoes, improving and diversifying diets. In Ireland, unequal social and class relations combined with the rapid spread of a particular variety of Andean potato (the white potato), on which peasants grew increasingly dependent, to the exclusion of other crops. This culminated in the Irish Famine of the late 1840s.

The situation in France contrasted sharply with the English case. Here the enclosures were far more limited, with peasants, in feudal relations with landlords, retaining access to most of the country's arable land. Through most of the 1600s and 1700s, agricultural production stagnated, remaining geared mostly toward subsistence and paying taxes to feudal lords. Even in zones closest to burgeoning markets, such as Normandy and Cambrésis, agricultural productivity stagnated or declined, while technical innovations were rare. Similar dynamics characterized the German-speaking principalities and kingdoms to the east. But despite the slow pace of change, by the end of the early modern period, much of northern and western Europe had undergone a long-term shift toward more market-oriented agriculture, with important implications for the economic changes and political and social upheavals of the 19th century.

Africa. In sub-Saharan Africa, global shifts in the social relations of food and agriculture during the early modern period had ambiguous consequences, though overall these were profoundly detrimental to most Africans' nutritional well-being. On the one hand, American maize, manioc, ground nuts (peanuts), and many fruits and vegetables provided a more diverse range of foodstuffs and improved diets across broad swaths of the continent. On the other hand, tropical plantation agriculture in the Americas, especially sugar production, was the driving force behind the transatlantic slave trade, which drained sub-Saharan Africa of its most productive laborers, caused demographic stagnation, and sparked devastating spirals of war and upheaval across much of the continent.

Americas. In the Americas, social relations in food and agriculture underwent profound changes. In Spanish America, the demographic catastrophe caused by warfare, enslavement, and epidemic diseases introduced from Europe caused steep declines in both indigenous populations and the amount

of cultivated arable land. In the most densely populated zones in central and southern Mexico and the Andean highlands, agriculture remained oriented mainly toward subsistence and meeting tribute and tax obligations. Surpluses were siphoned by government and ecclesiastical authorities, while vast tracts were appropriated by the church and an emergent class of hacienda owners. In the Caribbean and Brazil, the explosive growth of sugar production led first to enslavement of Native peoples, then to the massive import of African slaves. In the sugar mills of Bahia (Northeast Brazil) and the Greater and Lesser Antilles, slave-labor plantation agriculture melded with proto-industrial boiling and refining factories—a fascinating instance of early proto-industrialization in the New World linked directly to agriculture and empire.

In British North America, the rapid expansion of tobacco cultivation in the Chesapeake Bay area from the early 1600s engendered a highly stratified society, marked by profound divisions of class and race, the latter especially after Bacon's Rebellion in 1675, which solidified Euro-American solidarity and an emergent ideology of whiteness. Further north, in the Massachusetts Bay Colony and New England, small farms utilizing mostly family labor predominated. Abundant land, appropriated from Native peoples, formed the basis for an expanding agrarian empire that by the 1750s reached into the eastern Appalachian piedmont.

SCIENTIFIC AND TECHNOLOGICAL DEVELOPMENTS

In the years covered in this volume, roughly corresponding to the “early modern period,” the scope and direction of historical change around the globe were fundamentally transformed. Global history was born as western European empires, struggling for supremacy within Europe, struck out across the planet in search of treasure and power. In 1450, the world was divided into at least eight major empires and more than a dozen major culture zones, most out of direct contact with each other; modern science, as a collective enterprise devoted to the systematic investigation and accumulation of empirical knowledge about the natural world, did not exist. By 1750, most parts of the globe had become enmeshed in a rapidly evolving global capitalist system dominated by western Europe, and modern science was flourishing.

The vast majority of the world's inhabitants employed technologies in use for centuries, even millennia, while technological “progress” was partial, uneven, punctuated, and decidedly nonlinear. The historical evolution of the reciprocating steam engine, a device crucial to the 19th-century Industrial Revolution, is a good case in point. The first known application of steam power was among the Alexandrians (in modern Egypt) in 62 C.E. Falling into disuse in the West, steam engines were developed independently in China from the early 1200s. Five centuries later, in 1712, the English inventor Thomas Newcomen (1663–1729) patented his steam engine, building on the work of Italian physicist Evangelista Torricelli (1608–47) and German inventor Otto von Guericke (1602–86), who in turn built mainly on Greek antecedents. Yet half a century later, when Scottish inventor James Watt (1736–1819) and English engineer Richard Trevithick (1771–1833) sought to resolve key technical problems in Newcomen's design, they reached back far beyond Newcomen to 13th-century China. Similar discontinuities and ruptures characterize almost every other major field of technology and science in the Age of Empires to varying degrees: not only the harnessing of mechanical energy but also the production of thermal energy, as well as in agriculture, transportation, warfare, metallurgy, printing, navigation and geography, mathematics, medicine, and other fields.

Thus, in lieu of chronicling the most prominent European scientists, inventors, and inventions during this remarkable age, here we broaden the canvas to survey the sciences and technologies that most shaped the lives ordinary people in different parts of the globe.

Harnessing of Mechanical Energy. Human and animal power easily comprised more than 95 percent of the mechanical energy used during this period. Other major sources were water and wind engines, used mainly for grinding grain, as well as for irrigation and iron-smelting bellows. In the West, such engines saw significant advances from the 11th to the 13th centuries, mainly with running water turning wooden wheels driving systems of wooden gears. In the mid-1600s, there were some 1,200 watermills and 20 windmills in and around Paris, most used to supply the city with bread.

Urban zones in Spanish Galicia, England, and elsewhere saw similar densities. By 1800, Europe boasted an estimated half a million watermills.

China and the Muslim world also employed watermills from at least the ninth century. Peoples in sub-Saharan Africa and the Americas relied exclusively on human labor, the latter at least until the growth of sugar and slavery in Brazil and the Caribbean from the 16th century, when animal-driven sugar grinding mills were introduced. From the 15th century, the Dutch introduced major innovations in windmill technology, permitting extensive reclamations of land from the North Atlantic. Sails comprised the other major way to harness mechanical energy, used mainly in oceanic transport, discussed below. The steam-engine did not begin to replace these and related engine technologies in a significant way until the Industrial Revolution.

Production of Thermal Energy. Wood and its derivatives provided the overwhelming preponderance of thermal energy during this period—it was used for heating homes, cooking food, refining ores, and stoking furnaces to manufacture objects of iron, steel, glass, and ceramics, among other materials. For centuries coal had been used in China, Europe, and elsewhere, and began to be used on a large scale in the Liège basin and Newcastle basin from the early 1500s. By the 1650s, Newcastle, in England, was producing an estimated half a million pounds per year, used in saltworks, glassworks, ironworks, breweries, lime-kilns, and many other industries.

Techniques to produce coke from coal were developed in England by the 1620s, though smelting iron with coke did not become commonplace until the 1780s. Throughout this period, wood remained the only available fuel for the vast majority of the world's people. Deforestation became a major problem in some areas, prompting diverse responses, ranging from rising coal use in England to the invention of wok cooking techniques in China, an adaptation to perennial firewood shortages. In thermal energy production, if the 20th century was the Age of Oil, and the 19th the Age of Coal, the early modern period, like all previous epochs in human history, was the Age of Wood.

Food and Agriculture. The major transformations in agricultural technologies consisted principally of incremental improvements to iron-tipped wooden ploughs, an implement dating to around 1000 B.C.E. Overall, the pace of agricultural change in the early modern period was slow, despite the biospheric revolution brought about by the Columbian Exchange. The “agricultural revolution” had only begun by the end of the period under discussion here. Most agriculturalists around the world continued to employ technologies handed down from generation to generation: fire and digging sticks in sub-Saharan Africa and the Americas; draft-animal drawn plows in Europe and Asia; animal, waterwheel, and human-powered irrigation systems, using technologies dating back centuries or millennia. On the whole, and despite some important innovations, agricultural and food technologies did not undergo dramatic changes until the final decades of the early modern period, and even then on a tiny fraction of the globe's tilled surface.

Transportation. Until the 18th century, sea transport was slow and expensive, land transport slower and more expensive still. The principal overland conveyances were beasts of burden, wheeled carts, and carriages. Horses and mules were common across Europe, the Asian steppes, and the post-conquest Americas; camels from North China, India, and Persia to North Africa; pack-oxen and elephants in India. Sub-Saharan Africa had no such wheeled conveyances or beasts of burden (limited by the tsetse fly), in common with most of the pre-conquest Americas, save the Peruvian Andes, where llamas were used as pack animals—though by the mid-1700s herds of wild horses, introduced into Mexico by the Spanish, had migrated into North America and were adopted by the indigenous peoples of the Southwest and Great Plains. Roads, unpaved and seasonal, were generally poor and unreliable, with some exceptions, like the imperial Inca road system built from the 1450s. Throughout the early modern period, the maximum distance coverable by land in one day was around 60 miles (100 km); as one historian has observed, “Napoleon moved no faster than Julius Caesar.” River transport was generally faster and cheaper, in canoes (North America), poled barges, and other floating or rowed conveyances, and seasonal in northern latitudes.

Oceanic transport, dating back millennia, saw major advances during this period, based mainly on improved shipbuilding designs and technologies in northern Europe dating to the 1100s and

accelerating from the early 1400s. Europe's domination of the world's seas from the 1500s was based in large part on its superior ships, most notably the Portuguese caravel, dating from around 1430, measuring about 21 meters in length and eight meters across, and compared to other vessels fast, maneuverable, and versatile, with its multiple sails and centerline rudder. With the caravel and its refinements, European empires came to dominate much of the globe. Overall, however, oceanic transport remained slow, expensive, dependent on currents and seasonal winds, and dangerous, and would not see a major technological shift until the adoption of the steam engine in the 19th century.

Metallurgy. The production of iron and steel—the quintessential metals of modern civilization — saw important advances during this period, though did not begin to approach an industrial scale until the 19th century. High-quality carbonized “damask” steel had been produced in China and India since at least the 13th century, while the Chinese had begun to fabricate objects of cast iron as early as the fifth century B.C.E. Europeans did not learn to cast molten iron until the 1300s, though made significant advances in iron smelting using waterwheel-driven bellows from the 1100s. The frequent wars of early modern Europe heightened demand for iron and steel swords, pikes, cuirasses, cannons, balls, arquebuses, and other weapons, supplied by thousands of small workshops in and around major population centers—demand that dropped sharply when wars ended. In the late 1400s, Brescia, at the foot of the Italian Alps, had some 200 iron workshops employing several thousand workers; other major European iron-producing centers were the Rhine, the Baltic, the Meuse, the Bay of Biscay, and the Urals. The Ottomans and the Mamluks also excelled in ironworking of finely wrought dishes, ewers, and armaments. Almost everywhere, iron production was dispersed among a multitude of small shops run by master craftsmen who often jealously guarded their secrets, and, when not meeting wartime demand, produced a wide array of utilitarian items, from iron pots and horseshoes to buckles, rings, spurs, and nails.

Ironworking was not developed by the indigenous peoples of the Americas, whose metallurgy was limited to copper, gold, silver, tin, and bronze, almost exclusively objects of art crafted for elites and ceremonial purposes. The Incas were the Americas' most sophisticated metalworkers; their silver and gold work astounded the invading Spaniards, though the Aztec, Maya, and other civilizations also developed highly refined gold, silver, and copper-working skills. In the Andes, Atahualpa's ransom in 1533 yielded some 13,000 pounds of gold and 26,000 pounds of silver; the pillage of Cuzco yielded far more, and its magnificent artistic objects were melted down into ingots before shipment to Europe. After the conquest and the Spaniards' discovery of the “mountain of silver” at Potosí, the colonizers employed indigenous technologies and craftsmen to harness the high Andean winds to fire the silver-smelting furnaces. The mercury amalgamation process, refined in the 1570s, represented a key technological advance in the exploitation of Peruvian and Mexican silver.

Printing. In China baked-clay movable type dates to around 1040, metal movable type to Korea around 1230. By the 1500s, Ming China had a flourishing print culture, with wide circulation of printed texts. In Europe around 1450, the independent invention of movable type, in tandem with advances in papermaking, made books and other printed works vastly cheaper and more accessible and comprised a key element in the dissemination of advances in science and technology across Europe and beyond. By the mid-1500s, these technological innovations combined with increased literacy resulting from the Protestant Reformation and other factors to engender a revolution in print culture. Books, pamphlets, instructional manuals, religious literature, and other printed texts proliferated across much of Europe and were spread across much of the globe by European empires. Newspapers were not common until the 18th century, while colonies' adoption of print technology often lagged for centuries after the initial colonization. While print culture flourished in British North America from the late 1630s, for instance, Brazil, “discovered” by the Portuguese in 1500, did not see its first printing press until 1808. Despite Europe's revolution in print culture, however, throughout the early modern period the vast majority of the world's inhabitants remained nonliterate.

Navigation, Cartography, Geography, Geology. Thanks mainly to their practical utility in the larger enterprise of empire building, the sciences and technologies of navigation, cartography, geography, and geology witnessed a major revolution in the early modern period. European scientists

not only mapped the whole of the Earth but measured it, weighed it, determined its distance from the Sun, calculated its position in the solar system, estimated its age, approximated its evolution, and greatly refined understanding of its constituent elements and their practical applications. With the “discovery” of the Americas, published maps and atlases proliferated; notable there was the work of Flemish geographer Gerardus Mercator (1512–94), whose 1538 world map and 1541 terrestrial globe were superseded by his famous projection of 1569. While cartographic technologies saw major advances, navigational technologies lagged. Devices in use long before the Age of Empires—mainly the compass and astrolabe—were not significantly refined until the invention of the sextant in 1731 and a method for accurately determining longitude in 1761. Throughout most of this period, most seafarers continued to rely on technologies and knowledge many centuries old.

Mathematical Technologies. Integral to the Scientific Revolution was a revolution in mathematics, tied closely to astronomy and physics, culminating in the extraordinary mathematical achievements of Sir Isaac Newton (1642–1727), especially his invention of calculus. Among the many monumental mathematical achievements of these years was the invention of the decimal system in 1585, accompanied by a host of advances in accounting, banking, measurements of time and space, and related mathematical technologies. Still, throughout the early modern period the vast majority of the world’s inhabitants reckoned time by the Sun’s position in the sky and the cycles of the seasons, and distance by the time required to traverse it.

Medical Technologies. The first emergence of genuinely empirical science can arguably be traced to a millennium’s worth of trial and error regarding the nutritional and medicinal properties of plants. Throughout the early modern period, centuries-old herbal remedies comprised the overwhelming preponderance of medical technology for the vast majority of the world’s people. By this time, Chinese acupuncture, herbalism, and related bodies of knowledge dated back thousands of years. The major advances in medical technologies in the West were related to increased knowledge of human anatomy and physiology, gained mainly through systematic dissections, artistic renderings, and publication and dissemination of the knowledge thus gained. The discovery by William Harvey (1578–1657) of the circulation of the blood, combined with the invention of the microscope in the early 1600s, revolutionized the study of human anatomy. (Contrary to many popular and scholarly accounts, practitioners of ancient Chinese medicine did not discover or describe the circulation of the blood, though in 1242 the Arab physician Al-Nafis did, and in considerable empirical detail.) If clinical medical practices saw few tangible advances during the early modern period, the rapid accumulation and wide circulation of empirical knowledge in all spheres relating to health and disease laid the groundwork for the revolutions in medicine in the 19th and 20th centuries.

As this brief and selective survey suggests, the conventional narrative of the revolutionary transformations in science and technology in the early modern period needs to be combined with an appreciation of long-term continuities, and of the partial, uneven, and nonlinear nature of scientific and technological progress. Understanding these transformations further requires situating them within broader contexts of European empire building and the quests for power and profit that comprised one of their essential motives. Science and technology have always been intimately related to politics, economics, culture, and every other sphere of human activity, a fact especially apparent during the period covered in this volume.

SOCIAL AND CLASS RELATIONS

Wherever states have formed, so too have social classes and hierarchies characterized by unequal access to power, privilege, and other social resources. Through codes and laws, states “write the rules” about how society should be organized. The vast majority of all states, throughout world history and in the period under discussion here, codified into law the dominance of some social groups over others, enforcing those laws through their superior coercive powers, including military force. During the early modern period, an estimated 80 to 90 percent of the world’s population lived in territories dominated by states, and were thus designated by virtue of birth, gender, race, language, religion, and other factors, as members of specific social groups. Such states often developed elaborate ideological

systems, based on shared religious beliefs, that legitimated and “naturalized” these socially constructed hierarchies. Such hierarchies were defined mainly by differential access to economic and political resources, that is, access to wealth and power.

Relations of gender were dominated by men the world over, with males exercising greater control over property and other resources than females, and women’s class status derivative of men’s. Relations of social class mainly concerned control over the fruits of labor and production, with “social class” most usefully conceived as a social relationship determining who owned what and who produced what for whom. Most class structures around the world were pyramidal, with laboring people (perhaps 80–90 percent of the populace) occupying the bottom strata, a small middling group (around 5–10 percent), and a much smaller number of persons of rank and privilege toward the top (1–5 percent).

From the 1450s to the 1750s, the world was witness to a dazzling array of social classes, groups, and state forms, many in the throes of dramatic change. Around 1500 some states consisted of vast empires stretching thousands of kilometers and embracing millions of people of diverse ethnic and linguistic origins, such as Ming China, Mughal India, Safavid Persia, Ottoman Southwest Asia and North Africa, Songhai West Africa, Aztec Mesoamerica, and Inca Peru. Most were much smaller. Principalities, kingdoms, fiefdoms, and city-states of myriad types proliferated throughout Southeast Asia, East Africa, Mesoamerica, the northern Mediterranean, and Europe. In all cases, the formation of social classes and hierarchies was intimately entwined with the formation and development of states.

Power and Privilege. During this period, most state-governed societies were characterized by numerous, often overlapping social classes defined by relative access to power, privilege, and rank. Within each social class, and with very few exceptions, men were dominant and women subordinate. At the top, almost everywhere, were emperors, kings, queens, and supreme rulers or sovereigns of various kinds. Ruling families often comprised a “social class” by themselves, their internal struggles frequently the source of much social conflict. Beneath such supreme rulers and their families, one can distinguish at least eight broadly defined social classes common to most societies: (1) bureaucrats, administrators, and other agents of the state; (2) landowning aristocrats and nobility; (3) religious officials and authorities; (4) warriors and/or members of the military; (5) merchants and traders; (6) artisans and craftworkers; (7) peasants and farmers; and (8) slaves, servants, and other forms of bound or unfree labor.

These categories often overlapped or blended together, especially at the upper echelons—as in the Ottoman Empire, Mughal India, or Spanish America, where state officials could also be religious leaders, nobles, and landowners, or, as in Tokugawa Japan, where leading warriors (daimyo and samurai) were also aristocrats and agents of the state. Merchants often owned land, though sometimes did not, as with Jews in Christian Europe or the Aztec *pochteca* (traveling merchant class). In some polities, some of the categories listed above did not exist—merchants among the Incas, for instance, or landowning aristocrats in Ming China. Generally, however, most societies had an overwhelming majority of taxpaying laboring people subordinate to a small elite, overwhelmingly male, whose power derived from birthright, divine sanction, or control of key political and economic resources.

Surveying the many types of class relations and social hierarchies around the world during this period reveals a number of patterns. Beginning at the bottom of the social hierarchy, slavery and other forms of bound or unfree labor were features of almost every state-governed society, though the precise nature of the master-slave relationship varied enormously. In the great majority of cases (excepting Atlantic world slavery, c. 1500–1870), slavery was not hereditary or based on “race” or ethnicity, while slaves enjoyed certain rights, including the right to live, to form families, and not to suffer excessive punishment. In the Muslim world, slaves, purchased in markets or captured in wars, generally were used as household servants or soldiers; manumission was actively encouraged. Muslims could not enslave fellow Muslims.

Elite Slaves. Similar patterns characterized the domains of the Mughal Empire, where slavery was not hereditary, and most slaves were either debtors enslaved until debt repayment, children sold as slaves by poor parents, or war captives, especially from tribal frontier zones. In Safavid Persia,

as in other Muslim polities, the emperor (shah) appointed slave elites (ghulams) who often enjoyed high status, including in the royal court. Among the Aztecs, slaves, usually captured in war, were either integrated into households or ritually sacrificed to honor one of the numerous gods in the Aztec pantheon. In Ming China, slavery was actively discouraged. The race-based chattel plantation slavery of the Atlantic world, which began around 1500 and ended in the late 1800s, was unique in world history for its hereditary nature, its exclusively racial character, and the absence of constraints on slave owners, who generally enjoyed the legal right to dispense with their “property” as they saw fit, including breaking up families, torture, and murder, and the “breeding” of slaves through rape and forced reproduction.

Peasants. Far and away the largest social class in most state-governed societies during this period was peasants, farmers, and pastoralists—people who earned their living by the soil, paid taxes, contributed military service, and owed allegiance to the state and/or its local agents. Comprising 80 to 90 percent of the population, peasants and pastoralists were generally at or near the bottom of the social hierarchy, a notch above slaves, though not always, as in Ming China, where slaves were rare and farming was esteemed far more than mercantile activity or military service. In most societies, peasants, farmers, and pastoralists enjoyed certain customary rights, such as a relaxation of tax obligations in times of drought, flood, or pestilence; usufruct rights to land; familial autonomy; and control over livestock, tools, the labor process, and rhythms of work and rest.

In many cases, especially in tributary empires comprised of multiple ethno-linguistic groups, peasants exercised substantial religious autonomy as well, as among the Aztecs (where subordinate polities and their religious infrastructures were kept largely intact if they did not actively resist the authority of the central state and met tribute obligations), the Mughals, the Ottomans, Songhai, the Incas, and others. In many smaller states, such as the German-speaking principalities and fiefdoms of northern Europe, or the city-states of Italy, religious freedoms for ordinary people both increased and grew more circumscribed, depending on events, particularly after the onset of the Protestant Reformation from around 1517. Peasants, farmers, and pastoralists did not form a monolithic whole, of course; some were richer, most poorer, while within households, families, and communities, males almost always exercised greater power and authority than females.

In most societies, artisans and craft workers, generally dwelling in cities or towns, comprised another major social class. Membership in a specific craft was often restricted to certain individuals, almost always male, who had served a certain period of apprenticeship under a master artisan (generally seven or eight years) and had acquired a high degree of skill and proficiency. Exemplary here were the craft guilds of medieval Europe that grew through the early modern period, similar to the craft guilds of Tokugawa Japan and the *akhis* of the Ottomans. Sometimes specific types of craft workers clustered in certain neighborhoods and were identified by both craft and place of residence, as in the Aztec island-capital of Tenochtitlán. Fine gradations generally distinguished different types of craft workers, with some trades conferring greater honor and prestige, such as the sword craftsmen in Japan and Persia; the gold- and silversmiths of Cuzco (Inca Peru); and the feather workers and jade artisans in pre-conquest Mesoamerica. Most towns and cities also had a laboring class of porters, street sweepers, sanitation workers, and casual laborers whose occupations carried far less prestige than skilled artisans.

Commerce. Merchants and traders, also characterized by many fine gradations and types, ranged from street peddlers, itinerant traders, and small shopkeepers toward the bottom to wealthy merchants with imperial connections commanding huge stocks of goods and capital at the top. Merchants were generally superior in social position to farmers and craft workers, and inferior to landowning aristocrats, nobles, and state officials, though not always, as in Ming China, where mercantile activity was less esteemed than farming, or Inca Peru, where a merchant class did not exist. In early modern Europe, as in the Ottoman realms, Safavid Persia, and Mughal India, merchants were among the most prized allies of kings and nobles for the stocks of capital they controlled, from which ruling groups often borrowed to pay for wars, public works, and lavish consumption. Among the Aztecs, a distinctive class of traveling merchants (*pochteca*) served

to integrate different parts of the empire by their exchange of goods, while also acting as spies and informants for the central state.

Soldiers, warriors, and others whose primary occupation centered on warfare often comprised a distinctive social class, as in Ming China, where membership in the military was hereditary and of low esteem, or Tokugawa Japan, where membership in the class of military leaders (samurai) was also hereditary but conferred enormous social prestige. Among the Ottomans, the janissary corps formed an elite group of de-ethnicized professional soldiers who served at the behest of the sultan and his underlings; among the Aztecs, members of elite jaguar, eagle, and other warrior castes enjoyed high rank and prestige. Ordinary foot soldiers, invariably male, were rarely esteemed anywhere, while military officials generally enjoyed superior social status.

Upper Classes. At the highest echelons of society—state officials and bureaucrats, landowners, hereditary nobles and aristocrats, religious leaders of various kinds—the waters were frequently muddied, as these groups often melded into each other, and the types and characteristics of upper classes varied enormously. Suffice it to say that these groups comprised but a tiny fraction of most societies' populations and by law and custom exercised far greater privileges and rights than the vast majority of their fellows. In a key dynamic, especially in Europe, as early modern states coalesced, the broad tendency was for hereditary nobles to be brought into the state as coequals with the sovereign, because kings and princes needed their material and social resources to exercise their authority or pay for wars and other ventures. Conflicts between sovereigns and upper classes (and, in Christian Europe, between sovereigns and the church) were common, and, along with conflicts between states, comprised one of the major causes of warfare.

The degree of mobility between social classes was generally very small. People born into a particular social class had a very high likelihood of staying there. This was not always true, as in Ming China, where performance in state-sponsored exams, even by poor peasants, determined eligibility for entry into the most esteemed social class of scholar-officials, though the fluidity of social class diminished by the late 1500s as the ruling dynasty ossified. In many contexts, including Aztec Mesoamerica, martial skills could lead to quick ascent in rank and privilege. This was also true of the invading Spanish conquistadores and the officials who followed, some of whom profited immensely from conquest and colonization and became the founders of powerful lineages in Spain and the Americas. Rapid downward mobility also occurred, as when African notables captured in the slave trade became chattel on New World plantations or when resisting polities were conquered by expanding empires and their upper classes wiped out, as practiced by the Aztecs, Incas, Spanish, Ottomans, and others. The castes of Hindus in India represent perhaps the most extreme instance of class stasis, of fixity over long stretches of time, though caste-like class structures characterized most state-ruled society during this period.

In global terms, the major transformations in social class were propelled by European empire formation in the Americas, Asia, and Africa from the early 1500s, and the subsequent expansion of capitalist exchange relations within Europe and around the world. As European empires expanded, there emerged within Europe a powerful class of merchant capitalists that was key to the growth of markets and an incipient industrial revolution, especially in England, France, and Holland. Along with merchant capitalists there also emerged an incipient industrial proletariat, or working class. Capitalist relations of production, defined by the emergence of a distinctive social class of people without access to land or other resources, compelled to sell their labor power on the market, were very rare in most parts of the globe, forming only a small number of urban centers in England and western Europe. Soon, however, capitalist social relations would spread throughout much of Europe and beyond, in the modern period becoming one of the key axes of social, economic, and political struggle around the world.

TRADE AND CULTURAL EXCHANGES

With the dawn of the early modern period, roughly corresponding to the Spanish “discovery” of the Americas and Portuguese voyages around Africa to Asia in the 1490s, expansionist states

and commercial interests in western Europe began knitting together, for the first time in history, a truly global economy. Over the next three centuries, markets and commerce, ubiquitous features of almost every preindustrial society, reached a qualitatively new stage of development. By the time of the American and French Revolutions in the late 1700s, a dense and expanding web of commercial networks linked every major populated landmass on the globe: Europe, Africa, Asia, and the Americas. Trade and commerce, the engines of empire, in turn became the handmaids of modernity.

Prior to the formation of European overseas empires, a series of commercial and migratory networks that evolved in the preceding centuries already linked large parts of the globe. The most expansive stretched from East Asia to South Asia to East Africa and the Levant, woven together by Chinese, Japanese, Southeast Asian, Mughal, Persian, Ottoman, and East African polities, merchants, and traders. This Asian trade emporium was linked to the Judeo-Christian-Islamic world of the Mediterranean via land routes honeycombing Southwest Asia from the Black Sea to Arabia, and via land and river routes extending northward from East and sub-Saharan Africa. In the West African Sahel, the kingdom of Songhai was linked south to Benin, the Akan states, and Kongo, east to Ethiopia and the Levant, and north to Europe via the trans-Sahara gold trade.

Increasingly dense trade and migration networks also connected the kingdoms of northern Europe to Iberia and the Mediterranean. The Americas were wholly isolated from the Asian-African-European world, with the Mexica (Aztecs) dominating trade and commerce in central and southern Mexico; the Postclassic Maya forming complex trading networks within and beyond the core Maya zones of Yucatán and Guatemala; the Incas in the Peruvian Andes thriving without recourse to markets or trade as conventionally understood; and a plethora of lesser polities in North and South America also engaging in extensive local, regional, and long-distance trade.

European Expansion. The roots of European expansionism ran deep, from the Crusades of the 11th to 14th centuries, which piqued the interest of Christian kingdoms and merchants in the commercial wealth of Asia, especially its spices and silks, to the desire to dominate the centuries-old trans-Saharan trade in gold, ivory, and other prized commodities. Western European merchants and kingdoms, propelled by visions of power and treasure, took to the seas mainly because overland trade routes were blocked by Islamic polities: to the east, the expansionist Ottomans—especially after their conquest of Constantinople (Istanbul) in 1453—and, further east, the Safavids and the khanates of Central Asia; and to the south, the Ottomans, Berbers, and Songhai. Unable to conquer these states and empires, and unable to go through them (at least without paying high taxes), Christian western Europe opted to bypass them altogether. The global capitalist economy thus originated as a kind of second-best solution to western Europe's problem of establishing direct and sustained commercial relations with Asia.

The Portuguese were the first, under Prince Henry the Navigator from the 1430s, to systematically explore west into the Atlantic and south along Africa's west coast. By the time Portuguese navigator Vasco da Gama rounded the Cape of Good Hope and sailed to India in 1498, the Castilians, in dynastic alliance with the Aragonese and finally successful in the Christians' 774-year effort to expel the Moors from Iberia (718–1492), had already "discovered" the Indies. These "Indies" turned out not to be India but a hitherto unknown landmass, soon dubbed "America" after the Italian navigator Amerigo Vespucci. The Castilians (Spanish), long accustomed to wars of conquest against non-Christians, soon established the world's largest empire, embracing much of the Caribbean, central and southern Mexico, Central America, and the Peruvian Andes, destroying local states, subordinating the inhabitants, and siphoning their wealth. The Portuguese, less interested in conquering territory than in expanding commerce, established a series of coastal trading forts in Africa, Brazil, and Asia.

Emergent Empires. Spain and Portugal were soon followed by the Netherlands, Britain, and France, emergent empires eager to partake in the spoils of trade and conquest but too late to replicate the fabulous successes of Spain in America. Instead they played catch-up, competing with one another and the Spanish and Portuguese over the most accessible parts of the Americas and Asia. In the Americas, that meant the Atlantic seaboard of North America stretching into the Great Lakes,

and what remained of the Caribbean. In Asia, it meant the vast territories stretching from India to Southeast Asia, Indonesia, and the South Pacific. Some polities successfully resisted European conquest and colonization, most notably Ming and Qing (Ch'ing) China, Tokugawa Japan from the early 1600s, the Ottomans, and, until the 1750s, Mughal India. Other zones remained too inaccessible, especially sub-Saharan Africa (save the Cape, colonized by the Dutch from 1652) and most of the North and South American interiors.

One crucial result of these global transformations was the Columbian Exchange, in which American plants, animals, and microorganisms, isolated from the rest of the world for millennia, were disseminated across the globe, accompanied by the flooding of European, Asian, and African organisms into the Americas. The resultant changes in the Earth's biosphere profoundly shaped all subsequent human and environmental history.

As imperial competition intensified, commerce expanded, markets deepened, and increasingly dense trade networks came to encircle the planet. Mexican and Peruvian silver poured into Spain and flowed out again—thanks mainly to Spain's lack of an industrial base—primarily into the hands of English and Dutch merchants and their governments' treasuries, who poured it into further conquests, especially in Asia. The torrent of silver caused a price revolution worldwide in the late 1500s and early 1600s, from Europe to Persia, India and China; one historian estimates that half the silver mined in the Americas from the 1520s to the 1820s ended up in China; others estimate one-third. Both estimates are plausible, especially given the brisk trade in spices, silks, porcelain, tea, and other goods linking New Spain to the Philippines and the rest of Asia.

Atlantic World. The epicenter of the emergent global economy became the Atlantic world and its “triangular trade” linking Europe, Africa, and the Americas. In its simplest form, ships laden with manufactures (mainly textiles and firearms) would sail to West Africa, trade manufactures for slaves, sail to the West Indies, trade slaves for sugar, and return to their home port. In practice, the commerce was far more than triangular, with endless offshoots and ancillary linkages connecting different parts of Europe, the Mediterranean, Africa, and the Americas.

West Indian sugar, for example, fueled the North American rum industry, while North American lumber, bread, fish, and other goods poured into the West Indies, stimulating economic growth from New England to the mid-Atlantic colonies. On a typical journey, a ship might depart Marseilles for Cyprus, sailing thence to Senegal, across the Atlantic to Martinique, north to Acadia (Canada), then back to the Caribbean to Guadalupe and Saint-Domingue, thence north to Boston before heading back east across the Atlantic to the Canaries, to Venice, finally returning to Marseilles, carrying dozens of commodities at any given time, and profiting at each stop along the way. Despite its endless complexities and branches, however, at the core of the system were European manufactures, African slaves, and American sugar and silver.

From the 1500s to the 1800s an estimated 9.8 million Africans were enslaved and transported to the Americas in the largest forced migration in the history of the world, roughly 80 percent to Brazil and the Caribbean (and only 5 percent to North America). The height of the transatlantic slave trade in the 18th century coincided with the maturation of the Scientific Revolution, the dawn of the Enlightenment, and the first Industrial Revolution in England, based mainly on textiles. Through synergies and feedback loops, each development fueled the others. Some scholars, pointing to Britain especially, attribute the emergence of Europe's Industrial Revolution in the 18th century to the burgeoning stocks of capital accumulated over the preceding centuries through the triangular trade. The slave trade prompted the formation of powerful coastal states on Africa's Atlantic coast that waged increasingly destructive slaving expeditions into the interior, causing massive internal migrations and wreaking havoc with existing societies and polities. Similar destructive patterns came to characterize the Americas, as expanding European colonies either incorporated indigenous Americans as a subordinate labor force, or compelled migrations away from the zones of European domination, generating ripple effects far into the interior.

Migration. By the end of the 18th century, several million Europeans had migrated to the Americas, Africa, and Asia. From the 1580s to 1800, some 750,000 Spaniards migrated to Spanish

America; the Dutch East India Company employed more than a million European migrant laborers; and some 2.4 million Portuguese and their descendents lived outside Europe. By 1700, the British Americas contained around 270,000 persons of British ancestry, while another quarter-million would arrive between 1700 and 1775. Of the western European empires, France had the lowest emigration rates; to the 1760s, around 75,000 French had migrated to French America. In the 19th century, these European flows, especially to the Americas, would become a flood.

If the Atlantic world formed the epicenter of the emergent global capitalist economy, Asian and East African polities and peoples accessible to European imperial power found themselves increasingly caught up in the whirl of changes. Southeast Asia is a good example of a peripheral commercial zone brought firmly under the dominion of European empires and markets, illustrating how warfare, empire building, expanding commercial relations, and migrations became mutually reinforcing. From 1498 to the 1570s, the Portuguese, rounding the Cape of Africa, conquered and occupied coastal trading polities from Mozambique and Mombasa (East Africa) to Hormuz (Arabia), Goa (India), Malacca (Malay Peninsula), Macao (China), and Nagasaki (Japan). The Dutch, better financed and more capable of waging sustained wars of conquest, followed after 1600. Displacing the Portuguese, from 1619 to the early 1680s the Dutch East India Company became the region's preeminent power, waging successful wars of conquest against a string of independent Southeast Asian and Indonesian polities—including Batavia, Banda, Makassar, and Malacca—reconfiguring trade relations in tin, pepper, nutmeg, cloves, and many other commodities and leaving most of the region in prolonged crisis from which it would not begin to recover until the 18th century.

For many years, scholarly treatments of these processes were dominated by a Eurocentric approach that privileged the agency of European actors. In more recent years, scholars have paid greater attention to the agency of Asians, Africans, and indigenous Americans in shaping these processes, generating a more nuanced and holistic understanding of the profound transformations in states, economies, and cultures around the globe that marked the tumult of the early modern period.

WARFARE

The nature of warfare changed in profound and lasting ways in the period covered in this volume, in almost every arena: the weapons used, tactics deployed, strategies pursued, the scale and organization of land and sea forces, and the impact of warfare on states and societies. One thing that did not change was that making war remained an exclusively male pursuit, thus reinforcing gender inequalities and patriarchal modes of domination. Another was that, worldwide, the poor and subordinate did most of the fighting and dying. In 1450, European powers were roughly at par with the Ottomans, Chinese, and other major powers around the world. By 1750, European states commanded militaries of unprecedented violence-making capacities, qualitatively different than anything before.

The cumulative changes in the theory and practice of warfare over these three centuries have prompted scholars to speak of the Military Revolution, originating in Europe, that was both cause and consequence of the Scientific Revolution, the transition from feudalism to capitalism, the Industrial Revolution, the emergence of early modern nation-states, and the formation of overseas empires. Transformations in the scale and character of European warfare during this period marked a major watershed in world history and comprised one of the principal engines of modernity. For these reasons, this essay focuses mainly on Europe, the birthplace of modern conceptions and practices of warfare as practiced by states and militaries around the world today.

Weapons. The “gunpowder revolution” began in Europe in the mid-1400s, a development that would permanently transform the nature of warfare worldwide. Gunpowder, invented in China by the 900s and brought to Europe in the 1200s, soon became the key ingredient in a revolution in ballistic (projectile-firing) weapons. By the early 1300s, European smiths had developed hollow cylindrical barrels capable of firing spherical projectiles. Artillery makers quickly seized on the innovation, such that by the mid-1300s, early cannons firing stone balls became an important siege weapon, on par with centuries-old trebuchets. By the early 1400s, gunpowder technology

was incorporated into a portable, hand-held ballistic weapon, the arquebus, forerunner of all subsequent types of small arms and rifles. Prior to this, the principal infantry and cavalry weapons consisted of pikes, spears, lances, swords, crossbows, bows and arrows, and other types of hand-held, human-powered thrusting, cutting, projectile, and trauma-inflicting devices.

Incremental refinements to the arquebus led to the matchlock musket in the early 1600s, followed by the flintlock musket, by the mid-1700s the principal infantry weapon in Europe and North America. In a gradual and uneven evolution, muskets did not displace pikes, bows, and other hand-held weapons but were often used in combination with them. Artillery, both land and naval, underwent a parallel transformation.

By the 1700s, stone projectiles had been gradually displaced by iron spheres. Exploding cannonballs were developed in the 1500s, though many technical problems limited their use until the 1800s. Rifling, which imparts a spin on projectiles and thus greatly increases their accuracy and range, was limited to small arms utilizing lead, which was malleable enough to accommodate the intended rifling effect. Rifled artillery did not appear until the mid-1800s. The gunpowder revolution also transformed the weapons of siege warfare, beginning with the petard (a kind of portable bomb). From the 1420s heavy gunpowder artillery, first developed by France, spread rapidly throughout Europe. By the late 1400s wheeled artillery pulled by teams of beasts rendered castles and other fortifications far more vulnerable to siege. Cast bronze muzzle-loaded cannons, firing cast iron spheres of 12 to 24 kilograms, comprised the principal weapon of siege warfare from the early 1500s to the mid-1800s.

Tactics. All of these and many more technical innovations, based overwhelmingly on gunpowder technologies, led to major transformations in tactics, both on land and at sea. On land, the most effective tactical innovations combined mobility and firepower, and older technologies and techniques (pikes, bows, cavalry charges, etc.) with new ones. Emblematic here was King Gustavus Adolphus of Sweden (1594–1632), who creatively combined musketeers, pikemen, archers, heavy and light cavalry, field artillery, and diverse other weapons and specialized field units to forge one of the most formidable fighting forces of the early modern era. At sea, naval tactics were revolutionized both by improved shipbuilding technologies (which made sailing ships faster and more maneuverable), cannons, and new fleet formations. Representative of these shifts was the English defeat of the Spanish Armada in 1588, in which the Royal Navy combined speed, superior firepower, and disruptive tactics to defeat the 130-ship armada dispatched by King Philip II of Spain.

Strategy. As weapons and tactics changed, so too did strategy and strategic thinking. It is arguable that there have been no substantial contributions to strategic theory since the writings of the Chinese general Sunzi (Sun Tzu) from the sixth century B.C.E. in his tract *The Art of War*. Emphasizing stealth, surprise, deception, intelligence, mobility, nimbleness, exploiting the weaknesses in the enemy's strengths, and avoiding battles in order to win wars, Sunzi's writings did not begin to circulate in the West until the late 1700s. The first major strategic thinker of the modern era, Carl von Clausewitz (1780–1831), in his book *On War* (1832), encapsulated much of the strategic thinking that developed in Europe in the preceding centuries. The British strategy of achieving naval supremacy by trying to maintain a "balance of power" on continental Europe—in effect dominating the sea by pursuing policies intended to divide and wear down their enemies on land—is a good example of the era's most successful kind of strategic thinking. Overall, the most effective European war strategists worked to develop ways to integrate more fully their national economies with their war-making capacities, to achieve the most effective combinations of older and newer weapons and technologies and to pursue both military and extra-military ways to weaken their enemies and strengthen their allies.

From the 1400s until the late 1700s, most European states built on the medieval practice of employing mercenary forces or private armies-for-hire (*condottiere* in Italian; *Söldner* and *Unternehmer* in German), at land and at sea, complemented by conscripts commanded by officers commissioned by nobles and sovereigns. Yet by the early 1800s, the era of mercenaries had largely ended, and national armies had become the norm. The reasons were complex, rooted in the risks

entailed in hiring private armies (rivalry, rebellion, banditry), the relative advantages of mobilizing national populations, and the high costs of paying for war.

The cumulative effect of the more or less continuous warfare wracking Europe and its colonies from the 1450s to the 1750s was for state expenditures to grow dramatically and for states to expand their bureaucracies, extend their administrative reach, intensify taxation of their populations, and establish long-term structural relationships with merchants and capitalists. Just as states made war, wars made states. Some scholars argue that the dynamics set in motion by centuries of intensive military conflicts among early modern European nation-states created the preconditions for the emergence of republican forms of government, understood as a contractual relationship between states and citizens. Paying ever higher taxes, and serving in national militaries in ever higher numbers, men demanded something in return—namely, their rights, guaranteed by the state. Thus, Enlightenment notions of citizenship and citizens' rights, some scholars argue, found their origins in the crucible of early modern European wars. Women, as non-taxpayers and excluded from military service, were also excluded from the attendant rights demanded by men, thus reinforcing patriarchal norms and gender inequalities relative to the state and within the broader society.

Warfare, Capitalism, Empires, and Local Responses. The Military Revolution in Europe was intimately linked to empire formation, the transition from feudalism to capitalism, the Scientific Revolution, the Industrial Revolution, the Enlightenment, and all of the other defining characteristics of the era. Precisely how this occurred remains the topic of much scholarly research and debate. So, too, is the process by which cultures and civilizations around the world responded to these novel methods of waging war. The Japanese, for instance, rapidly adopted gunpowder weapons in the 1500s only to close their society to Western influences from the 1610s and largely purge guns and cannons from the island's repertoire of military technologies. In Mesoamerica in the early 1520s, the Aztecs suffered defeat in part because of their different cultural conceptions of warfare, in which capturing enemy soldiers, not taking enemy territory and destroying its state, was the principal goal. The ways in which people around the world responded to the European military revolution were as diverse as the world's peoples.

Abahai Khan

(1592–1643) *Manchu military and political leader*

Abahai (also named Hung Taiji) was the eighth son of NURHACI, a Jurchen tribal chieftain who founded the Manchu state in what is today northeastern China. Elected by the Hosoi Beile, or council of clan princes and nobles, in 1623 to be his father's successor, Abahai built upon his father's foundations for a Manchu state during the last years of China's MING DYNASTY. In 1644, his son was proclaimed emperor of the QING (CH'ING) DYNASTY, assuming leadership of China as the Ming dynasty collapsed.

The Jurchen tribal people who lived in Manchuria, a frontier region of the Chinese Ming Empire, did not recognize the right of firstborn sons to succeed their fathers. Because of this, all the ruler's sons were eligible to succeed him in an election by their fellow tribal leaders. Abahai was elected and continued his father's unfinished work. He expanded the powerful Banner Army that consisted of Manchu, Mongol, and Han Chinese units and used it to consolidate control of the Liaoyang area in southern Manchuria. Next he used his military forces to subjugate Korea, forcing its government to transfer its vassal relationship from the Ming dynasty to him. Abahai then conquered the Amur region of northern Manchuria and the Mongols of eastern Mongolia. His next move was to set up a civil administration in the capital city of Shenyang in 1631. The six ministries and other institutions he implemented were copied from the Ming government, and he staffed them with many Han

Chinese administrators. In 1635, he gave his people a new name, Manchu (from Jurchen), and changed his dynastic name from Hou Jin (Hou Chin, adopted by Nurhaci, which means "Later Jin," after the Jin dynasty that ruled northern China 1115–1234). By this act, he dissociated his dynasty with the Jin, who had conquered northern China after much bloodshed. Instead he adopted the dynastic name Qing (or Ch'ing, which means "pure"), and he assumed the title emperor rather than khan, which had been his father's title, because of its nomadic associations.

In 1640, Abahai attacked Jinzhou (Chinchow) at the southern tip of Manchuria, defeating a Ming force. This victory brought the Manchus to the key eastern pass of the Great Wall, Shanhaiguan (Shanhaikuan, or Mountain and Sea Pass). However, this formidable fortress was defended by a strong Ming army, and Abahai was not ready to challenge it. He died in 1643 before he could do so.

Abahai continued his father, Nurhaci's, work of building up Manchu power, and he transformed the Manchus from a frontier tribal vassal of the Ming Empire to become its rival. Under his rule, a collaborative relationship developed among the Manchus, the Mongols, and the Han, or ethnic, Chinese. The adoption of the Chinese model of a bureaucratic administration and its inclusion of Han Chinese would characterize the Qing Dynasty and account for its success in conquering and ruling China.

JIU-HWA LO UPSHUR

Abbas the Great of Persia

(1571–1629) *Safavid Persian ruler*

Shah Abbas the Great reigned from 1588 to 1629 during the zenith of SAFAVID glory and power. He effectively unified all of historic Persia and centralized the state and its bureaucracy. Using loyal slave soldiers (*ghulam*) recruited among Caucasians, Abbas successfully destroyed the influence of the Qazilbash princes and extended Crown-owned land taken from defeated local rulers. With English advisers, he moved to reform the army into a successful fighting force.

In the OTTOMAN-SAFAVID WARS, Abbas was generally successful. He conquered northwest Persia and in 1623 took Baghdad and then Basra in southern present-day Iraq from the Ottomans. His forces seized Hormuz in the Persian Gulf in 1622, thereby extending Safavid power along this important seafaring trade route.

By the time Abbas came to power, the majority of the people in Safavid Persia, who had previously been Sunni Muslims, had become Shi'i. Qom and Mashad, sites holy in Shi'i tradition, were enlarged into centers for pilgrimages, and the veneration of Shi'i imams became widespread. The martyrdom of Husayn, Ali's son, was annually commemorated in massive passion plays and ceremonies; pilgrimages to Kerbala, in present-day Iraq, where Husayn had been killed, became a major event for devout Shi'i.

However, unlike many of his predecessors, Abbas encouraged religious tolerance. He encouraged foreign traders, especially Christian Armenians, who were known as skilled silk producers, to move to Iran. Although the sale of silk became a royal monopoly, Abbas provided Armenians financial inducements, including interest-free loans for building houses and businesses, to move to the outskirts of ISFAHAN.

In 1592, Abbas made Isfahan his new capital and turned it into a center for Safavid arts, culture, and commerce. Under Abbas, Isfahan's population grew to more than one-half million people and became a major trading center. He sent envoys to Venice, the Iberian Peninsula, and eastern Europe to encourage trade in luxury textiles

and other goods; he also provided tax incentives to foreign traders. By 1617, the East India Trade Company had established trading posts along Persian Gulf, and Bandar Abbas became a major port. Along northern routes, the Safavids also enjoyed a lively trade with Russia.

As befitted 16th- and 17th-century monarchs, Abbas presided over a lavish court. He was the patron to numerous court poets and painters, even allowing portraits of himself and members of his court to be painted.

Like SULEIMAN I THE MAGNIFICENT of the OTTOMAN EMPIRE, Abbas, who had killed or blinded several of his sons, left no able successor. After his death, the Safavid empire entered into a century-long period of decline. It is a tribute to Abbas's abilities as an administrator and leader that the empire survived as long as it did.

absolutism, European

Royal absolutism is a controversial concept among historians. There has been considerable debate about both the proper definition of the term and its applicability to the actual workings of European states in the early modern period. Scholars have suggested that elements of absolutism appeared at one time or another in France, Russia, Spain, Austria, the German states, and other smaller entities, and that even England (after 1707, Britain) displayed some traits common to absolute monarchy.

At a most basic level, the term *royal absolutism* suggests a system of state administration centered on and dominated by a monarch as opposed to some other level of society or some other office or institution, and usually without legal or constitutional restraints. It can be differentiated from the older medieval form of monarchy by its increasing independence from, or suppression of, the feudal apparatus that linked each person in a hierarchy of mutual obligation between higher and lower. An absolute monarch controlled the state directly, rather than being forced to rely on the cooperation of the nobility through a lord-vassal relationship.

Medieval monarchs usually had to contend with multiple challenges to their authority. These challenges included rival claimants to the throne, powerful nobles

In his best-known work, *Leviathan*, Thomas Hobbes compares a country to a body, with a monarch as the head.

who could raise armies and funds independent of the sovereign, councils or parliaments that insisted on being heard, merchants and financiers who were more interested in profit than in paying taxes or serving political interests, towns that claimed immunity from certain controls, and frequent peasant uprisings. Religious institutions, which were often wealthy and had great influence over the population, could also be tenacious in defending their independence from temporal authority.

In essence, the idea of an absolute ruler was developed as one solution to these problems. Rather than living in constant fear of their antagonists, or being forced to share power with them, an absolute monarch could create and maintain a powerful kingdom and rule it effectively.

JAMES II

One of the problems with the study of royal absolutism in history is that too often the term *absolute* was used in a pejorative sense by those who opposed a particular ruler. This was true of both internal and external conflicts. In the 1680s, for example, the groups in England who opposed the policies of JAMES II accused him of attempting to establish an absolute monarchy that would disregard Parliament, reimpose Catholicism, and generally strip his subjects of their rights and liberties. The English would also apply this label to LOUIS XIV in the late 17th and early 18th centuries, when England fought two wars against France. Even the term *absolutism* to describe a particular style of government was not coined until after the French Revolution, with the explicit purpose of discrediting the *ancien régime*.

The concept of a powerful ruler in a centralized state was not always viewed in a negative light, especially among some intellectuals of the 16th through 18th centuries. Three thinkers closely associated with the development of absolutism as a political theory are Jean Bodin (1530–96), THOMAS HOBBS (1588–1679), and Jacques-Bénigne Bossuet (1627–1704).

Each was deeply influenced by the political circumstances of his time. Bodin and Hobbes were examining the nature of authority when it had clearly broken down; Bossuet was justifying a system developed in reaction to such crises, but which itself was subject to challenge. Although their ideas were not necessarily representative of the opinions of their contemporaries, or of the realities of statecraft in early modern Europe, each work was widely known and read in its time and afterward.

Bodin's *Six Books of the Commonwealth* first appeared in 1576, in the midst of the French Wars of Religion. Bodin undertook a sweeping study of various forms of government, taking care to distinguish between what he called royal monarchy, despotic monarchy, and tyranny. Despots generally violated the property rights of their subjects; tyrants were arbitrary and purely selfish. Royal monarchy meant that a ruler, although entirely sovereign, would always seek to rule in the best interests of his subjects. There were no formal constitutional checks on power, but a paternal sense of duty to the welfare of the kingdom would guide the ruler's actions.

PARLIAMENTS

The other limit on royal power evident in Bodin's own time was the legislative or consultative body, such as the Estates General and *parlements* of France. All such legislative bodies claimed some rights and privileges

from the sovereign. The political history of France and England after Bodin's time demonstrated that although rulers of those countries could circumvent Parliament and the Estates for extended periods of time, this eventually led to resistance and revolution.

Hobbes also lived in a turbulent age. Many of Hobbes's most important political works, including *De Cive*, *Leviathan* (both published in 1651), and *Behemoth* (1681), were heavily influenced by the events surrounding the English Civil War, which ended with the execution of King CHARLES I. In *Leviathan*, his best known work, Hobbes drew a lengthy analogy between a commonwealth and the human anatomy, in which the king is represented as the head and the rest of society as the body. He proceeded to set out his view of human nature unconstrained by government or communal moral standards.

In such a situation, he argued, there could be no guarantee of life or possessions except by violence. Human beings needed government to remove them from this state of nature, and the best government was the one that reduced violence and uncertainty the most. This required people to surrender a portion of their individual liberty (either by making a covenant between themselves or by being conquered) to a single authority, which would be charged with the protection of their lives, property, and other retained rights. This authority could take one of three forms: monarchy, aristocracy, or democracy. He argued that of these, monarchy was theoretically preferred, since it was least likely to degenerate into factional struggles and civil war. This monarchy, he continued, should not be elective (as in the Holy Roman Empire) or limited (as claimed in England), or else it was not a true monarchy, since the ultimate source of sovereignty lay with others.

ENLIGHTENED SELF-INTEREST

Like Bodin, Hobbes argued that a true monarch would be restrained from acting in an arbitrary and wicked manner through reason and enlightened self-interest. Because the monarch was the embodiment of sovereignty, his or her private interest would be aligned with the public good. A wise ruler would seek counsel from those best equipped to provide it, but would always reserve the personal right to choose and implement the best policy. Anticipating critics who would point to historical examples of rulers who did not concern themselves with the common good or the most reasonable policies, Hobbes repeatedly stated that whatever problems could be caused by the corruption of a single

sovereign would simply be multiplied in an oligarchy or a democracy.

Bossuet's *Politics Derived from the Very Words of Holy Scripture* (1709) was an exploration of the nature of kingly power as demonstrated in the Bible and in history. For a number of years Bossuet had served as the tutor to the Dauphin, the son and heir of Louis XIV, and he was thus highly interested in and knowledgeable about the workings of the French monarchy. He proposed that the power of the king is "paternal," "absolute," and "subject to reason," but he also added a "sacred" quality. The principle that temporal authority originates with God is found in many parts of the Bible, and most medieval European sovereigns were considered to be God's anointed. The doctrine of divine right kingship was invoked by 16th and 17th century rulers such as James VI and I of Scotland and England to justify their actions and to condemn resistance or questioning of their authority. In France, the sacred quality of kingship had an added dimension: since the king was placed on the throne by God, resistance to his power was illegitimate and sinful; those who opposed the political or religious policies of the king, such as the HUGUENOTS, should not be tolerated at all.

The Russian czar IVAN IV (reigned 1533–84) provides an early example of an attempt to centralize authority in the person of the ruler and circumvent existing institutions and controls. Ivan began his reign as the grand duke of Muscovy, but by 1547 he assumed the title of czar (emperor) of Russia. In 1565, frustrated with the problems still facing his fragmented domains, Ivan created a separate administration under his personal control, the Oprichnina. Originally this was confined geographically to certain towns and parts of the countryside, but over time it grew in both size and scope.

Ivan IV's reign illustrates two different concepts often associated with absolutism. The first is reform of the state, which included the creation of a standing army and a centralized bureaucracy responsible directly to the ruler, as well as a systematic overhaul of laws and institutions dating from feudal times. The second, despotic and arbitrary rule, was one of the primary reasons that many philosophers and statesmen feared and opposed anything resembling royal absolutism.

The one ruler who is most often associated with absolutism is Louis XIV of France (reigned 1643–1715). While it is true that the Sun King had a more powerful state apparatus at his disposal than his predecessors, and showed more vigor in running France than his immediate successors, he was not primarily responsible for creating the system he led. France had been divided

by internal political and religious wars in the 16th century, although the appearance of a strong ruler, HENRY IV, began the process of healing the rifts and stabilizing the government—at least until Henry was assassinated in 1610. His successor, Louis XIII, was not as assertive, and by the 1620s he had effectively delegated much of his authority to Cardinal RICHELIEU.

Louis XIV may have consciously portrayed himself as an absolute ruler, but the daily reality of managing his kingdom was something quite different. He did not rid himself of all obstacles to his authority, but through a combination of compromise and assertiveness he was able to reduce the resistance of such bodies as the nobility, the *parlements*, and the church.

Louis XIV was only partially successful in establishing himself as the unquestioned master of his kingdom, and even less so in his attempt to act as the “arbiter of Europe.” In fact, scholars such as Nicholas Henshall argue that the lingering image of Louis XIV as an absolute monarch owes more to the perpetuation of a myth by English polemicists than to his actual behavior. After the GLORIOUS REVOLUTION in 1688, Henshall says, absolutism came to be defined by the English as everything that their constitutional monarchy was not: French, Catholic, and despotic. This was a simplistic definition that ignored the continuing importance of the monarch in British politics and the real constraints on the power of the French king.

Even with all of the centralization and modernization associated with absolutism in this period, most states still remained a patchwork of different jurisdictions under the nominal control of a single crown. Spain, France, the Austrian empire, and Russia all had ancient internal divisions that no monarch could simply erase, no matter how much he or she might want to.

CHRISTOPHER TAIT

Africa, Portuguese in

The Portuguese were the first to make significant inroads into Africa during the age of discovery, yet they were the last to decolonize their African possessions. This was to a large extent true of Portuguese socio-economic and political activities in the various communities of Africa in which they operated. The Portuguese empire in Africa was the earliest and longest lived of the colonial empires, lasting from 1415 until 1974, with serious activity beginning in 1450.

The first attempt made by the Portuguese to establish a presence in Africa was when some Portuguese soldiers captured Ceuta on the North African coast in 1415. Three years later, a group of Moors attempted to retake it. A better armed Portuguese army defeated the Moors, although this did not result in effective political control.

In 1419, two captains in the employ of Prince Henry (Henrique) the Navigator, João Gonzalez Zarco and Tristão Vaz Teixeira, were driven by a storm to Madeira. A Portuguese expedition to Tangier in 1436, which was undertaken by King Edward (Duarte) for establishing Portuguese political control over the area, followed. However Edward's army was defeated, and Prince Ferdinand, the king's youngest brother, was surrendered as a hostage. Tangier was later captured by the Portuguese in 1471.

The coast of West Africa also attracted the attention of the Portuguese. The Senegal was reached in 1445, and Cape Verde was passed in the same year. In 1446, Álvaro Fernandes was close to Sierra Leone. By 1450, the Portuguese had made tremendous progress in the exploration of the Gulf of Guinea. Specifically under João II, exploration had reached the fortress of São Jorge da Mina (Elmina), which was established for the protection of the trade of the Guinea. The Portuguese reached the ancient kingdom of Benin and the coastal part of present-day Niger Delta region of Nigeria before 1480. Oba (King) Esigie, who reigned in the last quarter of the 15th century, is said to have interacted and traded with the Portuguese.

The famous Portuguese explorer Diogo Cão sighted the Congo in 1482 and reached Cape Cross in 1486. The Portuguese thus found themselves in contact with one of the largest states in Africa. The leading kingdom in the area was the KONGO KINGDOM built by the Bakongo, a

Bantu people whose king, the Mani-Kongo, had his capital at Mbanza-Kongo, modern San Salvador in northern Angola. Other leading states in the area included Ngoyo and Loango on the Atlantic coast.

When the Portuguese arrived on the east coast of Africa at the end of the 15th century, the region was already witnessing some remarkable prosperity occasioned by a combined effort of Africans and Arab traders who established urbanized Islamic communities in the area. These included the coast of Mozambique, Kilwa, Brava, and Mombassa. From East Africa the Portuguese explorer Pêro da Covilhã reached Ethiopia in 1490. The big island of Madagascar was discovered in 1500 by a Portuguese fleet under the command of Diogo Dias. The island was called Iiha de São Lourenço by the Portuguese. Other Portuguese might have visited previously, as was evidenced in the stone tower, containing symbols of Portuguese coats of arms and a Holy Cross. Mauritius was discovered in 1507. By 1550, Portuguese dominance in both the Indian and Atlantic Oceans had been confirmed. Their position was further strengthened by the TREATY OF TORDESILLAS of July 7, 1494, with Spain, leading to the emergence of a large empire. Some African communities were part of this sprawling Portuguese empire.

COMMERCIAL AIMS

The needs to establish Christianity and Portuguese civilization were not strong motivators; the aims of the Portuguese were essentially commercial. In the East African region, the Portuguese wanted to supplant the preexisting network of Arab seaborne trade. Consequently, Portuguese bases at Sofala, Kilwa, and other areas such as the offshore islands of Mozambique, Zanzibar, Pemba, Mombassa, and the island of Lamu were established. In this direction, VASCO DA GAMA took the first step on his second voyage to India in 1502. He called at Kilwa and forced the sultan to pay a yearly tribute to the king of Portugal. This was typical of Portugal's dealings with the coast, and unless tribute was paid, the town was destroyed. If it was paid, the local ruler was usually left in peace, provided he carried out the wishes of the Portuguese.

After Kilwa, Zanzibar was the next place to suffer from the Portuguese. In 1503, a Portuguese commander, Ruy Lourenço Ravasco showed the power of guns by killing about 4,000 men aboard canoes. The men were carrying commodities that were of interest to Ravasco. Available evidence shows that the local men in no way provoked the Portuguese official.

Sofala was another center of attraction to the Portuguese. The town was important because it gave the Portuguese control of the gold supply of the interior of

A statue of Prince Henry the Navigator in Lisbon portrays Portugal's early explorations of Africa.

East Africa. The town offered minor resistance to Portuguese incursion. Consequently, a fort was built there to protect the Portuguese colony that now replaced the old Arab settlement in the area.

Kilwa shared the fate that befell Sofala. As in the case of Sofala, the Portuguese met little resistance there. A Portuguese fleet commanded by D'Almeidas captured the town. From there the Portuguese official then sailed away to Mombassa, where they met strong resistance. Indeed the city was like a thorn in the flesh of the Portuguese. The island was consequently named "the island of war." However the resistance of the people of Mombassa collapsed and the city was set on fire.

Outside the coast the Portuguese were interested in the gold region of the Zambezi. The Portuguese embarked upon such a massive exploitation of the mineral that within a few years of their activities and occupation, the region had withered to an unattractive settlement. This development sometimes created a crisis and revolt from the local people. The first serious revolt to succeed was in 1631 when Mombassa rebelled.

It should be noted that it was in an effort to contain uprising from the local people that the Portuguese in 1593 established and garrisoned the great and famous Fort Jesus at Mombassa. Still, the safety and security of the Portuguese merchants were never guaranteed relative to Arab threats. Already a part of the Indian Ocean community was slipping out of the grip of the Portuguese. In 1622, they were ejected from the Persian Gulf and by mid-17th century, the seafarers of the maritime state of Oman were regularly making incursions and conducting

raids as far south as Zanzibar. By the middle of the 18th century, the maritime trade of the East African coast was more or less out of the control of the Portuguese and the region had gradually resumed its pre-Portuguese commercial activities that made the area an attraction for many traders. The appearance of the British and the DUTCH EAST INDIA COMPANIES was another threat to Portuguese commercial interests in East Africa.

Elsewhere in Africa the Portuguese experimented with the plantation system in São Tomé from where they introduced it to Brazil. Following this development a new era of Portuguese exploitation of Africa started. This was in the area of the SLAVE TRADE, which lasted for more than two centuries. During the 16th century, the Portuguese concentrated their slave trading attention on the Kongo Kingdom. During the reign (1507–43) of the Christian king Afonso (Nzinga Mbemba), the Portuguese had already started to export young Kongoleses across the Atlantic in large numbers.

Although King Afonso disliked the slave trade, he paid in slaves for European goods and services, which he regarded as essential to his kingdom. Such services included those provided by missionaries, masons, carpenters, and other artisans. King Afonso died frustrated with his desires to see the Portuguese technologically transform his kingdom unfulfilled. Instead the slave trade continued unabated.

A turning point in Portuguese exploitation of West Central Africa came in 1575 when Paulo Dia de Novais was sent as a conquistador to Africa. From his base at Loanda, south of the Kongo frontier, several wars were waged against the so-called recalcitrant king of Ndongo, the Ngola. Sometimes the Portuguese made an alliance with the predatory Jaga group encouraging them to wage wars against Ndongo and some parts of Kongo Kingdom.

The situation was so chaotic that early 17th century Mani-Kongos had to send petitions to the Holy See through the missionaries urging them to intervene in the matter, but nothing substantial came out of it. Not even the Portuguese Crown could help the situation. This was the development when in 1660 the Bakongo turned to war with the Portuguese. The Portuguese defeated them. Further raids weakened the kingdom. In fact many of the provinces began to break away. By 1750 the once powerful Kongo state had become a shadow of its former self.

The high demand of slaves in the Portuguese colony of Brazil put pressure on Ndongo, known as Angola by the Portuguese. The state was the largest supplier of slaves to the colony of Brazil in the whole of Africa south of the equator. The demand was so great that the Portuguese

often incited the local communities to wage war on one another in the interest of obtaining slave labor for Brazil.

The Portuguese also tried their hands in commodities other than slaves, such as pepper from the Benin kingdom (in present-day Nigeria) and gold from the Gold Coast. However by 1642, the Dutch had permanently ousted the Portuguese from the Gold Coast. This development encouraged both the English and French to join in the competition against the Portuguese. By the 18th century, it was the traders of these countries who became very active in the trade of the Gulf of Guinea, while the Portuguese continued with their slave-trading activities.

Meanwhile, before the other European powers joined in international trade, the Portuguese experimented with all sorts of goods. In the 1470s, for example, the Portuguese were able to procure cotton cloth, beads, and other items from the Benin kingdom, which they exchanged for gold on the Gold Coast. The Portuguese also participated in the trade in cowries in the Kongo and its offshore islands. They were also very active in the trade in salt along the Angolan coast.

The Portuguese dominated trade in this era because they were better organized compared to the Africans and they were technologically superior. This showed in the way the Portuguese dislodged the Arab traders along the East African coast who had been established in the area long before the advent of the Portuguese in Africa.

OMON MERRY OSIKI

Akan states of West Africa

The Akan people of West Africa are descendants of the residents of the early Akan states and continue to live in the area east of the Mende people that makes up present-day Ghana and the Ivory Coast. It is believed that the Akan people have been present in West Africa since the first century. However, it was not until the 15th century that the world outside Africa became aware of the Akan states. Most of the early information on the Akan came from the Portuguese who developed the West African gold trade. When the Portuguese first appeared

in West Africa, the area controlled by the Akan states stretched from the equatorial forest southward to the Ofin and Pra Rivers. This area roughly compares to what later became the states of ASHANTI and Adansi.

While locals called the early Akan settlements Akyerekere, Europeans identified the people as belonging to two separate groups, the Akany and Twifu (or Twifo). While a number of scholars suggest that members of Akan states were of Dyula ancestry, others disagree. It is true that a number of Dyula settlements existed in Akan states, but the most prevalent view is that Akan states grew in strength to rival Dyula rather than evolving from it. Further arguments that support the belief that the Akan states were separate from Dyula center on cultural differences. Two customs that were distinctly Akan in nature and that had no counterpart in Dyulan culture were the annual yam festivals and the tradition of matrilineal inheritance. Subsequent studies of the Akan people have led scholars to believe that the southern branch of the Akan, the Fante, traveled in earlier times from the Volta Gap to the coastlands of Accra, where they intermarried with existing inhabitants. As the area expanded, several powerful Akan states emerged. The oldest of these is thought to be Bono, which was also called Brong. Asante, which later came to be known as Ashanti, proved to be the most powerful Akan state. Others included Akwamu, Denkyira, Akyem, and Fante.

EUROPE AND THE AKAN STATES

When the Portuguese established their presence in West Africa in 1471, they discovered that the Akan people were not living in towns, as was typical in Africa during this period. Instead, the Akan were occupying small kingdoms ruled by kings and queens in the savanna north of the existing gold belt. Within each kingdom, families that were descended from seven or eight particular clans, identified by matrilineal lineage, lived in villages where they were ruled by their own chieftains. In addition to the chieftains, each family and clan had its own leader. All of the families, clans, and villages worshipped gods that they had individually deified. The various lineages also had their own symbols, which were used to identify matrilineal ancestry.

Once it became clear that the gold trade would develop into a significant economic undertaking, the Akan states realized that it was in their best interest to control the route to and from the Gold Coast. As a result, the Akan states took on a prominent role in developing West Africa. Early on, the Akan depended on three significant areas to establish their presence in the gold trade. The first of these was Bona, which was located close to

the Lobi gold mine. The others were Banda, which controlled passage to the main gold trading route through the Volta Gap, and Bono, where Bono-Mansa, the capital of the early Akan states, was located. Over the following decades, the gold trade with Portugal exploded, reaching its peak in 1560 with West African gold providing one-fourth of all revenue for Portugal.

From the earliest days, the Akan had been heavily involved in agriculture, developing a farming belt along the outer environs of the equatorial forest where they grew yams and oil-producing palms. Other agricultural activities included the production of plantain, bananas, and rice, as well as collecting kola nuts, raising livestock, hunting, fishing, and making salt. The density of the soil in and around the forest limited the type of produce that could be grown, and increasing populations soon exhausted the soil. As a result, the Akan people entered the equatorial forests, where they cleared enough land to support the needs of the people. In the 17th century, agricultural production and the growth of the trade along the Gold Coast led to permanent settlements in the equatorial forest. Rates of urbanization and increasing sophistication among the Akan states subsequently led to the emergence of more complex political and social structures. Strong leadership among the people of the Akan states allowed them to retain their own cultures in the midst of the expanding European presence, while winning the respect of the Europeans in the process.

SLAVERY IN THE AKAN STATES

In the past, attempts by some Akan leaders to dominate the entire region had resulted in tribal wars. As a result, victorious tribes had begun selling members of conquered tribes at local European slave markets. The more vulnerable tribes, such as the Ewe who lived in the lower Volta area, were continually subjected to being enslaved. Additionally, certain Africans were born into lineage slavery and were forced from their earliest years to serve the dominant African groups. The Akan states also bought slaves from the Portuguese. Most of these came from Benin, where the government regularly sold off its captives. After 1516, when the government of Benin reduced its military activity, most of the slaves that the Akan states purchased from Portugal came from the Niger Delta and the Igbo region.

The Akan states retained some slaves for local use, while others were placed on slave ships bound for markets along the Atlantic slave-trading route. Domestically, the Akan states used slaves in royal households and in transporting goods to market. Additionally, large numbers of slaves were put to work in construction, in

mines, and on farms. A smaller number of slaves were employed as artisans in various crafts. The Akan states also designated some slaves to be trained to use flintlock muskets as part of citizen armies employed in the Akan quest to crush neighboring states and expand the existing Akan empire. Along with slaves, the Akan states also commandeered the services of immigrants and migrants to be employed in various tasks. In general, both slaves and forced labor were allowed limited freedom because their numbers prevented total control over the population.

RIVALRY AMONG AKAN STATES

As individual states became more powerful, competition arose among the Akan states, with Denkyira and Akwamu emerging as the most powerful. By the middle of the 17th century, Denkyira had won the right to control most of the western gold-bearing area and had begun forging an empire leading northward to the established European trading routes that led to Banda and Bono. During the 1670s, Denkyira seized control of the entire area around the western Gold Coast and beyond. On the eastern coast, Akwamu had begun to do the same. From 1677 to 1781, Akwamu worked on its campaign to win control of Accara, which had been under Denkyira control since 1629. Ultimately, Akwamu annexed Accara, in addition to the surrounding areas of the eastern territory. This expansion provided them with direct control of the trading forts operated by the English, Dutch, and Danish along the eastern Gold Coast. Thus, by 1702, Akwamu had also gained control of the east coast slave-exporting businesses. Despite their enormous strength, greed ultimately destroyed both Denkyira and Akwamu.

Asante, which had originally been a dependency of Denkyira's, emerged as a major contender in the ongoing power struggle of the late 17th and early 18th centuries, giving birth to the powerful Ashanti state. Ashanti was formed from the various Akan states that had gathered together in the north-central section of the equatorial forest. The combined strength of these states enabled them to dominate the trading route from western and central Sudan. Within the state of Ashanti, the various kings agreed to accept the supremacy of one king to be based in the capital city of Kumasi. The first Ashanti king was Osei Tutu (c. 1680–1717).

In 1698, Osei Tutu declared war on Denkyira, using arms from Akwamu. In 1701, Ashanti finally succeeded in overwhelming Denkyira, thereby gaining essential territory for its southward expansion. Three decades later, Akyem, an important Ashanti ally, defeated Akwamu. After the downfall of Denkyira and Akwamu, Ashanti

became the most powerful influence in the area now known as Ghana, continuing to rule until the end of the 19th century when the British conquered the area.

ASHANTI DEVELOPMENT AND EXPANSION

Over the course of the 18th century, Ashanti strengthened its hold on the central forest region and began reaching outward to expand its territory. Each captive area was forced to pay tribute to Ashanti. Areas such as Dagoomba in the northeastern area of the equatorial forest paid their tribute in slaves, which had in turn been taken captive from more remote areas of Africa. Ashanti then traded those slaves for firearms, smelted iron, and copper. Between the 15th and 19th centuries, some 4 million slaves had been taken for this purpose from south of the equator in an area that extended from Cameroon to Kunene. Until the pope banned the sale and trade of European firearms to Ashanti out of fear that radical Muslims would lay hold of the guns and use them against Christian traders, the Portuguese regularly traded weapons to Ashanti in exchange for slaves.

By 1820, the Ashanti Empire controlled some 250,000 square kilometers that had been organized into three distinct regions. The first was composed of the six metropolitan chiefdoms that had furnished the military power for King Osei Tutu. The bulk of the people of Akan descent lived in the second region. The third was composed of dependencies, such as Gonja and Dagomba, which were required to pay tribute of 1,000 slaves each year. Since the strength of the Ashanti state was always dependent on the force of its military rather than on a sense of nationalism, it became impossible to maintain a hold on those tributary states that made up two-thirds of the Ashanti Empire. This weakness made Ashanti more vulnerable when the British declared war on the state in the 19th century.

Today, the remaining Akan people belong to either eastern or western Akan groups. The five groups of eastern Akan, which all speak Twi, include Asanta, Auapem, Akyem, Denkyria, and Gomua. Sehwi-speaking Western Akan is made up of Anya, Ahanta, Baule, Sanwi (Afema), Nzima, and Aowin. Despite the fact that each subgroup has its own dialect, groups are able to communicate with one another. While the Akan people continue to practice the tradition of matrilineal descent, some changes have been instituted to make inheritance laws more equitable.

ELIZABETH PURDY

Akbar

(1542–1605) *emperor of India*

Jalal ud-din Akbar was born in 1542 to HUMAYUN, in India, while the latter was a fugitive ruler. Akbar succeeded to a very shaky throne at age 13 but went on to enjoy a long and successful reign, becoming the greatest ruler of the MUGHAL (Moghul) EMPIRE founded by his grandfather BABUR and his followers, who were Muslims from Central Asia. Akbar spent much of his difficult childhood on the run. Consequently, he never learned to read or write. However, he was a brilliant man with an inquisitive mind and phenomenal memory who had others read to him throughout his life.

Akbar's leadership highlighted his diverse achievements. He was a good general who expanded his empire after personally leading troops to defeat the powerful Hindu Rajput warriors. Then he married a Rajput princess, daughter of the ruler of Amber; she would become the mother of his heir. His lenient treatment of the defeated Rajputs, whom he kept as his vassals, foreshadowed his policy toward other Hindu subjects. In 1572, he conquered Gujrat, thereby gaining access to the sea. When he encountered the Portuguese, he grew to admire their ships, arms, and European merchandise. In 1573, he signed a treaty with the Portuguese viceroy ensuring safe passage for Indian Muslims crossing the Indian Ocean on pilgrimages to Mecca. Later he added Bengal, Baluchistan, Afghanistan, Kashmir, and part of the Deccan region to his empire.

Like his grandfather Babur, Akbar was a builder. In Delhi, the tomb he built for his father was constructed of red sandstone and adorned with white marble, the precursor of the mature Indo-Islamic style of the TAJ MAHAL. He also built a fort at Agra from red sandstone. Above all, he was noted for building a new palace city at Fatehpur

Sikri near Agra, close to the retreat of a Muslim holy man and his mentor. Built of white marble, it became his headquarters until 1585, when he moved away and the palaces were never occupied again.

Akbar's national policies aimed at uniting his subjects. The centerpiece was religious tolerance, partly the result of his disillusionment with Sunni Islam's rigidity and intolerance and partly to conciliate his Hindu subjects. Thus he abolished the poll tax on non-Muslims and the special tax on Hindu pilgrims. He hosted religious debates of Hindu, Muslim, Parsi (Zoroastrian), and Christian (Jesuit) scholars at Fatehpur Sikri and concluded that no religion held the exclusive truth. Attracted by mysticism he also took up Sufi Islam and Hindu yogi practices. Akbar eventually established a new religion called Din-I ilahi, or Divine Faith, in 1582. With Akbar himself as spiritual guide, Din-I ilahi was drawn mainly from Hinduism, Jainism, and Zoroastrianism. Orthodox Muslims were offended and accused him of heresy. He ruled as an autocrat served by ranked officials who were given salaries. However, 70 percent of his officials were foreigners, mostly Afghans and Persians, and Persian was the official language of his empire. The rest were Indians, both Muslim and Hindu. The employment of some Hindus in government service was an improvement in the status of Hindus from previous Muslim dynasties. He abolished tolls, made roads safe, and kept dues low to encourage commerce. Akbar was a patron of the arts, and culture flourished during his reign, enormously impressing the Europeans who visited India at the time. His last years were saddened by the death of two sons from drinking and drugs, and by the revolt of his eldest son and heir, Selim (Salim). Similar troubles also plagued his successors, who faced revolts by their sons and civil wars among them.

Alawi dynasty in Morocco

The Alawi dynasty of Morocco, also known as Filalis or Filalians, first appeared in Morocco sometime in the 13th

century. Its members claimed they could trace their lineage directly to the prophet Muhammad (571–632). The dynasty's name was derived from the name of its ancestor, Mawlay Ali al-Sharif of Marrakesh. Mawlay Rashid (667–722), the first Alawite ruler of Morocco, is considered to be the founding father of the dynasty. The name Alawi is also used in Morocco in a more general sense to identify all descendants of Ali, who was the cousin and son-in-law of the prophet Muhammad. At the time the Alawi surfaced in Morocco, sultan kings with absolute power had ruled Morocco for almost four centuries.

In the 16th century, Morocco's sultan kings had been forced to make decisions about foreign trade. While the rulers wanted the gunpowder and arms that trading with Europe could bring, they were hesitant to trade with the continent that Moroccans knew as the "land of infidels." Weapons were particularly important for Morocco at that time, because the country was facing Iberian expansion along the Atlantic and Mediterranean coasts. Members of the Alawi dynasty were also cognizant of the possibility of their becoming a target of European colonialism. The rulers not only wanted to protect Morocco from foreign invaders, but they were also determined to maintain the purity of their Muslim society. In the past, they had accomplished this goal by banning foreign travel and restricting contact with all foreigners. Yet, the likelihood of continuing such practices was diminishing since foreign trade had become an essential economic activity.

In 1666, Mawlay Rashid of the Alawi dynasty seized power after the death of Ahmad al-Mansur of the SA'DID DYNASTY. Rashid came to power by outmaneuvering Ahmad al-Mansur's three sons. Rashid also killed his own brother, Mawlay Mohammad, who challenged him for the right to rule Morocco. Once in power, Rashid appointed the ulema (a group of learned religious men) and noted scholars as his advisers, and he celebrated his victory by holding elaborate ceremonies that combined elements of Moroccan politics, religion, and culture. These rituals were designed to introduce the Moroccans to their new leader and to demonstrate the right of the Alawi to rule Morocco because of its strong connection with the past.

In 1672, Mawlay Isma'il succeeded his brother as the ruler of Morocco after Rashid was killed in a riding accident. Isma'il became known as the greatest sovereign of the early Alawi period. He established a form of government that survived until the 20th century. Isma'il also reached out to the French, with whom he formed an alliance against the Spanish. The partnership resulted in a steady supply of weaponry into Morocco and in a number of construction projects for new palaces, roads, and forts. To finance these projects, Isma'il levied heavy taxes and

demanded ransoms for imprisoned Europeans. Rashid had great respect for scholarship, and he built Madrasa Cherratin in Fez and an additional college in Marrakesh. Rashid also reformed the monetary system and ensured that wells were dug in the eastern deserts.

In the 17th century, Alawi nationalists launched a jihad (holy war) designed to strip local Christians of all land located on the Atlantic and Mediterranean coasts of Morocco. The Alawi dynasty continued to rule Morocco from the mid-17th century until 1912, when the country became a protectorate, with Spain controlling northern Morocco and France ruling the southern part of the country. In 1956, Morocco reestablished its independence, and the Alawi monarchy again rose to power under the rule of King Mohammed V. Since that time, the Alawi dynasty has continued to rule Morocco.

In the 21st century, Moroccan members of the Alawi dynasty continue to practice close adherence to Sunni Islam. Moroccan scholars have scientifically documented the Alawi claim to be directly descended from the prophet Muhammad. As a result, the Alawi dynasty continues to hold wide legitimacy in contemporary Morocco. The Alawi are credited with bringing economic prosperity to the country by growing the economy, establishing foreign trade links, and improving the overall standard of living. A Syrian branch of the Alawi dynasty, which practices the Shi'i school of thought, follows the teachings of Muhammad ibn Nusayr. More liberal than the Moroccan Alawi, the Syrians celebrate both Muslim and Christian festivals.

ELIZABETH PURDY

Albuquerque, Afonso de (1453–1515) Portuguese explorer

One of the great sea captains in Portuguese history, Afonso de Albuquerque captured the cities of Goa, Malacca, and Hormuz and founded the Portuguese empire in Asia. He was born in Alhandra, near Lisbon. Both his paternal grandfather and great-grandfather had been

confidential secretaries to King João I and King Edward (Duarte), and his maternal grandfather had been an admiral in the Portuguese navy.

He grew up at the court of his godfather King Afonso V, and when he was 20 he sailed in the Portuguese fleet to Venice and was involved in the defeat of the Turks at the Battle of Taranto. He then spent 10 years in the Portuguese army in Morocco gaining military experience. Albuquerque was present when the Portuguese under King Afonso V captured Arzila and Tangier in 1471, and Afonso's son, King João II, made him a bodyguard and then his master of the horse. He returned to Morocco in 1489 and fought at the siege of Graciosa. When John's brother Manuel I became king in 1495, Albuquerque returned again to Morocco.

It was during this time that Albuquerque became interested in Asia. The possibility of opening up a trade route was tantalizing to Albuquerque and in 1503 he joined his cousin Francisco to Cochin on the southwest coast of India, where they built the first Portuguese fortress in Asia.

King Manuel appointed Dom Francisco de Almeida as the first viceroy of India with the aim of increasing trade and establishing a permanent presence on the Indian subcontinent. In April 1506, Albuquerque set out on his second (and final) voyage—one that would last nine years. He was skilled in military tactics, seafaring, and handling men and was incredibly ambitious.

However he was only in charge of five of the fleet's 16 ships. Overall command was given to Tristão da Cunha, who led the expedition up the east coast of Africa, and around Madagascar. They built a fort at Socotra to prevent Arab traders from passing through the mouth of the Red Sea and ensure a Portuguese trade monopoly with India.

In August 1507, Albuquerque was given permission by Tristão da Cunha to take six ships and 400 men. They headed straight for the Arabian and Persian coasts and, heavily armed, they sacked five towns in five weeks. Albuquerque then decided to attack the town of Hormuz (Ormuz), which was located on an island between the Persian Gulf and the Gulf of Oman. Taking it would cripple Turkish trade with the Middle East as it was the terminus for caravan routes from Egypt, Persia, Turkestan, and India. Even though Hormuz had a population of between 60,000 and 100,000, Albuquerque was able to capture the town and force it to pay him an annual tribute.

Albuquerque, appointed to succeed Almeida, found Almeida reluctant to hand over the office. Almeida was keen to avenge the death of his son, who was killed by an Egyptian fleet. He jailed Albuquerque and then led the

Portuguese into a naval battle off the island of Din near GOA in February 1509.

In October 1509 the marshal of Portugal, Fernando Continho, on a tour of inspection, ordered the release of Albuquerque and demanded that Almeida hand over his office. Albuquerque then set out to create the Portuguese empire in Asia. In January 1510 he attacked the port of Cochin but was unable to capture it. Two months later he attacked and took the town of Goa. After being there for two months he was forced out, but retook Goa in November 1510.

Albuquerque then made for MALACCA (now Melaka), the richest port on the Malay Peninsula. It was the center where traders from the Indonesian archipelago brought their spices. It had a population of 100,000 and was well armed. With 15 ships, three galleys, 800 European and 200 Indian soldiers, in July 1511, he attacked Malacca and after a day, took the city, which his men looted. They loaded their treasure into the *Flor do Mar*, and the ship was so overloaded that it sank off the coast of Sumatra; the wreck has never been found.

Back in Goa, Albuquerque fought off the attackers and then took a group of Portuguese and Indians to try to take the port of Aden. They failed and they returned to India. In February 1515, he again sailed from Goa, taking 26 ships to Hormuz. However he was taken ill in September and sailed back to Goa. On the way back he heard that his success had made him many enemies in Lisbon and he had been replaced by an enemy, Lopo Soares. Albuquerque died on December 15, 1515, at sea off the coast of Goa.

JUSTIN CORFIELD

Almagro, Diego de

(c. 1475–1538) *explorer and political leader*

A leading figure in the CONQUEST OF PERU Diego de Almagro launched a rebellion against the Pizarro brothers

around CUZCO that convulsed the newly conquered Andean territories in civil war (1537–38) and led to his own death by garroting at the hands of Hernando Pizarro. Almagro's mestizo son, also named Diego de Almagro (Almagro the Younger), nominally headed the Almagrist faction that murdered FRANCISCO PIZARRO in 1541, but he, too, was captured and executed in 1542. The name Almagro thus has come to be associated with internecine conflicts among Spaniards during the most tumultuous years of the conquest of the New World.

Both sides held substantial *ENCOMIENDAS* in Panama, and in 1524 Diego de Almagro and Francisco Pizarro formed a partnership for exploration and conquest along the Pacific coast of South America. After two exploratory expeditions (1524 and 1526–28), Pizarro returned to Spain in mid-1528 and in Toledo received sanction for conquest from King Charles. The seeds of later dissension were sown in this Toledo agreement, as Pizarro was named governor and captain-general of Peru, and Almagro given the much lesser title of commandant of Tumbez, an Incan city they had encountered in the Gulf of Guayaquil and the anticipated site of a new bishopric.

During the third expedition, which resulted in Pizarro's capture of the Incan ATAHUALPA in CAJAMARCA in November 1532, Almagro stayed behind in Panama, where he had taken ill. He rejoined Pizarro in April 1533 at Cajamarca, bringing some 150 Spanish reinforcements. Almagro's men received a much smaller share of Atahualpa's ransom than did Pizarro's, sharpening the factionalism between the two leaders and their followers. After their combined forces had taken and ransacked Cuzco, Pizarro sent Almagro and Sebastián de Benalcázar north to defeat the last substantial Inca military force and to prevent rival conquistador PEDRO DE ALVARADO from seizing Quito first. They succeeded. Alvarado returned to Guatemala with a handsome bribe to ensure his departure; Almagro returned to Cuzco; and Pizarro went to the coast to found the new capital city of Lima. About this time, in early 1535, news arrived that King Charles had divided Peru, with Pizarro awarded the northern portion and Almagro the southern. The actual document not yet in hand, rumors flourished among partisans of both camps that their leader had been awarded Cuzco. Open civil war was avoided by Francisco Pizarro, who persuaded his old comrade Almagro to head an expedition south into Chile.

Almagro's Chilean campaign (July 1535–April 1537) turned out to be a disaster, with no treasure but much hardship, many cruelties against the natives, and much native resistance. Upon his return to Cuzco in April 1537, Almagro was determined to wrest the city

Hernando Pizarro and Diego de Almagro swearing a peace oath, yet Spanish internecine conflict continued in the New World.

from Hernando and Gonzalo Pizarro. His forces took the city, for a year. A bitter civil war ensued between the two factions and their Indian allies. Hernando Pizarro was released, Gonzalo escaped, and both joined forces with Francisco on the coast. Marching inland, the forces of the Pizarro brothers roundly defeated the Almagrist faction in the Battle of Las Salinas, just outside Cuzco, on April 26, 1538. In July 1538, in Cuzco, Hernando Pizarro had Almagro garroted. Almagrist feeling against the Pizarros still ran high, however, culminating in the faction's murder of Francisco Pizarro in Lima in June 1541. Diego de Almagro the Younger, a figurehead, ruled Lima for the next year, until the new viceroy, Vaca de Castro, definitively crushed the Almagrist faction on September 16, 1542 in the Battle of Chupas, just outside the city of Huamanga, and had its young mestizo leader executed. Thus ended the bitter civil war between the Pizarrist and Almagrist factions in Peru. The conflict was emblematic of intra-Spanish divisions in the conquest

of the Americas, in its violence and factionalism comparable to the civil wars between the conquistadores of Central America a few years earlier.

MICHAEL J. SCHROEDER

Altan Khan

(c. 1507–c. 1582) *Mongol tribal leader, warrior*

Altan Khan led a federation of Mongol tribes that occupied the region called Chahar in today's Inner Mongolian region of China. His people were formidable because of their proximity to Ming China's capital Beijing (Peking), their wealth among Mongol tribes because of trade, and their prestige as the legitimate successors of Genghis Khan. Under his grandfather Bayan Khan, also known as Batu Mongke (c. 1464–c. 1532), and then under him the Mongols came close to unity. Thus they were able to threaten China. He also forged a close religious alliance with the Yellow Hat Sect of Tibetan Buddhism.

After their ouster from China in 1368 by the MING DYNASTY (1368–1644), the Mongols broke into five groups that fought among themselves. As a result they did not realize their military potential. Altan Khan was important because he united the Chahar Mongols and began launching annual raids against Ming lands along the northern frontier, even threatening Beijing in 1550. In one raid in 1542, he reputedly took 200,000 prisoners and 2 million head of cattle. Despite winning favorable trading rights with the Ming, the Mongols continued to raid Ming outposts for the next two decades until 1570, when Altan Khan's grandson defected to the Ming governor Wang Chonggu (Wang Chung-ku) at Datong (Tatung). A new Ming emperor was ready to reverse the hostile relations between China and the Chahar Mongols. Thus he treated the Mongol defector as a guest, assured Altan Khan of the young man's safety, and began negotiations that culminated in a

settlement in 1571. It provided for the establishing of many trading points along the GREAT WALL OF CHINA and a Chinese title for Altan Khan as the Prince Shunyi (which means "compliant and righteous prince").

Altan Khan also played an important role in the religion of the Mongols. Tibetan Buddhism had won increasing numbers of converts among Mongols since Kubilai Khan's acceptance of that faith in the late 13th century. In 1577, the head of the Yellow Hat Sect in Tibet visited Mongolia. Altan Khan used the occasion to declare Tibetan Buddhism the official religion of all Mongols and conferred on that cleric the title Dalai Lama, which means "lama of infinite wisdom" in Mongol. The title was conferred retroactively on that lama's two predecessors and is carried by his successors to the present. In return, the Dalai Lama conferred on Altan Khan the title king of religion. Thus began the close relationship between the Mongols and the Yellow Hat Sect of Tibetan Buddhism. In 1589 Altan Khan's great grandson was proclaimed the reincarnation of the third Dalai Lama, becoming his successor as the fourth Dalai Lama. He was the only non-Tibetan to hold that title. The Mongol-Tibetan axis that resulted has persisted to the present and plays an important role in the politics of Inner Asia. Significantly the so-called conquest changed Mongols from ferocious warriors to pious lamas and laymen, effectively ending their dreams of future conquest. Altan Khan's early raids struck fear to the Chinese over the revival of Mongol militarism, but his conversion and that of his followers to Tibetan Buddhism ended that threat.

JIU-HWA LO UPSHUR

Alvarado, Pedro de

(1485?–1541) *Spanish conquistador*

Renowned as one of the most powerful, fearless, and ruthless of all the Spanish conquistadores, Pedro de Alvarado was a key actor in the CONQUEST OF MEXICO and the CONQUEST OF CENTRAL AMERICA, and a minor player in the CONQUEST OF PERU. His flowing blond hair, imposing demeanor, and skill in battle reportedly prompted the AZTECS to nickname him *Tonatiuh*, meaning "the

daytime Sun” (an exceptionally high compliment in their solar-centric culture), while the Indians of Guatemala are said to have considered him so handsome and cruel that they made masks of him that became part of their culture and folklore. According to the Spanish priest BARTOLOMÉ DE LAS CASAS, Alvarado was responsible for the deaths of 4 to 5 million Indians in Guatemala between 1524 and 1540.

Born in Badajóz, Spain, around 1485, Alvarado arrived in Hispaniola in 1510 and participated in the exploratory expedition of Juan de Grijalva in 1518 along the Mexican gulf coast. He then served as the chief lieutenant of HERNÁN CORTÉS in the conquest of Mexico. It was his impetuous slaughter of the celebrants in Tenochtitlán in mid-May 1520, during Cortés’s absence, that led to the catastrophic *noche triste* and nearly spelled the doom of the Spanish expedition. After subjugating Tenochtitlán, in 1523, Alvarado was sent by Cortés to conquer the kingdoms and polities of Central America. For the next 11 years, Governor and Captain-General Alvarado headed the Spanish and Indian army that crushed the indigenous polities of Guatemala, a protracted process. Tales of his atrocities are abundant, and his own letters on these events have been translated and published.

In 1534–35, Alvarado headed to the northern Andes around Quito to participate in the subjugation of indigenous polities there. Running afoul of rival conquistadores Sebastián de Benalcázar and DIEGO DE ALMAGRO, Alvarado abandoned his Andean venture and headed back to Spain (1536–39), where he further solidified his power base. Returning to Mexico, in June 1541, he received fatal wounds when he fell from a horse and was crushed during the Mixtón War at Nochistlán in Guadalajara.

MICHAEL J. SCHROEDER

Anabaptism

Anabaptism refers to a series of REFORMATION-era movements that was a part of what is commonly called

the radical Reformation. The word *Anabaptism* comes from the Greek and means to rebaptize. Anabaptist interpretation of the Bible led adherents to hold that their original baptism as an infant was invalid because it was only as an adult that one could choose to be a part of God’s select people. Thus, members were often rebaptized if they were baptized first as infants. Most modern-day Baptists, while holding similar beliefs, only indirectly trace their roots to Anabaptists.

BEGINNINGS

The more radical reformers were not united as a group, mostly because they tended toward extreme views on issues, having little patience for the views of others. There were several key figures in the period from 1521 to 1535, which began with the Zwickau prophets and ended with Jan Bockelson and the MÜNSTER COMMUNE.

Although Anabaptists claim to come from dissident roots that go back to the time of Constantine, the first visible signs during the Reformation were in December 1521, in Wittenberg, Germany, home of MARTIN LUTHER. Luther was hidden at the Wartburg Castle when three men, Nicolas Storch, Thomas Dreschel, and Mark Thomas Stübner, arrived in Wittenberg from Zwickau, a city with a history of radical Christian movements. These so-called Zwickau prophets at first simply took refuge in Wittenberg, which by that time had a reputation as a safe haven for those dissenting from Roman Catholicism. Eventually their efforts to convince others of their beliefs caused enough consternation that Luther came out of hiding in 1522 to interview the men, causing their eventual expulsion from Wittenberg. The men from Zwickau were connected to a former resident of Zwickau, Thomas Müntzer, a key figure in the PEASANTS’ WAR of 1524–25.

Not long after the war, a separate group began in Switzerland, under the leadership of Conrad Grebel. Grebel, at first a follower and friend of ULRICH ZWINGLI, eventually disagreed with Zwingli regarding the role of the church and state. Grebel, like many other Anabaptists, saw Christians as separate from the society around them, and he resisted any entanglement between the Christians and the government.

The period 1524–35 was a time of strong conflict between Anabaptists and other Christians. Many Anabaptists were caught up in end-times expectations. The first and most violent conflict was the involvement of Müntzer in the Peasants’ War. Müntzer was convinced that God was coming to judge and condemn the unrighteous, and that the lowly and meek would soon inherit the earth by conquering the unrighteous rulers and

nobles (an aberration of Christian teaching that at the end time, God would judge the unrighteous). This eventually led to armed conflict that was put down in April 1525. For his part in it, Müntzer was tortured and killed. In January 1525, Zwingli and Grebel held a disputation in Zürich to debate Baptism, with Zwingli prevailing. Grebel left Zürich, and by October he was imprisoned for his beliefs. He escaped in March 1526 and died of the plague that summer.

In 1527, a group of Anabaptists, whose followers were called the Swiss Brethren, met in Schleithem, Switzerland, and adopted the Schleithem Confession. In it, seven articles described the basic theology of the Anabaptist movement—adult baptism, the “ban” (expulsion from the church of unfaithful believers), a definition of the Lord’s Supper, separation from the world, a definition of the office of the pastor, refusal to take part in military service, and refusal to swear an oath. The author, Michael Sattler, was subsequently put to death for his beliefs. Many of his fellow participants were eventually killed.

Later that year, in Augsburg, Germany, a different group of Anabaptists connected with Zwickau, led by Hans Hut, Hans Denck, and Melchior Hoffmann, met in Augsburg. This so-called Martyrs Synod (of the 60 attendees, only two were alive five years later) emphasized the imminent return of Christ (some thought in 1528), along with a communal sharing of goods.

HERETICS

In the coming years, many Anabaptists were executed as heretics for their beliefs. Both their view on baptism and their view on refusing military arms were grounds for punishment. Some were drowned as a mockery of their view of baptism (which the Anabaptists defined as full immersion). Many fled to nearby Moravia, where a substantial community was established under the leadership of Jacob Hutter. Hutter was captured and burned at the stake in Austria in 1536 for refusing to renounce his faith.

The culmination of the extreme wing of Anabaptism was the rise of the Münster Commune in 1534–35. Followers of Melchior Hoffman made their way to this German city and in a series of bizarre episodes, took over the city, forcibly converting townspeople to Anabaptism and eventually instituting polygamy and the “Kingdom of Münster” until the city was conquered in 1535.

After 1536, there were fewer violent episodes, though Anabaptists were persecuted by Roman Catholic, Lutheran, and Reformed alike. Anabaptists found new leaders, most notably Menno Simmons, a former

Catholic priest who became an Anabaptist in 1536 in the Netherlands. His followers were called Mennonites. The followers in Moravia, called Hutterites (after Jacob Hutter), were led by Peter Riedeman. By 1600, there were over 15,000 Hutterites in Moravia. The Amish were a group of Mennonites who, under the leadership of Jacob Amman in 1693, separated from the other Mennonite churches in Switzerland. Many migrated to Pennsylvania in the early 1700s. While some Baptist denominations can trace their origins to Anabaptist influence, most Baptist denominations trace their origins to the English Reformation and the PURITAN movement in the later 1500s and early 1600s. While both Baptist and Anabaptist would practice adult or “believer’s” baptism, Baptists would not have the same emphasis on nonviolence or separation from the world.

Today, the largest grouping of Anabaptists is the Mennonites, with around 1,250,000 followers throughout the world. The Amish number around 120,000 and are located primarily in the United States with a small number in Canada. The Hutterites number around 10,000 and are located in the United States and Canada.

All of these groups share the foundational beliefs and characterizations of the Anabaptists, being separate from the world around them, not serving in the military, and refusing to take oaths. The Amish and Hutterites still practice a strong communal approach to possessions.

BRUCE D. FRANSON

Andean religion

Because of the diversified nature of Andean tribes and the Inca Empire, a complex system of religious beliefs and rit-

uals developed. It is difficult to conduct a comprehensive examination that includes all of the different religions in the Andean region. A closer look at the Moche, Chinchorro, and Inca societies and religions provides insight to understand the basics of religious belief and practice in this region. The Inca, Chinchorro, and Moche cultures developed a complex system of religious beliefs as a result of the sedentary or semisedentary nature of their societies.

Historians believe that after 7500 B.C.E., the indigenous inhabitants in Andean regions began experimenting with certain plants in order to determine the conditions in which they could best flourish. This experimentation with agriculture was crucial as it allowed for an expanding population that developed craft specialization, a political hierarchy, and complex religious beliefs that later characterized a number of indigenous tribes in Andean societies and the Inca Empire.

The rulers of the Inca Empire and the Moche depicted themselves as possessing supernatural powers to help justify their ability to rule society. This depiction is evidenced by an archaeological examination of the Moche tomb in Sipán, which discovered that the skeletons in this tomb were clothed in regalia similar to that worn by the mythical individuals who were imprinted on Moche artwork. The desire of the Inca rulers to depict themselves with supernatural powers is illustrated in various myths.

The Inca incorporated the gods of the tribes they conquered into their religion as is illustrated by the Inca devotion to the gods Pachacamac and Viracocha. In fact, the gods of conquered tribes were sometimes popular and powerful deities in the Inca pantheon as Viracocha was believed to be one of the more powerful Inca gods, since he had the ability to give life. Besides sharing gods with conquered tribes to unite their empire, the Inca also used children from various tribes as human sacrifices.

HUMAN SACRIFICES

Human sacrifices were used by a number of indigenous tribes in the Andes for both religious and political purposes, as becomes clear when examining the Inca Empire and, to a lesser extent, the excavations at Tiwanaku. Excavations at Tiwanaku have uncovered evidence that human sacrifices were practiced in this region in the seventh century C.E., but it is difficult to determine whether religious and/or political reasons motivated these sacrifices. Human sacrifices were used by the Inca to maintain social bonds among the various tribes in the Inca Empire, as children from these tribes were either taken or presented to the Inca for this particular purpose.

The families to which these children belonged were given a position of power in the Inca Empire or goods in return for giving up their children. Recent discoveries of three children of varying ages who were sacrificed in the mountains of Argentina during the late 15th or early 16th century illustrate that the Inca believed that children were not only offerings to their gods but also ambassadors between the Inca and their deities. This tomb at Cerro Llullaillaco, which is 22,110 feet above sea level, held the remains of three children: one male and female, both approximately eight years old, and another female approximately 14 years old.

The goods that were deposited by the Inca near the three children provided archaeologists significant information regarding Inca religion. Archaeologists believe that the three llama statuettes positioned near one of the sacrificed children, two of which were made of spondylus (mollusk shell) while the other was constructed of silver, were offerings to Inca deities to seek divine assistance in guaranteeing that Inca herds remained fertile. Archaeologists also hypothesize that the two male statues, one constructed of spondylus and the other constructed of gold, were depictions of either Inca gods or Inca nobles. Archaeologists are also able to hypothesize about the clothing that was deposited with the sacrificial victims. The tunic the male was wearing was too large for him, indicating that it was an offering to the gods or that the boy was expected to grow into this tunic in the afterlife. Two extra pairs of sandals found by the boy also suggest that the Inca believed in life after death. The 14-year-old female victim was also wearing a tunic created for a male, which suggests that this was a present for the gods.

ORACLES

Oracles attracted large audiences and thus played a significant role in creating unity among various tribes situated in the Andes. Pachacamac was one of the more popular locations used by the local population for divination purposes. Individuals seeking to enter certain parts of this temple were forced to undergo certain rites such as fasting for 20 days to acquire access into the lower sections of the temple. Individuals seeking to enter the upper levels of the temple were forced to fast for one year. A piece of cloth was hung between the idol and the priest who was seeking divine advice for a petition, preventing the priest from viewing the idol. Blood acted as nourishment for the idol, which was fed this substance on a regular basis.

Mummification was a practice used by the indigenous tribes of the Andes for several millennia prior to Spanish contact. The Chinchorro, in the area of Chile and Peru,

practiced this death ritual at least seven millennia ago. Chinchorro culture did not just limit mummification to the elite of society, as archaeological discoveries noted that the Chinchorro mummified individuals regardless of gender, age, or class. The mummification of Chinchorro corpses followed a certain procedure: the skin was stripped off, followed by attaching reeds and sticks to the remains to maintain the basic skeleton structure. After this was done, the Chinchorro stuffed the corpses with plants and ash or dirt and then painted them.

It is difficult to assess whether the mummification of the Chinchorro corpses influenced other cultures in the Andes region to mummify their ancestors, but mummification was an important aspect of many Andean societies. Certain indigenous tribes used mummification to keep the corpses in their homes so that they could be escorted through the cities during the Festival of the Dead. The Inca practiced ancestor worship, and Inca royalty were mummified and their royal palaces maintained by a group of people known as the *panacas*. It was the responsibility of the *panacas* to tend to the royal mummies. By examining this aspect of Inca society, historians can conclude that the royal mummies played an important social role since they were expected to participate in certain ceremonies and various social engagements.

DYNAMICS OF RELIGION

The arrival of CHRISTOPHER COLUMBUS in the Caribbean in 1492 changed the dynamics of religion in the Andean region when thousands of Spanish friars came after Columbus to convert the indigenous populations to Christianity. The flexibility of the Inca religion is a compelling reason why many of the indigenous people in the Andes converted to Christianity so readily. The Spanish friars employed a variety of tactics to convince the indigenous populations to convert. The Spanish friars petitioned the Spanish Crown to alleviate the labor tribute imposed on the natives because they believed that it needed to be more moderate in order to ensure that Christianity flourished. This issue resulted in a bitter debate between the church and secular individuals concerning the treatment of the indigenous populations. Today Roman Catholicism has a sizable following in the Andes region.

Various aspects in the lives of the natives illustrate that the premise of Christianity was accepted in the 16th century. This is evidenced through the artwork of Francisco Tito Yupanqui. His work shows the devotion of some natives to Christianity in pieces such as his sculpture of Our Lady of Copacabana in 1582. The people who worship at this sculpture have attributed

to it many miracles they have witnessed. The stories of these miracles are some of the reasons the image of Our Lady of Copacabana has such a large following and have motivated other artists to create similar images throughout Peru.

There is no doubt that a great number of indigenous people in the Andes accepted Christianity, but a number of these natives refused to reject completely their past religions. Historians have actively debated the degree to which syncretism (reconciling different religious viewpoints into a single belief system) developed among the indigenous populations in the Andes. There is artistic evidence that suggests that a great deal of syncretism existed in the Andes. For example, within the cathedral in Cuzco, Peru, is a chapel called La Linda that is home to a painting of an Andean wearing a robe with symbols associated with Jesus Christ and the Inca god Inti.

The religions of the Andes are a complex and diversified facet of Andean societies. The Inca, Chinchorro, and Moche left indicators of their complex religious beliefs concerning the afterlife through their respective burial practices. The Moche and the Inca in particular used their religion in order to reinforce their political hierarchies. Religion was also a way to unite various tribes as in the cultural sharing between the Inca Empire and the tribes that it conquered or the use of oracles. The Spanish conquest of the Inca Empire by the Spanish conquistador FRANCISCO PIZARRO in the 1530s, and the subsequent subjugation of other Andean tribes by the Spanish, changed the religious dynamics in the Andes. In fact, that the Catholic Church attempted to convert the indigenous populations to Christianity, but the natives refused to renounce completely their existing religious beliefs, resulted in the blending of indigenous religions and Christianity.

Anne

(1665–1714) *queen of Great Britain*

The last of the Stuart rulers, Anne was born on February 6, 1665, in London to King JAMES II (r. 1685–88) and Anne Hyde. Although her father converted to Roman Catholicism, Anne's uncle, King CHARLES II, gave orders that Anne and her sister, Mary, were to be raised Protestant. In 1683, Anne married Prince George of Denmark, and by all accounts the two were well-matched and content in marriage. They were plagued, however, with the inability to have a family. In 1700, their 11-year-old son, William, died. After at least 18 pregnancies, 13 ended in miscarriage or stillbirth, and in the others infants did not live to the age of two. William was the only child to survive into childhood.

Anne entered the line of succession according to the 1689 Bill of Rights and succeeded her brother-in-law, WILLIAM III (reigned 1689–1702). She took the throne on March 8, 1702, as queen of England, Scotland, and Ireland. Anne was determined to look after the Anglican Church, believing that God had entrusted it to her care.

The WAR OF THE SPANISH SUCCESSION (1702–13) erupted over disputed claims to the Spanish throne. This conflict dominated Queen Anne's reign. France, Spain, and Bavaria were pitted against Britain, the Netherlands, Austria, most of Germany, Savoy, and Portugal. LOUIS XIV (1638–1715) had repudiated the Partition Treaty of 1698's solution to the succession problem. He debarred trade with the Spanish Indies and refused British imports as he set about his expansionist agenda. The dominating figure from the allies was General John Churchill, the duke of Marlborough (1650–1722), who marched rapidly to Blenheim to defeat the French in 1704.

The Treaty of Utrecht of 1713 ended the war, and its provisions were beneficial to Britain's colonial and commercial interests. Britain's marine supremacy was intact. Britain received Gibraltar and Minorca in Europe, along with Newfoundland, Nova Scotia, and Hudson Bay territory in North America. It won exclusive rights to supply slaves to the Spanish colonies. France was forced to recognize Protestant succession to the throne of Britain.

In 1707, England and Scotland combined under the Act of Union to become the single kingdom of Great Britain, making Anne the first monarch of Great Britain. The union of England and Scotland was mutually advantageous. Scotland accepted free trade, better economic opportunity, and an intact church in exchange for recognition of the Protestant English succession to the throne. England also benefited politically and militarily by having the land and coastline of Scotland as part of its kingdom.

The parliamentary party differences between the Tories and the Whigs fully emerged during Anne's reign. The Whigs were advocates of religious toleration, constitutional government, and the War of the Spanish Succession. The Tories adhered to the Anglican Church and divine right theory and supported the war only at early stages. Marlborough, a Tory, had influence over the queen through his wife, Sarah Jennings (later Sarah Churchill, duchess of Marlborough, 1660–1744). Marlborough switched his loyalty to the Whigs and brought his son-in-law, Charles Spencer Sunderland, in as secretary of state. Anne excluded other Tories from office at the insistence of the Marlboroughs and Sidney Godolphin (lord high treasurer, 1702–10).

The Tories passed the Occasional Conformity and Schism Acts in 1711 and 1714, aimed at weakening the Nonconformists. But the Tory desire for putting Prince James Francis Edward Stuart, "The Old Pretender," on the throne before the queen's death was not fulfilled. Anne had not produced an heir to her throne, so she arranged for the accession of a distant cousin, the Protestant Hanoverian prince George Louis (King GEORGE I, 1714–27). The Whigs were triumphant and enjoyed power for half a century. Queen Anne died on August 1, 1714, in London. She had no surviving children.

PATIT PABAN MISHRA

Araucanian Indians (southwestern South America)

Symbol of implacable resistance against Spanish domination, the Araucanian Indians of Chile successfully repulsed repeated Spanish efforts to subdue them and were not fully conquered until the late 19th century. Occupying the western slopes of the Andes in the fertile

lands between roughly 30 and 43 degrees south latitude, the Araucanians were loosely incorporated into the Inca realm in the late 1400s, though Inca influence was never strong. Sedentary agriculturalists who cultivated corn, beans, and other crops, the Araucanians were less a unified polity than a series of independent chieftaincies sharing the same language and broadly similar social and cultural attributes.

The first Spanish incursion into the area, led by DIEGO DE ALMAGRO in 1535–37, met with bitter disappointment. The second, led by Pedro de Valdivia beginning in 1540, was nominally more successful. In 1541, Valdivia founded Santiago and a number of lesser settlements. After returning to Peru in 1547 and helping suppress the rebellion of Gonzalo Pizarro, Valdivia was named governor of Chile. From 1549, he continued his effort to conquer the Araucanians, marching south to the Bío-Bío River and founding the fortress-towns of Concepción (1550) and Valdivia (1552). Dividing subjugated Indians into *ENCOMIENDAS* and heartened by reports of large deposits of gold, Valdivia encouraged miners and prospectors to stream into the district.

In 1553, a large force of Araucanians from the province of Tucapel and under the leadership of the chieftains Lautaro and Caupolicán launched a counterattack that annihilated an entire Spanish expedition, including Governor Valdivia, whom they ate in ritual cannibalism. A general uprising continued for four years. Their exploits were immortalized in the epic poem *La Araucana* (pub. 1569–89) by the Spanish poet Alonso de Ercilla y Zúñiga.

A brutal war followed. In 1598, victorious Araucanians captured and ate Governor Martín García de Loyola. By 1600, the successors of Lautaro and Caupolicán had destroyed most of the nascent Spanish settlements south of the Bío-Bío. Over the next two centuries, there emerged a complex military and political struggle, as the Spanish settlements slowly grew and groups of Araucanians rose in major uprisings in 1723, 1740, and 1776. Scholars have emphasized the internal transformations in Araucanian culture, politics, and militarism, and the role played by Spanish deserters, as key to their long success in resisting Spanish domination. They were not militarily conquered until 1883, while their cultural influence remains strong in Chile today.

MICHAEL J. SCHROEDER

art and architecture

From the 1390s onward, Renaissance ideas influenced European styles of art and architecture. This was initially seen in the architecture in Florence, Italy, with the completion of the Duomo. The building of the cathedral had ended in 1296 without the dome. Work on the dome started in 1419 when the architect Filippo Brunelleschi (1377–1446) created the design and got the city fathers to agree to it; it was completed in 1436. The baptistery, near the cathedral, has magnificent bronze doors showing the *Gates of Paradise* by Lorenzo Ghiberti (1378–1455), which were made from 1425 until 1452 and show a distinct Romanesque style; it, along with the nearby Basilica di San Lorenzo (construction started in 1425), are harmonious examples of Renaissance architecture.

The splendor of Florence spread to other parts of Italy. One of the largest artistic and architectural achievements was the rebuilding of St. Peter's Basilica, Rome, beginning in 1506 with Michelangelo as the architect of the Basilica and painter of the ceiling of the Sistine Chapel from 1508 until 1512. Work had begun on the Doges' Palace in Venice in the 1340s, and Leonardo da Vinci (1452–1519) painted the *Mona Lisa* and *The Last Supper* and created other works of art and science. Other artists and architects of the period include Leon Battista Alberti (1404–72), Piero della Francesca (c. 1416–92), Benozzo Gozzoli (c. 1420–97), Masaccio (Tommaso Guidi, c. 1401–28), with Tintoretto (Jacopo Robusti, 1518–94) flourishing from the 1560s, Giovanni Lorenzo Bernini (1598–1680) from the 1620s, and Canaletto (Giovanni Antonio Canale, 1697–1768) painting the first of his famous Venetian views in 1723. In the Mediterranean, following the defeat of the Turks at Malta in 1565, work began on building the city of Valletta close to the forts that had held out during the siege. The general and architect Gabrio Serbelloni (1509–80) from Spain was involved in much of the work there.

In Spain, the architectural style was moving from the Early Gothic to the Late Gothic, with the Church of San Juan de los Reyes in Toledo expressing the Isabelline style that marked the period after the accession of Ferdinand and Isabella, the capture of Granada in

1492, and the voyages of Christopher Columbus to the New World. Philip II's construction of his new palace, San Lorenzo de El Escorial in the 1560s, represented the emergence of Spain as a major world power evidenced by the conquering of the Americas and the destruction of the Ottoman navy at the Battle of Lepanto in 1571. The 17th century in Spain saw many of the greatest Spanish artists flourish: El Greco (Domenikos Theotokopoulos, 1541–1614), Bartolomé Estebán Murillo (1617–62), Jusepe Ribera (1591–1656), Diego Rodriguez de Silva y Velázquez (1599–1660), and Francisco de Zurbarán (1598–c. 1664).

In France, the Renaissance ushered in the development of its artistic and architectural styles, although the Wars of Religion from 1562 until 1598 caused massive destruction. In terms of military architecture, Marshal Sébastien Le Prestre de Vauban (1633–1707) was to draw up a new style of fortification, which soon became popular around the world; this style featured low thick walls, often made of earth with a stone surround, protected by artillery rather than the tall stone walls of the medieval period. The new Louvre Palace was constructed starting in 1546. In the 1660s Louis Le Vau and, from the 1670s, his successor Jules Hardouin-Mansart (1646–1708) worked on turning the former royal hunting lodge at Versailles into a palace that would be grander than any other in the world. Many of the great chateaux of the Loire Valley also date from this time, with that at Chantilly being exceptional in its size, although much of the present building was rebuilt in the 1870s. Paintings by Nicolas Poussin (1594–1665) and others frequently refer to classical mythology and biblical themes, and a number of recent writers see “hidden messages” in the works of Poussin. The founding of the French Royal Academy in 1648 by Charles Le Brun opened up French art, which saw the open scenes of the works of Jean-Antoine Watteau (1684–1721).

In Britain, the Tudor style of architecture gradually gave way to the more expansive Elizabethan style, and then the Jacobean, and Restoration styles, and during the 18th century, the Georgian. Following the end of the WARS OF THE ROSES in 1485, sections of many of the castles were destroyed or converted. Elegant country houses and “small” palaces were built with Hampton Court to the southwest of London, Nonsuch Palace in Surrey, and Hatfield House in Hertfordshire all dating from the early Tudor period. A number of the Oxford and Cambridge University colleges are from this date. For more modest buildings, the use of black-painted beams as a feature made the style recognizable around the world. By the late Elizabethan period, increased

Girl with a Pearl Earring painted in 1665 by Johannes Vermeer (1632–1675)

prosperity was often reflected in architectural flourishes such as brick chimneys.

Jacobean England—named after JAMES I, king from 1603 until 1625—saw architects such as Inigo Jones (1573–1652) flourish. During the English Civil Wars in the 1640s, much energy was put into building fortifications, or fortifying old buildings, often with little success. In Restoration England, the most famous of the early modern architects, Sir Christopher Wren (1632–1723), was able to work on the rebuilding of many churches destroyed in the Great Fire of London, with his masterpiece being St. Paul's Cathedral. Other notable buildings of this period include Guy's Hospital in London, and some of the buildings at Greenwich. Of the artists, Anthony Van Dyck (1599–1641), who painted a number of the important people in Jacobean and civil war England, and Godfrey Kneller (1646/49–1723) painted portraits of most of the major political and society figures of the late 17th and early 18th centuries. By the 1750s, Georgian urban architecture placed terraced houses around squares like London's Bedford Square. The most well-known Georgian architects were Colin

Campbell (d. 1729); Richard Boyle, third earl of Burlington (1694–1753), who designed Chiswick House; and William Kent (1685–1748), who designed House Guards, Whitehall, and Holkham Hall, Norfolk.

Elsewhere in Europe, there was also a large flourishing of the arts, with Renaissance artists such as Hubert van Eyck (c. 1366–1426) and Jan van Eyck (c. 1390–1441), and later Rembrandt van Rijn (1606–69), and Jan Vermeer (1632–75) being famous in Flanders and the Netherlands. In central Europe, one of the most famous artists was the Nuremberg-born Albrecht Dürer (1471–1528). This era also saw the construction of cathedrals and palaces, the best examples being the Hofberg in Vienna, Austria, which had the Amalia Wing and the Royal Chapel added in the 16th century, and the Imperial Chancery Wing in the 18th century. Mention should also be made of the Graz-born Johann Bernhard Fischer von Erlach (1656–1723), who developed the Austrian baroque style. Sadly the THIRTY YEARS' WAR (1618–48) led to mass destruction of much of the splendor of the Renaissance in many countries. Military architecture was also important in eastern Europe, in Poland, Hungary, Romania, and Russia. The great castle at Königsberg was reinforced and enlarged, with much work undertaken in other parts of the Baltic, in Oslo (Norway), Smolensk, and Moscow; the Kremlin Wall was built in 1486, the Archangel Cathedral built between 1505 and 1508 by the architect Italian Alevsio Novi, and St. Basil's Cathedral, built between 1555 and 1561, the architect believed to be Posnik Yakovlev. It was also the era of PETER THE GREAT, with the founding of St. Petersburg in 1703. This saw the construction of massive new government buildings and churches. On the Mount Athos Peninsula, Stavronikita, the last monastery to be founded on the peninsula, was built starting in 1542.

With the Ottomans capturing Constantinople in 1453, there was a great resurgence of Muslim architecture and art. The most famous architect of this period was Sinan (1489–1588), the son of a stonemason. Sinan worked for Sultan SULEIMAN THE MAGNIFICENT (reigned 1520–66) and was involved in the building of 79 mosques, 34 palaces, 33 public baths, 55 schools, and many other buildings. His best-known buildings are the Sehzade Mosque and the Mosque of Suleiman I the Magnificent, both in Istanbul. Mention should also be made of the Mostar Bridge in Bosnia, built in 1566, replacing a former wooden suspension bridge.

At Bokhara, Tashkent, and Samarkand, great cities were built along the Silk Route, with many magnificent mosques and substantial public buildings. The

building recognized as the greatest Muslim structure of the period is the TAJ MAHAL, which was built between 1631 and 1653. The main architect is unknown, but two European architects, Austin of Bordeaux and Veroneo of Venice, both helped in the design, although the overall concept is, of course, MUGHAL. In China, the Forbidden City was laid out between 1406 and 1420, with up to a million workmen constructing the central residence for the MING emperors of China, their court, and their administration. In 1642 work started on the building of the Potala in Lhasa, Tibet. By the early 18th century, there was extensive trade between China and much of the rest of the world, with the Chinoiserie style becoming popular in Europe in particular.

In the Americas, much of the early architecture involved the construction of forts, with domestic buildings in the Plymouth style of housing becoming popular in New England, the modern-day states of Connecticut, Maine, Massachusetts, New Hampshire, Rhode Island, and Vermont in the United States. The early architecture in New York tended to reflect its Dutch origins. The central part of Mount Vernon, a Georgian mansion, had been built by 1740 and was to become the home of George Washington; Williamsburg, dating from the same period, is now a colonial-style tourist site. Many of the cities of South America date from the 16th or early 17th century, with architects and artists working in cities such as Lima, Buenos Aires, and Rio de Janeiro on churches, cathedrals, and public buildings developing a style that became known as Ibero-American.

In North Africa, Moulay Ismail (r. 1672–1727), intent on proving Moroccan greatness worked on a massive palace at Meknes and moved the capital there from Fez. The palace was said to have rivaled Versailles in its extravagance, with some 25,000 slaves working on it. However little of it survives. In Timbuktu, and other parts of West Africa, many cities were built during this period, with many Dogon mosques built and artisans working on what is now known as “tribal art.” The great stone walls of Great Zimbabwe also date from this time, and there were undoubtedly many skilled architects in sub-Saharan Africa, but with no surviving writing from the period, and most of the buildings made from wood, little is known of the architects involved.

Much of the art and architecture in the great cities of the Middle East, such as Damascus and Aleppo, dates from this period. During the early and mid-18th century the wealth in Damascus led to a style known as Damascene, with villas constructed in stone around courtyards,

with the upper floors made from wood. Much of the old city of Cairo, and also of many port cities in North Africa—Algiers, Tunis, and Casablanca—dates from this period.

JUSTIN CORFIELD

Ashanti kingdom in Africa

The Ashanti kingdom, or *Asante*, dominated much of the present-day state of Ghana during the period between the late 17th and early 20th centuries. It was ruled by an ethnic group called the Akan, which in turn was composed of up to 38 subgroups, such as the Bekiai, Adansi, Juabin, Kokofu, Kumasi, Mampon, Nsuta, Nkuwanta, Dadussi, Daniassi, Ofinsu, and Adjitai. In the late 1500s, there were at least 30 small states, which corresponded to the subsections of the Akan people. By 1650, these groups had been reduced to nine, and by 1700, they united. Ultimately the groups formed a confederation headed by the chief of the Kunasi group.

The kingdom, formed by its legendary warrior Osei Tutu in 1691, was in fact a confederacy of both Akan and non-Akan people. The king's symbol was the golden stool; equivalent to the throne, the stool became the symbol of kingship, so that a ruler was said to be enstooled or destooled. The *asantehene*, or king, had authority when he was raised three times over the stool. Even after 1901, when Ashanti became a protectorate, and 1957, when it became part of the modern state of Ghana, the stool and the enstooling ceremony of the Asantehene were important ceremonies.

The Ashanti kingdom, although originally a confederacy, had three bases of power—administration, communications, and economics—and was located in what is now north Ghana. Osei Tutu took over the administration set up by Denkiyira, the former hegemon, and added to it. Communities within 50 miles of the capital city of Kumasi were directly ruled by the *asantehene*. Under Osei Tutu and his successor, Osei Apoko (whose reign

collectively lasted from approximately 1690 to 1750), the state expanded so much that by 1750, it encompassed about 100,000 square miles, with a population of 2 to 3 million. All of present-day Ghana with the exception of areas directly on the coast with small adjacent areas in the contemporary states of Togo, Ivory Coast, and Burkino Faso were part of the Ashanti state.

In order to accommodate the new extent of the state, the administration divided itself into a metropolitan and a provincial area. The metropolitan area consisted of those towns within a 50-mile radius of Kumasi. The rulers of these towns were made up of the confederacy. Their only obligation was to pay annual tribute to Kumasi and troops in the event of war. This practice was extended to newer members of the state. All towns elected a governing advisory council composed of powerful members of the community. The towns were considered part of the Kumasi sphere, as they paid taxes that supported a steady army in the early 20th century. After a revolt of a military chieftain in 1748, a palace guard was organized. The rulers of the metropolitan spheres were members of the royal Oyoko clan and served on the royal council and had autonomy in nonfiscal and military matters. The Council for the Asantehene had gained substantial power; it occasionally destooled an incompetent ruler and formally helped to choose the new *asantehene*.

BUREAUCRATIC CONTROL

The provincial aspect of administration was subject to increased centralization as the centuries progressed. Outlying Akan districts did not participate in the royal selection process but were forced to pay taxes. By 1800, they were also forced to pay tribute. They were subject to increasing bureaucratic control such as a state agency that controlled all internal and external trade. The non-Akan areas controlled until the mid-19th century also sent thousands of slaves annually to Kumasi.

The effectiveness of the Ashanti state relied on communication processes. The complex bureaucracy served as a conduit throughout the state. In addition both taxes and tribute were used to establish a well-maintained army throughout the century. Most famously were the talking drums. Since the national language of Ashanti, called Twi, was polytonal, any military commander or administrator could send out messages by matching syllables to the tones of the drum in a fashion similar to Morse code.

ECONOMICS

The mainspring of the confederation was economic. It had fertile soil, forests, and mineral resources, most notably

gold. The future state of Ashanti had two ecological zones. In the southern forest belt there were forests and fertile soil. Original subsistence crops included yams, onions, and maize and, in the 19th century as farming became commercial, cola nuts and cocoa. In the northern savanna belt, there were yams and Guinea corn. The state was advantageously located for the importation of slaves from both the north and the west. In this period, beginning in the 15th and 16th centuries and lasting until the 1830s when slavery was abolished, the Ashanti still used slave labor to plant more crops such as plantains, yams, rice, and new crops such as maize and cassava brought from the Americas. This led to an increase in population and a movement of the Akan peoples to the forest zones.

The use of slave labor was involved in its most important mineral product, gold. Akan enterprise utilized the labor of slaves for both trading with Europeans (Portuguese, Dutch, English) and in the state grassland belts first in clearing new land and then for the development of deep-level mining and placer mining. The slave trade for gold brought more slaves to produce more gold, and slaves were also traded for firearms. The desire to exert control over gold production and the new farming communities in the forest helped facilitate state functions.

The desire to control access to labor pushed the Ashanti state in its attempt to control the coast inhabited by its Fanti peoples. The attempt to conquer the Fanti led to disputes and battles with the British, who had taken over the Gold Coast by 1815. Earlier the Ashanti had played the Dutch and Portuguese against the British. However hostilities after 1800 erupted for control of its coast. After the Ashanti were able initially to defeat the British in 1807 and in 1824, they suffered setbacks and accepted the Prah River as a border. Thereafter peace reigned for over 40 years. In 1872, a long-simmering dispute on the control of El Mina (the great Portuguese and Dutch post) saw a renewal of hostilities. After early Ashanti success, the British occupied Kumasi in 1874 until peace was concluded.

In the late 19th century, the state began a rapid decline. Other parts of the state broke away so that by 1900, the state had dwindled to approximately 25,000 square miles and a quarter of a million people. The British began to interfere in events in Ashanti. In 1896, they deposed the *asantehene* and in 1900, a British demand for the golden stool resulted in an uprising that was put down in 1901, after which Ashanti was a protectorate. Incredibly, the golden stool was never surrendered and was restored to the nation after being “accidentally”

found in 1921. In 1926, the *asantehene* was restored to the stool, and in 1935, its ceremonial role in Ashanti was formally restored.

During the colonial period, its population increased more than fourfold. The Ashanti peoples engaged in cocoa growing while also actively producing crafts such as weaving, wood carving, ceramics, and pottery making. The bronze and brass artifacts produced by the lost-wax process became prominently displayed in museums throughout the globe. Since 1935, the kingdom, now part of Ghana, has been organized into 21 districts.

Throughout its golden age, the Ashanti state demonstrated impressive flexibility, often at the expense of neighbors whom it enslaved and whose tribute it exacted. It continued to increase production in the gold mines and to migrate and clear forest for agricultural production. It utilized the slave trade to increase its military might and diplomacy to key European allies. After slavery was abolished, it found a new economic outlet in cola nuts, and in the 20th century, the production of cocoa, Ghana’s biggest export. Even in independent Ghana, the Ashanti kingdom still maintains a clear existence and the Ashanti people have retained their cultural identity.

Atahualpa

(d. 1533) *Incan emperor*

The last independent ruler of the vast INCA Empire, Atahualpa Inca was seized by the forces of FRANCISCO

PIZARRO in CAJAMARCA, Peru, on November 16, 1532. He was held prisoner pending payment of an enormous ransom, and after the ransom was paid, he was executed for treachery on July 26, 1533. Atahualpa's name and legacy have come to be associated with Spanish avarice and duplicity in their conquests in the New World. His legacy will also be forever tied with indigenous political factionalism and incomprehension of the larger threat posed by European invasions, and with the persistence of pre-Columbian Andean culture and religiosity long after the Spanish military conquest of Peru was complete.

Upon the death of their father, Huayna Capac Inca, in 1525, the brothers Atahualpa Inca and Huascar Inca were granted two separate realms of the Inca Empire: Atahualpa the northern portion centered on Quito, and Huascar the southern portion centered on CUZCO. In keeping with a longstanding Inca and Andean tradition of fraternal conflict, Atahualpa rebelled against his brother and imprisoned him. Pizarro and his men had the fortune of ascending into the Andes just as Atahualpa was returning to Cuzco after successful conclusion of his northern campaigns. After launching a surprise attack in Cajamarca and massacring upward of 6,000 Incan soldiers, Pizarro took Atahualpa prisoner. To secure his release, Atahualpa pledged to fill a room of approximately 88 cubic meters with precious golden objects, the famous Atahualpa's ransom. Over the next months, trains of porters carted precious objects from across the empire, including jars, pots, vessels, and huge golden plates pried off the walls of the Sun Temple of Coricancha in Cuzco. On May 3, 1533, Pizarro ordered the vast accumulation of golden objects melted down, a process that took many weeks. Finally, on July 16, the melted loot was distributed among his men, and 10 days later, Atahualpa was executed.

The eight months during which Pizarro held Atahualpa prisoner provided the Spanish with ample opportunity to observe the Inca leader's customs and habits and the relations between him and his people. Their detailed descriptions offer valuable insights into the profound reverence with which the Inca was regarded, his semidivine status, and the social hierarchies and relations of the Inca realm. While being held prisoner, Atahualpa secretly ordered the assassination of his brother Huascar, an act that provided the Spanish with a ready pretext for executing him.

Atahualpa's execution provoked a fierce debate in Spain regarding the morality of the act, and of the conquest more generally. King Charles wrote to Pizarro of his displeasure, while other prominent Spaniards also condemned the execution. One result was that the Crown

decided to treat Atahualpa's descendants with considerable respect and deference. His sons and other family members were granted privileged status, and Atahualpa's many descendants ranked among the most socially privileged of Indians in postconquest colonial society. In subsequent decades, he was also transformed into a martyr in the cause of Indian resistance to Spanish domination.

Atlantic islands of Spain and Portugal

In the 15th century, the Atlantic islands of Spain and Portugal were crucial in the formation of a kind of technological and commercial prototype or template for slave-based sugar production that was transferred to the Americas after 1492. The Portuguese began colonizing the Madeira Islands (especially Madeira, La Palma, Hierro, and Porto Santo, c. 768 square kilometers) in the early 1420s; the nine islands of the Azores (c. 2,300 square kilometers) in the 1430s or 1440s; and the 10 principal islands of the Cape Verde Islands (c. 4,000 square kilometers), most importantly São Tomé and Príncipe, in the late 1400s. None of these islands were inhabited. This was not true of the seven Canary Islands (c. 7,300 square kilometers), which were inhabited by a group collectively known as the Guanches. In the late 1300s, Castilians, Italians, French, and others launched slave-raiding expeditions on the Canaries. The Spanish formally incorporated the Canaries into their empire in 1496 after the subjugation of the islands' natives, though nominal Castilian rule dated back to the early 1400s.

Together these Atlantic islands provided the aggressively expansive empires of Spain and Portugal with "stepping stones" to the Americas for their nascent sugar and other tropical export industries. Crucibles of empirical, hands-on experiments regarding all aspects of sugar production—from cultivation and harvest, to the importation and control of African slave labor, to the quasi-industrial processes by which cane juice was

transformed into granular sugar—the Atlantic islands were crucial in the development of the technological know-how necessary for the explosion of sugar production in the Caribbean and Brazil in the 16th century and after. By the late 1450s, sugar production on Madeira exceeded 70,000 kilograms, most exported to England and the Mediterranean, deepening markets and solidifying the financial and commercial networks that would later play a crucial role in the development of plantation-based export production in the Americas.

The administrative infrastructure that the Portuguese developed to rule Madeira, the Azores, and the Cape Verde Islands, based on hereditary “donatory captaincies,” were likewise transferred wholesale to Brazil during the first half-century of its colonization. Plantation-based sugar production on Madeira in particular, based on both slave and free-wage labor, also whetted the European appetite for this luxury commodity, deepening demand just on the eve of the encounter with the Americas. In addition both before and after sugar production had become established in the Americas, the Atlantic islands served as important way stations for the African slave trade and for long-distance trade with Asia.

MICHAEL J. SCHROEDER

Augsburg, Peace of

The Peace of Augsburg refers to a settlement between CHARLES V, Holy Roman Emperor, and the Lutheran princes that accorded Lutheran churches legal status in Germany. This settlement resolved the conflict on a state level but did not resolve any of the theological issues in the REFORMATION.

The period between 1546 and 1555 was one of substantial warfare in Europe, characterized mostly by smaller battles, opportunistic in nature, with a few more major conflicts. The main actors up to this time had been Charles V, the Emperor; Francis I, king of

France; Pope Paul III; and various princes in Germany who had made an association for mutual defense together in what was called the Schmalkaldic League (named after the town of Schmalkalden in central Germany). Charles V was frustrated by the religious conflict tearing apart his Empire. He pressured the pope to resolve the differences, resulting in the COUNCIL OF TRENT, which began in 1545. Charles V wanted the council to include the Protestant leaders, but this did not happen.

At the same time, Charles was maneuvering to gain greater control over the German princes, using military pressure and negotiations. His hope was to break apart the Schmalkaldic League by diplomacy (and intrigue), but if that failed, to drive a wedge through Germany with his armies and break up the league by military means. This was accomplished in a series of battles beginning in later 1546 and concluding in April 23, 1547, with the defeat of the league forces in Mühlberg and the subsequent imprisonment of a key leader, the landgrave, Philip of Hesse. Charles’s main ally in the battles was the Elector Maurice of Saxony, an opportunist with Lutheran leanings.

While Charles V accomplished his goal of gaining political and military control over Germany, Lutheranism was to prove impossible to eradicate. In April 1548, in an edict published in Augsburg (called the Augsburg Interim), Charles mandated restoration of the Roman Catholic Mass and other practices, allowing only two concessions to the Lutherans: married clergy and the use of both bread and wine in Communion. Later that year, the Lutheran PHILIP MELANCTHON was directed by Charles and Maurice to make certain alterations to the document in the hopes of making it more acceptable to the other Lutheran princes, who had refused to support the Augsburg Interim. This edict was published as the Leipzig Interim. Neither edict succeeded in bringing uniformity of church practice back to Germany. The Interim failed to gain support from the populace of Germany and Melancthon found himself reproached by his fellow Lutherans for his part in the Leipzig Interim. The only real effect of the Interim was the ability of those who were still Roman Catholics to observe their faith in the Lutheran territories.

The balance of power that allowed Charles V to gain control over Germany in 1547–48 soon changed. Charles was forced to give Maurice of Saxony a great deal of control over Germany in exchange for his continuing military support. Charles had negotiated a peace settlement with Francis I, king of France, in 1544, but Francis died in 1547 and was succeeded by

his son, Henry II, who would prove to be troublesome for Charles in the coming years.

After several years of political maneuvering, Maurice of Saxony formed the League of Torgau in May 1551 with several other German Lutheran princes. In January 1552, Maurice made formal peace with Henry II, who agreed to support the German princes against the emperor. This led to open war from March 1552 through June 1553. At this point, Charles was essentially surrounded. France was assaulting his territories from the east, Maurice from the north, and the Turkish sultan was battling Charles's brother Ferdinand from the south and west. Yet no one had the military power to defeat Charles completely, as the lands and armies of Charles's dominion were still immense, containing Spain, Austria, the Netherlands, and substantial amounts of Italy. Maurice of Saxony died in June 1553 from battle wounds, ending the major battles of that period.

An uneasy truce remained until 1555, when the representatives of the Lutheran princes met with representatives of Charles at the Diet of Augsburg, held from February through September 1555. Representatives of the pope were not invited. The various emissaries were able to negotiate both political and religious peace. The Lutheran princes were granted territorial independence. All people in Lutheran territories would follow the religion of their prince.

All people in Catholic territories would be required to observe Roman Catholicism. Certain cities that had both significant Catholic and Lutheran populations would allow both churches. People who did not wish to live in one territory because of their faith could freely move to another territory.

The Peace of Augsburg was a significant milestone in Western Christianity. It recognized the Lutheran Church as a separate church body, allowing its members rights within the empire. It did not settle any of the theological issues and was a major fissure in Western Christianity; nor did it address the rights of Reformed or Anabaptist believers. For Reformed believers, recognition would come at the Treaty of Westphalia in 1648. Anabaptist believers would continue to endure persecution for several centuries, causing many to flee into eastern Europe and eventually to America to practice their faith.

BRUCE D. FRANSON

Augsburg Confession

The Augsburg Confession is a document written in 1530 primarily by the Lutheran PHILIP MELANCTHON. It is addressed to the Emperor CHARLES V and makes a defense for the Lutheran positions on several theological issues. Divided into 28 chapters (or articles), it was designed to appeal to moderate Roman Catholics including, of course, the emperor himself.

After the DIET OF WORMS in 1521, MARTIN LUTHER had been declared a heretic by both pope and emperor. Between 1521 and 1530, there were many troubles in Europe that had occupied the emperor, including a war with France and political battles with the pope, which resulted in an invasion of Rome by the emperor in 1527. Emperor Charles V was hoping for a more united front to face the threat of Moslem invasions in the eastern part of his empire. His hope was to bring about reconciliation between the Lutheran parts of Germany and the Roman Catholics. He gathered all these parties together at the Imperial Diet of Augsburg in 1530.

On June 25, 1530, Melancthon and others presented the Augsburg Confession to the emperor. Luther was in a nearby castle but could not be present since he was officially still a heretic and thus was an outlaw in the empire. The confession was signed by many of the German princes. Many of the articles in the Augsburg Confession come from the Marburg Colloquy, a meeting of Lutherans and John Zwingli and some of his followers in 1529, a failed attempt to bring reconciliation between these Protestant parties. The Confession begins with 21 articles or chapters, which describe the basic beliefs of the Lutherans, belief in the Trinity or triune God, the Apostles and Nicene Creeds, and other definitions that were agreed to mostly by the Catholics. The second portion of the confession deals with the abuses that the Lutherans saw in the Catholic Church. Addressed to the emperor, the second portion begins:

Translated, the Augsburg Confession of faith states, “Inasmuch as our churches dissent from the church catholic in no article of faith but only omit some few abuses which are new and have been adopted by the fault of the times although contrary to the intent of the canons, we pray that Your Imperial Majesty will graciously

hear both what has been changed and what our reasons for such changes are in order that the people may not be compelled to observe these abuses against their conscience. Your Imperial Majesty should not believe those who disseminate astonishing slanders among the people in order to inflame the hatred of men against us.” The second portion then discusses various theological topics including marriage of priests, confession, and monastic vows.

The emperor handed the confession to the Roman Catholic officials and theologians present. Chief among these was Cardinal Lorenzo Campeggio from Rome, who with the other theologians composed a rather forceful rejection of the Lutheran positions. The emperor forced them to tone down the document before presenting what is called the Confutation of the Augsburg Confession to the Lutherans on August 3, 1530. The response by the Lutherans to the confutation was a much longer document, called the Apology to the Augsburg Confession, again written by Melancthon, which deals with the confutation point by point. This was published at the end of April or the beginning of May 1531 and also became an official position of the Lutherans when signed in Smalcald in 1537. This document was also more forceful in rejecting the Catholic position. The result was a stalemate, which led to various battles and conflicts over the following 25 years until the PEACE OF AUGSBURG in 1555.

Was this really a chance to reconcile Protestant and Catholic Christianity? Many historians think that there was at least a reasonable chance. Certainly the emperor desired reconciliation. Melancthon was more of a peacemaker than Luther, and if some of the more moderate Catholics had been able to get the emperor’s ear, perhaps the direction of Western European Christianity would have been different.

Today, the Augsburg Confession is still a foundational document of Lutheran Christianity. In 1575, a group of Lutherans worked to put together the key documents that defined Lutheranism in order to prevent further division.

This book was called the Book of Concord and contained the Augsburg Confession, the Apology to the Augsburg Confession, the Smalcald Articles, and several other statements of Lutheran belief and doctrine. These still are held as accurate statements of Lutheran theology and practice by most Lutherans.

BRUCE D. FRANSON

Aurangzeb

(1618–1707) *emperor of India*

Aurangzeb was the sixth Mughal (Moghul) emperor (r. 1658–1707). He ruled for 49 years as Emperor Alamgir (conqueror of the universe); he was the last great ruler of the Mughal dynasty, but left the empire economically exhausted and widely disaffected.

As SHAH JAHAN aged, his sons openly rebelled against him. The winner was the 44-year-old Aurangzeb, who imprisoned Shah Jahan and killed all three of his brothers. His personal strengths included widespread administrative and military experience, strict frugality in personal life, and devotion to work. He curbed corruption and took measures to improve agriculture. A strict and devout Muslim, he was also a bigot who had no tolerance of other religions and persecuted their followers. Thus began his troubles, which also contributed to the disintegration of the Mughal Empire. He ordered Hindu schools closed, had many Hindu temples destroyed, and ousted many Hindus from government service. Although he could not eliminate all Hindus from government, no Hindu under him rose to high positions. The last straw for Hindus was the reinstatement of the poll tax and other harsh taxes on non-Muslims, which had been dropped under his ancestor, Emperor AKBAR.

Aurangzeb’s religious policy contributed to the growth of revivalist Hinduism, a mixture of religion and what may be termed protonationalism. It began in southern India under SHIVAJI, who rebelled in 1662, heading the Maratha Confederacy. Long and costly campaigns failed to end the Marathas’ insurgency. In 1683, the RAJPUTS, powerful Mughal supporters, also revolted, even attracting one of Aurangzeb’s sons to their cause. While his lieutenants led the campaigns against the Marathas and Rajputs, Aurangzeb took personal charge of a drawn-out war in the south, where he had been viceroy under his father. His objective was to subdue the two remaining independent kingdoms of the Deccan, beginning in 1683. He was militarily successful, with the result that the Mughal Empire under Aurangzeb extended from Kabul in the north to Cape Comorin to the south. However, the wars left the empire financially exhausted and the overtaxed peasants in revolt. Moreover, his total

preoccupation with the campaign and absence from the capital had left the administration neglected.

Aurangzeb died in 1707 at the age of 89. Because he ascended the throne after killing his brothers, he trusted no kinsman and kept all power in his own hands. His religious bigotry alienated Hindus and his focus on subduing rebels and expanding the empire left him unaware of the new shift of power among Europeans in India and the passing of maritime supremacy from the Portuguese to the English. His Muslim generals served him faithfully in his life, but rose to usurp his inept sons' inheritance after his death. Mughal power soon declined and fell.

JIU-HWA LO UPSHUR

Austrian Succession, War of the (1740–1748)

The War of the Austrian Succession was primarily between the Austrian Empire and Prussia, although several other European countries were eventually brought into the conflict. There were underlying causes that led to this renewal of European hostilities aside from the question of the Austrian succession. The Treaty of Utrecht, which was signed in 1713 to end the WAR OF THE SPANISH SUCCESSION (1702–13), did not settle the underlying problems between ambitious powers seeking to extend their influence in Europe and the world.

Before the War of the Austrian Succession began, British and Spanish antagonism was prominent in European society. The British were furious with the Spanish over the limited amount of trade the Asiento Privilege, which was signed in 1713, granted the British with Spanish colonies in the Americas. British captains attempted to get around this agreement by resorting to smuggling, which resulted in the Captain Jenkins Incident. Captain Jenkins claimed he was captured by the Spanish, who cut off one of his ears, which he kept to show to the British parliament. The

British government declared war on Spain in October 1739 and commenced hostilities against the Spanish fleet in the Caribbean, but they were defeated.

Despite hostilities between Spain and England, the immediate cause of the War of the Austrian Succession was the death of Charles VI of Austria in 1740, which gave his daughter, Maria Theresa, control over Austria. When Maria came to the throne, the Austrian military and bureaucracy were in a weakened state. With regard to trade, Austria was a very weak country because its mercantile system was centered predominantly on a rural base, which failed to generate a significant degree of revenue.

Austria had fought a bitter war against the OTTOMAN EMPIRE that drained the treasury, leaving only 90,000 gulden for government spending. This war also angered many Hungarians since they were responsible for quartering the Empire's soldiers. This financial burden and discontent were domestic issues with which Maria Theresa was forced to deal when she assumed the throne in 1740. These problems created a great deal of instability in Austria, and many countries hoped to divide up Austrian territory for their own benefit.

An anti-Austrian coalition was formed, as neighboring countries were interested in seizing Austrian lands. This is evidenced by the fact that Prussia was interested in acquiring Silesia, France was interested in the Austrian Netherlands, Spain wanted to acquire more territory in Italy, and Piedmont-Sardinia wanted Milan. Frederick the Great, the ambitious king of Prussia, struck quickly against the Austrians by sending troops into Silesia in December 1740. Frederick the Great attempted to turn Prussia into a powerful country through the creation of a strong military and a centralized government that could effectively generate revenue through taxation.

The Austrian government faced larger problems as the Bohemian nobles were unhappy with Habsburg rule and revolted since they wanted to be placed under the control of the elector of Bavaria. At this point, war enveloped the European continent as British and Austrian governments sided together to counter the ambitious design of the French, Prussian, Bavarian, and Spanish governments. Many of the European countries became concerned about the balance of power since they did not want one country to become too powerful in Europe.

PRUSSIAN INVASION OF SILESIA

With the Prussian invasion of Silesia and the revolt in Bohemia, Maria was forced to ask the Hungarian diet

for assistance in 1741. The inability of the Austrians to repel the Prussian invasion forced Maria to assemble the Hungarian diet to acquire further assistance in the war effort. The diet attempted to assert Hungarian interests over Austrian interests as it demanded the institution of better economic policies, an alteration in the coronation oath, and greater Hungarian control over the region. Maria agreed to negotiate these terms, with the exception of the demand concerning the coronation oath, in order to acquire further Hungarian assistance in the war, but she refused to honor this agreement in its entirety.

As the war continued to deteriorate for the Austrians, Maria was forced to approach the diet again. She promised to give Hungarians greater control over the administration of Hungary, more Hungarian influence in regard to allocation of tax money, the selection of Hungarians to ecclesiastical offices in Hungary, and the promise to give more territory to Hungarian domains.

The members of the diet accepted this proposal and promised to provide the Austrian empress with at least 4 million gulden and a minimum of 60,000 troops. Despite the fact that Maria considered Hungarian opinion when creating government policies, she failed to implement most of the demands to which the Hungarians agreed.

The Hungarians also fell short on their promises regarding the number of troops they could offer to the service of the Crown, which helps to explain the poor performance of the Austrian war effort. The Peace of Dresden, which was signed in 1745 between the Prussian and Austrian governments, confirmed Prussia's control over Silesia. Despite the fact that Prussia and Austria negotiated a peace settlement the conflict still continued among the other European powers.

The British became involved in the war with the fear that the expansion of French influence on the European continent would affect Hanover. GEORGE II, who was king of England and elector of Hanover, led an army that defeated the French forces at Dettingen in June 1743, but the threat of an army led by Charles Edward Stuart, who was attempting to restore the Stuart dynasty to the throne of England, forced the British to recall a significant portion of their army back to England in 1745. The invasion failed as Charles could not acquire enough support from the English population, forcing him to give up his march on the English capital. The remains of the Stuart army were smashed by the duke of Cumberland at Culloden Moor in April 1746. Despite this success by the English at home, the recall of a major portion of the English army allowed the French to capture the Austrian Netherlands.

The war was also fought outside the European continent as the French and British combated with each other for a stronger position on the Indian subcontinent and in North America. The French were able to launch a successful offensive against the British in India by capturing Madras from the British. The British were able to gain some ground on the French in North America as a coordinated attack by colonists from New England and the Royal Navy captured the French fortress of Louisburg.

The Treaty of Aix-la-Chapelle, which was signed in 1748, forced England to relinquish control of the fortress of Louisburg in Nova Scotia to the French and in exchange, the French returned the Austrian Netherlands to Austria and Madras to the English. Spain and Piedmont-Sardinia each gained territory as the Spanish acquired Parma, and Piedmont-Sardinia acquired some territory in Milan. The War of the Austrian Succession was an important step in turning Prussia into a strong European power for the acquisition of Silesia increased the population of Prussia, provided Prussia with an abundant amount of coal and iron, and gave the Prussians a thriving textile industry. Maria Theresa lost territory, but her husband was acknowledged by the German princes as the Emperor of the HOLY ROMAN EMPIRE. Maria spent the rest of her reign attempting to reacquire Silesia from Frederick the Great as she centralized the Austrian administration and undertook reforms in the Austrian army and economic base to accomplish this goal.

BRIAN DE RUITER

Aztecs (Mexico)

Because the Aztec elite continually retold their own history to accord with contemporaneous political and religious concerns, the origins of the Aztec Empire are shrouded in myth and legend. The consensus view among scholars is that the Aztecs, or Mexica, were a

Nahua-speaking nomadic hunting and gathering people who began migrating south from their mythical homeland, called Aztlán, located somewhere in Mexico's northern deserts, beginning in the early 1100s. One in a series of Nahua-speaking ethnic groups that migrated into the more fertile regions of Mexico's Central Highlands after the fall of the Toltecs during the Postclassic period, the Mexica were considered barbarians and dubbed *Chichimeca*, or "lineage of the dog," by the more advanced and sedentary groups already settled in the Basin of Mexico. With its rich diversity of environmental resources, the Basin of Mexico, a region called Anáhuac in Nahuatl, had been a primary locus of sedentary agriculture and the development of advanced civilizations since the Preclassic period.

The Aztecs migrated into Anáhuac around the year 1250, where they lived a precarious existence for the next century, learning the sedentary lifeways of their more numerous and powerful neighbors. According to Aztec legend, the site of their capital city was chosen around the year 1325, when one of their holy men saw fulfilled the prophecy of their principal god, Huitzilopochtli: an eagle perched on a cactus, in some versions devouring a snake. The site was a small outcropping of rocks on the western edge of the southern part of Lake Texcoco. On this site the Aztecs began building their capital city, an island linked to the mainland by causeways, which they called Tenochtitlán (Place of the Cactus Fruit). At the time other city-states dominated the Basin of Mexico, most notably Tepaneca, Texcoco, and Tlacopán.

The island-city grew rapidly, as did Aztec military and political power. In 1428, under Itzcoatl (c. 1427–40), the Aztecs overthrew their Tepaneca overlords, asserted their independence, and became the "first among equals," in a Triple Alliance with Texcoco and Tlacopán. Bent on imperial expansion, the Mexica polity under Moctezuma I (c. 1440–69) combined wars of conquest with alliance-making to expand their domain, a process continued under the rulers Axayacatl (c. 1469–81), Tizoc (c. 1481–86), Ahuitzotl (c. 1486–1502), and MOCTEZUMA II (c. 1502–20).

By the early 1500s, the Aztecs had created an expansive tributary empire that reached far beyond Anáhuac to embrace most of the settled territories to the east (to the Gulf of Mexico) and south (to the edge of the Maya domains), and whose influence was felt as far south as the Maya kingdoms of Guatemala. To the west, various Tarascan polities resisted Aztec efforts to subdue them, while closer to home, some retained their independence—most notably the Tlaxcalans. Far from uni-

tary or monolithic, the Aztec Empire was shot through with multiple fractures and divisions—of languages, ethnic groups, religions, kingdoms, city-states—largely a consequence the Mesoamerican political-cultural imperial tradition of leaving intact the ruling dynasties and bureaucratic infrastructure of dominated polities. An estimated 400 polities were subordinate and paid tribute to their Aztec overlords.

By this time, Tenochtitlán had become one of the largest and most densely populated cities in the world, covering nearly 14 square kilometers, with intricate systems of canals, footpaths, gardens, walls, paved streets, residential complexes, temples, and pyramids. The city's population probably reached 250,000 people. The planned city was divided into quarters, corresponding to the four cardinal directions, with a separate fifth quarter, Tlatelolco, serving as the city's principal marketplace. At the city's core lay the sacred precinct, covering perhaps 90,000 square meters, filled with more than 80 imposing structures, dominated by the Great Pyramid (Templo Mayor), some 60 meters high, with its twin temples devoted to Huitzilopochtli (the god of the Sun and war) and Tlaloc (the god of rain).

AZTEC SOCIETY

Aztec society was extremely hierarchical, with complex gradations of class and status extending from top to bottom, with each individual and family pegged into a specific social category. After the household and nuclear family, the foundational social unit upon which social relations among the Mexica were built was the *calpulli*, an extended lineage group that corresponded to occupation, place of residence, and local governance—variously translated as "parish," *barrio*, and "clan." The vast majority of the inhabitants of Tenochtitlán and its subordinate polities were *maceualli* (commoners, plebians) engaged in agriculture, petty trade, or service. A small minority, at most 10 percent of the populace, constituted the ruling class of top-echelon bureaucrats, dignitaries, warriors, and priests. Merchants, or *pochteca*, divided into merchant guilds, appear to have constituted a separate social class, as did warriors, priests, and craft workers.

The Aztec economy was based on a highly developed combination of agriculture, tribute, and trade, along with intensive exploitation of Lake Texcoco's abundant lacustrine resources. An ingenious agricultural device, the *chinampas* (sometimes erroneously called "floating gardens"), artificial islands built of woven mats of reeds and branches atop which was piled mud and organic matter dredged from the lake bottom,

provided abundant maize, legumes, fruits, and vegetables. Trade and commerce occupied a central place in the Aztec economy. CACAO beans were the principal form of money.

Religious concerns intruded into every aspect of Aztec daily life. The notion that the worlds of the sacred and the secular constituted distinct or separate realms did not exist. The Aztec corpus of religious beliefs and practices was dizzyingly complex, their pantheon of gods, deities, sacred beings, and divine entities reaching into the hundreds. The most important deities were Huitzilopochtli (the Aztec's most honored deity), Tlaloc, Quetzalcoatl ("Plumed Serpent"), and Tezcatlipoca ("Lord of the Here and Now," "Smoking Mirror," "He Whose Slave We Are"). The latter was considered an especially capricious, devious, and dangerous god, one who derived great pleasure from laying waste to human ambition and pretension. Propitiation of these and many other gods constituted one of humanity's principal tasks, for without adequate ritual and obeisance, they might well turn on their mortal underlings and wreak havoc on their lives and fortunes. Unlike the Christian God of this same period, Aztec gods, like Mesoamerican deities generally, were not considered exclusive. It was common for groups and polities to adopt new gods, especially those of a dominant or conquered group, by incorporating them into an already well-populated pantheon.

Intimately tied to Aztec religion were Aztec conceptions of time. The Aztec solar calendar was divided into 18 "months" of 20 days each, with a five-day "barren" or "hollow" period at the end of each solar year—a time of foreboding and dread. Each month, in turn, was devoted to specific rituals and ceremonies paying homage to a particular god or combination of gods. Thus, for instance, the "Feast of the Flaying of Men" took place on March 5–24, and included mass ritual human sacrifice in honor of Xipe Totec (the god of fertility and martial success), as well as gladiatorial contests and sacrifices, dancing, and feasting. In addition to the solar calendar was the sacred or divinatory calendar, a pan-Mesoamerican phenomenon, composed of 260 days and divided into 20 units of 13 days each—all associated with particular gods and rituals. An Aztec "century" consisted of 52 solar years. The end of each 52-year cycle was considered a period of great danger, for unless the Sun god Huitzilopochtli was adequately propitiated with human blood, the Sun would cease to rise and the world would come to an end.

Closely linked to these temporal cycles, to the propitiation of the gods, and to the expansion of the Aztec Empire generally were conceptions and practices of warfare, which occupied a central place in Aztec politi-

cal culture and cosmology. By the Postclassic period, Mesoamerica as a whole had developed a highly elaborate series of beliefs and practices concerning warfare. In general, its principal purpose was not to occupy territory or kill enemy combatants, though the latter in particular was not uncommon, but to subdue competing polities and capture enemy soldiers on the battlefield.

These captives would be sacrificed to the gods, in order to ensure the good harvests, the well-being of the empire, and the continuation of the world. Thus, the so-called Flowery Wars ("flower" being a metaphor for human blood) between the Aztecs and as-yet unconquered kingdoms such as Tlaxcala were conceived and undertaken principally as ritual events whose principal purpose was to capture victims for later sacrifice. The accumulation of animosities that resulted from these ritual battles, along with these cultural beliefs concerning warfare and divine intervention in human affairs generally, proved crucial in the later CONQUEST OF MEXICO.

MICHAEL J. SCHROEDER

Aztecs, human sacrifice and the

Although some maintain that the notion that the AZTECS (MEXICA) practiced human sacrifice is a myth that originated with the Spanish conquistadores to justify and legitimate their conquests, in fact, abundant evidence demonstrates that the Aztec state, like many other pre-Columbian Mesoamerican and Andean polities, regularly practiced ritual human sacrifice. The evidence also shows that the Aztecs institutionalized this practice, elevating it to a high art form, the state's most important public spectacle, and a key state function essential to the well-being of the cosmos. This evidence includes scores of Spanish and native accounts composed during and after the CONQUEST OF MEXICO, along with abundant archaeological and textual artifacts that predate the Spanish invasion.

The religious and cultural beliefs inspiring Aztec ritual human sacrifice had deep roots in Mesoamerican society and culture. Many pre-Columbian polities in the Americas are known to have ritually sacrificed human beings to their gods. These included

many Maya kingdoms and city-states, Monte Albán and subsequent Zapotec polities, Teotihuacán, the Toltecs, and others. Such practices were rooted in a pan-Mesoamerican corpus of beliefs concerning the spiritual power of human blood, and the everyday intervention of the gods in human affairs.

States transformed these broad cultural understandings into state ideologies and spectacles. Ruling groups portrayed public offerings of human blood as payment of a debt owed to the gods. By propitiating the gods with the most valuable substance in the universe—human blood—states terrorized foes and depicted themselves securing a larger social and cosmic good. Public and private bloodletting rituals in the service of the gods were common across Mesoamerica, and ritual human sacrifice was the most extreme form of bloodletting.

The Aztecs took the practice to an extreme, sacrificing people on diverse occasions in propitiation of many divine beings. Of the 18 ceremonial events that occurred during each of the 18 months of the Aztec solar year, eight included ritual human sacrifice. These included the ceremony of Quecholli (“Precious Feather,” October 31–November 9), in which priests ritually slew and sacrificed captives dressed as deer, and the ceremony of Atl Caualo (“Ceasing of Water,” February 13–March 4), in which infants and children were publicly marched in groups before being sacrificed. The gruesome sacrifice involved four priests holding the victim down on top of a large stone for another priest to cut open in order to remove the heart.

By ritual preparation and transformation, the victim was depicted as becoming the god to whom he or she would be sacrificed. There were many variations on these general themes. The most frequently propitiated divine entity was Huitzilopochtli, the god of the Sun and war, particularly at the end of each 52-year Aztec century. Without such offerings, the state claimed, the Sun would cease to rise and the universe would come to an end.

After the Aztec Triple Alliance of 1428 joined together Tenochtitlán, Texcoco, and Tlacopán, the practice of human sacrifice was institutionalized at the highest levels of the Aztec state. Major events such as victory in war, inauguration of a new ruler, or dedication of an important public structure became occasions for large-scale human sacrifice. The most extensive such instance occurred in 1487 with the dedication

An Aztec priest performing the sacrificial offering of a living human's heart to the war god Huitzilopochtli

of the Temple of Huitzilopochtli in Tenochtitlán, in which an estimated 20,000 people were ritually sacrificed over four days. The Aztecs also initiated pre-arranged wars with neighboring polities—ritualized battles called the “Flowery Wars”—in large part to secure sacrificial victims.

In its meteoric rise to domination, the Aztec state made such practices integral to state ideology and imperial ambitions. Ritual human sacrifice displayed the Aztec state's awesome political and religious power, terrorized its enemies, worked as a cohesive ideological force among its subjects, and generated animosities against its rule among subordinate states that the Spanish later exploited in the conquest of Mexico.

B

Babur

(1483–1530) *Mughal warrior, dynastic founder*

Babur was descended from Tamerlane on his father's side and Genghis Khan on his mother's. Son of a petty ruler of Ferghana in Central Asia, he conquered Afghanistan, then northern India, founding the long-lived MUGHAL (Mogul, or Moghul, the different versions of the spelling all derive from *Mongol*) dynasty in India. His body was returned to Kabul, Afghanistan, where he was buried. He wrote an autobiography of great literary merit called *Baburnama* (Memoirs of Babur) in his native Turki that recorded his battles, plans for ruling India, his dealings with friends and foes, the flora and fauna of India, and much more.

Zahir ud-din Babur was the son of a petty prince in Ferghana in Central Asia. His father died when he was young and Babur had a difficult youth battling for his patrimony. He left Ferghana for good in 1504 and gained control of Kabul in Afghanistan, then an important stopping place along the trade route between India and Central Asia. In 1526, Babur led 12,000 soldiers into India and at the Battle of Panipat defeated and killed Ibrahim Lodi, a Muslim ruler of northern India who led a huge army of 100,000 horses and 100 elephants. The victory opened his way to Lodi's capitals Delhi and Agra on the shores of the Jumna River. Babur rewarded his men by distributing the huge quantities of loot that came with victory, and allowed those of his followers who wanted to return to Afghanistan to do

so, escorting more booty to reward his people who had stayed behind.

Babur then took the titles *padshah*, which means great ruler, and *ghazi* which means "fighter of the, (Muslim) faith." Agra and Delhi became his capitals, where he built forts, palaces, and gardens with fountains and running water to alleviate the heat of northern Indian summers. Babur spent the next three years campaigning against both Hindu and Muslim states in northern India, including Bengal; in organizing the administration of the provinces that he had conquered; and in parceling out the land among his supporters in a feudal arrangement. He also began to build a road that would link Delhi and Agra to Kabul. In 1529, when his favorite son and heir, HUMAYUN, became ill Babur performed a ceremony to cure his son by taking on the son's illness himself. He died shortly later, his health undermined by hard campaigning and India's hot climate, at age 46.

Babur was a many faceted man. A brilliant military leader, he founded a great empire in India that would last for two and half centuries, laying the foundations for unity in a politically fractured land. He was a builder who personally designed gardens and fountains, a patron of the arts, a poet, and a memoirist. Europeans who came to India during the early Mughal dynasty were so impressed with the splendor of the court that they called the rulers Great Mughals.

JIU-HWA LO UPSHUR

Bacon, Sir Francis

(1561–1626) *British statesman and philosopher*

Francis Bacon was an English lawyer, statesman, essayist, and philosopher. His public career stretched from Queen ELIZABETH's reign (1558–1603) to King JAMES I's (1603–25), witnessing the changes of political atmosphere of the early Stuart period. His essays unveiled beauty of modern English language and pleased the witty and pithy taste of English gentility. His advocacy of scientific reasoning helped initiate the English SCIENTIFIC REVOLUTION and his academic esotericism fascinated European intellectuals of future generations.

The son of a prominent lawyer, Bacon entered Trinity College, Cambridge, at the age of 12, where he mastered Greek wisdom, medieval Scholastic philosophies, and new Renaissance humanism. Afterward, he took up residence at Gray's Inn in 1580, and was admitted as an outer barrister two years later. He took a seat in the House of Commons in 1584, and made himself famous for his advocacy of the execution of MARY, QUEEN OF SCOTS in the Parliament of 1586. During his political ascendancy, he became acquainted with Robert Devereux, the earl of Essex and a personal confidant of Queen Elizabeth. The earl made young Bacon his confidential adviser and offered him generous financial support. But, in the courtly battle of 1601, the earl kidnapped the queen in an attempt to force her to dismiss his political enemies from the court. Bacon subsequently played an instrumental role in prosecuting and convicting the earl, his patron, and became very much disliked by his colleagues.

Bacon received rapid promotion after the accession of James I. For his loyal and effective service to the king, he was rewarded with office of solicitor in 1607, made attorney general in 1613, appointed to the position of lord chancellor and elevated to be baron verulam in 1618, and ultimately created viscount St. Albans in 1621. In Parliament, he often vehemently defended royal prerogatives, and thus gradually alienated himself from a group of intelligent, ambitious, and eccentric gentlemen in the House of Commons. This group of men was driven by a new sense of assertiveness, willing to challenge the king, an insatiable Scot by their biased calcula-

tion, for his breaching laws, customs, and parliamentary rules of England. Meanwhile, Bacon always lived in debt and his careless lifestyle was often under the scrutiny and criticism of his peers. At the very peak of his political career in 1621, a parliamentary committee charged him with 23 counts of corruption. He was convicted, suffered a heavy fine, and was committed to the Tower of London for a short period of time. But his life was spared, and he escaped from being deprived of his noble title.

Although Bacon's political career ended in disgrace, his scholarship earned respect from both his friends and foes. He made great efforts to transcend the limits that medieval Scholasticism set on human minds. While criticizing deductive syllogism, he argued forcefully that human minds should be freed from "idols," the erroneous notions and fallacious tendencies that distorted truth. He saw himself as the intellectual CHRISTOPHER COLUMBUS, discovering a new world of natural science, where he collected and analyzed data to establish a hypothesis, and experimented to reach and verify truth. His new method was so enlightening that many of the first generation of modern English scientists viewed themselves as his disciples.

His essays in the form of fables and aphorisms revealed his insightful and ambiguous worldview. He believed that, if understood correctly, Greek wisdom and the Judeo-Christian truth were complementary, and the Bible and the Book of Nature were compatible. Scientific knowledge, if applied properly, could bring humans back to the original divine Garden of Eden. In his fictional *New Atlantis* published posthumously in 1627, he imagined an island kingdom ruled by the monarchy, which coexisted with Christianity in harmony, and an Academy of Scientists to stand at the pinnacle of its internal hierarchy. The kingdom was located on a hill as the light of the world, because there the progress of scientific knowledge expanded human capacity to its full to meet the perfect plan of God. *New Atlantis* revived the idealism of the Greek philosophers, who had anticipated philosophical kingship as the perfect form of human government. This fictional kingdom might explain why Francis Bacon, a brilliant scientific mind, would defend so staunchly King James I and the CHURCH OF ENGLAND at the awakening moment of parliamentary consciousness.

WENXI LIU

Bacon's Rebellion

This uprising, the most significant in BRITISH NORTH AMERICA before the Revolution, occurred in Virginia in 1675–76. It was a result of colonial government corruption, declining opportunities for white immigrants, and increased conflict with Native Americans.

Since the late 1610s, Virginia had been a profitable enterprise for both tobacco planters and impoverished English men and women who came to America as indentured servants. By 1665, however, a decline in the price of tobacco and increased regulation of trade had brought the boom times to a halt. By this point, the wealthiest planters, especially those allied with the royal governor Sir William Berkeley, had patented thousands of acres of land and were well suited to ride out the hard times. For small planters and recently freed servants, hard times coincided with a decline in the amount of available land and a high male to female ratio. "Six parts of seven at least are Poore, Endebted, Discontented and Armed," noted Berkeley, although he did little to mitigate the situation. Instead, as landownership became less attainable, the government limited suffrage to property owners. Faced with a lack of opportunity and high taxes, poorer colonists rented land or headed to the frontier. As the latter group grew in number, it came into conflict with the Susquehannock Indians and war broke out in 1675.

Into this volatile situation came Nathaniel Bacon. A young and charismatic member of the English gentry, Bacon garnered a following among poor and frontier colonists by leading indiscriminate attacks on Native Americans. Berkeley worried that Bacon's actions were hurtful to peaceful tribes and interfered with his monopoly over the fur trade. Accordingly, Berkeley denied Bacon a military commission to continue his war with Native Americans, but the growing unrest of the populace soon sent events spiraling out of control. On June 23, 1676, Bacon and four hundred armed men arrived in JAMESTOWN and demanded that Berkeley accede to their demands. However, once Bacon left town, Berkeley declared him a traitor, to which Bacon responded by

twice chasing Berkeley out of the capital and burning Jamestown to the ground on September 18. A month later, Bacon fell ill and died, bringing the rebellion to an abrupt halt. His fellow conspirators were hanged the following spring, while Berkeley returned to England and died soon after.

In the short term, Bacon's Rebellion changed little in Virginia society. Although political inequalities had been addressed during the uprising, many of these, including the expansion of the electorate, were rescinded thereafter. Poverty and a lack of opportunity remained prominent for at least another generation and it was less than a decade before another uprising broke out. In the long term, Bacon's Rebellion further poisoned relations between colonists and Indians. It also caused Virginia's planters to realize that the success of a tobacco economy could not rest on a population of white servants for whom there was little opportunity for land ownership and a family once they finished their indentures. Indirectly, then, Bacon's Rebellion became an impetus for the Chesapeake's shift from white indentured servants to African slaves.

JOHN G. MCCURDY

bandeirantes in Brazil

Bandeirantes were members of *bandeiras*, or roving bands of explorers, prospectors, and Indian slavers originating principally in the frontier settlement of São Paulo in colonial Brazil, beginning around the 1580s and continuing for the next 150 years or so. The original meaning of the term *bandeira* was "flag," though in medieval Portugal it also came to mean a small autonomous militia. Their primary purpose was to acquire Indian slaves for their Paulista (São Paulo) patrons. Some *bandeiras* were gone years at a time and traveled thousands of kilometers through the back country. In the process, the *bandeirantes* explored much of the vast Brazilian interior—its forests, grasslands, rivers, jungles, and backlands (*sertão*) to the west, south, and north—pushing back the colony's known frontiers and opening up new paths for settlement and colonization.

In Brazilian historiography and national culture, *bandeirantes* occupy a very important and highly ambiguous position—praised for their endurance and discoveries, and condemned for their brutalities and cruelties that were integral to Indian slaving in the backcountry.

By 1600, most residents of São Paulo (which at the time was a small settlement of only about 120 houses and 2,000 people) were Portuguese, Indian, and racially mixed *mamelucos* (the Portuguese equivalent of the Spanish term *mestizo*). The predominant language was Tupí. Their city and homesteads vulnerable to attack, Paulistas initially launched *bandeiras* as a defensive measure against hostile natives. By around 1600, *bandeiras* had transformed into offensive slave-raiding expeditions. The indigenous inhabitants around São Paulo having all but disappeared by this time, victims to enslavement and diseases, the Paulistas found themselves chronically short of servile labor. The *bandeiras* were their effort to remedy this chronic labor shortage.

Most *bandeiras* left no written record, though many others did, thanks in large part to Jesuit missionaries or foreigners who accompanied them through the backcountry and reported on their experiences. As one Jesuit priest marveled, “One is astounded by the boldness and impertinence with which, at such great cost, men allow themselves to enter that great sertão for two, three, four or more years. They go without God, without food, naked as the savages, and subject to all the persecutions and miseries in the world. Men venture for two or three hundred leagues into the sertão, serving the devil with such amazing martyrdom, in order to trade or steal slaves.” A classic account is by the Jesuit priest Pedro Domingues of 1613, which described a journey of several thousand kilometers lasting 19 months. Occasionally clashing with Spanish settlements emanating out from the Río de la Plata, the *bandeirantes* helped to define colonial Brazil’s southern boundaries. As time went on, they also clashed repeatedly with the Jesuits, who saw their slave raiding as antithetical to their own goal of converting the natives to Christianity and saving souls. This conflict between *bandeirantes* and Jesuits in colonial Brazil can be aptly compared to similar conflicts between *encomenderos* and religious missions in colonial Spanish America during this same period.

By around 1650, there occurred a broad shift among *bandeiras* from slave raiding to the search for precious metals. By this time, African slaves were fulfilling the colony’s servile labor requirements, while the Jesuit missions had fortified their defenses, making Indian slaving more difficult. Greatly extending geographic knowledge of the vast Brazilian interior, the *bandeirantes* have come

to occupy a position within Brazilian national culture akin to the cowboys of the United States or the gauchos of Argentina, symbolizing the spirit of adventure, independence, and, ironically, freedom. It is estimated that *bandeirantes* enslaved and caused the premature deaths of hundreds of thousands of Indians during the decades of their greatest activity.

MICHAEL J. SCHROEDER

baroque tradition in Europe

“Baroque” describes both a period and the artistic style that dominated the 17th century. The baroque style originated in Rome, Italy, c. 1600, largely as an expression of Catholicism and the royal courts, and spread throughout Europe, lasting into the early 18th century. Following the Counter Reformation in the 16th century, the Roman Catholic Church, the main patron of the arts in Europe, required new forms of art in ecclesiastical contexts to educate the masses and to strengthen the church’s spiritual and political positions.

Baroque painting not only includes portraits of saints and the Virgin, but also encompasses numerous styles and diverse themes—large-scale religious works with monumental figures that clearly convey a narrative, which were intended to convince worshippers to adhere to the church’s doctrines; heroic mythological and allegorical cycles, designed to engage the intellect of the viewer and glorify royalty; portraiture; and still life. Seventeenth-century painting comprises five stylistic categories. Caravaggio (1571–1610), who stressed painting from the model and the use of chiaroscuro, the strong contrast of shade and light, helped to spread naturalism from Rome into Italy, Spain, and the Netherlands.

Classicism, represented by Annibale Carracci (1560–1609) and his school, drew from Renaissance and Venetian sources to create works of great drama, vitality, and grandeur that appealed to the senses. Academic classicism, or the LOUIS XIV style, developed in France through the Royal Academy. Peter Paul Rubens (1577–1640) popularized the later high baroque style,

which emphasized unity of composition and context, rich color, emphasis on theatrical drama, and robust, monumental interacting figures. Painters in the Dutch Republic such as Vermeer (1632–75) introduced realism, using themes from everyday, contemporary life and giving great attention to faithfully reproduced detail. In Spain, Velázquez (1599–1660), Murillo (1618–82), Zurbarán, and Cotán created genre scenes and still life. Baroque relief sculpture and sculpture-in-the-round emphasized action and theatricality, employed a single optimal viewpoint, and often depended on context for interpretation.

Bernini (1598–1680), considered the greatest sculptor of the baroque era, worked in Rome and sculpted single, dramatic moments that expressed the subject's inner psychology. Architects of the baroque era, notably Bernini and Francesco Borromini (1588–1667) in Italy, Sir Christopher Wren (1632–1723) in England, Jules Hardouin-Mansart (1646–1708) and Louis Le Vau (1612–70) in France, and Johann Michael Fischer von Erlach (1656–1723) and Balthasar Neumann (1687–1753) in central Europe, created large, impressive buildings with an emphasis on complete spatial integration, in which all architectural elements work together to form a unified whole.

Architects altered the planar, horizontal facades of the Renaissance style, embellishing outer facades with central bay projections, freestanding columns, niches, and classical ornament, which emphasized verticality and allowed light and shadow to play across the surface and enhance the sculptural effect of the monumental structures. Architects developed circular, elliptical, elongated cross, and octagonal ground plans for religious and secular buildings. Architects often crowned these baroque structures with an interior dome, employed illusory interior trompe l'oeil effects, and made use of opulent ornament to intensify the dramatic experience for the viewer.

Musicians of the baroque era, such as Bach (1685–1750), Handel (1685–1759), Vivaldi (1678–1741), and Monteverdi (1567–1643), developed a contrapuntal style of imitative counterpoint, harmony, and elaborate ornamentation and popularized opera.

In literature, the English metaphysical poets explored metaphor and paradox, authors focused on allegory and metaphor, and the novel form gained in popularity.

ALECIA HARPER

Bible traditions

The sources surrounding the earliest manuscripts of the Bible are vast and varied. In the first five centuries of the New Testament text, for example, the Bible was copied by hand in stylish capital letters called uncials, but in the next five centuries it was copied in lowercase letters called minuscules. Thus, there were different text forms, to say nothing of the variations caused by human copying in the first thousand years of the written biblical tradition.

In 1454 Johann Gutenberg put an end to textual diversity when he invented a new form of printing press. In one fell swoop he standardized the Bible that a community would use for its reading. The question Jews and Christians faced, however, was which Bible text they should use as the Textus Receptus (“received text” or standard, TR) for all printings of the Bible.

The Jewish Bible (Old Testament) was not hard to standardize because the rabbis used a version going back to the first millennium C.E. called the Masoretic Text (MT). The MT kept variations to a minimum by strictly controlling the reading and the use of the Bible, though even here the most careful copying could not prevent ambiguities and errors to slip in. As time went on and more discoveries were made, it became clear that the MT indeed was the TR, but there were other less-influential rival texts used by Jews in various places and times.

The first printed version based on the MT was the Venice edition of 1524–25, done by Daniel Bomberg and edited by Jacob ben Hayyim. This Bible was dominant among Jews until the 20th century. At that time scholars began using the Leningrad Codex because it reflected the MT from a single and self-consistent editor.

Matters were more complicated with the Christian Bible (New Testament). Here there are thousands of Greek manuscripts, quotations from the fathers of the church, and ancient versions. Research on which text was “correct” and therefore to be standardized for the religious community began as early as Origen (185–254)

and Jerome (347–420). These scholars noted that there were a number of readings for each of the verses that they interpreted, and they set up rules to justify the ones they used.

The issue of text became important in the time of the Renaissance when scholars questioned the millennium-old Latin Bible used by the Western Church. The most influential intellectual of the time ERASMUS OF ROTTERDAM (1466–1536) published a Greek New Testament in 1516 based on a mere five to six manuscripts. In spite of his many errors and educated guesses about the original text, his pioneering work was the basis for later editions.

When Robert Estienne compiled his “Stephanus” version of the Greek (four editions, 1546–51), the Protestant world picked it up as its TR, in use until the 19th century. MARTIN LUTHER used Erasmus for his German Bible in 1519, and Anglicans in England used Stephanus after 1550. The popular King James Version of the Bible is based on the TR, and continued as the best-selling translation until the last 20 years in the United States.

As time went on it became clear the Renaissance scholars of the Bible relied too much on the minuscule texts of Byzantine manuscripts and not enough on the earlier uncial sources. Nonetheless, the TR was dominant until B. F. Wescott and F. J. A. Hort decisively led biblical scholarship in new directions with their *The New Testament in the Original Greek* (1881–82).

Bible translations

In the ferment of the Protestant REFORMATION there was public clamoring to read the Bible independently of church interpretations. The King James Version (KJV) for the Protestants and the Douai-Reims Version for the Catholics are the products of hierarchical recognition that the Bible should be more available to church members.

One of the first in the 16th century to make an effort to translate the Bible into English was William Tyndale of Oxford University. Accused of heresy and rejected by the bishop of London for his translating, he went to Antwerp to finish his edition in 1537. There he became associated with the Lutherans and died a Protestant martyr’s

death. His Bible was smuggled back into England where it had a profound impact on later translating efforts.

HENRY VIII, the instigator of the Anglican Reformation, was initially not in favor of new translations of the Bible. He banned the Tyndale Bible and opposed the Lutherans abroad and the Lollards (followers of John Wycliffe) at home. But once the rupture with Rome occurred he was more receptive to the notion.

Henry’s ministers CROMWELL and Cranmer cooperated to bring the “Great Bible” to all English churches, rescuing it from Inquisition censure in France, where it was initially being printed. The main translator for this version was John Rogers, a friend of Tyndale, and so the Great Bible contains some of Tyndale’s unpublished notes and Protestant sentiments. Though it was eventually displaced by the KJV, its Psalter was retained in the BOOK OF COMMON PRAYER, the daily liturgy of the Anglican Church. After 1542 Henry VIII took a dimmer view of Bible availability and public reading, an attitude that prevailed until the reign of JAMES I in the early 1600s.

Émigrés from Switzerland put together the Geneva Bible during the reign of ELIZABETH, and it became the reference translation for the likes of Shakespeare, John Bunyan, and the Puritans. Though lay people—even King James—grew up on the Geneva Bible, the ruling elites were not comfortable with its destabilizing notes and Calvinistic tone. In 1569, a revision of it was carried out by Anglican bishops, and hence received its name, the Bishops’ Bible. Though it was now the official version of the Anglican Church, many of the bishops who had worked on its revision continued to use the Geneva Bible.

King James was neither pleased with the Bishops’ Bible nor sympathetic to the Bible of the Puritans, the Geneva Bible. He wanted a Bible that all his subjects would “bound unto it, and none other.” So a new Bible translation project was commissioned, this time without notes unfavorable toward kings and rulers and relying on the best of all the English Bibles of the previous century.

The task was given to 54 men—though this number is in question—in 1604. Puritans and Anglicans worked side by side, along with linguists, theologians, laymen, and clergy. Their aim was to derive a Bible that the common citizen could use in every context. The Greek text was the Textus Receptus, the standard New Testament edition pioneered by ERASMUS, Stephanus, and Beza; and the Hebrew text was probably from the Complutensian Polyglot (1514–17), a scholarly effort originating in Spain.

King James was unable to finance the work out of his immediate revenue, so compensation was given through ecclesial positions. Room and board for the

translators were provided by the three sponsoring institutions, Oxford, Cambridge, and Westminster. The job of printing went to Robert Barker in 1611, whose family retained the license to print for two generations. Although it claims to have the endorsement of the king and his council, no record of this direct mandate comes from royal sources. Although it is often referred to as the “Authorized Version,” this term more accurately speaks of the approval of the CHURCH OF ENGLAND and thus the indirect support of the king.

Other Bibles continued to be used and cited in the English-speaking world, but by 1640 the KJV had over 40 editions and was considered as the superior Bible. By 1662, the Anglican Book of Common Prayer used only it, except for the Psalms. It became so sacrosanct that corrections of its obvious typographical and translation errors were considered by its users as blasphemous.

Often called the “noblest monument of English prose,” it has had untold impact on the English language and literature, spawning countless proverbs and images. Increasingly in modern times, however, its vocabulary is more and more archaic, so that in 1988 its American sales were surpassed by the New International Version of the Bible.

Meanwhile the Catholics were critical of the new Bible translations and the Protestant government policies in general. Forced to flee, many took refuge across the English Channel in the Spanish Netherlands (present-day France), where they established seminaries for secretly sending back to England hundreds of newly ordained priests.

There at Douai and Reims they reworked Jerome’s Vulgate Latin Bible into English, and it was called the Douai-Reims Bible (1582–1609). It was directed by an Oxford-trained scholar, Gregory Martin, under the direction of William (later cardinal) Allen. His New Testament appeared in Reims in 1582 and the Old Testament at Douai in 1609. Later generations of Catholics embraced it over all others, although its heavy use of Latinism is criticized as excessive and sometimes unintelligible.

The notes of the Douai-Reims are heavily Catholic. The preface insists that vernacular translations are not necessary and that the Latin Vulgate is superior to the Greek manuscripts (thus, the commonly accepted *Textus Receptus* pioneered by Erasmus is inferior). Its publication along with the KJV set the stage for continuing controversies between Catholics and Protestants over which was the better translation. The Douai-Reims did not attain widespread acceptance of its Protestant counterpart, due in part to the official Catholic teaching discouraging the public from reading the Bible. A new version of the Douai-Reims appeared in 1749–63 under

the supervision of Bishop Richard Challoner of London. The Challoner Bible then was used by Catholics for the next 200 years.

MARK F. WHITTERS

Boabdil (Muhammad XI)

(d. c. 1527) *last Muslim ruler in Spain*

Boabdil, who ruled as Muhammad XI (reigned 1482–83, 1487–92), was the last Muslim Nasrid ruler in Granada, Spain, during the final stages of the Reconquest of Spain, or Reconquista. For several centuries the Muslim dynasties in the Iberian Peninsula had lost territory to the Christian Portuguese and Spanish forces. The Almohads (a Berber dynasty from Morocco) lost Cordoba in 1236 and Seville in 1248. The Almohads, strict unitarians, followed the teachings of Ibn Tumert (d. 1130), an extremely conservative religious leader who even condemned all four schools of Islamic law. The far more liberal land and pleasure seeking Muslim population in the Iberian Peninsula rejected the Almohad brand of extreme puritanism and support in wartime. The Muslim city-states were also weakened by internal dynastic divisions and competition among themselves. Granada was left as the last Muslim stronghold; after the Christians took Gibraltar in 1462, Granada was cut off from ports and reinforcements from North Africa.

During the first years of his reign, Boabdil was taken prisoner by the Christians and was forced to become a vassal of Castile as a price for his release. He then disputed with his brother, who had styled himself Muhammad XII, before regaining the throne in 1487. But his victory was short lived, for in 1491, the forces of FERDINAND V AND ISABELLA I OF SPAIN lay siege to the city. The defeat of Granada was a foregone conclusion and in January 1492 (on the day of Epiphany), Boabdil handed over the key to the city. He was forced into a temporary exile at Alpujarras. As he reached the ridge overlooking the city, he looked back and sighed. Boabdil’s mother, A’isha, then supposedly taunted her son that he “wept like a woman for what he could not hold as a man.” A stone marker to the “Moor’s sighs” still commemorates the spot.

Ferdinand and Isabella, devout Catholics, and their successors moved to erase evidence of the long

Muslim control over the territory and to establish a Christian society. In reaction some remaining Muslims, known as Mudejars, rose up in a futile revolt that was brutally quashed in 1570. Others, known as Moriscos, converted to Christianity. The majority, including Boabdil, fled to Morocco and other parts of North Africa. For Christendom, the victory over Granada compensated in some measure for the earlier loss of the Byzantine Greek Catholic capital of Constantinople to the Ottoman Turks in 1453. From the Islamic perspective, the loss of Granada and all of Andalusia was a major defeat.

JANICE J. TERRY

Book of Common Prayer, the

The Book of Common Prayer contains the liturgy and main theological articles of the Anglican (Episcopal) Church. Still in use today, it has a long history dating back to the REFORMATION and ELIZABETH I.

The CHURCH OF ENGLAND was established under HENRY VIII in 1534. Breaking from the Roman Catholic church and influenced by the Reformation, the church still maintained a liturgy that was quite similar to the Catholic Mass. While Henry VIII was not in favor of Protestantism, the succession of his son, EDWARD VI, to the throne resulted in a decidedly Protestant tilt for England under Archbishop Thomas Cranmer. During Edward's short reign, at Parliament's request, Cranmer wrote a communion liturgy in English (rather than in the traditional Latin). In 1549, he completed a prayer book called *The Bishops Book*, which was used until Edward's death. Cranmer drafted a statement of faith in 42 articles (sections) in 1551, but this was never officially approved. A moderate revision was made in 1552 and used until the accession of his half sister MARY I in 1553. Mary, a staunch Roman Catholic, turned England back toward Catholicism (though without complete success), and Cranmer was burned at the stake in 1556.

In 1558, Mary died and her half sister Elizabeth I came to the throne. Elizabeth was determined to have religious peace in England, and so she sought a way for those with both Protestant and Catholic leanings

to be together in one national church. Saying she had "no desire to make windows into men's souls," Elizabeth nonetheless desired to bring outward observance into uniformity, without binding people's consciences unnecessarily. From this effort comes the expression "window-dressing."

In 1559, the issue came before Parliament. Most of the House of Commons was Protestant-leaning, and in the House of Lords (which included the church bishops), the small number of Catholic-leaning bishops were unable to sway the other lords toward retaining much in the way of Catholic practice. Parliament requested a new liturgical book that would be a revision of the 1549 and 1551 editions, and work began on the project. Later that year, the first edition of the Book of Common Prayer was approved by Parliament and Elizabeth.

In 1562, discussion regarding the theological articles of faith concluded with the approval by Elizabeth of the 39 Articles. These were based on Cranmer's original 42 articles with several articles condemning ANABAPTISM removed. The 39 Articles were not formally added to the Book of Common Prayer until the edition of 1604. In 1662, after the restoration of the monarchy, a new version was produced that contained modest revisions, making it more accessible to the PURITANS.

The 1559 edition contained 21 chapters. Beginning with the Act of Uniformity passed by Parliament, it contains several chapters that gave the order of Bible readings, including psalms and lessons for morning and evening prayers. Most important were the liturgy for the Sunday church service, including chapters on the litany, collects (prayers), and the Holy Communion ceremony. Finally, there were chapters for the order of baptism, marriage, burial, and other short liturgies.

In 1928, a substantial revision of the Book of Common Prayer failed to pass Parliament. While some of that revision was approved as an alternate form in the 1960s, the 1662 version remains the official version for the Anglican Church of England.

Other Anglican and Episcopal Churches have approved their own versions of the Book of Common Prayer. The composition has widespread influence on Christians today, especially among those desiring structure and tradition in their prayer.

BRUCE D. FRANSON

Borgia family

The Borgias, or Borja, were a Spanish family from Valencia. There are a number of people identified with this family who have notorious reputations such as Pope Alexander VI and Cesare Borgia. On the other hand, there are family members with good reputations, such as Francis, leader in the Jesuit order and saint. Other notable Borgias are Pope Calixtus III and Lucretia Borgia.

The family's fortunes were founded by Calixtus III, born Alonzo de Borja or Alphonso Borgia (1378–1458). Ingratiating himself with Alphonso V of Aragon, who also ruled Naples and Sicily, he was made a cardinal in 1440 and elected pope in 1455. A capable administrator, he supported crusades against the Turks. He also supported John Hunyadi at Belgrade and the struggles of the Albanian national hero Scanderbeg against the Turks. An unapologetic nepotist, in his largesse to his sister's family he led to their prominence in Italy as well as Spain.

One beneficiary of his uncle's benevolence was Rodrigo Borgia (1431–1503). Originally from Valencia, he studied law at Bologna. When his maternal uncle was elected pope in 1455, he exchanged his original name of Lazol for the maternal name of Borgia. After his uncle's election, he received great wealth and in short order was made bishop, cardinal, and vice-chancellor of the church.

After his uncle's death, he served five popes. During this period, he amassed great wealth and had assorted mistresses by whom he had many children, of which Lucretia, Giovanni, and Cesare are the best known. Elected pope, in an election marked by accusations, he initially governed well as Pope Alexander VI. It was not long, however, before he became obsessed with enriching his relations at the expense of the church. Anxious to carve out fiefdoms inside the Papal States, he manipulated and conspired against others who he felt stood in the way of his children's advancement. He then enlisted the king of France as an ally. This act led to wars that lasted from 1494 to 1559 and ended with Italy under the influence of Spain.

His relationship with his subjects was arduous. After his eldest son, Giovanni, was assassinated by his second son, Cesare, he supported the latter as Cesare attempted to carve out an independent kingdom in central Italy.

Although he was a good administrator, his unbridled ambition for his children led to chaos in the Papal States. His selling of cardinal hats for money became notorious as did the convenient deaths of a great number of people who earned him the money he coveted.

His guiding principle was family advancement. It became clear that the papacy to him during the 11 years of his pontificate was an instance of family aggrandizement. Although most of the misdeeds were done at the behest of Cesare, some were his own. On the plus side, his support of his son and his campaign against the Orsinis and Colonna rid most of the Papal States and Portugal of petty tyrants. He also became a patron of the arts and supported Leonardo da Vinci, Raphael Santi, and Michelangelo. However, his desire to gain wealth, power, and advancement in the interests of his family at any cost left a legacy of crime and infamy, and a heritage of such corruption that it became one of the causes of the REFORMATION 14 years later. Interestingly, the brother of his last mistress, Giulio Farnese, was made a cardinal and later as Pope Paul VI (1534–49) called the COUNCIL OF TRENT (1545–63), which began the COUNTER-REFORMATION, or Catholic Reformation.

His son, Cesare (1476–1507), said to be a model for NICCOLÒ MACHIAVELLI, was suspected of many crimes including the murder of his brother and brother-in-law. Completely unscrupulous, he was a good soldier. Once he conquered a place, he usually governed better than the petty tyrant he replaced. His attempt to carve out a kingdom in central Italy was on the verge of success but was frustrated by the death of his father. He died in 1507 while in the service of his brother-in-law.

His sister, the beautiful Lucretia (1480–1519), was also accused of many crimes. These alleged crimes tend today to be traced to others such as her father and brother. She had an illegitimate child at 17, her first husband was forced to divorce her first, and her second husband was assassinated. In 1502, she married the heir to the duchy of Ferrara, Alfonso, and the marriage was fairly happy and uneventful. She rose above her past, became a mother of four children, patronized artists such as Titian, did works of charity, and led a respectable life. She died in 1519 in childbirth, but her legend endures.

The Spanish branch of the family became dukes of Gandia after Giovanni's assassination in 1497 and was less notorious. One member served as a viceroy of Peru. However, the most famous member of this branch who died out in the 18th century was St. Francis Borgia. An able administrator, he entered the newly formed Jesuit order in 1546. He became an itinerant preacher and supervised the order in Spain, Portugal, and the Indies. In 1565, he

Cesare Borgia confers with Niccolò Machiavelli in this reproduction of a painting by Faraffini. Cesare was said to be a model for the kind of ruler Machiavelli described in his famous treatise on government, The Prince.

became the head of the order and wrote a number of influential texts. He led an exemplary life and was canonized in the following century.

NORMAN C. ROTHMAN

Bourbon dynasty in Latin America

In 1700 Philip V became king of Spain and inaugurated the House of Bourbon, which was to rule Latin America until Napoleon deposed King Ferdinand VII in 1808 and put his (Napoleon's) own brother, Joseph, on the Spanish throne. In the events that followed, all of Latin America gradually gained its independence.

When Philip V became king of Spain the Spanish dominions in the Americas were divided into two viceroyalties—the VICEROYALTY OF NEW SPAIN and the VICEROYALTY OF PERU. New Spain consisted of the Viceregal Audencia of Mexico (established in 1529) and the interlinked Audencias of Santo Domingo (1511),

Panama (1538), Guatemala (1544, as Audencia de los Confines), Manila (1583), and Guadalajara (New Galacia) (1549). Thus it controlled Mexico, the Spanish Caribbean, Central America, and the Philippines. The Viceroyalty of Peru included the Viceregal Audencia of Lima (1542), the Audencias of Santa Fé de Bogotá (New Granada) (1549), Chile (1609), Buenos Aires (1661–71), Characas (1559), and Quito (1564). The *audencias* were further divided into provinces.

Strictly speaking the two viceroyalties held the same position as the kingdoms of Valencia, Catalonia, Aragon, León, and Castile. All colonial matters since 1524 had been decided by the Royal and Supreme Council of the Indies, and this process continued until 1714 when most functions were assumed by the Ministry of Marine and the Indies, although the council remained in existence until 1834.

The Bourbon rulers in Spain always felt that their American colonies could deliver more in tax revenue. Philip V (r. 1700/01–1724, 1724–46) started a campaign to reorganize the administration, assume greater control, and increase trade. One of the greatest handicaps to trade with South America was that goods from Spain to the Americas had to go through Lima. This led to emerging centers for contraband. The most important of these was the town of Colonia, founded by the Portuguese in 1680 on the east bank of the Río de la Plata (River Plate), directly opposite Buenos Aires. From there Spanish, Portuguese, and British goods were smuggled across the river while the city authorities in Buenos Aires proclaimed themselves helpless to deal with the problem.

SAILING REGULATIONS

In 1720, measures were introduced to regulate the sailing of ships to remove the need for people to buy smuggled goods. During the 1720s and 1730s, there was a rebellion in Paraguay with settlers attacking the Jesuit privileges. The religious order had established communes (known as *reductions*) in southern and eastern Paraguay and the low prices of their crops undercut many small farmers. The Comunero Revolt saw many farmers march on Asunción and the governor, José de Antiquera, refuse to accept a new governor sent from Lima. However the rebels were ousted by Indian levies from the Jesuit *reductions*.

A force from Buenos Aires arrived in 1724, and two years later Antiquera was captured. At the same time there was also a small rebellion among the ARAUCANIAN INDIANS in southern Chile. In 1736–37, there was also a small rebellion led by Juan Santos with Indians rebelling

against harsh conditions in mines in central Peru. The rebels damaged the city of Oruro but then dispersed. A more serious conflict broke out in 1735 when the Spanish took advantage of being on the opposite side to Portugal in the War of the Polish Succession. A small Spanish force from Buenos Aires captured Colonia, but two years later the British persuaded them to return it.

The task of reforming the colonial administration was left to Philip V's successor, Ferdinand VI (reigned 1746–59). He established the Viceroyalty of New Granada in 1739 with a viceroy taking up the position in the following year. However the Anglo-Spanish War of 1739–48 (known in England as the War of Jenkins' Ear) initially hampered links between Spain and its colonies. Further attempts were made to reduce smuggling but too much was at stake, especially in Buenos Aires, where people still objected to goods' having to be shipped through Lima. In the Treaty of Madrid of 1750 the Portuguese finally agreed to hand over Colonia, in return for taking the region of the Upper Paraná. When some Jesuits refused to hand over the latter, Portugal sent in soldiers who easily drove back the lightly armed Indians in the Jesuit *reductions*. As it felt that Spain had not honored its side of the treaty, the Portuguese held on to Colonia. This caused Charles III of Spain to annul the treaty in 1761 and send in soldiers, who finally captured Colonia in 1762. Smuggling, however, continued.

SEVEN YEARS' WAR

The Seven Years' War (1756–63) resulted in a humiliating defeat for Spain. It had stayed out of the war for the first three years, and when in 1760, it entered the conflict, the British attacked the Philippines and Cuba, taking both territories. Spain did manage to take most of the Banda Oriental (now Uruguay). Both the Philippines and Cuba were returned at the Treaty of Paris at the conclusion of the war, but Spain conceded Florida to the British. The easy losses that Spain sustained at the hands of the British illustrated the military vulnerability of Spain's American colonies. King Charles III (r. 1759–88) decided to push ahead with further administrative reforms.

One of the first measures was to increase taxes to help pay for the costly and futile involvement in the Seven Years' War. In 1765, people in Quito rioted. The colonial administration held firm, and in 1776 Charles III created the Viceroyalty of Río de la Plata, with a viceroy taking up the position in 1778. It covered modern-day Argentina, Bolivia, Chile, Paraguay, and Uruguay and eroded further the power of the Viceroyalty of Peru. This move followed a delineation of the land boundary

between Portuguese Brazil and the Spanish territories that confirmed the east bank of the River Plate, covering modern-day Uruguay, as Spanish. Buenos Aires was made capital of the Viceroyalty of Río de la Plata, and the important silver mines in Upper Peru (modern-day Bolivia) were given to the new viceroyalty. Trade was now allowed to come from Europe. In one stroke, smuggling was reduced and the revenue from tariffs increased.

Gálvez, fresh from his triumphs in Mexico, returned to Madrid and was appointed minister of the Indies in 1776. He sent officials who worked on increasing revenue, bolstering defenses, and helping increase agriculture and mining. One of the first changes was the Law of Free Trade in 1778, which enabled one part of the Spanish Americas to trade with another more easily. This further reduced smuggling. Gálvez then introduced the position of *intendant*. This person worked in the Americas but was directly responsible to the Spanish Crown, not the viceroy, so was able to give an independent report on events in the Americas. An intendant was introduced in the Viceroyalty of the Río de la Plata in 1782, in Peru two years later, and finally, in 1786 in New Spain.

Although these moves followed the economic liberalization that was taking place in Europe, the government in Spain also introduced new laws that served to destroy much of their support in the Americas. New laws reduced the ability for governors to appoint officials. Massive dissent arose, some of it leading to talk of rebellion and even moves for independence.

This coincided with the Tupac Amaru rebellion; the great-grandson of Inca leader Tupac Amaru rallied his followers near CUZCO in modern-day Peru. He led the first major uprising against the Spanish in two centuries. At its height tens of thousands of Indians joined the rebellion with the Spanish having to send in large numbers of soldiers to restore colonial rule at the cost of thousands of lives. The rebellion was brutally crushed.

The Tupac Amaru rebellion also showed that there might not be enough Spanish soldiers in Latin America should another large rebellion or external invasion take place. Furthermore a brief stand-off with the British over the Falkland Islands in 1771 had ended when France indicated itself not willing to give military assistance to Spain. In 1715, there were only 500 soldiers in Buenos Aires. These were largely for protection of the governor and in case Portuguese from Colonia caused trouble. In 1765, the numbers had been increased to 5,500 and 7,000 in 1774. The same happened in Asunción, Santiago, Caracas, Quito, and Bogota. In 1776, the Spanish were suf-

ficiently strong to take back Colonia; at the Treaty of San Ildefonso, Colonia, and the Banda Oriental was awarded to Spain forever.

Spain's involvement in the American Revolution was expected to have brought greater wealth to the Spanish colonies. However, as with the French, it was a costly venture and although it broke up the British Empire in the Americas, it left both Spain and France with large bills to pay. Furthermore exposure to the ideas of democracy affected soldiers like Francisco de Miranda (1750–1816), who, after time in the United States, served in the French Revolutionary Army before trying to free Venezuela from Spanish rule. When Spain sided with France against Britain in the first part of the Napoleonic Wars, 1796–1808, some people in the Americas saw it as their opportunity to use the British to gain independence. Furthermore Britain at the time was unable to sell any of its goods to Europe because of Napoleon's rigorously enforced "Continental System" and thus also had a commercial motive in South American independence. When Napoleon ousted the king of Spain and placed Joseph Bonaparte on the throne, the days of Bourbon rule in Spain were numbered.

JUSTIN CORFIELD

Boyne, Battle of the

After JAMES II of the HOUSE OF STUART was forced off the throne of England in the GLORIOUS REVOLUTION of 1688, he sought to regain his fortunes in Ireland. James went into exile in France in January 1689, as a guest of LOUIS XIV, the king of France. After his Protestant daughter Mary and her husband, William of Orange, stadtholder of Holland or the Netherlands, were secure in England, Scotland and Ireland were still largely favorable to the Stuarts. In Ireland, the Catholic population favored James II, who was a Roman Catholic. Regardless

of the regime change in London, among the Irish Catholics, James II was still “Rígh Seamus” (King James).

Louis XIV firmly supported James when he landed in Ireland at Kinsale in March 1689. Not only did Louis XIV see this as a real “second front” in his struggle with William, but he also seems to have been personally committed to James’s cause. In England William and Mary had to support the Protestant succession to the throne, but the Irish Parliament James summoned came out for freedom of conscience.

One of the causes of the Glorious Revolution was that James was building an Irish army in Ireland to offset the forces in England that were more under the control of the Protestant Parliament. Richard Talbot, the earl of Tyrconnell, had been charged in 1685 to form the Irish troops and ruled Ireland in the name of James as his lord-lieutenant.

Unfortunately, not enough authority was given to Patrick Sarsfield, a natural leader who inspired his troops quite beyond what Tyrconnell could do. This seems to have aroused Tyrconnell’s jealousy, which undermined James’s hopes of using Ireland as a launching point to regain England.

In August 1689, William sent an army across the Irish Sea to face James in Ireland. It was commanded by Friedrich Hermann, the first duke of Schomberg. Like Sarsfield, who had fought for the French in the Dutch War of 1672, Schomberg was a veteran of the wars in Europe. Ironically, Schomberg had fought in the French Army as well, but when Louis XIV revoked in 1685 the EDICT OF NANTES, giving toleration to French Protestants (HUGUENOTS), Schomberg left French service to become commanding general of the margrave of Brandenburg, Frederick William. In 1688, he accompanied William to England, and was there made the duke of Schomberg. However, his military record in Ireland proved disappointing to William.

William landed at Belfast on June 14, 1690. Having secured Ulster, the traditional Protestant stronghold of northern Ireland, William moved south toward Dublin, the heart of the Catholic south that supported James. On the strategic defensive now, James decided to meet William along the line of the Boyne River, using it as a natural defensive rampart against William’s southern advance. William’s army numbered about 36,000 men, while James could muster only about 25,000 men. Moreover, William’s army was given a strong boost by his Dutch Guards, veterans of the years of warfare against Louis XIV. On July 1, the two armies met along the banks of the Boyne. William decided to force a crossing of the river about four miles from the city of Drogheda.

William III, prince of Orange, at the Battle of the Boyne. William commanded a force of some 36,000 men during the conflict.

Immediately, the strategic deficiencies of James’s army showed themselves when William was able to open the battle with an artillery barrage from a cannon he took with him from England. James had no such strength in artillery. William, Schomberg, and other military advisers had decided to cross the Boyne at the village of Oldbridge, where there was some natural shelter for his troops. At the same time, part of the Williamite army made a feint north up the river, hoping to force a response from James to protect his line of retreat. In the morning of July 1, the troops began their march under Schomberg’s son, Charles de Schomberg. The fighting under Schomberg, while not decisive, succeeded in tying down some 6,000 of James’s soldiers.

Four hours after the combat had started in the north, William’s troops under Schomberg began the main crossing at Oldbridge, with the Dutch Guards bearing the brunt of the offensive. In what would become one of the most brutal battles of the era, the Dutch Guards, supported by regiments of French

Huguenots, forced a passage of the Boyne. They ran into stiff opposition from the Irish Guards when the earl of Tyrconnell led a charge of his cavalry down the slope of the river, adding their weight to the contest between the Dutch and Huguenots, and the Irish Guards backed by other Irish regiments.

For two hours, a savage fight followed, with neither side gaining the upper hand. The battle was so intense that the elder Schomberg spurred his horse into the thick of the fight to urge on the Dutch. In the heat of the moment, he had failed to put on his breast plate and was mortally wounded by Tyrconnell's Irish horsemen.

With the bulk of James's army now tied down in the north or at Oldsbridge, another Williamite column had crossed the Boyne to the south. At noon, William himself crossed the Boyne at Drybridge, a deep crossing spot. Meanwhile, James kept his attention riveted on the fighting at Oldbridge. With the appearance of William's fresh troops, James's Irish soldiers, who had been fighting furiously for two hours at Oldbridge, became seriously outnumbered. James and Tyrconnell began a withdrawal after almost three hours of continuous combat, covered by the sabers of Tyrconnell's Irish cavalry.

James's army made its retreat to Duleek, where the parts of the army that had confronted the young Schomberg were united with those from the main part of the battle at Oldbridge. Although William attempted a pursuit, he was stopped by the Irish. Although the war would continue until the Irish surrender at the Treaty of Limerick in October 1691, James II would never be able to recover the strategic initiative he had lost on the banks of the Boyne River in July 1690.

JOHN MURPHY

Braganza, House of

The House of Braganza (Bragança) in Portugal began in 1640 when João IV, formerly duke of Braganza, took the throne. The country had been controlled by the Spanish,

and João's action set off the war for Portuguese independence. The restoration dominated his reign and that of his sons, Afonso VI (1658–68) and Pedro II, prince-regent (1668–83) and king (1683–1706). The end of the war with Spain in 1712 allowed João V (1706–50) to focus on the creation of an absolute monarchy.

In 1640 Portugal was under Spanish control. The last Portuguese king, Sebastião, had died in 1578 and the two crowns united under PHILIP II of Spain (Philip I of Portugal). After years of discontent with Spanish rule, a group of provincial nobles convinced the duke of Braganza to accept the renascent Portuguese throne in 1640. The duke was the largest landowner in Portugal and overlord of some 80,000 people. He was crowned João IV on December 15, 1640. Philip IV of Spain, absorbed with mounting setbacks in the THIRTY YEARS' WAR and facing internal revolts such as the Catalan uprising, was unable to reconquer Portugal immediately.

The new Portuguese king was neither a brilliant nor a particularly charismatic figure. He was cautious and stubborn and had relatively modest ambitions. His position was not to be envied. The break with Spain created a host of political, economic, and religious problems. Spanish influence with the Holy See and Pope Urban VIII ensured that Rome would not recognize the new dynasty. By 1668, 20 of the 28 dioceses in Portugal and overseas had no legal prelate. Militarily, João IV's first task was to withstand the Spanish counterattack. The dismal state of Portugal's defenses made this difficult. Border fortifications had lapsed into disrepair during the HABSBURG period, the army was virtually nonexistent, and the once vaunted navy was in disarray. As a result, João adopted a largely defensive stance. João died in early November 1656, with the work of securing the dynasty and what remained of the empire still very much in doubt. This task would fall to his wife and sons.

Luísa de Gusmão was the sister of the duke of Medina Sidonia. Intelligent, ambitious, and unafraid of the implications of the break with Spain, she had demonstrated more support for the plot against the Habsburgs in its initial stages than had her husband. The revolution of 1649 had given her royal status and she was determined to maintain the future of her children and the dynasty. At home her main political problem related to the immediate succession. She had borne the king three sons: Teodosio (b. 1634), Afonso (b. 1643), and Pedro (b. 1648). From 1640 Teodosio had been groomed to succeed his father but he died of illness in 1653. Therefore, upon João's death, Afonso, a child of 10, was next in line to the throne.

One of the most enigmatic figures in Portuguese history, Afonso had evidently suffered some type of paralytic seizure early in life that left his right arm and leg partially paralyzed and may also have affected his thinking. He also displayed a profound lack of good judgment. Although the Cortes of 1653 had proclaimed Afonso the legitimate heir upon his brother's untimely death, there was considerable opposition to crowning him three years later. In the end, a compromise was reached. Afonso VI was proclaimed nine days after his father's death, while Luisa ruled as regent.

During her regency, the queen shared power with a group of conservative nobles who dominated the Council of State. She pursued policies at home and abroad that largely followed the priorities established by her husband. Unfortunately for her, the political, economic, and societal pressures engendered by the Spanish offensives of the years 1661–62 combined with increasing difficulties relating to the continuation of the regency to end her governance. In the spring of 1662, she was deposed by Afonso. She retired to a convent, where she died in 1666 without fully reconciling with her son.

The regency had done little to prepare Afonso for the demands of kingship. An impulsive and rebellious man, he spent most of his time riding, watching dog and cock fights, and carousing in the seamier districts of Lisbon. By 1667, his more restrained brother Pedro wanted both power and Afonso's wife, Maria-Francisca of France. On November 23, Afonso signed a document under pressure that surrendered royal authority to Pedro and his legitimate descendants. The Cortes recognized Pedro II in January 1668. He served as prince regent in deference to his imprisoned elder brother until 1683 and then became king until 1706. Pedro established peace with Spain in 1669 and began the age of ABSOLUTISM in Portugal by never summoning the Cortes after 1698.

João V (b. 1689), who took the throne in 1706 at the age of 17, was the son of Pedro and his second wife, Maria-Sophia-Elizabeth of Neuberg. An absolute monarch who saw LOUIS XIV as model, João spent considerable sums to glorify both Portugal and his reign. In 1742, he suffered an illness of the chest that effectively stopped his days as an active ruler. The country slid into decay. When João died on July 31, 1750, he was succeeded by his son, José I.

CARYN E. NEUMANN

Brazil, conquest and colonization of

The Portuguese conquest of Brazil was a complex, prolonged, and partial process that many scholars argue was never fully realized. Lacking large cities, a centralized political structure, and a common language, the estimated 2 to 3 million precontact indigenous inhabitants of the Brazilian coast and interior were divided into an intricate patchwork of ethnolinguistic groups and clan-based tribes. The principal coastal groups were Tupi-speaking peoples who had migrated into the area in the preceding centuries, displacing and absorbing existing groups. Seminomadic hunter-gatherers with intimate knowledge of the local environment, Tupi speakers were divided into numerous major branches and hundreds of autonomous bands, often in conflict with each other and other groups, and possessing great skill in the arts of war. Their principal weapon, often used with deadly effect, was the bow and arrow. Like other ethnolinguistic groups in the Americas, many Tupi-speaking peoples practiced ritual cannibalism in the most general terms, a cultural-religious practice acknowledging the spiritual power of slain enemies. The Portuguese used reports of ritual cannibalism to justify their invasion, slave raiding, and other excesses of violence, much as the Spanish had used the practice of ritual human sacrifice to justify their subjugation of the AZTECS in the CONQUEST OF MEXICO.

The first European explorer to sight the Brazilian coast was Portuguese noble PEDRO ÁLVARES CABRAL, in command of 13 ships headed around the southern tip of Africa to India, on April 22, 1500. Following a brief excursion on the beach, the expedition's chronicler, Pêro Vaz de Caminha, produced the first written report on the land and its people. Cabral sent one ship back to Portugal loaded with brazilwood, a red dyewood from which the later colony derived its name, and left behind two convicts to begin the process of mixing with the natives. The following year Florentine explorer AMERIGO VESPUCCI sailed along Brazil's southern coast. A number of French and Spanish expeditions followed. These initial contacts with the natives were largely peaceful, though here as elsewhere they resulted in the spread of European

A group of headhunters from the upper Amazon region in Brazil. Enslaving native peoples was the initial strategy of colonizers.

diseases against which native peoples had no biological immunity. These diseases led to rapid population declines in many areas long before Europeans arrived.

The years 1500–30 saw the growth of the brazilwood trade between Europeans and Brazil's coastal peoples. Relations between rival French and Portuguese traders soon degenerated into a series of violent clashes, with the French ignoring the TREATY OF TORDESILLAS of 1494, to which it was not a signatory. In the early 1520s, the Portuguese established a garrisoned trading station at PERNAMBUCO, where sugar cultivation was introduced in 1526. French-Portuguese hostilities along the coast intensified. In 1530, the Portuguese Crown responded by commissioning Martím Afonso de Sousa to begin the process of settlement and colonization, an expedition that in 1532 established the first permanent colony at São Vicente near modern São Paulo.

As conflicts with the French grew, in the mid-1530s King João III and his advisers devised the donatory system,

which divided the coastland into 15 sections or donatories that extended along imaginary boundaries west into the interior, each to be ruled by a captain or hereditary lord. Entrusting colonization to a handful of private individuals who would exercise full authority within their respective domains, the Crown hoped to secure its claims against its French rivals. Most donatories languished and failed, with São Vicente and Pernambuco seeing the greatest albeit limited success.

Important in this early phase of colonization were a small number of individuals who mixed with the natives and acted as cultural intermediaries between indigenous peoples and the Portuguese. Sailor Diogo Álvares ventured into the interior near Bahia in the early 1500s, married the daughter of the chief of the Tupinambá tribe, learned their language and culture, and changed his name to Caramurú.

By the 1530s, he had become a respected tribal chief-tain and from this position of authority worked to facilitate the process of colonization. That the Bahia captaincy failed was due mainly to poor administration and the settlers' failure to heed Caramurú's counsel regarding their interactions with the natives. Farther south, the settlement of São Paulo succeeded in large part by the efforts of Portuguese castaway João Ramalho, who had also married into a local tribe, the Goiana Tupinikin, and served as interpreter and intermediary. Portuguese colonists generally mixed with the local inhabitants to a greater extent than was true of other European powers, thereby facilitating subsequent cultural and linguistic melding of different ethnic and racial groups.

SUGAR TRADE

As the brazilwood trade faded, sugar became the colony's economic backbone. By the mid-1540s, two sugar-producing centers had emerged; one was around Pernambuco in the north, and the other was in São Vicente in the south. By this time, competition with French, Spanish, and other rivals had sharpened, prompting the Portuguese Crown to intensify colonization efforts. Consequently, the Crown would play a major role in the colony's economic development.

In 1549, Tomé de Sousa was appointed governor-general of Brazil at the head of a major expedition that included royal officials, artisans, soldiers, and Jesuit missionaries. Sousa established Salvador as the colony's capital. To the south, the French colony at the Guanabara Bay threatened Portuguese control of the southern littoral. In 1565–67, the Portuguese defeated and ousted the French colony and established the town São Sebastião de Rio de Janeiro. Sousa's successor Mem de Sá

(governor-general, 1558–74) consolidated royal control over these coastal population centers. Indigenous resistance to colonization intensified, particularly in consequence of slave-raiding expeditions organized by planters in the rapidly growing sugar industry. Indian counterattacks nearly destroyed the settlements of Bahia, Espirito Santo, and Ilhéus, and killed Brazil's first bishop, but could not stem the Portuguese tide.

The Jesuits played a key role in this early phase of colonization and in the centralization of royal authority. Though their numbers were never large (110 in all of Brazil in 1574), their economic, social, and cultural impact was huge. Young and aggressive, the Jesuit order (founded in 1540) was instrumental in establishing the town of São Paulo in 1557, and in facilitating generally peaceful relations between Indians and colonists in the south. Taking no vow of poverty, Jesuits made their missions (*aldeas*) self-supporting and profitable through farming, ranching, and related enterprises. They were also crucial to the colony's educational life. For most of the colonial period, Jesuit colleges in all the major towns served as the colony's principal schools.

By the mid-1500s, sugar planters considered that labor had become the colony's principal economic bottleneck. Land was plentiful, but sugar production in their view required a steady and reliable supply of bound labor. Enslaving native peoples was their initial strategy for meeting these rising labor demands. The period from 1540 to 1600 saw the most extensive use of Indian slave labor in Brazil's burgeoning sugar industry. By the late 1500s, disease and native resistance combined to make Indian slavery unable to meet sugar growers' labor demands, leading to conflicts among the Crown, sugar growers, and the Jesuits. The Crown tended to advocate the integration of Indians into the economy as free wage laborers; sugar growers promoted slavery; and Jesuits worked toward the transformation of Indians into a kind of smallholding or peasant class. Whose vision predominated hinged on a host of local and regional variables.

The transition from Indian to African slave labor was gradual, though by the early 1600s African slave labor dominated the sugar industry. The first Africans came as servants and sailors, while the first large-scale importation of African slaves did not begin until the 1570s. By the 1580s, the labor force on the 66 sugar plantations of Pernambuco is estimated at two-thirds Indian and one-third African slaves. In later decades, the proportion of African slaves grew, so that by 1600 Brazil's slave labor force was predominantly African.

Over the next 250 years, Brazil became the single largest recipient of African slaves in the Americas, especially the Northeast, the colony's principal sugar zone.

Brazil's European population remained overwhelmingly concentrated in coastal areas. All the major cities founded in the 1500s were ports, including Bahia, São Vicente, Olinda (1537), Santos (1545), Salvador (1549), Vitória (1551), and Rio de Janeiro (1565). The pattern continued well into the 1600s, especially in the north and along the lower reaches of the Amazon. The Brazilian population remained heavily concentrated in coastal areas through the colonial period and after. As European coastal populations swelled, migrations of Indian peoples away from the coast intensified, producing a ripple effect throughout the interior. In 1585, São Paulo colonists officially authorized slave-raiding expeditions, and for the next 150 years the *BANDEIRANTES* hunted Indian slaves across much of Brazil in the service of Paulista sugar planters. From the 1550s on, a series of epidemics ravaged Indian populations, including those of 1552 around Bahia, 1554 around São Paulo, Espirito Santo in 1559, and continuing through the colonial period.

Further impelling the Portuguese Crown to consolidate its hold on the colony was the Dutch presence in the Northeast, from the 1620s until their expulsion in 1654. The discovery of gold in present-day Minas Gerais in the mid-1690s led to a gold rush in these regions from 1700 to 1760, while discovery of diamonds in the same region in the 1720s further propelled expansion into the interior. Many escaped African slaves also escaped into the interior, sometimes forming *MAROON SOCIETIES* of runaway slaves, called *quilombos*. The largest and most resilient, Palmares, endured through most of the 1600s. By 1700, the population of the colonized areas was an estimated 300,000, with 100,000 whites, 150,000 mostly African slaves, and 50,000 free blacks, Indians, and mixed-race groups.

Colonial Brazil's first 250 years set in motion a series of patterns and processes that profoundly shaped the subsequent development of Brazilian society. Especially important in this regard were the formation of an export-oriented economy (most notably brazilwood, sugar, gold, and diamonds); stark divisions of race and class; highly unequal landownership; a substantial degree of racial and ethnic intermingling, particularly among the lower classes; the gradual movement of the frontier of settlement westward; the subordination of Indian and African peoples within a relatively rigid social hierarchy; and the existence of vast unconquered lands beyond the western and northern frontiers.

MICHAEL J. SCHROEDER

Brest, Council of

The Council of Brest took place in the city of Brest, in modern-day Belarus, on June 1, 1596. It produced a “union of the churches,” an agreement between the Roman Catholic Church and Eastern Orthodox Christians who lived in modern-day Belarus, Poland, and Ukraine.

During the 16th century, a large number of Eastern Orthodox Christians found themselves living within the expanding Polish-Lithuanian Commonwealth. The Church of Kiev, historically a center of Byzantine Christianity, had avoided formally breaking ecclesial communion with either Rome or Constantinople after the Great Schism of 1054. The leader of this church, Metropolitan Isidore, had been an active participant in the Council of Florence (1438–39), which sought the reunion of all the Eastern Churches with Rome. In much of the Polish-Lithuanian Commonwealth, memory of the Council of Florence Union continued to guide church relations. For example, there are a number of extant letters of complaint between Kiev and Rome that refer to the directives of the Council of Florence.

Metropolitan Michael (Ragoza) of Kiev and a number of his colleagues began negotiations with Roman Catholic authorities and King Sigismund III of Poland in 1594. The Orthodox Church hierarchy wished to have the protections and privileges enjoyed by the Roman Catholic hierarchy. The Orthodox were facing discrimination and pressure from the local Protestant and Roman Catholic landholders and nobility. The hierarchs wished protection from these forces, and the Polish king wished to lessen the growing influence of Moscow upon the Orthodox faithful. The king promised the Orthodox hierarchs the same privileges the Roman Catholic hierarchs received. He also promised to preserve the Orthodox faith, rituals, and customs. These guarantees were proclaimed by the king on August 2,

1595. Pope Clement VIII accepted the union with additional conditions. The Orthodox hierarchs accepted the agreement at a subsequent synod held in Brest in 1596. While the Union was accepted by the bishops of Vladimir, Lutsk, Polotsk, Pinsk, and Kholm, it was rejected by the bishops of L'viv and Przemysl (ironically two of the centers of the Greek Catholic Church today) and numerous Orthodox monastics and laypeople. These laypeople formed religious brotherhoods led by Cossacks opposed to the Union and sought new Orthodox bishops from Constantinople.

The strongest reason for opposition to the Union was the belief that such an agreement would lead to the destruction of the autonomy of the Kievan Church and restrictions on its traditions, liturgy, and faith. Sadly all of these consequences eventually came to pass.

The success or failure of the Union was largely based on the strength of the Polish-Lithuanian Commonwealth, and later the Kingdom of Poland. After the partitions of Poland by Prussia, Russia, and Austria, the Union was violently abused under the Russian Empire. The Union continued to prosper within the Austrian Empire, however, and became centered in the Galician capital of L'viv. Today the largest of the Eastern Catholic Churches, the Greek Catholic Church in Ukraine (or Ukrainian-Greek Catholic Church), is the successor of the Union of Brest. Fifty years later, another agreement called the Union of Uzhorod, uniting the Orthodox Church of Mukachevo with the Roman Church, was extensively based on the Union of Brest.

British North America

Italian merchant JOHN CABOT'S 1497 voyage from England west to what is now Newfoundland, Canada, was Europe's first contact with North America since the Vikings. Cabot's feat intensified English attention to the

In an engraving by John Hall published in 1775, William Penn is shown standing (center, right) as he negotiates with local Native Americans. Penn founded the colony of Pennsylvania in 1681 for those fleeing religious persecution.

New World, yet for more than a hundred years, England would trail Spain and other European nations in exploring and exploiting the hemisphere. By 1750, however, Britain, having overcome a multitude of political, religious, and economic crises, was poised to dominate North America.

EARLY UNDERTAKINGS

During the reign of Queen ELIZABETH I, two efforts to establish English colonies in America ended in failure and death. In 1582, Sir Humphrey Gilbert personally led a large crew across the Atlantic to reclaim Cabot's Newfoundland for the queen. Its unfavorable climate and competition from Spanish and Portuguese fishermen dampened Gilbert's hopes. On the voyage home less than a year later, Gilbert perished in an Azores storm.

Somewhat more successful was SIR WALTER RALEIGH, Gilbert's half brother, and, for a time, a court favorite. Raleigh mounted a new colonial project in 1585, send-

ing five ships bearing a hundred colonists to Roanoke Island, off the North Carolina coast. When these settlers abandoned their mission in 1586, a second group was shipped to Roanoke, including the parents of Virginia Dare, who was, in 1587, the first English child born in North America. By 1590, a series of reprovizioning and rescue missions were reporting that the colony had disappeared, leaving generations of historians to argue whether Indian warfare, internal clashes, famine, disease, or some combination of these had wiped out Raleigh's colonial ambitions.

As the 17th century dawned, England, despite its 1588 defeat of the SPANISH ARMADA, followed by other triumphs over Spain, was still scarcely a presence in North America. At home, rapid population growth and policies that forced subsistence farmers off the land, combined with REFORMATION-fueled religious conflicts, were creating both crisis and opportunity. British colonization in America emerged as a patchwork process that sent royal

courtiers, London investors, religious dissident families, and the desperately poor across the Atlantic in search of profits and new hope.

COLONIAL “PLANTATION” BEFORE 1660

Britain’s eventual dominion in eastern North America started unpromisingly in 1607 when JAMESTOWN was founded in the region Raleigh had earlier named “Virginia” for Elizabeth I, the presumed “Virgin Queen.” Disciplinary measures imposed by soldier-adventurer John Smith, followed by John Rolfe’s 1614 introduction of TOBACCO cultivation, eventually saved Jamestown, although major crises continued. Finding capable colonists in this wild and dangerous land remained difficult; Virginians turned to INDENTURED SERVITUDE and eventually slavery for their labor needs.

As religious conflict deepened in the mother country, British dissidents of varying faiths sought refuge, influence, and livelihoods in North America. In 1632, MARYLAND was founded near Virginia by George Calvert, the first baron Baltimore, a recent convert to Catholicism. He was granted a proprietary charter by King CHARLES I, whose wife was Catholic. Together, Virginia and Maryland composed the Chesapeake region and survived with similar economies based on tobacco and coerced labor.

Meanwhile, in the MASSACHUSETTS BAY region other dissenting Englishmen deliberately sought exile from what they saw as a religiously and politically corrupt homeland. The Pilgrims, who made their way to Plymouth in 1620, and the PURITANS, who began arriving in large numbers in 1630, sought to create a religious commonwealth that would serve as a “light to the world” and end the reign of the hated STUART monarchy. Shrewd Puritan investors managed to assemble a joint-stock company that won Crown authorization to claim New England land. By the 1640s, more than 20,000 English men and women were living there.

Although more socially stable and economically diversified than the Chesapeake, the growing Puritan religious state experienced problems that fractured Massachusetts Bay. JOHN WINTHROP’s leadership soon sparked internal religious dissent, led by ROGER WILLIAMS and ANNE HUTCHINSON, resulting in their 1635–36 banishment to Rhode Island. Religious differences and a desire for more land led Thomas Hooker and others to relocate in 1636 to what became Connecticut.

With the end of the CROMWELL Commonwealth and the Restoration of King CHARLES II in 1660, Britain hit its imperial stride in the New World. Between 1660 and 1732, all the colonies that would eventually break away in the American Revolution came into existence or were

wrenched from European rivals. Additionally, the British made significant inroads in the Canadian Maritime regions east of NEW FRANCE.

In 1664, as part of a consolidation of royal power, Charles II sent a fleet of ships to seize lands along the Hudson River that had been claimed in 1609 by the Dutch West Indian Company and settled by Dutch colonists. NEW NETHERLAND, soon renamed New York, was the king’s gift to his brother James, duke of York, who became King JAMES II in 1687. As sole proprietor of a territory that also included New Jersey and Delaware, the duke ruled autocratically, parceling out some of his holdings to favored friends. Although he was also the duke’s personal friend, WILLIAM PENN in 1681 became a very different kind of proprietor when, in payment of debts owed Penn’s late father, the king granted him an extensive holding named Pennsylvania. To the dismay of family and his royal connections, Penn had become a member of the Society of Friends, known scornfully as “Quakers,” and his “Holy Experiment” made Pennsylvania a refuge for Friends and others fleeing religious persecution.

In 1663, Charles II rewarded eight men who had supported his return to the British throne by granting them a proprietorship that they promptly named Carolina, Latin for *Charles*. By 1670, Carolina was peopled mainly by Virginians, moving south for better or more expansive lands, and Englishmen from West Indian sugar plantations.

This territory became the first in North America to depend heavily on slave labor from its inception. Within 20 years, the colony was profiting from such warm-weather commodities as cotton, indigo, timber, cattle, and rice. By the early 1700s, African slaves outnumbered white settlers in this “Rice Kingdom.”

At its founding in 1732, Georgia was quite unlike other British colonies. Located between Carolina and Spanish-controlled Florida, it had a royal charter from King GEORGE II that allowed English general James Oglethorpe to fulfill his philanthropic dream of resettling poor British immigrants. To assure the virtue of these worthy poor, this new colony’s overseers forbade alcoholic beverages and banned slavery. By 1750, however, Georgia had become a slaveholding society, much like neighboring Carolina.

MIX OF RELIGION AND GOVERNANCE

Britain’s North American colonies began as a hodgepodge of religions, forms of governance, and economic systems. Clinging mainly to the continent’s eastern seaboard, colonists of different regions and settlement

histories had little to do with one another. As Britain began to consolidate its imperial power and goals in the period of political stability that followed the GLORIOUS REVOLUTION of 1688, its colonies experienced enormous population growth and new social and political challenges both within colonial society and in dealings with the “Mother Country.”

In 1651, during Cromwell’s regime, Parliament passed its first Navigation Act, designed to assure that growing colonial holdings, including those in North America, would produce wealth only for Britain’s benefit and not for its European rivals. Many more navigation acts would follow. These MERCANTILIST laws attempted to control both agricultural and manufactured goods. Many colonists, including plantation owners and New England shipbuilders, were enriched, but these laws also restricted colonial growth and trade initiatives.

As part of its aggressive commercial policy, Britain, by the 18th century, had become the world’s major trader in African slaves, surpassing the Dutch. Although the majority of slaves were destined for the sugar islands of the Caribbean, almost three hundred thousand slaves were “delivered” to the North American colonies between 1700 and the outbreak of the American Revolution. Slave importation outstripped robust immigration of whites. No longer suffering a manpower glut, England discouraged emigration by its own people (with the exception of convicted criminals) but wooed colonists from many countries, including France, the Netherlands, and German principalities, often offering religious freedom and British citizenship.

As colonial populations increased and competed, issues of governance and home rule emerged. Many colonies had set up assemblies—Virginia’s House of Burgesses of 1619 was the first—to deal with local political problems. These were by no means representative elected bodies, but were dominated by large landowners and other men of importance. Colonies that traced their origins to proprietors (like Calvert and the duke of York) tended to have more autocratic governments. The New England colonies generally allowed broader participation in political decision making. Quaker Proprietor William Penn’s policies allowed more than half of Pennsylvania’s male population to have some political say. Royal governors, chosen by the king or Parliament, would often override local assemblies’ intentions. As colonial populations grew in the 1700s, so too did their thirst for effective political power. Between the Glorious Revolution and the French and Indian War, assemblies in Pennsylvania, New York, Virginia, South Carolina, and Massachusetts often contested royal prerogatives and frequently had their way. Colonial legislators asserted their rights as British citizens to participate in lawmaking.

But European powers also made alliances with tribes, hoping to recruit their military aid against other tribes allied with their rivals. The powerful Iroquois Confederacy, centered in New York and Pennsylvania, had once helped the Dutch, but later became an important British ally during KING PHILIP’S WAR. The Iroquois would help British and colonial forces attack the French and their set of Indian allies in the run-up to the 1754 French and Indian War.

By 1750, although not unchallenged, Britain’s North American empire was near its zenith. Britain’s mastery of the continent would soon be enhanced by its smashing

Wars with Indian tribes were a constant from the earliest years of British incursion in North America. In 1622, Opechancanough, the chief who succeeded his brother, Powhatan, became convinced that whites had no intention of leaving. He and his men attacked Jamestown, killing 300 settlers. In 1675, Wampanoag chief Metacom, known to New Englanders as King Philip, launched a major but ultimately unsuccessful effort to drive out the rapidly growing white population. Twelve towns in Massachusetts were destroyed; a thousand whites and three thousand natives perished. At almost the same time, Virginians desperate for land were killing local Indians in an uprising known as BACON’S REBELLION.

By 1750, although not unchallenged, Britain’s North American empire was near its zenith. Britain’s mastery of the continent would soon be enhanced by its smashing

By 1750, although not unchallenged, Britain’s North American empire was near its zenith. Britain’s mastery of the continent would soon be enhanced by its smashing

victory in the coming war with France. Yet from that victory grew the seeds of colonial rebellion that would, before the end of the century, lose Britain a major portion of North America.

MARSHA E. ACKERMANN

Bull of Demarcation

CHRISTOPHER COLUMBUS's first voyage to the Americas threatened to intensify the rivalry between the Catholic kingdoms of Spain (Castile) and Portugal into open warfare. Both kingdoms wanted to claim all newly discovered lands that were not Christian, that is, not Catholic. The Line of Demarcation was Pope Alexander IV's solution to this problem. He issued the Bull of Demarcation to prevent Spain and Portugal from battling over new territories with resources such as gold. The bull successfully prevented a war between Spain and Portugal in the 16th century.

Neither the pope nor the Spanish or Portuguese actually knew what this line was dividing. The knowledge of the lands west of Europe was sketchy, and most people thought that the land Columbus had reached was part of Asia. The pope may have believed that the Spanish would reach the same lands sailing west over the Atlantic that the Portuguese would reach sailing east around Africa. Previously in 1455, 1456, and 1481, popes had issued bulls about newly discovered land, although they had no knowledge of the actual geography of the earth.

The Roman Catholic nations left out of these bulls, including the French and Dutch, paid no attention to the papal decrees. The power of the Catholic Church in the Middle Ages had guided all international affairs in Europe up to the 15th century. France and Holland ignored the document, showing that the temporal power of the church was waning.

When Columbus returned from the Americas, he stopped in Portugal before going to back to the court of FERDINAND V AND ISABELLA I OF SPAIN. King João II of Portugal claimed the lands Columbus told him

about even though the explorer had sailed for the Spanish monarchs. Ferdinand and Isabella appealed to Pope Alexander VI, a Spaniard, for a solution. He issued the *Inter caetera*, the papal Bull of Demarcation, which was very biased toward Spain. This document conferred all non-Christian lands found west of the designated line to Spain to explore and convert to Christianity. Portugal was to have all non-Christian lands east of the line. This decree in principle shut the Portuguese out of the Americas.

Dissatisfied, the Portuguese appealed to both the pope and Spain. Two more papal bulls followed—*Examinae devotionis* and another *Inter caetera*. These documents drew a line 100 leagues west of Cape Verde Islands. Discoveries east of the line were to belong to Portugal, and discoveries west of the line were to belong to Spain. This resulted in Spain's domination of all of South and Central America except Brazil, which the Portuguese claimed. The TREATY OF TORDESILLAS modified the papal bull in 1494.

The Bull of Demarcation and later decrees gave the rights to colonize, exploit, and convert all non-Christian territory to Catholicism. These decrees treated all newly discovered nations and people as property and disregarded all non-Christian governments the Catholic explorers found.

Later the church realized these bulls were the cause of the enslavement and brutalization of native peoples and tried to emphasize peaceful, noncoerced conversion to Christianity. But it was too late; the system of Europeans' forcibly taking control of non-Christian lands was already entrenched in the Americas, Africa, and Asia.

There have been modern movements for the revocation of these papal bulls. Indigenous peoples feel they were used for the subjugation of non-Christian indigenous peoples and should be rescinded to reflect modern thinking. Certainly, the leaders in Rome could not have foreseen the horrendous decimation of native peoples that the conquest by the European powers caused. The Falkland War of the 1980s was in part justified by Argentina's claim that the Falkland Islands is based on the *Inter caetera*. However, the Treaty of Madrid in 1750 annulled the boundary line.

NANCY PIPPEN ECKERMAN

Bushido, Tokugawa period in Japan

When TOKUGAWA IYASU defeated Ishida Mitsunari at the Battle of Sekigahara in October 1600, Bushido, the "way of the warrior," which his victorious samurai followed, was just reaching its apogee. (*Bushi*, which means "warrior," is another term used interchangeably with *samurai*, which means "one who serves [a lord].")

It is an unwritten code that governed the lives of the upper-class warrior and was more severe than the law code governing the common people. In 1603, Tokugawa was recognized as the shogun, or military ruler of Japan, by Emperor Go-Yozei. A samurai served in the household of a *daimyo*, or lord. A samurai whose lord's line was extinct became a *ronin*, or masterless samurai. As a result of prolonged warfare between lords before 1603, there were many *ronin* in Japan.

Bushido's origins can be traced to the first appearance of Zen Buddhism in Japan in the 12th century. Zen Buddhism was widely adopted by an emerging warrior class.

Zen gave samurai the moral and intellectual strength to follow a demanding calling in life, for which only death could free the true warrior. Bushido emphasized strict loyalty to one's lord, even to the point of death in battle. And, if faced with disgraceful surrender, Bushido called for the samurai to meet death by his own hand. In *seppuku*, commonly called *hara kiri* in the West, a samurai disemboweled himself with a short dagger, after which a trusted friend or comrade, acting as his second, would sever his head with a blow of his sword.

Bushido also demanded the samurai lead a clean and honorable life, protect the weak, abstain from riotous living and drunkenness, conscious that he was the representative of the daimyo he served, whose heraldic badge was always displayed prominently on his clothing. Aside from giving him a code of honor, Bushido made the samurai a fearsome warrior with his sword. He strove for mental discipline achieved through swordsmanship akin to that achieved through the pursuit of Zen.

Perhaps the greatest statement of Bushido and the sword in the Tokugawa period is found in 1716's *Hagakure*, or "hidden leaves." It is a compilation of the

A *ronin*, or masterless samurai, fends off arrows in this Japanese print. The study of samurai philosophy continues today.

philosophies of Yamamoto Tsunetomo that was sanctioned by the Tokugawa shoguns for its accurate representation of the prevailing philosophies during its reign. It blended the discipline and insight of Zen with the ancestor worship taught by Confucianism.

JOHN MURPHY

Cabeza de Vaca, Álvar Núñez

(c. 1490–1557) *Spanish explorer of America*

Álvar Núñez Cabeza de Vaca was the first European to see and travel through the U.S. Southwest and author of one of the most remarkable tales in the history of exploration. He and several companions survived a shipwreck off the Texas coast in 1528, were enslaved by Indians, escaped, and spent the next eight years wandering westward through Texas, New Mexico, Arizona, and possibly California before turning south into Mexico and reuniting with their countrymen. His official report of this remarkable odyssey of some 6,200 miles, submitted to the king under the title *La Relación (The Account)*, was published in 1542. His report stirred the Spanish imagination with its speculations about the fabled “Seven Cities of Cibola,” which he claimed lay just to the north of the lands through which he had journeyed, while also providing modern-day scholars with an unprecedented glimpse into Native American society and culture before the Spanish invasion and conquest of portions of the U.S. Southwest after 1550.

Born in Jérez, Andalusia, Spain about 1490, Álvar Núñez was the grandson of Pedro de Vera, renowned for his ruthless conquest of the Canary Islands in the early and mid-1400s. (*Cabeza de vaca*, or “cow’s head,” was an honorific title bestowed on his mother’s side of the family from an incident in the reconquest of Iberia dating to the year 1212; this explorer is often referred to simply as Álvar Núñez.) After a distinguished mili-

tary career in Spain from 1511 to the 1520s, in 1527 he was appointed second in command of an expedition of conquest in Florida led by Pánfilo de Narváez. It was Narváez’s bungling leadership, along with bad luck and bad weather, that eventually led to the shipwreck off the coast of Texas, whence the Cabeza de Vaca’s overland odyssey commenced.

Certain features of Cabeza de Vaca’s *Relación* have received particular attention. One concerns the customs and lifestyles of the indigenous peoples whose paths he and his companions crossed. Descriptions of their foods, material cultures, gender relations, marriage rites, celebrations, religious beliefs and practices, languages, methods of warfare, and relations with other groups captivated European readers. Cabeza de Vaca’s personal transformation is another element of the book that readers find striking. Stripped of the accoutrements of European civilization, Cabeza de Vaca grows humbler, more spiritual, and more appreciative and sympathetic with his native hosts. His journey has thus been interpreted as both a literal journey across unknown lands, and an inner spiritual journey in which he comes to acknowledge the humanity of the Indians. This is reflected, some maintain, in the reputation he and his companions earned as healers. Time and again they reportedly cured the ailments of those soliciting their assistance, an aspect of his *Relación* that has aroused considerable attention. In the 1930s, the scholars Carl Sauer and Cleve Hallenbeck attempted to retrace Cabeza de Vaca’s overland journey. Hallenbeck’s account is still considered the definitive study on the topic.

After reuniting with his countrymen and returning to Spain in 1537, Cabeza de Vaca was appointed governor of the Río de la Plata region. Undertaking further remarkable overland odysseys in South America, he ran afoul of the authorities, was imprisoned for two years, and was sent back to Spain, where he was found guilty but pardoned by the king. His odyssey inspired an award-winning film (*Cabeza de Vaca*, 1991), further testimony to the enduring interest inspired by his extraordinary odyssey as described in his *Relación*.

MICHAEL J. SCHROEDER

Cabot, John (c. 1451–c. 1498) and Sebastian (c. 1483–1557)

European explorers

Key figures among the European explorers during the age of discovery whose exploits gave important knowledge of the Americas to their European patrons, John Cabot (c. 1451–98) and his son, Sebastian Cabot (c.

John and Sebastian Cabot are credited with the discovery of North America, although their exact landing spot is not known.

1483–1557), have long been a source of controversy and speculation regarding various aspects of their lives and achievements. Probably born in Genoa around 1451, John Cabot moved to Venice in his youth, where he became a naturalized citizen. Believing, like CHRISTOPHER COLUMBUS, that he could reach the Far East by sailing west, he journeyed to England in the 1480s, residing mainly in Bristol until March 1496, when KING HENRY VII granted him the authority to launch an expedition of discovery in his name. Sailing from Bristol on May 20, 1497, with one ship and a crew of 18, he reached the North American coast on June 24. It is not known whether his son, Sebastian, accompanied him.

The precise location of his landing is a matter of some dispute but is generally believed to be Cape Breton Island. Cabot is conventionally credited with “discovering” North America on behalf of his English patrons, even though the fish-rich seas off the coast of northern North America had been visited for most of the previous century by commercial fishermen of various European nationalities. Regardless of which European first sighted the North American mainland during this era, Cabot’s claims of discovery became the basis for English claims to North America.

Rewarded for his discovery with an annual pension of 20 pounds, Cabot launched a second voyage in 1498. He was never heard from again and is presumed to have died in or near North America. His son, Sebastian, also received a patent from the king of England to continue the explorations begun by his father. Searching for the fabled Northwest Passage through the Americas to the Far East, he is generally believed to have explored the northern shores of North America, perhaps sailing as far as Hudson Bay, in 1508–09. In 1512, he switched patrons, entering the Spanish service under Holy Roman Emperor CHARLES V. In 1518, he was named chief pilot, and in 1526, following the return of the ship of FERDINAND MAGELLAN, he sailed to the Río de la Plata region of southern South America, probably searching for gold and other treasure.

In 1530, after the expedition had largely failed, he returned to Spain. In 1548, he switched patrons again, returning to England and in 1553 becoming governor of a joint-stock company, later known as the Muscovy Company, much of whose capital was expended in the failed effort to discover the Northwest Passage. One of the company’s expeditions did reach the White Sea, culminating in a commercial treaty with Russia and substantial weakening of the Hanseatic League. Sebastian Cabot claimed for himself many of the discoveries and

achievements of his father. Until the work of 19th-century scholars, it was thought that Sebastian, not John, had “discovered” North America for the English.

MICHAEL J. SCHROEDER

Cabral, Pedro Álvares

(c. 1460–1526?) *Portuguese explorer*

Commissioned by the king of Portugal Manuel I to follow the route of fellow Portuguese navigator VASCO DA GAMA around the Cape of Good Hope on a major trading expedition to India, the nobleman Pedro Álvares Cabral set sail from Lisbon on March 8, 1500, in command of 1,200 men in 13 ships laden with trade goods and provisions sufficient to last a year. Swinging far to the west—by some accounts to avoid a brewing storm, by others in consequence of being blown off course by a storm—on April 2, 1500, he encountered instead the coast of Brazil, with whose discovery he is generally credited. There, at various spots along the beach, he and his crew spent nine days peaceably bartering and interacting with the natives. Building a large wooden cross, planting a flag, and claiming the land for Portugal, Cabral and his expedition sailed on to India. He left behind two convicts, previously condemned to death, in the hopes that they would mix with the natives.

What became of them is not known, though the episode illustrates the Portuguese policy of promoting miscegenation as a way to draw unknown lands and peoples into the Portuguese orbit. Cabral also filled one of his ships, the *Lemos*, with brazilwood, a red-tinted tree whose pulp, he correctly surmised, would serve as a commercially viable textile dye. Cabral sent the *Lemos* and brazilwood straight back to Portugal, along with a long descriptive letter on the discovery from the ship’s chronicler, Pêro Vaz de Caminha.

Caminha’s letter was the first European eyewitness description of Brazil. In it he paid special attention to what he perceived as the simplicity, innocence, and primitivism of the people, represented especially in their nakedness. His report, like those of others who fol-

lowed in subsequent years, fueled the European imagination regarding the “noble savages” inhabiting the New World. Caminha was also struck by the natives’ lack of domesticated animals; their lack of knowledge of metal, including gold; and the limited commercial potential of the land and its people.

Fortunately for the Portuguese the lands Cabral and his men had just encountered fell well within the boundaries of the lands granted to Portugal as codified in the TREATY OF TORDESILLAS of 1494. In subsequent years, the Portuguese Crown commissioned a series of navigators to continue the explorations and trade relations begun by Cabral. By the 1530s, Brazil had been loosely incorporated into the Portuguese sphere of influence, though their superior position was tentative and under serious challenge by the French.

MICHAEL J. SCHROEDER

cacao

Called *kakaw* in the language of the ancient Maya, associated with the merchant deity El Chuaj, or “black scorpion,” cacao (processed into cocoa), from which chocolate is derived, was widely produced across large parts of lowland Mesoamerica and Central America, the regions to which it was indigenous. Like coffee, the seed of a small tree, cacao was one of the region’s most important trade items, with cacao beans often used as a form of currency, as among the Aztecs. Cultivated since at least 600 B.C.E., cacao was one of the chief items of trade and export among some Maya polities, such as the Early Classic Pacific Coast city-state of Balberta. Its consumption limited to the elite, with strict taboos against commoners’ production and use, cacao was mixed with foods and spices such as chili, maize flour, and cinnamon to make various chocolate drinks.

The CONQUEST OF MEXICO and CONQUEST OF CENTRAL AMERICA transformed the production and consumption of cacao in important ways. No longer restricted exclusively to the elite, cacao consumption soared among most all social groups—Indian, Spanish, mestizo, and, to a lesser extent, Africans. Spaniards also changed the traditional recipe, often dispensing with maize flour

and sweetening it with sugar and vanilla. By the mature colonial period, cacao had become a most popular nonalcoholic beverage in Spanish and colonial Mexico.

Cacao also became an important element in Spain's mercantile economy, along with other tropical export commodities such as sugar, TOBACCO, INDIGO, and cochineal. As a result of increased demand, both within the colonies and overseas, cacao production increased dramatically. Cacao plantations soon emerged across Mesoamerica and the circum-Caribbean, including Venezuela, along the Pacific coast from Guatemala to Ecuador and Peru, and southeast to the settled coastal areas of Brazil. Guatemala witnessed a cacao boom in the decades after the initial conquests that declined along with Indian populations after 1570. Cacao, along with maize, beans, and other staple crops, became one of the stock items that *ENCOMIENDA* Indians were required to pay in tribute to their *encomendero* masters.

Throughout the colonial period, as the European market for American tropical export commodities grew, cacao, transformed with sugar into various types of chocolate, became very popular among both the elite and Europe's burgeoning industrial working classes. This was part and parcel of a consumption revolution within Europe in consequence of overseas colonization and the Industrial Revolution, as urban working classes in particular consumed increasingly prodigious quantities of coffee, tea, tobacco, sugar, and chocolate. Cacao, like coffee, also became increasingly important across large parts of Africa, transforming local economies and local consumption patterns. An important element of the COLUMBIAN EXCHANGE, cacao, along with maize, manioc, potatoes, and other staple crops, represented yet another of the Americas' gifts to the world.

caciques in Latin America

Cacique (ka-SEE-kay) is an umbrella term designating a wide variety of indigenous forms of political rule in

pre-Columbian and postconquest Latin America, particularly Spanish America. In the Andean highlands, the equivalent term is *curaca* or *kuraka* (koo-RA-ka). *Cacique* refers to an individual political headman, chief, or local lord, almost always male, while *cacicazgo* (ka-see-KAZ-go) refers the political and social institution of rule by *caciques*. Most indigenous polities encountered by the Spanish in their explorations and conquests were governed by caciques. In many instances, such as highland Guatemala, Mexico, and Peru, the privileged social and political status of *caciques/curacas* was hereditary, though the specific degree of political authority they exercised varied enormously, from almost absolute to a kind of "first among equals" status in more egalitarian polities. In other cases, such as parts of Nicaragua, political power was exercised by a kind of council of elders, and *cacicazgo* as such did not exist.

In the postconquest environment, the Spanish found the institution of *cacicazgo* extremely useful, as it allowed for the formation of a class of indigenous leaders who would serve as intermediaries between the mass of indigenous inhabitants and Spanish priests, administrators, and *encomenderos*. Caciques, where they existed and where possible, were thus effectively transformed into agents of the colonial state. Where the institution of *cacicazgo* did not exist (as in parts of Nicaragua), it was essentially imposed upon indigenous societies by the Spanish conquerors in the effort to create viable institutions of indirect rule.

Overall the Spanish found the existence and perpetuation of indigenous nobility highly desirable. Such an elite class of local lords, loyal to the Crown, would minimize social disruption; legitimate the conquests; obviate the need for direct rule and the enormous expenditures of resources such rule would require; and provide a ready mechanism for social control among a defeated and potentially rebellious populace. In practice, the formation and reproduction of such a class of local lords proved exceptionally difficult, given the ambiguous structural position of caciques of essentially serving two masters, each with material and cultural interests antithetical to those of the other: on the one hand, the Spanish rulers, interested mainly in extraction of surplus labor and Christianization; and on the other hand, the mass of indigenous inhabitants, interested mainly in retaining as much surplus production and indigenous forms of religiosity as possible.

In the postconquest period, then, *caciques/curacas* thus often found their grip on power both tenuous and partial, able to meet the expectations and requirements of neither their Spanish overlords nor their indigenous underlings. The literature abounds with analyses of

the ambiguous structural position of caciques/*curacas*, which many scholars regard as crucial to understanding the colonial period as a whole.

In some respects the indigenous practice of *cacicazgo* paralleled the Spanish institution of caudillos and caudillismo, though there were important differences. Both were patriarchal institutions in which political power was exercised by political strongmen through extensive networks of clients and subordinates. In general, however, most caudillos were of Iberian extraction and gained power through their martial and political skills, while most caciques ruled indigenous communities by virtue of hereditary or natural right. In many communities, localized variants of the institution of *cacicazgo* continued into the 20th century, making it one of the most enduring forms of political practice in the Americas.

MICHAEL J. SCHROEDER

Cajamarca, Peru

Site of one of the most memorable and important set of events in the Spanish conquest of the Americas, the valley and town of Cajamarca sit high in the northern Andes Mountains. It was here, on Friday, November 15, 1532, that FRANCISCO PIZARRO'S 62 horsemen and 106 foot soldiers had the striking good fortune to encounter the large military force of the Inca ATAHUALPA. The next day, after an initial exchange of pleasantries, the greatly outnumbered Spanish force launched a surprise attack from behind a series of walled enclosures, slaughtering an estimated 6,000 of the Inca's soldiers before taking the Inca himself hostage. The Inca soldiers, wielding slings and clubs, proved no match for the armored Spanish horsemen and their steel swords and pikes.

After witnessing the deaths of thousands of his troops, the captive Inca offered the bearded strangers an enormous ransom of gold, silver, and precious objects to secure his release—enough to fill a room measuring approximately 85 cubic meters: the famous Atahualpa's ransom. For the next seven months, trains of porters carted to Cajamarca precious objects from across the Inca realm. During this

A depiction of the seizure of the Inca Atahualpa at Cajamarca by Spaniards in the northern Andes Mountains

period, the Spanish had ample opportunity to observe the Inca and take careful note of his and his followers' customs and rituals. Regarded as a semidivine being, the Inca had his every need attended to by large numbers of servants and retainers.

In mid-February 1533, as the treasure slowly trickled into Cajamarca and his men grew increasingly restless, Pizarro sent a large reconnaissance expedition, led by his brother Hernando, south to survey the route to the Inca capital in CUZCO. In mid-April 1533, the 153-strong contingent of DIEGO DE ALMAGRO marched into Cajamarca from the Pacific coast, effectively doubling the Spanish force. Not having participated in the slaughter in the square or capture of Atahualpa, Almagro and his men were to receive a substantially lesser share of the ransom, sowing the seeds of the Almagrist civil wars that wracked the early years of the CONQUEST OF PERU. Eleven days later, on April 25, after some three months, the reconnaissance expedition of Hernando Pizarro returned to Cajamarca with important intelligence on the topography that lay between Cajamarca and Cuzco and the distribution of the Inca's military strength.

The melting down of the accumulated treasure began on March 16, 1533, and continued for nearly four

months, until July 9. Distribution of the loot commenced on July 16. An estimated 110,000 kilograms of gold objects were melted down in the furnaces of Cajamarca, transformed from vessels, ornaments, and other artistic objects into bars of bullion. Each Spanish soldier received an allotment based on his rank, status, and degree of participation in the events of November 15–16, 1532, with Almagro's men receiving a far lesser share than Pizarro's. Finally, on July 26, 1533, some 10 days after the distribution of the loot began, Pizarro decided not to honor the agreement to release Atahualpa but instead to execute him. All of these events mark Cajamarca as the site of one of the most dramatic and important episodes in the history of the European conquest of the New World.

MICHAEL J. SCHROEDER

Calvin, John

(1509–1564) *religious leader*

John (Jean) Calvin was a key figure in the Protestant Reformation. He influenced directly or indirectly the beginning of the Reformed churches (Swiss Reformed, Dutch Reformed, Presbyterian, and other “Calvinist” churches). Like MARTIN LUTHER, Calvin was a scholar and prolific writer. He is most famous for his *Institutes of the Christian Religion*, a systematic presentation of the Protestant Christian faith, but his influence extends far beyond this book. The British statesman Lord Morley wrote: “To omit Calvin from the forces of Western evolution, is to read history with one eye shut.”

Born in 1509 at Picardy, a city south of Paris, Calvin studied law at the University of Orléans. He then studied under some humanist scholars at the Collège de France in Paris beginning in 1531. During this time, Calvin experienced what he later called a “sudden conversion” in his understanding of the Christian religion, becoming convinced that the Protestant thought of Luther and the humanist influence of ERASMUS OF ROTTERDAM were true.

At this time, France was completely Catholic and opposed any Protestant influences that came from nearby Germany or Switzerland. When Calvin's friend Nicholas Cop delivered his inaugural address at the University of Paris in 1533, it caused a sensation, as Cop used evangelical language drawn from both Luther and

Erasmus. King Francis swiftly condemned the “Lutherans,” and both Calvin and Cop had to flee, with Calvin settling in Basel, Switzerland (a Protestant city), in 1535.

Calvin felt compelled to make a defense for his beliefs to the French king. The result was the first edition of the *Institutes of the Christian Religion*. The original edition was divided into six articles or chapters and was ordered in a fashion similar to that of Luther's catechism. In later editions, Calvin added two chapters, but much more explanation (the eighth edition, written in 1559, was more than four times the size of the first). The emphasis in Luther's writings was on the doctrine of JUSTIFICATION BY FAITH, but Calvin's emphasis was on the sovereignty of God and for him it was a key to understanding man: “Nearly all the wisdom we possess, that is to say, true and sound wisdom, consists of two parts: the knowledge of God and of ourselves.”

Calvin is perhaps best known for his views on predestination, “that terrible doctrine,” where Calvin asserted that God's plan for individuals is foreknown and predestined. While a person still has free will, the person's free will intersects with God's foreknowledge. Since God “knows” in advance if a person is destined for heaven or hell, how do the person's own decisions affect this destiny? Calvin's views on this highly complex area were simplified by many readers to assert that God chooses which people go to heaven and which ones go to hell.

Calvin is also associated with Geneva, Switzerland. Because of the tight connection between church and state, various rulers in the early years of the Reformation would decide for a region whether it would become Protestant or remain Catholic. In Switzerland, each city ruled itself by means of a town council. In 1536, the general assembly of the city of Geneva voted unanimously to become Protestant. Calvin was asked by the Protestant preacher and leader William Farel to help organize the city. Calvin's legal training and gift of organization soon resulted in a novel form of separation of church and state in Geneva by means of a series of regulations called the *Ecclesiastical Ordinances*.

Geneva was ruled by the town council, but there was also a council of all the pastors in the city called a consistory, which included a group of men to watch over the morals of the city. The city had laws against various forms of immorality (ranging from prostitution to dancing, card playing, or wearing “slashed breeches”). The town council wanted to ensure that it had full authority for civil matters; yet the *Ecclesiastical Ordinances* recognized a shared authority in certain areas: “These arrangements do not mean that the pastors have

any civil jurisdiction, nor that the authority of the consistory interferes in any way with the authority of the magistrates and the civil courts.” Though some have called this period of Geneva’s history a time of “theocracy,” this term does not accurately reflect the actual organization of the city.

Calvin’s influence has extended to many churches throughout the world. Churches that are “Reformed” or “Calvinist” in their theology include Reformed, Presbyterian, Anglican/Episcopalian, Baptist, Methodist, and Congregational. There are many reasons for this influence. First, the *Institutes of the Christian Religion* was a remarkable work and is still used as a basis for Reformed doctrine to this day. Second, many English Protestant pastors and theologians fled to Switzerland during the persecution under the reign of Queen “Bloody” Mary (MARY I) of England. When Mary was succeeded by her sister ELIZABETH I in 1558, the theologians were able to return, but did so convinced of reformed doctrine. Thus the English churches became largely reformed in their doctrine, though their various practices of worship differed. Finally, Calvin’s close associate Theodore Beza must be credited with further systematizing the work Calvin began. Beza was an equally prolific writer and continued the influence of Calvin’s thought and writing into the 17th century.

Calvin was an austere man, wholly dedicated to his preaching, governance, and writing. He married a widow named Idelette de Bure in 1541. She had three children from her previous marriage and bore a son, Jacques, on July 28, 1542, but Jacques only lived a few days. Idelette was in poor health after this time, and died in 1549. Calvin died in the arms of his disciple and friend Theodore Beza on May 27, 1564, at the age of 55.

BRUCE D. FRANSON

Caribbean, conquest of the

The Spanish conquest of the islands of the Caribbean region constituted the first stage in a process of conquest and colonization in the Americas that lasted more than 300 years, and whose effects remain read-

ily apparent to the present day. Prior to the Spanish arrival, the four large and scores of smaller islands of the Caribbean were inhabited by a diversity of ethnolinguistic groups whose total numbers, by the best estimates, ran into the millions. The Taino (or Arawak) Indians constituted the dominant group in the Greater Antilles—Hispaniola, Cuba, Jamaica, and Puerto Rico—while the Caribs, relative newcomers from the South American mainland, occupied many of the islands of the Lesser Antilles. Other groups inhabited different parts of the region, generating a complex mosaic of ethnolinguistic groups across the Caribbean in the centuries prior to the European arrival.

Population estimates for the preconquest Caribbean vary widely. For Hispaniola, the first large island the Spanish encountered and subdued, scholarly estimates of precontact populations range from a low of 60,000 to a high of 8,000,000. Most estimates fall between 300,000 and 1,500,000, though it will never be known with any degree of precision how many people inhabited Hispaniola, or the Caribbean, or any other part of the Americas, before the European arrival. At the same time there is broad scholarly consensus that by the late 1400s the Caribbean, like the Americas as a whole, supported a large and growing indigenous population, a growth that was suddenly and irrevocably reversed by the European invasion.

Genoese sailor CHRISTOPHER COLUMBUS, patronized by the Crown of Castile and Aragon (Spain), headed the expedition that inaugurated the modern encounter between the Old World and the New. His first landfall in the New World occurring on October 12, 1492, Columbus went on to skirt the shores of Cuba, Hispaniola, and other islands before beginning the journey back to Spain in mid-January 1493. Before departing he left a contingent of some 40 men on Hispaniola, at a fort called Navidad, to initiate the process of settlement.

Convinced he had reached the East Indies, Columbus called the native inhabitants *Indians*, the name by which the indigenous inhabitants of the Americas have been called ever since. The six Taíno Indians, as well as the finely wrought native gold work, parrots, and other items that he took with him to the Spanish court, which he reached in March 1493, convinced the Crown to finance a second voyage, much larger than the first.

Meanwhile, published versions of Columbus’s report to the Spanish Crown circulated quickly throughout much of Europe, beginning in Italy in April 1493. The effect was electrifying, as early modern

A print made in 1884 shows Christopher Columbus presenting his request to sail west to reach the East Indies to Queen Isabella I and Ferdinand V and a gathering of royal courtiers.

Europe became aware of an entire world that hitherto had lain beyond their ken.

The Spanish Crown required and sought the pope's approval to engage in the process of settling unknown non-Christian lands and converting their non-Christian inhabitants to the Catholic faith. Pope Alexander VI responded to the Crown's solicitation by issuing a series of papal bulls, most importantly the 1493 bull *Inter Caetera*, which divided the lands of the New World between Spain and Portugal. Soon after the Spanish and Portuguese agreed to a modified version of the bull, the TREATY OF TORDESILLAS (1494), which became the basis for Spanish and Portuguese claims to the newly discovered lands of the Americas.

Columbus's second voyage to the Indies was much larger than his first, with 1,200 men (no women) in 17 ships carrying ample weaponry and at least six months' worth of supplies. Making landfall in November 1493, the expedition claimed several islands in the Lesser Antilles before moving on to claim Puerto Rico (called

Boriquén by its inhabitants) and returning to the Natividad garrison on the northern shore of Hispaniola. To the explorers's chagrin, the garrison was in ashes and all of the 40 men dead, most probably killed by the island's Taíno inhabitants. Hispaniola at the time was ruled by a series of chiefdoms ruled by Taíno CACIQUES (chieftains), who had responded violently to the Spaniards' violent efforts to acquire women for sexual liaisons and to force men to pan for gold in the island's rivers.

In response, Columbus sailed a few miles east along Hispaniola's northern shore and established a new outpost called Isabela. Foraging parties into the interior returned with 30,000 ducats worth of gold—the most the island would ever yield. Retaining five ships and a strong contingent to protect the garrison, in February 1494 Columbus sent 12 ships back to Spain with instructions to return with more livestock, arms, medicines, and men. Leaving his younger brother Diego in charge of Isabela, Columbus sailed west, exploring the southern shore of Cuba, and Jamaica to the south,

before returning to Isabela in September 1494. In his absence, the colonists under Diego Columbus had enraged the island's Taíno inhabitants by their violent efforts to secure their women and labor.

Meanwhile Columbus had settled on the idea of enslaving the Indians, who would pan for gold and other precious metals in the islands and be sold as chattel in European markets. In February 1495, he approved the first shipment of some 500 Taíno to Spain to be sold as slaves. A month later, in the interior of Hispaniola, there occurred the first large-scale pitched battle between Spanish and Taíno forces. The Battle of Vega Real of March 1495 resulted in the Taínos' total defeat, their slings and arrows proving no match for the Spaniards' swords and armor. One of the defeated caciques, Caonabo, was put in chains and sent to Spain. He died en route and was buried at sea. A statue in his honor can be found in present-day Santo Domingo, where many remember him as the Americas' first indigenous martyr against the European invasion.

In the next few years, as news of Columbus's discovery spread and as the Crown determined to subjugate the Indies, ships and men poured into the Caribbean. In 1495–96, the island of Hispaniola was completely subdued and its surviving inhabitants enslaved. The Crown soon replaced outright enslavement with the institution of *ENCOMIENDA*, in which the Crown granted groups of Indians to individual *encomenderos*, who were said to hold them in *encomienda*, or “in trust.” The explorations continued through the late 1490s and into the 1500s. In 1508, the Crown's attention shifted from Hispaniola to Cuba, where a major expedition of conquest was launched in 1511 under the leadership of Crown-designate Diego Velázquez. The invading Spaniards slaughtered thousands of native Arawak (or Sub-Taíno), Ciboney, and Mayarí. By 1515, the conquest of Cuba was complete.

The conquest of the Caribbean thus took place in piecemeal fashion, with the Spanish “hopping” from one island to the next in their seaward march toward the west. By 1515, the native population of Hispaniola, Cuba, and other Caribbean islands had declined precipitously. In addition to warfare, violence, and forced labor, the principal cause of Indian deaths was their lack of biological immunity to European diseases, especially smallpox, as well as measles, bubonic plague, typhus, and cholera. By the 1550s, the indigenous inhabitants of the Caribbean had all but disappeared, only a few thousand surviving; by 1600, virtually all had died. The Caribbean islands, in turn, were used as launching-off points for further conquests in the Americas, beginning with the CONQUEST OF MEXICO under HERNÁN CORTÉS in 1519–21.

MICHAEL J. SCHROEDER

Central America, conquest of

The Spanish conquest of Central America ranks among the most violently destructive processes in world history. The combination of prolonged warfare, forced labor, enslavement, and disease decimated the indigenous population, which nonetheless survived and endured both the conquest and 300 years of colonial rule. The conquest profoundly affected every aspect of life across the isthmus.

After consolidating their conquest of Hispaniola and establishing garrisons along the coast of Cuba in the 1490s, Spanish explorers began probing the coast of the Yucatán Peninsula and the Caribbean coasts of Central and South America. In 1509, the Spanish Crown granted two concessions for colonization of these unexplored lands. One was christened Nueva Andalusia, covering the territory east of the Gulf of Darién (at the junction of present-day Colombia and Panama). The second, Castilla de Oro, extended from the Gulf of Darién north to Cabo Gracias a Dios (at the modern Nicaragua-Honduras border). Initial forays along these coastal regions met with stiff native resistance, disease, hardship, and failure.

These early Spanish encounters with the Caribbean littorals of Central and South America implanted virulent European diseases among the native inhabitants that quickly spread north, south, and west. Within a decade, smallpox and other pathogens were decimating the population of both the Andes and the Central American isthmus, years before Spaniards actually set foot in these areas. Weakening indigenous polities by causing precipitous demographic declines and generating profound cultural and political crises, the rapid spread of these highly contagious pathogens helped to make subsequent conquests possible.

The first Spanish successes in these regions were those of Vasco Núñez de Balboa, a minor nobleman, indebted farmer, and gifted military leader. Invading the Darién region, Balboa subdued numerous polities and accumulated considerable treasure before hacking his way across the Central American isthmus in Panama at the head of 190 Spaniards and numerous Indian porters and guides. On September 29, 1513, Balboa discovered the Pacific Ocean, which he dubbed the “South Sea.” By the late 1520s, Panama City, the settlement at the Pacific terminus of the land corridor through Panama, had become an important shipbuilding center and the launching-off point for subsequent expeditions of exploration and conquest, including the CONQUEST OF PERU.

MOSAIC OF GROUPS

Pre-Columbian Central America was populated by a mosaic of ethnic and linguistic groups divided politically into scores of kingdoms, city-states, and smaller polities. This political fragmentation was paralleled in subsequent divisions and conflicts among the Spanish, a key feature of the Central American and Peruvian conquests. These conflicts first erupted in 1519, when the conquistador Pedrarias Dávila executed Balboa after accusing him of treason. Establishing the settlement of Panama City the same year, Pedrarias was supplanted by royal orders by Gil González Dávila, who launched exploratory expeditions north into Costa Rica and Nicaragua, slaughtering and enslaving the native inhabitants.

A key moment in these initial incursions came in 1522 along the shore of Lake Nicaragua, when Dávila convinced the Nicaráo CACIQUE Nicaragua to submit to Spanish suzerainty and embrace Christianity. Soon afterward, the Chorotega cacique Diriangén assaulted and defeated Dávila’s forces, compelling his hasty retreat back to Panama. To this day, the opposite paths chosen by the caciques Nicaragua and Diriangén in response to Spanish demands—peaceful submission versus armed resistance—serve as symbolic counterpoints in discussions regarding Central America’s relations to more powerful adversaries.

A bitter conflict soon arose between Pedrarias and Dávila, the latter refusing to relinquish his claims on the Nicaraguan territories. In 1524, Pedrarias’s subordinate Francisco Hernández de Córdoba returned to Nicaragua with a stronger force, determined to subjugate the region’s indigenous polities. Meeting initial success, he founded two towns, Granada and León.

The next two years saw a series of civil wars erupt in Nicaragua between the competing conquistadores and their respective allies, as Dávila attacked Hernández and

the latter rebelled against Pedrarias, who in turn defeated and executed Hernández.

Meanwhile, with the CONQUEST OF MEXICO consolidated, HERNÁN CORTÉS and his lieutenants turned their attention south. In 1523, Cortés dispatched PEDRO DE ALVARADO south to the Guatemalan highlands. Deftly exploiting the political rupture between the Cakchiquel and Quiché kingdoms, much as Cortés had exploited indigenous divisions in Mexico, Alvarado allied with the Cakchiquel and defeated the Quiché in a series of battles and massacres. A legendary moment came in the Battle of Quetzaltenango of April 1524, when the combined Spanish-Cakchiquel force slaughtered the much larger Quiché army and Alvarado personally killed the Quiché chieftain Tecún Umán. Alvarado’s Guatemalan campaign was marked by a series of atrocities and outrages that later became memorialized in highland Indian oral and written culture. Soon after the Battle of Quetzaltenango, Alvarado captured and burned alive a large number of Quiché lords and nobles. Then, after using his Cakchiquel allies to defeat their enemies the Tz’utujils, Alvarado betrayed the Cakchiquels by executing their leaders and committing other atrocities.

Surviving Cakchiquels fled into the mountains, where for four years they engaged in a guerrilla campaign against Alvarado’s forces. Relentlessly pursuing his erstwhile allies, Alvarado’s forces captured many rebel leaders and hanged them in the central plaza of the Cakchiquel capital of Iximché as an object lesson to other potential rebels. Alvarado then destroyed the capital city. These and related events were later recorded in a native manuscript, the *Annals of the Cakchiquels*. In the coming years, Alvarado, his lieutenants, and their successors continued their conquest of the highlands, committing many outrages and establishing the kingdom of Guatemala under the jurisdiction of New Spain. Soon after, Alvarado went on to become a leading figure in the conquest of Peru. The last autonomous polity in Guatemala to be subdued by the Spanish was the kingdom of Tayasal in the jungles of the Petén in 1697. It is estimated that warfare, forced labor, and disease during the first 50 years of the conquest killed more than one-third of Guatemala’s 2 million inhabitants.

Alvarado’s forceful leadership in Guatemala effectively quelled incipient disputes among his men. This was not the case in the rest of Central America, where conflicts among Spaniards frequently erupted into open civil wars. In 1524, after dispatching a seaborne expedition under Cristóbal de Olid to the Gulf of Honduras, Cortés discovered that Olid had rebelled against his authority and allied with Cortés’s nemesis, Governor Diego Velázquez of Cuba. After sending Francisco de las Casas to relieve

Olid, Cortés marched overland hundreds of kilometers through the steamy jungles of Yucatán and the Petén to subdue Olid himself. The 19-month-long campaign was a disaster. When he finally reached Honduras, his forces thinned and exhausted, Cortés found that Las Casas and González had already vanquished and beheaded Olid. Despite a Mexican tribunal's sentences of death, Cortés ensured that neither was punished for the act.

CIVIL WARS

From the 1520s to the 1550s, in short, much of Central America became a vast killing ground. Civil wars between rival conquistadores continued, while divisions and fractures among indigenous polities led the Spanish to adopt a piecemeal strategy, prolonging the process of conquest and the violence that accompanied it. Frustrated in their efforts to discover large caches of gold and other treasures and repeat the experience of Cortés in Mexico, the Spanish invaders turned to whatever marketable commodities from the region might turn a profit. In the late 1520s, gold was discovered in Nueva Segovia in north-central Nicaragua. The mines soon proved disappointing.

By this time it had become apparent that the region's most valuable marketable commodity was human labor. The slave trade thus became the most important pillar of Central America's early colonial economy. Many indigenous peoples fled into the interior, joining other native groups that maintained stiff resistance against determined Spanish efforts to subdue them. What the Spanish called *indios bravos* (wild Indians) in the tropical mountains and jungles of eastern Nicaragua and pockets of Honduras, Guatemala, and elsewhere remained outside the orbit of Spanish control throughout the colonial period.

Estimates for the Pre-Columbian population of Central America vary widely. By the best estimates, as many as 5 million people inhabited the isthmus before the Spanish arrival, with well over 1 million in western Nicaragua and southern Honduras. From 1528 to 1550, an estimated 400,000 to 500,000 indigenous inhabitants of this latter region were enslaved. Many died en route, the survivors shipped primarily to Panama and Peru. A report to the Crown of 1535 estimated that by that time approximately one-third of western Nicaragua's Indians had been enslaved. The slave trade peaked between 1536 and 1540. In 1550, the practice was banned, by which time it had slowed to a trickle, for the simple reason that there remained few Indians left to enslave. By this time, warfare, forced labor, the slave trade, and diseases had reduced western Nicaragua's indigenous population

by around 90–95 percent. Following a larger pattern in the Americas—wherein lowland indigenous populations experienced more precipitous declines than highland populations—the highlands of Guatemala saw a lesser decline, but still of enormous magnitude.

As elsewhere in the Americas, the Spanish intended that a spiritual conquest accompany the military conquest. Religious conversion of the natives was meant to be integral to their economic and political subjugation. In practice, the spiritual conquest was much more partial and incomplete than the military conquest, as many indigenous spiritual beliefs and practices survived for centuries beneath a veneer of Roman Catholicism.

In sum, and by almost any measure, the Spanish conquest of Central America represents one of world history's most destructive holocausts, one that bequeathed to subsequent generations across the region a legacy and social memory of violence that endure in various forms to the present day.

MICHAEL J. SCHROEDER

Charles I

(1600–1649) *English monarch*

Charles I, the most tragic king of the HOUSE OF STUART, was born at Dunferline in Fifeshire in Scotland on November 19, 1600. Charles was the second son of James VI of Scotland and Anne of Denmark. When Charles was three, his father became king of England in March 1603, on the death of Queen ELIZABETH I, the last from the House of Tudor.

Charles became heir to the throne in 1612, when his elder brother Prince Henry died. In November 1616, he was made Prince of Wales, and thus first in line to succeed his father on what were now the combined thrones of England and Scotland.

On the death of his father, Charles became King Charles I on March 27, 1625. He almost immediately married Henrietta Maria, King Louis XIII's sister. During this period, he became heavily influenced by George Villiers, duke of Buckingham. Villiers had also been a favorite of JAMES I. Buckingham propelled England into a distasteful policy of foreign intervention that the economy of the country simply could not support. Buckingham was widely disliked, and although he was impeached by Parliament in 1628, he was killed before he could lead another failed international expedition.

DIVINE RIGHT OF KINGS

The main point of contention between Charles and the Parliament was his belief in the divine right of kings. His father, James I, had taught him that, as king, he was answerable only to God. Indeed, the impeachment of Buckingham by Parliament was as much a challenge to Charles's belief in absolute royal authority as it was an attack on the king's favorite courtier. While Parliament conceded that the king had a right to appoint his own government ministers, members of Parliament felt that Charles should govern with their advice and consent. Parliament attempted to use the voting of subsidies for the king's government as leverage to gain such equality with the king in matters of governing the kingdom.

Religion also became an issue. Although the country had been officially Protestant since the Act of Supremacy in 1534 established the king as the head of the CHURCH OF ENGLAND, Charles's queen, Henrietta Maria, carried out private Roman Catholic religious rites in the court. Even more, the king himself favored Catholicism rather than the Church of England, the religion of the state.

Charles dissolved Parliament three times during his reign. He also imprisoned in the Tower of London his chief parliamentary opponent, Sir John Eliot, who died in the Tower in 1632. When Charles dismissed his fourth Parliament in March 1629, he played out his belief in the divine right of kings and ruled as the sole authority in England. He did not call another Parliament for 11 years. Deprived of subsidies voted by the other governing bodies, Charles depended on ship money, a royal levy first applied to towns that depended on maritime trade for their livelihood, but later extended to inland cities. Charles also sold monopolies, giving to royal favorites control of certain industries in return for funds, a thinly disguised attempt at royal influence peddling in return for financial gain.

Charles's attitude toward religion also became a political point of crisis. The archbishop of Canterbury,

William Laud, who governed the Church of England in the name of the king, was head of the "High Church Party," which in effect was still similar in many ways to Roman Catholicism, more often than not referred to now in England as the Church of Rome, as distinguished from the Church of England. Laud and the king further affronted supporters of Parliament during the years of the king's personal rule because the monarchy was turning more to bishops for counsel than to nobles.

At the same time, the rise of Sir Thomas Wentworth, the earl of Strafford, was seen as another indication of the king's belief in royal ABSOLUTISM. Wentworth was appointed president of the Council of the North and was later to rule Ireland. Wentworth's determination to rule in the king's name had made a close friend of Archbishop Laud, but an army of enemies among those opposed to the king's growing authoritarian rule. In the end, the crisis came in September 1639, when Archbishop Laud had attempted to impose his vision of the Church of England, with its BOOK OF COMMON PRAYER, on Scotland.

REFORMATION

The Protestant REFORMATION under JOHN KNOX followed a different path in Scotland than it had in England. Scottish Presbyterianism was violently opposed to the Church of England's neo-Catholic hierarchy and it was Laud's ambition to impose the Church of England upon Scotland, supported by Wentworth and the king, that led the Scottish to assert their rights in defense of their Presbyterian Church in 1638. When an attempt to come to an agreement with the king failed at Glasgow, open rebellion broke out in Scotland in September 1639. Believing Scottish liberty to be under siege by Charles I, hundreds of veterans of the THIRTY YEARS' WAR flocked to the Scottish army.

Wentworth advised Charles to summon Parliament to raise money for an army to defend England from a likely Scottish invasion. When Parliament was called in April 1640, its members, especially those in the House of Commons, quickly asserted Parliament's right to share in the governing of England with the king. On May 5, 1640, Charles closed what became known in history as the Short Parliament. On his own again, Charles called Wentworth to northern England, where he attempted to raise an army to face the Scots. In response, the Scots crossed the historic boundary between England and Scotland, the River Tweed, in August 1640. By this time, an unspoken alliance united the Scottish Presbyterians with leading opponents of Charles's absolutism in Parliament.

The Scottish invasion forced Charles to convene Parliament again in November 1640. Parliament, furious at Charles's virtual dictatorship, struck back. Wentworth and Laud were brought before Parliament by an act of attainder, denied legal advice, and imprisoned. Wentworth was soon executed, in an act of parliamentary absolutism as strong as any that Charles had ever been accused of by Parliament. The crisis came to a head in October 1641, when the Irish Catholics rose up in bloody rebellion against the Protestants. Charles and the Parliament engaged in a back-and-forth battle of legislation, each attempting to bring the other under control. The unprecedented forced entry by Charles into Parliament in January 1642 brought to an end any hopes of compromise.

Charles abandoned London to Parliament and raised the royal standard at Nottingham in August 1642, making Oxford the temporary royal capital. The first battle of what would be the English Civil War took place at Edgehill in October 1642, but was inconclusive. The earl of Essex withdrew his parliamentary forces after the battle, leaving the road to London open to Charles. But the king did not press his advantage, and Essex was soon able to gather reinforcements to block the way. In 1643 Parliament formed an alliance with the Scots against the king. Partly from exposure to the Scottish military tradition, Sir Thomas Fairfax began to form the New Model Army, perhaps the first truly professional force in British history. OLIVER CROMWELL, an English squire, emerged as the driving force behind the New Model, which scored decisive victories over the king at Marston Moor (1644) and Naseby (1645).

At last, Charles realized his cause was lost, and large-scale military operations ceased. Negotiations were entered into with Charles but rather than treat with Parliament in good faith, he urged on the Scots to attack again for a Second Civil War in 1647. In January 1649, Charles I was tried for treason by Parliament, with his alliance with the Scots one of the gravest of charges leveled against him. On January 30, 1649, Charles I was beheaded.

JOHN MURPHY

Charles II

(1630–1685) *English monarch*

Charles II was born on May 29, 1630. His upbringing was tumultuous, given his father, King CHARLES I's, power struggles with Parliament. As early as his teenage years, Charles II accompanied his father in military operations and was even put in command of some regiments. Charles I had previously sent his wife, Henrietta Maria, to France for safety, where she had received a warm welcome. She was the daughter of HENRY IV, king of France and Navarre, and Marie de Médicis, of the ruling family of the city of Florence in Italy.

Eventually, Charles I was imprisoned, tried for treason, and executed. Charles II then became the king of both England and Scotland. In June 1650, Charles arrived in Scotland, promising to recognize that the Presbyterian Church was the dominant sect in Scotland. The Scottish Covenanted Army under David Leslie was defeated by OLIVER CROMWELL, now virtually the ruler of England, at Dunbar in September 1650. A year later, determined to press his right to the throne, Charles and Leslie invaded England. Cromwell would ever after call his victory at Worcester his “crowning mercy.” For some 45 days, Charles remained in hiding before he could make his escape to France.

Cromwell ruled in England until his death, when his son, Richard, assumed the role. However, he was unable to muster public support and resigned in May 1659. Charles was called back to England, and he returned on his 30th birthday—May 29, 1660. Charles's reign was seen by most as a welcome return to normality after the harsh Protectorate of Cromwell, who had eventually divided England up to be ruled by major-generals answerable only to him. Even the theaters had been closed because of strict Puritan morality—not to be opened again until Charles had become king. Determined to be a very different king than his father had been, Charles was careful to avoid the frictions over church and state that had cost his father so much.

At home, he attempted to find some common ground between the Scots Covenanters and the CHURCH OF ENGLAND. Although his efforts eventually ended in failure, he permitted on the whole both churches to follow the dictates of their own consciences. While his efforts at ecclesiastical reform did not meet his expectations, Charles's relations with Parliament—his father's sworn enemy—were much more fruitful.

In 1665, growing commercial rivalry at sea led Parliament to encourage Charles to declare war on the Netherlands. While the British Navy was large,

the Dutch had more gifted commanders. To complicate matters further, Charles was distracted in the middle of the war by the Great Fire of London and the great plague of London and was unable to wage the war fully against the Dutch. A peace was reached in 1667, leaving conditions almost unchanged from before the war began. With an eye toward the future, Charles continued the program of modernizing the British fleet.

REVENGE ON THE DUTCH

In 1670, Charles's determination to have revenge on the Dutch led to the Treaty of Dover with LOUIS XIV, king of France, who would attack the Dutch in 1672. Charles, whose finances were subject to the approval of Parliament, agreed by the secret treaty to become a Catholic (he already had Catholic sympathies from his mother) and to support Louis in his coming war with the Dutch. Knowing nothing of his secret agreements, Parliament urged Charles to support the Dutch against the French. Charles, without actively going to war against his ally Louis, made peace with the Dutch at Westminster in 1674.

With military matters settled, the question of the succession to the throne became a dominant concern of Charles. Lacking any legitimate heirs, the next in line to the throne was his brother James, the duke of York. James was a proven military leader, but unlike his brother, he was openly Roman Catholic. Consequently, the Protestants in Parliament moved to bar his succession to the throne. Two test acts, which involved allegiance to the Church of England, had already been passed to bar Roman Catholics from sitting in either house of Parliament, the House of Commons or the House of Lords. A "Popish Plot," inflamed by an Anglican agitator named Titus Oates inflamed sentiments against the Catholics in 1678 and was one of the reasons that Charles dissolved Parliament in 1679, despite its having sat without interruption since he had come to the throne in 1660.

Between 1679 and 1681, the struggle continued between the Parliament and the king. At about this time, the Rye House Plot was discovered, which included an apparent attempt to assassinate the king. Public sentiment veered toward the king again, and the last four years of Charles's reign passed mostly uneventfully. A much-needed alliance with Parliament remained largely intact.

When Charles II died on February 6, 1685, the people remembered him for his bright court life, his colorful mistresses, and the style that graced his reign. For

the British, Charles II would always be remembered as the "Merry Monarch."

JOHN MURPHY

Charles V (Charles I of Spain)

(1500–1558) *Holy Roman Emperor, king of Spain*

Charles V of the HOLY ROMAN EMPIRE was the first monarch who was in the position to aspire to universal dominion. From his paternal grandfather, he stood to inherit the paternal domain of today's Austria and South Tyrol, as well as claims to parts of Switzerland and southwest Germany. In addition, the HABSBURGS had held the elected position of the Holy Roman Emperor (a collection of lands that included today's Germany, Austria, the Czech Republic, northern Italy, Switzerland, the central eastern part of France, and the Low Countries). Although the constituent lands of the Holy Roman Empire (mostly Germany and adjacent lands) were basically independent, the title held great prestige as it implied a primacy in Western Christendom. The fall of Constantinople in 1453 placed the Western Empire in a position of primacy in Europe.

Charles's inheritance from his paternal grandmother was also impressive. The House of Burgundy, although an offshoot of France, had amassed a whole series of lands that included the Netherlands and adjacent areas, such as the County of Burgundy (*Franche-Comte*) and Luxembourg. At that time, the Netherlands not only included the present-day countries of Holland and Belgium, but also much of northern France and parts of northern Germany. In many ways, it was the wealthiest country in Europe with textile products, crafts, commerce, and precapital financial processing, thereby making it a center of the European economy.

After the death of an older sister, Charles's mother, Juana of Spain, became the heiress of the fabled Indies. From his grandmother, Isabella, Charles inherited the Crown of Castile, which comprised 60 percent of the Iberian Peninsula. More importantly, it included the title to the Indies, which turned out to be western South America, most of the present West Indies, Central America, and present-day Mexico, including parts of the present-day Southwest United States. From his maternal grandfather, he inherited the Crown of Aragon, about one-quarter of Iberia. Significantly, this included claim to Naples, Sicily, and Sardinia, together about 40 percent of modern-day Italy. Charles inherited these territories at an early age.

His father died in 1506, and soon thereafter, his mother was declared insane. His maternal grandfather and grandmother, FERDINAND V AND ISABELLA I, passed away in 1515 and 1504, respectively, while his paternal grandfather, Maximilian, passed away in January 1519.

FAR-FLUNG GOVERNMENT

With these vast inheritances came vast responsibilities. All of Charles's land possessions had separate governments that warranted consideration. Castile had separate governments not only in Granada, which had recently been conquered, but also overseas. The American possession was so vast that separate viceroalties had to be set in Peru, NEW SPAIN (Mexico), and lesser jurisdictions in Colombia and Santo Domingo. In addition, Castilian claims to territories in North Africa included Ceuta and Melilla. Aragon also had its own separate parliaments, as did Naples, Sicily, and Sardinia. The Netherlands had 18 separate jurisdictions in addition to *Franche-Comte*, as did the landgraviate of Alsace and the Austrian possessions. While all of these could at least contribute to the exchequer, the Holy Roman Emperor was a title without much power.

Germany also at this time was composed of 300 separate states. To complicate matters further, Charles faced the menace of the Turks under their greatest ruler, SULEIMAN I THE MAGNIFICENT, who were advancing into the Balkans. He forced the Turks back after they invaded Austria in 1531, but much of the Balkans remained under Turkish control. Charles captured Tunis in 1535 and helped drive the Turks out of northern Africa temporarily.

Among Charles's greatest challenges was France and its monarchs, the VALOIS. The French, especially under Francis I (1515–47), resented his position in Europe and feared encirclement by Charles and his family,

the Habsburgs. The French sought to regain French-speaking sections of the Netherlands and wanted to gain power in Italy with claims to both Milan and Naples. The result was a series of wars between 1521 and 1559 between the French and Charles and his son, PHILIP II of Spain. In the end, the Spaniards remained supreme in Italy with Lombardy under their control, in addition to Naples, Sicily, and Sardinia.

The Protestant REFORMATION, which broke out in the German territory between 1517 and 1521, was another of Charles's major challenges. The Reformation split Germany and prevented unity against the Turks and the French. After earlier successes, opposition that appeared in 1552 forced Charles to retreat as some of his allies—both Catholic and Protestant—felt he was too powerful. The resulting PEACE OF AUGSBURG froze existing section lines in place between Catholics and Protestants.

In broad terms, Charles's job was to preserve his inheritance. He tried to maintain his inheritance via marriage alliances and aiding his royal family, although he was not always successful. He tried to gain peace with France through the marriage of his widowed sister Eleanor to Francis I. On the other hand, he could not help his brother-in-law, Christian II of Denmark, who was deposed. And although he supported his aunt, Catherine, whose husband, HENRY VIII, divorced her, he could not stop the divorce. More successfully, after his sister's husband, Louis of Hungary, perished at MOHÁČZ in 1526, he arranged a marriage of his brother Ferdinand to Anne of Hungary, which led to the annexation of Czech territories and that part of Hungary not conquered by the Turks. His own marriage to Isabella of Portugal led to the annexation of that country in 1580 when the last male heir of the royal house of Portugal died.

Ultimately Charles realized that his empire, lacking real cultural or administrative unity, could not be sustained. Realizing that his health was failing (he had gout and dropsy), he handed over his Spanish, Italian, and Netherlands possessions to his son, Philip II, in October 1556, and his Austrian lands and Holy Roman Emperor title to his brother Ferdinand I. He died two years later. Although not a brilliant ruler, Charles accomplished his goal of maintaining his empire so as to pass it on to his heirs.

NORMAN C. ROTHMAN

Chilam Balam, books of

The sacred books of the Maya of Yucatán, the books of Chilam Balam were written in the Mayan language in Mexico in the 17th and 18th centuries. They supposedly contain the secrets of the Mayan civilization. They are a major source for contemporary knowledge of Mayan religion, history, folklore, medicine, and astronomy. Historians believe that once the books of Chilam Balam collection held many more books, although only a handful, named for the towns in which they were written, have survived. Most important among the remaining books of Chilam Balam are Mani, Tizimin, Chumayel, Kaua, Ixil, Tusik, and Codice Perez.

The books of Chilam Balam is named after the last and greatest Mayan prophet, Chilam, or *chilan*, meaning the mouthpiece or interpreter of the gods. *Balam* means jaguar, but it is also a common family name in Yucatán. The title of the present work could be translated as the Book of the Prophet Balam, who lived during the last decades of the 15th century and foretold the arrival of strangers from the east who would establish a new religion. The prophecy came to pass and established the prophet Balam as the authority for many other prophecies in the older books of the same kind, so the Maya named the other books after Balam.

HIEROGLYPHIC WRITING SYSTEM

The Maya developed a complex system of hieroglyphic writing to record astronomical observations, calendar calculations, and historical and genealogical information centuries before the Spanish conquest. To the Maya, the written word had sacred significance and the priests were the only members of the community who wrote. Texts were considered divine objects, containing the religious and moral principles of the community, the path of the truth, and the example of ancestors and prescriptions of the gods. Priests read the sacred books during religious ceremonies imbuing the community with the meaning of its existence.

A party of shipwrecked sailors who landed in Yucatán in 1511 was the first group of Spaniards to encounter the Maya. In the next 150 years, expeditions of Francisco de Córdoba, Francisco de Montejo, and PEDRO DE ALVARDO extended Spanish domination of Maya territory. Finally Martín de Ursúa, the Spanish governor of Yucatán, completed Spanish domination of the entire Maya region in 1697 when he conquered the small group of Maya in the central Petén area. The Spanish brought European diseases against which the Maya had no natural immunity; consequently many of them died. The Spanish also killed many Maya in battle and forced the survivors to labor on Spanish farms or in gold and silver mines.

Among the Spaniards' goals was eradicating Mayan language and culture. The Catholic Church of 16th-century Mexico sought to educate and to evangelize. Shortly after the Spanish conquest of the Maya, Spanish monks and friars learned the Mayan language for evangelical purposes and adapted the Latin alphabet to Maya, improvising when necessary to include sounds foreign to the Romance languages. Spanish monks and friars wrote the books of Chilam Balam in the Mayan language, but used European script instead of Mayan hieroglyphs. Each book is a self-contained library covering a vast array of subjects. Besides the prophecies there are brief chronicles, fragmentary historical narratives, rituals, native catechisms, mythological accounts of the creation of the world, almanacs, and medical treatises. The Spanish friars and the Maya undoubtedly transcribed some of the material from older hieroglyphic manuscripts that still existed in northern Yucatán at the close of the 17th century. As time passed, more European material was added to the native Mayan lore. In some books, there are a mixture of the old faith with Christianity and translations of Spanish religious tracts and astrological treatises into Maya as well as notes of events occurring during the colonial period. Part of a Spanish romance translated into Mayan is found in two of the books.

The Spanish grudgingly admired the Mayan graphic system, but they were determined to destroy the old manuscripts and erase all knowledge of the hieroglyphs from the minds of the converts. For their part, the Maya revered their hieroglyphic writing, which symbolized their old religion. The Spanish intended their new, improved version of the Mayan language for Christian use only, but the Maya quickly adapted it to their own purposes. They recorded everything from prophecies and rituals to petitions to the Crown, but the books of Chilam Balam were the most important

manuscripts that the Mayans recorded in the century after the conquest. Shaped by the dominant Spanish culture, they contain much information about life in colonial Yucatán, but basically reflect the religious and mythological traditions of the Maya.

The Maya and the Spanish produced two categories of books during this time of transition and translation. The Spanish authorities often solicited books written for legal purposes, and the second type were written as new sacred literature of the communities. The first type of books served to secure privileges such as reducing tributes and conserving ancestral lands. The authors tried to please the Spanish authorities, by demonstrating that they had assimilated the teachings of the friars and endeavoring to prove that they had embraced the doctrines of Christianity instead of the stories of their own past.

Books in the second category, new sacred literature of the communities, were written out of the desire of the Maya to reclaim the truth of their religion and their customs that the Spanish had invalidated. New sacred books were written to replace the ancient codices and they reproduced the myths of the gods and the history of the Maya ancestors as well as recording the oral traditions passed down from father to son. They also recorded the explanations that the old priests gave of the codices. These new books did not serve any legal purpose, but were designated to be read in native community ceremonies as sources of songs and dances and rituals of prehistoric tradition. The impetus for writing the new books in the Mayan language, using the writing that the Spanish taught, spread across the entire Yucatán peninsula and the entire Mayan area. Although the style of the Yucatán books is different from the style of the Guatemala books, the structure and contents of all of the books faithfully preserve the religious traditions and the memory of the past. All of them represent the moment in Mayan time when the Spanish conquered them and imposed a new religious, social, political, and economic way of life on them while reducing them to servitude in their own homelands.

Many of the old Mayan communities have preserved the books, some secretly. The Maya had to hide some of these books that contained ancient spiritual rituals, because the Spaniards pursued and killed those who performed and participated in the rituals, considering them demonic. Families closely guarded these books and passed them down from father to son. The existence of these books did not become known until the 18th century, when scholars discovered them. The most important of these books were the *POPOL VUH* of the Quiches, the *Memorial de Solola* of the Cakchiqueles, and the *Libros de Chilam Balam* of the Yucatán Mayans.

The majority of the texts of the books of Chilam Balam are religious, describing individual parts of cosmological myths without a discernable connection between them. Others are ritual texts, prophecies of the Katunes, symbolic formulas of religious initiations, calendar and astronomical texts, and historical descriptions about the main groups of Yucatán and the Spanish conquest. The work ends with the famous prophecies about the arrival of a new religion, attributed to Chilam Balam and other prophets.

The myths and prophecies are written in archaic, symbolic language, using metaphors, colors, and natural beings to express ideas. The authors use cryptic language and secret texts and as in many sacred books there are parallels, repetition of the same thought in different terms, and numberings that give the texts a rhythm that allows them to be recited or sung. The books of Chilam Balam were written on European paper and bound in notebooks, some with cowhide covers. The existing versions of the books of Chilam Balam are not the 16th century originals, but are copies of copies made in the last part of the 17th and 18th centuries.

ORIGINS

Historians surmise that the Chilam Balam de Chumayel originates in Chumayel, a district of Texhax, Yucatán, and that the compiler was a native of Yucatán named Juan José Hoil. His name appears on page 81 of the manuscript next to the date listed as January 20, 1782. Later, other people integrated other texts and Justo Balam, the secretary of Jose Hoil, next owned the book. He wrote two baptismal registrations on one of the blank pages of the book in 1832 and 1833.

During the following decades, the book of Chumayel passed through several hands and in 1868, Dr. Carl Hermann Berendt copied it by hand and Daniel Brinton published fragments of it in his work *Maya Chronicles*. In 1910, George B. Gordon, director of the Museum of the University of Pennsylvania, made a photographic reproduction and edited it in a facsimile form in 1913. Juan Martínez Hernández published a translation in Spanish from these chronicles and from other fragments of the book in 1912, 1913, 1927, and 1928. Antonio Mediz Bolio did the first complete Spanish translation of the books of Chilam Balam, which the *Repertorio Americano* edited in Costa Rica in 1930. Ralph L. Roys translated the second complete version into English, edited by the Carnegie Institution of Washington in 1933. Alfredo Barrera Vásquez and Silvia Rendon included various fragments in their version of the *Libros de Chilam Balam* in 1938, and the Universidad Nacional Autónoma de

Mexico edited the version of Mediz Bolio in the Biblioteca del estudiante Universitario in 1941. In 1952 and 1973, the second and third editions were published. The same version was reedited in 1980, in the anthology titled *Literatura Maya*, prepared by Mercedes de la Garza for the Biblioteca Ayacucho, of Caracas, Venezuela.

RON YOUNG

Christian century in Japan

Francis Xavier, a founder of the Society of Jesus, arrived in Japan in 1549, inaugurating a century of Catholic Christian missionary activity in that country. After enjoying enormous success, Christians suffered brutal persecution and were almost eliminated a century later.

Japan was ruled by warring feudal lords in the mid-16th century who sought to wrest power from the failing Ashikaga Shogunate. These lords eagerly welcomed the newly arrived Portuguese to their domains in order to purchase European firearms. Observing the respect the Portuguese merchants showed toward Catholic priests, many Japanese lords converted to the new faith and ordered their subjects to convert also. Some Japanese even mistakenly thought that Christianity was a variant form of Buddhism. Jesuit missionaries came under the protection of the Portuguese Crown and were soon joined by the Franciscans, who came via Spain's colony the Philippines and were under the protection of Spain. The southern island of Kyushu as well as the imperial capital Kyoto became centers of Christian missionary activity. Japan became the most successful area of Christian conversion in Asia. By 1582, an estimated 150,000 had become Christians, with the number rising to 300,000 by the century's end, and 500,000 at its height in 1615.

Christian missionaries were welcomed as allies by Japan's first aspiring unifier, ODA NOBUNAGA (1534–82),

in his military confrontation with powerful Buddhist sects. Oda destroyed his formidable Buddhist opponents and their castles, but was assassinated. He was followed by HIDEYOSHI TOYOTOMI (1536–98), who continued the wars of unification. Hideyoshi was ambivalent toward Westerners, on the one hand welcoming their trade. He also feared their influence, both the authority of the pope and Spain's colonial ambitions, which had made the Philippines a colony. Thus he banned all missionary activities in 1587, but did not enforce the law until 1597, when he ordered nine missionaries and 17 Japanese Christians executed. Hideyoshi died in 1598. Another succession struggle ensued until another nobleman, TOKUGAWA IEYASU (1542–1616), won a definitive battle in 1603, after which he was confirmed shogun by the emperor, thus inaugurating the Tokugawa Shogunate (1603–1868).

The newly victorious and as yet insecure Tokugawa Ieyasu regarded Christians as potentially subversive and began to move against them in 1606. His son and successor continued his policies, expelling missionaries and ordering noblemen and ordinary people in his domain to renounce Christianity; he went so far as to execute those who remained Christian clandestinely. The shogunate then forced all lords throughout Japan to conform to anti-Christian laws. Suspected Christians were forced to trample on the cross or other Christian symbols while those who refused were tortured to death. Persecution climaxed in 1637–38 when oppressed Christian peasants revolted in western Kyushu. They were put down and slaughtered. A law in 1640 compelled all Japanese to register at a local Buddhist temple. Christianity was wiped out in Japan except for a few small underground communities. The Catholic Church recognized 3,125 Japanese martyrs between 1597 and 1660, several of whom were beatified by Pope John Paul II. The Tokugawa Shogunate enacted other laws that banned trade with Europeans except for two Dutch ships annually and took other measures that almost totally isolated Japan from the Western world until 1854.

Thus between 1549 and 1640, Japan presented the paradoxical picture of success and then total prohibition of the Christian missionary movement.

JIU-HWA LO UPSHUR

Christina Vasa

(1626–1689) *Swedish monarch*

Christina was born on December 8, 1626, in Stockholm as the only legitimate child of King Gustavus Adolphus (1594–1632) and his wife, Maria Eleanor of Brandenburg. She was mistakenly thought to be a boy at her birth; consequently Gustavus Adolphus had her raised as a boy. Her mother, who had suffered numerous miscarriages and desperately wanted a son, repudiated Christina at birth because she was a female and “ugly.” The masculine-looking Christina was trapped in a female body, causing her difficulty throughout her life. Gustavus insisted on raising her as a prince. He died as a martyr for Protestantism at the Battle of Lutzen on November 6, 1632, when Christina was six years old.

Christina was tutored by the liberal-minded Bishop Johannes Matthiae Gothus (1592–1670), her father’s court chaplain, and received a male rather than a female oriented education. He taught Christina religion, history, and classical languages and considered her a brilliant student. Axel Oxenstierna (1583–1659), Sweden’s powerful statesman, taught her political statesmanship. She grew up to be extravagant, with a restless and whimsical nature and aspirations toward intellectual pursuits rather than governance. She was egotistical, considering herself superior to those beneath her. Having received a masculine upbringing, Christina adamantly refused to accept the traditional feminine role expected of her. She was determined to follow her own path and ignored criticism about her actions.

Christina’s 12-year regency consisted of five guardians, headed by Chancellor Oxenstierna. Christina was crowned in 1644 at age 18. She was a very accomplished and astute businesswoman, perhaps the most capable woman of her era. And although she had a strong sense of purpose, she was not suited to be a monarch.

The willful, eccentric Christina decided never to marry because of her aversion to sexual contact and to avoid the restrictions submission to a male would place on her. Her advisers wanted her to marry the prince of the Palatinate, Charles X Gustavus (1622–60), her cousin and dearest childhood friend. Despite the wishes of the Privy Council and Oxenstierna, Christina forcefully declined. She had the Riksdag (parliament) name Charles

X Gustavus as her eventual successor in 1649 and he became a hereditary prince of the realm in 1650.

Christina was intent on focusing her attention on the sciences and on peace. She impulsively ended the war with Denmark and obtained territory for Sweden at the 1645 Brömsebo Treaty. She went against the advice of Oxenstierna at the Peace of Westphalia in 1648 at the conclusion of the THIRTY YEARS’ WAR and followed her own ideas. Although Sweden received Gotland and Saaremaa, some counties in Norway, and authority over Estonia, it lost control over the lucrative Polish ports. However, huge reparations were to be paid by the Catholic German states and at the conclusion of the war most of the Baltic Sea trade belonged to Sweden.

Christina caused considerable internal discord in Sweden with her obstinate eccentricities and reckless extravagance. She squandered Crown property and created noble positions that led to dissension and revolt. She gave unwarranted distinction to the unworthy and caused difficulties for her realm with her arbitrary manners. A split developed with the old ministers, some of whom were extremely loyal and had worked well with her father, on one side, and the people who benefited from her largesse on the other.

On the positive side, Christina gave towns new privileges. She instigated enormous trade and created manufacturing industries. She initiated Sweden’s first school ordinance in 1649. She lionized the arts and sciences and encouraged countless institutes with her patronage, and she attracted great luminaries to her court such as the revered scholars Hugo Grotius and RENÉ DESCARTES, with whom she conversed as equals.

Tired of the minutiae associated with governance, in 1651 Christina decided to abdicate but was persuaded to stay. She thereafter firmly focused primarily on philosophy, art, and religion. Although her actions after 1651 indicated she no longer had much interest in Sweden, it was her distaste for Lutheranism that lay behind her grievance about governing. The Pact of Succession of 1544 made it illegal for any Swedish monarch not to be Lutheran, but she refused to practice a faith she abhorred.

The restraints against her caused Christina to abdicate in 1654. She renounced the Crown in Uppsala Castle on June 6, 1654. She gave herself an income and complete independence with complete power over her household, and her cousin Charles X Gustavus succeeded her. She converted to Roman Catholicism in Innsbruck and was confirmed by Pope Alexander VII (1599–1667) in Rome, who deemed it a great coup for Catholicism. She was renamed Maria Christina Alexandra. He granted her a grandiose apartment in the

Vatican. Christina's personal appearance and masculine manners were berated during her visit to France in 1646, but she was admired for her intellect. She had her grand equerry Giovanni Monaldeschi executed in 1657; he had betrayed her plans to take over the throne of Naples, a plan that ultimately failed. She was quickly removed from France and temporarily lost the support of Pope Alexander.

When Charles X Gustavus died in 1660, Christina visited Sweden, pretending to arrange her personal affairs but in reality trying to reclaim the throne intended for Crown Prince Charles XI (1655–97). The Swedes rejected Christina and forced her to sign a formal abdication agreement. A second attempt to recover the throne failed in 1667. Her endeavor to obtain the Polish throne was rejected, along with her numerous other intrigues. Resigned, Christina moved to Rome permanently and pursued her literary, artistic, and scientific interests. Her salons made her the center of Roman society.

Christina died in Rome on April 19, 1689. She was buried in St. Peter's Basilica in the Vatican. Her huge library was donated to the papacy.

ANNETTE RICHARDSON

Church of England

The Church of England was the national and reformed church established and amended by parliamentary statutes during the English REFORMATION of the 16th and 17th centuries. Its institutions included Governorship in the Monarchy, Prelateship in the Archbishop of Canterbury, and the threefold episcopal ministry: bishops, priests, and deacons. Its theological doctrines and liturgies sought to absorb truths from the Bible, the early Christian tradition, and reason, and to comprehend Catholic, humanist, and reformed elements of the time.

The Church of England was not a theocracy, because in these two centuries, the legislative authority belonged to “King in Parliament.”

The Church of England was established in 1534 by the parliamentary Act of Supremacy, which recognized HENRY VIII (r. 1509–47) as the “only supreme head on earth” of the Church of England, or the Anglican Church. The Reformation Parliament (1529–36) abrogated papal authority and declared royal supremacy, but made no attempt theologically or liturgically to break with the Catholic past. Rather, the Six Articles enacted by the Parliament of 1539 reiterated Catholic teachings and practices and put a check on the spread of the embryonic Protestantism in England.

The ambiguities left from the reforms were tested after Henry VIII's death. Under EDWARD VI (r. 1547–53), antipapal rhetoric increased, the apparatus of worship became simplified, and the Parliament reformed the Church of England to meet Calvinist essentials. Then, Queen MARY I (r. 1553–58) restored Catholicism, persecuted Calvinist heretics, and pushed her Protestant subjects into exile, or confined their worship in rural cells.

Queen ELIZABETH I (1558–1603) undertook the precarious task of reconstructing the Church of England according to Henry VIII's blueprint and simultaneously finding a satisfactory settlement for the great majority of her subjects. In 1559, her first Parliament enacted a new Act of Supremacy, which established her, using a slightly softer tone than her father's, as the “supreme governor” of the Church of England. Despite the political independence from the papal authority, the church remained administratively and judicially the same. The convocations of Canterbury and York survived. The diocesan hierarchy and administrative systems continued. The church courts, the ecclesiastic laws, and judicial proceedings followed basically medieval precedents and routines. Under the queen, one novel practice was to require Anglican clergy to take an oath of allegiance to the queen, as all her civil servants did.

In 1563, Parliament sanctioned the Thirty-Nine Articles. In 1571, under the queen's personal instruction, a slightly altered version was approved by the convocation of the Church of England and was printed as an appendix to the BOOK OF COMMON PRAYER, a revision of Thomas Cranmer's book of the same title issued originally in 1549. While the Articles and the Book adopted some of the Protestant theological teachings and liturgical regulations (especially in the administration of baptism and Holy Communion) into the Church of England, they held firmly royal supremacy as the church's

foundation and episcopacy as its government. The Book served as the textbook, compelling local people to weekly church attendance and other services in liturgical uniformity and in the English vernacular, which managed to mask the differences between Catholic and Calvinistic followers within the church.

Although the queen's sincere and meticulous compromise won the people's broad acceptance, she could not pacify ardent opposition to her settlement. Neither was she able to persuade all her subjects to conform to the national and reformed church required by the Act of Uniformity of 1559. The Marian bishops and their followers adamantly rejected her breach with Rome and her governorship of the church. After Pope Pius VI issued a bull in 1570 deposing her and absolving her Catholic subjects from allegiance, a series of plots were carried out against her life, including one led by her cousin MARY, QUEEN OF SCOTS, in 1586. At the same time, radical Calvinists refused to conform to the Church of England because of their resentment of its episcopal structure. To a great extent, the Catholic conspiracies confirmed the Calvinist conviction that the Church of England had to be purified of the accreted institutions, doctrines, and liturgies inherited from medieval Catholicism.

KING JAMES BIBLE

In the 17th century, both the popish plots, real or imagined, and radical movements of the PURITANS would test the vitality of the Elizabethan Church of England. At the Hampton Court conference of 1604, the first Stuart king, JAMES I (r. 1603–25), met his Puritan subjects to receive their petition for purifying the Catholic remnants from the Church of England. The king commissioned a panel of 54 to produce an authorized English Bible. The so-called James I Version was finished in 1611, and the Church of England began to have its own standardized book for centuries to come. However, at the same conference, the king was displeased by the demands of the Puritan nonconformists to reform the episcopacy, and later responded to it with his succinct statement "No bishop, no king." Afterward, the Gunpowder Plot by Catholic extremists, aiming at blowing up all of royalty at the opening session of Parliament of 1605, further inflamed anti-Catholic sentiment in England, and helped the Puritan cause to gain growing support from its popular base. The leading Puritan parliamentarians under King CHARLES I (r. 1625–49) became infuriated when the king refused to transform the Church of England toward congregational structure, and they linked the episcopal structure of the church to the king's personal tyranny.

CIVIL WAR

Although the Puritans' frustration alone might not have caused the breakout of the Civil War in 1642, the uncompromising antipapal and antiepiscopal attitude of the Puritan politicians and military men undoubtedly shaped the fate of England and its church in the next 20 years. After the regicide of 1649, General OLIVER CROMWELL, a Puritan providentialist and a pragmatic politician, was forced to suppress his fellow Puritan extremists, the levellers and the followers of the fifth monarchism, in order to preserve the episcopal organization in his Puritan-styled Church of England. During the Restoration (1660–88), endeavors were made among different religious leaders to find a new settlement, but King CHARLES II (r. 1660–85) and the Anglicans now in power refused to recognize the nonconformists who had been previously ordained to serve in their congregations. The king expelled about 2,000 of them from the church after they refused to pass the test, defined by the Act of Test of 1673 as taking oaths of allegiance and receiving Holy Communion in the Church of England.

The national church became schismatic, and the specter of the Civil War loomed. When the nation faced a very real possibility of the restoration of Roman Catholicism under JAMES II (r. 1685–88), Parliament met in 1688 to contemplate how to contend with the crisis. In Parliament, the majority of the Tories supported royal authority, but cared about the future of the Church of England more than King James II; the Whigs favored parliamentary supremacy, but were willing to work with the Tories in order to prevent Catholic resurgence. After suffering military defeats at the hand of the king's opponents, James II abandoned the throne and fled to France at the end of 1688. In 1689, Parliament offered the Crown jointly to Mary (r. 1689–94), the Anglican daughter of James I, and her husband, WILLIAM III (r. 1689–1702), the Calvinist duke of Orange. In the same year, Parliament required William and Mary to accept the Bill of Rights, which was designed to guarantee the members of Parliament freedom of speech and immunity from prosecution for their opinions presented in parliamentary debates. In 1689, the Parliament also adopted the Toleration Act, which offered some freedom of worship to the nonconformist Protestants; their right to hold public offices, however, was still technically restricted by the Act of Test of 1673, which would be finally repealed in 1828. But the Catholics did not gain religious freedom until 1829.

Political and religious struggles continued to disrupt the English life from the GLORIOUS REVOLUTION in England to the succession of the first Hanoverian king, GEORGE I (r. 1714–27), when the restoration of

Catholicism became not only barred by law but also less and less realistic. However, the Glorious Revolution of 1688–89 was the great landmark in the history of the Church of England. In general, the religious strife and bloodshed that had troubled England for more than a century began to subside, and the national and reformed church began to operate within the Elizabethan framework of the church constitution. Moreover, the church spread throughout the British Empire in the 18th and 19th centuries, and hundreds of episcopacies all over the empire lived under the governorship of English monarchs.

Today, the Church of England is still the religion of the English monarchy but no longer enjoys any privileges over other religions in the British parliamentary democracy. The archbishop of Canterbury, as St. Augustine's successor, is honored as the universal primate among the Episcopalian believers in more than 400 dioceses all around the world, but he exercises no authority over them. At the same time, the church is currently playing an important role in women's ordination, Christian ecumenical dialogue, and interfaith communications among world religions.

WENXI LIU

Clement VII

(1478–1534) *pope from the Medici family*

Pope Clement VII was born in 1478 as Giulio de' Medici and died on September 22, 1534, in Rome. He was a member of the powerful Florentine de' MEDICI FAMILY. In his youth he was educated by his uncle, the powerful Lorenzo the Magnificent. Another uncle, Pope LEO X (Giovanni de' Medici), made him cardinal on September 28, 1513. Because of his family's control over much of the politics of northern Italy, he was one of the favorite candidates for pope in the next conclave, but he was not elected to the papacy until November 18, 1523.

During his reign as pope, Clement was heavily involved in the conflict between French king Francis I and Holy Roman Emperor CHARLES V. Clement took the side of the French and organized the League of Cognac of France, Venice, and Florence on May 22, 1526. On Italian soil Clement was thrown into an ongoing territorial conflict with the city-state of Colonna, which had for years been invading the Papal States. On September 20, 1526, Clement was shut up in the Castle of Sant' Angelo while the Vatican was plundered by Colonna soldiers. German Lutheran soldiers also sacked Rome during his pontificate, possibly with the blessings of the Holy Roman Emperor. A treaty with Charles V in February 1530 brought peace once again to Italy, a peace that did not last long. Clement VII is best known as the pope who denied the divorce of HENRY VIII, king of England, and Queen Catherine of Aragon and denied the validity of the marriage of Henry to Anne Boleyn. Clement eventually excommunicated the king and the English Reformation ensued. Clement helped support the Capuchin reform of the Order of St. Francis of Assisi and

continued the patronage of the great artists Michelangelo and Raphael Santi. Clement was the pope who ordered the painting of the great fresco of the Last Judgment in the Sistine Chapel.

JAMES RUSSELL

Clive, Robert

(1725–1774) *British empire builder*

Robert Clive went to India as a clerk of the British East India Company. Through daring and ability he was instrumental in defeating the French and their Indian allies. He consolidated British power in Bengal in the BATTLE OF PLASSEY in 1757 and twice served as governor of Bengal.

The English (later British) East India Company was established in 1600, the FRENCH EAST INDIA COMPANY in 1664. The goal of both was to establish trading stations in India, and neither harbored territorial goals until after Emperor AURANGZEB's death in 1707, when the MUGHAL EMPIRE began to disintegrate. The French governor-general at Pondicherry (the leading French trading station in India) Joseph Dupleix (1697–1764) was first to make alliances with native rulers and train Indian soldiers (called *sepoys*) under French command and with European firearms. Through these means Dupleix gained land and influence for France. Significantly Dupleix's forces captured the British Fort St. George (Madras) in 1746 and took Robert Clive, a clerk recently arrived from England, prisoner. Clive escaped, took a commission in the British East India Company's army, and in a brilliant maneuver, defeated the forces of the ruler of Hyderabad, France's major ally in the Deccan, and captured an important port called Arcot against great odds. As a result Dupleix was recalled to France in disgrace. Clive then took a page from Dupleix's book and began to train sepoys.

In 1756, the new Mughal governor of Bengal, Siraj-ud-Daula, sent an army against the British trading settlement at Calcutta. Most of the 146 English men and women who could not flee died in a dungeon in which they were imprisoned. This episode, called "The Black Hole of Calcutta," gave Clive the pretext he needed for expanding British power in Bengal. He recaptured Calcutta and with a small force of 1,000 Europeans and 2,000 sepoys and eight pieces of artillery decisively defeated Siraj-ud-Daula's 35,000 infantry, 15,000 cavalry, and 50 cannons manned by Frenchmen, with only 22 Europeans killed and 49 wounded. This was the famous Battle of Plassey, after which Clive made a pro-British Indian governor of Bengal under his tutelage until he returned to England in 1760. In recognition the British government ennobled him as Baron Clive of Plassey. Britain and France were once again enemies between 1756 and 1763 during the Seven Years' War when Britain's superior navy blocked French reinforcements from reaching India. In 1761, Britain captured Pondicherry, finally ending French imperial aspiration in India.

Clive returned to India in 1765 as governor of Bengal to settle problems that had arisen since his departure. He made an agreement with the now very weak Mughal emperor whereby the British East India Company was made revenue administrator for the provinces of Bihar and Bengal, making it de facto territorial ruler of this huge Indian territory. After organizing the administration of Bengal, Clive returned to Britain in 1767. He faced a parliamentary inquiry instigated by his enemies for corruption while in India but was exonerated. Depressed by the charges, he committed suicide in 1774.

Clive's was a remarkable career of empire building. He played a crucial role in the elimination of France from India and set the stage for the British Empire on the subcontinent. For this reason he is called Clive of India.

JIU-HWA LO UPSHUR

coca

Coca (family Erythroxylaceae) is the generic name for several varieties of shrub that grow in the Andean mountains and adjacent tropical forests from whose leaves cocaine is derived. Archaeological evidence from the

Valdivia culture of southwestern Ecuador and elsewhere, including small ceramic figurines and containers, indicates that coca cultivation and chewing date back to at least 2500 B.C.E., making it likely that coca was among the first plants cultivated by the indigenous peoples of South America. Known today as the *gran remedio* (great remedy), the plant's small fleshy leaves are chewed, producing a mild narcotic effect that diminishes hunger and fatigue and produces an overall sense of well-being.

Traditionally viewed as a sacred plant, whose cultivation and ingestion were linked to various social rituals, coca was and remains integral to indigenous highland Andean culture, particularly among Quechua- and Aymara-speaking peoples. The word *coca* itself derives from the Aymara word for tree. Several varieties of coca are cultivated in a variety of ecosystems, from windswept highlands to tropical lowlands. Its chemical composition, including its cocaine content, makes the plant highly resistant to pests and predators. It will also tolerate many harvests a year, a harvest consisting essentially of plucking a portion of the shrub's leaves. The lifespan of a single shrub will typically extend up to 40 years, while the plant itself will tolerate a wide range of soils and ecological conditions, making it, in these respects, an ideal cultivar.

The first documented use of coca by the indigenous inhabitants of the Americas comes from the 1499 journal of European explorer AMERIGO VESPUCCI during his second voyage to the New World, in which he described the practice of coca chewing among the inhabitants of a Caribbean island off the coast of Venezuela. Later Spanish chroniclers decried the natives' persistent use of coca, but proved unable to eradicate it. The tens of thousands of indigenous laborers forced to work in the silver mines of POTOSÍ, for instance, routinely chewed coca, combined with ground seashells or other sources of alkalinity (which facilitates the body's absorption of the plant's active chemicals) in order to alleviate the effects of mine labor—a tradition that continued in Andean mines and elsewhere through the 20th century.

There is an important distinction between coca and cocaine. *Coca* refers to the plant and its leaves. Cocaine is but one chemical component of the plant, isolated and refined by chemical and physical processing. A chemical isolate, cocaine is highly addictive. Such chemical refinement is wholly antithetical to the traditional social and cultural use of coca leaves in highland South America. There is no evidence that traditional coca chewing is addictive or harmful. On the contrary, abundant evidence exists that coca's beneficial effects

far exceed any potential negative side effects. Rich in vitamins and minerals, the plant is used for everything from toothaches to altitude sickness.

Coca, in short, is integral to highland Andean culture. Many informed observers are convinced that contemporary efforts to eradicate the plant from the Andes in the U.S.-led "War on Drugs" constitute a direct assault on indigenous culture and are doomed to failure. Suggestive of the continuing cultural and political vitality and power of coca in the Andes, in 2006 the newly elected president of Bolivia ran on a platform of defending *cocaleros* (coca growers) from the assault on their traditional lifeways.

MICHAEL J. SCHROEDER

Colbert, Jean-Baptiste

(1619–1683) *French statesman*

Jean-Baptiste Colbert was born on August 29, 1619, in Reims, France. His father was a draper, but Jean-Baptiste was educated in business. At age 20 he began service in the Ministry of War under Michel Le Tellier. In 1651, he became Jules Cardinal Mazarin's (1602–61) personal financial attendant; it was Mazarin who later recommended Colbert to LOUIS XIV, king of France (1638–1715).

Colbert became Louis XIV's comptroller (minister of finance) in 1665 and held that position until 1687. France's financial system had been plagued by corrupt and weak administration, and funds collected scarcely made their way to the proper authorities. Due to Colbert's investigations, superintendent of finance Nicolas Fouquet (1615–80) was tried for embezzlement in 1661 and imprisoned for life. The office of superintendent was abolished, and numerous other officials lost their positions. Colbert restructured French finances, which were thereafter ruled by a council of finance bound to a new set of accounts to keep to the budget.

Colbert reduced interest rates on France's public debt to free funds for other projects. He made tax collections and distributions so efficient that he reaped a 50 percent tax decrease in costs. Soon, he managed to increase France's net revenues by 30 million livres. Colbert also oversaw the *corvée*, the much

despised free labor that peasants owed to their lords. He was a gifted financier and administrator, but he found it exceedingly difficult to control Louis XIV's extravagant spending, which often brought France to the brink of bankruptcy.

A mercantilist intent on market reforms, Colbert expanded commerce and maintained a positive trade balance. He also pushed for protective tariffs and subsidies and introduced government control over commerce and trade in 1644 with price and quality controls. He declared more than 100 edicts to govern guilds. With an eye toward the world market, he introduced the luxurious silk trade, Venetian glass blowing, and Flemish cloth trades to France.

Colbert initiated massive roadwork projects and had the Canal of Languedoc built to facilitate easier commercial communication. His model factories used specific production standards to ensure quality along with volume. He closely supervised colonization costs by establishing the FRENCH EAST INDIAN COMPANY and the French West India Company.

In 1669, Colbert became marine minister. He ordered arsenals and harbors to be built including the ports of Rochefort and Brest. He immediately wrote new navigation laws and then instituted the merchant marine and the French navy. To improve the navy's training and patriotism, he established naval schools and instituted a system of classes for the service to ensure loyalty. Every seaman would provide six months of service once within a four-year period in which he would receive full pay and then receive half-pay and a pension when these conditions were met. To fill up the ranks, Colbert used condemned criminals, North American Indians, and slaves to serve in the navy.

A patriot of France, Colbert declared new codes to centralize power in the monarchy. These included a civil code in 1667, a criminal code in 1670, a commercial code in 1772, a marine code in 1681, and colonial codes in 1685. Because he believed in the superiority of French art and science, his avid support of these institutions led him personally to found at least four major prestigious French academies.

Although Colbert had dealt with various challenges with the extravagant King Louis XIV, the king's decision to declare war on the Netherlands in 1672 forced him to change some of his basic policies. For example, he had no choice but to raise funds for the war by increasing taxes, selling office, and borrowing money. Despite Colbert's track record prior to the war, these unpopular policies created strong dissent. Moreover, he had never really gained much support within court circles, prob-

ably because of the power he wielded. For all his efforts to make improvements at all levels of France, he was not rewarded with the appreciation of his countrymen. Still, most historians consider him a great French statesman.

Colbert died on September 6, 1683.

ANNETTE RICHARDSON

Columbian exchange

Two ecological systems, evolved for thousands of years in near total isolation from each other, suddenly thrust together, flooding each side with the organisms of the other over the course of nearly five centuries—this is the concept of the Columbian exchange, a term coined by historian Alfred W. Crosby in 1972 to describe the biological intermingling of the Old World and New World in the centuries following the first contacts of Europeans, Africans, and indigenous Americans. Encompassing all classes of animals, plants, and microbes, and the attendant cultural and social transformations they engendered, the Columbian exchange forever transformed the face of the planet and represents one of the most important consequences of the European encounter with the Americas.

Plants comprised one broad category of this centuries-long biotic exchange. In 1951, Russian botanist Nikolai Ivanovich Vavilov listed 640 of humanity's most important cultigens. Of these, more than 500 originated in the Americas. Among the most important staple crops of the Western Hemisphere to make their way to Europe, Africa, and beyond were maize, beans (of many varieties), potatoes and sweet potatoes, squashes and pumpkins, peanuts, and manioc (cassava). Also important were the papaya, guava, avocado, pineapple, tomato, chili peppers of many varieties, and CACAO. Maize cultivation originated in Mesoamerica around 5000 B.C.E. before spreading to both South and North America at least 1,000 years before the European arrival. The most important staple crop of the Americas, maize soon became one of the most important cultigens in both Europe and Africa. Beans, of which there are more than a thousand species, formed one pillar of the maize-beans-squash triad of staple crops common

Florida Native American (Timucua) men cultivate a field while women plant seeds of maize or beans. From a 1591 engraving.

among many pre-Columbian American cultivators. Not all beans are American in origin—soybeans, for instance, originated in the Eastern Hemisphere—but many of the most popular varieties are American, including the lima, Rangoon, kidney, navy, snap, and *frijole* beans (pinto, red, black, and others).

Potatoes, indigenous to the Andes, were developed into hundreds of varieties in the centuries before 1500. After the CONQUEST OF PERU, Spaniards selected several varieties to transport back home, particularly the white potato, which soon spread across much of Europe. Wealthier classes tended to look upon the potato as a quasi-food, while for many of the poor it became an important staple crop, most infamously in Ireland, where overreliance on a few varieties led to the Irish famine of the 1840s. Another tuberous American starch was manioc. Known in its form as tapioca pudding among many Europeans, and as cassava across much of Africa and Asia, where it became an important staple crop and famine food, manioc has very little nutritional value but grows where many other cultigens will not, thriving in a broad belt extending 30 degrees north and south of the equator.

Far and away the most important nonfood cultigens transferred from the Americas to the Old World were TOBACCO and coffee, both of which rapidly became extremely popular in Europe before their subsequent spread across the globe. Also important were some varieties of cotton, and, from the 19th century, rubber. The most important plant crops making their way from the Old World to the Americas included

wheat, rice, bananas, sugar, grapes, olives, mangos, breadfruit, and African yams. Also important were chickpeas, melons, onions, cauliflower, cabbage, lettuce, and radishes. European fruits transplanted to the New World included oranges, lemons, pomegranates, citrons, and figs. Wheat was taken to NEW SPAIN soon after the CONQUEST OF MEXICO. By 1535, New Spain was exporting wheat to the Caribbean and beyond, while wheat cultivation soon spread to wherever conditions permitted. Bananas were taken to the Antilles from the Canary Islands in 1516, after which banana cultivation spread rapidly throughout the Caribbean Basin and beyond.

Sugar, originating in the Mediterranean and cultivated in the Canary Islands and Azores in the 1400s, was taken to Hispaniola in 1493 by Columbus. Its subsequent spread in the Spanish Antilles was slow until the Spanish Crown intervened actively to promote its cultivation, while its spread in Brazil was due mainly to the actions of planters. Grape cultivation, overwhelmingly for wine production, met many obstacles in the Caribbean and New Spain but proved successful in Peru and Chile; by the 1650s, they were producing wine for export. Olives followed a similar path, with initial failures in the Antilles and New Spain followed by success in Andean highland valleys.

Another category of plants consisted of weeds, plants for which people had not devised a use, and whose exchange across the Atlantic was unintended; examples include the dandelion, daisy, and Kentucky bluegrass. Though no definitive study has determined the precise number of such species exchanged, there is little doubt that it runs into the thousands.

ANIMALS

The introduction of cattle, pigs, sheep, and goats also profoundly affected peoples and cultures across the Americas, with important regional variations. Pigs proliferated across the Caribbean from early on, and there were few places thereafter where abundant pigs did not accompany both Spanish and Portuguese or were not adopted by indigenous Americans. Cattle ranching emerged as an important economic pillar across much of the hemisphere, with beef, hides, and tallow becoming major commodities across most of the Americas save the Amazon Basin and the Andes. Sheep thrived especially on the high plateau of Central Mexico and Rio Grande Basin, the Andes, and across southern South America. Native peoples were quick to adopt whatever of these animals the environment permitted, generating widespread variations across the hemisphere. The unin-

tended consequences of sheep and cattle proliferation in some regions included widespread overgrazing and soil erosion. During the colonial period, the environmental effects of unrestrained sheep herding in central and northern Mexico were especially deleterious. Animals unintentionally taken to the Americas by Europeans included thousands of species of insects, rats, and a variety of other vermin.

Animals comprised another broad category of organisms exchanged between Old World and New. The pre-Columbian Americas had no beasts of burden save the camelids of the Andes, the llama and alpaca. Other domesticated New World animals included the guinea pig, dog, turkey, and duck. European introductions included horses, donkeys, mules, cattle, oxen, pigs, sheep, goats, chickens, and many varieties of larger dogs. While many indigenous peoples rejected wheat and other European crops, many also readily adopted these four-legged European domesticates. The horse, several varieties of which had evolved in the Americas and become extinct at the beginning of the Holocene, exercised a profound influence across the hemisphere. From the Argentine pampas to the Great Plains of North America, horses and their kin transformed fundamental aspects of society and culture, beginning with their introduction into the Antilles by CHRISTOPHER COLUMBUS in 1493. Herds of wild horses spread quickly north after the conquest of Mexico, reaching the Great Plains by the mid-1700s and perhaps before. The introduction of horses to South America is generally attributed to Pedro de Mendoza's few animals taken to Buenos Aires in 1535. Fifty years later, vast herds populated the vast open prairies of the pampas.

PATHOGENS

A final and monumentally important category of organisms exchanged between Old World and New consisted of microbes. While the vast majority were harmless, a handful were deadly pathogens responsible for one of the most precipitous and widespread demographic declines in world history. The overwhelming direction of the flow of disease was from Europe to the Americas. By the 16th century, after centuries of plagues and epidemics, European peoples inhabited a highly evolved disease pool in which immunities to the most virulent pathogens were widely shared. Such immunities did not exist in the Americas, although a wide variety of diseases were endemic in the Western Hemisphere, including tuberculosis, histoplasmosis, leishmaniasis, Chagas' disease, amebic dysentery, various rickettsial fevers, syphilis, and many types of intestinal parasites. Of the diseases transplanted from Europe to the Americas,

smallpox was the deadliest killer, along with typhus, measles, bubonic plague, and malaria.

The one pathogen that migrated the other way was syphilis, a disease and a process of transmission that spawned a huge body of literature and debate. A broad scholarly consensus emerging from this debate holds that both venereal syphilis and an endemic nonvenereal strain (caused by various strains of the bacterium *Treponema pallidum*) were most likely first contracted by European men through sexual relations with indigenous women and spread by the captured Indians taken to the Spanish court by Columbus in 1493. It is believed that the epidemic that spread among the men of Christopher Columbus at the garrison of Isabela on Hispaniola in 1493 during the CONQUEST OF THE CARIBBEAN was a form of syphilis, probably contracted through the rape of Indian women. The disease was unknown in Europe before 1493. By 1496, it had spread to France, Germany, Holland, Switzerland, and Greece, and by 1503, to China, spreading farther and becoming endemic thereafter.

In sum, scholarly debates and investigations continue on these and many other environmental and biological consequences engendered by the coming together of Europe, Asia, Africa, and the Americas after 1492.

MICHAEL J. SCHROEDER

Columbus, Christopher

(1451?–1506) *Genoese navigator*

Genoese navigator and explorer, most renowned for his voyage to the Americas on October 12, 1492, Christopher Columbus (Cristóbal Colón) ranks among the most important actors in the early modern era. His encounter with the Americas ranks among the most consequential

events in world history, placing Old World and New into sustained contact with repercussions that are still being felt today.

Sometimes erroneously credited with the notion that the Earth was spherical and that sailing west would permit reaching the Far East, Columbus was but one of many European navigators in the late 1400s to hold such views. His fame is not based on his pursuit of an original idea, but on his dogged determination, despite many setbacks, to achieve his goals, combined with the striking good fortune to be the first to reach the Americas and return with evidence of a world that hitherto had lain beyond the ken of Europe.

As a youth Columbus followed his father's trade and worked as a weaver, also spending some of his time at sea. In 1475, in his early 20s, he journeyed to the eastern Mediterranean. The following year he arrived in England. Settling in Lisbon in 1477, he married and became enmeshed in the heady world of Portuguese navigators, who at that time were in the forefront of European efforts to reach India and China by sea and thus skirt the Muslim-dominated lands of the Middle East. Adopting the conviction, widespread among experienced navigators, that uncharted lands lay west across the sea, Columbus for several years tried and failed to secure the patronage of King João II of Portugal for his exploratory venture. Rebuffed in Lisbon, Columbus took his scheme to the court at Castile, the largest and most powerful of the Spanish Christian kingdoms, and at that time in the final stages of expelling the Moors from Iberia. After eight years, his persistence finally paid off, when FERDINAND V AND ISABELLA I OF SPAIN, flush with their victory over the Moors in Granada, agreed to patronize the scheme of the Genoese navigator.

Setting sail from Palos, Spain, on August 3, 1492, Columbus commanded three small caravels: the *Santa María*, which he himself captained; the *Pinta* under experienced navigator Martín Alonso Pinzón; and the *Niña* under Vicente Yáñez Pinzón. After replenishing supplies in the Canary Islands, the convoy headed due west from September 6 to October 7, changing course to southwest at the suggestion of Martín Pinzón. Quelling a small mutiny on October 10, Columbus and his convoy sighted land on October 12, probably Watling Island in the Bahamas.

Erecting a cross, planting a flag, and claiming the land for Spain, Columbus christened the island San Salvador. He also interrogated the natives about the source of the gold ornaments they were wearing. As in subsequent expeditions, gold was paramount in the

litany of marketable commodities from which Columbus and his subordinates were seeking to profit. After exploring and charting neighboring islands, on October 27, the convoy sighted Cuba, and on December 5, Hispaniola. Earlier, in late November, in an act of insubordination, Martín Pinzón took the *Pinta* east in search of the island of Babeque, reputed to be a source of gold. Columbus did not see Pinzón again until January 6, 1493, when they reunited on the north coast of Hispaniola. On December 20, the *Santa María* and *Niña* sailed into Acul Bay on the north coast of Hispaniola. On December 24, in the midst of Christmas Eve celebrations, the *Santa María* drifted onto a coral reef and was destroyed.

Interpreting the wreck as a sign from God, Columbus used what remained of the *Santa María* to create the rudiments of the first European settlement in the New World, which he called Villa de la Navidad (Christmas Village). Leaving some 40 men behind at Navidad, Columbus linked up with the *Pinta* under Pinzón, and together they continued exploring the north coast of Hispaniola. On January 15, 1493, Columbus decided to return to Spain. After a brief and unexpected stop in Lisbon, he, Pinzón, their crews, and six native Taínos sailed into Palos, Spain, on March 15.

Received at the court with great pomp and majesty, Columbus was granted a coat of arms and other high honors, including being named Admiral of the Ocean Sea as stipulated in his contract. Less than two months later, on April 29, his letter to King Ferdinand and Queen Isabella describing his discoveries was published in Italy, and within the year was circulating widely throughout Europe.

The overall effect was electrifying and distinguishes Columbus's voyage from others who may have reached the Americas before him. Its political impact was also immediate and profound, ratcheting up the competition between Spain and Portugal in particular. Fortunately for Spain, Pope Alexander VI declared Spain's right to claim all new lands west of a north-south line 100 leagues (less than 500 kilometers) west of the Azores, into which all of the Americas fell. In 1494, the line was modified, to the benefit of Portugal, in the TREATY OF TORDESILLAS.

Columbus made three subsequent voyages to the New World in 1493, 1498, and 1502, making many additional discoveries, none of which, however, compared to his first. During this period, his reputation at the Spanish court declined markedly, as he proved a great explorer and self-promoter but a very poor administrator of the numerous settlements he had founded. Indeed

in 1500, the newly appointed governor of Hispaniola sent Columbus back to Spain in chains in consequence of the colony's dismal conditions.

Until the end of his days, Columbus was convinced that he had reached the East Indies, while the scramble for lands and resources that his discoveries initiated forever transformed the face of Europe, Africa, and the Americas.

Copernicus, Nicolaus

(1473–1543) *astronomer*

Nicolaus Copernicus presented an alternative model of the universe that broke with that proposed by Ptolemy in the second century C.E. and thus with the prevailing assumptions of astronomers in his own time. Although he did no observations and lacked advanced mathematical skill, he nonetheless ushered in the “new” science and physics of GALILEO and ISAAC NEWTON.

The Latinized name *Copernicus* belonged to the man born in Torun, Poland, as Mikolaj Kopernik. His wealthy merchant father died when his son was only 10 or 11 years old; Copernicus spent his youth in the household of his maternal uncle, Lucas Waczenroade, who was also bishop of Ermeland. He therefore received a good education that enabled him to succeed when he went on to the University of Krakow in 1491. He developed an interest in astronomy while in Krakow, but he instead pursued law and medicine while in Bologna and Padua. He became a doctor of canon law in 1503. His participation in the broader humanist movement was made manifest by his 1519 publication of his translation from the Greek into Latin of letters by a seventh-century Byzantine poet. His uncle appointed him canon at Frombork Cathedral in 1503, but Coperni-

cus did not reestablish residency in Poland until 1506. He served his uncle as secretary and physician until the bishop died in 1512. Thereafter, Copernicus devoted his time to astronomy, along with his responsibilities as canon, physician, and local mathematician. In the latter capacity, he developed a plan for currency reform. He also took command of a castle at Allenstein in 1520 after the Teutonic Knights invaded the region.

Copernicus did not at first widely disseminate the ideas that later made him famous, even though he had developed them by 1510. His doubts about the Ptolemaic model of the universe focused on a few weak points that had also been identified by other astronomers. First, the Ptolemaic system required the Moon's orbit to be offset from the Earth to explain apparent variations in the speed of the Moon's motion around the Earth.

The magnitude of this offset would entail equally dramatic variations in the apparent size of the Moon, dependent on its distance from the Earth. No observer had witnessed anything of the kind. Second, Copernicus disliked the complexity and incoherence of Ptolemy's model. He expected that a single principle governed the organization of the universe, whereas Ptolemy dealt with each planet, the Sun, and the Moon individually and gave each body its own epicycles and own offset from the Earth. Copernicus aspired to formulate a far more elegant model that would better evidence the unity of what he believed to be God's creation.

Shortly after he first became interested in astronomy, Copernicus read a book published by German natural philosopher Johannes Mueller, known as Regiomontanus. Regiomontanus published *Epitome* in 1496. In this work, he provided a summary of the *Almagest*, included new observational data, and added critical textual commentary. For example, he highlighted the problem of the Ptolemaic model with regard to the apparent size of the Moon.

Copernicus circulated his own model among close friends soon after 1510 in the form of a manuscript, called *Commentariolus*. It attracted the interest of various astronomers, and it was mentioned by papal secretary Johan Widmanstadt in a lecture at the Vatican given to an audience that included the pope and cardinals. Cardinal Nicholas von Schönberg requested that Copernicus publish his ideas; his letter was reproduced at the beginning of Copernicus's *De revolutionibus orbium coelestium* (*On the Revolution of the Celestial Spheres*), published in 1543.

Copernicus remained somewhat dissatisfied with his model; that may in part explain his reluctance to publish. Although placing the Sun at the center and arranging the

orbits of the planets around it had several advantages (for example, it accounted for observations of the planets and allowed estimates of their distance from each other), it did not completely satisfy his desire for unity and order. The Moon orbited around the Earth, for instance. Also, he could not explain the seeming acceleration and deceleration of planets in their orbits because he assumed that orbits were perfectly circular (rather than elliptical) and that the universe could have an exact center.

Further, Copernicus continued to believe that the stars were fastened upon a crystalline sphere beyond the spheres that carried the planets. If the Earth was moving, he and other astronomers anticipated that an observer on Earth should see the stars appear to move. The absence of the so-called parallax effect results from the fact that the stars lie thousands of times farther than the outermost planet, such that the parallax is too small to be seen by all but the most careful observers using sophisticated telescopes not available until the 19th century at the earliest. Last, Copernicus offered no explanation for why people on Earth perceive no evidence that the planet constantly moves, such as a wind. After much hesitation and work on other tasks, Copernicus yielded to the request of mathematics professor Georg Joachim von Lauchen (called Rheticus), who arrived at Frombork in spring 1539 to meet with him. He agreed to allow Rheticus oversee the publication of his work.

Rheticus published *First Account of the Revolutionary Book by Copernicus* in 1540, but he left his post at Wittenberg for one at Nuremberg before he could complete preparations for *De revolutionibus*. Rheticus left the project to Andreas Osiander, whose unsigned preface made explicit that Copernicus offered a model, not an assertion of fact. Osiander, a Lutheran minister, would have known that MARTIN LUTHER had condemned the notion of a Sun-centered universe as contrary to the cosmology hinted at in the Bible. Leaders of the Roman Catholic Church expressed no concerns about the theory at the time, however.

PUBLISHED WORK

Copernicus died before he could read the published version of his book. *De revolutionibus* did not have many readers, in fact: All of its first edition of 400 copies did not sell. In England, an astronomer by the name of Thomas Digges discussed the Copernican model in his book of 1576, but the theory did not gain much additional attention until the declared heretic Giordano Bruno was executed in 1600. Bruno subscribed to an assortment of heterodox beliefs and to the cult of Hermes Trismegistus, which worshipped the Sun; he claimed that the Egyp-

tian religion was the true faith. Bruno also happened to believe in the Copernican model of the universe, a circumstance that may have brought the idea into disfavor with the church in a form of guilt by association. The Vatican placed *De revolutionibus* on the Index of Forbidden Books in 1616 (it was removed in 1835).

When JOHANNES KEPLER derived his laws of planetary motion after postulating a Sun-centered universe and after Galileo defended the theory as a description of reality and confronted the church with new evidence, Copernicus's ideas began to exercise an important influence on the course of scientific inquiry. As with any useful theory, that of Copernicus directed research in particular directions and could be tested by observation.

MELANIE A. BAILEY

Coronado, Francisco Vázquez de (1510–1554) Spanish explorer

Francisco Vázquez de Coronado was the Spanish explorer who led the expedition looking for the fabled Seven Cities of Cibola rumored to be located in southwestern North America. Coronado served in the entourage of Antonio de Mendoza, Spain's first viceroy to Mexico. He served as governor of New Galicia from 1538–39, when he was named the commander of the expedition Mendoza was putting together to look for the Seven Cities of Cibola. The expedition spent 1540–42 looking for the cities, but did not find them. After the expeditions returned to Mexico, Coronado faded into obscurity and died in 1554.

Born into a wealthy family in Burgos, Spain, in 1510, Coronado decided to go to the New World to make his fortune. He arrived in Mexico in 1535 as part of Mendoza's following, where he was appointed as governor of New Galicia in August 1538. New Galicia was a frontier outpost on Spain's northernmost border

of Mexico. During the preceding years, rumors had circulated in Mexico of a fabulously rich kingdom of seven cities called Cibola in the American Southwest. In 1539, Mendoza determined to send an expedition into that area to find the Seven Cities of Cibola, and he named Coronado to command the expedition.

The expedition set out on April 22, 1540, and headed where the first of the cities was supposedly located. Arriving on July 7, Coronado discovered only an unimpressive pueblo village. Attacking the village Coronado was knocked out by a stone and almost killed, but was saved by two of his officers. The Spanish eventually captured the village, and Coronado made the pueblo his temporary camp from which he sent out parties to scout the surrounding area in hopes of finding Cibola.

These parties scouted a large part of the American Southwest and were the first Europeans to see the Grand Canyon. In November 1540, the main body of the expedition caught up with Coronado. He then moved his base camp into the valley of the Rio Grande in December, where they spent the winter forcing the local natives to give them food and warm clothing.

The expedition set out again in spring, leaving camp on April 22, 1541. They moved east into Texas and then southwest. They picked up a local guide, who told them of rich kingdoms to the north. Coronado sent most of the expedition back to the previous winter's camp and headed north with a small group of horsemen to try to find these kingdoms.

The rich villages turned out to be Wichita Indian villages made up of grass huts along the Arkansas River in what would become Kansas. Finding no gold, Coronado returned to his camp. In December 1541, Coronado was thrown from his horse under another horse and nearly killed. The following April, Coronado decided to return to Mexico.

Upon returning to Mexico, Coronado lost his governorship and was charged with incompetence and mistreating the local natives. He was cleared of both charges but never held another command or office. He died in 1542.

DALLACE W. UNGER, JR.

Cortés, Hernán

(1485–1547) *Spanish conqueror*

Famed for his ruthlessly brilliant leadership in the Spanish CONQUEST OF MEXICO, Hernán Cortés (Hernando [or Fernando] Cortez) occupies a peculiar position in Mexican national memory, remembered by all but revered by none. A contemporary of NICCOLÒ MACHIAVELLI, Cortés through his exploits in Mexico earned the reputation as one of the early modern era's most Machiavellian of historical actors.

Born in Medellín, Extremadura, Spain, in 1485, of minor nobility, his mother related to the family of FRANCISCO PIZARRO, Cortés studied briefly at the University of Salamanca before opting for a life of militarism and adventure in the recently discovered Americas. In 1504, he journeyed to Hispaniola, and soon after, from 1511, participated in the conquest of Cuba under Governor Diego Velázquez. His successes earned him a substantial *ENCOMIENDA*, sufficient to provide a steady stream of revenue for the rest of his life, though his adventures and conquests had only begun. In 1518, after much behind the scenes maneuvering by Cortés, Governor Velázquez appointed him to head an exploratory expedition to the Mexican mainland. Over the next three years (1519–21), Cortés revealed the extraordinary courage, ambition, single-minded determination, and political cunning for which he became justly renowned. Time and again, faced with seemingly insurmountable odds, he managed to turn the political and military tide to his favor. Among his most brilliant maneuvers were his swift recognition and deft exploitation of the political divisions between the AZTECS and their subject polities; his keen perception of the Aztec emperor MOCTEZUMA II's psychological weaknesses and the stratagems he devised to exploit them; his instillation of a sense of unity of purpose and inevitability of victory among his men; his winning over of members of the Narváez expedition sent by Governor Velázquez to bring him to heel; and his successful representation of himself to King CHARLES V and the court as a loyal subject acting only on behalf of church and king.

This latter capacity is especially apparent in the five lengthy letters Cortés dispatched to King Charles from 1519 to 1526, reporting on and justifying his actions.

After reducing Tenochtitlán to rubble, he continued the conquests, sending expeditions north, west, and south into northern Central America. His appointment as governor and captain-general of New Spain in 1522 was considered the high point of his life, along with his admission into the Order of Santiago in 1525. In 1524–26, he headed an expedition overland through the Maya zones into Honduras, along the way executing his prisoner, the Aztec lord CUAUTEMOC, in 1525. The expedition a disaster, he returned to Mexico City in 1526 only to find that his enemies had gained power at his expense. Journeying to Spain (1528–30), he was appointed marqués of the Valley of Oaxaca by King Charles, who granted him the colony's largest encomienda (of 23,000 Indians), making him one of the richest men in all of Spain's dominions.

Upon his return to New Spain in 1530, his enemies again had gained the upper hand, including (from 1535) Viceroy Antonio de Mendoza, among others, against whom he spent years in fruitless squabbling and defending himself in a long series of accusations and judicial inquiries. After embarking on an expedition to the Pacific and discovering and naming California in the late 1530s, he once again returned to Spain in 1540 to continue to press his claims, was largely ignored by the court, and died.

Insights into Cortés's political and military brilliance during the conquest of Mexico, and his political shortcomings later in life, can be gleaned from his five letters, along with the narrative of BERNAL DÍAZ DEL CASTILLO, and a range of other accounts.

MICHAEL J. SCHROEDER

Cossacks

The Cossacks originally settled in the southern steppes of Europe and into Russia. As early as 1380, the Cossacks along the Don River are recorded as fighting with the Russian grand duke Dmitri against the Mongols. On September 8, 1380, Dmitri won a decisive victory over the Mongols at Kulikovo by the Don River, effectively marking the end of Mongol rule over much of Russia.

By the 16th century, the Cossacks had merged into two large autonomous bands, the Don Cossacks and the Zaporojie, who lived along the bends of the river Dnieper. (*Zaporojie* is translated as “below the bend in the river.”) Other historians have pointed to additional areas of Cossack settlement as time progressed, including areas in which entire settlements of Cossacks resided. While surrounded by the power of the growing Russian state of Poland in addition to the Crimean Tartars (or Mongols), the Cossacks still managed to keep a large measure of independence because of their military prowess.

Many serfs, or slaves, ran off to join the Cossacks because the measure of freedom enjoyed under the Cossack leaders (called atamans or hetmans) was not found anywhere else in Russia or East Europe during that period. The word *Cossack* is derived from the Turkic term *kazak*, meaning “free man.” Most of the Cossacks were of Slavic descent, and the majority Christian, usually of the Russian Orthodox faith. The Cossacks were governed by the Rada, or Legislative Assembly, led by the ataman. During wartime, the ataman served as the supreme war commander.

The Cossacks realized that keeping their freedom meant keeping their military skills at a high degree of readiness. Their lifestyle reflected the influence of the Mongols before them. Boys were given weapons almost as soon as they could hold them and taught to ride sometimes before they could even walk. Indeed, the main strength of the Cossacks came from the quick charges they could execute on their horses. The atamans staged sham battles with the younger boys to accustom them to a military life from as early an age as possible. Brave and daring boys were noticed by the leader and were marked from an early age for advancement.

Cossacks began to use their centralized position to raid the domains of the nations growing around them, although most of their attacks were directed toward the Muslim Tartars of the Crimea and the Turks of the OTTOMAN EMPIRE. At the same time, when the frontiers of the powers in East Europe were so fluid, each county could see the value of the Cossacks as frontier troops, perfectly suited to counter raiders from enemy lands.

In 1569, Poland and Lithuania formally became the Union of Lublin. Lithuanian grand duke Jogaila ruled the united monarchy as Ladislas (Władysław) II Jagiello, first of the Jagiello dynasty. The pact that set the state for his marriage to the queen of Poland stipulated that he become a Roman Catholic, the religion of Poland. In 1596, the Union of Brest united the Russian Orthodoxy of Lithuania with the Roman Catholicism of Poland to form what was known as the Uniate Church. The

Uniate Church began a persecution of Orthodox believers who would not convert, and perhaps thousands fled to the Sech Commonwealth of the Cossacks. In 1645, Ladislas IV sought to involve the Cossacks, who by now were within the boundaries of Polish power, in war against the Ottoman Empire. When his plans were revealed, the Cossacks feared becoming the scapegoats for the two countries.

In addition to the continued persecution of the Orthodox Church, the exposure of Ladislas's secret treaty led the Cossacks under Bohdan Khmel'nitsky to rise up against Poland in 1648, the very year that the Treaty of Westphalia sought to bring peace to Europe by ending the THIRTY YEARS' WAR (1618–48). Khmel'nitski formed an alliance with the Tartars and the Zaporozhie Cossacks and led an invasion of Poland. Polish serfs rose up when Khmel'nitski approached. For six years, the rebellion ravaged Poland and the Ukraine. Thousands of Poles and Jews were massacred in some of the most savage butchery ever seen in Europe. Finally in 1654, seeing that the destruction of the Polish Kingdom was beyond his means, Khmel'nitski took the irrevocable step of making an alliance with Czar Alexei, the second of the Romanov dynasty. Tragically for the Cossacks' love of freedom, Khmel'nitski had exchanged one master for another, the Polish king for a Russian czar.

Under the Romanovs, the 17th century saw a tightening of the control of Russia over the Cossacks. The Russians saw the Cossacks as excellent troops to be used against the Ottoman Turkish Empire. The Cossacks carried out fierce raids against the Tartars and in 1663, Turkish sultan Mohammed IV sent a large army against the Zaporozhie Cossacks. Although the Zaporozhians were asleep after a drinking bout, one aroused himself in time to see the Turks approaching. Incredibly, the Cossacks were able to fend off their attackers and force them to retreat.

Eventually, the tension between Russian rule and the Cossacks' desire for freedom led to the rebellion of Stephan (Stenka) Razin in the last years of Czar Alexei's reign. Razin turned against the Russians in 1670, beginning what became a full-fledged Cossack revolt. Although many Cossacks joined him, others allied themselves with the Russians, whose disciplined troops soon crushed Razin's uprising at Simbirsk. After undergoing torture in Moscow, Razin was beheaded in 1671. Ever after, he became a symbol of Russian resistance to tyranny.

The son of Czar Alexei, PETER I, or Peter the Great, recognized the military potential of the Cossacks, despite their rebelliousness. In 1696, Peter seized the Black Sea port of Azov from the Turks, thanks to his

Cossack allies. The greatest test of Peter's reign came in the Great Northern War against King Charles XII of Sweden (1700–21). Ivan Mazeppa was the leading Cossack hetman at the time, and he reestablished the Cossacks as an important factor in eastern European affairs, balancing the ambitions of Poland and Russia. When Peter decisively defeated Charles at Poltava in July, Mazeppa was forced to flee. Mazeppa died of natural causes in September 1709, before Peter could catch him. After Mazeppa, the Cossacks became a part of the Russian Army, even raiding Berlin in the army of Czarina Elizabeth during the Seven Years' War (1756–63) against Frederick II of Prussia.

However, the Cossacks' love of liberty would lead to one more rebellion before the close of the 18th century. When Elizabeth died in 1762, her son Peter III was overthrown and killed in a palace coup by his wife, Catherine. Catherine, who would be known to history as Catherine the Great, was faced in September 1773 with the rebellion of the Don Cossack Emelian Pugachev. To the serfs of Russia, little better than slaves, Pugachev seemed to be their champion, as he fought against the oppressing landlords. In March of 1774, Pugachev was defeated by Catherine's troops at Orenburg; as was Razin, he was executed by beheading. The rebellion of Pugachev was the last real defiance against the loss of the Cossacks' liberty. It is one of the great ironies of history that in later years, the Cossacks would become some of the most ruthless defenders of the Russian despotism against which they once had fought so bravely.

JOHN MURPHY

Counter-Reformation (Catholic Reformation) in Europe

Beginning in the late 15th century, calls for reform of the Catholic Church “in head and members”—that is,

in respect to both the papal administration and the life of the faithful—had become commonplace in all ecclesiastical circles. However, in the early 16th century, there were increasing calls from many sides for the calling of a General Council. The Fifth Lateran Council of 1512–17, called by Pope JULIUS II, undertook various reforms, but its pronouncements had little effect.

If reform “in the head” was stymied by political and bureaucratic inertia, reform “in the members” was proceeding ahead. The late 15th century saw reforms within the Franciscan, Augustinian, and Carmelite orders, leading, in the case of the Franciscans and Augustinians, to the founding of separate branches of the orders incorporating friars following a stricter version of their rule. It was indeed from the observant branch of the Augustinians that MARTIN LUTHER came.

There was also a revival of the study of the theology of St. Thomas Aquinas, whose work had been neglected in most universities (outside his own Dominican order) in favor of the *via moderna* represented by William of Ockham and Gabriel Biel. Cardinal Tomasso de Vio (1469–1534), known as Cajetan, a leading Dominican scholar and superior general of the order, led the way with new works on Thomistic theology. At the same time, scholars using humanistic methods called for new approaches to education and theology, most notably DESIDERIUS ERASMUS (c. 1466–1536), Jacques Lefèvre d’Etaples (c. 1455–1536) in France, John Colet (1467–1519) and SIR THOMAS MORE (1478–1535) in England. In Spain Cardinal Francisco Jiménez de Cisernos, an Observant Franciscan, carried out reforms of the church in Spain and opened the University of Alcalá in 1508, where many of the new methods of learning were cultivated. It was there that the Complutensian Polyglot Bible, incorporating Hebrew, Greek, and Latin texts, was completed in 1517 and published three years later.

During the 15th century, a movement of spiritual renewal known as the Modern Devotion (*Devotio Moderna*) had attracted followers among both clergy and laity, especially in Northern Europe. This movement stressed personal devotion and conversion, rather than theological speculation. The *Imitation of Christ* by Thomas à Kempis (1418) was the most popular representative work of this period. By the end of the century, groups of reformers that focused on personal piety and charitable works had emerged in several cities in Italy. The Oratory of Divine Love, founded in Genoa by a layman, Ettore Vernazza, in 1497, brought together both clergy and laity in pursuit of holiness and good works. Vernazza moved to Rome early in the 16th century and founded an Oratory there. Branches of the Oratory

were founded in a number of Italian cities, where they were the seedbeds of many later reform initiatives.

The foundation of new religious orders was central to the reforming efforts of the period. Several of these orders were of a new type, “clerks regular”—that is, priests (and in some cases lay brothers) living according to a religious rule, but not bound to celebration of the Divine Office in community as were monastic or mendicant orders. This mode of living suited their orientation to active life, including preaching, teaching, and the hearing of confessions. The first of these orders were the Theatines, founded by Gaetano Thiene (1480–1547) and Gian Pietro Carafa (1476–1559), then bishop of Chieti, both of whom had been members of the Oratory of Divine Love. Their order was approved by Pope CLEMENT VII in 1524. Other such orders included the Clerks Regular of St. Paul, also known as the Barnabites, founded in Milan by Anthony Maria Zaccaria in 1533, and the Society of Jesus (Jesuits), the best-known Counter-Reformation order. The Capuchins, officially approved in 1528 and active in spreading Catholic reform, were one of several offshoots of the Observant Franciscans, whose apostolate was nevertheless similar to that of the new orders. The period also saw the foundation of the first orders of women oriented to the active life, including teaching and care of the sick. The best known of these were the Ursulines, founded in Brescia in 1535 by Angela Merici, a Franciscan associate who had also been a member of the Oratory of Divine Love.

For the first 20 years after Luther’s emergence onto the general European scene in 1517, it was by no means clear that his movement would provoke a split in the church. The doctrine of justification, which formed the basis of Luther’s teaching, had been much debated in the 15th century, especially within the schools of the *via moderna* from which Luther himself had emerged. While his interpretation of this doctrine led Luther to reject the sacramental and hierarchical system of the Catholic Church, there were many who desired to preserve that system but at the same time adopt at least some of his theology. Likewise many of the attacks by Luther and his followers against corruption in the church echoed the concerns of both humanist and Observantine reformers. Thus the writings of important bishops and thinkers were suspected of heresy in their teachings on grace and justification. The suspicions of the more traditional among the hierarchy were further confirmed when Bernardino Ochino, vicar-general of the Capuchins, and the popular preacher Pietro Martire Vermigli fled to Switzerland in 1542 and openly espoused Protestant doctrines.

The most prominent order of the Counter-Reformation was the Society of Jesus, founded by Saint

IGNATIUS LOYOLA (1490–1556). Loyola, a Basque from a family of minor nobility, was converted after being seriously wounded while serving in the army of the king of Spain. After preliminary studies in Spain, he went to the University of Paris, where he assembled a group of like-minded young men, nine of whom took religious vows along with him in 1534. The group put themselves under obedience to the pope, and their rule was approved in 1540.

GAINING MOMENTUM FOR REFORM

The program of institutional reform gained momentum in the 1530s. Paul III, pope from 1534 to 1549, made a number of the leading reformers cardinals, increasing their influence within the church. In 1536, he commissioned a group of these same men to study the problems confronting the church. Their report, the *Consilium de emendanda ecclesiae*, presented in 1537, advised reform of the papal curia, better discipline for bishops, and reform of the religious orders. This was the agenda for a coming General Council, for which not only church reformers, but likewise many secular rulers, in particular the Holy Roman Emperor CHARLES V, had been calling for some time. Convocation of a council, however, was impeded by the continuing war between the emperor and the king of France.

The council was finally convened at Trent in 1545. Protestants were invited to send observers, but none attended. The French likewise stayed away from the early sessions of the council, both because of its location in Imperial territory and because of suspicion that it would take measures that would interfere with the French king's attempts to control the church in France.

The council's doctrinal decrees reaffirmed traditional teaching in areas challenged by Protestants, such as the doctrine of free will and the sacraments. The disciplinary decrees of the council strengthened the authority of bishops over the clergy in their dioceses, at the same time demanding that bishops and other holders of pastoral responsibilities personally reside in their jurisdictions. The council mandated the foundation of seminaries in every diocese for the training of priests, an innovation that was perhaps the most influential in the formation of the early modern Catholic Church. The council also recognized the importance of the new medium of print by establishing the Index of Forbidden Books and providing that all works dealing with religious questions be approved beforehand by the local bishop.

The publication of the first index was the work of Pope Paul IV, whose reign was marked by an intensification of the efforts to stamp out heresy in Italy. While he himself was a reformer, he had suspected many

Counter-Reformation figures of excessive sympathy with Protestantism, some of whom had to appear before Inquisition tribunals.

COUNCIL OF TRENT

The institutional reforms mandated by the COUNCIL OF TRENT were put into action only gradually. Pius IV set up a Congregation for the Council in 1563 to supervise its implementation; this was the first of the Roman congregations that became the central administration of the Catholic Church. His successor, Pius V (reigned 1566–72), issued the Roman Catechism, a summary of Catholic teaching, and a revision of the Roman Missal that imposed a uniform standard for the liturgy of the Roman Rite.

Beyond Rome, the application of the Council of Trent, which proceeded gradually, nation by nation and diocese by diocese, depended on both the local bishops and the cooperation of secular rulers. The council was applied relatively quickly in Spain and in parts of Italy. Cardinal Charles Borromeo (1538–84), archbishop of Milan and nephew of Pope Pius IV, set the pattern for many of these reforms. He established a seminary and enacted other provisions of the council in the administration of the diocese. He brought the Ursulines and other new orders to Milan, and encouraged the work of the Confraternity of Christian Doctrine, which had been founded in 1536 for the purpose of the religious education of children and included both clergy and laypersons. His efforts extended beyond his diocese throughout northern Italy and Switzerland.

By the end of the Council of Trent, the Jesuit order had gained numerous vocations and considerable influence. Several Jesuit theologians participated in the council. The Jesuits had begun the first overseas missionary work in America, Africa, and particularly East Asia; Saint Francis Xavier (1509–52), one of Ignatius Loyola's original companions, traveled to Goa in 1542 and spent the rest of his life evangelizing in India, the East Indies, and Japan, dying as he was preparing to enter China.

The Jesuits were also active within Europe, establishing schools and preaching to the public. In their schools, they combined humanist and Scholastic methods, aiming at attracting the ablest boys and those from the most influential social groups. In many areas where substantial portions of the population had been converted to Protestantism, such as Austria and Bohemia, Jesuit education was one of the means by which these areas were returned to Catholicism by the first part of the 17th century. Jesuit preachers like Peter Canisius

(1521–97) began a revival of what had become, by the middle of the 16th century, an almost moribund Catholic Church in Germany.

In Spain, a country where Protestantism had attracted very few followers, the Counter-Reformation was marked by a revival of religious and mystical life. The most prominent figure in this revival was the Carmelite reformer and spiritual writer Teresa of Jesus (or Teresa of Ávila, 1515–82) and John of the Cross (1542–91).

The revival of religious life characterizing the Counter-Reformation went beyond, however, religious orders and the clergy. The application of the Council of Trent affected the religious experience of laypeople in all parts of Catholic Europe. Circles of “the devout” or “friends of God” had grown up in many places even before the advent of institutional reform. Reforming orders like the Jesuits built on these groups to form organized lay confraternities and sodalities to pursue prayer, education, and charitable works. Confraternities devoted to the Virgin Mary and especially to the Blessed Sacrament held public processions and reaffirmed Catholic doctrines under attack by Protestants. At the same time, reforming bishops and pastors attempted to suppress quasi-magical devotional practices unapproved by church authority, which in many cases had attracted the criticism of Protestant reformers.

The Counter-Reformation left the Catholic Church more organized and disciplined. In many ways, the changes in the Catholic Church paralleled those introduced by Protestants in the areas under their control. Both created a disciplined and educated clergy and clearer teaching on doctrinal matters and attempted to bring about effective conversion of the mass of the population. Both relied to a greater degree on the cooperation of secular governments. While many scholars have recognized the contribution of the Counter-Reformation to the strengthening of the Catholic Church, others have suggested that by raising the standards of education of the clergy and attempting to impose a uniform discipline on the laity, the Counter-Reformation alienated many of the uneducated masses and prepared the way for the secularization that began in the 18th century.

D. HENRY DIETERICH

Cromwell, Oliver

(1599–1658) *British ruler and Puritan religious leader*

The controversies over Oliver Cromwell’s character and his politics began when he was still serving as the General and the Lord Protector of the Commonwealth in England during the Interregnum of the mid-17th century. The fact that Cromwell was the first private individual to have occupied the highest position in a major European state and had dramatic impact upon his contemporaries all over the British Isles has continued to fascinate historians and political scientists even in modern times.

A country gentleman by birth and a Puritan by faith, Cromwell, whose great-grandmother was the older sister of the Tudor statesman Thomas Cromwell, became the member of Parliament for his hometown Huntington in the parliament of 1628–29. He first gained fame during the second session of the Long Parliament (1641–42), where he urged Parliament to fight against the treacherous plot of King CHARLES I against the House of Commons, and to take control over the army, which had been sent to Ireland to suppress the Catholic rebellion. After the English Civil War broke out, 43-year-old Cromwell joined the Parliamentary Army in the summer of 1642, leading a cavalry unit composed of lightly armed volunteers with devotion and capacity but without noble blood.

In the battlefields Cromwell, although an inexperienced commander, led his highly disciplined soldiers to successive victories over the Royalist Army in East Anglia. In January 1644, he outmaneuvered the Bohemian prince Rupert, the nephew of King Charles I and a war veteran in continental battles, and defeated the Royalist cavalries at the Battle of Marston Moor. Because of his military successes, he was promoted to the rank of lieutenant general in charge of cavalry in the parliamentary New Model Army under the leadership of the gen-

English Civil Wars: Battle of Naseby, June 14, 1645. A decisive victory over Royalists by Parliamentarians under Lord Thomas Fairfax and Oliver Cromwell. The Parliamentarians abolished the monarchy and established a commonwealth in England.

eral Lord Thomas Fairfax. In 1646, Cromwell played a decisive role in securing the surrender of the Royalists at Oxford, which ended the First Civil War.

During the interval between the two civil wars, Cromwell was the only general to be allowed to hold his parliamentary seat. He made a few attempts to persuade his colleagues, especially the radical Puritan members of Parliament, to reach a compromise with King Charles I, but his conciliatory efforts were frustrated by the king's refusal to give up his dream of divine kingship. After the Scottish Army intervened into English affairs, the Second Civil War broke out, and General Cromwell was forced back to battle against the joint forces of the English Royalists and the Scottish Presbyterians.

In August 1648, he executed brilliantly the Battle of Preston Pans, which resulted in the complete defeat of the Scottish interventionists. After cleansing the Royalist remnants in northern England, he marched back to London. One day before his arrival, Colonel Pride, persuaded by Henry Ireton, Cromwell's son-in-law, who

was supported by officers of the New Model Army, had purged 110 hostile members from the Long Parliament. The Pride's Purge scared another 160 members away and left a "rump" (merely enough for a quorum). The Rump Parliament voted to rename England as a commonwealth on January 4, 1649. In the Rump Parliament, Cromwell became a relentless advocate for trying to convict King Charles of war crimes and for being a traitor to the English people. The king was executed on January 30.

COMMONWEALTH

England was formally declared a commonwealth on May 19, 1649. General Cromwell, his colleagues in the army, and the Rump abolished the kingship, the House of Lords, and the Stuart administrative institutions with the intention of reconstructing the state of people with all original just power under God. In reality, the commonwealth was governed by the Council of State, accountable to the Rump and elected by and among its members.

In August 1649, Cromwell landed his army in Dublin against the Irish rebels, who had proclaimed CHARLES II, the son of Charles I, their new sovereign. Within a year, Cromwell defeated the rebels in their strongholds of Drogheda and Wexford. In the following years, the New Model Army devastated all of Ireland, where about one-third of the people were killed either as a result of the war, the persecution of Catholics, the forced ethnic relocation of the Celts, or starvation. In May 1650, after assigning Henry Ireton to govern Ireland, Cromwell marched to Scotland, where Charles II had been crowned king. Since Lord Fairfax refused to be involved in the Scottish campaign, Cromwell was commissioned the general of the New Model Army, and thus assumed the highest leadership position of the commonwealth. Cromwell first defeated the Scottish army at Battle of Dunbar in 1650, and then crushed the Scottish monarchists led by Charles II at the Battle of Worcester in northern England in September 1651. The subjugation of Scotland finally concluded the civil war in the British Isles and resulted in the expansion of the Commonwealth to include both Scotland and Ireland. However, added to the 600,000 Irish victims of the war were 60,000 Scottish and 200,000 English deaths. In Europe, such a death toll was unprecedented at the time and might have only been exceeded during the world wars of the 20th century.

DOMESTIC POLICY

At home, Cromwell was preoccupied by the restoration of law and order in England. He imposed restrictions on uncompromising Catholics and Anglicans, and at the same time promoted a policy of toleration toward all non-Anglican Protestants and Jews. However, a Puritan himself, he did not give Protestants freedom to materialize their sectarian claims in the Commonwealth. He excluded Ranters and Quakers from the policy of toleration, because they were too ecstatic and mystic in practicing their faith and too defiant of the state authority. Of his fellow Puritans, he first dispersed the diggers for their radical demand for land reform, he then destroyed the rebellious levellers in the New Model Army for their mutinies and advocacy of equal right to both men and women, and, finally, he suppressed the militant fifth monarchists, who attracted many Puritan officers and soldiers in the army, for their accusation that he “took the crown off from the head of Christ, and put it upon his own.”

Cromwell was an ardent providentialist, inspired by the faith in divine wisdom to guide his policies. He was also a pragmatist, who sought to organize different reli-

gions within the framework of a Puritan-styled CHURCH OF ENGLAND. Therefore, he sincerely hoped that his moderate policy of religious tolerance would ultimately ease the century-long religious frictions among his people and transform their inner religious conscience into a civil obligation of obedience of authority in the name of public order. Some of his fellow Puritans, though in the minority, were determined to establish a godly kingdom on earth. The constant clashes between Cromwell and his power base often rendered his policies impracticable in the Commonwealth.

FOREIGN POLICY

Cromwell's foreign policy was brilliantly designed and executed. A staunch antipapist, he did not execute English diplomacy in hopes of a lasting peace with its Catholic rivals on the Continent. However, the Navigation act of 1651 redirected English foreign policy from settling old scores with Catholic France and Spain to meeting new challenges from Calvinist Dutch dominance of international trade and commerce. The act required all international trade of England, both imports and exports, be carried in English ships with one exception: Ships of a country exporting its native-produced goods might be permitted. This act eventually excluded all foreign ships, especially the targeted Dutch ships, from trade profits from the emerging British Empire. The First Dutch War broke out in 1652. Within two years, the antagonistic navies fought nine battles. In 1653, Cromwell ordered a blockade of the Netherlands, and forced the Dutch to agree to a peace dictated by England. A peace treaty was signed in 1654, which recognized English supremacy in the Channel.

While the Dutch War was in progress, unrest at home continued to mount with a growing demand for extending voting rights and redistributing property. In April 1653, Cromwell dissolved both the Council of State and the Rump Parliament, replacing them with a new council and the so-called Barebone's Parliament, comprising 140 members from the New Model Army and local congregations. This government survived for about nine months and was abandoned in December 1653. Soon, the army leaders drafted a new constitution, the Instrument of Government, which entrusted the state authority to Cromwell as Lord Protector, eventually enabling the general to exercise his personal rule over England with the support of the military elites.

In next five years, despite English victories over the Dutch in 1654 and over the Spanish island of Jamaica in the West Indies in 1655, Cromwell's personal rule garnered less and less popular support from the English people. He made a few attempts to restore a parliamen-

tary government, but apparently never figured out how the medieval constitutional formula “King in Parliament” could be adapted to his faith in people’s power under divine guidance.

When the general and Lord Protector died in September 1658, his son Richard (1626–72) succeeded him in title and power. Without possessing his father’s charisma, determination, or ability, Richard resigned in May 1659. The army took over the government of the Commonwealth, and its leaders began to contemplate restoring monarchy. In April 1660, General Monck, one of Cromwell’s lieutenants, quietly persuaded the temporarily reinstated Rump Parliament to invite Charles II back to England, and then dissolve itself. The Long Parliament was finally closed. The bloody and unnatural war that had ravaged England for about two decades was finally over, and the Commonwealth was dead. Cromwell’s legacy was temporarily suspended when his body was exhumed from its grave and hanged on a gallows in a macabre form of legal retribution by the monarchists. His spirit, however, would certainly come back in the efforts of other modern revolutionaries.

WENXI LIU

Cuautemoc

(d. 1525) *Aztec defender*

Young cousin of Aztec emperor MOCTEZUMA II, married to Moctezuma’s daughter, and the son of Ahuitzotl, Moctezuma’s uncle and the previous Aztec emperor, Cuautemoc assumed command of defense of Tenochtitlán after HERNÁN CORTÉS and the Spaniards killed Moctezuma and laid siege to the island-city in June 1521. He had been a lord of Ixtateopan and royal administrator of

Tlatelolco, the “fifth ward” of Tenochtitlán. His name has come to be associated with implacable resistance to the Spanish invasion.

His decisive leadership during a catastrophic period in Mexican history is often contrasted to the vacillating stance taken by the emperor Moctezuma. This is seen, for example, in the Codex Ramírez, which has Cuautemoc denouncing Moctezuma for his weak leadership immediately prior to the latter’s death in June 1520, an event that preceded the Night of Sorrows in which the Spaniards were forced to flee the island-city.

After the siege of Tenochtitlán began, and despite a raging smallpox epidemic and severe shortages of water, food, and other supplies, Cuautemoc refused negotiations and did everything possible to prevent a Spanish victory. According to one account, during the darkest hours of the siege he delivered the following speech: “O Brave Mexicans . . . remember the bold hearts of the Mexica–Chichimeca, our ancestors who, though few in number, dared to enter this land and to conquer it. . . . Therefore, O Mexica, do not be dismayed or cowardly. On the contrary, strengthen your chests and your hearts . . . and . . . do not scorn me because of my youth.”

After the Spanish had reduced Tenochtitlán to rubble, they captured Cuautemoc and brought him prisoner before Cortés. “I beg you to end my life” were his reported words to the victorious conquistador. Cortés instead installed him as a figurehead emperor, imprisoned him, and designated lesser notables to take charge of the day-to-day maintenance of the island-city. His empire in ruins, Cuautemoc did everything he could to lessen the suffering of his surviving subjects, supervising the repair of the city’s water supply and other tasks crucial to the health and well-being of the people. Because he and his men were hungry for gold, which they were convinced was hidden somewhere, Cortés had Cuautemoc tortured so he would reveal its location, tying him to a pole, dipping his feet and hands in oil, and setting them aflame. The tortures crippled Cuautemoc for the rest of his life.

A prisoner of the Spanish for four years, Cuautemoc died in 1525 at the hands of Cortés, who had him hanged on the pretext of his fomenting rebellion during the latter’s ill-fated overland expedition to Honduras. His memory among Mexicans remains strong, as evidenced by reports of his remains’ being found in Guerrero state in 1949, and by naming practices, most notably Cuautemoc Cárdenas, a leading political figure of the late 20th century and son of Mexican president Lázaro Cárdenas.

MICHAEL J. SCHROEDER

Cuzco (Peru)

Cuzco was the center of the great Inca Empire, located in modern-day Peru. The word *cuzco* means “navel of the universe.” As in many other civilizations throughout history, this term suggests that the Incas saw themselves as the center of the world. The Inca Empire itself incorporated not just modern-day Peru, but also parts of Chile, Argentina, Bolivia, Ecuador, and Colombia. Cuzco, with a very pleasant climate, is situated in a valley at an altitude of 3,250 m (10,000 ft.).

In terms of pre-Columbian Latin American history, the Incas were relative latecomers to the area, similar to the Aztecs in Mexico. It was really in the 1400s that the Inca Empire flourished. By the time the Spaniards arrived in 1533, the empire had been in existence about 200 years.

Modern knowledge of the origins of Cuzco comes from legends. Legend holds that Cuzco was founded by Manco Capac, the first Inca ruler. There are two similar legends regarding the founding of Cuzco.

In the first, four brothers and four sisters left a cave just south of Cuzco. One of the siblings carried a golden rod that was stuck into the ground at several points during their travel. As these people were the children of the God of Sun, they were looking for a homeland.

When they arrived at Cuzco, only four children were left, one of whom was Manco Cápac. In another version, the God of Sun sent out his two children, one of each gender, from Lake Titicaca. They were told to drive a golden rod into the ground wherever they stopped to rest or eat. The staff would drive into the ground and disappear. According to the legends, it was the place where the staff disappeared that became Cuzco.

Despite the legends, archaeologists have determined that the Incas did move to Cuzco, which was previously occupied by a different tribe. Their rule from Cuzco is believed to have begun somewhere around A.D. 1200. During the 1300s the Incas were an ordinary tribe residing in the general Cuzco area. The name *Inca* itself means “ruler,” and this group often fought with other tribes in the area for control of both the land and water. When compared to other South American tribes, the Incas were not initially considered as advanced as others.

Peruvians surrounded by the mortarless masonry of the ancient Incas, in Cuzco, Peru

Using Cuzco as a starting point, the Incas began to raid their neighbors. Many historians have pointed out that the Incas themselves were not so much innovators as they were adapters. Whenever a new tribe or group of people were conquered, the Incas immediately took note of their industrial and artistic strengths, drawing from their knowledge to increase their own. Skilled artisans or artists were often sent to Cuzco to demonstrate their knowledge to the Inca ruler. At its height, Cuzco was a stunningly beautiful city. The temples and palaces were massive and extravagantly decorated with gold.

Although the Inca Empire expanded rapidly, it was not necessarily through the use of brute force. Often the Incas would send out a courier to a new tribe or group of people. These people were given a choice—either incorporate into the Inca Empire willingly or military force would be used. Cuzco itself was the target of numerous attacks. Sapa Inca Pachacutic, an Inca king, became a hero for defending Cuzco and calming the areas around the city. He also helped to raise Cuzco back up into a major center for both empire administration and scientific learning.

The Incas relied upon the oral tradition to preserve their heritage. Historians know of approximately 11

Inca kings; there may have been more, but their names are forgotten. According to Inca heritage, it was better to forget the name of a corrupt person or ruler than to remember that person at all. To be forgotten was considered to be a terrible shame.

As an administrative center, Cuzco controlled an empire of approximately 350,000 square miles. The streets of Cuzco were laid out according to a planned, geometric design. There were carefully defined sections of the city. The empire's best masons were brought in to work on the imperial palaces. Some of the stone blocks used to build the palaces were delicately cut pieces as long as 20 feet. Ordinary houses, however, were made of adobe with a straw thatch. Cuzco was thus a great center for government, religion, commerce, and military life. Great wealth, both public and private, was apparent in Cuzco. But the city was not without its problems. Besides the threat of invasion from outside, many of its residents lived in decadence. Drinking and addiction to COCA were major problems.

There were no attempts to curb drunkenness on a social level. As for the use of coca, its cultivation was restricted to a specific area. Its use provided the user with great endurance, even without the use of food for nourishment. As opposed to drinking, the Incas restricted the use of coca to those of the upper echelons of society. The conquest of America at the hands of the Span-

ish is a story well known and documented. In 1533, the conquistador FRANCISCO PIZARRO entered the city of Cuzco. The city was swiftly conquered, and plundered.

The conquering Spanish then built up Cuzco as a colonial city, even to the point of using the foundations of the Inca buildings that were destroyed or damaged. Cuzco remains a thriving town today. It has good transportation access and a commercial base. Cuzco was hit by a devastating earthquake in 1950, but the town was rebuilt, and most of the ancient buildings were restored.

M. NEWTON-MATZA

D

De Soto, Hernando

(c. 1500–1542) *Spanish explorer*

There is no accurate record of when Hernando De Soto was born in Spain, but historians believe it was in 1500. Being from a poor community, De Soto looked to the New World to make his fortune. He left on February 25, 1514, for Castilla del Oro (present-day Costa Rica and Panama), where he served under Pedrarias Dávila. In 1524, he was involved with the conquest of Nicaragua. During this time, he and Hernán Ponce de León became partners and became two of the richest men in Nicaragua. From 1524 to 1528, De Soto was involved with the exploration of the Pacific coast of South America financed by FRANCISCO PIZARRO, DIEGO DE ALMAGRO, and Hernando de Luque. It was in 1528 that the expedition made contact with the Incas.

When Pizarro launched his expedition into the Incan lands, he was in need of ships. De Soto and de León had a ship that Pizarro hired along with both men. The expedition set sail in December 1531. At that time, the Incan Empire was in the midst of a civil war and Pizarro used this to his advantage. Although his army was significantly smaller (a few hundred against hundreds of thousands), the Spanish army was technologically superior. Especially important to the Spanish were their mounted lancers led by De Soto, who repeatedly routed the Incan soldiers in battle. Pizarro eventually captured the Incan emperor and after his ransom was paid, killed him. When the loot was divided up,

De Soto came away with the third largest amount. Still, what De Soto really wanted was to govern his own territory in the New World, but Pizarro was not inclined to give him any territory to govern.

De Soto returned to Spain in 1536 with most of the gold and silver that he and de León had accumulated. De Soto used his new wealth to live well and get married. He was also admitted to the Order of Santiago. CHARLES V, the Holy Roman Emperor, granted De Soto the right to conquer Florida in 1537 and made him governor of Cuba. De Soto would have to pay for the expedition, but would receive land in the area as payment.

De Soto launched his expedition from Havana, Cuba, in May 1539, and landed on May 30 at Tampa Bay, where the expedition remained until mid-July. De Soto moved north, fighting battles with the local natives and looting their villages. He spent the winter of 1539–40 in the area of present-day Tallahassee. On March 3, 1540, De Soto and his men started northeast passing through Georgia, South Carolina, and North Carolina. At that point De Soto turned west and his men became the first Europeans to cross the Appalachian Mountains. The expedition then moved through Georgia and Alabama, finally ending near Columbus, Mississippi. They stayed there through the winter of 1540–41.

The next year De Soto and his men continued west, and in June 1541 they became the first Europeans to see the Mississippi River, which they called the Río del Espíritu Santo. They crossed the river on June 10 and continued west into Arkansas. De Soto's scouts pushed farther west

In the course of his travels, Spanish explorer Hernando De Soto became the first European to see the Mississippi River.

as far as the edge of the Great Plains. The expedition spent the winter of 1541–42 camped in the area of modern-day Little Rock, Arkansas. It was during this winter that De Soto realized there was no great civilization in this area on par with the Incans or Aztecs, and that he was financially ruined. In spring he fell sick, and on May 21, 1542, he died. His body was dropped into the Mississippi River.

The remainder of the expedition explored eastern Texas before returning to the Mississippi River. From there they built barges and floated down the river to the Gulf of Mexico. Then they sailed along the coast until they finally reached a Spanish settlement in Mexico in September 1543.

With De Soto's death, de León sought to recover money he said De Soto owed him. De Soto's widow

fought these charges in court, but the decision of the court was not recorded.

DALLACE W. UNGER, JR.

Delhi and Agra

Delhi, now the capital of India, has been the political center of Indian civilization for over a thousand years. The settlement known as Indraprastha, which was mentioned in the Indian epic the *Mahabharata*, was located at modern-day Purana Qila, near Delhi. It became the capital of Muslim dynasties of Turkish, Afghan, and slave origins that invaded and ruled northern India beginning in the 12th century. Because of its strategic importance at the confluence of the Ganges and Jumna Rivers, it was the battleground of successive conquering armies. The most ferocious invader was Timurlane (Tamerlane), who laid waste to city and killed or enslaved most of its inhabitants in 1398. Two regional Muslim dynasties rebuilt Delhi after Timurlane left India in 1399, the second being the Lodi dynasty, which was destroyed by BABUR at the BATTLES OF PANIPAT in 1526. Babur made Delhi and Agra his capitals.

Although Babur only reigned from 1526 until 1530, his reign was important because of the impact it had on India in succeeding centuries. He was descended from Timur on his father's side, and Genghis Khan on his mother's. He ran much of his administration from Delhi and began to rebuild it. Babur was buried in Afghanistan but his son HUMAYUN was buried in Delhi. His tomb is an early example of Mughal (or Moghul) architecture, which reached its peak under Humayun's great-grandson SHAH JAHAN. In 1556, Babur's grandson, AKBAR, became emperor and he decided to move the capital from Delhi to Agra, where Babur had begun building palaces and gardens befitting a capital. From 1571 until 1585, Akbar mainly

ruled in Fatehpur Sikri. Foreign visitors, including ambassadors from European countries, commented on the opulence of Akbar's court and the beauty of Agra.

Akbar's successor JAHANGIR (ruled 1605–27) held court at Agra, where he received Sir Thomas Roe, the ambassador of JAMES I of England, but for most of his reign Jahangir resided in Lahore in modern-day Pakistan, or in Kabul in Afghanistan. Only a few important buildings were added to Agra during Jahangir's reign.

Jahangir's son Shah Jahan was a great builder who greatly added to both Agra and Delhi. His greatest legacy is the TAJ MAHAL, a great mausoleum he built for his wife, Mumtaz Mahal. It is one of the wonders of the world. Shah Jahan also built and improved many monuments in Delhi that include large city walls with grand gates, most notably the Ajmeri Gate, the Delhi Gate, the Kashmiri Gate, and the Turkman Gate. Shah Jahan in 1648 began work on the Red Fort in Delhi to improve the city's defenses.

In 1739, NADIR SHAH, emperor of Persia, captured and looted Delhi, taking the fabulous jewel-encrusted Peacock Throne back with him to Persia. In 1760, the Marathas attacked and looted Delhi again. In 1761, the Jats captured Agra and sacked the city, including the Taj Mahal. Nine years later it was captured by the Marathas, who held it until 1803, when both cities were taken by the British.

JUSTIN CORFIELD

Descartes, René

(1596–1650) *mathematician and philosopher*

René Descartes was a metaphysician, mathematician, and natural philosopher responsible for changing the course of philosophy and creating analytic geometry and an influential physical theory. His early life is obscure. Born into a wealthy French family of physicians and civil servants, he was educated at the Jesuit College of La Flèche from 1606 to 1614, taking a law degree from the University of Poitiers in 1616. He then wandered through Europe as a soldier. He later claimed that in 1619, in Germany, he had a vision of a new philoso-

phy. Descartes envisioned himself as a new Aristotle, with a philosophy universal in its application.

In 1628, Descartes settled in the Dutch Republic, remaining there for 20 years. Descartes was a loyal Catholic who, despite living in a Protestant society, never showed any interest in conversion. He differed from Catholic orthodoxy in his acceptance of the Sun-centered Copernican astronomy. Although Descartes was in no physical danger from the church, he was shocked by his fellow Copernican GALILEO GALILEI's condemnation in 1633. Abandoning a treatise on the verge of publication that would have systematically expounded his natural philosophy, Descartes turned to metaphysics to find a religiously unimpeachable basis for natural knowledge. In 1638, he published *Discourse on Method*, setting forth his program for natural philosophy and three associated treatises he claimed exemplified his method on geometry, optics, and meteorology, including matter theory. These works were in French rather than Latin, aimed at an educated public, rather than university scholars. Descartes was the first notable European male intellectual to think of women as an important part of his audience.

The *Discourse* sets forth the famous *cogito ergo sum* (although not in those words), Descartes's argument that the very process of thinking proves that the thinker exists. This metaphysics was further elaborated in *Meditations on First Philosophy*, published with a number of objections from others and replies by Descartes in 1641. Descartes attempted to use the *cogito* as a foundation for both metaphysical claims (a logical proof of the existence of God) and physical ones—that which can be logically deduced from known truths can be certain. Descartes's proof of the existence of God is similar to the famous “ontological argument” of Anselm of Canterbury. God's perfection is so great that our “clear and distinct” idea of it could not have been caused by a being less perfect than God. Indeed, the clearness with which we hold the idea of God is in itself proof of God's existence. Descartes was a rationalist who viewed logical consistency as prior to empirical observation.

As a natural philosopher, Descartes set forth a vision of nature as mechanical, a “mechanical philosophy.” He did so most systematically in his 1644 Latin textbook, *Principles of Philosophy*. He claimed that the universe was full of matter, defined as that which occupied space—Descartes, like Aristotle, denied the possibility of a vacuum—and everything that occurred in the material universe could be explained by the

interaction of matter and motion. Descartes's picture of matter in motion was dominated by vortices, whirlpools of matter.

Large vortices carried the planets around the Sun while smaller ones on Earth explained various physical phenomena such as the weather and magnetism. This led to the problem of the interaction of the human soul, whose spiritual nature Descartes accepted, with the material and mechanical human body. He suggested that this interaction might be the function of the pineal gland.

Descartes was a great mathematician, and along with his contemporary and rival Pierre de Fermat, he founded analytic geometry. Descartes used these powerful methods to solve long-standing mathematical problems. He also introduced the still-existing convention of representing powers by numerical superscripts, an important contribution toward making mathematics more abstract, as the previous convention of referring to second powers as squares and third powers as cubes made it hard to deal with fourth and higher powers. In optics, Descartes independently rediscovered the sine law of refraction previously known to the English scientist Thomas Harriot and the Dutch professor Willebrod Snell, now known as Snell's law.

By the 1640s, Descartes ran into trouble in the Dutch Republic where Cartesianism had won an extensive and vociferous following. Intellectually conservative, university-based Aristotelian Calvinists identified Cartesianism with their liberal Protestant enemies. Although Descartes was not a courtier by nature and was quite concerned in his career to avoid patronage, he eventually succumbed to the lure of the court, and went to Stockholm in 1649 to tutor the brilliant young Queen CHRISTINA VASA of Sweden (1626–89) in philosophy. Unfortunately, she wanted to be tutored at 5 A.M. during one of the coldest winters in Swedish history, and Descartes died shortly thereafter. His last work to be published in his lifetime was *The Passions of the Soul*. It sets forth Descartes's theories of the relation of the soul and body and recommends the government of the passions lest they lead people into evil deeds.

Descartes's body was returned to France in 1667. As further developed by other philosophers, Cartesianism became the dominant school of philosophy in France and widely influential elsewhere.

WILLIAM E. BURNS

Dias, Bartolomeu

(c. 1450–1500) *Portuguese explorer*

Bartolomeu Dias, sometimes spelled Bartholomew Diaz, was an explorer for the Portuguese. He is best known for being the first European to round the southern tip of Africa, thereby establishing a sea trading route between Western Europe and Asia.

Very little is known about Dias's early life. Unproven tradition holds that he descended from one of Prince Henry the Navigator's pilots. In the early 1470s, Portugal expanded trade with Guinea and other parts of Africa's western coast. In 1481, voyages were ordered to ascertain the southern boundary of the African continent and stake claims. In 1487, Dias was ordered by King João II to reach the southern end of Africa to determine whether ships could reach Asia by sailing around Africa.

Dias's fleet of three ships, which left in August 1487, reached Walvis Bay on December 8 and Elizabeth Bay on December 26. Storms prevented him from proceeding along the coast during January 1488, so he sailed out of sight of land for several days. When he turned back toward land, no land was spotted. He turned north and sighted land on February 3. Dias unknowingly rounded the southern tip of Africa.

It was clear India could be reached by sailing around Africa, so Dias turned back. Little is known of the return journey or of his reception by King João II. After his return, VASCO DA GAMA was authorized to continue along Dias's route by King Manuel I, whom Dias accompanied for a time. On his return to Portugal, Dias commanded a ship that was part of a fleet commanded by PEDRO CABRAL. However, Dias did not survive the journey, as he died on May 29, 1500, near the Cape of Good Hope.

JAMES E. SEELYE, JR.

Díaz del Castillo, Bernal

(c. 1492–1584) *Spanish historian*

Author of one of the most widely read and important chronicles of the CONQUEST OF MEXICO, *The True History of the Conquest of New Spain* (originally published in 1632; English translation published in five volumes in 1908–16), Bernal Díaz del Castillo was born in Spain in 1492, the son of magistrate Francisco Díaz del Castillo and María Díez Rejón. Journeying to Panama in 1514 with a military expedition led by Pedrarias Dávila, he then went to Cuba and participated in two initial reconnaissance expeditions of the Mexican gulf coast under Francisco Hernández de Córdoba and Juan de Grijalva. It was his experiences in the subsequent expedition of HERNÁN CORTÉS in 1519 that provided him with the raw material from which he penned his classic chronicle many years later.

Lauded especially for its direct and plainspoken style—and criticized for its pedestrian rudeness—Díaz's *True History* provides an intimate and unvarnished look at the conquest of Mexico from the perspective of a common foot soldier. Among the most oft-cited portions of his chronicle are those describing the Spaniards's first sighting of the AZTEC island-city of Tenochtitlán, the entry of Cortés's army into the BASIN OF MEXICO, and the initial meeting between Cortés and MOCTEZUMA II. Also frequently quoted is his remark on the mingling of religious and economic motives that propelled the Spanish conquests in Mexico and beyond. Intending to honor his fallen comrades, he wrote: "For they died in the service of God and of His Majesty, and to give light to those who sat in darkness—and also to acquire that wealth which most men covet." This was a remark that the 19th-century historian William Prescott described as "a specimen of that naïveté which gives an irresistible charm to the old chronicler."

After the fall of Tenochtitlán, Díaz went on to accompany Cortés in his ill-fated trek across Central America, and later served under PEDRO DE ALVARADO in the CONQUEST OF CENTRAL AMERICA. It was from his ENCOMIENDA in Guatemala in the late 1500s that Díaz (who was, by his own description, an infirm, deaf, and blind old man) brought to completion his *True History*, begun years before and finished largely as a rebuttal to other chronicles of the conquest of Mexico that incensed him because he regarded them as filled with inaccuracies. Contemporary English translations have pruned many redundancies and excised many superfluous passages, trimming the original five volumes down to one and making *The Conquest of New Spain* one of

the most gripping and popular accounts of one of the most consequential episodes in world history.

MICHAEL J. SCHROEDER

Diet of Worms

The Imperial Diet (German Reichstag) of Worms refers to MARTIN LUTHER's legal appearance before CHARLES V in April 1521. There Luther defended himself before the civil government regarding the Roman Catholic Church's condemnations of him as a heretic. The Protestant REFORMATION began on October 31, 1517, when Martin Luther nailed his 95 Theses to the church door in Wittenberg, Germany. Luther was convinced that the practices of the church were in error but he did not initially see himself protesting against the leadership of the church; instead, he felt he was trying to bring reform to the church.

Several debates and many tracts later, Luther had become a popular figure in Germany. For many reasons, Germans were unhappy with the leadership of the Roman Catholic Church, and resented the fact that Rome, rather than Germany, was telling German citizens what to do. In addition, there had been much maneuvering surrounding the 1519 election of Charles V. The pope and Rome were not in favor of Charles V's election, and there was little love lost between these two powerful figures. Yet Charles V wanted to cooperate with Rome, if only to show that he (and not the pope) had the power over Germany and its controversies.

In 1520 Pope LEO X wrote a document (papal bull) condemning Martin Luther, and describing him as a heretic. Luther was not excommunicated from the church at that time, but he knew it would not be long in coming. Yet Luther had political supporters in Germany, most notably several princes, including Elector Frederick the Wise, who was one of the small number of electors who chose a new emperor.

When the controversy was brought to Charles's attention in 1520, he did not want to interfere in a church affair, seeing potentially much to lose and little to gain in getting involved. After some negotiating,

Charles agreed to a hearing at the next German diet in April 1521, as long as the princes agreed to support his decision, and they did. He agreed also to grant Luther safe conduct (a significant issue, as one who was named a heretic was technically an outlaw in the Empire and could be killed without penalty).

Accompanied by an Imperial herald, in early April 1521, Luther slowly went from Wittenberg to the city of Worms, a journey of several hundred miles, preaching at several churches along the way. He was hailed as a hero by the townspeople in the various cities. Charles V was present when Luther arrived, conducting many other items of business. (The issue with Luther was only a small part of the schedule for the Diet.) On April 17, 1521, Luther appeared before Charles, the papal envoy Alexander, and the princes of Germany. On a table nearby were piled high all of Luther's writings. There he was asked two questions—were the writings his, and would he retract them? Luther answered that the writings were his, but that he needed more time to consider the answer to the second question. Appearing the next day, Luther was asked again whether he would retract his writings, and his response was “Unless I am convinced by Scripture and plain reason—I do not accept the authority of the popes and councils, for they have contradicted each other—my conscience is captive to the Word of God. I cannot and I will not recant anything for to go against conscience is neither right nor safe. God help me. Amen.”

While Luther is often credited as saying, “Here I stand, I can do no other, God help me. Amen,” most scholars believe this to be a later addition by one of Luther's followers. A small committee was appointed by Charles to negotiate with Luther to see if he would retract portions of his statements. Luther was ready to admit that he overstated some of his attacks on the pope and church practices, but was unwilling to bend on any of his theological statements. Faced with an impasse, Luther was dismissed, with a letter of safe conduct for 21 days. On his journey back to Wittenberg, Luther was kidnapped by soldiers loyal to Frederick the Wise and secretly taken to Frederick's castle in Wartburg where he stayed for several months until the initial reaction to the Diet had quieted down.

BRUCE D. FRANSON

dissenters in England

The term *dissenters* refers to those who officially or unofficially separate themselves from an established or state church. This term is sometimes used interchangeably in the context of early modern English history with *Nonconformists*. However, nonconformity is a later development within the larger dissenter movement, usually denoting those who disagreed with the state church in both practice and principle. In England, religious dissenters did not constitute a single discernible movement or program but a series of protests against the established CHURCH OF ENGLAND during the 16th to 18th centuries.

While the history of religious dissent is as old as Christianity itself, dissent in England can certainly be traced to the time of John Wycliffe and the sect known as the lollards. Wycliffe was a 14th century English university professor whose greatest contribution was his translation of the Scriptures into the English vernacular. He believed that the Bible was the supreme authority for religious matters, that the clergy should not own property, and that the Catholic understanding of transubstantiation had no basis in Scripture. While his ideas were condemned by the Catholic Church, the later, more radical sect of the lollards adopted some of his views and continued on until the time of the English reformations in the 16th century, consequently setting the stage for later religious dissents.

English dissenters began to appear once again during the time of the PROTESTANT REFORMATION in England under EDWARD VI, ELIZABETH I, the Stuart kings, and during and after the time of the interregnum of the English Civil War. Many of these had hoped for a purer reformation of religion in England and expressed their dissatisfaction with the efforts of the English monarchy to continue to control the established state church. During the reign of Elizabeth I, many of her Protestant advisers had also hoped for a reformation in England similar to the continental reformations. They desired a total break with the vestiges of the more liturgical and episcopal structures, which they felt were entirely consistent with the medieval Catholicism from which they had separated. During this period, dissenters and Nonconformists began to refer to the group now commonly known as Puritans. Many of these English Puritans disliked both the structure of the

episcopacy and an established state church. They began to separate themselves from the Church of England and have their own private meetings.

While Elizabeth I would attempt to get her clergy to conform, many of these dissenters would continue to spread their ideas about church government and worship, attracting more followers. In 1620, a group of these dissenters would sail to America on the *Mayflower* and settle in New England in attempt to find religious freedom in the New World. Consequently, they transplanted their own religious dissent to America profoundly shaping both early American religion and national identity in the process.

During the time of the English Civil War (1642–51) and the interregnum (1649–60), the dissenters seized power and abolished the Church of England. They began to practice iconoclasm, destroying churches and stained glass and imprisoning many of the Anglican bishops. Parliament was now the head of the Church of England and it quickly instituted a more Presbyterian form of church government. The Westminster Assembly now became the sole and permanent committee dedicated to the reform of the English Church.

In May of 1660, CHARLES II was restored to the throne of England from exile in France. He made attempts to ensure some sort of religious toleration with his Declaration of Indulgence. However, the now mostly Anglican Parliament had forced him to withdraw this measure. Instead they passed what is known as the Clarendon code, which established Anglicanism as the true state religion of England and made overt threats toward any that might not conform.

The Test Act of 1673 required all persons in civil or military offices to subscribe to the oaths of supremacy and allegiance and to affirm that they did not believe in the doctrine of transubstantiation. Furthermore, they had to receive the sacrament of the Anglican Church within three months after admittance to office. Eventually, in 1689, Parliament passed the Toleration Act, which allowed the English people to practice whatever religion they desired so long as they were trinitarian Protestants. This act however did not suspend any of their civil disabilities that went along with their dissenting religion. The Test Act, which was expanded in 1678, was not suspended until 1828. In 1829, Parliament passed the Roman Catholic Relief Act, which began to give freedom to Roman Catholics to practice their religion freely for the first time since before the Reformation.

Consequently, many of the dissenters in English religious history survive in present-day Christian denominations. Many of these are now known as “Free Churches.”

Some of these are Baptists, Presbyterians, Congregationalists, Methodists, Quakers, and Moravians.

T. W. BOOTH

divine faith in Europe

Between 1730 and 1760, western Europe experienced a revivalist movement that advocated acceptance of the divine faith doctrine. This movement later came to be known as the First Great Awakening. The title was used to differentiate this first rise in evangelical revivalism from the second wave of religious fervor that surfaced between 1800 and 1801, which became known as the Second Great Awakening. During the First Great Awakening, the acceptance of the divine faith doctrine in Europe was most prevalent in England, Scotland, Wales, and Germany, although the movement also received a good deal of attention in Ireland, Holland, Switzerland, Sweden, and France. At the same time, a similar but separate revivalist movement took place across the Atlantic in the United States. Despite the common factors in the teachings of the various evangelists, the divine faith movement was not a single movement but a large number of highly individualistic movements that surfaced around the Western Hemisphere. In addition to Anglicans and DISSENTERS IN ENGLAND, the Protestant sects that endorsed divine faith included Calvinists and Arminians in England, Presbyterians in Scotland, Lutherans and Pietists in Saxony, and Puritan Congregationalists in New England.

All proponents of the divine faith movement advocated a strong faith in the divine will of God. Most of them taught that conversion must come from a heartfelt acceptance of Christian teachings rather than from a blind acceptance of religious dogma or from confessional conformity. Advocates taught that God was actively involved in shaping history and that he was constantly guiding the

day-to-day activities of believers. To the early evangelicals, prayer was the means by which chaos could be averted. Therefore, it became the responsibility of all believers to intercede for those who did not understand this fact. Believers were also encouraged to pray for one another.

The divine faith movement was built around four cornerstones: *conversionism*, *activism*, *biblicism*, and *crucicentrism*. To the evangelical, *converting* others to the faith had been a major element of Christianity since the formation of the early church following the death and resurrection of Jesus Christ. *Activism* was, therefore, a foregone conclusion because all believers were required to reach out to those inside and outside their own churches and countries. These two concepts had been the motivating forces behind the practice of sending missionaries to the farthest reaches of the globe since the founding of the early church. Because the basis for all Christian faith comes from the Holy Bible, the insistence on *biblicism* reminded believers that they were to be led by the Word of God and to refrain from following false prophets. The concept of *crucicentrism* was intended to keep the focus of the Christian on Christ, who gave his life on the Cross of Calvary to save the world from the darkness of sin. The overreaching goal of the early evangelical movement was, therefore, to bring about a global fellowship of all humans who worked together to understand and advance the will of God.

The time of the First Great Awakening has been called the age of faith as well as the era of pietism and the era of evangelism. The motivation for spreading the doctrine of divine faith arose from the Protestant determination to mitigate the effects of the age of Enlightenment, which had intrigued most of the upper and educated classes in western Europe and the United States with its emphasis on reason and individualism. Advocates of the evangelical movement taught that many things should be accepted on faith alone because some things could never be proved by science.

THE GOOD OF HUMANKIND

The concept of individuality was viewed by early evangelicals as counterproductive because it encouraged people to promote their own interests rather than working for the good of all humankind. Instead of emphasizing the concept of the scarcity of resources that was a significant element in the classical liberal thought that had gained momentum in the age of Enlightenment, proponents of divine faith taught that God had granted humans dominion over nature and animals, which were

to be used to better the lives of *all* humans. Members of the lower and working classes who were more inclined than others to accept the theory of divine faith without reservation attended revivals in large numbers, resulting in a rapidly increasing number of converts.

In autumn 1729, the widely celebrated and respected Episcopalian minister George Whitfield (1714–70), known as the “apostle of the British Empire,” traveled to the United States, where he converted large crowds of Americans to the divine faith movement. Whitfield was considered the founder of Methodism, a name that at the time was loosely and sometimes derisively used to refer to all evangelicals. Whitfield was strictly Calvinist in his beliefs, although he was instrumental in shaping the beliefs of Presbyterians, Congregationalists, and Baptists as well. Throughout his lifetime, Whitfield preached 18,000 sermons, an average of 500 a year.

While in America, Whitfield publicly broke with John Wesley (1703–91), the founder of the official Methodist Church and one of the great evangelists of the period. Wesley taught that through grace Christians were capable of realizing a state of perfect love with God. He encouraged his followers to become involved in fighting injustice wherever they found it. Whatever their commonalities, Whitfield and Wesley were unable to reconcile their divergent beliefs on salvation theology. Wesley believed that when babies were born, some had been predestined to become Christians, while others had not. To Whitfield, salvation was a personal experience that was derived from conscious choice rather than from predestination.

Henry Venn (1796–1873), who became the leader of the second wave of evangelistic fervor, was heavily influenced by both Whitfield and Wesley. However, he found himself treading a middle path between the doctrines supported by these prominent evangelists. To Venn, clemency and humanitarianism were irrevocably joined to moralism and to the avoidance of sin. Together, the influence of these three evangelists ignited reform movements in education and penal systems, and their teachings were instrumental in planting seeds that blossomed into antislavery movements, which in turn led to the eventual abolition of slavery.

ELIZABETH PURDY

Dominicans in the Americas

When the first wave of Spanish explorers and invaders came to the Americas, they were accompanied by a few clergy who served the sailors and military personnel as chaplains, but none of any note belonged to the Dominican order.

However it was a Dominican bishop, Diego de Deza, who first sponsored CHRISTOPHER COLUMBUS at the Spanish court and afterward took credit for Spain's opportunity to claim the West Indies. In 1508, the master of the Order of Preachers, Thomas de Vio (also known to history as Cajetan), called for 15 Dominican friars to be sent from the University of Salamanca in Spain to the island of Hispaniola (modern Haiti and Dominican Republic).

The first four friars arrived in 1510 at Santo Domingo and quickly made that stronghold their base of operations. They learned the indigenous language and proceeded to minister to both Spaniards and the local people. It did not take them long to become critical of the treatment of the natives by the Europeans. These early friars refused the comfortable accommodations that were offered to them by the colonizers and instead moved into a simple hut where they began to share in communal life and common prayer and give support to each other's ministry of preaching. Dominican criticism of the Spanish who were forcing natives to labor in mines and on estates is recalled in a number of early sermons aimed at colonists, soldiers, and representatives of the Crown.

In 1512, Dominicans traveled back to Spain and brought their criticisms of the Caribbean *encomendero* system and its human rights violations directly to King FERDINAND V. Certain compromises with the Crown were put into effect in the form of modified laws that gave natives some protection, putting an end to child labor, as well as the exploitation of Native women. The conversion to the Dominican order of a Spanish secular priest in the Caribbean, BARTOLOMÉ DE LAS CASAS, proved to be instrumental in the struggles of the church against Native oppression. Bartolomé had come with the conquerors in 1502 and was given a huge portion of land to administrate, sharing in the fruits of Native exploitation and forced labor. In 1524, he took on

the Dominican habit and gave up his estates in Cuba. Through his writings (particularly *Historia de las Indias*) as well as his preaching and ministry, Bartolomé became an advocate for justice in the Spanish colonies.

Dominican professors of theology like Francisco de Vitoria (1485–1546) at Salamanca in Spain had argued against slavery using Thomistic principles to support the case for basic human dignity. Francisco was one of the first to condemn the CONQUEST OF PERU by FRANCISCO PIZARRO, promoting instead a pastoral evangelization of the region. Francisco de Vitoria is best known for his treatises *Relecciones de Indias* and *De jure belli*. Julián Garcés, the Dominican bishop of Tlaxcala in New Spain, along with Las Casas and other friars sent petitions to Pope Paul III to become an advocate for the rights of natives in the Americas.

This resulted in the 1537 bull *Sublimis Deus*. In it Paul III wrote, "The Indians are truly men, and are not only capable of understanding the Catholic faith, but according to our information they desire exceedingly to receive it. . . ." This opened the door for continued missionary activity in Central and South America as well as the islands. Antonio de Montesinos was among the first party of Dominicans to land in North America, near Georgetown, South Carolina, in 1526. They build a small church, San Miguel de Gualdape, and a temporary settlement where the expedition's leader, Lucas Vázquez de Ayllón, was to die a few months later. He was buried there. The following year de Montesinos abandoned the settlement and returned to the Caribbean where he was assigned by the Crown as protector to the natives of Venezuela. After some 15 years of service to the community in Venezuela, Friar Antonio was murdered by a Spanish officer in 1540.

THE MAYA AND NORTH AMERICA

The Dominicans also sent missionaries to the Mayans. Luis Cancer, who served the community of Hispaniola as a young friar, was assigned in 1521 to the mission of San Juan in Puerto Rico. In 1542, he left San Juan to join Bartolomé de Las Casas among the Maya in Guatemala. The two friars learned the Mayan language and attempted to cooperate with the natives, delivering the message of the Gospel in the land the Spanish referred to as La Tierra de la Guerra (the land of war). Struggles between the Maya and Spanish had been ongoing in the region since the arrival of the invaders. Las Casas and Cancer even succeeded in translating Bible passages into Mayan song.

Friar Luis traveled unescorted into their lands and was said to have been welcomed by the Mayan people.

Cancer next traveled to Florida in 1548 accompanied by a native woman and translator from the island of Hispaniola named Magdalena. She had been converted to Christianity by the Dominicans.

The party landed on the west coast of Florida and Magdalena went ashore with Friar Diego de Tolosa and an oblate named Fuentes. Both of the Dominicans were killed and Magdalena was never found. The following year Luis Cancer was murdered near Tampa Bay during an effort by his landing party to make contact with the natives.

Earlier expeditions to North America by HERNANDO DE SOTO in 1539 had resulted in battles between natives and some 600 Spanish soldiers near Mobile. Three Dominican chaplains had accompanied the voyage that sailed out of Havana. De Soto continued with his troops along the coast of Louisiana and ventured into parts of Mississippi, Arkansas, and Texas. The excursion ended in 1543 with Juan Gallegos being the only friar to survive. Subsequent Dominican missions to Florida were attempted in 1559 and in the early 1560s.

The first attempt by Tristán de Luna y Arellano and a talented Mexican preacher named Domingo de Salazar was abandoned for lack of food and terrible weather conditions. They were followed by Gregorio de Beteta, a former companion of the martyred Luis Cancer. The mission met with mixed success.

Dominican foundations in Mexico had been highly successful as they were able to enlist both friars trained on the Continent as well as colonial Europeans born in the New World. They were reluctant however to accept Mesoamerican natives or even recruits of mixed blood. In 1526, they established a house in Mexico City. By 1555, the province of St. James in Mexico counted some 210 friars residing in 40 houses. In the fall of 1528, Dominicans developing southern missions reached the town of Huaxyacac (modern Oaxaca). Among the friars making that journey were Father Gonzalo Lucero and Bernardino de Minaya.

A royal patent letter from CHARLES V bestowed upon Huaxyacac the rights of a city and it was given the name *Antequera*. They begin building the first Dominican priory there and dedicated it to St. Paul. By the 17th century, there were more than 70 priories functioning in the province of St. Hyppolitus in the Oaxaca area. It took more than 50 years fully to complete construction of a magnificent new priory named after Santo Domingo. In 1623, Santo Domingo became a university offering degrees in theology and philosophy for both secular and religious clergy.

PERU

Missionary work in Peru was initiated by the Dominicans when Vincent Valverde arrived in 1531. The Dominicans were successful in ministering to the Indians of Peru decades before Franciscan evangelizers. By 1544, the Dominican province in Peru had 55 members. Two of the most famous saints of Peru were Dominicans. Saint Rose of Lima (1586–1617) was a Creole and member of the third (lay) Order of St. Dominic. Rose spent most of her life as a contemplative, living at her parents' home, wearing a coarse habit and living the vow of perpetual virginity. Her life was devoted to prayer, penance, and fasting. It has been recorded that she slept on broken glass, potsherds, and thorns. She also constructed a crown of metal spikes and wore an iron chain about her waist. Later in life, Rose retired to a small cell in the garden of her home where she spent her final days in prayer and mortification. Visions, revelations, and divine voices were visited upon her. Rose's death was reputedly followed by numerous miracles and in 1670 she was canonized by Pope Clement X.

Martín de Porres (1569–1639) was another famous Dominican saint of Peru. He was a mulatto from Lima, son of a free black woman and a white noble father. As a young man he received training as an apothecary (druggist), surgeon, barber, and physician. His skills were used to serve the poor. He became a lay associate of the Dominican monastery of the Holy Rosary and later joined the community as a lay brother. He spent his life healing the sick, feeding the hungry, and attending to abandoned children. Martin was also reputed to have the gifts of visions, mystical experiences, miraculous healing, and even bilocation. Interestingly, Saint Toribio, the archbishop of Lima, and St. John Massias (also a Dominican lay brother) were contemporaries of both Saint Rose and Saint Martín in Peru. The Dominicans maintained both urban and rural Peruvian missions, monasteries, and schools throughout the 16th, 17th, and 18th centuries.

The conquest of Colombia by Spain in 1536 and its eventual unification with Venezuela in 1549 produced the Audiencia of New Granada. This quickly became the domain of Dominican missionary activity. However unlike their efforts in Mexico and Peru, the Dominicans began to develop small missions and schools rather than monasteries. By 1569, there were 40 small missions (or *doctrinas*); some 18 priories were also established. One of the leading Dominican figures in New Granada was Saint Louis Beltran (1526–81), who converted thousands of Natives to Christianity.

The running of schools and universities was among the special talents of the Dominicans. At Lima and in Mexico City universities were founded in the 16th

century. In Guatemala the Real y Pontificia Universidad de San Carlos was recognized in 1676. Universities were also founded in Bogotá (1627), Quito (1688), and Santiago, Chile (first as a college in 1619 and then as a university in 1684). Faculties included studies in logic, history, physics, philosophy, mathematics, theology, and canon law. Early on, the Jesuits had begun to compete with the Dominicans in Latin America for students and had founded rival universities and colleges in Bogotá, Quito, Bolivia, and Santiago. During the 18th century, the Dominicans succeeded in establishing a university at Havana (1728), which was raised to the title of Royal and Pontifical University in 1734.

The end of the 17th century saw a rise in the number of Dominican foundations for women. There were 22 houses in Mexico City, 10 in Puebla, and a male monastery outside Oaxaca that was turned into a convent for Dominican nuns. The education of Spanish, Creole, and Indian women was undertaken in a number of these convents.

There were also separate convents for the education of the daughters of native chiefs (CACIQUES). Indian women were rarely denied admittance to the Dominican order. The creation of female houses followed throughout the 18th century with convents established at Corpus Christi in Mexico (1724), Cosamalupan (1737), and Oaxaca (1782).

TIM DAVIS

Dorgon

(1612–1650) *prince regent of China*

Prince Dorgon was regent for his nephew between 1644 and 1650. He seized the opportunity offered by Ming general WU SANGUI (WU SAN-KUEI) to lead the

Manchu forces inside the Great Wall and together to defeat the rebels who had seized Beijing (Peking) that ended the Ming dynasty. After defeating the rebels Dorgon placed his six-year-old nephew on the vacant throne. With this act, the QING (CH'ING) DYNASTY was transformed from a frontier state to a national dynasty of all China.

When Manchu leader ABAHAI died in 1643, the Manchu clan leaders assembled to elect a new ruler among his sons. Prince Dorgon, Abahai's younger brother and the most able among the princes, successfully maneuvered to have five-year-old Fulin (Fulin) elected ruler, rather than an older son, so that he could be regent. An able statesman and warrior, Dorgon continued to consolidate central power and strengthened the bureaucratic style government established by his brother. As the weakening Ming dynasty was threatened by internal revolts Abahai prepared to invade north China.

In April 1644, a rebel army led by Li Zucheng (Li Tsu-ch'eng) advanced on the capital city Beijing (Peking), taking the city before General Wu Sangui and his troops stationed at Shanhaiguan (Shanhaikuan) at the eastern terminus of the GREAT WALL OF CHINA could arrive to defend the city. General Wu then invited the Manchus to assist him against the rebels, an invitation that Dorgon was delighted to accept. Dorgon and Wu ousted the rebels and entered the city with their joint forces on June 6, 1644. While Wu and some Manchu units chased down the rebels, Dorgon remained in Beijing, buried the last Ming emperor and empress (who had committed suicide) with honor, declared that the Manchus had come to restore order, and placed his young nephew on the vacant throne as Emperor Shunzi (Shun-chih).

He thus established a new national dynasty, the Qing (Ch'ing), that would last until 1911. He also confirmed most Ming officials in their positions, including the Jesuits who headed the Board of Astronomy; reduced taxes; and forbade Manchu imperial clansmen from interfering in administration. The defeat of Li and other rebels and immediate reforms won over many northern Chinese although it took several decades to end Ming loyalist movements in southern China. However one of Dorgon's orders, that all Han Chinese men wear their hair in a queue as Manchu men did, greatly irritated Chinese sensibilities.

Dorgon was a forceful administrator but his arrogance and autocratic style alienated many. He gave himself increasingly exalted titles, such as "Imperial Father Regent," but was frustrated that he could not become emperor. A showdown between Dorgon and his nephew

never occurred because he died in 1650 during a hunting trip. Shunzi then took over personal control but continued the successful policies of his uncle. Thus while NURHAICI and Abahai prepared the way for the rise of the Manchus, it was Dorgon who seized the opportunity to realize it.

JIU-HWA LO UPSHUR

Drake, Francis

(c. 1540–1596) *English explorer*

Sir Francis Drake was an English mariner-adventurer, and sometime privateer, who circumnavigated the globe. Drake was born near Tavistock, Devon, England, not far from the important port of Plymouth. He came from a well-connected Protestant farming family, one of 12 children born to Edmund Drake.

At approximately age 13, Francis went to sea on a cargo bark and eventually became the master of the ship at age 20. These early seafaring years spent in the North Sea built his experience as a skillful sailor and navigator and gave him a sense of command. When he was 23 he joined his cousin Sir John Hawkins and for the first time voyaged to the New World. In association with Hawkins, he undertook the initial English slave-trading expeditions to the New World.

Drake discovered the lure of the Spanish Main with all its riches in silver, gold, and slaves. He disliked the Spanish from the onset, no doubt in part for their Catholicism, and in the 1560s, began his campaign against Spanish interests, appearing a pirate to some and a privateer to others. His raids demonstrated his bravado and determination, but almost cost him his life. Drake's most famous attack came in 1573 when he took the Spanish Silver Train at the port of Nombre de Dios. Finding the silver too heavy to carry, he took all the gold he could and returned to Plymouth on August 9, 1573, with 30 survivors. Unfortunately, Queen ELIZABETH I had undertaken a temporary truce with PHILIP II of Spain, and Drake's exploits were not officially celebrated.

In 1577, Queen Elizabeth, facing new Spanish hostilities, sent Drake with 150 men and five ships on an expedition against the Spanish interests on the Pacific coast of the Americas. Two ships had to be abandoned at Río de la Plata and the remaining three navigated the Straits of Magellan, making Drake the first Englishman to do so. The voyage continued to be difficult; another ship was destroyed, and still another separated and returned to England. Drake sailed along the coast of South America alone in the *Golden Hind*, attacking Spanish interests, plundering Valparaíso, and seizing cargo as he moved. He continued along the coast of North America looking for a passage to the Atlantic, possibly as far north as the present state of Washington. He stopped for supplies and repairs in San Francisco Bay and named the area New Albion. Drake now made the decision to cross the Pacific. He rounded the Cape of Good Hope and eventually returned on September 26, 1580, to Plymouth, laden with treasure. His exploits could not be denied even in the face of Spanish fury, and Queen Elizabeth knighted him.

WAR WITH SPAIN

Another war with Spain in 1585 put Drake back in his element. He took command of a fleet and launched assaults against Vigo in Spain, São Tiago in the Cape Verde Islands, and the New World ports of Santo Domingo and Cartagena, as well as St. Augustine in Florida. In 1587, he "singed the King of Spain's beard" with a preemptive and destructive raid on Cádiz, burning 31 ships and holding the town for three days in the process. This attack delayed the SPANISH ARMADA sailing by a year.

By the time the Spanish Armada sailed to England to invade in 1588, Drake was vice admiral in command of the English fleet. It was at this time that the famous Drake myth first appeared that had Drake enjoying a game of bowls on Plymouth Hoe as the Spanish fleet approached. Here he supposedly stated that he had plenty of time to finish the game before the Spanish arrived.

The English fleet pursued the Spanish through the channel. Drake caught the rich galleon *Rosario* and Admiral Pedro de Vales in the process. On July 29, 1588, Drake and Lord Howard of Effingham organized the fire ships that broke the Spanish formation, causing damage that forced the Spaniards into the open sea toward Calais. The following day, Drake and the rest of the English fleet defeated the Spanish at the Battle of Gravelines.

Drake's final expedition against the Spanish occurred in 1595, supported by Hawkins. On this occasion, the Spanish inflicted defeat, particularly against Drake's raids

England's Sir Francis Drake and the British fleet defeated the invading Spanish Armada in 1588.

on San Juan, Puerto Rico. Hawkins died off Puerto Rico and Drake became ill from dysentery and died on January 28, 1596, while in the process of mounting a further attack on San Juan. Placed in a lead coffin, Drake was buried at sea with his crew burning the town of Puerto Bello as a dedication to his passing.

Drake's life was one of adventure and determination, which helped enrich England with his plunder. He established claims to the New World and made England a recognized naval power.

THEODORE W. EVERSOLE

Dutch East India Company (Indonesia/Batavia)

The Verenigde Oostindische Compagnie (VOC) is better known in English as the Dutch East India Company, a joint stock company formed in 1602 and granted a monopoly for all trade between the Cape of Good Hope and the Straits of Magellan. The VOC had a twofold purpose: first, to organize and promote Dutch trade in the East Indies, vital because the area produced extremely precious spices; second, to raise revenue for the Dutch War of Independence against Spain.

In East Asia, the VOC was successful in evicting the Portuguese from their holdings and establishing a base at Batavia (modern Jakarta) from which to control the island of Java. In time, the VOC was transformed from a military-trading organization to administrator of a colonial empire. By 1799 the company's usefulness had been outlived and because of corruption was dissolved by the Dutch government.

From its inception the VOC was premitted by the Dutch government to enter into diplomatic relations with foreign powers and to engage in military actions to further Dutch interests, including seizing land and building forts. In Southeast Asia, Protestant Dutch and English contended for influence with Catholic Portuguese and French.

While Portugal and France were interested in religious conversion of local people as well as trade, Britain and the Netherlands were primarily interested in commerce. Its first Dutch overseas base at Ambon was won from the Portuguese and used as a staging post for the import and reexport of pepper and other spices. It next established a permanent base on Java in order to play a greater role in trade throughout Southeast Asia.

They selected a site and named it Batavia, which became their permanent headquarters. The VOC overcame local opposition with their superior weapons and the British decided to focus on India.

The VOC gradually controlled all of Java and spread its influence to other islands. Through a series of naval campaigns, it attempted to create a monopoly of trade in the islands and so fought against local powers and against Indian and Malay states also. It gained control of land and regulated the growth of pepper and other crops. Dutch rule was harsh, forcibly relocating local people and exploiting them.

In 1740, conflict broke out between the Chinese community in Batavia and Dutch officials. It became

known as the Chinese War and resulted in 10,000 Chinese deaths.

By the end of the 18th century, the Dutch state had become exhausted by the effects of prolonged warfare in Europe, especially the Fourth Anglo-Dutch War of 1780–81. The VOC was also facing stiff competition from the British. It was dissolved in 1799 by the Dutch government, which decided to assume direct responsibility for overseas possessions. Java and other VOC holdings in the East Indies were transferred to the Dutch government.

JOHN WALSH

Dutch in Latin America

The Dutch presence in the Americas was integral to the worldwide competition for empire among European powers in the early modern era. Among the most important national actors in the newly discovered lands of the New World in the 16th and 17th centuries, the Dutch rapidly lost influence and power to the French, English, and Portuguese in the mid-1600s, though their impact on the history of the Americas was profound and long-lasting.

The Dutch influence in Latin America was greatest in Brazil, where they began to challenge Portuguese dominance in the 1620s. Dominated by Calvinists and fierce enemies of Catholic Spain in the great power rivalries of Europe, the Dutch began challenging Portuguese claims to Brazil soon after the union of the Portuguese and Spanish Crowns in 1580. Their first assaults on Portuguese and Spanish commercial interests began in West Africa in the 1590s, culminating in their 1606 attack on the Portuguese trading station of São Jorge de Mina, which after several attempts they captured in 1637, opening up the African trade to Dutch merchants. In Asia, too, the Dutch challenged Spanish and Portuguese dominance, seizing several key ports in India, Ceylon,

and elsewhere and becoming a major commercial power in the seas and ports of the Middle and Far East.

The upshot of these far-flung conflicts in the jockeying for power in Latin America was to make Brazil Portugal's most important overseas possession, thus intensifying the Portuguese Crown's efforts to solidify their hold on the colony. Eager to participate in the lucrative sugar trade, the Dutch formed their West India Company (WIC) in 1621, modeled after the DUTCH EAST INDIA COMPANY, founded in 1602. The WIC's goal was to weaken and plunder the Spanish and, where possible, to displace the Portuguese.

Three years after the WIC was created, in May 1624, under the leadership of Piet Heyn, a massive Dutch force launched a military assault on the Portuguese Brazilian capital port city of Salvador (Bahia). Holding the town for nearly a year, the Dutch were expelled by a joint Spanish-Portuguese counterassault in April 1625. After failing to retake the port, the Dutch turned their attention north, to the port of Recife, at the heart of the sugar trade in the rapidly growing province of PERNAMBUCO. With some 67 ships and 7,000 men, the Dutch attacked and took Recife and Olinda in 1630. They held the town and its outlying districts for the next 24 years, extending their influence along some 1,800 kilometers of coastline in Brazil's burgeoning northeast.

In keeping with the Netherlands's mercantile orientation, Dutch rule in Brazil was characterized by an emphasis on trade; increased production of sugar, tobacco, hides, dyewood, and other tropical export commodities; and an overall policy of generalized tolerance toward Roman Catholicism despite a strong undercurrent of tension between Dutch Calvinists and Spanish and Portuguese Catholic monasteries and nunneries. The Dutch hold on the Brazilian northeast prompted the Portuguese Crown to redouble its efforts to strengthen its hold on the colony.

Two years before taking Recife, in 1628, a fleet of 30 Dutch ships captured the Spanish silver fleet off the coast of Cuba—the only instance in which an entire Spanish *flota* (convoy) was captured by enemy forces. The Dutch victory stunned Europe, prompting Italian bankers to withdraw their credit from Spain, causing the Spanish Crown to intensify its efforts to find new sources of credit for their overseas enterprises, and ultimately leading to revolt by the Portuguese and Catalans.

For the Dutch, the costs of defending their Brazilian holdings against Portuguese counterattacks, by land and by sea, proved very high, while the revenues gained by commerce in sugar, tobacco, and African slaves proved disappointingly low. In the 1630s, despite their

frequent successes in plundering Portuguese ships, the Dutch began to rethink the extent of their commitment to holding Brazil. The Dutch regime in Brazil was governed by Johan Maurits van Nassau-Siegen (1637–44), who attempted to diversify agricultural production, extend the sugar zones, and institute mechanisms of nominal self-rule among the colony's European inhabitants, including the Portuguese.

In late 1640, Portugal revolted against Spanish domination, a few months after a Catalan revolt prompted largely by intensifying fiscal demands of Madrid. In December 1640, the Portuguese rebels threw off Spain's rule and named the duke of BRAGANZA as King João IV. In June 1641 the newly independent Portuguese Crown and the Netherlands signed a 10-year truce, though through the 1640s the Dutch continued to assault and chip away at Portuguese power in the Americas. By the late 1640s, as the costs of holding Dutch Portugal continued to rise, the Dutch leadership decided to cut the country's losses and withdraw its forces, a withdrawal completed in 1654. During the period of Dutch rule in northeast Brazil, the WIC imported an estimated 26,000 African slaves. After their withdrawal from Brazil, the Dutch remained a major player in the transatlantic slave trade.

Elsewhere in the Americas, the Dutch also decided to cut their losses rather than pour more blood and treasure into enterprises they accurately calculated they were bound to lose. In the Treaty of Breda of 1667, the Dutch relinquished New Amsterdam to the English (renamed New York) but gained formal title to Suriname on the north coast of South America, as well as several islands in the Lesser Antilles, including Curaçao, St. Eustatius, Saba, and St. Maarten, the latter island shared with the French. Dutch sugar production in Suriname, their largest holding in the Americas, never approached that of the other sugar producing zones of the circum-Caribbean, a consequence of low Dutch population and the high cost of maintaining a viable sugar colony.

By 1700, there were approximately 8,000 African slaves in Suriname, a substantial proportion of whom escaped from the sugar plantations into the interior, where they established MAROON SOCIETIES and mixed with the region's indigenous inhabitants. By the late 1720s, growing numbers of these "Bush Negroes" prompted the Dutch colonial state to launch a series of assaults on the interior, which nonetheless failed to defeat or dislodge the Maroon communities. In 1749, the Dutch concluded a treaty of peace with a Bush Negro leader, one Captain Adoe, though a major slave uprising rocked the colony in 1763, while hostilities between Dutch planters and

runaway slave communities continued through the rest of the 18th century.

MICHAEL J. SCHROEDER

Dutch in South Africa

The year 1652 marks the beginning of the Cape Colony, which started with the founding of Cape Town by Dutch commander Jan van Riebeeck, who worked for the DUTCH EAST INDIA COMPANY, known in Dutch as the Vereenigde Oostindische Compagnie (VOC). The colony was situated halfway between the so-called Dutch East Indies and the Dutch West Indies.

The early 16th century saw the start of many European nations, such as Spain and Portugal, pursuing the sea route rather than the land route to India and establishing a colonial global empire outside continental Europe. From the late 16th century, the Netherlands was a preeminent naval power. The Dutch founded the VOC trading company as early as 1602. They reigned supreme at sea, and dominated global commerce by the second half of the 17th century. This epoch coincides with the cultural flowering known as the Dutch golden age with such figures as the philosopher Baruch de Spinoza, the mathematician and physicist Christiaan Huygens, and the painter Johannes Vermeer. In 1647, while exploring a route to India, a ship named *Nieuwe Haerlem* ran aground in Table Bay. The survivors, including possibly the captain, Leendert Janszen, with some crew remained onshore for about a year to look after the shipment. Only 12 months later, a Dutch ship returned Janszen and his crew to Europe. Upon disembarking in Holland, Janszen wrote a feasibility report called *Remonstrantie* to the Council of Seventeen of the Dutch East India Company, in which he recommends the founding of a station where ships can resupply before sailing onto India.

Jan Anthoniszoon van Riebeeck was later appointed by the VOC to establish the station and eventually founded Cape Town in 1652, which soon opened South Africa to white settlement. The town's purpose was "to provide fresh water, fruit, vegetables, and meat for passing ships en route to India as well as build a hospital for ill sailors." The development of Cape Town was slow at first, owing

to crop failures and organizational chaos. Van Riebeeck advocated the introduction of more workers to save the colony and encouraged importation of slaves. Though the VOC did not send slaves for five years, captains on passing ships gave Van Riebeeck some in the meantime.

In 1654, the first Cape-based slave expedition was sent to Madagascar and Mozambique and three years later the first group of slaves was brought to the Cape from Angola and West Africa to meet the needs of the construction of a solid station.

Starting in 1655, Van Riebeeck's exploration outside Cape Town eventually led to a war between the small colony and the local Khoikhoi (named *Hottentots* by the whites). The Khoikhoi were a pastoral people, inhabiting the coast of the Cape of Good Hope until the arrival of European colonizers. When Van Riebeeck left the Cape in 1662, the settlement had more than 100 colonists.

The Netherlands lost many of its colonial possessions to the British when the motherland surrendered to French conquest led by Napoleon, and more territory

annexation to the French from 1795 to 1814. Subsequently Great Britain seized the colony in 1797 during the Fifth Anglo-Dutch War, and annexed it in 1805.

The Dutch colonists who remained after the British took over are now known as Afrikaners. Their language, Afrikaans, is derived from a creolized variety of a colonial dialect of Cape Dutch, influenced by both indigenous Khoikhoi peoples who speak the Khoisan language and the imported slave population.

CÉLINE SWICEGOOD

Eck, Johann Maier von

(1486–1543) *religious humanist and polemicist*

Johann Eck is best remembered for his debates with MARTIN LUTHER during the initial period of the REFORMATION. He was born Johann Maier in the city of Eck in southern Germany on November 13 (some say November 15), 1486, and later took the name of his city as his surname. At age 12, he entered Heidelberg University and went on to Tübingen, where he received his master's degree. He continued his studies in both theology and classical languages. In 1508, at age 22, he was ordained a Roman Catholic priest. In 1510, at age 24, he received a doctorate in theology. After receiving his doctorate, he went to the University of Ingolstadt in southern Germany as a full professor.

Eck was a humanist in the tradition of Desiderius Erasmus of Rotterdam and was well versed in Greek and Hebrew. He was interested in many theological topics, and when the monk Martin Luther posted his 95 Theses on the castle church door in Wittenberg in 1517, he at first received a cordial reception from his fellow humanist Eck. Luther's expectation in his posting of the Ninety-five Theses was a debate with fellow academics and church theologians, and he hoped for gradual reform of the Roman Catholic Church.

As Luther's writings became almost instantly popular, Eck saw Luther's theology as both wrong and dangerous for the Roman Catholic Church and decided to take action against Luther. In 1518, he circulated among

other academics a work attacking Luther's theology titled *Obelisci* and in it accused Luther of being a follower of John Huss, a Bohemian reformer from the previous century who was burned at the stake for his views.

Luther's fellow professor Carlstadt responded to the *Obelisci* with a document refuting Eck and declared himself ready to meet Eck in a public disputation. This series of debates took place at the University of Leipzig, beginning in June 1519, and continuing through July. The debate was academic in style (as would befit university professors). Eck clearly won the debate against Carlstadt, forcing Luther to defend his doctrines. While Eck and Luther were more evenly matched in intellect and debating ability, most agree that Eck won the debates.

Returning to Ingolstadt, Eck attempted to get the other universities to condemn Luther's theological writings but failed. He continued to write against Luther and in 1520 went to Rome to help with the official Catholic attack on Luther. Eck was a significant contributor to the papal document *Exsurge Domine* (Arise, O Lord), which condemned Luther's teaching as heretical.

Eck continued to write and campaign against Luther as well as other Protestants, particularly ULRICH ZWINGLI. Eck debated supporters of Zwingli in 1526 near Zürich, Switzerland. He never succeeded in his goal of bringing about a clear condemnation of Luther by the political authorities. Luther was seen in the eyes of many Germans as a champion for Germany against the influence of Rome and was simply too popular among both the nobles and common persons to be suppressed effectively. Eck is also

known for his translation of the Bible into German, published in 1537. (Luther had published his own translation into German about 10 years previous.) Roman Catholics normally used the Latin Bible, but Eck as a humanist followed Erasmus and others in promoting the Bible in the vernacular, the language of the people. Eck died on February 13 (some say February 10), 1543, in Ingolstadt.

BRUCE D. FRANSON

Edo period in Japan

The Edo period in Japanese dates between 1600 and 1867. It denotes the government of the Tokugawa Shogunate from Edo. The shogunate was officially established in 1603 with the victory of TOKUGAWA IYASU over supporters of Toyotomi Hideyori in the BATTLE OF SEKIGAHARA (1600). The Tokugawa shoguns ruled Japan for more than 250 years with iron fists and tight discipline.

Ieyasu had centralized control over the entire country with his strategic power sharing arrangement between *daimyo* (feudal lords) and *samurai* (warriors). Daimyos were ordered to be present every second year in Edo to give an account of their assigned work. Tokugawa Ieyasu promoted economic development through foreign trade. He established trading relations with China and the DUTCH EAST INDIA COMPANY (INDONESIA/BATAVIA). While OSAKA and Kyoto became emerging centers for trade and handicraft production, his capital Edo became the center for supply of food, construction, and consumer items.

To ensure its control, the shogunate banned all Japanese people from travel abroad in 1633. Japan thus was isolated except for limited commercial contact with the Dutch in the port of NAGASAKI. All Western books were banned in Japan.

Despite Japan's cultural isolation from the rest of the world, new indigenous art forms such as Kabuki theater and *ukiyo-e*, woodblock prints and paintings of the emerging urban popular culture, gained increasing popularity. Intellectually the most important state

This print, titled *Yoroi ferry at Koami District*, is from the series *Meisho Edo hyakkei*, an Edo period series.

philosophy during the Edo period was NEO-CONFUCIANISM. Neo-Confucianism stressed the importance of morals, education, and hierarchical order in the government. A rigid class system also took shape during the Edo period with samurai at the top, followed by the peasants, artisans, and merchants. Below them were outcasts (*burakumin*) or pariahs or those who were deemed impure. Neo-Confucianism contributed to the development of *kokugaku* (national learning) that stressed the study of Japanese history.

In 1720, with the lifting of the ban on Western literature, some Japanese began studying Western sciences and technologies, *rangaku* (Dutch studies). The fields that drew most interest were related to medicine, astronomy, natural sciences, art, geography, languages, as well as physical sciences including mechanical and electrical engineering.

External pressure on Japan grew toward the end of the 18th century. The Russians tried to establish a trade link with Japan to export their Russian goods, particularly vodka and wine. Other European nations also

became interested. Finally the United States forced Japan to open to the West when Commodore Matthew Perry sailed into Edo Bay with a flotilla of warships. Meanwhile, anti-Tokugawa sentiments had been growing that demanded the restoration of imperial power.

In 1867–68, the Tokugawa government collapse was partly due to foreign threat and to tensions that had been growing against a political and social system that had outlived its usefulness. The shogunate surrendered power in 1867 to Emperor Meiji, who began the Meiji Restoration in 1868.

MOHAMMED BADRUL ALAM

Edward VI

(1537–1553) *king of England*

Edward VI was the only son of HENRY VIII, king of England, born from his marriage to his third wife, Jane Seymour, on January 28, 1537. He succeeded to the English throne at age nine by his father's last will and by the parliamentary statute of 1543, and died unmarried at the age of 16 on July 6, 1553.

The young king inherited from his father a constitution, under which he was not only the secular king but also the supreme head of the CHURCH OF ENGLAND. However, the kingdom was deeply divided among factions of great nobles in the court, and, in the countryside, the people were unsettled by the direction of the religious policy under the new king.

In spite of his lovable personality, good education, and well-respected intellectual capacity, the young king could hardly design and dictate policies on his own. Edward Seymour, the duke of Somerset and the king's maternal uncle, ran the kingdom as lord protector in loco parentis (in the place of a parent) for the first three years. After his dismissal from the court in 1549, John Dudley, the earl of Warwick, who became duke of Northumberland in 1551, ruled the nation as the chief minister under the pretense that the king had assumed full royal authority.

The two chief ministers shared similar interest in moving the Church of England toward Protestantism. In 1547, Parliament repealed the Six Articles, enacted in 1534 by the Reformation Parliament, to keep Catholic doctrines and practices in the Church of England. In 1549, the publication of Thomas Cranmer's BOOK OF COMMON PRAYER and the adoption of his 42 Articles by Parliament pushed the Anglican Church closer to Calvinism.

In 1552, Parliament enacted the Act of Uniformity, requiring all Englishmen to attend Calvinist-styled Anglican Church services. Moreover, Parliament stopped enforcing laws against heresy, permitted priests to get married, and even confiscated the property of Catholic chantries, where for centuries, local priests had been praying for souls wandering in purgatory. To the Protestants in the Continent, these policy changes made England a safe haven and an escape from persecution by the Catholic Church. In England, the Protestants welcomed the reforms, although they felt that the policies did not satisfy their Calvinist needs. The Catholics, however, were shocked by their loss of properties, privileges, and powers and were provoked into rebellions in 1549.

Neither of the two chief ministers was a master of statesmanship. They failed to curb runaway inflation and continuous devaluations of English currency. They lacked competence in pacifying domestic unrests caused by enclosure of land and worsening living conditions of the rural poor. They appeared shortsighted and clumsy in maneuvering diplomacy to meet increasingly complicated challenges from other European nations. Most of all, they mismanaged the young king's marriage, the great affair of the state. The duke of Somerset invaded Scotland in 1547, intending to conclude the negotiation, which had begun under Henry VIII, for the marriage of Edward VI to Mary of Stuart, the four-year-old daughter of King James V.

Although the duke defeated the Scots at the Battle of Pinkie, the Scots betrothed the princess to Francis, the dauphin of the French throne, in 1548. After the fall of Somerset, the duke of Northumberland appeared to be actively negotiating a marriage of Edward to Elizabeth, the daughter of French king Henry II, in 1551. The marriage never materialized. In 1553, rumors spread around the diplomatic circle in Paris that the duke was going to manage a marriage between Edward VI and Joanna, a daughter of Ferdinand, the brother of CHARLES V, the Holy Roman Emperor. Despite his apparent busy diplomacy, the duke was secretly carrying out a plan of his own, probably with the king's

knowledge, that would enable Lady Jane Grey, his daughter-in-law and the granddaughter of Henry VIII's sister, Mary, to succeed Edward and thus disinherit MARY I, the Catholic sister of the king, who had been bastardized by her father but later placed to succeed her brother in his last will.

Following the death of Edward VI, Lady Jane Grey was proclaimed queen with the military support of her father-in-law. However, much of the nation, though favoring a Protestant ruler, rallied against the conspiracy of the duke of Northumberland. The "reign" of Lady Jane Grey lasted only nine days, and Mary I eventually succeeded to the throne in 1553.

The dramatic turn toward Protestantism under Edward VI and the even more dramatic restoration of Catholicism under Queen Mary have been viewed as the major aspects of the so-called mid-Tudor crisis by many historians.

WENXI LIU

Elizabeth I

(1533–1603) *English monarch*

Queen Elizabeth I is regarded as one of the greatest monarchs in English history, reigning as queen of England and queen of Ireland from 1558 until her death in 1603, and, in name only, styling herself as queen of France. Elizabeth was born the second daughter of King HENRY VIII. King Henry had the marriage to his first wife, Catherine of Aragon, annulled as she had given birth to a daughter, Mary, and he had started a romance with Anne Boleyn, whom he married. She gave birth to Elizabeth on September 7, 1533, and although Anne Boleyn was pretty, intelligent, witty, clever, and a devout Protestant, her inability to give Henry VIII a son essentially caused her to be executed, although the charge leveled against her was incestuous adultery.

As a result, Elizabeth, who was three when her mother was executed, grew up secluded from the court. When Henry VIII died in 1547, he was succeeded by his sickly son EDWARD VI. By this time Elizabeth could speak and read not only English and Latin, but also ancient Greek, French, Italian, and Spanish. She managed to keep a low profile during the reign of Edward VI and tried to do the same during the reign of her older sister Mary, after Edward had died in 1553. Mary, however, was a devout Roman Catholic and determined to rebuild the Catholic Church in England. Elizabeth, by contrast, was Protestant but she was careful to keep herself removed from plots against her Catholic sister. The most serious of these was Wyatt's Rebellion of 1554, which sought to depose Mary and replace her with Elizabeth. Even though she was not involved, Elizabeth was, nevertheless, arrested and placed in the Tower of London, making the entry by boat through "Traitor's Gate."

The death of Mary on November 17, 1558, led to Elizabeth's succeeding to the throne. She was crowned on January 15, 1559, by Owen Oglethorpe, bishop of Carlisle, as the Roman Catholic archbishop of Canterbury, Reginald Pole, had already fled and refused to take part in the coronation. It was to be the last coronation where the Latin service was used; all subsequent coronations except that of GEORGE I in 1714 were in English. In 1559, Queen Elizabeth enacted the Act of Uniformity whereby all churches had to use the BOOK OF COMMON PRAYER. In the same year, she also signed into law the Act of Supremacy whereby all public officials had to acknowledge, by oath, Elizabeth's right, as sovereign, to be head of the Church of England. In these two acts, her main adviser, who would remain as such for the rest of her reign, was Sir William Cecil (later Lord Burghley).

There were many stories regarding whether Queen Elizabeth I wanted to marry. Certainly she enjoyed a long affair with Robert Dudley, earl of Leicester, whom she appointed as master of the Queen's Horse. She was acutely aware of her sister's bad move in marrying PHILIP II of Spain, and anxious not to marry any foreign Roman Catholic prince, although there were moves made by the French. With constant plots against Elizabeth, she faced trouble in Scotland from MARY, QUEEN OF SCOTS, who was her first cousin once removed. Mary was the granddaughter of Margaret, sister of Henry VIII. Mary was, however, unpopular in Scotland and after the death of her first husband in France, she returned to Scotland, where her second husband was murdered, most probably by the man

Elizabeth I, queen of England, signs the death warrant of Mary Stuart, accused of treason against the English throne.

whom she was subsequently to marry, Lord Bothwell. Mary was hounded out of Scotland, fleeing to England, where she was arrested and held in close confinement for the next 18 years.

In 1569, the Northern Rebellion led by Thomas Howard, the fourth duke of Norfolk; Charles Neville, the sixth earl of Westmoreland; and Thomas Percy, the seventh earl of Northumberland, failed, although it led to Elizabeth's being excommunicated by the pope. With Elizabeth allying herself to the Protestants in France and the Netherlands (United Provinces), she viewed the developments in Europe with concern, especially when Philip II of Spain became the king of Portugal after the last Portuguese king, Henry, died childless. There was also a rebellion in Ireland, and when Sir Francis Walsingham, Elizabeth's main spymaster, uncovered the Babington Plot implicating Mary, Queen of Scots. Mary was put on trial for treason, sentenced to death, and beheaded on February 8, 1587, at Fotheringay Castle. With Mary having willed her lands to Philip II, Elizabeth was facing a major threat from the Spanish king, who was also angered at the way in which English ships attacked his treasure ships and others bringing wealth

from the Americas. FRANCIS DRAKE, who circumnavigated the world in 1577–79, Walter Raleigh, and John Hawkins, and Martin Frobisher were among the “sea dogs” preying on the Spanish ships.

In 1588, Philip II sent a massive navy and expeditionary force known as the SPANISH ARMADA against England. By a mixture of luck and good planning, the Spanish Armada was crushed, with a few ships managing to escape around the northern coasts of Scotland and Ireland. Queen Elizabeth I's speech at Tilbury, rallying her soldiers and sailors, is one of the most famous in history: “I know I have the body of a weak and feeble woman, I have the heart and stomach of a king, and a king of England too.”

The reign of Queen Elizabeth I, known as the Elizabethan age, was also a period of great prosperity in England, with the Levant Company leading to the later formation of the East India Company. Many books were published, and many playwrights, notably William Shakespeare and Christopher Marlowe, wrote large numbers of plays. During the 1590s, Elizabeth continued to receive threats to her rule in Ireland, and in 1599 a plot was mounted by Robert Dudley's stepson, Robert Devereaux, the earl of Essex, who had emerged as Elizabeth's new favorite. Essex was executed on February 25, 1601. Elizabeth gradually came to see that her heir would be King James VI of Scotland, and when she died on March 24, 1603, James succeeded her.

JUSTIN CORFIELD

encomienda in Spanish America

Encomienda ranked among the most important institutions of early colonial Spanish America. Described as a kind of transitional device between the violence of conquest and the formation of stable settler societies, *encomienda* has been the topic of enormous research and debate among scholars.

Rooted in the verb *encomender* (“to entrust”, “to commend”), an *encomienda* was a grant of Indian labor by the Crown to a specific individual. Holders of such grants, called *encomenderos*, were said to hold Indians in

encomienda or “in trust.” The institution and practice of *encomienda* originated during the Spanish Christian reconquest of Iberia from the Moors (718–1492 C.E.), creating an institutional template that was quickly transferred to the New World after 1492. Unlike its Iberian predecessor, *encomienda* in the Americas did not include land grants, except occasionally in marginal areas.

Instead, it was primarily a mechanism of labor control that also permitted the Crown to maintain the legal fiction that Indians held in *encomienda* were technically free, were not chattel, and could not be bought or sold. It also served as an effective way to reward conquistadores and others in service to the Crown, including priests and bureaucrats. The term *encomienda* was often used interchangeably with *REPARTIMIENTO* (“distribution” or “allotment”) during the early years of conquest and colonization, though the two were legally distinct. The later practice of compelling subject Indian communities to purchase Spanish goods, common in the 17th and 18th centuries, was also called *repartimiento*. Later forced-sale *repartimiento* had little relation to the institution of *encomienda*.

The first substantial effort to codify *encomienda* in the New World were the Laws of Burgos (1512–13), which required *encomenderos* to “civilize,” “Christianize,” protect, and treat humanely Indians held in *encomienda*. A vast corpus of subsequent laws, proclamations, and edicts further refined and limited the institution. The practical effect of these laws was minimal. In practice *encomienda* was akin to slavery, especially during the early years of the conquests. Abundant evidence exists of the abuses and mistreatment inflicted upon *encomienda* Indians, who were bought and sold, worked to death, and in other ways treated for all practical purposes as slaves.

These abundant abuses prompted some Spaniards to condemn the institution as unchristian, most prominently the priest BARTOLOMÉ DE LAS CASAS, beginning in 1514. In response to this simmering debate, in 1520 Holy Roman Emperor CHARLES V decreed that the institution of *encomienda* was to be abolished. In the Americas the decree had little practical effect, as most *encomenderos* and officials ignored it. The Crown, concerned that *encomenderos* not become a permanent aristocracy, continued its efforts to impose strict limits on the institution, culminating in the so-called New Laws of 1542–43, which from the perspective of *encomenderos* were far more draconian than the Laws of Burgos issued 30 years earlier.

The major features of the New Laws included provisions preventing the inheritance of *encomiendas*; the forbidding of new grants, requiring royal officers and ecclesiastics to give up their *encomiendas*; and prohibitions against Indian enslavement for whatever reason. The New Laws provoked an outcry across the colonies, especially in Peru, where factions of colonists rose in rebellion against them. In 1545–46, three years after they were issued, the New Laws were repealed as unenforceable.

Encomienda nevertheless died a slow death over the next half-century. The principal cause for its decline was not royal decree but Indian depopulation. Grants of Indian labor became moot when there were so few Indians left to grant. *Encomienda* lasted less than a century in most areas, enduring into the late colonial period only in peripheral regions such as Yucatán. The transition from *encomienda* to HACIENDA (private landownership) was neither direct nor clear-cut, and comprises another major arena of scholarly research and debate.

MICHAEL J. SCHROEDER

epidemics in the Americas

The European encounter with the Americas after 1491 set in motion a demographic catastrophe among indigenous peoples across the hemisphere, specifically epidemic and pandemic diseases against which native peoples had no biological immunities, and a crucial component of the larger COLUMBIAN EXCHANGE between the Old World and New. The precise characteristics and magnitude of this catastrophe remain a matter of scholarly debate. Population estimates for the Americas on the eve of the encounter vary widely. The most reputable estimates fall between 40 and 100 million for the hemisphere as a whole, a population reduced by an estimated overall average of 75 to 95 percent after the first 150 years of contact, with tremendous variations in time and space.

COLONIAL LATIN AMERICA AND THE CIRCUM-CARIBBEAN

Central Mexico is the most intensively studied region regarding the impact of European diseases on indigenous demography. Where in 1520 there lived an estimated 25 million native peoples, in 1620 there lived some 730,000—a decline of 97 percent, attributed overwhelmingly to disease. Similar catastrophes unfolded across the hemisphere. The most precipitous decline is thought to have occurred in the Caribbean, where the pre-contact indigenous population of several millions had been all but exterminated by the 1550s. Such diseases spread rapidly in all directions, preceding and accompanying military incursions, weakening indigenous polities, and facilitating the process of conquest and colonization in the Caribbean, Mexico, the Andes, Brazil, New England, and beyond. This process of demographic catastrophe, an unintended consequence of the European encounter with the Western Hemisphere, affected every aspect of the subsequent history of the Americas.

In the English-speaking world, the predominant view for centuries regarding Indian depopulation in postconquest Spanish America centered on the “Black Legend” of Spanish atrocities, a view most forcefully articulated and propagated by the Spanish bishop BARTOLOMÉ DE LAS CASAS in the 1500s. By the early 2000s, a scholarly consensus had emerged that the principal cause of indigenous population declines was in fact pandemic and epidemic diseases. The exact sequence and timing varied greatly from place to place. Every locale had its unique history of demographic decline, with periodic outbreaks of various pathogens: smallpox, measles, typhus, influenza, yellow fever, diphtheria, bubonic plague, malaria, and others.

Far and away the deadliest killer was smallpox, the first documented New World outbreak occurring in the Caribbean in 1518. Spanish friars, reporting to King CHARLES V in January 1519, estimated that the disease had already killed nearly one-third of Hispaniola’s Indians and had spread to Puerto Rico. In these earliest outbreaks, influenza probably accompanied the spread of smallpox. By the early 1520s, three principal disease vectors, mainly of smallpox and influenza, were spreading rapidly through indigenous populations. One had entered through northern South America near the junction with the Central American isthmus, and by the late 1520s had spread far into the interior along the northern Andes. The second had entered along the gulf coast of Mexico, from Yucatán to present-day Veracruz, and by mid-1521 was decimating the population of the AZTEC capital of Tenochtitlán. By the late 1520s,

this second vector had bifurcated, spreading south into Central America and north into western and northern Mexico, where it was poised to sweep farther north. The third disease vector was launched with the first exploratory expeditions along the Pacific coast of Central America and Peru, beginning in the early 1520s. By the late 1520s, this third vector had also bifurcated, spreading north through Nicaragua and Guatemala, and in less than a decade racing 3,000 miles south down the Andes, reaching as far as southern Bolivia. A fourth set of vectors began spreading inland from the Brazilian coast from the beginning of permanent settlements in the early 1550s. By the late 1550s and early 1560s, the epidemics had spread along much of the Brazilian coast and were sweeping into the interior.

Widespread death from disease weakened indigenous polities, engendering profound cultural crises and facilitating processes of conquest and colonization. The most dramatic and extensively documented such instance occurred in Tenochtitlán during the CONQUEST OF MEXICO, where a major smallpox outbreak coincided with the Spanish invaders’ siege of the island city. From May to August 1521, as many as 100,000 of the city’s inhabitants succumbed to the disease. The smallpox virus typically enters the victim’s respiratory tract, where it incubates for eight to 10 days, followed by fever and general malaise, then the eruptions of papules, then vesicles, and finally large weeping pustules covering the entire body, followed soon after by death. Scholars agree that this smallpox epidemic, occurring just as their empire and capital city were under assault by the Spanish and their Indian allies, fatally weakened the Aztec capacity to mount an effective resistance.

A similar if distinctive dynamic is thought to have unfolded before and during the CONQUEST OF PERU. Again, the timing of the Spanish invasion could not have been more propitious. Less than a decade before the incursion of FRANCISCO PIZARRO in 1532, the vast Inca Empire was in relative tranquility under a unified ruling house. Around 1525–28, at the height of the Inca Huayna-Capac’s northern campaign against recalcitrant indigenous polities around Quito, an unknown pestilence, probably smallpox, ravaged the northern zones. During this epidemic, the Inca was struck by fever and died. Spanish chronicler Pedro de Cieza de León recorded that the first outbreak of the disease around Quito killed more than 200,000 people. Other chroniclers offered similar descriptions of a wave of pestilence in the northern districts during this same period. Huayna-Capac’s death set in motion a crisis of dynastic succession and civil war that Pizarro deftly exploited to the

Spaniards' advantage. Contributing to the spread of the disease was the Andean tradition of venerating the mummified corpses, as thousands of indigenous Andeans came into contact with the dead Inca and those who ritually had prepared his body.

During this early period, more politically decentralized zones including the Central American isthmus, the Maya regions, northern South America, and the Brazilian coast and hinterlands were also severely stricken, facilitating Spanish and Portuguese incursions less by exacerbating elite divisions or shattering cosmologies than by the sheer magnitude of the deaths. Almost everywhere that Europeans intruded, indigenous polities, societies, and cultures became profoundly weakened by maladies with no precedent and no cure, as emphasized repeatedly in scores of locales by a diversity of Spanish, mestizo, and indigenous chroniclers.

The second major pandemic to sweep large parts of the Americas was measles, beginning in the early 1530s. From the Caribbean islands the pathogen quickly spread to Mesoamerica, South America, and Florida, causing mortality rates estimated at 25–30 percent. Outbreaks of bubonic and pneumonic plague began erupting around the same time. In the mid-1540s, came another series of waves of epidemics across large parts of Mesoamerica and the Andes. The precise bacterial or viral agents responsible for the “great sickness” that swept Central Mexico in the 1540s remain the subject of debate, though the evidence suggests typhus, pulmonary plague, mumps, dysentery, or combinations of these. There is little disagreement that the death rates thus generated were extremely high, as upward of a million natives in New Spain succumbed to the collection of epidemic diseases in the 1540s. By this time, bubonic plague, typhus, and other pathogens had spread to the Pueblo Indians in the Southwest and to Florida.

The spread of epidemic diseases swept inland from Florida beginning in the 1520s and perhaps earlier. The odyssey of ÁLVAR NÚÑEZ CABEZA DE VACA and his small party of shipwreck survivors across the U.S. South and Southwest (1528–37) is thought to have introduced numerous diseases to the native inhabitants. In particular, the expedition of HERNANDO DE SOTO from Florida through the North American Southeast to the Mississippi River Valley (1538–42) is believed to have wreaked tremendous ecological damage, introducing previously unknown pathogens across large parts of the interior. By the time of sustained European encounters with these regions, beginning in the 1680s, the dense populations and many towns and settlements described by De Soto more than a century before had

vanished, leaving behind a landscape largely denuded of its human inhabitants.

Local and regional studies show endless variations on these more general themes, with wave after wave of epidemic diseases wreaking demographic havoc for centuries after the initial encounter. In Brazil, the creation of numerous disease vectors along the coast from the 1550s to the 1650s, diseases often carried by African slaves, generated repeated epidemics of smallpox, typhus, and other pathogens that dramatically reduced populations in the interior. The disease chronology of northwestern Mexico in the first half of the 17th century illustrates the more general pattern of repeated outbreaks, which in this case were recorded in 1601–02, 1606–07, 1612–15, 1616–17, 1619–20, 1623–25, 1636–41, 1645–47, and 1652–53. In his classic study of the postconquest Valley of Mexico, Charles Gibson recorded major disease outbreaks every few years, with 50 major epidemics from 1521 to 1810, an average of a major epidemic every six years.

COLONIAL NORTH AMERICA

The Pilgrims in Massachusetts and the first Europeans to settle on the coast of MARYLAND and Virginia found a nearly empty country. Almost nine-tenths of the former Native American populations had been wiped out by smallpox in an epidemic of 1618–19. JOHN WINTHROP, the leader of colonial Massachusetts, commented in 1684: “For the native, they are neere all dead of the small Poxe, so as the Lord hathe cleared our title to what we possess.” This Puritan leader and others felt that this disease was God’s plan to make land available for Europeans by eliminating the Native Americans who had previously occupied it.

Smallpox followed the priests, explorers, traders, soldiers, and settlers from Europe into the heartland of the North American continent. The Hurons were affected in 1640, the Iroquois in 1662. In BRITISH NORTH AMERICA, smallpox indirectly promoted the growth of institutions of higher learning. Wealthy colonial families sent their sons to England to educate them. Many of these young men, born in North America, did not have the immunity to smallpox their fellow students in England possessed. Enough of these young men from the colonies contracted and died from smallpox while being educated in Europe that colonial North Americans founded their own colleges, including HARVARD, William & Mary, and Yale.

In some cases, smallpox was spread to North American indigenous peoples intentionally, as a form of germ warfare. During the American Revolution,

American troops were victims of the disease during a campaign in Quebec. George Washington successfully had the susceptible American troops inoculated. British troops, who had grown up in England and Ireland, had immunity to the disease. By the time George Vancouver explored the Pacific coasts of what would become Washington State and the Province of British Columbia, he found entire villages of Native Americans in ruins and deserted with skeletons lying all around. By the 20th century, smallpox had wiped out as much as 90 percent of the pre-conquest Native American population.

In sum, the impact of hitherto unknown European diseases on indigenous societies unleashed a demographic cataclysm across the Western Hemisphere, representing one of the most important chapters in the history of the post-conquest Americas, whose characteristics and impacts scholars are still grappling to comprehend.

NANCY PIPPEN ECKERMAN AND
MICHAEL J. SCHROEDER

Erasmus of Rotterdam

(1466–1536) *Renaissance humanist and writer*

Desiderius Erasmus was an internationally acclaimed celebrity and the greatest European scholar during the 16th century. Despite the polemics of the Protestant REFORMATION, he could make friends among kings and lords in every land and on all sides of the central questions of his day, and this trait led him to reside in Holland, France, England, Switzerland, and Italy. His pursuit of Christian HUMANISM and his intellectual curiosity led into a lifetime of travel and writing, seeking to promote the values of the Italian Renaissance in northern Europe.

Erasmus was born in Rotterdam on October 27, 1466, as an illegitimate child. His father was Roger Gerard,

For Erasmus, virtue came not from religious ritual, but in each person's desire and ability to emulate the life of Christ.

who later became a priest, and his mother Margaret, the daughter of a physician. One of the major Catholic renewal groups of the Low Countries, the Brethren of the Common Life, adopted him and no doubt generated in him an unpretentious and broadminded orientation toward spirituality.

For the rest of his life, Erasmus never was enticed by the outward show of formal religion, whether it came from Catholic pomp or Protestant sectarianism. He never held an office in the church, even though he was offered the cardinal's hat by the pope; he also rejected the pandemonium caused by the likes of MARTIN LUTHER, HENRY VIII, and ULRICH ZWINGLI.

At first, he spent time in a religious order, though he probably chafed at requirements that he remain in a monastery under a superior. What attracted him were the disciplined study and fraternal companionship a monastic life afforded. He found an excuse to leave when he took up a position with a local bishop and later obtained permission to study theology in Paris. It was not theology that interested him as much as the life of

intellectual stimulation and possibilities of travel. After leaving the monastery, he never looked back. In the university he gravitated toward literature and humanism of the Renaissance more than toward the theology and philosophy of Scholasticism.

He made friends with Italian scholars in Paris, who kept him informed about the intellectual currents of the Renaissance. His skills at Latin and his need for income led him into contact with English students, who in turn invited him to England. At the age of 33, he accepted their invitation and emigrated there.

The English intellectuals he met included John Colet, SIR THOMAS MORE, John Fisher, and Archbishop Warham, men of the “New Learning” school who were interested in reviving the Greek and Latin classics instead of the hidebound studies of medieval Europe. Erasmus began to realize that such a philological methodology could also be applied to the church fathers and the scriptures, the literary pillars of his traditional Catholic faith. His object was not to undermine the established religious doctrines of his time, but simply to make the writings more available and understandable to the broader public.

Erasmus discovered the advantages of travels and friends in high positions. Whereas other scholars had to worry about financial support and institutional approval, Erasmus attracted the favor of benefactors in many countries, especially those who were outside the church hierarchy. This new life afforded him independence of thought, though it meant that he never lived in one place more than eight years.

His celebrity status as an intellectual can only be compared to the likes of Herodotus among the ancient Greek and Persian officials or Voltaire among the Enlightenment thinkers. He was a trendsetter in bringing the ideas of the Renaissance to northern Europe. His book of commonplace wisdom, *Adagia*, propelled him into the limelight and was published more than 12 times between 1500 and 1535 in several languages.

On the topic of religion he wrote *Enchiridion militis Christiani* (Handbook of a Christian Knight), a book that found its way throughout Europe. This book attempted to make Christianity practical by teaching about how to choose virtuous life. For Erasmus, this choice did not come through rite or ceremony; nor was it mental speculation or Scholastic dialectic, but it was learned through practice and imitation of Christ. However, Christ was Savior, as well as supreme teacher, and only Christ and conversion of heart could make Christian life possible. *Enchiridion* stays within Catholic bounds by stressing the need for

the external church as a peaceful and orderly environment where such learning about Christ can occur.

Erasmus’s most lasting contribution lies in the field of biblical studies and patristics. He can only be compared to Origen and Jerome, Christian scholars of the third and fourth centuries. He compiled the manuscripts that led to five new editions of the New Testament. His historical-critical methodology for studying the Bible laid the groundwork for a new generation of interpretation and modern thinkers. He edited and commented on many writings of the church fathers. These include Jerome (1516), Augustine (1529), John Chrysostom (1530), and Origen—his favorite—(1536), and also Athanasius and Ambrose.

Erasmus died a Catholic in Basel, a Protestant city, without Catholic last rites and was buried under a cathedral that had been converted to a Protestant church. Many of his writings were put on the Index of Forbidden Books by the COUNCIL OF TRENT as supportive of the Protestant critique of the Catholic Church. Protestants maintained that they brought into the light what Erasmus had already hinted at in the dark.

Yet Erasmus never refused to submit to the Catholic Church. He feared that the Protestants’ invectives against the church destroyed the irenic atmosphere so necessary for learning and dialogue. He also believed that the church was in spite of its flaws the necessary environment where virtue could be lived out. He stood in the lonely middle ground, saying that the Apostles Creed held both groups together.

As early as 1516, his opposition to Luther was known. Finally, in 1524 he wrote *De libero arbitrio* (On free choice) against Luther’s ideas, arguing that the consensus of the church was authoritative for biblical interpretations. By the end of his life, Erasmus had alienated many erstwhile Protestant friends and allies, including Luther, Zwingli, and Henry VIII.

The principles that animated his life and inspired a whole generation of thinkers were his respect for conscience and the rule of reason over coercion and military might. Both of these principles proved to be impossible to live out in the politics of the Reformation. He saw his best friend in England, Thomas More, executed by Henry VIII for these humanist ideals, the year before his own death.

Ewuare the Great

(1440–1473) *king of Benin*

Oba Ewuare the Great of West Africa was one of the most celebrated kings of Benin. However, since most of the history of Benin during this period was oral, it is sometimes difficult to separate legend from reality in the accounts of this powerful and charismatic monarch. Known as the first of the warrior kings of West Africa, Ewuare belonged to a group of 15th and 16th century kings of Ife origin who transformed Benin City from a group of small villages into a thriving metropolis. Ewuare's three brothers, Egbeka, Orobiru, Uwaifiokun, occupied the throne of Benin for 70 years. After succeeding Uwaifiokun, Ewuare continued to reign for 33 years. As oba, Ewuare designated his eldest son as the heir-apparent, discontinuing the practice of collateral transmission to the throne. Ewuare subsequently bestowed the title of *Ihama* upon his family.

Ewuare is credited with conquering at least 201 surrounding towns and villages during his reign. By the time his new subjects had been resettled, Ewuare's kingdom had grown from a small group of villages to a substantial kingdom. To solidify his position, Ewuare built a palace and fortified the city's defenses. He also proceeded to rid the Beninese government of hereditary tribal heads. In their place, Ewuare created a patrimonial bureaucracy in which freemen served as military and administrative chiefs.

Ewuare did not strip these chiefs of all powers, however, but divided Benin into departments and placed each department under the control of a group of chiefs. Ewuare also persuaded the tribal chiefs to allow their firstborn sons to serve him in the palace. Together, Ewuare and his son and successor Oba Ozolua were responsible for establishing a viable foreign trade in Benin. Consequently, by the time the Portuguese arrived in Benin in 1486, trade was already well established. After the arrival of the Europeans, Benin became the entry point for arms and other European goods designated for transport to points around Africa.

Oba Ewuare was a monarch of wide interests and was responsible for establishing a number of religious and cultural rituals. He was also widely known for his celebration of Beninese arts. During this period,

art in Benin was practiced chiefly by hereditary craftsmen who lived in the palace. To honor members of the royal family, Ewuare had brass smiths cast the heads of the royal family, both past and present, on a variety of objects. According to Beninese lore, Ewuare preferred the likenesses of himself created by brass smiths to those created in other forms because he believed he looked younger in the brass casts. It was common practice at the time to depict all kings as young men rather than the way they looked later in life. The technique used by the brass smiths of Benin combined European techniques with those handed down among the Ife people.

Ewuare also had a more practical side and was responsible for massive architectural innovations and extensive town planning in Benin. The monarch was a great lover of ceremony, and he established the practice of holding annual ceremonies in which the participants wore elaborate costumes and used ritualistic paraphernalia to depict various religious and cultural elements. Ewuare commanded the Beninese people to wear distinctive facial markings that identified them according to their status and barred all foreigners from the palace. Among the Beninese people, Ewuare was highly esteemed for his introduction of coral beads, which became an essential part of royal symbolism. The Beninese people also greatly admired Ewuare for his discovery of red flannel, which he had probably received from a source with European connections. Under Ewuare, ivory and woodcarvings became common in Beninese works of art. Somewhat surprisingly, Ewuare was also interested in herbology and was a noted herbologist.

Dedicated to building up the treasures of Benin, Ewuare founded the Iwebo Palace Association, which was given the responsibility for caring for all royal regalia. However, during Ewuare's reign, the royal storehouses were twice burned down, and an untold number of priceless relics were destroyed. Further historical relics were lost to history when the royal storehouses were looted in the early 18th century under the rule of Oba Ewuakpe and when they were again burned during the reign of Oba Osemwede in the early 19th century.

In Benin, the Emeru were designated as caretakers of all *iru*, the sacred brass vessels used in Beninese rituals. The more contemporary *irus* were replicas of those used during Ewuare's time when it was believed that the vessels had mystical powers that allowed spirits who resided in the vessels to affirm the prayers of the faithful in audible voices. These vessels were placed on the Ebo n'Edo shrine in Ewuare's palace. According to the legend

of the *iru*, after Ewuare died, a successor broke the pots in an attempt to discover what was inside. Because the spirits supposedly fled from the broken pots, new vessels were cast. Thereafter, the royal family was required to mimic spirit voices during ceremonies.

Another legend has it that Ewuare predicted that if a king named Idova ascended to the throne of Benin, the country would experience a major change in government. He declared that he did not know whether the change would be for good or ill. When Oba Ewuakpe became king in 1700, it was noted that his given name was *Idova*. Whether Oba Ewuare had had some premonition of what would happen during Ewuakpe's reign, or whether events were a result of his being expected to institute major changes, Oba Ewuakpe responded to political conflicts by initiating a number of reforms in Benin. However, the monarch later fell out of favor with the people. When his mother died, he ordered that human sacrifices be made in her honor. Outraged, the people rebelled and thereafter boycotted the palace.

ELIZABETH PURDY

exclusion laws in Japan

In 1534, the first Portuguese ship arrived in southern Japan bringing a cargo that included firearms. For the next hundred years, Japanese-Western trade flourished and Christian missionaries converted many Japanese to Catholicism. However in 1636 strict isolation laws were enforced, foreigners were expelled, Japanese Christians were compelled to renounce their religion on pain of death, and Japanese were forbidden to leave the country. These strict exclusion laws would last until 1854.

The Japanese had known about gunpowder since the 13th century. However in the midst of extensive civil wars in the 16th century, Japanese feudal lords were immediately impressed by the accurate firing arquebuses and cannons the Portuguese traders introduced and immediately began to buy and then make them in Japan. These new weapons changed the nature of the warfare and led to the building of heavily fortified castles.

Catholic missionaries followed merchants. Francis Xavier, associate of IGNATIUS LOYOLA, founder of the Society of Jesus, arrived in Japan in 1549. Franciscan and Dominican missionaries soon followed. Many feudal lords, anxious to increase trade with European merchants, and seeing the deference Portuguese and Spanish merchants showed to priests, welcomed missionaries to their domains; some converted and even ordered their subjects to convert also. ODA NOBUNAGA, the most powerful military leader of Japan, became a patron of the Jesuits. The number of converts increased dramatically, to 150,000 and two hundred churches by 1582 and perhaps to as many as 500,000 by 1615.

The very success of the Catholic missionaries created a backlash against Christians. Some opponents were Buddhists. Significantly political leaders began to fear the political loyalty of their Christian subjects. Thus Oda's successor TOYOTOMI HIDEYOSHI (1536–98) banned Christianity in 1587 but did not strictly enforce his edict until 10 years later.

It was Hideyoshi's successor TOKUGAWA IEYASU (1542–1616) who seriously persecuted Christians, beginning in 1612 when, as shogun, he ordered all Japanese converts to renounce Christianity on pain of death and then to be registered in a Buddhist temple. He also executed some missionaries and expelled all others. His policies were ruthlessly carried out, with military force where there were large Christian communities. Tens of thousands were killed and only isolated clandestine communities remained.

The Tokugawa Bakufu, or Shogunate, expanded the ban on missionaries to include all Spanish, Portuguese, and English traders also. Only the Dutch among Europeans were allowed to send two ships annually to NAGASAKI under strict supervision. Chinese ships were also allowed under license. In 1636, another law was promulgated that prohibited all Japanese from leaving Japan and members of the sizable Japanese communities in Southeast Asia from returning. Shipbuilding was limited to small coastal vessels to prevent Japanese from secretly trading with foreigners.

Fear and insecurity motivated the newly established Tokugawa Shogunate (1603–1868) to ban Christianity and foreign contacts. Seclusion became Japan's national policy.

JIU-HWA LO UPSHUR

expulsion of the Jews from Spain (1492) and Portugal (1497)

In a year most remembered for CHRISTOPHER COLUMBUS's discovery of the New World, the Spanish monarchs were also making history at home. In March 1492, FERDINAND V AND ISABELLA I OF SPAIN issued the Alhambra Decree, which ordered the expulsion of all Jewish men and women from the newly united kingdom. Also known as the Edict of Expulsion, this decree gave the Jews four months to depart and forbade their return to Spain. Those who did not comply with the decree would be stripped of all belongings and put to death.

Traditional accounts of the expulsion contend that as many as 400,000 Jews fled to North Africa and Turkey in response to this decree. Recent scholarship has challenged this account and reduces the number of refugees to a total of 30,000–40,000, with only 10,000 fleeing to Turkey from the western provinces. The remaining refugees from Spain fled overland to neighboring Portugal, where tensions were already growing between the native Christian and Jewish populations. The addition of 20,000 Jewish refugees led to increased persecution, and just four years after the Alhambra Decree was issued in Spain, King Manuel of Portugal followed suit by ordering the expulsion of all Jews residing within the borders of his kingdom.

Hoping to avoid the logistical problems of the Spanish expulsion, Manuel gave the Jewish community 10 months to prepare, moving the actual date of expulsion to October 1497. In the interim, many of the Jews chose to convert to Christianity to avoid the treacherous journey across the Mediterranean. The Spanish refugees were also able to return to their homeland as “new Christians” if they were willing to convert. The small number of Jews unwilling to make this sacrifice had no choice but to travel across the Mediterranean to North Africa. It is most likely these Jews, expelled from Portugal and not Spain, made up the first population of Sephardic Jews in North Africa.

The expulsion of the Jews from Spain has been a subject of great historical interest, and numerous scholars have weighed in with varying accounts of the causes, processes, and consequences of this event. All agree that

the expulsion was the inevitable result of the Spanish Inquisition, instituted by Ferdinand and Isabella in 1478. Traditional theories hold that the Inquisition was created to combat the growing number of Jewish converts (*conversos*), who were thought to be practicing Jewish rituals in secret. According to this approach, the expulsion was an attempt to rid the kingdom of genuine Jews, who were assumed to be a bad influence on the conversos.

Revisionist historians have challenged this account of the expulsion in one of two ways. Some have argued that the conversos were genuine converts to Christianity and that the Inquisition against them was instituted to undermine their economic and political success. According to this theory, the expulsion was an unintended consequence of an Inquisition that had gained its own inertia among the populace. Others have argued that the Inquisition was largely a political institution instituted to secure the religious unity of the newly united Spanish kingdom. On this account, the expulsion was actually less about removing the Jews from the kingdom than it was about forcing them to convert to Christianity by default. The historical events leading to the expulsion of the Jews from Portugal are less enigmatic. As was mentioned, tensions had been rising between Jews and Christians within Portugal for some time. In fact, King João II was considering an expulsion as early as 1493. After João's death in 1495, the situation of the Jews improved for a brief period under the reign of Manuel.

Yet, all hope was crushed when the Spanish Crown interfered, pressuring Manuel to expel his own Jews for the sake of greater Christendom. Ferdinand and Isabella were able to force this second expulsion because Manuel was intent upon marrying their daughter, Isabella. This marriage was an important political move for Portugal, and Ferdinand and Isabella made the expulsion of Portuguese Jews a necessary condition of the marriage contract. Thus, despite his unease over the expulsion, Manuel issued his decree in 1496.

ELIZABETH A. BARRE

Fénelon, François de Salignac de la Mothe- (François Fénelon)

(1651–1715) *educator, intellectual, bishop*

François de Salignac de la Mothe-Fénelon had one of the gentle minds of the 17th century that adapted the mold of the Christian humanist to the social and intellectual world of France. Though he did not find contemporary authorities receptive to his ideas, later generations of politicians, educators, and church officials took their inspiration from his writings.

He was born the 13th child of a family of venerable pedigree in Gascony. By the age of 24, he was ordained and took up parish work. Having dreamed of doing outreach work among Orthodox Christians in Greece, he instead took up a new mission of winning French Protestants back to the Catholic Church. His first project, called Convent of New Catholics, catapulted him into prominence as an educator. The convent offered first-rate education to girls from Protestant families in accordance with Fénelon's pedagogy. His second project was to undertake direct preaching missions among the Protestants of the region, reflecting Fénelon's feeling that persuasion was preferred to force when it came to converting souls.

In 1687, his *Traité de l'éducation des filles* articulated his sentiments about the dignity of women and their rights to an education. Fénelon criticized the harsh pedagogy applied to students of his day and presented more gentle and persuasive ways of molding character, according to

the mentality of each child. Among those who became his advocates were the powerful bishop, Jacques-Bénigne Bossuet, and several important relatives of LOUIS XIV. In 1689, he was chosen as the tutor of the dauphin.

For the dauphin Fénelon prescribed a regimen of moral education, stressing that a great king depended on greatness of personal character. One of his texts, called *Télémaque*, was based on the opening books of Homer's *Odyssey*, where Odysseus's son, Telemachus, learns to take responsibility for his father's house. Another text featured the testimonies of past heroes, meant to inspire the student to set high ideals.

The effects of his pedagogical experiments were dramatic. The king's family noticed that the lad, once spoiled and prone to temper tantrums, now became serious, self-controlled, and even pious. Fénelon thus became the toast of the court; by 1693, he was elected to the French Academy, and in 1695 he was named an archbishop.

Fénelon's downfall came from an unexpected source—his lifelong speculation about piety and prayer. In 1688, he had made friends with the French mystic Mme. Guyon, a widow known for her eccentricities but followed by a notable clique. Her teaching sounded suspiciously similar to a spiritual movement called QUIETISM, originating from Spain and condemned by the Holy See. Bossuet censured Guyon, while Fénelon stood by her.

In the fateful year of 1699, Fénelon was stripped of his position as royal tutor. Appealing to the pope, Fénelon was faulted for 23 of his propositions. Then his text *Télémaque* was found by Louis XIV to be too

critical of the French monarchy. It was well known that Fénelon had reformist views on the absolute monarchy, free trade, and a church free from Louis XIV's and Bossuet's controls.

Fénelon retired to his diocese in disgrace. Unto his dying day, he maintained the common touch with the faithful of his region, steered clear of scandal, and was revered as a saint. His educational theory was unmatched until the time of Rousseau; had his views on the monarchy been considered, France might have been preserved from its bloody revolution 100 years later.

MARK F. WHITTERS

Ferdinand V and Isabella I of Spain

patrons of exploration

Ferdinand (1452–1516) and Isabella (1451–1504) united Castile and Aragon creating modern Spain under a dual monarchy, initiated the Spanish Inquisition, conquered Granada, expelled the Moors and the Jews who would not convert to Christianity, funded CHRISTOPHER COLUMBUS, and established royal authority.

Ferdinand was born at Sos, Aragon, on March 19, 1452, as the son of John II of Aragon and Navarre (1397–1479) and Juana Enriquez, his second wife. As heir to the throne of Aragon, Ferdinand became king of Sicily in 1468. He was skillful, ruthless, ambitious, self-centered, and political in all his endeavors. Ferdinand was often deceitful in his agreements, repudiating treaties and other agreements soon after they were signed.

Ferdinand married his equally ambitious, pious, but wiser cousin Isabella of Castile and León. She was born at Madrigal de las Torres in Castile on April 22, 1451, the daughter of feeble-minded King John II of Castile and León (1405–54) and Isabelle of Portugal, his strong-minded second wife. Isabella had a more ethical character than Ferdinand. She inherited an extensive royal lineage from several generations of European dynasties. The couple maintained exceptionally close ties to the papacy.

Isabella's imbecilic half brother HENRY IV (1425–74), also known as the Impotent, ascended the throne after their father died in 1454. Along with her younger brother, Alfonso, Isabella was brought to Henry's court for protection and stricter supervision. Isabella became a pawn in her brother's plans to make her future marriage econom-

ically beneficial and politically advantageous for Castile. He wanted her to marry, among others, the king of Portugal, the French dauphin, or an English prince, all of whom she firmly refused. After Alfonso's death in 1468, Henry proclaimed the prudent and gentle Isabella his heir on September 19, 1468, when they both affixed their signatures to the Accord of Toros de Guisando.

Isabella secretly married her cousin Ferdinand at Ocaña, on October 19, 1469, without Henry's consent. He disowned her, promptly revoked the Accord of Toros de Guisando, and named his alleged daughter Princess Juana la Beltraneja (1462–1530) princess of Castile and by 1475 the wife of King Afonso V of Portugal (1432–81), as his heir. Juana was the illegitimate daughter of Henry's wife and Beltrán de la Cueva.

After Henry died on December 10, 1474, Isabella ascended the throne on December 13 at Segovia. Her claim was immediately contested by Juana and Afonso; the struggle became a civil war. Isabella had strong support from Aragon and her countrymen. Ferdinand defeated Juana's forces at the Battle of Toro on March 1, 1476, and again on February 25, 1479. The Treaty of Alcaçova on September 1479 concluded the civil war. Juana entered the convent of Santa Clara of Coimtra in 1480.

To solidify firmer control over Spain once they became comonarchs, Ferdinand and Isabella subdued all the resistance groups, captured the insubordinate towns and fortresses, and vanquished all rebellions against their rule. Then they proceeded to reconstruct the Cortes (Parliament), revamped the government's administration, and produced a legal framework for Spain that granted greater power to the monarchy at the expense of the nobility, who had become dangerously powerful under previous monarchs.

When Ferdinand's father died in 1479, Ferdinand and Isabella's union merged the two largest kingdoms of the Iberian Peninsula and created 90 percent of present-day Spain. The astute Isabella insisted that there be joint rule and that she govern Castile herself. The saying "Tanto monta, monta tanto" (They are one and the same), became their motto. Isabella also insisted that both their names be placed on each royal document and that she preside at each state transaction. She also allowed their coat of arms to be united. She collected important artworks, was widely read, learned Latin after the age of 30, established schools, and supported the Franciscan order of the Poor Clares. Together they reformed the church and the monasteries in Spain, as both had become corrupt and ineffective.

The couple had five children: Isabella of Aragon (1470–98), Juan of Aragon (1478–97), Juana of Castile

Ferdinand V and Isabella I receive Christopher Columbus after his return from his first voyage. Though responsible for the golden age of exploration for Spain, the monarchs also sponsored the Spanish Inquisition and the expulsion of the Jews from Spain and Portugal.

(1479–1551), Maria of Aragon (1482–1517), and Catherine of Aragon (1485–1536), to whom Isabella was devoted. They all received the same classical education and were taught the basics of household duties such as sewing, making beds, and cleaning.

The children were married into European royal dynasties mainly to outflank French territorial ambitions. Juan married Margaret of Austria but died within six months and left no children. Juana became insane after the death of her husband, HABSBURG archduke Philip the Handsome (1478–1506). Isabella married King Afonso V of Portugal (1432–81) and then King Manuel I of Portugal (1469–1521). She died in childbirth, and her son Miguel died within two years. Maria married her brother-in-law Manuel I of Portugal after her sister's death. At the conclusion of at least 13 years of negotiations, Catherine married Arthur Tudor, prince

of Wales (1486–1502) on November 14, 1501. Arthur died six months later. After Arthur's death, because her father had not yet completed payment of her dowry, Catherine would marry the future king HENRY VIII (1491–1547) on June 11, 1509. He divorced her on March 30, 1533. Ferdinand and Isabella's grandson by Juana and Philip inherited their and Philip's parents' huge territorial inheritance; he would become Holy Roman Emperor CHARLES V (1519–56).

Ferdinand and Isabella believed that religious conformity was crucially important for Spain. They also realized the political and economic advantages for their monarchy and zealously instigated the Spanish Inquisition, deeming saving souls and eradicating heresy as their most sacred duty. During their reign, heterogeneous Spain had Europe's largest Jewish population. Ferdinand and Isabella insisted that Spain become white

(non-Moorish) and of pure Christian blood, or *sangre limpia*. On the threat of withdrawing military support from the pope Sixtus VI (1521–90), who deemed their actions as a plot to gain Jewish property, Ferdinand demanded that Spain initiate the Inquisition. After a number of arguments between Ferdinand and Sixtus, the pope issued the Papal Bull of 1478 that created the Inquisition in Seville. It then expanded throughout Spain and began a lengthy period of religious cleansing.

Pope Innocent VIII (1432–92) appointed the Dominican priest Tomás de Torquemada (1420–98), Isabella's confessor and himself a grandson of a convert, to head the Spanish Inquisition. The partially converted Jews, the Marranos, secretly maintained their Jewish cultures and customs. To force them to confess, Torquemada imposed increasingly penurious methods. He forfeited Jewish property, which conveniently financed a war against another minority in Spain. Torquemada humiliated the Marranos by forcing them to wear a *sambenito*, a yellow shirt containing crosses that exposed their genitals in public.

Some 130,000 *conversos* were tried at tribunals from 1480 to 1492. Some Marranos were burned at the stake. The ruthless Torquemada staged the LaGuardia show trial in 1490 where no guilt was proved yet the victims were burned at the stake. Some 30,000 Jews were ritually murdered during the Spanish Inquisition. Ferdinand and Isabella issued the Edict of Expulsion on March 31, 1492. The Jews were commanded to leave Spain and never return. With his work done, Torquemada retired to St. Thomas monastery in Ávila, where he died in 1498. Historical debate lingers about the number of victims of the Inquisition in Spain.

Ferdinand and Isabella relied greatly on the expertise of her next confessor, Cardinal Francisco Gonzalo Jiménez de Cisneros (1436–1517), who helped raise Spain to unprecedented predominance on the European continent. The couple gained control over the military orders of Calatrava, Alcántara, and Santiago, which greatly increased their power, wealth, and territory.

Ferdinand and Isabella revived the centuries-long Reconquista. They waged a costly 10-year war against the Moors and finally conquered Granada, the last Moorish stronghold, in 1491. They triumphantly entered Granada on January 2, 1492. Isabella, more so than Ferdinand, was responsible for the horrific slaughter of the Moors who would not convert to Christianity. In 1501, Ferdinand and Isabella offered the Moors the alternative of baptism or exile; those who remained became known as Moriscos. In 1492, Pope Innocent VIII (1432–92) granted Ferdinand and Isabella the title

of “Most Catholic Majesties” for spiritually unifying Spain. The Reconquista was completed.

Isabella was largely responsible for initiating the golden age of exploration for Spain. She financially supported the voyage of Christopher Columbus to the New World. She had rejected his request numerous times, but when he threatened to petition funds from France she relented and Columbus sailed in August 1492. When he brought 150 natives to Spain, she bought some and gave them their freedom. Ferdinand and Isabella were strongly involved with the establishment of the TREATY OF TORDESILLAS in 1494 that divided the non-Christian world overseas between Portugal and Spain.

Isabella died at Medina del Campo on November 26, 1504. Ferdinand married Germaine de Foix on October 19, 1505. Ferdinand served as regent of Castile after Juana died and later for his grandson Charles V. Ferdinand also fought in lengthy Italian Wars against France. His generals conquered Naples in 1504, and in 1512 he annexed Navarre. He also joined the League of Cambrai in 1508 to thwart Venetian objectives and the Holy League in 1511 to counteract France. Ferdinand also founded universities.

Ferdinand died at Midrigalejo, Spain, on January 23, 1516. He is buried beside Isabella, at the Capilla Real in Granada alongside Juan, Philip, and a grandson.

ANNETTE RICHARDSON

Francis de Sales (François de Sales), St. (1567–1622) prelate and writer

In an age of religious division and strife, Francis de Sales (François de Sales) was a voice of reason and charity and a leader in the Catholic COUNTER-REFORMATION. Plagued by lifelong doubts about his faith, he was revered as a saintly man by both Catholics and

Protestants precisely when violence was the usual recourse for religious controversy.

Francis's father expected him to be either a lawyer or a military officer and raised him accordingly, sending him to the University of Paris to study rhetoric and humanities under the Jesuits and then to the Padua Law School. He was not much interested in the hidebound teachings of the Dominicans and Jesuits, consummate Scholastics who followed the old ideas of Thomas Aquinas. He found himself fascinated by the new ideas of the Protestant reformer JOHN CALVIN, who taught predestination. Struggling with doubts, he finally came to the conclusion, at age 19, that his main concern was to love God in this life and to entrust his eternal fate to the hands of this God.

During Francis's days in law school he resolved to become a priest. He became involved with the Catholic diocese of Geneva-Annecy, an area particularly hard-hit by Protestant proselytism. He was ordained in 1593, and through some papal connections was appointed provost of the diocese.

Francis's position allowed him to begin a mission to the resident Protestants. He conceived it as based on charity toward the poor, care of the sick, and evangelical preaching instead the conventional Counter-Reformation tactics of law and military force. Francis endured daily hardships of harassment, cold, violence, and threats. When offered another diocese by HENRY IV, he refused, saying, "Sire, I am married; my wife is a poor woman, but I cannot leave her for a richer one." Miracles were associated with his mission. The area, Protestant for some 60 years, largely returned to the Catholic Church within four years.

Francis soon became bishop of Geneva, where his patience and mildness became proverbial. He often dared to walk the streets of the city where Calvin had his headquarters 50 years earlier. In fact he dialogued with the reformed leader and scholar Theodore Beza. Though again plagued by doubts, his philosophy was "Love will shake the walls of Geneva; by love we must invade it."

Francis produced a stream of writings that proved that the pen was mightier than the sword. Among his most famous books were *Introduction to the Devout Life* (1608). He also became renowned as a spiritual director, having a profound effect on the founders of two Catholic Counter-Reformation orders, later declared saints, Vincent de Paul and Jane de Chantal. Protestant King James of England and Scottish Calvinists in Aberdeen read his literature. He had a vast correspondence, perhaps sending out 20,000 letters.

He suffered an agonizing death in 1622, was beatified by Pope Alexander VII only 39 years later, and was canonized by 1665. He was declared doctor of the church in 1877 partly for his irenic affects on religious dissent and patron saint of journalists and writers in 1923. Among the organizations that claim direct connection with him today are Visitation Sisters, Missionaries of St. Francis de Sales, Oblates of St. Francis de Sales, Salesians of Don Bosco, and the St. Francis de Sales Association.

MARK F. WHITTERS

Franciscans in the Americas

The Franciscans sent the greatest number of missionaries to minister in the New World. This is quite likely due to the fact that they were the largest order in Europe during the 16th and 17th centuries. In 1493, there were some 22,000 friars participating in various Franciscan observances. A large number of them were in Spain. By 1517, this number had grown to 30,000, mainly due to reforms initiated by Cardinal Francisco de Cisneros in the simpler more relaxed Observant reform (which retained the name *Order of Friars Minor*). The Franciscan order has had a history marked by reforms and divisions. In 1517, Pope LEO X divided into two independent groups disgruntled Franciscans still unsatisfied by the medieval attempts at reform. The result was a Conventual Franciscan group (those resisting change) and the Observant group, which would be called Friars Minor. A Capuchin reform surfaced in 1528 and became an independent group by 1619 (Order Friars Minor Capuchin). Among the three groups, the Franciscans had an overwhelming majority of religious representatives in the New World.

It has been suggested by historians that Franciscan missionaries, Friars Juan de la Deule and Juan de Tisin along with Father Ramón Pané, were the first members of a religious order to come to the Americas. These men accompanied CHRISTOPHER COLUMBUS in 1493 during his second expedition. They had been sent by a special

commission of the Franciscan order in response to royal instructions from the Spanish Crown aimed at bringing the natives of the Americas to Catholicism. Their initial chapel was built at Port Conception on Hispaniola, where in December of 1493 they offered Mass for the first time in the New World. A convent was built for them by Columbus at the stronghold of Santo Domingo.

Pane, probably more of a contemplative, accompanied Columbus on his voyage to Puerto Rico in 1496. Pane kept very exacting records of his activities and observations of the natives that have survived to this day. The Franciscans were at the vanguard of missionary activity on the newly discovered islands. In 1502, 17 more Franciscans arrived along with the first governor of Hispaniola. They would go on to build the first convent and church (San Francisco) at Santo Domingo.

Domingo became the base of operations for countless missionary expeditions to the north, south, and central continental mainland for many decades. During the next 25 years, more than 50 Franciscan missionaries attempted to evangelize the Caribbean islands, particularly Hispaniola, Cuba, Jamaica, and Puerto Rico. Friar Juan de la Deule died while ministering to Jamaicans sometime between 1508 and 1511.

In 1512, Father García de Padilla was consecrated as bishop of Santo Domingo and, two years later, another Franciscan, Juan de Quevendo, was consecrated as the first bishop of the Central American mainland at Santa Maria Darién. The eastern part of Venezuela was also established as a Franciscan apostolic mission that lasted from 1514 to 1521. Not until after 1576 were friaries founded in the province of Caracas. In the 17th century, the Capuchins attempted to evangelize in Venezuela. Francisco de Pamplona (a former military general) began work at Darién in 1650. The Capuchin houses located there refused to accept Creoles into the order.

EXPEDITIONS TO MEXICO

During 1523 and 1524, two Franciscan missionary expeditions set out for Mexico from Santo Domingo. The first friars among the Mexicans were Flemish. Among them was Father Peter of Ghent (d. 1562), who spent some 40 years among the native Mesoamericans. The following year 12 more Franciscans arrived. Around 1527, a diocese was organized under the Franciscan bishop Juan de Zumárraga. At that point, some 70 Franciscan houses rapidly surfaced in Mexico and the region was raised in status to a province. Zumárraga is credited with setting up the first printing press in the New World. Publications in 12 languages were printed and distributed throughout the Americas.

Education of the Indian children of Mexico became a priority and labor of love among the friars. However, there was some opposition on the part of the Spanish government in regard to the education of the natives. Most convents had schools where thousands of Mexican boys were taught to read, write, and sing. Eventually the Franciscans assisted with the development of a school for girls in Mexico City. Several colleges were also founded for the sons of tribal chiefs throughout Mexico; they became centers for further missionary activity to both South and North America.

Before the end of the 16th century, friars extended missionary efforts from Guadalajara in the northwest to New Mexico in the north, northeast to the Gulf of Mexico, and south to the Yucatán, Guatemala, and Costa Rica. Beautiful churches were constructed at Huejotzingo, Tlamanalco, Huequechula, Izamal, and Cholula. Friars Pedro de Betanzos and Francisco de la Parra became experts in the Mayan language and have handed down keys to its translation. By 1569, there were some 300 Franciscan missionaries in NEW SPAIN (Mexico) alone.

MISSIONS TO PERU

Missionary efforts to Peru were launched by Franciscans from Santo Domingo, after 1527 by Juan de los Santos, and followed by Marcos de Niza between 1531 and 1532. Earlier, Franciscans accompanied Pizarro during his conquest and exploration of the region. Evangelization progressed fairly slowly in Peru for the first 20 years due to the animosity between natives and the Spanish invaders. From Santa Cruz eight missionaries were sent out to Peru. Friar Francisco de Aragón took 12 Franciscans and traveled south to form the main trunk from which communities in Ecuador, Chile, and Bolivia grew. A center for ministry was established at Quito as well as a college. By 1549, a supervisor was sent to Lima to coordinate all Franciscans in the southern part of the continent. It was not until 1553 that Peru saw permanent Franciscan establishments. In Ecuador a Franciscan province was erected in 1565. Missionary activity to the east and south continued.

During the 17th and 18th centuries, many friars were lost to martyrdom in the territories of the Ucayali and the region north of the Amazon. Franciscans count 129 friar deaths on the Ucayali alone. In 1742, most of these centers of ministry were destroyed during native uprisings. It took 50 years to restore the Franciscan missions in these areas. Attempts by Franciscans to evangelize Chile were gravely disappointing. Between 1553 and 1750, repeated hostilities between Spanish settlers and natives made activity in the region difficult. Not until Chilean independence in 1832 did the friars

resume their missionary work. In the southern part of Chile and Bolivia the Franciscans were more successful. Seven missionary colleges were established and Franciscans ministered to the people of Bolivia between the 16th and 19th centuries.

They reached Paraguay in the early 1600s and Uruguay a century later. In Argentina, Paraguay, and Peru, the Franciscan missionary St. Francis Solano (1549–1610), who was said to have had the gift of tongues (having learned numerous native languages), spent 14 years ministering to colonists and natives. He is still held in highest regard among descendants of the indigenous people of South America.

FRANCISCANS IN FLORIDA

Franciscans arrived in Florida in 1573, eight years after the first permanent Spanish settlement. A larger influx of friars in 1587 and again in 1589 helped with the conversion of the Guale. Many of the northern tribes of Florida were urban dwellers, so the Franciscans attempted to move into their cities and live among the people. Soon a chain of missions were established along the Atlantic coast for some 250 miles. However, during Indian uprisings of 1597, five Franciscan friars were martyred. In 1612, the Franciscan province of Santa Elena, which was headquartered in Havana, Cuba, began to supervise missionary work in Florida. At its peak in 1675, some 40 friars maintained 36 missions and the bishop of Havana claimed 13,000 native souls and about 30,000 total Catholics (which might be an exaggeration) under his care. Eventually, the Franciscan missions would fall victim to the struggle between England and Spain over the territory between St. Augustine and Charleston. Slaving raids, armed conflicts, and British alliances with Native American tribes caused the Florida missions to vanish. By 1706, most Franciscan houses in Florida had ceased to function.

By 1680, there were more than 60,000 Franciscan friars worldwide. This may have had to do with the growing number of friaries (2,113 in 1585 and 4,050 in 1762). There were 16 provinces in the Spanish Americas alone. By the middle of the 18th century, at least a third of all Franciscan houses and friars were in the Spanish New World. Some of this growth reflected an increase in the number of native Franciscans in the Americas, especially in the 16th century. In fact, in Mexico, Spanish friars began to constitute a thin minority by the mid-1600s.

TEXAS SETTLEMENTS

Texas began to be settled by Franciscans while the area was still linked to New Spain. Some missionaries refer

to the areas occupied by Texas, New Mexico, Arizona, and California as the New Kingdom of St. Francis. There was trouble in 1680; the PUEBLO REVOLT saw the uprising of many Native Americans, primarily in response to the denigration of their religion by the Spanish Franciscans as well as the disruption of the Pueblo economy. Under the direction of Popé, the revolt was successful, and Popé ruled from the former governor's palace until his death in 1688. Shortly after his death, the Spanish returned, reconquering the land without bloodshed by offering clemency to the inhabitants. In 1690, permanent missions began to be founded in the area of Texas, mostly through the efforts of Father Damian Mazanet.

Many Indians in Texas were open to accepting the Christian gospel. During the 1700s, some 21 Franciscan missions staffed by more than 160 friars were established in Texas and thousands of Indians embraced the faith. During the mid-1700s, many were constructed in magnificent fashion of stone; some included fortress walls. Several examples of these still survive, particularly in the area around San Antonio, Texas. After the period of Mexican independence in the early 1800s, a large number of these missions were left to ruin.

While Mexico and Arizona had Franciscan visitors in the 1500s, it was not until the early 17th century that there was any permanent activity there. Father Juan de Padilla died in the region for his faith in 1542 during an early expedition.

By 1628, there were 43 churches and an estimate of some 30,000 Catholics (native and Spanish) in the territories. The Franciscans were the only missionaries to minister there and it has been recorded that nearly 300 Franciscans preached in the area during the 16th and 17th centuries. California did not experience Franciscan activity until 1769.

The work of Father Junípero Serra and his assistants saw the founding of 21 permanent missions extending from the initial foundation in San Diego north to San Francisco. For the next 100 years, 144 friars would labor in California, resulting in an estimated 80,000 baptisms among Native Americans and settlers.

ENGLISH AMERICAN MISSIONS

In the English American colonies there was some isolated Franciscan activity in the late 1600s as well as some activity in French Canada in the early part of the 17th century. Between 1672 and 1699, English friars assisted the Jesuits with work in Maryland, New York, Pennsylvania, Kentucky, Michigan, Illinois, and Minnesota. The only permanent success seems to have been in Detroit. However, even that region was unstable. In

1706, the Franciscan priest Constantine Dehalle was killed in an Indian uprising.

Father Gabrielle de la Ribaude also gave his life near Joliet, on the banks of the Illinois River, in 1681. In NEW FRANCE (Canada) the first missionaries in the region were four French Franciscans in Quebec around 1615. They spent the 10 years ministering to the Huron and Algonquins in the regions of the St. Lawrence River and the Great Lakes. Father Nicholas Veil was the first Franciscan to be martyred in Canada. By 1630, the British ended friar activity in most of Canada. Some work continued among the Abnaki in Nova Scotia and Arcadia until around 1633. A group of explorers led by the Franciscan Father Louis Hennepin (1640–1701) sailed from Niagara Falls down the Mississippi. Hennepin wrote several accounts of his adventures. One of the last of the formative Franciscan missionaries in Canada was Father Emanuel Crespel, whose efforts extended all the way to the Fox River in Wisconsin during the 1720s.

Historical information on Franciscan activities during the 17th and 18th centuries is not as abundant as that of the 16th century formative period. Heroic tales of martyrs and founders survived in the form of oral traditions, written accounts, and records kept by the order. By the 17th century, the scope and goals of missionary and evangelical activity began to change. By then it was even more necessary to educate and catechize as well as bring European culture and ideas to the native inhabitants. Dealing with a second generation of settlers, the arrival of new Europeans, as well as the issue of intermarriage, preoccupied the friars.

The mission foundations, or *doctrinas*, began to evolve into parishes (some were exclusively native, others were urban European, and there were many mixed communities). It was also customary to hand many of the more successful parishes and mission foundations over to diocesan secular clergy, freeing many Franciscans to attend to ministry in the more remote areas. As the 18th century progressed, growing control by the secular clergy eventually gave way to the specialization of the Franciscans in attending to new and more isolated missionary territories in addition to the establishment of missionary colleges directed at the propagation of the faith.

TIM DAVIS

French East India Company

The French East India Company was one of several companies created to promote Western European commercial interests in Asia, particularly in India, beginning in the 17th century. Lured by Spanish and Portuguese traders' tales of lucrative spice exports from the Spice Islands (in present Indonesia) during the 16th century, Dutch, British, and French rulers commissioned voyages to Asia in search of economic, and subsequently, colonial opportunities. In India Europeans discovered a plethora of items for export, including cotton, silk, indigo, and later, opium, all of which generated great demand by both European and other Asian markets.

France entered the Asia trading arena significantly later than Great Britain, which founded the British East India Company in 1600, and the Netherlands, which founded the DUTCH EAST INDIA COMPANY (INDONESIA/BATAVIA) in 1602. While France attempted to cultivate trade connections with Asia in the early 17th century as well, initial expeditions failed to secure any trading posts or settlements. During the reign of King LOUIS XIV (1643–1715), however, JEAN-BAPTISTE COLBERT, minister of finance, reorganized earlier unsuccessful trade ventures into the French East India Company (Compagnie des Indes Orientales) in 1664.

Colbert sent an expedition that reached India in 1668 and built the first French factory (production center) in Surat on the western coast, and soon after another in Masulipatam on the eastern coast. In 1673, the company established its headquarters in Pondicherry, on the southeastern coast below Madras (now Chennai), and founded Chandannagar on the northeastern coast, north of Calcutta. Madras and Calcutta, along with Bombay,

were Britain's major settlements. Pondicherry eventually became a thriving port town with a population of nearly 50,000, and Chandannagar became the most important European trade center in Bengal, its commercial success rivaling that of Calcutta.

While France never became the dominant European authority in the region, for more than 50 years the French East India Company made great efforts to capitalize upon the expanding demand for textiles, dyes, and other goods that could be supplied by Indian merchants. French accounts of the activities in port towns such as Surat detail the intricate steps involved in creating the fabrics, known collectively as *indiennes* (Indians). Particularly on the southeastern coast, Indian weaving villages generated thousands of bolts of textiles for eager European companies.

Most in demand were *guinee* cloths (cotton long-cloth, usually 35 to 50 m in length), *salempores* (staple cotton cloth), and *morees* (cotton cloth of superior quality). Also coveted were the stunning *toiles peintes* (painted cloths) and *toiles imprimés* (printed cloths), as well as the magnificent silks and dyes. The textiles were adored not only in Europe, but also in other parts of Asia; indeed, India had engaged in Asian textile trading centuries before Europeans arrived. In the Indonesian archipelago, China, and Japan, Indian cotton was popular for its lightweight, yet sturdy qualities. In due course, the French, British, and Dutch acquired materials from India not only for their home countries, but for transport to MALACCA or Java, for example, where they were traded for spices—cloves, nutmeg, mace, sugar, and pepper—crucial in Britain and Europe to preserve meats during harsh winters.

By the 18th century, the French had secured agreements to provide woven products tailored to Asian buyers' interests: they had colored, patterned handkerchiefs specially woven for particular island markets, for example, which proved a successful entrepreneurial venture. Moreover, cloths of different types played a symbolic role in rites of passage and were sought after for use in birth, marriage, and death ceremonies, and bolts of cloth were commonly given as offerings or gifts.

A salient corollary to the French East India Company's textile exchange is that its movements between Asia and Europe also supported the exchange of slaves. While the slave trade is often described as triangular, with the three corners Europe, Africa, and the Americas (the "New World"), trade between Europe and Asia also helped to sustain slavery. French ships traded European goods in Asia, where they acquired cowry shells and Indian textiles highly valued in West Africa. Traders exchanged these

goods in Africa for slaves, who were sent to France's colonies in the Americas. "The circle was completed," notes the Yale Center for the Study of Globalization, "when sugar and other goods from the Americas were loaded on board and shipped back to France."

In commencing trade with India, the French East India Company entered an already well established, complex economic system, an intricate network of production, negotiation, delivery, and distribution. Indian merchants operated large commercial fleets as well as prosperous shore-based businesses. Inland weavers and merchants worked with overland freight deliverers and brokers, who worked with shipowners and exporters. All of these agents had to negotiate with local politicians and state officials for commercial privileges. Regional and individual trading groups developed their own intra- and intercountry rules and practices as well. In order to gain access to the goods they desired, moreover, the French had to learn these rules and practices and successfully collaborate with indigenous envoys.

The French were able to develop manufacturing centers in various Indian states, but cooperating with Indian middlemen sometimes proved trying. In addition to conflicts between French traders and middlemen, clashes between traders and local authorities (and between middlemen and local authorities) often impeded successful business transactions. The Dutch and the English had mastered the art of working with indigenous traders, shippers, and rulers much earlier than the French, and although their interactions were not always seamless, they operated with that distinct advantage. In most of the towns and ports in which the French operated, there were also English and Dutch associates. Where there was a French factory, there were likely to be English and Dutch factories as well. At the peak of the Indian trade, during which the demand for Indian goods exceeded the volume weavers and other artisans could produce, the presence of several East India companies, even in the same town, did not lead to serious rivalry. As the three companies grew more competitive, however, the Dutch and particularly the English, better funded and more conversant in local business etiquette, were able to expand their factory outposts to larger industrial towns under their jurisdiction. These commercial strongholds became political enclaves, eventually enabling Great Britain to consolidate its power and control throughout India.

Despite its numerous settlements, after the death of Louis XIV, the French economy faltered and by 1719, the French East India Company was nearly bankrupt. The French East India Company resumed its independence in 1723.

While the British East India Company began as primarily a trading company, it increasingly became a governing power. As the British expanded not only economic but also political and colonial influence, tensions between Britain and France grew. In 1742, Joseph Dupleix was appointed governor general of all French settlements in India and dedicated himself to exerting French power. He envisioned a French empire and to this end began to interfere in local Indian politics, playing local rulers against each other for his French benefit. In French port towns, officials equipped factories for defense.

The battle for supremacy led to a series of military conflicts between France and Britain, with triumph and defeat alternating between the two. In 1747, the French besieged and captured Madras. In 1751 and 1752, however, Englishman ROBERT CLIVE dislodged Dupleix's forces in Arcot and Trichinopoly, taking many French prisoners. In 1754, the French government, anxious to make peace, recalled Dupleix to France. During the next half-century, British forces further colonized and forcefully subjugated much of India. While several Indian ports remained under French directive, Britain became the definitive Western authority of the Indian subcontinent. Clive's victory in the BATTLE OF PLASSEY in 1757, which brought the state of Bengal under British control, is often cited as the landmark turning point of the British colonial heyday in India. Bereft of both authority and capital, Dupleix returned to the country for which he had so vigorously labored and died penniless in 1763.

Despite its earlier successes in both inter- and intra-continental trade, the French East India Company never regained its former eminence. Ultimately, King LOUIS XV suspended the enterprise; took over its forts, ships, and other properties; and in 1769, the French East India Company essentially dissolved.

CHRISTINE SU

Fronde, the

The Fronde (1648–53) was a civil war that took place in France during the era of LOUIS XIV. Although not a particularly unified movement, the Fronde was nevertheless a protest against both the power of the Crown and the perceived loss of privilege. The term *fronde* came from the word signifying a child's slingshot, and a game whereby children would fling stones at the nobility. The term *frondeur* soon meant a person who believed in limiting monarchical power, or one who simply speaks out against the current government.

Louis XIV was barely 10 years old when the revolt erupted. The Fronde itself was not directed against the boy king; rather, it was directed mostly against the policies of Cardinal Mazarin and Louis's mother, Anne of Austria, who were at the time ruling France until Louis would come of age to rule on his own.

By the time Louis XIV was born, France was in serious financial difficulties. The THIRTY YEARS' WAR (1618–48) placed extreme demands upon the French treasury. Mazarin resorted to several tactics to raise money, including increasing taxes, selling government offices, and forcing creditors to make government loans.

THE THREE ESTATES

Society in prerevolutionary France was divided up into the Three Estates. In the first estate was the clergy, followed by the nobility in the second. Whoever was not in the first two was clearly in the third, which was the bulk of the population. While the struggle for power and authority may have caused the first two estates to hate each other intensely, they would always band together to block any attempts by the third to assert themselves.

But the third estate was beginning to make strides toward improving their lot. With the discovery of the New World, and improved methods of sea travel, international trade improved the economy of Europe. Many people who were not part of the third estate tapped into the opportunities and often amassed personal fortunes greater than that of the nobility, and thus a new middle class was born. This new middle class often loaned money to kings and nobles alike, often to finance wars or expeditions. But with that came another demand from

the middle classes—political power. Mazarin was happy to provide these offices, much to the chagrin of the nobility, who believed such power was reserved to them.

In May 1648, judicial officers of the *parlement*, a high court, were taxed. The officers met with Mazarin, refusing to pay. The officers presented Mazarin with a list of demands, which were constitutional reforms, including giving them the power to approve any new taxes. Not to be bullied, Mazarin had the leaders of the *parlements* arrested.

Open revolt broke out in Paris in August. Since the army was engaged elsewhere, there was little choice but to release those arrested, along with an empty promise to enact reforms. As soon as this was done, Mazarin and the court fled Paris in October, taking the young Louis with them.

Upon the signing of the Peace of Westphalia, ending the Thirty Years' War, the army returned to Paris and began to fight the insurgents. Both the middle and lower classes joined in the struggle, also unhappy with the rate of taxation. But the movement was anything but unified. Throughout France, various armies were formed by local city government units, such as *parlements* and councils, and by social groups such as the nobility. Many of these armies fought against the Crown, while other armies fought against each other.

The army began a siege of Paris by January 1649, but the number of casualties was small. By March, the Peace of Rueil was signed, which would last only until the end of the year. The battles and intrigue, however, did not cease. Princes and nobles alike still conspired to unseat Mazarin and gain more power for themselves. In January 1650, Mazarin arrested three such leaders

and then turned to the army to suppress any remaining rebellion throughout the kingdom. In 1651, the prisoners were released, and the royal army managed to quell the rest of the minor revolts. Eventually, the royal court returned to Paris. *Frondeurs* continued to fight, although against each other, and with the royal army. Some *frondeurs* fashioned their own government in Paris in 1652, and Mazarin, feeling pressure from outside, once again left France.

Constant infighting among the *frondeurs* doomed the movement, and Louis XIV was allowed to reenter Paris in October 1652. By the next year, Mazarin returned to France, and with that, the Fronde was officially over. But long term Louis XIV never trusted nobility, and upon ascending the throne, he ruled as an absolute monarch. While he may have utilized the skills of advisers, he ruled without a minister or the Estates General. Furthermore, remembering Paris as a place of violent revolt, he built the palace of Versailles, at tremendous cost to the country, and moved the seat of government there.

M. NEWTON-MATZA

Galileo Galilei

(1564–1642) *astronomer, mathematician, and physicist*

Galileo Galilei was the most important physical scientist of his time. His father, Vincenzo Galilei, performed significant experiments in musical science. After entering the University of Pisa in 1581 as a medical student, Galileo discovered mathematics and promptly became enraptured. The ancient Greek mathematician Archimedes became his intellectual hero. He supplemented classes in natural philosophy at Pisa with private mathematical study in Florence. He left Pisa without a degree in 1585 and became a mathematics tutor in Florence, where he established the isochronous nature of the pendulum—the fact that the frequency of a pendulum is a constant. In 1589, his Archimedes-inspired work won him the mathematics chair at Pisa.

In 1592, Galileo became professor of mathematics at the University of Padua, Europe's leading scientific university. Whatever the personal and financial stresses of the Padua years, they were Galileo's most intellectually fruitful time. He moved from a highly mathematical approach to knowledge to a greater interest in experiment. He began to elaborate a non-Aristotelian approach to the problems of moving bodies. His most famous result was the discovery that the distance covered by a falling body varies with the square of the time of the fall—the “law of falling bodies.”

Galileo's work with the telescope in the early 17th century catapulted him to European fame. From what

information he could gather, he designed his own, superior to the contemporary Dutch telescopes, in 1609. He observed the previously unknown moons of Jupiter. These were the first satellites of a planet (other than the Moon) ever known. The fact that the system of the planets could have more than one center helped support the Copernican theory. Galileo's other discoveries included the mountains of the Moon, the phases of Venus, and the composition of the Milky Way out of innumerable stars.

Galileo wanted to move to Tuscany in Florence. The naming of Jupiter's moons the “Medicean stars” after the ruling MEDICI FAMILY of Tuscany was a brilliant stroke to win the duke's favor, securing Galileo's appointment as court mathematician. Galileo insisted that he be given the title not merely of mathematician, but philosopher as well. Since the actual physical nature of the universe was the province of natural philosophers, Galileo as a philosopher could make cosmological claims that he could not make as a mere mathematician.

It was from Rome that Galileo faced what would prove to be the greatest challenge of his career, that of the church's condemnation of Copernicanism. Church authorities were increasingly opposed to Copernicanism and Galileo as its principal Catholic champion. Copernicus's *On the Revolution of the Celestial Spheres* was placed on the church's Index of Forbidden Books in 1616. Galileo argued that Copernicanism had no relevance to theology, but church authorities did not accept this position. Galileo's works were still not specifically condemned.

Galileo offering his telescope to three women and pointing to the heavens—site of his astronomical discoveries

Despite his enormous importance in the development of astronomy, Galileo was not at all what the early modern period considered an astronomer. He was not concerned with the precise observations and elaborate calculations necessary to predict the courses of the stars that absorbed the vast majority of the labor of working astronomers. Galileo was more interested in making telescopic discoveries and establishing cosmological theory. The most significant work he wrote on astronomy after *The Starry Messenger* (1610) was *Dialogue on the Two Chief Systems of the World* (1632). In this work, Galileo used the motion of the Earth to explain the tides.

Galileo's trial and conviction have been interpreted in many ways by historians. There were two dangers in *Dialogue on the Two Chief Systems of the World*. One was its bold statement of support for the Copernican system. The other was that the pope, Urban VIII (Maffeo Barberini), became convinced after the dialogue's publi-

cation, which in all probability he himself had licensed, that the dull-witted Simplicio was a satire of him.

Urban reacted to Galileo's ridicule by suppressing the *Dialogue* and establishing a commission to investigate the whole matter. After reading the commission's report, Urban referred the Galileo case to the Roman INQUISITION. The Inquisition summoned Galileo to Rome in the winter of 1632–33, a savage requirement to impose on an old man in ill health during a plague epidemic. On his arrival in Rome in February, he was imprisoned. Negotiations between Galileo and the inquisitors, who threatened torture, produced a public confession. On June 22, 1633, he was condemned to house arrest and the recitation of penitential psalms. He spent his arrest first in Rome, and from the end of 1633 to his death, at his own house outside Florence.

WILLIAM E. BURNS

Gama, Vasco da

(1460?–1524) Portuguese explorer

Vasco da Gama was a Portuguese explorer who discovered the sea route to India from Europe through the Cape of Good Hope. It is believed that da Gama was born in Sines, Portugal, in approximately 1460. He received his first important appointment in 1497 when he was named commander of a four-ship expedition that was to continue the work started by BARTOLOMEU DIAS, who had attempted to find a route from Europe to India via the Cape of Good Hope. Dias's expedition had only made it a short distance past the Cape of Good Hope. Da Gama's expedition set out from Lisbon on July 8, 1497. The ships passed the Canary Islands on July 15, but then became separated in a fog. They were able to regroup on July 26 at the Cape Verde island of Santiago.

Da Gama wanted to avoid the Gulf of Guinea, where Dias had had problems with the weather and currents. To do this da Gama sailed his ships out into the Atlantic Ocean, eventually coming within 600 miles of South America. When da Gama's ships finally made landfall on November 7, they had been on the open sea for 96 days and had sailed 4,500 miles. The fleet spent the next eight days at St. Helena Bay before continuing on to the Cape of Good Hope, which they sailed around on November 22. Putting into Mossel Bay, da Gama's crews broke up their supply ship and distributed the supplies to the other ships. They set off again on December 8.

Making their way up the eastern coast of Africa the expedition anchored in the Kilimane River estuary, where they spent 32 days repairing their ships and nursing members of the crew who had come down with scurvy. From there they continued up the coast putting into Malindi on April 13, 1498. In Malindi, the local

sultan gave da Gama a pilot, who left with them on April 24 as they set out to cross the Indian Ocean.

Da Gama was successful in crossing the Indian Ocean and anchored off the city of Calicut, India, on May 20. He spent the next several months trying to work out a trade treaty with the local rajah, but because of the intervention of the local Muslim merchants, he was unable to reach an agreement and headed home at the end of August 1498. The trip back across the Indian Ocean proved to be much harder. By the time his ships put into Malindi (January 7, 1499), he was forced, because of losses among his crew, to burn one of his ships and proceed with only two ships. The ships sailed on and rounded the Cape of Good Hope on March 20, 1499. The ships became separated in a storm in April. The ship da Gama was on made it to Cape Verde, where he sent the ship on to Lisbon while he took his dying brother on a hired ship to the Azores, where his brother died. Da Gama

Vasco da Gama delivers the letter of King Manuel of Portugal to the samorim (samutiri) of Calicut in India. With 13 ships full of goods he set sail for Portugal on December 28, 1502. King Manuel I rewarded him with the titles of admiral of the Indian Seas and count of Vidigueira.

then went on to Lisbon, where he arrived in September 8, 1499, to a hero's reception.

Da Gama's second voyage to India was in 1502 and was made up of 20 ships. During this voyage, he bombarded the city of Calicut. He was able to sign treaties with the rajahs in the cities of Cochin and Cannanore. With his remaining 13 ships full of goods he set sail for Portugal on December 28, 1502. He reached Lisbon on September 1, 1503. King Manuel I rewarded him with the titles of admiral of the Indian Seas and count of Vidigueira.

Da Gama was called upon again in 1524 by King JOÃO III THE PIOUS when Portuguese affairs in India had been declining. The king appointed him viceroy of India and sent him there with 14 ships. The fleet left Lisbon on April 9, 1524, and arrived at the Indian port of Chaul on September 5, 1524, having lost two ships along the way. By the end of the month, he had reached GOA, the Portuguese capital in India. Da Gama tried to put an end to the corruption, but his harsh ways did not help. Then on Christmas night of 1524, he passed away. His body was not returned to Portugal until 1538.

DALLACE W. UNGER, JR.

Geneva

Geneva is the city-state seen by many as the capital of the Calvinist REFORMATION in Europe; others have viewed its disciplinary program as the prototype for the surveillance systems in totalitarian societies. The truth lies somewhere in the middle; JOHN CALVIN's prominence as the leader of the reformed movement has tended to mask independent developments in the Calvinist Reformation that occurred elsewhere, and the focus on Geneva ignores the similar development of religious disciplinary institutions throughout all of Western Europe.

The emergence of the Reformation in Geneva is intimately related to the city's attempt to establish its

own autonomy over against its sovereign, a prince-bishop who was a puppet of the neighboring Duchy of Savoy. Over the course of the later 15th and early 16th centuries, the most important governmental functions had been turned over to the city's magistrates, an elected group of representatives led by magistrates called syndics. In possession of the organization of taxation, coinage, diplomacy, and criminal jurisdiction as well as military defense, the syndics and their followers drove the bishop out in the late 1520s. Because Geneva did not control much of its food-supplying hinterlands, this rebellion was possible through alliances with the nearby city-states of Bern and Fribourg. Bern sent Protestant preachers to the newly autonomous city, urging the population to cast out Catholicism just as they had exiled their bishop. In 1536, under the influence of the preaching of William Farel, the citizens of Geneva voted to renounce the Mass. Bern protected the vulnerable city from attempts by Savoy to reinstate its influence.

In 1536, Farel called a French visitor, Jean Calvin, to serve as a fellow reformer within the city. In 1538, when they and their fellow preachers tried to impose religious authority over the civil authority of the city council, they were expelled. Calvin went to Strasbourg and undertook the rhetorical defense of the city when the Catholic reformist cardinal Jacopo Sadoletto attempted to call it back to the old church. Geneva recalled Calvin in 1541 to create a church for the community. His ordinances for the city were the first attempt to create a reformed city constitution and a model for other communities throughout Europe. Though they may seem harsh from the modern perspective (mandating church attendance, for example, and forbidding dancing), they were not met with resistance and indeed spread to other European communities.

This model was particularly influential in the establishment of early North American colonies a century later. Immigrants fleeing persecution in Europe rapidly fled to Geneva, taking what they learned there along and instituting at later stations in their life (JOHN KNOX, the Scottish reformer, sojourned in Geneva in the 1550s and brought his experiences back to influence decisively the polity and doctrine of the Church of Scotland). But the presence of the immigrants and their growing religious, political, and financial influence caused tension among the native Genevans and a faction in the city always challenged Calvin's authority. This faction, led by the local notable Ami Perrin, was defeated in 1555 after a riot and its partisans were executed, exiled, or thrown out of the city government. The Genevan reformers created a "Company of Pastors" as missionaries for the

reformed cause into France, where their success caused severe controversy and bloodshed as the so-called HUGUENOT (French Protestant) movement spread.

Geneva was most famous for its institutions, such as the Company of Pastors. The organization of its church policy in a structure with preachers, doctors, elders, and deacons presaged later Presbyterian polities in Scotland. In 1559, it founded an academy for the purpose of educating future reformed leaders. But its most notorious institution was the Geneva Consistory, a religious and morals court that met regularly to provide religious discipline for the local population. Its records have been edited by Robert M. Kingdon and are a fascinating source for the social history and everyday life of the period. Although its influence was widespread, its severity has been overstated.

Most people called before it for minor transgressions were asked to repeat the catechism, the vernacular prayers that had replaced prayers in Latin during the Reformation, or the content of sermons that all were required to attend. If they could not do so, they were generally warned to be more attentive and cited to return to the court to demonstrate that they had reformed their lives. In fact, only one individual was executed for heresy during all of Calvin's regime in Geneva—the antitrinitarian heretic Miguel Servetus, who had managed previously to escape the clutches of the Spanish Inquisition. Controversy over Calvin's participation in the decision to burn Servetus at the stake produced the first sustained debate about the grounds for religious tolerance in Europe.

After Calvin's death, the Genevan church was headed by Theodore Beza, who, as his mentor, refused to alter reformed theology for the sake of compromise. This insistence, along with the tendency to develop in a manner most useful for academic teaching rather than the care of souls, has caused historians to characterize the later Genevan reformation as doctrinaire and Scholastic. Geneva continued to be threatened by Savoy's attempts to regain its territory well into the 16th century. The Genevan academy continued in importance, but it was supplemented by theological centers at Heidelberg, Leiden, Herford, and other locations in the Low Countries and France. The success of the consistory model led to its implementation in other Calvinist cities such as Emden and even in nonreformed areas of Europe.

SUSAN R. BOETTCHER

Genroku period in Japan

Between 1688 and 1704, a rapidly expanding economy resulted in the expansion of the three major cities in Japan—Kyoto, OSAKA, and Edo (Tokyo)—and the emergence of an urban culture. This was the result of 80 years of peace under the Tokugawa Shogunate, when many people chose to move from samurai castles or villages to urban centers. The Genroku period saw Edo as the administrative capital, Osaka as the commercial center of the country, and Kyoto, the former imperial capital, retaining some of the artistic talent.

Although the period covers the years 1688–1704, some cultural historians use the term to refer to the whole period, of the rule of the fifth shogun, Tokugawa Tsunayoshi, which lasted from 1680 until 1709. During this period, there was a massive increase in the number of towns people (*chonin*) who started to throw off the restrictions of the traditional Japanese lifestyle. They indulged in creative expressions such as changes in dress, food, and customs. The emerging urban class accumulated possessions on a far wider scale than before and filled their houses with furniture and paintings. With more spare time they indulged in extravagance and devoted themselves to making and spending money.

At the end of the 16th century, improved printing techniques originally developed in Korea were introduced into Japan. By the 1670s, books were available more cheaply, and hence accessible to the urban middle class and wealthier artisans, satisfying their hunger for learning.

Typical books dealt with literature, history, and philosophy. In addition there were large numbers of books imported from China and Korea.

During the height of the Genroku period, stories were published that dealt with ordinary life in the cities and the exploits of samurai. One popular writer and poet, Matsuo Bashō (1644–94), traveled extensively around Japan during the 1670s and 1680s and described the country as well as created an anthology of poetry, including some in haiku form.

There was also interest in more artists who produced woodblock prints in the genre known as *ukiyo-e*. Suzuki Harunobu (c. 1725–70) was the first artist to produce

full-color woodblock prints, developing a multicolor technique using between four and 10 colors. As a result of advances in printing, illustrated books became popular, as well as handbills and advertising for theatrical performances and geisha houses.

In other areas of the arts, such as the Bunraku puppet theater and Kabuki theater, attendance increased with many ordinary people watching performances that had been the preserve of the *daimyo* and the samurai. Most actors who had previously worked in traveling troupes began to work in semipermanent theaters that allowed them to have a more settled life. The result was that acting became a more respectable profession. Playwright Chikamatsu Monzaemon (1653–1724) was the first to use the Bunraku puppets to show everyday themes and ordinary emotions, writing a total of 100 plays, which were performed to large audiences.

Although the Genroku period came to an end in the early 18th century, the literary and artistic advances were to be revived again during the Bunka-Bunsei period (1804–29), when Edo emerged as the sole cultural center of Japan.

JUSTIN CORFIELD

George I

(1660–1727) *first Hanoverian king of England*

George I of England came to the throne of England through the Act of Settlement of 1701. This legislation, passed by the British parliament, ensured the succession of Protestant heirs to the throne of England. JAMES II of the HOUSE OF STUART had been a Roman Catholic and had been expelled in the GLORIOUS REVOLUTION of 1688. Carried to England on a “Protestant wind,” his daughter Mary and her husband, WILLIAM III of Orange, the stadtholder of the Netherlands, took his place on the throne. Although William would act as king, it was always clear that he did so through his wife, Mary. The line of succession was established so that if William and Mary were to die without producing an heir, the Crown would pass to Mary’s Protestant sister, ANNE. Mary died in 1694, and William would

follow her in death in 1702. Anne, who had been born in 1665, became queen on William’s death. Anne, too, would die without issue in 1714, and, under the explicit terms of the Act of Settlement, the throne passed to Sophia, the electress of Hanover in Germany.

The English parliament decided to amend the law of succession to the throne in favor of the Protestant House of Stuart. In default of heirs from William III of Orange—who had ruled alone in England after the death of Mary in 1694—or Anne, the act declared that the English Crown would devolve upon Princess Sophia and her Protestant heirs. Ironically, Sophia died before Anne in August 1714. Therefore, the Crown of England passed to her son, who became George I, king of Great Britain and Ireland, as well as the elector of Hanover in the HOLY ROMAN EMPIRE. The lineage made George I’s succession direct and in accord with the Act of Succession. Born in 1660, George I was the son of Elector Ernest and Sophia, who was the granddaughter of James I of England. James himself, first the king of Scotland, had established the Stuart dynasty on the English throne after the death of Queen ELIZABETH I, the last of the House of TUDOR to rule in England, in 1603.

New in his realm, George I at first relied on advisers from Hanover. Although he was not a man of particularly acute knowledge, as had been King CHARLES II, he was able to judge those who had talent. He used these able men to govern his new kingdom for him. Under George I, John Churchill, the first duke of Marlborough, was allowed again to enjoy the fruits of his victories, as England’s most respected general. In politics, Robert Walpole was the brightest star. A leading member of the Whig Party, Walpole became so central to the administration of government that some historians consider him the first British prime minister.

However, Walpole’s period of favor with the king was relatively brief. His concern that George I was subordinating England’s interests to Hanover, especially since the British sacrifices in the WAR OF THE SPANISH SUCCESSION (1701–13), led to a complete rupture with the monarch. Walpole left office and George’s own son, the future GEORGE II, left the royal palace to set up an opposing government. Three years after he broke with Walpole, George I invited Walpole back to his government in 1720. Moreover, Walpole effected a reconciliation between the king and his son. By 1724, Walpole and his brother-in-law, Charles, Viscount Townshend, virtually were the government.

In foreign and military affairs, George I had difficulty in his choice of advisers. In September 1715, John Erskine, the earl of Mar, raised the standard of Anne’s

half brother James, whose goal was to attempt a restoration of a Catholic Stuart dynasty in Scotland. Mar represented perhaps George's worst political mistake; Mar turned against the king after he was driven out of government. Parliament passed the Riot Act and 100,000 British pounds was offered for the apprehension of James. With the Jacobites, as the supporters of James were known (*James is Jacobus in Latin*), the British military authorities immediately turned toward Marlborough. On November 13, 1715, the government troops under the duke of Argyll defeated the Jacobites at Sheriffmuir. Mar withdrew, and by the time James finally arrived, the most that he could do was to evacuate some of his followers back with him to France. George's punishment against his enemies was swift and harsh; 30 Jacobites were executed. Still, the Jacobites rose again four years later in a rebellion against Scotland launched from Spain.

As with the majority of the British, the Lowland Scots had come to associate George I with stability that made everyday life feel safe. Thus, by 1724, England enjoyed a peaceful life, with a steady government led by Walpole. In 1727, George I suffered a stroke and died on his way to his beloved Hanover.

JOHN MURPHY

George II

(1683–1760) *king of England*

George II was born into the House of Hanover in 1683 in the Schloss (Castle) Herrenhausen, which had been the seat of the dynasty since George, the duke of Brunswick-Lüneberg, moved to Hanover during the THIRTY YEARS' WAR. When George II's father became king of England, the court moved from Herrenhausen to London. Unlike GEORGE I, who had a bevy of mistresses, George II was devoted to his wife, Caroline of Anspach, whom he wed in 1705. Caroline, the daughter of the margrave of Brandenburg-Anspach, accompanied her husband to England when his father, usually known as the elector of Hanover, became king of England in 1714. Caroline of Anspach was one of the most illustrious women of her

age and a patroness of science and philosophy. When the great philosopher Gottfried Wilhelm von Leibniz (1646–1716) was at Schloss Herrenhausen, Caroline was his best student.

The rule of George I featured a stormy relationship between George I and his son. In a dispute over British policy in Germany, the future George II broke with his father when Robert Walpole, George I's prime minister, felt that British interests were being subordinated to those of Hanover in Europe. With Caroline's help, the future George II set up what amounted to a government in exile at Leicester House, where Caroline established a learned salon similar to what she had at Schloss Herrenhausen. However, father and son were reconciled and in 1720, Walpole returned to the government.

When George I died in Germany in 1727, his son immediately became king, as much a testimony to the skill of Walpole as to the Act of Succession of 1701. When James Edward Stuart, the son of JAMES II, invaded Scotland in 1715 and 1719, it showed the value of his legislation in the eyes of those who favored the Hanovers over the Stuarts. For the duration of George I's reign and much of George II's, the threat of a Stuart restoration to the throne was real. In 1745, the son of James Edward, Bonnie Prince Charlie, did in fact land in Scotland and administer two stinging defeats to the Hanoverian army at Prestonpans and Falkirk and occupied Scotland. This precipitated the greatest crisis of George II's kingship. Bonnie Prince Charlie reached as far south as Derby in England, but concerned about a lack of support among the English, he began his retreat north again.

George II, who at Dettingen in 1743 in the WAR OF THE AUSTRIAN SUCCESSION (1740–48) had been the last British king to take part in a battle, sent his son, George Augustus, duke of Cumberland, in pursuit of Bonnie Prince Charlie. At Culloden Moor in April 1746, Cumberland defeated him in a decisive engagement.

Aside from the Stuart threat, the kingdom, which included Scotland and Ireland, enjoyed peace and stability, shown by the rise of the middle class and the birth of modern English literature. Henry Fielding gained prominence in the reign of George II. Fielding's satiric plays incurred the wrath of Walpole, who set about closing Fielding's theater. Rebounding from this defeat, he would go on to write his greatest novel, *The History of Tom Jones, a Foundling* (1749), which perhaps better than any other work presents life in the time of the second George. Daniel Defoe had an active career through the reigns of Queen ANNE, George I, and George II.

In 1756, Britain became involved in the Seven Years' War, which had actually begun in the conflict

between the British and French colonies in North America in 1754. The war soon spread to encompass much of the world, although the decisive battles would be fought in Europe and America. Britain's greatest ally was Frederick the Great of Prussia, an admirer of the French field marshal Maurice de Saxe. The use of English money as a subsidy, an inheritance from Walpole's passionate pursuit of MERCANTILISM, enabled Frederick to field an army that, along with his undisputed military genius, would keep at bay the combined forces of France, the Austrian Empire, and Russia.

William Pitt was an accomplished and reliable wartime prime minister for England. He strategically strengthened the British navy, sent fleets where they would be most effective, and oversaw supply exchanges with allies. After several years of reverses, British arms in 1758 scored several victories against France, earning both the king and Pitt great popularity among the people. In 1760, at the height of his power, George tragically succumbed to a stroke. Since his son Frederic Louis had died in 1751, his grandson succeeded him on the throne as George III. From his grandfather, George III inherited a monarchy—and an empire—at the height of its power and prestige.

JOHN MURPHY

Glorious Revolution

The 1688 Glorious Revolution, sometimes known as the “Bloodless Revolution,” represented a culminating stage in Britain's tumultuous 17th century history, a history characterised by the struggle between king and Parliament, and most notably, between Catholic and Protestant. The crisis of 1688 came about following the succession of JAMES II to the throne following the death of his brother, CHARLES II, in 1685. James was a committed Catholic; he hoped to strengthen the Catholic position if not restore it and return lost powers to the monarchy. James also wanted to transform and expand the army, which was dominated by a Protestant officer

corps of aristocrats and gentlemen. James desired more Catholic officers whose loyalty was to the Crown. A more Catholic army might help him pursue his political agenda. This agenda brought him into conflict with the Test Act, passed under Charles II, which required all those seeking military or civil posts to accept the Anglican Church and its teachings.

Following the earlier suppression of the Monmouth and Argyll rebellions, James was emboldened and started his campaign to reject the Test Act, and appointed Catholic loyalists to key state and university positions. He issued a Declaration of Indulgence in 1687, which ended penal laws against Catholics, and followed this with a Second Declaration of Indulgence in 1688, which furthered the pro-Catholic policy and led to unrest among his bishops, and the alienation of both the Tories and Whigs in Parliament. James increased the political divides within the country, and when his wife, Mary of Modena, gave birth to a son on June 10, 1688, there was now the prospect of a Catholic succession.

The conspiracy to overthrow James began in earnest, and a mixed Tory and Whig parliamentary group approached the Dutch prince, William of Orange, and his wife, Mary, the Protestant daughter of James, to go to England to assume the throne. William agreed to accept the Crown in order to gain English resources for his war against LOUIS XIV of France. William landed at Brixham, near Torbay in Devon, on November 5, 1688, with an army of some 14,000 composed mainly of Dutch, Brandenburg, Finnish, Swedish, and French troops. Although James's army stationed on Salisbury Plain had double the manpower, his confidence failed, and on November 23, he withdrew toward London.

His meddling with the army now took its toll and many of his men deserted, including Lord Churchill (later duke of Marlborough), so that by December 10, his force was reduced to approximately 4,000 men. Lord Feversham, James's leading commander, interpreted the situation as hopeless and disbanded his army without a fight. On December 17, Dutch Guards took over Whitehall, the seat of government, and James attempted to flee the country. He was captured in Kent, but eventually was allowed to leave England. The taste for further regicide had passed.

In 1689, a Convention of Parliament decided that James's departure was an abdication. William and Mary could now accept the throne on February 13, 1689, as legitimate joint rulers. To prevent future disruptions of this sort, Parliament passed a Declaration of Rights and a Bill of Rights in 1689. These acts redefined the monarch's position and authority in regard to

his/her subjects, ending absolutism and any possibility of a Catholic monarchy. This redefinition of power created a constitutional monarchy, the form of government that continues today.

James however was not finished with his struggle to regain the throne. In 1689–90 he turned his attention to Scotland and Ireland, where he hoped to exploit nationalist and Catholic feeling. This first Jacobite rebellion in Scotland failed, and it led to the construction of Fort William to subdue the region. In March 1689, James landed in Ireland with French troops thinking it would become a base to retake England. At Enniskillen, the Jacobites were pushed back. In June 1690, William landed his forces in Ireland and encountered James's army at the Boyne on July 1, 1690. William outflanked the Jacobite army, who were forced to retreat, while James once more fled to France. The remnants of James's army continued to struggle on. They suffered further defeat at Aughrim on July 12, 1691, before surrendering totally that October.

The Glorious Revolution, according to some historians, was more of a coup d'état than a revolution proper and might better be described as the Revolution of 1688. The after-effects were not bloodless. The revolution helped seal English rule over Ireland, the seed of future unrest. However, its most lasting effects were constitutional monarchy, the end of absolutism, and the ascendancy of Parliament as the nation's paramount political force.

THEODORE W. EVERSELE

Goa, colonization of

This port city on the west coast of India was the center of Portuguese influence in India from 1510 until 1961, and at its height, in the early 17th century, was one of the great cities in the region. Goa as a port dates to the third century B.C.E.

A Portuguese force under AFONSO DE ALBUQUERQUE with 20 ships and 1,200 men took the town in 1510 from Muslim rulers. Albuquerque had all Muslim men there killed, and gradually a Portuguese town of Goa began. The nearby regions of Bardez and Salcete were added to the areas under Portugal's control and these areas together became known as the "Old Conquests." Missionaries arrived, the most famous being Spanish Jesuit Francis Xavier (later sainted). The Inquisition was established in Goa in 1560 and operated until 1774.

Goa was initially threatened by a large Muslim force, which, in 1570, besieged the city for nearly a year. When Portugal merged with Spain in 1580, Goa was attacked by the English and the Dutch also. Goa thrived in the early 17th century and was said to exceed Lisbon in wealth with a population of 200,000. However Goa was located in a swampy area and diseases caused major health problems. In the late 18th century, Portugal acquired additional lands near to its original holdings. These areas became known as the "New Conquests."

There were major differences between the "Old Conquests" and the "New Conquests." In the former the population was overwhelmingly Catholic while in the latter there were large numbers of Hindus and Hindu temples survived. Freedom of worship was restored to the Hindus in 1833.

In 1752, the capital was moved from Goa to Panaji for health reasons. The old capital had been easy to protect from attack since the British accepted the Portuguese enclave on the west coast of India. Defense from enemies was no longer a problem. Goa continued as a Portuguese colony until 1961.

JUSTIN CORFIELD

Godunov, Boris

(c. 1551–1605) *Russian czar*

Boris Godunov was born in about 1551 and was one of the transitional figures in a nation's history who keeps the machinery of state running in times of crisis. Godunov first came into prominence as one of the apparatchiks of

IVAN IV (THE TERRIBLE), who helped that czar organize his social and administrative system.

This must have also clandestinely involved operating the *oprichnina*, the secret state police that Ivan used to keep his realm in a state of terror. The *oprichniki*, as they were called, used to ride through Russia with wolves' heads tethered to their saddles to frighten the population into submission.

Ivan IV died in 1584 at the height of his power, having carried on a long correspondence with none other than Queen ELIZABETH I of England. In the year after his death, the Cossack Yermak died in Siberia, but not before starting the massive Russian *drang nach osten* (drive to the east) that would take the Russians to the shores of the Pacific Ocean.

There they established the city of Vladivostok. When Ivan died, his son Theodore succeeded him to the throne as Theodore I. Theodore charged Boris with leading the Russian counterattack against Kuchum, the Siberian khan who had killed Yermak. Under Boris's firm military hand, the Russians built two fortified trading posts at Tobolsk and Tyumen to guard their new frontier in Siberia.

Theodore's younger brother, Dimitri, died in 1591, and Theodore followed him in 1598. Whatever scruples the Russians may have had in the deaths of Ivan's two sons, they were willing to sacrifice everything on the altar of expediency. Caught between a hostile Poland and Ottoman Turkey, they needed a strong man in the Kremlin to guide the affairs of the state, and Boris seemed the most likely candidate. Any doubts about Boris's suitability to rule had been washed away in the year of Dimitri's death. In that year, a vast horde of 150,000 Tartars swept out of the Crimean Khanate.

Khan Ghazi Gerei II was determined to destroy Russia before it could attack the Crimea. On July 4, 1591, outside Moscow Boris met the Tartars with a fraction of the Russian army. The muskets and artillery held by Boris and his commander, Prince Theodore Mstislavsky, wreaked terrible slaughter as thousands of Tartars were killed or wounded. The next day, Godunov and Mstislavsky launched a furious pursuit of the panic-stricken Tartars, marking the beginning of the decline of the Crimean Khanate.

To the Russian people, Boris was obviously the man to lead them, and he was raised to be czar by the Russian Great Assembly in February 1598. Constantly insecure on his throne, Boris feared one family among the boyars—the Romanovs. Ivan IV's first wife, Anastasia, had been a member of the Romanov family and had been the wife of Theodore I. With the death

of Theodore I, the Riurik dynasty became extinct, and the Romanovs had an excellent claim on the throne. In June 1601, Boris moved against the Romanovs, taking their lands and banishing them from Moscow. He continued efforts to modernize the medieval Grand Duchy of Muscovy into the Russian empire. The Russian Orthodox Church was formally organized, and Boris continued a policy of peace in the west.

In 1604, Boris faced a new danger. A challenger to the throne, known as the False Dimitri, appeared, supported by the Poles, who were determined to weaken the growing Russian state. Dimitri claimed to be the son of Ivan come back to claim his father's throne. People rallied to him. The COSSACKS, always looking for an opportunity for a good fight and loot, joined his cause. In spring 1604, Boris's brother and minister of the interior, Simeon, led a force against the Cossacks. However, he was defeated by them and sent back with the message that the Cossacks would soon enough arrive with the real czar—Dimitri.

In November 1604, Dimitri committed a grave tactical mistake. Rather than pressing on to take Moscow, he committed his army to the prolonged siege of the city of Novgorod Seversk. The commander of Novgorod Seversk, Peter Basamov, managed to defeat all attempts to take the town. On January 20, 1605, battle erupted. None could make headway against the closely mustered musketeers and artillery of Boris's army. However, in a major tactical blunder, the leaders of Boris's relief army squandered their victory. Rather than pursue the enemy into the steppes, they instead decided on punishing the cities that had sworn allegiance to the false czar.

Suddenly in April 1605, Czar Boris died; many suspected he had been poisoned. In May 1605, Peter Basamov, the defender of Novgorod Seversk, swore allegiance to Dimitri. With Peter's support, Dimitri entered Moscow in triumph. Both Dimitri and Basamov would be killed. Foreign invasion and internal dissent continued to tear apart the Russian state.

JOHN MURPHY

Great Wall of China, the

Most of the Great Wall of China that stands now was built in the second half of the 16th century during the MING DYNASTY to connect the principal garrison points of the Ming defensive system against Mongol attacks.

Being northern nomads the Yuan (Mongol) dynasty had no need for the Great Wall as a defense barrier. In 1368, a Chinese rebel, Zhu Yuanzhang (Chu Yuan-chang), ended the Yuan dynasty, established the Ming dynasty (1368–1644), and gained complete control of both Inner and Outer Mongolia almost to Lake Baikal and to Hami

in the northwest. His son Yongle (Yung-lo), the third Ming emperor, was also a seasoned commander and personally led five campaigns into Mongolia in the early 15th century. Then he chose a defensive posture against the approximately 2 million Mongols whose homeland stretched from northwestern Manchuria, across Mongolia and modern Xinjiang (Sinkiang).

Mongols still nurtured the dream of rebuilding the empire of Genghis Khan but fortunately for the Ming, they were divided and often warred with one another. In a pattern that went back for 2,000 years, the sedentary Chinese and their nomadic northern neighbors had conducted official trade under the tributary system. Thus Mongol chiefs were enrolled as Ming vassals, paid tribute, and received gifts in return. Mongols also sold livestock, especially horses, to the Chinese in exchange for Chinese raw materials and manufactured goods such as silks, tea, and metals.

The Great Wall of China meanders across mountains and valleys. Most of the Great Wall that stands now was built during the second half of the 16th century during the Ming dynasty.

After his conquests, Emperor Yongle (r. 1402–24) decided to withdraw to an inner line of defense and divided the northern border into the Nine Defense Areas, each guarded by a garrison along a line that eventually became the Great Wall. It stretched from Shanhaiguan (Shanhaikuan) or Mountain Sea Pass in the east to Jiayuguan (Chiayukuan) 1,500 miles to the west. It was a gigantic project. Stone was used for the lower courses, facing, and gates, while rubble filled the core. Huge kilns fired large bricks where stone was not available; bricks were also used for the towers and crenellations.

Although not uniform throughout most of the wall measured 35 feet high and 25 feet wide at the top with towers every half a mile or so that reach to 50 feet. Where the land is mountainous the wall followed the crest of the ridges; it blocked roadways and damned rivers. Since the Ming capital Beijing (Peking) was close to the wall (one day's ride), more than a hundred passes or barriers with monumental gateways guarded strategic points along the eastern section to the sea at Shanhaiguan. At the western terminus at Jiayuguan (Chiayukuan) at the northwestern tip of Gansu (Kansu) province another formidable fortress marked the starting point of the Silk Road.

The Great Wall was Ming China's inner line of defense against the nomadic Mongols in the north and wall building continued to the end of the dynasty. Yet it was not totally effective because the Mongols were able to breach or bypass it. Its building exhibited sophisticated technology and consumed vast resources.

JIU-HWA LO UPSHUR

Guicciardini, Francesco

(1483–1540) *historian, diplomat, and statesman*

Guicciardini was born in Florence to patrician parents. After receiving a humanistic education, he obtained a degree in civil law from the University of Padua and began practicing law in Florence. In a calculated maneuver that was designed for political advancement, he mar-

ried Maria Salviati, whose family was aligned with the Medici. Within a few years of his marriage, he became ambassador to Ferdinand of Aragon for the Republic of Florence and later served in the Florentine government when the MEDICI FAMILY held political power.

Although Guicciardini was critical of clerical abuses in the church, he did not hesitate to accept political preference from the papacy when it was to his advantage. He was an official in several cities and territories in the Papal States under popes LEO X and CLEMENT VII and served as counselor and papal lieutenant general for the latter.

Guicciardini's writings on politics and history are extensive. They include a history of Florence and a critique of his friend NICCOLÒ MACHIAVELLI's *Discourses on the First Ten Books of Titus Livy*. However, today Guicciardini is appreciated primarily for his *Ricordi* and for his magnum opus, *The History of Italy*.

The *Ricordi's* maxims offer a set of reflections on politics, history, and the conduct of life. Those that deal with Guicciardini's sense of history demonstrate that he held a view of history that differed from that of Machiavelli and humanist historians, who perceived history as exemplary and counseled their contemporaries to imitate ancient Rome. Guicciardini stressed that the mutability of human affairs, driven by the conflicting self-interests of leaders, coupled with the unpredictability of fortune make it impossible to derive lessons from history. To expect his contemporaries to act like citizens of ancient Rome, he wrote, was similar to expecting a jackass to behave like a horse. Guicciardini believed that the value of history lies in its ability to preserve the memory of the past.

The *History of Italy* is the product of his mature thinking about the momentous events that he participated in or was witness to from the 1490s to 1534. Its scope and its stress on the self-aggrandizement of the secular and religious leaders of the time give the book an appeal that far exceeds the parochial orientation of humanist history. The book opens with the invasion of Italy in 1494 by the forces of Charles VIII of France, an event that Guicciardini regarded as calamitous because it opened the door to repeated invasions by European powers. It marked the end of city-state hegemony on the peninsula and the balance of power politics brokered by Lorenzo de' Medici. The discovery of the New World, the spread of syphilis in Europe, and an awareness of the impending rift in Christianity are also features of the book. The *History* ends with the rapacious sack of Rome by the Imperial forces of CHARLES V and the death of Pope Clement VII. Guicciardini was

completing the *History* when he died at his estate in Santa Margherita on May 22, 1540.

LOUIS B. GIMELLI

Habsburg dynasty

The Habsburgs were a European dynasty that ruled much of central Europe for six centuries (1273–1918). During this period, they ruled over Hungary, the Czech lands, Croatia, Slovenia, Slovakia, and Austria. Consequently, they were known as the House of Austria. Through a series of fortuitous marriages, they ascended to the monarchy in Spain after 1516 (including Spanish possessions overseas and in Italy) and in Hungary and Bohemia after 1526.

The Habsburgs attained preeminent European status with Maximilian I (1459–1519). His fortune was made when he married the heiress of Burgundy in 1477, thus securing the rich inheritance of the Netherlands and the county of Burgundy for the family. As he now held all of the Austrian possessions as well as Alsace, the family was now a dynasty on a par with the VALOIS DYNASTY of France. More energetic than his father, Maximilian tried to make the HOLY ROMAN EMPIRE a functioning entity rather than a collection of 300 independent principalities. For a time, he succeeded, but, overall, the Empire remained divided, due in part to the jealousy of other dynasties, such as the Houses of Bavaria and Saxony, which felt eclipsed by the Habsburgs. Maximilian secured the fortune of his house when he married his son and his daughter, Philip and Margaret, to the son and the daughter of FERDINAND V AND ISABELLA I OF SPAIN. Although the Spanish heir, Juan, soon died, the progeny of Philip and Juana—the

eldest son Charles—inherited the whole of the Spanish possessions including the overseas possessions in the Americas as well as in Italy.

CHARLES V

CHARLES V strode the globe as a colossus and was the most dominant figure in European history since Charlemagne. Inheriting all Habsburg and Spanish possessions, he had as his main concern during his reign to preserve the integrity of the Empire. He was able to do so although beset by the Turks, France, and the PROTEST REFORMATION. On his abdication in 1555, the Habsburgs split into a Spanish line (1555–1700) and an Austrian line (1555–1740). After 1740, the Habsburgs ruled through a female line, the House of Habsburg-Lorraine.

The period between 1525, when Spanish troops defeated the French at Pavia, and 1643, when the French returned the favor at Rocroi, is known as the golden age of Spain. Enriched by the precious metals from the Americas and with an impressive military, Spain dominated Europe especially during the reign of PHILIP II (1556–98). Attempting to add England through marriage with MARY I, he saw his dream die with her in 1558. Her successor, ELIZABETH I, ultimately became hostile, leading to the SPANISH ARMADA's defeat by the Dutch and English in 1588. His attempt to put down the Reformation led to a revolt of the Dutch that ultimately succeeded. His annexation of Portugal in 1580 led to tensions that led to revolt in 1640.

His intervention in France was an attempt to aid Catholics; the attempt to put his daughter on the throne as a daughter of a French princess was in vain.

Ultimately, Habsburg Spain under Philip II tried to do too much. In terms of family solidarity, Spain was the leader under Philip II, the money source under his next two successors, and the duke under the last ruler of the line. Philip embarked on a series of marriages between the two branches of the Habsburgs. The resulting lineage was weakened by inbreeding. Philip III (1598–1621), the product of the marriage of Philip and his niece, was a rather feeble ruler. Phillip IV (1621–65) was more capable but also somewhat lazy. He was a patron of the arts however and his age was the age of El Greco and Velázquez. His son, CHARLES II (1665–1700), another product of an uncle-niece marriage, was somewhat feeble-minded and physically weak. On his death, the subsequent WAR OF THE SPANISH SUCCESSION (1702–13) led to the loss of Spain to the Habsburgs.

AUSTRIAN HABSBURGS

The Austrian Habsburgs made peace by acquiring the Habsburg possessions in the Netherlands and in northern Italy. They had survived by having successive missions in Europe. In the 16th century, Austria was a bulwark against the Turks. In the 17th century, it supported the COUNTER-REFORMATION and tried to make a real state out of the Holy Roman Empire. When the latter failed, Austria found a new mission in expanding along the Danube and into the Carpathians, which included Hungary, Transylvania, Bohemia, and Galicia in Poland. For a brief time, the Empire also included northern Serbia.

Ferdinand I (r. 1556–64) and Maximilian II (r. 1564–76) were rulers who governed moderately and wisely the Holy Roman Empire. Ferdinand, through his marriage to the heiress of Hungary and Bohemia, added these lands to the family. Rudolf I (r. 1575–1612) was less capable and was deposed, and his successor, Mathias I (r. 1612–19), was not effective.

A member of a cognate line, Ferdinand II (r. 1619–37), faced with rebellion by Protestants in both Bohemia and Austria, put these revolts down and came close to enforcing a revocation of the Treaty of Augsburg. For a while, it seemed that he would reach his goal in the THIRTY YEARS' WAR (1618–48). Nonetheless, Ferdinand II and Ferdinand III (r. 1637–57) devoted their energies to Austrian expansion. Leopold I (r. 1657–1705) was the most dogged opponent of Louis XIV and the Turks. He was succeeded by Joseph I (r. 1705–

11), who in turn was succeeded by his brother, Charles VI, who was the Austrian candidate in the War of the Spanish Succession.

The death of Charles VI in 1740 led to the War of the Austrian Succession, as he left no male descendants. However, his capable daughter, Maria Theresa (1740–80), held the dominions together with the exception of Silesia. She was considered an enlightened despot, as she instituted civil reforms. Her son, Joseph II, tried to institute reforms too soon. His successors Leopold II (r. 1790–92) and Francis II (r. 1792–1835) were more conservative.

The 19th and early 20th centuries saw new challenges as rising nationalism threatened to break up the multinational empire of the Habsburgs. The last ruler of the dynasty was Franz Josef, who ruled from 1848 to 1916. However, Austria lost territories to Italy and Germany despite gaining land in the Balkans.

The end came in World War I when the Emperor Charles was forced to abdicate in 1918–19. Today, of the Habsburg descendants, the only monarchs are the ruling family of the tiny municipality of Liechtenstein sandwiched between Austria and Switzerland.

NORMAN C. ROTHMAN

hacienda in Spanish America

Hacienda (ah-see-END-ah) in Spanish America refers to the institution of private landownership, or a landed estate, owned by a *hacendado* (ah-sen-DA-doh). Hacienda emerged as the principal form of landownership, and one of the principal social institutions in the core areas of the Spanish empire (especially NEW SPAIN and New Castile, or Mexico and Peru) in the late 16th century. The transition from *ENCOMIENDA* to *hacienda* has been the subject of considerable research and

debate among scholars. Since the pioneering work of François Chevalier (1952), a large body of scholarship has shown that this transition was neither linear nor direct, and that attention to local and regional history is essential for understanding this transition in specific contexts.

It is useful to distinguish between two main types of hacienda, although the two were often combined: agricultural and pastoral. Agricultural haciendas were typically established in areas of densest Indian settlement, where a servile labor force made possible its day-to-day operation. The rich agricultural lands surrounding Mexico City, for instance, were peppered with hundreds of such haciendas. At the core of a typical agricultural hacienda was the “great house,” the residence of its Spanish or Creole *hacendado*. Pastoral haciendas, devoted principally to grazing of cattle and sheep, emerged mainly on the periphery of Spain’s American holdings, such as in northern Mexico and the pampas (plains) of the Río de la Plata region. Haciendas could also include mines, *OBRAJES* (workshops), and other enterprises. A typical *hacienda* included numerous tracts of noncontiguous lands devoted to a variety of productive operations, especially farming, ranching, and mining.

Hacendados accumulated their lands in numerous ways, mainly through direct and legal usurpation of collectively held Indian lands. Hacienda lands were also often acquired through purchase and legal appropriation of tracts left vacant in consequence of Indian depopulation. The distinction between haciendas and plantations is not always clear, although the latter term is generally applied to large-scale, well-capitalized, market oriented economic enterprises devoted to one or two tropical export products (sugar, tobacco, indigo), often worked by African slaves. This is in contrast to the typically less capitalized, more locally and subsistence oriented production of haciendas, though the distinctions are often difficult to draw. Other forms of landownership that blend into hacienda include *estancias* (a-STAHN-see-ahs) and *latifundia* (lah-te-FOON-dee-ah). The former refers principally to large cattle and sheep ranches on the periphery of the Spanish American empire, and the latter to massive private landholdings and monopolization of land resources in a particular area.

The question of labor relations inevitably accompanies discussions of the nature of the Spanish American hacienda. The typical colonial labor relationship on haciendas was the institution of debt peonage, in which laborers were bound to the hacienda principally in consequence of their accumulated debt to the *hacendado*. Yet here, too, there remains considerable controversy. In

some contexts, debt effectively bound laborers to *haciendas*. In other cases, mainly those in which population densities were lower and labor thus scarcer, debt was sometimes used as a kind of lever by peons in order to secure pay advances and more favorable working conditions, and to play one *hacendado* off against another. In light of the great variety and complexity of Spanish American colonial society, questions regarding the nature of land and labor relations in specific contexts remain the topic of ongoing scholarly research and debate.

MICHAEL J. SCHROEDER

Harvard College

Founded in 1636 in Cambridge, Massachusetts, Harvard was the first institution of higher learning in England’s American colonies and has remained a preeminent center of education in the United States for almost four centuries.

From the beginning, Harvard was an intrinsically PURITAN institution. It reflected the Calvinists’ commitment to biblical literacy and was founded so that New England could train its own ministry. The General Court of Massachusetts chartered the college on October 28, 1636. It was in Newtown, which was subsequently renamed Cambridge as tribute to the English university where many Puritans had been educated. Harvard’s first master was Nathaniel Eaton, who began teaching classes in 1638, although his tenure lasted only a year. As Governor JOHN WINTHROP noted, Eaton was guilty of providing his boarders with “ill and scant diet” and of beating one student with “a walnut tree plant big enough to have killed a horse.” Nevertheless, many early New Englanders placed their faith in the college, including a young man named John Harvard. When Harvard died in 1638, he left his library and half of his property to the college, leading the General Court to rename the school in his honor.

In 1640, Henry Dunster was named the college’s first president and he placed Harvard on firm footing. Within two years, the college constructed “Old College,”

Harvard's first college building. At this site, on September 23, 1642, the college hosted its first graduation. Nine "young men of good hope" received their bachelor degrees according to Winthrop, seven of whom left to fight for the Puritan cause in the English Civil War. In 1655, Harvard built an "Indian College" to educate and evangelize Native Americans, although this experiment was largely abandoned after KING PHILIP'S WAR. The building subsequently became the site of the first American university press.

Although founded to train ministers, Harvard provided a far broader education from the start. The charter of 1650 (under which Harvard still operates) stated that the college's purpose was "the advancement of all good literature artes and Sciences." Accordingly, Harvard provided a liberal arts education, heavily emphasizing the Greek and Latin classics, rather than vocational training. Yet religion remained central to Harvard's mission in the 17th century. Most of its presidents were ministers, including INCREASE MATHER, while more than half of its graduates became clergymen. By 1700, more than four hundred men had attended Harvard, including many of Massachusetts's secular and religious leaders.

In the 18th century, Harvard liberalized its curriculum and theology, reflecting the emergent ideas of the European Enlightenment. Student life likewise became more vibrant in the 1720s with the establishment of the first college periodical ("The Telltale") and groups like the Philomusarian Club. Enrollment surged and graduates' vocations shifted focus, with only a quarter entering the ministry. The Great Awakening and the American Revolution divided the college, although Harvard graduates John Adams and John Hancock were instrumental in the creation of the United States. Harvard was first called a "university" in 1780 and quickly grew into its name, adding a medical school in 1782.

JOHN G. MCCURDY

Henry IV

(1552–1610) *first Bourbon king of France*

Henry was born in Pau, Béarn, Navarre, on December 13, 1552, to Antoine de Bourbon, duke of Vendôme

(1518–62). Antoine was descended from the Capetian royal line, became HUGUENOT (Protestant), but then returned to Roman Catholicism. Henry's mother, Jeanne d'Albret, the Huguenot queen of Navarre (1528–72), raised Henry as a Huguenot in Béarn. Henry received a military education from French general Gaspard de Coligny (1519–72) and became the Huguenot leader in 1569.

Henry succeeded to the throne of Navarre upon his mother's death on June 9, 1572. On August 18, 1572, he married Marguerite de Valois (1555–1615), his second cousin and childhood playmate. The marriage was arranged to alleviate the divisions wrought by the French Wars of Religion and reconcile the Roman Catholics with the Huguenots. Queen Mother Catherine de Médicis (1519–89) forced King Charles IX (1550–74) and the future Henry III (1551–89) to order the Huguenot guests at the wedding to be killed. Some 3,000 Huguenots were killed in Paris, including de Coligny. Despite a royal order to stop the killing, the slaughter spread throughout France, and 70,000 more Huguenots were killed. To save his life, Henry was forced to become Roman Catholic and stay confined to the court. He escaped and returned to Navarre and the Huguenot faith.

The Catholic League was formed in 1576 to oppose the Huguenots. It operated under the guidance of Henry, duke of Guise (1550–88), who controlled Henry III. Henry III and Guise fought Henry of Navarre unsuccessfully at the Battle of Coutras on October 20, 1587. Henry III was afraid of Guise's popularity and his secret longing for the throne and ordered his assassination; he promptly left Paris under threat by Guise supporters.

Henry III reconciled with Henry in Navarre to gain his military support against the league and to win control over Paris. Together, they besieged Paris on July 30. Henry III was assassinated on August 2, 1589, and Henry of Navarre became king. The Catholic League, which was financially supported by Roman Catholic Spain, would not accept him as monarch and forced him to fight for the throne.

On July 25, 1592, Henry was encouraged by his mistress and mother of three of his illegitimate children, Gabrielle d'Estrée (1571–99), to repudiate his Protestant faith and permanently become Roman Catholic. He did so in July 1593. He was immensely popular not only because he ended decades of war, but also because he was conciliatory and practical. Henry declared the EDICT OF NANTES in 1598, which established Roman Catholicism as the state religion and offered religious toleration to the Huguenots, who were heavily engaged in trade.

The Wars of Religion had taken an enormous toll on France, so Henry's immediate goal was reconstruction. Rather than exhaust the treasury with more wars, Henry paid off the nobles who disagreed with him. He systemized finances and soon created a reserve of 18 million livres.

Henry's marriage to Marguerite of Valois was annulled by Pope Clement VIII (1536–1605) in 1599. Henry married Marie de Médicis (1573–1642) on December 17, 1600. They had six children, the first of whom would become Louis XIII. The couple welcomed Marguerite of Valois into their family; she helped rear the children and was very popular with the French people. Henry also had eight more illegitimate children with various other mistresses.

Henry sent Samuel de Champlain, Pierre Dugua, sieur de Monts to the New World to claim it for France. Henry's foreign policy was meant to bring France to the forefront of power. He made alliances with Italy, the Swiss, and some Protestant German princes. He was assassinated on May 14, 1610, by a religious fanatic. He was buried at the Saint Denis Basilica, the burial place of French monarchs. His legal son and heir, the future Louis XIII, was only nine years old, so Marie de Médicis served as regent until 1617.

ANNETTE RICHARDSON

Henry VII

(1457–1509) *Tudor king of England*

Henry Tudor was born to Margaret Beaufort of the House of Lancaster—the “red roses” in 15th century England's War of the Roses—and Edmund Tudor, the earl of Richmond, who died in Henry's infancy. The War of the Roses came to a lull in 1471 when Edward IV (of the House of York, the opposing “white roses”)

was restored to the throne—but his death 12 years later returned turmoil to England. Encouraged by his Lancastrian maternal family, Henry contested the claim to the throne made by Richard III, the duke of Gloucester and Edward's brother and most powerful general. It took two years, but Henry's eventual victory ended the War of the Roses decisively and established the House of Tudor in the monarchy of England.

Peace and prosperity were Henry's watchwords as king of England. Though his taxes were often high, they aimed not to line pockets but to restore the coffers depleted by civil war, and a treaty with the French that granted to them much of the territory they had gained during previous reigns brought substantial money to the royal treasury and spared the kingdom further fighting over matters now generations in the past.

Economic reforms presaged the weakening of the nobility's financial power compared to that of the merchant class, which under Tudor rule would become more and more significant up through the English Renaissance (both HENRY VIII and ELIZABETH I were TUDOR monarchs).

Henry also turned the Star Chamber—a court that had developed from the royal council—into a special tribunal whose sessions were closed to the public, which made them available to commoners who sought to make complaints against the nobility.

Although the Star Chamber could examine and overturn the decisions of lower courts, it was explicitly used by Henry to ensure the power to prosecute individuals considered untouchable by ordinary courts. It was not a new concept—similar courts had been used across Europe for centuries—but Henry's application of it at the end of the War of Roses helped to turn the chaos of that period into the opportunity for a new order.

Though it was his son and successor, Henry VIII, who would split the Church of England off from the diocese of Rome, Henry VII in a sense got the ball rolling: When his oldest son died, he sought to marry his daughter-in-law, Catherine of Aragon, to Henry VIII, his younger son. A papal dispensation was necessary, and although it was granted, the necessity lent a tense tenor to European affairs for most of a year. Eventually, Henry decided against the marriage, and the dispensation was not required—but this betrothal was instrumental in influencing young Henry VIII's opinion of the pope's influence in royal matters.

BILL KTE'PI

Henry VIII

(1491–1547) *English monarch*

Henry VIII was king of England from 1509 to 1547. He is perhaps best known for his succession of wives, some of whom were put to death, and was a key figure in both English and religious history.

EARLY LIFE

Henry was born June 28, 1491, the second son of King HENRY VII. Raised as a prince and second in succession to the throne, Henry was an intelligent and athletic youth. He was schooled in Latin, Greek, and French, his upbringing in a large degree under the control of his paternal grandmother, Margaret Beaufort, an intelligent and shrewd woman. By age 10, Henry was expected to attend and even preside at royal functions, officially receiving his brother's betrothed bride and his own future first wife, Princess Catherine of Aragon, in 1501.

Henry's life changed dramatically in 1502 when his older brother Prince Arthur died unexpectedly at age 16. Arthur had been married less than five months to Catherine of Aragon. A year later, Henry's father began negotiations to allow Henry to marry his brother's widow, which required special permission from the pope in Rome. That year, at age 11, Henry became officially engaged to Catherine, though they were not married till after Henry became king. During those years, Catherine became a political pawn in the diplomatic negotiations between Spain and England, as Henry's father threatened several times to cancel the engagement.

THE YOUNG KING

When his father died in April 1509, Henry was officially crowned king of England, lord of Ireland, and king of France (a nominal title, since he only ruled a portion of France). Two months later, Henry married Catherine of Aragon. The 18-year-old king made an impressive appearance at court, being extremely physically fit and robust and thrilled with jousting, hunting, and dancing. He was attentive to the responsibilities of governing, but avoided routine meetings, expecting his counselors to go to him at his convenience to report and present issues requiring Henry's decision. Chief among his counselors was Thomas Wolsey, who

Most famous for having six wives, Henry VIII broke with the Catholic Church and created the Church of England.

became Henry's chief minister in 1512. His early years of marriage to Catherine were generally happy ones, but marred by the fact that his first child was stillborn, and his second child, a son, died within six weeks of his birth. In 1515, a daughter, MARY I (crowned Queen Mary in 1553), was born.

During this time, there were substantial changes in neighboring France and the rest of Europe. In 1515, King Louis XII of France died, and his son Francis I took the throne. In 1519, Emperor Maximilian died and his son Charles (nephew of Queen Catherine) became Emperor CHARLES V. The three young rulers were at times allies, and other times enemies (often two against the other) over the next 30 years. After Charles's accession, Henry made an official visit to both King Francis and Charles at elaborately planned events marked with enormous pomp and ceremony. Wolsey, increasing in personal power during these years, represented Henry ably in orchestrating the events, ensuring that Henry had the upper hand wherever possible.

These years also marked the beginnings of the Protestant REFORMATION in Germany, when the young priest MARTIN LUTHER nailed his 95 Theses to the church door in Wittenburg on October 31, 1517. Henry was fascinated by theology and sought to bring to his court men of great learning, including the esteemed scholar ERASMUS OF ROTTERDAM. At this time, Henry was completely opposed to the reformers, writing his own refutation of Protestant doctrine titled *The Assertion of the Seven Sacraments*, published in May 1521.

HENRY'S DIVORCE FROM CATHERINE

By 1525, Henry could see that Catherine would never bear him a son. Catherine was already 40 years old, and only their daughter Mary had lived past early childhood. Henry was greatly concerned to ensure a male heir to the throne for he knew that others would claim the throne, especially under a queen. Henry had an illegitimate son and considered the possibility of raising him to an official status but worried that this would simply aggravate the problem. Complicating matters was the fact that Henry had become enamored of a woman at his court named Anne Boleyn and was seeking to make her his mistress.

Finally in 1527, Henry decided to seek divorce from Queen Catherine and marry Anne Boleyn. This required papal dispensation, a matter complicated greatly by the fact that Charles V had recently invaded Rome, the home of the pope, and was understandably hostile to Henry's desire to divorce Charles's aunt. The key figure in the negotiations with Pope CLEMENT VII was Wolsey, now England's cardinal and the second most powerful man in England after Henry. The argument crafted by Henry, Wolsey, and other councilors was that the marriage of Henry and Catherine was illegal, since she was previously married to Henry's brother Arthur (even though a papal dispensation had been received for the marriage). Clement was pressed by both Henry and Charles to decide one way or the other but succeeded in delaying a decision for nearly five years. Wolsey's unsuccessful efforts to get a decision from Clement eventually led to his downfall and removal from office.

BREACH WITH THE CATHOLIC CHURCH

When informed by Anne Boleyn in 1533 that she was pregnant, a frustrated Henry decided to take matters into his own hands and declared that England had the authority to decide this matter, not a foreign pope. The legal and political maneuvering to accomplish this was complex, as Henry was both trying to avoid open war with Charles and Francis and to ensure that the neces-

sary acts of Parliament were done correctly. By May of 1533, the new archbishop of Canterbury, Thomas Cranmer, with the support of nearly all the English bishops, had declared Henry divorced from Catherine and recognized his marriage to Anne.

The breach with the Roman Catholic Church became complete in March 1534, with the passing of the Act of Supremacy, declaring that the king was, next to Christ, the "only Supreme Head in earth of the CHURCH OF ENGLAND." In order to ensure support for the act, an oath was administered to both church and civic officials. Most took the oath, but a few notable men refused to take the oath, including the king's own chancellor, THOMAS MORE. More, Bishop Fisher, and several others were put to death for their refusal to take the oath. This marked the beginning of the present-day Anglican Church as well as the suppression of the Catholic Church in England.

HENRY'S SUBSEQUENT WIVES AND CHILDREN

The hoped-for male heir did not come from Anne Boleyn. In September 1533, Anne bore Henry a daughter named Elizabeth, eventually crowned Queen ELIZABETH I. Anne and Henry's relationship slowly worsened after their marriage, but it was in April 1536 after Anne miscarried a baby boy that rumors of Anne's infidelity surfaced. Charges of infidelity and treason were brought against Anne and her supposed lovers (though it is not clear how truthful the charges were). Anne and several men were put to death in May 1536. Two weeks after Anne's death, Henry married Jane Seymour, a woman he had been courting for several months. Jane bore a son, EDWARD VI, in September 1537 and died soon after from the effects of childbirth. Henry was not to have any more children.

Henry did have three more wives in succession. After a series of negotiations in 1540, Henry agreed to marry Anne of Cleves, the sister of an influential German duke. Assured that Anne was a great beauty, Henry was greatly disappointed upon meeting her, nearly putting off the marriage. Henry divorced her six months later in order to marry his new lover, Catherine Howard, in July 1540. His choice of Catherine was an unwise one. Unbeknown to Henry, Catherine had several previous lovers and perhaps had continued a relationship with one of them after her marriage. This eventually came to the notice of Henry's councillors, and with Henry's consent, Catherine was tried and convicted of treason and executed in February 1542. In July 1543, Henry married Catherine Parr. Only Catherine Parr and Anne of Cleves outlived Henry.

By 1544 at age 53, Henry was an old man. He was substantially overweight, and his legs gave him great

trouble with infections nearly killing him. He rallied at the prospect of invading France, which he did in July 1544, capturing the city of Boulogne at a high cost of men and supplies. War with France continued till 1546, when a treaty was signed between Henry and Francis I. By this time, Henry could no longer walk or stand without assistance (though he could still be lifted onto a horse and enjoy a hunt). Later in 1546, Henry realized he had not long to live and set about eliminating opponents to the succession of his heirs, most notably the duke of Norfolk and his son, the earl of Surrey, who were convicted on charges of treason just before Henry's own death.

Henry died on January 28, 1547. He was succeeded by his nine-year-old son, Edward VI.

BRUCE FRANSON

Hobbes, Thomas

(1588–1679) *political philosopher*

Thomas Hobbes, natural philosopher, was born to a local vicar and his wife on April 5, 1588, near Malmesbury in Wiltshire, England. Aspects of his early family history remain obscure, but his uncle, Francis Hobbes, a successful merchant, took over his upbringing and early education. Hobbes, a talented and serious student, entered Magdalen College, Oxford, at age 14 and graduated with his B.A. in 1608.

Following his graduation, Hobbes became tutor and then secretary to William Cavendish, who would become the second earl of Devonshire. This connection would mark a lifelong association with the Cavendish family. The position also allowed Hobbes a return to study. Following William's death, Hobbes took employment as a tutor to the son of Sir Gervase Clinton of Nottinghamshire from 1628 to 1631. In the midst of this period, he published his translation of Thucydides and began at age 40 a vigorous study of mathematics.

He returned to the Cavendish family as tutor to the third earl of Devonshire in 1631 and spent time on the Continent meeting important scholars such as GALILEO GALILEI in 1636 as well as other intellectuals during his travels with Cavendish.

POLITICAL AND RELIGIOUS STRIFE

Hobbes's life intersected with an era of turbulent political and religious divides, and as a committed Royalist, Hobbes left for Paris in fear for his life when the Civil War erupted in 1640. Here he challenged RENÉ DESCARTES's *Meditations*, studied optics, and published *De cive* in 1642, which examined the roles of the church and state. Hobbes also in these exile years tutored the prince of Wales from 1646 to 1648. In 1651, he completed his most famous work, the *Leviathan*, and returned to England. Hobbes tempered his Royalist views, angering some Royalists along the way, and seemingly accepted the Puritan government, which had triumphed in the Civil War.

The *Leviathan* established Hobbes's lasting reputation and marked him as an important transitional thinker from medieval to modern thought. As the age seemed to confirm, Hobbes had an essentially dark view of human nature and mankind's selfish appetites. Humans left to their own devices allowed evil impulses to flourish. Because of these traits and conditions, mankind must create a state, or Leviathan, for protection. For Hobbes, the best ruler the state could produce was a monarch. Other issues such as freedom, property rights, justice, law, and morality were social creations without natural meaning. It was the existence of the power of the state alone that prevented war and chaos. The natural state of nature was "solitary, poor, nasty, brutish, and short."

To escape from his base and animal nature, mankind enters into a contract, giving up individual interests for a covenant of security and peace, which the state provides. The sovereign, through its arbitrary power, guarantees these freedoms by the exercise of absolute authority. In this way, citizens are given their liberty. Mankind can follow his/her will without interference, yet this falls far short of the concept of free will in a religious sense.

Hobbes's examination of human society and human nature introduced a mechanistic and materialist worldview and stressed the importance of rationalist thought in understanding man and society. He also wrote in English, which allowed philosophical thought to be expressed in a common voice not dependent upon classical thinkers.

The *Leviathan* was followed by *De corpore (On the Body)*, 1655) containing large mathematical sections, and *De homine (On Man)*, 1657). These works completed his philosophical trilogy. Following the restoration in 1660, Hobbes gained the protection of CHARLES II as well as a state pension. However, Hobbes agreed to allow the king to vet his future publications for possible controversy.

Hobbes mathematical works and his attacks on methods of mathematical analysis led to further debate. Hobbes defended his mathematical arguments until the end of his days against a variety of scholarly attacks, some of which dismissed him as a serious mathematical thinker. Other works followed such as his *Dialogue* (1681), an attack on common law, and *Behemoth* (1682), a history of the Long Parliament and the Civil War. Both had to await publication until after his death. He completed his autobiography in 1672, and in 1675 at age 86, he published translations of the *Iliad* and the *Odyssey*.

Hobbes returned from London to spend his final years with the Cavendish family and died at the age of 91, on December 4, 1679, at Hardwick Hall, Derbyshire. He never retired and was working on a book on squaring the circle at the time of his death.

THEODORE W. EVERSOLE

Hohenzollern dynasty in Brandenburg and Prussia

The Hohenzollern family established a dynasty ruling the German kingdoms of Brandenburg (1415–1918) and Prussia (1525–1918) until the end of World War I (1914–18). The Hohenzollerns were one of the most influential among the German royal families within the HOLY ROMAN EMPIRE and, during the period following its dismantling by Napoleon I of France (1769–1821)

in 1806, joined the German kingdoms into a unified nation-state in 1871, thereby becoming emperors of Germany (1871–1918).

The Hohenzollerns originated from the eastern portions of the Frankish empire of Charlemagne (742–814). In 962, Otto I (912–73) was made Holy Roman Emperor. The Holy Roman Empire was a conglomeration of a multitude of distinct entities differing greatly in size, rank, and influence (kingdoms, duchies, principalities, etc.). The most powerful rulers within the Empire served as electors, who selected a member from among their ranks to serve as emperor. Originally from southwestern Germany, the Hohenzollern family increased its land possessions and political influence through marriages, negotiations, and wars. The first recorded reference to a count of Zollern dates from 1061. The origin of the family's name is uncertain and may have been from the castle of Zollern near Stuttgart, Germany. Eventually, two distinct lines of the family emerged: the Zollern-Hohenberg branch, which became extinct in 1486, and the burgraves, or imperial representatives, of Nuremberg, which continued into the modern era.

Frederick of Zollern (?–c. 1200) succeeded as burgrave of Nuremberg in 1192. After achieving power

Today's view of the castle in Hohenzollern, Germany. The Hohenzollerns set the course for the future of the country.

in Nuremberg, the Hohenzollerns continued expanding their control in the regions of Swabia and Franconia, both now part of Bavaria. Frederick's sons founded two significant branches of the family known as the Franconian and Swabian lines, both controlling multiple territories. From the Franconian line derived the burgraves of Nuremberg, and later the electors of Brandenburg, the kings of Prussia, and the Emperors of Germany.

In 1363, the Hohenzollerns attained the rank of princes of the Holy Roman Empire. Frederick VI (1371–1440), who controlled Nuremberg and other estates in Ansbach and Bayreuth in Franconia, became margrave of Brandenburg in 1411. In 1415, Holy Roman Emperor Sigismund (1368–1437) made Frederick elector of Brandenburg. As elector, he became known as Frederick I. From then on, Brandenburg emerged as the center of Hohenzollern power and the family continued to rise in influence among the German royal families. Frederick II (1413–70) increased his patrimony by purchasing territory from the Teutonic Knights and lower Lusatia from the Holy Roman Emperor. Albert Achilles (1414–86) initiated an attempt to consolidate the Hohenzollern family's landholdings by passing a family law preventing the divisibility of Brandenburg.

CONVERTING TO PROTESTANTISM

In 1525, Albert of Brandenburg (1490–1568), the last grand master of the Teutonic Order, converted Prussia into a secular duchy and then, on advice from MARTIN LUTHER, converted to Protestantism at the time of the REFORMATION. The territories previously belonging to the order shifted to Prussian control. Though the Hohenzollerns converted to the Lutheran religion, they later converted to Calvinism. However, the Hohenzollerns' subjects were allowed to remain Lutheran. The Hohenzollern holdings of Brandenburg and Prussia united under a single ruler when John Sigismund (1572–1619), who acquired Cleves, Mark, and Ravensburg in 1614, inherited the duchy of Prussia in 1618.

Frederick William, the Great Elector (1620–88), was elector of Brandenburg and duke of Prussia. He expanded his landholdings by obtaining East Pomerania and secularized territories. During his reign, Frederick William worked to consolidate Hohenzollern authority throughout its landholdings to establish the centralization necessary to implement an absolute monarchy. His son was crowned Frederick I (1657–1713), "king of Prussia," in 1701. However, this title was not recognized fully until the Peace of Utrecht in 1713.

The new title symbolized the unity of the Hohenzollern lands under one ruler and marked the emergence of the family as one of the most influential royal families in central Europe.

Frederick William I (1688–1740), known as the "soldier-king," implemented several reforms that set the path for the future success of the Hohenzollern dynasty and obtained part of West Pomerania in 1721. A firm autocrat, Frederick William reformed Prussia's finances and made the Prussian military one of the most powerful in Europe.

FREDERICK THE GREAT

Frederick II (1712–86), known as Frederick the Great of Prussia, was an enlightened despot who turned Brandenburg-Prussia into one of the top five European powers. An accomplished musician and aspiring philosopher, he codified Prussian law and established a modern bureaucracy in Prussia. He also abolished torture and granted wide religious freedom. Using the military resources left to him by his father, Frederick II warred against the Habsburgs of Austria, who were also Holy Roman Emperors almost continuously from the 15th century onward and the chief rivals to Hohenzollern ambitions in central Europe. The ensuing rivalry between Austria and Prussia prevented German unification until the Austro-Prussian War in 1866 conferred Prussian dominance. Frederick II was regarded as a great military tactician and commanded Prussian forces in the WAR OF THE AUSTRIAN SUCCESSION (1740–48), the Seven Years' War (1756–63), and the War of the Bavarian Succession (1778). He seized Silesia from Maria Theresa (1717–80), Holy Roman Empress and queen of Austria, which provided Prussia with a wealth of raw materials. He also acquired West Prussia and Ermeland in 1772 as part of the first partition of Poland.

Frederick II was succeeded by Frederick William II (1744–97), Frederick William III (1770–1840), and Frederick William IV (1795–1861). All were rulers of unexceptional ability. The kings of Prussia retained their title of electors of Brandenburg until 1806, when Napoleon I of France defeated the Holy Roman Empire and ordered its dissolution. In 1871, William I of Prussia (1797–1888), with the aid of his prime minister Otto von Bismarck (1815–98), became emperor of a united nation-state of Germany.

Another branch of the Hohenzollern family, the Hohenzollern-Sigmaringens, held vast landholdings during the era before German unification and became princes (1866–81) and later kings (1881–1947) of Romania. They also made an unsuccessful bid for the

throne of Spain, which led to the Franco-Prussian War (1870–71).

ERIC MARTONE

Holy Roman Empire

During the period of 1500 to 1750, the Holy Roman Empire grew to be a large political entity but faced serious problems that brought it close to the point of disintegration. The immense territory of the empire—over 300 states of varying size—was to be its ultimate undoing. Though several emperors—most notably CHARLES V—tried to unite the Empire into a modern state like France and England, they were frustrated by the diversity, size, and vested interests of its many rulers.

When CHARLES V (Charles I of Spain) was elected the Holy Roman Emperor in 1519, he raised the profile of the Empire by uniting Habsburg Spain, Austria, and the Austrian Netherlands, with the Holy Roman Empire. Combined with the Kingdom of Naples, and also the Spanish colonies in the Americas, the Holy Roman Empire was becoming an important political entity. When Charles V opened the DIET OF WORMS in 1521, he proclaimed that “the empire from of old had not many masters, but one, and it is our intention to be that one.” Charles’s power was accentuated when he was crowned as the Holy Roman Emperor in February 1530, by Pope Clement VII at Bologna, the first emperor to have been crowned since Frederick III, and the last person to be crowned as the Holy Roman Emperor by the papacy.

But Charles V faced many challenges in his quest to unite and extend the Holy Roman Empire. The increasing power of the French kings and OTTOMAN Turkey threatened the Empire. In 1529, the Ottoman army—after having overrun Hungary—besieged the gates of Vienna, but the city held fast and the Turks were forced to retreat. However, within Europe itself the religious debates following the increasing popularity of MARTIN LUTHER and JOHN CALVIN led to factionalism and fighting between Protestants and Catholics, the former being supported by the HABSBERG DYNASTY.

Engraving after a Niccolò Bettioni portrait of Charles V (Charles I of Spain), elected the Holy Roman Emperor in 1519

These conflicts merged with wider dynastic struggles within the House of Austria for power in Europe that became known as the THIRTY YEARS’ WAR, which lasted from 1618 to 1648. Germany was devastated in the war, with more than 5 million German lives lost, while Austria was forced to sign the Peace of Westphalia, which allowed the princes of the Empire to negotiate their own foreign alliances without the Emperor. After this defeat, the Holy Roman Empire ceased to play a dominant role in the European balance of power.

Although the political power of the Holy Roman Empire was sapped, the role of the electors became important. Initially there were three archbishops, those of Mainz, Cologne, and Trier; the king of Bohemia; the count Palatine of the Rhine; and the elector of Saxony; and the elector of Brandenburg. To these seven, the rulers of Bavaria, Hanover, and Hesse-Cassel later were appointed electors. These electors were granted considerable autonomy and acted as a counterweight to Imperial power. Though the Habsburg

Empire and the Holy Roman Empire were two distinct political entities, the Habsburg dynasty continued to assume the title of Emperor. Only now the Habsburgs had to share power with the electors, and their control over the Imperial diet was reduced. In 1806, Francis I, Emperor of Austria, relinquished the title of Holy Roman Emperor. After the Napoleonic wars, the political map of Europe was redrawn at the Congress of Vienna (1814–15), at which time the Holy Roman Empire was officially dissolved.

JUSTIN CORFIELD

honor ideology in Latin America

The cultural concepts of honor and shame played an extremely important role in the history of Latin America, influencing everything from national politics to domestic divisions of labor. Most scholars agree that the roots of these cultural notions reach back to the Mediterranean world in the centuries before the European encounter with the Americas.

Scholarly investigations into what has been termed the *honor-shame complex* in Iberia, North Africa, and elsewhere in the Mediterranean all point to a diverse but widely shared set of beliefs and practices regarding the appropriate social roles of males and females that often transcended the differences between Christianity and Islam. Institutionalized in various ecclesiastical, political, and legal frameworks, these cultural notions were transported to the New World in the decades and centuries after the European conquests. There they entwined with indigenous and African notions regarding honor, shame, and proper gender roles, leading to a shifting kaleidoscope of beliefs and practices among all social groups and classes.

The most effective scholarly efforts to probe the honor-shame complex in Latin America have remained attentive both to broader shared patterns in diverse historical contexts and to temporal and spatial specificity marked by changes over time. In the most general terms, honor among Latin American men was considered both a prized personal possession and a crucially important expression of one's public self. Honor derived from both social status and

virtuous behavior. This distinction in the sources of honor found expression in the Spanish language: the term *honor* generally referred to status-derived honor, while *honra* generally referred to virtue- or behavior-based honor. Higher social status necessarily conferred more honor: wealthy men inherently possessed more honor than poor men; noble lineage inherently conferred more honor than plebian lineage.

The second component, virtue-based honor, was based especially on a man's capacity to act "with manliness" (*con hombría*). Such manliness derived from many sources, but among the most important was a man's capacity to control and monopolize the sexuality of the girls and women he considered his. For a man's daughter or wife to be sexually active outside his control, or sexually assaulted or raped, caused dishonor and shame to both the victim and to the man claiming sexual dominion over her.

Women's honor, in contrast, was based on their capacity to act with shame (*vergüenza*), defined especially by their sexual propriety and their deference and submission to men. Among the most humiliating insults that could be launched at members of either gender was to be called "shameless" (*sin vergüenza*). The notion of humiliation was crucial to all aspects of honor. According to historian William Ian Miller, "Honor [ideology in Latin America] is above all else the keen sensitivity to the experience of humiliation and shame . . . to simplify greatly, honor is that disposition which makes one act to shame others who have shamed oneself, and to humiliate someone who has humiliated oneself."

Recent research demonstrates the various ways in which patriarchy, masculinity, honor, shame, violence, and sexuality were tightly bound up together in a dynamic cultural complex that shared certain key attributes and that varied widely over time and space, but characteristically in ways that asserted males' dominion over females. Inquiries into this cultural complex in specific contexts comprises an exceptionally fertile field among contemporary scholars of Latin American history.

MICHAEL J. SCHROEDER

Hudson's Bay Company

It is one of the ironies of history that the British owe the beginnings of the famous Hudson's Bay Company to their traditional enemies in North America: the French. Pierre-Esprit Radisson (who posthumously gave his name to the famed modern hotel chain) and his older brother-in-law, Médard Chouart, sieur des Groseilliers, were two of the famed French *coureurs de bois*, or "runners of the woods," who began the trade in beaver skins. In 1659, the hoard of pelts that Radisson and des Groseilliers brought to Quebec was so great it aroused the greed of the governor-general of NEW FRANCE, Pierre de Voyer, the vicomte d'Argenson. He had arrived in Quebec on July 11, 1658, to serve as the fifth governor-general of the colony.

CHARLES II, enjoying a fortunate beginning to his reign, was never one to miss the opportunity of seeking riches, in part because the British parliament sought to limit his power by the amount of money it voted him each year. According to *Empire of the Bay*, Radisson wrote, "The King gave good hope that we should have a ship ready for an expedition for the next spring. And he granted us 40 shillings a week for our maintenance."

Queen ELIZABETH I had made her mark by chartering the Honorable East India Company in 1600, and King Charles II had decided to do the same by chartering a company to trade with New France. However, before committing his limited royal funds to outright backing for what would become known as the "Empire of the Bay," Charles II first commissioned an exploratory voyage. On June 3, 1668, des Groseilliers and Radisson headed back to New France, this time on two English vessels, the *Eaglet* and the *Nonsuch*. The mission was so urgent that Charles sent the ships in 1668, barely a year after the end of the Second Dutch War, a naval conflict with the Netherlands.

Fierce Atlantic storms off the west coast of Ireland buffeted the ships, and the *Eaglet* was forced to return to England. However, the *Nonsuch* continued its voyage successfully to New France. To Charles II, the voyage had proved the worth of the dreams of des Groseilliers and Radisson. The king formally chartered the Governors and Company of Adventurers Trading into Hudson's Bay, forever known as the Hudson's Bay Company. To oversee the company, he appointed his relative, Prince Rupert of the Rhine, who had served his father, CHARLES I, as a commander of cavalry in the English Civil War.

However, it would not be long before the French in New France took action against this new British threat along the remote shores of Hudson's Bay. In 1686 and 1697, the French mounted combined land and sea assaults that effectively broke the back of the Hudson's Bay Company. With the British main effort in the New World fixed on protecting the colonies on the East Coast of the Americas, little could be spared for the outposts in the frozen north. Besides, the French attacking from New France had far less distance to travel to attack the forts of the Hudson's Bay Company. The main Hudson's Bay posts, York Factory, Rupert House, and Albany Fort, fell into the hands of the French.

Throughout the 18th century, a series of wars was fought between England and France for the control of New France and the vast wealth in fur in the interior. Called the French and Indian Wars in the United States, the conflicts saw French and English pitted in savage battles along the eastern coast of North America; both sides generally ignored the frozen north of Hudson's Bay. On September 13, 1759, a French army under Louis-Joseph, marquis de Montcalm, was soundly defeated outside Quebec by a British force under General James Wolfe. Both men were killed from battle wounds, but the battle marked the decisive defeat of the French in North America. Although the British later lost a battle outside Quebec, the French were finally forced to surrender at Montreal in 1760. By the terms of the Treaty of Paris in 1763, all of New France became part of the British Empire.

The leaders of the Hudson's Bay Company felt they could exploit the great wealth of the fur trade, free from the raids of the French and their Indian allies. The French alliance against England in the American Revolution, however, brought war again to Hudson's Bay. The company's first great explorer, Samuel Hearne, was forced to surrender Fort Prince of Wales to a French squadron under Jean-François de Galoup, comte de La Pérouse. After the Treaty of Paris ended the war, however, Hearne was able to return to open a new post at Churchill. But a new threat came from an unexpected corner: from within the British Empire in North America. By the 1770s, rival fur traders began to appear to contest the monopoly of the Hudson's Bay Company. Formally chartered in 1779 as the North West Fur Company in Montreal, the newcomers determined to wrest control of the fur trade from the Hudson's Bay Company trappers by any means necessary.

The North West Fur Company proved much more aggressive than the Hudson's Bay Company, whose long monopoly had bred in it a spirit of complacency

that the “Nor’westers” were quick to exploit. As a result of this competition, exploration and the expansion of trade moved into the interior of the continent. The North West Company was much more flexible than the London-based Hudson’s Bay Company; while Hudson’s Bay’s men had to defer to their distant management, the partners in the North West Company were in the field and met every summer on the Lake Superior shore to determine trapping and harvesting strategies for the coming season.

Spurred on by the enterprising spirit of the Nor’westers, the company produced two of the greatest explorers in all of North American history: David Thompson and Alexander Mackenzie. Significantly, Thompson had first signed on the roster of the Hudson’s Bay Company in 1784, moving to the North West Fur Company in 1797. During his tenure, he charted the course of the Columbia River, located the source of the Mississippi River, and explored throughout the Missouri River area. He retired in 1812, having logged nearly 55,000 miles in the wilderness by canoe and on foot.

Alexander Mackenzie would equal Thompson in the annals of North American exploration. In June 1789, Mackenzie began with a party of Indians to explore for the Arctic Sea, seeking the Northwest Passage to the Orient, which had lured English mariners since the time of Queen Elizabeth I. On July 14, 1789, Mackenzie found the Arctic Sea. The Scotsman would crown his exploring career with a search for an overland route to the Pacific. He began this trek in May 1793 and with the aid of the Bella Coola tribe reached the Pacific on July 22.

The great explorations of Thompson and Mackenzie opened more territory to the Canadian West for the North West Company at a time when the original territory worked by the trappers of the Hudson’s Bay Company was now suffering from diminishing animal population; the hunters were trapping to the brink of extinction. The Hudson’s Bay Company was being encircled by the new fur trading posts, and the Nor’westers were moving into the United States as well. In his 1806 expedition to claim the northern regions of the Louisiana Purchase for the United States, the U.S. army explorer Zebulon Pike staked his claim on a North West Company post by having his soldiers shoot down the British flag and raise the American one.

The climax came when Thomas Douglas, the fifth earl of Selkirk, bought a controlling interest in Hudson’s Bay Company. The company awarded the earl a

massive tract of land—which was right in the middle of the western territory now being exploited by the North West Company. In 1812 Scottish immigrants arrived in what became known as the Selkirk Settlement. Many of these were Scots dispersed during the Highland Clearances, when their own lords expelled them from their ancestral “crofter” farms to make room for the raising of sheep. Immediately, the Nor’west Company began a guerrilla war against the newcomers, its ranks filled with *métis*, the offspring of French Canadians and Native Americans. The climax came at Seven Oaks, in modern-day Winnipeg, on June 19, 1816. Robert Semple, with a force of Hudson’s Bay men, met a force of Nor’wester Métis under Cuthbert Grant. In the skirmish that followed, Grant and his Nor’westers massacred Semple and the Hudson’s Bay men.

Despite this, the odds were in favor of the Hudson’s Bay Company. The buccaneering tactics of the North West Company frightened off staid City of London investors, and the Hudson’s Bay Company still held the Royal Charter of 1670. Finally, London stepped in to end the hostilities, essentially giving title of the North West Fur Company to the Hudson’s Bay Company. This gave the Hudson’s Bay Company a tract of nearly 3 million square miles—most of North America. Today, the company still operates, supplying goods and services for remote settlements in western Canada.

JOHN MURPHY

Huguenots

Huguenots is the name given to Protestants in France who were severely persecuted for their faith. The origin of their name is unclear, but its roots probably go back

to a German word meaning “confederates” or “conspirators,” reflecting public suspicions about the foreign and subversive intentions of the group.

The REFORMATION spread into France almost as early as it shook and divided Germany. In 1523, two years after MARTIN LUTHER’s excommunication from the Catholic Church, Jean Vallière was burned at the stake in Paris for his Protestant beliefs. JOHN CALVIN, an exile from France, began the reformed movement in Switzerland, but his dream was to convert his native land. It was inevitable that his Francophile followers would return on a mission in spite of opposition.

Government measures taken against the Protestants backfired, and by 1555 there was a Calvinist congregation in Paris. In 1559, Protestant deputies from all provinces assembled in Paris and formed the National Evangelical Church. Within two years, the number of churches went from 15 to 2,150.

Their strategy for survival was to find allies among the nobles and obtain their patronage. They organized themselves into military and political units, unified with the church structure. Close-knit, clannish, and theocratic, they were identified by the name *Huguenots*. Although the Huguenots won the right to organize, matters took a dark turn in the late 1550s when the French Crown and the noble family of the Guises forcefully countered the Huguenots. The last straw was the Vassy massacre in 1561, and the Huguenot nobles took up arms.

Seven wars were fought over the next period, summed up in the THIRTY YEARS’ WAR. Many slaughters of Protestants in French cities occurred, most infamously in the Massacre of St. Bartholomew’s Day (1572). The next year, the Huguenot Party was formed, insisting on full liberties for their religion. In the next decade, they formed themselves as a state within a state, and their internal governance was tight and severe. They were so effective at discipline that rival Catholic groups in the COUNTER-REFORMATION imitated their organization.

Peace came with the EDICT OF NANTES in 1598, imposed on the French people by HENRY IV, a Huguenot-turned-Catholic. The regime and the public had spent themselves on violence and now foreign interference threatened state sovereignty. In the streets, however, tensions continued to fester, making the edict hold precariously.

The Huguenots meanwhile pushed through their agenda so that by 1611 they were recognized as a provisional republic within France. This arrangement began to unravel in 1615 when three Protestant provinces temporarily took up arms against the central gov-

ernment, and other signs of dissatisfaction arose over the next 10 years.

Cardinal RICHELIEU, the master tactician of French federal government, concluded that the edict would only destroy the unity of France. In 1626, he mounted a full-scaled attack on Huguenot strongholds. Within three years, all that the Protestants had left was a guarantee of freedom of conscience.

Under LOUIS XIV (1661–1715) all Protestant rights were gradually withdrawn. Nantes was officially revoked in 1685, and massive emigration of Huguenots ensued. The loss of the Huguenots dealt a severe blow to France’s efforts to keep up with their rivals during the Industrial Revolution: a generation of entrepreneurs had emigrated. Just before he died, Louis announced that Protestant exercises in France had ceased.

MARK F. WHITTERS

humanism in Europe

Humanism originated in 14th-century Europe as a movement to recover the culture of the ancient Greek and Roman pagans. The term derived from the identification of ancient pagan texts as “human” rather than divine like the Bible or the writings of the fathers of the Christian Church. With a few exceptions, humanists were not anti-Christian, but attempted to get behind centuries of church interpretation to understand ancient pagan texts on their own terms. Humanists preferred studying original texts rather than commentaries, and reading whole texts rather than isolating particular sentences or passages, as had frequently been the practice during the Middle Ages. Many violently rejected much of medieval Latin culture and scorned Arab writers such as Avicenna who were greatly respected in the university world. Humanists searched out surviving manuscripts of the classics from monastery, cathedral, and other libraries, sometimes discovering works that had been lost for centuries. They sought to restore the classical texts to what their authors had originally written, and pioneered scholarly methods of textual analysis and manuscript

comparison. They also made the classics public, eventually through print.

The birthplace of the humanist movement was Italy, and the earliest prominent humanist was an Italian, Francesco Petrarch. Italy possessed the strongest connections to pre-Christian culture in its buildings, art, and manuscripts, and the most developed civic life. Humanism was not initially connected with the universities and often flourished in towns without universities such as Florence. The first few generations of humanists were definitely not university scholars and attacked the Scholastic Latin inherited from the Middle Ages and used in the universities as nonclassical and barbaric. Humanists supported writing a Latin based on ancient authors, particularly Cicero. Some university professors denounced humanists as neopagan or heretical, although some university scholars and humanists got along well. Rather than being university scholars connected to an institution, early humanists formed an international body, or “republic of letters,” linked by a common Latinity and later by Greek.

TRANSFORMATION OF HUMANISM

Humanism was transformed by two 15th century events, the decline of the Byzantine Empire and the European invention of printing. The decline of Byzantium, which had been apparent for decades before the fall of Constantinople in 1453, led Greek scholars to make their way west to enjoy greater security. These scholars took Greek manuscripts with them, as well as knowledge of the classical Greek language. Humanists now had direct access to ancient Greek writings, rather than medieval Latin translations and adaptations (and even these were often adapted from Arabic versions, rather than the original Greek). Greek and Greek authors began to supplement and to some degree even displace Latin ones in humanist study.

The revival of Greek studies led to new interest in the works of Plato, which had been largely lost in the Latin Middle Ages. Humanists influenced by Plato sometimes broke with the political involvement of early humanists to exalt the contemplative life removed from civic affairs. The revival of Plato, usually seen through the lens of mystical Neoplatonism, was often accompanied by an interest in ancient magic, such as the writings of “Hermes Trismegistus.” Magic was seen as a secret discipline known only to the elite.

Although only a small proportion of early printed texts were humanist, printing had a great impact on the movement and enabled it to institutionalize itself in a way that previous classical revivals during the

Middle Ages had not. Printing standardized the classical Greek and Latin texts, and for the first time it was possible for humanists to be sure that they were all working with the same text and the same pagination, as opposed to manuscripts, all of which are different. Early printing was not error-free by any means, but to some extent it was possible to correct for this by issuing lists of errata. Manuscripts also physically decayed. Printed books did, too, but fact that printing produces thousands of copies for the same outlay as a scribe producing one or two meant that much less information was lost. Print enabled learning to survive a series of disasters, ranging from the sack of Constantinople to the destruction of the library of King Matthias Corvinus of Hungary, the sack of Rome in 1527, and the ravaging of the English monastery libraries during the REFORMATION.

MEMBERS OF HUMANISM

Many humanists were members of the clergy (including some popes), but humanism also provided a way for European men to be professional intellectuals without having to be in the church. Humanists could support themselves by founding schools to teach ancient languages and writing. Humanists developed the idea that learning was necessary to the fullest development of the person. Particularly in its earlier phases humanism emphasized rhetoric, the study of persuasive speech, a discipline with a large classical literature but one that had been largely overlooked in the medieval university in favor of logic.

As did teaching, rhetoric opened career possibilities to humanists, who found employment in courts writing and giving formal Latin orations praising the prince or writing formal Latin letters as diplomatic communications. The early humanists had often presented their skills as useful in the urban republics of northern Italy, but by 1450 humanists mainly adapted to the Italian princely order. (NICCOLÒ MACHIAVELLI, one of the most radical humanists, wrote both *The Prince*, a manual for autocrats, and *Discourses on the First Ten Books of Livy*, an analysis of republics.) Humanists also rediscovered history as a subject worthy of study, which it had not been during the Middle Ages, when it was not a part of the school or university curriculum. Humanists revived the idea that the “great men” of history could serve as models for emulation, and also that history was a useful stockpile of examples for making rhetorical arguments.

There were a few women humanists, who often faced great difficulties entering humanist professions. However,

a woman who overcame these difficulties could acquire renown. Humanistic attainments were often considered incompatible with marriage for a woman, and most successful early women humanists were known either as virgins or as prostitutes. In their writings on the family, male humanists upheld a patriarchal and domestic ideal. A particularly influential male writer on the family was Leon Battista Alberti, whose second book on the subject, entitled *On the Ruler of the Family*, was devoted to the dominant role of the father in the household.

In the late 15th and 16th centuries, humanism moved from its Italian base to other countries in Europe, a movement often called northern humanism. Italy remained the center of the movement, and nearly all prominent northern humanists visited Italy, but the northern movement was also distinctive. Northern humanists, led by Desiderius ERASMUS OF ROTTERDAM, were as a group much more oriented to employing humanism to lead a Christian life and reform Church institutions than were Italian humanists. Erasmus, followed by other northern humanists, pioneered the application of humanist methods of textual scholarship to the Bible and other ancient Christian texts.

INTEREST IN RELIGIOUS TEXTS

The interest in religious texts meant that northern humanists were more interested in Hebrew than were most Italian humanists. Humanists even entered the Jewish ghetto to learn Hebrew from rabbis. This led to a controversy involving Johannes Reuchlin, one of Germany's leading humanists and Christian Hebraists. The substance of the dispute was whether it was permissible or desirable for a Christian to study Jewish books. A fanatically anti-Jewish Jewish convert to Christianity named Pfefferkorn set forth an anti-Jewish program including an attempt to enforce a mandate from the HOLY ROMAN EMPIRE for the seizure of Jewish books. Some lesser rulers in the Empire were concerned about this and consulted Reuchlin. Reuchlin advised them that the seizure of Jewish books was a bad idea for several reasons: Jewish books contained much valuable knowledge, by studying their own books Jews might be converted to Christianity, and seizing the Jews' books would be a violation of their rights as human beings and Imperial subjects. He also argued that chairs of Hebrew should be established in the universities. This led to attacks from the theological faculties of various German universities, who supported the confiscation measure and accused Reuchlin of being bribed by rich Jews. Although humanism was not originally the issue, Reuchlin's eminence in the

humanistic community made it so. Younger humanists who admired him claimed that university professors were attacking Reuchlin as a way of attacking humanism in general and issued vicious works of satire, attacking Pfefferkorn and the university professors for their ignorance and bad Latin. Interest in Hebrew did not mean that all northern humanists were sympathetic to the Jews. Some such as Reuchlin were relatively pro-Jewish in the context of their times, while others like Erasmus were vehemently anti-Jewish.

German humanists in particular often took a nationalist position, encouraged by the rediscovery of a classical Latin text, the *Germania* of Tacitus, in the 15th century. Tacitus's portrait of simple, brave Germans became very popular and was presented in opposition to the alleged corruption of Mediterranean lands. German humanists argued that the pious Germans were being exploited by the Italian-dominated international church. Like other European humanists, German humanists attempted to connect their people's past with that of the ancients as descendants of the ancient Trojans or other classical groups.

Northern humanism was greatly affected by the Protestant Reformation. Many humanists initially supported MARTIN LUTHER as a reformer but began to distance themselves from him as his message grew more radical. It was common for older humanists to remain in the Catholic Church, while younger humanists were more likely to become Protestants. Erasmus and SIR THOMAS MORE, a martyr for his faith, were among the humanist leaders who remained in the Catholic Church, while PHILIP MELANCTHON and JOHN CALVIN were prominent among the many Protestant leaders with a humanistic background.

By the late 16th century, humanism in both Italy and elsewhere in Europe had grown more technical and scholarly. There was less emphasis on the ancients as providers of moral examples and more on recovering the details of ancient life. For example, there were enormous efforts to recover ancient calendars and to catalog ancient coins. Recovery and reading of a broader range of ancient texts meant that humanism affected more fields of learning. For example, recovery and study of the ancient mathematical texts of Archimedes and Apollonius influenced the development of European mathematics and science. Humanism influenced medicine both positively, through the study of the texts of ancient physicians, most notably Galen and Hippocrates, and negatively, through the rejection of Arab physicians such as Avicenna. Humanists also influenced the development of law through the study

and promotion of Roman law. As it grew more intellectually diverse, humanism also became more closely connected to university life, at first through humanists' offering popular lectures outside the formal system of instruction and then through the work of younger university masters with an interest in humanism.

WILLIAM E. BURNS

Humayun

(1508–1556) *emperor of India*

At the age of 23, Humayun succeeded his father, BAHUR, as the second Mughal ruler of India. He ruled successfully for the first few years, then abandoned himself to pleasures, including use of opium, resulting in the loss of his patrimony to Sher (Shir) Shah and years of wandering and exile in Persia. He was finally restored to power in India with Persian help in 1555 but died from a fall in 1556.

Humayun inherited a shaky empire that had just been conquered by his father, and he had to deal with three ambitious brothers eager to oust him. Although capable of courage, he was self-indulgent and addicted to pleasures. Two enemies confronted him after his accession, Sultan Bahadur in the southwest and Sher Khan (later titled Sher Shah), leader of Afghans who had

settled along the Ganges River in Bihar. Sultan Bahadur was eliminated by the Portuguese but the more able Sher Khan decisively defeated him in 1539. He was forced to flee with few followers across India, to Afghanistan, finally finding refuge in Persia, whose ruler Sha Tahmasp gave him refuge on condition that he converted to the Shi'i (from Sunni) Islam. He did so, at least outwardly.

The victorious Sher Khan assumed the title of shah and very ably ruled India from 1540 to 1545. He built up an excellent administrative system, which became the foundation of the later resurrected MUGHAL EMPIRE. He relied on centrally appointed local officials who administered under a hierarchical system of responsibility. Local officials assessed and collected taxes, at one-third of the total production. He set up courts and weeded out corrupt and oppressive officials. He also established charitable organizations to help the poor and built roads shaded with trees and with rest houses and wells for drinking water interspersed along the way. He died in 1545, when a gunpowder magazine accidentally exploded. Sher Shah's sons lacked his ability and made matters worse by fighting with one another for their inheritance. Thereupon Sha Tahmasp helped Humayun return to power, first conquering Kandahar and Kabul in Afghanistan, and then winning back his throne in India in 1555. He died the following year, however, after a fall in his palace, leaving the throne to his 13-year-old son, AKBAR, born on the northwestern frontier of India during his father's desperate flight. Babur founded the Mughal Empire, Sher Shah laid its administrative foundations, and Akbar later consolidated it.

JIU-HWA LO UPSHUR

Hutchinson, Anne

(1591–1643) *Puritan dissenter*

Born Anne Marbury in 1591, Anne Hutchinson was the daughter of an Anglican priest who was an advocate of church reform. During her childhood, the family moved to London, where she received an excellent education and became well grounded in the tenets of Puritanism. At 21, she married William Hutchinson, a prosperous London cloth merchant, and they settled in Alford, Lincolnshire, Anne's birthplace. She

attended the church of John Cotton in nearby Boston, and when Cotton migrated to New England, Mrs. Hutchinson convinced her husband that the family should follow. They arrived in Boston sometime in the summer of 1634 and quickly became church members and her husband a community leader. She was skilled in the use of herbal medicine and soon developed a reputation for her medical advice.

She soon moved into religion. An extremely intelligent and thoughtful woman, well versed in theology, she took to expanding on Cotton's sermons to an ever-increasing group of followers. Taking what she believed to be Cotton's lead, she stressed a covenant of grace; in her view individuals gained salvation solely through God's love, and unrelated to their actions, a covenant of works. Her opponents labeled her an antinomian (against the law), for her doctrine implied the negation of clerical power and church discipline and had unacceptable implications for social order and the authority of the established government. This was of special concern in the MASSACHUSETTS BAY COLONY; a new colony, isolated in the wilderness, and dedicated to defending its mission to establish a godly community. Although Hutchinson originally had a large following, including some prominent merchants and even the colony's governor, she came to be viewed as a threat to Massachusetts's mission and was eventually banished from the colony and later excommunicated from her congregation.

Because her accusers were also her judges, her trial was unjust by modern standards, but typical of sedition trials at the time; a formal defense was not permitted. Perhaps most importantly, she guaranteed a guilty verdict when she asserted a direct communication with God, a position unacceptable to a society that believed God spoke through the Bible as interpreted by clergymen. That she was a woman in a society in which women had no public power only made her ideas all the more threatening. Coupled with the challenges of ROGER WILLIAMS and others, the Hutchinson affair prompted Massachusetts to ensure religious orthodoxy, at least among its clergy, by establishing HARVARD COLLEGE in 1636.

In the spring of 1638, Mrs. Hutchinson, her family, and a small number of followers moved to Rhode

Anne Hutchinson preaching in her home in Boston, a practice that resulted in her excommunication

Island and settled at Aquidneck. After the death of her husband in 1642, she moved to Long Island and then to the New York mainland. In the late summer of 1643, Indians attacked her home, killing all but one member of her household. Long viewed as a victim of Puritan intolerance and a champion of religious freedom, Anne Hutchinson is also recognized for her contribution to the struggle for women's rights.

H. ROGER KING

Ibn Ghazi, Ahmed

(c. 1507–1543) *Somali military leader*

Popularly known as *the Gran* or *Ahmed, the Left-handed*, Ahmed ibn Ghazi, the king of Adal, was a Somali general who, after establishing an inland Muslim empire, laid siege to Ethiopia in 1529 in an attempt to wipe out Christianity and establish Ethiopia as a Muslim state. Christian Ethiopia was particularly vulnerable to outside attacks from neighboring Muslim countries because from 1478 to 1527, the average age of Ethiopian rulers was only 11. The Sultanate of Harar, which was heavily Muslim, repeatedly attempted to overtake Ethiopia. Around 1500, zealous Muslims announced the onset of a jihad (holy war) in which Islam was to be instated throughout Africa.

In the late 1520s, the sultanate's position was reinforced by the Islamization of Somali, which was effected by the concentrated efforts of Turkish and Arab adventurers. Consequently, Harar's troops, led by Ahmed ibn Ghazi, attacked Ethiopia in 1529. Ahmed's forces were reinforced by the recently conquered Chushitic troops who hoped to gain their freedom by fighting with Ahmed's forces. Ahmed triumphed during the Battle of Amba Sel on October 28, 1531. By the following year, he had succeeded in gaining control of Ethiopia and had forced Ethiopian emperor LEBNA DENGEL (1508–40) into hiding. Ahmed subsequently established himself as the ruler of Ethiopia. He was a vengeful conqueror, brutally destroying land and churches and devastating the Ethiopian people.

Once he was in power, Ahmed proceeded with his attempts to eradicate Christianity from Ethiopia. He even destroyed the Church of Our Lady Mary of Zion where Ethiopian emperors had been crowned for centuries. At swordpoint, Ahmed's troops ordered Ethiopian Christians to renounce their faith and swear allegiance to the Muslim faith instead. Ahmed also executed a Portuguese commander who refused to convert to Islam. Although appearing to comply with Ahmed's orders, the Ethiopian Christians, including Emperor Lebna Dengel, continued to adhere to the Christian faith. When Ahmed ordered the emperor to command his daughter to marry him, Lebna Dengel defied him and refused to have his daughter marry a nonbeliever.

On September 2, 1540, Ahmed succeeded in tracking Lebna Dengel to the monastery of Dabra Dam in Tigre, where the emperor was killed in battle. However, the emperor's earlier request for military assistance from Portugal had finally resulted in the arrival of 400 Portuguese musketeers in Ethiopia under the leadership of Cristovao da Gama, the son of Portuguese explorer VASCO DA GAMA. In addition to the Portuguese, the Ethiopians had been reinforced by large numbers of Oromo (Galla) people, who threw considerable force into destroying Islamic communities and attacking the invaders.

While generally successful in their attacks on Ahmed's troops, da Gama and 140 of his troops were killed in a battle north of the Tekez River. After Lebna Dengel's death, his son Galawdewos, who had succeeded to the Ethiopian throne, led an attack on Ahmed's

forces on February 21, 1543. In what became known as the Battle of Wayna Daga, a Portuguese musketeer who was determined to avenge the death of da Gama and his comrades killed Ahmed, even though it cost him his own life. Once Ahmed was dead, his troops lost the will to continue the jihad. As a result of the Battle of Wayna Daga and Ahmed's death, Galawdewos was able to restore the Ethiopian Empire.

The Ethiopian Christians celebrated their restoration to power by holding ceremonies in which they publicly renounced the Muslim faith and reembraced Christianity. Despite this success, Galawdewos's reign was cut short when he was killed in one of the frequent raids conducted by Bati Del Wambara, Ahmed's widow, who was determined to avenge her husband's death.

During the years of Muslim occupation, much of Ethiopia had been destroyed. In the 21st century, Ethiopian churches still bear the scars of the Muslim attacks. Despite these scars, Ethiopia has survived as an African nation with a considerable Christian presence. Currently, between 35 and 40 percent of the Ethiopian population belong to the Ethiopian Orthodox Church, and between 45 and 50 percent embrace the Muslim faith.

ELIZABETH PURDY

indentured servitude in colonial America

This compulsory work system was an important form of labor in colonial America, especially in 17th century Chesapeake. In exchange for several years of labor, English men and women received passage to America and opportunity. A cruel life, servitude was ultimately replaced by African slavery.

Indentured servitude was an American invention with English roots. The idea of serving for a period of years had long been a part of apprenticeships; after 1563, English law had required nearly all wage laborers

to contract by the year. In both cases, masters assumed nearly total control over their workers: They could set them to a variety of tasks and punish them physically but also had to feed and house them. Apprentices and servants were typically young and unmarried people seeking money to establish their own households. A large percentage of English men and women, perhaps a majority, spent a portion of their youth in service.

England's decision to plant colonies in the New World precipitated the invention of indentured servitude. In 1584, Richard Hakluyt advocated colonization as a solution to England's "valiant youths, rusting and hurtful by lack of employment" and a number of young laborers accompanied the first settlers to JAMESTOWN in 1607. However, most colonists expected that Native Americans would work for them and it was only after attempts to enslave the Powhatan Indians failed that the Virginia Company seriously looked to England for workers. In 1616, the company instituted the headright system by which colonists received 50 acres of land for every servant imported. That same year, tobacco was introduced to Virginia and the demand for workers increased dramatically.

In the 17th century, 90,000 of the 120,000 English emigrants to Virginia and Maryland were indentured servants. Most were between the ages of 20 and 24, and men outnumbered women by six to one. Most came from desperately poor backgrounds and had no other opportunities. Before leaving England, a servant signed (usually with an X) a contract. Two copies of the contract were written on the same sheet of paper and then cut apart, leaving a rough or indented edge, hence "indentured" servitude. The servant received one copy and the other was sold in America. Typically a servant agreed to serve between four and seven years for passage to America. When the contract ended, a servant received "freedom dues": clothes, tools, food, and for the first half of the 17th century, 50 acres of land.

Life as an indentured servant was hard and cruel. "Am toiling almost day and night, very often in the horse's drudgery," wrote Elizabeth Sprigs. "Scare any thing but Indian corn and salt to eat... almost naked no shoes nor stockings to wear." In addition to inadequate food and clothing, beatings were common. In 1624, Elizabeth Abbott died at the hands of her master, leaving a corpse "full of sores and holes very dangerously raunckled and putrified above her wa[i]st and upon her hips and thighs." In the case of Abbott and others, Chesapeake courts habitually sided with the masters. Masters were allowed to sell their servants' contracts, practically reducing the workers to chattel. Servants

who ran away, killed a master's pig, or bore an illegitimate child faced extensions of their servitude. Not surprisingly, many died before completing their indentures: Although 15,000 servants arrived in Virginia between 1625 and 1640, the population only increased by 7,000. Among those who survived, success was attainable, at least at first. For Maryland servants freed before 1660, a majority obtained land and many held public office. Yet the unbalanced sex ratio prevented many freedmen from marrying. Opportunities for ex-servants declined considerably after midcentury as available land became scarce. As this happened, many ended up working for their former masters for wages. Disgruntled ex-servants were a primary impetus behind several uprisings including BACON'S REBELLION.

Indentured servitude also existed outside the Chesapeake. Perhaps 20 percent of immigrants to New England in the 1630s came over as servants, while indentured servitude supplied critical labor for the early plantations of Barbados and the Carolinas. However, by the middle of the 17th century, a decline in the English population reduced unemployment and motivation for servitude. As this happened, planters acquired African slaves. Barbados was the first English colony to switch from servitude to slavery, and by 1660, blacks outnumbered whites. A similar process took place in the Chesapeake in the 1680s and 1690s. Indentured servants fell to less than 5 percent of the population, and by 1710, were outnumbered by slaves six to one.

Indentured servitude remained an important source of labor in the 18th century. Between 1718 and 1775, 50,000 English convicts were sent to America as servants and typically indentured for 14 years. Other servants emigrated from Scotland and Germany and settled in the middle colonies. In 1760, indentured servants constituted 20 percent of Philadelphia's workforce, many laboring in trades alongside black slaves. Although servants continued to arrive by the thousands through the 1770s, the American Revolution caused many to question their presence. In 1784, "a number of respectable Citizens" of New York paid to free a cargo of servants because they found "the traffic of White people" contrary "to the idea of liberty this country has so happily established." Thereafter indentured servitude rapidly declined and all but disappeared by 1800.

indigo in the Americas

Prized for its beauty as a deep blue dye for clothing and textiles, indigo has a long history in the Western world. Archaeologists have unearthed indigo-tinted fabrics in Greece dating to 2500 B.C.E., while the Greek historian Herodotus, writing about 450 B.C.E., provides the first documentary evidence on the use of indigo as a dye. In the decades after the CONQUEST OF CENTRAL AMERICA, indigo became another of the marketable commodities produced in the Americas to feed the growing European demand for foodstuffs, dyes, and other products. The dye itself was derived, via a complex and odoriferous steeping and fermentation process, from the dark green, oval-shaped leaves of two species of leguminous shrub in the *Indigofera* genus: *Indigofera tinctoria*, indigenous to Asia, and *Indigofera suffruticosa*, native to Central and South America. The latter species, called *xiquilite* in NAHUATL, was used as a pigment and dye by the Maya of Central America for centuries, perhaps millennia, before the conquest. The Spaniards called indigo dye *añil*, derived from *al-nil*, the Arabic word for "blue."

From around 1580 to 1620, indigo production saw something of a boom in the Central American lowlands, particularly western Guatemala and Nicaragua. In light of the precipitous decline in native populations across much of the isthmus, and the severe shortages of labor that ensued, indigo's minimal labor requirements constituted one of its principal commercial advantages. The plant itself was sturdy, grew readily in well-drained soils at an elevation below 1,500 meters, and required little attention prior to harvesting the leaves. Only one to two months of intensive labor was required during the harvest and processing phases, making indigo one of the few commercially viable commodities in Central America's labor-scarce environment.

Initial efforts were focused on wild plants, but from the 1580s indigo plantations and processing facilities were established in many parts of the isthmus. By 1600, indigo had emerged as Central America's principal export product. After 1620, production stagnated, witnessing a brief resurgence in the late 1600s before stagnating again for the rest of the colonial period. Nearly a quarter-million pounds of indigo was imported

to Seville annually from 1606 to 1620, though these figures exclude illicit commerce, which was doubtless substantial. Meanwhile, indigo production in Asia continued to grow. Throughout the 1600s, indigo was one of the chief products of the Dutch and British East India Companies. Evidence suggests that the inability of Asian indigo production to meet rising European demand was one of the principal engines of indigo production in the Americas.

Other regions in the Caribbean basin also emerged as important sources of indigo, including Saint-Domingue (France to 1803), Jamaica (Great Britain after 1655), Suriname (Holland), and Brazil (Portugal). Soon sugar displaced indigo, tobacco, and other products as the Caribbean's principal export crop, though indigo production continued throughout large parts of the Americas through the colonial period and after. By the 1740s, an indigo boom had emerged in South Carolina, complementing rice production in the same region. It was not until the late 19th century, that a viable synthetic dye finally displaced indigo as the most important source of dark blue coloration in fabrics.

MICHAEL J. SCHROEDER

Inquisitions, Spanish and Roman

The Inquisition in the early modern period was a permanent papal judicial institution of the Roman Catholic Church that was to eradicate heresies, originally dealing with alchemy, sorcery, and witchcraft, as well as dealing with heretical groups like the Cathars and subsequently with relapsed converts or "heretics" who refused to recant.

The most well-known of the inquisitions was the Spanish Inquisition, which was established in 1478 by King Ferdinand and Queen Isabella of Castile, with the support of, and carrying the authority of, Pope Sixtus IV. Although the inquisitor-general was appointed by the pope, the Spanish Inquisition was run by the Spanish monarchy. The first inquisitors of the Spanish Inquisition worked from Seville and were so vindictive that even Pope

Sixtus IV tried to moderate them. However he was not successful as the Spanish government established grand inquisitors in Castile and placed Aragon, Valencia, and Catalonia under the power of the Spanish Inquisition.

The first grand inquisitor was the Dominican friar Tomás de Torquemada, who terrorized his victims using torture and the threat of execution to extract confessions, which resulted in as many as 5,000 people being burned to death at the stake before the practice was ended in 1834. Torquemada's reputation for brutality quickly became well known, and other inquisitors were appointed, with the Spanish Inquisition established in Sicily in 1517, although attempts to set it up in Naples and Milan failed. The Holy Roman Emperor CHARLES V introduced it into the Austrian Netherlands in 1522 to use it against Protestants there, and its use continued until 1834, operating in South America.

As well as the Protestants, Muslim and Jewish communities in Spain were singled out by the Inquisition. In the case of these communities, the Spanish Inquisition only had the role of dealing with those who claimed to have converted to Christianity but who went back to their original religious beliefs. While many Jews and Muslims left Spain for North Africa, many Jewish converts, known as the *conversos*, and the Muslim converts known as Moriscos, remained in Spain, where some continued to be strong business leaders. It was not long after conversion that some reverted to following their original beliefs and they were deemed, by the Spanish Inquisition, as being relapsed converts. A study of the 49,092 trials held by the Spanish Inquisition between 1560 and 1700 showed that 11,311 were of Moriscos, 5,007 of *conversos*, 3,499 of Lutherans, 14,319 for heresy, and 3,750 for superstitions, including witchcraft, and 3,954 were for offenses against the Inquisition itself.

Even when the Inquisition tried heretics—often using dubious evidence gained from the torture of the accused—the results were usually that the defendants were found guilty and sentenced to be burned at the stake. The burning was done not only to purge the sin, but also to serve as a warning of the flames of hell. Occasionally if people recanted and accepted the church teachings, they would be freed. More often they were strangled and spared the punishment of being burned alive. These trials and executions were known as *autos-de-fe*.

As well as persecuting heretics and suspected heretics, the Spanish Inquisition drew up lists of banned books, which were also burned. Its role served to create a united

The Spanish Inquisition reached into the Netherlands; this print shows the burning of Protestants there in 1544.

political unit in Spain, weaken opposition to the Spanish monarchy, and to strengthen the Catholic orthodoxy against the Protestants. Pope Sixtus IV accused the rulers of Spain of profiting from the Inquisition as people found guilty of heresy had their property confiscated by the state. The Spanish Inquisition survived until it was banned by Napoleon in 1808, and by royal edict in 1834.

The Roman Inquisition was established in 1542 and staffed by cardinals and other papal officials with the role of defending the integrity of the Roman Catholic faith. This involved arraigning people on charges of heresy, sorcery, blasphemy, and witchcraft. With trials presided over by a cardinal, it had jurisdiction on the Italian peninsula and on other parts of Europe under papal rule, such as Avignon. It was this group that tried the astronomer GALILEO GALILEI in 1633, when he faced the Inquisition on the suspicion of heresy, following the publication of his ideas about the Earth's moving around the Sun. Although Galileo escaped with his life, another astronomer, Giordano Bruno, was not so lucky and was burned at the stake for heresy. Bruno is now often considered the first martyr for science.

Generally the Roman Inquisition was not as fierce as its counterpart in Spain, except during the rule of Pope Paul IV (1555–59) and Pope Pius V (1566–72), the latter having been a grand inquisitor himself. It was Paul IV who declared at the start of his short reign that he felt that matters of doctrine were far more important

than all other matters facing the papacy. Indeed Paul IV personally oversaw much of the persecution himself. The persecution of the Protestants in Italy meant that they were eliminated as threats to the states in late Renaissance Italy. The Inquisition continued its activities well into the 19th century but has long since ceased to be a force in Italy or elsewhere.

JUSTIN CORFIELD

Isfahan (Persia)

In 1592 Shah Abbas I made Isfahan the capital of the SAFAVID EMPIRE. In an earlier era, Isfahan had been the capital of the Seljuk Empire, but under Shah Abbas the city became a major economic and cultural center or as the Persian saying went, “Isfahan is half the world.”

The Masjid-i Jami, or Friday Mosque (1088), an earlier Seljuk building, dominates one section of the city. This mosque is known for its brick domed chambers and stucco *mihrab* (prayer niche). Under Shah Abbas, a huge open square, the Maydan-i Shah, with a polo field the favorite amusement of the Safavid court, became the centerpiece of the city. The square was surrounded by Safavid buildings. The Masjid-i Shaykh Lutfallah (1602) stands on one side; a vast covered bazaar anchors another, and the monumental Masjid-i Shah (1612–13) dominates a third side. An elaborately decorated blue tiled dome with Qu’ranic inscriptions in finely wrought calligraphy covers the mosque, which is entered through a courtyard and towering *iwans*, or arched entryways. The Ali Qapu, a vast royal palace complex, is the main building on the fourth side of the square. The palace’s second-story porch, covered by a wooden roof supported by slender columns, overlooks the square. From this porch, the shah and his court could watch polo games and other state ceremonies.

As a commercial center, Isfahan attracted numerous traders and artisans, many of whom built lavish homes with gardens that were much esteemed in Persian society. The bazaar sold everything from common

The Masjid-i Jami mosque of Isfahan, arguably the religious center of the Safavid Empire

everyday products to luxury goods including silk brocades, jewelry, carpets, and painted miniatures. As in the OTTOMAN EMPIRE, flowers and bird motifs were favorite designs among the Safavids. The Safavids became known for Persian carpets with floral patterns and center medallions as opposed to the geometric designs favored by tribal artisans. Safavid artists also excelled in the painting of miniatures and illustrated manuscripts, many of which included figural representations that were rare in Arab or Ottoman works.

JANICE J. TERRY

Ivan III the Great

(1440–1505) *Russian ruler*

Ivan III, grand duke of Moscow (or, Muscovy), was the first monarch to begin the creation of a recognizable Russian state, earning him the title “Ivan the Great.” Born in 1440, he ascended the throne in 1462 and ruled continu-

ously until his death in 1505, giving Muscovy a stable period for its political evolution. Some of Ivan’s greatest triumphs took place within Russian territory. Domestically, his greatest achievement was the incorporation of the city of Nizhny Novgorod, also called Lord Novgorod the Great, into the Grand Duchy of Muscovy.

In 1471, Novgorod had made an alliance with Lithuania and Poland, which had been united since the marriage of Queen Jadwiga of Poland to the grand duke Ladislaus Jagiello of Lithuania in 1386. He became king of Poland as Ladislaus II. Fearing encirclement, Ivan III launched his first attack on Novgorod in 1471, before the Polish king Casimir V could come to the city’s aid. Cowed by the appearance of the Muscovite army, the citizens of Novgorod submitted. However, the boyars (the noble class) were divided between Polish and Muscovite factions, and the division spread throughout the city. Novgorod held off making final submission to Ivan III until he declared war on Novgorod a second time in November 1478. This time, faced with destruction at his hands, the city capitulated completely to Grand Duke Ivan. The richest city in Russia, made so by its trading, now belonged to the Grand Duchy of Muscovy.

In 1480, Ivan demonstrated a streak of daring that no previous Russian ruler had exhibited. Since the invasions of 1240–41, the Mongols (or Tartars, as the Poles and Russians called them) had been a constant threat to the Russians. During their onslaught of 1240–41, which carried them as far as Poland and Hungary, they burned Kiev to the ground. Although the age of great Mongol supremacy had passed, the Khanate of the Golden Horde remained one of the most powerful states in Central Asia and eastern Europe. At that time, the khan of the Golden Horde was Ahmed.

Then in 1480, Ivan III refused to pay the annual tribute to Ahmed Khan. Ivan’s determination, in the face of years of fear of the Tartar rampage, marked the real independence of the Russian state from Tartar rule. Ivan made an alliance with the rival Crimean Khanate to make war on Poland, to prevent the Poles from attacking from the west as he confronted the Golden Horde. Ahmed mustered an army to battle Ivan in September 1480, but just as he was about to fight, he received word that a Muscovite and Crimean Tartar army was headed toward his capital at Sarai. Rather than face Ivan, he withdrew. Such seeming cowardice could not be tolerated in the Golden Horde, and Ahmed was soon assassinated. His place as khan was taken by Shaykh Ahmed in 1481.

The defiance of the Golden Horde led to a renaissance in the Grand Duchy of Muscovy. Ivan felt secure

enough to exchange ambassadors with such world powers as the Vatican, Turkey, and the HOLY ROMAN EMPIRE. Earlier (in 1472) the Vatican under Pope Sixtus IV had given to Ivan as a bride Zoe (Sophia), the daughter of the last Byzantine emperor Constantine Palaeologus, who had died defending his capital of Constantinople from the attack of the Ottoman sultan MEHMED II in May 1454.

It was fitting that when Ivan III died in 1505, he was buried in the Archangel Cathedral in the Kremlin in Moscow, which he had made the first city of Russia, earning the title of Ivan the Great.

JOHN MURPHY

Ivan IV the Terrible

(1530–1584) *Russian ruler*

Ivan IV, the grand duke of Muscovy, or Moscow, is usually considered the first czar of Russia, although many historians argue that the title should belong to IVAN III (THE GREAT). Ivan IV was born in 1530, the son of Vasili III, who had ascended the throne after the death of his father, Ivan III the Great, in 1505. Vasili continued the deliberative policy of “gathering in” the Russian lands begun by his father. Vasili III also faced a threat from the Tartars, the Russian and Polish name for the Mongols. By 1519, the Golden Horde had been conquered by the Gerei dynasty of the Crimean Khanate, who would rule the Crimea until its last khan surrendered in 1783 to Catherine the Great of Russia. When Vasili died in 1533, he left a stable and expanded grand duchy to his successor, Ivan IV.

Ivan was only three years old when his father died, and his childhood was a nightmare of a sanguinary feud between the dominant families of the Kremlin and the Shuisky and Belsky families. He was purposely ignored, an object of contempt, and lived a life in fear of assassination. At the age of 13, he dramatically demonstrated his right to rule against the elite families of the *boyars*, or high nobility.

On December 29, 1543, 13-year-old Ivan called for Prince Andrew Shuisky to be arrested and thrown to starving hunting dogs. Ivan showed clear signs of sadism through his treatment of animals and women as well, whom he and his compatriots often raped and killed.

In January 1547, Ivan IV was crowned with great ceremony as the Russian czar. He underscored his “Russianness” by marrying a native-born Russian woman, Anastasia Romanova, of the wealthy Romanov dynasty. The Romanovs, while not hereditary boyars, were a wealthy trading family, whose fortune depended on royal patronage. In this, Ivan was following the model of most European monarchs, who were now favoring the ascendant middle class, who would be beholden to them directly, rather than their ancestral nobles, many of whom also had claims to the thrones of their countries.

The early years of Ivan’s reign were indeed promising for Russia, and he seemed to be following in the careful, almost analytic footsteps of Ivan III and Vasili III. It was the same cautious way that Russia would expand into Central Asia, beginning in Ivan’s own reign, by fortifying each resting place before undertaking further progress. Ivan called a Russian great council and swore that he would carry out continual reforms in the government

Best known for his cruelty, Ivan IV may have suffered from mercury poisoning in his last years of life.

of the state. Reforms were carried out in local government to diminish the influence of the boyar nobility and enhance the participation of all classes, in a conscious attempt to bind them to throne. A Foreign Ministry was officially established, and a Ministry of War was also put on a permanent foundation.

In 1550, Ivan embarked on a period of military reform that essentially made him the father of the Russian army. He realized the importance of muskets and artillery as a way to overcome Tartar tactics. The reliance on muskets and artillery assured Muscovite, or Russian, superiority in most battles.

In 1552, Ivan felt confident enough to use his new army to attack the Khanate of Kazan, one of the successor states to the Golden Horde. Since all such kingdoms traced their origins to sons or grandsons of Genghis (or Chingiz) Khan, these are known to history as the “Chingizid” khanates. Kazan fell to Ivan, as did the Khanate of Astrakhan in 1556. The Khanate of the Crimea felt sufficiently threatened by Ivan’s sudden eastward expansion that in 1555 Dawlet Gerei Khan had raided Moscow, but the attack did not deter Ivan.

In the same year, the Crimean Tartars raided Moscow, Ivan began the Livonian War in 1555. It would end fitfully in 1583, absorbing most of Ivan’s energies, manpower, and treasure for three decades. (Some accounts give the dates of the Livonian War as 1558–82.) Taking advantage of Ivan’s preoccupation in the Livonian War, the Crimean Tartars returned in 1571 to burn Moscow. Still, the extensive negotiations Ivan carried out with ELIZABETH I of England not only ensured England a welcome partner in the lucrative Baltic Sea trade, but also supplied Ivan with a reliable source of high-grade gunpowder for his army. The downside, however, was that the war produced the political union of Lithuania and Poland in 1569, although the two countries had been united by royal marriage since 1386.

In March 1553, the second, darker, period of Ivan’s reign began, after he recovered from a high

fever. When his queen, Anastasia, died in 1560, he had several of the boyars tortured and executed because he suspected them of poisoning his wife. Then in 1564, he left Moscow, vowing never to return. Ivan established the *oprichniki*, who may have terrorized Muscovites in earlier years. When he felt Novgorod defied him, he had the city destroyed, and Pskov almost suffered the same fate. The *oprichnina*, among whom were BORIS GODUNOV and Anastasia’s brother, Nikita Romanov, rode with dogs’ heads (some say heads of wolves) dangling from their saddles and established a reign of terror. The *oprichnina* was an attempt by Ivan to terrorize all Russians into obeying his will without complaint. Ivan’s experiment in state-sponsored terror succeeded.

Although many causes have been brought forward to explain Ivan’s apparent insanity, one seems to have received comparatively little attention—mercury poisoning. It is known that in his later life Ivan ingested large quantities of toxic mercury. Mercury was used as late as the World War I as a treatment for syphilis, a disease a later autopsy determined Ivan had. Syphilis itself in its final phase can also cause insanity. In November 1581, Ivan IV, in a rage, raised the iron-tipped staff he carried and struck dead his beloved son, Ivan. The czar never recovered from his terrible act. In March 1584, Ivan IV died while playing a game of chess.

JOHN MURPHY

J

Jahangir

(1596–1627) *Mughal ruler*

Jahangir inherited the Mughal throne from his father, AKBAR, the greatest Mughal emperor. His realm included part of Afghanistan and the Indian subcontinent up to the Deccan. It was one of the largest empires of the world and enjoyed prosperity.

Prince Salim (Selim) was Akbar's eldest son, who took the reign name *Jahangir*, which means "world grasper." He explained in his memoir that there was a contemporary Ottoman emperor also named Salim, which made him decide to change his name. Jahangir had to suppress many revolts during his reign, including those of his sons, one of whom he had blinded after the revolt failed. Other campaigns were against rulers in the Deccan area subdued by Emperor Akbar and again in revolt, and against the Persian ruler for control of Kandahar.

In addition to his frank memoir, there are vivid accounts by others about Jahangir. One was by his boon companion, the English sea captain William Hawkins, and another was by Sir Thomas Roe, English ambassador, who arrived at the Mughal court in 1616 to negotiate a treaty between England and the Mughal government but failed and left two years later. As were many Mughal princes, Jahangir was addicted to strong alcoholic drinks, and to eating opium, which seldom left him sober. He professed himself an orthodox Muslim but was generally tolerant of other reli-

Jahangir atop the Mughal throne: His reign was marked by good intentions, internal rebellion, and revolutions headed by his sons.

gions. However, he let divine faith, a religion that his father sponsored, wither away.

In 1611, Jahangir married the Persian-born widow of one of his officials after having her husband killed for refusing to divorce her and for revolting against him. The lady was given the title Nur Jahan, which means “light of the world,” and she became the empress for the remainder of his reign. Both Jahangir and Nur Jahan patronized the arts. But Nur Jahan was also politically ambitious. To influence her husband’s succession she married her daughter to one of his sons, and her niece (Mumtaz Mahal) to another, who became his father’s successor as SHAH JAHAN. She surrounded herself with her relatives, arousing the jealousy of Jahangir’s relatives; intrigues among the members of the two factions led to rebellion. In 1627, her protégé, a general named Mahabat Khan, revolted in alliance with Shah Jahan; they imprisoned both Jahangir and Nur Jahan for several months. Just as he had revolted against his father, so he died in the midst of his son’s revolt, followed by a power struggle between his sons.

Despite wars and rebellions, Jahangir’s reign was generally prosperous, as he enjoyed the legacy of his father. His memoirs often expressed good intentions for promoting justice and efficiency, but he seldom followed through because of his indulgence in alcohol and drugs.

JIU-HWA LO UPSHUR

James I (James VI of Scotland) (1566–1625) *first Stuart king of England*

James Stuart became king of England in March 1503, following the death of the last monarch of the House of TUDOR, ELIZABETH I, the daughter of HENRY VIII, king of England. Robert Carey brought the word of Elizabeth’s death to James, already king of Scotland as James VI, at Holyrood House in Edinburgh on March 26.

James was born on June 3, 1566, the son of MARY, QUEEN OF SCOTS, and Henry, Lord Darnley. From the birth of James, Mary feared for the safety of her son, one main reason being the desire of Darnley to be king,

an ambition that the birth of a male heir to the throne threatened. James Hepburn, the earl of Bothwell, and other Scottish lords shared the same concern. (Bothwell would later become Mary’s lover and then her husband.)

There was more at stake than the throne of Scotland, because Mary also had a claim on the throne of England through Margaret Tudor, the daughter of HENRY VII, king of England. Margaret had married James IV of Scotland. By the beginning of February 1567, Elizabeth recognized Mary, Queen of Scots, as heiress to the throne of England (since Elizabeth was childless). Thus, through his mother, one day the infant James would reign in England. Elizabeth had already undertaken to be the baby boy’s protector.

With such high dynastic stakes, the fate of the conspiratorial Darnley was sealed. On February 10, 1567, he was killed when his house was blown up with the knowledge of, if not on the orders of, Mary. However, the death of Darnley brought neither peace to Scotland nor security to Mary. Defeated in battle by James Stewart, earl of Moray, Mary in May 1568 made a surprising decision—she would seek refuge with Elizabeth in England. Her closest supporters urged her to go to France, where she had been queen to King Francis II, who had died in 1560. Nevertheless, she entered England. Once in England, she remained in varying stages of confinement until Elizabeth had her executed for plotting against her in February 1587.

During the intervening years, James was brought up in the Protestant faith, his guardians preventing any exposure to the Roman Catholic religion of his mother. At 19 years of age, he became monarch of Scotland as James VI. It appears that the goal of succeeding to the English throne became the abiding ambition of James VI. Indeed, he was so fixated on this goal that his reaction to the trial and execution of his mother was quite mild. Then in March 1603, upon the death of Elizabeth, James VI of Scotland also became James I of England.

In becoming king of England James had not reckoned on the growing assertiveness of the English parliament that Elizabeth had managed throughout her long reign (1558–1603) with an effective mix of feminine guile and political art. James’s deep-set belief in the divine right of kings brought him into collision almost immediately with his English parliament. He attempted to stay on good terms with Parliament, especially when the Catholic-inspired Gunpowder Plot of 1605 was seen as an attack on the entire Protestant settlement of England. For a time, Parliament and king could combine against the common foe of a Catholic conspiracy.

When Parliament refused to accept James's Great Contract, James took the dramatic step of dissolving Parliament in 1611. Parliament met twice more during James's reign, and both times he dissolved it again. His overall adroit handling of the situation can be attributed to the wise guidance given James by Robert Cecil, first baron Cecil of Essenden, and the son of Elizabeth's wise councilor, Lord Burghley. When Cecil died in 1612, the king lost his most astute adviser.

As evidenced in his strong belief in the divine right of kings, James had a special interest in religious matters. In 1604, he presided over the Hampton Court Conference, which produced a new and definitive Protestant version of sacred Scripture known as the King James Bible. For a man skilled in the modern arts of political intrigue, he was a firm believer in witches and in 1604 made witchcraft a capital offense, without benefit of clergy.

In foreign affairs James's later years were overshadowed by the eruption of the THIRTY YEARS' WAR in Europe, a struggle between Catholic and Protestant nations that ravaged central Europe, where many of the battles were fought. Although James's daughter Elizabeth was wed to Frederick V, the elector Palatine, one of the Protestant champions, James's son Charles was engaged to marry the daughter of the Catholic king Philip III of Spain in 1623.

Ultimately domestic opposition in England ended the arrangements for a Spanish marriage. Charles instead would become engaged to wed Henrietta Maria of France, the daughter of HENRY IV, king of France and Navarre, who had brought an end to the Wars of Religion in France, and the sister of King Louis XIII.

Although often derided as a witless king, James I proved himself to be a wise ruler. He managed to keep Scotland and England united, though bitter enemies for centuries. On the world stage in 1607, English voyagers to the New World arrived in what is now the United States and established the first permanent English settlement at JAMESTOWN. Thus, when James I died in March 1625, he not only could lay claim to the union of England and Scotland, but to the foundation of what would become the British Empire.

JOHN MURPHY

James II

(1633–1701) *Catholic Stuart king of England*

James II was the second son of King CHARLES I and his wife, Queen Henrietta Maria. Like that of his elder brother, Charles, who had been born in 1630, James's childhood was blighted by the events of the English Civil War. In 1645, the royalist city of Oxford was taken by the forces of Parliament, and the young James, duke of York, who lived there, was taken prisoner. In April 1648, James escaped London and fled to Holland.

On news of the execution of his father, Charles I, in January 1649, James's elder brother, Charles, prince of Wales, was immediately proclaimed king. James would make his mark as a soldier. By the 1650s, OLIVER CROMWELL had gone far to becoming the leading member on the side of Parliament and soon styled himself the almost-regal Lord Protector. James gained military service in the French army under the great Marshal Henri de Turenne, but when Cromwell entered England into an alliance with the French, James left the service of LOUIS XIV and joined the army of France's enemies, the Spanish.

The next year marked the beginning of another chapter in James's life. On May 29, 1660, his brother was welcomed into London on his 30th birthday as CHARLES II. When the English went to war with the Dutch in 1665, James proved himself on sea as the lord high admiral. James was an able and determined military leader in the naval battles against the Dutch.

In England, however, James did not fare as well. His open conversion in 1688 to Roman Catholicism alienated both of the growing parties in Parliament. Two Test Acts, requiring one in effect to pledge allegiance to the state-sponsored Anglican Church, barred Roman Catholics from serving in either of the two Houses of Parliament. James, clearly perceiving this as an attack, resigned his office of lord high admiral in 1673. Attempts were made to press through Parliament an Exclusion Bill to bar James from the throne, but the bill ultimately failed.

By the time Charles II died on February 6, 1685, the Tories and Whigs were both resolved to receive James

as king (James VII of Scotland and James II of England). Both political parties were resigned to his practicing his Roman Catholic faith as long as he and his second wife, Mary of Modena, did so privately.

On April 23, 1685, he was crowned king in Westminster Abbey and Mary of Modena his queen. In June, James, duke of Monmouth, landed in England to claim the throne as the Protestant claimant. Monmouth's forces were quickly defeated. Within three months, James began to squander the goodwill he had enjoyed at his coronation. Rather than behaving magnanimously toward Monmouth, he had him beheaded as a common traitor. Additionally, he unleashed a political reign of terror, known as the Bloody Assizes in the West Country. In November 1685 James shut down Parliament to rid himself of the debates and challenges to his decisions.

James also seemed determined to disestablish the Anglican Church in England. Magdalen College, in Oxford University, became a Roman Catholic seminary to train native English Catholic priests. James also presented a Declaration of Indulgence designed to lift legal restrictions from those who did not profess the Anglican creed. He required the declaration to be read in all Anglican churches and when the archbishop of Canterbury William Sancroft and six other Anglican bishops protested, they were imprisoned in the Tower of London.

While it appeared that the throne would go to James's Protestant daughter Mary, or the hereditary ruler of the Netherlands, William of Orange, the English people hoped that the Protestant religion would survive James's rule. However on June 10, 1688, a son was born and Whig and Tory leaders realized that a Catholic would be the next monarch of England. On the day the bishops were acquitted, Thomas Osborne, the first earl of Danby, a Tory, and six other Tory and Whig party members signed a secret invitation requesting William to invade England and, with Mary, overthrow James. On November 5, 1688, helped by what would be called the "Protestant Wind," William's invasion fleet anchored at Torbay. Danby led a rising for William in the north of England, while rebellion broke out in other parts of the country. The army's leading commander, John Churchill, also gave his support to William. James fled England to seek asylum with Louis XIV in France in December 1688. William and Mary were welcomed in London and, on February 13, 1689, formally proclaimed king and queen of England by Parliament.

JOHN MURPHY

Jamestown

Jamestown was the first permanent English colony in the New World, founded in 1607 under the direction of the Virginia Company. Although the settlement struggled to survive at first, the discovery of tobacco made Jamestown a success and it remained the capital of the Virginia colony until 1699.

In 1605, a group of influential merchants seeking to profit materially from the natural resources of America petitioned England's King JAMES I for permission to settle in America. The following April, the king chartered the London Company (later known as the Virginia Company) and granted it the right to settle a colony between 34 and 41 degrees north latitude. The charter created a joint-stock company, which allowed the merchants to seek investors and operate as a private business. The charter provided that the colony would be governed by two councils, one in America and one in England, and guaranteed that colonists would enjoy the "liberties, franchises, and immunities" of English subjects.

On April 26, 1607, the *Sarah Constant*, *Godspeed*, and *Discovery* arrived in Virginia carrying 105 passengers, who named their settlement Jamestown after the king. From the start, the colony was beset by troubles. The Chesapeake Bay region was then controlled by a confederation of Algonquian Indian tribes led by the paramount chief Powhatan. Powhatan was instrumental in helping provision the colonists in the early years, but the two groups often came into conflict thereafter. More immediately, the colonists died in large number of disease and starvation: Only 38 of the original passengers survived "seasoning," or their first winter in America. Ultimately, the colonists proved unwilling to grow their own food, preferring instead to search for gold, leading to internal dissension.

John Smith's map of Virginia first appeared in 1612. The first decade of Jamestown's existence was fraught with trouble and financial disaster. It was not until the colonists discovered tobacco that the settlement became profitable for the Virginia Company.

A series of governors tried with varying degrees of success to salvage the colony, including most notably John Smith, who ordered that "he will not work, shall not eat." Yet such attempts often proved fruitless such as in the winter of 1609–10, appropriately termed "the starving time," when desperate colonists turned to cannibalism and ate the dead. Only the constant infusion of new colonists kept Jamestown afloat. Relations with the Indians improved in 1614 when Powhatan's daughter Pocahontas married John Rolfe, yet it was Rolfe's introduction of tobacco (*Nicotiana tabacum*) two years later that finally made the colony profitable. Because tobacco sold in London for five to 10 times as much

as it cost to grow, soon "the marketplace and streets, and all other spare places were planted with tobacco." Within a decade, Virginia became the wealthiest and most populous colony.

Despite Jamestown's success, the Virginia Company teetered on the verge of bankruptcy. In the late 1610s, the company tried to make the settlement more profitable by giving more control to colonists. It instituted the headright system, which gave land to settlers, and the House of Burgesses, the first representative assembly established in America. Yet when a violent Indian attack in 1622 wiped out a fifth of the colony's population, the king revoked the company's charter and, in

1624, he placed Virginia under the control of the English government.

JOHN G. MCCURDY

Janissaries

Following the custom of expanding empires everywhere, the Ottoman sultans had routinely taken one-fifth of the booty taken in conquest for themselves, enslaving some of those conquered as footsoldiers for further military conquests. However as the empire took control of predominantly Muslim territories, Islamic legal injunctions against the enslavement of other Muslims made the old practice impossible. Therefore, Muslim theologians under Murad I (reigned 1362–89) innovated a levy whereby young non-Muslim boys were taken into the sultan's service. These enforced recruits were called *Yeni Cheri*, new soldiers, or Janissaries.

On a rotation system of about every five years, a levy or *devshirme* of young boys between the ages of eight and 20 was collected from mostly Christian areas, especially in the Balkans. All the recruits were taught Turkish and converted to Islam. The most able of the young boys were taken to be educated in the palace to become servants and, sometimes, high officials within the vast Ottoman bureaucracy. The rest were given rigorous military training and became a formidable fighting force. The Janissaries owed their sole allegiance to the sultan. The Ottoman Empire was one of the first so-called gunpowder empires, and the Janissaries were known for their skills with the most advanced weaponry of the age. The Janissaries enjoyed considerable legal privileges, including the right to own land and to pass on property to their heirs under Islamic law.

Gradually the Janissaries increased in numbers and power and became the core of the Ottoman army with increased pay and benefits. Spread throughout the empire, the Janissaries lived communally in military barracks and were the main protectors of the Ottoman government throughout the provinces. When the empire was at its zenith, the Janissaries were loyal protectors

and champions of the sultan. However, as the empire declined and the sultans became increasingly weak and corrupt, the Janissaries became a political force in their own right and frequently rose up in armed rebellions. The overturning of the huge cooking pots used by all Janissary garrisons became the signal of such revolts. In some instances, the Janissaries even overthrew sultans to replace them with candidates of their own selection.

JANICE J. TERRY

Jesuits in Asia

The missionary enterprise of the Jesuits in Asia is comprehensible only against the background of three foundational principles. The first two are from the *Spiritual Exercises* of IGNATIUS OF LOYOLA, founder of the order: Following Jesus as a Jesuit entails missionary outreach, and being a missionary implies cultural adaptation because Jesus adapted himself to the human condition. The third theological principle is that missionary activity should reflect the shared life of the Society of Jesus (the Jesuits) as documented in the *Formula of the Institute and Constitutions*.

The nascent Society of Jesus was yet to receive full papal approbation (September 27, 1540) when a request arrived from JOÃO III THE PIOUS, king of Portugal, for Jesuits to work in the Portuguese domains of Asia. Ignatius of Loyola chose two of his first companions, Simão Rodrigues and Nicolas Bobadilla, for the mission. However, before they could leave for Portugal, Bobadilla fell ill. Providentially, Francis Xavier was then in Rome and Ignatius decided to send him instead. The king of Portugal, impressed by the two Jesuits, decided to keep Rodrigues in Lisbon. Xavier, accompanied by Micer Paul, a secular priest recently admitted into the Society of Jesus, and Francisco Mansilhas, a Jesuit aspirant, set sail for India. They finally reached Goa in India on May 6, 1542. Xavier would labor in Asia for 10 years as a missionary, baptizing and catechizing the inhabitants of the Fishery Coast of southern India; Malacca on the western coast of the Malay Peninsula; the Moluccas, also known as the “Spice Islands”; and Japan. While in Japan, Xavier heard about China and resolved to preach the Christian message there. While awaiting Chinese government permission to

The Jesuit orphanage in Shanghai, China. Jesuit missionaries were sent throughout Asia to spread the word of Jesus.

land, he died on the island of Sancian in 1552, unable to fulfill his dream of converting the Chinese to Christ.

That dream would be partially realized not much later as thousands of Jesuits of various nationalities followed Xavier in the Asian missionary enterprise. Missions were conducted in West Asia, for example, with the appointment of Jesuits as papal legates in establishing relations with the Maronites and in negotiating church unity with Orthodox, Nestorian, and Monophysite Churches. But the majority of Jesuit missionaries worked farther afield, chiefly in South Asia and in East Asia. After India, Jesuits would find themselves laboring in places in peninsular (Malacca, Indochina) and insular (Indonesia, the Philippines) Southeast Asia, and in Japan and China. The primary goal was of course the spread of Christianity, but the diverse cultures who populated the huge continent called for various missionary strategies and tactics.

The chief architect of the Asian missionary enterprise was an Italian Jesuit named Alessandro Valignano. He called for cultural adaptation to Asian ways where this was legitimate and did not compromise the Christian message. Perhaps the most significant cultural adaptation was the use of Asian languages in the preaching of Christ and teaching of doctrine. They also extended this cultural adaptation to the manner of dress, civil customs, and

ordinary life of their target audience. His principles were put to good use by such as MATTEO RICCI and Michele Ruggieri. Aside from exploiting European sciences and arts of their day to gain entrance into the educated elite of China, Ricci and his companions decided to study the Confucian classics esteemed by the Mandarin ruling class. In a similar way, the Jesuits working in the south of India decided on a two-pronged strategy that enabled them to reach out to both the higher and lower social castes, tailoring their manner of living to gain initial acceptance from their respective audiences. "Dressed in cloth of red-ochre, a triangular sandal mark on his forehead, high wooden sandals on his feet," Roberto de Nobili lived in the manner of a Hindu man of God (*sannyasi*), learned Sanskrit, and memorized the Vedas so that he could share the message of Christ and his church with the Indian people.

In other Asian places not as highly developed in civilization and culture, the Jesuits were animated by the same principles of cultural adaptation. In the Philippines, they creatively replicated strategies that were used elsewhere. Because local populations were dispersed far and wide, the Jesuits encouraged people to set up permanent communities in planned settlements (a method they used in Latin America called *reduction*), thus laying the foundation of many towns and cities that exist today. They also set up schools wherever these were needed and constructed churches and other buildings that transformed European architectural designs to suit Asian artistic sensibilities. They learned the various local languages and dialects and produced grammars, vocabularies, and dictionaries, thus systematizing the study not just of the languages themselves but of the cultures of the peoples that they were seeking to convert. They wrote books that mapped the ethnography of Asia and were keen observers of Asian ways and traditions, including their interaction with the natural environment.

The Jesuit missionary enterprise in Asia met with obstacles along the way. Some of these obstacles arose from European ethnocentric fears and prejudices that burdened the church of their times. Cultural adaptation was denounced as syncretism, and the missionaries themselves were often at loggerheads on the appropriate strategies to use in mission work. It was not always clear for example whether Chinese categories used to translate Latin ones were without ambiguity, but a lack of understanding, trust, and generosity created a poisoned atmosphere that did not produce the requisite witness to Christian charity. The distance between Rome and Asia proved to be not only a geographical problem but also a psychological barrier that prevented

church authorities from being more sympathetic to the needs of the missionary enterprise in Asia. Furthermore the political, economic, and social burden imposed by Portuguese and Spanish royal patronage of the church in the Indies proved too heavy at times to carry; Rome itself would be forced to set up the Congregation of the Propagation of the Faith in 1622 to loosen the viselike grip of the European monarchs who wished to manipulate the missionary enterprise for political and economic gain. Also, Jesuits allowed themselves to be caught in political controversies of their host countries, thus inevitably creating enemies for themselves among members of the ruling classes.

In 1759 the Portuguese king expelled all Jesuits working in Portugal and Portuguese Asia. In Spain, the Spanish king followed suit and banished the Jesuits from his domains in 1767. Finally, in 1773, Pope Clement XIV, under extreme political pressure from the Bourbon monarchs of Europe, could no longer prevent the inevitable from happening. Through the bull *Redemptor ac hominis*, the pope suppressed the Society of Jesus, thus bringing an end to their missionary work in Asia. This work would be resumed only in the 19th century, when Jesuits would return to their former mission fields now besieged by new historical forces.

TONY DE CASTRO

Jiménez de Quesada, Gonzalo

(c. 1495–1579) *Spanish conquistador*

The man who conquered New Granada (modern-day Colombia) for the Spanish Empire, Gonzalo Jiménez (or Ximenes or Giménez) de Quesada, was one of the least controversial of the famous conquistadores and one of the few to write in detail about his experiences (although the book has been lost).

Jiménez de Quesada was born in either Córdoba or Granada in Spain. He was trained in the law in

Granada, which had been captured from the Moors in the last stage of the Reconquest of Spain (Reconquista) in 1492. After many years as a lawyer, he was offered the position of magistrate and auditor to the province of New Andalusia, the northern part of South America, with a base at Santa Marta in modern-day Colombia. There Governor Don Pedro de Lugo put Quesada in charge of an expedition to find some land suitable for settlement as Santa Marta, despite being located on the Pearl Coast. Of the 1,000 men capable of bearing arms, Quesada took charge of 800. He organized the men into work parties and they built six rivercraft. Quesada divided his men into two groups; 200 manned the vessels and sailed up the Magdalena River, while the remaining 600 with him trekked inland, leaving on April 6, 1536. In spite of the heat, all the men wore heavily padded quilted cotton to protect them from arrows; even the horses were covered in the improvised armor.

Quesada had arranged a meeting point up the Magdalena River where the men on foot would meet with the boats, which carried much of the supplies. The land group were slowed down by the jungle, occasional attacks by Indians, insects, and disease. However they reached the agreed meeting point on time but the sea party was not there. After waiting a few days, Quesada urged the men to continue inland, rather than return to Santa Marta. Although he had no military training, Quesada's years as a lawyer enabled him to present the matter in a persuasive manner, and all acquiesced. The men were desperately short of food, and there are the usual accounts of eating snakes, lizards, frogs, and even some dogs captured from the Indians, as well as boiling down leather harnesses to satiate their hunger.

EXPEDITION SAVED

The expedition was saved when the sea party turned up soon afterward, having been delayed by tropical storms. Quesada was then able to send the sickest men back to Santa Marta, replenish the supplies of the others, and press on with the expedition, which, in January 1537, reached the foothills of the Andes. After covering 400 miles in eight months, there were only 166 men and 60 horses left. Quesada then had his men elect him as their captain-general, and they were determined to conquer land for themselves.

Unlike many other conquistadores, Quesada forbade his men to slaughter Indians, urging them to treat them humanely. However, Quesada was not averse to looting Indian temples, which were often covered in gold and precious stones. After one Indian chief, Bogotá, was killed in battle, the Spanish captured his suc-

cessor, Sagipa, whom they offered to free for a large ransom in gold. Soon afterward, Quesada heard that Sagipa was planning to trick him, and he had the chief executed. The nearby land was then declared conquered “in the name of his most sovereign emperor, CHARLES V.” A small township was then built, which Quesada named as Santa Fe de Bogotá (it was long believed that Quesada was born at Santa Fe, in Spain).

Having established his own town, Quesada was eager to return to Santa Marta and have the conquest officially acknowledged. Before he could do so, two other conquistador parties arrived. One, led by Sebastián de Belalcázar, one of the men who had served under FRANCISCO PIZARRO, arrived from Quito, having founded the cities of Pasto, Popayan, and Cali. The other, led by a German adventurer, Nicholas Federman, on an expedition paid for by the Welser financiers of Germany, who had been granted a concession by Charles V, had come from Venezuela.

The three forces—that of Quesada, and the two new arrivals—were all about the same size, and they all realized that any fight would probably leave the victor, with numbers seriously depleted, at risk of attack from the Chibcha Indians, who still lived in the area. Sense prevailed and the three decided to return to Spain and put their claims to the king of Spain, who would be able to arbitrate the matter. It seems that Quesada would have been the man who suggested this and also thought that he would have the best hope of winning any litigation.

Quesada then returned to the coast and in July 1539 sailed from Cartagena back to Spain. In Madrid, all three conquistadores failed to win the land. Don Pedro de Lugo, who had been a friend of Quesada, had died and his son, Luís, who had abandoned Santa Marta many years earlier after having stolen vast amounts of gold and emeralds from the Indians, was given title to his father’s land, and to the area found by Quesada. Quesada was appointed marshal of New Granada, and an alderman of Bogotá, the city he had founded.

Returning to New Granada, as the new Spanish colony was called, Quesada became one of the most influential men in the region, where he was well known for being critical of the rapaciousness of the large landowners, and also that of some officials. Many people came to him for advice and it was not until 1569, when he was in his 70s, that Quesada decided to lead one last expedition. This was to try to locate the famous El Dorado, which was said to be 500 miles southeast of Bogotá. There, an Indian king was said to cover himself in gold dust and then wash it all off in a lake. The

legend had long captivated many people in Europe and the king of Spain agreed to help with the expedition in exchange for a share in the proceeds.

The expedition had 300 mounted soldiers, 1,500 Indian porters, several hundred black African slaves, 1,100 horses and mules, 600 cattle, and 800 sheep. Nearly three years later, Quesada led 28 men back to Bogotá. On the journey several thousand Spanish, Indians, and Africans had died, and others had fled into the jungle. Disease, Indians, and wild animals had taken their toll and even Quesada had contracted leprosy. He was also faced with a massive bill—60,000 ducats—for the failed expedition. Devastated by his failure, Quesada retired to his country house, La Suesca, where he wrote of his life, in the hope that sales might help pay off his debts. He died on February 16, 1579, of leprosy. His book was lost. The township that Quesada had founded is now the city of Bogotá (current population 7 million), and one of the main roads in the city is Avenida Jiménez de Quesada.

JUSTIN CORFIELD

João III the Pious

(1502–1557) *king of Portugal*

Born in Lisbon on June 6, 1502, to King Manuel I and Maria of Aragon (the daughter of FERDINAND V AND ISABELLA I OF SPAIN), João’s relationship with his father that was strained, especially after Manuel decided to marry João’s betrothed, Leonor, sister of Charles I of Spain (Emperor of the HOLY ROMAN EMPIRE known as CHARLES V), instead of letting his son marry her. João was a very religious man, a trait that led him to continue to push for the introduction of the Spanish Inquisition to Portugal.

With the death of his father, João was crowned king December 19, 1521. One of his first actions was to arrange his marriage to Catarina, also the sister of Charles I of Spain. At the same time, he arranged to have his sister, Isabel, marry Charles. When his daughter was of age, he married her to Philip of Spain. João

used these marriages, along with very large dowries, to strengthen Portugal's ties with Spain, which he hoped would protect Portugal from Spanish ambitions, even though Spain was not really a threat to Portugal at this time. João fathered nine children with Catarina, none of whom survived him.

Portugal had been trying for some time to build an empire in Morocco. Unfortunately Morocco was costing Portugal more in men and money than it was making for them. It took João 20 years to decide to withdraw from Morocco. During that time, Portugal's Indian possessions, especially Goa, received only minimal support. Portugal's Indian possessions were their primary source of income. India continued to receive fewer resources and attention than other areas of the Portuguese empire.

In 1535, working with the Genoese, João helped raise a fleet that destroyed a Muslim pirate fleet based in Tunis. He was less successful against the French pirates who preyed on his ships carrying spice back from India. Being a religious man, João worked hard to convince the pope to authorize the Inquisition in Portugal, that the pope did in 1536. One primary target were the new Christians (Jews who had converted to Christianity), many of whom were members of the middle class. The persecution of this class had a detrimental effect on Portugal's tax base by eroding it.

The Portuguese claimed to be the first Europeans to arrive in Japan, landing there in 1543 and establishing a base in 1550 at NAGASAKI. Also during João reign, the Portuguese started to colonize Brazil. In an attempt to correct administrative problems in India, João appointed VASCO DA GAMA viceroy for India in 1524. João wanted da Gama to clean up the corruption in India, as he started to do upon his arrival there. Unfortunately da Gama died after only six months in India. None of João's sons outlived him. Consequently when he passed away on June 11, 1557, his three-year-old grandson, Sebastião, succeeded him.

John III

(1624–1696) *king of Poland*

John III was the most well known of the 11 elected kings of the Polish-Lithuanian Commonwealth and one of only four Poles among them. John was a notable military talent, his reign marked by a significant deterioration in the governing capacity of the republic's legislature, whose members began to abuse their power to veto any proposed legislation without explanation during his reign. In general, John III was more known for his military than for his governmental or political achievements, but like all Polish monarchs of this period, he was decisively restrained by the commonwealth's recalcitrant nobles.

Born in Olesko (near L'viv, Ukraine) to a noble family, John III studied at the University of Kraków. As did many Poles of the early modern period, he spent an extended period of travel and study in western Europe. His maternal grandfather had been a significant military commander, but John III appears to have entered the military first in response to the Chmielnicki Uprising. This uprising was a Ukrainian nationalist revolt that began in 1648 and became a civil war that significantly weakened the commonwealth, allowing Sweden to invade Poland shortly before the war's conclusion in 1655.

During this period, John III resided briefly at the Ottoman court as Polish envoy, returning to command a Polish regiment that briefly capitulated to the Swedes before reverting to Polish allegiance in 1656. John III took part in the factionalist court politics of the period on the side of the French faction but remained loyal to the Crown during the Lubomirski Rebellion, a revolt against the reforming initiatives of King Jan II Kazimierz Vasa. Although John III was defeated while defending Vasa, his loyalty during the rebellion led to repeated promotions after 1665, all the way to commander in chief of the Polish army in 1668. This was the same year he married a French noblewoman, with whom he would father seven children.

John III distinguished himself in repeated border skirmishes with the OTTOMAN EMPIRE. After a great victory at Chocim in 1673 and the near-simultaneous death of the previous king, John III was elected king and crowned on February 2, 1676. Because the Swedish invasion had ruined the Polish economy, he moved to foster a tense peace with the Ottoman Empire after 1675. Some historians have suggested that he sought to reunite Prussia with the Polish Crown at this time, but whatever his plans, Polish magnates would not support them. Over their resistance, he enforced a series of military reforms

that included the modernization of the Polish artillery. John III's most important victory over the Turks came at Vienna in 1683, when he successfully attacked an army about 50 percent larger than his own. Military struggles continued to influence his later years, although he became ill after 1691, thus enabling the intrigues conducted by the Polish nobles on behalf of various European power at court to flourish in his final years. This state of affairs made it impossible for the Polish government to conduct business effectively, thus accelerating the coming collapse of the Polish state. John III's successor, August II of Saxony, became king only with Russian support.

SUSAN R. BOETTCHER

Julius II

(1443–1513) pope

Pope Julius II was born Giuliano della Rovere on December 5, 1443, at Albissola, Italy, and died November 28, 1503, in Rome. He was of Roman and Greek heritage and followed his uncle (the future Pope Sixtus IV) into the Franciscan order and was educated at Perugia. Rovere was elevated to cardinal in 1471. Although a bishop, he became the father of three daughters, a scandal even then. He was a skilled papal diplomat and was sent to restore papal authority in Umbria; to France and the Netherlands to settle the Burgundian inheritance; and to France to obtain help against the Turks and free Cardinal Balue, a prisoner of LOUIS XI, king of France.

In the next two conclaves, he fought against the election of Pope Innocent VIII and Pope Alexander VI and thus earned disdain from them. Rovere was elected pope on October 31, 1503. He saw as the chief aim of his papacy to extend the temporal power of the pope and fought the influence of Casare Borgia and the Republic of Venice, entering the League of Cambrai in 1509 to continue this fight. He is chiefly remembered for his establishment of the Papal States. He also laid the cornerstone of St. Peter's Basilica.

JAMES RUSSELL

justification by faith

The term *justification by faith* refers to a Christian doctrine that has its roots in the Bible but became crucially important during the REFORMATION controversy in the 16th century. In recent years, progress has been made on resolving this key issue, which divides the Roman Catholic and Protestant Churches.

In order to understand the term, it is helpful to take it apart. *Justification* is a word often used in a legal sense. A person may be justified in breaking the speed limit if it was necessary in order to get someone to the hospital. Instead of getting a fine, he or she is excused before a judge who has authority to declare that the person is not guilty for a particular reason. *Faith* is a word that implies belief and trust. People have faith that their parents want the best for them. *Justification by faith* then refers to Christians' belief that they have been declared or made "not guilty" by reason of Jesus Christ's death on the cross. It has to do with the foundational aspects of a person's relationship to God according to Christian teaching.

BACKGROUND

The concept of justification by faith is found in the Bible, most clearly in the letters of Paul. His letter to the Romans uses the example of the biblical figure Abraham. Abraham believed in the promises of God, and as Paul puts it, that faith "was credited to him as righteousness" (Romans 4:22). St. Paul applies the example of Abraham to all Christians, holding that Abraham's faith was the same faith as a Christian's, looking forward to God's saving action for his people. Justification is a freely given gift of God.

Paul also drew a contrast between faith and works (or good deeds) in justification. The good deeds done by a person, while counting for something, count nothing in his or her meriting eternal life. On this issue turned much in the Reformation controversy described later.

But if the gift is freely given, why do most Christians teach that some people go to heaven and others to

hell? What is the role of human will? If we need to do something in order to get to heaven, how much do we need to do? Will it be enough? If we have done something in order to merit eternal life, does that take away from what Jesus did on the cross? While the questions may seem finicky, much ink and blood have been spilled over them.

In the centuries following the events of the Bible, those very questions resulted in various theological points of view. Augustine of Hippo is best known for his clarification and refinement of the doctrine of justification by faith, which set the stage for the rest of Western Christianity. Against his opponents (particularly those advocates of the Manichean and Pelagian heresies), Augustine taught that a person has free will, but one that is limited and tainted by the human condition. Thus a person participates in justification, but more in the sense of standing before a judge. Echoing St. Paul, Augustine would hold that there is no good work a person can do to balance out his or her justly deserved sentence.

MARTIN LUTHER AND THE REFORMATION

More than 1,000 years after St. Augustine the issue of justification by faith boiled into a raging controversy, which resulted in the fracturing of the Roman Catholic Church. In the years preceding 1517, the sale of indulgences had become increasingly popular. Indulgences were certificates issued under the authority of the church that absolved people from certain penalties due to their sins. These were now sold, and those selling them promised forgiveness of all sins and seemingly an easy entry to heaven. While this was not official church teaching, the way the indulgences were sold implied this easy entry. MARTIN LUTHER objected strenuously to the sale of indulgences, arguing that a piece of paper could not gain entry to heaven, since nothing a person could do could result in entry to heaven. God's grace alone was the cause of the justification of the sinner.

While Luther first intended a theological debate, his argumentative style and the various political undercurrents of the time resulted in a defensive posture on the side of the Catholic Church. All agreed that one is justified by faith, but the nuances of the role of works (and the related issue of indulgences) were positions of sharp disagreement.

Luther was excommunicated for his beliefs in 1521, but that did not put the issue to rest. Several attempts to reconcile the issue were made, with the Marburg Colloquy in 1538 nearly bringing the issue to a positive resolution.

COUNCIL OF TRENT (1545–1563)

When the COUNCIL OF TRENT was called by Pope Paul III, there was initial hope that the issues between Catholic and Protestant would be resolved. Luther had originally called for such a council in the early years of the Reformation, but by 1545 there was little hope that the council would include Protestant participation.

Nevertheless, when the council took up the issue, it produced a fairly nuanced statement on justification by faith. The council was concerned to refute the Lutheran position but had to take care not to condemn positions held by differing schools within the Catholic Church (most notably the Augustinians).

Long discussions regarding the wording of the statement were held, and finally after seven months of debate, the statement was issued. In the statement, there was a definition of justification by faith, and then followed 33 Canons, each ending with "let him be anathema" (cast out of the church). It is interesting that the very first canon states something with which Catholic and Protestant would heartily agree:

If anyone shall say that man can be justified before God by his own works which are done either by his own natural powers, or through the teaching of the Law, and without divine grace through Christ Jesus: let him be anathema.

On the other hand, Canon 9 was aimed well at the Lutheran position:

If anyone shall say that by faith alone the sinner is justified, so as to understand that nothing else is required to cooperate in the attainment of the grace of justification, and that it is in no way necessary that he be prepared and disposed by the action of his own will: let him be anathema.

Thus the Council of Trent worked to clarify Catholic teaching and draw a firm line between it and Lutheran teaching. Between the end of the Council of Trent in 1563 and the Vatican II Council in 1963, there were few significant changes to the positions of the Catholic and Protestant Churches. Vatican II did not revisit the issue of justification by faith, but did open the door for further dialogue with other churches. Dialogues began in earnest in 1967 patterned after dialogues that had been held in the previous 40 years by various Protestant churches, bringing together both leaders and theologians from the churches. Such dialogues are limited in their authority. Agreement on an issue in a dialogue is

similar to two ambassadors' negotiating an agreement on behalf of their country. If the ambassadors come to an agreement, the agreement must still be ratified by the leaders of the countries before it is accepted.

Dialogues were held on the specific issue of justification by faith between the Lutherans and Catholics both in the United States and in Germany. The result of these dialogues was the Joint Declaration on the Doctrine of Justification. The Joint Declaration did not "solve" all the differences between Catholic and Protestant on the issue, but did resolve some of the differences that were matters of misunderstanding and worked to provide a common basis for further dialogue.

BRUCE D. FRANSON

K

Kaikhta, Treaty of

The Treaty of Kaikhta in 1727 between China and Russia defined the boundary between Russian Siberia and Chinese Outer Mongolia.

The TREATY OF NERCHINSK of 1689 between China and Russia drew the boundary between the two empires between Russian Siberia and Chinese Manchuria in the northeast but left the boundary between Chinese Outer Mongolia and Russia undefined. Thus another treaty was needed to complete the border between these two empires and to settle other issues. The first treaty with Russia allowed Qing (Ch'ing) emperor KANGXI (K'ANG-HSI) to defeat the Olod Mongol chief Galdan in 1697, thus extending his domain to Outer Mongolia in the north and Hami in the northwest. However, China was still not completely secure from the Olod threat and feared plotting between them and Russia because the Olod had earlier become vassals of the Russian czars. Russia was also anxious to negotiate with China over trade and the establishment of an Orthodox religious mission in Beijing (Peking). Meanwhile both rulers who had negotiated the Nerchinsk Treaty (Kangxi, emperor of China, and PETER THE GREAT of Russia) had died, succeeded by YONGZHENG (Yung-cheng) and Catherine I, respectively.

In 1725, Empress Catherine I sent envoy Sava Vladislavich Ruguzinski to China, ostensibly to congratulate Yongzheng on his accession to the throne.

The Russian negotiations with China's chief delegate Tulisen used Jesuit missionaries as interpreters. They reached agreement in 1727; it was called the Treaty of Kaikhta, named after a frontier town where the signing took place. It provided for a commission to settle on the spot the border between the two countries from the Sayan Mountain and Sapintabakha in the west to the Argun River in the east. In addition to existing trade at Nerchinsk, another trading station would be opened at Kaikhta and every three years a Russian caravan of 200 men would be allowed to go to Beijing to buy and sell goods without duties. Russia would be allowed to establish a religious mission and church in Beijing, and deserters and fugitives from each country to the other would be extradited.

Russia gained 40,000 square miles of territory between the Upper Irtysh and the Sayan Mountains and land south and southwest of Lake Baikal, trading concessions, and the right to open a religious mission in Beijing. China gained security by cutting off Mongol tribes from access to Russia. A follow-up embassy from China to Russia in 1731 won for China the right to pursue the Mongol into Russian territory. This provision would be important in China's quest to consolidate its northern border.

Both Treaties of Nerchinsk and Kaikhta were negotiated between two equal empires and to their mutual benefit. Unlike in relations with all other European nations, whose ambassadors to China were treated as tribute bearers from vassal states, the Russian envoys

were regarded as representatives of an equal nation. While Russian envoys performed the kowtow to the Chinese emperors, likewise the Chinese envoys to St. Petersburg kowtowed to the Russian monarchs. The Russian religious mission in Beijing that trained students in Chinese would give Russia an advantage in the 19th century in negotiations with China.

JIU-HWA LO UPSHUR

Kangxi (K'ang-hsi)

(1654–1722) *successful Chinese emperor*

The Kangxi emperor's personal name was Xuanye (Hsuan-yeh). He became the second emperor of the QING (CH'ING) DYNASTY when barely eight years old on his father's death, chosen because he had survived smallpox. His 61-year reign would be one of the greatest, and the longest in China since the first century B.C.E. Thus he deserved the posthumous title Shengzu (Sheng-tzu), which means "sagacious progenitor."

At his accession, the Qing dynasty (1644–1911) was by no means secure, and a council of four regents governed in his name. At 13, Kangxi got rid of the regents and assumed personal power. Kangxi was an extremely energetic and conscientious ruler who studied history and philosophy under Chinese tutors, military arts under Manchu officers, and Western sciences, music, mathematics, and Latin under Jesuit teachers. He followed a prodigious work schedule that began before dawn and ended late at night. He personally read and answered memorials and reports, writing with the left hand when the right became cramped. His leisure hours were spent practicing calligraphy and writing poetry and essays. He also enjoyed the outdoors, personally leading his troops in maneuvers, military expeditions, and hunting. He set high standards for his personal conduct; for example, he fasted before he reviewed capital cases, saying that a life ended cannot be restored.

Kangxi's greatest military accomplishment was the suppression of the Rebellion of the Three Feudatories, 1673–81, led by WU SANGUI (WU SAN-KUEI), who

invited the Manchus to help him oust the rebels whose occupation of Beijing (Peking) had ended the MING DYNASTY. Wu and two other allies of the Manchus were granted autonomous princedoms in southern China as reward. Their revolt jeopardized the Qing dynasty and was defeated after arduous campaigns. Two years later another Qing expedition conquered Taiwan, the headquarters of a Ming loyalist force under ZHENG CHENG-GONG (CHENG CH'ENG-KUNG) and his son. Next he dealt with the Mongol threat, conquering both Outer Mongolia and the northwest. Then he extended Qing authority over Tibet by installing a friendly cleric as the seventh Dalai Lama (1708–57) and the leader of the Yellow Hat sect of Tibetan Buddhism. In addition he defined China's northeastern border with Russia at the TREATY OF NERCHINSK in 1689.

Domestically, Kangxi instituted a number of important reforms. He stopped Manchu abuses in the treatment of the majority Han Chinese, reformed the practice of collecting revenue, cracked down on corruption, and repeatedly reduced taxes, finally fixing the tax quota on the basis of population count of 1712 regardless of later increases. The emperor was a patron of many fields of learning. He appointed a board of 50 historians to write a history of the preceding Ming dynasty, following a 2,000-year-old tradition that each dynasty sponsored writing a comprehensive history of its predecessor. The work was published in 1739 when Kangxi's grandson was on the throne. Other boards of learned men worked on multivolume works including the *Kangxi Dictionary* and a 5,020-volume work comprising ancient and modern published books.

Kangxi fathered 36 sons (20 of whom reached adulthood). His empress bore him one son and died in childbirth. He was proclaimed heir and despite his father's love and care, the youth grew up dissolute and unstable, became involved in a conspiracy to assassinate the emperor, and was finally demoted and arrested. The troubles with his heir clouded Kangxi's last years. He refused to announce another heir until his deathbed, when his last will proclaimed his fourth son, Yinchen (Yin-chen), the next emperor. Kangxi inherited an unstable empire and left it splendid, in large part through his conscientious, frugal, and efficient administration.

JIU-HWA LO UPSHUR

Kepler, Johannes

(1571–1630) *German mathematician and astronomer*

Johannes Kepler, founder of celestial mechanics, was born December 27, 1571, at Weil der Stadt, Stuttgart, Germany. His grandfather was lord mayor of the town, but his family had many hardships; his father, Heinrich, was a mercenary who abandoned his family and his mother, Katharina, was an innkeeper's daughter tried for witchcraft. Kepler amazed travelers with his mathematical knowledge.

Kepler embraced his studies and proved a bright student. After studying in the Protestant seminary at Adelberg in 1584, he entered the University of Tübingen. He joined the mathematics faculty of the Protestant seminary at Graz, Austria, in 1594. Kepler studied NICOLAUS COPERNICUS (1473–1543) in depth and wrote the *Mysterium cosmographicum* (The Sacred Mystery of the Cosmos, 1596), a work defending the Copernican system, which postulated that the Sun—not the Earth—was the center of the universe, and that planets moved in circles in their orbits around the Sun.

Kepler is known for his three revolutionary laws of planetary movements, which explained the organization of the solar system. He observed that the orbit of Mars was an ellipse and found similar deductions for orbits of other planets. He realized there was a mathematical explanation, and his first law states that the planets moved in elliptical paths around the Sun. The second law stipulates that the path the planet travels around the Sun comprises equal areas in equal times as the planet moves its orbit. The first two laws were published in his book *Astronomia nova* (New Astronomy) in 1609.

His third law of planetary movement states that the square of the time it takes for a planet to revolve once around the Sun is proportional to the cube of planet's distance from the Sun. The third law was published in 1619 in a book titled *Harmonices mundi*. The three laws made a seminal contribution to the study of planetary motion. Kepler made great progress in the development of modern astronomy by abandoning theories

held for two prior millennia. However, the reasons behind the laws were discovered by ISAAC NEWTON, who demonstrated that they were the result of the law of universal gravitation.

Religious tensions in Europe forced Kepler to move on more than one occasion. In 1599, he left Graz because of religious persecution and went to Prague at the invitation of Danish astronomer Tycho Brahe (1546–1601). Kepler became the imperial mathematician after Brahe's death in 1601. Kepler held the post until 1612, when Lutherans were being driven out of Prague. He went to Linz to continue his work in mathematics and stayed there until 1626.

After years of hardship, Kepler died at Regensburg, Bavaria, on November 15, 1630. Kepler the mathematician, astronomer, and astrologer was one of the dominating figures of the SCIENTIFIC REVOLUTION that swept Europe.

PATIT PABAN MISHRA

King Philip's (Metacom's) War (1675–1676)

King Philip's War was one of the bloodiest conflicts between English colonists and Native Americans in history. Incited by growing colonial population, the war confirmed white domination of New England and significantly weakened Indian presence in the region.

From the settlement of Plymouth in 1620, the colonial population of New England grew rapidly and displaced many coastal Indians. By 1670, the 52,000 colonists of southern New England outnumbered natives by three to one. As colonial populations grew, they pressed farther inland, seizing Indian land through dishonesty and allowing unfenced livestock to spoil Indian crops. At the same time, Puritan clergy sought to convert Indians to Christianity by placing them in “praying towns” where their beliefs and behaviors could be closely monitored. Led by the Reverend John Eliot, the praying towns held 1,600 natives by 1674.

In March 1675, the colony of Plymouth accused three Wampanoag Indians of the murder of a praying town Indian and colonial informant. When the three were tried and hanged three months later, the Wampanoag sachem Metacom (known to the colonists as King Philip) retaliated against the town of Swansea. Throughout the summer of 1675, the conflict escalated from an isolated incident into a regional war. Massachusetts and Connecticut came to the aid of Plymouth and launched indiscriminate attacks on a number of native peoples, which caused the powerful and previously neutral Narragansetts to ally with the Wampanoags. Over the next few months, the Indians gained the upper hand, using flintlock muskets to launch a total war. Before the end of 1675, Indians had attacked 52 of the region’s 90 towns, destroying buildings, murdering entire families, and obliterating 12 entire settlements.

In early 1676, colonial leaders forged an alliance with the Pequots and Mohegans and gained the advantage by turning the conflict into an Indian civil war. The colonists also became increasingly aggressive in their warfare. In late 1675, they trapped 300 Narragansetts in the Great Swamp and set them on fire. The colonists also attacked women and children, selling the captives as slaves in the Caribbean. After one battle, Benjamin Church noted that Indians who surrendered “were carried away to Plymouth, there sold, and transported out of the country; being about eight score persons.” True to their Puritan nature, the colonists saw the Indian attacks as God’s punishment for their transgressions. As Mary Rowlandson remarked after several weeks in Indian captivity, “I see the Lord had his time to scourge and chasten me.” By the summer of 1676, the Indians had run out of supplies and when Metacom was killed in battle in August, the rebellion collapsed.

King Philip’s War brought about the death of 1,000 colonists and 3,000 Indians. It also resulted in the abolition of most of the praying towns, as angry colonists attacked, imprisoned, and even sold the Christian Indi-

ans into slavery. Their hegemony over the region secured, the colonists drove the remaining Native Americans to the frontier. After King Philip’s War, Indians became largely invisible in New England, causing many whites to declare mistakenly a number of tribes extinct.

JOHN G. MCCURDY

Knox, John

(c. 1513–1572) *religious leader*

The country of Scotland is well known for its fiery, individualistic spirit, which is combined with a deep loyalty to the Scottish people and their religion. John Knox, the “thundering Scot,” was no exception to this tradition. Knox is best known as the founder of Scottish Presbyterianism, and he lived during a tumultuous time in the history of Scotland. Not known for his tact, Knox viewed himself in the style of an Old Testament prophet, being God’s “trumpet,” blasting against every king and queen reigning during his lifetime.

John Knox was born around 1513 in the region of Lothian, Scotland, to a middle-class farmer. Little is known of his upbringing or education. It is likely that he studied at St. Andrews University in St. Andrews, Scotland. Knox was listed on the rolls in 1540 of St. Andrews as a papal notary, leading most historians to believe that he was ordained to the Roman Catholic clergy by that time. Unlike England to its south, which became Protestant in 1533 under King HENRY VIII, Scotland had remained Roman Catholic. However, many lairds and nobles of Scotland were increasingly influenced by Protestant preaching and thought. In 1543, Knox became a tutor to the two sons of a Protestant-leaning laird named Hugh Douglas. During this time, Knox became a convinced Protestant. In 1544, Knox became a bodyguard for a fiery theologian and preacher named George Wishart. Wishart preached against Catholic cardinal Beaton and Scotland’s queen mother, Mary of Guise, who were aligning themselves with Roman Catholic France against the military might of England under King Henry VIII. Wishart was eventually captured by the Roman Catholics and strangled

and burned in March 1545. The death of Wishart was a turning point for Knox, making him determined to continue the work of Protestant reform in Scotland.

In 1546, men conspired successfully to murder Cardinal Beaton and take over his Castle of St. Andrews. Knox was not involved in the initial conspiracy but came into the castle in 1547, simply as a tutor for three boys. Soon after, he was asked to take over the spiritual leadership of the people in the castle. Agreeing reluctantly, Knox preached his first sermon in the castle church in 1547. The castle was eventually forced to capitulate later in 1547 to a fleet of French galley ships and Knox was captured. Knox served two years as a galley slave, then was freed in 1549, and moved to northern England, where he began to preach in Newcastle. In 1553, the Catholic MARY I ascended the throne of England, forcing Knox to flee to Frankfurt, Germany, and eventually to Geneva, Switzerland, home of JOHN CALVIN. Knox greatly respected Calvin's thought and writing and their meeting in GENEVA led to a long period of friendship and correspondence.

Knox became increasingly convinced that the only way for England and Scotland to have freedom for Protestant worship was by military intervention. He began writing pamphlets, the most controversial of which was entitled "A Faithful Admonition to the Professors of God's Truth in England." In it, he called the preachers to rebuke more aggressively those leading sinful lives, but then went on to thunder against Queen Mary I of England, who at the time was considering marriage to the Roman Catholic king PHILIP II of Spain, charging her with usurping the government and handing it over to a foreign ruler. This pamphlet proved influential in strengthening the Protestant resistance to Mary I, which continued to her death in 1558 when her Protestant half sister ELIZABETH I took the throne of England.

In 1557, Knox published his most famous pamphlet, entitled "The First Blast of the Trumpet against the Monstrous Regiment [unnatural reign] of Women." Arguing from the Old Testament, Knox contended that it is wrong for a woman to be the head of state, especially turning over the reign of a country to a foreign husband. While there were exceptional times when a woman could reign, he felt that the normal result was disaster.

In 1559, Knox returned to Scotland via England, where he received a frosty reception from Queen Elizabeth. By this time, Scotland had several influential Protestant nobles who could protect Knox. Knox was called to serve in St. Giles, the most important church

John Knox reproving the ladies of Mary, Queen of Scots' court, painting by W. T. Roden; Knox helped establish Protestantism in Scotland.

in Edinburgh, where the queen mother, Mary of Guise, and her daughter, Mary, Queen of Scots, lived. In 1560, a treaty was signed by England, Scotland, and France, and as a result, Scotland became officially Protestant, though Queen Mary remained Roman Catholic. Thus began 12 years of conflict between Knox and Queen Mary, often resulting in public rebukes on both sides.

From 1560 till his death in 1572, Knox did much to establish the Protestant church in Scotland, from which the current Presbyterian Church takes much of its form. He was a tireless preacher but also organized a system of discipline for both pastors and church members. Knox was against any practice not found directly in the Bible (such as kneeling during communion or devotion to the saints). He also organized a system of financial help for the poor, out of funds raised for the churches. Knox married his wife, Marjory (Bowes), around 1555. Marjory bore him two sons (Nathaniel, Eleazer) but died in 1560. He married a second wife, Margaret (Stewart), in 1563, who bore him three daughters (Martha, Margaret, Elizabeth). He died November 24, 1572.

Kongo kingdom of Africa

The kingdom of the Kongo (Kongo dya Ntotila) flourished along the Congo River in the west-central coast of Africa from about the 14th century. The kingdom covered a large part of what is now the Democratic Republic of Congo, but the king (the *manikongo*) lived in what is now Angola.

King Nimi, from near present-day Boma, conquered the Congo Plateau. He and his followers married into the local elite and he was accepted as ruler of the region. The wealth of Kongo was based on trade in ivory, hides, and slaves, and it also used a shell currency popular in western Africa. In 1482, King João II of Portugal sent an expedition, under the command of Diogo Cão, to explore the west coast of Africa, and they reached the Congo River in the following year. Diogo Cão sent a delegation to see the fifth king of the Kongo, Nzinga-a-Cuum (or Nzinga Nukuwu), who was living at Mbanza (São Salvador do Congo). Nzinga-a-Cuum asked Cão to take charge of a young relative, Caçuto, and others, and take them back to Lisbon to receive a Christian education. Caçuto learned Portuguese and much about Portuguese and European history, also converting to Christianity. At Bela in 1489, he was baptized and took the name João Silva, after King João II of Portugal, and Pire Silva, a court official who had served as his godfather. Caçuto then returned to Mbanza.

Nzinga-a-Cuum had become wary of the Portuguese. Possibly worried about Portuguese military power, Nzinga-a-Cuum converted to Christianity, becoming King João I of the Kongo. However he had long practiced polygamy. After his baptism, he returned to his many wives and disowned his son, who, with his mother and other members of the family, sought the protection of the Portuguese. When his father died in 1506, Afonso returned to Mbanza, was crowned, and then set about converting his people to Catholicism. He regularly corresponded with King Manuel I of Portugal and sent over more of his subjects to Lisbon to receive a European education.

When Afonso I of Kongo died in 1542, his son and successor Pedro I became the next king; he was succeeded briefly afterward by Francisco I (Mpudi a Nzinga Mvemba). Pedro became king again briefly. A nephew, Diogo, disputed these two rulers and staged a rebellion against Pedro and then Francisco and then Pedro again. He forced Pedro to seek sanctuary in a Catholic church, where he wrote and pleaded for help from King JOÃO III THE PIOUS of Portugal and from the pope. Diogo came to the throne at a time when some Portuguese traders were eager to expand the slave trade, and Diogo was

eager to profit from this. When he died in 1561, his illegitimate son, Afonso II, succeeded him, and a violent succession crisis broke out.

While he was attending Mass within months of becoming king, Afonso II was murdered by his brother Bernardo. Bernardo I reigned for six years. His successor, Henrique I, was king for a year before being forced to flee when the neighboring kingdom of Jagas invaded Kongo. Henrique was succeeded by Alvaro I, who reigned for 19 years and brought some stability to the country. Alvaro I also stepped up the slave trade and sent as many as 14,000 slaves annually to Brazil. Finally Antonio I, who became king in 1661, quarreled with the Portuguese over control of the slave trade. In 1665, he gathered his supporters and met the Portuguese in battle at Mbwila. He was wounded in the fighting, captured, and subsequently beheaded. After 1678, after a violent internal civil war, the kingdom of Kongo rapidly fragmented into a number of warring states. The kings of Kongo—descended from Afonso I—did, however, continue to hold court and conduct ceremonial functions. Henrique III, Afonso Nlengi, reigned from 1793 until 1802, and the male line continued until Pedro VII, Afonso, died in 1962, whereupon Isabel María da Gama became the regent. Although some people wanted to restore the Kongo monarchy, when Angola gained its independence in 1975, the new government refused to recognize its existence.

JUSTIN CORFIELD

Koprülü family

Four different members of the Koprülü family served as grand viziers in the OTTOMAN EMPIRE during the 17th century. Of obscure Albanian origins, Mohammad Koprülü had a fairly inauspicious career in the vast Ottoman bureaucracy until 1656, when he was appointed grand vizier. He soon distinguished himself as an able, efficient, and honest administrator. Mohammad removed corrupt officials from office and oversaw the defeat of major

rebellions in the Anatolian Peninsula and the Balkans. He also reinstated rigorous adherence to the law.

Before his death in 1661, Mohammad recommended that his son Ahmed (Fazil Ahmed Koprülü) succeed him as grand vizier. Ahmed (served 1661–76) proved to be as able an administrator as his father and continued to strengthen the empire. Led by Kara Mustafa, Ahmed's brother-in-law, the Ottomans moved in 1683 to regain their ascendancy in Hungary and lay siege to Vienna, the city SULEIMAN I THE MAGNIFICENT had failed to take in 1529. Reinforced with troops from Poland, the Habsburgs, now equipped with heavy artillery, defeated the Ottomans, who were forced to retreat to Belgrade. Upon the sultan's orders, Kara Mustafa was then assassinated.

In 1689, Ahmed's brother Mustafa was appointed grand vizier and continued the family tradition of honest administration; Mustafa reduced some taxes—a popular policy—as well as instituting other economic reforms. Although a devout Muslim, Mustafa was also known for his religious tolerance and fair treatment of the large Christian minority populations in the empire and he became known as “Koprülü the Virtuous.” However, his tenure as grand vizier was short as he died fighting with Ottoman troops in the Balkans in 1691.

In 1697, Sultan Mustafa II sought to restore Ottoman power by appointing Husayn Koprülü as his grand vizier. His tax policies enabled the Ottomans to raise and equip a large army and fleet to protect territory in the Balkans; Husayn served as vizier until 1702 and another Koprülü became vizier for a short time in 1710. But even the reforms and efficiency of the Koprülü viziers failed to halt the decline of the Ottoman Empire and the gradual loss of territory to Russian and other European enemies.

JANICE J. TERRY

Korea, Japanese invasion of

Japanese warlord TOYOTUMI HIDEYOSHI dreamed of conquering China and launched two invasions of Korea,

in 1592 and 1597, in order to do so. Although he ultimately failed, the wars inflicted terrible devastation on Korea. Because as its overlord the Ming dynasty in China sent a large army to aid Korea, the war also considerably weakened the Ming dynasty.

In the 16th century, Japan underwent constant civil wars as the Ashikaga Shogunate weakened and various feudal lords sought supremacy; in fact this period was called the “Warring States” era in Japanese history. Hideyoshi was an ambitious general who rose from obscurity. By 1590, he had destroyed all rival lords and unified Japan, freeing him and his large army to conquer new lands. His target was China and to reach China he needed passage through Korea. When Korea refused his demands he led an invading army of 160,000 men, landing on the southern tip of the peninsula and advancing northward. The inferior Korean army was overwhelmed, King Sonjo abandoned his capital city Seoul and fled, and his two sons were made captives.

The Korean cause was saved from complete ruin by the emergence of Admiral Yi Sun-sin, who built a fleet of “turtle ships,” the world's first wooden ships with steel plating, which repeatedly defeated the Japanese navy, thus disrupting their supply lines. Meanwhile, China responded with 200,000 troops, who captured Pyongyang and pursued the Japanese forces southward until they only held the southern tip of the peninsula. Peace negotiations proved fruitless and were broken off because China demanded that Hideyoshi acknowledge Chinese overlordship while Hideyoshi demanded a part of Korea to be ceded to him, the marriage of a Ming princess to the Japanese emperor, and Korean princes as hostages.

Undaunted, Hideyoshi launched a second invasion in 1597 but proceeded no farther than Korea's two southernmost provinces because both the Koreans and the Chinese relief army were prepared. When Hideyoshi died in 1598 his army quickly returned home. In 1606, TOKUGAWA IYASU, the new shogun of Japan and Hideyoshi's successor, made peace with Korea.

The two Japanese invasions inflicted terrible sufferings on the Koreans. Whole areas were devastated and depopulated and many historical sites and libraries were burned. The YI DYNASTY of Korea never fully recovered its authority and the country its prosperity. The retreating Japanese moreover took many looted treasures and took as prisoners men with skills, most notably Korean potters, who built up Japan's ceramics industry. Hideyoshi's dream of ruling Japan died with him because his son was too young to rule, allowing

another feudal lord, Tokugawa Ieyasu, who had not participated in the Korean campaigns, to seize power. Finally the cost of the war weakened the already declining Ming dynasty in China. Additionally, the sending of a large army to Korea denuded southern Manchuria of Ming garrisons and paved the way for the rise of the Manchus.

JIU-HWA LO UPSHUR

Landa, Diego de

(1524–1579) *Spanish Franciscan friar*

Among the first Spaniards to venture into the Maya heartland of the Yucatán Peninsula, the Franciscan friar Diego de Landa owes his fame, and infamy, to two distinct but related actions. His infamy rests on his systematic destruction of dozens of Maya texts (or codices) and thousands of Mayan idols in his crusade to extinguish idolatry and spread Christianity among the Maya in the 1560s—a crusade accompanied by tortures, burnings at the stake, and many other atrocities against the region’s indigenous inhabitants. Yet Landa was also among the earliest experts on Mayan language and culture, his *Relación de las cosas de Yucatán* (*Account of the Things of Yucatán*, 1556) representing a landmark document that provided an exceptionally vivid, detailed, and important description of Maya language and culture, and that proved key in the eventual decipherment of ancient Maya texts in the second half of the 20th century. Landa thus occupies a peculiar and highly ambiguous position as both the most important early destroyer and preserver of knowledge on the prequest Maya of Yucatán.

Born in Cifuentes, Guadalajara, Spain, on March 17, 1524, Landa entered the Franciscan monastery of San Juan de los Reyes in Toledo in 1540. Nine years later he journeyed to Yucatán as part of the broader missionary effort to convert the New World’s indigenous inhabitants to Christianity. His first several years were spent at the monastery at Izamal, learning Mayan, revising an

existing grammar, and undertaking the routine duties of Franciscan missionaries: preaching, tending to the sick, performing sacraments. Growing restless, Landa sought and received permission to venture alone into the interior, where he spent many months wandering through large parts of the peninsula and acquiring intimate knowledge of Mayan language and culture.

In 1553, he returned to the monastery at Izamal and supervised the construction of a permanent structure at the prominent Maya religious center. Eight years later, in 1561, the General Chapter of the Franciscans appointed the 37-year-old Landa as the region’s first provincial. By 1562, Landa had overseen the construction of 12 monasteries and the baptism of thousands of Maya, who Landa believed had abandoned their idols and embraced the Christian faith.

In May 1562, a chance discovery of a cave near the village of Maní containing numerous idols and human skulls launched Landa on a crusade to extirpate, once and for all, idolatry among the natives. Employing a torture technique known as the *garrucha*, or hoist (in which the individual was bound at the wrists, hoisted into the air, and lashed, sometimes with large stones attached to the feet and hot wax hurled onto the body), the friars gained numerous “confessions” from the natives on their continuing adherence to non-Christian religious beliefs and practices. Soon afterward, on Sunday, July 12, 1562, the friars celebrated a massive auto-da-fé at Maní, in which great piles of idols (including at least 27 Maya manuscripts, or codices) were set to the torch, and various

punishments meted out to offenders against the Christian faith, including floggings, incarceration, and fines.

The inquisition continued for the next three months. Altogether an estimated 4,500 natives were tortured, with many hundreds left permanently disabled and 158 dying in consequence of the interrogations. Landa's illegal and unauthorized excesses led to a prolonged power struggle with the region's bishop, Francisco de Toral, whose authority he was charged with usurping. Ordered back to Spain, he was absolved by the Council of the Indies, and in 1573 he returned to Yucatán as second bishop of Mérida, in which capacity he served until his death on April 30, 1579.

MICHAEL J. SCHROEDER

Las Casas, Bartolomé de

(c. 1474–1566) *Spanish priest, bishop, historian*

One of the most influential figures in the history of Latin America, the Spanish priest and historian Bartolomé de Las Casas became known as the “Apostle of the Indians” for his impassioned and relentless moral condemnations of the excesses of violence and cruelty perpetrated by Spanish conquistadores and *encomenderos* against the native inhabitants of the Americas. His book, *The Devastation of the Indies: A Brief Account*, first published in 1552, caused a sensation across Spain and at the highest levels of church and state. Translated into many languages, it also formed an important component of the “Black Legend” of Spanish atrocities, a perspective that continues to hold enormous sway in considerations of the Spanish impact on the Americas. An indefatigable writer and activist, he continued writing, publishing, and speaking in favor of Indian rights from 1514 until his death in 1566. His writings were an important element of later Enlightenment discourses on the universality of human rights and continue to reso-

nate among liberation theologians, human rights activists, and indigenous rights activists across Latin America more than 450 years after his “brief account” was first published.

Born in Seville in 1484, son of a well-to-do merchant, Las Casas first came to the New World in 1502, at age 18, in the company of his father and some 2,500 other adventurers in the fleet of Nicolás de Ovando. Around 1506–07, he returned to Europe, was ordained a deacon in Rome, and returned to the Indies, where he was granted an *ENCOMIENDA*. In 1512, he became the first priest ordained in the Americas. Over the next two years, an *encomendero* himself and eyewitness to the forced labor, enslavement, and violence that characterized the CONQUEST OF THE CARIBBEAN, he gradually came to an understanding of Spanish actions that diverged radically from that of the vast majority of his countrymen. His first public condemnation of Spanish excesses was in a Pentecost Sunday sermon in 1514. Freeing his own Indians, henceforth he preached incessantly about the evils of *encomienda* and other forms of forced labor and violence, making many enemies in the process.

In 1520, King Charles granted him an official hearing to expound his views and defend himself against his many detractors. A handful of other ecclesiastics, most notably Antonio de Montesinos and Juan Quevedo, had been advancing similar arguments. The king sympathized with Las Casas's position and decreed that the Indies would henceforth be ruled without recourse to force of arms—an unenforceable edict that was largely ignored. After a failed attempt to establish an economically self-sustaining Indian commune in Venezuela, in 1522 Las Casas became a Dominican monk.

Over the next four decades, he wrote prolifically and became an obsessive collector of documents that later proved of inestimable value to scholars. He was instrumental in persuading the king to issue the New Laws of 1542, which placed severe restrictions on *encomienda*, sparked furious resistance by *encomenderos* across the empire, and were repealed in 1545–46. In 1544, he was appointed bishop of Chiapas (Mexico), where he continued his work on behalf of the Indians. Three years later, in response to mounting opposition to the radical bishop, the Council of the Indies recalled him to Spain.

In 1550, came one of the most memorable and important public debates in early modern Europe, on the question of the morality of Spain's actions in the Americas. Pitting two intellectual giants—Las Casas versus the eminent humanist JUAN GINÉS DE SEPÚLVEDA, who argued from Aristotelian premises that Indi-

ans were “natural slaves” and that Spanish actions were therefore just and appropriate—the great debate of Valladolid failed to resolve the question, even though most council members sided with Las Casas. In the coming years, he wrote many other works of enduring historical importance, most notably his *Brief Account* (1552), *Apologética historia*, and *Historia de las Indias* (3 vols., first pub. 1875–76). He continued denouncing the institution of *encomienda* and Spanish cruelties and championing Indian rights until his death in July 1566. His body was interred at Our Lady of Atocha in Madrid.

MICHAEL J. SCHROEDER

Lebna Dengel

(1508–1540) *Ethiopian ruler*

Emperor Lebna Dengel of Ethiopia, also known as Dawit II, or David II, was one of the celebrated Christian kings of Ethiopia. Lebna Dengel succeeded to the throne of Ethiopia at the age of 12, partly through the maneuverings of his grandmother, the empress Eleni. The empress was the daughter of King Hadiya, a Muslim, and she officially served as Lebna Dengel’s regent. Eleni had begun her rise to power when she became one of the four wives of Zara Yakob (1438–68) in 1445, thereby joining her prominent Muslim family with the Christian family of Zara Yakob. As one of the celebrated evangelizing emperors of Ethiopia, along with Amda Tseyon (1314–44) and Sayfa Arad (1344–72), Zara Yakob holds a unique place in Ethiopian history. When he built a new royal residence at Debre Berhan, Eleni, who had converted to Christianity, established a church on the grounds.

Zara Yakob died after designating his young son Ba’eda Maryam (1468–78) as his heir, and Eleni became even more prominent in Ethiopian politics. Since his mother was dead, Ba’eda Maryam designated Eleni, to whom he was close, as the queen mother and chose her to serve as his regent. Eleni also served in this capacity

during the troubled reign of her son Na’od (1494–1505), who had succeeded his half brother Ba’eda Maryam to the throne. When Na’od was killed in a battle against the Muslims, his son Lebna Dengel was only seven years old. Throughout much of the late 15th and early 16th centuries, Eleni served as the power behind the Ethiopian throne, essentially serving as the reigning monarch. As a devout and active Christian, Eleni is credited with founding the modern church of Ethiopia. Although her exact birth date is unknown, Eleni was born sometime in the 1430s and died in the early 1520s in her 90s.

While Christians and Muslims coexisted in Ethiopia during Lebna Dengel’s reign, it was far from a peaceful relationship. In 1516, when the emir Mahfuz of Haran invaded the Ethiopian highlands, Lebna Dengel ambushed the invaders and continued to press his advantage by killing the emir and following them back to Haran, where he again attacked. Lebna Dengel returned to his home a hero, convinced that the Muslims would no longer threaten Ethiopian Christians. He was fatally wrong. Suspecting that a Muslim attack was imminent, Eleni sent out a plea for assistance from Portugal. Consequently, in 1520, a Portuguese expeditionary force arrived in Ethiopia, led by Dom Ridrigo da Lama. Despite the presence of the Portuguese in Ethiopia, in March 1529, Muslim forces under AHMED IBN GHAZI (c. 1507–43), popularly known as “the Gran,” triumphed over Lebna Dengel’s forces. By 1531, Muslim forces were in control of Ethiopia and remained so until 1543.

During the Muslim invasion, Christian Ethiopians had been forcibly converted to the Muslim faith, to which they were forced to swear allegiance. In reality, Christian Ethiopians remained steadfast in their own faith. During the period of Muslim dominance, Emperor Lebna Dengel actively resisted all efforts to make him renounce his faith. When Ahmed ibn Ghazi demanded the hand of Lebna Dengel’s daughter in marriage, warning Lebna Dengel that he had no other course than to comply, the emperor summarily refused. Assuring the Gran that he would not allow his daughter to marry a nonbeliever, Lebna Dengel wrote to him that he was determined to retain his trust in the Lord rather than in the Gran. Afterward, Lebna Dengel’s faith was repeatedly tested as he was forced to flee for his life. For the rest of his life, he was often hungry, uncomfortable, and in physical danger.

Lebna Dengel was still hiding from Muslim forces when he was killed in battle on September 2, 1540, near the monastery of Dabra Dam in Tigre. Subsequently, the tide turned for Christian Ethiopians. Lebna Dengel had appealed to Portugal for assistance in 1535, but

help did not arrive until after his death. The emperor Galawdewos (Claudius) succeeded to his father's throne, and the Ethiopian Empire was restored with the help of the Portuguese who arrived in Ethiopia in 1541. This force of 400 Portuguese musketeers was led by Cristóvão da Gama, the son of the celebrated explorer VASCO DA GAMA.

After Lebna Dengel's death, his son Galawdewos, assisted by the Portuguese musketeers, led an attack in which the Gran was killed in 1543 in a battle near Lake Tana. Once the Muslims were ousted, the Christians performed a penitential and reinstatement ceremony and proclaimed the return of Christianity to Ethiopia. Although the Muslims had been ousted from Ethiopia, the Gran's widow, Bati Del Wambara, continued raids on the Christians. Galawdewos was killed in battle in 1559, and the Muslims triumphantly displayed his head on a stake.

Many of the Portuguese who survived the various battles remained in Ethiopia when the troops pulled out of Ethiopia in 1547. They were soon joined by a group of Jesuit missionaries. The presence of the Portuguese was evident in Ethiopia in a number of ways since the Portuguese government fully intended to retain a certain amount of power in the country. The Portuguese taught the Ethiopian soldiers how to use firearms and converted a number of locals to Western Catholicism. By the mid-17th century, however, the Ethiopian government had expelled the Jesuits and denied other missionaries admission to the country. For the next two centuries, Ethiopia rejected all foreign overtures, preferring to exist in isolation.

ELIZABETH PURDY

Le dynasty of Vietnam

The Le dynasty ruled Vietnam from 1428 to 1788, the longest reign in Vietnam's history. Le Loi, the founder of the Le dynasty, who ascended the throne as Le Thai To, is one of the most celebrated heroes in the country. He is credited with freeing the country from Chinese

Ming domination in 1428. Le Loi was an aristocratic landowner. He was helped by Nguyen Trai, a Confucian statesman, poet, and military strategist. Vietnam would maintain peaceful relations with China as a vassal state for more than 300 years.

Le Thanh Tong, who ruled Vietnam from 1460 to 1497, is the second-most significant ruler of the Le dynasty. He reorganized the administrative divisions of the country and upgraded the civil service system. He ordered a census of people and landholdings to be taken every six years, revised the tax system, and commissioned the writing of a national history. He completed the conquest of Champa in 1471 and quelled Lao-led insurrections in the western border area. He also ordered the formulation of the Hong Duc legal code, which was based on Chinese law but included distinctly Vietnamese features, such as recognition of the higher position of women. Under the new code, parental consent was not required for marriage, and daughters were granted equal inheritance rights with sons. He also initiated the construction and repair of granaries, dispatched his troops to rebuild irrigation works following floods, and provided medical aid during epidemics. He also encouraged and emphasized the Confucian examination system. Thus his reign was a golden age of literature and science.

Le Thanh Tong presided over a great period of southward expansion. The *don dien* system of land settlement, borrowed from China, was used to develop territory wrested from Champa. Military colonies were established and soldiers and landless peasants moved to and cultivated a new area and served as a militia to defend it. After three years, the village was incorporated into the Vietnamese administrative system, a communal village meetinghouse (*dinh*) was built, and the workers were given an opportunity to share community land granted by the state to each village. The remainder of the land belonged to the state. As each area was cleared and a village established, the soldiers would move on to clear more land. This method contributed greatly to the success of Vietnam's southward expansion and eased the land hunger of the peasants. As the Le dynasty declined, landlessness contributed to the turbulence as the peasants rose up in revolt.

Under the Le dynasty there was a division between state and local responsibilities in government. The central government was responsible for military, judicial, and religious functions, while village authorities oversaw the construction of public works projects such as roads, dikes, and bridges. The autonomy enjoyed by the villages, however, contributed to the weakness of

the Vietnamese political system. If the dynasty could not protect a village, the villages would often support a rebel movement, which then had to provide security and to institutionalize their political power. Although it ensured the preservation of a sense of national and cultural identity, the strength of the villages was a factor contributing to the political instability of the society as it expanded southward.

Beginning in 1527, Vietnam came under the control of two families, the Trinh, dominant in the northern, and the Nguyen in the southern part. Their military and political rivalry destabilized Le dynasty and brought its end in 1788. The new Nguyen dynasty ruled Vietnam into the modern period.

JITENDRA UTTAM

Leo X

(1475–1521) *pope*

Pope Leo X was born Giovanni de' Medici in Florence on December 11, 1475, and died in Rome on December 1, 1521. He was the second son of Lorenzo the Magnificent. He became abbot of Font Douce in France in 1483, at the age of eight. Under political pressure by Lorenzo Giovanni, he was made a cardinal at age 13 by Pope Innocent VIII. His family's political dealings caused friction in late 15th century Italy, and Giovanni fled to France at the election of Pope Alexander VI. He was captured by the French army at the defeat of the combined papal and Spanish armies in 1512 at Ravenna, probably for purposes of ransom. Giovanni was elected pope on February 21, 1513, at age 38, again because of the political pressures of his family on the college of cardinals. He lived a lavish life and expended the papal treasury within two years of his election; he also sold offices within the church to raise money to support the papacy.

This practice, known as simony, led in part to the REFORMATION in Germany and other parts of Europe. The reformers argued against the selling of church offices and indulgences, practices taken up by Leo X and

other popes and bishops. Leo never recognized the gravity of the Reformation, and the Counter-Reformation did not come about until after his death. He was a great patron of the arts and prepared a critical edition of the works of Dante. His greatest contribution was his support of the collection of historical Christian manuscripts and the merging of the Medici family library with the papal library.

JAMES RUSSELL

Leo Africanus (Hassan El Wazzan)

(c. 1494–1554) *Moroccan traveler*

Leo Africanus exemplified the positive cross-cultural exchanges between the Muslim and Christian worlds in the 15th and 16th centuries. Hassan El Wazzan was born circa 1494 in Granada during the last years of Muslim rule in Spain. His family, following the example of BOABDIL, the last Muslim ruler of Granada, went into exile to Fez in present-day Morocco around 1502 after the final Reconquista of the Iberian Peninsula by Christian forces.

Leo Africanus received a classical Islamic education at the well-known Quarawin (Kairaouine) mosque and university in Fez. He worked for a short time in a *maristan*, a combination hospital and asylum for the mentally ill. While in his teens, he accompanied a relative on major diplomatic missions within Morocco and Africa. Leo Africanus lived during an age of political and cultural changes. He twice visited the famed city of Timbuktu, as well as much of the Sudan in western Africa (Mali and Mauritania), Constantinople, and Cairo, where he saw the defeat of the Mamluks by Ottoman forces.

In 1518, the ship he was traveling on from Egypt to Tunis was captured by Portuguese Christian pirates (corsairs); however, owing to his learning and diplomatic experience he was not sold into slavery as a galley slave but was given to Pope LEO X as a gift. The pope made use of Leo Africanus's knowledge of Arabic and the Muslim world in his dealings with

other Mediterranean political powers. While under the patronage of the pope, Leo made what was probably a conversion of convenience to Christianity and was baptized Johannes Leo de Medici in Italy.

His Latin/Hebrew/Arabic dictionary indicates the centrality and common use of these three languages by the educated elite in the 16th century. He also wrote a compiled description of 30 famous Arab thinkers, but the *Cosmographia del’Africa* (Description of Africa) written in a corrupt form of Italian from Arabic notes in 1526, is Leo’s most famous work. It was translated into English and published in London in 1600 and served as a major resource on African societies for hundreds of years. His descriptions, especially of Timbuktu, fueled Western imaginations about Africa while his life may have been a model for Shakespeare’s *Othello*. After the death of his patron Pope Leo X and the accession of Adrian VI in 1521, Leo fell out of favor. It is not known for certain but following the sack of Rome in 1524, Leo may have left Italy for North Africa, although it is likely he returned to Fez, where he died around 1554.

literature

The literature of this period was characterized by several trends: The growing humanism of the Renaissance and Enlightenment led to a revival of classical themes and concepts as well as an interest in social commentary (and with it, the writing of a number of sophisticated satires), and the invention of the printing press made the distribution of literature easier. The combination of these factors with the exploration of the New World also led to a number of significant translations of the Bible, of which the Gutenberg Bible is the most famous. Johannes Gutenberg, who invented the movable type printing system in 1450, published his Bible in 1455. In Gutenberg’s case, no new translation was done—he used the Latin Vulgate text in use by the church.

The most important translation of the Bible from the period is undoubtedly the King James Version,

which represented one of the largest scholarly undertakings of the era. King JAMES I of England proposed the new translation in order to settle disputes caused by extant versions, and to define a canonical text for the Church of England. The first King James Version (KJV) was produced 10 years later, in 1611, and revisions continued to be issued for the next century and a half; the KJV in circulation today is the 1769 edition.

In 1516, the Dutch theologian ERASMUS OF ROTTERDAM published a new Latin translation of the Bible, correcting some of the translation errors of earlier editions. He had previously written *The Praise of Folly*, a satire of the corrupt practices of the Roman Catholic Church. Erasmus was a devout Catholic, dismayed when *Folly* became his most popular work, becoming part of the corpus of the Protestant Reformation. His friend SIR THOMAS MORE, the Englishman, published *Utopia* alongside Erasmus’s Bible. *Utopia* was named for a fictional island, a “perfect society” (though not at all More’s ideal society) in which religious tolerance is the norm, divorce is easily obtained, women can become priests—a catalog of liberal reforms that More disapproved of and apparently wanted to cast in a comical light. Like *Folly*, it may have had an effect the author did not intend, as his work often seems reasonable.

Other significant editions of the Bible included MARTIN LUTHER’s 1534 German translation, which helped to further and define the modern German language, and John Eliot’s 1663 translation into the Algonquin language, a Bible he used as a missionary in his efforts to convert the Native Americans in the Massachusetts area.

John Bunyan wrote his allegorical novel *The Pilgrim’s Progress from This World to That Which Is to Come*, published in 1679, while serving a prison sentence for holding religious services without the blessing of the Church of England. The novel presents in a plain style the journey of the protagonist, Christian, in the form of the city of Zion, and unlike much of the devotional literature that came before it, it reflects Bunyan’s strictly Protestant theology.

Vernacular language in general became more and more popular across Europe. The Byzantine romances written in vernacular Greek continued to be popular in the 15th century as they had been in the previous two. Cretan literature developed shortly thereafter, characterized by the use of realistic dialogue that incorporated loan phrases from Latin and Italian into regional dialect. The best-known piece of literature from this Cretan renaissance is the *Erotokritos* of Vincenzo Cornaro. Published in the early 17th century, the *Erotokritos*

consists of just over ten thousand 15-syllable rhyming lines of verse, about the two lovers Erotokritos and Aretousa, princess of Athens. The use of modern language in a deft and structurally impressive poem helped to bring power and respect to Cretan literature.

William Shakespeare (1564–1616) is of course the best known dramatist and poet of his era; in his lifetime he was respected but not revered (reverence was reserved for Edmund Spenser). His contributions continue to form a major part not only of Western literature but also of British national identity. His plays included comedies, tragedies, and histories, drawing on classical sources as well as older plays and (in the case of his histories) Thomas North's 1579 translation of Plutarch's *Parallel Lives*. Characteristic of Shakespeare's work is the combination of great literary merit, complexity, and nuance with subject matter of broad appeal (sex, lust, seduction, murder, betrayal, and revenge). His later works, such as *The Tempest*, incorporate magic and the fantastic to a greater degree than the earlier, more realistic pieces. His reputation as the greatest English-language playwright began in the late 17th century, thanks to his compatibility with the romantics, and continues to this day.

Close friends of Shakespeare included satirist Ben Jonson (whose comedies, unlike Shakespeare's, were generally set in London) and dramatist Kit Marlowe, whose *Tragical History of Dr. Faustus* was the first dramatic adaptation of the Faust legend. While it is believed that Shakespeare came from a family of secret Catholics, Marlowe is often thought to have been an atheist.

Edmund Spenser (1552–99) was the most respected poet of his day, the first master of modern English, whose *Faerie Queene* was not only a work of great art but an allegory about the Tudor dynasty. Spenser was outspoken in his political views and called for the outright destruction of Irish culture in order to bend the Irish to English will, going so far as to recommend forced famines to weaken the native spirit.

Published in two parts at the start of the 17th century, *Don Quixote* remains the greatest published work of satire. Miguel Cervantes composed his lengthy farce about a knight whose reach exceeds his grasp in response to the Italian epic *Orlando Furioso* and other chivalric romances. But while working within the structure of the works he was spoofing, Cervantes managed to explore much deeper material, by showing the world from two perspectives: the fanciful Quixote's, and that of the jaded Sancho Panza, Quixote's devoted squire. So popular was *Don Quixote* that the book had the same influence on the Spanish language

that Shakespeare had on English, and when an unauthorized sequel came out, Cervantes wrote his own to supplant it, much more serious in tone, almost a philosophical text, in which Quixote gradually recovers his senses and sees the world as it is rather than the outlandish world he perceived in the first part; as his sanity returns, he abandons the ideals of chivalry.

The French author Molière (1622–73) was one of the masters of comedy in the Western tradition, incorporating satire, French high drama, and elements from the Italian *commedia dell'arte*. He brought a new realism to the stage that accounted for his overwhelming popularity, but also the condemnation of moral authorities, who were offended by his irreverence for the church and the earthiness of his material. In addition to Molière, the “big three” of French dramatists included his contemporaries Jean Racine and Pierre Corneille, both tragedians.

Jonathan Swift (1667–1745) was the master of English-language satire, best known today for *Gulliver's Travels* and his essay (often comically misunderstood by students) “A Modest Proposal.” A politically active Irishman, Swift was known for both his patriotism and his biting wit; as fanciful and fantastic as *Gulliver* is, much of it is political satire in the form of a parody of travel narrative.

Another influence on *Gulliver* was *Robinson Crusoe* (1719), the shipwreck novel by spy and journalist Daniel Defoe. In his time, Defoe was just as well known for *Moll Flanders*, who commits virtually every sin known to Englishwomen at the time but is redeemed by the novel's end.

Alexander Pope (1688–1744), an English Catholic poet, found his fame early and quickly became known for his elegant parodies. *The Rape of the Lock* is a mock-heroic epic about a real-life quarrel between two Catholic families, over the unauthorized cutting of a lock of hair.

Sir Thomas Malory's *Le Morte d'Arthur*, published in 1485, is the best-known and most influential piece of Arthurian literature. Malory compiled many French and English legends about Arthur and his supporting characters, including Lancelot (and his romance with Guinevere), the Knights of the Round Table, and the quest for the Holy Grail, popularizing these elements for centuries of readers to come.

Parallel with the compilation and refinement of the Arthurian legends was the development of the Robin Hood legend. The anonymous manuscript *A Gest of Robyn Hode* dates to about 1475 and was the first attempt to weave into a single narrative the various

stories told about the English bandit hero. In these early stories, Robin is more like the pirate and highwayman protagonists of other stories: His enemies may be villainous, but not until generations later is there any mention of robbing the rich to give to the poor. This Robin fights with both sword and bow, and by the 16th century is often called Robert of Locksley. In that same century, Marian is introduced to the legends, and the context of Robin living under the rule of an unjust king while Richard fights in the Crusades is added.

John Milton's 1667 epic poem *Paradise Lost* has been an enormous influence on popular Christianity, casting Satan as the passionate protagonist in a struggle against a tyrannical god. Milton was raised a Puritan and dictated the work while blind from glaucoma, incorporating elements from Virgil and Spenser. Over the course of the poem, which portrays the fall of man, Milton explicitly seeks to "justify the ways of God to men."

The metaphysical poets, including John Donne and Andrew Marvell, were a group of British poets in the 17th century, most of them acquainted with each other, all of them possessed of a fascination with metaphysical concerns and striking metaphors. Their poetry appealed to the reader's intellect and curiosity, rather than emotions or piety.

Although it was not published until five years after his death in 1527, Florentine NICCOLÒ MACHIAVELLI wrote *The Prince* in 1513. A wide-sweeping instructional text on how to govern, the political treatise outlined the ruthlessness and dedication an effective leader needed to possess; the leader is alleged to have been modeled after Cesare Borgia.

CHINA

Yuan Hung-Tao (1568–1610) was the greatest of the three Yuan brothers who composed poetry during the Ming dynasty; his poetry, inspired by his wanderings with the Persian-Chinese philosopher Li Zhi, itself inspired the Gong'an school of poetry, which valued poetry of strong emotions and personal experience. His contemporary Tu Long (1542–1605) was a playwright who believed the same thing, eschewing the formalism of ancient dramatic traditions in favor of a more emotive focus.

The third of the "four classical novels" of Chinese literature was written in this period: The anonymously written *Journey to the West* was published in the 1590s. Today it is best known to Westerners as *Monkey*, the story of a Buddhist pilgrimage to India, reflecting both Chinese folk religion and Buddhist beliefs in the path to enlightenment. The "monkey" of the Western title is

Sun Wukong, a stone monkey martial artist who revolts against heaven and is trapped under a mountain by the Buddha for five centuries, before joining the pilgrimage and finding redemption along the way.

The "fifth of the four," *Jin Ping Mei* (The Plum in the Golden Vase), was also written in this period. The pseudonymous Lanling Xiaoxiao Sheng wrote this full-length, sexually graphic novel sometime in the 16th century. Despite its explicit focus on sex, the novel explores at great length the nature of power and influence among Chinese women.

Fengshen Bang, by Xu Zhonglin, in the 16th century, is a vast epic novel, a sort of Taoist fantasy incorporating fox spirits, talking animals, magic, and legend into the historical story of King Wu's righteous rebellion against the despotic rule of Di Xin during the Shang dynasty.

OTHER LITERATURE

Early colonial American literature largely consisted of recent histories and accounts of colonial life designed to attract settlers, such as John Smith's *True Relation of Such Occurrences and Accidents of Note as Happened in Virginia* (1608), about JAMESTOWN. The first Great Awakening, a nationwide revival of religious fervor, inspired the writings of COTTON MATHER and Jonathan Edwards.

In India, the henotheistic Bhakti movement inspired two schools of epic poetry: the Nirguna, who believed in a formless abstract God, and the Saguna, who believed in a more personal God. The Nirguna school tended to embrace secularism to a greater degree, and it was during this period that Hindu and Islamic elements began to be combined in Indian arts, especially poetry. To the south, in the Tamil country, religious and erotic poetry were popular, and toward the end of our period, an intellectual revival brought about many commentaries on ancient works and a strong interest in the Tamil language, along with its first dictionary (by Veeramaunivar, a missionary who also wrote a Tamil-Latin dictionary and an epic about the life of Jesus). Gosvami Tulsidas (1532–1623) was an Awadhi poet (Awadhi is one of the roots of the modern Hindi language), whose *Ramacaritamansa* is an epic dedicated to Lord Rama, containing many of the proverbs that have remained popular in northern India.

In EDO PERIOD JAPAN, Neo-Confucianism and the study of Western science as introduced by Dutch traders led to an increasingly secular view of the world. Chikamatsu Monzaemon (1653–1725) was the master of *yoruri*, plays performed by puppets, and his Romeo and

Juliet-like “love-suicides” were among the most popular shows of the day. Later in his career he moved to Kabuki, or live actor theater. The haiku flourished at the hand of Matsuo Bashō (1644–94), who wrote crisp and clear verse. One of his best-known poems, composed in 1686, still stands as a popular example of the form, creating a vivid image in very few syllables: “The old pond / a frog jumps in — / water’s sound.”

BILL KTE’PI

Locke, John

(1632–1704) *social and economic theorist*

Of all of the thinkers of modern times, few have had the wide impact of John Locke. Locke was born in Wrington, in Somerset, England, on August 29, 1632, during the political ferment that preceded the English Civil War (1642–49). At the time, CHARLES I was ruling without Parliament and exercising his firm belief in the doctrine of the divine right of kings. This basically held that the king, anointed with holy oil at his coronation, was the representative of God on Earth and thus could commit no wrong in his rule. The idea of limiting the power of the monarch would dominate England through the rest of the 17th century and form the seminal basis of much of Locke’s great work.

Locke’s first significant educational experience was gained in the Westminster School, in 1646, while the English Civil War was at its height. Among noteworthy graduates of Westminster School were Jeremy Bentham (father of the utilitarian school of philosophy), Robert Cotton (founder of the Cottonian Library), England’s great poet John Dryden, and the historian Edward Gibbon, author of *The Decline and Fall of the Roman*

John Locke was instrumental in disseminating the idea that governments were beholden to their subjects.

Empire. At Westminster, Locke was one of the gifted King’s Scholars.

Locke was a junior student at Christ Church College, at Oxford University, in 1652, where he studied medicine, although he did not receive his bachelor’s in medicine until 1674. At Oxford, Locke became acquainted with the leading minds of his day, including Robert Boyle and SIR ISAAC NEWTON. They left an indelible imprint upon Locke, who had found the medieval approach of studies of the ancient Greek philosophy Aristotle to be sterile and devoid of meaning for his times. Initially, there was little to indicate that Locke would make his greatest contribution to the emerging study of the philosophy of politics. In 1666, while at Oxford, Locke met Anthony Ashley Cooper, the later earl of Shaftesbury, certainly one of the boldest—and most unscrupulous—figures in the great age of English political intrigue.

As Shaftesbury’s ambition launched him on what became a drive for power, Locke loyally followed his patron. Shaftesbury’s eventual fall from grace led Locke to return to complete his studies at Oxford for his bachelor’s degree in medicine. This was followed by a 15-month tour of France, which may have been occasioned in part by his close identification with the fallen earl. In Holland, Locke

actively joined English exiles seeking to bring down King Charles and his brother. Charles's agents infiltrated the group. When Charles II died in 1685, JAMES II began a reign that would lead to the GLORIOUS REVOLUTION and the rule of William and Mary.

It is likely that Locke, with his wide contacts, played a role in the intrigue that came to a climax upon William's and Mary's landing in England. The extent of Locke's role in the machinations seems clear from the fact that he sailed on board the same ship with William and Mary as a close counselor. Back in England, Locke penned two works that would shape the future of philosophy and government. In *An Essay Concerning Human Understanding* (1690), he posited that human beings gain almost all knowledge through experience. Consequently, Locke became one of the founders of the empirical school of knowledge. In helping to propagate the empirical view, he helped shape modern philosophy, removing forever the primacy of the teachings of Aristotle (against which he had rebelled years ago as a student at Oxford) and the medieval view of Thomas Aquinas.

Locke also looked at the political turmoil of his era and attempted to apply his perspective of reason to government. He produced a clearly written document free from the use of biblical Scripture and frequent appeals to ancient guides like Aristotle. Locke's views are related in *Two Treatises on Government*. In the First Treatise, he attacks the divine right of kings, which formed the basis of the governments of Charles I, and to a lesser extent that of his son, James II. The Second Treatise on Government would have important relevance to the American Revolution because America's founders based much of their opposition to the tyranny of George III on the writings of Locke. Locke's theory of government holds that man, once in a state of nature, where arbitrary force ruled, agreed to government as a way to seek protection for all from the willful use of force to dominate them, to replace the law of the jungle with the rule of law.

With his *Two Treatises on Government*, Locke had used the political turmoil of his time to write a document that would transcend his time. No more would people accept willful, dictatorial governing. Instead, all administrations would govern under the revolutionary concept that their government was done by the consent of those they governed. Locke died on October 28, 1704, at Oates in the home of his friends, Sir Francis and Lady Masham.

JOHN MURPHY

Louis XI

(1423–1483) *king of France*

Louis XI, son of Charles VII, was a king of France from the VALOIS DYNASTY that had replaced the Capetian dynasty a century earlier. A schemer whose reputation in history was solidified when Sir Walter Scott condemned him a century later, Louis was nicknamed “the Spider King” for his weaving of webs of intrigue. At age 16, he tried to overthrow his father, Charles VII. The so-called Praguerie—Prague had been the site of similar uprisings—was the second such led by the duke of Bourbon, as the nobility sought to remove Charles from power and replace him with Louis, in response to Charles's limits on noble power and reforms increasing the power of the monarchy. When the revolt failed, the major participants, including Louis, were forgiven after their surrender and submission.

Six years later, Louis was sent to the province of Dauphine to govern and never saw his father again. They continued to plot against each other, and Charles even sent soldiers to retrieve Louis in 1456, but the prince was given shelter by Philip the Good, duke of Burgundy. Charles died five years later, and Louis succeeded him at the age of 38. Two Charleses—Louis's brother the duke of Berry and Normandy, and Philip's son Charles the Bold—led a revolution against Louis, each motivated by the desire to expedite his inheritances and seeking Louis's removal in the name of breaking down the centralized authority of the French monarchy. Like Louis's rebellion against his father, it was unsuccessful—and like the aftermath of that rebellion, the participants were forgiven after submitting to the king's authority.

Louis was the king of France during England's War of the Roses, and since the rebel Charles the Bold was an ally of the Yorkists, Louis supported the Lancastrians, even manipulating events in order to force France's Yorkist king Edward IV into exile. When Edward was restored to power, Louis prevented his planned retaliatory

invasion of France by relinquishing any French claim to the English throne—which became another bone of contention between the king and the nobility. When Louis finally decisively defeated Charles, there were no pardons this time—the rebel was killed in battle and many of his noble supporters executed.

Louis strengthened the monarchy, further limiting the powers of the nobility even as he granted more power to common-born merchants. Though he was poorly remembered, France prospered under him—prosperity it lost under the reign of his son, Charles VIII, a pleasant-natured man called Charles the Affable whose bumbling led to mounting debts, ill-considered wars, and treaties that put the kingdom at severe disadvantage as the Middle Ages waned.

BILL KTE'PI

Louis XIV

(1638–1715) *king of France*

Louis XIV was born in 1638, the son of King Louis XIII and his wife, Anne of Austria, from the HABSBERG DYNASTY. Anne served as regent until Louis XIV began to govern in his own name in 1651. However, he was carefully guided by Cardinal Jules Mazarin, who had been the protégé of Cardinal RICHELIEU. Anne's loveless marriage to Louis XIII fueled the rumor that Louis XIV's father was actually Jules Mazarin, with whom the love-starved Anne shared a romance.

As he settled into his reign, he increased the size of his bureaucracy. To fill expanding government positions, Louis XIV turned toward the middle class. These men, rather than owing their positions to ancestral power, were truly “the king's men”; everything they gained was from the king, and they knew the king could take it away if he became displeased with their service.

Louis XIV began construction outside Paris of his Palace of Versailles, which earned him the name “Sun King.” This not only was a reflection of his wealth and power, but also served to provide distance from the danger of rebellious Paris mobs. The palace itself and its grounds are huge. Under the scepter of the Sun King, Versailles became the cultural capital of Europe. Among many cre-

Perhaps the greatest French monarch, Louis XIV was a shrewd politician and diplomat.

ative personalities stimulated by the cultural atmosphere was the playwright Molière, who, in October 1658, staged his first royal performance before the king.

ABSOLUTIST POLICIES

Louis XIV continued pursuing the absolutist policies of Richelieu and Mazarin. In domestic affairs, JEAN-BAPTISTE COLBERT assured a steady and reliable system of finance for the king, while overseeing spending by the various departments of the French government's budgets. Colbert also became the father of the French navy, establishing a fleet of the best-designed warships in the world, a distinction they would hold until the Napoleonic Wars. What Colbert did for the French navy, Michel Le Tellier, and his son Michel Le Tellier, marquis de Louvois, did for the French army. The combined efforts of these men gave France military might.

In one of the last state acts before he died, Mazarin negotiated peace between France and Habsburg Spain. However, eight years later, Louis XIV began a series of wars that consumed most of the rest of his reign, and

the royal treasury. When Philip IV of Spain died, territory in the Spanish Netherlands was ceded to Charles II of Spain and not to Louis XIV's wife, MARIE-THÉRÈSE, who was Charles's half sister. Louis XIV went to war in 1667 under a claim for the territory in the Spanish Netherlands. Once again, Spain and France were at war.

The Dutch feared that Louis XIV could easily lay claim to Holland, because it too had once been ruled by Spain. In 1668, the Dutch formed the defensive Triple Alliance with England and Sweden against Louis XIV. But Charles II of England signed a separate peace with Louis XIV in 1670 guaranteeing Charles a secret subsidy, which freed him from dependence on the money annually voted him by the British parliament. In 1672, Louis XIV and Charles smashed into the Dutch United Provinces in one of the most devastating invasions in European history. Although Charles left the war in 1674, Louis XIV continued until 1678. He gained more territory in Spanish Netherlands and the strategic border region of the Franche-Comte but was still not satisfied with his territorial enlargement.

EDICT OF NANTES REVOKED

A decade of peace followed, in which Louis continued to assert his royal power both in France and in its colonies. In 1685, Louis revoked the EDICT OF NANTES, which had granted religious toleration to the HUGUENOTS; this caused thousands of them to flee. Consequently, the Huguenots and their children became some of France's most bitter enemies during the wars of the 18th century. Since Jansenist (a sect of the Roman Catholic Church) ideas bore some resemblance to Calvinism, Louis waged war against the Jansenists, even closing their spiritual center, the Abbey of Port-Royal.

In 1688, the diplomatic balance of power in Europe suddenly shifted against Louis XIV. His ally, Charles II of England, had died in 1685 to be succeeded by his Catholic brother, JAMES II. James's religious stance brought on the GLORIOUS REVOLUTION of 1688. James was forced to flee, to be supplanted by his Protestant daughter, Mary, and her husband, William of Orange, the stadtholder of the Dutch Netherlands, who had come to power as a result of Louis's Dutch War. William in the same year brought England into the League of Augsburg with the Dutch Netherlands, then known as the United Provinces, the HOLY ROMAN EMPIRE, and other European powers. With England now part of the coalition to frustrate Louis XIV's European ambitions, the War of the Grand Alliance broke out in 1688; it would continue until 1697.

A major series of battles was fought in Europe, but Louis XIV neglected to support James II fully when James

II attempted to regain his English throne in 1688. A victory by James could have removed William from the throne, thus taking the most relentless adversary out of the coalition. However, the death of Charles II of Spain led Louis XIV to pursue seeing his grandson become King Philip V of Spain. Louis succeeded, only to wreck his diplomatic triumph by decreeing in 1701 that the future rights of Philip and his line were to go to the French Crown. The prospect of a French-Spanish union was something the other powers in Europe could never accept, and the WAR OF THE SPANISH SUCCESSION broke out.

The war devastated both Europe and the European colonies until 1713. Two years later, in September 1715, Louis XIV died. Although he had lived to see his ultimate diplomatic triumph, his Bourbon grandson Philip on the throne of Spain, the cost of his wars had inflicted such a toll that the royal treasury never really could recover before the French Revolution swept the monarchy away entirely in 1789.

JOHN MURPHY

Louis XV

(1710–1774) *king of France*

When LOUIS XIV died in 1715, his great-grandson and heir Louis XV was five years old. The child king's regent was Philippe II, duc d'Orléans, related to the royal Bourbon dynasty. Philippe II, in the period of French history often called "the Regency," became known for a sensational lifestyle. The duke, famous for his sensual appetite, resigned his regency in 1723 largely because of the adverse publicity brought about by his lifestyle that was in effect funded by the French people. He died later that year.

Philippe II's downfall was followed by that of the financial network set up in France by the Scottish economist John Law. Philippe II had employed Law to help the French economy, which had suffered severely from the almost incessant wars of Louis XIV. Law's note-issuing

bank was a spectacular success, until it collapsed after a bank run in 1720, plunging France and Europe into a severe economic crisis that contributed to the French Revolution. John Law was exiled from France. Had Louis XV followed a more conservative fiscal policy, the revolution might have been delayed, or averted. However, with dire consequences, Louis XV's reign was marked by the same disastrous spending on maintaining France's position in Europe as the reign of Louis XIV.

With the resignation of Orléans, catastrophe was averted by the appointment of Cardinal André-Hercule de Fleury, who essentially served as the king's first minister. Louis XV left most of the government of France to Cardinal Fleury. Fleury stabilized France's currency, built roads, expanded the reach of the merchant marine, and stimulated the economy. He set his sights on peace, although the War of the Polish Succession was unavoidable because of Louis XV's marriage to Marie Leszcynska, a member of Polish royalty.

Although Cardinal Fleury attempted to make the kingdom more fiscally responsible, the dynastic wars of Europe continued to drain the French treasury, as they had during the reign of King Louis XIV. Indeed, during the reign of King Louis XV, two of the largest wars in French history, the WAR OF THE AUSTRIAN SUCCESSION and the Seven Years' War, took place. These wars would be global conflicts, because not only were France and England combatants in Europe, but the fighting spread to overseas colonies. The War of the Austrian Succession highlighted the rise of Maurice de Saxe to French command; he had joined the French army in 1720. De Saxe was a son of King Augustus II of Poland.

The era of Maurice de Saxe marked the apogee of the reign of King Louis XV. With the death of Cardinal Fleury during the war in 1743, Louis XV lost his most important minister. He sought to govern on his own but lacked the abilities to do so. Too much influence was given to his mistresses, Madame de Pompadour and Madame du Barry. At the same time, unchecked by the king, corruption worked to sap the strength and morale of the army.

In 1756, in a move at least partly attributed to Madame de Pompadour's influence, Louis XV embarked on what has become known as the diplomatic revolution of the 18th century. Orchestrated by Maria Theresa's foreign minister von Kaunitz, the diplomatic revolution saw the alliance of France, the HOLY ROMAN EMPIRE (of which Austria-Hungary was the most important part), and Russia.

With Frederick the Great of Prussia occupied with the Russians and Austrians, in the fall of 1757, Louis XV sent a French army under Marshal Soubise to attack

Frederick from the rear. Unfortunately, Soubise, a product of the favoritism now governing France, proved no match for Frederick. Then on August 1, 1759, a French army commanded by the marquis de Contades suffered a serious defeat at the hands of a British, Hanoverian, and Prussian army led by Prince Ferdinand of Brunswick. Contades was only saved a near-rout like Soubise's because Sir George Sackville, through cowardice or incompetence, refused to charge the enemy with his cavalry squadrons.

While the war was going badly for Louis XV in Europe, it was worse overseas. British prime minister William Pitt had set as his goal the destruction of France's colonies. The war began in 1754 with a skirmish in North America where George Washington made his first appearance in command against forces from NEW FRANCE (Canada). In North America, the conflict became known as the French and Indian wars. In 1760 the French finally surrendered to Jeffrey, Lord Amherst at Montreal. In India, the British East India Company, supported by regular British troops, fought its own struggle with the French Compagnie des Indes, buttressed by French troops sent from France to support it. Yet, in India too, the balance of power tipped in favor of the British.

In February 1763, the Seven Years' War was brought to an end for England and France by the Treaty of Paris, by which France relinquished its claims on New France. France, however, retained its islands in the French West Indies which, because of their great production of sugar, the French government valued more than New France. The end of the war found the reputation of French arms, raised to new heights by Maurice de Saxe, at its lowest point in the century. Financially, the years of war were a calamity for France. Efforts to reform the financial system of France proved frustrated by opposition, and Louis XV lacked the personal determination to force them through opposition. Although the last decade of Louis XV's reign passed in relative peace, it was only the quiet before the storm. Only 15 years after his death, the French Revolution destroyed the monarchy.

JOHN MURPHY

Loyola, Ignatius of, and the Society of Jesus

(1491–1556) *religious leader and organization*

Ignatius of Loyola, founder of the Society of Jesus (the Jesuits) and author of the spiritual classic *The Spiritual Exercises*, holds a place among the most influential people of his time. Such a claim says a great deal about his impact, for Loyola lived in an age of many powerful and influential personalities.

Ignatius was born one year before Columbus discovered America into a noble family in the Basque country of northern Spain. The youngest of 13 children, he dreamed of making his fame and fortune as a valiant knight in the service of his king, and he pursued the swashbuckling life of a soldier until he reached the age of 30. Then, in May of 1591, he found himself heading a small garrison of Spanish troops in the fortress of Pamplona when it was attacked by a vastly superior French army. Although the city's leaders wished to surrender without a fight, the zealous Loyola convinced them to defend their walls, and he bravely rallied his troops in battle until a French cannonball shattered his right leg. Pamplona promptly fell to the French, and Ignatius was transported by stretcher to his family's castle at Loyola, where he endured excruciating operations aimed at repairing and straightening his leg.

He nearly died under the surgeon's knife, and his recovery process was long and slow. During his lengthy recuperation, a profound change took place in him that would totally alter the course of his life. As he lay in bed day after day, he grew extremely bored and asked for something to read. He was an avid reader of the stories of gallant knights, who performed daring deeds in the service of their lady, and he craved such books to help him pass the time. But in his family's castle, there was only a book on the life of Jesus Christ, and another on the lives of the saints. In his desperation for something to occupy his mind, he would read from these books as he lay in bed and then daydream about knightly exploits. Yet, the more he read about Christ and the saints, the more impressed he became by their heroic virtue and

goodness. His daydreams began to alternate: At times he would envision himself as a valorous knight of the king of Spain; at other times, he would dream of becoming "a knight of Christ," and of heroically following Jesus Christ as the great saints of old had done. After a period of serious deliberation, he became utterly convinced that he must leave behind his former way of life and dedicate himself completely to the cause of Christ.

A HERMIT, PILGRIM, AND STUDENT

Over the following 13 years, Ignatius investigated various ways of responding to his new calling. His early attempts were not highly successful. First, he lived for many months as a poor hermit, begging for his food and spending his days in prayer. Then he took ship and went on pilgrimage to the Holy Land, hoping to offer himself in lifelong service there. When he was denied permission to remain permanently in the Holy Land, he returned to Spain and began a long process of study, which would take him from Barcelona, to the Spanish university town of Alcalá, and ultimately to the University of Paris, where he studied theology and was ordained a Catholic priest. During his years at the University of Paris, by force of his virtuous character, his strength of personality, and his other powerful leadership qualities, he gathered around himself a group of extremely talented younger men from Spain, France, and Portugal, who were also studying for the priesthood. He led each of them through *The Spiritual Exercises*, his life-changing 30-day retreat, which he had by that time developed. As their numbers and their friendship grew, this impressive band of men dreamed of doing something together in the service of God.

FOUNDING OF THE JESUITS

In August 1534, Ignatius of Loyola and several others joined together in Paris to make promises to remain permanently single for God (chastity) and to live in poverty, in order to place their lives as completely as possible at the service of God. Their first ambition was to sail together to the Holy Land, and to preach the Gospel of Christ in Jerusalem. When this proved impossible, they journeyed to Rome and placed themselves at the disposal of the pope, ready to serve in whatever way he should direct. The small group continued to grow, attracting many other young and gifted men who were inspired by the lives of Ignatius and his companions, and by the scope of their vision. Although numerous religious orders of men already existed in the Roman Catholic Church, Ignatius's company was utterly new: a bold and dynamic missionary band of highly gifted men who were prepared to go anywhere in the world, and

to do anything that would advance the cause of Christ. In 1540 the new order, called the Society of Jesus, was officially established by Pope Paul III.

In the following year, Ignatius was elected the first superior (“general”), and he remained in that role until his death 15 years later, in 1556. Throughout these years, Ignatius remained in Rome, crafting the *Constitutions* of his order and directing his far-flung society through his extensive correspondence. A gifted leader of men and an able administrator, he was also revered by his men for his personal holiness and his profound life of prayer.

Under his direction, the Society of Jesus became a powerful force in the Counter-Reformation, exercising enormous impact through their dominance in the field of education, through their popular preaching and their theological disputations, and through their worldwide missionary activity. The order continued to grow rapidly throughout his life, and by the time of his death numbered nearly 1,000 men.

SOCIETY OF JESUS

The Jesuit order exploded onto the European scene in the decades following their official establishment in 1540. Their growth in numbers was rapid, and within 25 years after Ignatius’s death, 5,000 Jesuits were at work all over the world. They played a major role in educating the youth of upper-class European society and had established nearly 150 colleges by 1580. As time went on, they enjoyed enormous popular appeal through their creative use of preaching, drama, music, extensive use of the recently invented printing press, and promotion of baroque art and architecture. In the highest echelons of society, Jesuits became confessors and counselors to many of Europe’s kings and queens and leading statesmen.

Over the next 200 years, hundreds of intrepid Jesuit missionaries followed in the footsteps of the first Jesuit foreign missionary, Francis Xavier. They journeyed from Europe to many parts of North and South America, Africa, and Asia. Many of them would die on the journey itself, the hazards and hardships of sea travel at that time being so great.

Many others would die a martyr’s death in the land of their mission. Jesuits were known to be outstanding in developing creative missionary methods for different cultural settings, and in respecting the indigenous cultures within which they sought to adapt the preaching of the Gospel. The work of such men as Valignano in Japan, MATTEO RICCI in China, Di Nobili in India, and the Jesuit *reductions* in Paraguay continue to be studied

today by missionaries seeking to adapt the Gospel effectively to new cultures with respect and sensitivity.

All was not smooth sailing for the Society of Jesus, however. Their unprecedented success in so many of their endeavors, their massive influence at all levels of society, and serious doubts that were raised about some of their methods all contributed to making the Jesuits a storm center of controversy.

Although they won many influential friends over the years, they also accumulated a long list of powerful and dedicated enemies, who considered them a dangerous force to be eliminated. Some of their implacable foes came from within the Catholic Church itself, others from among the Protestants of Europe, and many more from among Europe’s Enlightenment intellectuals and rulers. By the mid-1700s, fierce opposition to the activity and influence of the Jesuits had coalesced into strong pressure from different quarters for the complete suppression of the order. The society was first driven out of Portugal, then out of France and Spain, and finally in 1773, the pope was prevailed upon to suppress the entire order. The suppression was not lifted by Rome until 40 years later, in 1814.

The restored Society of Jesus flourished in many parts of the world in the 19th and 20th centuries, including in the United States, and became especially well-known for its excellent high schools and universities. Today the Society of Jesus ranks as the largest Catholic religious order in the world, with more than 20,000 members serving in 112 nations on six of the world’s continents.

JOHN H. KEATING

Luba-Lunda

The Luba-Lunda states, in what is now the southeast of the Democratic Republic of the Congo in Central Africa, were a network of kingdoms that lasted from

the 15th to the 19th centuries C.E. The Luba culture had emerged a millennium earlier, a civilization that soon began working in iron and dam construction. The local conditions—marshy wetlands that required drainage and provided a surplus of fish—encouraged large, stable communities and communal labor over individual self-sufficiency.

In time, trade relations and intermarriages between smaller communities led to a unified Luba state around the end of the 15th century C.E., by which time the Luba people were widely respected for the sophistication of their art and the quality of their ironwork, especially their axes and spears. Luba kings ruled by right of descent from Kalala Ilunga, a mythic cultural hero who had invented much of Luba culture. The Luba king was the head of a large hierarchy of officials at the state and local levels, who paid him tribute he redistributed as rewards for loyalty. Prominent in this hierarchy were the Bambudye, the “memory men” (though women were included) who maintained oral histories of the Luba kings and their deeds. As the Egyptian pharaohs and rulers in much of the ancient and antique world, Luba kings were revered as deities upon death, and these oral histories are comparable to Christian “saints’ lives” and other religious biographies.

The Luba system of divine kingship spread to other nearby cultures, notably including the Lunda, a strong military force in the region who increased their power by intermarrying their royal family with the Luba’s and colonizing large parts of central Africa before European colonization arrested their expansion. The Luba kingdom itself extended its power and resources to include not only the copper mines of communities who had once been only trade partners, but New World goods from the Portuguese colonists (in exchange for ivory and slaves, among other commodities), leading to a centuries-long period of growth. The Lunda continued to self-govern, though were closely aligned with the Luba; they soon controlled much of the copper trade.

By the end of the 19th century, the Luba and Lunda states were in decline. Prosperity and intermarriage had encouraged infighting in periods when royal succession was not clear-cut; neighboring tribes had acquired firearms, a significant military advantage to which neither the Luba nor the militarily superior Lunda had any recourse except to acquire guns of their own, which they did by devoting more efforts to the slave trade. But the slave trade itself was dwindling, and this proved not only disruptive to the economy

and political balance, but also ultimately ineffective. Belgian colonists took control over the region, which King Leopold II called the Congo Free State. The Luba rebelled several times, but fruitlessly, and many were sent into forced labor in the copper mines. The Luba and Lunda (and their other client tribes) persist today as ethnic groups, but their culture has been absorbed into that of the Democratic Republic of the Congo.

BILL KTE’PI

Luther, Martin

(1483–1546) *religious reformer and leader*

Martin Luther began the Protestant Reformation in 1517 when he nailed his 95 Theses on the castle church door in Wittenberg, Germany. Luther was a controversial figure in his day, with great friends and foes during a period of tumult in the Roman Catholic Church.

Born in 1483, Luther was the son of a reasonably prosperous copper miner. An intelligent boy, he was sent away to school by his father, who hoped he would be a lawyer. That was not to be. At the end of his university studies at Erfurt in 1505, Luther was caught in a terrible thunderstorm, where he prayed to St. Anne for deliverance, vowing to become a monk. Soon after that, he made good on his promise and entered the Augustinian monastery in Erfurt.

The monastic life at that time varied greatly, depending on the monastery. The Augustinian monks were quite strict, with fasting and a rigorous schedule of prayer, study, and work. Luther was ordained a Catholic priest in 1507 and completed his doctoral studies in 1512.

He then was assigned by his superior to teach biblical studies at the University of Wittenberg in Germany. Preparing his lectures on the Bible (especially the books of Romans and Galatians), he became increasingly dissatisfied with the current practice of

the church compared to what he saw in the Bible. His lectures were quite popular among the students, and he drew together a circle of other professors around him for discussion.

In 1517, he decided to tackle the issue of the sale of indulgences (a document granting a person exemption from the penalty for his or her sins) by writing a document that contained 95 statements (or theses) that argued against the practice of the sale of indulgences. Many knew that Prince Albert of Germany had arranged with Pope LEO X to turn over half of the proceeds from the sale of indulgences to the pope, who needed money to finish building St. Peter's Basilica, and turning the rest over to bankers who had funded Prince Albert's purchase of bishoprics. But it was the shameless manner in which the indulgences were sold that was too much for Luther.

Freedom from the penalty of even the gravest sins was promised by the Dominican monk Tetzel as he sold the indulgences in the neighboring areas. At that time, Luther did not imagine the storm of controversy that his few pages would cause. Because of the recently invented movable type printing press, within a few short months, Luther's 95 Theses were printed and sent out all over western Europe.

The Catholic Church's response was first to wait and see whether the controversy would die down. When it did not, Luther was approached by high-ranking church officials who asked him to retract or recant his statements. Finally in 1521, Luther was summoned before the emperor at the DIET OF WORMS.

There, with his books and pamphlets in front of him, he was asked to recant his writings. His response, considered apocryphal by some, "Unless I can be instructed and convinced with evidence from the Holy Scriptures or with open, clear and distinct grounds and reasoning . . . then I cannot and will not recant, because it is neither safe nor wise to act against conscience. Here I stand. I can do no other. God help me! Amen."

Luther knew that his statements would probably cause his expulsion (excommunication) from the Roman Catholic Church and that he would have to flee for his life. Fortunately for Luther, a sympathetic German prince, Frederick the Wise, "kidnapped" him and hid him in the Wartburg castle till the storm blew over. Because of the support of Frederick and other German princes, the "Lutheran" movement grew in strength over the next 10 years. Excommunicated from the Roman Catholic Church, Luther and his followers took over the churches in the areas in Germany that had sympathetic princes.

Martin Luther burns the papal bull of excommunication—the document that expelled Luther from the Catholic Church.

Luther continued to teach and write at the University of Wittenberg. He married a former nun, Katharina von Bora, in 1525 and had six children. Luther died in 1546. Luther wrote a great many books and shorter articles. (There are more than 100 volumes of his works.) These include *Luther's Small Catechism*, *Luther's Large Catechism*, *The Bondage of the Will*, and *On the Freedom of a Christian*. He also translated the Bible into German—prior to this time it was only available in Latin.

Luther was an outspoken man, tending to make outrageous statements, especially at the dinner table (e.g., "When I die I want to be a ghost and pester the bishops, priests, and godless monks so that they have more trouble with a dead Luther than they could have had before with a thousand living ones"). Some controversy has arisen in more recent years about Luther's statements in his later years against the Jews. These were not unusual for their time but are seen by Lutherans today as very unfortunate.

Many people try to simplify the Reformation as if Martin Luther appeared out of nowhere with a strident call for reform. This was not the case. There were many calls for reform and many attempts at it during the previous 100 years.

Luther was also heavily influenced by the humanists, especially ERASMUS OF ROTTERDAM, who were arguing for an intellectual reform, returning to the original Greek and Hebrew sources for both philosophical and Christian thought. "Luther hatched the egg that Erasmus laid" is a common phrase describing the intellectual development of Luther. Luther was a somewhat reluctant, but certainly courageous leader and thinker during a time of great change in the church and society.

BRUCE FRANSON

M

Macao, Portuguese in

Portugal established a trading empire in Asia in the 16th century by means of a string of important ports that tapped the products of the continent. Macao (Macau) was Portugal's outpost on the South China coast.

VASCO DA GAMA was a Portuguese explorer and the first European to reach India via Africa. He was followed by AFONSO DE ALBUQUERQUE (1435–1515), viceroy of Portuguese India, who arrived in Goa on the western coast of India. In 1410, he sent a fleet to capture MALACCA on the Malay Peninsula. There they found many Chinese sailing vessels trading in silks and other products throughout Southeast Asia. In 1517, Portugal's envoy Tomé Pires arrived in Guangzhou (Canton) on the Pearl River delta, an important trading port for two thousand years. The eight Portuguese ships fired cannon shots as a salute upon entering the harbor, a ritual that the Chinese misunderstood. Pires however remained in China, attempting to negotiate with the government of the MING DYNASTY (1368–1644). The Chinese held him responsible for the misdeeds of Portuguese sailors and he died in a Chinese jail in 1524.

Despite this inauspicious beginning, the Portuguese continued to explore trading opportunities along the Chinese coast and finally were permitted to build an outpost at the end of a peninsula on the southwestern end of the Pearl River estuary in 1535, a two-square-mile land with a good harbor called Macao. The Portuguese paid rent to China for Macao and in return were

allowed to build docks, trading facilities, a church, schools, and so on, and to govern themselves. Even when other European nations were allowed to establish trading companies in Guangzhou, they had to leave their "factories" (offices and warehouses) along the waterfront outside that city when the trading season was over and retreat to Macao. In addition, Macao became the base for Jesuit missionaries coming to China.

Jesuit missionaries were honored and their services in fields such as astronomy, cartography, architecture, and weaponry were valued by the Ming, and later the QING (Ch'ing [1644–1911]) court. Several Jesuit fathers designed and supervised the making of European style weapons such as cannon pieces in Macao for the Ming government up to 1644 and the Qing after that.

The arrival of the Portuguese in China in the early 16th century opened a new chapter in China's relations with the outside world. Sino-Western relations would be fundamentally different from China's interactions with its land neighbors and with earlier Persian, Arab, and Malay maritime traders in eras past.

JIU-HWA LO UPSHUR

Machiavelli, Niccolò

(1469–1527) *historian, playwright, and diplomat*

Machiavelli was born in Florence on May 3, 1469. His parents provided him with a humanistic education, with a stress on Latin grammar, rhetoric, and history. As he matured, he deepened his knowledge of the works of the philosophers and historians of ancient Greece and Rome and became familiar with the comedies of Plautus.

Machiavelli was head of the Second Chancery and secretary to the Ten of War of the Florentine Republic from 1498 to 1512. His duties included diplomatic missions to heads of state on the Italian peninsula and elsewhere in Europe. Especially noteworthy are those missions to Louis XII of France, Emperor Maximilian I, Caterina Sforza of Forli, Pope Julius II, and Cesare Borgia, the son of Pope Alexander VI. When the Medici overthrew republican rule in 1512, Machiavelli was suspected of a conspiracy against them, imprisoned, and tortured. After his exoneration and release under a general amnesty in 1513, he turned to writing.

Machiavelli's literary output is extensive. His *History of Florence*, commissioned by the Medici, begins with the city's origins and ends on a pessimistic note with the death of Lorenzo de' Medici in 1492. *The Art of War* is a technical look at military preparations and makes a plea for a citizen militia. Machiavelli's best known work, *The Prince*, is based on his diplomatic experience and his reading of ancient history. It is a complex assessment of the qualities needed for political leadership by a new prince. Although the book is modeled on the "mirror for princes," advice books common to the Renaissance era, many of its recommendations are the inverse of the princely virtues advocated by that literature. Its meaning has often been reduced to the trite phrase "The end justifies the means." Some critics have deemed the book an advice manual for would-be autocrats. As early as the century in which he lived, Machiavelli and *The Prince* were condemned and demonized in French Protestant circles and in Elizabethan English literature. Leading Jesuits also attacked him, and his works were placed on the Index of Prohibited Books of the Roman Catholic Church in 1559.

Although criticism of Machiavelli and *The Prince* continues, recent scholarship has modified these negative assessments. Greater stress is now placed on his advocacy of republicanism, especially as expressed in the *Discourses on the First Ten Books of Titus Livy*. Modern scholars also recognize Machiavelli's literary creativity. His play *Mandragola* presents a comic as well as ironic look at Renaissance marriage patterns and offers an astute analysis of desire and ambition. Another, *Clizia*, revolves around an aged married man's attempts to gain the love of a young woman. The fable *Belfagor* recounts the experiences of a fiend who is delegated by the devil to spend time in marriage on Earth. His *Tercets on Fortune* is an extended study of Fortune, whom he personifies as a woman and associates with discord and unpredictability in human affairs. Machiavelli died on June 21, 1527, and is entombed in the basilica of Santa Croce in Florence.

LOUIS B. GIMELLI

Magellan, Ferdinand

(1480?–1521) *Portuguese explorer*

Ferdinand Magellan's exact date of birth is unknown but is believed to be in 1480. His parents were petty nobles. After the return of VASCO DA GAMA's expedition from India, Portugal launched subsequent expeditions there. When Francisco de Almeida, who would become the first Portuguese Indian viceroy, set out for India in 1505, Magellan joined his expedition. Magellan spent eight years there in a number of different positions. He was also involved with Diogo Lopes de Sequeira's expedition to MALACCA in 1508–09. Magellan returned to Portugal in 1513.

Magellan then served in Morocco, where he was involved in a number of battles and skirmishes. He also served as quartermaster in charge of the spoils of war. Upon his return to Portugal, he requested an increase in pay from King Manuel, but the request was denied because of rumors that he sold cattle to Portugal's enemies in Morocco. Magellan returned to Morocco to clear his name so the king would consider his request for more pay. King Manuel still denied the increase.

Ferdinand Magellan discovered a way to reach the Pacific Ocean from the Atlantic Ocean by going west, rather than around Africa.

This was apparently one of the main motivations behind Magellan's decision to approach the Spanish with his idea of finding a passage from Europe to India sailing west, either around or through the Americas.

Magellan convinced the Spanish to back the expedition in 1517. The expedition set out in September 1519 with five ships. They sailed to the South American coast of Brazil. From there Magellan explored the bay at Rio de Janeiro and the Rio de la Plata before halting for the winter in Patagonia from March through August 1520. It was during this time that Magellan faced a mutiny and saw one of his ships desert the expedition. With winter over, Magellan continued south along the coast of South America.

Upon reaching the southern tip of South America, Magellan took 38 days to find a passage to the Pacific through the strait that now bears his name, the Strait of Magellan. Having found the way through to the Pacific, the expedition started up the western coast of South America on November 28, 1520. Magellan took 98

days to cross the Pacific with hopes of reaching China but instead made landfall at Guam. From there, the expedition continued on a western course that brought them to Cebu on April 7, 1521. There Magellan made an alliance with the local leader and agreed to help them attack a neighboring island. It was during this attack that Magellan was killed on April 27, 1521. The expedition continued west and eventually made its way back to Spain, having rounded the Cape of Good Hope in September 1522, three years after having left.

While Magellan did not actually live to complete the circumnavigation of the globe, the journey was the product of his ambition and determination. More important was his discovery of a way to travel from the Atlantic Ocean to the Pacific Ocean going west rather than around Africa.

DALLACE W. UNGER, JR.

Malacca, Portuguese and Dutch colonization of

Malacca (Melaka) is a settlement that commands the strategically important Malacca Straits and thus the sea route linking China to the west. The Strait also links to the Spice Islands of Indonesia. The location of Malacca has made it attractive to pirates.

A settlement was established at Malacca by the Sumatran prince Paramasvera at the beginning of the 15th century and it grew in importance rapidly. The prince converted to Islam and the Sultanate of Malacca became an important outpost of that religion in a region in Southeast Asia. In the 18th century, the sultanate became a tributary to the Ming dynasty in China. The Portuguese were the first Europeans to arrive at Malacca and captured it in 1511, with a force commanded by AFONSO DE ALBUQUERQUE. The Portuguese would control Malacca for 130 years before being supplanted by the Dutch.

The defeated sultan established a new capital at Johor and attempted to expel the Portuguese in alliance with Malay rulers nearby, but their mutual rivalry prevented them from forming effective alliances to defeat the Portuguese. The Acehnese made the most serious attempt to expel the Portuguese with an armada of 300 boats, perhaps 15,000 troops, and artillerymen from Turkey. The Portuguese, however, were able to withstand the repeated assaults.

The Portuguese attempted to convert some of the people of Malacca to Christianity. The noted Jesuit Saint Francis Xavier spent some time in the region. The arrival of Sir FRANCIS DRAKE of England in the late 16th century brought a new power to the region and another challenge to Portugal. Dutch ships also became active in the region in the latter part of the 16th century as part of the Dutch trading empire. The Dutch eventually struck up a strong alliance with Johor, a state on the Malay Peninsula, and thus were able to prosecute a successful siege that ended in the Netherlands's gaining control of Malacca.

The rise in importance of Malacca in the 16th century and beyond was the result of local elites and their ability to mobilize trading networks and the arrival of enterprising Chinese who became merchants, miners, and general traders. Other ethnic groups also contributed to making Malacca a cosmopolitan port. They include Indians, Arabs, Persians, and other Europeans.

JOHN WALSH

Malinche, La (Doña Marina)

(c. 1496–c. 1529) *translator*

La Malinche was one of the key players in the 16th century CONQUEST OF MEXICO by Spanish conquistadores. However little is known about Malinche's life before or after the years of the Spanish conquest in the 1520s.

Malinche was born into a noble family of the Aztec upper class. Her name is probably derived from a corruption of the Nahuatl word *Malintzin*. She was probably born in Oluta, in the province of Coatzacoalcos, which is in the area between central Mexico and the Yucatán Peninsula. Upon the death of her father, her mother sold Malinche into slavery. During this time, Malinche learned several languages, including Mayan. She was approximately 18 years old when the Spanish conquistadores landed in Mexico and began their conquest of her native land.

In April 1519, Malinche was given as a translator to HERNÁN CORTÉS during his dealings with the Aztecs. She was immediately baptized as a member of the Roman Catholic Church, and the Spaniards bestowed upon Malinche the Christian name Marina.

A great amount of the information that has survived about Malinche is the result of the writings of BERNAL DÍAZ DEL CASTILLO. In his writings, Díaz noted that Malinche was a beautiful woman who was intelligent, extremely loyal, and not easily embarrassed. She was greatly respected by many of the men, both Aztec and Spanish, with whom she interacted in her role as Cortés's interpreter.

In his famous book *The Discovery and Conquest of Mexico, 1517–21*, Díaz del Castillo stated that Malinche's mother remarried upon the death of her first husband, Malinche's father. When her mother gave birth to a new son, in order to safeguard the baby's inheritance, Malinche's mother and stepfather sold the little girl into slavery to some Aztecs from Xicalango. The Aztecs from Xicalango then sold Malinche to a group of Aztecs from Tabasco.

After staying in Tabasco for a short period of time, Malinche was eventually given as a gift to Cortés upon his arrival in Mexico. In addition to working as a translator for Cortés, Malinche served as a guide and diplomat. Cortés was so impressed with Malinche's efforts on his behalf that he eventually arranged for her marriage to one of his men, a Castilian knight named Juan de Jaramillo. They were married at the town of Orizaba. She later bore him a daughter named María.

Despite her marriage to de Jaramillo, Malinche remained a key figure in Cortés's later exploits in Tenochtitlán. Díaz observed that she was present when Cortés was carrying on negotiations with MOCTEZUMA II in 1523.

Working with a Spanish priest named Geronimo de Aguilar, Malinche translated Cortés's words into the Nahuatl dialect spoken by Moctezuma after de Aguilar

translated from Spanish to the Mayan dialect that she understood.

Later, Malinche apparently became fluent enough in Spanish that Aguilar's assistance was no longer needed during the final negotiations with Moctezuma. Indeed, Malinche's skill in language and in secular politics was so great that she even acted as counselor to the Aztec king during his dealings with Cortés.

In addition to their professional relationship, Malinche bore Cortés a son named Martín. Cortés seemed to have held his relationship with Malinche in some esteem as he named their son *Martín* after his own father. Cortés later had the boy legitimized, and he always seemed to favor Martín among his other children in later life. However, in the majority of letters Cortés sent back to Spain, anytime he mentioned Malinche, it was always in her role as his translator. He never alluded to any personal details about Malinche in his Spanish correspondence. Over the next several years, Malinche's power seemed to increase. She always dressed in expensive garments and appeared to have her hair styled in the most elegant native fashions. She traveled throughout much of Mexico with Cortés, translating for him in his dealings with the Mayan Empire in 1526.

Sometime after the birth of their son, Martín, the relationship between Malinche and Cortés seemed to flounder. She is rarely mentioned in Cortés's correspondence after the mid-1520s. After the completion of the Spanish conquest of Mexico in late 1526, Malinche all but disappears from historical records to the point that little to no information is recorded about her death. There is some speculation that she may have died of complications surrounding the birth of her daughter, María, in 1527 as her husband Juan de Jaramillo is recorded as having married again the following year.

VILIFICATION IN HISTORY

The vilification of Malinche in Mexican history can be traced to the expulsion of the Spaniards by the Mexicans in 1821. Malinche became synonymous with the image of Eve. Mexican nationalists came to blame Malinche for all the woes suffered by the Mexican people during the colonial rule of the Spanish. She served as the scapegoat when the Mexican government needed someone to blame for the poor state of political affairs that the new Mexican government faced in the 1820s. Malinche was painted as a scarlet woman whose actions were driven by her extreme sexual appetite.

In the 19th century, particularly in Mexican literary and artistic movements, Malinche's role as an interpret-

er, strategist, and diplomat was virtually ignored. Her historical reputation was reduced to that of having been merely Cortés's sex-starved mistress who betrayed her people. In reality, Malinche was a respected female who played a crucial role in the Spanish conquest of Mexico and the growth and spread of Christianity among the Aztec and Mayan peoples. While women such as La Malinche are vilified for their respective roles in the conquests of their peoples by foreign invaders, this condemnation signifies the important role that such women played in the secular politics of their native lands.

Mamluk dynasties in Egypt

The Mamluks ruled Egypt from the middle of the 13th century to 1517. The first 24 Mamluk sultans were called the Bahri (river) rulers. In 1382, they were followed by the Burji (tower) Mamluks, so called because they had been quartered in the towers of the Citadel fortress overlooking Cairo. The Mamluks, mostly of Turkish and Mongol origins, were slaves and professional soldiers. They were purchased by other former slaves as young boys in the slave markets in Syria and Egypt and educated as a professional military caste. With the completion of their education they were freed and given full military regalia and land to pay for the upkeep of the equipment and horses.

The Mamluks were notoriously disputatious and constantly fought among themselves for succession to the throne. Since there was no principle of hereditary

monarchy, any Mamluk could hope to become the ruler if he could overthrow the current sultan. As a result, the average reign of a sultan was only six years. Mamluks married within the caste to the sisters and relatives of other Mamluks. Their society was based on a feudal hierarchy of allegiance of a vassal to a lord.

Recent converts to Islam, the Mamluks emphasized their rule as Muslims, even though many of them were not personally particularly devout. They allowed the exiled Abbasid caliph from Baghdad to reside in Cairo but successive caliphs exercised no real power.

The Mamluks encouraged metalworking, book binding, and textile industries. But Mamluk attempts to monopolize the trade on luxury goods, coupled with high taxes, discouraged many foreign and local merchants. As great builders and patrons of the arts, the Mamluks encouraged scholars, including renowned historian Ibn Khaldun, to work in Cairo. Under the Mamluks, Cairo became a major intellectual and artistic center and grew into arguably the largest city in the region. The Mamluks built hospitals, caravansaries, public fountains, and massive mausoleums for their families. The mausoleum of Sultan Qaitbay (reigned 1468–96) was particularly impressive. Much of medieval Cairo dates from the Mamluk era.

The Mamluk sultan Baybars (reigned 1260–77) drove the crusaders out of the eastern Mediterranean and repelled major invasions by the Mongols. A wily politician, Baybars also established alliances with potential enemies of Sicily, Seville, and the Turks.

The Black Death (plague) in 1340 reduced the population throughout Mamluk territories; in Cairo alone over 25 percent of the people perished. They were further weakened by Timurlane's destruction in Syria. The expansion of Portuguese trading outposts along the African and Indian coasts led to mounting economic competition and as they lost control of trade from the east, the revenues from commerce declined. In addition, constant disputes over succession weakened Mamluk authority and made them vulnerable to outside attacks. Their failure to forge a united front contributed to their defeat and the conquest of Egypt by the Ottoman Turks in 1517.

JANICE J. TERRY

Marie-Thérèse of Austria

(1638–1683) *queen of France, wife of King Louis XIV*

Marie-Thérèse's role as the queen of France and the wife of King LOUIS XIV was a precarious one, as she was used by the Spanish branch of the HABSBURG DYNASTY to secure peace with France in the 17th century. King Philip IV of Spain and Elisabeth of France welcomed the birth of their daughter Marie on September 10, 1638. The ambitions of Cardinal Jules Mazarin and Anne of Austria, the mother of King Louis XIV, to link the BOURBON DYNASTY to the Spanish branch of the Habsburg family extend back to 1646. These two individuals wanted to create a marriage union between Louis XIV and Marie-Thérèse to stabilize relations between the French and Spanish governments as these two countries had been at war since 1635.

There were complications with the proposed marriage between the two families because the Spanish Habsburg family did not want to give the Bourbon dynasty an opportunity to inherit any part of the Spanish Empire. The Spanish court was also reluctant to allow the proposed marriage for it feared that the offspring of this union would create instability within the Spanish empire for rival claimants might seek to acquire various parts of the empire.

The anxiety of the Spanish court over this proposed marriage was relieved by the fact that Mariana of Austria, Philip IV's second wife, gave birth to a son named Philip Prospero in 1657. Despite the fact that infant mortality rates were high in the 17th century, the birth of this son made Philip IV more agreeable to the marriage between Marie and Louis XIV. The marriage contract between Marie and Louis XIV was completed when the Treaty of the Pyrenees was finalized in 1659, and the two were married in June 1660.

In accordance with the marriage contract, Marie abandoned any territorial claim she possessed to the Spanish Empire, and the Habsburg family had to provide 500,000 gold escudos for Marie's dowry. Because of the financial weakness of the Spanish Empire, the Habsburg family could not pull together enough funds for the dowry. Despite the fact that Marie renounced her claims to the Spanish Empire, she was unable to do

this on the part of her offspring, which Mazarin knew at the time of the wedding.

Mazarin also intended to use the inability of the Spanish government to pay the dowry as an excuse to ignore the fact that Marie renounced her inheritance to parts of the Spanish Empire. The French government used the failure of the Spanish government to pay the dowry as a justification to attack the Spanish Netherlands in 1667, resulting in the War of Devolution.

Marie was a devout woman who believed it was her responsibility to marry Louis XIV and to provide him with offspring to succeed him. Marie fulfilled these obligations to Louis XIV by providing him with a number of children, but only their son Louis survived into adulthood. She often prayed and had great admiration for priests but was also concerned for the Catholic religious community.

Despite this extreme faith in her religion, she failed to possess a strong influence in the French government, probably as a result of her lack of education and her poor relationship with her husband. Marie's relationship with Louis XIV was a strenuous one, but she continued to be loyal to him and fulfilled her obligations as a wife and queen. Marie did exercise some influence over the French court as regent in 1672 when Louis XIV was fighting in Holland, but this was for a short period. Louis XIV had several mistresses, a well-known fact in the French court. Marie learned of many of these relationships, but it usually took time before she was made privy to this information.

Despite the fact that Marie had no major influence at the French court, her death on July 30, 1683, was properly mourned in France as she was given a state funeral. There is some degree of speculation that Marie might have been poisoned, but there is no firm evidence to support this claim. Marie's funerary rites possessed similarities to the funerary rites observed by Egyptian pharaohs, as her heart was removed from her body, placed in a silver box, and deposited in a chapel situated at Val-de-Grâce, while her intestines were also removed from her body and deposited in an urn.

BRIAN DE RUITER

Maroon societies in the Americas

Maroon societies is a term designating communities of runaway slaves in the Americas, the formation of which constituted a recurrent feature of the history of African slavery over nearly 400 years, from the first importation of African slaves in the early 1500s through the final abolition of slavery in the Western Hemisphere in Brazil in 1888. The term derives from the Spanish *cimarrón*, originally referring to feral cattle but by the early 1500s also signifying runaway slaves.

Maroon societies were most common in the Caribbean and Brazil but were also widespread in North America and elsewhere. To slave owners and ruling groups they represented a constant and serious challenge to the institution of African slavery generally, while to slaves they represented the possibility of life outside the shackles of the slave regime. Often called *palenques* in the Caribbean region and Quilombos in Brazil, they had a history closely linked to the hundreds of slave rebellions that also mark the history of the Americas.

Ranging from small nomadic bands to extensive settled communities of thousands of people that endured for decades, even centuries, on the fringes of the plantation economy, Maroon societies came into existence almost as soon as African slavery in the Americas did. Most of their members were African-born, as they reproduced many of the social and cultural features of their homeland in their new surroundings. Among the first official acknowledgments of the existence of such communities was a report to the Council of the Indies from Hispaniola of March 1542, in which Archdeacon Álvaro de Castro estimated that 2,000 to 3,000 runaway slaves were at large on the island. A follow-up report of July 1546 described some of the island's numerous Maroon communities, some hundreds strong, and the mixed success of Spanish efforts to subdue them. Often mixing with indigenous groups and allying with their slave masters' enemies, Maroon communities displayed tremendous resilience in the face of persistent efforts to eradicate them and horrific punishments meted out to captured runaways, which included castration, amputation of limbs, branding, garroting, and burning alive.

The hinterlands of plantation economies throughout the Caribbean, Mexico, Brazil, North America, and elsewhere witnessed the formation of Maroon societies alongside the very introduction of slavery. In Mexico, rapid Indian depopulation prompted colonists to import upward of 120,000 African slaves in the years between 1521 and 1650. Many thousands were compelled to work in the silver mines and ranches north of Mexico City centered on Zacatecas. From the 1560s to the 1580s, a series of revolts and uprisings rocked the region, as runaway African slaves joined forces with besieged Indians to raid ranches and storehouses, attack travelers, and return to their hidden hamlets in caves, arroyos, and other places beyond the reach of the authorities.

JUNGLES OF VERACRUZ

In the 1570s, the Crown issued a series of draconian laws intended to discourage such uprisings, which nonetheless failed to have the desired effect. In 1609, a rebel Maroon community in the jungles of Veracruz, led by Yanga, successfully negotiated a peace treaty with the Spanish authorities that granted them their freedom. Nearly a century later, the community was thriving. Slave uprisings and the formation of Maroon societies continued until the final abolition of slavery in Mexico in 1829.

Some *palenques* survived for decades, later becoming towns and municipalities, such as El Cobre in eastern Cuba, where a slave uprising in 1731 led to the creation of a stable community that 50 years later had a fugitive slave population of over 1,000 scattered throughout the Sierra del Cobre. In 1800, following a recommendation of the Council of the Indies, the Crown declared the slave-descended inhabitants of El Cobre free. Other well-known *palenques* in eastern Cuba included El Frijol and Ciénaga de Zapata, which survived through much of the 19th century. Despite their best efforts to extinguish such fugitive slave communities, colonial authorities were often compelled to negotiate with them—as in the district of Popayán in Colombia, where in 1732 the Audiencia of Quito authorized a local official to offer a treaty of peace to the *palenque* called El Castillo, granting its inhabitants their freedom if they would agree to accept no more runaway slaves. The *palenque* refused the offer, and in 1745 a series of military expeditions finally captured and defeated El Castillo.

More than a century earlier, in the early 1600s, in the Cartagena district of Colombia, a runaway slave named Domingo Bioho, claiming to be African royalty and adopting the title King Benkos, staged a series of

raids on plantations and farms around Cartagena and founded a fortified *palenque* called San Basilio. After defeating two expeditions sent to subdue his independent kingdom, in 1619 King Benkos negotiated a favorable treaty with the Spanish authorities, only to be betrayed, captured, and hanged. Despite this setback, San Basilio survived for another century and was finally suppressed in 1713–17.

Similar episodes unfolded in the British and French Caribbean islands. In Martinique in 1665, a Maroon who called himself by his master's name, Francisque Fabulé, led a group of 400–500 Maroons who staged repeated attacks against plantations and settlements. The French Sovereign Council negotiated a treaty with Fabulé that granted him his freedom and a promise that his band would not be punished. He was later condemned to life in the galleys. In 1771, a decree of the Supreme Council of Martinique lamented the existence of fugitive slave communities on the island, where they had built huts, cleared land, and planted crops, and from which they sallied forth to commit various depredations. In the French island of Guadeloupe in 1668, the governor reported more than 30 Maroons living in Grande-Terre and recommended an example be made by capturing and beheading them. Despite the authorities' best efforts, however, the Maroon societies could not be eradicated. Nearly 70 years later in Guadeloupe, in 1737, a group of 48 Maroons led by one Bordebois was put on trial; eight were sentenced to be garroted. Similar events transpired on Jamaica, Antigua, Barbados, and other islands in the British Antilles.

NORTH AMERICAN SOCIETIES

In British North America and, after 1783, the United States of America, Maroon societies formed and reformed repeatedly. There is evidence for at least 50 such communities during the period 1672–1864 in the mountains, forests, and swamps from Florida to Louisiana to Virginia. Most notable among these were those in the Dismal Swamp area in the Virginia–North Carolina borderlands, where thousands of runaway slaves and their descendants survived repeated efforts to capture and subdue them. Sometimes Maroons allied with local Indians, forming mixed communities of Indians and fugitive slaves. Other times Indian individuals and polities allied with Euro-American authorities, assisting them in their eradication efforts, as occurred among the Notchee Indians in South Carolina in 1744, in Georgia in 1772, and in other places.

Communities descended from Maroon societies can be found in many parts of the Americas. In the 1980s,

it was estimated that more than 10 percent of the population of the Republic of Suriname was descended from six Maroon or “Bush Negro” communities or tribes that formed in the 1500s and waged a century-long war for liberation against the Dutch authorities before finally winning their freedom in 1762. The collective memory of the modern-day descendants of such Maroon societies has provided fertile ground for historians, anthropologists, linguists, and other scholars interested in exploring this chapter of the history of Africans in the Americas.

MICHAEL J. SCHROEDER

Mary I (Bloody Mary)

(1516–1558) *Catholic Tudor queen of England*

Mary I, queen of England, was born on February 18, 1516, in Greenwich Palace in London, England. Her father, HENRY VIII, of the House of TUDOR, had also been born at Greenwich on June 28, 1491. Mary was the fifth child of Henry and his first wife, Catherine of Aragon.

Although there was jubilation at Greenwich at Mary's birth, Henry VIII was disappointed in that Catherine of Aragon had failed to deliver a son. Mary would be the only one of Catherine and Henry VIII's children who would live to adulthood. In an age when monarchs were preferably men, young Mary's purpose diplomatically was to secure a strategic nuptial alliance for her father.

In Henry VIII's eyes, the only way to secure the throne in the Tudor family—and to make it a true dynasty—was to have a male son who would succeed

him as king. Consequently, Henry began his quest to divorce Catherine of Aragon to marry again in the hopes of producing a male Tudor heir. However, to assure the succession of the Tudors to the throne, Mary was recognized by her father as princess of Wales, which meant that, should her father die without male issue, she would succeed him as Queen Mary I.

In the end, Henry had his marriage to Catherine of Aragon dissolved, and he wed his mistress Anne Boleyn, who was crowned queen of England in 1533. Pregnant at the time of her marriage to Henry, she gave birth to the princess Elizabeth, the future ELIZABETH I, in September 1533. Still the king determined to have his way in all things, Henry was frustrated in his pursuit of a male Tudor heir.

In 1534, Henry had Parliament pass the Act of Supremacy, which made him the head of the Roman Catholic Church in England, known as the CHURCH OF ENGLAND. As far as Princess Mary was concerned, she was placed in almost double jeopardy, because she still held out for her mother and for the Catholic Church. Boleyn was her bitter enemy, especially after the birth of Elizabeth as Mary's rival for the throne, and it was feared that Boleyn would demand Mary's execution. Finally, under the entreaty of the king's chief minister, Thomas Cromwell, Mary assented to the Act of Supremacy.

When Anne Boleyn was executed for adultery in May 1536, much of the danger passed for Mary. Henry's next wife, Jane Seymour, finally provided a male heir, EDWARD VI, in October 1537. Seymour began a reconciliation with Mary, who still had a spot in her father's heart as his “chiefest jewel.”

Tragically, Jane would die soon after childbirth and Edward would only rule from 1547 to 1553, at which time Mary became queen. When Mary ascended the throne in July 1553, she trod lightly at first on the issue of religion, not wishing to shake England by revoking the Act of Settlement and the new order that had come with it.

However, Mary did have Henry's divorce from her mother declared invalid, legally making Elizabeth a bastard. The half sisters carried on harsh competition for a rightful claim to the throne. Elizabeth was implicated in two plots against Mary, one led by Sir Thomas Wyatt in 1554 that caused Elizabeth to be sent temporarily to the Tower of London.

Eventually Mary's affection for the Catholic Church brought personal disaster. In November 1554, Reginald Cardinal Poole brought from the Vatican the terms by which Rome would accept England back into

the church—all those who had carried out the Act of Settlement must be judged as heretics and condemned to execution. Almost 300 would be executed, including Thomas Cranmer, archbishop of Canterbury, who had also approved of the divorce of Henry VIII from Catherine. Mary sacrificed the affection of her people, not a few of whom had supported her during her years of exile. She compounded her error by marrying PHILIP II of Spain in July 1554. Mary's legacy in England included the loss of Calais to France's king Henry II in January 1558. It was the last possession England had left in France from the Hundred Years' War.

Indeed, there is much reason to think that Philip only wed Mary to draw England into the enduring feud between Spain and France, hoping to tip the balance in favor of Spain. Plagued by ill health and foreign adventures, Mary I died in November 1558. Before her death, she had provided that Elizabeth would succeed her on the throne as the rightful queen.

JOHN MURPHY

Mary, Queen of Scots

(1542–1587) *queen of Scotland*

The queen of Scotland from 1542 until 1567, Mary was born on December 8, 1542, at Linlithgow Palace, Scotland, the only child of King James V of Scotland, who died six days after she was born. When Mary was five, her French mother, Mary of Guise, sent her to the French court, where she lived for many years. Being extremely attractive, she caught the eye of Francis, the eldest son of King Henry II of France. They were married, and when Henry died in 1559, Mary became the queen consort of France.

In 1558, following the accession of Elizabeth Tudor, as Mary's grandmother was a sister of Henry VIII, the father of Elizabeth, Mary became the heir to the English throne. However, some English Roman Catholics felt that Elizabeth was illegitimate, as they regarded Henry

VIII's divorce from his first wife, Catherine of Aragon, as invalid, as was his subsequent marriage to Anne Boleyn, Elizabeth's mother. Thus, Mary was queen of Scotland and the queen consort of France and had a disputed claim to the throne of England.

After Mary's first husband, Francis, died, and she became isolated at the French court, Mary decided to return to Scotland. There she had great difficulty in trying to reconcile the various court factions. Her illegitimate brother, James, earl of Moray, tried to help, and Mary, a Roman Catholic in a country that had been officially proclaimed a Protestant nation during her absence in France, initially embarked on a policy of religious tolerance.

In July 1565, Mary married Henry Stewart, earl of Darnley, a cousin. He was handsome, had his own claim to the throne of England, but was foolish and quickly alienated many at the Scottish court by his irresponsible and wanton behavior. In March 1566, Darnley, jealous at Mary's reliance on advice from her secretary, David Rizzio, stormed into the royal apartments and with others stabbed Rizzio in front of the queen. Three months later the son of Mary and Lord Darnley, James, was born. However, Mary hated Darnley for what he had done to Rizzio and may have started having an affair with James Hepburn, fourth earl of Bothwell. She certainly came to trust Bothwell. It was not long afterward that Lord Darnley was killed while recovering from an illness; his house was blown up and his strangled body was later found in the garden. Soon afterward, Mary married Bothwell, but this started a major Scottish rebellion against the pair.

Mary was formally deposed as queen, with her infant son proclaimed king. She fled to England; Bothwell went overseas. Over the next 18 years, she was held in custody in England. Some English Catholics started conspiring with her, and in 1586 she was found to have been involved in a rebellion against Queen Elizabeth. Tried by an English court, she was sentenced to death and was executed on February 8, 1587, at Fotheringhay Castle.

JUSTIN CORFIELD

Maryland

Maryland was chartered in 1632 as a refuge for English Catholics, although the colony's religious mission was ultimately undermined by internal disputes. As did neighboring Virginia, colonial Maryland maintained an economy based on TOBACCO and bound labor.

Since the REFORMATION, Roman Catholics in England had faced persecution. Wanting to provide a place where they could worship freely, George Calvert, the first Lord Baltimore, envisioned an American haven for Catholics. Baltimore was a recent convert to Catholicism and had previously invested in several colonization schemes. In 1632, King CHARLES I granted Baltimore's request and issued a charter for a colony in the upper Chesapeake. The king was sympathetic to the plight of Catholics and Maryland was named in honor of his Catholic wife, Henrietta Maria. Unlike previous charters, Maryland's named Baltimore and his heirs "absolute Lords and Proprietors," essentially giving the Calvert family total control over the colony.

English colonists first reached Maryland in 1634, settling on the north side of the Potomac River at St. Mary's City, the colony's first capital. Within the first decade, settlers began erecting tobacco plantations and importing INDENTURED SERVANTS to work them. The colonists established an elective assembly in 1638, although the governor and governor's council were appointed by Lord Baltimore. Economic success ensued, but religious tensions threatened the colony's stability. Maryland had attracted both Protestants and Catholics from the start, although Baltimore gave the best lands to Catholic gentlemen and appointed Catholic governors and councilors. In contrast, Protestants came over largely as indentured servants and were shut out of the political process. Inspired by the English Civil War, Protestant colonists seized control of the colony in 1644 in what was termed "the plundering time."

Hoping to prevent future confrontation, Baltimore granted An Act Concerning Religion in 1649, guaranteeing that no person "professing to believe in Jesus Christ" would be "any ways troubled, molested, or discountenanced." The first American law to ensure religious liberty, the act was intended to preserve the rights of Catholics, who had already become a minority in their own colony.

Religious strife continued nonetheless. During the GLORIOUS REVOLUTION of 1689, Protestants led by John Coode again seized the colony. This time, the Calverts did not regain control until 1715, when the family converted to Protestantism. During the interim, the colonial assembly established the Anglican Church and barred Catholics from owning firearms and holding office. Thereafter religious conflicts abated as the population and economy diversified. In the late 17th century, African slaves replaced servants and became an important minority in the colony, constituting a third of Maryland's population at the revolution. In the northern counties, iron foundries were established and wheat farming appeared in the 1740s. Annapolis became the capital in 1694 and soon grew into a center of culture, boasting a newspaper, academy, and several clubs by the middle of the 18th century. To the end of the colonial period, Catholics remained an important minority in Maryland. When the Maryland delegates signed the Declaration of Independence in 1776, one of the signatures belonged to Charles Carroll of Carrollton, a Catholic.

JOHN G. MCCURDY

Mary Tudor (Mary of France)

(1496–1533) *queen of France*

Mary Tudor was born in 1496, nine years after her father, HENRY VII, had become king of England by defeating Richard III at Bosworth in 1485. Mary Tudor is often confused with MARY I, who was queen of England from 1553 to 1558, and with MARY, QUEEN OF SCOTS. However, Mary Tudor, the daughter of Henry VII, would be queen in her own right.

Mary was born in the age of great dynastic marriages when a king contracted for marriage of his daughter to benefit his kingdom. Mary was at first intended to wed Charles of Anjou, who would later become CHARLES V, the most powerful European monarch of his time. The contract, originally made by Henry VII, was renewed

A portrait of Princess Mary Tudor and her second husband, Charles Brandon, duke of Suffolk, c. 1516, artist unknown

on the October 17, 1513, by HENRY VIII at a meeting with Margaret of Savoy at Lille, with the wedding being set for the following year. But the Emperor Maximilian I, to whom Louis XII had proposed his daughter Renée as wife for Charles, with Brittany as a dowry, postponed the match with the English princess in a way that left no doubt of his intention to withdraw from the contract altogether.

Henry VIII succeeded to the throne when Henry VII died in April 1509. When it came time to renew the marriage agreement with Charles of Anjou, it was King Henry VIII who did so. With the customary determination of his younger years, Henry decided to invade France in June 1513 as a forceful demonstration of English might.

Henry joined the Holy League against France and went to war. While he was involved in France, his brother-in-law James IV of Scotland, who was married to his sister, Margaret Tudor, invaded the north of England. However, Henry had left the capable Thomas Howard to face any threat from Scotland. James IV was defeated and killed at Flodden on September 9, 1513.

The victories at the Spurs and Flodden made both France and the Holy Roman Emperor reconsider the marriage plans of Mary Tudor. Obviously, Henry had proved it was not wise to have him as an enemy. A diplomatic settlement was reached. Cardinal Thomas Wolsey contracted for Mary to wed King Louis XII. His queen, Anne of Brittany, had died in 1514, making him a desirable spouse for Mary. The two were wed on January 1, 1515, but Louis XII died three months later.

Mary had developed an intense love for Charles Brandon, duke of Suffolk. His marriage to Margaret Neville Mortimer had been annulled, and his second wife, Anne Browne, died in 1512. At the time of the Battle of the Spurs, he was engaged to an orphan girl. Henry VIII knew about the love between Charles and Mary. Moreover, Francis I learned of it when Mary told him of her true feelings when he attempted to marry her off to one of his relatives. As Louis XII's widow, Mary had become a valuable diplomatic asset to Henry again, and she feared that he might try to marry her to another royal suitor.

Mary was determined she and Charles would not be parted. In February 1515, they were married in Cluny Chapel in France. In May 1515, as a mark of royal favor, the couple was wed a second time in England; Henry VIII and his queen, Catherine of Aragon, were the guests of honor. For the time, peace between France and England was maintained. Mary Tudor died on June 26, 1533.

JOHN MURPHY

Massachusetts Bay Colony

In the early 17th century, England began acting on its imperial ambitions by chartering business organizations called joint-stock companies, which undertook the actual work and expense of spreading England and its institutions around the world. The system had

created the colony of Jamestown, Virginia, and the Council for New England, under the leadership of Sir Ferdinando Gorges. During the 1620s, one of the council's patents went to some Dorchester merchants to develop a fishing industry at Cape Ann on the New England coast. By 1626, the effort had failed, although John White, a Puritan minister in England associated with the project, began to see the enterprise as a potential refuge for discouraged Puritans from England.

Unfortunately for White and a group of fellow Puritans who had joined him, the Council for New England had ceased effective operation, and the group instead applied directly to the government for its own charter for the lands it already held. The charter, for a company called The Governor and Company of the Massachusetts Bay in New England, was issued in March of 1629. The company was to be managed by a governor and a council of 18 assistants, who were to be elected by a General Court of investors, which also had the power to legislate for the company. Not part of the charter was the usual requirement that the company conduct its business meetings in England.

This omission, quite possibly done by design, allowed the company to hold its meetings wherever it chose. In late August of 1629, in what is known as the Cambridge Agreement, the company opted to move its operations, including the charter, to New England. When control of the company quickly passed into the hands of dedicated Puritans willing to leave England, the company started its transformation into a colony. By late 1629, the company had sent out John Endicott to assert its control over a settlement at Salem and had then supported that effort with five more ships and possibly one hundred additional settlers.

CITY UPON A HILL

Thus, by April of 1630, when a flotilla of 11 ships left England, the Massachusetts Bay Company was already a significant presence on the New England coast, and its conversion into a full-fledged colony assured. JOHN WINTHROP, elected the company's governor, established the character of early Massachusetts in a sermon preached at the outset of the journey. He stressed that the colony would be created as a covenant with God, and that religious orthodoxy would be maintained by the merging of civil and ecclesiastical power and consolidated in the hands of the colony's leaders. His reference to Massachusetts as a "city upon a hill" to serve as an example to England of what God intended for

his people further solidified the religious nature of the proposed colony.

There is no question about the success of the enterprise. The Company of the Massachusetts Bay was indistinguishable from what came to be called simply the colony of Massachusetts. And the religious nature of the colony was secured by requiring that only male church members could vote in colony elections. There were challenges to some aspects of the colony from ROGER WILLIAMS, ANNE HUTCHINSON, Quakers, and the freemen of the colony who demanded an elected body to represent them, but there was never any likelihood in New England that the colony would not succeed.

But that certainty was not the case in England. Sir Ferdinando Gorges, still hanging on to the remnants of the Council for New England, argued that the colony's charter had been secretly obtained and started a campaign to have it annulled. To the same end in 1635, the council gave up its own charter and requested that the king reassign the disputed territory to eight members of the former Council for New England. The outbreak of the English Civil War, or Puritan Revolution, in 1640, however, prevented any of the grants except the one for Maine from being made.

By the time of the Restoration of the Stuart monarchy in 1660, Gorges had died, the Council of New England had passed from the scene, and Massachusetts had become too powerful and too independent to be easily tamed.

CONTROL OF COMMERCE

With the Restoration, England commenced a colonial policy that stressed the importance of commerce in the empire and the necessity of England's control of that commerce for the greater good of the mother country. Massachusetts viewed such a policy as interference in its self-styled independence. When England decided to oust the Dutch from NEW NETHERLAND in 1664, the leaders of the expedition were ordered to investigate the situation in New England. Their report was especially critical of Massachusetts, but through delay and avoidance the colony managed to escape serious ramifications.

England tried again in 1676, when it sent over Edward Randolph. Randolph's report was more damaging than the previous commissioners' account, and the English government felt compelled to act. It ordered the colony to send representatives to negotiate a settlement, but when England determined that the colony had not lived up to its agreements, it commenced legal action

against the original charter as the only method whereby Massachusetts could be brought under control.

England completed the effort in 1684, and the courts annulled the original 1629 charter. The colony existed dependently until it was incorporated into the Dominion of New England in 1686. In the aftermath of the GLORIOUS REVOLUTION in England, Massachusetts received a new charter in 1691 as a royal colony, the Province of Massachusetts Bay.

The Puritan old guard were displeased, but by the end of the 17th century the original charter had generally outlived its usefulness, as perhaps demonstrated by the Salem WITCHCRAFT trials. The more practical and forward-looking portion of the colonists recognized that future growth and prosperity lay with a royal charter, the institution of a property qualification for the vote, and a more cooperative relationship with English authority. Those whose ancestors had migrated as Puritans under the 1629 charter had become the Yankees of the 1691 charter. They and their colony were ready for the 18th century.

H. ROGER KING

Mather, Increase (1639–1723) and Cotton (1663–1728)

Puritan intellectual leaders

The Mathers, father and son, were intellectual and institutional leaders of New England's Puritan clergy for decades, preachers of thousands of sermons, and authors of hundreds of books. Increase's father was the distinguished minister Richard Mather, whose biography, *The Life and Death of that Reverend Man of God, Mr. Richard Mather* (1670), he wrote. Increase graduated from Harvard in 1656 and spent the next several years in Ireland and England. He returned to Massachusetts in 1661 and became an active disputant in the controversies roiling the New England churches.

Increase's most important political work was his preservation of the Massachusetts church and colony in the crisis of the 1680s, when the English government

was increasingly hostile to Puritanism. He was a leader in the opposition to the new royal governor, Sir Edmund Andros, and went to England in 1688 as the representative of the General Court of Massachusetts, an unusual role for a minister. Taking advantage of the Revolution of 1688 and forging alliances with English dissenters, Increase was able to procure a new charter for the Massachusetts colony and the annexation of Plymouth Colony to Massachusetts. Mather also served as president of HARVARD COLLEGE, although his refusal to reside in Cambridge led to controversy, and he resigned in 1701. His son Cotton would be frustrated in his ambition to succeed his father as Harvard president, and both Mathers would shift their support from Harvard, seen as corrupted by liberal ideas about admission to communion, to the new university of Yale.

Increase and Cotton would be remembered for their involvement in the Salem witch cases. Although both had a long-standing interest in the subject of WITCHCRAFT, they were not initially involved in the outbreak. Increase had been in England when the witch hunt broke out, but on his return the colony's governor, Sir William Phips, a close political ally, consulted him on the Salem affair. Increase did not doubt that witches afflicted New England and that magistrates had acted properly in response to accusations, but he was deeply troubled by the lack of procedural safeguards and the use of "spectral evidence," the appearance of alleged witches in spirit form used as evidence as guilt. His *Cases of Conscience concerning Evil Spirits Personating Men* (1693) was originally given as a sermon to a group of ministers in Cambridge on October 3, 1692. To Increase, it was perfectly possible for a devil to take the appearance of an innocent person. His position helped bring the persecution to an end. But he did not blame the magistrates; any condemnation of innocents at Salem was Satan's fault, not that of the colony's leaders.

Cotton's position on the Salem cases was ambivalent. He generally approved of persecuting witches, initially encouraged persecution, and intervened against the accused witch George Burroughs (1650–92). Cotton's acceptance of the reality of Salem witchcraft can be seen in his belief that witches were responsible for the death of his infant son immediately after the trial. Despite his acceptance of the witches' guilt, he shared his father's concern that the persecution was getting out of hand and affecting the innocent as well as the guilty. As did other Boston ministers, he eventually followed Increase's lead in encouraging the end of the persecutions. Cotton's somewhat hastily composed *Wonders*

of the *Invisible World* (1693) was the New England leadership's official account of the Salem witch hunt. He later interpreted some misfortunes that had befallen his family as God's punishment of him for not having spoken out against the persecutions, but in public he defended the actions of the magistrates. He was the principal target of the Boston merchant Robert Calef's anti-witch hunting work *More Wonders of the Invisible World* (1700).

Cotton Mather survived the attacks of Calef and others to remain Boston's leading minister until his death. He also reached beyond Boston to participate in the debate over the implications of the new science for Protestant Christianity taking place all over the British world. Mather prided himself on being a fellow of the Royal Society, the leading scientific society in England, and communicated stories of oddities from America to be included in its journal, *Philosophical Transactions*.

One of Mather's most important 18th century works was *Magnalia Christi Americana* (1702), an attempt at a providential synthesis of New England history. Mather had begun the *Magnalia* in 1693 and regarded it as his most important work. It covers the origin of the New England colonies, the lives of its governors and ministers, the story of Harvard College, remarkable events, and the colonies's conflicts internal and external.

Other major works from this part of Cotton's career include an unpublished medical compendium, *The Angel of Bethesda*, and a book integrating early 18th century science and Puritan theology, *The Christian Philosopher* (1721). After Increase's death, Cotton published a biography of his father, *Parentator* (1724). He also wrote many manuscript volumes of biblical commentaries that were never published.

Cotton Mather, who lost wives and children to smallpox, was the leading American champion of inoculating people with a weak form of smallpox to prevent their catching the disease later, an idea introduced to the English-speaking world in the early 18th century. His knowledge of inoculation came primarily from reports in *Philosophical Transactions* and accounts of African practices from his slave Onesimus. Mather began openly promoting inoculation during a smallpox epidemic in Boston in 1721.

He was personally attacked by those who thought the procedure too risky. A bomb was actually tossed into his house, but fortunately it failed to explode. (Mather believed that the devil had taken possession of those who opposed inoculation in order to attack

him personally.) The smallpox campaign contributed to Mather's loss of influence in his last years.

WILLIAM E. BURNS

Medici family

Salvestro de' Medici, in the 14th century, was the first of the family to make a bid for political power when he led the revolt of the the small artisan class against the nobility who governed the city. Salvestro overbid his hand and became virtually a dictator in Florence, causing all Florentines to unite and banish him from the city in 1382. After Salvestro's ejection from the city, Giovanni di Bicci de' Medici was able to restore both the family's wealth and its social standing in the community, important in the tightly knit fabric of the Italian city-states of the period. Giovanni made the Medici the richest family in Italy, perhaps in Europe.

The Medici family became paramount in Florence due to Giovanni's son, Cosimo the First, or Cosimo the Elder (Cosimo il Vecchio). However, at first, taking advantage of the death of Giovanni in 1429, the powerful Albizzi family banished Cosimo from Florence in 1433. Cosimo's exile was brief. The Florentines brought Cosimo back in triumph to the city the next year. He respected the republican character of the city and did not make an obvious grab for power. However, through his great wealth and personal ability, Cosimo nevertheless became the first citizen of Florence and the virtual ruler of the city.

Indeed, Muslim pirates, or corsairs, had been preying on Venetian shipping for some time. However, boasting one of the largest navies in Renaissance Europe, the Venetians at this time were a great power

at sea. A great shift in the Italian balance of power took place when Cosimo shifted the historic Florentine support to the rival city of Milan, where the Sforza family was fighting for supremacy. While Muzio Attendolo Sforza made his name as a *condottiero* (mercenary leader), it was his son Francesco who became duke of Milan in 1450 with the aid of Cosimo de' Medici.

Meanwhile, Cosimo was establishing himself as one of the great patrons of the Renaissance. Countless rare documents formed the foundation for Cosimo's library; he also patronized the leading artists of his day.

Piero de' Medici was a civic-minded ruler, as was his father, Cosimo. He already had experience in Florentine diplomacy and public affairs. He wed Lucrezia Tornabuoni, whose family had turned its back on its noble heritage. Together, they had three daughters, Maria, Bianca, and Lucrezia, and two sons who would mold the future history of Florence, Lorenzo and Giuliano. Lorenzo was precocious and unusually gifted for his age. His father entrusted him with diplomatic missions throughout Italy.

However, within Florence, serious opposition was building to Medici rule. Luca Pitti, perhaps Piero's chief adviser, was secretly planning to seize power. In March 1464, taking advantage of the death of Francesco Sforza, the conspirators made their plans. When Piero was ill and left the city in August, they struck. Piero came back in force at the end of the month after Lorenzo had gathered loyal troops. The coup collapsed. Luca Pitti was pardoned; others were banished.

When Piero died in 1469, Lorenzo was the natural choice to take his place. Unlike Cosimo and Piero, he ruled more as a prince or an ancient Roman tyrant than a man of the people. At the same time, there was a chilling of relations between Lorenzo and the new pope, Sixtus IV. The main reason was a struggle over the town of Imola, which Lorenzo wanted to gain for Florence because it guarded the strategic road from Rimini to Bologna. The pope wanted Imola as a gift for his nephew—possibly his son—Girolamo Riario. The cold feelings developing between Lorenzo and Sixtus led to the pope's replacing the Medici as the papal bankers with the Pazzis, rivals of the Medici.

The enmity between Lorenzo and the pope, now allied with the Pazzis, led to one of the bloodiest incidents of the Italian Renaissance: the Pazzi Conspiracy. The conspiracy aimed at wiping out the Medici. The plotters knew too that Lorenzo suffered a serious weakness: His strong ally, Galeazzo Maria Sforza of Milan, had been assassinated in December 1476. The conspirators struck on Easter Sunday, April 26, 1478, while

Lorenzo and Giuliano were at mass. In the bloodbath that followed, Giuliano was stabbed 19 times, but Lorenzo escaped. In a purge that followed, many of the conspirators were killed, including five who were publicly hanged. Pope Sixtus continued his campaign to oust the Medici from Florence. Finally, in a bold move, Lorenzo decided to make a trip and attempt to make peace with one of Florence's most implacable enemies, King Ferrante of Naples, in December 1479. Amazed at the Medici's bravery, Ferrante made peace with Florence, and Sixtus's war came to an end. Lorenzo returned to Florence in triumph. Under him, Florence entered a new era of greatness.

In January 1492, Lorenzo fell ill and died in April of that year. He was succeeded by his son Piero, who had the misfortune to rule at one of the most disastrous epochs of Italian history. King Charles VIII of France invaded northern Italy in 1494 with a large and well-equipped army. His artillery, perhaps the most modern in Europe, destroyed Italian citadels and caused cities to surrender before he even approached them. Piero, lacking the fortitude of his father, fled Florence and died in exile.

During the next century, the rise of the family to the ranks of the Italian nobility gave proof of the singular determination of the family, and the faith of the Florentines in the Medici clan.

The Medici rise continued when Cosimo I became duke of Florence in 1537. Like Lorenzo the Magnificent, Cosimo I was young, coming to power at 18. However, like Lorenzo, he understood the art of politics but showed a ruthlessness more characteristic of a Borgia than a Medici. Cosimo I added Siena and Luca to his realm. In 1569, his rise to eminence was recognized when he became grand duke of all Tuscany.

On the death of Cosimo I in 1574, Cosimo's son Francesco I ruled as grand duke until his death in 1587, and his rule proved to be a weak and uninspiring one. His son Ferdinand II restored luster to the Medici name. Cosimo II became grand duke in 1609 but died in 1620, never having fully recovered from a fever he had suffered in 1615. His son Ferdinand II became grand duke on his father's death.

With the reign of Ferdinand II, the House of Medici began its period of decline. It was the misfortune of the heirs of Ferdinand II to live in the era of the rise of the European great powers. Ironically, Marie de' Medici (Médicis) played a role in the demise of her family's duchy. In 1600, she married King HENRY IV of France, and when he was assassinated in 1610, she served as regent for her son, King Louis XIII.

In 1735, Austria and France arranged that France would take Lorraine and Austria would seize possession of Tuscany. By this time, the Medicis were powerless to defend their ancient lands. In 1737, Austrian troops entered Florence. In the same year, in July 1737, Grand Duke Gian Gastone died without a male heir at the age of 65. The House of Medici had ceased to rule in Florence.

JOHN MURPHY

Mehmed II (Mehmet II)

(1432–1481) *Ottoman sultan*

Mehmed II (reigned 1444–46; 1451–81) was only 12 years old when his father, Murad II, abdicated to pursue a life of religious contemplation (following Sufi or Islamic mysticism) and appointed him sultan in 1444.

Faced with a threatening battle at Varna, Mehmed called his father back from central Anatolia to lead the troops. When his father died in 1451, Mehmed resumed the throne. Noted for the many military victories throughout his life, Mehmed was known as *al-Fatih* or the Conqueror.

Mehmed was only in his early 20s when he launched the successful siege of Constantinople, the Byzantine capital that the Ottomans had previously failed to conquer. In a siege that lasted over 50 days, the Ottomans mounted a major assault with over 200 ships and at least 50,000 well-trained soldiers. Ottoman cannon bombarded the walled city that had been considered impregnable. A fortress, Rumeli Hisari, was constructed on the northwest coast of the Black Sea to prevent reinforcements from assisting the besieged city. To circumvent the long chain that blocked the waterway into the Golden Horn, Mehmed transported seafaring galleys over a long greased planked road

built north of the city and used a pontoon bridge to take troops across.

After some weeks the Ottomans broke through the city walls and met with little resistance from the inhabitants, who had vainly hoped for outside reinforcements. Rather than the customary three days allotted to soldiers taking a conquered city, Mehmed only allowed his troops a few hours of pillaging in the city. He entered the city with great pomp and promptly offered prayers at the great Byzantine basilica, Aya Sophia, which was then turned into a mosque.

Although he was known, especially on the battlefield, for his furious temper, Mehmed was generous in victory, granting autonomy to the Greek Orthodox residents of city and permitting the return of those who had fled prior to the siege. Mehmed also encouraged others to move into his new capital, known to the Turks as Istanbul.

Mehmed made Istanbul a major entrepôt and center of learning and culture. He established new schools, hospitals, caravanserais, and soup kitchens. He saw himself as the heir to the Roman Empire and viewed his empire as the guardian of Islam, whose duty it was to protect Muslims everywhere. Islam was the source of legality of his new great empire.

Under Mehmed, the empire developed a centralized administration; the janissary corps was enlarged while the many religious and ethnic minorities within the empire were treated with leniency and fairness. Mehmed also encouraged skilled artisans and intellectuals escaping Muslim Spain after it fell to the Reconquista to settle in Istanbul. He granted monopolies over the sale of basic necessities to private individuals and used these revenues to bolster the Ottoman treasury.

Well educated, Mehmed spoke numerous languages and was interested in the study of military tactics, especially the exploits of Alexander the Great. Unusually for a Muslim leader who generally eschewed physical representations, Mehmed also hired the famed Venetian artist Gentile Bellini to paint his portrait.

Under Mehmed, the Ottomans dominated all of the Balkans to the Danube River and all of Anatolia, but he failed to defeat the MAMLUKS in Syria. Mehmed died preparing for a campaign to take the island of Rhodes and southern Italy and was succeeded by his son Bayezid II.

JANICE J. TERRY

Melancthon, Philip

(1497–1560) *religious reformer*

Philip Melancthon was a key Lutheran reformer. He worked very closely with MARTIN LUTHER and was the author of many of the major REFORMATION documents, including the AUGSBURG CONFESSION. Philip Melancthon was born Philip Schwarzerd on February 16, 1547, in Bretten, Germany. A brilliant boy, he was tutored in Greek and Latin and entered the University of Heidelberg just before his 13th birthday in 1509, graduating at age 14. The university would not allow him to study for his master's at such a young age, so Philip moved to Tübingen, studying both philosophy and humanistic thought. He completed his master's degree in 1514 at age 17. He was offered a position as an instructor at Tübingen and taught there until 1518.

During his time at Tübingen as an instructor, Melancthon began to study theology and continued his studies of Greek, producing a Greek grammar in 1518. Offered a position at Wittenberg as a professor of Greek in 1518, Melancthon eagerly accepted. It was there he met another professor, the monk Martin Luther, who had posted his 95 Theses on October 31, 1517, on the church door at Wittenberg. Melancthon was an early supporter of Luther, attending the debates that preceded Luther's excommunication from the Roman Catholic Church. By the time of his publishing a defense of Luther against JOHANN MAIER VON ECK in 1519, Melancthon was considered a part of the Lutheran camp.

AUGSBURG CONFESSION

Melancthon was the primary author of the Augsburg Confession, written in 1530. This is a key Reformation document, explaining the Lutheran position on various theological issues. Written in Melancthon's clear and lucid style, it represented the Lutheran position in a manner that many hoped would bring about reconciliation between the Lutherans and Roman Catholics. Melancthon would prove always to take the more moderate position in the various Reformation controversies.

Melancthon worked closely with Luther on many of Luther's writings. He assisted in Luther's translation of the Bible into German, revised many of Luther's commentaries on the Bible, and assisted Luther in some of the Luther's most important polemical works. Yet Melancthon would not always agree with Luther. In 1537, at a meeting in Smalcald, Luther had previously prepared what are commonly called the Smalcald Articles (a part of the Book of Concord), attacking the pope virulently. Melancthon, writing his own "Treatise on the Primacy and the Power of the Pope," persuaded the others present to adopt his more moderate position. Melancthon married Katharina Krapp, daughter of the mayor of Wittenberg, in 1520. They had four children and their marriage lasted 37 years until Katharina's death in 1557. They lived in Wittenberg throughout their marriage.

Melancthon had many roles at the University of Wittenberg. He gave immensely popular lectures in over 100 courses to thousands of students (some of his most popular lectures had over 2,000 in attendance). His lectures included theology, philosophy, philology, and world history. He served as rector and academic dean at various times, helping to establish the university as a leading educational institution.

Melancthon published many books. His most famous book, a systematic theology called the *Loci communes*, was first published in 1521 and revised several times by Melancthon.

Melancthon reached out to many church and public figures including HENRY VIII, king of England; King Francis I of France; and the patriarch of Constantinople. He also counted as friends many Calvinists, including Oecolampadius, Bucer, and JOHN CALVIN himself. This would leave him open to later charges of being a crypto-Calvinist.

The most tragic event in Melancthon's life was his role in the document called the Leipzig Interim. Soon after Luther's death in 1546, Emperor CHARLES V invaded the German area of Saxony and forced the defeated princes to adopt a document that was designed to be an interim document until the theological matters were settled by the COUNCIL OF TRENT, which had begun recently. The authors of the document were two Roman Catholic bishops and Luther's old nemesis, John Agricola. The resulting document so favored Roman Catholicism that the defeated princes refused to sign it. Melancthon was asked to improve the document to make it more palatable. This he did, but just barely. The document compromised on JUSTIFICATION BY FAITH, a key Lutheran tenet, and Melancthon's association with

it would unfairly brand him as a traitor to the Lutheran cause for the rest of his life.

Melancthon provided a kind of balance to Luther that Luther himself appreciated. He was not a strong leader, and many rightly accuse him of being too eager to compromise. Yet his key role in many of the Reformation documents and his personal influence and friendship with many of the reformers clearly show how essential Melancthon was in the early years of the Reformation. Melancthon died in 1560 and was buried next to Luther in the castle Church of Wittenberg.

mercantilism

The theory and practice of mercantilism in early modern Europe were densely entwined with both the emergence of capitalism and the formation of overseas empires. Briefly, capitalism can be defined as an economic system in which goods and services, produced by individuals and privately owned firms, are bought and sold in markets, thus benefiting individual owners of capital and private property. In early modern Europe, mercantilism extended this notion regarding capitalist production and exchange to the level of the state. More specifically, it refers to the theory and practice of how the early modern European states and nation-states related to each other and to their respective colonies.

The basic theory behind mercantilist practice was fairly simple. The whole point of creating overseas colonies was to augment the economic, political, and military power of the colonizing state, often referred to as the “mother country,” though this locution is deceptive, since the unit of analysis is less a “country” than a specific state apparatus. Colonies were to serve the colonizing state in two principal ways: as a market for manufactured goods produced in the home country, and as a source of raw materials from which the nation-state’s private producers would cre-

ate manufactures. An ideal mercantile relationship was thus conceived as hierarchical, reciprocal, and exclusive; the colonizing power was to be dominant, the colony subordinate. Manufactures were to flow in one direction, raw materials in the other. At the same time, rival colonizing states were to be excluded from this relationship. It would not serve the English state’s mercantile interests, for instance, for its rivals (e.g., Spain or France) to trade with its colonies. From the perspective of any given colonizing state, the whole point of creating overseas colonies was to enhance its own power vis-à-vis competing states.

It would therefore be counterproductive for a colonizing state to permit its rivals to benefit by trading with its colonies by either exporting manufactures to them or receiving raw materials from them. The exclusionary nature of the ideal mercantilist relationship was thus just as important as its hierarchical and reciprocal qualities. Finally, mercantilism also called for low wages and minimal consumption in the home country and for maximizing of exports, thus encouraging industrial development and permitting the greatest percentage of money and resources to be kept in the hands of the state.

Mercantilist practice often deviated from mercantilist theory, however, depending on time, place, and circumstance. Spain, the New World’s first colonizing power, endeavored relentlessly to forge an exclusive mercantile relationship with its colonies, with decidedly mixed success. Despite an abundance of laws and decrees intended to ensure an exclusive relationship, smuggling, contraband, and other forms of illicit trade made Spain’s mercantile system, hermetically sealed in theory, exceedingly leaky in practice. In addition, Spain did not have the industrial base with which to meet its own or its colonies’ demands for manufactured goods. As a result, much of the silver and gold plundered from its New World colonies slipped through the fingers of the Spanish state on its way to Dutch, Flemish, and English merchants, who were able to provide the industrial manufactures that Spanish merchants were not.

The English were more successful in achieving the mercantilist ideal, principally through a series of Navigation Acts (most notably in 1651 and 1660) that required England’s colonies to trade exclusively with the mother country. But here, too, smuggling and contraband poked many holes in the system, rendering mercantilist practice a far cry from the ideal. The Dutch state, committed to free trade and frequently encouraging its capitalist class to invest in its rivals’ colonies, rarely adhered to mercantilist theory, yet Dutch

merchants and the Dutch state succeeded in amassing vast quantities of capital during the colonial period.

Principally because their domestic economies had undergone the most extensive transition to capitalism, by the end of the colonial period the English and French states had become the most successful in employing mercantilist theory and practice to augment their own economic, political, and military power, and, by extension, the power and prestige of their respective nation-states.

MICHAEL J. SCHROEDER

Mexico, Basin of

Like a giant bowl gouged out of the Earth, ringed by mountains and active volcanoes, the Basin of Mexico, the site of contemporary Mexico City, is one of the world's most ancient and important cradles of human civilization. Conventionally called the Valley of Mexico, this singular geographic feature has no outlet to the sea, and thus technically is a basin, not a valley. Tectonically unstable, ranging in elevation from 2,000 to 2,400 meters above sea level, and extending roughly 110 kilometers north to south and 80 kilometers east to west, the Basin of Mexico covers an area of approximately 7,000 square kilometers. Prior to the CONQUEST OF MEXICO, the basin's diverse ecological zones saw the rise and fall of diverse city-states and kingdoms. Because it formed a closed hydrological system, and because it has ample volcanic and alluvial soils, the basin evolved a complex network of lakes, streams, and springs that also made it one of the richest and most productive ecological zones in all of Mesoamerica.

The basin's first human inhabitants, arriving some 15,000 years ago, found an environment teeming with life—not only birds, fish, plants, and insects but a staggering diversity of mammals like rabbit, fox, pigs, deer, wolves, as well as camelids, horses, mammoths, mastadons, giant sloths, bears, and other large prey. Initially a hunter's paradise, the basin had by 9,000 years ago seen its largest fauna become extinct, probably due to a combination of climate change and anthropogenic pres-

ures. The beginnings of maize cultivation, which later provided the economic underpinnings for the development of complex societies and civilizations across Mesoamerica and beyond, began in or near the basin around 5,000 B.C.E. It is hypothesized that the absence of large draft animals suitable for domestication delayed for several thousand years the emergence of fully sedentary societies. As late as 1,000 B.C.E., the entire basin was home to an estimated 10,000 inhabitants—a tiny fraction of its carrying capacity, and of what it would be two millennia later.

Beginning around 1100 B.C.E., in the basin's wetter southern zones, conscious manipulation of the basin's abundant water resources marked the beginnings of an agricultural revolution, and along with it of complex societies that relatively quickly developed into large-scale state systems. Around 500 B.C.E., to the northeast the construction of irrigation ditches and other water-control mechanisms permitted the emergence of the basin's first true city and state, Teotihuacán. Around the same time, a host of other polities emerged around the five interconnected shallow lakes that dominated the basin's center—from south to north Lakes Chalco, Xochililco, Texcoco, Xaltocán, and Zupango.

From around 100 B.C.E., and continuing for the next 16 centuries, there emerged an exceedingly intricate array of polities, kingdoms, and city-states across the basin, most with their capital cities located near the lakes at the basin's center, the exact sequence and relationships of which scholars are still endeavoring to understand. The Aztecs built their capital city Tenochtitlán atop what began as a small island on the western edge of Lake Texcoco, the basin's central and largest lake.

By the time of the Spanish arrival in 1519, the Basin of Mexico was home to an estimated 2 million to 3 million people, making it one of the most densely packed areas in the world, with an average population density of from 300 to 500 persons per square kilometer. After the conquest, the Spanish devoted enormous resources to draining the giant lakes. In the early 21st century, the Basin of Mexico was home to the world's second-largest megalopolis and an estimated 25 million to 30 million people.

Mexico, conquest of

The conquest of Mexico represents one of the most oft-told and epic sagas in the European conquest of the New World. Our knowledge of the defeat of the AZTECS (MEXICA) is based on a rich array of firsthand accounts, both Spanish and native. The first conquest of a major indigenous polity in the Americas by a European power, the conquest of Mexico fueled the European imagination while providing a template for the violent subjugation of the rest of Mesoamerica and large parts of South America in the decades to follow.

With the conquest of Cuba complete and much of the Caribbean under Spanish dominion, the first explorations along the coast of modern-day Mexico were in 1517 under captain Francisco Hernández de Córdoba. This initial exploratory foray was followed in 1518 by an expedition under Juan de Grijalva that further probed the easternmost fringes of the Aztec domain. Both were under the authority of the governor of Cuba, Diego Velázquez. In a series of sometimes violent encounters with the native inhabitants along the coast, the Grijalva expedition learned that a great city lay somewhere in the interior.

The stage was thus set for a third expedition, also under Governor Velázquez's authority, to ascertain further the nature of these mysterious lands and peoples. After much behind-the-scenes political intrigue and deal making within Cuba, the governor selected HERNÁN CORTÉS as the expedition's leader—a choice he would soon come to regret.

SETTING SAIL

The 11 ships under Cortés's command set sail from Cuba in December 1519 with some 530 European men, several hundred Cuban Indians (including women), 16 horses, and numerous dogs. They were exceedingly well armed with artillery, cannons, swords, cutlasses, lances, crossbows, arquebuses, and other weaponry, and well stocked with bread, meat, and other provisions, including trinkets for use as gifts to friendly natives. Officially this was to be an expedition of discovery only. Governor Velázquez had not granted its leader the authority to conquer or colonize.

Making initial landfall at Cozumel Island, Cortés learned from the natives that two Christians were held captive in the interior. One of them, Jerónimo de Aguilar, had shipwrecked off the coast of Yucatán in 1511 and lived among the local inhabitants for the past eight years. His knowledge of Chontal Maya and native customs would prove crucial in the events to

follow. The expedition continued north and west, past Yucatán and along the coast of present-day Tabasco state. On March 25, 1519, at the village called Potonchan, after one in a series of violent encounters with coastal peoples, Cortés was given 20 young native women as a peace offering. One of these women, Malinali, baptized Marina, became one of the key actors of the conquest, acting as Cortés's interpreter, confidant, and later mistress, bearing his child—reputedly the first *mestizo* (Spanish-Indian) child. She spoke both Maya and Nahuatl, the latter the language of the Aztecs, and had intimate knowledge of Indian people's customs and practices. To Mexicans she was later known as LA MALINCHE (DOÑA MARINA), or worse, La Chingada (the violated one) and conventionally has been viewed as a traitor to her people, an interpretation challenged by more recent feminist scholarship.

The expedition reached San Juan de Ulúa, an island off the coast of modern-day Veracruz, on Maundy Thursday 1519. Reaching the mainland on Good Friday, Cortés established friendly relations with the local Totonac chieftain, an Aztec subordinate named Teudile. On Easter Sunday, Cortés undertook a characteristically theatrical gesture when he staged a mock-battle on the beach, firing cannon and racing his horses, to the astonishment of his hosts. He also asked for gold, which he portrayed as medicine for sick comrades. Within days, Aztec emperor MOCTEZUMA II was informed of the strangers' activities via oral reports and painted renderings. Scholarly debates continue regarding whether Moctezuma and his priests viewed the bearded strangers as gods, particularly whether Cortés was the Plumed Serpent Quetzalcoatl returning from the east as prophesied.

In order to circumvent the authority of Governor Velázquez and establish his own authority to wage a campaign of conquest, Cortés pulled a legal sleight of hand, founding a town called Villa Rica de la Vera Cruz, appointing its officials, and resigning his office. His men in turn elected him the town's principal judicial and military authority. In accordance with Spanish law, he now derived his authority directly from the Crown. The maneuver is often cited as a prime example of the conquistador's political cunning.

INLAND EXPEDITION

With their base at Villa Rica, the expedition inland began. Soon a pattern developed, whereby Moctezuma politely denied Cortés the right to enter the Aztec capital, and Cortés politely insisted on visiting the sovereign as an ambassador of King Charles I. The campaign

A 1585 illustration from a painting depicting Hernán Cortés (seated) greeting Aztec leaders. La Malinche, his translator, stands at his side. The arrival of Europeans on the North American continent spelled the eventual demise of the Aztec Empire.

that followed demonstrated Cortés's masterful ability to perceive and exploit the political and ethnic divisions between the Aztecs and their subordinate polities. Events in Cempoala—in which Cortés tricked the Cempoalan cacique into an alliance—are often cited as exemplary of this ability. So too is his decision to scuttle his ships, along with other actions that worked to instill a sense of purpose, unity, and loyalty among his men.

After winning the alliance of the Tlaxcalans—one of the few polities the Aztecs had proved unable to subdue—and slaughtering some 6,000 Cholulans in an infamous surprise attack, the expedition reached Tenochtitlán on November 8, 1519. Entering the mag-

nificent city, the Spaniards were greeted graciously by the indecisive Moctezuma.

A few days later on November 14, Cortés boldly took the Aztec emperor hostage, holding him as prisoner within his own capital city. After some six months in this uneasy state, Cortés learned that Governor Velázquez of Cuba had dispatched an expedition under Pánfilo de Narváez to arrest him (Cortés) for violating his orders. Leaving his second in command PEDRO DE ALVARADO in charge in Tenochtitlán, in early May 1520, Cortés hastened back to Cempoala, defeated the Narváez force on May 28–29, and won over its survivors. Returning to Tenochtitlán, the Spanish force

under his command now more than 1,000 strong, Cortés learned to his chagrin that Pedro de Alvarado had slaughtered hundreds of Mexican nobility during a religious celebration.

Trapped for several days, the Spanish force barely escaped the city in its withdrawal of La Noche Triste (The Sorrowful Night) of July 1, 1520, in which an estimated 400–600 Spaniards were killed. During the fighting, the emperor Moctezuma was slain, by which side remaining a matter of debate. Regrouping his forces near the coast, Cortés decided to lay siege to the great city. In an audacious and monumental undertaking, he supervised the construction of 13 brigantines, which were then carried in sections over the mountains, assembled, and launched on Lake Texcoco. By this time, his forces numbered some 900 well-armed Spaniards, 86 horses, and thousands of Indian allies.

The siege of the island city of Tenochtitlán began in May 1521. Meanwhile an epidemic, probably of smallpox, was laying waste to the Aztec capital. Even before the siege had begun, an estimated one-third of the city's inhabitants had succumbed to European diseases against which they had no immunity.

After three months of furious fighting, the Spanish invaders and their Indian allies reduced Tenochtitlán to rubble. Leading the city's defense was CUAUHTEMOC, Moctezuma's cousin, whom much Indian lore later came to memorialize as a hero. The city fell on August 13, 1521—some two and a half years after the invaders' first landfall at Villa Rica de la Vera Cruz.

Scholars have emphasized various factors that made possible the defeat of the mighty and war-hardened Aztecs by a few hundred Spanish invaders. Near the top of all such lists is Cortés's political brilliance, combined with his unshakable will to conquer, acquire riches, and spread the Christian faith. His ability to perceive and exploit preexisting divisions within the Aztec polity, and success in gaining thousands of loyal Indian allies, are often cited as *sine qua non* of the conquest. Also emphasized in this vein is that no native inhabitants could have known that Cortés was but the advance guard of an aggressive and expanding kingdom, accustomed to campaigns of conquest, inspired by an exclusive and highly militarized religion, determined to create an overseas empire.

Other major factors most often cited in making the conquest possible include Spanish superiority in the technologies of warfare, especially their horses, swords, and armor; the invaders' skills in the arts of war, steely resolve, unity of purpose, and loyalty to each other and their leader; the adversaries' very dif-

ferent cultural conceptions of warfare, with the Spaniards focused on killing the enemy, and the Aztecs more concerned with capturing prisoners for later sacrifice; the Spaniards' advantage of language, thanks to Jerónimo de Aguilar and La Malinche; the weak and indecisive leadership of Moctezuma; the role of myth, legend, and fatalism in weakening Aztec resolve; and the role of disease in weakening the Aztec capacity to resist once the final siege had begun.

Atop the smoldering ruins of Tenochtitlán the Spaniards built a new capital city—Mexico City—often using the same blocks of stone they had just toppled, and foundations already in place, using the labor of the vanquished Indians to realize their vision of the Spanish Christian kingdom spread to the New World. For the next 300 years, NEW SPAIN would be Spain's most important colony. Soon many of the victorious conquistadores and their countrymen began looking beyond Mexico, as New Spain served as a launching point for further campaigns of conquest.

MICHAEL J. SCHROEDER

Ming, Southern

When a frontier people, the Manchus, took over control of China in 1644, Ming dynasty loyalists fled to southern China, where they held out for many years; they became known as the Southern Ming.

Over several centuries, descendants of the Ming emperor surnamed Zhu (Chu) were settled throughout the Chinese empire. As a result when the last Ming emperor committed suicide there were members of the imperial family throughout China, especially in the south, and it was natural that anti-Manchu forces would use them to legitimize their rebellions.

The first of these was Zhu Yusong (Chu Yu-sung), better known as the Prince of Fu. He was descended from Emperor WANLI (WAN-LI) (r. 1573–1620); in fact all of the main claimants of the Southern Ming were descended from him. He assumed the title Emperor Hongguang (Hung-kuang) and reigned in Nanjing (Nanking).

The new Southern Ming emperor sent emissaries to the Manchus. He initially tried to conciliate the Manchus and offered them a subsidy if they would return to Manchuria. The offer was rejected by the Manchu regent, Prince DORGON. In the ensuing fighting, the Southern Ming fared badly. Nanjing was captured by the Manchus and Hongguang was taken prisoner to Beijing (Peking), where he died in captivity in 1646.

Following the Manchu capture of Nanjing, several Ming princes were elevated to lead movements by loyalists against the Manchus, but none of them showed worthy qualities and their causes fizzled in quick succession, succumbing to campaigns led by both Manchus and Han Chinese generals who had defected to the Manchus.

The most notable example of Han Chinese participation in opposing the restoration of the Ming was WU SANGUI (WU SAN-KUEI), the general guarding the easternmost pass of the Great Wall against the Manchus, who opened the way for the combined Manchu and his effort that defeated the rebel Li Zicheng (Le Tzu-ch'eng). General Wu commanded a force that drove Prince Guei (Kuei), a Ming pretender, into Burma and was rewarded with a princely title and granted Yunnan Province as his fief.

The most sustained resistance was led by ZHENG CHENGGONG (CHENG CH'ENG-KUNG), better known as Koxing in the West (1624–62) who had a formidable force along the southern coast and along the Yangzi (Yangtze) River. After his defeat on mainland China, Zeng and his son retreated to Taiwan where they held out until 1683. The fall of Taiwan to Manchu forces ended the southern Ming resistance.

JUSTIN CORFIELD

Ming dynasty, late

The Ming dynasty of China (1368–1644) was founded by a commoner, Zhu Yuanzhang (Chu Yuan-chang), who ruled as Emperor Hongwu (Hung-wu), 1368–98. He expelled the Mongols and began the recovery of China. His son, Emperor Yongle (Yung-lo), ruled from 1402 to 1424 and was also a capable general and administrator. Together they expanded China's borders, strengthened the defenses, and pursued policies that led to economic recovery and agricultural revival. The schools that they founded and the examination system that they revitalized to recruit government officials would serve the empire well during long decades when minors and weaklings occupied the throne. However a succession of capricious and weak rulers eventually led to eunuchs' controlling power and massive corruption that resulted in domestic revolts, unwise foreign wars, and dynastic collapse.

Emperor Hongwu instituted an autocratic style of government and both he and Yongle exercised their power vigorously and effectively. However while Hongwu treated eunuchs as mere palace servants, Yongle began to entrust them with administrative duties, but under his firm control. Yongle died leading his fifth campaign against the Mongols. His son was already ill and died within a year, passing the throne to his son, who ruled for 11 years as Emperor Xuande (Hsuan-teh). Xuande was succeeded by his eight-year-old son in 1436. Such short reigns were damaging in an autocratic system of government where continuity in leadership was an asset. Minors on the throne required regencies by empress dowagers, who notoriously relied on eunuchs rather than ministers for advice.

Most Ming dynasty eunuchs came from poor families in northern China and were noted for their greed and extortion. Boy emperors who were isolated from normal human contacts grew up dependent on them as friends and advisers. For example Emperor Zhengtong (Cheng-t'ung) appointed his eunuch Wang Zhen (Wang Chen) commander in chief and the two men set out together in 1494 with a large army against the Mongol Esen Khan. The army was cut to pieces, Wang died, and Zhengtong was taken prisoner. Although the Mongols were too weak to take the offensive, this disaster ended

Chinese military superiority over the nomads and put the Ming government on the defensive on the northern frontier. In the mid-16th century, Mongol chief ALTAN KHAN would raid China's northern borders at will for two decades. At the same time, Japanese pirates and Chinese renegades raided and looted the southern coast inflicting huge damage. In the 1590s, Japanese warlord TOYOTOMI HIDEYOSHI invaded Korea. Suzerain China had to send a huge army to aid the Koreans for six years, at enormous cost.

Two long reigns in the 16th century (Jiajing or Chia-ching between 1520 and 1566, and WANLI (WAN-LI) between 1572 and 1620) brought a measure of stability, largely due to able ministers in the early part of each reign. However both monarchs were grossly negligent of their duties, isolating themselves from government officials and relying on power-hungry palace eunuchs, with the result that the bureaucracy became increasingly demoralized. A government that was unresponsive to social and economic problems would eventually be brought down by peasant rebels from northwestern China led by Li Zicheng (Li Tzu-ch'eng) in 1644.

Ming China prospered, however, despite inept political leadership. The population increased from about 60 million at the beginning to possibly 200 million by 1600. In addition to great metropolitan centers such as Suzhou (Soochow) and Hangzhou (Hangchow), many intermediate-sized market towns emerged. Society was egalitarian and the flourishing printing industry facilitated the spread of education so that the sons of millions of families could realistically aspire to obtain an education, pass the state exam, and join the elite. Popular culture represented by the theater and opera flourished in the cities. In addition, a new genre of literature developed during the Ming. It was the novel, written in the vernacular and depicting men and women of all social classes.

The government's principal source of income was the land tax, assessed on land owned by farming families and not on the number of males in a household. This system of taxation gave farmers greater freedom to choose employment and allowed the development of industries. Silk and cotton manufacturing prospered, as did the porcelain industry, which led the world.

While China had traded with South and Southeast Asia and beyond for over a millennium, the Portuguese entered the trading scene in 1516, opening direct seaborne Sino-European commercial relations. Portuguese merchants were followed by men from the Netherlands, England, France, and other European

nations. Westerners brought European products, but more significantly New World crops such as maize, sweet potatoes, and tobacco, with enormous impact on Chinese agriculture and diet. More immediately European demand for Chinese silks, porcelain, and tea brought an influx of silver to China. In 1581, the first Jesuit missionary landed in China. Jesuits would be important during the late Ming and early Qing (Ch'ing) as cultural ambassadors between China and Europe. They introduced Western sciences, mathematics, astronomy, cartography, and firearms to China and the ideals of Chinese philosophy to Europe, laying the foundations of Sinology, or study of Chinese civilization in Europe.

The 16th century was an era of great changes in Europe and China, where modern societies were beginning to develop. Despite inept Ming emperors the educational system and civil service continued to provide for a prosperous and advancing civil society.

However by the beginning of the 17th century, many signs pointed to the fact that the country was exhausted. An ineffective government could not simultaneously deal with internal rebellions and border incursions by nomads.

The last Ming emperor hanged himself as rebels swarmed into the capital; a beleaguered frontier general then invited the Manchus, a minority ethnic group living on the northeastern borders of the Ming empire, to help him put down the rebels. Astute Manchu leaders seized this opportunity to ascend the throne and founded a new dynasty.

mita labor in the Andean highlands

For many centuries prior to the Spanish conquest, the indigenous peoples of the Andean highlands had employed a system of reciprocal labor exchange known as *mita* (MEE-ta). Literally translating as “turn work” or a “turn” of labor, *mita* was integral to the system of *ayllus*, which in the absence of markets constituted the principal mechanism by which individuals, families, and communities exchanged goods and services. *Mita* was also the principal way in which pre-Columbian Andean states, including the Inca, secured the labor necessary for the construction of roads, agricultural terraces, warehouses, temples, and other public works.

In the aftermath of their conquest of the Inca, the Spanish came to employ a modified version of the *mita* labor system, which by convention is generally referred to as *mita* (rather than *mit'a*) labor. The differences between the two systems were profound. In the prequest *mita* system, even the lowliest peasant could be assured of a minimal level of subsistence, just as highland communities were ensured an adequate number of workers even after local notables (*kurakas*) and the imperial state had siphoned off the specified number of *mita* laborers (*mitayos*).

Under Spanish rule, the *mita* system was essentially shorn of much of its reciprocal qualities, while demands for labor intensified dramatically. Especially after the reforms instituted by Viceroy FRANCISCO DE TOLEDO in the 1570s, the *mita* labor system became, in effect, a system of forced labor in which the state demanded that communities (now called *REPARTIMIENTO*) contribute as many as one-seventh of their able-bodied labor force at any given time to work in the silver and mercury mines, in workshops (or *OBRAJES*), in agriculture and ranching, and in many other capacities.

Combined with the devastation wrought by the violence of conquest and the epidemic disease that raged throughout the highlands, causing precipitous population declines for which periodic censuses failed to account, the *mita* labor system emerged as one of the most fearsome and brutal institutions of the entire colonial period. Overall, the Spanish state was less concerned with fostering conditions under which individuals, families, and communities could reproduce the conditions of their own existence than with extracting the greatest quantity of labor in the shortest possible time.

The results of this transformation, for ordinary Andeans, were horrific. Communities were drained of their most productive workers, who were gone for months at a time, making it far more difficult for them to meet their tributary quotas “in kind” (e.g., in corn, textiles, and sundry other goods).

This presented a new imposition, since before the conquest the Inca state and its agents had required communities to contribute *mita* labor exclusively, not goods. *Mitayos*, often accompanied by their wives, children, and other relatives, were often subjected to the most brutal working conditions imaginable, especially those assigned to work in the silver and mercury mines.

Females who accompanied *mitayos* during their turn at labor became vulnerable to rape and other abuses, while other family members were frequently assigned to secondary tasks by colonial authorities, further depleting the quantity of labor available to the larger community.

The abuses of *mita* labor continued throughout the colonial period and were a major contributing factor in the many revolts and uprisings that rocked the Andean highlands in the decades and centuries after the consolidation of colonial rule in the 1570s.

Moctezuma II

(1466–1520) *Aztec emperor*

High priest and eighth son of Mexica emperor Axayácatl (d.1481), Moctezuma II, succeeding his uncle Ahuítzol, was selected as the new emperor by a gathering of some 30 Aztec lords in 1502. Popularly remembered as a weak and indecisive ruler who failed to perceive or resist the threat posed by the invading Spaniards, Moctezuma (or Montezuma, meaning “he who angers himself”) was a key actor in the CONQUEST OF MEXICO.

Ample historical evidence supports the interpretation that Moctezuma's vacillation and political paralysis were crucial in giving the HERNÁN CORTÉS and the Spanish the strategic and tactical edge they needed to defeat the mighty Aztecs.

Like all seven Mexica rulers who preceded him following the establishment of the royal house in the late 1300s, Moctezuma II was considered semidivine in a culture saturated with state-sponsored religious symbols and practices. During his tenure as emperor, he also earned a reputation as a stickler for probity, propriety, and solemnity in public and religious affairs and for ruthlessness in military matters. He has been described as dark, having wavy hair and communicating in stern but eloquent speech.

His weaknesses as a ruler became apparent only after his spies reported the arrival of strange, white-skinned, bearded men, accompanied by imposing four-legged "deer . . . as high as rooftops" (horses) in large floating vessels off the Caribbean coast in April 1519.

His indecisiveness from this point forward is commonly attributed to his belief that the strangers' arrival represented the fulfillment of a prophecy regarding the return of the god Quetzalcoatl—an assertion that continues to provoke controversy among scholars.

Regardless, it is clear that the Mexica emperor did almost everything in his power to appease and placate the Spaniards, especially Cortés. Most often cited in this regard are his decisions not to attack but to welcome the armed strangers into the capital island-city of Tenochtitlán, against the counsel of many of his advisers, and to submit willingly to being kept as Cortés's prisoner for seven months, from mid-November 1519 until his death the following June. Extant documentation demonstrates many instances of his paralysis, indecision, fear, and anxiety, even as it offers a detailed portrait of him as a ruler and human being.

Also controversial is the manner of his death; whether he was slain by his Spanish captors, or by the stones hurled by his own subjects following his efforts to quell their violent revolt against the invaders, the sources agree that he died on June 30, 1520, and that his death marked the end of the initial, relatively peaceful phase of the conquest and the beginning of the war without quarter that would result in Spanish victory and the onset of 300 years of colonial rule.

Mohács, Battle of (Mohacz, Battle of)

The Battle of Mohács, which erupted in the summer of 1526, was a major Ottoman victory over the Hungarian king Louis, marking the end of the Jagiellon dynasty. Led by SULEIMAN I THE MAGNIFICENT, the Ottoman troops, estimated at 100,000 strong, crushed the far smaller Hungarian forces on the open plain of Mohács. Besides having numerous soldiers, the Ottomans had far superior weaponry that included artillery and highly skilled marksmen.

One of the first so-called gunpowder empires, the Ottomans effectively used cannons to stop the charging Hungarian cavalry. King Louis was killed fleeing the field, and Suleiman was said to have mourned him as a valiant opponent. Several bishops and over 20,000 Hungarian troops also perished.

Following the victory, Suleiman swiftly moved on to conquer the twin cities of Pest and Buda, the Hungarian capital on the Danube River, in the fall of 1526. Following the custom of Ottoman armies, Suleiman then led his victorious troops, laden with booty and captives, back to Istanbul for the winter.

As result of their victory, the Ottomans incorporated Hungary into their expanding empire. The Habsburgs, rulers of the HOLY ROMAN EMPIRE, took advantage of the destruction of most of the Hungarian nobility to increase their authority in central Europe, and the two great empires began their long struggle against one another for control of southern and central Europe.

JANICE J. TERRY

Montaigne, Michel Eyquem de

(1533–1592) *French philosopher*

The French nobleman Michel de Montaigne was the inventor of the modern form of the personal essay and the greatest exponent of philosophical skepticism in the 16th century. His father was a rural landowner and his mother a descendant of Spanish Jews who had converted to Christianity. His father ensured that Montaigne received a good humanist education; his tutor was directed to speak nothing but Latin to him until he reached the age of six. Montaigne was educated in the law and as an adult served in the *parlement*, or law court, of Bordeaux and was mayor of Bordeaux from 1581 to 1585. The first two volumes of his essays were published in 1580, followed by a complete revised edition of three books in 1588. A third, posthumous edition with further revisions was published in 1595, and his personal journal of a trip through Germany, Switzerland, and Italy in 1580 and 1581 was published in 1774.

Montaigne is responsible for introducing the word *essay*, originally *essai*, meaning “attempt.” Unlike SIR FRANCIS BACON, who was greatly influenced by Montaigne as an essayist, Montaigne saw self-knowledge as a goal and dwelled on his personal thoughts, feelings, and experiences in addition to drawing from his extensive reading. Montaigne was utterly at home in the classics but wrote his essays in French. (His work has also influenced the development of the French philosophical vocabulary.)

As a skeptic, Montaigne’s motto was *Que sais-je?* (What do I know?). He followed the tradition of classical skeptics like the ancient Greek philosopher Pyrrho in asserting that certainty could not be attained either by the senses or by reason. Montaigne was particularly interested in the ethical teachings of the ancient pagan Greek and Roman philosophers. As a skeptic, he held that people should be even-tempered, tolerant, and not overly invested in their opinions. Montaigne’s skepticism was also informed by the growing knowledge of foreign cultures in 16th century Europe. This knowledge led him to doubt the intrinsic superiority of his own culture.

One of his most famous essays, “On Cannibals,” is about the contrast between some Native Americans who had been brought to France and French society and suggests that the “savage” custom of eating a man after he is dead is not worse, and perhaps better, than the European practices of torturing or burning people alive for their religious opinions. Montaigne’s longest essay, “Apology for Raymond Sebond,” is devoted to a 15th-century Spanish theologian, the author of *Natu-*

ral Theology, which Montaigne had read on the advice of his father. Montaigne published a translation of Sebond’s work from Latin to French in 1569. Sebond believed that, with a proper attitude toward the Catholic faith, the knowledge of God was attainable through reason. Montaigne doubted this thesis and suggested that there are many things about the world that the human intellect is simply inadequate to understand.

Montaigne’s travels were inspired by curiosity and the pain he suffered from kidney stones and hoped to relieve in foreign spas. The journal focuses on the six months he spent in Rome. Montaigne wrote the account of his Roman stay in Italian, as he believed that one of the best ways of understanding a foreign culture was learning and using its language. Montaigne was particularly interested in ancient monuments and other reminders of the classical Romans including place names and festivals. He was less interested in the art and culture of the contemporary Italian Renaissance.

A Catholic, Montaigne took a *politique* stand in the French Wars of Religion, emphasizing the importance of civil peace and national unity over religious uniformity. He was a friend and correspondent of Henri of Navarre, the leader of the Protestant faction who after Montaigne’s death converted to Catholicism and became the tolerant HENRY IV, king of France and Navarre. Despite Montaigne’s skepticism, moderation, and occasional sympathy with Protestantism, he had little trouble with the Catholic Church, perhaps because his skepticism could be turned to Catholic ends by suggesting that faith in the authority of the church was the only source of certainty. His writings were not put on the Church’s Index of Forbidden Books until 1676, and he was invited to write Catholic polemic.

Montaigne’s works were extraordinarily popular and influential, both in the original French and in the English translation by John Florio, published in 1603. William Shakespeare was among those who read Montaigne in Florio’s translation, and signs of the Frenchman’s influence can be found in Shakespeare’s later plays. Although Montaigne’s use of French rather than Latin and of the new essay form rather than traditional philosophical genres such as the treatise or dialogue limited his effect on the community of the learned, his friend and disciple the priest Pierre Charron put forth Montaigne’s skepticism in a more systematic form aimed at refuting Protestants and atheists.

WILLIAM E. BURNS

Montesquieu, Charles de Secondat, baron de la Brède et de

(1689–1755) *French political theorist*

The baron de Montesquieu (Charles-Louis de Secondat, baron de la Brède et de Montesquieu) was an important cultural critic and political theorist of the early French enlightenment. He was a member of the hereditary nobility of French judges and lawyers known as the nobility of the robe. As was a traditional right of his family, he served actively in the criminal division of the *parlement*, or high-ranking judiciary, of the French province of Guienne, at its capital, Bordeaux. His first book was *Persian Letters* (1721). Because it addressed controversial subjects, the book was published with no indication of its author and a false imprint; it was credited to an imaginary publisher in Cologne when in fact, like many underground French books during the Enlightenment, it was published in the Dutch Republic. Nevertheless, the book was extremely popular. Montesquieu added material to later editions.

Persian Letters employed the literary device, very widely used during the Enlightenment, of having a fictional foreigner describe European society. It is an example of a popular genre in the 18th century, the epistolary novel, consisting of a collection of letters. The main characters are two Persians, Usbek and Rica, touring Europe, commenting on and sometimes mocking European society as well as discussing history and institutions. (Montesquieu's knowledge of Persian culture came mostly from contemporary travelers' accounts.) Europeans are not the only targets of Montesquieu's satire, however, as Usbek, perceptive in his denunciations of tyranny in Europe, is shown in his correspondence with his household in Persia as a tyrant over the women and eunuchs of his harem. It is the resistance of Usbek's wife, Roxana, that provides the novel's abrupt tragic climax. Targets of Montesquieu's satire closer to home included the emptiness of much Parisian conversation, religious intolerance, and royal despotism.

In 1725, Montesquieu retired from the bench, then moved to Paris the following year. In 1728, he was

admitted (with some controversy) to the French Academy, which had previously been a target of his satire. He spent some years traveling through Europe observing different social institutions and in 1731 began to work on his masterpiece, *The Spirit of the Laws*, first published in 1748. It went through more than 20 editions during Montesquieu's lifetime. (Some of the themes of *The Spirit of the Laws* first appeared in Montesquieu's *Considerations on the Grandeur of the Romans and the Causes of their Decline* [1731].) *The Spirit of the Laws* is the first great comparative study of social, political, and legal institutions.

Montesquieu believed that laws and institutions should be judged not against an abstract standard of perfection but in terms of how they were adapted to different peoples. Seemingly irrational laws may well have a rational function in their society. Given that adaptation of laws to peoples, legal reform should be undertaken very carefully. Strengthening the power of the French monarch against the nobility, for example, as many reformers of the Enlightenment wished to do, would be harmful in that it would remove a check on the monarch's power.

The king's increased power could lead France away from monarchy, of which Montesquieu approved, toward despotism, which he despised. Despotism differs from monarchy in that the despot has no responsibility to follow the laws. Montesquieu's three basic types of government are monarchy, despotism, and the republic, in which either the people rule democratically or the aristocratic state is ruled by a few. Except for despotism, which is innately corrupt, each of these governments can appear in good and in corrupt forms. In order to protect individual freedom and guard against corruption, it is necessary that all power not lie in the same place. Montesquieu established the distinction among legislative, executive, and judicial power. He endorsed commerce as preferable to war to enrich a state.

Montesquieu's analysis of how different types of governments are formed and maintained includes consideration of physical factors such as climate. Harsh countries are less tempting to invaders, and the hard work required to cultivate them is linked to virtue and republican government. Montesquieu analyzes religion in *The Spirit of the Laws* principally in relation to its social utility—different religions are adapted to different societies, as Protestantism is to republics, Catholicism to monarchies, and Islam to despotisms.

As did other Enlightenment thinkers, Montesquieu strongly endorsed the principle of religious toleration and admired the Protestant and relatively free societies

of the Dutch Republic and Great Britain. *The Spirit of the Laws* was placed on the Index of Forbidden Books by the Catholic Church in 1751 but had great influence on the Scottish Enlightenment and on the founding fathers of the United States. His theory of the distribution of powers influenced the writing of the U.S. Constitution. Montesquieu also contributed an article on “taste” to the *Encyclopédie* of Denis Diderot and Jean Le Rond d’Alembert.

WILLIAM E. BURNS

More, Sir Thomas

(1478–1535) judge and chancellor of England

Sir Thomas More was a lawyer and judge in Renaissance England who rose to the highest appointed office of chancellor under HENRY VIII, king of England. More was born in London on February 7, 1478, son of Sir John More, a prominent judge. More studied at Oxford under Thomas Linacre and William Grocyn. He returned to London around 1494 to complete his studies in law and in 1496 was admitted to the law court of Lincoln’s Inn, located in central London. He became a lawyer in 1501.

At one point in his early legal career, More seriously considered becoming a monk. While he worked at Lincoln’s Inn, he lived at a nearby monastery run by the Carthusians, taking part in their monastic life of prayer, fasting, and religious studies. Although More quit the monastery, he continued to live out many of its religious practices throughout his life. More decided to enter a lifetime political career when he joined Parliament in 1504. Shortly after, he married Jane Colt. She bore him four children. She died at a young age in childbirth and More quickly remarried a widow named Alice Middleton to care for his children.

When More urged Parliament to decrease its appropriation of funds to King HENRY VII, Henry retaliated by imprisoning More’s father until a fine was paid and More had withdrawn from political service. After the king’s death, More became active again. He was appointed undersheriff of London in 1510. He was noted for his impartiality and speed in seeing that

Most famous for his imaginary “perfect” society, *Utopia*, Sir Thomas More was beheaded in 1535 for opposing Henry VIII.

cases were heard in a timely fashion. More attracted the attention of King Henry VIII, who appointed him to a number of high posts and missions on behalf of the government. He was made Speaker of the House of Commons in 1523. As Speaker he helped establish the parliamentary privilege of free speech. Henry made him chancellor in 1529. He resigned in 1532, at the height of his career and reputation.

Throughout his life, More was recognized as a reformer and scholar. He wrote and published many works in Latin and English and was friends with a number of scholars and bishops. In 1499, the scholar DESIDERIUS ERASMUS OF ROTTERDAM first visited England and formed a lifelong friendship and correspondence with More. On subsequent visits, Erasmus lived in More’s household at Chelsea. They produced a Latin translation of Lucian’s works, which was printed at Paris in 1506. In 1509, Erasmus wrote the *Encomium moriae*, or *Praise of Folly* (1509), dedicating it to More. During one of his diplomatic missions to Flanders in

1515, More wrote his Latin classic, *Utopia*, a witty political satire on the role of government and society. It became an instant bestseller throughout Europe.

In the REFORMATION controversy of his time, More opposed Lutheranism and was a staunch supporter of the papacy and defender of the Roman Catholic Church. He enforced government suppression of the reformed movement in England until Parliament changed the laws at Henry VIII's instigation. More resigned his office and withdrew from public service when Henry, with Parliament's approval, made himself supreme head of the CHURCH OF ENGLAND and enforced the Oath of Supremacy and Act of Succession.

In 1534, More was imprisoned in the Tower of London on grounds of refusing to take the oath. More defended himself as a loyal subject, but he also declared that he was bound to follow his conscience on matters of principle. Fifteen months later, he was tried and convicted of treason. Henry allowed him a few public words on the scaffold when he was beheaded on July 6, 1535. He declared himself "the King's good servant, but God's first."

Robert Whittinton, a contemporary of More, wrote of him in 1520, "More is a man of an angel's wit and singular learning. I know not his fellow. For where is the man of that gentleness, lowliness and affability? And, as time requireth, a man of marvelous mirth and pastimes, and sometime of as sad gravity. A man for all seasons."

DONALD K. SCHWAGER

Mughal Empire

The Mughal Empire in India was founded by BABUR, also known as Zahir-ud-din Mohammed, born in 1482 in Ferghana in Central Asia, a descendant of Timur-lane. With Central Asia in turmoil in 1501, Babur fled

his native Ferghana and gained the great city of Samarkand, but he could not hold it. He next captured Kabul in 1504, with the intention of creating his own kingdom in Afghanistan.

However, for Babur, Afghanistan was only the stepping stone to the greatest conquest of all: India. For seven centuries, India had been the ultimate prize for all Muslim conquerors from Central Asia, and Babur shared that dream. In 1505, Babur staged his first raid into northern India, then controlled by Sikander, one of the Lodi dynasty of Muslim sultans in Delhi. The Lodi dynasty had also come to India from Afghanistan. Surprisingly, Sikander took no real action against Babur's incursion, a fact that was not lost on Babur in the future.

The troublesome Afghan tribes delayed Babur's plans until 1526, when he invaded India in force. He met the Lodi sultan Ibrahim outside Delhi at the BATTLE OF PANIPAT. Although Babur commanded only 12,000 men and Ibrahim about 100,000 and 1,000 elephants, Babur used his men well, armed with matchlock muskets and cannon, and won the battle. The Lodi forces were defeated and Ibrahim killed. Establishing his capital in Delhi, Babur then conquered most of northern India, establishing the Mughal (Mogul, Moghul) Empire.

Babur died in 1530 and his son HUMAYUN succeeded him as the second Mughal emperor. However within 10 years Humayun lost his empire. He fled to Persia, then ruled by the SAFAVID DYNASTY. This time of exile instilled in Humayun and his son a profound respect for Persian ways so that when they conquered India again their rule was influenced by Persian culture. Persian would become the official language for Mughal India.

In 1555, Humayun raised another army in Persia with the support of Persian shah Tahmasp I and set out to reconquer his kingdom from Sher Shah, who now ruled in northern India. By August 1555, he had reentered Delhi in triumph but died in 1556. His son AKBAR, then only 13, took power in 1556. But Akbar won a decisive victory at the Second Battle of Panipat and became the *padishah* and undisputed ruler of the realm. Having crushed his Afghan and Hindu foes at Panipat, Akbar moved to consolidate his rule of Afghanistan and northern India.

Akbar began to implement a program of cooptation with his Hindu subjects to neutralize the threat of a Hindu uprising against his rule. He married a Hindu princess and his son and successor JAHANGIR was born of this marriage. Hindus were invited to join the bureaucracy that governed his empire and

became an important part of Mughal administration. Akbar wisely allowed the Indian princely states a large degree of autonomy so long as they recognized him as their *padishah*.

RELIGIOUS TOLERANCE

Akbar did not impose the shariah, or Muslim law, upon his Hindu subjects. Instead, he limited the application of the shariah to the Muslim community within his kingdom and let the Hindus retain their own laws.

Exposed to a different religious tradition, including Zoroastrianism and Jainism, Akbar began perhaps the greatest intellectual exploration in Indian history. Studying all the faiths, including the Roman Catholicism that had been brought to GOA by the Portuguese, Akbar created a new religion named Din-i Ilahi, or “the Religion of God.” It was nothing less than an effort to draw together all the religions in his empire into one faith, which he hoped all would accept under his leadership. However this endeavor failed.

In 1605, Akbar died, leaving a legacy of stability to his son, Jahangir. Jahangir did not pursue a military policy but did cement his position in Bengal in the east, probably to gain control of the maritime trade. In 1614, the Rajput king, Man Singh, who had fought Akbar to a stalemate at Haldhigati in 1576, made his submission to Jahangir. Toward the end of his reign, Jahangir’s son, who would reign as SHAH JAHAN, rose in rebellion against his father, a trend that would weaken the Mughal dynasty.

When Shah Jahan became emperor in 1628, he attempted to return to the days of military glory of Akbar and engaged in campaigns in the south. In 1658, Jahan’s son AURANGZEB seized power and imprisoned his father, who would live in captivity until his death in 1666. During a reign that would last until 1707, Aurangzeb waged many wars, driving the Mughals to conquer much of the Indian subcontinent. He conquered the rest of the Deccan region, seizing the sultanates of Bijapur and Golconda, which had achieved virtual independence during the reigns of Jahangir and Shah Jahan. Aurangzeb turned his armies against the martial Hindu called Mavalhas and conquered their lands after an exhaustive campaign.

While Aurangzeb was extending the Mughal domains to their greatest territorial extent, he was also fatally changing the unified society that Akbar had tried to create. Aurangzeb was a pious, extremist Muslim and returned to the traditional Muslim doctrine that Muslim shariah law should extend to all subjects of an Islamic realm. He persecuted Hindus.

As a result, rebellions started to break out. Aurangzeb’s religious intolerance also made mortal enemies out of the Sikhs, who had peacefully followed the teachings of Guru Nanah from the 16th century. Their ninth guru, Tegh Bahadur, was brought before Aurangzeb on a charge of blasphemy for preaching a non-Muslim faith and put to death. Sikhs under their 10th guru Govind would retreat to the Punjab to form their own martial kingdom to defend themselves against Aurangzeb’s holy war.

At the same time, the French and British East India Companies had established trading posts in India. Taking advantage of the growing unrest in the Mughal Empire, they would make their first inroads into the Indian subcontinent. When Aurangzeb died in 1707, another succession crisis would further weaken the great Mughal Empire, already in decline, largely the result of his policy decisions.

Toward the end of his life, Aurangzeb wrote, “I am forlorn and destitute, and misery is my ultimate lot.” In a very real sense, he had also penned the obituary for the Mughal Empire.

JOHN MURPHY

Münster commune

The Münster commune is a bizarre chapter in the history of the REFORMATION. Lasting slightly over a year beginning in 1534, it involved some revolutionary Anabaptists who took over the city of Münster and instituted a new order while defending against besieging troops.

In 1533, a Lutheran named Bernard Rothmann, a former Roman Catholic priest, succeeded in bringing Lutheran control to the city of Münster, a good-sized city in northwest Germany. Rothmann, who had only been Lutheran since 1531, became more convinced of the Anabaptist beliefs and in May 1533 formally renounced infant baptism. Later that year, he began preaching in

favor of primitive Christianity, interpreted to mean sharing of all goods in common and living a simpler, morally upright life. This caused much controversy with those citizens continuing to hold Lutheran beliefs.

The success of Rothmann drew other Anabaptists flocking to the city, increasing the tension between the merchants and guildsmen in the town and those emigrating from other places in Germany and the Netherlands. In early 1534, Rothmann and nearly 1,400 others were rebaptized in Münster. Around this same time, there was a heightened expectation by more radical Anabaptists of the end of the world described in the book of Revelation in the Bible. Associated with this were the rise of many so-called apostles and prophets ready to prepare the people for the second coming of Jesus Christ.

In February 1534, Jan Matthys (Matthijs) and Jan Bockelson, immigrants from the Netherlands, ran through the streets of Münster crying for all people to repent of their sins. This caused a mass hysteria, ending in an armed revolt against the town council (still predominately Lutheran). The town council did not act aggressively, instead continuing to allow the Anabaptists their freedom. Many Lutheran citizens, concerned that the town would revolt, departed. This event, coupled with the continuing stream of immigrants, resulted in the town's becoming Anabaptist. On February 27, 1534, armed groups of men, led by Jan Matthys, went through the city, driving out all those not Anabaptist, calling, "Get out, you godless ones and never come back, you enemies of the Father." By early March, the town was completely Anabaptist, with forcible rebaptizing of all those not already declaring themselves Anabaptist.

Matthys, Bockelson, and Rothmann, along with a leading merchant named Knipperdollinck, took over the control of the city. They declared that all possessions were to be held in common, threatening the wrath of God and public execution against those who withheld possessions from the community. After three days of prayer, Matthys appointed seven deacons to administer these goods.

All of this activity did not escape the notice of the Roman Catholic prince-bishop of Münster. While he did not live in the city and failed to get the support of those in the town in the early days of the conflict, the problems in Münster concerned the other princes enough to allow him to raise funds for troops to besiege the city. By mid-March 1534, the city was somewhat ineffectively besieged. In early April, Matthys, believing God would give him power over the besiegers, went

out with a band of troops, but he and all the troops were killed immediately.

Matthys's death gave opportunity to Jan Bockelson to strengthen control over the town. Though the son of a tailor, Bockelson was an effective organizer and had, if anything, a more radical approach than Matthys. In May 1534, Bockelson ran through the town naked and then sat silent for three days. He then prophesied that God had a new plan and organization for the town, with himself as chief apostle and 12 elders. A morally strict code was at first enforced, but eventually the lack of men in the town (and probably Knipperdollinck's very attractive daughter) led Bockelson, who was already married, to declare that God had ordained polygamy. Bockelson eventually married 15 wives, and many other men took multiple wives. This caused many problems in a few short months, resulting in an increasingly loose approach to sexual relations.

In August 1534, an attack by the bishop's forces was effectively fought off by the town militia. Bockelson took the opportunity to declare himself the king of Münster, and the short-lived kingdom began. Bockelson appointed many immigrants as his councilors and had a gold-covered throne placed in the market square. He thought of himself as a new King David and dressed in magnificent robes and held court with his equally well dressed counselors. At the same time, a reign of terror began for any of those who opposed the king and his counselors.

By January 1535, the blockade of the town was increasingly effective. A time of famine followed, though the king and his court managed to escape it for the most part by requisitioning supplies. In March, the king predicted that the town would be saved by Easter, but when this day passed, he quickly asserted it was a spiritual salvation and continued to proclaim the imminent return of Christ. Finally in June of 1535, aided by some residents, the forces of the prince-bishop invaded the town, killing Rothmann during the battle. The deposed king and Knipperdollinck were put to death by torture after the king was hung in a cage and then led around the town on a chain.

While a few smaller Anabaptist uprisings occurred after this, most Anabaptists distanced themselves from these more radical uprisings and somewhat in reaction would disavow any kind of military role for their followers in future generations.

BRUCE D. FRANSON

music

One of the most significant nonmusical events to influence the history of music in this period was the development of the printing press, which allowed for the dissemination of music in ways that had previously been impossible. A composer who had never heard another's work performed could still be influenced by him, even working in a completely different regional tradition. Such radical borrowing was not necessarily common, but regional styles tended to spread more quickly than they had in the past.

Polyphony, the use of independent melodic voices, developed from the use of chant in church music. During the Renaissance, it became more sophisticated, encompassing a broader range of tones. Masses and madrigals remained popular forms of church music, and secular music underwent a steady increase in popularity and variety. The brief-lived English madrigal school (1588–1627) produced light, a cappella madrigals based on Italian works. By the 17th century, the transition to the BAROQUE TRADITION IN EUROPE had begun in secular music.

Josquin des Prez (1453–1521) was the principal composer of the Franco-Flemish school, which produced polyphonic vocal music. As for many famous artists, his reputation was great enough that his name was often falsely attached to sheet music in the hopes of selling it. He wrote for every style of music in western Europe at the time, sometimes satirizing other composers' styles, other times producing multiple compositions to approach a theme or motif from different angles. Though in the present day his name is not as recognizable as Bach's or Mozart's, few creators in any media have been as accomplished.

Renaissance polyphonic techniques culminated in the work of Giovanni Pierluigi (1525–94), born four years after the death of des Prez. Pierluigi was a master of the Roman school, which incorporated into church music the influences of visiting foreign composers to the Vatican, composing especially for the Sistine Choir. The COUNCIL OF TRENT's 1563 requirement that vocals

be clearly understandable drove the Roman school to compose crisp, clear, well-defined arrangements rather than abandon polyphony, and the result has been a cornerstone of Catholic devotional music ever since. While others experimented with forms, Pierluigi set specific rules for himself and did all that he could within those bounds.

Opera was born at the very end of the 16th century. The first was Jacopo Peri's 1597 *Dafne*, staged as a revival of Greek theatrical forms. In *Dafne*, as in the operas to follow, singing and dancing combined with acting, all in highly stylized modes, in order to tell a unified story. Opera had been developed for the Florentine Camerata, a humanist-intellectual group who met to discuss and attempt to guide trends in the arts. It was their call for a return to classical forms that inspired Peri's *Dafne*, which as the other operas to come was sung in a style called monody, a style of vocal solos with a single melody. The style had been developed by composers associated with the Camerata and would become integral to the early baroque compositions.

Claudio Monteverdi (1567–1643) was one of the earliest opera composers, whose *L'Orfeo* (premiering in 1607) was the first of the *dramma per musica* (dramatic musical) style. Monteverdi's sense of high drama and grand scale orchestrations prefigured George Frideric Handel's 1741 *Messiah* (an Easter oratorio drawing from the Christian readings of the book of Isaiah, along with Gospel selections) and Johann Sebastian Bach's 1727 *Matthauspassion*, which adapted the death of Jesus from the Gospel of Matthew. The chain of influence shows the way that the Italian invention of opera became popular in its most dramatic forms among German composers, beginning in the 18th century.

Venice quickly became known for its opera, offering a season of shows open to the ticket-buying public, and Monteverdi moved to the city to be part of the new scene. These early Italian baroque operas mixed melodramatic tragedy with broad comedy, sometimes to a muddled effect. Over time, although opera remained a form devoted to extremes of emotion, it became more sophisticated and subtle in the expressions thereof.

From the start of the 17th century until about 1750, the baroque period dominated European music, which became more ornate and ornamented, differing from Renaissance music in its tonal progressions and stronger rhythms. As would jazz music later, baroque compositions usually left room for improvisation, and solo pieces would usually repeat themselves once, with the intent of letting the performer add his own flourishes and adjustments to the repetition. The characteristic baroque form

was the fugue: a contrapuntal composition in which a central theme is echoed by each of a fixed number of voices. The manner of the form allows for a great deal of sophistication in its composition, a sort of intellectualism that appealed to many of the new composers. This same intellectualism, and the Renaissance rediscovery of the classical world, led to the German *Affektenlehre*, or “doctrine of affects,” inspired by ancient rhetorical theory: According to the doctrine, a piece of music (or a movement in a longer work) should be characterized by one and only one vivid “affect,” or emotion. This was a considerable difference not only from the music that had come before but also from what would follow.

Alessandro Scarlatti (1660–1725) was a baroque opera composer whose work bridged the gap between the early baroque styles, centered in Italy, and the Germanic styles of the 18th century. He worked primarily in traditional molds but brought a sense of dramatic depth to his work and was the first to incorporate horns into opera orchestration. One of the best known baroque pieces is *The Four Seasons*, by Antonio Vivaldi (1678–1741), a Venetian priest; the piece consists of four violin concertos, one for each season, each evocative of the weather and mood of that season.

The baroque period reached its apex with Bach (1685–1750), the son of a German musical family, whose work with fugues and canons realized the heights of polyphonic technique. He composed more than a thousand works, introducing nothing wholly new but perfecting that which was already current, as if to use up baroque tropes so that the musical world could move on to something else. In his lifetime, he was best known for his keyboard works (works composed for organ, harpsichord, and clavichord, the precursors to the modern piano). *The Goldberg Variations* were a set of variations (alterations performed during repetition of a musical sequence) for performance on the harpsichord, in the form of an aria followed by 30 variations on its chord progression and bassline. Almost an intellectual exercise in the limits of variations, it is a testament to Bach’s skill in he was able to make it beautiful as well.

Die Kunst der Fugue (The Art of the Fugue) is a similar blend of musical beauty and technical wizardry. Two different versions were published, with 12 or 14 fugues and two or four canons; neither was finished. The work takes simple movements and repeats them with increasingly complex contrapuntal devices, including a series of counterfugues (in which both the theme and its inverse are used), double and triple fugues with multiple themes, and a quadruple fugue in which one of

the themes is his own name (B-A-C-H on the musical scale) and the final theme is the same as the first fugue in the work. It was after inserting himself into the work that Bach abandoned it. Modern scholars continue to discover mathematical tricks and subtleties in *Die Kunst der Fugue*, including algorithms derived from the piece that can be used to demonstrate some of the necessary traits of its final form.

The son of Alessandro Scarlatti, born the same year as Bach, was Domenico (1685–1757), whose work straddled the line between the baroque period and the classical. An Italian who spent most of his life on the Iberian peninsula (Spain and Portugal), he incorporated Iberian folk music in his work to a much greater degree than had been seen before, as radical and natural as the combination of country and blues elements in rock and roll would be two centuries later. The energetic, syncopated style of his keyboard sonatas would influence the development of the pianoforte, and he completely abandoned the doctrine of the affects by emphasizing shifts in harmony in order to create sweeping changes in the emotional texture of his work.

Bach’s son Carl Philipp Emanuel Bach was another pioneer in classical music. While Scarlatti’s work set the tone for much of what was to come, C. P. E. Bach’s is sometimes called “rococo,” to refer to the very late baroque, early classical period (the term is sometimes used to refer more specifically to the French composers of this description). While his father had embodied the best of what the old forms had to offer, C. P. E. Bach preserved the old forms but moved forward with them and updated them.

DEVELOPMENTS BEYOND EUROPE

In Japan, the 1609 acquisition of Okinawa introduced that country’s folk music, relying heavily on the *sanshin*, a sort of snakeskin three-stringed banjo. During the EDO PERIOD, *gagaku* (elegant music) ensembles were reorganized into the form they derive from today, incorporating Chinese, Korean, Manchurian, and Shintoist forms played on wind instruments, percussion, and stringed instruments introduced from China. *Gagaku* was influenced by *Yayue*, the imperial court music of China, which imposed strict forms upon folk music elements. *Yayue* also influenced Korean court music, which took three forms: the purely Chinese *aak*, the native Korean *hyangak*, and the hybrid *dangak*.

On the Indian subcontinent, Carnatic music was ushered in by the composer Purandara Dasa, the son of a pawnbroker, who wrote rhyming songs of various levels of sophistication and composed pieces for novice

musicians in addition to his more complicated work. Carnatic music was generally devotional or concerned with revelations of human nature and was always meant to be sung, much like the sung poetry of earlier times.

Much of the formal music of Latin America during this period drew heavily from Spanish and Italian music from Europe. This led to the formation of orchestras in major cities, such as Lima, Mexico City, and Buenos Aires, with the playing of harp music being common in large European households. Some European musicians also traveled to remote parts of South America in search of music of the indigenous people. The pipe music of people in the Andes and elsewhere, as well as music played on bamboo flutes, was occasionally transcribed using European notations and helped influence the pan pipes of Peru and the harp music of Paraguay. It was not long afterward that many indigenous people started using bass drums, a much longer flute, and the tambourine.

The slave communities of Latin America maintained many African musical traditions. Occasionally the Afri-

can rhythm was adopted by the Spanish, with the tango in Argentina essentially being a fusion of European and African forms of music and drawing from African forms of dance. The rumba and the salsa in Latin America also drew heavily from African musical traditions.

In Africa, where most languages are tonal, there was a close relationship between language and music, with instrumental music usually being accompanied by singing or humming. There were also a wide range of instruments used in African music such as the balafons, similar to a xylophone, and various types of flutes and drums.

BILL KTE'PI

N

Nadir Shah

(1688–1747) *Persian conqueror*

Nadir Shah (Nader Shah), often called the “Napoleon of Iran,” was the last of the Central Asian conquerors who made the region quake under the hoofbeats of his army. Like Genghis Khan, BABUR the Tiger, and Timurlane before him, Nadir came from humble origins and rose to the pinnacle of power through a potent combination of great courage, implacable brutality, and shrewd wisdom.

Nadir was born in 1688 in Persia, five years after the defeat of Persia’s great enemy, the Ottoman Turks, at the gates of Vienna in 1683. He was an outsider in Persia, a member of one of the Turkomen tribes that had once swelled the ranks of the armies of Genghis Khan and Timurlane. Much like Genghis Khan, known in early life as Temujin among the Mughals, Nadir was captured and taken into slavery by a rival Turkomen clan, the Ozbegs, while a boy. The Ozbegs (modern-day Uzbeks) had been powerful in Central Asia since the 14th century, even before the birth of Timurlane, in 1336. Nadir apparently managed to escape his slavery, although his mother, taken with him, seems to have died in captivity. Nadir went to the Afshar clan and sought service under one of their chieftains.

His ambitions proved too much for the Afshars, and he left to found a bandit army, which eventually reached the strength of 5,000 men, all hardened Turkomen warriors like him.

Nadir seemed destined to live out his life as a bandit until war erupted between Persia and Afghanistan in 1719. Prior to this date, the SAFAVID DYNASTY had been powerful in southern Afghanistan and claimed the loyalty of the powerful Ghilzai tribe. The Safavids, however, were Shi’i Muslims, while the Ghilzais were Sunni. Safavid rulers had respected the different Ghizai beliefs until the Safavid sultan Hussein, who had been raised to the Persian throne in 1694, began a purge under the ayatollah Mohammed Baqir Majilesi, whose zeal in his religion would equal that of the ayatollah Ruhollah Khomeini some 300 years later. All Sunnis were persecuted, both in Iran and in Iranian-controlled regions of Afghanistan. Zoroastrians (Parsees), Jews, and Christians also suffered from this Shi’i inquisition.

In 1715, the Ghilzai leader Mir Wais died of natural causes, but his example kept the Ghilzai resistance alive. Even the Abdali tribe in Afghanistan, which had tried to maintain its neutrality, revolted against the Persians in the city of Herat, which would be contested by Afghans and Persians for decades. When Mir Wais’s brother seemed willing to come to terms with the Persians, his son, Mahmoud, killed his uncle and in 1719 invaded Persia itself. In 1722, Mahmoud defeated Hussein and became ruler of Iran. Then he unleashed a reign of terror among the Persians, which soon caused his own supporters to fear for their lives. Consequently in 1725, his Ghizais assassinated him in the Persian capital of ISFAHAN and his cousin Ashraf became shah, attempting to legitimize his rule by marrying a Safavid princess.

By this time the weakened Safavid Empire proved a tempting target for its enemies. In 1723, Ottoman Turkish troops of the sultan Ahmed III struck from the west, launching damaging raids as far as Hamadan. At the same time, the Russian forces of PETER THE GREAT, who had just won the Great Northern War (1700–1721), attacked Persia from the north. The once-powerful Safavid Empire was so weakened that it agreed to a peaceful settlement and dividing Iran's northwestern provinces.

In the beginning of the Afghan invasion of Persia, Nadir had supported Mahmoud and the Ghilzais. But when they ceased paying him and his bandits, he changed loyalties to the son of the Safavid sultan Hussein, who had succeeded his father as Shah Tahmasp II. With Tahmasp II's support, Nadir began what today would be called a war of national liberation to free the Persians from their foreign oppressors. He began his revolt in his home province of Khusan, where he knew he could count upon the support of his clansmen. With a growing army he was able to expel Ashraf from Isfahan, but not before he massacred thousands of Persians in revenge. Nadir relentlessly pursued Ashraf, who was overtaken during his retreat and killed in 1730.

STRATEGY

Nadir pursued a cautious attack strategy and concentrated his efforts on first removing the weakest of his enemies, the Ghilzais. However Tahmasp II foolishly attacked the Turks, losing Georgia and Armenia to them. Nadir, now the preeminent Safavid general, deposed Tahmasp and put upon the throne the young Abbas III. Although careful to keep up the legitimacy of the Safavid dynasty, there was no doubt now that Nadir was the true ruler of Persia, although Abbas III was officially shah from 1732. In a series of lightning campaigns Nadir struck back at the Russians, now under the czarina Anna, and at the Turks. The Turks were driven out of the territories they had conquered, and the Russians by 1735 had also been expelled from Persia. By this time, a successful warlord, Nadir overthrew Abbas III and became ruler of Persia in his own right, the first of the Afshar dynasty, in 1736.

Having consolidated his position at home, as Genghis Khan and Timurlane before him, Nadir embarked on a campaign of conquest that took him first into Afghanistan. His diplomatic cunning was shown at its greatest when, apparently with the promise of much booty, he was able in 1739 to enlist the Ghilzais and Abdalis into his army, only nine years after he had chased them out of Persia. Moreover, in a show of bravura, he allowed the Afghans to join his personal bodyguard troops.

Nadir swept aside any Afghan resistance at the cities of Kabul and Kandahar.

It was now that he revealed the real target of his invasion—the riches of the Mughal Empire of India. Nadir was able to enter the capital of the now-decrepit Delhi almost unopposed by the emperor Mohammed Shah. Nadir had already destroyed the main Mughal army at Karnal in the Punjab. On the pretext of an attack on the Persians, Nadir ordered the massacre of thousands of citizens of Delhi. Some estimates put the number as high as 20,000. For 58 days, Nadir pillaged Delhi. When he finally grew tired, he took back with him a treasure trove of riches. He even took the priceless Koh-i-noor Diamond and the Mughal emperor's own Peacock Throne. Until the fall of the Persian (Iranian) monarchy in 1979, the Peacock Throne would be used by the reigning shahs of Persia. On his way back to Afghanistan and then Persia, Nadir was attacked at the Khyber Pass by the Pashtun tribes, either urged on by the Mughals or tempted by the sheer size of Nadir's treasure train. The attack, however, was defeated by the Persian forces in a counterattack.

Undeterred by the attack in the Khyber Pass, Nadir resumed his campaigns of conquest by sweeping north over the Amu Darya and attacking the rich cities of the Silk Road that reached throughout Central Asia. Bokhara, Khiva, and Samarkand, the city of Timurlane, all fell before him. However, in his later years, Nadir seems to have fallen victim to a form of dementia and began to think that his closest supporters were turning against him and coveting his power. Fearing that his own son, Reza Qouli, was plotting against him, Nadir had him blinded, presumably in the Persian way, with daggers thrust into both eyes. Nadir's end came in his camp at Quchan, when he ordered his Abdali guard to kill his army commanders. Apparently some of the Abdalis, perhaps Ahmad Shah himself, carried the news to the Persians. In June 1747, Nadir was assassinated and beheaded by his own troops.

Ahmad Shah was able to retreat to Afghanistan, where he founded the Durrani dynasty. In Iran, Nadir was succeeded by his nephew Adil Shah, who had most of Nadir's offspring, including the unfortunate Reza Quoli, killed to assure his title to the throne. The Afshar dynasty would rule in Persia until Karim Khan seized control in the midst of anarchy, launching the Zand dynasty.

JOHN MURPHY

Nagasaki

The city of Nagasaki is situated on the southeastern coast of the southern Japanese island of Kyushu. Nagasaki is port of entry for vessels coming from the south and the west. Nagasaki was opened as an important trading port for the Portuguese in 1571 by Omura Sumitada, a major *daimyo* (feudal lord) of the area. Earlier, Francis Xavier, a Spanish Jesuit priest, had reached Nagasaki as the first Christian missionary to Japan. Initially, ODA NOBUNAGA, the military leader of Japan, tolerated Christianity. However, his successor, TOYOTOMI HIDEYOSHI, banned Christianity in 1587 because he was afraid of the intense rivalry among the Dutch, Portuguese, Spanish, and English and feared the success of Christian missionaries in winning converts. TOKUGAWA IYASU, the successor of Hideyoshi, was initially friendly toward the Christians. In 1614, however, he banned Christianity, as he too was afraid his authority could be challenged by the growing influence of the missionaries. One of the most infamous massacres took place in Shimabara, Nagasaki Prefecture, in 1638; 30,000 Japanese Christians were massacred.

The Dutch, whose Protestant faith was considered safer than the Catholicism of the Portuguese, were however allowed to continue trading in Japan. But Dutch activities were confined to the artificial island of Dejima in Nagasaki harbor under severe restrictions. As Japan's only window to the Western world, Dejima became the center for Western or Dutch learning for two centuries.

Chinese ships however were allowed to trade in Nagasaki. Ships came to Nagasaki harbor from all parts of China and imports from China to Nagasaki included silk, sugar, metals, medicine, and books. Japan's main export to China was copper, primarily through Mitsui, Mitsubishi, and Sumitomo companies. During the 17th century, the number of Chinese settlers in Nagasaki rose to 10,000.

MOHAMMED BADRUL ALAM

Nahua (Nahuatl)

While Nahua, or Nahuatl, is the primary Mesoamerican linguistic group, its origins are actually in North America, where the first speakers of the language originated. It is from the general linguistic family known as the Uto-Aztecan, one of several language groups spoken by Native Americans. Among related languages are those spoken by the Hopi, the Comanche, Shoshone, and Ute in the current United States. It is also spoken by the Tarahumara, Huichol, and Yaqui peoples today in Mexico, among other tribes. In what is known as the Classical period, before the Spanish conquest of 1519–21, it was the language spoken by the imperial Aztecs of Mexico. The Athabaskan language group, in the American Southwest, includes languages spoken by many of the Apache clans, such as the Chiricahua, Jicarilla, Mescalero, Lipan, and Western Apache. It is also spoken by the Kiowa, who are related to the Apache but took to the southern Great Plains of America, where they rode with the Comanche.

Archaeological evidence suggests that the Athabaskan-speaking Indians came after the Uto-Aztecs. Some archaeological sites point to what could have been savage warfare between Athabascans like the Navajo and Apache and the Uto-Aztecan Hopi. There is a theory that the Hopi took to their high mesa homes as a refuge from these more warlike people. An indication of this situation is that there is evidence that the Hopi first called themselves the *Hopituh*, or “the peaceful ones.” Even today, there is rivalry between the Navajo and the Hopi for land in the Southwest United States.

LANGUAGE

As with all languages, much effort has been made to classify the Nahua, or Nahuatl, branch of the Uto-Aztecan language group. While the AZTECS (MEXICA) are no doubt the most well-known Mesoamerican (Central American) speakers, Nahuatl really made its first appearance around the seventh century C.E., when the Toltec came from the

north and began to expand at the expense of settled people like the Mayas of Guatemala and the Yucatán in Mexico. The warrior cultures of both the Toltecs and the Aztecs, including their common language, could lead to the theory that both were from the same general area in North America, the present day United States or Canada, and that the Toltecs were the first wave of conquerors. The Aztecs made their dramatic appearance in the Valley of Mexico in about the 14th century, and perhaps represented the last wave of conquering immigrants from the north.

Chicano (Mexican-American) activists have placed Aztlan in the southwestern United States, in the region that was seized from Mexico by the United States during the Mexican-American War of 1846–48. This may be, archaeologically speaking, a more accurate assessment. As discussed, the Aztecs and the other Uto-Aztecs may have originated farther north, even with the migration of Asiatic tribes from Siberia, the traditional route of Native Americans into the Americas. The Indians already settled in Mexico called the newcomers like the Toltecs and Aztecs, the Nahuatl speakers, Chichimecas, a term loosely translated as “barbarians.” Aztec legend recounts there were seven Aztec tribes, including the Tepenecs and the Acolhuas. The Aztecs were the last to arrive in Anahuac, as they called the Valley of Mexico.

The arrival of the Spanish in the 16th century with HERNÁN CORTÉS, who landed at Vera Cruz in 1519, was the end of Aztec independence, and ultimately that of all the peoples of Mesoamerica. Early Spanish missionaries, after viewing the blood sacrifices of the Aztecs, made it their goal to eradicate the Aztec culture and with it their Nahuatl language. However, there were scholars among the missionaries who saw that the culture of the Aztecs merited preservation. Thus rather than being destroyed, Nahuatl was preserved in considerable measure by enlightened members of the religious orders whose majority attempted to destroy it. Today some 1.5 million Mexicans still speak Nahuatl, although the language of the Classical period ended with the defeat of the Aztecs. Today Nahuatl is enriched by a large vocabulary of Spanish “loan words,” as Spanish and English have been enlivened by Nahuatl words. Geographically speaking those who use Nahuatl also include those as far south as the Pipil of El Salvador, thus embracing the whole of Mesoamerica. Considering its influence on English, one can say that today perhaps a larger area is influenced by Nahuatl than at any other time in the history of the language.

JOHN MURPHY

Nantes, Edict of

The Edict of Nantes was the royal decree of HENRY IV that ended the French Wars of Religion in 1598.

In 1562 the massacre of a HUGUENOT congregation in Vassy, carried out by Francis, duke of Guise, triggered the French Wars of Religion. The Catholic noble houses led by the duke, a religious fanatic, escalated the nationwide violence against the so-called Huguenot (Calvinist) heresy. In response, the Huguenots, with Henry of Navarre as their leader, retaliated by devastating Catholic communities under their control.

The ongoing religious conflict was complicated by political struggles within the royal court. After the death of Henry II in 1559, his three sons, Francis II, Charles IX, and Henry III, would successively wear the crown. Their mediocre political and military skills left a vacuum at the heart of royal authority, which enabled the House of Guise to make a move. Queen Catherine de Médicis, their mother and a Machiavellian stateswoman, was determined to defend the hereditary rights of her three sons and preserve the Crown for her family.

After three major military confrontations and two failures to sustain negotiated peace in the 1560s, the two sides reached the third peace at St. Germain in 1570, which offered more favorable deals to the Huguenots. On August 23, 1572, the Huguenots from all over France gathered in Paris to celebrate the marriage of their leader Henry of Navarre, now a converted Catholic, to Margaret, the queen’s daughter. The reconciliatory event, however, turned into a massacre of the Huguenots by the Catholic faction of the court. It remains murky whether or not Catherine de Médicis personally conspired in or ordered such a senseless bloodshed. The havoc of St. Bartholomew’s Day, however, killed an entire generation of Huguenot leaders, claimed more than 15,000 innocent lives, and, thereafter, prolonged the Wars of Religion for another two decades.

The turning point of the domestic crisis came with the Wars of Three Henriess (1584–89), Henry of Guise versus Henry of Navarre versus Henry III, who had ascended to the Crown in 1574. During the war, Henry of Guise, whose ambition now was to succeed Henry III, conspired with PHILIP II of Spain, who needed the French support for checking England and suppressing the Netherlands's Protestant rebellion. In 1588, Henry of Guise and his Catholic League marched into Paris, besieged Henry III, and pressed him to abdicate the throne. While being still free, Henry III, a pious and militant Catholic, allied with Henry of Navarre, who converted back to the Huguenot faith after the St. Bartholomew's Day massacre. After the king made his own brother-in-law the heir to the throne, the two Henriess marched against Henry of Guise and the Catholic League. Soon, the bodyguards of Henry III assassinated Henry of Guise. Shortly thereafter, the aged queen died and a Dominican monk murdered Henry III. Henry of Navarre, the only survivor, succeeded to the throne of France as HENRY IV in 1589.

It took a full decade for the first Bourbon king, Henry IV, to end the religious wars and to reconstruct peace. He solemnly adjured his Huguenot faith again to become a Catholic in 1593. This compelled Pope Clement VIII to grant him absolution in the same year. The peace with Rome enabled him gradually to dissolve the Catholic League in France and pacify Spain overseas.

STATE RELIGION

On April 13, 1598, Henry IV promulgated an edict in Nantes, Brittany. It ordained that Catholicism would be restored and reestablished as the religion of the state, and the Catholic Church would preserve its privilege of collecting tithe, observing holidays, and enforcing restrictions regarding marriage. Meanwhile, it permitted Protestants to live in the kingdom without being questioned, annoyed, or compelled to change their faith against their conscience. Moreover, the edict offered Protestants rights to property, to public offices, to education in a few designated Protestant colleges, to holding their own synod, and to having cases involving breaches of the edict to be adjudicated by special courts composed of half Catholic and half Protestant judges. It further bestowed on Protestants freedom of worship in about 100 fortified towns and cities outside the city of Paris, where they retained right to self-defense for eight years.

The Edict of Nantes appeared unpopular among both the Catholics and the Protestants at the time, but Henry IV had the personal charm and the political strength to implement and enforce it. While Europe was engulfed

by religious wars, the edict defied the existing ideal of universal faith: "one faith, one law, one king" (*une foi, un loi, un roi*) and experimented with a policy that was more tolerant than the principle of "as the ruler, so the religion" (*cuius regio, eius religio*) embodied in the Peace of Augsburg of the HOLY ROMAN EMPIRE in 1555.

However, a fanatic Catholic assassinated Henry IV, the first tolerant monarch in the age of REFORMATION, in 1610. The edict, observed for about 90 years, was revoked by LOUIS XIV, the grandson of Henry IV, in 1685.

WENXI LIU

Natives of North America

Perhaps no other group in human history has experienced as extreme a change in its circumstances as did the indigenous inhabitants of the Western Hemisphere between 1450 and 1750. The so-called COLUMBIAN EXCHANGE, set off by CHRISTOPHER COLUMBUS's 1492 voyage from Spain, completely altered the ecology, economy, and web of social relationships among the diverse peoples that Columbus (inaccurately) named "Indians."

The people who populated North and South America between 40,000 and 15,000 years ago crossed what was then a land bridge between Siberia and modern Alaska and gradually settled the hemisphere. When a worldwide Ice Age ended about 10,000 years ago, the land route between Asia and the Americas disappeared. By the time of Columbus's first voyage, historians and anthropologists have estimated that the hemispheric population stood between 10 million and 75 million, most living in Central and South America.

The peoples of North America were diverse in almost every possible way except biologically. Experts argue about the extent of North America's precontact population—the range is 1 million to 18 million—but most agree that populations began declining several hundred years before Europeans showed up. By 1450, some large

Algonquian village on the Pamlico River estuary, showing Native structures, agriculture, and spiritual life

Indian communities in the Southwest, Pacific Northwest, and middle Mississippi Valley had vanished or dispersed, abandoning sophisticated buildings and artifacts. Factors that have been proposed to explain these declines include climate change, warfare, and disease.

By 1450, there were dozens of tribal groups and alliances speaking diverse languages and following very different religious and social customs. There were some commonalities: Most Indians were animists, believing in the spiritual power of their natural surroundings. They devised elaborate rituals to placate these spirits, especially those of animals they had killed. In many areas human burials were placed in elaborate and extensive earthen mounds. Most tribes respected shamans (healers) and believed that a Great Spirit oversaw the natural world. Because tribes were likely to move often in search of better land or more abundant game—or to avoid other hostile tribes—property ownership in the European sense was all but unknown. Archaeologists have found abundant evi-

dence of trade routes that spanned the continent, bringing tribes together in the process of barter and exchange.

In most North American tribes, women were in charge of agricultural production, while men hunted for game. Maize (corn), first cultivated in Mexico, was by the time of contact a basic crop in much of North America. Squash and beans were also staples of most tribes' diets. While by no means environmentalists in any modern sense, most North American tribes were well adapted to their surroundings and were often helpful to inexperienced Europeans. For example, natives taught French explorers how to build lightweight birchbark canoes to travel where their clunky wooden ships were useless. Others helped Europeans identify strange plants and animals, learning which were edible and which poisonous. Most famously, Squanto, a Patuxet who had been kidnapped by an English slave trader in 1614, returned to America in time to teach the Pilgrims how to fish and grow corn, keeping them alive to hold a Thanksgiving in 1621.

Warfare was a constant among various Indian groups both before and after European contact. Early on, some tribal groups welcomed alliances with Europeans as a way to overpower their traditional rivals, in part by acquiring the foreigners' goods and technologies, especially their superior weapons. But as the trickle of Europeans became a flood, especially in British-claimed regions, some tribes forged alliances with traditional friends and even enemies to counter European threats to Indian survival.

For example, Algonquian chief Powhatan, head of a strong confederacy, at first welcomed JAMESTOWN settlers, even allowing his daughter, Pocahontas, to marry Englishman John Rolfe. But in 1622, Powhatan's brother Opechancanough, now leader of the POWHATAN CONFEDERACY, launched a surprise attack on settlers, killing more than three hundred of them and capturing women and children. Ultimately, the Virginians rallied, using trickery and even poison to reclaim their holdings. In this early war, as in later conflicts, tribes were responding to growing white populations. Whites were no longer perceived simply as traders who would soon move on; they had become settlers using—and claiming as their own—traditional tribal lands.

Disease did even more damage than European land grabs and weapons of war. Because Indians were genetically very similar, and because they had been isolated in the New World for many centuries, they were at the mercy of pathogens carried by the invaders. The worst of these was smallpox, with measles and influenza also sowing death. These diseases killed Europeans, too, but ravaged the Indian population. Long before germs were known to cause disease, Europeans praised God for

smiting Indian enemies, thus making it easier to colonize America. Some Europeans “assisted” this process by purposely distributing to Indians smallpox-infected blankets and other tainted goods. Smallpox epidemics could and did change the course of battles and negotiations between natives and Europeans.

SOUTHWEST

Descendants of the Anasazi, whose complex civilization came to a puzzling end in about 1300 C.E., the Pueblo Indians, including Hopi and Zuni, for centuries had lived in settled agricultural communities in today’s southwestern United States. The Spanish, who had already made a fortune exploiting Central and South America, in the 17th century also began aggressively exploring the southern reaches of North America, with terrible consequences for the native population. In 1598, JUAN DE OÑATE marched four hundred soldiers, priests, and colonists into New Mexico, killing almost half the residents of the cliff city of Acoma and forcing most of the rest into slavery.

In 1680, Popé, a Pueblo religious leader who had been punished for rejecting FRANCISCAN priests’ attempts to convert him, led the PUEBLO REVOLT, the most successful native retaliation in this era of European occupation. Indian ranks had thinned through disease and compelled labor, but they still outnumbered the Spanish colony of about three thousand. The Pueblo peoples spoke several different languages, yet they managed to unite, with the help of traditionally hostile Apache, to expel the Spaniards and destroy symbols of Catholicism. Although internal native strife, including raids by Apache and Navajo enemies, soon resumed, and the Spanish retook New Mexico in 1692, the Pueblo were treated with greater respect, becoming one of the few tribal groupings in North America to mostly retain ancestral homelands.

SOUTHEAST AND FLORIDA

In 1513, Hernán Ponce de León invaded Florida in search of slaves, wealth, and promises of eternal youth but was repulsed by local Calusa Indians. More sustained and far-ranging efforts led by HERNANDO DE SOTO and others in the 1540s explored the Gulf coast and penetrated as far as the Great Plains. Not until 1565 did KING PHILIP II authorize what was essentially a Florida military base to deter British, French, and Dutch piracy of Spanish gold. In the process, the Spanish massacred a tiny colony of refugee French HUGUENOTS and built a fort at St. Augustine, the oldest U.S. site continuously peopled by Europeans. Efforts to convert the local Guale tribe sparked an uprising in 1597.

The tiny Spanish colony put down the uprising in 1602 but never attracted more than a few thousand settlers.

In other sections of the Southeast, a confederacy among four tribes—the Cherokee, Chickasaw, Choctaw, and Creek—preceded the European invasion. They would be tested by European incursions that forced these tribes to relocate, sometimes competing among themselves for territory. By 1745, the Cherokee were allied with the British in their effort to contain France and Spain, focusing on lands between Florida and the recently established colony of Georgia. In this period, Creek began migrating to Florida under pressure from both Europeans and members of their own tribe. In the 19th century, they would call themselves Seminole.

BRITISH AND FRENCH AMERICAN ALLIANCES

The five (later six) tribes that became the Iroquois Confederacy (Haudenosaunee) centered in what became New York State, had also, prior to European contact, initiated a Great League of Peace in response to destructive warfare among tribes. These “people of the longhouse” included the Mohawk, Seneca, Onondaga, Cayuga, and Oneida tribes, joined in the early 1700s by Carolina’s Tuscarora. The Iroquois were not nomadic but lived in large villages. Their longhouses were wood and bark structures that might be 400 feet long and accommodated many family groups.

Skilled negotiators, the tribes individually and confederacy as a whole for a time held their own against Dutch, British, and French claims and demands. Some among the Iroquois hoped to remain neutral, but they soon were edging toward the British. By the 1670s, the Iroquois and British had pledged mutual friendship. After a sneak attack by French forces in 1687, the Five Nations retaliated by attacking NEW FRANCE settlements on behalf of British objectives in what was known in North America as King William’s War. They fought both the French and France’s Indian allies, including the Huron and Abenaki and Algonquian people of the Great Lakes region. Both groups of Indians inflicted and suffered terrible casualties; by 1701, the Iroquois were promising their people to remain neutral in future European conflicts.

By 1750, eastern and Great Lakes Indians of many tribes, displaced by white settlement, were seeking new lands in the Ohio Valley, on the frontier between British and French territorial claims and control. The Iroquois, as well as Shawnee, Delaware, Cherokee, and Chickasaw, were all trying to use this no-man’s-land to enhance trade and perhaps prevent both the British and French from expanding even farther into the continent.

In 1749, Virginia awarded some of its favored citizens development rights to almost 8,000 square miles of the Ohio Valley. The ensuing French and Indian wars would set off a series of events that ultimately made hundreds of Native tribes—survivors of 258 years of warfare, land loss, and disease—strangers in their own land.

MARSHA E. ACKERMANN

Neo-Confucianism in Japan

Neo-Confucianism was the revival and reinterpretation of the thoughts and principles of the ancient Chinese philosopher Confucius (551–479 B.C.E.) in China in the 11th century. Neo-Confucianism was used as state policy by the TOKUGAWA IEYASU Shogunate (1603–1867) as a means of social control. It emphasized paternalism and promoted a strong central government. The studies promoted by Neo-Confucianism also led to an increase in the practice of traditional Shinto and the study of Japanese historical texts. Its central tenet was that harmony could be established and maintained in society only through creating and nourishing proper relationships between superiors and inferiors. Superiors have the duty to behave in a wise and benevolent manner toward social inferiors, who in return should behave with restraint, propriety, and, above all, obedience toward their superiors.

When Tokugawa Ieyasu rose to prominence, Japan was decentralized and power was divided among feudal domains. It was questionable whether the shogunal government would be able to enforce its will over the outlying regions. Tokugawa drew from the teaching of Fujiwara Seika (1561–1619) in utilizing Neo-Confucianist ideas to draw the country together. Though ultimately successful it required a long and complex struggle over the regional nobility. The promotion of Bushido, or the Way of the Warrior, also reinforced

the bonds between patrons and followers in a code of honor as a meaningful objective in life.

THREE SCHOOLS OF THOUGHT

There were three schools of Neo-Confucianist thought in Japan. They were the Kogaku, the Oyomeigaku, and the Shushigaku schools. Of these, the most influential was the Shushigaku, which was promoted by the Tokugawa Shogunate; it was based on the work of the Chinese philosopher Zhu Xi (Chu Hsi 1130–1200). Zhu Xi was the principal founder of Neo-Confucianism in China. He emphasized the role of the thought of Confucius and his follower Mencius. He also integrated the concept of human nature (*li*) with matter (*chi*) as the essence of the nature of humanity. Zhu and his followers stressed the need for the rigorous investigation of ethical conduct and personal actions as part of the systematic evaluation of the universe. This was found to be of great use in Tokugawa Japan and helped to support the *bakuhau* system of social hierarchies because it was interpreted to promote stability.

The Oyomeigaku school was based on the thought of the Chinese philosopher Wang Yangming (Wang Yang-ming 1472–1529), who combined an idealistic interpretation of Confucianism with a career of military and governmental service. Wang stressed the need for the intuitive understanding of the world and the importance of self-knowledge and self-study. This strongly contradicted Zhu's attempt to understand the world through the study of existing, external texts. The Kogaku school was dedicated to resurrecting the original thought of Confucius and Mencius, which its proponents held had been contaminated by the interpretation of Neo-Confucianists. The return to "Ancient Learning," which is central to Kogaku, would bring a return to a better time than the present. The person most credited with formulating the Kogaku school was Ito Jinsai (1627–1705), who established the School for the Study of Ancient Meaning, which has lasted into the 20th century.

Ito Jinsai established a reputation for a humanitarian approach to the world and promoted a life of selfless diligence. These contending schools of thought in Japan conflicted with each other. However Neo-Confucianism provided a means of legitimation for the shogunate established by Tokugawa Ieyasu and ensured its success as the central control of Japan.

JOHN WALSH

Nerchinsk, Treaty of

The Treaty of Nerchinsk, 1689, was China's first treaty with Russia and was important because it settled the boundary between the two empires and began diplomatic relations on an equal footing. In the mid-17th century, Russia's eastward conquest across Siberia reached the Amur River region on the boundary of the newly established Qing (Ch'ing) Empire in China. In 1675, Russia sent Nicolai G. Spathary as ambassador to the Chinese court, and he was received by the KANGXI (K'ANG-HSI) emperor; he learned all he could about China but otherwise returned home empty-handed.

Kangxi's early years were focused on suppressing a serious revolt in southern and southwestern China (called the Revolt of the Three Feudatories, ended in 1681) and the Ming loyalist movement on Taiwan (ended in 1683). Next he dealt with Russia's advance to areas claimed by China by ordering General Pengcun, at the head of 10,000 soldiers, 5,000 sailors, and 200 pieces of artillery, to take on the small Russian force at Albazin in 1685, which he captured and then returned home. The reinforced Russians however returned, rebuilt their fort at Albazin, and continued to raid the Amur region. China did not wish to continue a protracted conflict that might drive the yet unpacified Olod Mongols to the Russian fold.

Thus the two countries agreed to negotiations at Nerchinsk in 1688. The Chinese delegation was headed by Prince Songgotu and had two Jesuit priests, Jean-François Gerbillon and Thomas Pereira, as interpreters. The Russian delegation was led by Fedor A. Golovin. Each delegation was supported by a large contingent of soldiers, the Chinese one being much larger. The Treaty of Nerchinsk was signed on September 7, 1689. It had six articles and was in five languages, Chinese, Manchu, Mongolian, Russian, and Latin, with the Latin version being the official text. The treaty delineated the boundary between Russian Siberia and Chinese Manchuria along the Argun and Amur Rivers to the mouth of the Kerbechi, and along the Outer Xingan (Hsing-an, Stenovoi in Russian) to the sea. The Russian-built fort at Albazin was to be demolished and Russian residents there were

A portrait of the Kangxi emperor in court dress, from a silk scroll hanging in the Palace Museum in Beijing

to be repatriated. It also provided for the right of residence and trade between peoples of the two countries, the issuing of passports, and the extradition of fugitives.

The Treaty of Nerchinsk was negotiated between two equal countries. Russia gained 93,000 square miles of hitherto disputed territory that included Nerchinsk while China secured Albazin and peace with Russia that would allow it to deal with and eventually defeat the western or Olod Mongols. Most significantly it regularized Chinese-Russian relations and began the periodic exchange of diplomatic missions between the two countries.

JIU-HWA LO UPSHUR

Netherlands, revolt against Spanish rule in the

The revolt of the Netherlands, often known as the Dutch Revolt, or the Eighty Years' War, started in 1568 and was only finally resolved by the Treaty of Westphalia in 1648. It began with 17 provinces in the Netherlands rising up against the rule by the Spanish royal family, the HABSBURGS. The reasons for the revolt were threefold. The transformation of Spain under the Habsburgs, from a European power to a major world empire with extensive colonies in the Americas led to involvement in numerous wars, and the taxes imposed on the Netherlands to help pay for these wars were greatly resented. Many of the towns and cities in the Netherlands also resented Habsburg moves to centralize the administration of the region. By the 1560s, Protestantism had become popular in parts of the Netherlands, with the Habsburgs being keen to restore Roman Catholicism.

When friction started between Antoine Perrenot de Granvelle, the French statesman whom PHILIP II of Spain appointed to the Netherlands, and the many burghers in the Netherlands, it rapidly led to religious tensions. In August 1566, a small Catholic church was stormed and images of Catholic saints were destroyed. It was quickly followed by similar moves elsewhere, and Philip II responded by sending in soldiers. When some of his opponents were executed, a rebellion broke out, with William of Orange, an influential Protestant politician, becoming its figurehead. The Battle of Rheindalen, on April 23, 1568, marked the start of the revolt.

Initially the Spanish were able to crush the rebellion, but when the rebels launched a naval assault in 1572 and captured the town of Brielle (Brill), the Protestants quickly rallied to support the rebels. Soon the northern provinces of the Netherlands were effectively independent of Spanish rule, and when Spanish soldiers tried to reimpose Imperial rule, the fighting escalated. There were some who wanted the younger brother of the French king—Hercule François, duke of Anjou—to become the new king of the Netherlands, but this idea fell through after two years, as did one to make ELIZABETH I of England the queen of the Netherlands.

The ruthless manner in which the Spanish commander, the duke of Alba, tried to retake the Netherlands led to an intense hatred of the Spanish. The action that earned the duke his reputation came after a seven-month siege of the city of Haarlem. In July 1573, Alba's victorious soldiers massacred the entire garrison. In October 1575, the Spanish slaughtered many people in

Antwerp, the largest city in the region, and large numbers of its inhabitants fled.

In 1585, Robert Dudley, earl of Leicester, brought 6,000 English soldiers to fight alongside the Dutch rebels. Two years later, the English withdrew, but not before many important English, including SIR WALTER RALEIGH, had fought against the Spanish. As the stakes rose, the Spanish gathered together their armada for a naval attack on England in 1588, but this failed. In the following year, Maurice of Orange, the son of William of Orange, took the offensive and captured Breda in 1590. By this time, the north of the Netherlands was enjoying effective independence, with fighting continuing until 1609. It was during the mid-1590s that the Englishman Guy Fawkes fought on the Spanish side, gaining some experience in the use of explosives, which resulted in his recruitment for the Gunpowder Plot of 1605. From 1609 to 1621 there was a 12-year truce, with fighting starting again in 1622 and merging with the THIRTY YEARS' WAR, which ended in 1648.
