Sanskrit is an ancient Indo-Aryan language that has for thousands of years become associated with religious teachings and beliefs, notably Hindu and Buddhist forms of thought. Its earliest use is associated with the migrating Aryan peoples who settled in north India and Iran and from whom several families of languages descended in various forms. *Aryan* means “noble” in Sanskrit. The long history of its use and the fact that so many religious and philosophical concepts are expressed in the language means it has become almost impossible to separate consideration of the language from the content it has most commonly been used to convey. Sanskrit remains an important language in religious expression in the modern world, although it is not spoken widely otherwise. Some religious experts and scholars are able to communicate in Sanskrit.

VEDIC AND CLASSICAL SANSKRIT

Vedic Sanskrit is the oldest form of the language and was used to explain the VEDAS (knowledge) that framed the first known forms of Indian religious expression. Vedic literature includes the Samhitas, which are four collections of texts: the Yajur-Veda, the Sama-Veda, the Atharva-Veda, and the Rig-Veda. The last three of these consist of verse forms used by priests in ritual chants. However, the *Yajur-Veda* may be divided into two parts, one of which—the Black, or Krishna, Yajur-Veda—contains both ritual verses (mantras) associated with sacrifice, as well as explanatory Brahmana, which detail meanings for mythological terms and concepts and also the derivations of some words. These works predate Buddhism and have been dated to c. 1000 B.C.E.

As the VEDIC AGE continued, more literature was written in Sanskrit that was of a nonsacred nature. Panini, the earliest known writer about Sanskrit and its structure, considered the nonsacred forms of communi-

cation to be *bhasa*. Meanwhile, sacred texts included a growing number of sutras, or apophthegms. The Chan-da texts and particularly the Brahmanas represent the foundations of the Brahmanical practices that spread across India and later Southeast Asia. The sacred Vedic Sanskrit texts were considered by Hindu believers to be in a mystical way at one with the universe and uncreated even by the divine gods. Since the language was universal and immortal, it follows that words expressed by it should be treated with respect, and it was particularly fitting for certain types of thoughts and concepts. Nevertheless, the language was also used for mundane and even profane communication. The fact that no definitive single script has been used for the language is an indication that meaning drift between different groups of Sanskrit speakers took place.

Subsequent development of the language meant that it became polished or crafted—more versatile for literary expression. Two of the great literary epics, the *RAMAYANA* and the *MAHABHARATA*, were created in this phase of epic or classical Sanskrit. The *Mahabharata* details at some length the struggle between the Pandavas and the Kauravas, together with a large amount of additional religiomythical material. Contained within the *Mahabharata* is the BHAGAVAD GITA, which is an extended treatise on religious and human duties and forms a central strand of Hindu thought.

The *Ramayana* concerns the romance of Rama and was compiled according to tradition by the poet Valmiki c. 300 B.C.E. In the *Ramayana*, Prince Rama and his companions are instructed in virtue and duty and then suffer the loss of the prince’s wife, Sita, to the demon king of Lanka. Sita is ultimately recovered with the assistance of the monkey god Hanuman, but her trials continue, as Sita is made to demonstrate her fidelity to Rama, which she resents. The *Mahabharata* and the *Ramayana* constitute a basis of poetic expression and intellectual exploration that greatly expanded the mental vocabulary and reference material of all those people able to understand and converse in Sanskrit. To these were added a variety of dramatic and poetical works (*nataka* and *kavya*), together with narrative works. The language evolved considerably over the centuries, and this is evident in changes to pronunciation, word choice, and grammar.

Sanskrit was also used to create technical, philosophical, grammatical, and other scientific texts that were widely used throughout ancient and medieval Asia. It was used for Buddhist works in India and Sri Lanka, and these spread to mainland Southeast Asia where the language is known as Pali and formed the basis for educated discourse, as well as influencing the development of local

languages. Chinese monks and pilgrims traveled to India in search of Buddhist texts to translate into Chinese, and they formed an important medium through which Sanskrit-expressed ideas entered into the Chinese world and its intellectual tradition. Sanskrit is also the language through which early Jainist thought is expressed.

SANSKRIT IN THE COMMON ERA

Sanskrit moved from being a spoken language to one that was better known for its use in sacred rituals and written literature. The great Buddhist king ASHOKA, for example, followed GAUTAMA BUDDHA's teaching to use vernacular languages to spread religious teachings. Although religious and philosophical texts used Sanskrit, government-produced monuments and pronouncements employed other languages (Indo-Aryan) until the early centuries of the Common Era. A parallel development was for commentators to insist that only correct pronunciation in Sanskrit should be permitted and that this could only be achieved by studying the methods of the past. Sanskrit became separated from the masses, who were excluded from learning and mastering the language. Grammarians distinguished between words of Sanskrit origin and words influenced by Sanskrit. Sanskrit witnessed the importation of words from other languages, especially those necessary to describe new concepts or proper nouns.

Sanskrit also spread as a result of political and military change. The expansion of first the Persian Empire and subsequently the entry into northern India of ALEXANDER THE GREAT provided conduits through which the language could spread to the West. Contact with the Arab world in later centuries was also important in the transmission of cosmology and mathematics.

Sanskrit epics had tremendous influence on cultural and artistic production throughout India and Indian-influenced societies. Some works, including the retelling of part of the *Mahabharata* by Nannaya Bhatta (1100–60 C.E.), took as their subject well-known tales of the past and brought them into contemporary focus both through the contrast between the heroic milieu and that familiar with the audience, and also by presenting existing characters with new encounters and events to face. This has begun a tradition of inventive mixing of the past and present that has led to a burgeoning form of popular culture in both oral and written forms. Some critics maintain that the use of Sanskrit has been a tool by which the central Indian state has sought to oppress local traditions and cultures. Sanskrit studies became popular in Europe in the early modern period both as a subject of scholarly inquiry and also as a source of spir-

itual sustenance. Its popularity has waxed and waned with interest in Eastern philosophies.

STRUCTURE OF THE LANGUAGE

Sanskrit has come most commonly to be expressed through the Devanagri script, although this is a comparatively modern invention. Sanskrit has a complex and highly mannerized structure, resulting from its origins as a deliberately created language. There are three genders and three numbers, with 10 types of verbs, eight cases, and 10 noun declensions. There are a variety of voiced and unvoiced aspirated sounds in the language and the retroflex sound that has been introduced and distinguishes Indian languages from the Indo-European family. The language is highly inflected and numerous suffixes, for example, govern different shades of meaning and emphasis. Expressions of time in verb tenses are also complex and contain various types of meaning embedded within them.

JOHN WALSH

Sappho

(fl. early 6th century B.C.E.) *Greek poet*

Sappho is one of the most important of the lyric poets of the ancient Greek world. She probably lived from the middle part of the seventh through the early part of the sixth centuries B.C.E. Though the exact date of her birth and death are unknown, it is fairly certain that she was born in the city of Mytilene on the island of Lesbos, which is located in the eastern Aegean Sea near Turkey. She came from a noble family. Her father's name was Skamandronymos, her mother's Kleiss, and her husband's Kerkylas. She had a daughter named Kleiss and either two or three brothers. Around the year 600

B.C.E., she, along with the other nobility on Lesbos, were forced into exile to the island of Sicily when a middle-class tyranny, led by Myrsilos, took control of Lesbos. Eventually, she was able to return. Some argue that she taught at a school for young women, others that she was simply at the center of a local poetry clique.

Her reputation was great in the ancient world; Plato, about 200 years after her death, called her the “tenth Muse,” referring to the nine Greek goddesses who were the patrons of the arts and sciences and who were the source of inspiration and artistic excellence. Little of her work has survived, but what has is highly praised in the modern world and still has the power to move people.

LYRIC POETRY in the ancient Greek world refers, first of all, to the fact that a lyre originally accompanied the poetry. Unlike our modern conception of the lyric, Greek lyric poetry fit into at least two major categories: choral ode and monody. The monody is closest to our modern conception of the lyric, that is, a short, personal poem expressing intense emotion. This was the type of poetry that Sappho wrote. She created the Sapphic stanza and may have been the first to accompany her poems with a harp.

She is known to have written between seven and nine books of poetry, with the last being a book of wedding songs. Her poems are often favorably mentioned in ancient writing (in fact, the ancient world erected at least one statue to her), but during the Byzantine era, Pope Gregory Nazianzus, in 382 C.E., had most of them destroyed. In 1073 Pope Gregory VII likely burned any of the books that still survived. The problem, from the Catholic Church’s perspective, was that Sappho was likely bisexual, and much of her poetry was erotic and concerned with love between women.

Unlike much of the Greek poetry before her, most of Sappho’s poetry is personal, not social. The worlds of beauty, personal relationships, and love are the typical topics of her poems. Unfortunately, all that is left are mostly scraps, sometimes a line, sometimes a stanza, and in only one or two cases, a complete poem. They come to us as quotes in the writings of authors from antiquity and in strips of papyrus used to wrap mummies in Egypt. The most recent discovery of her poems was in 2004 in papyrus wrappings from a mummy and was combined with a previous fragment, also written on papyrus and found in 1922, resulting in a new, nearly complete 12-line poem. This particular poem is about growing old and is a type of *carpe diem* addressed to a group of girls. The Egyptians copied it about 300 years after her death. The 2004 wrappings also contained two other new fragments.

A typical remnant of her poetry is the three lines often titled “The Blast of Love”: “Like a mountain whirlwind / punishing the oak trees, / love shattered my heart.” One of her other likely complete poem is called “A Prayer to Aphrodite.” It is generally presented as a seven-stanza poem and ends by asking the goddess to “labor for my [Sappho’s] mad heart.” Despite the scarcity of surviving poetry, she has influenced English-speaking writers as diverse as Philip Spencer and Ezra Pound, as well as many writers in other languages. She continues to have the power to fascinate and delight, and her poetry—as fragmentary as it is—is still worth reading.

WILLIAM P. TOTH

Sargon of Akkad

(2334–2279 B.C.E.) *king of Sumer and Akkad*

Sargon of Akkad was the first Mesopotamian ruler to control both southern and northern Babylonia thus becoming the king of SUMER and AKKAD and inaugurating the Akkadian Empire. He established his capital at the newly founded site of Akkad in northern Babylonia; its exact location is unknown but perhaps near modern Baghdad.

Two things can be known from his name, which means “the legitimate king”: This was not his birth name, and he was probably a usurper. One legend names him as the cupbearer of Ur-Zababa, king of Kish. He started the practice of maintaining a standing army, which allowed him to campaign from eastern Turkey to western Iran. While he fought battles in these areas, it is unclear if he sought and maintained permanent control everywhere he fought, or if he conquered some areas just for the plunder. In many areas he was content to have the local rulers continue as governors so long as they pledged allegiance to Sargon, providing him with taxes and acknowledging him as the “legitimate king.” It is known that he received tribute from EBLA in northern Syria and ELAM in western Iran.

In later literature he was seen as a good and triumphant king, in contrast to Naram-Sin, who was usually incompetent and disrespectful to the gods. In the

“Sargon Legend” his mother, a priestess not allowed to have children, abandons him in a basket in the Euphrates in order to hide his birth. From this humble beginning, Sargon establishes himself as the king of the first Mesopotamian empire. The “King of Battle” is another tale that tells of how Sargon traveled to Purushkhanda in central Turkey in order to save the merchants there who were being oppressed. After defeating the king of the city, Nur-Daggal, the local ruler is allowed to continue to govern as long as he acknowledges Sargon as king. The version of the story that we have comes from 1,000 years after Sargon’s reign and shows the difficulty we have in reconstructing Sargon’s reign with texts that are not contemporaneous. Because of all the successes of this king, Sargon’s name was adopted by a Neo-Assyrian king of the eighth century B.C.E.

JAMES ROAMES

Sassanid Empire

The Sassanid Empire was the last pre-Islamic Iranian dynasty that ruled over a large part of western Asia. Following the Achaemenid dynasty, the Sassanids are considered one of the most powerful and famous Iranian dynasties that positively influenced the evolution of Iranian nationality and culture during their 400-year sovereignty (224–651 C.E.). The dynastic name, Sassanid or Sassanian, is derived from Sasan, said to have been father or grandfather of Ardashir I, also called Artaxerxes.

ARTAXERXES

Founder of the Sassanid dynasty, Artaxerxes was first appointed as the governor of Darabgard because of his firm familial relationship with the local royal families of Fars. He took advantage of the weakness of the Parthian (Arsacide) kings and expanded his realm. Having achieved a successful supremacy over Fars, he conquered Isfahan and Kirman and won a face-to-face battle with Arsacid Artabanus V, the last Parthian king, defeating and killing him in 224 C.E., leading to the invasion of Ctesiphon, the Parthian’s capital, in 226. He was crowned as the “king of kings of Iran,” according to the fire temple of Anahita at Istakhr.

He expanded his kingdom by conquering the east of Persia, invading Sistan, Khurasan, Marw, Khwarazm, and Balkh. Kushan’s kings, who ruled over Punjab and Kabul, sent envoys to announce their obedience to him. To expand his territory Artaxerxes moved toward the west and was involved in a war with the Roman Empire in 228, in which he defeated the Romans several times. Through these wars he invaded Carrhae and Nisibis and then conquered Arminiya and annexed it to Persia.

Following Artaxerxes, 34 Sassanid kings ruled over Persia. Amalgamation of clerical institutions with the monarchy provided the Sassanid monarchs a divine legitimacy, which led to the interference of Zoroastrian priests in the social and political affairs of the country, especially when less powerful kings were ruling. This mix of state and Zoroastrian religion threatened the lives of followers of other religions when religious and biased kings ruled the country.

SHAPUR I

During the reign of Shapur I, ARMENIA, which had gone undisciplined, was brought under control. Gordian III, the Roman emperor who had attacked Nisibis and Mesopotamia, was defeated and killed, while his successor, Philip the Arab, established peace with Shapur in return for submitting a heavy indemnity to Shapur, as well as a free hand in Armenia. In a war between Rome and Persia near EDESSA, the Roman army was defeated, and Valerian was taken captive. The event increased the Sassanids’ self-confidence and dignity. Shapur used tens of thousands of captives to advance economic development of his empire. The fall of the KUSHAN EMPIRE by Shapur was one of the most influential events of his kingdom, because it caused the civilized world to be divided between the two empires of Persia and Rome. This new Persia was no longer a partner with Rome but a more powerful rival.

HURMUZ I, BAHRAM I, BAHRAM II, AND BAHRAM III

Shapur’s successor, Hurmuz I (272–273) was called “brave” for his courageous actions in wars with Rome and Armenia. By allowing the freedom of various religions and limiting the power of clergies and nobles, he followed his father’s lead. These activities brought him an early dismissal from the throne. In Manichaean literature Hurmuz has been mentioned as the “good king.”

Following Hurmuz I, his brother Bahram I (273–276) took the throne. In his reign the policy of tolerance toward non-Zoroastrians was discontinued. Limiting other religions, the clergies of the time gained more

king of Perse-Armenia, rebelled. Bahram IV defeated him and made his brother (Bahramshapur/Vramshapuh) king of Perse-Armenia. Another significant event during his reign was the formal division of the Roman Empire into eastern and western parts (395), which was apparently one of the outcomes of THEODOSIUS I's death, who was killed by his own son. Bahram IV was killed in a violent attack, possibly by a conspiracy of the nobles, which led to a rebellion in his army.

Yazdadjird I (399–420) was most likely a brother of Bahram IV and was to some extent successful in limiting the power of nobles in his court, though he was enthroned by them as a pawn. He was called “delight of the state” and “Rameshras” meaning “peace-seeker” on his coins.

Tolerating other religions and their followers, Yazdadjird I was not welcomed by the strict Zoroastrian priests, who had labeled him as a “sinner.” However, he imposed his power rather than endanger the stability and independence of his monarchy. Yazdadjird was not able to escape the nobles’ violence and was killed in a conspiracy.

BAHRAM V AND FIRUZ I

Attempting to exclude the son of Yazdadjird from succession, nobles enthroned a descendant of Ardashir I, Khosrow, but he later abdicated, and Bahram seized the throne as Bahram V (420–438). Bahram V was the son of Yazdadjird I. Bahram V had been raised at al-Hira by al-Mundhirhir of Lakhm.

Early in his reign Bahram V defeated an invasion of Hayatila Hephthalites in the northeast of Iran and killed their king. In the west of Iran the wars with the Byzantines ended (422) with a 100-year peace treaty between Byzantines and Iran, providing security and religious freedom of Zoroastrians in Byzantium and freedom for Christians in the Sassanid state. Bahram V was a comfort-seeking man and apparently was not concerned with the interference of clergy in his affairs. He was fond of hunting and is said to have died after falling into a swamp while hunting.

The growing interest in Christianity in Armenia created negativity, and to prevent independence Armenia was invaded, and many Christians were killed. The death of Yazdadjird II was followed by a civil war between his sons. His wife, Dinak, as the “queen of queens,” ruled over the country in Ctesiphon for a short time, until her son Hurmuz III (457–459) took the throne; however, the king’s brother Firuz, who was supported by the nobles and priests, defeated and killed Hurmuz and seized power.

A major problem during the reign of Firuz I (459–484) was a seven-year-long famine and drought. Trying to control and manage the country, Firuz remitted taxes and distributed stores of corn and even imported more corn. Following famine and starvation, the country was involved in a war with Hephthalites. In about 469 Firuz was captured and lost Harat to them, agreed to pay tribute, and left his son Kubadh as a hostage to guarantee its payment and levied a poll tax over his entire state to provide his ransom.

Firuz fulfilled his promises, but the Hephthalites did not release Kubadh. Firuz waged war and was killed. The Hephthalites captured many areas in Iran, but Zarmehr, known as Sukhra, one of the great nobles of the state, prevented their advance toward the center of the country. In 484 Zarmehr and other nobles enthroned Balash, Firuz’s brother (484–488), who established peace with the Hephthalites in return for tribute. Balash was a kind and just king as mentioned in Christian and Armenian documents, but having an empty treasury, he was not able to control the state and provide stability, even though he encouraged agriculture to improve economic conditions in Iran. In 488 he was deposed by the nobles and priests, who enthroned Kubadh I (487–531) the son of Firuz.

KUBADH I AND KHOSROW I

The early years of Kubadh I’s reign were accompanied by growth of the Mazdakites in Iran. The Mazdak revolution was mainly a reaction toward the increasing power of aristocrats, religious nobles, and the pressure imposed on ordinary people as productive sectors of society and as taxpayers. Mazdak believed that the world was covered in dark, and a resurrection was required to help the light overcome the “darkness.” Accordingly, human beings, who are equally born, should share wealth. It is likely that Mazdak’s philosophy was the first egalitarian and socialistic idea. The competition between the monarchy and clerical institutions caused Mazdak’s thoughts to flourish and spread in the Persian Empire.

Kubadh I, with popular support against the nobles and priests, allied with the movement and their leader, Mazdak. The nobles and priests who found the ongoing situation against their own interests, deposed and imprisoned Kubadh and enthroned his brother, Djamasp. Kubadh escaped prison with the help of his wife and one of his generals and took refuge among the Hephthalites, whose army restored him to the throne in 499. In the second phase of his reign Kubadh gradually changed his policies toward Mazdakites and tried to attract the priests’ and nobles’ support. In spite of

the Mazdakites' announcement of Kawus as the crown prince, Kubadh appointed his younger son Khosrow, who successively executed the Mazdakite heads and settled the dispute. Kubadh became involved in a 10-year war with the Hephthalites (503–513) and defeated them so heavily that they were never a threat to Iran's territory again. He defeated the Byzantines in two wars; the first one in 503 at the reign of Anastase and the other in 531 at the reign of JUSTINIAN I.

KHOSROW I (531–579) was remembered as Anushirwan (of immortal soul) and became the subject of legends. He was recorded in history as the most powerful and knowledgeable king of the Sassanids. He led Iran toward a flourishing period. Although he was cruel with Mazdakites at the beginning, in his governing policies he followed Mazdak's socialism and prevented cruelty from the nobles. Properties that had been taken by force were returned to their former owners. The nobles kept their status but lost their power. He tried to satisfy the poor and afterward was entitled as "dadgar," meaning "fair." He implemented a tax reform that paid for his expanded governing system.

At the beginning of his reign he accepted the peace treaty proposed by the Byzantine emperor, Justinian I, and tried to reconstruct the state, especially the destruction left by Mazdakite rebels. With a well-equipped army he revived Sassanid power. A new class of militant landlords was created, and the military was trained and paid regularly so that the army could be a continual power. Kharsaw, who found Byzantine growth and power a threat to Iran, invaded Byzantium and occupied many cities in that state. The Byzantines were obliged to pay tribute and sign a 50-year treaty accepting the expenses for the common defense of the Caucasus passes. Khusraw I destroyed the Hephthalites through an accord with the western Turks and divided Hephthalite territory between the Sassanids and the Turks. At the end of his reign Khosrow occupied YEMEN and annexed it to Iran, expanding Sassanid territory up the southern coasts of the Persian Gulf and the Oman Sea.

HURMUZ IV, BAHRAM VI, AND KHOSROW PARWIZ

Khosrow Anushirwan was succeeded by his son Hurmuz IV (579). He was remembered as "Turkzad" meaning "born as a Turk" since his mother was connected to the kings of western TURKS. The conflict between the crown and the nobles resurfaced in his reign. Hurmuz IV is said to have favored common people against the nobles, possibly as a basis of support for his crown. The

Zoroastrian clergy were dissatisfied with Hurmuz IV's tolerance toward other religions and turned against him. Ongoing peace negotiations with Byzantium were progressively impeded by Hurmuz IV, and war broke out again, although there was no clear victor.

At the same time the king of Turks invaded the eastern borders of Iran. Bahram Chubin of the Mihran family, one of the Parthian princes, fought heavily with the Turks and defeated them at Harat, killing their king. Hurmuz IV, afraid of Bahram Chubin's fame and wisdom, sent him immediately to Georgia to fight with the Byzantines, where he was defeated. Jealous of Bahram's popularity, Hurmuz IV disgraced him on the pretext that he held back war booty, provoking Bahram to rebel. Groups of nobles and the military supported Bahram Chubin, and the first steps for the collapse of Hurmuz IV's throne were taken. The rebel forces, including Hurmuz IV's brothers-in-law, dethroned Hurmuz IV, enthroning his son Khosrow. Hurmuz IV was killed. Bahram Chubin, who had more widespread objectives, did not recognize Khosrow's monarchy and attacked Ctesiphon and defeated Khosrow and his uncles. Bahram Chubin entered the capital in 590 and took the throne as Bahram VI (590–591), with upper-class support.

Khosrow, who was later named Khosrow Parwiz (the triumphant) sought help from the Byzantine emperor Maurice. Maurice sent two armies accompanied by his own daughter, Maria, who married Khosrow. Khosrow then defeated Bahram in 591, and he fled to the Turks, where he was killed in the next year. Bahram never was able to obtain legitimacy among the nobles since he did not belong to a royal family. Khosrow Parwiz took preventive measures by selecting his own guards from the Byzantine army and eliminated rival sources of power. His lenient treatment of Christians might have been influenced by the fact that both of his wives (Maria and Shirin) were Christian.

In 602 Maurice was dethroned and killed. His son fled to Iran, and Khosrow recognized him as the new Caesar. Supporting the young Caesar to take over by posing as Maurice's avenger, Khosrow found an opportunity to regain territories ceded to the Byzantines. Khosrow started the last and greatest of Sassanid-Byzantine wars, which lasted about 20 years (604–624). Between 604 and 610 Sassanid armies conquered Armenia, Mesopotamia, and many cities in Syria. Consequently, Byzantium could not control other parts of the empire as firmly as before. Khosrow Parwiz arrested and killed Noman-b-Mundhar, the king of Hira. This unwise violence later proved to be very costly, because Khosrow destroyed the wall between Iran and the Arabs of the

desert. During wars between Iran and Rome, Heraclius found his way to the throne in Byzantine following a revolt; however, he was not able to overcome the chaotic situation. The vigorous Sassanid army conquered Antioch and Damascus (613), and Shahrbaraz, the Sassanid commander, joined by 26,000 messianic Jews, conquered Jerusalem. He burned the churches of the city and deported 35,000 captives to Ctesiphon, the Sassanid capital, along with the patriarch of Jerusalem and the relic of the True Cross. Then Shahrbaraz invaded ALEXANDRIA (619) and the rest of Egypt.

Another Iranian commander, Shahin, also conquered Asia Minor. Sassanid territory was at this point comparable to Persia of the Achaemenids. Khosrow's victories, especially conquering Egypt, which was a major source of food for CONSTANTINOPLE, forced Heraclius to move his capital to CARTHAGE, an ancient city on the coast of North Africa near Tunis. Using the property and treasures of the churches, the Roman army was again well equipped and able to defend Rome against Iran.

In this phase of the war the Byzantine army, enjoying an effective navy, crossed the Black Sea and took the war to the Asian arena. In 622 Heraclius invaded Armenia and Adharbaydjan in 626. The Byzantines allied with the Khazars north of the Caucasus. Heraclius advanced into the Mesopotamia plains and descended into the Tigris Valley, where he defeated Sassanid forces at NINEVEH. Khosrow fled to Ctesiphon, leaving Dastagered, his royal palace and animal preserve, for Heraclius to capture in 627.

Although weakened, Khosrow obstinately rejected the peace proposal suggested by Heraclius. At the same time he killed and imprisoned many people, including some of his own army officers. Furious at his behavior and rejection of the peace proposal, in 628 a group of generals and high-ranking officials entered the capital and revolted against him, captured and imprisoned Khosrow, and proclaimed his son Kubadh II as king.

They later asked Kubadh to execute Khosrow. In the ancient history of Iran Khosrow is famous for his luxurious lifestyle. Some experts believe that his interest in such a lifestyle promoted and expanded fine arts, music, and architecture in his reign. After the execution of Khosrow Parwiz, the Sassanid dynasty lost its power and started to collapse.

YAZDADJIRD III

During the four-year period between Khursaw's execution and the enthroning of Yazdadjird III, the last king of the Sassanids (628–632), more than 10 people took power and claimed to be king, none of them exceeding

two months in their reign. The real and absolute governors were the priests and nobles to whom the kings were nothing but a pawn. Shiruya, Khosrow's son, who was enthroned and entitled as Kubadh Firuz (victorious), did not reign more than eight months. He started peace talks with Heraclius and accepted the peace proposal, being aware of Iran's political instability.

Shahrbaraz, the most famous Sassanid general, broke with Khosrow II by the end of his reign and refused to abdicate his provinces, Egypt and Syria. In the summer of 629 he negotiated with Heraclius on his own and left Syria and Egypt. Kubadh II remitted taxes for three years and released many prisoners, in an effort to be unlike his father, Khosrow, but to stabilize his reign and kingdom he killed all of his adult brothers. Leaving only sisters and children, he created subsequent dynastic problems.

Kubadh was succeeded by Ardashir III, just a child (628); Sharbaraz was dissatisfied with the chaotic situation and revolted and killed Ardashir III and made himself king. He reigned for only 42 days before being killed by his own guards.

This was followed by a dynastic crisis, with 11 rulers taking the throne in two years. Khosrow III, who had made himself king in the eastern lands of the Sassanid Empire, was killed, and Jawanshir's reign was also brief. Since none of Khosrow Parwiz's sons were alive, his daughter Buran (who was Kubadh II's wife) was enthroned by the support of the nobles in 630. She struck coins, built bridges, and completed peace negotiations with the Byzantines before being deposed in 631. Her successors were Firuz II, Adhar Midukht, Hurmuz V, and Khosrow IV. At the end of 632 a grandson of Khosrow II, Yazdadjird III (632–651) was proclaimed king. He was the last Sassanid monarch.

The Sassanid position in the Arabian Peninsula had already been weakened by widespread revolts. Arab Muslims formed their own alliances and Sassanid governors acknowledged the prophet Muhammad and converted to Islam. The Muslim forces claimed "equality" and "justice" and promised a "better life" for people and were respected and received warmly in the frontiers and even the capital.

Yazdadjird III, who hoped to reinvigorate his army, fled to Marw and was killed in 652 by a rogue who coveted his elegant clothes and jewelry. Yazdadjird III's death put an end to the Sassanid monarchy in its known frontiers. His son Firuz took refuge in Tang China and was permitted to establish a fire temple.

MOHAMMAD GHARIPOUR AND FARAMARZ KHOJASTEH

Saul

(c. 1020 B.C.E.) *first king of Israel*

The story of Saul is the story of how ISRAEL received its monarchy. It is a tragic story because Saul represents the acceptance of a line of kings, yet the biblical commentary makes known that this new form of government represents a rejection of direct divine government represented by PATRIARCHS, JUDGES, and PROPHETS. It is doubly sad for Saul because he is the divinely conceded choice for the first king, yet he is by the end of his life the divinely rejected king, displaced by a new divine choice, DAVID. For David (c. 1000 B.C.E.) there is good evidence of his existence, but for Saul all that historians have is the biblical narrative.

Saul's story is told in 1 Samuel 8–31. The text speaks of public dissatisfaction with Israel's lack of the centralized and continued authority that other nations have because of their kings. The main motivating factor is that Israel is disunited in the face of many neighboring hostile nations. The age of the charismatic Judges was over. Samuel as popular leader is the bridge figure between the era of leadership by the Judges and leadership by kings. He is the last remaining judge of his day—also a prophet—and he seeks to find someone who can facilitate the unity and security of Israel. Samuel's choice, Saul, seems like a natural candidate for kingship: He is physically head and shoulders above his compatriots, meek in judgments, courageous in battle, and magnanimous in victory. This first phase of Saul's career as king stunningly accomplished, Samuel, who has dominated the first part of the book of 1 Samuel, now exits the scene.

However, once Saul is on his own, the unraveling of his kingdom begins. Three times he specifically ignores or rejects a royal mandate given to him by Samuel, and three times Samuel reappears in the text to reject Saul's decisions. What is interesting is that Saul does what kings of other nations around Israel do: He wins battles, gives terms of surrender, and presides at national celebrations, but what Samuel faults him for revolves around specifically religious obligations. He should have not presided at a religious sacrifice,

he should have slaughtered the enemy king Agag as a sacred vow, and he should not consult with witches: These are actions that Samuel as prophet finds such fault with that he announces the divine rejection of Saul. Now the divine choice would find another and more unlikely candidate, one who put religious devotion above the human expectations for kings. That new choice would be David, “a man after God's heart.” The rest of Saul's story is intertwined with his rival and erstwhile page David. He fights a civil war with David and chases him out of his kingdom into the land of Israel's enemies, the Philistines. The sense of inescapable Greek tragedy envelopes the last phase of his life, as popular opinion, many of his family members, and even his own sanity often desert him. At the end of his troubled life he is surrounded in battle by the Philistines and commits suicide. Yet, the narrative of his life does not end in complete darkness. The people whom he had gallantly rescued at the beginning of his reign risk their lives to retrieve his body from the victorious enemies. And David, his rival, grieves his tragic death, lifting up an elegy of praise for his fallen “hero” at the national funeral.

MARK F. WHITTERS

scribes

Scribes were key to the administrative and legislative aspects of many societies after the creation of writing and fulfilled numerous functions other than simply record keeping. Very often scribes were instrumental in creating and maintaining the legal, economic, and religious aspects of a culture. In many cultures scribes were a ruling class, and those who possessed literacy maintained a monopoly of knowledge over the largely illiterate agrarian and working-class members of society. In cultures where only a small amount of the population was literate, or even had no concept of symbolic representation, scribal culture was also closely associated with ritual and religion, and in many cases scribes were responsible for the codification of writing, religion, and law. The role of the scribe became important in castes or administrative classes within societies that helped develop and demonstrate the importance of symbolic forms and helped

develop more sophisticated methods of notation. These cases in the West led to the development of the alphabet and in the East to the codification of the Chinese language. Scribes were also extremely important in political structures, and many theorists link scribal culture to the expansion and political solidification of many civilizations.

MESOPOTAMIA

Mesopotamia was the birthplace of writing and civilization, and as a result, scribes were extremely important as key administrators who maintained administrative and economic offices and also aided in the development of literature, religion, and historical documents. Scribes in Mesopotamia were trained early, in schools known as Tablet Houses, which were associated with important temples.

Scribes were initially not as vital in the FERTILE CRESCENT, growing in importance when the Akkadians settled among Sumerians c. sixth millennium B.C.E. and became the dominant culture in 2350 B.C.E. Their scribes undertook a more systematic notation of the language, retaining the Sumerian ideograms, reading them in their own language, and creating a syllabary based on the Akkadian language.

The Akkadians used writing as something akin to a grid for comprehending and ordering the way in which the world worked. The systems of codified law are also attributed to the influence of scribal culture, and the Sumerian codes, while not the first, were the basis of legal codes for the following 1,000 years. Scribes effectively maintained a monopoly of knowledge where literacy was restricted to a relative few who were trained from birth to belong to the administrative class. Scribal culture was also key in the diffusion of written systems for record keeping and codifying religion that spread throughout the region, particularly to Egypt and other surrounding kingdoms.

EGYPT

Scribes were extremely important to Egyptian culture, and it is generally thought that writing appeared c. 3150 B.C.E. in Egypt, two centuries after it appeared in SUMER. Scribes in Egypt used papyrus and as a result of its relatively perishable nature compared to the clay tablets used by the Sumerians for their CUNEIFORM writing, much of early Egyptian work has vanished. There is evidence that Egyptian scribal culture helped develop writing systems and HIEROGLYPHICS. In doing this they created a writing system that used phonetics and signs to represent consonants, which, unlike the Sumerian system, helped avoid ambiguity.

There was even a god of writing and of scribes, Thoth, who was considered a tricky god, and the written word was endowed with power where names had hidden meaning. Hieroglyphs were considered, not representations, but living realities that aided in religious ritual and funerals. Hence, scribes were heavily involved in ritual and the organization of Egyptian culture and politics. Egyptian scribes may have been among the earliest in history, and Sumerian writing could be derived from Egyptian writing.

CHINA

Writing developed independently in China. Earliest surviving examples of Chinese writing date to the 14th century B.C.E., found on bovine scapula bones and tortoise shells used for divination in Yin, the last capital of the SHANG DYNASTY. Already advanced, the writing system consisted of ideograms, pictograms, and logograms that evolved into modern Chinese writing. Short written inscriptions were also cast into Shnag ritual bronze objects, which became long texts detailing political and military events after the establishment of the ZHOU (CHOU) DYNASTY c. 122 B.C.E. Bamboo and wood slips and silk fabrics were also probably used as early writing materials but have not survived.

The earliest surviving Chinese writings were the works of priests/diviners who asked questions of the supernatural on behalf of kings and recorded the answers and outcomes. During the Zhou dynasty the diviners became scribes and historians charged with the task of keeping accurate records. Paper was invented in China around the beginning of the Common Era. The growing size and complexity of the Chinese state and society resulted in a trend that gradually systematized and simplified Chinese script. Written Chinese was adopted as the basis of written Korean, Japanese, and Vietnamese.

JUDAISM

Known as the people of the book, Judaic culture enjoyed a much higher level of literacy than most cultures, as most of the Judaic tribes were encouraged to read in order to fulfill their religious duties. By the seventh or sixth century B.C.E. scribes became central to religious practice, codified under David when scribes served under a minister in the king's court and wrote and copied official texts, such as those inserted later into the book of David. Priestly scribes were leaders of the dispersed communities in Babylon who kept records of what had been left behind during the Diaspora. Scribes helped the king keep order and levy taxes, and as time went on the importance

of scribes in Judaic culture increased to the point where scribes became key to the political life of the Judaeans.

The scribal figure was often connected with the idea of wisdom and read and commented on the TORAH in synagogue, becoming the primary interpreters of Jewish law. They also played an essential part in the courts and were indispensable in administering and diplomacy. SOLOMON may have been a scribe king who annotated a mass of texts, commentaries, and translations. As time went on, scribes became associated with Talmudic scholarship, and some scribes wrote copious commentaries, which were only cast in definitive form in the fourth and fifth centuries C.E.

Scribal culture was extremely important in the development of ancient civilizations, and they not only developed systems of writing that allowed the passage of knowledge down through history but also helped to codify the languages of various cultures and were extremely influential in most societies in governmental, administrative, religious, and economic aspects of state.

BRIAN COGAN

Sea Peoples

At the end of the third and the beginning of the second millennia B.C.E. Egypt was beset by a series of invasions. Diverse groups whom the Egyptians associated with "the north" and the Mediterranean Sea carried out these invasions. The most distinguishable groups were the Denyen, Ekwesh, Lukka, Peleset, Shardana, Shekelesh, Teresh, and Weshesh. It is from Egyptian records

that these ethnic groups have come to be designated as Sea Peoples. All came to Egypt from the Aegean region or Cyprus, though individual origins of the separate peoples have been ascribed to regions extending from Sardinia to Syria.

The main sources for information about the Sea Peoples are inscriptions of the Egyptian kings Merneptah and Ramses III, who defeated respectively a Libyan invasion in which some of the Sea Peoples served as mercenaries (1220 B.C.E.) and a direct assault of Sea Peoples on Egypt (1186 B.C.E.). Reliefs at Medinet Habu illustrate the victory of Ramses III over all enemies including the Sea Peoples in highly symbolic representation. For the Philistine community, major sources consist of Assyrian inscriptions, biblical narratives, and archaeological excavations. Numerous minor references associated with the Sea Peoples have been proposed from throughout the Mediterranean.

In the 13th century B.C.E. the most influential civilizations in the eastern Mediterranean (the Egyptian, the HITTITES, the culture of MYCENAE) collapsed. The Sea Peoples, already existing as raiders, traders, and pirates in the region of the Aegean Sea, became major threats to the coasts of these former political powers. The Hittite and Mycenaean Empires disappeared as much due to internal conflict as to the incursion of Sea Peoples, but Egypt survived. Reconstructions of the demise of these powers all include Sea Peoples, but the extent to which these seafarers influenced the actual collapse varies from the catastrophic theory of mass invasion with military conquest, to the opportunistic theory with settlement following the rise of political vacuums.

Successful at colonizing the southern coast of Asia Minor, some Sea Peoples moved down the Levantine coast to form settlements stretching from Asia Minor to Egypt. Established cities that attempted to slow or stop this activity, such as UGARIT, might have been overrun by these invaders; however, most settlement may well have come about by infiltration from other communities. Skilled at sailing and fighting, many of the Sea Peoples turned to mercenary service. Egypt itself had made use of mercenary Shardana even as the Hittite Empire had employed the Lukka when these two empires fought each other. When the Libyans and Meshwesh allied to attack Egypt, they hired Shardana, Shekelesh, and Ekwesh for their unsuccessful invasion. Under their own command 34 years later the massed Sea Peoples attacked Egypt from the Mediterranean Sea by ship and from their communities to the northeast by land. Entire families came with the invaders intending to settle the Nile Delta in line with the Levant. Instead, the invaders

were decisively defeated by the Egyptians, resulting in large numbers of both dead and captured, which ends the story of the Sea Peoples.

In the Egyptian inscriptions and reliefs the Sea Peoples are depicted with unique features and costumes reflecting the diverse cultures now included in the blanket term *Sea People*. However, the ships associated with the invasion are all of a kind, with prows and sterns shaped into the form of a stylized bird's head. Square sails provide the propulsion, and there is a crow's nest for observation. The vessels resemble ships of the early Phoenician trading variety, save that no oars are represented. The warriors wear various styles of short kilts, neckbands, and some form of breast covering. Headdresses are of two major kinds: horned helmets and feathered, flanged "top hats." Spears, swords, and shields are the standard weapons displayed. In the Egyptian depiction the Sea Peoples are both chaotic in their attack before the orderly Egyptian archers and defeated and captured even as they fight; these depictions are a form of Egyptian propaganda.

At the conclusion of Ramses III's defeat of the Sea Peoples, the Peleset and their allies were driven from Egypt proper into the Mediterranean coastal area north-east of the Egyptian border where they were thenceforth known as Philistines. Their warrior culture settled down to a sedentary life around five central cities: Ashdod, Ashkelon, Ekron, Gath, and Gaza. After expanding their territorial control westward to the hill country, the Philistines took up agriculture, modest manufacturing, metallurgy, and trade, for which their location was ideal. Egypt to the south, the Phoenician cities to the north, and the Mediterranean to the west allowed them to become the market center for the state of Judah to their east. The cities remained autonomous and independent until the reign of the Assyrian king Tiglath-pileser III, who invaded Philistia in 734 B.C.E. and subjugated the region. The end of the Philistines is generally accepted to come with the disappearance of the region in 604 B.C.E. into NEBUCHADNEZZAR II's Neo-Babylonian Empire.

Archaeological excavations at Philistine sites confirm material and religious connections to the Aegean and to Cyprus. Pottery resembling Mycenaean ware continued to be manufactured along with the distinctive Philistine "beer mugs" even as pottery construction adapted from the indigenous population was produced. Evidence of trade or migration related to Anatolia and Syria also appears at the sites. By the time of the incorporation of the Philistine cities into the Neo-Babylonian Empire the culture had been assimilated into regional traditions.

LOWELL HANDY

Second Sophistic

The philosophical school of SOPHISM, which first flourished in fifth-century B.C.E. Athens, underwent a revival in the second century C.E., and for a brief period it attained a measure of intellectual fashionableness. Although the political center of the Western world moved from Greece to Rome, the new capital did not feel the need to enforce its status as the center of the intellectual world. Instead, many Romans were happy to accept the importation of new ideas and religious systems, from whichever part of their burgeoning empire they should arise. Within this generally liberal atmosphere, Greek and especially Athenian systems of thought held a special place.

Greek was likely to be the language of intellectual discussion among the educated urban elite, and familiarity with the works of the past was an essential part of refinement and statesmanship. A revival in interest in Greek learning was ushered in by the emperor HADRIAN in the second century C.E., and this inspired the growth of a set of professional teachers who came to be labeled Sophist and to be members of the Atticist school—that is, to be from Attica, or Athens. Unlike the original Sophists, the later teachers focused entirely on the techniques of rhetoric and ability to argue so as to win an argument. Their methods had no ethical or truth-seeking element and were, therefore, susceptible to the criticism of sophism that it was amoral and improper for a person of good faith to use.

Those whose writings have been preserved and who have been associated with this movement include the historians Dio Cassius and Herodian, Maximus, Aelius Aristides, and Polemon of Athens. Polemon managed a successful school of rhetoric at Smyrna and was highly regarded by the emperors TRAJAN, Hadrian, and Antoninus Pius. According to legend, Polemon had himself buried alive at the age of 56 to escape the misery of chronic gout. Since most extant works of this group are

concerned mostly with substantive matters rather than in the practice of sophistry as a deliberate technique, there is no specific body of work that commemorates the Second Sophistic movement.

JOHN WALSH

Seleucid Empire

The Seleucid Empire (312–63 B.C.E.) was the largest of the Hellenistic states that emerged from the conquests of ALEXANDER THE GREAT. Seleucus I (c. 358–281 B.C.E.), one of Alexander's generals, founded the Seleucid Empire in 312. Seleucus, who took the title *Nicator*, or "victor," was the most successful combatant in the bloody and protracted wars of the *DIADOCHI*. The empire he founded stretched from the Middle East and Asia Minor to BACTRIA in Central Asia. Seleucus initially claimed the Macedonian conquests in India as well but was forced to abandon them to CHANDRAGUPTA II around 305 B.C.E. Seleucus was later killed by Ptolemy Keraunos, a member of the ruling Egyptian dynasty.

The Seleucid dynasty drew from both Greco-Macedonian and Near Eastern traditions of rule. The Seleucid monarch was theoretically not identified with a particular people, but in practice, was Greek in culture. Greeks and Macedonians constituted the vast majority of the kingdom's governing elite, known as the king's friends. The Seleucids claimed a particularly strong relationship with the Greek god Apollo but also patronized the traditional religion of Babylon and presented themselves as rulers in the Mesopotamian and Persian traditions. Like other Hellenistic rulers, they claimed divinity.

The original capital of the empire was Seleucia on the Tigris, but it finally settled at Antioch in Syria. The empire's vast size made complete centralization impossible. Drawing from the Persian Achaemenid political tradition of dividing the empire into satrapies, the early Seleucids divided their empire into large administrative districts mostly assigned to members of the royal family.

Another disadvantage of the size of the Seleucid Empire was that it faced problems on several frontiers,

making it difficult for Seleucid kings to follow consistent foreign and military policies. After Seleucus the Seleucids lost much of their direct control over Iran and Bactria. Around the middle of the third century B.C.E. a new Greek kingdom arose in Bactria, while Iran fell to the Iranian Parthians. Antiochus III (r. 223–187 B.C.E.), known as Megas or "the Great," reasserted Seleucid overlordship in this area in the late third century B.C.E., but his success proved short lived. In Asia Minor the Seleucids lost territories to invading Gauls and to a secession that led to the foundation of the independent Hellenistic kingdom of Pergamum, which would become a perpetual rival.

The Egyptian PTOLEMIES challenged Seleucid leadership in the Hellenistic Middle East. Antiochus expelled the Ptolemies from Palestine and Phoenicia, a long-standing area of contention between the two dynasties, after the Battle of the Panium in 200 B.C.E. However, the most fatal rival of Seleucia was the rising power of the Mediterranean, the Roman Republic. Antiochus came into conflict with the Romans when he sought to expand into Asia Minor and Greece. After two defeats Antiochus agreed to the Peace of Apamea in 188 B.C.E., withdrawing from Europe and western Asia Minor and disbanding his navy and elephant force.

After Antiochus the Seleucid Empire was caught between the Romans in the west and the Parthians in the east. The empire also faced a major internal challenge from the population of Judaea. Antiochus IV Epiphanes (r. 175–163 B.C.E.) was an avid promoter of Hellenic culture and of his royal cult. These policies provoked a revolt of the Jews, led by the MACCABEES, who eventually managed to establish Judaea as an independent kingdom. Antiochus IV was also forced into a humiliating withdrawal from Egypt, which he had reduced to a Seleucid satellite, when the Roman Senate sent an emissary demanding that he leave. The fact that Antiochus agreed to withdraw when faced merely by a representative of the Senate, not a Roman army, was particularly humiliating.

Antiochus died attempting to restore Seleucid power in the east. His death was followed by more defeats and turmoil within the Seleucid house between the descendants of Antiochus IV and his brother and royal predecessor, Seleucus IV Philopator (r. 187–175 B.C.E.). Mithridates I of Parthia took Babylon in 142 B.C.E. and captured the Seleucid ruler Demetrius II *Nicator* (r. 145–138, 129–126 B.C.E.) in 138 B.C.E. There was a partial Seleucid recovery under Demetrius's brother Antiochus VII when he advanced far into Parthian territory, but he was killed in battle in 129 B.C.E. The wife of both Demetrius and Antiochus, Cleopatra Thea from

the Ptolemaic family, was the only Seleucid woman to rule under her own authority (r. 125–121 B.C.E.). Seleucid power dwindled to Syria while the last Seleucids fought bitterly among themselves. Tigranes of Armenia briefly conquered the late Seleucid state, and finally the Roman general POMPEY in 64 B.C.E. reduced Syria to a Roman province. The last Seleucid, Antiochus XIII Asiaticus (r. 69–64 B.C.E.) was murdered shortly thereafter.

WILLIAM E. BURNS

Seneca

(3 B.C.E.–65 C.E.) Roman philosopher and statesman

Lucius Annaeus Seneca's father, Marcus Annaeus Seneca (Seneca the Elder, c. 55 B.C.E.–39 C.E.), was an imperial procurator. He so mastered public speaking and debate that he became an authority on rhetoric. Marcus Annaeus had two other sons besides Lucius Annaeus Seneca. The eldest was Junius Annaeus Gallio, who as governor of Achaëa declined to exercise jurisdiction over PAUL (Acts 18:11–17). Marcus Annaeus's third son Annaeus Mela was an important financier and the father of Lucan (Marcus Annaeus Lucanus) the poet. Lucius Annaeus Seneca (Seneca the Younger) was born the middle son at Corduba, Iberia (modern Córdoba, Spain). He became the leading Roman intellectual of his day and a successful orator, lawyer, tragedian, Stoic philosopher, statesman, and wealthy financier.

Seneca the Younger studied the Greek poets and playwrights and law in his youth. He was also attracted to the mysticism associated with Pythagorean philosophy. Later in life he adopted STOICISM. As a young man, Seneca served in the Roman administration of Egypt under Tiberius (16–31 C.E.) where he gained experience as an administrator and financier. He also acquired a taste for natural philosophy, studying geology, marine life, and meteorology. After 31 C.E. Seneca went to Rome to train as a Roman lawyer. There he distinguished himself with brilliant legal oratory, causing the emperor Caligula to threaten his life. He was accused of having illicit relations with Julia Livilla, sister of Caligula. The reason

for the accusation is not clear but the notorious Valeria Messalina (c. 22–48 C.E.) may have been involved as an opponent of the potential wealth and power of Seneca.

Seneca went into exile on Corsica, and while there he wrote numerous works, including tragedies, poems, and essays. In 49 C.E. Seneca was appointed a praetor by the Senate and recalled to Rome by the empress Agrippina to serve as the tutor of her son, Lucius Domitius Ahenobarbus. Then aged 12, he would become emperor NERO after the poisoning death of the emperor Claudius in 54 C.E. During the first five years of the reign of Nero both Seneca and Burrus, a Roman army officer, aided the management of the public affairs of Rome. They were able to restrain Nero and Agrippina. Neither one actually held office but were able to influence public affairs to the benefit of the empire. Nero eventually listened to the more demagogic of his courtiers who encouraged his murderous impulses. They also sowed suspicion in Nero's mind about Seneca and Burrus.

In 58 C.E. Seneca was the target of political attacks by a number of people, including Publius Suillius Rufus, on an array of charges from sleeping with the emperor's mother to introducing Nero to pederasty to abuse of power. However, the most serious charge was the contrast between Seneca's philosophical teachings and his political practice. Using his position with Nero, Seneca was able to gain fame and wealth. During the early years of Nero's reign Seneca and Burrus were almost as powerful as Nero. Eventually, Marcus Suillius Nerullinus charged Seneca with hypocrisy for denouncing tyranny while tutoring a tyrant. He also charged that there was no philosophy in the world that showed how to gain the immense wealth held by Seneca or that justified Seneca's opulent spending.

In 62 C.E. Burrus died under suspicious circumstances, which broke Seneca's power. To escape Nero he retired with the emperor's permission, and in the three remaining years of his life he wrote on philosophy, including *Epistulae Morales to Lucilius the Younger*. He traveled a good deal with his second wife, Paulina, and rarely visited Rome. In 65 C.E. the conspiracy against Nero conducted by Caius Calpurnius Piso, and others, implicated Seneca. Nero ordered Seneca to commit suicide, which he did.

Seneca's death is described in the works of Tacitus, and his surviving literary works include 12 philosophic essays. His essay *Consolationes (On Consolation)* expressed his grief at the loss of sons. His essay *De Clementia*, addressed to Nero, commends mercy in a ruler. His *De vita beata* and *De Otio* discuss living as a Stoic sage. Seneca's surviving meteorological essay

was, as was his work on scientific questions in *Naturalis Quaestiones*, inspired by the Stoic philosophy of Poseidonius. Nine of Seneca's plays have survived. They are tragedies that express the Stoic belief that disaster comes when passion destroys reason. They were greatly influenced by the plays of EURIPIDES, AESCHYLUS, and SOPHOCLES. Of Seneca's letters 124 have survived. His surviving satire, *Apocolocyntosis divi Claudii* (*The Pumpkinification of the Divine Claudius*) ridicules the deification of the emperor Claudius.

ANDREW J. WASKEY

Septimus Severus

(146–211 C.E.) Roman emperor

Septimus Severus was founder of the African dynasty of Roman emperors. He came from a family of Roman citizens who had served as imperial bureaucrats in northern Africa. He found favor with the emperor MARCUS AURELIUS and served in many high provincial positions.

Under Emperor Commodus, Septimus Severus was appointed the legate of the fourth legion in 191 C.E., stationed on the Euphrates. He disdained traditional Roman ways and saw himself as a soldier and ruler of the East, becoming immersed in the religion and culture. He married a member of a priestly family of Emesa and solidified his influence over the politics of the eastern provinces. When his own soldiers killed Emperor Pertinax in 193, Severus was proclaimed emperor by his own legions of the East and by the Danube legions. Some scholars speculate that support for Severus in both the East and West make it clear that he was a part of the conspiracy to overthrow Pertinax, but there is no concrete proof.

Severus believed his destiny to rule the empire was found in careful study of the positions of the stars in the heavens. He strengthened his control over the empire by

executing the prefect of the infamous Praetorian Guard and put his trust in barbarian troops over the Roman legions under his control. Granting of land and money to troops showed his preference for the barbarians, as well as giving Roman women in marriage to barbarian officers and displaying their likeness on new coins. The Roman soldiers in the Praetorian Guard were replaced by barbarian troops from the outlying districts of the empire.

Although he had the support of many legions in the East and south of the Danube, Severus had trouble taking control of the whole empire and spent many years fighting battles against regional generals in Britain, GAUL, and Mesopotamia. Not every opponent was a rival for the title of Caesar; many simply did not want Septimus Severus to rule the empire. After defeating every opponent, Severus shook the social circles of Rome by granting the right of every common soldier to enter the equestrian order and serve in the Roman Senate. This incensed the Roman gentry, but Severus suffered no repercussions from his actions.

He began the fifth persecution of Christians and made it a crime against the state to convert to Judaism or Christianity. Saints Perpetua and Felicity, highly revered by the church, were martyred during this persecution. Severus traveled to Britain in 208, trying to restore order to the province and gain support for a vigorous military program.

While there, he restored HADRIAN'S Wall and ensured the protection of the province from the barbarian Picts to the north. He gave control over the outlying province to his sons and died amid a family feud for control of the area.

RUSSELL JAMES

Servant Songs of Isaiah

The Servant Songs refers to a group of texts found in the biblical book of Isaiah. These passages center upon someone known as the Servant of the Lord. This person or character is commissioned by the God of the Bible to carry out a mission in relation to the nation of ISRAEL.

There are at least four such blocs in the book of Isaiah that have been identified as Servant Songs: 42:1–4; 49:1–6; 50:4–9; 52:13–53:12. All these blocs are found in the latter half of Isaiah, often called “Second Isaiah.” Bible scholars beginning with Bernhard Duhm (1892) isolated these passages and suggested that they could be separated from the rest of the book without changing the literary development of the surrounding material. Together these passages appeared to tell their own story and theology. At the same time they do not necessarily form a clear-cut literary unit as though together they form a complete book. Almost all Bible scholars now accept the existence of the Servant songs. In addition to the four blocs, some scholars also think that some of the surrounding material of Isaiah has been adjusted to accommodate the songs. Thus, 42:5–9; 49:7–13; 50:10–11 respond to each of the first three songs. The last Servant Song, the longest and most poignant, might serve as a fitting conclusion to all the other songs and responses.

The first song features the “Lord” of Israel as the speaker. The Lord has chosen the Servant and given the Spirit so that he can bring “judgment” to the nations that oppose Israel. The Servant will accomplish the task without violence. The Servant delivers the second song. He says that he is chosen to restore Israel and to be a light for the nations surrounding Israel. The third song also has the Servant for the speaker. He is a teacher who encounters opposition, but God will grant success and accomplish the divine plan through the Servant. The fourth song is the longest and most eloquent and elevated of the songs. The speaker is not identified. The Servant has died, but the death has accomplished something for “the many,” a Semitic way of saying human beings. The Servant had been popularly regarded as guilty of wrongdoing, but he will be vindicated and raised up by God. Sometimes it is regarded as the climax of the Servant Songs. The lines of the fourth song are the most frequently cited passage of the Hebrew Bible in the New Testament.

If the songs can be put together into a progression of action, they tell of the Servant’s career, that is, his calling, activities, popular rejection, death, and vindication. The level of misunderstanding, opposition, and hostility is so great that often Jews and Christians refer to the person as the “Suffering Servant.” In the ancient world someone who was a servant was not always an abject slave or menial laborer. Often the servant would publicly represent the master and carry authority of the master, so the Servant might be a dignified or important person for the writer of Isaiah. At the same time the servant’s fate would reflect on the master, so the treat-

ment of the Servant in these songs suggests the relationship between Israel and Israel’s God.

The problem is determining who Isaiah considers to be the Servant. Readers often find several candidates: Israel as a nation, a collective body within Israel (“the remnant”), the community surrounding the writer of the songs (“Isaiah’s disciples”), or a specific person (MOSES, DAVID, Cyrus). Jews are traditionally sympathetic to the corporate Servant identity; while Christians normally find in Jesus the “Suffering Servant.” It is also possible that Servant may be an idealized Israel as represented in an idealized person, thus adopting a composite among the above options and appealing to traditional Jews and Christians.

Christians find in the Servant Songs a messianic image of Jesus Christ (e.g., Acts 8:32–35). JESUS (CHRIST) OF NAZARETH himself may have seen himself as the fulfillment of these passages (see Mark 8:31; 9:30–32; 10:33–34). Christians see in the Servant an explanation for Jesus’s expiatory suffering, that is, he was commissioned by God to bear the sins of the people. Thus, Christianity teaches that suffering has a positive value and that it is not simply a punishment for sin. On the other hand, the apostle PAUL also adapts the image of the Servant to his own life and mission among the Diaspora Jews and non-Jews (Acts 13:47; Gal. 1:15; Rom. 15, 21). Paul’s use shows how Christians and Jews can agree on what the Servant image represents: an insight into the way that the biblical God interacts with humanity in the realm of suffering, judgment, and salvation.

MARK F. WHITTERS

Shang dynasty

The Shang is the first truly historic Chinese dynasty (c. 1766–1122 B.C.E.). It is also called the Yin, after its last capital city, where the last 12 kings ruled c. 1395–1122 B.C.E. Traditional accounts of the Shang came under doubt until the discovery of inscribed oracle bones unearthed near a modern town called ANYANG in present-day Henan (Honan) Province in 1900. Systematic digging at Anyang beginning in 1928 revealed an

extensive city and more than 100,000 oracle bones; the writing on some of them is the oldest deciphered from which later written Chinese evolved. Numerous sites excavated since show that by the mid-third millennium B.C.E. an interrelated culture had spread over a wide area in China. However, the core of Shang civilization lay across northern China from the western edge of the Yellow River valley to the coast in Shandong (Shantung) Province, with the core region in modern Henan.

Tang (T'ang) the Successful founded the dynasty, overthrowing the last tyrant king of the XIA (HSIA) DYNASTY, named Jie (Chieh, c. 1766 B.C.E.). According to tradition, Tang established his capital at Ao or Xiao (Hsiao). The dynastic name Shang derived from the name of its sacred city, near Shangjiu (Shang-ch'iu) in eastern Henan. Ruins beneath the present city, called Zhengzhou (Chengchow), correspond to early Shang in time. Shang kings moved their capital five times, the last capital being Yin, which gave its name to the last phase of the dynasty. Although a Shang-era city wall has been uncovered at Zhengzhou, which would be consistent with the site being a capital city, the absence so far of contemporary written records or royal tombs there preclude definite identification of this and other sites as the various dynastic capitals. The fact that later Shang-era remains in Zhengzhou were of poorer quality than the earlier layer suggests the moving of the capital to other locations. It is not clear why the capital moved five times, exhaustion of tin mines near to each capital could have been a motive because the Shang was a Bronze Age culture. Bronze was power in ancient China, and tin is a key alloy in bronze.

THE SHANG CAPITAL AT ANYANG

Mature Shang civilization excavated at Anyang shows that Yin was divided into several sections totaling over 16 sq. miles. The royal palace complex had a huge tamped earth platform above a drainage system, on which there were placed regularly spaced stone or bronze bases that once supported timber pillars. The palaces and ritual buildings once had walls of wattle-and-daub construction. Smaller houses nearby presumably served for storage or to accommodate other persons. There were also bronze foundries, stone and jade workshops, pottery kilns, and living quarters for workmen. The royal cemetery consisted of 11 large graves, each for the 11 kings who ruled from Yin, excluding the last one, who died in his burning city and did not get a kingly burial; they are surrounded by more than 1,000 smaller graves. The large graves are square or oblong and had ramps that led to the burial chamber 30 feet

underground. Although all had been looted, it is apparent that they were richly furnished with objects to serve the owner in the next life. Besides objects, dogs, horses, chariots, and human sacrificial victims also accompanied the grave owner to the next world.

Archaeologists estimate that it required 7,000 working days to excavate each of the large graves. In 1976 the intact tomb of Lady Fu, a wife of the powerful king Wuding (Wu-ting) was excavated. It contained more than 1,600 precious objects of jade, bone, ivory, bronze, and other materials and sacrificial victims. Buildings once stood atop the underground graves where rituals were held for the dead, but they have long perished. Beyond the city core at Yin and other sites were the semisubterranean dwellings of farmers. There was no city wall around Anyang, but a wall of pounded earth 30 feet high, 65–100 feet wide, and 4.5 miles long protected Ao. Archaeologists estimated that it took 12 years for 10,000 workmen, each working for 330 days a year, to complete the task. This suggests that the Shang government was rich in human and material resources.

ORACLE BONES

The use of tortoiseshells and scapula bones of bovines for divination was peculiar to China. They were used during the Neolithic, Xia (Hsia) dynasty, and early Shang, but only during the Yin phase of the Shang dynasty was writing found on the oracle bones. Shang kings consulted the high god, called Shangdi (Shang-ti), and their ancestors very frequently for advice on many subjects, including the weather, crop conditions, war and peace, the rulers' health, their wives' pregnancy, and hunting.

The usual formula specified the date, the diviner's name, the king's name, and the question, all written down on the bone. Then a heated bronze rod was inserted into an indentation predrilled into the bone, causing cracks, which contained the answer, also written down, and often the actual outcome. The used oracle bones had holes drilled on top through which cords were threaded to bind them together.

Bundles of them must have been stored, thus their preservation. The oracle bone inscriptions are the oldest deciphered Chinese writing. They were already sophisticated and therefore must have gone through a long evolutionary process. They contain symbols that are pictographs, ideographs, and logographs, all characteristic of later written Chinese. The oracle bone inscriptions contain the names of all 30 rulers of the dynasty, proving the traditional accounts correct. They give data on natural phenomena such as eclipses and comets, which

help date the events. They also include the names of many officials but without details of their functions.

The oracle bone inscriptions make clear that a king ruled the Shang state, with the throne passing among men of the royal clan that varied from one brother to another and between father and son. The kings had multiple wives, some like Lady Hao, a wife of king Wuding, was very powerful, commanding troops and managing her own estates. Royal wives came from other clans than the royal one. Officials bearing different titles assisted the king, and they were probably aristocrats, but we do not know their functions. Many oracle bones discuss the king waging wars with 1,000 to 5,000 troops against neighboring “barbarians.” The leaders rode to war in chariots drawn by two or four horses, wielding bronze weapons, leading infantrymen. The main weapons were bronze dagger-axes, swords, compound bows, and arrows with bronze tips. When not warring, Shang kings and nobles hunted for sport and probably for meat; many oracles dealt with hunting and big game.

METALWARE AND CRAFTS

While bronze was used for weapons and chariot fittings, the largest use of bronze was to make ritual vessels used in sacrifices to gods and ancestors. The earliest Chinese metalware dates to approximately 2000 B.C.E., and many of the early forms have their prototype in potteryware. By late Shang the bronze smiths’ works had reached the highest form of artistry and technological progress. Vessels of complex form and decorated with intricate geometric patterns and animal masks weighing up to 1,500 pounds were made by the piece mold method. They differed from the lost wax method used by metalsmiths in the ancient West. Short inscriptions were also cast into many bronze vessels that bear the personal or clan name of the owner and that clearly designated the pieces for ritual use. More than 30 different shaped vessels of different sizes were produced for the storage, cooking, serving, and consumption of food and alcohol in ceremonies that honored gods and ancestors. Those pieces that survived were buried with the dead. Jades were used as luxury items such as ornaments and also used in rituals. Shang craftspeople also excelled in making a high fired pottery that approached stoneware, in using the sap of a lac tree to make lacquerware, and in making silk fabrics. No Shang silks have survived but there are imprints of silk fabric in bronzes that were once wrapped in them.

FARMING

Farming continued along the lines developed since the NEOLITHIC AGE, using the same stone and wooden

tools, for bronze was too precious for ordinary use. The principal grains of north China were various forms of millet, followed by wheat. Animals provided protein, hides, bones, and antlers. Dogs, pigs, cattle, water buffalo, sheep, and horses were domesticated, used for meat, as draft animals, and in ritual sacrifices. Many different kinds of fowl were raised, as were fish for food, and turtles for shells used in divination. Hunting of wild animals provided sport and food. Several kinds of fermented alcoholic beverages were drunk in rituals and feasting; they were made from millet. Archaeologists have found a site that was possibly used for manufacturing alcohol. The many bronze objects for serving and drinking alcohol testify to the frequency of its use. The founding fathers of the successor ZHOU (CHOU) DYNASTY accused the last Shang king of many crimes and vices, among them were excessive drinking and warned their people against drunkenness.

CONCLUSION

In conclusion, the Shang dynasty was directly descended from the Neolithic cultures of northern China and was centered along present-day Henan Province. The unity of conception of Shang art and the unique and independently derived writing system define the Shang people and civilization as distinctive. In its fully mature phase, called the Yin, it headed many states that bore variants of the same culture and were less powerful and sophisticated than Yin. Shang was a complex and highly organized society, headed by a king, who was supported by his officials, artisans, and farmers. It is uncertain who the sacrificial victims were, whether they were enslaved prisoners of war or retainers who accompanied their superiors in death. The agricultural economy did not seem sophisticated enough to require the labor of slaves.

JIU-HWA LO UPSHUR

Shintoism

Believed to be an indigenous religion of Japan, Shintoism (or Shinto) involved the worshipping of *kami* and

prescribed shrine rituals as a way of showing respect and devotion. The term was not in use until the 19th century. Shinto is the religious structure that provides definition and a framework in which the practitioner can navigate the worship of specific *kami*. Shintoism is also believed to encompass the indigenous animistic beliefs of the Japanese and was an attempt to formalize different types of beliefs into a cohesive structure. The word *kami* is the collective term used to describe the representation of what can be referred to as beings (or deities) found within such things as mountains and rivers. Deceased persons are sometimes able to become *kami*; however, this is a rare occurrence. The written characters that make the word *Shinto* consist of two *kanji*, the first being *shin* (meaning “god” but also translated as “*kami*”) and the second being *tao* (meaning “path”). The literal translation means “way of the gods.” It is believed that the Yamato imperial court systematically deployed *kami* worship as a religious system during the third century C.E.

Shinto is widely recognized as an essentially Japanese religious system, having come into existence during the animistic Jomon Period (12,000 to 400 B.C.E.) and practiced by rural rice-cultivating peoples from the Yayoi Period (400 B.C.E. to 300 C.E.). Before the Meiji Restoration in 1868, which saw Shinto becoming the sanctioned religion, there were three distinct forms of Shinto, or more appropriately, *kami* worship: These were Rural, Shrine, and Imperial Shinto. Before the intervention of the imperial state *kami* worship was, at best, disorganized and highly individualistic. From the fifth century C.E. Shinto practices amalgamated with Mahayana Buddhist and Confucian theology. Shinto’s amalgamation with Buddhism and the ritualistic nature of Buddhist practices contributed to its remarkable integration into all levels of society, from the imperial family to the rural population. It is believed that the naming of the religion occurred as a way of distinguishing it from Buddhism and Confucianism.

Rural *kami* worship was often referred to as folk Shinto. In order to ensure prosperous crops and a harmonious village life *kami* would be worshipped through rituals designed to appeal to or appease the deities. Each region in Japan was thought to have different rituals concerning the *kami* in their area, and each ritual was defined by the type of *kami* worshipped (such as rice cultivation and fish farming), hence different regions in Japan would have had entirely different and diverse systems of worship. As agricultural developments increased and society underwent social and political change, ritual was increasingly employed to ensure a balance between the deities (*kami*) and the people. As

Shinto is a Japanese religious system that began before the historic era in Japan.

society modernized so did the need for a codified structure of religion and religious practices.

Shrine Shinto and imperial Shinto are similar in that they were dependent upon *kami* worship as ritual. During the beginnings of the imperial state an official network of shrines was established, and through imperial decrees and ritualized (and state-controlled) prayers (*norito*) the *kami* system was formalized. Chinese influences and concepts of deities during the Yamato court, such as *ama-tsu-kami* (heavenly deities), also contributed to the continual construction of Shintoism. The majority of information obtained from primary sources concerning Shinto comes from those written during the Yamato court era. The construction of *ritsuryo* law (Japanese imperial law) focused particularly on shrine rituals that meant that many indigenous rituals or practices had not been written down. Imperial Shinto practices are more likely to have survived in historical record, as imperial households commissioned such records.

One such practice is the continual use of clerical titles denoting Shinto priests and practitioners in relation to their duties at various shrines. The highest-ranking priest or priestess in Japan is referred to as Saishu and is affiliated with the Grand Shrine of Ise. A member of the imperial family most often holds this position. The lowest-ranking Shinto priest is the Toya, a part-time layperson chosen from village members to enter the shrine for a specific amount of time. Women were originally allowed to hold ceremonial positions within Shinto; however, as the religion underwent a

metamorphosis from a rural-based practice to an imperial one they were increasingly relegated to positions that entailed less power, as assistants to the male members of the priesthood.

The oldest known texts in which Shinto practices appear is the 712 C.E. *Kojiki* (Record of ancient matters) and the 720 C.E. *Nihongi* (Chronicles of Japan). Both texts make mention of the belief that two *kami* (Izanami and Izanagi) created Japan. Izanami gives birth to a *kami* of fire but dies in the process and resides in a place called Yomi no Kuni (Land of Darkness). Izanagi is shocked to witness Izanami in such a place and returns to the living, stopping on the way to wash himself of his visit to Yomi no Kuni. The stories indicate an early belief in death as a pollution of the living and are thought to have guided the creation and formulation of other Shinto practices. The chronicles also legitimized the rule of Emperor Mimaki-iri-hiko by ascribing him the name *hatsu-kuni-shirasu sumera-mikoto* (First Emperor to Rule the Realm). The emperor initiated a state-sponsored adoption of *kami* worship that included all members of the royal family and the elite ruling members of society. Before this, *kami* worship lay in the hands of the local rulers and was based more upon shamanistic principles than ritualized worship.

Kami were, and still are, found in prominent and often strategic locations throughout Japan. The original underlying foundation of Shinto is the worship of *kami* to ensure prosperity, health, and an abundance of food and supplies. The Yamato court focused on the Mount Miwa *kami* called Omononushi, which appeared in the form of a snake and was the subject of agricultural ritual. The area was fertile and consistently provided sustenance for the population, thus the *kami* was considered powerful. Strategic sites such as the opening of a sea route also had important *kami* associated with them, such as Sumiyoshi, the *kami* of Naniwazu (Osaka). However, while *kami* tied to the environment were viewed as important, the Yamato court also worshipped *kami* spirits found in ritual objects and objects such as ceremonial weapons. This type of worship became centralized in court life as it pointed toward the power of the court and enabled the transference of power through an object (for example, *kami* spirits embodied within a ceremonial sword) that was readily visible.

Shinto became a structured religious system by the systematic integration of *kami* worship into early imperial Japanese law and society. It is an indigenous religion that has also absorbed Buddhist and some Confucian rituals and philosophies. Shintoism is notoriously difficult to define, especially in light of the fact that the rituals associated with the religion were often fluid in

their approach and highly interchangeable depending on the circumstances of offering.

SAMAYA L. SUKHA

Silk Road

A German explorer of western China and Central Asia coined the name *Silk Road* at the end of the 19th century. It describes a route of international commerce that linked China and Rome, exchanging many luxuries by camel caravans, most important of them China's coveted silks. Seres, which means the "land of silk," probably referring to China, was first mentioned in Greek accounts in the sixth century B.C.E.; some Chinese silk fabrics must have been traded to western lands in early times. During the early HAN DYNASTY (202 B.C.E.–220 C.E.) China appeased the powerful nomads called the XIONGNU (HSIUNG-NU) by regularly giving them large quantities of silk, silver, and food. The Xiongnu traded some of the silk with other peoples. Seeking to end the Xiongnu's threat to China and their stranglehold of Chinese exports, Emperor Wu launched huge military expeditions against them beginning in 134 B.C.E., ending in the surrender of some Xiongnu tribes and the flight of others.

The overland route covered was more than 4,000 miles. No caravan traveled the entire route; rather it was a series of journeys in a network of trading centers where buyers and sellers converged. The trans-Asian route began in China's capitals LUOYANG (LOYANG) or CHANG'AN (Ch'ang-an); proceeded westward to China's frontier city DUNHUANG (TUN-HUANG), where the route split into two, skirting the Taklamakan Desert; then converged at Kashgar (at China's present western

frontier) on to Tashkent and Bukhara in Central Asia, where one branch split southeastward across Afghanistan to the Indian subcontinent and another westward through Merv in Iran (ancient Parthia) to Baghdad in Iraq, Antioch or Tyre on the eastern Mediterranean coast, thence by sea to Rome. For much of the journey merchants were protected by the power of China and Rome under the Pax Sinica and PAX ROMANA. States and cities along the way benefited from charging of taxes and dues. When they became too burdensome, as happened with the Iranians, the trading countries sought to open new routes. Thus, in the first century C.E. a sea route was opened that linked the southern Chinese port Guangzhou (Canton), across the Strait of Malacca and Bay of Bengal to India, then through the Persian Gulf or Red Sea to the Roman East to the Mediterranean. After the fall of the Han dynasty and the Western Roman Empire, the Tang (T'ang) dynasty in China and the Byzantine Empire continued the trading relations.

In addition to silk, other textiles, metals, gems, glass, horses, and spices were important items of trade. The road was also important for introducing new crops and food items across cultures and for exchange of technological innovations, for example, ground glass lenses from India and paper from China. Finally, it was the route of missionaries and pilgrims that brought Buddhism from India to Central Asia and China and, less important, Nestorian Christianity, Judaism, and Manichaeism from the Roman East and Iran to East Asia. Marco Polo from Venice traveled via the Silk Road to China in the late 13th century, bringing tales of the fabled East to Europe. The Silk Road was finally eclipsed when Europeans discovered a sea route to Asia via Africa after 1498.

JIU-HWA LO UPSHUR

Sima Qian (Ssu-ma Ch'ien)

(145–87 B.C.E.) *Chinese historian*

The prestige of history as a field worthy of study and historical writing as an honored pursuit were strongly rooted in Chinese intellectual life from earliest antiquity. The

HAN DYNASTY had the distinction of producing the earliest and most important major historical work. It is titled the *Shiji* (*Shih-chi*), or *Records of the Historian*. It was the work of two men, Sima Dan (Ssu-ma T'an), who died in 110 B.C.E., and his more famous son, Sima Qian (145–87 B.C.E.). The monumental work totaled 130 chapters and more than half a million words. The father-and-son team successively held the title Lord Grand Astrologer in the Han government. The title suggests that in antiquity the role of historian was closely associated with astronomical affairs and divination. With their deep knowledge historians were also accepted from antiquity as mentors and teachers of rulers. Such ideals were endorsed and encouraged by CONFUCIUS and Confucians who held a deep sense of history and honored memories of the past. Confucians believed that to understand humanity, one had to study history. Two of the five CONFUCIAN CLASSICS, the *Book of History* (*Shujing*) and the *Annals of Spring and Autumn* (*Qungiu*), are works of history.

Sima Dan began a project to write a complete history of the world, as the Chinese knew it, from the beginning down to his own time. Although the feudal states during the preimperial period had kept their historical records, the unification of China by the QIN (CH'IN) DYNASTY and the following Han dynasty required a national history. Sima Dan's position gave him access to government archives, but he died long before he could complete the task. According to Sima Qian, his father: "Grasped my hand [when on his death bed] and said weeping: 'Our ancestors were Grand Historians for the house of Chou . . . Will this tradition end with me? If you in turn become Grand Historian, you must continue the work of our ancestors . . . Now filial piety begins with the serving of your parents; next you must serve your sovereign; and finally you must make something of yourself, that your name may go down through the ages to the glory of your father and mother . . . Now the House of Han has arisen and all the world is united under one rule. I have been Grand Historian, and yet I have failed to make a record of all the enlightened rulers and wise lords, the faithful ministers and gentlemen who were ready to die for duty. I am fearful that the historical materials will be neglected and lost. You must remember and think of this!'"

Sima Qian received an excellent education. He traveled widely throughout China and knew of local traditions and men who had participated in the great events of the day. He carried on his father's legacy, completing his monumental work, especially considering the tragic circumstances in his later life. He had taken the unpopular stand of defending a general who had surrendered to the nomads called XIONGNU (HSIUNG-NU) for which he was

sentenced to death in absentia. This infuriated Emperor Wu (HAN WUDI), who condemned him to be castrated. Although a fine would have been accepted as substitution, Sima Qian did not have the required sum and refused to accept help from his friends. Thus, he suffered the humiliating punishment but lived to complete his work.

The *Shiji* is a multifaceted masterpiece of organization. It is divided into five sections as follows:

1. Basic Annals (12 chapters): the account of principal events from the legendary YELLOW EMPEROR down to the reign of Emperor Wu.
2. Chronological Tables (10 chapters): tables of dates for important events, holders of government positions from the establishment of the Han to that date, and genealogical information of ruling families down to his time.
3. Treatises or Monographs (eight chapters): essays devoted to history and important subjects, for example, music, economics, the calendar, astronomy, rites, and the Yellow River and canals.
4. Hereditary Houses (30 chapters): detailed accounts and collective biographies of earlier feudal families.
5. Biographies (70 chapters): lives of famous or interesting people, including good and evil officials, historians, philosophers, politicians, rogues, rebels, assassins, imperial favorites, merchants, and foreign lands and peoples, including aboriginal tribes, some lumped together as groups, others receiving individual chapters. This section ended with a biography of his father, Sima Dan, an outline of his own career, and his motives and methods in writing the work

Sima Qian's format became the standard and was copied by authors of subsequent dynastic histories that chronicled imperial China. They are unsurpassed in the world for their detail and order. This work is also notable for its elegance of style, emulated but never equaled by later historians. In addition, the work is a model of objectivity, with quotations from firsthand sources. In the first century C.E., another family of great historians, surnamed Ban (Pan), would write another great work of historiography called the *Hanshu* (*Han Shu*, or *Book of Han*). Begun by BAN BIAO (PAN PIAO), 32–92 C.E., it was completed by his son Ban Gu (Pan Ku) and daughter Ban Zhao (Pan Ch'ao). These two monumental works mark the Han dynasty as the era of great historians who set the standard for later generations.

Simeon the Stylite

(392–459 C.E.) *religious leader*

St. Simeon Stylites was a famous Byzantine ascetic. Many devout Christians in Byzantine society were convinced that the way to higher religious experience and demonstration of faith came through the mortification of the flesh or by depriving themselves of all earthly pleasures. These ascetics often entered monasteries or became cavedwellers, devoting their lives to fasting and praying in their search for god through privation.

As a means of demonstrating his religious devotion Simeon began sitting on top of a 10-foot pillar in a remote area outside the city of Aleppo in northern Syria. Over the next 30-plus years he increased the pillar's height to almost 50 feet. He added to his suffering by wearing an iron collar; he was tied to the pillar, and food was brought up by a basket on a rope. Simeon preached to the crowds who, as his fame spread, made PILGRIMAGES to see and hear the famous ascetic. Like most Byzantine ascetics, Simeon was a confirmed misogynist, who yelled and threw things at women pilgrims.

His fame created something of a fad for pillar sitting in the GREEK CHURCH in the Middle East: More than 200 other people took up Simeon's lifestyle over the next 1,500 years. Pillar mounting became a common tourist attraction throughout the whole region. Whenever many pilgrims gathered, inns had to be built, religious goods were manufactured, and books were written and sold. Mystics like Simeon and their devotees from as far as the corners of Europe stimulated spiritual—and financial—revival. Simeon was ultimately canonized.

A mere 50 years after Simeon's death, the Byzantine emperor Zeno had a large octagonal church and monastery complex constructed around the pillar. The sanctuary was the largest in the Christian world, surpassed only by the HAGIA SOPHIA in CONSTANTINOPLE more than two generations later. Every attempt of Simeon to escape this world's grasp by climbing higher on his pillar had failed: His death had brought only more of the same attention and following. The "stylite" movement of Simeon was the last big revival of

Byzantine Christianity in the Middle East before the advance of ISLAM.

JANICE J. TERRY

Sinai, Mount

Judaism and Christianity regard Mount Sinai (also called Mount Horeb) as the place where their common spiritual ancestors entered into a unique and exclusive relationship with the supreme deity. The name of the ancestral group was “the children of Israel”; the name of the deity was given as *yhwh*, not pronounced by religious Jews and often transliterated as *Yahweh* or *Jehovah* in versions of the Jewish Bible. (Traditionally, the term used for the deity’s name is *the Lord*.) The relationship between the two parties, the Lord and ISRAEL, was formalized into an abiding covenant with 10 main planks, called the Ten Commandments.

The Jewish Bible tells the story of MOSES first encountering the Lord on Mt. Sinai in the form of a burning bush. Years later Moses returned with a throng of refugees who had escaped from Egypt. They stayed for a year or so, during which time the Lord appeared on the mount in an awesome way, revealed the terms of the covenant, and inscribed the Ten Commandments on stone tablets. The ARK OF THE COVENANT was then carefully built as a portable shrine to transport the stone tablets. Sinai also served as the place where Israel raised up institutional community leaders, both priests and judges.

From these various literary contexts, especially in the TORAH, scholars have been able to sketch out how Mt. Sinai functioned for early Israel. Sinai served as a place that symbolized the people’s remarkable solidarity and focused on their religious obligations. Sinai also symbolizes the place where the Lord lived or came from and thus perhaps was a destination for PILGRIMAGE in the early days of Israel.

However, as Israel became more ensconced in Canaan and in political stability, pilgrimage to Mt. Sinai became rare. “Mt. Zion” (Jerusalem) replaced Mt. Sinai as the center of cultic attention.

Where is Mount Sinai? Today Sinai refers to the whole peninsula or triangle of desert land between Israel and Egypt, surrounded by the waters of the Suez Canal, the Gulf of Aqaba, and the Mediterranean Sea. In the south of this region is Jebel Musa, “the mountain of Moses” (7,497 feet), the place popularly associated with Mt. Sinai. In the shadow of this mountain is the ancient monastery of St. Catherine, which JUSTINIAN I built because he considered that this was the location of the burning bush. Many ancient pilgrims, such as EGERIA, testify to Jebel Musa as the site of Mt. Sinai.

However, alternative sites have been proposed, with varying degrees of persuasiveness. Among them is Har Karkom—also in the Sinai region—and various hills in Saudi Arabia and Jordan. Har Karkom comes closest to the geographical location described in the Jewish Bible, but archaeological excavations there show that it was venerated as a religious center only in the third millennium B.C.E., long before Moses is thought to have lived. The heights of Saudi Arabia and Jordan have some indirect support from early Jewish scriptures and inconclusive references in the writings of PHILO, PAUL, ORIGEN, EUSEBIUS, and JEROME, as well as archaeological remains that date to the time of Moses.

MARK F. WHITTERS

Six Schools of classical Hindu philosophy

The Six Schools are part of the Sutra Period in the development of Hinduism. Beginning in the 200s C.E. several schools wrote systematic treatises. Their speculations developed into the basic philosophical systems that were classics in modern times. Their speculations saw philosophy as something to be lived rather than simply as a vehicle for understanding or for social reform. The historical development of the schools is difficult to construct because Indian intellectuals were not particularly concerned with chronology, consequently records have been lost or were never kept.

Originally most of the schools of HINDU PHILOSOPHY were nontheistic, or naturalistic, meaning they did not use stories or beliefs about the gods, goddesses,

theistic tendencies into a system. He taught that the soul (atman) is an aspect of the impersonal Absolute (Brahman) from which everything in the cosmos has come. The result is that the world is an illusion (*maya*) that tricks people into believing that the world is real. He taught that by means of knowledge obtained by identification with the Absolute, the soul might find release.

Shankara's argument is nondualistic because he claims that ultimate reality (Brahman) and temporal reality are of the same essence. He opined that *moksha* (liberation) arises from the knowledge that Brahman and atman are one. Shankara's system is called Advaita (nondualism) Vedanta. Its implications for Hinduism were great. The inferences that arise from his nondualism are that the world is an illusion (*maya*). Furthermore, the practice of bhakti is devotion to an illusion. For those who achieve the liberation of understanding from the Advaita system the ultimate implication is that there is only one Brahman and all else including dharma, gods, rituals, scripture, and devotional practices are illusions.

Later Vedanta philosophers rejected his radical nondualism. Ramanuja (c. 1017–1137 C.E.) was a member of the Vedanta tradition who wrote commentaries that moved devotion to a mode or avatar of Brahman back to the center of spiritual belief and practice. His system is called Vaishnavites (qualified nondualism). This system allowed for worship of Vishnu. In the 1200s C.E. the Vaishnavite theologian Madhva taught dualism in the Davait (dualist) Vedanta school. A little earlier Ramanuja (1100s C.E.) took a middle qualified nondualistic position between Madhva and Shankara. This meant that there was a real difference between the Brahman and the individual self that worshipped. This theology aided the development of bhakti movements in south India. It allowed for a tension between identity with the divine power (*abheda*) and individuality (*bheda*) to create *bhedaabheda*.

The Samkhya ("knowledge" or "wisdom") school taught "evolutionary dualism." It is probably the oldest of the Hindu philosophical systems. It is believed by some to have been founded by Kapila after 100 B.C.E. References in the Svetasvatara Upanishad and the Bhagavad Gita are considered to be references to the philosophy in its preliterate form. One of its important ideas was *prakrti* (matter).

Another important idea was *purusha* (consciousness). Both *prakrti* and *purusha* are words in the *MAHABHARATA*, suggesting that these ideas are at least as old as the *Mahabharata*. The opposition of *prakrti* and *purusha* was basic. Individual souls were infinite and discrete, so

salvation occurred when the soul recovered its original purity, completely purged from matter.

The Samkhya school taught that *prakrti* is composed of three *gunas* ("strands" or "ropes"). The *sattva* ("reality" or "illumination") rope is the psychological rope that produces happiness. The *raja* ("foulness" or "corrupt activity") rope leads to pain. The *tama* ("darkness" or "unilluminated") rope leads to darkness of mind or ignorance. The Yoga (disciplined meditation) school of philosophy is usually paired with the Samkhya school. It developed and practiced the disciplines necessary to achieve liberation from karma in accordance with Samkhya philosophy. The yogi (practitioner of yoga) applying the Samkhya metaphysics used ascetic meditation disciplines and a strict moral code to purge himself or herself of *prakrti*. Eventually, the Samkhya, Yoga, and Vedanta schools adapted their philosophy so that it served as a base for their theistic system.

ANDREW J. WASKEY

Socrates

(c. 470–399 B.C.E.) *Greek philosopher*

Socrates is one of the three greatest philosophers of Greek classical thought and, together with ARISTOTLE and Plato, helped to provide the foundations of Western thought. Socrates was the first of this triumvirate, although he did not produce any written records of his beliefs. A number of issues concerning his beliefs remain controversial, and there is still doubt about the reasons for his death and whether he could or should have sought to escape his fate.

Socrates was born in Athens a decade after the Battle of Salamis signaled the end of the Persian attempts to conquer Greece. Consequently, he was born into a society that was coming to terms with its physical independence and matching that with intellectual independence, although that had been expressed by what are now called the pre-Socratics in terms mostly of vague metaphysics and religious speculation. The main event during his lifetime was the PELOPONNESIAN WAR fought between Athens and Sparta, which was also seen as a struggle between personal independence and the militarization of society. The ultimate defeat of militarism did not occur until the long and perilously difficult years of warfare had passed, with the coarsening of public life and morals that accompanied the war.

Socrates was at the forefront of public life in Athens. Xenophon describes him as being part of the circle of PERICLES and the other prominent leaders of Athenian society. It is also possible that he worked for a period with Archelaus, a pupil of Anaxagoras, who is reputed to be the first Athenian philosopher. He also may have been familiar with the subjects of geometry and astronomy. Notwithstanding these advantages in society, it is believed that the later part of his life was lived in poverty, as he is so depicted in a play by ARISTOPHANES. Socrates spent most of his working life teaching and practicing philosophy, and he has been depicted as a man so captured by the world of the mind that he could be found unmoving like a statue, completely rapt in thought.

Socrates chose to self-administer the fatal hemlock that killed him and ensured that all his domestic duties were completed.

He married Xanthippe comparatively late in his life and had three children with her, who survived him when he was arrested by the state on charges of corrupting the youth of Athens and not worshipping the gods of the city. He was brought to trial and condemned to death. Socrates chose to swallow the hemlock that killed him even though it is likely that he could have escaped from confinement had he so desired. However, Socrates believed it was his duty to continue to serve the state and so acquiesced in the process.

SOCRATIC BELIEFS

It is from Aristotle and, especially, Plato that understanding of Socrates' beliefs may be found. Aristotle's main commentary is contained in *Metaphysics*, while Plato created a number of dialogues in which Socrates was supposed to have been a participant, notably in *Crito* and *Phaedo*, while his *Apology of Socrates* claims to be a set of speeches the philosopher made at his trial in making a case for his vindication. Both Aristotle and Plato report that one of his main philosophical methods is the use of syllogism in the effort to ascertain what a thing is. Socrates was concerned with the application of reason in the search for the true nature of humanity and of society, which was quite a different body of knowledge from that which occupied PRE-SOCRATIC PHILOSOPHY.

The syllogism is a technique that requires the pupil to question personal beliefs through answering the questions of the teacher. The pupil must first state a position in respect of some ethical concern, which is one that cannot be settled by an immediate objective test and is subjective. Socrates then poses supplementary questions that the pupil is required to answer by either an affirmative or a negative response. Socrates guides the dialogue until the pupil is obliged to come to the opposite of his or her original statement. Socrates uses this technique both as a philosophical tool, with which he develops knowledge by adding premises to those already existing and thereby developing the argument, while also claiming that he had no real knowledge of any sort, which could be demonstrated by the same method. This technique can be used by the skilled questioner to demonstrate the opposite of any moral position and comes close to the accusation made against the early Sophists that they would use debating technique merely to advance their own interests rather than in the pursuit of truth.

Socrates tried to bypass this accusation by claiming that he never taught anybody anything and that his technique merely pursued the answers to genuine questions, and that it was beyond his control (or even inter-

est) what those answers ultimately turned out to be. Socrates left himself open to accusations of impropriety by this method, and he was condemned by a number of people who supported the concept of immutable truths or moral guidelines for a variety of reasons. But this form of inductive reasoning is at the heart of the beginning of the scientific approach, which was subsequently used by Aristotle to start the classification of existing knowledge. The word Socrates used for the opposing premise used in constructing a syllogism was *irony*, and this concept has survived to the modern day as meaning an action that contradicts the words used to describe it.

Despite the complaints made about Socrates, he believed he was a staunch defender of the concept of absolute morality. He considered this the center of the soul's quest for truth and virtue, a quest on which the great majority of people had scarcely embarked. Only through a rigorous application of reason could there be any kind of understanding of true morality, which is that which also provides the greatest level of pleasure to the soul, the soul being identical with the individual. He rejected the existing religious concept that held the soul separate from the individual. Consequently, what is good for the soul is also good for the body. This leads to a connection with hedonism, which became more fully expressed through the work of Epicurus and his followers.

However, Socrates was more concerned to show that the pleasure a person derives from life and to some extent the value of a person's life depends on the soul's ability to understand true goodness. Only true goodness brings happiness, according to Socrates, because any activity that is not inspired by the quest for goodness will bring unintended unhappiness or misfortune to the individual, the surrounding people, or society as a whole. For this reason Socrates opposed early innovations with the concept of democracy since the majority of people were not to be trusted to be motivated by true goodness but, instead, false and probably unexamined desires. This should not really be construed as elitism since Socrates believed that the elite of society was no more likely to be properly educated in morality than anyone else. However, he would have maintained that he was the only person in Athens suited for rule, and that the optimum arrangement would have seen him installed as a tyrant like PEISISTRATUS.

THE LEGACY OF SOCRATES

As one of the seminal thinkers of Western philosophy, Socrates's legacy has been enormous. Perhaps his most influential legacy was one of the earliest—the distinction

between idea or concept and reality that was to become such an important part of Plato's thought. Socrates was also influential in the development of the educational system. He opposed the utilitarianism of the early Sophists and their tuition that was aimed at educating people and empowering them into achieving a better type of life. Instead, he believed that since virtue was the true goal of humanity but could not be taught, the proper type of education should center on the rigorous and personal search for reality. This led to a debate as to the purpose of education in society that has persisted until the present day. However, the Socratic idea that it is possible to lead the mind to profound truths without previous knowledge of the background to those truths is no longer widely supported in academic institutions. Instead the Western tradition features the mastery of content as well as the ability to guide the mind to the truths behind or beyond that content.

Socrates has also been considered a founding father of science and of agnosticism, although these attributions depend on contested ideas of exactly what he originally said and believed. It is perhaps in his trial and death that Socrates remains most central to the Western imagination. Some have conflated the charges of corrupting the youth of Athens with homosexual activities with his followers, which would have been a common enough activity at the time. He has been viewed as both foolish pederast and heroic supporter of the truth in an age of religious persecution and the suppression of freedom of speech. Existing Athenian popular sources referring to Socrates are mostly those found in satirical plays in which he is lumped together with Sophists as a kind of disreputable wordsmith with questionable hygiene habits. This representation clashes noticeably with the striking and compelling personality of Plato's descriptions.

His legendary status as defender of personal liberty has been buttressed by the notion that he would have been able to escape from confinement in Athens had he so desired. That he chose to stay and administer to himself the fatal poison renders him something of a martyr. According to Plato's account, at the moment of his death, Socrates was concerned with ensuring that all his remaining domestic duties and chores were complete.

JOHN WALSH

Soga clan

The Soga became the most powerful ruling clan in the early Japanese Yamato state between the seventh and eighth centuries C.E. The origins of the Soga clan are unclear, but they claimed to be descended from the Katsuragi clan leader who survived the purge of emperor Yûryaku in the fifth century C.E. Some scholars believe that the Soga were an immigrant family from the Korean peninsula. They moved to the Soga region of the Yamato state in central Japan and formed alliances with immigrants from the Korean kingdoms, providing scribal and managerial technical skills. The Soga clan's rise to power began with Soga no Iname, the head of the clan and the first Soga to hold the position of grand minister. He was victorious in the policy debates of 540 C.E. and married two of his daughters to Emperor Kimmei. However, neither of Iname's grandsons became heir to the throne.

The next Soga clan head, Soga no Umako, also grand minister, succeeded in marrying one of his daughters to Kimmei's son, King Bidatsu, and the couple produced a son who was one of three candidates for the throne. The Soga candidate was eventually enthroned as emperor Yômei after fierce military battles between the Soga clan and their rivals, the Mononobe, who also supplied a male heir to the throne through a Mononobe woman. Yômei took another daughter of Soga no Iname to be his queen, and the two produced the famous prince Shôtoku Taishi. The victory was short lived however when Yômei fell ill, and fighting between the Soga and Mononobe resurfaced. Again the Soga were victorious, and another male offspring of a Soga woman became the sovereign King Sushun. Once the main line of the Mononobe was massacred in 587 the Soga dominated court affairs.

Despite Sushun's connection to the Soga, rumors spread that Sushun would betray his uncle Umako, so Umako had him assassinated and Sushun's consort, SUIKO, became empress. Suiko ruled alongside her son and regent, Shôtoku, during a time when the Soga clan heads Emishi and his son Iruka attempted to assert Soga dominance by levying taxes and trying to expand their

lands. Suiko, despite being a part of the Soga, refused requests to expand Soga lands. Iruka even killed Prince Shôtoku's son. Histories of the time criticize the Soga for trying to become monarchs. The most tyrannical of the Soga patriarchs, Iruka, was assassinated in 645 in a palace coup that effectively ended the Soga rule.

The significance of the Soga dynasty was their importation of culture, government, and religion from China and Korea and their influence in domestic politics through marriage arrangements and intrafamilial assassination. The Soga supported Buddhism over other forms of court-related native religions, creating several large Buddhist temples, statues, and bells that attested to their power in the physical and spiritual realms. This support for Buddhism further antagonized other clans, who often held key religious-political positions.

MICHAEL WERT

Sogdians

Sogdiana was the meeting point of Asia and Central Asia before 100 B.C.E. The Sogdiana area encompassed modern-day Uzbekistan and Tajikistan and was also called Transoxiana. The use of the word *Sogdiana* was an attempt to distinguish surrounding BACTRIA from Transoxiana, and the provincial Persian terminology has persisted in modern historical literature. *Sogdiana* was a collective term to describe the various principalities within its area. Positioned alongside the SILK ROAD, it is where Greco-Roman, Indian, and Persian culture collided. The major cities of Sogdiana—Samarqand (Samarqand), Bukhârâ, and Pendzhikent (Penjikent, Panjikand)—enjoyed the fruits of trade that came with their positioning along the Silk Road and played an important part in establishing and maintaining trade relationships between Asia and Central Asia.

Merchants and trade caravans traversed the Silk Road during the early first century B.C.E. Contrary to popular belief, the Silk Road was actually a network of roads that crossed from China into Europe. It was at least 2,000 years old by the time the Chinese had set up

satellite towns along specific routes to facilitate trade and commerce. Some cities were the creation of such trade and were in existence from the Bronze Age.

Inscriptions dating to the reign of King DARIUS I (522–486 B.C.E.) refer to the Sogdian area as Sugudu or Sughuda (in Persian), and the whole region was under the patronage of the Achaemenids for some time. Each province functioned much like a separate state, with its own political, economic, and even social systems. Greek and Latin manuscripts speak of a “Land of the Thousand Cities,” roughly located in the area surrounding Bactria, and in 329 B.C.E. ALEXANDER THE GREAT overthrew the area, placing it under the control of his extended empire. Later, Transoxiana experienced various political changes due to a wave of strategic invasions led by nomadic tribes. The KUSHAN EMPIRE (an offshoot of a Chinese nomadic tribe called the YUEZHI [YUEH-CHIH]) established a state that encompassed the Transoxiana area, however Sassanians overthrew them in 300 C.E. The SASSANID EMPIRE is believed to have been partly responsible for the reformation of Sogdiana (politically, economically, and socially) and hence contributed to its rise among the trading cities along the Silk Road. Sogdian cities endured various foreign rulers such as the Samanids, who had their capitals at Samarkand and Bukhârâ, and the Mongols from 1219 to 1369 C.E. under Genghis (Chinggis) Khan and Tamurlane (Timur).

The area was a melting pot of religion and culture. Major religions included Buddhism, Manichaeism, ZOROASTRIANISM, DAOISM (TAOISM), and Nestorian Christianity, and all were tolerated by the Sogdians. Different ethnic and religious groups were free to worship any god until Islam became the dominant religion. From around the seventh century C.E. Islam strongly permeated the Sogdian area and as a consequence the area is renowned for its Islamic architecture and for the urbanization of the surrounding areas for irrigation, housing, and farming. The inhabitants were skilled linguists as they often acted as translators to the Chinese with whom they traded and delivered Buddhist scrolls. The spoken language of Sogdiana was primarily an Iranian dialect (Sogdian); however, due to the mixture of nationalities other languages as diverse as Tajik (Persian as spoken by Tajik ethnic groups of Uzbekistan and Tajikistan), Mongolian, Greek, and Chinese were widely used. Indo-European languages spread quite quickly as the popularity of the trade route grew, and the numbers in the trading cities increased substantially. Written language was highly evolved. Sogdian script was derived from Aramaean script and was used to communicate business deals (among other things) between the trading cities along the Silk Road.

The Sogdian cities first participated in intracountry trade with China around 140 B.C.E. The great Chinese diplomat ZHANG QIAN (CHANG CH’IEN) established commercial trade with the Sogdiana area as well as other parts of Central Asia. The Silk Road is thought to have originated from CHANG’AN (Ch’ang-an), a prosperous and thriving Chinese city whose markets sold silk, glassware, perfumes, and various spices. It is from this city that Asian traders journeyed to the west, passing such cities as Samarkand, Bukhârâ, and Pendzhikent.

Due to the wealth attained by commerce the cities of Samarkand, Bukhârâ, and Pendzhikent all had internal palaces, surrounded by housing, independent shops, and bazaars. Most bazaar spaces could accommodate more than 2,000 people. The inclusion of palaces pointed toward the existence of a sophisticated social network and hierarchy. Sections of the cities were transformed into market gardens that produced food for the city inhabitants, as well as providing a surplus for close intracity trade. Most cities of sizable proportions were heavily fortified, its citizens protected by the walls of the city. The cities also had their own citadels outside of the city that offered added protection to inhabitants and wandering traders. Each city, though it encouraged trade, could be self-reliant when required. The Sogdian region was an area that traditionally had a strong Turkish and Iranian presence, politically, economically, and socially.

The trade routes between some cities were in heavy use, especially that between Samarkand and Bukhârâ, which was referred to as the Royal Road, or Golden Road. The area was famed for the production of artwork and architecture, and Sogdiana artisans were in high demand along the Silk Road. Pendzhikent and Bukhârâ were known along the route for their frescoes and murals, and Bukhârâ was believed to have functioned more as a city of artisans and scholars than as a commercial trading city, such as Samarkand. Bukhârâ was also infamously known for its trade in Turkish slaves, who were often used as city laborers or transported to Baghdad for use by the courts. Despite an emphasis on artworks by Bukhârâ artisans, Samarkand and Bukhârâ were seen as the two major trading towns in the Sogdian area. This perhaps contributed to the small size of Pendzhikent in relation to Samarkand and Bukhârâ.

Samarkand is one of the oldest known inhabited cities in the world. The original city was called Afrasiab (Samarkand expanded and outgrew the old city) and may have been Marakand or Marakanda, the Greek name given by Alexander the Great and his forces. It functioned as the eastern administrative region for the Achaemenid empire and functioned as the commercial

An 1860s photograph of residents near tea stalls in Samarkand, one of the oldest known inhabited cities in the world.

center of the Sogdian region. It was also named the capital of Mongolian rule in Central Asia by Tamurlane. The city had an eclectic and diverse history of rulers, having experienced mild domination by the Chinese, Mongolian, Persian, and Turkish empires. Though each empire had acted as an overlord of sorts, Samarkand, Pendzhikent, and Bukhârâ were able to maintain some degree of independence (much like a state would function within a country) and thus continued to flourish due to the influx of trade and the different social and cultural customs of the merchants.

Samarkand was considered the epicenter of trade in Sogdiana; the local traders had established a mint and produced their own coinage. The city was known for trading lustrous textiles and gilded ware (silver and gold). It had established profitable commercial trading ties with China to the extent that Samarkand traders lived in China and had established a trading embassy of sorts. Samarkand was also known for its military prowess and for the breeding of military grade horses.

Similarly, Pendzhikent was a highly organized and economically stable city. It was located southwest of Samarkand, overlooking the valley, and was the smallest of the satellite capitals. Pendzhikent acted as a capital of the local area before Samarkand rose in popularity and is believed to have been established around 500 B.C.E. It experienced a prominent role in the region during the seventh to eighth centuries C.E., mainly due to the trade and commerce brought into the region by the Silk Road.

The city was quite wealthy and had a well-established and famous bazaar that indicated a constant influx of traders and merchants had passed through. The city was used by the Hephthalites (an Iranian tribe believed to have ancestry with the YUEZHI (YUEH-CHIH) of Central Asia) as a capital, then also by Persian invaders aiming to control the lucrative region.

Bukhârâ had strong ties with Samarkand and once functioned as a capital for the Samanids. The word *Bukhârâ* is thought to mean “favored place” in ancient Sogdian, or it is thought to refer to a Buddhist word *vihara*, meaning “place of learning.” Persian sources (verbal and written histories such as *Tarikh-i Bukhara*) speak of a city in the area after Alexander had established his sovereignty. It was already an established crafts center in 709 B.C.E. Archaeological sites have been uncovered that point toward the city being somewhat active during Kushan rule. A female, Khatun, ruled Bukhârâ on behalf of her son Bukhar Khudah Tughshada sometime before 670 B.C.E. Persian sources confirmed her existence when their invading forces came into contact with Sogdiana.

The Samanids were interested in trading with Europe, and coinage from Bukhârâ has been located as far north as Scandinavia. This points toward a sophisticated commerce culture, something that the three cities are well known for in their own right. The Sogdian cities enjoyed a relatively long period of influence in the area and even managed to survive numerous political, religious, and social changes. Samarkand, Bukhara, and Pendzhikent contributed greatly to commerce between Asia and Central Asia, even extending as far as the northern tip of Europe. They disseminated learning, in the form of manuscripts and scrolls, cultural exchange, and political and social tolerance.

SAMAYA L. SUKHA

Solomon

(10th century B.C.E.) *king and religious leader*

The life of Solomon enters like a fairy tale into religious and political traditions, stretching from his life to the times of JUSTINIAN I and Muhammad some 1,600 years later. Israel became a political power and military empire never again achieved in its history when Solomon presided as king from 962 to 922 B.C.E. His reign brought unmatched prestige and prosperity to his people and civilization. On the other hand, Solomon also represents a life of precipitous moral decline. The traditions that claim his authorship or inspiration mark a man who squandered his inheritance and ended up in dissolution and lechery. As the Jewish Bible might paraphrase the lesson, it was the best of times for Israel as a nation of might, the worst of times for Solomon as a man of character.

He was born as the son of King DAVID, also called Jedidiah (the Lord's beloved). He was the son of Bathsheba, the woman whom David scandalously took while her husband was away fighting David's wars. Bathsheba's first son by David died in infancy, and perhaps Solomon was the second. After a period of court intrigue his mother succeeded in obtaining David's choice of Solomon as his successor. His 40 years as king were marked by a burst of public works. His most famous effort was the construction of the Temple, confirming Jerusalem as the religious center of the kingdom. Its beauty and its size were so touted by its pilgrims that it was eventually considered, like the DELPHIC ORACLE for the Greeks, as the center of the world. Solomon's successors made the Temple a symbol of unity and hope in their less glorious times.

Other building projects that Solomon began or oversaw were the fortification of major cities around his territory. A whole host of fortresses and military stations went up in the desert to the south, protecting the flank of Israel against marauders coming from Egypt or the Arab lands. Strategic cities like Hazor, Megiddo, and Gezer became food storage cities to serve as refuges against invading armies from the north and northeast. They also prospered because they were on important trade routes. Archaeological investigations confirm a

higher standard of living for these times. Israel most likely served as a hub for trade coming from such places as Sheba (YEMEN) in the south, Phoenicia (Lebanon) in the north, and in Aramaea (Syria and Turkey) in the northwest. The Jewish Bible speaks of rulers of these lands paying homage to Solomon and of Solomon being involved with an extensive trade in horses, chariots, and timber. Remarkably, his kingdom invested in seafaring, something that ancient Israel invariably shied away from. The endeavor ended in failure, and Israel never tried again.

The moralizers who wrote about Solomon's kingdom were not reticent to speak about his character. Solomon was supposedly endowed with divine wisdom in a dream shortly after he assumed the kingship. Then two women came to him and claimed the same child as their own. As proof of his wisdom he discerned who the true mother was by a test. The legendary queen of Sheba also came to him seeking advice from the young king and went away marveling about his magnificence. Solomon's name was associated with poetry, songs, scientific investigations, and even the occult; the Jewish Bible says that Solomon's wisdom "surpassed the wisdom of all the people of the east, and all the wisdom of Egypt" (1 Kings 3).

Nonetheless, Solomon's writers then describe his downfall: womanizing. He acquired 700 full wives and 300 concubines. No doubt many of these were for political alliances with foreign peoples—in fact his son and successor, Rehoboam, was born from an Ammonite woman, and Solomon is recorded as building a special home for PHARAOH's daughter.

Nonetheless, the judgment of his biographers is negative. The foreign women brought their foreign gods, and the king compromised his exclusive devotion to the Lord. Internal opposition emerged as Solomon's projects required more and more taxation and national resources. One critic, Jeroboam, later became an insurrectionist and self-appointed king of the northern tribes (called Israel or Samaria), who seceded from the southern tribes (called Judah). External opposition also challenged Israel's temporary control of the region.

Among the many uplifting works attributed to him are the book of Proverbs and several psalms. The Songs of Solomon and Qoheleth (Ecclesiastes) probably reflect darker days in Solomon's life when he was carried away by hedonism, materialism, and cynicism. Other works associated with him are not part of the Jewish Bible canon but are viewed as possibly divinely inspired: the Psalms of Solomon and Testament of Solomon. He seems to have been a role model for such later "good"

A blacksmith, sitting on a stool next to the throne of Solomon, is thought to be a usurper. The man explains to Solomon that the Temple could not have been built without tools made by blacksmiths (ironworkers), whereupon Solomon grants him a seat of honor.

kings of Judah as HEZEKIAH and JOSIAH. Even Byzantine emperor Justinian claimed that his famous church, the HAGIA SOPHIA, made him the Solomon of his day. In later history Solomon is cited as a heroic figure by the major religious traditions. JESUS (CHRIST) OF NAZARETH cites him as a wise man, and the Gospel of Matthew lists him as an ancestor of Jesus. Rabbinic Jews add to his lore their various tales, and the fathers of the church add to the lore surrounding him. Islam finds in him a good statesman and governor, and even the Ethiopian Christians of the ORIENTAL ORTHODOX CHURCH claim him as a full ethnic ancestor.

MARK F. WHITTERS

Solon

(c. 635–559 B.C.E.) *Greek politician*

Solon was an important leader and lawmaker of ancient Athens, who brought political reform and stability to the region in the sixth century B.C.E. One of the Seven Wise Men of Greece, he also wrote poetry that still exists and demonstrates his philosophy. Some of the sayings attributed to him are, "I grow old learning something new each day," and "Speech mirrors action." Solon, son of Excestides, was born to a noble family. Athens at that time followed laws laid down by Draco—laws so cruel that the word *draconian* still connotes harsh and pitiless treatment. All power rested with the aristocrats; the poor became poorer and were often imprisoned for debt. Violent rebellion was a constant threat.

Not yet a center of culture or learning, Athens suffered several losses as it battled with a smaller city, Megara, over control of the island of Salamis. Solon returned to Athens after years of travel and trading and led the Athenians to victory against Megara c. 600 B.C.E. In six years he was elected archon, or chief magistrate, and

given unusual power. The city—or at least, the all-male, wealthy electorate—knew it faced a crisis. Plutarch says Solon was empowered as a lawmaker by the rich because he was wealthy and by the poor because he was honest. Solon warned that enslavement and oppression would lead to civil war, destroying rich and poor alike, and avoided it with the power he was given.

Solon cancelled all debts and mortgages, enabling the poor to keep their farms and allowing those who had fled indebtedness to return. Families who had been sold into slavery to pay off debts were brought home as well. To further safeguard the economy, Solon restricted food exports, standardized weights and measures, offered citizenship to craftsmen who settled in Athens, obligated children to support their aged parents, and ordered parents to provide for their children's futures with either land or training. Solon reclassified Athenian society so that taxes and duties were fairly distributed and created the Council of Four Hundred, a legislative body that would debate issues prior to a populace vote.

Solon repealed the death sentence that Draco had assigned to trivial crimes so that only manslaughter and murder received such punishment. Some of his laws were innovative, such as the one that stripped a citizen of his rights if he did not join a side during a civil war. Presumably, Solon saw danger in the inaction and apathy of citizens. Solon's laws were written on wooden tablets, mounted on display panels in public, and all citizens swore obedience to them.

Solon was urged to assume absolute authority and become a tyrant—at that time, an acceptable role. He refused and left Athens for 10 years. Popular legend tells that he met with the wealthy King Croesus and AESOP, the teller of fables. Solon learned of Atlantis during a trip to Egypt and wrote part of the story in his old age. He did not complete the work, but a distant relative, Plato, took up the story in his dialogues some 200 years later.

Returning to Athens, Solon found the people had split into factions. He took on the role of adviser and peacemaker. Eventually, his own cousin, PEISISTRATUS, became a tyrant. Solon spoke against him without fear of reprisal and urged the people of Athens to throw off tyranny and servitude. When they did not, Solon retired to write and died in 559 B.C.E.

VICKEY KALAMBAKAL

sophism

The development of thought and society in the democratic Athens of the fifth century B.C.E. and the increasing sophistication of society inspired and benefited a class of peripatetic philosopher-teachers who became known as the Sophists. There were numerous Sophists practicing their profession, and around 30 of them are particularly well known, including Protagoras, Isocrates, Gorgias, and Thrasymachus. Their teachings included not just speculation as to the nature and substance of the universe but also rhetoric and the art of life and politics. The education they offered was, therefore, a practical one and suited to contemporary life in Athenian society. Subsequent philosophers such as SOCRATES and Plato established permanent schools, and their education was more focused on the search for truth. Adherents of these later schools used the term *sophist* as a term of abuse to imply that the method of sophism deliberately failed to engage with the truth and used philosophical methods falsely to win arguments in an underhanded way. However, in the fifth century B.C.E. the term was not assigned to any one particular school of thought.

Perhaps the greatest of the Sophists was Protagoras of Abdera, who was active in approximately 450–440 B.C.E. He traveled from city to city teaching for pay. His particular area of expertise was in the practice of *arete*, which involves the development of political and rhetorical skill. He believed that because there was a subjective, human element involved in every judgment or decision, it was impossible to reach ultimate truth about any external phenomenon. Opposing statements could be made about anything, for example, the existence of the gods, without any means of determining what was true because of the imperfection of the human mind (or the shortness of life) and the complexity of issues involved. He observed: “Man is the measure of all things, of the existence of the things that are and the non-existence of the things that are not.” In other words, final or ultimate truth could not be known.

His fellow Sophist Gorgias, meanwhile, argued (perhaps satirically) that nothing exists, or if it does exist it cannot be known, or if it could be known it could not be communicated to anyone else. These forms of arguments were in opposition to the Eleatic school, which was then

flourishing in the southern Italian colony of Elea and was best represented by the thought of Parmenides and his pupil Zeno. Eleaticism featured the monistic belief that thought, expression, and existence all coalesced into being. The Sophists found this to be of little practical value in the Athens of PERICLES, where they mostly congregated and where the limits of personal influence were being extended for those not of noble birth. Exactly to what extent individual doctrines can be ascribed to individual Sophists is difficult to ascertain because knowledge of those teachings is mediated by the writings of Plato, whose dialogues feature debates between Sophists and more modern thinkers such as SOCRATES but whose audience would have been expected to know in some detail what individual Sophists taught and does not itemize those beliefs in detail. Other sources of early Sophist thought include the “Exhortation to Philosophy” by Iamblichus (third century C.E.) and the “Dissoi Logoi” of Sextus Empiricus (third century C.E.).

A particular use of antilogic employed by Sophists was the opposition of custom and nature. Possibly employing a line of thought that had been developed earlier, Sophists aimed to contrast the existing laws of society with the higher laws of nature, either because laws were not sufficiently rigorous to deal with the nature of humanity or, more commonly, to free people from unwanted restrictions.

This form of political discourse represented a feature that could be characterized as an attack on public morals, and so Socratic thinkers claimed it. A number of Sophists were brought to trial for impious teaching, not least because their ideas challenged the existing social order. Critias, for example, taught that the gods were invented by the powerful elites of society to intimidate and help tyrannize the rest of society. Prodicus suggested a sociological approach to the development of the gods of Olympus, while Protagoras, as has been shown, refused to accept that the existence of the gods could ever be known.

The Sophists were important as part of the development of education, politics, and philosophy. They represented an early example of the professional educator and the political tutor, one who tempered in his students the desire to succeed with the importance of virtue.

JOHN WALSH

Sophocles

(496–406 B.C.E.) *Greek dramatist*

Sophocles was one of a trilogy of great Athenian tragic dramatists, along with AESCHYLUS and EURIPIDES. Sophocles was the greatest of these dramatists and was the most decorated of the three at theatrical festivals. Sophocles was born into a comparatively wealthy family. His father was an armor-maker who lived in Colonus, a small village close to Athens. Sophocles received a high level of education and was a golden youth, noted for his athletic abilities and personal beauty. At the age of 16 he had the honor of leading the formal celebrations in praise of the naval victory over the Persians at Salamis, which helped end the threat of the invasion of Greece.

He was also an actor in the earlier part of his life and received some fame and recognition. However, he abandoned acting in favor of civic and religious duties, in addition to his writing. He served as a *strategos* on three occasions, when he was elected as one of 10 Athenian officials placed in charge of military affairs. He was later elected a *proboulos*, which was one of 10 officials charged with overseeing the finances of the city. He also gave the oration at the funeral of Euripides, in the same year in which he himself later died. These achievements indicate that he was not only a popular individual who recognized the duties laid upon the privileged of Athens but also one trusted to enact important roles.

Sophocles wrote more than 120 plays, although only seven still exist in complete form. The most notable of these works is *Oedipus the King* (*Oedipus Rex*). However, Sophocles is perhaps better appreciated as an innovator of the theater rather than for the quality of his individual works. At the beginning of his career the Athenian stage was a somewhat inflexible and formalized institution, but as a result of Sophocles' innovations it became a place where dramatic tension and characterization could be more deftly manipulated. Perhaps his most important innovation was to introduce a third actor. Previously, only two actors were able to act onstage at one time, although it was possible for those actors to take other roles.

The third actor allowed a great deal more flexibility in the nature of the action and in the possible interactions between the characters. Sophocles was skilled in

creating characters with terse but powerful strokes that were capable of impelling themselves toward an inevitable doom through the possession of innate tragic flaws. This conception of tragedy was documented by ARISTOTLE and formed the basis of Western tragic drama. Other Sophoclean innovations include the expansion of the chorus and the intensification of the action through focusing on the resolution of the plot within a single play rather than a trilogy.

The play *Oedipus the King* recounts the story of Oedipus, who was initially the happy and fortunate king of Thebes, but whose fortune unravels as his bad-tempered arrogance leads him to kill an old man in an act that subsequently causes his kingdom to be plagued. He finally comes to realize that, through a combination of his own character flaws and the ineluctable nature of fate, he has married his mother and murdered his father. At the conclusion of the play Oedipus blinds himself and prepares to face the world in a state of utter desolation. The early play *Ajax* considers the conventional plot material of the Trojan War. The eponymous hero is outraged by his failure to murder the enemies he has made and kills himself. Odysseus, whose victory over Ajax in a contest had sparked the action, persuades the ruling Greeks to permit Ajax to be buried with dignity. This play shows a possibility of redemption in the character of Odysseus.

The play *Oedipus at Colonus* takes place between the action of *Oedipus the King* and of *Antigone*. Oedipus is wandering the world in desolation but refuses to assent to his son Polyneices and his request to take action against Creon. For thereby standing for honor and duty, Oedipus appears to transcend to divine status. The other important plays are *Antigone*, *Electra*, and the *Trachiniae*. Several hundred lines also exist of a satyr play and the names of various other plays exist, especially those rewarded by the 24 victories in the Dionysia festival, in addition to several other fragments. Sophocles rarely diverges from the orthodox religious conception of the universe and adds little to philosophical understanding. However, the power of his dramatic vision and some of the lyrical verse employed within it testify to his standing as a major figure in world literature.

JOHN WALSH

Spartacus

(first century B.C.E.) *gladiator and rebel slave leader*

Slavery was widely practiced in the ancient world, though documentation of it is uncommon. Sparse records show that slave revolts were frequent. The ancient Spartans and other Greeks had slaves; in Sparta the conquered people of Messenia were tied to the land as agricultural slaves, called *helots*. The *helots* outnumbered the Spartans and fought for freedom but were kept under control for centuries by the militaristic, disciplined government. Other stories of Greek slaves include that of Drimakos, who led a band of escaped slaves on the island of Chios. They lived by robbery, so Drimakos negotiated a treaty with local landowners. The slaves agreed not to steal too much in exchange for being left alone, and Drimakos promised only to accept new runaways into his group if they could prove mistreatment at the hands of their masters.

Roman historian Livy tells of revolts south of Rome, involving men recently enslaved after the Second Punic War. Their plot to escape was revealed, and 500 slaves were arrested and executed. Within 12 years a revolt in Etruria and one in Apulia led to the execution of 7,000 slaves. Diodorus Siculus reported two major slave wars in Sicily. The first lasted at least five years and ended in 132 B.C.E. The second slave war occurred in 104–100 B.C.E. In both, Syrian slaves rallied around a leader with mystical powers and joined forces with a second slave rebellion. During the first war the slaves, some 200,000 strong, took over several cities until betrayal from within their ranks led to their downfall. A new law that freed some 800 slaves prompted the second war. Landowners complained, the manumissions ceased, and slaves revolted. A second group, led by Athenion, joined this slave army. Rome's Senate sent an army of 17,000 to defeat them. The Romans killed 20,000 slaves but won no firm victory until its general dueled with Athenion and killed him. A thousand slaves were dispatched to Rome to become gladiators, but all of the men killed each other when they learned of their destination.

Historians Plutarch, Sallust, Appian, Florus, and others reported the most famous slave revolt in 73–71 B.C.E.—that of Spartacus, a gladiator in Capua, who may

have once been a Roman soldier. Gladiators were slaves or enemies who had committed an offense deserving of special punishment; as a gladiator, Spartacus would have been trained to fight to the death. Spartacus and at least 50 other gladiators staged an escape from their combat school using kitchen knives as weapons. They hid near Mount Vesuvius and elected three leaders: Spartacus, Crixus, and Oenomaus—the latter two from GAUL. They defeated the initial force sent from Capua to recapture them and were soon joined by other rebel slaves.

Italy's estimated population of 6 million included 2 million slaves, and revolt was taken seriously. Approximately 3,000 soldiers marched to the Vesuvius area but were tricked and defeated by the slaves. Another army engaged the slaves several times but was constantly outwitted by them. Spartacus's force grew: By some estimates it numbered 70,000 and included slaves from Gaul, Thrace, and the German tribes. The Senate was humiliated and afraid and dispatched consuls Publicola and Lentulus with nearly 9,000 men. Publicola defeated a force led by Crixus, but Spartacus beat both armies and marched his troops north to the Alps where they met and defeated the army of Cisalpine Gaul, led by the Roman governor.

While many of the details of Spartacus's revolt are confusing, a true mystery evolved at this point: Spartacus, so close to escape and freedom, turned his army around and headed south again. After months of enduring raids up and down the Italian peninsula, Marcus Licinius Crassus, the most powerful man in Rome, gathered legions of men and began a hunt for the slaves and their leaders. When one of his legates led two legions into an unwise attack, Crassus had one of every 10 of the soldiers clubbed to death by his fellows, a practice called decimation.

After a failed attempt to cross the sea to Sicily, Spartacus drove further south. Crassus began to build a wall across southern Italy, trapping the slaves. They would not be trapped, however, and crossed the trench that was dug, even though thousands of them died. Still in the south, the slaves won a victory against one part of Crassus's army but were finally defeated. Crassus lost only 1,000 men, but the battlefield was littered with more rebel corpses than the Romans could count, and Spartacus was among the dead. Five thousand slaves escaped but were cut down by the army of POMPEY, Crassus's rival, and Crassus pursued other rebels into the mountains. About 6,000 survivors were rounded up and crucified along the Appian Way, the road leading from Capua to Rome.

More revolts are recorded in the ROMAN EMPIRE after Spartacus's time, including a rebellion of gladiators

during NERO's reign. As late as the third century C.E. a gang of 600 slaves led by Bulla eluded capture for two years. None of these reached the proportion of Spartacus's army, though, and none endured through millennia, as Spartacus's story has, to inspire and serve as a symbol of resistance to oppression.

VICKEY KALAMBAKAL

Stoicism

Stoicism was a belief system founded by Zeno of Citium at the end of the fourth century B.C.E., at a time when the system of GREEK CITY-STATES was coming to an end and apparent chaos was about to descend. Stoicism reflected this situation until the end of its period of influence, about the beginning of the fourth century C.E. Important additions to the philosophy were made by Chrysippus and subsequently by the Romans SENECA, Epictetus and MARCUS AURELIUS. The term *stoicism* was developed from the *stoa*, or column, alongside which Zeno customarily taught.

The early period of Stoicism is closely associated with Athens, where successive generations of philosophers had flourished and helped associate the city with the tradition of thought. However, influential early Stoics arrived in Athens from various parts of the eastern Mediterranean, showing how Greek culture had spread, most particularly as a result of ALEXANDER THE GREAT's conquests. Zeno was born on Cyprus and traveled to Athens at the age of 22, where his early career was associated with the Cynics, and there is an undercurrent of cynicism in Stoic thought. The Cynics believed that happiness, a suitable goal for humanity, can only be achieved by focusing the mind on what can be achieved and what is under the power of the individual. Since physical phenomena such as personal health and wealth are beyond the control of individuals, they should not be regarded as appropriate goals.

The only things that can be controlled are personal virtue and mental fortitude. To this, Stoics added the concept of *logos*, which is divine reason and the inspiration

of the universe. The presence of logos divides matter into the passive and the active, all of which combines to make an integrated whole. Logos, cognate with the fire aspect of the four elements, makes up the human soul and the reason of the soul, which is at one with the nature of the material of the universe, and can be fully expressed only when it fully comprehends its place in the universe.

As a result of the nature of the material that makes up the universe, it follows that people are formed with various desires and attributes that are entirely natural. In common with most forms of Greek philosophy, Stoicism aimed to find the ideal relationship between the individual and nature. Aiming to achieve the desires with which people are naturally endowed, for example, for security, comfort, wealth, was a perfectly acceptable form of behavior.

However, it was possible for the individual to approach these goals in the wrong way, owing to imperfections in personal perception, which is the method of seeking to understand the universe. The true Stoic, therefore, should have a rigorous grasp of true perception and an understanding of the reality of the universe, and this tends to lead to a certain acerbity of character. Moral duty and personal virtue are inescapable characteristics of a properly Stoic individual.

The second period of Stoic thought occupied the first and second centuries B.C.E. and was dominated by the philosophers Panaetius and Posidonius. These men made some alterations to the nature of Stoic thought but did not significantly change the basis of the philosophy. They were more interested in restoring Stoicism to its Platonic and Aristotelian roots. This conflicted with the additions of Chrysippus, who had added an ethical component to Stoicism that had not been present in Zeno's teaching. Posidonius and Panaetius were largely responsible for the popularity of Stoicism in Rome, where it was seen as a moral corrective to the temptations of conquest and empire. This was recorded in the second book of CICERO's *De Natura Deorum* (*On the Nature of the Gods*).

Lucius Annaeus Seneca (4 B.C.E.–65 C.E.) achieved prominence both for his scholarly works, which adopted Stoicism for the Roman world, and for his tutelage of NERO and subsequent position as joint regent emperor of Rome. His works provided consolation to BOETHIUS in prison, and he then later restated the philosophy as a means of escaping from the trials of the world by rejecting the importance of transitory events and phenomena. The freed slave Epictetus (c. 55–135 C.E.) established his own school of Stoicism that focused on practical humanity and individual freedom. He favored universal justice

and the cultivation of a calm indifference to the slings and arrows of fate. Since failure was an inevitable part of human life, it was not to be condemned; only hypocrisy and falsehood was to be avoided. The thought of Epictetus had considerable impact upon subsequent Christian thought. It was warmly embraced by Marcus Aurelius (121–180 C.E.), emperor of Rome.

Marcus Aurelius maintained a personal journal in which he recorded his thoughts and moral injunctions, most of which were drawn directly from Epictetus's statements of Stoic philosophy. His *Meditations* have subsequently become extremely influential in shaping subsequent thought of the Western world.

Stoicism has been one of the most enduring thought systems to emerge from ancient Greece. Its influence can be traced to numerous subsequent schools of thought, including various forms of Protestantism and Puritanism. In focusing on the separation between the attainable and the worthless and its concentration on the moral imperatives of the individual, Stoicism has proved useful in many contexts.

JOHN WALSH

Suiko

(d. 628 C.E.) *empress of Japan*

Suiko ruled Japan from 592 to 628 C.E. alongside her regent, the crown prince Shotoku Taishi. She was the daughter of Emperor Kimmei and his consort, a woman from the powerful SOGA CLAN. After Kimmei's death his son Bidatsu took the throne, and Suiko, his half sister, became his wife. Bidatsu soon died, and another of Suiko's brothers, Yomei, became sovereign until his death two years later. A subsequent power struggle over the throne ended in victory for the Soga as Sushun, one of Suiko's half brothers, took the throne. However, the

head of the Soga clan, Umako, did not trust Sushun's growing resentment toward the Soga, and Umako had him assassinated in 592 C.E. After his murder Umako asked her to accept the throne, which she conceded. Shōtoku became her regent and coruler.

Scholars used to emphasize Shōtoku's role over Suiko's in the governing of Japan, stating that Suiko merely served as the head priestess of the court *kami* worship. This is due in part to Chinese texts that focused more on Shōtoku's activity. In Confucianism males rule over women, and thus the Japanese court may have used Shōtoku as the proper male representative in its relations with China.

It is also possible that Confucian scholars chose to write more about their interactions with the Yamato state through Shōtoku rather than Suiko. Some scholars note, however, that Suiko was active in sending the Yamato state's first embassy to China in 600 and established relations with the Korean kingdom Silla in 621. Both Japanese and Korean sources demonstrate that Suiko was just as active as Shōtoku in her administrative rule over the Yamato state.

Suiko even asserted her rule against attempts by her uncle Soga no Umako to expand the Soga clan's power. She rejected Umako's request for more land, claiming that future scholars would castigate her for being a foolish woman if she allowed the Soga clan to obtain more power. An overly powerful Soga clan encroaching on the power of the sovereign was said to be analogous to two kings in one kingdom, which was like having two suns in the sky. Suiko's death in 628 created a power vacuum that led to yet another showdown between the Soga and their rivals.

Crown Prince Shōtoku had died before Suiko, and Suiko died before declaring an heir. The Soga forged documents that stated Suiko preferred the Soga-backed candidate of her two remaining sons. The forgery and authoritarian rule by the Soga, especially that of Iruka who used the military to eliminate his critics, pushed opponents to join forces in a coup. Iruka was assassinated in 645, bringing an end to Soga power.

Sulla

See MARIUS AND SULLA.

Sumer

Sumer is the name for the region of southern Mesopotamia, between the Tigris and Euphrates (modern-day southeastern Iraq and Kuwait), settled during the third millennium B.C.E. The Sumerians were a non-Semitic people whose place of origin and ethnic identity remains unknown. The Sumerian civilization may have been the first to invent writing. Sumerian early writing, called CUNEIFORM, consisted of drawing pictures on clay tablets with a writing instrument called a stylus. Originally used to keep economic and administrative records, the art of writing later expanded to include religious texts such as hymns, prayers, and myths. Due to their extreme age, these texts are often not fully understood by modern scholars.

According to some scholars the earliest form of government in Sumer appears to have consisted of something like a primitive democracy with elected leaders who occupied two main offices known as the *en* and the *lugal*. In addition to these leaders, the government had a bicameral legislature consisting of two groups: a council of elders and a body of younger, military-aged men. The offices of the *en* and the *lugal* were not hereditary and would later be replaced by kings in the Early Dynastic Period (c. 2900–2300 B.C.E.). During the period of the monarchy the city-state was the main type of government. Each significant city governed a small amount of territory, which also included smaller towns and villages. Some of the prominent cities include Kish, Lagash, UR, Uruk, Eridu, and Nippur. Although each city was autonomous and had its own particular deity, the city of Nippur served as the religious center of Sumer.

Between c. 2334 and 2154 B.C.E. the empire of AKKAD interrupted Sumerian control of southern Mesopotamia. Founded by SARGON OF AKKAD and ruled from the city of Akkad, this empire stood for nearly two centuries until it finally succumbed to internal anarchy and external pressure from a foreign people known as the Gutians. After an interlude of a little over two centuries, the original Sumerian population reasserted itself and regained control c. 2112 B.C.E. The result was the Ur III dynasty, which was governed from the city of Ur. Sometimes called the "Sumerian renaissance," the Ur III period was a reestablishment of Sumerian power and culture. This Indian summer of the Sumerian civilization featured building programs, the flourishing of the arts and literature, and the emergence of

law codes. This revival did not last long, however. After about 100 years the Ur III dynasty fell in 2004 B.C.E., eventually to be replaced by the Babylonians.

Sumer left a lasting impression on the cultures that followed. Some of the inventions the Sumerians contributed include writing, the city-state, the wheel, legal documents, and schools. Although the language of Sumer is not related to any other known language, it had some influence on Akkadian, the Semitic language that eventually became the dominant language of the ancient Near East. The influence of Sumerian culture, however, continued through the later periods of the Babylonians and the Assyrians in their mythology and historiography.

DEWAYNE BRYANT

Sunzi (Sun Tzu)

(6th century B.C.E.) *Chinese general and author*

Sunzi means “Master Sun” in Chinese. He was also known as Sun Bin (Pin) or Sun the Cripple because his feet were amputated as punishment for some crime. He was the putative author of a book titled *Sunzi Bingfa* (*Sun-tzu ping-fa*), or the *Art of War of Sunzi*, which analyzed warfare and strategy. He lived toward the end of the sixth century B.C.E. and led the army of one of China’s warring states to victory. In time Sun became almost a legend.

Several new groups of men gained prominence during the Warring States period (487–221 B.C.E.), when warfare among the Chinese states became intense and large scale. One group was the diplomats, who could negotiate successfully. Another group was the professional warriors, because valor in battle provided one avenue of upward mobility for the officers and exemption from taxes and labor services and rewards for common soldiers. Strategists and tacticians were also in demand; Sunzi belonged to this group.

The *Sunzi Bingfa* opens thus: “The art of war is of vital importance to the state. It is a matter of life and death, a road either to safety or to ruin. Hence under no circumstances can it be neglected.” The work consists of 13 chapters: Laying Plans, On Waging War, The Sheathed Sword, Tactics, Energy, Weak Points and

Strong, Variation of Tactic, The Army on the March, Terrain, The Nine Situations, Attack by Fire, and The Use of Spies. Each chapter is short and succinct. For example, chapter 3, “The Sheathed Sword,” opens this way: “To fight and conquer in all your battles is not supreme excellence; supreme excellence consists in breaking the enemy’s resistance without fighting. In the practical art of war, the best thing of all is to take the enemy’s country whole and intact; to shatter and destroy it is not so good. So, too, it is better to capture an army entire than to destroy it . . . Thus the highest form of generalship is to balk the enemy’s plans; the next best is to prevent the junction of the enemy’s forces; the next in order is to attack the enemy’s army in the field; and the worst policy of all is to besiege walled cities.”

The *Sunzi Bingfa* has been an influential book for Chinese generals since the fourth century B.C.E. It was first translated into French in 1782 and was translated into English in 1905. It has been used as a textbook in all Western military academies since the early 20th century and, more recently, in business schools because the strategies it offers are applicable to many endeavors.

Syracuse

In 421 B.C.E., with the establishment of the Peace of Nikias, Athens and Sparta managed to set a provisory truce on the PELOPONNESIAN WAR (431–404 B.C.E.). However, a period of mutual suspicions and instability followed, which created new conflicts for both poleis and their allies. In the winter of 415 B.C.E. the Sicilian city of Segesta decided to ask for Athenian support against their neighbor Selinus, which was helped by Syracusan forces. According to Thucydides (in his *History of the Peloponnesian War*), Athens agreed to organize and send 60 ships to the island under the joint command

of ALCIBIADES, Nikias, and Lamakhos. Full power was granted to the three generals in order to assist Segesta.

Strong debates were held concerning the opportunity and the need of the expedition, and Nikias expressed his view against the inconvenience of sending troops far from Athens with an imperialist goal. However, the people supported Alcibiades in favor of the expedition. Shortly before the departure of the fleet a shocking event interpreted as a bad omen took place: It is recorded that in one night almost all of the statues of Hermes in the city (known as the *Hermai*) were mutilated. This violent destruction of the busts was seen as a clear act of conspiracy against the state. Alcibiades was suspected in the episode, and claims for responsibility were presented against him. But he had a popular image and was not immediately charged.

The huge fleet, composed by Athenian and allied *triremes*, constituted the biggest military expedition ever conducted in classical Greece. They left Athens in June 415 B.C.E. and, after joining other forces in Corcyra, reached Sicily. As soon as it was clear that Segesta had no money to support the military deployment, the generals clashed: Whereas Nikias proposed a return to Athens, Lamakhos wanted an immediate attack in Syracuse, and Alcibiades suggested some initial negotiations with the enemy. Informed about his condemnation in Athens, Alcibiades decided to escape to the Peloponnesian islands, where he contacted the Spartans. However, the other two generals followed his plan and decided to put off the main attack. They settled their fleet in Catana, where Syracusan troops under the command of Hermokrates prepared for combat. A first encounter between cavalry forces occurred, and the Syracusans had to flee the battle camp.

During the winter both parties discussed alliances with different cities in Italy, reinforced their military capacity, and built defensive walls. Called in to help by the Syracusans, a Spartan contingent under Gylippos arrived in the city and successfully held some skirmishes with the Athenians, turning the tide. The Athenians received reinforcements from DEMOSTHENES and Eurymedon. Nonetheless, this support was not enough to overcome the local horsemen.

A mistake by Nikias, who decided to postpone the Athenian homecoming, sealed their defeat: Syracusan and Spartan vessels took advantage of the situation, attacked the rival ships in the harbor, pushed them into the shore, and started a blockage. Athenians decided to leave camp, guided by Nikias and Demosthenes. But they were obliged to split troops in two, and after final encounters with Syracusans, both generals were forced to surrender (413 B.C.E.).

Many Athenians were massacred, a few escaped and asked for refuge in Catana, and the remaining were taken as prisoners under harsh conditions. The effects of this catastrophic expedition put the POLIS at stake. Even if Athens was able to go on with the war against Sparta for another nine years, the truth is that the Sicilian disaster entailed an absolute loss of power and clearly represented the beginning of its final military and political decadence.

EMILIANO J. BUIS

Syriac culture and church

The Syriac culture and church are found in northern Mesopotamia, between the Euphrates and the Tigris Rivers, dominated by the cities of EDESSA, Nisibis, and Mosul (from west to east). Syriac, a form of Aramaic, was spoken throughout this area from the time of JESUS (CHRIST) OF NAZARETH to the 13th century C.E., when Arabic prevailed. Its culture is often traced back to the Aramaic and Assyrian civilizations. Sebastian Brock, a noted Oxford scholar, calls the Syriac culture and church an authentic Semitic descendant of the biblical world and an ancient voice of early Christianity.

Beginning in the first century C.E. Christianity spread quickly in the Syriac region. The fifth-century *Doctrina Addai* tells of the disciple Addai sent by Thomas the Apostle to convert the people of Mesopotamia. There are second-century Christian writings in Syriac such as the Odes of Solomon and the Acts of Thomas, and there is likelihood that other books only available in Greek or Coptic, such as the Pseudo-Clementines and the Gospel of Thomas, were composed originally in Syriac. The famed teachers Bardesanes and Mani, who founded their own widespread sects, began in the Syriac-speaking Christian communities. Many other groups and movements had their beginning here as well: the Elkesaites and the Mandaeans of southern Iraq and the Christian ascetics called the Encratites, the celibate and elusive “Sons and Daughters of the Covenant.”

The principal Roman city of the region, Antioch, was its link to the West, while its link to the East was Persian Ctesiphon (Baghdad). Thus, the cradle of Syriac culture was on the frontier between the two empires and civilizations. The effects of this geographic position were dramatic: The Syriac Church split in 484 according to its location, with the establishment of an autonomous (Assyrian) church in the Persian domain and the remaining (Syrian) church in the Roman domain. Another split occurred in the sixth-century Syrian Church, with one side identifying with the adherents of Council of Chalcedon (Melkites), the other side dissenting (Syriac Orthodox). All three Syriac-based groups claimed their biblical roots in Antioch, the city out of which Peter and PAUL launched their missions. Their political affiliations varied: the Assyrians identified with the Persians, the Melkites with the Romans and Byzantines, and the Syriac Orthodox somewhere in the middle.

Among the Syrians, the Melkites were concentrated in urban and Hellenized areas (Antioch, ALEXANDRIA, and the Mediterranean coast), while the Syriac Orthodox were in the countryside and hinterlands. The Syriac Orthodox adherents were not alone in their resistance to the Council of Chalcedon: Together with the Egyptians, the Armenians, the Georgians, and the Ethiopians, they formed the core of the ancient ORIENTAL ORTHODOX CHURCHES. The divisions between the Melkites and the other Syriac churches were mainly a result of cultural, linguistic, and political factors rather than theology. The Syriac churches formally rejected the Chalcedonian Creed that Christ has two natures, divine and human, in one person as an innovation of the ancient traditions. Their Byzantine (Melkite) opponents incorrectly held them to be Monophysites, heretics who believed that Christ had only one nature. In fact, the Syriac position was that “Christ is perfect God and perfect man” and was only slightly different from the Chalcedonian formula.

The fourth through the sixth centuries were the most prolific era for Syriac writers. During this time the language came to flourish in its classical forms of Jacobite (*serto*) and Eastern (Nestorian), together with Estangelo, the common written language. The Syriac Bible, called the Peshitta, was written early enough in the development of Judaism and Christianity that it was one of the oldest witnesses to the scriptural text. The *Diatessaron*, attributed to Tatian, is an indispensable witness to the gospel texts of the New Testament. Some of the notable religious writers of this period include Aphraates (fl. 336–345), EPHREM the Syrian (d. 373),

Narsai (d. c. 503), Jacob of Sarug (d. 521), and Philoxenus of Mabbugh (d. 523). Their elevated prose and poetry manifest in metrical homilies and hymns, some of which spread into the GREEK CHURCH and the LATIN CHURCH. The secular chronicles and histories of Syriac origin are valuable for filling in the gaps left by Latin and Greek works. Some of the outstanding early historians include John of Ephesus (c. 575–585), Pseudo-Zachariah Rhetor (c. 580), and Jacob of Edessa (d. 708).

By the early 600s Syriac missionaries had spread their religion as far east as China. The Assyrian Church maintained valuable connections to the silk and spice routes, so they were able to carry their religion into far-flung areas. Syriac Orthodox villages and churches were oftentimes swallowed up by the Persian Empire as the Romans and Byzantines retreated toward the Mediterranean Sea. But they did not fight the new regime because they had experienced disparagement and persecution from their Melkite coreligionists and former Byzantine rulers.

By contrast, the Assyrians and the Syriac Orthodox often took positions of influence in science, administration, and education among the Persians, Muslims, and Mongols. Many scientific and philosophical books, otherwise lost to the West during the early Middle Ages, were transmitted from their Greek origins to the Arabs by way of the Syriac scholars. Syriac missionaries are legendary for spreading Christianity into India, where their descendants are called Thomas Christians (because of their purported link to the mission of Thomas the Apostle). They follow customs that show affinities with Judaism. In fact the largest group of Syriac Christians resides in contemporary India.

Talmud

The Talmud of Judaism is a collection of commentaries. It is the extended and loosely organized elaboration of selected tractates of the MISHNAH, an earlier religious book. Its contents are not limited by the Mishnah but often serve as the base for wide-ranging discussions. Ancient rabbis found all kinds of reasons for recording their discussions on Talmudic topics, and this eventually became the constitution of medieval Jewish life. It is the source for the TORAH among rabbinic Jews today, binding on orthodox Jews. Legal rulings within the Talmud are called the Halakhah, and the interpretations and the stories that support the rulings are the Haggadah. Technically the Talmud means the whole body of rabbinic materials, namely, the Mishnah and its later commentaries, while the Gemara refers specifically to the commentary on the Mishnah. In common parlance, however, the Talmud refers to the Gemara, or commentary on the Mishnah, written between 200 and 600 C.E.

The writers of the Talmud are the “sages” of various periods of Jewish history. The rabbis before the Mishnah are called the *tannaim*, from a Hebrew word meaning “teach” or “repeat.” The rabbis who lived after the Mishnah are called the *amoraim*, from an Aramaic word meaning “discuss.” The *sevoraim* come after the *amoraim*, and their name comes from the Aramaic word for “reconsider” or “rethink an opinion.” Finally come the *geonim*, from the Hebrew word for “learned,” usually applied to the authoritative later teachers. The Talmud loosely follows the organization of the Mishnah,

divided into the orders or tractates, then chapters, and then paragraphs. The technique of developing the topic is to go over each phrase of the Mishnah and discuss it thoroughly. Sometimes digressions slip in and go on for pages before the Mishnah lines are taken up again.

For several generations sages debated and consulted about the meaning of the Mishnah. These discussions were collected and passed down orally or as makeshift documents. Additions and revisions and shifting within the collections meant that they were not standardized texts. Sometimes free associations of ideas and even extraneous materials were included and added to the confusion of the collections. As time went on, rabbis felt free to comment on the original commentaries in order to give clarity and relevance. The earliest comments were mostly law related: brief, apodictic statements of law; later, comments were longer dialectical treatments of laws and principles.

There grew to be two centers where Jews compiled available Gemara into their own Talmuds: Palestine and Babylonia. The Yerushalmi, or Palestinian, Talmud mostly reflects the work of Galilean rabbis, and it was completed by the mid-fifth century C.E. It is characterized by brevity and an absence of clarification and editorial transitions, which is in keeping with its early dating. Its discussions are seen as elliptical and terse, but occasionally dialogues arise and show development of argument and resolutions. The Bavli, or Babylonian, Talmud was completed by the year 500 C.E. However, there are discussions that show development over a longer time period (450–650). The Bavli is far more worked out than

the Yerushalmi. It is more sophisticated and technical and formal for introducing source materials, considering objections and counterobjections. The *sevoraim* took a much bigger role in the Bavli, composing entire sections, especially introductions and transitions. In general, the Bavli is of a superior literary quality and logical clarity, and it is much longer. The last period of the Talmud teachers, the *geonim*, consists of Bavli authorities.

The Bavli leaves out a lot of the first order (“Blessings”) because many of the issues concern obligations that do not apply outside Israel. Harder to explain is the Bavli’s fascination with the regulations concerning the Temple—not found in the Yerushalmi. Otherwise, the two books of Talmud mostly cover the same ground. The Bavli gradually grew in its influence over the Yerushalmi. It is clear the Babylonian *geonim* of the latter part of the first millennium C.E. were more prestigious than the Palestinian rabbis. Diaspora Jews gradually adopted the Bavli as their primary book. Palestinian Jewry declined, while the Diaspora communities spread throughout Spain, Portugal, and North Africa. Another blow to the Jews of Palestine and their Talmud was the CRUSADES.

At a certain point the Talmud always meant the Bavli, and that Yerushalmi only applied where the Bavli was silent or ambiguous. And the momentum continued: It became the focus of more and better commentaries and larger numbers of scribes. Modern scholarship therefore has more to work with in terms of Bavli materials, while Yerushalmi is less polished and extensive.

Early Mishnah study and commentaries were oral, so that the Gemara was in the beginning an approximation of the spoken tradition. There is no reason, then, to speak of the “original Talmud,” and there are many parallel texts in various centers of Jewry. Standardization of text has come largely because of the Diaspora Jews’ adaptation to the modern world and eventually their access to the printing press and formation of education institutions. All these factors stood in favor of the Bavli. It is traditional to believe that MOSES presented the Torah as the written laws for Israel but that his rulings about various applications of the written laws were passed on orally at the same time.

As medieval Judaism developed more and more oral laws to interpret the Torah and to expand its application, the rabbis gave credit to various legendary non-biblical figures (the “Great Synagogue” officials, Hillel and Shammai and YOHANAN BEN ZAKKAI). The only historical person to corroborate this process is JUDAH HANASI, who presided over the compilation of the Mishnah around the year 200 C.E.

The mode of composition is in dialogue form, a bit like the dialogue between SOCRATES and his followers. Questions regarding the Mishnah are introduced and then the dialogue seeks after causes and origins. The lengthy digressions are the Haggadah, while the conclusions are the Halakhah. While this method may strike the modern reader as drawn out and boring, it actually is a novel way of dealing with the complexity and monotony of legal rulings. The Talmud contains the rejected as well as the accepted opinions of the rabbis. The Talmud is a book of laws and opinions on the laws. Rarely does it appeal to the reader’s sense of inspiration and elevated speech. To the casual reader the rabbis appear as judges, teachers, and public administrators, and that was their role within the medieval Jewish community. The personalities of the thinkers—the rabbis—were not important in the Talmud, but the legal chains of thought were. Their genre was the text commentary, and even today the Talmud text page contains the text surrounded by several later celebrated commentaries.

The religious current of the text is deeper and more satisfying. The law is a source of God’s creativity and thus a gift to Jews and a joy to fulfill. The task of the rabbi is to apply this law to every aspect of life, an opportunity and not a burden. In fact, by expanding the oral Torah, the rabbis were imitating what previously God accomplished through the written Torah. Thus, study and application of Torah were engaging in a form of divine creativity. Everyone was expected to join in the creative process, whether it was the ascetic holy man who studied 20 hours per day, or the common Jew who studied Torah only at the Sabbath service. Rabbinic skill was expressed in finely honed argumentation, and the argumentation became a sign of holiness. The rabbis taught that they became a “kingdom of priests and a holy nation” when they sufficiently studied and understood the Torah.

Rabbis were elected and rated according to their command of the Talmud. As medieval rabbis devoted themselves to Talmudic studies, they enhanced their stature as community leaders. As a result they had to work out their relationships with the political rulers of the lands where their Jewish followers were. The Roman authorities, the Byzantine governors, and even the designated Jewish officials (the Jewish patriarchs and the exilarchs) eventually had to accommodate the rabbis. Nonetheless, the rabbis kept a low political profile. The rabbis found their niche in the internal religious life of the Jews (marriages, divorces, religious rituals, calendar, and the education of the youth). Their opinions were treasured much like medieval Christians valued the fathers of the church.

The Talmuds are the major sources of information about Jewish culture and religion in the period of late antiquity and the early medieval period. Often its pages reveal even earlier stages of Jewish life and culture—perhaps preserving fragments of teachers and teachings of the period after the last writings of the Bible and before the completion of the New Testament. The problem is that the Talmuds add layer upon layer of editing so that the original historical kernel cannot be identified with certainty. Another problem with determining the historicity of the Talmud came from outsiders: Christians often censored or destroyed copies of the Talmud in various regions of Europe. Often, in order to avoid destruction, Jews submitted the Talmud to censorship so that early rabbinic discussion of such topics as JESUS (CHRIST) OF NAZARETH or EARLY CHRISTIANITY was lost or scattered.

MARK F. WHITTERS

Tantrism

Vajrayana Buddhism, or Tantrism, is a form of Buddhist thought that has flourished in northern India and particularly Tibet. The term *vajra* is a Sanskrit word that can mean either “diamond” or “thunderbolt.” Vajrayana Buddhism provides enlightenment in a single lifetime, rather than as a result of numerous incarnations as posited by other forms of Buddhism. These means, which are known as *upaya*, include meditation techniques, thought exercises, chanting, and sexual practices. Like Mahayana Buddhism, Vajrayana Buddhism aims to recreate the experience of GAUTAMA BUDDHA and to enable the individual to attain Buddhahood, rather than just to escape from the endless wheel of death and rebirth that is caused by attachment to the insubstantial things of the world, which is the goal of Theravada Buddhism. Like the other forms of Buddhism, Vajrayana Buddhism also enjoins upon the follower to take such measures as proper behavior, abstinence from

intoxicants, and supporting the monkhood. An alternative name for Vajrayana Buddhism is Mantrayana Buddhism, owing to the practice of reciting mantras to escape from the human desire to grasp illusory and impermanent sensory data as reality.

Vajrayana Buddhism developed from Mahayana (or Great Vehicle) Buddhism around the sixth–seventh centuries and was particularly influential until the 11th century. Tibetan adherents claim that Sakyamuni Buddha taught the tantras as secret texts that were preserved in writing some time after the sutras. A tantra is a continuum that flows from fundamental ignorance to enlightenment, as well as being the text in which this message is recorded. Tantras include continua of the path, the ground, and the result. Three inner tantras, in addition to six outer tantras, once mastered, offer the capability of entering the Buddhahood. This is managed through sophisticated mental techniques that facilitate the resolution of states of mental dissonance into one of enlightening union. The three inner tantras are the Mahayoga, Anuyoga, and Atiyoga, which are the generation stage, the perfection stage, and the Great Perfection (*dzogchen*) stage. The Indian spiritual leaders Padmasambhava, Vimalamitra, and Buddhaguhya (among others) introduced them. Their works have been subsequently collected in multiple-volume canons, notably in Tibetan translation by Buton Rinchen-drub (1290–1364). The different collections of works gave rise to different schools of Vajrayana thought.

Vajrayana adherents stress the importance of the teacher-student relationship and the esoteric transmission of knowledge and *upayas* through that relationship. Not only is meditation involved but also ritual chanting, the drawing of mystical charts, and the practice of tantric sexual congress with female priests known as *yoginis*. The most well known repetitive chant is *Om mane padme hum* (ah, the jewel is indeed in the lotus), which when repeated can help the mind overcome dissonance. Sexual congress is important in the quest for enlightenment because it is part of the attempt to resolve and unite opposing principles. In addition, as one of the Four Delights, it aims to unite bliss with emptiness, by means of liberating the body’s energy center to receive the pristine cognition of supreme delight.

In some cases tantric activities, including sexual yoga, became associated with occult activities and sacred drinking of alcohol. Tantrism on the island of Java, for example, included drinking and fornication with *yoginis* that rather scandalized some visitors, unaware of the purpose of the rituals. Kertanagara (r. 1268–92), the last king of Singosari on Java, for example, was obliged to protect his people and demonstrate the legitimacy of

his kingship by combating the demoniac energies loose in the land through seeking ecstasy through bouts of drinking and sexual congress. Kertanagara was unfortunately murdered in the course of one of these bouts. Tantric practices are also associated with Hinduism and differ from Buddhist tantrism accordingly.

Vajrayana Buddhism was influential in Tibet and India, but has also been practiced in Central Asia, China, Java, Nepal, and what is now Pakistan. In addition, the Mongols adopted aspects of Tibetan Buddhist practice and helped spread them through the Asian continent. Variations of tantric practice spread further, although often dissociated from the essence of Vajrayana Buddhism. In aesthetic and artistic terms Vajrayana Buddhism has inspired the creation of the mandala, which is a representation of the universe employed in meditation. A series of concentric circles identifies the individual and the womb and its connections with wider reality. Characteristic forms are found in China, Japan, and Tibet. Tibetan versions are one form of *thang-ka* (*tanka*), which are cloth paintings that may be used in personal meditation, used for display, or in processions. They are created according to a series of strict canonical rules and began to appear from about the 10th century.

JOHN WALSH

Taoism

See DAOISM (TAOISM).

Teotihuacán

Located some 25 miles northeast of Mexico City in the Basin of Mexico, the massive ruins of the great city of Teotihuacán have long puzzled and intrigued observers. Despite more than a century of archaeological investigation, many mysteries remain about the people who built, ruled, and lived in this vast urban complex. The city was founded in the first century B.C.E., just north-

east of Lake Texcoco, which lay at the basin's center. Its builders were most likely the former inhabitants of the ancient ceremonial center of Cuicuilco, at Lake Texcoco's southwest corner, which was destroyed in the eruption of the volcano Xitle around 50 B.C.E. Construction on Teotihuacán began soon after the abandonment of Cuicuilco. The city flourished for the next 600 years, dominating most of the central highlands, before its partial destruction and abandonment around 650 C.E.

The city's civic and ceremonial core was built in stages, from its beginnings in the first century B.C.E. to its completion by 300 C.E. Carefully designed in a grid-like pattern, the core was dominated by several towering structures connected by a broad avenue: the massive Pyramid of the Sun; the slightly less imposing Pyramid of the Moon; the Temple of Quetzalcoatl (Plumed, or Feathered, Serpent); and the large open-air Citadel. Scholars offer varying interpretations of its builders' intentions regarding its orientation, with the Avenue of the Dead at 15.5 degrees west of south. Some argue that it is aligned with solar equinoxes; others, with the constellation Pleiades; others, with the nearby Cerro Gordo volcano; still others have proposed mathematical relationships between the city's orientation and the sacred 260-day calendar. All agree that its exacting alignment carried deep meaning for its designers and builders.

Its largest and oldest vertical structure, the massive Pyramid of the Sun, was built over a series of caves (discovered in 1971) whose interior chambers were modified and used extensively during the pyramid's construction phase (1–150 C.E.). In Mesoamerican mythology caves were linked to the underworld, the dwelling place of the gods, and the origin of creation, suggesting that the pyramid's location held profound cosmological significance to its designers.

Estimates of the city's population range from a low of 80,000, to a high of 200,000. During its first century its population grew rapidly, reaching perhaps 80,000 by 150 C.E., with many thousands of people from the Basin of Mexico migrating to the city. Growth slowed in subsequent decades, with the city's population reaching its height probably around 200 C.E. In the 200s and 300s a series of more than 2,000 apartment or residential compounds were built to house the city's huge population. The sizes and qualities of these compounds varied considerably, suggesting an intricate system of socioeconomic stratification based on wealth, occupation, status, and lineage. Most scholars agree that persons claiming a common lineage inhabited these compounds.

Different districts or neighborhoods within the city also varied widely. In some areas, specialized craft or

artisan workshops predominated. Elsewhere, distinct ethnic enclaves are evident, most notably, a cluster of some dozen compounds evidently inhabited by Oaxacans from Monte Albán.

A “merchant’s neighborhood” has been identified near the city’s eastern perimeter. Throughout much of the city, however, it is difficult to identify specific qualities that defined its spatial demographics. While the remnants of walls can be found in various parts of the city, there is no evidence that the city as a whole was walled. An estimated two-thirds of the city’s inhabitants worked in agriculture, in the fields surrounding city, with the remainder engaged in various types of craft production.

The inhabitants of Teotihuacán employed a system of notational signs but had no system of writing comparable to the Maya during this same period. Scholars have identified no grammatical or phonetic elements in the notational system and thus do not know what languages its inhabitants spoke or what they called themselves. Some scholars have proposed that its rulers sought to create a secretive, mysterious symbolism; others suggest that the signs’ meanings were probably clear to their creators and those who viewed them. The artistic style at Teotihuacán is repetitive, uniform, and

somewhat stiff, in sharp contrast to the great variability of styles and motifs among the Maya city-states.

Religion was practiced in at least two distinct spheres: at the level of the household and village and at the level of the state. Village- and household-level religious practices focused on ancestors and deities linked to specific lineages. There is no evidence that these household- and village-level religious practices were in conflict with the state or that there was any organized or lower-class resistance to the state or ruling groups. State religion was very distinct from village-level religion, emphasizing especially the cult of the Feathered Serpent, most graphically expressed in the Temple of Quetzalcoatl, with its hundreds of huge sculpted heads gracing its massive walls and stairs. Other major state deities included what is commonly called Tlaloc, the rain god (though interpretations differ on whether this was indeed Tlaloc), the storm/war god, various death and underworld gods, and what E. Pasztory has termed the Great Goddess.

State religion focused on legitimizing the dominance of ruling groups and providing ideological underpinning for the state and its political, military, and ideological dominion within the Basin of Mexico and beyond.

Located northeast of Mexico City in the Basin of Mexico are the massive ruins of the great city of Teotihuacán. Despite extensive archaeological investigation, many mysteries remain about the people who built, ruled, and lived in this vast urban complex.

This was a highly stratified and militarized society with both extensive and intensive military capacities. The city dominated the Basin of Mexico, though probably not much beyond it, and regardless of the extent of its direct rule, it carried enormous ideological prestige throughout Mesoamerica. Perhaps providing a template for the later Aztec military, Teotihuacán's armies were divided into military orders associated with particular creatures, such as the eagle and jaguar. Its military forces consisted of both commoners and elites that fought in disciplined groups and were highly effective in their use of dart- and spear-throwers (*atlatl*) and obsidian-studded clubs.

The city's impressive military capacities and ideological prestige worked together to facilitate exchange and trade relations with neighboring polities. Trade routes, as far south as Central America and as far north as the present-day U.S. Southwest, linked the city to all of Mesoamerica's significant polities. Long-distance trade was especially active in prestige items, such as shells, ceramics, obsidian, mica, hematite, jade, turquoise, and cinnabar. Marketplaces within the city were especially important, some suggesting that the Great Compound was also the city's central marketplace, with cacao serving as a form of currency. Ritual human sacrifice was practiced at Teotihuacán, though the practice is depicted in the city's artwork principally through portrayals of human hearts, some impaled on knives. Skeletons of sacrificial victims have been unearthed in the Pyramid of the Sun, the Temple of Quetzalcoatl, and other buildings.

The decline of the great city was rooted in long-term ecological crises, particularly water shortages, deforestation, and soil degradation, trends exacerbated by a series of invasions or attacks by nomadic or seminomadic peoples from the north. Between 500 and 600 these deleterious ecological processes had become irreversible. Around 650 much of the city was destroyed by fire, probably by external assailants, and most of its buildings and compounds were abandoned. The core ceremonial area around the temples saw the greatest destruction, suggesting a conscious effort to incapacitate the city's ritual and ideological power. By 750 the city was completely abandoned. Some six centuries later, upon their arrival into the Basin of Mexico from the northern deserts, the Aztec would look upon the ruins of Teotihuacán as the dwelling place of the gods. Today Teotihuacán remains one of Mexico's most popular tourist attractions.

M. J. SCHROEDER

Tetrarchy

The Tetrarchy, or "rule of four," was a reform of the Roman imperial government initiated by the emperor DIOCLETIAN in 286 C.E. This was a total change of the *princeps* system begun by the emperor AUGUSTUS CAESAR in 30 B.C.E. Augustus, despite his name of "revered one," was addressed while emperor as "*princeps*," or "first citizen," and his imperial rule was built informally around government offices of the Roman Republic. His true power had come from a combination of the office of tribune and his role in society as "first citizen." Diocletian, on the other hand, changed the position of Roman emperor from one cloaked in republican virtue and office into a full Eastern-style monarchy. Access to the emperor was limited under Diocletian and he was addressed as "*Dominus Noster*," or "our lord." This change in the imperial system had two main goals. The first was a more efficient military command and control, and the second was an attempt to change the way the emperor was chosen.

Diocletian had good reason for instituting new changes for the Roman world. Prior to Diocletian's imperial rule, beginning in 286, the Roman world had seen what historians now call the Crisis of the Third Century. Since only 235 C.E., which had seen the death of the emperor Alexander Severus, Rome had been ruled by generals, by some accounts as many as 50. During the exceedingly short rules of these generals, Rome had been raided by Vandals and Goths and attacked outright on her eastern border by the SASSANID EMPIRE. While the ROMAN EMPIRE was both politically and militarily unstable, Rome was also in terrible financial straits. The Roman Empire had seen years of hyperinflation due to the debasing of the coinage. When Diocletian came to power, he had ample reason to introduce reforms, reforms that some scholars say saved the empire for two more centuries.

This new imperial system was designed first to provide for an increased military command capacity within the empire. No longer would the Roman army sit only

on the frontiers, but there would now be a “defense in depth” policy. The army would patrol the farthest reaches of the empire and also provide a defense for all Roman territory. Diocletian secured these changes with two fundamental alterations to military policy. The first was a de facto division of the empire into an eastern and western half, with each half having its own emperor. Beneath these two emperors, who held the title of Augustus, were two junior emperors who held the title of Caesar. In all, the new imperial college would contain four members: two Augusti and two Caesari. For the military this allowed for a total of four military commanders who could campaign on the very edge of empire, without the others having to worry about a victorious general being elevated to the rank of emperor by his troops. In addition to the edges of empire, there would be military resources and military commanders for the new defense in depth policy.

The imperial college was also intended to create a sense of stability in the empire. The political division between East and West was not intended to be a true division. In fact, all imperial decrees continued to be made in the name of all four men of the imperial college. This allowed for a sense of stability during the sometimes-unstable transfer of power between Roman rulers. The previous *princeps* system of government had for hundreds of years left the empire with no formal way to choose a new emperor after the death of the previous reigning emperor. Diocletian’s reforms sought to rectify this. In theory, when the senior Augustus died, his Caesar would be elevated and would in turn choose a new Caesar. In this manner the Caesar would gain both experience and legitimacy with the Roman populace.

In practice, however, Diocletian’s reforms did not even last for one full transfer. In order that he see his system of succession put into effect, Diocletian decided to retire after 20 years as emperor and forced his co-Augustus, Maximian, to retire as well. When this occurred, each man’s Caesar was elevated to the imperial throne, and two new Caesari were chosen. Maximian did not agree to this forced abdication, and eventually he attempted to regain his position as head of the Western Roman Empire. This failure by Maximian marked the beginning of the end of the Tetrarchy. By the end of CONSTANTINE THE GREAT’s reign in 337, most of Diocletian’s reforms had failed. The rule of Constantine and his progeny was marked by civil war and competing imperial claims, just as had been the case before Diocletian’s reforms of 286.

STEPHEN GRIFFIN

Thebes

In the *Iliad* Homer famously described the city as “hundred-gated Thebes.” However, Thebes is better understood as an entire site that encompassed the east and west banks of the Nile, containing temples and palaces, the dwelling-places of the living and the everlasting homes of the dead. On the east bank were the temples of Amun at Karnak and Luxor. The ancient city lay to the east of the great temple of Karnak. As the temple expanded, the city had to move and was laid out on a grid plan. Across the river on the west bank, bordering the strip of cultivated fields, stood the mortuary temples of PHARAOHS from the Middle and New Kingdoms. Behind them lay the cemeteries of the nobility, while beyond in the desert valleys, the tombs of kings and queens of Egypt. On the west bank was the village of skilled craftsmen and scribes, who worked on the royal tombs, their burial places, and those of commoners. In effect there were two Thebes, one for the living, the other for the dead. Ironically, the mud-brick city of the living has long vanished under the fields and houses of the modern city of Luxor, while Thebes of the dead on the west bank remains one of Egypt’s primary tourist locations. It is one of the largest archaeological sites in the world.

Thebes lies about 400 miles south of Cairo, just south of the Wadi Hammamat where the Nile Valley comes closest to the Red Sea. The Egyptians called the town Waset, “dominion,” and later simply Nìwt, “the city.” Although there are some remains from the Early Dynastic and Old Kingdom periods (3100–2181 B.C.E.), it was a small town, the capital of the fourth nome (district) of Upper Egypt. The Greeks would name it Thebes after the principal city of Boeotia in Greece. A family from the Theban nome ruled Upper Egypt at the close of the First Intermediate Period (2181–2055 B.C.E.). One of these rulers, Mentuhotep II (2055–04 B.C.E.), gained control over all Egypt founding the MIDDLE KINGDOM. His mortuary temple lies beside that of the female ruler Hatshepsut, at Deir el-Bahri. Although subsequent pharaohs moved away from Thebes, the rulers

The ancient city of Thebes lay to the east of the great temple of Karnak. As the temple expanded, the city had to move.

of the Twelfth Dynasty (1985–1795 B.C.E.) made it the capital of Upper Egypt.

At the end of the Second Intermediate Period (1650–1550 B.C.E.), the local Theban princely family drove the HYKSOS from Egypt and reunited the “Two Lands.” This inaugurated the NEW KINGDOM, the time of Thebes’s greatest glory and that of Amun, its god. The Eighteenth Dynasty (1570–1293 B.C.E.) ruled from Thebes, with the brief exception of AKHENATEN (1350–44 B.C.E.). The rulers of this dynasty built extensively at Thebes. The present temple of Amun at Karnak was begun at this time and endowed, enlarged, and embellished right down to the Greco-Roman period. The pharaohs of the Nineteenth Dynasty (1293–1185 B.C.E.) moved their capital to the eastern Delta, but Thebes remained a prestigious religious center and burial site. Power inevitably passed into the hands of the high priests of Amun, who controlled a huge clerical corporation that owned land all over Egypt. By the end of the New Kingdom (1069 B.C.E.) the priesthood of Amun controlled two-thirds of all temple lands and 90 percent of Nile shipping. Thebes was sacked and looted by the Assyrian king Ashurbanipal in 664 B.C.E. By this time the importance of the city even as a religious site had begun to diminish as successive foreign conquests, Persian, Greek and Roman, forced Egypt to look north to the Mediterranean.

On the east bank of the Nile stand the temples of Amun at Karnak and Luxor. The site at Karnak includes the temple of Amun, the temple of Mut (the Mother), his wife, and the temple of their son Khonsu, a moon god. To the north of the precinct of Amun sits the temple of Montu, the old falcon war god of Thebes. At the south, at the end of an avenue of sphinxes, is the

temple at Luxor. This is dedicated to Amun in his fertility aspect: It was called the “Place of Seclusion.” It was the destination of the Theban Triad at the “Beautiful Festival of Opet,” celebrated in the second month of the Inundation. Statues of Amun, Mut, and Khonsu were placed on their barques, loaded onto barges, and towed amid scenes of great jubilation from Karnak to Luxor.

Thebes of the dead on the west bank is a rich archaeological site. At Deir el-Bahri, the mortuary temple of Hatshepsut preserves the illustrated record of the expedition to the fabled land of Punt that she ordered. There are several well-preserved mortuary temples including that of Ramses III at Medinet Habu. The Valley of the Kings contains the famous tomb of Tutankhamun, the tomb of Ramses VI with its astronomical ceiling, and that of Thutmose III. The Valley of the Queens holds the magnificently restored tomb of RAMSES II’s chief wife, Nefertari. Any Theban palaces, built of mud brick, have long since vanished. Even the grand palace of the opulent Amenophis III at Malqata on the west bank has disappeared. However, the site of the craftsmen and artisans’ village at Deir el-Medina and their tombs opens a window into the lives and hopes of ordinary Egyptians.

JOHN BARCLAY BURNS

Themistocles

(c. 524–459 B.C.E.) *statesman and general*

Themistocles was a great Athenian statesman and general who played an important role in the Second Persian War by leading the Greeks to victory. Born to an Athenian father, Neocles, and what seems to have been a foreign mother, Themistocles demonstrated great potential from an early age. He is said to have spent his leisure time in youth composing and performing mock speeches, unlike other children who remained idle or engaged in play. An early teacher of Themistocles told him the following: “there is going to be nothing insig-

nificant about you; somehow or other you will become a great man, either for good or for evil.”

With much determination Themistocles strove for greatness in action and longed to distinguish himself from others, both politically and militarily. Themistocles also fought the Persians at the BATTLE OF MARATHON, and while most Athenians were convinced that the victory at Marathon would keep the Persians at bay, he believed otherwise. He sought to ensure that his city and its inhabitants would be ready for the enemy's return. Themistocles successfully persuaded the Athenians to increase their naval fleet by building more than 100 ships with the silver that was mined at Laurium, despite the many arguments against the idea and the desired alternative of distributing the wealth.

His effectiveness was due to the fact that he played on popular Athenian fears of Aegina, a traditional enemy; however, Themistocles himself was undoubtedly preparing for the next encounter with Persia. Additionally, Themistocles persuaded his fellow citizens to believe in his interpretation of a prophecy given by the priestess at the DELPHIC ORACLE. It spoke of a wooden wall and great destruction at Salamis. While others felt that the allusion to a wooden wall meant the Athenians should hide behind the wall of the Acropolis, Themistocles convinced them that the wooden walls represented the naval fleet and that the Athenians were destined to win the battle at Salamis against XERXES. Sure enough, in 480 B.C.E. the enlarged Athenian fleet met the Persians to wage the naval battle of Salamis with the courageous Themistocles at the helm.

Themistocles managed to bring many of the GREEK CITY-STATES together to fight on behalf of a common goal and against a common enemy, despite their recurring internal animosities. Largely due to the Athenian general's wisdom the Greeks managed to fight in the narrow strait of Salamis, which was crucial for the Athenian advantage. Despite being outnumbered by nearly twice as many Persian ships, the Greeks fought valiantly and came out victorious in the end. The judgment and timing of Themistocles was instrumental as he crowded the large Persian fleet in the strait and used the winds as well as the maneuverability of the smaller Greek triremes to ram and sink more than 200 enemy ships while only losing roughly 40 of his own. The Persians eventually retreated, and not only was Greece saved, but so too was Western civilization. Themistocles was generously honored for his leadership, and the historian HERODOTUS wrote, “Themistocles was acclaimed throughout the whole of Hellas and deemed to be the wisest man by far of the Hellenes.” As a political leader

Themistocles rebuilt and fortified Athens, which had suffered prior to the successful naval battle.

The initial respect and praise that Themistocles was showered with quickly came to an end. Such was the nature of a fickle citizenry and manipulative rulers who used the city-state's democratic structure to their advantage. By 471 B.C.E. Themistocles was ostracized by his political opponents and forced to live in Argos for a number of years. He was later summoned back to his native city due to criminal charges of treason, which were likely fabricated by his rivals in Athens. Convinced of certain failure against such powerful adversaries and trumped-up charges, he went into self-imposed exile. Ironically, he eventually ended up in Persia. Themistocles managed to convince the Persian king that he arrived voluntarily as an ally and that it was because of his decision making that the Hellenes had not pursued and destroyed more retreating Persian ships at Salamis. Having successfully convinced and wooed the king, the bounty that was formerly on Themistocles' head was removed and instead the reward was given to him. After learning the Persian language Themistocles became a consultant on Greek matters in the Persian king's court. He took up residence in Magnesia, one city of three in Asia Minor that he was additionally rewarded with.

However, around 459 B.C.E. the Persian king called upon Themistocles not simply for the purposes of consultation but to fight directly against the Greeks. Instead of tarnishing and undermining his earlier reputation and the deeds done on behalf of his homeland, he is said to have called a banquet with friends at his home in Magnesia whereupon he poisoned himself. Disagreement persists surrounding the factual manner of Themistocles' death, and it is not certain whether it was truly his loyalty to Athens that drove him to suicide. In any case the life and story of Themistocles remains a legendary and heroic one that continues to serve as an example of how a single man as both statesman and general can have a significant impact on a political community and important historical events.

Theodoric

(c. 454–526 C.E.) *Ostrogothic ruler*

Theodoric the Great was king of the Germanic tribe of the OSTROGOTHS, who dominated the western Balkans in the fifth century C.E. He received a Roman education during his teenage years spent as a political hostage in CONSTANTINOPLE under the watchful eyes of the Byzantine government. When he returned to his people, Theodoric took up arms against the empire and gained additional land, a position in the Byzantine military command, and imperial rank. Faced with a powerful and sometimes hostile neighbor, Byzantine emperor Zeno encouraged Theodoric to attack Italy where another German, ODOVACAR, had deposed the last legitimate Roman ruler, Romulus Augustulus. Theodoric and his Ostrogoths migrated to Italy, defeated Odovacar, and ruled as the representative of the Byzantine emperor. His capital was in the northeastern Italian city of RAVENNA, located on the Adriatic Sea.

As ruler of Italy, Theodoric attended to the redevelopment of this land. He encouraged settlement to areas that had been depopulated due to war and fostered agricultural production and trade. He was also concerned with the repairing and building of walls, aqueducts, churches, and other buildings in Roman cities. Several of his impressive monuments still stand in Ravenna, including the Church of St. Apollinare Nuovo, the Arian Baptistery, and his own mausoleum.

Although a German king, Theodoric respected Roman traditions. Since the majority of the subject population was Roman, Theodoric respected prevailing structures of government, from local urban magistrates to the Roman Senate, as well as Roman law. Many Romans served in his court, such as BOETHIUS and Cassiodorus, two of the most important Latin authors of the period. Even the pope and the Roman Senate received him in the city of Rome, where he stayed for a short period before returning to Ravenna. Besides developing a certain harmony between cultures, Theodoric was also a shrewd and powerful German king, cognizant of the reality of German power in the West. He sought to expand his kingdom and also to secure his position. He married a sister of Clovis, the king of the Franks and founder of the Merovingian dynasty, and joined his family by marriage to the kings of the Vandals, Visigoths, and Burgundians.

The Italian cultural harmony was made more difficult by the fact that the Ostrogoths were Arian Christians, while the Roman population was Orthodox Christian. They differed theologically over their understanding of Jesus's relationship to God the Father, whether he was

created (Arian) or begotten (Orthodox). The Orthodox condemned Arian theology at the COUNCIL OF NICAEA (325) and Council of Constantinople (381). At first Germans and Romans joined together as allies against the East. But when rapprochement occurred between Rome and Constantinople, Theodoric feared a Byzantine invasion with potential Roman support.

Making matters worse, the Byzantine government began to persecute Arians in the early 520s. Theodoric commenced a more hostile approach to his Roman population. Roman officials were accused of collaboration and arrested, among them Boethius, who wrote his *Consolation of Philosophy* while awaiting his execution. Theodoric sent the pope to negotiate with Constantinople but did not trust him and, upon his return, imprisoned him. Theodoric died in 526, only a few years before the start of the Byzantine invasion that did, in fact, end Ostrogothic rule.

MATTHEW HERBST

Theodosius I

(c. 347–395 C.E.) *Roman emperor*

Theodosius was born in Spain and followed in his father's footsteps as an able military commander. This changed when his father was condemned and executed, and Theodosius withdrew from public life. The Western Roman emperor desperately needed his talents in 378 C.E., when the German Goths defeated the Roman army and killed the Eastern Roman emperor at the BATTLE OF ADRIANOPOLE and overran the Balkans. Theodosius was recalled to military command and promoted to Eastern Roman emperor in 379. He recruited a new army (including many Germans), fought the Goths, and made peace by settling them as independent allies (*foederati*) inside the empire. They ruled their own people, provided military service, and received positions in the empire's military command.

It was a precarious situation, but it restored a level of order and security. Theodosius's military ability was also demonstrated by two victorious campaigns against western usurpers in 384 and 394. In the latter campaign, the usurper murdered the Western Roman emperor but

was defeated by Theodosius, which left him sole emperor for the entire empire from Britain to eastern Anatolia. This was the last occasion when a single emperor ruled both halves of the ROMAN EMPIRE. Theodosius governed not from Rome in the West but at CONSTANTINOPLE in the wealthier and more populous East.

Theodosius was a zealous Christian. When he fell ill in 380 and believed that he was near death, he was baptized. It was not uncommon to wait until just before death for baptism in order to wash away sins. However, he recovered unexpectedly, becoming the first emperor to reign as a full member of the church. This gave bishops tremendous influence during his reign.

When Christians destroyed a Jewish synagogue in an Eastern city, Theodosius ordered the local bishop to pay for its restoration. AMBROSE was appalled, believing that this demonstrated the triumph of Judaism over Christianity. He demanded the emperor rescind his order if he wanted to stay in good standing with the church. The emperor yielded. In 390, after Theodosius had massacred several thousand citizens in Thessalonica for the murder of his military governor, Ambrose threatened Theodosius with excommunication. The emperor again yielded, publicly repenting for his action.

When Theodosius had first reached the East, he found the church struggling against ARIANISM, even though Arian theology had been condemned at the COUNCIL OF NICAEA (325). Theodosius expelled Arian clergy in Constantinople and firmly stood by the Orthodox Church, including Patriarch Gregory Nazianzus. He called the Second Ecumenical Council that met in Constantinople in 381 and ended the Arian threat. Theodosius also supported the church by legislating against non-Christians. He closed pagan temples, banned pagan sacrifices, ended the pagan Olympic Games, and declared Orthodox Christianity the official religion of the empire. Henceforth, loyalty to the emperor was determined by adherence to his theological position. Upon his death in 395 his younger son Honorius ruled in the West, while his older son Arcadius ruled in the East. The dynasty of Theodosius ruled the empire until at least 450.

MATTHEW HERBST

Theravada and Mahayana Buddhism

Theravada and Mahayana Buddhism (often called northern Buddhism) are forms of Buddhism, a spiritual religion and philosophy created by GAUTAMA BUDDHA (b. c. 566 B.C.E.) and followed by more than 700 million people worldwide. Developed over thousands of years, Buddhist tradition ultimately leads to what is called enlightenment, becoming a Buddha, and breaking the cycle of reincarnation. Mahayana, derived from Theravada Buddhism, dominates in India, China, Taiwan, Tibet, Japan, Korea, and Vietnam. Theravada is often called southern Buddhism. Theravada Buddhism is more conservative and is popular in Sri Lanka, Thailand, and Myanmar (Burma).

After his enlightenment the Buddha delivered his first sermon and set the framework for his teachings, consisting of the Four Noble Truths. Buddha laid out the fundamental principles of nature that ruled the human condition. He taught that these Four Noble Truths were the way people should frame their experiences. The Four Noble Truths are Dukkha, the suffering of people, stress, and discontent of ignorance; Samudaya, the cause of this dissatisfaction is desire; Nirodha, the cessation of desire and the achievement of nirvana (extinguishing or liberation); and Magga, the path of practice that leads out of suffering and into nirvana, Noble Eightfold Path. Buddha wandered the Indian plains for 45 more years. Along his travels he taught what he had learned in the moment of his awakening. Around him a community of monks, and later nuns, developed from every tribe and CASTE. These followers believed in his path, or dharma, and devoted themselves to his teachings. Buddha did not call himself a deity, nor did he wish to be worshipped.

THE FOUR NOBLE TRUTHS AND THE EIGHTFOLD PATH

Buddhist tradition teaches that living in ignorance of the Four Noble Truths is due to inexperience and desire to frame the world on one's own terms and thus, one remains bound to the cycle of birth, life, aging, illness, death, and rebirth in another life. Craving and desire propel this cycle over the course of countless lifetimes in accordance with karmic actions. The Buddha taught that gaining release from this cycle requires adherence to each of the Four Noble Truths and to assign a task to each one. The first is to comprehend, the second to abandon, the third to realize, and the fourth to develop. The full realization of the third is the path to enlightenment and the achievement of nirvana.

The Noble Eightfold Path is a set of personal qualities that must be developed. It is not a sequence of steps along a linear path. The Noble Eightfold Path is the right view, right resolve, right speech, right action, right livelihood, right effort, right mindfulness, and right concentration. The development of the right view and right resolve, wisdom, and discernment facilitate the movement of right speech, right action, and right livelihood, the three factors associated with virtue. As virtue develops, it is thought that the factors associated with awareness, right effort, right mindfulness, and right concentration are further developed. Buddha taught that the practitioner is then lifted in an upward spiral of spiritual maturity that eventually leads to enlightenment.

As the practitioner begins the Noble Eightfold Path, an individual's well-being is not predestined by fate, nor is it left to the whims of a divine being or by random chance. Responsibility for happiness is only dependent on the individual. With this realization it is taught that habitual ignorance is replaced with awareness. The practitioner is then mindful of his or her actions and chooses them with care. At this point some followers make the personal commitment to become enlightened and become a Buddha.

Buddha died at around the age of 80. His last words were "Impermanent are all created things; strive on with awareness." Naming the religion and philosophy he founded the Dharma-vinaya, the doctrine and discipline, Buddha created a social structure supportive of his practice. The monks and nuns who followed his teachings organized and preserved his teachings for prosperity, although none of his teachings were recorded until hundreds of years after his death.

Buddhism is sometimes criticized as a negative, or pessimistic, religion and philosophy in its assertion that life is suffering and disappointment. The Buddha based his teaching on what is considered a frank assessment of the plight of human life. Practitioners believe that the Buddha offered hope for an end to suffering. His teachings were thought to offer the reward of true happiness and the cycle of rebirth. Although release from the cycle of rebirth means to become extinct after death, this extinguishing is considered the ultimate freedom from suffering.

Assimilating Hindu, Persian, and Greco-Roman influences, Buddhism grew across India, Central Asia, and Eastern Asia into the first century B.C.E. In the third century C.E. the emperor ASHOKA of India converted to Buddhism, sponsored several monasteries, and sent missionaries into neighboring countries. During this period the practice spread across India and into Sri Lanka. As Buddhism spread, differing interpretations of the

Buddha's original teachings emerged, which led to the differing schools of Buddhism. One of these gave birth to a sect called Mahayana (the Greater Vehicle), and from it emerged Theravada (the Lesser Vehicle, also the Teaching of the Elders). Due to the pejorative nature of the terms and the historical regions in which the two branches became popular, the two sects are often called northern Buddhism and southern Buddhism.

THERAVADA BUDDHISM

Theravada Buddhists believe that they practice the original form of Buddhism as it was handed down by the teachings of Buddha. The doctrine of Theravada Buddhism corresponds with the recorded teachings of Buddha and is based on the Four Noble Truths. Through the practice of the Eightfold Noble Path, an individual can eventually achieve nirvana. However, Theravada Buddhism primarily focused on meditation, the eighth of the Eightfold Noble Path, and emphasized a monastic life removed from society. In addition, Theravada Buddhism required an extremely large amount of time to meditate. These strict ideas were not practical for the majority of people. The Theravada texts are written in a language called Pali, which literally means "text" and is based on a Middle Indo-Aryan dialect probably spoken in central India during Buddha's lifetime. Pali was originally a spoken language with no alphabet. It is thought that Ananda, Buddha's cousin and personal attendant, committed the Buddha's teachings to memory. After the Buddha's death, Ananda and 500 senior monks recited and verified the sermons they heard. Because the teachings were committed to memory, the teachings begin with the words "Thus I have heard..."

Teachings were passed down orally within the monastic community. The body of classical Theravada literature consists of Buddha's teachings arranged and compiled into three divisions. The Vinaya Pitaka, "basket of discipline," concerns rules and customs. The Sutta Pitaka, "basket of discourses," is a collection of sermons and utterances by the Buddha and his disciples. The Abhidharma Pitaka, "basket of higher doctrine," is a detailed psychological and philosophical analysis of the dharma. Together, these are known as the TRIPITAKA, "three baskets." By the third century C.E. monks in Sri Lanka created a series of commentaries on the Tripitaka, and by the fifth century they were translated into Pali as the Tipitaka. Since then the Tripitaka has been translated into many different languages. However, many Theravada students commit to learning Pali in order to deepen their understanding of the Tripitaka and related commentaries.

The Tripitaka and related commentaries are not considered statements of divine truth to be accepted by pure faith. The teachings of Buddha are to be experienced and assessed through personal experience. It is the finding of truth in the teachings of Buddha that matter, not the words of the teaching themselves. In this way the Tripitaka's passages serve as a guide for followers to use in their own path to enlightenment. Until the late 19th century the teachings of Theravada were unknown outside of southern Asia, where it had grown for more than 2,000 years.

MAHAYANA BUDDHISM

While Theravada was constructed for serious followers who could devote a large bulk of their time to meditations, Mahayana Buddhism could accommodate a greater number of people. Calling their path the Greater Vehicle, Mahayana Buddhists distinguished themselves from Theravada by calling Theravada the Lesser Vehicle. Instead of following a direct line of teachings from the Buddha, the Mahayana Buddhists believed they were recovering the original teachings of the Buddha. Their canon of scriptures represented the final teachings and accounted for the loss of their presence for hundreds of years by claiming that these secret teachings were only given to the most faithful. Regardless of its origins, Mahayana Buddhism is a departure from Theravada philosophy in that the overall goal was to extend religious authority over a greater number of people.

In this quest Mahayana Buddhists developed a theory of progressions for attaining enlightenment. At the top level was becoming a Buddha. Preceding enlightenment was a series of lives, called the bodhisattvas, or beings of wisdom. The bodhisattva was a major contribution to Mahayana Buddhism in that it was a concept created to explain Buddha's lives before his last. In this tradition the lives of Siddhartha Gautama before his last were spent working toward becoming a Buddha. In those lives he was a bodhisattva, a Buddha-to-be, that could achieve wonderful acts of joy and compassion for others. Literature surrounding those lives is collectively called the Jataka, or the Birth Stories.

Although much is unknown about the earliest traditions in Buddhism, some evidence exists that followers thought there would only be one Buddha. Within a short amount of time, it was believed that another Buddha would soon follow. This concept of the Maitreya Buddha, or Future Buddha, grew to include the belief that if a Future Buddha was coming then a Buddha or bodhisattva was already on earth passing through life. This meant that someone alive at any given moment

was the Maitreya. In addition, the numbers of Maitreya Buddhas were uncertain. The person serving food or cleaning the floors may be the Maitreya.

Instead of the goal of attaining full enlightenment, as in Theravada Buddhism, a practitioners' goal is to be the *arhant*, or the "worthy." The worthy is one who has learned the truth from others and has realized it as truth. Mahayana Buddhists believe that in this way, the follower hears the truth, realizes it as truth, and then passes into nirvana.

Mahayana Buddhists adhere to seven particular features of Mahayanism. The first is Its Comprehensive-ness. Mahayana Buddhists do not confine their beliefs to one Buddha but strive to see truth wherever it may be found. The second is Universal Love for All Sentient Beings. This belief differs from Theravada Buddhism in that it strives for general salvation of all people. Third is Its Greatness in Intellectual Comprehension, meaning that all things in general are not directed by a metaphysical deity. The fourth is Its Marvelous Spiritual Energy. The bodhisattvas are thought never to tire of working for universal salvation, and they do not worry about how much time it takes to achieve this. The fifth feature is Its Greatness in the Exercise of the Upaya. *Upaya* translates as "expediency," or acting as appropriate to achieve a goal. The sixth feature is Its Higher Spiritual Attainment, meaning that followers strive to achieve their highest spiritual level. Seventh is Its Greater Activity. When a bodhisattva becomes a Buddha, it is then able to manifest everywhere to minister to the spiritual needs of all beings.

Mahayana Buddhism disappeared from India during the 11th century. In Southeast Asia, Theravada Buddhism replaced Mahayana Buddhism. However, Mahayana Buddhism is the most popular of branch of Buddhism in the world today.

Three Kingdoms, China

The Three Kingdoms period lasted between 220 and 280 C.E. It inaugurated almost four centuries of political division in Chinese history, comparable to the Dark Ages in Europe after the fall of the Roman Empire in the West. This is because similar to the Roman Empire in western Europe, the fall of the unified HAN DYNASTY signaled a period of civil wars, intrigues, and nomadic invasions and rule over northern China.

Several events heralded the fall of the Eastern Han dynasty, beginning with the YELLOW TURBAN REBELLION in 184 C.E. This peasant revolt with messianic overtones was put down by regional warlords, who proceeded to war against one another, with the hapless emperors as their pawns. Cao Cao (Ts'ao Ts'ao) emerged as the most powerful warlord, but his attempt to reestablish unity under his leadership ended at the Battle of the Red Cliff in 208, when his forces were defeated by a coalition of two rivals. As a result, Cao could only control northern China, while one rival Liu Bei (Liu Pei), who was a descendant of the Han imperial house, established himself in Sichuan (Szechwan) and the southwest with a capital city in Chengdu (Cheng-tu), while Sun Quan (Sun Ch'uan) controlled the southeast from the Yangtze River valley to northern Vietnam with his capital in Nanjing (Nanking). Cao Cao, known as one of the most wily and ruthless politicians in Chinese history, consolidated his rule in the north, gave himself the title of king, and would probably have usurped the throne but died in 220.

In 220 Cao Cao's son Cao Pi (Ts'ao P'ei) forced the last Han emperor to abdicate in his favor and proclaimed the establishment of the Wei dynasty. However, his rivals immediately challenged him. Liu Bei proclaimed himself emperor because of his imperial lineage, and his dynasty was called the Shu Han (Shu is another name of Sichuan). Zhugo Liang (Chu-kuo Liang), a brilliant tactician who gained legendary renown, and Liu Bei's sworn brothers, Zhang Fei (Chang Fei) and Guan Yu (Kuan Yu), aided him militarily. The latter became known as Guandi (Kuan-ti), or Emperor Guan, and was deified as the god of war in Chinese popular religion.

Liu Bei's early death in 223 and the inability of his successor resulted in the annexation of Shu Han by Wei in 263. Sun Quan also proclaimed himself emperor in 222 and called his realm the Wu dynasty. Meanwhile, Cao Cao's weak descendants would suffer the same fate as the last Han emperor. In 265 the last Wei ruler was forced to abdicate to his powerful general, Sima Yuan (Ssu-ma Yuan), who founded the Jin (Chin) dynasty.

Sima Yuan then destroyed Wu in 280 and ended the era of the Three Kingdoms. It was an era of chaos, wars, and murderous intrigues but has been romanticized as one of chivalry and romance.

Three Kingdoms, Korea

The Three Kingdoms period refers to an era in Korean history in the fourth century C.E. when the three states of Koguryo, Silla, and Paekche existed simultaneously until the unification of the peninsula by Silla in 668 C.E. Koguryo was the largest and earliest unified kingdom, followed by Paekche and Silla. Our knowledge of the three kingdoms comes from archaeology and ancient historical texts from China, Japan, and Korea, particularly the *Samguk Sagi*, Korea's first history written in 1145.

Koguryo was unified as a kingdom under the sixth ruler, King T'aejo, and occupied the northern part of the Korean peninsula and Manchuria in northeastern China. The Yemaek tribes, who conquered the Puyo state in 37 B.C.E., founded Koguryo. For centuries Koguryo kings fought against tribes to the north and China to the west. In 313 C.E. the Koguryo king drove the Chinese out of their LO-LANG commandery centered in Pyongyang. However, the Chinese retaliated in 342, successfully attacked the Koguryo capital, dug up the corpse of the Koguryo king, and departed with 50,000 prisoners. Paekche took advantage of Koguryo's weakness by invading the capital near Pyongyang and killing the ruler.

The golden age of Koguryo's territorial expansion was during the rule of King Kwanggaet'o. According to an inscription in his tomb, he conquered 64 fortresses and 1,400 villages. He also took over the Liaotung region of northeastern China, which had been a focal point for Chinese attacks against Koguryo. He drove back a Japanese invasion of Silla in 400 C.E. In 475 Kwanggaet'o attacked the Paekche capital and expanded his borders southward by defeating an allied force of the Chinese Northern Wei kingdom and Paekche soldiers. Koguryo

dominance did not last, however, and starting in the early seventh century Koguryo was constantly at war with the Chinese Sui dynasty. Although Koguryo defeated the Sui invasions, the largest consisting of 1 million soldiers, the years of warfare significantly weakened the country. The subsequent Tang (T'ang) dynasty also invaded Koguryo and was defeated until a fateful alliance with Silla, which led to the unification of the peninsula.

After the fall of the Sui dynasty Koguryo prepared itself for further invasion by the Tang, setting up defenses along the border between the two states and forming an alliance with the Turks. The key to Koguryo's destruction was the pact between Tang and Silla and internal power struggles. Under this agreement the Tang helped Silla defeat Paekche, and then the two attacked Koguryo. The Tang court was not content to simply defeat its Koguryo enemies but intended to incorporate the peninsula into its state. The Chinese left 10,000 troops in Paekche after the latter's surrender in 660. They also established administrative and military offices throughout Paekche. The Chinese planned a similar strategy with Koguryo when the Tang-Silla alliance laid siege to the capital, Pyongyang, in 661. After the Koguryo king surrendered in 668, the Chinese removed the king, officials, and 200,000 prisoners and placed rule over the territory under a military governor and established commanderies.

Paekche was a kingdom that mixed Puyo refugees (who had moved southward after their defeat by the Koguryo) with native Mahan tribes. Although the *Samguk Sagi* claims that Paekche was founded in 18 B.C.E., the state was unified by the reign of King Koi in the mid-third century C.E. and became a centralized aristocratic state a century later. Paekche was located in the southwest part of the peninsula and shared a border with Koguryo to the north and Silla to the east. Between the mid-fourth and mid-seventh centuries Paekche maintained a relatively friendly and consistent relationship with Japan, providing various technical and cultural advisers in return for occasional military support against Koguryo. It was Paekche that acted as the main conduit of culture and technology between China and Japan.

Silla unified as a state under the rule of King Naemul (356–402 C.E.) when the Kim family was established as the reigning family of the kingdom. Silla's unification was aided by adopting Buddhism as the official state religion.

Located in the southeast section of the peninsula, Silla often allied with Koguryo to help defeat the smaller tribes that were eventually incorporated into their

realm and to fight off the invading Japanese. Silla also unified with Paekche to counter Koguryo's dominance of the peninsula.

During the Three Kingdoms period Silla had a famous military academy and a group of young warrior aristocrats called the Hwarang. Originally a local institution for educating young males and providing them with military training at the village level, it quickly grew into a national center for young, elite male cultivation. Even after the fall of the unified Silla state, the Hwarang (flower knights) were the heroes of legendary tales. The legends of the Hwarang should not belittle the very real military power of the Silla kingdom. Although it was the smallest of the three kingdoms, the great Koguryo and Paekche formed an alliance in an unsuccessful attempt to stave the rise of Silla and its alliance with the Tang Chinese.

The Silla leaders understood that the Tang planned to take over the peninsula, and immediately after the surrender of Koguryo, Silla began supporting rebellions in the fallen kingdom. The Silla followed up with an attack on Chinese-controlled Paekche in 671, eventually defeating the Chinese. In addition to Silla-supported rebellions in Koguryo, however, were the Malgal tribes who fought against the Tang and eventually took control of the Manchurian area of former Koguryo. The Koguryo natives and Malgal formed a new state called Parhae. The chaos accompanying the fall of the Tang dynasty weakened Parhae, which was eventually invaded by the Khitan tribes in 926. Refugees fled south into Silla and became part of the Koryo dynasty.

Thucydides

See HERODOTUS, THUCYDIDES, AND XENOPHON.

Toba (T'o-pa) dynasty

The Toba, or Northern Wei, were nomads variously described as belonging to Tungusic or Turkic ethnicity. During the ERA OF DIVISION after the fall of the HAN DYNASTY in 220 C.E., and after invading nomads drove the Jin (Chin) dynasty to south China, confusion reigned in northern China. In 386 the Toba established a dynasty called the Northern Wei that would control most of northern and northwestern China until 534.

The first capital of the Northern Wei was near modern Datong (Tatung), a frontier city near the GREAT WALL OF CHINA, important because it guarded the boundary between agricultural China and the steppes. There they built a city modeled on Han capitals CHANG'AN (Ch'ang-an) and LUOYANG (LOYANG). The Toba converted to Buddhism and showed their devotion by commissioning the carving of huge cave temples into a rocky escarpment near their capital called Yungang (Yunkang), which remains a monument to Buddhist art. In 494 the Northern Wei dynasty capital was moved to Luoyang, a city resonant with the history of China. Outside Luoyang they began to build another monument to Buddhism called the Longmen (Lungmen) Caves. The move showed the sinicization of the Toba aristocracy and their identification with Chinese civilization.

In 494 the Northern Wei government outlawed the Toba language, names, and clothing and ordered the Toba people to adopt Chinese names and clothes and to use Chinese exclusively. The imperial family led the way by adopting the surname Yuan. Claiming to be the legitimate successor of ancient Chinese dynasties, the government also forbade tribal ritual and allowed only Confucian and Buddhist observances. Intermarriage between the tribal aristocracy and Chinese upper classes was actively encouraged. The Northern Wei also behaved toward other nomadic peoples beyond its frontier in the same manner as traditional Chinese dynasties, when not warring against them, accepting tribute and bestowing gifts, including princesses when necessary.

These policies resulted in a severe split among the Toba. The tough Toba soldiers who still lived by their ancient ways and who guarded the northern and western frontiers revolted in 523. Ten years of civil war followed during which Luoyang was sacked and many of the sinicized aristocrats were massacred, including the empress dowager and the child emperor. Two strongmen emerged in 534 who divided the territory: One part was called Western Wei, with its capital city in Chang'an; it retained tribal traditions and Toba heritage. The other was called Eastern Wei, with its capital city at Ye (Yeh) in Henan

(Honan), where the Toba and Chinese governed in collaboration. Both of them were short lived and were replaced by two equally ineffective dynasties of nomadic origin. In 581 a nobleman of mixed Sino-nomadic ancestry named Yang Qian (Yang Chien) proclaimed the founding of the Sui dynasty under his leadership. He would unify north and south and end the Era of Division. Among the northern dynasties the Northern Wei had the longest existence and controlled the most territory. It owed its success and also its ultimate destruction to the policy of sinicization.

Torah

The Torah of MOSES is a unique collection of writings that either refers to the first five books of the Bible, the whole of the Jewish Bible, or, generally speaking, the "teaching" or "instruction" of the religion of ISRAEL. In this article the first meaning will principally be used. Because the first five books cover most of the laws related to the religion of Israel and to the current Jewish faith, it is also called the Law. In Greek these books are called the Pentateuch, because they are five (*penta*) and they are set apart as an order or collection (*teuch*) of books. The five books are Genesis, Exodus, Numbers, Leviticus, and DEUTERONOMY.

The first five books of the Bible tell the story of the faith of the true religion, beginning with the creation and ending with the relationship that the God of the Bible makes with a particular people called Israel. There is no other work of such scope in the ancient civilized world, either in terms of length, complexity of sources, or subject matter. There are older religious canons that have endured even to modern times (such as the VEDAS for Hindus), but the Torah is more systematic and coherent in its present form. For modern Jews it is the oldest and most important part of the Bible, and Jews and Christian alike view it as the introduction to the whole Bible.

According to Deuteronomy, the Torah refers to the teaching copied by Moses on MOUNT SINAI in response to the divine command. The teaching was inscribed on stone tablets and deposited in the ARK OF THE COVENANT, and so it was something like a written contract uniting Israel's God and God's Israel. However, only half of the Penta-

teuch is legal code. The rest consists of narrative stories and rhetorical exhortations so that the reader can read it as an interesting and persuasive book and not simply as a compendium of religious law. The story line, or plot, can be summed up in the following broad outline: the history of the human race (Genesis 1–11), the history of Israel's origins and ancestry (Genesis 12–50), the history of Israel in Egypt before the Torah (Exodus 1–18), the collection of laws for Israel (Exodus 19–Numbers 10), Israel's response to the Torah laws (Numbers 11–36), and Moses's final exhortation to Israel to follow the Law contained in the Torah (Deuteronomy 1–34). Moses is important but is not present in all of the material. The reason for calling it the "Torah of Moses" is that Moses is its chief character and is also considered by religious tradition to be its author. Writings as early as 400 B.C.E. assign the authorship of the Pentateuch to Moses, as do later Jewish and Christian authorities, like JOSEPHUS, PHILO, the MISHNAH, the fathers of the church, and the TALMUD. This belief continued almost unanimously until the time of the Renaissance when its authorship was questioned.

Ancient authorities had a different notion of authorship than moderns: For them it was sufficient to consider as author the one who provided the initial impulse and served as inspiration for the writing more than the one who actually finished the job. For them the author was the one who bore responsibility for the creative enterprise, not the scribe or editor. Today, however, few modern scholars regard Moses as the only—or even the main author—of the Pentateuch. No passage in the Bible says so in such terms, although certain parts are specifically stated as his writings. Later readers probably felt that if Moses wrote some of the pieces, he probably wrote them all: After all, he spent more than 40 days on Mt. Sinai learning about the Torah's Law. A good parallel to Moses and the Pentateuch is SOLOMON and Solomonic literature, that is, a famous person comes to be associated with a particular type of literature so that the popularity of both is increased.

In the legal material there are 613 commandments that define the relationship that Israel is to have with its God. These laws pertain to ethical, religious, and civil matters. They date from the earliest days of Israel's founding as a nation to the later stages of the Bible's formation. There may be several sources of material for the five books, and these arise from various perspectives and dates.

Scholars claim to discern the outlines of these documents in the Torah, but often there is not agreement about the seams and interpretations. Other scholars have noticed the similarity between the Torah's cov-

enant and the ancient treaties that the HITTITES' rulers imposed upon their client vassal peoples.

The centrality of the Torah of Moses is evident in the later parts of the Bible. It becomes the basis for the legitimacy and inspiration for these books even before they are included in the canon. The writings of the New Testament, especially those of JESUS (CHRIST) OF NAZARETH and PAUL, and the Mishnah and the Talmud also claim their authority from the Torah. This is especially seen in the rabbinic doctrine of the "oral Torah," that is, the words of Moses that were not written down in the Bible. The purpose of this new canon (Mishnah and Talmud) is to unlock the secrets of the written Torah of Moses.

MARK F. WHITTERS

Trajan

(53–117 C.E.) *Roman emperor*

Trajan was one of the greatest Roman emperors. Born within a distinguished Roman family from Hispania, he spent the first years of his public life as a renowned general whose victories spread quickly through the empire. During the last years of the first century C.E. Nerva—one of the ANTONINE EMPERORS—decided the destiny of such an extensive territory. Adopted by him in 98 C.E., Marcus Ulpius Nerva Traianus managed to seize power and hold it until 117. He was a good example of how adoption proved to be extremely fruitful, since its system allowed minimizing the contingencies of heritage. Under Nerva and Trajan, after almost 100 years of empire, a new understanding commenced between the supreme authority of the *princeps*, and the community submitted to him, based on a twofold concession: the acceptance that this form of government was indispensable and the recognition by the emperor of the legitimate privileges of the upper class. Thus, the *princeps*'s power not only became stable and dominant, but also his relationship with the citizens improved.

Trajan was more a good administrator than an innovator, believing in the supremacy of good management

over an excessive confidence in reforms. Nonetheless, he reacted militarily when the king of the Dacians, Decebalus, prevented the advance of the army in Germania. He declared war against Dacia and conducted the army to his territory, where the king was completely beaten. Trajan did not kill his enemy, but despite his mercy, two years later Decebalus organized a new rebellion against the emperor. This time the traitor was fiercely defeated, and all the gold mines in the area were confiscated. Trajan used the great bounty to finance a huge program of public works. He built a large aqueduct, a new port in Ostia, four new big roads, and the amphitheater in Verona. His most famous construction was the Trajan Forum.

During Trajan's period Roman culture flourished with masterpieces of Latin literature. Pliny the Younger was one of the prominent advisers of Trajan. He left hundreds of letters in which we can appreciate the emperor's personality as well as the customs of the time. Aiming at concluding the work of Caesar and Antony, Trajan tried to expand the limits of the empire as far as the Indian Ocean, which he managed to do by fighting the Parthians. He was also able to conquer Babylon, Seleucia, Ctesiphon, and Susa. Unfortunately, several rebellions arose, and he was compelled to return to Rome. He never arrived back to the *urbs*, as he died on the way. HADRIAN succeeded him.

SILVANA A. GAETA

Tripitaka

The Tripitaka (or Tipitaka) is the SANSKRIT (or Pali) canon of religious discourse most highly regarded in Theravada Buddhism. The literal translation is the “three baskets,” so named because the original writings were kept in baskets. The three elements of the canon are the Vinaya Pitaka, which are the disciplinary rules by which monks are expected to live their lives; the Sutta Pitaka, which are the discourses of the Lord Buddha and other leading schol-

ars of Buddhist belief; and the Abhidharma Pitaka, which are a series of philosophical discourses on the nature of the universe and of Buddhist belief. The Tripitaka was assembled shortly after the death of GAUTAMA BUDDHA through a *sangha*, or council of monks. It was preserved in oral tradition for some four centuries before being committed to palm-leaf manuscript in the first century C.E.

Owing to linguistic and cultural differences, the Tripitaka varies from country to country where Theravada Buddhism is practiced. In each case the writings are extensive and occupy many volumes. The Sutta Pitaka, for example, contains more than 10,000 sutras of the Buddha. These include details of the life of the Buddha and his road to nirvana, or enlightenment; Mahayana and Vajrayana forms of Buddhism also have their own Tripitaka canons. The Vinaya Pitaka consists of rules and junctures for both monks and nuns, although in some societies the role of nuns is not officially accepted. Various offenses against the *sangha* are enumerated together with their degree of severity and, hence, the sanctions that they attract. Monks are expected both to know and to abide by the 227 rules of the Great Division (Maha-vibhanga), which greatly expand on the five basic precepts that all followers of Buddhism are expected to follow.

An additional section of the Vinaya Pitaka is the Khandhaka, which contains a variety of different sections that are not presented in an intuitively logical order. This section contains precepts for the monkhood that vary from country to country. Members of the *sangha* spend much of their time studying and attempting to master the many meanings and lessons inherent in the Tripitaka. Lay Buddhists may also do the same, either directly from the original canon or, more commonly, through the mediation of well-read monks who are able to translate the lessons into language and concepts easier for most people to understand.

JOHN WALSH

Triumvirate

The years prior to the First Triumvirate were unstable and anticipated future conflicts. A series of external struggles—such as a long war to suffocate the rebel-

lion of Sertorius in Spain, the second war against Mithridates, and the fight against the gladiators and slaves commanded by SPARTACUS—weakened the vigor of the already wounded Roman Republic. After MARIUS AND SULLA disappeared from the political arena, the civil wars seemed to be over but only temporarily. A much bloodier struggle was about to begin. The First Triumvirate was a tripartite alliance shared by three of the most influential men in politics during those days: JULIUS CAESAR, Gnaeus Pompeius Magnus (POMPEY), and Marcus Licinius Crassus. This coalition lasted from 60 to 54 B.C.E.; however, the name First Triumvirate was never used by the Romans, and it is somewhat deceptive since many other men were involved in the agreement, such as Lucius Lucceius and Lucius Calpurnius Piso.

THE FIRST TRIUMVIRATE AND CAESAR

By 60 B.C.E. Caesar was the foremost figure of the popular party, particularly after his achievements in Spain, which put him in a position to demand an opportunity in the near election for consulship. The Senate considered him a powerful opponent, and his candidature arose considerable resistance from the *optimates*. Even though Caesar had overwhelming popularity within the citizen assemblies, he was compelled to forge alliances within the Senate in order to secure his election. He needed a wealthy ally to support his ambitions, and he found that backing in one of Pompey's rivals, Crassus. Pompey was discouraged by the lack of land reform for his eastern veterans, and Caesar skillfully mended any differences between the two powerful leaders. On the other hand, Crassus, whose business in the East was significant, could not achieve his projects without a politician like Caesar supporting his interests, so he joined the coalition with enthusiasm.

Under the protection of these two prominent men, Caesar won the consulship in 59 B.C.E., and one of his main concerns was conciliation with Pompey. He managed to secure the passage of an agrarian law providing Campanian lands for 20,000 indigent citizens and veterans, which was expected not only to lighten the problem of the unemployed mass in Rome but also to please Pompey and his legions. Julia, Caesar's daughter, married Pompey, further securing the alliance.

By the end of his consulship, through the *lex Vatinia*, he succeeded in obtaining the proconsulship of Cisalpine GAUL and Illyricum with four legions for the term of five years, from 58 to 54 B.C.E. The extension of this period, unprecedented for an area with no imminent seditious crisis, was a real sign of Caesar's ambition for external conquests. During this time he accomplished remarkable achievements, such as the conquest of the Britons and the

successful defeat of one of his greatest enemies, the Gaul leader VERCINGETORIX, who was vanquished in the Battle of Alesia in 52 B.C.E. During his absence old rivalries between Pompey and Crassus returned, and in 56 B.C.E. Caesar returned to Rome to patch up matters, and it was agreed that both Pompey and Crassus should be consuls in 55 B.C.E. They obtained—as proconsular provinces—Spain and Syria, respectively, and Caesar gained an extension of his command in Gaul until 49 B.C.E.

BREAKUP OF THE FIRST TRIUMVIRATE

The bonds that connected these three personalities were soon broken. The first symptom of the imminent rupture was the death of Caesar's daughter, Julia, in 59 B.C.E. Furthermore, during the years Caesar spent abroad, Pompey progressively withdrew from the senatorial party, which had never fully accepted Caesar's power. Since the beginning it was clear that the weakest element of the group was Crassus. He died soon after the Battle of Carrhae, leaving the ground ready for an open clash between the two remaining forces. Civil war broke out between Caesar and Pompey; they fought for control over Rome.

In 49 B.C.E. Pompey convinced the Senate that Caesar was a danger to their interests. Caesar was immediately ordered to disband his army and give up the province of Gaul. Instead, Caesar crossed the Rubicon River. The river, close to Rimini, indicated the frontier between the Cisalpine Gaul, where the proconsul had the right to instruct his army, and the Italic territory, where it was forbidden to drive the army. No Roman could legally cross that line, so Caesar's decision was a slap in the Senate's face, and war against Pompey and the *optimates* began.

As Caesar marched to Rome, Pompey and his allies escaped to Brundisium and, from there, to Greece. Finally, in 48 B.C.E. in the famous Battle of Pharsalia, Caesar struck Pompey, who retreated to the court of King Ptolemy XII of Egypt, where he was assassinated as a gesture of gratitude to Caesar. Caesar went to ALEXANDRIA and participated actively in the internal political conflict between opposing Ptolemy and Cleopatra.

From 47 to 45 B.C.E. Caesar fought with followers of Pompey. After Pompey's death Caesar's power grew, and the Senate felt unease with his power. In 44 B.C.E. a conspiracy grew, led by Cassius and Brutus—thought by some to be the illegitimate son of Caesar. Caesar was murdered on the Ides of March before a meeting of the senators. The political situation changed abruptly after the assassination of Caesar, and the political map had to be redesigned. His murderers were amnestied and forced to leave the city, while Mark Antony and Marcus Aemilius

Lepidus, also named *pontifex maximus*, became the two official heads of state.

In his will Caesar adopted Gaius Octavius (Octavian) as his heir—the future AUGUSTUS CAESAR—and left him almost all of his fortune. This practically unknown, inexperienced, and extremely young man was studying in Illyricum at the time of Caesar's murder and promptly set out for Rome to take control of his heritage. He tried allying with Antony, who refused to help him, having been offended at not having been appointed Caesar's legitimate inheritor.

Octavian gained power and raised a private army. He gained influence in Rome, which he secured through a series of demagogical acts, such as the provisions of food and entertainment for the urban plebs and adopting the name of the late Caesar.

MARK ANTONY AND THE SECOND TRIUMVIRATE

Antony departed to Gaul where, by means of the powerful legions that were stationed there, he gained increasing strength. In November Octavian, Antony, and Lepidus met near the river Bononia with their legions and formed the Second Triumvirate. Whereas the First Triumvirate was almost a secret pact of mutual help, the *lex Titia* presented to the tribunal assembly consolidated the Second Triumvirate within an official framework and invested the initiative with legality.

The triumvirate was backed and sealed by the marital union of Octavian and Antony's stepdaughter, Claudia, and by Antony's marriage to Octavia, Octavian's sister. Lepidus, a former consul in 46 B.C.E. with no major political accomplishments, had an impressive military force in Spain and was wealthy enough to support the huge expenses that foreign campaigns demanded. He also acted as a shield between Antony and Octavian, whose personal relationship was never quite strong, both eagerly looking for power.

One of the first political acts carried out by the new government was the persecution of Caesar's assassins. Brutus, after finding out that the Senate's support could no longer save him, escaped toward the East, but he was captured and executed on the way, and according to Suetonius, his head was sent to Rome to be placed under Caesar's statue. The punishment extended to some 300 senators, and 2,000 knights were banned and their possessions confiscated.

The most famous case was the murder of the orator Marcus Tullius CICERO. In 40 B.C.E. the Roman territories were divided into three regions: Lepidus received Africa, the West was granted to Octavian, and Antony obtained the Middle East, Greece, and Egypt, where in

42 B.C.E. he encountered Cleopatra. It was the beginning of a relationship that would seal Rome's fortune and their destinies.

ANTONY AND CLEOPATRA

Octavian in Rome was dealing with one last menace: that of Sextus Pompey, son of Pompey, member of the First Triumvirate. Being the provincial governor of Sicily, he had a large amount of power in the area, and therefore many of the outlawed citizens sought his help. In 37 B.C.E. the Pact of Tarentum renewed the triumvirate for another five years.

Nevertheless, the relationship between Octavian and Antony was deteriorating daily. In 36 B.C.E. as the triumvirate foresaw a clear danger, the island of Sicily was invaded, and Agrippa—one of Octavian's men—defeated Pompey's army. Later that year Lepidus tried to keep Sicily for himself, but his troops did not support him and deserted to Octavian, who consequently deprived Lepidus of all his triumviral powers, leaving Octavian with 40 legions.

In 35 B.C.E. Antony and his wife were in Greece, and he sent her back to Rome and carried his army against Labienus (the son of a general who had betrayed Caesar), who was helping the Persian king to assemble a powerful army. Cleopatra joined him. In 34 B.C.E. he celebrated a huge triumph in Alexandria. He repudiated Octavia, married Cleopatra, and declared Caesarion, Caesar's son, the legitimate heir of Egypt and Cyprus. By doing so he cut the final bond that connected him to Octavian. The latter openly attacked him and turned him, in the eyes of Rome, into an Eastern enemy, dominated by the Egyptian queen. In 31 B.C.E. Octavian, elected consul for the third time, defeated Antony in the famous naval battle of Actium, which sealed not only Antony's fate—he and Cleopatra committed suicide in 30 B.C.E.—but also the Republic's destiny.

Troy

The ancient city of Troy is the basis of Homer's *Iliad* and site of the Trojan War. Troy lies in present-day western Turkey, at Canakale on the ancient Scamander River. Troy is known through the writings of the poet Homer and the stories of Heracles, Laomedon, King Priam, Hector, Paris, Achilles, the Trojan Horse, and HELEN OF TROY. Virgil vividly discussed the Mycenaean Greek sacking of Troy in his book the *AENEID*. The events that Homer reported as taking place in Troy occurred around 1200 B.C.E., and he wrote and sang them around 800 B.C.E.

Troy was thought to be a mythical city in modern times, but archaeologists found proof of its existence. In the 19th century a succession of excavators determined that the ancient city consisted of nine layers, one on top of the other. Troy is known as the cultural center of classical antiquity. After the Trojan War the city was abandoned for four centuries, until 700 B.C.E. when the Greeks settled there. The Romans captured Troy in 85 B.C.E., and the Roman general SULLA attempted to restore the city. Excavators determined that Troy I to IV existed from 3000 to 1900 B.C.E., during the early Bronze Age. At this time fortifications were built around the city. Troy VI existed from 1790 to 1250 B.C.E., and Troy VII existed during the middle to late Bronze Age. An extensive fire destroyed Troy V. Troy VI, an embellished reconstruction of Troy V, was destroyed by an earthquake. Survivors built Troy VII around 1250 B.C.E., but they died in the Trojan War. This is confirmed by the existence of a mass grave containing the remains of a Greek army. Troy IX was a trading city during the reign of Roman emperor Augustus, however it waned in importance after the rise of CONSTANTINOPLE.

Concrete knowledge about Troy emerged with the excavations of Charles McLaren, who found the ruins of Troy VII to Troy IX in 1822. German archaeologist Heinrich Schliemann, a wealthy retired businessman, illegally excavated the city three times from 1870 to 1890. He ruined much of the site, taking most of the treasures he found, and was forced to pay a huge fine to the Turkish government for the theft. The treasure was displayed at the Museum of Prehistory and Early History in Berlin. At the end of World War II the Soviets claimed the treasure. Further excavation was done in 1893–94 and again in 1932–38. Sponsored scientific excavations took place after 1988 under the leadership of Manfred Korfmann, and no further levels were discovered. Two geologists, Jan Craft and John V. Luce, determined in 2001 that the geology of present-day Troy is depicted in the *Iliad*. The

site of Troy is known as New Ilium and consists of a huge mound, a replica Trojan Horse, and a small tourist museum.

ANNETTE RICHARDSON

Trung sisters

(first century C.E.) *Vietnamese heroines*

Trung Trac and Trung Nhi are sisters who led a failed revolt against Chinese rule in northern Vietnam between 40 and 43 C.E. and are honored as heroines in Vietnam. The Southern Yue (Yueh), or Nanyue, people are a branch of Mongoloids who lived in tribal society and practiced slash-and-burn agriculture along the coast of China in present-day Guangdong (Kwangtung) and Guangxi (Kuanghsi) Provinces and the northern part of present-day Vietnam. The area was conquered during the reign of the first emperor of the QIN (CH'IN) DYNASTY between 220 and 210 B.C.E. and divided into three commanderies. When the Qin dynasty fell in 206 B.C.E., a man from northern China named Zhao Tuo (Chao T'uo) proclaimed himself king of Nanyue and made his capital in modern Guangzhou (Canton). Gaozu (LIU BANG), the first emperor of the HAN DYNASTY, confirmed Zhao as king, and a loose tributary relationship was established between Nanyue and Han. In 113 B.C.E. the queen dowager of Nanyue, who was Chinese and wanted a close relationship with Han China, was murdered by her opponents. This action resulted in war between Han and Nanyue, the destruction of the kingdom, and its annexation by Han, which established nine commanderies in the former kingdom.

Chinese rule resulted in economic advancement, with the introduction of irrigation and iron tools for agriculture. It also resulted in the gradual influx of Chinese immigrants to the best new lands, especially in the Red River valley. Friction led to a revolt led by two sisters, surnamed Trung (Zheng or Cheng in Chinese transliteration), daughters of a local chief, in 40 C.E. One proclaimed herself queen. A number of local tribes from 65 towns and settlements joined their cause. Emperor GUANGWU (KUANG-WU) of the Han dynasty reacted slowly, waiting

until 42 C.E. to appoint General MA YUAN as commanding officer in charge of suppressing the revolt. An experienced general, Ma was given the title “general who calms the waves.” He reached Guangdong in 43, sent his supplies via ships, and led the 10,000 troops overland to the Red River delta. The campaign was quickly over, the sisters were captured and executed (some say they committed suicide), and the mopping up was completed by the end of the year. Ma returned to capital city LUOYANG (LOYANG) in 44 and presented the emperor with a huge bronze horse, cast with the bronze melted from Yue drums that symbolized the power of the chiefs.

Resistance to sinicization and Chinese immigration was the likely cause of this revolt and many other similar revolts by aboriginal peoples in the southern borderlands of the Han empire during the first and second centuries C.E. The primary cause was Chinese immigrants moving deeper into the river valleys and appropriating good land, either assimilating the natives or driving them to less accessible areas. Some natives revolted, and the Han government felt compelled to put down the revolts to protect the Chinese settlements. Whereas Guangdong and Guangxi were eventually fully integrated into the Chinese state, Vietnam (Yuehnan in Chinese transliteration) became a separate state in the 10th century. In light of this the rebellion led by the Trung sisters had nationalistic overtones, and for this reason they were revered as symbols of resistance to Chinese domination. General Ma Yuan became deified in Chinese popular religion and was especially revered in southern China.

JIU-HWA LO UPSHUR

Turabdin

While the history of Christianity focuses on the GREEK CHURCH and the LATIN CHURCH, a third major source of the faith is often ignored or unknown: Syriac (or Semitic) Christianity. Its traditional center lies in southeast Turkey in a region called Turabdin, which may mean “mountain of the servants.” It is not truly a mountain but a limestone plateau overlooking modern Syria, on which were founded at least 80 monasteries of the Oriental Orthodox Christian tradition.

Its people descended from the ARAMAEANS, who were the dominant group of biblical times. The language of its inhabitants even today reflects ancient Aramaic roots, a dialect of Syriac called Turoyo. Centuries later the Eastern Roman Empire established its epicenter near Turabdin, in ancient EDESSA and its frontier city Nisibis. The region then became the bloody border between the Persians and the Romans and, later, the Byzantines. Edessa—to the west of Turabdin—did not fall to the Persians until 609 C.E. Nisibis—much closer to Turabdin—was largely cut off from the Greco-Roman world when the Persians took the area in 363 C.E. and kept the region isolated from the West for centuries afterward. Successive groups of Muslims kept up the same policy under the Umayyad, Abbasid, and Seljuk Empires. Thus, because of Turabdin’s origins and its colonial status, it is one of the most authentic descendants of the biblical world.

Legends speak of Thomas the Apostle, Addai, MARI, and others who first took the Christian message to Mesopotamia. The first bishop came as early as 120 C.E., but full conversion of the region did not happen until the fourth century. Residents of Turabdin set such a high standard for themselves that nearly every town and village had its own monastery and its own mystics and miracle workers. The oldest continual monastery in the world, Mor Gabriel, owes its foundation to that burst of Turabdin enthusiasm between 350 and 400 C.E.

Turabdin boasts an honor roll of teachers, poets, and missionaries. In the foothills nearby Jacob and his pupil EPHREM taught one of the most important schools of theology. Awgin, the founder of Mesopotamian MONASTICISM, and Abraham of Kashkar, the reformer of Syriac monasticism, also claim the heritage of Turabdin. Many of its monks possessed healing gifts and supernatural abilities of self-denial.

One of the great benefactions of Turabdin is its collection of Syriac manuscripts, many of which have not yet been published. From its earliest days Turabdin has preserved manuscripts so that Syriac Christianity will not stray from its Aramaic cultural and linguistic moorings. It is through these ancient books that scholars have been able to discern the roots and development of Christian liturgy in the other Greek and Latin churches.

MARK F. WHITTERS

U

Ugarit

Ugarit was an ancient harbor city located on the Mediterranean coast of northern Syria. The site is known today as Râs Shamra. Archaeological expeditions began there in 1929, and since that time over 1,250 clay tablets containing CUNEIFORM texts have been discovered. The tablets, dating from the middle of the second millennium B.C.E., are written in the alphabetic language of Ugaritic, a northwest Semitic language closely related to Hebrew. The culture reflected in the texts has shed great light on the Canaanite backdrop of the JEWISH BIBLE, providing scholars a look at the linguistic and cultural conditions of the Canaanites from their point of view. In addition to the clay tablets, archaeologists have uncovered a royal palace and several administrative buildings, as well as an extensive residential area. The palace was enormous, consisting of approximately 90 rooms and six large courtyards. In addition, several temples have been found, one of which was dedicated to Baal.

Although the material finds at Ugarit are certainly impressive, the most significant find is the texts. In the very first season of excavations, clay tablets were found littering the floor of a house. This nicely built house turned out to be the home of the high priest of Baal. It was near the temple of Baal, and the texts were from the priest's personal library. Particularly interesting are the numerous tablets containing mythological poems about the Canaanite gods Baal, Baal's sister the warrior goddess Anat, El, the head of the pantheon, and El's consort, Asherah, the mother of the gods. Other gods

in the texts include Athtar (biblical Ashtaroah) and the divine craftsman Kothar wa-Hasis. These mythological texts help scholars understand the backdrop of biblical admonitions to avoid contact with the gods of Canaan, as well as the worldview of the ancient inhabitants of Ugarit. Legendary figures in the texts include the hero Daniel and his son, Aqhat.

The main mythological texts from Ugarit are the Baal cycle, the Kirta epic, and the legend of Aqhat. The Baal cycle tells the story of Baal's efforts to establish his kingship over the universe as well as the building of his temple. The Kirta epic tells of the near extinction of a royal house and its subsequent restoration at the hands of the creator god El. The legend of Aqhat, who is the son of Daniel, is the primary text showing the relationship between a human hero and the gods. Since the mythological texts are poetic, much has been learned about the conventions of Canaanite poetry, helping scholars understand the biblical poetry contained in the PSALMS and Proverbs.

There have also been many administrative and ritual texts discovered at Ugarit. Five separate archives have been found at the royal palace, yielding texts in Ugaritic as well as Akkadian. Other libraries have been recovered from the private homes of priests, lawyers, government officials, and professional scribes. The administrative documents show how the kingdom of Ugarit was organized as well as the nature of its interactions with surrounding nations, allowing scholars to reconstruct the political history of the last seven kings of the city. The ritual texts shed light on Canaanite

cultic rituals and present many parallels to the sacrificial sections of the Jewish Bible. The kingdom of Ugarit ended with the invasion of the SEA PEOPLES in approximately 1200 B.C.E. Tablets discovered abandoned in a kiln date to the fall of the city and describe the transfer to the north of Ugarit's army and navy, leaving the city defenseless against attack. One tablet records the sack of the city from which the kingdom was never able to recover.

ERIC SMITH

Ulfilas

(c. 311–c. 383 C.E.) *religious missionary*

Ulfilas (Gothic: Wulfila) was a tireless missionary and educator among various Gothic tribes of the Western Roman Empire in the latter half of the fourth century C.E. Not only did he contribute to the culture and education of the “barbarian” tribes before they were integrated into civilized Europe, but he profoundly affected the course of Christianity in the Western LATIN CHURCH.

He was born in Cappadocia, in modern-day Turkey, probably to a Christian family. Like another great Christian missionary, PATRICK, a marauding tribe captured him and taught him barbarian customs and language in his youth. At some later point in his life he received a classical education, so that by the time he was an adult he was fluent in Greek, Latin, and the language of his former captors, Gothic. He became a priest and then was consecrated a bishop by EUSEBIUS of Nicomedia, a leading proponent of ARIANISM.

His skills in languages made him a valuable asset for spreading the Christian faith. He was assigned missionary work among the Gothic tribes who were just outside the Roman Empire in the area around the lower Danube River. He did missionary work for seven years before being forced out by a hostile Visigoth chief. Nonetheless, he persisted in his work for 30 years on both sides of the imperial border, sending out missionaries among the Visigoths and putting the Gothic language into writing. At last he succeeded at both of his projects: The Visigoths as a people became Christian, and he translated the Bible into Gothic.

The Christianity that he taught his followers was not that of the COUNCIL OF NICAEEA. Ulfilas apparently believed that JESUS (CHRIST) OF NAZARETH was “like” the Father and not of the same essence or being with the Father. Few of his theological writings remain, but a statement of his faith quoted by one of his students, recorded by a bishop in opposition to AMBROSE of Milan, shows Arian language. This same tendency can be found in the tribes among whom he worked. His most famous writing, however, is the Gothic Bible, done alone or with collaborators. He may have devised the first alphabet for the Goths, using a combination of Greek and Latin letters. This achievement by itself had enormous repercussions for the transmission of Roman and Greek ideas into Gothic culture. The New Testament part of the Gothic Bible now includes only the four Gospels and the letters of Paul, and the Old Testament survives only in small parts.

The ideas of Arianism spread from the tribes with whom he worked to other Germanic groups across the Danube River. Eventually all barbarians were converted: Vandals, Burgundians, Suevi, and Lombards. When the HUNS invaded and forced all of these tribal groups into Roman territory, they brought their Arianism with them and made it as big an influence in the West as it had been in the East. Were it not for emergence of the Franks—who were Orthodox Christians—Arianism might have become the predominant belief of the Latin Church.

MARK F. WHITTERS

Ur

The Sumerian city of Ur is identified with Tell el-Muqayyar in southern Iraq, along a course of the Euphrates River that has dried up. It is commonly related to the birthplace of Abraham (“Ur of the Chaldeans” in Genesis 11:28–31). Excavations at Ur began in 1849, but C. Leonard Woolley did most of the work in 1922–34. Ur was first occupied from the middle of the Ubaid period (c. 5000–4000 B.C.E.), attested by only

The Ur III dynasty of 2112–2004 B.C.E. was a period marked by urbanization and academic accomplishments. Dated to this time are the famous ziggurat temple tower of Ur-Nammu (above) and the Temenos (temple complex) of Nanna, among others.

pottery, tools, and a few graves. The Uruk and Jemdet Nasr periods (c. 4000–3000 B.C.E.) saw the construction of a temple platform adorned with clay cones, suggesting the city's religious importance even at this early stage. A huge cemetery site indicates a thriving local population.

Rubbish deposits near the temple platform contain proto-CUNEIFORM clay tablets and pottery dated to the Early Dynastic period (c. 3000–2350 B.C.E.). Seal impressions bear symbols that supposedly represent city names, implying Ur's relations with other cities. Furthermore 16 "Royal Tombs" of the Early Dynastic III period (c.2600–2350 B.C.E.) were discovered in these deposit layers, including the magnificent burials of King Meskalamdug and Queen Pu-Abi. Numerous burials in the tombs' outer rooms suggest that attendants were sacrificed along with the dead king. The strata above these tombs have yielded seal impressions of King

Mesannepada, named in the Sumerian King List as the founder of the First Dynasty at Ur.

During the Akkadian period (c. 2350–2193 B.C.E.), SARGON OF AKKAD appointed his daughter Enheduanna as the en-priestess of Nanna, the moon deity whose cult center was Ur. This strategy helped legitimize the new Akkadian dynasty by emphasizing its continuity with Sumerian tradition. From then and into the Ur III period, a pattern emerged in which the en-priestess at Ur was a princess from the dominant royal family.

The Ur III dynasty (2112–2004 B.C.E.) was founded by Ur-Nammu. Like Sargon, Ur-Nammu reigned over an empire encompassing SUMER and AKKAD, this time with Ur as the capital. This period was marked by intensive urbanization and proliferation of written (mostly economic) records, as well as the standardization of the writing system, weights and measures, and the calendar sequence. Also dated to this time are

the famous ziggurat (pyramidal temple tower) of Ur-Nammu, the Temenos (temple complex) of Nanna, the Ehursag palace, and the Giparu, where the en-priestess lived. Shulgi, the son of Ur-Nammu, claimed deification for himself, a status later adopted by his successors. The Ur III city was eventually captured by the Elamites of the Shimashki dynasty, and its last king, Ibbi-Sin, was carried away into exile.

Ishbi-Erra, founder of the first dynasty of Isin, expelled the Elamites from Ur and rebuilt the city. Henceforth, the rulers of Isin claimed to be heirs of the Ur III heritage. The city, however, soon came under the control of the rival dynasty at Larsa. Babylon's ascendancy under Hammurabi further eclipsed any political power at Ur. Nonetheless, Ur remained an important religious center in the years to follow. Ur-Nammu's ziggurat and the Temenos enclosure

underwent restoration by the Kassite king Kurigalzu, and the Neo-Babylonian kings NEBUCHADNEZZAR II and Nabonidus. Also, Nabonidus revived the then-obsolete tradition of appointing the king's daughter as Ur's en-priestess. Ur, however, eventually declined in the fourth century B.C.E., possibly due to the Euphrates' shift away from the city.

JOHN ZHU-EN WEE

Vajrayana Buddhism

See TANTRISM.

Vardhamana Mahavira

(c. 599–527 B.C.E.) *religious leader*

The Mahavira (Great Hero) Vardhamana was one of the 24 Tirthanakras (Conquerors, or Ford-makers) who were founders of the Indian religious philosophy of JAINISM. Vardhamana was born in Ksatriyakundagrama in India in approximately 599 B.C.E. and died in 527 B.C.E. Jainism, or its antecedent, was developed by the first Tirthanakra, Rishabhadeva, who lived c. 1500 B.C.E. Through the example of his life and teachings, Vardhamana helped establish Jainism throughout India. The facts of his life may have become distorted by the desire of followers to lend additional spiritual meaning to them. Nevertheless, he was born a prince of the Kshatriya, or military CASTE, and lived his youth enjoying the perquisites of wealth before renouncing this at the age of 30.

Jainism depends on the concept of *ahimsa*, which means avoiding injury to all living beings. In addition, it requires obedience to various *vratas*, or vows relating to the correct behavior. Vardhamana lived a life of extreme asceticism and obedience to the five great *vratas* of renunciation of the physical world. These vows are similar to Buddhist precepts and call for avoidance of all violence, speaking the truth, avoiding theft, chastity, and the avoidance of attachment to any physical

thing or person. Jainists reject the concept of a universe created by God and focus on the perfectibility of humanity and the attainment, therefore, of freedom from the physical world. Vardhamana attained the state of *kevala*, which means a form of omniscient perception beyond that possible for the average person. As a contemporary of GAUTAMA BUDDHA, who was born in the same region of India, Vardhamana lived in an era of considerable religious excitement and development. Jainism had similar characteristics to Buddhism but stood in contrast to Hinduism, which in its earliest form was influenced by Brahmanical ritualism.

Recognized as the final Tirthanakra of the current age, Vardhamana attracted many followers and disciples. He appointed 11 Ganadharas (disciples) to continue his work—each were converts from Brahmanism—but only two survived him. At the time of Vardhamana's death, some 14,000 monks and 36,000 nuns served in his congregation. These then split according to various schisms, the most notable of which continues to the current day and features on one side the Shvetambaras (white-robed) and the Digambaras (naked), who believe theirs is the appropriate costume for monks and who deny the possibility that souls can transcend from the female body. Vardhamana's disciples collected his thoughts and teachings in works known as the Agam Sutras but the originals of these have been lost.

JOHN WALSH

Vedas

The Vedas are the oldest sacred writings of all of the world's major religions. Most scholars believe that the Vedas were transmitted orally for hundreds if not thousands of years before they were committed to writing. When written down, they were recorded in archaic SANSKRIT and organized into collections called Samhitas. There are several versions of the Vedas in different parts of India. Internal evidence in the Vedas suggests that they were first composed to serve as rituals at the performance of sacrifices.

The Aryans who moved into the Indus Valley region around 1500 B.C.E. produced the Vedas. They were Indo-European-speaking peoples from the steppes of Central Asia, whose language when committed to writing became Sanskrit. The Aryan invaders (or possibly immigrants) moved through what are today areas of Iran and Afghanistan before crossing the Hindu Kush through the Khyber Pass or other mountain canyons. There may have been five tribes of Aryans who called themselves *arya*, which means “noble” or “kinsman” in Sanskrit. They conquered the original residents or pushed them southward as they moved down the Indus River valley and eventually spread across much of the north Indian plain. The Aryans brought their own religion to India. The gods (*devas*) and goddesses of the nomadic cattle herding Aryans were usually primal forces of nature. Their Vedic religion practiced rituals that used songs and sacrifices.

The title Veda(s) comes from a Sanskrit word, *veda*, which means “knowledge” or “sacred teachings.” They were the heard revelations (*shruti*) of holy men (*rishis*). The *rishis* did not “create” the Vedas, but “heard” the Brahma speak them and recorded them. The Vedasamhitas are a huge body of materials, six times the length of the Bible. There are four Vedas: the Rig-Veda, the Sama-Veda, Yajur-Veda, and the Atharva-Veda. The Rig-Veda (hymn knowledge) is a collection of more than 1,200 hymns. A *rig* is the Sanskrit word for “hymn,” and each *rig* is addressed to a single god or goddess. The oldest of the *rigs* date from well before the Aryan migrations into the Indus Valley. They were addressed to the sky god, Dyaus Pitar, who can be identified with the classical Olympian god Zeus Pater or the Latin Deus (Ju)pitar. In a subsequent stage in the develop-

ment of the Vedas the old gods faded and were replaced by new gods. These newer gods include Indra, the sky god and the king of the gods. Among the newer Aryan gods included in the Vedas are Agni, the Vedic god of fire, and Soma, the god of a hallucinogenic drug.

The hymns in the Rig-Veda developed during the period of 1500–1200 B.C.E. They reached their final form around 1200 B.C.E. and were used as part of the cult of Soma. They were also used at the sacrifices used to extol the personified deities of fire (Agni), the sun (Surya and Savitr), the dawn (Usas), the storms (Maruts), war and raid (Indra), honor (Mitra), divine authority (Varuna), and creation (Indra and Visnu). A priest would chant the *rigs* of the Rig-Veda during the performance of a sacrifice. The gods that are praised in the Rig-Veda hymns are addressed individually, and each is praised above all the other deities to create a form of henotheism. There is first an invocation of the deity. Then the deity is presented with a petition. Then the deity, a god or goddess, such as Varuna, Mitra, Aditi (mother of the gods), and Uma (the dawn) is given praises that recount the deeds of the deity. The final part of the form of the *rig* is a summary restatement of the worshippers' request.

The themes of the *rigs* in the Rig-Vedas include creation, death, the elements of sacrifice, the horse sacrifice, gods of the storm, solar gods, and to sky and earth gods. In addition, *rigs* may be dedicated to Agni, to Soma, to Indra, to Varuna, or to Rudra and Visnu. The *rigs* that are dedicated to Indra tell of things such as the birth and childhood deeds of Indra. Some *rigs* were written about speech used to sing of Indra's origin. Other *rigs* express delight in the drawing of the bow to strike those who hate prayer. Others *rigs* were used during the investiture of a new king. The Sama-Veda (chant knowledge) is a collection of chants and melodies (*saman*) used in sacrifices. It was composed after the Rig-Veda was completed. Most of the words in the Sama-Veda were taken from the Rig-Veda. The lines of the Rig-Veda quoted in the Sama-Veda were to be sung to fixed melodies making them in effect mantras. The melodies used to sing the Sama-Veda materials were not captured in the text but are passed on from a singing priest to his disciples. The priests who sang the Sama-Veda were different from those who used the Rig-Veda. Proper lyrics and music are essential to the success of the rite.

The Yajur-Veda (ceremonial knowledge) was also written after the Rig-Veda. Most of it is a collection of prose sacrificial formulas (*yujus*), used by the presiding priest in a sacrifice. More specifically they are directions for conducting the sacrifice. The Rig-Veda, Sama-Veda, and the Yajur-Veda are today known in Hinduism as

the “threefold Veda” (*trayi-vidya*). These reflect the religious life of the priestly group. The Atharva-Veda (knowledge from the teacher Atharva) differs greatly from the other three. It is composed of spells, prayers, curses, and charms that are practical in nature. They include prayers for warding off snakes or sickness. When sacrifices were performed the priest would sing or chant materials from the Vedas that were appropriate to the type of sacrifice. A different priest would handle each part of a sacrifice. There were at least three groups of priests using the Rig-Veda at the sacrifices. The chief priest (*hotr*) would take material for his changes from the Rig-Veda. The priest responsible for chanting the sacred formulas (mantras) was the *adhvaryu*. A third group of priests, the chanters (*udgatr*), would chant melodic recitations that were linked to the Rig-Veda.

Over time additional materials came to be attached to each of the four Vedas. Most commonly the Vedas are viewed as including the Brahmanas, the Aranyakas, and the Upanishads. The Brahmanas (Brahman books) were the name for the priests, or Brahmins. They are the manuals for sacrifice. They discussed in detail rituals, proper time and place for ceremonies, the preparation of the ground, ritual objectives, purification rites, and other matters.

Ascetic holy men who went into the forests to meditate composed the Aranyakas (forest books). These books interpreted the Vedas in a nonliteral and symbolic ways. They contain speculations on sacrifice, especially the sacrificial fire and the New Year festival. The Upanishads (Sittings near a teacher) were the last to be composed and added to the Vedic collections. Several theories have been proposed to explain the origin of the name *Upanishad*. The belief is that they were composed as disciples sat near a guiding teacher. With the disciple sitting near the priest, both of them would experience spiritual enlightenment. They would experience the spiritual reality that is the unifying reality underlying all of the separate realities of the world.

Most of the Upanishads are dialogic. The prose Upanishads, like the Chandogya, Bṛhadaranyaka, Taittiriya and the Kena are probably earlier than the poetic ones such as Katha and Mandukya. The emphasis on spiritual experience suggests a shift in Vedic religion from the view that only hereditary priests can be religious masters to the view that both priests and nonpriests can experience spiritual realities. The Upanishads are the most philosophical of the Vedas and are concerned with ultimate philosophical truth. They number about 100. Their concerns are to record insights into internal and external reality.

ANDREW J. WASKEY

Vedic age

The roughly 1,000 years between 1500–500 B.C.E. is called the Vedic, or Aryan, age. The beginning of the Vedic age corresponded with the end of the INDUS CIVILIZATION (c. 2500–1500 B.C.E.), although it is not clear what precise role the Aryans played in the final fall of the Indus civilization. The two peoples belonged to different racial groups, and the Indus urban culture was more advanced than the mainly pastoral society of the Indo-European Aryans.

The 1,000 years after 1500 is divided into the Early and Late Vedic age, each spanning about 500 years, because of significant differences between the cultures of the two halves. The earlier period marked the conquest and settlement of northern India by INDO-EUROPEANS who crossed into the subcontinent across the Hindu Kush passes into the Indus River valley, across the Thar Desert and down the Ganges River valley.

The latter half saw the development of a more sophisticated sedentary culture. The name *Vedic* refers to the VEDAS, sacred texts of the Aryans, which is a principal source of information of that era.

THE RIG-VEDA

There are no significant archaeological remains from the first five centuries of the Vedic, or Aryan, era. Therefore, scholars must rely on the hymns and prayers of the Aryans, called the Vedas, or Books of Knowledge, for information about the earliest centuries. The most important work of the Aryans is the Rig-Veda, consisting of 1,017 hymns and songs addressed to various gods. Initially memorized by a class of priests, they were collected and written down c. 600 B.C.E. after a written script, called SANSKRIT (related to other Indo-European languages such as Greek and Latin), was invented. The Rig-Veda is the oldest surviving Indo-European literature.

Some hymns of the Rig-Veda refer to a god named Indra who demolished forts that could have been the walled Indus cities. They refer to themselves as Aryans, which means “high born” or “noble,” while the non-Aryan enemies are called the *dasas* or *dasyus*, which means “dark” and also came to mean “slave.” Aryan social organization was patrilineal. Upon marriage women became members of their husbands’ joint families. Sons were prized over daughters because they performed the family sacrifices, and only sons could inherit from their parents. Related Aryan families belonged to a clan, and associated clans formed a tribe, ruled by a raja, or king. Many Aryan tribes took part in the conquest and settlement of northern India. The most powerful one was called Bharata, which is the Sanskrit name of present-day republic of India. The battles between the ancient kings, many of them related to one another, is related in a long epic poem titled the *MAHABAHARATA* (Great Bharat).

SOCIAL CLASS DISTINCTIONS

Aryan society was stratified, based on function, and after the conquest, also on skin color. It is called CASTE, or class in English, and *varna* in Sanskrit, which means “covering,” referring to the color of the skin that covers one’s body. The top castes were the Brahman, who were priests and teachers, and the Kshatriya, or rulers and warriors. They were followed by the Vaisya, who were landowners and artisans. The secular hymns in the Rig-Veda mention many occupations that include carpenters, wheelwrights, blacksmiths, tanners, weavers, spinners, farmers, and herders as members of the Vaisya caste. All three were of Aryan origin and called “twice-born,” the second birth referring to religious initiation or rebirth, which qualified the males to participate in religious rituals. The fourth caste was called Sudra, who were servants and manual laborers, probably many of them were originally the pre-Aryan *dasas*. Thus the invaders were able to integrate the conquered indig-

enous people and assign them a position in society. The division of people into castes was sanctioned in Vedic literature. Vedic literature describes the Aryan culture as one dominated by warrior heroes, men who fought hard and enjoyed feasting and strong drinks, and gambling.

RELIGION AND GODS

The Rig-Veda was the most sacred text of the Aryan religions. It was supplemented by three other ancient collections of poems, spells, and incantations, called the Sama-, Yagur-, and Arthava-Vedas. Other ritual works were added later. They were the Brahmanas, which elaborated on the ancient hymns and described the necessary steps for priests in performing the rituals and sacrifices. The Upanishads, philosophical essays written during the last centuries of the Vedic era, 108 of which survive, followed the Brahmanas. The above works are the core religious literature of Hinduism.

The early Aryans worshipped a pantheon of nature gods, offering them sacrifices in return for granting their requests. There were many sacrifices that ranged from the daily domestic sacrifices performed by the head of the family, to great sacrifices ordered by kings that were presided over by many Brahman priests with many animal sacrifices. The most powerful early gods were Indra, the warrior god, who wielded the thunderbolt, killed *dasas* and destroyed their forts, and also brought rain. Varuna was the god of universal order and punished sinners by afflicting them with diseases. Agni was the god of fire and protector of the home and hearth. Soma was both the god of immortality and a hallucinogenic drink made from a hemp-type plant and drunk on the same day at religious ceremonies. There were many other gods and demigods in charge of various functions.

SANSKRIT

Writing began around 1000 B.C.E., although nothing has survived from the earliest period. It was called SANSKRIT. The Vedic literature continued to be memorized by Brahman priests and was not written down until around 600 B.C.E. By that time some of the vocabulary had already become archaic. Classical Sanskrit used by scholars and government officials in the Late Vedic age was less complex grammatically than the Sanskrit of the Vedas.

Less important writing was done in vernacular tongues, called Prakrits, meaning, “unrefined,” as opposed to the “perfected” or “refined” form of writing called Sanskrit. Modern languages in northern India are descended from Sanskrit and are related, whereas languages of southern India belong to the indigenous

DRAVIDIANS and are unrelated to Indo-European languages. The year 1000 B.C.E. also marked the transition from the Early to the Late Vedic age.

There are still few archaeological sources for the Late Vedic age, so scholars must principally rely on sacred texts: the later Vedas, the Brahmanas, and Upanishads. Other written sources include the epics (*MAHABHARATA* and *RAMAYANA*) and *Puranas*, which include legends that seem to refer to this period. By the Late Vedic age the Aryan tribes had spread across north India and almost forgotten their earlier home in the northwest and Punjab. Territorial kingdoms had replaced the tribal state and old kinship relationships were being replaced by geographic alignments. Late Vedic society was more advanced economically compared with that of the Early Vedic.

Most people had settled down and become farmers. Many different kinds of trades and crafts were mentioned, indicating a more advanced material culture. They include jewelers, goldsmiths, basket makers, dyers, and potters. The rich had servants; there were also references to professional acrobats, musicians, fortune-tellers, and dancers who entertained the townspeople. While most people lived in villages, texts from the period mention towns; some of those names persist to the present.

NEW RELIGIOUS TRENDS

Two religious trends emerged. One had Brahman religious leaders challenging the power of the kings. Another was dissatisfaction with established religious rituals because they no longer satisfied the popular longings nor answered the questions of people whose lives had become more prosperous but felt insecure as a result of the changes. New religious ideas emerged. One was the doctrine of karma (*karma* means “deed” or “action”), which held that that one’s position in this life is the result of actions in previous lives and that one’s actions in this life will influence future lives.

This doctrine of the transmigration of the soul gave ethical content to human conduct and also justified inequities in life. Since the doctrine included all living things, it inspired kindness to animals, which resulted in vegetarianism. Some sought an answer in asceticism and joined bands of holy men debating religious questions and seeking answers. Out of the intellectual quest came the writing of the Upanishads and the emergence of two new religions, Buddhism and JAINISM. The end of the Vedic age also ended the shadowy early historic age in Indian civilization.

Vercingetorix

(72–46 B.C.E.) *Gallic chieftain*

Vercingetorix was a tribal chieftain of the Gallic Celtic Arverni tribe who attempted to stop the encroachment of Romans into his territory, Provence, in present-day France, from 53 to 52 B.C.E. The Roman leader, Gaius JULIUS CAESAR (100–44 B.C.E.), and his lieutenant Quintus Atius Labienus (100–45 B.C.E.), lost early engagements against Vercingetorix, who against all odds had managed to unite the generally warring tribes in Provence. This temporary alliance allowed Vercingetorix the upper hand. He retreated by using hit-and-run tactics within the natural boundaries of Provence that were unknown to the Romans. To prevent the Romans from finding sustenance, they scorched over 20 towns.

In the spring of 52 B.C.E. Caesar ordered siege fortifications to be built in order to capture the capital of Avaricum, present-day Bourges, which contained huge supplies of grain. Through unrelenting rain his troops built two 80-foot towers with more than 300-foot ramps in one month. The Gauls tried to sabotage the Roman siege works unsuccessfully. In the end 800 Gauls fled to Vercingetorix. The angry Romans massacred the 40,000 remaining inhabitants of Avaricum. Caesar, tired of the ceaseless and unproductive skirmishes and battles, had no desire to face the fierce Celtic tribes and decided to starve them out before reinforcement could reach Alesia. Caesar had his Romans build encircling fortifications around the Arverni stronghold at Alesia, near present-day Dijon, from which Vercingetorix had planned to fight and in which he was ultimately trapped.

Caesar once again used siege warfare to obtain his objective. He had his troops build a two-walled perimeter that would keep the Arverni and the Romans within close contact. The outer ring held the Romans,

Vercingetorix Throws His Arms at Caesar's Feet. A reproduction of a painting by Lionel-Noel Royer, created in 1899.

who besieged the Arverni. Modern-day excavators found the first wall to be 13 miles long with an 18-foot ditch that was meant to starve the Arverni. The second wall faced pointed stakes that could easily impale unsuspecting tribesmen. Yet another wall, 9 feet high and full of breastworks of earth, was constructed. In addition, every 130 yards, observation towers were erected. Two siege towers were built, each 80 feet high, that could contain ramparts of varying lengths. Vercingetorix tried to destroy the walls and often had skirmishes with the Romans, but to no avail.

His last attempt to alleviate the siege led to failure, his men fell onto the spikes, and the Romans killed many Gauls. Alesia was so well fortified by the Romans that Vercingetorix was given no choice when reinforcements failed to arrive. The war council in Alesia decided to wait for the end. The Arverni were slowly starving, so Vercingetorix released the women and children from his stronghold, hoping Caesar would take pity and treat them as prisoners, but he refused, and the women and children perished. Caesar won the five-day Battle of Alesia because the tribes under Vercingetorix were poorly organized and some betrayed their leader.

Various stories surround the surrender of Vercingetorix. One story relates that Vercingetorix and several tribal leaders simply surrendered to Caesar. The second story, written by Plutarch at least 100 years after the event, accounts that Vercingetorix rode out of Alesia in a stately fashion and around Caesar's camp, removing his battle armaments and surrendering with theatrical gestures before kneeling to him. His death is also shrouded

in debate. One historian claims he was killed shortly after his surrender. Another argues that for the next five years Vercingetorix was Caesar's prisoner in the Tullianum in Rome. Vercingetorix allegedly became a showpiece and was paraded around various Roman cities for five years in between stays at the Tullianum prison in Rome. Vercingetorix was publicly beheaded in Rome in 46 B.C.E. The Celtic tribes never fought again in present-day France and were absorbed into the ROMAN EMPIRE.

ANNETTE RICHARDSON

Visigoth kingdom of Spain

The earliest Visigoths were a Germanic group that alternated between opposing and serving the ROMAN EMPIRE. Unlike some other Germanic tribes, the Visigoths retained elected leaders, never shifting to a fully hereditary kingship. The early Visigoths, like other Germanic peoples in the late Roman and early post-Roman periods, were Arian Christians—believing that the Son, Christ, had been created by the Father rather than being coeternal, as the Catholic Church believed. This meant that Visigothic kings could not be fully sure of the loyalty of the Catholic Church in their dominions, although they did not attempt to destroy the church or extirpate Catholicism.

After the famous sack of Rome by the Visigothic king Alaric in 410 C.E., the Visigoths settled in southern France, from which they first spread into the Iberian Peninsula in 416, as allies of the Roman emperor Honorius. The Roman government was trying to regain control of the province, then in the hands of a barbarian coalition. The Visigoths returned to Spain, this time permanently, under their King Theodoric II in 456. The most significant king of this phase of Visigothic history was Euric, who reigned from 466 to 484, under whom the Visigothic kingdom, with its capital at Toulouse, reached its greatest geographical extent, incorporating most of Iberia. Euric eliminated the last areas of direct Roman rule in Spain following the collapse of the Western Roman Empire in 476.

The Visigothic kingdom was based in Spain after 507, when the Visigoths were defeated and the Catholic Franks under Clovis killed their king, Alaric II. In

alliance with the Burgundians, the Franks drove the Visigoths out of nearly all their possessions in France. The sole remainder of the French Visigothic kingdom was Septimania, between the Pyrenees and the lower Rhone. The Visigoths also lost some coastal territories in southern Spain to the Byzantines under the Emperor JUSTINIAN I. The most important rulers in sixth-century Visigothic Spain were Leovigild, who reigned 568–586, and his son Reccared, who reigned 586–601. Leovigild reinvigorated the Visigothic monarchy, defeated the Suevi kingdom of northwestern Spain and incorporated it into the Visigothic kingdom, and drove the Byzantines from all but a few small footholds in the south. He also established a permanent capital at Toledo—previously, Visigothic rulers had traveled through the peninsula rather than having a permanent base. Leovigild was also a lawgiver, promulgating extensive revisions of the earlier code of King Euric.

In 587 Reccared solved the problem of the kingdom's religious divisions by converting to Catholic, Trinitarian Christianity, the religion of nearly all of his non-Visigothic subjects, as well as a growing number of Visigoths. He extended this conversion to his kingdom in the Third Council of Toledo in 589. At this council Reccared, his family, and other leaders of the kingdom formally renounced ARIANISM before the Catholic bishops. The new regime was intolerant toward Arians, and Reccared crushed a series of rebellions led by Arian clergy and believers. The removal of the religious divisions between the Visigoths and the Roman elite led to greater assimilation between the two groups.

The seventh-century Visigothic monarchy was marked by strong cooperation between church and state, with the king making ecclesiastical as well as civil and military appointments, building churches, and working closely with the bishops. The Catholic Church in Spain, although in communion with Rome, was more subject to the king than to the pope. The Visigothic kingdom was also one of the more peaceful and prosperous areas of the post-Roman West, retaining its links to the Mediterranean economy and a relatively high degree of urbanization.

One way in which the strongly sacral nature of Catholic Visigothic kingship was expressed was a series of

decrees against the Jews. The Catholic Visigothic kings were an exception to the generally tolerant practices of Germanic barbarian kings toward the Jews in the early Middle Ages. King Sisebut (r. 612–621) ordered that Jews be forcibly baptized or exiled from the kingdom. Sisebut was one of the most learned early medieval kings, writing in Latin the *Life of St. Desiderius* and a poem on eclipses. Legislation was an important component of Visigothic kingship.

The legal decrees and codes issued by the Visigothic rulers show a progression away from different laws for Visigothic and Roman subjects, toward a single code of law for all peoples in the kingdom. This process of assimilation culminated in the Laws of the Visigoths, issued in 654 by King Recceswinth. Recceswinth, following the path laid out by his father, King Chindaswinth, abolished previous codes of Visigothic and Roman law in favor of a law applying uniformly over Visigothic territory and drawing from both Germanic and Roman sources. The Laws of the Visigoths, revised again by King Erwig in 681, was the most detailed and sophisticated law code of the early post-Roman kingdoms. The Laws of the Visigoths continued to influence law in Christian Spain long after the fall of the Visigothic kingdom.

Late seventh-century Visigothic kings, although supported by the church, suffered disputed successions, rebellions, and problems with the nobility. A dispute weakened the kingdom before the Arab invasion in 711. The Arabs also benefited from the Visigothic rulers' alienation of the Jewish population, who welcomed the Muslim invaders as liberators. The Arabs killed the last Visigothic ruler, King Rodrigo, or Roderic, and the Visigothic kingdom and ethnic identity came to an end.

WILLIAM E. BURNS

Wang Mang

(45 B.C.E.–23 C.E.) *Chinese usurper*

Wang Mang's fame derived from his failed attempt to establish a dynasty called Xin (Hsin), meaning "new," between 9 and 23 C.E. when the HAN DYNASTY divided into two parts, the Western, or Former, Han (202 B.C.E.–9 C.E.) and the Eastern, or Later, Han (25–220 C.E.). His rise reflected the great power the families of imperial consorts of Han rulers often enjoyed, leading to his usurpation of the Han throne.

The Wang family was gentry; some of its male members served in the civil service, but its rise to power was due to the selection of one of its daughters. Wang Chengjun (Wang Cheng-chun) was sent to the harem of the future emperor Yuandi (Yuan-ti) and bore him a son in 51 B.C.E., for which she was made empress. When her husband died in 33 B.C.E. and was succeeded by her 18-year-old son, she gained the powerful position of empress dowager. Her longevity and the youth and short life span of her son and his successors enabled her to dominate the Han government and to appoint her family members to the most important offices of the land. After the death of all her brothers the now Grand Empress Dowager Wang appointed her nephew Wang Mang regent, then acting emperor. Finally he proclaimed himself emperor of a new dynasty called Xin (Hsin) in 9 C.E., crushing revolts by loyalists of the Han dynasty.

As emperor, Wang Mang made drastic changes to the government, rationalizing his changes on his interpretations of Confucian teachings. He thus reinstated feu-

dalism, made many offices hereditary, nationalized land, changed the monetary system, and made laws that discriminated against the merchants. Although many of his changes were unenforceable and were soon rescinded, they nevertheless provoked popular discontent. His attempts to change the relationship with the nomadic XIONGNU (HSIUNG-NU) and Central Asian states produced unrest along the borders. Finally, even nature turned against his regime: droughts in the capital region, breaks of the Yellow River dikes, extensive flooding due to a change of the course of the Yellow River, and other natural disasters resulted in famine and revolts. The most serious peasant revolt was called the RED EYEBROW REBELLION. Several princes of the imperial Liu clan rose to lead the rebel forces in 22 C.E., and Wang Mang was killed the following year. Two more years of civil war ended in the restoration of the Han dynasty in 25 C.E. Although some of his reforms were well intentioned, Wang Mang is remembered in history as a usurper, and Chinese historians do not recognize his brief Xin dynasty as legitimate.

Way of the Sea

See KING'S HIGHWAY AND WAY OF THE SEA.

Wei Man (Wiman)

(second century B.C.E.) *founder of Korean state*

Wei Man came from northern China and lived in the second century B.C.E. He staged an unsuccessful uprising against the newly established HAN DYNASTY in 195 B.C.E. and fled with 1,000 followers to the northern Korean peninsula, where he founded a state called Caoxian (Ch'ao-hsien) in Chinese—the name is anglicized as CHOSON, one of the names by which Korea is called. His capital was close to modern Pyongyang, capital of modern North Korea. Choson was a sinicized state, reflecting the accelerated penetration of Chinese economic, military, and political power into the Korean peninsula since the late Warring States era in China in the third century B.C.E.

With superior military and economic strength, Wei Man's successors (who controlled highly developed ironworks) were able to expand the kingdom throughout the northern part of the Korean peninsula against Korean tribes. The killing of a Chinese envoy by Choson soldiers and the harboring of Han deserters by Choson led to war between the two states. A Chinese force invaded Choson in 109 B.C.E. and forced its surrender in 108 B.C.E. after the assassination of King Ugo, Wei Man's grandson. The establishment of four commanderies in Korea followed the destruction of Choson; they were administered as territories of the Han dynasty.

Wen and Wu

(fl. 12th century B.C.E.) *dynastic founders*

Kings Wen (the Literary or Cultivated) and his son Wu (the Martial) are the founders of the ZHOU (CHOU) DYNASTY, c. 1122–256 B.C.E. The Zhou people lived to the west of the Shang in the Wei River valley on the plain of Zhou (hence the dynastic name) in present-day Sha'anxi (Shensi) Province, west of the Shang heartland.

Both were descended from the Neolithic Longshan (Lungshan) culture, but the Zhou people were less cultivated. The Shang oracle bones described them as sometimes enemies and also as allies against the Jiang (Chiang) barbarian tribes further west. A Zhou leader was also referred to as “Chief of the West,” to whom a Shang noblewoman was given in marriage. A son was born of the union, King Wen.

King Wen was described as a paragon of virtue. Wen paved the way for overthrowing the SHANG DYNASTY by forming coalitions with other states but died in the 50th year of his reign, about 1133 B.C.E., before he could accomplish his goal. Since Zhou rulers practiced primogeniture, his oldest son, Wu, succeeded him. Around 1122 B.C.E. King Wu led a second campaign against the Shang, a coalition army purportedly 45,000 strong that consisted of forces from eight anti-Shang states, including men from a faraway Yangtze River valley state called Ba (Pa) in present-day Sichuan (Szechwan).

At a place called Muye (Mu-yeh), meaning “Shepherd's Field,” not far from Yin, Wu gave a speech that detailed the crimes of Shang king Shou. In a decisive battle against a larger but disaffected Shang army Wu's forces won decisively. King Shou retreated to his palace in Yin, set it afire, and died.

Wu restored order quickly, even placing a Shang prince in Yin as his vassal ruler, to continue conducting sacrifices to his powerful ancestral spirits, but under the supervision of three of Wu's brothers. Wu then returned to his capital in Hao, located just southwest of the modern city Xi'an (Sian), but died soon after, in 1116 B.C.E. while still young and before consolidating his conquest. The throne passed to Wu's oldest son, King Cheng (Ch'eng), but under the supervision of one of Wu's younger brothers, Dan (Tan), the DUKE OF ZHOU. As regent, the duke consolidated the new state and laid down the foundations that made the dynasty a great and lasting one. Kings Wen and Wu and the Duke of Zhou are remembered as great men and ideal rulers in Chinese history.

Early Zhou proclamations justified the transfer of power as the wish of their high god, Tian (T'ien), or heaven, who was equated with Shangdi (Shang-ti), the Shang high god. From this came the concept of the Mandate of Heaven, that heaven oversaw the affairs of humans and appointed a virtuous human to rule on its behalf. The mandate could be passed down the generations in the ruling family, provided they ruled justly. If they did not rule justly, as was the case with the last Shang king, he forfeited the mandate. A righteous man would be appointed to replace him, in this case the Zhou king. This concept became central to Chinese political thinking.

wisdom literature

Historians of the ancient world have come to recognize that wisdom literature represents the expressions of cultures and civilizations that rely on human experience to cope with life's mysteries and uncertainties. The genre is pervasive over a wide spectrum of peoples in many ages and places. Wisdom literature in the Bible is a genre that is somewhere between the prophetic and the apocalyptic writings in its content and style. When the prophets of the Bible became fewer and less vocal after the Babylonian captivity, the teachers of wisdom began to promote their perspective as the representatives of biblical faith. After them there arose, centuries later, the seers and mystics who were writers of APOCALYPTICISM. In many ways the teachers of biblical wisdom coincided with the development of philosophy in the Greek intellectual world as it outgrew the mythical explanations of the creation and life crafted by Homer and HESIOD. The time period for both biblical wisdom and Greek philosophy was the fifth–fourth centuries B.C.E. and later, otherwise known as the Persian, or Attic, Period.

The Hebrew people drew upon three sources for their wisdom literature. First, ISRAEL had produced leaders and thinkers over the centuries whose achievements had been remembered, studied, and emulated. In the course of its history, such figures as SOLOMON, Daniel, and BARUCH had made an impression on later generations as teachers of wisdom. Thus, traditions developed that were native to the Hebrew people and distinctive in comparison to neighboring ethnic groups. By the same token, many other ancient kings and rulers had reputations for dispensing wisdom and sound advice, and stories circulated in their societies that would enhance public trust in their administration. Second, the nature of government and civilization favored the emergence of educated classes who could organize peoples and run social institutions. These people had to learn reading and writing, and they specialized in bringing stability to otherwise chaotic situations. This source of wisdom

literature, therefore, relied on SCRIBES and bureaucrats who had the leisure for reflection and writing. They might have had the resources to travel, learn other languages, and consider moderate reforms.

Third, the surrounding nations of the Middle East also presented a rich matrix for biblical wisdom literature. The Egyptians, the Sumerians, and the Babylonians were most famous for their wisdom teachings. Their traditions emerged long before the Greeks and the Hebrews of the fifth–fourth centuries B.C.E. Scribal schools probably sprang up in response to the demands of Middle Eastern governments for able administrators. Masters who exercised great influence over their pupils led such schools. This phenomenon also is similar to the education that was offered by the purveyors of SOPHISM (and perhaps SOCRATES, Plato, and ARISTOTLE) in the Greek world. Invariably, in most of these environments the scribal classes favored stability and order, and so wisdom literature was largely supportive of the status quo.

Ancient Egypt in particular was the center for learning for thousands of years. As is often the case in wisdom literature, Egyptian materials come in the form of a father's advice to his sons. One very old collection of sayings, the *Instruction of Vizier Ptah-hotep* (2400 B.C.E.), shows parallels to the biblical book of Proverbs. Schools set up for educating Egyptian civil servants about their roles in court life are the background for passages in the *Instruction of Amenemope* (1000–600 B.C.E.) and excerpted and adapted by the editor of Proverbs. The civilization of SUMER has proverbs almost as old as Egypt's. Clearly it also had scribal schools set up by its government. Sumerian editors organized their wisdom materials by topic and theme, while it is hard to find the organizational thread that unites much of biblical wisdom. Sumerian observations on nature also do not moralize as much as the Hebrew writings.

The city-states of AKKAD and BABYLON also gave a milieu for Hebrew biblical traditions. One theme of wisdom literature has to do with undeserved suffering, most famously expressed by the long-suffering hero JOB in the Bible. This theme is found in the Babylonian poem *I Will Praise the Lord of Wisdom*, whose main character is often called the Babylonian Job, and in other works such as *Dialogue about Human Misery* and *Dialogue of Pessimism*. There are a couple other possible influences on Hebrew wisdom literature. First, there is a fragmentary book from the ARAMAEANS called *Proverbs of Ahiqar* that was well known in the ancient Middle Eastern world and translated into many languages. The earliest written text, however, for Ahiqar comes from the Persian Period. Then there is the Greek world, with its later emphasis on

rationalism and science. Biblical books such as Sirach, Wisdom of Solomon, and Ecclesiastes may betray familiarity with late Greek philosophy.

The themes of Hebrew wisdom imply that the God of the Bible works through creation, natural phenomena, and life experiences. Contemplation of the created order gives perspective for life's most vexing problems: death, sickness, and poverty. There is often optimism in early wisdom literature that everything has a purpose and that this purpose can be discovered. Later wisdom literature, however, shows skepticism that nature alone will supply answers. Even wisdom has its limits in the face of the mystery of suffering. Wisdom books in the Bible are distinguished from others because they do not depend on law and prophecies—direct revelation—for their validity. These books include Proverbs, Job, Qoheleth, Sirach, and Wisdom of Solomon (Greek). Other candidates for this category are Song of Solomon and specific parts of Genesis, PSALMS, Jonah, Daniel, and Baruch (Greek).

In the New Testament one can find the semblances of wisdom sayings in many of the speeches of JESUS (CHRIST) OF NAZARETH and in the practical teachings of the letter of James. In fact, there is a tension between the wisdom dimension of much of the New Testament and the apocalyptic urgency of the KINGDOM OF GOD in its preaching. Outside of the Bible canon are later pseudepigraphical sources (e.g., 4 Ezra, 2 Baruch [Syriac], Odes of Solomon), and many believe that rabbinic Judaism has its roots in the traditions of Hebrew wisdom literature. According to the Bible, true wisdom is personified as a woman in a variety of positive female roles. The book of Proverbs especially shows her to be a hostess, a sister,

a wife, and source of intimate revelation about how the biblical God relates to creation. In some cases she serves as a mediator between God and humanity. Early models for this image can be found in the Egyptian concept of *maat*, or cosmic truth or balance, and in the Canaanite fertility goddess of Asherah, who was symbolized as a tree of life and who hosted banquets in the Ugaritic myths of Baal. In the New Testament aspects of personified wisdom were incarnated in the divinized identity of Jesus Christ. Rabbinic Jews tended to interpret any personification of wisdom in terms of the Halakah, or the religious duties of daily life.

Xerxes

(fl. 486–465 B.C.E.) *Persian king*

Xerxes was the oldest son of DARIUS I, from his first wife, Atossa, daughter of CYRUS II. Xerxes is familiar to students of the Bible since he appears in two books: in the book of ESTHER he is called by his Hebrew name Ahasuerus; and in the book of Ezra (4:6) he is mentioned in relation to an accusation lodged against the Jews in his reign. We have access to more than 20 Old Persian inscriptions written during his reign, but they do not add much to our knowledge of the man and his rule. As a result, our most important source is the *Histories* written by HERODOTUS of Halicarnassus (c. 480–c. 429 B.C.E.), a Greek who described the expansion of the Persian Empire from Cyrus to Xerxes.

As the crown prince, Xerxes was trained to be emperor. Although he was not an active soldier as his father had been before him, Xerxes was schooled in statecraft through his position as viceroy of Babylon. Soon after his accession he had to deal with rebellion, first in 485 B.C.E. in Egypt, and then in 484 B.C.E., and then again in 484–482 B.C.E., in Babylon. The last of these rebellions forced Xerxes' hand, and the conciliatory policy toward Babylon that had been established by Cyrus was replaced with one of severe punishment: The great temple of Marduk, the main god in Babylon,

was pulled down; a huge gold statue of Marduk was taken away and melted down for bullion; and the satrapy of Babylon lost its independent status, being merged with ASSYRIA, its erstwhile enemy.

Having dealt with rebellions relatively near at hand, Xerxes looked to the West, and in the spring of 481 B.C.E. he left Persia with what probably was the greatest ancient army ever amassed, to avenge his father's defeat by the Greeks at the BATTLE OF MARATHON in 490 B.C.E. His army wintered in Asia Minor and continued their journey in the spring of 480 B.C.E., forcing a crossing to Europe in high summer. With the defeat of the Spartan king LEONIDAS at Thermopylae in August of that year, Xerxes moved on Athens. He arrives in Attica, the surrounding area to Athens, probably in early September. If Xerxes had patiently blockaded Athens, he would most likely have won, but tempted by the chance of a glorious victory in battle, he led his ships into a trap, the Battle of Salamis, that had been prepared by the Athenian general and ruler THEMISTOCLES. The Persians retreated, and Xerxes took a ship for Asia Minor, leaving his general and cousin Mardonius in charge. Two land battles were fought in the summer of 479 B.C.E. at Plataea and Mycale, both of which ended in Greek victories.

Xerxes returned to Persia discouraged by his failure against the Greeks, and his focus shifted to the building of his father Darius's palace at Susa and the finishing of the construction of Persepolis. The early years of his life, which had seemed to bear so much promise, now saw the full weakness of his character expressed in a fierce temper and in lack of self-control in his relations with

women. The resulting palace intrigues, accusations, and murders fostered an atmosphere of decadence in the Persepolis court and weakened Xerxes' ability to rule effectively. The Greeks no doubt saw this, and in 466 B.C.E. Cimon led a Greek force to Asia Minor from where he gradually increased his strength. Xerxes was roused from his lethargy and sent out an expedition to deal with the threat, but the Greeks were too strong, and the Persians abandoned their ships at Eurymedon. The land battle that followed ended with the Greeks taking the Persian camp. Eurymedon proved decisive, and the Persian Empire lost Europe. The loss of Europe and the slow loss of Asia Minor marked the beginning of a steady, if unhurried, decline in the empire to its eventual defeat at the hands of ALEXANDER THE GREAT in the next century.

In 465 B.C.E. Xerxes was assassinated in his bedchamber by several of his court favorites. He was buried in a rock-cut tomb excavated in a cliff to the east of his father's tomb. Xerxes' oldest son Darius was next in line for succession, but a younger son, ARTAXERXES I, had Darius slain and took the throne for himself. There was a second emperor of the same name, Xerxes II, Artaxerxes' son, who ruled for just 45 days from the end of 428 B.C.E. However, his claim to the throne was tentative and was initially only certain in Susa. One of his half brothers murdered him while he was drunk in bed following a party.

ANDREW PETTMAN

Xia (Hsia) dynasty

According to Chinese history taught until the early 20th century, culture heroes such as the Divine Farmer and Ox Tamer taught the people the arts of civilization. The Three Emperors (YAO, SHUN, AND YU), also mythical, followed the culture heroes, who were venerated because they abdicated in favor of the most worthy man rather than letting their less-qualified sons succeed them. The third of the sage rulers, called Yu the Great, solved the flooding problems that afflicted the reigns of Yao and Shun by dredging the riverbeds and channeling the

water to flow to the sea. As a result Shun appointed Yu king (r. 2205–2198 B.C.E.). The people were so grateful that they overruled Yu's choice of a successor and put his son Qi (Chi) on the throne. Thus began China's first dynasty, the Xia, which ended in 1766 B.C.E. with the overthrow of the last tyrant king Jie (Chieh). The Xia was followed by the SHANG (or Yin) DYNASTY (1766–1122 B.C.E.), which was succeeded by the ZHOU (CHOU) DYNASTY (1122–1256 B.C.E.) Collectively they were called the Three Dynasties and established the foundations of the Chinese civilization. Students of the scientific method in early 20th-century China began a "doubting antiquity school" that rejected the traditional dating in teaching Chinese history and called both the Xia and Shang dynasties fictional or mythical. Scientific archaeology in China began in the 1920s; it has authenticated the Shang as fully historic because of the existence of writing dating to the Shang era, which has been deciphered.

Archaeological excavations in China since the 1920s show that north and northeastern China, from the Yellow River valley to the coast entered the NEOLITHIC AGE around 8000 B.C.E. Thousands of sites show regional differences in the development in the pottery, jade, stone, ivory tools, and vessels used for both utilitarian as well as religious and ritual purposes. They also show increasing sophistication with the passage of time, evidenced in advances in technology and differentiation in status from the quality and quantity of items buried with the dead. They also show a geographic expansion that ranged from the highlands in the northwest to southern Manchuria in the northeast, southward to the Yangtze River valley and along the coast. Interactions between them are manifested in similarities in the styles of items they produced.

In the third millennium B.C.E., in present-day Shandong (Shantung) Province in northeastern China, a Neolithic culture began to make the transition to the threshold of the historic age. It is called the Longshan (Lungshan) culture. Other Longshan sites are located in Henan (Honan) and Shanxi (Shansi) Provinces, also in northern China. They date from c. 3000 to c. 2000 B.C.E. Urban centers with protective walls, elaborate tombs, and palatial sized buildings have been excavated, some clutters of settlements stretching over several hundred sq. miles. Implements were still made of stone, bone, and shell; pottery was wheel made and high temperature fired; and objects of alloyed metals were made for the first time. As ancient Chinese historians expressed it, China had entered the era of 10,000 states; while 10,000 is an exaggeration, there definitely were hundreds, even thousands,

of such settlements, and there must have been interactions and competition among the states.

Civilizations become historic with the existence of deciphered written records. Traditional Chinese historiography is the longest continuous historiographical tradition in the world. According to that tradition, China's first dynasty, the Xia, dates to between 2205 and 1766 B.C.E. AS SIMA QIAN (SSU-MA CH'IEN), Grand Historian and author of *Shiji* (*Shih-chi*), or *Records of the Historian* (a comprehensive history of the Chinese world from the beginning to his lifetime in the first century B.C.E.) wrote that it was begun by Yu the Great and ended with the overthrow of the tyrant king Jie by the founder of the following Shang dynasty. Sima Qian named 13 successive rulers during the dynasty and had little information for any except the first and last kings. He listed 30 kings for the Shang dynasty. No contemporary written documents have been discovered, although pottery shards bearing writing that date to the Xia have been found but have not been deciphered. On the other hand, huge amounts of Shang writing that were inscribed on oracle bones (tortoiseshells or scapula bones of large animals) have survived and have been deciphered. Shang writing is proven to be the ancestor of modern Chinese writing. Information provided by the oracle bones proved Sima Qian correct in the names of Shang kings and their relationship to one another. By the same process they proved those who doubted the existence of the Shang wrong.

Excavations since the 1970s have established a major urban site at Erlitou (Erh-li-t'ou) in Henan as of the Xia era (c. 2000 B.C.E.); it was perhaps a capital city of the Xia (Sima Qian stated that the Xia moved capital cities several times). According to Sima Qian, King Yu once summoned his contemporary rulers of the 10,000 states to meet at Tushan, his wife's home state. He went on to give details about capital cities, genealogy, and other details of Xia and not of the other states. Perhaps this indicates that by the end of the third millennium B.C.E. Xia had emerged as the leader among Chinese states, while others, including its successor dynasties, the Shang and Zhou did not become prominent until later. Since Sima Qian was right about the succession of Shang kings, perhaps in the future additional archaeological information will also prove the Xia chronology correct.

Xiang Yu (Hsiang Yu)

(d. 202 B.C.E.) *Chinese general*

Xiang Yu was a brilliant general who contributed to the fall of the QIN (CH'IN) DYNASTY but failed to become the master of China. The unexpected death of the first emperor of the Qin in 210 B.C.E. created a crisis that ended the 10-year-old dynasty. In the ensuing power struggle the emperor's chief minister, Li Si (Li Ssu), and eunuch Zhao Gao (Chao Kao) got rid of the crown prince and MENG TIAN (MENG T'IEN), the most powerful Qin general, and placed a weak younger brother of the deceased crown prince on the throne. Later Zhao had Li murdered in jail. Since Li had been the architect of the Qin empire, his death spelled its doom.

Meanwhile, popular revolts had broken out throughout China, led by desperate people who could no longer bear the oppression of Qin. The spontaneous peasant rebellions were followed by better-led and organized revolts by the survivors of the royal houses that had been conquered by Qin. The most notable noble leader was Xiang Yu, whose family had long served as generals of the southern state called Zhu (Ch'u). Xiang resurrected the house of Zhu and elevated one of its members to be king. Survivors of several other states followed suit. Another leader was LIU BANG (LIU PANG), a peasant by birth who had risen to minor office.

In 208 B.C.E. Xiang and Liu joined forces and agreed that whoever first entered the heartland of Qin at Guangzhung (Kwanchung) would be king. Liu achieved that honor in 206 B.C.E. when his forces entered the Qin capital Xianyang (Hsien-yang) and accepted the surrender of the third Qin ruler, thus ending the dynasty. Liu won widespread respect by not allowing his men to loot, protecting the Qin royal family, reducing taxes, and relaxing the harsh Qin legal code. Two months later Xiang Yu arrived at Xianyang and, breaking the pact with Liu, had the Qin royal family murdered and looted and destroyed the Qin palaces and the imperial library.

Because he was the foremost general, Xiang immediately undertook to create a new political order for China. Instead of continuing the unified empire set up by Qin, he created 19 feudal states, each under a king, with himself ruler of one of them and president of the

confederacy of states, heralding a return to the political model of China of 200 years earlier. Liu Bang was awarded a region called Hanzhung (Han-chung) in northwestern China and became king of Han. The rivalry between Xiang and Liu came to a head when Xiang attempted to have Liu assassinated. In the ensuing war Xiang won important victories, but his arrogance and cruelty lost him allies and supporters, while Liu won adherents with his generosity and administrative skills. Deserted by his followers, Xiang committed suicide in 202 B.C.E. Liu's followers proclaimed him emperor of the new HAN DYNASTY.

JIU-HWA LO UPSHUR

Xiongnu (Hsiung-nu)

Chinese texts describe the Xiongnu, a nomadic people, as ferocious warriors and raiders. Powerful Xiongnu men practiced unlimited polygamy, and when a leader died, his successor married all his father's or grandfather's wives except his mother. Likewise a surviving brother took over his deceased brother's widows. Differences in customs, languages, and lifestyles made relations difficult between the Chinese and Xiongnu. The Xiongnu language is believed to belong to the Altaic group, whereas Chinese was a Sinitic language. Moreover, the Xiongnu were nomadic, and the Chinese led a sedentary lifestyle. The Chinese were literate, whereas the Xiongnu had no written script.

North and northwest of the Yellow river valley, the increasingly arid climate allowed for mixed farming and herding lifestyle in an intermediate zone, then only herding by nomads was possible. By the fourth century B.C.E. during China's Warring States era, most of the seminomadic people had been absorbed into the northern Chinese states. As a result, Chinese and nomadic cultures came into direct contact. One of these nomadic groups was the Xiongnu. As they had no written language, the only textual accounts about them are in Chinese, starting in the fourth century B.C.E.

Around 324 B.C.E. three northern Chinese states called Qin (Ch'in), Zhao (Chao), and Yan (Yen), which

bordered on the Xiongnu, began building defensive walls along their frontiers. In 307 B.C.E. the king of Zhao, whose state was most threatened by the Xiongnu, ordered his troops to practice archery, changed their uniform to the Xiongnu style, and began to acquire a large cavalry—with good results, winning both battles and lands. China was unified under the Qin in 221 B.C.E. The first emperor of the QIN (CH'IN) DYNASTY, either pursuing expansion or to give work to his huge army or, as he stated, to prevent Xiongnu aggression, ordered his most capable general, MENG TIAN (MENG T' IEN) to clear all land south of the northern bend of the Yellow River of nomads.

General Meng defeated the Xiongnu *shanyu* (king) named Touman with an army of more than 100,000 men (some records say 300,000) and annexed land across present-day Manchuria, through Inner Mongolia to Gansu (Kansu) Province in the west. He linked existing walls and extended them to form the GREAT WALL OF CHINA with heavily fortified outposts, settled the frontier lands with convicts and colonists, and built roads that linked the borderland with the metropolitan area. Touman and his followers fled northward. However, Qin victories were quickly undone. The first emperor died in 210 B.C.E., followed by the forced suicide of General Meng in a power struggle; widespread revolts toppled the dynasty in 206 B.C.E.

Defeats by the Chinese forced the loosely knit confederation of Xiongnu tribes to reorganize. In 209 B.C.E. Touman's son MAOTUN (MAO-T'UN) murdered him. As the new *shanyu*, Maotun solidified his forces into a disciplined and loyal fighting unit. He defeated other nomadic tribes called the YUEZHI (YUEH-CHIH) and the Dong Hu (Tung Hu), forcing them to flee. The Dong Hu fled to Manchuria, and the Yuezhi were broken up. One group moved south of the Great Wall, while the main group, called the Great Yuezhi, moved west, eventually settling in present-day Afghanistan and Pakistan. He also confronted the ruler of the new HAN DYNASTY in China. In a battle in 200 B.C.E., 300,000 of Maotun's cavalry defeated LIU BANG's mostly infantry forces.

The two sides concluded a treaty in 198 B.C.E. that stipulated peaceful relations between the two equal states, trade, fixed gifts between the two states (Han gave Xiongnu large quantities of silks, silver, liquor, and other valuables, for token return gifts by Xiongnu), and a Han princess as wife for Maotun. This was called the Heqin (Ho-ch'in) Treaty, the word meaning "peace and amity." A total of 10 Heqin treaties were signed between 198 and 135 B.C.E., when a new ruler succeed-

ed to either throne. Several more Han princesses were given as wives to Xiongnu rulers, and each revision entailed additional gifts from the Han. China agreed to the terms because the newly established dynasty was too unstable and the people were too exhausted from previous wars to pursue an aggressive policy. Although the treaties brought a measure of peace, Xiongnu raids continued. It is estimated that approximately 10,000 Chinese died annually from these continuing raids, in addition to seized people (for slaves) and property.

In 134 B.C.E. the Han, fully recovered and under a young, vigorous ruler, HAN WUDI (HAN WU-TI), ended the appeasing Heqin treaties. The first indecisive campaign in 129 B.C.E. had four Han armies, each 100,000 strong in simultaneous attacks. In 127 B.C.E. the Han scored a major victory, chasing the Xiongnu north across the Gobi Desert to the shores of Lake Baikal in present-day Russia.

It was a prolonged struggle, which finally broke the Xiongnu but also cost the Han huge losses in lives and treasures. Wudi sent an emissary, ZHANG QIAN (CHANG CH' IEN) to find the Yuezhi and offer them an alliance against their common enemy, but when the envoy finally found them in Afghanistan, the Yuezhi were settled and no longer interested. He did find other allies, willing to become Han vassal states, from as far away as Ferghana and Sogdiana in Central Asia.

Xiongnu power was finally broken in 60 B.C.E. The reasons were superior Han resources and leadership, the declining ability of later Xiongnu *shanyu*, the inability of the Xiongnu tribal structure of government to handle expanded power, and better treatment of vassal states by the Han. Civil wars ensued among the Xiongnu, which broke them into two groups in 54 B.C.E. The Southern Xiongnu surrendered to the Han dynasty and became vassals; their leaders came to pay homage at the Han capital and received subsidies, while many of the tribesmen were settled along the border regions.

Campaigns against the Northern Xiongnu continued sporadically until the end of the first century C.E. when they were finally defeated in present-day Outer Mongolia and Central Asia. Some were forced to move west; those remaining became intermingled with other nomadic groups. After the fall of the Han in 220 C.E. groups among the Southern Xiongnu formed brief regional dynasties in northwestern China, and some claimed to be descendants of the Han imperial family through Han princesses who had become wives of their rulers. By the sixth century the Xiongnu had been absorbed into Chinese culture.

JIU-HWA LO UPSHUR

Xunzi (Hsun Tzu)

(300–235 B.C.E.) *Chinese philosopher*

Xunzi means “Master Xun” in Chinese; his personal name was Qing (Ch’ing). He was a heterodox Confucian philosopher, and his collected writings of 32 chapters are named the *Xunzi*. Each well-argued chapter is devoted to a single topic, such as self-cultivation, proper kingly rule, the recruitment of officials, military affairs, and music.

Xunzi’s great mind ranked him third in importance among Confucian philosophers, after CONFUCIUS and MENCIUS. He spent most of his life studying and teaching, with a brief interlude as a magistrate. Living at a time of intense interstate warfare as China struggled toward unification, he despaired of a restoration of the old order that Confucius and Mencius had hoped for.

This may explain Xunzi’s hardheaded realism and opposition to excessive idealization of the past. He also looked to more recent role models from Chinese history, going back to the founders of the ZHOU (CHOU) DYNASTY rather than the remote legendary sage rulers such as YAO, SHUN, AND YU. He also rejected traditional concepts that heaven rewarded virtuous rulers and punished wicked ones; instead he postulated a mechanical universe that operated independent of the doings of humans.

Xunzi’s interpretation of Confucian teachings on human nature was opposite of that of Mencius. Whereas Mencius taught that human nature was innately good and became corrupted because of poor environment and lack of moral education, Xunzi believed human nature was evil and selfish. However, he also believed in the crucial role of education and trusted that a good moral education could make sages of all men. Therefore, Xunzi made the role of a wise and strong teacher key to moral progress. He also concluded that humans had a choice, a key element that made them superior to animals.

He said: “The nature of man is evil; his goodness is only acquired by training. The original nature of

man today is to seek for gain, if this desire is followed, strife and rapacity results and courtesy dies . . . therefore the civilizing influence of teachers and laws, the guidance of the 'li' [proper good conduct] and justice is absolutely necessary. . . . Hence they [ancient kings] established the authority of the prince to govern man; they set forth clearly the 'li' and justice to reform him; they established laws and government to rule him; they made punishments severe to warn him, and so they caused the whole country to come to a state of good government and prosperity." However, Xunzi agreed with Mencius's social and economic welfare plans and agreed that unworthy rulers should be overthrown, saying, "Heaven does not create people for the sake of the sovereign. Heaven made the sovereign for the sake of the people."

While Xunzi's interpretation of Confucianism had great influence during his lifetime, it waned during the

HAN DYNASTY (202 B.C.E.–220 C.E.) and thereafter, and the more altruistic interpretations of Mencius were accepted as the Confucian orthodoxy. Two of his students, Han Fei and Li Si (Li Ssu), would become leaders of the Legalist school, gained great power under the Qin (Ch'in) state, and engineered the unification of China under the QIN (CH'IN) DYNASTY.

Yamato clan and state

The Yamato court is known as the birthplace of the Japanese political state. It is a term applied to the political system of the Kofun period but also its development and refinement in the late fifth to seventh centuries C.E. The Yamato state unified north Kyushu, Shikoku, and southern Honshu. The people were a clan-, or kinship- (*uji*), based society, where religion played an important part in controlling their lives, but during the Kofun period (the name given to the large key-shaped burial mounds of the time) powerful clan leaders and their families started to emerge as the stratification of communities evolved within the late YAYOI CULTURE. Small kingdoms were established, each ruled by a different clan. The rulers at this time were mainly religious figureheads using the people's faith to govern them. One of the most powerful was the Yamato clan, and after continual warfare among the different kingdoms a union of states developed—the Yamato state, under the rule of the Yamato clan.

In the fourth century C.E. the Yamato were situated in the rich agricultural region around the modern city of Kyoto. In the fifth century, when the Yamato court reached its peak, there was a shift in the power base to the provinces of Kawachi and Izumi (modern Osaka). The emergence of such powerful clans is evidenced by the increased elaboration of their burial mounds in comparison with the Yayoi period. Burial sites in the Kofun period illustrated a segregating of the workers and elite of the community. The mounds took on a new shape, a “keyhole” design, were larger in size, and were

surrounded by moats. By the fifth century it was evident that the power of the Yamato clan had increased. These huge tombs represented the power of the Yamato aristocracy, holding swords, arrowheads, tools, armor, and all the signs of military might. Only religious and ceremonial items had been placed in earlier burial mounds. As Yamato had increased the contact with mainland Asia, the items in the burial tombs reflected their power and influence. Besides the military items, there were such things as gilt bronze shoes and gold and silver ornaments.

The Yamato clan and its strongest allies formed the aristocracy of the Yamato state, occupying the most important positions in the court. A hereditary ruler headed the Yamato court, and because intermarriage within clans produced a large family network, there were constant struggles for power. Believing that they were descendants of the sun goddess, the Yamato clan developed the notion of kingship and thus began the imperial dynasty. An emperor, based on the Chinese system, represented it. The first legendary emperor of Japan was Jimmu. The emperor, the supreme religious symbol of the state, had no real political power. The power base lay with the clan leaders, headed by a prime minister-style official. These officials had very close ties with the ruler, showing the importance that was placed on the harmony between religion and the governing of the people. There was also economic and military support from the occupational groups within the court known as *be*. These groups consisted of rice farmers, weavers, potters, artisans, military armorers, and specialists in

religious ceremonies. They were subordinate to the ruling families. One group of *be* were especially important to the ruling family as they consisted of highly skilled immigrants from mainland Asia, who specialized in iron working and raising horses.

The Yamato court became the unifying force in Japan. They began to limit the power of the lesser clan leaders and started to acquire agricultural lands to be controlled by a central body. A bureaucratic ranking system was developed when the separate kingdoms were incorporated into the Yamato court, and the stronger clan leaders were given titles to reflect their status as regional chiefs. The two titles bestowed on the chiefs were *muraji* and *omi*. The greatest of the chiefs lived at the court and as a collective ruled over the productive lands and hence the farming communities. This also gave them access to large resources of manpower to be used in such activities as burial mound building and also as conscripted troops for the military forays into the Korean Peninsula.

By the fourth century the Yamato court was developed enough to send envoys to mainland Asia, sometimes military, but mostly to gain knowledge of the political and cultural aspects of the far more advanced Chinese and Korean civilizations. They also procured supplies of iron resources said to be plentiful in the south of Korea. By the end of the fourth and in the beginning of the fifth centuries the military were involved in the expansion of Yamato power throughout the Korean peninsula. At the same time Korea was going through cultural and political changes, with warring between the three kingdoms, Koguryo (north), Paekche (east), and Silla (west). Alliances were made with the Paekche, against the Silla, with Yamato gaining some power in the region. However, in the sixth century Silla became more powerful militarily, causing Yamato to face power reversals in the region and forcing them to withdraw from the peninsula.

Paekche began to exchange knowledge and resources with the Yamato; scribes, sword smiths, horsemen, and horses were introduced to the court. The Yamato court had a large number of mainland scholars brought over for their advanced knowledge and skills. The Paekche court also sent a Confucian scholar, a Buddhist scholar, Buddhist scriptures, and an image of the Buddha. These scholars dramatically altered the fast-developing Japanese culture. Scholars were sent to China to learn about their political and cultural ideals, and in the sixth or seventh century they were brought back to the Yamato court to establish a written system based on Chinese characters and the grounding for the establishment of a

parliamentary system. Based on Chinese models of government, the Yamato court developed a central administrative and imperial court.

The sixth century saw the SOGA CLAN'S rise to power. The Soga clan, which did not claim to be descended from the gods, had entrenched themselves in the Yamato court by establishing marital connections with the imperial family. As well as having administrative and fiscal skills, this allowed them considerable influence within the court structure. They introduced fiscal policies based on Chinese systems and established the first treasury. They collected, stored, and paid for goods produced by employees. The Soga introduced to the court the idea that the Korean peninsula could be used as a trade route rather than for military conquest.

The powerful Soga clan was in favor of the introduction of Buddhism to Japan, but in the beginning the Soga found opposition from other clans, such as the Nakatomi, who performed the Shinto rituals at the court, and the Mononabe, who wanted the military aspect of the court to be maintained and elevated in importance. Conflicts arose between the clans, with Soga vowing to build a temple and encourage the spread of Buddhism as the main instrument of worship if successful in battle. They were successful, and there were several Buddhist temples built, and Buddhism became a strong religion in Japan. The Soga believed that the teachings of Buddhism would lead to a more peaceful and safe society.

The intermarriage of the Soga with the imperial family paved the way for Soga Umako (Soga Chieftain) to install his nephew as emperor, later assassinate him, and replace him with Empress SUIKO. Unfortunately, Empress Suiko, was a puppet for Soga Umako and Prince Regent Shotoku Taishi. A system of 12 ranks was established, making it possible to elevate the status of officials based on merit rather than birth right. Prince Regent Shotoku Taishi was a devout Buddhist and a scholar of Confucian principles. Under his instigation Confucian models of rank and etiquette were introduced, and he introduced the Chinese calendar. He built numerous Buddhist temples, had court chronicles written, and established diplomatic links with China.

However, with the deaths of Prince Regent Shotoku Taishi, Soga Umako, and Empress Suiko, there was a coup to gain succession to the imperial throne. The coup was led by Prince Naka and Nakatomi Kamatari, who introduced the Taika (Great Change) Reforms, which established the system of social, fiscal,

and administrative codes based on the *ritsuryo* system of China. The reforms were aimed at strengthening the emperor's power over his subjects and not leaving the final decisions to his cabinet. These reforms ushered in the decline of the Yamato court by lessening the control of the court clans over the agricultural lands and the occupational groups. The reforms abolished the hereditary titles for the clan leaders and instead of them advising the emperor there would be ministries. The new order wanted to have control over all of Japan and make the people subjects of the throne. There were taxes placed on the harvests, and the country was divided into provinces headed by court-appointed governors.

SHELLEY ALLSOP

Yao, Shun, and Yu

(fl. 3rd millennium B.C.E.) *legendary Chinese rulers*

In Chinese accounts of the beginning of their civilization, three rulers of exceptional virtue followed the legendary culture heroes Fuxi (Fu-hsi), Shengnong (Sheng-nung), and the YELLOW EMPEROR; they were Kings Yao, Shun, and Yu. Their shared characteristic was that each rejected his own son as unworthy and tried to install the best-qualified man as his successor, unsuccessfully in the case of Yu. Their unselfishness has figured importantly in Chinese historical writings and made them model rulers. Documents that purportedly date to their rule constitute the first section of the second Confucian classic, the *Shu Jing* (*Shu Ching*), or *Book of History* (also called *Book of Documents*).

Yao (r. 2357–2256 B.C.E.) and Shun (r. 2255–2205 B.C.E.) are revered figures because they epitomized wisdom, humility, and unselfishness. The canon of Yao in the *Book of History* cites Yao as a descendant of the Yellow Emperor and credits him with devising a calendar of 356 days to regulate agriculture, encouraging

morality, establishing a rudimentary government, and above all selecting a successor unselfishly. After ruling for 70 years he set about choosing a worthy successor because he thought his own son unfit and found a humble man called Shun, who was admired as a dutiful son to undeserving parents. Shun did not think himself worthy, but Yao insisted and married his two daughters to Shun to observe his behavior. Yao shared his rule with Shun for 28 years and then abdicated in favor of Shun.

Shun, according to legend, also descended from the Yellow Emperor and was a virtuous and benevolent ruler. Both Yao's and Shun's reigns were troubled by great floods and attempts to build dikes that did not work. Shun then appointed an official named Yu to deal with the problem. Yu traveled the land and worked on flood control for more than a decade, succeeding because he dredged the riverbeds and channeled the water to the sea. He worked so hard that on three occasions he passed his own house and heard his wife and children weeping in loneliness but did not go in. Such was his dedication that Shun set aside his son, made Yu his co-ruler for 17 years, and then abdicated in his favor.

Yu was also a humane and wise ruler (r. 2205–2198 B.C.E.). Together Yao, Shun, and Yu are called the Three Sage Rulers. Yu also attempted to bypass his son and appoint the best man his successor. The people were so grateful to him that they insisted on putting his son Qi (Chi) on the throne. Thus began the first Chinese dynasty, the XIA (HSIA) DYNASTY. The territory under these three rulers was centered on modern Shanxi (Shansi) Province in northern China. Later, Chinese historians idealized Yao, Shun, and Yu, extolling their reign as the golden age. Their moral conduct became the grand themes of historical and literary writings for posterity. As a result of modern scientific methods of investigating history they have been assigned to the position of legendary figures.

Yayoi culture

Beginning in Kyushu and spreading eastward toward the north, migrants from mainland Asia introduced Yayoi culture to Japan, especially via the Korean peninsula. The Yayoi culture of Japanese history was evident between the third century B.C.E. and the third century C.E. The population practiced animism, that is, they attributed all natural phenomena as having a living soul that they called *kami*. They also worshipped the spirits of their ancestors. Shrines were few in number. There was no written language in Japan at this time, so nothing was documented by the people about their culture and way of life. The Chinese, however, did have an advanced writing system, so they were able to record the development of the culture.

Clothing was simple, with most fabric woven from hemp and bark fibers. There was no currency, so bartering was used to trade farm implements. Yayoi farmers fished, hunted, gathered, and grew vegetables and rice. In the early Yayoi years there were no cities, and it was the first time in Japan's history that permanent settlements started to appear in the agricultural community. This was because of the introduction of a highly advanced form of rice cultivation using irrigation, known as wet rice farming. As time went on, the Yayoi started large-scale irrigation farming, which strengthened their economy, including the establishment of terraced paddy fields. The Yayoi were so successful in the growing of rice that there was often a surplus. To store this surplus they developed storage buildings on stilts, after finding that the traditional method of burying rice in pits resulted in moldy rice. Such surpluses allowed the villages to increase in population, and as the Yayoi era progressed, these villages would merge to create larger settlements.

As the cultivation of wet rice necessitated the building of paddies, migrants brought implements to work the land, hence the introduction of metal tools from the mainland. Iron was the first metal, mainly from Korea, followed by bronze from China. As time progressed, the local craftsmen were taught to work the metal, and they began to develop their own styles. Among the implements produced in this period were swords, arrowheads, axes, chisels, knives, sickles, and fishhooks. They also produced decorative items like mirrors and ceremonial bells that were mainly used for religious rituals and symbols of status.

Another distinctive characteristic of Yayoi culture was earthenware. The pottery wheel was first introduced to Japan in this period. Yayoi pottery was smoother and more uniform and had a better shape than earlier Jomon pot-

tery. It was unglazed and more simply decorated in comparison with Jomon pottery, more akin to early Korean pottery. The term *Yayoi* is derived from an area in Tokyo where evidence of this earthenware was discovered. Even though the Yayoi culture covered much of Japan, not all regions developed the same traits; for example, the pottery found in the north had indications of using a comb effect in the decorations to form lines or bands.

During these years there was a progression toward civilization illustrated in methods of burying the dead, regardless of their position in the community. At first the dead were buried in simple, single graves covered in dirt mounds. Later they were left in more elaborate graves, some of stone or clay, often with stone dolmens over the site. This shows one aspect of the Chinese influence on the cultural elements of the Yayoi. In the later years of the period, leading into the Kofun (Yamato) era, some of the burial sites were set apart from the others suggesting the beginning of a class stratum and that some people had started to gain power in the community.

The Yayoi period was the turning point for the development of Japanese culture. At the end of the era, when the villages had amassed wealth, conflicts began over the surrounding lands. It proved beneficial to amalgamate into larger settlements, thus initiating the beginnings of social order and the evolution of political entities that would unify the larger villages into states, finally accepting one ruling body.

SHELLEY ALLSOP

Yellow Emperor (Huangdi, or Huang Ti)

(r. 2697–2597 B.C.E.) *legendary Chinese hero*

According to Chinese tradition or mythology, civilization began as a result of the innovations introduced by culture heroes at the beginning of the third millennium B.C.E. The first ones were Fuxi (Fu-hsi) the Ox Tamer

and Shengnong (Sheng-nung) the Divine Farmer, who taught people to domesticate animals, instituted family life and settled agriculture, and established markets for trading. Their inventions or innovations denoted advancement of ancient peoples from the PALEOLITHIC AGE to the NEOLITHIC AGE.

A period of chaos ensued after Fuxi and Shengnong's rule until Huangdi (Huang Ti), or the Yellow Emperor, established most of the trappings of kingship. Many advances resulted from his reign. People began to live in wooden houses, built walled towns, traveled in boats and carts, and made pottery. His wife taught women to raise silkworms and spin and weave silk. His ministers taught the art of divination by the Sun, Moon, and stars and invented musical notations, arithmetic, and established the calendar. They also invented writing. Fuxi, Shengnong, and the Yellow Emperor are culture heroes.

Huangdi was also credited with winning a great battle against "barbarian" tribes somewhere in modern-day Shanxi (Shansi) Province in northern China, consolidating his kingdom and beginning the history of China as a nation. Later legendary rulers YAO, SHUN, AND YU (founders of the XIA [HSIA] DYNASTY) and the founders of the SHANG DYNASTY and ZHOU (CHOU) DYNASTY were all reputedly his descendants. Since the Xia, Shang, and Zhou dynasties together constituted the formative age of Chinese civilization, and their rulers all claimed descent from the Yellow Emperor, by extension the Chinese people have regarded him as their common ancestral hero and called themselves his descendants. Thus, the legend of the Yellow Emperor is important to the Chinese civilization.

JIU-HWA LO UPSHUR

Yellow Turban Rebellion

The Yellow Turban Rebellion was a messianic uprising (184–185 C.E.) that was both a symptom and cause of the fall of the HAN DYNASTY (202 B.C.E.–220 C.E.). It occurred during the disastrous reign of Emperor Lin (r. 168–189 C.E.) Ascending the throne at age 12, Lin was under the control of the regent, who sought to

eliminate the dominance of corrupt eunuchs with the assistance of the scholar-officials. However, the eunuchs acted first, killed the regent, purged the officials, and proceeded to rule unchecked during the next 20 years. They let landlordism increase unchecked while increasing taxes on the peasants. The economic distress of the population was exacerbated by natural disasters including droughts and flooding of the Yellow River, all producing famine and refugee movements.

These distresses caused peasant revolts, which combined political discontent with religious overtones. They culminated in 184 C.E. in the Yellow Turban Rebellion. The name was derived from the yellow turban the rebels wore to distinguish themselves from government troops. The rebels had chosen yellow because it symbolized the earth, their logo, which according to Chinese cosmology followed fire, represented by red, the symbol of the Han. The rebels chose signs and symbols to signify cosmic support and religious justification. The rebels were also messianic and millennialist, based on certain interpretations of popular DAOISM (TAOISM). The Yellow Turbans were led by a man surnamed Zhang (Chang) who taught that the recent plague was caused by sin and could be cured by public confessions, magical and religious practices, and the wearing of amulets and charms. Zhang proclaimed that he could then renew the world and bring about a golden age of Great Peace (*taiping*). (Great Peace became the name of another major messianic peasant revolt in the 1850s.)

The Yellow Turbans met success in 16 commanderies in northern China but were defeated by 185 C.E., not by the inept regular troops, but by troops raised by powerful provincial commanders. The result was the breakdown of the central government that inaugurated an era during which emperors, all minors after Emperor Lin's death, were puppets of the regional warlords, while at the capital families of their mothers and grandmothers vied for control.

The first powerful warlord to march on the capital of LUOYANG (LOYANG) was named Dong Zho (Tung Cho), who massacred more than 2,000 eunuchs, ending their power, then deposed the young emperor, looted the city, and burned down the imperial library. Dong was soon killed. A new boy emperor was installed, named Xiandi (Hsien-ti), but he was a pathetic plaything of the rival generals. Xiandi's abdication in 220 was a mere formality that ratified the real power alignment between three major contenders. The Yellow Turban Rebellion contributed to the long decline and fall of the Han dynasty.

JIU-HWA LO UPSHUR

Yemen

Yemen is the state occupying the southwestern part of the Arabian Peninsula. Because of the extensive desert in the interior of the peninsula, Yemen has undemarcated borders with Oman to the east and Saudi Arabia to the north. The western and southern borders are marked by the coast, running along both the Red Sea and the Gulf of Aden. Trade characterized the history of early Yemen. The harsh climate and the generally unproductive nature of much of the interior meant that

most of Yemeni culture and history was focused on a comparatively narrow coastal strip. However, some highland areas were important economically and were settled from an early period. Recent discovery of megaliths on a coastal plain at al-Tihamah indicate that even marginally habitable desert regions of Yemen were occupied perhaps as long ago as 2400 B.C.E. However, it was not until some centuries later that a number of powerful, independent city-states emerged in the area. The basis of these states was the local monopoly control of frankincense and myrrh and the command of the spice trade from South Asia, which resulted from knowledge of wind conditions. Both myrrh and frankincense are derived from gum resins, obtained by removing the bark from a portion of a tree and allowing the resin to extrude and harden.

From the seventh century B.C.E. caravans took the myrrh and frankincense along land routes to Ctesiphon, Syria, and the Mediterranean cities. The biblical queen of Sheba was located in Yemen, an area later known

The city of Thula in Yemen stands at the eastern foot of an ancient fort. Much of Yemeni culture was focused on the narrow coastal strip, yet even marginally habitable desert regions of Yemen were occupied perhaps as long ago as 2400 B.C.E.

by the Romans as Arabia Felix—"fortunate Arabia." In addition to the Sabaean or Sheba state, there were also the Minaean and the Himyarite states. These states also had access to eastern Africa and traded into luxury items such as ostrich plumes. The wealth that these various items produced meant that from approximately 1200 B.C.E. to 255 C.E. they were famous throughout the Mediterranean world. Inevitably, wealth stimulated desire and a number of attempts were made to dominate the region from the outside. The most well known of these attempts was by the Romans, and eventually Arabia was annexed by TRAJAN, who redirected maritime trade to the west coast of the Red Sea. Further, Roman sailors discovered the knowledge of the winds, and monopolization of the spice trade by Yemenis ended. Both Greeks and Romans had already managed to source their own trade goods through the Yemeni port of Muza, which is now lost. Independent, wealthy Yemeni states were no longer possible. The great engineering projects began to fail as falling incomes meant lower revenues for public works. Symbolically, the Ma'rib Great Dam failed in 525, victim of the failure to reinforce its structure.

Yemeni people were a mixture of Jewish and Christians by this time, together with a mixture of adherents of indigenous beliefs. The last Himyarite king, Dhu Nuwas (Yusuf Asaf Yathar), converted to Judaism and subsequently ordered a massacre of Christians. Survivors called for help from the Byzantine emperor in the name of the Aksumite Christians of Yemen. This enabled the Aksumites to dominate Yemen and even threaten to control the area around Mecca and Medina. In return, Himyarites called the Persian Empire for help, which led to the absorption of Yemen into Persia. Subsequently, Yemen came to be governed by the Umayyid caliphate in Damascus and afterward by the Abbasid caliphate in Baghdad.

Islamization of Yemen occurred rapidly but has become a controversial subject among Islamic societies and their scholars, many of whom have little interest in pre-Islamic history and in some extreme cases have inhibited research into the subject. The Yemeni people enthusiastically embraced Islam, and the early conversion of the state is remembered as a matter of considerable pride.

JOHN WALSH

Yuezhi (Yueh-chih)

In the second century B.C.E. the Yuezhi people, described as light-skinned and speaking an Indo-European language (and without a written language), lived in western Gansu (Kansu) Province and the region between the Altai and Tianshan (T'ien-shan) Mountains in present-day northwestern China. They were hereditary enemies of another nomadic group, the XIONGNU (HSIUNG-NU). Their misfortune began when MAOTUN (MAO-T'UN), who had spent time as a hostage among them, became leader of the Xiongnu in 209 B.C.E. Maotun would lead his people to unprecedented power by defeating both the newly established HAN DYNASTY in China and other nomadic tribes. The Yuezhi were among his first victims: After being defeated in 175–174 B.C.E., they were expelled from the Gansu Corridor and began their westward migration.

Maotun's successors continued to wage war against the Yuezhi who had settled in the Ili Valley in present-day Xinjiang (Sinkiang) in China. One branch, called the Xiao Yuezhi (Hsiao Yueh-chih), or Small Yuezhi, moved south into areas controlled by another, nomadic people called Qiang (Ch'iang) and lost their separate identity. Another branch, called the Da Yuezhi (Ta Yueh-chih), or Greater Yuezhi, moved further west, eventually playing a role in the destruction of the Greek kingdom of BACTRIA and settling in the northwestern edge of the Indian world. There they prospered, due to the location of their new home: an important meeting point along the SILK ROAD between China, India, Persia, and the Roman Empire. A mosaic of peoples mingled in the cosmopolitan state they created, called the KUSHAN EMPIRE. Archaeologists have excavated the rich remains at Begram in modern Afghanistan, the capital of the Kushan Empire, and at other sites.

The remains included Greco-Roman sculptures and bronzes, Indian ivory, jewelry and gold ornaments, Chinese bronzes, silks and lacquerware, and Alexandrian glass, indicating that rich trade existed under the Kushans over 2,000 years ago. The dominance of Buddhist religious art shows the primacy of Buddhism among the Kushan people, though the presence of Persian and Greco-Roman deities suggest the presence of other religions among the population. In 138 B.C.E.

the Han emperor Wu sent an envoy ZHANG QIAN (CHANG CH' IEN) west to seek out the Da Yuezhi for an alliance against their mutual enemy the Xiongnu. After many tribulations Zhang did find them, not in the Ili Valley, but in Afghanistan. They had however settled down and refused to cross swords with the Xiongnu again.

JIU-HWA LO UP SHUR

Zakkai, Yohanan ben

(d. 80 C.E.) *religious leader*

Yohanan ben Zakkai was the religious and political leader who laid the foundation for rabbinic Judaism after the fall of Jerusalem and its Temple. H. J. Schoeps said of his leadership: “The state was changed into an academy, the royal dynasty into a patriarchate, and the Sanhedrin left the Temple site and continued independently in Jabneh.” As a PHARISEE, Yohanan studied under Hillel and Shammai, though he was more influenced by Hillel, the liberal sage. He found himself constantly arguing with the SADDUCEES and the Zealots, an anti-Roman group who figured heavily in the uprising of 70 C.E. Yohanan was known as a pious and pacifistic rabbi who ran his own school in Jerusalem at the time of the Roman invasion and siege. Like many Pharisees, he had specific interpretations of the Bible and predicted the doom of the Temple. To escape the city he feigned his own death and was carried out in a coffin.

Vespasian received him as a religious holy man and allowed him to run an academy of scholars and rabbis in Yavneh until his death in 80 C.E. In the literary framework laid out in rabbinic documents, both Vespasian and Yohanan are stereotypes representing Israel and rabbinism and Rome and the Gentiles. In fact, Yohanan was supposed to have prophesied to Vespasian—like the mighty prophet Jeremiah—that he would be the new Caesar. The point of the stereotypical story is that Yohanan and his band of rabbis were a prophetic movement that accurately interpreted the Bible in real-world

ways and were respected by the Romans. From the time of Yohanan until the time of Bar Kokhba, the city of Yavneh was a cultural and spiritual center for Jews in Palestine. There Yohanan is alleged to have formed his disciples and to have carried out the religious duties of the Law, good deeds, and prayer. In reality Yavneh allowed Jews to reformulate a vision for their faith. There the MISHNAH was put together as the religious constitution of what would become rabbinic Judaism. Late 19th-century German historians proposed that Yavneh was the place where Yohanan’s council of rabbis took decisive actions to formalize their faith. Based on flimsy rabbinic evidence they persuaded the world that the rabbis, between the days of Yohanan ben Zakkai and Eleazar ben Azariah (90 C.E.), chose the books that made up the Jewish Bible, chose which texts represented the true biblical texts (and rejected all other texts as deviant), and formally excluded the Christians as heretics from the faith. In short, Yavneh’s supposed decrees became for these historians the symbol of the Jewish response to a world without temple, holy city, or holy land—in the absence of solid evidence.

Yohanan’s own contributions to the deliberation, recorded by the rabbis, cannot be ascertained exactly. However, one of his important assertions was that sages had more practical authority than priests. The authority covered such things as Sabbath customs and festal and calendar observances. This position would serve Jews well in the years after 70 C.E., when keeping temple holiness in homes and villages had to serve when no temple sacrifice could be made. The legends about him suggest

that he restrained messianic fervor, urged obedience to the Law as a response to defeat, and taught that good deeds atoned for sin in a world without the Temple. After Yohanan retired from the council of rabbis at Yavneh, Gamaliel II succeeded him. Gamaliel II formalized the role that Yohanan played at Yavneh when he was recognized as “prince” by provincial Roman authorities and made his own official visit to Rome in company with other rabbinic scholars. More important, rabbis who did not initially participate at Yavneh now began to look to Gamaliel and his rabbis for leadership.

Yohanan is so revered in later rabbinic Judaism that he is simply called “Rabban” in the documents, meaning “Our Teacher.” Modern-day rabbinic Jews consider him their founding father in the faith. He also is one of the most quoted rabbis in the TALMUD. Despite all the legends told about him in the later Jewish writings, scant first-rate historical records exist about him. History’s recollection of him is based on mythical reports written centuries later.

MARK F. WHITTERS

Zhang Qian (Chang Ch’ien)

(d. 113 B.C.E.) *explorer and diplomat*

Zhang Qian was the greatest explorer in ancient China, having made two long journeys in 139 and 115 B.C.E. He was also an important diplomat for the Han emperor Wu. After suffering a major defeat at the hands of the nomadic XIONGNU (HSIUNG-NU), LIU BANG (LIU PANG), founder of the HAN DYNASTY (202 B.C.E.–220 C.E.) decided to appease his formidable northern neighbors by concluding the first of many Heqin (He-ch’in) treaties with them. The terms included gifts of large quantities of silver, food, and silks to the Xiongnu and the marriage of Han princesses to the Xiongnu rulers. Han agreed to the humiliating terms because the dynasty was new and unstable and because the people

were exhausted from previous wars and not ready to undertake new ones.

In 141 B.C.E. a young man, posthumously known as HAN WUDI (HAN WU-TI), or the Martial Emperor, ascended the throne. By this time the empire was stable, had grown materially, and commanded sufficient resources and manpower to support an expansionist policy. Moreover, appeasement of the Xiongnu had resulted in ever more exorbitant demands for gifts each time the Heqin Treaty was renewed and also because appeasement had not bought border peace from Xiongnu raids. A broad new strategy emerged. One part was to seek allies against the Xiongnu. Thus in 139 B.C.E. a young courtier named Zhang Qian was chosen to journey west to find the YUEZHI (YUEH-CHIH), a nomadic group that had suffered under Xiongnu power and had been expelled from their home in northwestern China.

Zhang set out with 100 men. He had to cross Xiongnu territory to reach his goal and was captured. He would remain among them for 10 years, marry a Xiongnu woman, and raise a family before he could escape and resume his journey. He did finally find the Yuezhi in the borderland of modern Afghanistan and Pakistan, but they were content in their new home and refused an alliance with the Han against the Xiongnu. En route home Zhang was recaptured by the Xiongnu but finally escaped and reached home in 126 B.C.E. with only one of his original entourage. Meantime, Emperor Wu had begun massive many-pronged campaigns against the Xiongnu in 133 B.C.E. Though Zhang failed in his primary mission, his reports of the lands, resources, and people of Central Asia and of the availability of Chinese silks in India, possibly via trade routes across southwestern China, piqued Emperor Wu’s interest to expand in both directions.

Campaigns under Wudi’s generals brought vast regions under Chinese rule. They included southwestern China, northern Vietnam, and much of Korea. China also established a tributary system in Central Asia (called Western Regions by the Chinese) whereby local rulers retained their authority but submitted to the supervision of Chinese protector-generals (similar to Roman proconsuls), rendered tribute, and left sons to be educated in China and as hostages at the Chinese court. In 115 B.C.E. Zhang was sent as envoy to Wusun (Wu-sun) and established relations with that nomadic state northwest of the Xiongnu (a Han princess was married to the Wusun ruler) and further west with such Central Asian states as Ferghana, BACTRIA, Sogdiana, and Khotan. Zhang Qian was important because his missions and reports

stimulated Chinese military, diplomatic, and commercial expansion into vast new realms.

Zhou, Duke of

See DUKE OF ZHOU (CHOU).

Zhou (Chou) dynasty

The Zhou, together with the preceding XIA (HSIA) DYNASTY and SHANG DYNASTY, are called the Three Dynasties in Chinese history. They account for two millennia that are the formative era of the Chinese civilization. All three dynasties are the products of the Neolithic civilization of northern China, each occupying a different but overlapping region of the Yellow River valley. They are moreover contemporaries of one another, each achieving dominance over several centuries, then receding to subordinate status.

For example, postdynastic Xia became a state called Qi (Ch'i), while postdynastic Shang survived as a state called Song (Sung). Because the Zhou (Chou) was very long lived, it is subdivided into several shorter eras, beginning with the Western Zhou (1122–771 B.C.E.), followed by the Eastern Zhou (770–256 B.C.E.). Eastern Zhou is further subdivided into the Spring and Autumn era (722–481 B.C.E.), followed by the Warring States era (463–222 B.C.E.).

Unlike the Xia and the Shang, multitudes of contemporary written records survived from the Zhou. Early Zhou records include the *Shu Jing* (*Shu Ching*), or *Book of History* (or *Book of Documents*), which include proclamations, edicts, and pronouncements on the early phase of the dynasty, and the *Shi Jing* (*Shih Ching*), or *Book of Poetry*, with many poems that dealt with the early Zhou era. These are supplemented by thousands of bronze vessels found in archaeological digs cast with inscriptions up to 500 words long that described important events, such as battles and the creation of fiefs. The number of surviving written works

multiplied with the progress of time. The information they provide are supplemented by other material evidence from thousands of excavated Zhou sites.

KINGS WEN AND WU

Predynastic Zhou people were frontiersmen living in the Plain of Zhou where the Wei River joined the Yellow River in modern Sha'anxi (Shensi) Province. They acted as a bastion against the "barbarians" beyond the frontiers, and their leader was given the title Lord of the West by Shang kings. King Wen (the Cultivated) was the first great Zhou leader, noted for his benevolence and for building up his state that could challenge the Shang. Wen's son, King Wu (the Martial), followed him in 1133 B.C.E. Wu formed a coalition with eight other states disgruntled with the Shang. In 1122 B.C.E. Wu's forces decisively defeated the Shang king Shou at the Battle of Muye (Mu-yeh), who then committed suicide. Wu died shortly after destroying the Shang and left the task of consolidating the new dynasty to his brother, the DUKE OF ZHOU (CHOU), who acted as regent for Wu's young son for seven years.

THE DUKE OF ZHOU

The Duke of Zhou fought to defeat remnant Shang forces and enlarged the realm to the eastern seaboard, creating a state that is larger than modern-day France. He governed the realm from two capitals, the original Zhou capital at Hao, near modern Xi'an (Sian), and a new one called LUOYANG (LOYANG), further down the Yellow River valley to govern the former Shang lands and beyond. He granted land to relatives and allies and gave them grand titles. The lords built walled towns and governed the surrounding land but were accountable to the king and could pass their titles and land to their sons with royal permission. Each lord swore allegiance to the king in rituals conducted in the ancestral temples of the Zhou royal house. Most people were farmers with status similar to that of European medieval serfs who changed hands with the land. Ideally eight families farmed individual plots around a manor and jointly farmed the ninth plot for the lord. The farming system was called the well-field system. These political and economic arrangements resembled those of European feudalism during the Middle Ages; hence the Zhou system is also called feudal. In retrospect, King Wen the dynastic founder, King Wu the conqueror, and the Duke of Zhou the consolidator are honored as sage rulers, who established a golden age.

WESTERN ZHOU

For three centuries Zhou kings generally maintained internal peace and expanded the frontiers until 771 B.C.E.

when non-Chinese tribal people overran the capital, Hao, and killed King Yu. Reputedly he had numerous times falsely summoned the feudal lords to march their troops to the capital because the sight of massed troops pleased his favorite lady. Then when a true emergency occurred, the disgruntled lords had refused to come. The survivors of the Zhou court abandoned Hao in favor of the second capital, Luoyang.

EASTERN ZHOU

The Eastern Zhou (770–256 B.C.E.) saw progressive decline of the power of the kings, whose domain was reduced to land around Luoyang. The king was consulted perfunctorily, then only on genealogical matters. Powerful regional states emerged, warring among themselves, gradually swallowing up the lesser ones. The Zhou monarchs remained on the throne until 256 B.C.E. because they were too insignificant to count. The 500 years of the Eastern Zhou is divided into the Spring and Autumn era after a book of the same name by CONFUCIUS that chronicled the history of his state, Lu (ruled by descendants of the Duke of Zhou), from 722 to 481 B.C.E. In 681 B.C.E., in response to threats from Zhu (Ch'u), a new state in the south, the remaining states joined to form an alliance, and because the Zhou king was powerless to keep the peace, they elected one lord hegemon, or *ba (pa)* in Chinese.

For the next 200 years the reigning dukes of several of the states were successively elected hegemon, convening conferences between the states at intervals and formulating policies or waging wars, or keeping a precarious peace. This was a stopgap solution to maintain some order in the Chinese world without the power and leadership of Zhou kings, who were consulted pro forma and ratified decisions that were already made. The chief feature of the Spring and Autumn era was interstate diplomatic sparring and generally small-scale wars fought by chariot-driving knights. Many of the rival leaders were related by blood, and the defeated lord was shamed rather than killed. A large battle fought between Jin (Chin) and Qi (Ch'i) in 589 B.C.E. involved 800 chariots and 12,000 men, but most battles were smaller. By the end of the era 110 states had been reduced to 22.

WARRING STATES

The Warring States era (463–222 B.C.E.) that followed was also named after a book, *The Annals of the Warring States*. The wars became very destructive and were fought by large disciplined infantry armies, fewer chariots (which were not useful in varied terrain), and more

cavalry. Iron weapons replaced bronze ones, and the powerful crossbow came into general use. Whereas the Chinese world up to 335 B.C.E. had only one king, thereafter the rulers of major states also began to call themselves kings; in 256 B.C.E. one state, Qin (Ch'in) deposed the last Zhou king and annexed his domain. The continued fighting between the seven major states that had emerged was based on the accepted premise that all China be unified under one ruler. The final victor was Qin in northwestern China. Fighting the non-Chinese nomads toughened its people, its frontier position saved it from earlier phases of destructive wars between the other states, and its conquest of the Sichuan (Szechwan) plains gave it huge new resources. Finally its state ideology, called LEGALISM, enabled Qin to build a strong economy, large army, and efficient bureaucracy that allowed it to launch a final successful drive for unification, achieved in 221 B.C.E.

TECHNOLOGICAL AND PHILOSOPHICAL ADVANCEMENTS

Many social and economic changes occurred during the Eastern Zhou period. Early farming by serfs was gradually replaced by freehold farming. Qin led the way by ending feudalism on the premise that free tax-paying farmers would work and fight harder. By the fifth century B.C.E. iron tools had replaced stone and wooden ones in land clearing and farming, increasing acreage using iron-tipped, animal-drawn plows that replaced wooden digging sticks. Borrowing techniques used in bronze making, Chinese metalsmiths were making cast-iron tools and weapons 1,000 years earlier than their counterparts in Europe. States competing for supremacy encouraged advanced farming techniques that included irrigation, fertilization, and crop rotation. Hunting and grazing decreased in importance as more land was used for crops. Manufacturing and commerce flourished; sizable multifunctional towns proliferated, and growing artisan and merchant classes emerged. During the Warring States period the capital city of Qi boasted a population of 70,000 households. Cowrie shells, bolts of silk, and dogs were used as media of exchange in an earlier primarily barter economy, and cast-metal coins became common by the mid-fifth century.

The Zhou conquest appeared to have ushered in a period of social mobility—the establishment of a new Zhou order resulted in stability when positions and jobs became hereditary. By the Warring States era society had outgrown the old order; merchants did not fit into the feudal hierarchy. More important, the competitive political scene encouraged rulers to hire and promote

men based on merit and not birth. Capable men began to sell their talents wherever they could find employment. The frequent wars also made for social mobility. Men and women from the losing side lost at least their status; in many instances lords and ladies from defeated states became slaves and servants to their conquerors. The lowest among the aristocrats, the *shi* (*shih*), originally professional fighting men, became educated and served as bureaucrats of the rulers. Some among them became teachers and philosophers. They became the teachers of the HUNDRED SCHOOLS OF PHILOSOPHY, and their ideas, writings, and debates produced the classical philosophies of the Chinese civilization.

Zhuangzi

See LAOZI (LAO TZU) AND ZHUANGZI (CHUANG TZU).

Zoroastrianism

Western European scholars have traditionally referred to ancient Iranian religion after the acknowledged founding figure of the political formulation of that religion, Zarathushtra. The term *Zoroastrianism* was derived from his name. Today the faith is better known by the name of its devotees, the Parsis. In the ancient Persian Empire there was no general designation for their religion. Moreover, even when centralized authority was pursued and Zoroastrianism was adopted throughout the realm, the religion remained locally distinct throughout the ancient empires, each region having its own variation on the general scheme.

The Avesta, the holy text, was first committed to writing in the sixth century C.E. Both religious tradition and linguistic evidence points to an ancient oral transmission. The oldest texts are the Gathas, assigned a date of roughly 1000 B.C.E. on linguistic grounds; whether they can seriously be ascribed to Zarathush-

tra is unknown. Little is known about Zarathushtra. Some scholars doubt the existence of a historical figure at all. Dates proposed for his life extend from the sixth millennium B.C.E. to 569 B.C.E. Scholars place his life in the range of c. 1200–600 B.C.E. He lived in eastern Iran, was from a priestly family, and was well trained in ritual observance. He reduced the Iranian pantheon to the single deity Ahura Mazda and defined religious life in terms of proper behavior in the pursuit of truth. Observance of purity and avoidance of pollution were central concerns. Fire became the symbol of truth, light, and order; as such it was protected from pollution.

The history of ancient Zoroastrianism can be divided into four stages. First, in the formative period, a conflation of religious traditions took place with two predominating. One was the Indo-Iranian mythology reflected in the Rig-Veda of India that shows a division of the divine realm into deities and demons, though good and evil are reversed in Iran. Creation stories, purity rites, and sacrifices are shared by these traditions. The second major influence on early Zoroastrianism was the religious tradition of Babylonia and ASSYRIA, especially the centrality of the king and the relationship between the ruler and the major deity.

In the second, or Achaemenid period, equated with the Persian Empire c. 559–336 B.C.E., the ruling elite accepted Ahura Mazda as their patron deity and as their contact with the divine realm. They were responsible for spreading the faith from eastern Iran throughout the empire. The establishment of fire towers to house flames symbolizing the pure thought and deeds of the faithful were instigated. The humane administration of CYRUS II may have stemmed from the ethics of Zoroastrianism.

Third, during the era of HELLENIZATION, which extended from ALEXANDER THE GREAT's conquest of the Persian Empire well into the restored Parthian Empire, c. 336 B.C.E.–224 C.E., Greek rulers and classical thought impinged on Iranian religion. By tradition it is during this period that the Avesta was standardized as an oral ritual text. Most of what is known of early Zoroastrianism is derived from contemporary Greek and Roman writers of this time, and they held Zarathushtra in godlike esteem.

Finally, the SASSANID EMPIRE, c. 224–632 C.E., codified, centralized, and nationalized Zoroastrianism as the state religion. Priests became major political players, and the Avesta was first committed to writing. This period ended with the Islamic invasions. Zoroastrianism made such an impression on Muhammad and his followers that they were guaranteed protection along with the Jews and Christians.

Central tenets of ancient Zoroastrianism included the cosmic battle between *asha* (truth) and *druj* (lie) represented by the deities Ahura Mazda and Angra Mainyu, respectively (Angra Mainyu is the same as Ahriman, or Satan, in the biblical tradition). Time was divided into eternal time, in which dwells Ahura Mazda, and temporal time, which is an aspect of creation. Space also consists of the invisible, which contains the ordering principles, and the visible, which is the material world. The Amesha Spentas (Beneficent Immortals) and a host of lesser divine beings aid Ahura Mazda in the fight with Angra Mainyu's demons. This essentially dualistic vision of the cosmos would eventually end with the victory of *asha* and the establishment of a perfect future world into which the righteous would be resurrected in their youthful bodies. A notion of a savior figure (*saoshyant*) as redeemer of the world arose with this idea.

The body and soul of every individual would meet after death on a bridge spanning earth and heaven. For those whose lives were on the side of truth, the bridge was a wide thoroughfare to heavenly rewards; for those whose lives were a lie, the bridge was too narrow to sustain them and they fell into a pit. Little is recorded of the delights of heaven, but the punishments of the pit were extensively described. In the Sassanid

period corpses were laid out on structures designed to keep bodies from pollution until birds consumed the earthly body. Three major priesthoods existed. Zaothar performed sacrifices. Mathran composed hymns, until the Avesta was standardized. Magi became the primary priests of the Parthian period and were recorded by classical writers as adept at interpreting signs and dreams as well as being prophets. Other groups of priests are also attested, though women were not allowed into any priesthood. The faithful were expected to sacrifice to Ahura Mazda through pure thoughts, words, and deeds. Prayers were to be said five times a day, though the central ritual of reciting the Avesta from memory was the duty of two priests selected to represent all Zoroastrians.

ABOUT THE EDITORS

Marsha E. Ackermann received a Ph.D. in American culture from the University of Michigan. She is the author of the award-winning book *Cool Comfort: America's Romance with Air-Conditioning* and has taught U.S. history and related topics at the University of Michigan, Michigan State University, and Eastern Michigan University.

Michael J. Schroeder received a Ph.D. in history from the University of Michigan and currently teaches at Eastern Michigan University. Author of the textbook *The New Immigrants: Mexican Americans*, he has published numerous articles on Latin American history.

Janice J. Terry received a Ph.D. from the School of Oriental and African Studies, University of London, and is professor emeritus of Middle East history at Eastern Michigan University. Her latest book is *U.S. Foreign Policy in the Middle East: The Role of Lobbies and Special Interest Groups*. She is also a coauthor of the world history textbooks *The 20th Century: A Brief Global History* and *World History*.

Jiu-Hwa Lo Upshur received a Ph.D. from the University of Michigan and is professor emeritus of Chinese history at Eastern Michigan University. She is a coauthor of the world history textbooks *The 20th Century: A Brief Global History* and *World History*.

Mark F. Whitters received a Ph.D. in religion and history from The Catholic University of America and currently teaches at Eastern Michigan University. His publications include *The Epistle of Second Baruch: A Study in Form and Message*.

FOREWORD

The seven-volume *Encyclopedia of World History* is a comprehensive reference to the most important events, themes, and personalities in world history. The encyclopedia covers the entire range of human history in chronological order—from the prehistoric eras and early civilizations to our contemporary age—using six time periods that will be familiar to students and teachers of world history. This reference work provides a resource for students—and the general public—with content that is closely aligned to the *National Standards for World History* and the College Board’s Advanced Placement World History course, both of which have been widely adopted by states and school districts.

This encyclopedia is one of the first to offer a balanced presentation of human history for a truly global perspective of the past. Each of the six chronological volumes begins with an in-depth essay that covers five themes common to all periods of world history. They discuss such important issues as technological progress, agriculture and food production, warfare, trade and cultural interactions, and social and class relationships. These major themes allow the reader to follow the development of the world’s major regions and civilizations and make comparisons across time and place.

The encyclopedia was edited by a team of five accomplished historians chosen for being specialists in different areas and eras of world history, as well as for having taught world history in the classroom. They and many other experts are responsible for writing the approximately 2,000 signed entries based on the latest scholarship. Additionally, each article is cross-referenced with relevant other ones in that volume. A chronology is included to provide students with a chronological reference to major events in the given era. In each volume an array of full-color maps provides geographic context, while numerous illustrations provide visual contexts to the material. Each article also concludes with a bibliography of several readily available pertinent reference works in English. Historical documents included in the seventh volume provide the reader with primary sources, a feature that is especially important for students. Each volume also includes its own index, while the seventh volume contains a master index for the set.

CHRONOLOGY

600 C.E. Late Preclassic Period in Maya Zones

Beginning of the Late Preclassic period in the Maya zones of Mesoamerica.

604 C.E. Shotoku's Reforms

Between 593 and 628 Empress Suiko rules Japan. During her reign regent Prince Shotoku undertakes major reforms with China as a model culminating in a 17-article constitution based on Confucian principles.

606–648 C.E. Harsha Reunifies India

His work is undone at his assassination. India is divided after its short unity.

610 C.E. Prophet Muhammad Receives Revelations

The prophet Muhammad in Mecca receives revelations that are set down in the *Qur'an*, the Muslim holy book.

618 C.E. Tang Dynasty Founded

The Tang dynasty is founded by Li Yuan and his son Li Shimin at the fall of the Sui dynasty. It inaugurated China's second imperial age.

618 C.E. Grand Canal

By the fall of the Sui dynasty the Grand Canal has

been extended to Hangzhou, providing an efficient water transport system.

622 C.E. New Muslim Community Flees to Medina

The fledgling Muslim community led by the prophet Muhammad makes the Hijrah (flight) from Mecca to Medina to escape persecution.

627 C.E. Battle of Nineveh

At the Battle of Nineveh, the forces of the Byzantine Emperor Heraclius defeat the Sassanids.

629–645 C.E. Xuanzang Travels to India

Chinese Buddhist monk Xuanzang's journey and translation of Buddhist canons mark the height of Buddhism in China.

632 C.E. Muslim Rule over Mecca and Medina and the Prophet Muhammad Dies

Following several battles, the Muslims retake Mecca and establish a Muslim community; following the prophet Muhammad's death Abu Bakr is chosen as the first caliph or leader.

634 C.E. Omar Chosen as Second Caliph

Omar, known as the "second founder of Islam,"

establishes a single authoritative version of the *Qur'an* and presides over the rapid expansion of the Muslim state. Within 100 years the Arab/Muslim state would stretch from the Indus River in the east to Morocco in North Africa and Spain in the west.

636 C.E. Battle of Yarmuk

The Arab/Muslim forces decisively defeat the Byzantine Empire at the Battle of Yarmuk and rapidly expand their new empire.

638 C.E. Arab Forces Take Jerusalem

Having taken Damascus, Arab/Muslim forces take Jerusalem, the third most holy city in Islam, but grant religious freedom to “people of the book,” Jews and Christians.

642 C.E. Arab Conquest of Egypt

Arab forces under the command of Amir ibn al-As attack Egypt and in 642 Egypt surrenders.

644 C.E. Omar I Assassinated

While at prayers in the mosque at Medina, Omar is assassinated by a Persian slave; Uthman, from the powerful Umayyad family, is chosen as the third caliph.

645 C.E. Fujiwara Clan

This clan receives its name and rises to dominate Japan under the emperor as a result of a coup d'état.

645 C.E. Taika Reform

Great political and economic changes that are made in Japan according to the Chinese model.

650 C.E. Fall of Teotihuacán

Partial destruction and abandonment of Classic-era city-state of Teotihuacán in the Basin of Mexico.

656 C.E. Ali Selected as the Fourth Caliph and the Battle of the Camel

Following Uthman's assassination by rebels, Ali, the prophet Muhammad's son-in-law, is selected caliph. However, the succession is opposed by the Umayyads and A'isha, the Prophet's favorite wife, who astride a camel leads forces against Ali at what becomes known as the Battle of the Camel, but Ali's supporters win.

657 C.E. Battle of Siffin

At the Battle of Siffin, Muaw'iyah of the Umayyad family challenges Ali's supremacy and wins. In 661,

Ali is assassinated by opponents, thereby ending the age of the “rightly guided” caliphs.

660 C.E. Kingdom of Silla (Korea)

The kingdom of Silla, on the Korean Peninsula, conquers the Paekche and Koguryo Kingdoms. They bring about the first unification of the Korean Peninsula.

661 C.E. Umayyad Caliphate Established

Muaw'iyah establishes the Umayyad Caliphate with its capital at Damascus. He establishes a centralized empire that incorporates many institutions and artistic forms from the older Byzantine Empire.

673–678 C.E. Arab Forces Fail to Capture Constantinople

Arab forces besiege Constantinople. The siege fails due to both the strength of the city walls and a new invention: “the Greek Fire” that caused havoc among the Arab fleet. In 678, a 30-year peace treaty is negotiated.

680 C.E. Battle of Kerbala

At Kerbala, in present-day Iraq, supporters of the Umayyad Caliphate kill Ali's son Husayn and his supporters. This marks the split between the Sunni Muslims and Shi'i Muslims who believe that the line of leadership for the Muslim community should follow through Ali and the Prophet's family; Husayn becomes a martyr to the Shi'i community.

680–1018 C.E. First Bulgarian Empire

The first Bulgarian Empire is created when the Bulgars defeat the Byzantines.

685 C.E. Caliph Abd al-Malik

Under Abd al-Malik I, reigned 685–705, Arabic becomes the major language of the Umayyad Empire and the first Arab/Muslim coins are minted at Damascus; his further centralization of the empire causes internal disputes.

690–705 C.E. Empress Wu of China

Wu Hou becomes the first female ruler of China after serving as regent upon her husband's death.

700 C.E. Chinese Invent Gunpowder

The Chinese combine saltpeter, sulfur, and carbon to create gunpowder. It is initially used for fireworks.

- 700 C.E. Srivijaya Empire (Indonesia)**
The Srivijaya Empire becomes the leading power in Indonesia. The Srivijayas originated in southern Sumatra. They control commercial trade routes through the islands.
- 701 C.E. Taiho Code**
Elaborate Chinese-style law code is adopted by Japan as it developed a system of government based on the Chinese model.
- 707 C.E. Muslim Army Conquers Tangiers**
Tangiers is captured by Muslim armies, and the territory is placed under a governor appointed by the Umayyad Caliphate in Damascus.
- 710 C.E. Nara**
Nara becomes Japan's first permanent capital, modeled on the Chinese capital Chang'an. The court moves to Heian in 794.
- 711 C.E. Islamic Conquest of Spain**
The Islamic conquest of Spain begins when Tariq, a Muslim general, crosses the Straits of Gibraltar (Jabal Tariq). His army of 7,000 men defeats Roderick, the last king of the Visigoths, and Spain (or Andalusia) becomes a Muslim territory for almost 800 years.
- 712–756 C.E. Tang Xuanzong**
Xuanzong's reign marks the zenith of Tang culture. It is the golden age of Chinese poetry. It ends in the disastrous An Lushan Rebellion.
- 730 C.E. Khazars Defeat Arab/Muslim Forces**
The Khazar commander Barjik leads Khazar troops through the Darial Pass to invade Azerbaijan. At the Battle of Ardabil, the Khazars defeat an entire Arab army. The Khazars then conquer Azerbaijan and Armenia and, for a brief time, northern Iraq.
- 732 C.E. Battle of Tours**
At the Battle of Tours, the Franks, under Charles Martel, defeat a Muslim expedition led by Abd al-Rahman; this marks the furthest incursion of Muslim forces into western Europe.
- 750 C.E. Abu al-Abbas Finds the Abbasid Dynasty**
Having taken most of Iran and Iraq, Abu al-Abbas and his followers overthrow the Umayyad dynasty centered in Damascus and establish a new Abbasid dynasty with its initial capital at Kufa in present-day Iraq.
- 751 C.E. Battle of Talas River**
The Chinese army is defeated by forces of the caliph near Samarkand. China withdraws from Central Asia as a result.
- 754 C.E. Pepin the Short Finds the Carolingian Dynasty**
Pope Stephen II sanctifies Pepin as both king of the Franks and king of the Frankish Church.
- 755–763 C.E. An Lushan Rebellion**
Though put down, the Tang dynasty never recovers from the rebellion's effects.
- 756 C.E. Abd al Rahman III Rules Andalusia**
Under Abd al Rahman III, reigned 756–788, of the Umayyad Caliphate, Córdoba, in present-day Spain, becomes one of the richest cities in the world and a center for scholarship and the arts.
- 762 C.E. Abbasid Caliphate under al-Mansur and the Construction of Baghdad**
The Abbasid Caliph Abu Jafar, or al-Mansur, reigned 754–775, builds a new capital, Baghdad, on the west bank of the Tigris River. A circular fortress, the city becomes one of the largest and richest in the world.
- 771 C.E. Charlemagne**
Charlemagne becomes the Frankish ruler in the east after the death of his brother Caroman I. Until his brother's death, Charlemagne had ruled the Neustri and Aquitaine. In a series of campaigns, Charlemagne expands his empire to include all of Germany.
- 774–842 C.E. Uighur Empire**
Seminomadic state on the western border of the Tang Empire in China. Uighurs were vassals and troublesome allies of the Tang.
- 780–809 C.E. Golden Age of Islam and Harun al-Rashid**
Under Harun al-Rashid, reigned from 786–809, and his son Mamun, reigned 813–833, the Abbasid Caliphate reaches the zenith of its power and glory and is memorialized in the *Arabian Nights*. An academy for study of sciences and other disciplines, Bayt al Hikmah, becomes the center for scholars from around the world.

794 C.E. Heian Founded

The Heian period in Japanese history begins when the emperor moves the capital from Nara to a site near that of present-day Kyoto. The Heian period was noted for its high culture.

800 C.E. Charlemagne, Roman Emperor of the West

Charlemagne is crowned emperor of the West by Pope Leo III on December 25th—Christmas Day—in St. Peter's Church.

800–900 C.E. Terminal Classic Period in Maya Zones

Transition from the Late Classic to the Terminal Classic period in the Maya lowlands of Mesoamerica.

802 C.E. Angkor Period

The Angkor period begins in 802, when Jayavarman II establishes his capital at Angkor. Jayavarman unites all of Cambodia and achieves independence from Java.

843 C.E. Treaty of Verdun

Under the Treaty of Verdun, the Carolingian Kingdom is divided into three parts. Louis II rules the Frankish Kingdom east of the Rhine; Lothair I rules northern Italy, part of France, and Belgium; and Charles II (the Bald) rules the western Frankish Empire, consisting of most of present-day France.

851 C.E. Danish Vikings Sack London

Danish Vikings sailed up the Thames in 851. They sack London and Canterbury but are defeated at Ockley by the king of the West Saxons.

860 C.E. Khazar Kings Convert to Judaism

The Khazar kings convert to Judaism. A Jewish dynasty of kings presides over the Khazar Kingdom until the 960s.

862 C.E. Rurik Leads Viking Raids, Founded Russia

The Viking chieftain Rurik leads raids on northern Russia, marking the beginning of the imperial Russian period.

866–1160 C.E. Fujiwara Period

The Fujiwara period begins in Japan in 866. Fujiwara Mototsune becomes the first civilian dictator.

867 C.E. Basil Founded Macedonian Dynasty

Basil has his co-emperor Michael III murdered and

becomes the sole ruler of the Byzantine Empire. Basil creates what became known as the Macedonian dynasty that lasts until 1076.

872 C.E. Harold I King of Norway

Harold I creates modern Norway by deposing many of the petty chieftains to unify the country.

878 C.E. Alfred the Great

Alfred the Great wins a major victory over the Danes in the Battle of Edington in southern England.

900 C.E. Ghanaian Kingdom in West Africa

The Kingdom of Ghana, made rich on the trade of salt and gold, dominates West Africa.

900 C.E. Mesoamerican Civilizations

Fall of the Zapotec city-state of Monte Albán in Oaxaca Valley in Mexico, and the height of Classic Veracruz states along Mexican gulf coast.

907 C.E. Five Dynasties in China

At the fall of the Tang dynasty, China is divided between 907 and 959, known as the period of Five Dynasties. Five short-lived dynasties successively rule parts of North China while 10 kingdoms rule parts of southern China.

911 C.E. Treaty of St-Clair-sur-Epte

The Treaty of St-Clair-sur-Epte is signed. Under the terms of the treaty, the kingdom of Normandy is established; Rollo the Viking becomes the first ruler, and he converts to Christianity.

916–1125 C.E. Liao Dynasty in Northeastern China

A nomadic people called Khitan establish a state in northeastern China and force the Song to pay annual tribute.

918 C.E. Koryo Dynasty Founded

The Koryo dynasty is founded by Wang Kon, who unites Korea. This dynasty remains in power until 1392.

945 C.E. Collapse of the Abbasid Caliphate and Establishment of Buyid Dynasty

Ahmad Ibn Buwa, a Shi'i from Iran, takes Baghdad and is made caliph.

955 C.E. Otto the Great Defeats Magyars

Otto the Great defeats the Magyars in 955 c.e. at the

- Battle of Lechfeld. This ends 50 years of Magyar raids on western Europe.
- 960 C.E. Song Dynasty Founded**
The Song dynasty is founded by Zhao Kuangyin, who reigns as Emperor Taizu. Even at its height, the Song dynasty (960–1126) does not rule the entire Chinese world. Kaifeng becomes the capital.
- 962–1886 C.E. The Ghaznavids**
The Ghaznavid dynasty is founded by Subaktagin, a Turkish slave who converts to Islam. The dynasty establishes itself in present-day Afghanistan.
- 962 C.E. Otto I Emperor of Rome**
Otto the Great is crowned Holy Roman Emperor by Pope John XII and revives the power of the Western Roman Empire.
- 968 C.E. The Fatimid Dynasty in Egypt**
The Fatimids establish a Shi'i Muslim dynasty in Egypt.
- 970 C.E. Al-Azhar, Islamic University, Founded by Fatimid Dynasty**
The Fatimid dynasty in Egypt founds the al-Azhar University in Cairo that becomes the premier educational center in the Islamic world.
- 980–1037 C.E. Ibn Sina (Avicenna), Foremost Philosopher and Medical Scholar**
Ibn Sina, born in Iran, spent most of his academic career in Baghdad, where he wrote extensively on medicine, religion, and philosophy.
- 989 C.E. The Peace of God**
The Peace of God is passed at the Council of Charroux. It is supported by Hugh Capet, king of France. The Peace of God attempts to reduce feudal warfare by limiting private wars to certain parts of the year, and by providing protection for noncombatants.
- 1000 C.E. *Tale of Genji***
Murasaki Shikibu, author of what some claim is the world's first novel, used the Japanese written form—called *kana*—to describe Japanese court life.
- 1000 C.E. Zimbabwean Complex in Southern Africa**
The massive stone complex at Zimbabwe is one of the largest Bantu cities and serves as a capital for several Bantu rulers.
- 1014 C.E. Basil II Defeats the Bulgarians**
The Byzantine Emperor Basil II routs the Bulgarians at the Battle of Cibalugu.
- 1016 C.E. Canute II Rules All of England**
On the death of Ethelred II, the king of England, Edmund II succeeds to the throne. Following his death, Canute II, a Dane, is chosen by the Witan, the advisory council to the king.
- 1025 C.E. Boleslas, First King of Poland**
Poland gains independence from the Holy Roman Empire when Boleslas I is crowned the first Polish king at Gniezno.
- 1031 C.E. The Umayyad Caliphate of Spain Dissolves**
After 30 years of anarchy, the Umayyad Caliphate of Spain dissolves after the death of Hisham III and Andalusia (Spain) is divided into a number of small Muslim states.
- 1038–1227 C.E. Xixia a State in Western China**
Proto-Tibetan Xixia—a Buddhist state—was Genghis Khan's first victim, destroyed by the Mongols.
- 1050 C.E. Kingdom of Ghana at Its Most Powerful**
The kingdom of Ghana at its most powerful but it begins to decline in the 1070s.
- 1055 C.E. Seljuk Turks Take Baghdad**
The Seljuk Turks, under the command of Tughril, reigned 1038–63, capture Baghdad from the Buyids in 1055.
- 1057 C.E. Anawratha Unites Burma**
Anawratha, the Burmese king of Pagan, conquers the Mon kingdom of Thaton. For the first time, all of Burma is under unified rule.
- 1066 C.E. Normans Win at the Battle of Hastings**
At the Battle of Hastings, William the Conqueror defeats Harold II, king of England. The victory leads to the complete domination of England by the Normans.
- 1071 C.E. Battle of Manzikert**
At the Battle of Manzikert, in present-day Turkey, the Seljuk Turks led by Alp Arslan defeat the Byzantine forces and capture the Byzantine emperor, Romanus IV. The Seljuks subsequently take most of Asia Minor and gain control over trade routes used by Christian

- pilgrims to reach Jerusalem. The persecution and harassment of Christians is a contributing cause to the Crusades.
- 1076 C.E. Kingdom of Ghana Defeated by Amoravids**
The Berber Almoravids who control most of Morocco conquer the Kingdom of Ghana; its capital Koumbi Saleh is sacked but the Almoravids are soon forced to withdraw.
- 1085 C.E. Alfonso VI Conquers Toledo**
Alfonso VI, the Christian king of León and Castile, captures Toledo from the Almoravids and makes it his capital.
- 1094 C.E. El Cid Takes Valencia**
Rodrigo Díaz de Vivar, known as El Cid, captures the Moorish kingdom of Valencia after a nine-month siege.
- 1095–1099 C.E. Christian Crusades against the Seljuk Turks and Muslims**
The First Crusade begins with a call by Pope Urban II for Christian states to free the Holy Land from the Muslim Seljuk Turks.
- 1099 C.E. Crusaders Arrive in Jerusalem**
The crusaders capture Jerusalem and kill thousands of Muslims, Jews, and eastern Orthodox Christians indiscriminately. The Crusades establish feudal states in the territories they hold in the eastern Mediterranean.
- 1100 C.E. Fall of Chichén Itzá**
Approximate date of the fall of the Maya Postclassic state of Chichén Itzá in the northern lowlands.
- 1113 C.E. Khmer Empire Reaches Peak**
The Khmer Empire in present-day Cambodia is established in 600 and reaches its peak under Suryavarman II.
- 1115–1234 C.E. Jin Dynasty in North China**
The seminomadic Jurchen in northeastern China destroy the Liao dynasty and establish the Jin dynasty. Then the Jin drive the Song out of North China. Thus the Song is divided into the Northern Song (960–1127) and Southern Song (1127–1279).
- 1125 C.E. Song Huizong is Captured by Jin**
Huizong's disastrous reign results in his capture by the seminomadic Jin dynasty and ending the Northern Song.
- 1127–1129 C.E. Tului Khan Regent of Mongol Empire**
Tului is the youngest son of Genghis Khan. His two sons, Mongke and Kubilai, later become grand khans.
- 1141 C.E. Yue Fei Murdered**
General Yue led a successful campaign to recover North China from the invading Jin dynasty. His murder in jail by leaders of the Southern Song government led to peace between the Song and Jin, with the Jin controlling northern China.
- 1143 C.E. Afonso I King of Portugal**
Under the terms of the Treaty of Zamora in 1143, the independence of Portugal is recognized. Afonso I becomes the first king.
- 1147 C.E. Second Crusade**
The Second Crusade is organized by Louis VII, king of Spain and Conrad III, king of Germany. The crusade comes to a disastrous end due to a lack of leadership.
- 1147 C.E. Almohads Conquer Morocco**
Morocco is conquered by Abd al-Mumin, the leader of the Berber Muslim Almohad dynasty. This conquest ends the Almoravid dynasty.
- 1157 C.E. Eric IX Defeats the Finns**
Eric IX, Christian king of Sweden, defeats the Finns and forces them to convert to Christianity.
- 1163 C.E. Gothic Architecture and the Building of Notre-Dame**
Construction of one of the most notable Gothic churches, Notre-Dame in Paris, begins.
- 1168 C.E. Oxford Founded**
The school of Oxford is founded in 1168 in England, the oldest university in the English-speaking world.
- 1171 C.E. Saladin (Salah ad-Din) Found the Ayyubid Dynasty**
Saladin, reigned 1174–93, abolishes the Shi'i Fatimid Caliphate in Egypt and establishes the Sunni Muslim Ayyubid dynasty.
- 1171 C.E. Henry II Invades Ireland**
Henry II, king of England, responds to a request for

- help from Ireland's deposed king Dermot MacMurrough by sending forces to Ireland.
- 1174 C.E. William the Lion Defeated**
Henry II defeats William the Lion, king of Scotland, at the siege of Alnwick Castle.
- 1176 C.E. Frederick I Barbarossa Defeated**
The Holy Roman Emperor Frederick I (Barbossa) is decisively defeated by the Lombard League at Legnano and therefore fails to take northern Italy.
- 1180–1185 C.E. Gempei Wars**
Wars in Japan between two prominent clans. The Taira clan won the first round and became shogun. The Minamoto clan won the second round and gained control of the country; established the Kamakura Shogunate.
- 1181 King Lalibela Rules Ethiopia**
Under King Lalibela massive stone churches are constructed in Ethiopia.
- 1187 C.E. Saladin (Salah ad Din) wins the Battle of Hittin against the Crusaders**
At the Battle of Hittin, Saladin decisively defeats the crusaders and retakes Jerusalem and most of the main cities in the eastern Mediterranean.
- 1186 C.E. Second Bulgarian Empire**
A successful revolt takes place against the Byzantine rule of Bulgaria. This establishes the second Bulgarian empire that lasts until 1396.
- 1192 C.E. The Third Crusade**
Spurred by Saladin's triumph, the Christians launch the Third Crusade, led by Richard the Lionhearted. Following a two-year siege, the crusaders capture Acre; Richard then negotiates a truce with Saladin that ensures Christian access to holy sites in Jerusalem, but the crusaders retain only a small area along the coast and the island of Cyprus.
- 1199 C.E. Richard the Lionhearted Dies**
Richard the Lionhearted dies of an arrow wound while besieging Chalus in western France.
- 1199 C.E. Rise of the Hojo**
The Hojo clan controls Japan through marriage into the Minamoto clan, gaining control of the Kamakura Shogunate.
- 1200 C.E. Rise of Mayapán**
Approximate date of the rise of the city-state of Mayapán in the Maya northern lowlands.
- 1200 C.E. University of Paris Founded**
Philip II, king of France, issues a charter to establish the University of Paris.
- 1202 C.E. Fourth Crusade**
The Fourth Crusade begins at the behest of Emperor Henry, king of Sicily. Pope Innocent III issues a call to European monarchs to participate in the crusade. The call is answered primarily by French nobles.
- 1202 C.E. Danish Empire**
Valdemar II succeeds to the Danish throne and expands the Danish empire to include northern Germany.
- 1204 C.E. Crusaders Capture Constantinople**
Crusaders capture Constantinople in 1204; they kill many Eastern Orthodox Christians and pillage the city; this is a devastating blow to the Byzantine Empire, and the city never regains its former power.
- 1206 C.E. Genghis Khan**
Temujin is proclaimed Genghis Khan, or universal ruler, after he unifies various Mongol tribes. His empire at his death includes northern China, Korea and Central Asia to the Caspian Sea and Don River in Russia.
- 1215 C.E. Magna Carta**
In 1215, a group of determined barons force King John of England to sign the Magna Carta, under which the British aristocracy is granted the rights of trial by jury and protection from arbitrary acts by the king.
- 1217 C.E. French-English Battles**
With the death of King John, civil war divides England. The French intervene and occupy parts of England, but the French are defeated by the English at the Battle of Lincoln and then lose their fleet at the naval Battle of Sandwich.
- 1222–1282 C.E. Nichiren**
Nichiren, a Japanese monk, founds a sect based on a militant and nationalist interpretation of Buddhism.
- 1227 C.E. Chagatai Khanate Established**
Central Asia became domain of Genghis Khan's second son Chagatai and his descendants down to Timurlane.

1227 C.E. The Golden Horde

This Mongol Khanate ruled Russia through Genghis Khan's eldest son, Juji.

1229 C.E. Crusaders Retake Jerusalem

The Sixth Crusade, led by Frederick II, gains control of Jerusalem through a diplomatic settlement with Malik al-Kamil, a nephew of Saladin. Under the agreement, the crusaders control Jerusalem but the Ayyubids rule Damascus and control the valuable trade routes to India and further east. Internal disputes further weaken the crusader-state.

1229–1241 C.E. Ogotai Becomes Khan

Ogotai, Genghis Khan's third son, is confirmed as the second Mongol grand khan. He continues conquests in China and eastern Europe.

1232 C.E. First Known Use of Rockets

The Chinese use rockets in battle for the first time. This demonstrated the military use of gunpowder. From this moment the use of gunpowder spreads rapidly around the world.

1235 C.E. Sundiata Defeats King Sumanguru at the Battle of Kirina

King Sundiata of Mali defeats the Ghanaian ruler King Sumanguru at the Battle of Kirina, making Mali a major power in West Africa.

1236 C.E. Córdoba Taken from Muslim Rulers

Ferdinand III captures Córdoba; after 1248 with the capture of Seville, only Granada remains under Muslim rule in Andalusia, present-day Spain.

1240 C.E. Nevsky Defeats the Swedes

In 1240, Alexander Nevsky, a Russian prince, defeats the Swedes, near St. Petersburg. The Swedes invade at the request of Pope Gregory IX, who wanted to punish the Orthodox Russians for helping the Finns avoid conversion to Latin Catholicism.

1243 C.E. Seljuk Turks Crushed at Battle of Kosedagh

The Seljuks are crushed by the Mongols at the Battle of Kosedagh in present-day Turkey.

1244 C.E. Jerusalem Recaptured by Muslims

Mamluks from Egypt take Jerusalem from the crusaders.

1250 C.E. Seventh Crusade and the Founding of the Mamluk Dynasties

In 1250, the Seventh Crusade is defeated by Egyptian forces led by Turanshah who captures Louis IX whom he releases after the payment of a ransom. The Mamluks, former slaves and professional soldiers, subsequently overthrow Turanshah and continue to rule Egypt until 1517.

1250 C.E. Mali King Sundiata Conquers Ghana

Sundiata, king of Mali (r. 1234–1255), conquers the older Ghanaian kingdom in West Africa and establishes a huge empire with its capital at Niani on the Upper Niger. The empire becomes wealthy from its control of the trade of salt and gold.

1250 C.E. Migration of Aztecs

First wave of migration of the Mexica (Aztecs) from the northern deserts into the Basin of Mexico.

1250–1280 Chinese Invent the First Gun

The technology for the manufacture of this weapon reached Europe in the 1320s.

1251–1259 C.E. Mongke Made Fourth Grand Khan

Mongke is the grandson of Genghis Khan. He continues Mongol expansion against Southern Song China and in the Middle East. His death results in a civil war between his remaining brothers.

1260 C.E. Battle of Ain Jalut

The Mamluks defeat the Mongols at the Battle of Ain Jalut in Palestine, ending the Mongol threat to Egypt.

1260 C.E. The Mamluk Sultan Baybars Defeats the Crusaders

The Mamluk sultan Baybars (r. 1260–1277), drives the crusaders out of most of their holdings.

1260–1294 C.E. Kubilai Khan Made Fifth Grand Khan

Kubilai's election split the Mongol Empire. He destroys the Southern Song and establishes the Yuan dynasty centered in China.

1271 C.E. Marco Polo

Marco Polo, accompanied by his father and uncle, sets off for China. They arrive at the court of the Kubilai Khan, where Marco Polo serves Kubilai Khan. He later dictates *The Travels* about his adventures.

- 1273 C.E.** Founding of the Habsburg Dynasty
The Great Interregnum from 1254 to 1273 ends, and Rudolf I of Habsburg is elected Holy Roman Emperor. In 1278, the Habsburgs gain control over Austria and rule a dynasty that lasts until 1918.
- 1274 and 1281 C.E.** Mongols Fail to Conquer Japan
Kublai Khan's naval expeditions fail to subjugate Japan. The second one involves an armada of 4,500 ships and 150,000 men. It is destroyed by Japanese resistance and a typhoon.
- 1282 C.E.** King of Denmark Accepts Limitation of Power
Danish nobility forces Eric V to sign a Danish "Magna Carta." This document establishes a Danish parliament that meets once each year and the king is made subordinate to the parliament.
- 1284 C.E.** Genoa Defeats Pisa
The Republic of Genoa fights the rival Italian city-state of Pisa.
- 1291 C.E.** Founding of the Swiss Confederation
Three Swiss cantons form the League of the Three Forest Cantons in 1291; the league is established for mutual defense.
- 1291 C.E.** Fall of the Last Crusader Territory
In 1291 Acre, the last crusader territory, falls to Muslim forces.
- 1298 C.E.** Scottish Rebellion against the English
The English under Edward I win a decisive victory over the Scots at the Battle of Falkirk. The Scots rebelled under the leadership of William Wallace.
- 1300–1326 C.E.** Osman Lays the Foundations of the Ottoman Empire
Osman (r. 1299–1326) leads his Ghazi warriors into battle and extends his rule in the Anatolian Peninsula; his son Orhan then takes Bursa that becomes the capital of the new Ottoman Empire.
- 1302 C.E.** Philip IV Calls Meeting of the Estates General
King Philip IV of France calls together representatives of the nobility, townspeople, and clergy for the first time; the gathering becomes known as the Estates General.
- 1309 C.E.** Avignonese Papacy
Pope Clement V, heavily influenced by King Philip IV, moves the papacy to Avignon, France. Clement rescinds Boniface's pronouncements against Philip.
- 1314 C.E.** Battle of Bannockburn, Scotland
The Scots, led by Robert the Bruce, rout a larger force led by Edward II, king of England.
- 1314–1317 C.E.** Great European Famine
The worst famine to strike Europe occurs. It is widespread and affects all of northern Europe.
- 1315 C.E.** Swiss Victory
Swiss forces gain a victory over Leopold I (Habsburg), duke of Austria, at the Battle of Morgarten. The victory leads to an expanded Swiss alliance.
- 1324–1325** The Mali King Mansa Kankan Musa
Makes Famous Pilgrimage to Mecca
At the height of his powers as king of Mali, Mansa Kankan Musa and an enormous entourage laden with gold travel from West Africa to Arabia.
- 1325 C.E.** Foundation of Tenochtitlán
According to Aztec legend, the fulfillment of an ancient prophecy and year of the foundation of their capital island-city of Tenochtitlán in the Basin of Mexico.
- 1337 C.E.** Hundred Years' War
The Hundred Years' War begins when Philip VI contests the English claim to Normandy and other northern provinces in France.
- 1338 C.E.** Ashikaga Shogunate
Established by Ashikaga Takauji, the Ashikaga replaces the Kamakura Shogunate in Japan. It lasts until 1573, though exercising effective power only during its first century.
- 1340 C.E.** Battle of Crécy
A smaller British force under the command of Edward III defeats a French army under the command of Philip VI.
- 1347–1353 C.E.** Black Death
The Black Death (bubonic plague) that spread throughout Europe between 1347 and 1353 is the worst natural disaster in European history. It is estimated that of a population of 75 million people, between 19 million and 35 million die.

1356 Nanjing Capital of Ming Dynasty

After consolidating southern China, the founder of the Ming dynasty establishes his capital in Nanjing (Nanking). It remains capital until 1421 when it is moved to Beijing (Peking).

1356 C.E. Battle of Poitiers

At the Battle of Poitiers, Edward, the “Black Prince” of Wales, defeats the French. In the course of the battle, the French king, John II, is taken prisoner and brought to England.

1362 C.E. Murad I Takes Title as Sultan of the Ottoman Empire

Murad I takes the title of sultan of the Ottoman Empire and leads his forces into Thrace, taking Adrianople, which then becomes the new Ottoman capital of Edirne.

1368 C.E. Ming Dynasty Established

Zhu Yuanzhang leads a successful revolt that expells the Mongols from China. Zhu rules as Ming emperor Taizu and begins the rebuilding of China.

1369 C.E. Timurlane Conquers Empire

A descendant of Genghis Khan, Timurlane sets out from Samarkand and conquers and despoils Russia, Afghanistan, the Middle East, and northern India.

1377 C.E. Ibn Khaldun as Pioneer in the Study of the Philosophy of History

Ibn Khaldun, born in present-day Tunisia, begins his pioneering study in the philosophy of history.

1381 C.E. War of Chioggia

The Venetians and the Genoese fight in the War of Chioggia. The Genoese blockade the Venetians after seizing Chioggia, but the Venetian fleet defeats the Genoese thereby beginning the golden age of Venice.

1381 C.E. Peasants’ Revolt in England

Peasants, led by Wat Tyler, rebel against high poll taxes, leading to reforms of the old feudal system in England.

1385 C.E. Portugal Free from Spain

The Portuguese, under John the Great, fight Castile at the Battle of Ajubarrota; their victory ensures the independence of Portugal.

1389 C.E. Ottomans Defeat the Serbs at the Battle of Kosovo

At Kosovo the Ottoman forces defeat the Serbs in a battle that becomes an important milestone in Balkan history.

1392 Yi Dynasty in Korea

Founded by General Yi Songgye, this dynasty (also known as the Li dynasty), with the capital located at modern-day Seoul, lasts until 1910.

1397 C.E. Union of Kalamar

Magaret, queen of Sweden, completes the conquest of Denmark and Norway. She then forms the Kalamar League, a union of all three countries.

1400 C.E. Kingdom of Malacca Founded

The Kingdom of Malacca is founded on the Malay Peninsula in current-day Indonesia. Malacca, which is founded by Paramesva, soon becomes the leading maritime power in Southeast Asia.

1400 C.E. Rise of Inca Empire

The beginning of the rise of the Inca Empire in the Peruvian highlands.

1402 C.E. Timurlane Defeats the Ottoman Sultan Bayezid at the Battle of Ankara

At the Battle of Ankara, Timurlane defeats Sultan Bayezid; he dies in captivity and Timurlane turns over the Anatolia territories to Bayezid’s sons.

1403 C.E. Mehmed (Mehmet) I Reunites and Expands the Ottoman Empire

Mehmed I (r. 1403–21), begins to reunite and expand the Ottoman Empire after the loss to Timurlane.

1403 C.E. Moveable Type Invented in Korea

This was an important improvement on the block printing first invented and used in China in the ninth century.

1403 C.E. Yongle Becomes Ruler of the Ming

Yongle (Yung-lo) defeats his nephew and becomes emperor of the Ming dynasty. He crushes the Mongols, moves the capital from Nanjing to Beijing, and sends naval expeditions across the Indian Ocean to the east coast of Africa.

1405 C.E. Mongol Empire Divided

Timurlane, the leader of the Mongols, dies suddenly while preparing to attack Ming China. With his death the Mongol Empire rapidly falls apart.

- 1405–1433 C.E.** Explorations of Zheng He
Ming admiral Zheng He (Cheng Ho) sails in six maritime expeditions. The expeditions showed the flag, cleared pirates, and promoted trade across Southeast Asia and the Indian Ocean.
- 1410 C.E.** Battle of Tannenberg
The Poles and the Lithuanians defeat German knights at the Battle of Tannenberg. Despite the victory, at the Peace of Thorn signed in 1411, the Poles fail to gain access to the sea.
- 1415 C.E.** Battle of Agincourt
The English decisively defeat the French at the Battle of Agincourt. As a result, the French nobility is shattered and the feudal system is destroyed. Normandy lays open to reconquest by the English.
- 1415 C.E.** Henry the Navigator Takes Ceuta
The Portuguese explorer and prince, Henry the Navigator, captures Ceuta on the northern coast of present-day Morocco. This begins the Portuguese conquest of coastal areas and cities around Africa.
- 1420 C.E.** Chinese Capital Beijing (Peking)
The second Ming emperor moves the capital of China from Nanjing to Beijing.
- 1420 C.E.** Treaty of Troyes
The French under Philip and England under Henry V sign the Treaty of Troyes. Under the terms of the treaty Henry becomes the king of both France and England.
- 1421 C.E.** Murad II Enlarges the Ottoman Empire
Murad II (r. 1421–44; 1446–51) brings all of western Anatolia under his control and takes Salonica.
- 1424 C.E.** France Invades Italy
Charles VIII, king of France, begins the Italian Wars by invading Italy; Naples surrenders to Charles and he temporarily becomes the king of Naples.
- 1428 C.E.** Aztecs Gain Predominance in Basin of Mexico
Aztecs become the “first among equals” in the Triple Alliance with city-states of Texcoco and Tlacopán in the Basin of Mexico, the beginning of the Aztec Empire’s domination of much of central and southern Mexico.
- 1429 C.E.** Joan of Arc Frees Orléans
War between France and England continues on and off, despite various agreements for peace. In 1428, the English lay siege to the city of Orléans. Joan of Arc, a young girl from Lorraine, begins to have visions and claims to hear voices; she convinces the French dauphin to provide her with a small army that liberates Orléans. However she is ultimately captured by the English and put to death.
- 1431 C.E.** Angkor Sacked
Angkor, the capital of the Khmer, is captured and sacked by the Thai. The Khmer Empire is forced to move its capital to the present site of the Cambodian capital Phnom Penh.
- 1433 C.E.** Tauregs Occupy Timbuktu
In 1433–34 the nomadic Tauregs occupy Timbuktu; this weakens the kingdom of Mali that would fall in the mid-15th century.
- 1435 C.E.** Peace Treaty of Arras
Duke Philip of Burgundy signs a peace treaty with Charles VI that recognizes Charles as the one king of France.
- 1438 C.E.** Inca Dynasty Founded
The Inca dynasty that rules Peru until 1553 is founded in 1438. Its founder is said to have been Pachacutec. He rapidly expands the empire.
- 1440 C.E.** Ewuare the Great Rules Benin
Ewuare the Great (r. 1440–73) rules a rich West African kingdom stretching from Lagos to the Niger.
- 1444 C.E.** Ottomans Win the Battle of Varna
In 1444 the Hungarians, the Byzantine emperor, and the pope join forces in a crusade to defeat the Ottomans and push them out of Europe; however, Murad II commands a victorious Ottoman army at the Battle of Varna, marking the end of Western attempts to regain the Balkans and assist Constantinople.
- 1450 C.E.** Printing Press Invented in Europe
In 1450 Johann Gutenberg invents the printing press, which revolutionizes communication and education.
- 1450 C.E.** Decline of Mayapán
The Maya city-state of Mayapán splinters into numerous petty kingdoms the in northern lowlands of Central America.

MAJOR THEMES

600 C.E. TO 1450

FOOD PRODUCTION

Unlike the significant advances in food production of the previous era, Europe, Asia, and Africa witnessed no revolutionary advances in agricultural technology from 600 to 1450. Nor were significant new crops introduced comparable to what occurred after 1492 as a result of Europeans coming to the Americas. As during earlier eras, forests continued to be cut down and swamps drained and turned into grazing and agricultural land. More efficient methods were developed to plant and harvest food, using iron implements. Trade and migrating peoples introduced food crops to new regions. Tea made from leaves of a bush grown in southern China became a popular drink throughout the land after the seventh century because of political unity and better transportation. From China, tea drinking and tea cultivation spread to Japan, to its nomadic neighbors, and later to Europe. Grapes and wine were introduced to China from western Asia via the Silk Road. Coffee, from a plant indigenous to the Arabian Peninsula, became a ubiquitous drink from western Asia and the Ottoman Empire to Europe.

Europe. Europe suffered centuries of invasions and disruption with the decline and fall of the Roman Empire. Life fell to subsistence level, not to improve until around 1000 with the end of barbarian invasions. During the following centuries, the clearing of forests and repopulating of lands previously abandoned because of the invasions tripled available farmland, sharply increasing the food supply and population. Medieval farmers also improved productivity by adopting the three-field system and crop rotation, thereby producing crops from two-thirds of the cultivated land rather than half under the previous two-field system. They also farmed more efficiently by adopting improvements such as a heavier plow, the shoulder collar and metal horseshoes for draft horses, and water and windmills. As a result, the population of Europe jumped from 25 million in 500 C.E. to more than 70 million in 1300 C.E.

Most European farmers were serfs, free in person but tied to the land. They lived in villages ranging from 10 to several hundred families around a manor house that belonged to a secular lord or to the church. Each farming family was allotted strips of land scattered around the village so that all had good as well as poor land. Families shared the pastureland and woods and retained

about half of what it produced for itself, giving the remainder to the lord or the church. They were subsistence farmers, though bartering took place for products that the serfs did not produce locally. By the 13th century, rising prosperity had led to improved conditions for serfs, and some were able to raise cash crops, pay off their obligations to their lords, and move to towns. However, European economies suffered sharp reverses in the 14th century due to climatic changes; colder and rainier weather caused lower harvests, higher prices, and population decline. Wars ravaged farmlands and contributed to famines. Between 1348 and 1354, the bubonic plague (Black Death) struck, reducing the population by about a third. It did not recover to pre-plague levels until about 1600; ironically, the sharply reduced labor supply resulted in better working conditions for the surviving serfs.

Asia and Africa. Like Europe, northern China suffered repeated nomadic invasions and warfare between c. 200 and 600. They caused economic disruption in northern China and development in the south, which was spared invasions and saw an influx of northern immigrants and rapid development. The completion of the Grand Canal around 600 C.E., which connected lands from south of the Yangzi (Yangtze) River to the Yellow River valley, would be crucial for the economic integration of the Chinese Empire after reunification and ensured efficient distribution of food and other resources. Wheat and millet were the main cereal crops in northern China, and rice from irrigated fields was the main staple crop of the south.

The introduction of early ripening rice from the Champa Kingdom (modern Vietnam) around 1000 made double cropping possible; this, together with major projects to build irrigation canals and clear land, made possible significant population increases in subsequent centuries. Whereas the Chinese population remained fairly static at about 60 million during the Han dynasty (202 B.C.E.–220 C.E.) and Tang (T'ang) dynasty (618–907), it had surged to about 150 million in the early 13th century. It dropped to below 100 million, or by 40 percent, by the end of the 14th century because of disruptions caused by the Mongol invasions and subsequent Mongol misrule, including turning farmland to pasture land and hunting ground, neglecting irrigation systems, and the bubonic plague.

China's population would not reach 150 million until the early 17th century. The ability to feed an increasing population was because of effective government measures that improved agricultural technology by investment in hydraulic engineering that drained marshes and extended irrigation. Sea walls were built along the southern coast to protect delta lands from storm tides, and a well developed network of granaries, roads, and canals were maintained to store and transport food. According to nutritional experts, a wide variety of food crops, fish, and meat from domesticated animals made the Chinese among the best fed people of Asia, and perhaps of the world during this era, at an average daily intake of more than 2,000 calories. Except under Mongol rule, Chinese farmers during these centuries either owned their land or worked as tenants or sharecroppers. Chinese technological advances in agriculture were transferred to Vietnam, Korea, and Japan. Thus agricultural patterns and food habits followed similar patterns throughout eastern Asia.

There is little information on food production from similar periods in India. Indian governments, since the Mauryan dynasty (324–c.185 B.C.E.), claimed ownership of agricultural land and let it out to the tiller for an annual rent and tax, up to about half of the product. Rice was grown along river valleys and on delta land, relying on monsoon rains and irrigation. Where water was available, up to three crops could be harvested on some lands. The farmers also cultivated wheat and millet, many kinds of vegetables, and fruits. India was famed for growing a wide variety of spices used in cooking. The Spanish and Portuguese voyages of exploration in the 15th century were motivated in part by the desire to obtain spices and other riches from India. Increasing emphasis on vegetarianism by Hindus meant that there was less raising of animals for meat in India than in many other lands. However, Indian farmers used bullocks for draft animals and raised cows for milk, which provided much of the protein in their diet. In the eastern Mediterranean and Ottoman Empire, the production of grains and fruits was the main agricultural activity. From China, Central Asia, Persia, the Middle East, to North Africa, sedentary agriculturalists and nomadic (or seminomadic) herders and pastoralists depended on one another to supply what each could not produce. Pastoralism

generally existed in areas less favored with rainfall. As a result, pastoralists were more dependent on outsiders for vital food items such as grains and salt than were farming societies. Therefore, hard times or inability to trade for needed items often led to nomadic raids, wars, and migrations.

In sub-Saharan Africa, farming ranged from advanced to slash-and-burn methods. Herding, hunting, and fishing were also important sources for food in many regions. In most European and Asian societies, men performed the heavy agricultural work and women spun and wove cloth, but in many African societies, men hunted and herded animals while women farmed and produced most of the food. Major crops included millet, sorghum, and ground nuts as well as some vegetables.

The Americas. The method of food production and the types of food produced throughout the Americas did not change from the beginning of the Neolithic age to this period. Maize, beans, and squash remained the staple crops. The range of animals available for domestication remained the same also—dogs, turkeys, llamas, alpacas, and guinea pigs. All farm work was done (by humans) with stone, bone, wooden, and sometimes copper tools, as there were no sturdy draft animals. In the Amazon basin the people combined slash-and-burn tropical forest agriculture with hunting for wild game, fishing, and gathering of nuts and edible plants. In North America, the peoples combined agriculture with hunting both big and small game and gathering edible nuts and fruits.

Peoples across the world used many methods to produce food. Incremental improvements in food production were most noticeable in Europe and eastern Asia during this period, where most of the population increases and improvements in living standards occurred.

SCIENTIFIC AND TECHNOLOGICAL DEVELOPMENTS

Between the seventh and mid-15th centuries, Christian and Muslim scholars of Europe and the Middle East preserved and studied the scientific and technological knowledge that they had inherited from ancient Greek, Roman, and Hellenistic civilizations. They also made progress in many fields, including astronomy, mathematics, and human physiology, that led to greater understanding of the natural world. They thus laid the foundations for the Renaissance to come. Life, culture, and learning were severely set back in Europe when the Roman Empire fell. Several centuries would elapse before the barbarian invasions subsided, allowing recovery to begin.

Education. Before about 1000, monks dominated learning and education in monastic and cathedral schools where boys from elite families were educated in the seven liberal arts derived from ancient Greco-Roman civilizations. These were grammar, logic, rhetoric, arithmetic, geometry, astronomy, and music. Later they benefited from knowledge from the classical world transmitted through Jewish and Arab scholars. After 1000, universities were founded where monks and secular scholars taught theology, law, the sciences, and medicine.

Roger Bacon (1214–94) made Oxford University famous by pioneering the inductive investigation method of observation and experimentation. He described the nervous system of the eye, made magnifying glasses, and wrote about creating gigantic mirrors that would focus the Sun's rays to incinerate one's enemies in warfare. A hundred years before Copernicus, Jean Buridan (c. 1300–58), rector of the University of Paris, had written that Earth was round and rotated on an axis. Many universities became famous in particular disciplines, for example, medicine at the University of Padua. Two inventions first made in China and then spread across Eurasia had an incalculable affect on advancing learning. They were the introduction of paper making that spread from China to the Muslim world in the eighth century, thence to Europe, and the invention of printing and movable type, which reached Gutenberg in Germany in 1450.

Theoretical advances in such areas as mathematics had practical application. For example, the architectural style for church building during the 11th and early 12th centuries was called Romanesque because it employed the plan of the Roman basilica. It featured a cross-shaped floor plan with intersecting aisles and a large open rectangular area called a nave to accommodate the worshippers and a semicircular apse for the altar. A new Gothic style was introduced in the 12th century, reflecting mastery of complicated mathematical calculations and great engineering skill. Its innovative features were height, with raised high roofs supported by pointed arches and external buttresses,

space, and brilliant light through soaring windows decorated with stained glass. All major European cities would build cathedrals in the Gothic style until the 16th century.

Europe and the rest of the world owed much to Islamic civilization for the preservation of ancient Persian and Hellenistic manuscripts after the conquest of Persia and the eastern Mediterranean area by the first caliphs. The early caliphs at Damascus encouraged the arts and education and established universities, the most famous being the al-Ahzar in Cairo, probably the oldest continuing university in the world. The famous Bayt al-Hikmah (House of Wisdom) in Baghdad attracted scholars from around the Mediterranean. Islamic culture reached its zenith between the eighth and 13th centuries. Arts and the sciences flourished during this era, called the golden age, and incorporated the earlier achievements of lands that the Arabs had conquered. Scholars of many cultures, including Jewish, Zoroastrian, and Christian, worked together, translating Hebrew, Indian, and Persian texts into Arabic, the lingua franca of the entire Muslim Empire. For example, major works of ancient Greek physicians and scientists such as Hippocrates and Galen were studied and advanced in centers from Baghdad to Granada in Spain.

Scientific Developments. During the Islamic golden age from the eighth to 13th centuries, Arab and Muslim scientists and scholars were the most advanced in the fields of medicine and pharmacology as well as in applied sciences and mechanical engineering. Scholars like Ibn Rushd (Averroës) and al-Kindi made major contributions to the knowledge of mathematics as well as music.

Muslim medical doctors and scientists were pioneers in treating such ailments as kidney stones and small pox. Hospitals were established in many cities under Muslim rule. Arab astronomers were influenced by the Ptolemaic (Earth-centered) system of the universe, based on which they developed new accurate tables of solar and lunar eclipses. Their superiority to earlier calculations were such that Muslim astronomers were given employment in the Bureau of Astronomy in the Chinese court and were given the responsibility for calendar making and predicting eclipses until around 1600 when they were replaced by Jesuit astronomers from the by then more advanced Europe. The first paper mill in the Islamic world was established in Baghdad in 793, followed by many others. Paper was important to transmitting technological inventions among scholars of many cultures and enabled the growth of libraries with large collections.

Most of India's many contributions to world civilization, including those in the sciences and technology, occurred before 600. The Indian subcontinent suffered repeated devastating conquests after 600 from Scythians, Huns, Afghans, and Turks. Muslim raids and conquests launched by Afghans and Turks from Afghanistan were particularly destructive. Besides destroying cultural centers and libraries, the invaders amassed huge amounts of loot, massacred the population, and deported many as slaves. Indians gradually ceased sailing to other lands as they had done during earlier eras, when they had spread so much of their scientific and technological knowledge to the peoples of South and Southeast Asia. However, many Arabs who came to India learned and spread much of Indian learning on mathematics (for example, the zero) and astronomy to other lands.

Many of China's great scientific breakthroughs occurred before the era covered here, although knowledge continued to be advanced, refined, and spread throughout China and to other cultures. Japan in particular was the beneficiary of many of China's earlier inventions after 600. This was due to Japan's policy to learn all major aspects of China's civilization, starting around 600, that continued for several centuries. An important example of technological breakthrough and diffusion is the stirrup. The use of a loop made of rope or leather to assist people in mounting horses probably first began with the nomads north of China. Expert at metal casting and needing to counter the threat of the nomads on their northern borders, the Chinese began to make cast iron stirrups in the third century. Fierce nomads called Avars in the sixth century carried this invention to Europe as Avar attacks threatened the Byzantine Empire.

In response, Byzantine emperor Maurice Tiberius promulgated a military manual in 580 that specified the need for Byzantine cavalry to use iron stirrups. After that, stirrups became universal throughout Eurasia. China was also the first to make true porcelain in the third century through high-temperature firing in kilns. In the next 1,000 years and beyond, all innovations and advances

in porcelain making were initiated by the Chinese, hence the name *china* for porcelain. This technology was later copied by every culture throughout Europe and Asia. The same is true of gunpowder used in warfare, first invented by Chinese in the ninth century. Its invention and rapid spread throughout Europe and Asia forever changed the nature of warfare.

Alchemy and Metallurgy. Alchemy was an area of inquiry that preoccupied many people throughout Europe and Asia. Many alchemists conducted experiments in their quest to turn base materials into gold. This quest turned out to be a dead end. However, although incidental, the experiments of the alchemists contributed to advancing scientific knowledge in many fields, including pharmacology, chemistry, and metallurgy. In China, alchemy was associated with Daoists (Taoists) and their quest for longevity and immortality as well as the search for gold. This association between science with magic and alchemy contributed to the denigration of scientific research by scholars in traditional China. Similarly in Europe alchemy acquired ill repute among scientists. The cultures of Mesoamerica made no dramatic advances in scientific and technological developments during this period, due in part to political fragmentation. The Mayan city-states had earlier developed sophisticated calendrical and astronomical knowledge, which they continued to rely on.

The centuries between 600 and 1450 witnessed gradual and incremental increases in human knowledge in the sciences and technology. Islamic civilization led the way in assimilating the knowledge of the ancients, integrating them with that garnered by other cultures, and advancing them during the first part of this era. Its achievements made those centuries the golden age of Islam. By the latter part of the period under discussion, Europeans were rising to the forefront in many areas of scientific inquiry and technological improvements. This trend of rapid progress would continue and accelerate in the following centuries and result in Europeans becoming world leaders.

SOCIAL AND CLASS RELATIONSHIPS

From 600 to 1450, social and class relationships varied greatly from society to society around the world. Within each society, developments were dependent on local circumstances, wars, invasions, and migrations. Many invasions and group migrations that occurred throughout Eurasia during this period greatly affected relationships between different peoples and social classes. While much information is available about some societies, little is known of others, especially those without written languages.

In Europe the invasions and chaos that contributed to the end of the Roman Empire continued through this period as Germanic tribes, Magyars, and Vikings raided, conquered, and settled. Feudalism emerged because governments failed to provide the needed protection. Under feudalism, lords provided protection in return for allegiance and service from their vassals. It was a graded social relationship with the king at the apex, followed by nobles of varying ranks who served their superiors in war and governed the fiefs that were granted to them. The bulk of the population were serfs, free in person, but obligated to remain on the land that they worked, living in villages around a manor. Slavery was rare. Marriages in Europe were monogamous because of the teachings of the Christian Church. Most marriages took place within the individual's social group.

The church also functioned to mitigate the harsher aspects of feudalism. As in lay society social class divisions were rigid within the church; whereas most parish priests came from the common people, high-ranking clerics almost invariably came from the aristocracy. However religious orders, beginning with the Benedictine order from the sixth century, presented an alternative class structure and a powerful source of social organization because they were independent of the political rulers of the land and were put directly under papal control after the 10th century. Missionaries, some belonging to religious orders, notably the Knights of the Teutonic Order, spread Catholic Christianity and culture to northern and parts of eastern Europe that had not been part of the Roman Empire. Throughout this period in Europe, religious orders of monks and nuns provided education for boys and girls in monastic and convent schools and, later, for young men in the universities.

European economy prospered after 1000 because of the waning of outside invasions, technological advances in agriculture, and new lands brought under cultivation. The church also promoted economic growth because the lands that belonged to it were among the best administered and, as

a result, most productive. Local and international trade also increased. These factors led to the growth of towns, many of them self-governing and not subject to the strict feudal social order. The flight of serfs to towns and the need for workers to develop new lands led to better and freer conditions for serfs who remained on the land, leading to the eroding of serfdom.

In Asia, Japan was the only country where social and class relationships approximated those in Europe. Beginning in the sixth century, Japanese leaders attempted to replicate China's political and social institutions in order to achieve rapid progress. However, conditions in Japan differed significantly from those of more developed China. Thus Japanese society failed to advance into the more meritocratic and open Chinese model; instead, it developed along feudal lines. Paying lip service to powerless emperors, feudal lords, descended from aristocratic clans that traced their lineages to antiquity, were served by hereditary warriors (called *bushi* or samurai). They ruled the land that was worked by peasants whose position approximated that of European serfs. Social mobility was extremely rare.

In contrast to Europe and Japan, Chinese society became more egalitarian as the great families that were descended from ancient aristocratic clans declined and lost power. Although individuals were rewarded with high rank and titles, a hereditary aristocracy had ceased to exist by the end of the ninth century. Bureaucrats recruited through civil service exams dominated government. The invention of paper and printing, both of which took place in China, and government and private support of education all contributed to the development of an increasingly egalitarian society where many family fortunes rose and fell through the educational attainment of their sons.

The social leveling and increasing egalitarianism was severely set back when the Mongol Yuan dynasty completed its conquest of all China in 1279. The Mongols instituted a class structure in China that placed themselves on top, followed by their subjects of non-Chinese ancestry from Central Asia, then northern Chinese, with southern Chinese at the bottom. Huge numbers of Chinese were made slaves. A similarly iniquitous class structure characterized Mongol rule in Persia and Russia. In Russia, local princes were obliged to render tribute of gold and human beings to their Mongol overlords. The Chinese rebel who expelled the Mongols from China and founded the Ming dynasty (1368–1644) was an orphan from an impoverished family and felt great compassion for the poor. He emancipated people enslaved by Mongols and enacted laws that favored the poor and dispossessed. Thus Ming Chinese society was more egalitarian than that of pre-Yuan eras, and people enjoyed social mobility that was determined by economic and educational success. Marriages were monogamous for the majority, though rich men could take concubines. Divorces were rare and favored men when they occurred.

Indian society continued to be divided by caste, which originated with the Aryan invasion or the migration of Indo-Aryans from the Eurasian plains into the Indian subcontinent during the second millennium B.C.E. Caste was a method to separate the Aryans from the non-Aryans—the Dravidians and aboriginal tribes—and was a more peaceful solution than the victors enslaving, killing, or evicting the conquered. The four castes were Brahman, who were priests and scholars; Kshatriya, who were warriors and rulers; Vaisya, who were farmers, artisans, and merchants; and Sudra, who were servants. The first three castes claimed Aryan origins, while Sudras were the natives. Each caste was subdivided into numerous occupational groups or subcastes called *jati*.

Below the four castes were outcasts, also called untouchables—peoples relegated to the bottom of society who performed scorned functions. They were probably descended from tribal peoples or those that had been thrown out from their original places in society because of crimes or other misdeeds. Over the centuries, invaders and immigrants had assimilated into the caste structure. Around 500 B.C.E., Buddhism and Jainism, two major new religions that evolved out of the Aryan Vedism-Hinduism, both rejected caste, but by 600 C.E. Buddhism was in decline in India, while Jainism never claimed the loyalty of large numbers of people. Thus the caste system remained the prevailing method of social organization. While there were many local variations in marriage customs, most Hindus were monogamous, although the ruling elite had concubines.

While many earlier incoming groups had been absorbed, Muslims who came into India after 712 either as conquerors, settlers, or traders maintained their own religious and social structures. Since

the Muslim impact was felt mainly in northern India, many Hindus fled southwards, while those who remained retreated into the relative safety of their caste social structure, which became stricter as a result. Hindu women in northern India began to veil themselves in public, and girls married earlier partly due to fear for their safety in an area that was constantly under threat of Muslim raids and conquest. Some Hindus, mainly from lower castes, converted to Islam voluntarily. However, many were forcibly converted. Social intercourse between Hindus and Muslims was restricted. Even among Hindus, interdining between castes was taboo, and intermarriages were severely frowned upon. Vegetarianism, especially among upper castes, was encouraged, and the immolation of widows at the cremation of their husbands was esteemed and encouraged among the upper castes. Great divisions existed between the upper classes and the majority farmers, and while many men and women of the upper classes/castes were educated, the majority of both faiths were illiterate.

Until the rise of Islam in the seventh century, much of eastern Europe and western Asia was ruled by the Byzantine Empire. It was ethnically and culturally diverse, with many Arabs, Slavs, Armenians, and Jews among the population, but was dominated by peoples of Greek descent. Much of the land was owned by wealthy aristocrats and worked by free tenant farmers. The small numbers of slaves mostly worked in the home. Society was hierarchic, and while a few highly placed women wielded power, most women tended to affairs related to the home. Missionaries from the Byzantine Empire converted the Slavic peoples of eastern Europe to Christianity and also passed to them the ideals and mores of Greek civilization.

In western Asia, the rise and spread of Islam had significant impact on all aspects of life. Victorious Muslim leaders did not attempt to force the conquered people to adopt Islam and allowed them to maintain their own laws, content with collecting taxes in lands under their control. Those who did not convert were sometimes treated as second-class subjects. Thus, in time, many of the local populations converted to Islam and were then treated as equals within the community. Islamic law also strictly regulated the treatment of slaves. Muslims could not enslave other Muslims, and slave owners were encouraged to free their slaves. Most slaves in Islamic societies were used for domestic chores, or as soldiers. Although women in Islam enjoyed higher status than did women in many other contemporary societies, men remained dominant. They were allowed a maximum of four wives and were favored in divorce, among other advantages. By the eighth century, as in most of the world, there was great disparity between the ruling wealthy and the rest of the community in the Islamic realms under the Abbasid Caliphate.

While northern Africa was Islamized, the many peoples who lived in sub-Saharan Africa followed diverse cultures with different social patterns. Islam spread peacefully to sub-Saharan Africa through commerce and the movement of peoples. Societies and polities of sub-Saharan societies were extremely varied. Some, for example the Kikuyu of Kenya, were open and egalitarian, while others in societies in central Africa were narrowly hierarchic. Work in most was divided along gender lines; men were hunters, warriors, and herders, while women farmed and produced most of the food. Assignment of tasks by age was also common. One group, the Bantus, migrated from central to eastern and southern Africa, spreading their language from a common language group. Bantu societies were often led by tribal chieftains who also maintained armies. The societies were generally polygamous and patriarchal, although a few passed descent or “blood” through women.

THE AMERICAS

The peoples in North America lived in tribal groups, including the Hohokam, the Mogollon (Zuni), and Anasazi in the Southwest, the Algonquian and Iroquoian in the East, and the Hopewell and Cahokia in the Mississippi and Ohio Rivers region. Very advanced cultures developed in regions from modern Mexico to southern America, including the Teotihuacán northwest of the Mexico Valley (ended c. 650), the Mayan city-states in southern Mexico and Central America, and in the highlands of Peru. In general, as the states became more advanced and expanded, they also became more hierarchic, and greater social distinctions prevailed. In Mesoamerica and the Andes, the exceedingly elaborate social and class distinctions were based on birth, lineage, and occupation. A hereditary

ruler and the nobility topped the class structure, followed by a priestly class, a warrior class, merchants and traders, farmers, servants, and slaves at the bottom. The rulers claimed divine sanction and jealously guarded astronomical and calendrical knowledge, aided by priests who served them. On the other hand, there was less stratification among the less urbanized and developed peoples in the Amazon basin and in the grasslands of southeast South America.

No overall trend characterized social and class relationships on any continent. Within each society, class distinctions ranged from the extremely hierarchic in medieval Europe, feudal Japan, and Hindu India to the gradually more open one in China. Two factors instigated dramatic upsets and lasting changes in social and class relationships in many societies during these centuries. One was internal—the result of economic and technological changes that eroded feudalism in Europe and made Chinese society relatively more egalitarian. The other was war that brought a new religion: Islam introduced a new way of life to much of Asia and northern Africa. Invasions—Mongol, Viking, and others—disrupted and forced the reorganization of societies in much of Europe and Asia.

TRADE AND CULTURAL INTERACTIONS

From 600 to 1450, many old patterns of trade continued, others were disrupted, while new ones developed among Europe, Asia, and Africa. The Western Hemisphere continued isolated from the rest of the world. The fall of the Western Roman Empire in the fifth century and subsequent centuries of barbarian invasions severely disrupted trade in western Europe and between western Europe and the rest of the world, although the Byzantine Empire continued to serve as go-between for European and Asian goods. Eastern Christian missionaries from the Byzantine Empire converted most Slavic peoples of eastern Europe from the Balkans to Ukraine and Russia to Orthodox Christianity and Greek cultural traditions. In western Europe, Catholic missionaries converted the Anglo-Saxons, Lombards, and others to the Catholic Church and Latin culture. By the late eighth century, there had been sufficient recovery in western European lands controlled by Emperor Charlemagne to warrant calling the period the Carolingian Renaissance. However, subsequent widespread Viking invasions would bring back a “Dark Age” for much of Europe.

Asia. These centuries were highly active ones along the Silk Road that connected China with India, Central Asia, the Indian subcontinent, Afghanistan, Persia, the Byzantine Empire, and the Umayyad and later Abbasid Caliphates. Traders, missionaries, and conquering armies linked cultures and spread innovations across continents. European lands became linked to the international trading network as a result of the Crusades that brought large numbers of English, French, Germans, and Italians to western Asia and introduced them to goods from Asia. The taste for Eastern luxuries led to increased trade overland and via sea routes. In the 12th and 13th centuries Marco Polo became world famous for traveling vast distances and writing colorful accounts about other peoples and ways of life. Polo traveled from Italy to China. Arab seafarers also traveled along the east coast of Africa and in Southeast Asia. Other Europeans had traveled via land to the Persian Gulf and then by sea to India and China. Political and other obstacles encountered on these traditional routes would motivate Spanish and Portuguese navigators to seek alternate routes to the East in the latter part of the 15th century.

In East Asia at the beginning of this era, the emerging Japanese state made a concerted effort to learn all it could from the higher civilization of China by sending many embassies, each with around 500 students, to spend years studying in China and then spread what they had learned in Japan. Japan adopted China’s written script, system of government, philosophy, art and architectural styles, legal codes, and Chinese schools of Buddhism. During the early centuries, Japan exported raw materials such as pearls and shells to China in return for books, textiles, art works, ceramics, and even Chinese metal coins that became currency in Japan. In time, as Japanese culture advanced, it began to export its manufactures to China; these included steel swords, folding fans, and painted screens that the Chinese prized.

The Silk Road that connected India and China through Afghanistan brought goods between the countries—mainly silks from China for cottons, optic lenses, and precious stones from India. It also

brought Buddhist missionaries from India and Central Asia to China and Chinese pilgrims to study in India. Buddhist missionaries first entered China at the beginning of the Common Era and continued to come until cut off by Muslim forces in the eighth century. Buddhism was the single most influential foreign ideology that affected the Chinese civilization until modern times. Buddhism, then flourishing in Central Asia, acted as a melting pot of Greco-Roman, Persian, and Indian cultures. It brought to China the art and architectural styles of all the lands that had influenced it, enriching Chinese intellectual and artistic life. Chinese Buddhists then synthesized the foreign with native Chinese traditions and passed on Sinicized Buddhism to its cultural satellites—Vietnam, Korea, and Japan.

The Silk Road was so called because China's most prized export was silk. By the seventh century, India and other lands had acquired the art of raising silkworms and the technology of silk weaving. However, Chinese silks continued to be prized. China imported cotton from India. Later, China also began to cultivate the cotton plant and manufacture cotton cloth and passed the skill to Japan. Cotton cloth became widespread for clothing because it was cheaper than silk. The Silk Road was also the conduit of innumerable food items from different lands that enriched all people's diets and introduced items that changed people's lifestyles. For example the ancient Chinese sat on futons placed on raised floors. Buddhist monks introduced the chair to China. Initially only Buddhist monks sat on chairs, but by the 10th century, chairs had become universal in Chinese households. The Tang (T'ang) Chinese garments, like many other Chinese artifacts, were adopted by contemporary Japanese, who modified them and continued to wear them as the kimono, even after the Chinese had changed clothing styles.

The Silk Road also brought peoples of many ethnic groups to new lands throughout Eurasia and created cosmopolitan cultures. This was especially true during the seventh century when a vibrant Tang dynasty in China exchanged ambassadors, merchants, and religious pilgrims with a flourishing India under Emperor Harsha, the Sassanid Empire in Persia, and the Byzantine Empire. Although early Muslim conquests disrupted trading and political relations, they would be resumed between China and the Muslim caliphate in Damascus and Baghdad. The Muslims who conquered the eastern Mediterranean lands became heirs of the Hellenistic and Byzantine cultures of the region. The early caliphate continued many Byzantine institutions, especially in taxation and the bureaucracy, and employed Greek architects to design mosques that incorporated the architectural style of Byzantine churches. Muslim scholars became the best mathematicians and astronomers; for centuries they would be employed by the Chinese governments as official astronomers and put in charge of issuing the calendar. Muslim scholars held primacy in these fields until the Renaissance. The Crusades brought major disruptions in the eastern Mediterranean region during the 11th and 12th centuries, but they also accelerated cultural contacts and created new tastes for luxuries. They in turn led to land and sea voyages of exploration to create new trade routes, leading to vast discoveries in subsequent centuries.

Asia, the Middle East, and eastern Europe suffered major disruptions in the 12th and 13th centuries as a result of Mongol imperialism under Genghis Khan and his successors. Huge areas across Eurasia were devastated and depopulated as a result. However, once established, the Mongol Empire, largest in the world, would encourage trade and provide security in a Pax Tatarica, similar to the Pax Romana and Pax Sinica of earlier centuries. Examples of cultural interactions that took place under the Mongols would be the adoption of Tibetan Buddhism by the eastern Mongols and Islam by those Mongols who had migrated westward. Another example is the import of cobalt from Persia to China for creating a blue color for decorating porcelains that became prized from Japan, India, and the Middle East to Africa. Cobalt blue underglaze porcelains from China would be imitated from Iznik in Turkey to Delft in Holland.

The collapse of the Western Roman Empire in the fifth century and subsequent power changes in western Asia disrupted the flourishing sea trade with India of previous centuries. However, Indian merchants, settlers, and missionaries remained active in Southeast Asia, sailing from ports along the Bay of Bengal to Burma (modern Myanmar), Malaya, Cambodia, and Java, Sumatra, and other islands of the East Indies. They brought Hinduism and Buddhism, Indian art and architectural styles, Sanskrit-based written scripts, and many other elements of India's great civilization to the entire region, which entered the historic era due mainly to the influence of India. Outside their

home regions, Chinese and Indian cultures met at the southern tip of mainland Southeast Asia—in a region called Indochina, named for that reason. Chinese culture and political control prevailed in Vietnam, whereas Indian culture predominated in Laos and Cambodia.

Africa. Just as the Silk Road spread goods and ideas across Eurasia, trading routes spread Islam from North Africa across the Sahara to sub-Saharan West Africa. In a reverse pattern, export of salt and gold northward via camel caravans made West African kingdoms of salt and gold fabled lands of wealth. West African Muslims also traveled through North and East Africa and Arabia to make a hajj, or pilgrimage, to Mecca and Medina. The hajj was a major factor in the exchange of goods and ideas among Muslims from Africa to Asia. Ivory from African elephant tusks was valued as material for art and ritual objects from medieval Christian Europe to China. East Africa developed a cosmopolitan culture as a result of trade with Arab Muslims. Many Arabs and Persians settled in coastal regions in East Africa, and Islam spread there through intermarriage and conversion. Swahili, an African language infused with many Arabic and Persian words, became the international language of trade in East Africa.

War also created opportunities for cultural exchanges. Chinese prisoners of war captured by armies of the Muslim caliphs in the mid-eighth century taught their captors paper making, which spread from the Middle East to Europe. Likewise, gunpowder, cannons, and guns spread from their Chinese inventors to their Mongol enemies, westward across Eurasia, and changed the nature of warfare throughout Eurasia. Wars also resulted in relocations of populations, either forcibly as refugees or deportees, or willingly by conquering powers. In either case, the transfers of peoples to new lands resulted in cultural interactions.

The Americas. In the Americas, there was a continuation of regional exchange networks and cultural interactions that had developed before 600. The people of the Mississippi River valley area in North America made significant advances after about 700; that culture reached its zenith between 1200 and 1400 and disappeared about 1700. Archaeologists have excavated large settlements with earthen temple mounds shaped like truncated pyramids, on top of which the people had built major community buildings. The Mississippian Culture extended its influence throughout northern America east of the Rocky Mountains, probably through trade and travel along the various river systems. In Central America, long-distance trade depended on the strength of states that could protect it. In central Mexico, the fall of Teotihuacán around 650 splintered both political and trading structures of previous centuries. To the south, the city-state of Monte Albán dominated regional exchange for several centuries after 650. In Central America after 900, powerful city-states, most notably Tikal, conducted trade throughout the region. Two main state systems, the Tiwanaku and Wari, dominated the Andes region of South America, with textiles as major trading items.

Despite major disruptions caused by the rise and fall of empires and the introduction of new religions, international trade continued along long-established routes in Europe and Asia. While Islam was spread by military conquest in much of western and southern Asia, its gradual acceptance by many peoples in eastern and sub-Saharan Africa was the result of trade. Christian and Buddhist missionaries mostly worked to convert through peaceful means. Chinese culture spread to Korea and Vietnam aided by Chinese political control, while Japan's acceptance of all things Chinese was entirely voluntary. Except for the Mongol conquest of Eurasia, which only benefited the Mongols, and some Turko-Afghan raids on northern India, other cultural contacts, even those imposed by war, had some beneficial results.

WARFARE

During 600–1450, military technology throughout Eurasia retained the principal characteristics of earlier times. Iron and steel weapons had long since replaced those made of bronze. In large empires such as those of China and the Byzantine, Persian, and Islamic Empires, large-scale industrial production of weapons became commonplace. Japan, Damascus in present-day Syria, and Toledo in Spain were famous centers for the production of swords. Refinements and improvements were continuously made to older inventions, such as poison gas and smoke bombs. The crossbow was first

manufactured in China in the fourth century B.C.E. and possibly in Greece about the same time and then disappeared in Europe. It reappeared in western Europe in the 10th century (some scholars suggest, reintroduced through Central Asia by the Khazar people), and was reputedly used by the forces of William the Conqueror at the Battle of Hastings. Its effects were so lethal that its use was condemned at the Second Lateran Council of the Catholic Church in 1139 for use against Christians. Its use was, however, accepted by the Catholic Church against the infidels (Muslims). It was one of the main weapons used by Hernán Cortés to subjugate Mexico in 1521.

China revitalized the ancient means of defense of wall building in the early 15th century. The Romans had built Hadrian's Wall in Britain in the second century C.E., and the Chinese had built a longer Great Wall during the Qin (Ch'in) dynasty and Han dynasty before the Common Era. The Great Wall had fallen into disuse between the 10th and 14th centuries because nomads controlled northern, and later all of China. Even though the Ming dynasty (1368–1644) had ousted the Mongols, they remained a threat, hence the rebuilding and reinforcing of the Great Wall along China's northern frontiers. The survival of large sections of the Ming Great Wall is a testimony to the technical excellence and engineering skills applied in its construction.

Several significant inventions and advances in military technology and weaponry made warfare more destructive. One formidable weapon was called "Greek fire," a petroleum-based incendiary substance that combined sulfur and saltpeter and could be shot from tubes and could not be extinguished by water. It was invented in India in the 600s, refined and used in China as a continuous flame-thrower on land in the 10th century, and used by the Byzantine Empire in naval warfare that allowed it to maintain naval supremacy. Gunpowder was invented in China. It was given military application in the 10th century in response to attacks by its formidable nomadic neighbors, most notably the Mongols. In the 11th through 13th centuries, the Chinese invented rockets, and a proto-gun called a "fire-lance," which worked as a flame-thrower. From these evolved guns and cannons made from cast iron, which became ever bigger and more sophisticated.

A Chinese manual dating to 1412 described a cannon that weighed 60 pounds called the "long-range awe-inspiring cannon." By the mid-15th century, a "great general gun" had been made with a barrel six feet long that weighed 330 pounds and could be placed on a wheeled carriage. It fired an eight-pound "grandfather shell" that traveled 800 paces. Unfortunately for China, the advantage gained by its inventions were short-lived because skilled prisoners of the Mongols quickly replicated the new weapons. In short order, gunpowder, cannons, and guns became available throughout the Middle East and Europe, revolutionizing warfare and castle building. Soon so-called gunpowder empires emerged, including the Ottoman Empire. Wars among Chinese and between Chinese and their neighbors involved hundreds of thousands of men on both sides and inflicted huge casualties that made contemporary European campaigns fought seasonally by a few thousand combatants seem puny by comparison. Although the European knights wore formidable chain-mail armor in battle, it proved too cumbersome against the light armor worn by Mongol horsemen.

Armies of great empires consisted mainly of infantry soldiers, supported by cavalry, and in India, by elephant corps. Soldiers were either conscripts, professional long-term recruits, or came from hereditary military families. In India *kshatriya* clans called Rajputs (which means "sons of kings") proudly bore arms as elite soldiers fighting among themselves and unsuccessfully against Muslim raiders and invaders from Afghanistan. In Japan, hereditary elite fighting men called samurai or *bushi* enjoyed a position in society similar to that of knights in medieval Europe. They lived by their own severe code of conduct and were distinguished from commoners by their right to bear arms. As Japan was an island nation, only the Mongols threatened invasions in late 12th century; thus it never needed to develop large infantry armies.

Western Asian and African Warfare. Among nomadic and seminomadic tribal peoples that included Mongols, Afghans, and Turks, every able-bodied adult male was a soldier, and society was highly militarized. Their mobility and elusiveness made nomads especially difficult for sedentary peoples to defend against. Thus nomads could conquer and control large numbers of sedentary peoples. The Mongols under Genghis Khan and his descendants conquered the largest land empire in history, their

realm at its maximum stretched from Korea on the eastern rim of Asia, across China, Afghanistan, Persia, Central Asia, Russia, and eastern Europe to Hungary. Mongols discovered no new weapons or technology. Their phenomenal success was because of leadership, planning, intelligence gathering, strategy, speed, and above all ruthlessness. Mongols struck like lightning and were willing to exterminate all inhabitants in any area that had opposed them. Their military campaigns inflicted unprecedented destruction throughout Eurasia. On the other hand, victorious nomadic rulers, Mongols included, quickly lost their martial spirit, corrupted by the soft lifestyle they enjoyed as rulers. Thus they were soon overthrown by their subject peoples or by other hardier nomadic tribes. Then they were either assimilated into the majority population or reverted to nomadism in the steppes.

Arabs, inspired by religious fervor, conquered a huge empire in the seventh–eighth centuries. Even some Arab women went to war during the initial campaigns of conquest. The swift expansion of Islam, the limited human resources among the Arabs, and the luxurious lifestyle adopted by the conquerors made finding new sources of soldiers an urgent necessity by the ninth century. The remedy came in the form of the Mamluk (the word means “slave” in Arabic) system, whereby young boys from non-Muslim tribes in the Eurasian steppes, many Turkish, were purchased and brought to Muslim lands. They were given a rigorous military training and Islamic education, converted to Islam, and then freed. Faithful to their masters and comrades, Mamluks became elite soldiers to Muslim rulers; later they became the rulers. Mamluks were a one-generation aristocracy because their sons, who were born free and Muslim, could not become Mamluks. In other words, new batches of boys were continuously bought from the Eurasian steppes to be trained to be the next generation Mamluks. The institution survived for 1,000 years, mainly in Egypt and Syria.

Similarly, in northern India former Turkic slaves to Muslim rulers turned the tables on their masters and established slave dynasties. Likewise, the Ottoman Empire instituted a Janissary Corps (from Turkish words meaning “new soldiers”) with boys taken from Christian lands that it conquered. The boys were given military training, converted to Islam, and became elite loyal soldiers to the rulers; they played a key role in the expansion of the Ottoman Empire. Sundiata, the first king of Mali in West Africa, maintained a standing army clad in padded cloth suits of armor or chain mail as well as cavalry with horses and camels. In Africa, some tribes or ethnic groups, such as the Tauregs and Zulus, dominated their weaker neighbors because of their military prowess.

Maritime Warfare. Most major empires during this era relied primarily on land power, but sea power also played a role. The Vikings were expert seafarers who traded and raided throughout the coastal waters and several inland waterways of Europe, traveling in their long boats. One group of Vikings first raided the English coast and later invaded England from their new stronghold in Normandy, France. Another crossed the Baltic Sea to Russia and then sailed southward along the rivers to the Black Sea to Constantinople and to the Mediterranean to conquer ports in Sicily and other areas. Muslims also developed formidable naval forces and merchant fleets, but all of India’s Muslim invaders came overland across the mountains from the northwest; China’s enemies also came overland during this period.

However, as the Mongols pressed southward across the Yangzi (Yangtze) River and encountered Chinese resistance along the coastal waterways, they, too, ordered their Chinese prisoners to construct a fleet. The last Song (Sung) emperor drowned at sea after suffering final defeat at the hands of the Mongol navy. In 1274 and 1281, Mongol ruler Kubilai Khan launched two invasions of Japan with a huge armada of Korean and Chinese built ships that carried 140,000 soldiers during the second expedition. The ships were no match against typhoons, and both invasions failed. Between 1405 and 1433, Chinese naval power dominated the Asian waters, as six huge armadas fought pirates, intervened in local civil wars, and conducted trade and diplomacy from Java to India, Sri Lanka, to the east coast of Africa. The magnetic compass, discovered centuries earlier, had been used by Chinese sailors in navigation since the ninth century and was passed on to sailors of other lands. China’s government abandoned its interest in naval affairs after the last great voyage of Admiral Zheng He (Cheng Ho) in 1433.

The Americas. Isolated from Europe and Asia, the civilizations in the Americas did not develop iron and steel technology, nor did they possess the horse. Across Mesoamerica there was intensified

warfare, militarization, and the glorification of the warrior class during this era. Warfare became endemic; hence this period is called a “Times of Trouble.” In both Mesoamerica and among the Mayan city-states, the principal goal of warfare was the creation of subordinate tributary states among the defeated to obtain tribute, although the Maya sometimes occupied the lands of the defeated city-states. Thus the defeated states were often left intact to collect the required tribute. Another goal of warfare was to take captives for prestige and to provide labor for the victor. Artwork depicted warfare and glorified the warrior.

As a result, warfare was often endemic in the regions and contributed to the depletion of resources and, combined with ecological degradation and burgeoning population, led to the decline and fall of Classic Maya in the ninth century. Scholarly debate prevails concerning the nature of warfare in the Andes region. While one school of thought contends that warfare was more ritualized and ceremonial than destructive, another argues that the wars waged in this region was extremely destructive, with the winner achieving domination and rule over the vanquished. Throughout the world, most successful states relied on formidable military forces to conquer and defend their empires. They also devoted considerable resources and effort to developing successful strategies, tactics, and advanced weaponry to maintain their rule and defeat their competitors and enemies.

Abbasid dynasty

The Abbasids defeated the Umayyads to claim the caliphate and leadership of the Muslim world in 750. The Abbasids based their legitimacy as rulers on their descent from the prophet MUHAMMAD's extended family, not as with some Shi'i directly through the line of Ali and his sons. The Abbasids attempted to reunify Muslims under the banner of the Prophet's family. Many Abbasid supporters came from Khurasan in eastern Iran. Following the Arab conquest of the Sassanid Empire, a large number of Arab settlers had moved into Khurasan and had integrated with the local population. Consequently, many Abbasids spoke Persian but were of Arab ethnicity.

THE NEW CAPITAL OF BAGHDAD

The first Abbasid caliph, Abu al-Abbas (r. 749–754), took the title of al-Saffah. His brother and successor, Abu Jafar, adopted the name al-Mansur (Rendered Victorious) and moved the caliphate to his new capital, BAGHDAD, on the Tigris River. Under the Abbasids the center of power for the Muslim world shifted eastward with an increase of Persian and, subsequently, Turkish influences. Persian influences were especially notable in new social customs and the lifestyle of the court, but Arabic remained the language of government and religion. Thus, while non-Arabs became more prominent in government, the Arabization, especially in language, of the empire increased. Mansur's new capital, built between 762 and 766, was originally a circular

fortress, and it became the center of Arab-Islamic civilization during what has been called the golden age of Islam (763–809). With its easy access to major trade routes, river transport, and agricultural goods (especially grains and dates) from the Fertile Crescent, Baghdad prospered. Agricultural productivity was expanded with an efficient canal system in Iraq. Commerce flourished with trade along well-established routes from India to Spain and trans-Saharan routes. A banking and book-keeping system with letters of credit facilitated trade. The production of textiles, papermaking, metalwork, ceramics, armaments, soap, and inlaid wood goods was encouraged. An extensive postal system and network of government spies were also established.

HARUN AL-RASHID AND THE ABBASID ZENITH

The zenith of Abbasid power came under the caliphate of HARUN AL-RASHID (r. 786–809). Harun al-Rashid, his wife Zubaida, and mother Khaizuran were powerful political figures. Zubaida and Khaizuran were wealthy and influential women and both controlled vast estates. They also played key roles in determining succession to the caliphate. Like the Umayyads, the Abbasids never solved the problem of succession, and their government was weakened and ultimately, in part, destroyed because of rivalries over succession. Under Harun al-Rashid the Barmakid family exerted considerable political power as viziers (ministers to the ruler). The Barmakids were originally from Khurasan and had begun serving the court as tutors to Harun al-Rashid. The Barmakids served as competent and powerful officials until their fall from

favor in 803, by which time a number of bureaucrats and court officials had achieved positions of considerable authority. The wealth of the Abbasid court attracted foreign envoys and visitors who marveled over the lavish lifestyles of court officials and the magnificence of Baghdad. Timurlane destroyed most of the greatest Abbasid monuments in the capital, and Baghdad never really recovered from the destruction inflicted by him.

Under the Abbasids, provinces initially enjoyed a fair amount of autonomy; however, a more centralized system of finances and judiciary were implemented. Local governors were appointed for Khurasan and soldiers from Khurasan made up a large part of the court bodyguard and army. In spite of their power and wealth the Abbasids twice failed to take Constantinople. The Abbasids also had to grapple with ongoing struggles between those who wanted a government based on religion, and those who favored secular government.

CIVIL WAR OVER ACCESSION AND THE END OF THE ABBASIDS

Harun al-Rashid's death incited a civil war over accession that lasted from 809 to 833. During the war, Baghdad was besieged for one year and was fought for by the common people, not the elite, in the city. Their exploits were commemorated in a body of poetry that survives until the present day. The attackers finally won and the new Caliph Mutasim (r. 833–842) moved the capital to Samarra north of Baghdad in 833. During the ninth century the Abbasid army came to rely more and more on Turkish soldiers, some of whom were slaves while others were free men. A military caste separate from the rest of the population gradually developed. In Khurasan, the Tahirids did not establish an independent dynasty but moved the province in the direction of a separate Iranian government. As various members of the Abbasid family fought one another over the caliphate, rulers in Egypt (the Tulunids), provincial governors, and tribal leaders took advantage of the growing disarray and sometimes anarchy within the central government at Samarra to extend their own power.

The Zanj rebellion around Basra in southern Iraq in 869 was a major threat to Abbasid authority. The Zanj were African slaves who had been used as plantation workers in southern Iraq, the only instance of large-scale slave labor for agriculture in the Islamic world. Other non-slave workers joined the rebellion led by Ali ibn Muhammad. Ali ibn Muhammad was killed fighting in 883 and the able Abbasid military commander, Abu Ahmad al-Muwaffaq, whose brother served as caliph, finally succeeded in crushing the rebellion.

Under Caliph al-Muqtadir (r. 908–932) the capital was returned to Baghdad where it remained until the collapse of the Abbasid dynasty. By the 10th century any aspirant to the caliphate needed the assistance of the military to obtain the throne. The army became the arbiters of power and the caliphs were mere ciphers. A series of inept rulers led to widespread rebellions and declining revenues while the costs of maintaining the increasingly Turkish army remained high. By the time the dynasty finally collapsed, it was virtually bankrupt. In 945 a Shi'i Persian, Ahmad ibn Buya, took Baghdad and established the Buyid dynasty that was a federation of political units ruled by various family members. A remnant of the Abbasid family, carrying the title of caliph, moved to Cairo where it was welcomed as an exile with no authority over either religious or political life.

JANICE J. TERRY

Abelard, Peter and Heloise

Peter Abelard (1079–1142) was an abbot in the monastery of Saint-Gildas in the province of Brittany, France. He was born in Nantes, moved to Paris at the age of 15, and attended the University of Paris. He became a prolific writer, composing philosophical essays, letters, an autobiography, hymns, and poetry. He is best known for his intellectual work in the area of nominalism, the antithesis of realism and basis of modern empiricism. His book *Sic et Non* posed a number of theological and philosophical questions to its readers. In *Ethics*, he began two works: "Dialogue between a Philosopher, a Jew and a Christian" and "Know Yourself." Neither work was completed. His rebellious nature frequently angered people, particularly those in positions of authority. Often his independent thinking gave rise to conflicts, especially when he demonstrated mastery of

a subject being taught by a mentor. On one occasion he challenged his former teacher, William of Champeaux, regarding realism and logically proved that nominalism, also known as conceptualism, explained what realism could not prove.

At a time when education was not yet public, professors had no permanent place to teach. They would post an announcement that advertised where and when they would teach a particular subject and wait for students to arrive. In this way they established a following. Abelard was quite brilliant at age 25 and set up his own school despite limited teaching experience. He founded his school uncomfortably close to his former teachers', provoking their anger. He lived a life of extremes, gaining the admiration, respect, and awe of those who studied under him, but often receiving the wrath of those whom he defied. He was accused of heresy on many occasions and at one point was forced to leave his monastery because he aggravated his peers so intensely. On two occasions he was excommunicated from the church.

Heloise (1101–64) was the highly intelligent, beautiful, and charming niece of Fulbert, a prominent canon of Notre-Dame. Fulbert doted on her and demanded that she have only the best education, which took her to Paris near the monastery. Abelard heard of Heloise and requested that he be allowed to tutor her in her home. Permission was granted, and he moved in. There he found an eager pupil, 22 years his junior, and they soon became involved in a physical as well as scholarly relationship. When Heloise became pregnant, they rejoiced in their child (whom they later named Astrolabe) and made plans to marry. Heloise was fiercely independent and would not be forced into a marriage where she had no rights.

But in her collected letters she mentions that she did not want to bring shame on Abelard by being a burden to him. In order to hide their relationship, and Heloise's imminent delivery, Abelard took her to his sister's house, where she stayed until she gave birth to their son. They secretly married in Paris, with only Heloise's uncle and a few of their friends in attendance. Right after the marriage, Heloise took refuge in the Argenteuil convent to allay any gossip regarding her relationship with Abelard.

Unaware that both Heloise and Abelard had planned this provisional measure, Fulbert thought that Abelard had abandoned Heloise and forced her into a nunnery. He planned to ambush and restrain him and cut off Abelard's genitalia. In a series of maneuvers he arranged to pay one person to put a sleeping powder in

Abelard's evening meal and his servant to allow a gate to remain open. Fulbert sent word that he was looking for a Jewish physician to perform the sordid mutilation. After he had assembled his kinsmen and associates, they sought out Abelard and performed the horrible act. After the surgical alteration, Abelard took vows to become a monk at the monastery of Saint-Denis and persuaded Heloise to take vows to become a nun in a convent in Argenteuil.

Although their physical relationship could not continue, they remained in contact throughout their lives. Ironically, Abelard, who had previously considered himself a ravening wolf to whom a tender lamb had been entrusted, wrote that the alteration had been a positive rather than a harmful event. He wrote, "...divine grace cleansed me rather than deprived me..." and that it circumcised him in mind as in body to make him more fit to approach the holy altar and that "no contagion of carnal pollutions might ever again call me thence."

Abelard and Heloise have been resurrected in a variety of artistic genres since their plight was first told in the 12th century. Although never completed, in 1606 William Shakespeare wrote the play *Abélard and Elois, a Tragedie*. Josephine Bonaparte, upon hearing the tragic story, made arrangements for the two to be buried together in Père LaChaise Cemetery in Paris. Their modest sepulcher can be found on the map at the entrance to the cemetery. In 1819 Jean Vignaud (1775–1826) painted *Abélard and Heloise Surprised by the Abbot Fulbert (Les Amours d'Héloïse et d'Abeilard)*, which is now at the Joslyn Art Museum in Omaha, Nebraska. The extent to which artists have chosen Abelard and Heloise to create operas, plays, and movies is testament to the universality and poignancy of their story.

LANA THOMPSON

A'isha

(d. 678) *wife of the prophet Muhammad*

A'isha bint Abu Bakr was the daughter of Abu Bakr, one of the first converts to ISLAM and a close personal friend of the prophet MUHAMMAD. According to the

custom of the time, the family arranged A'isha's engagement to the prophet Muhammad when she was only nine years old. Because A'isha played an important role in the personal disputes that evolved over the leadership of the fledgling Muslim community after the Prophet's death, accounts about her life vary widely between the majority orthodox Sunni Muslims and Shi'i Muslims. Sunni accounts argue that the marriage was only consummated after A'isha was older, while more negative Shi'i narratives accept the tradition that she was only nine. However, historical accounts are unanimous in describing the union as a close and loving one. A'isha was thought to have been the Prophet's favorite wife.

A'isha played an active role in the political and even military life of the Islamic community in Medina. She was seen as a rival to Ali, the Prophet's son-in-law by marriage to his daughter Fatima. Ali's followers, or Shi'i, viewed Ali and his descendants as the rightful heirs to the leadership of Islamic society. On the other hand, the Sunni, the overwhelming majority of Muslims worldwide, believed that any devout believer could assume leadership of the community. While the Prophet was still alive, Ali accused A'isha of adultery after she left the Bedu (Bedouin) encampment in search of a lost necklace and failed to find the group when she returned. She was rescued and returned to camp by a man named Safwan. A'isha's rivals, including Ali, took this opportunity to urge the Prophet to divorce her. The Prophet took A'isha's side and subsequently received a revelation that adultery had to be proven by eyewitnesses.

According to Ibn Ishaq's *Life of Muhammad (Sirat Rasul Allah)*, the oldest existing biography, the Prophet died in A'isha's arms in 632 C.E. A'isha's father, Abu Bakr, was then chosen as the first caliph, or leader of the community. Although Ali's supporters felt he should have been the rightful heir, they reluctantly went along with the majority. When Ali's supporters were believed to have been involved in the assassination of the third caliph, Uthman, in 656 C.E. and proclaimed Ali the fourth caliph, A'isha, astride a camel, led an armed force in a pitched battle against him. A'isha lost what became known as the Battle of the Camel and was forced to retire to Medina, where she died in 678 C.E.

Albigensian Crusade

The matter of heresy in the Catholic Church threatened the unity of Christendom precisely at the time that the pope was calling for an all-out war to reclaim the Holy Lands from the Muslims. Pope INNOCENT III conceived of the plan to wipe out the Albigensian heresy in the south of France in the early decades of the 13th century. He would call for a crusade. At first the plan seemed ingenious: The pope would grant to fighters the spiritual benefits of a crusade, but the time of service would be brief (40 days) and close to home in comparison to earlier wars in the Holy Land. His ultimate goal was to unify Europe under papal authority so that he could marshal its resources into the Byzantine Empire, MUSLIM SPAIN, and, most important, the Holy Land. However, the twists and turns in the politics of the Albigensian Crusade (1208–29) ultimately drained resources from the wars abroad and strengthened the anti-Roman forces in France. In the next centuries the blunder of the Albigensian Crusade would be apparent in the schism of Avignon, where a French pope would oppose a Roman pope.

Innocent at first supported the work of preaching and persuasion to win back the Albigensians, a loose network of sectarians and heretics of southern France. A variety of church investigators, from BERNARD OF CLAIRVAUX to the pope, readily admitted that Catholic clergy serving the Albigensian natives stood in grave need of reform. But when peaceful measures did not make speedy enough progress, Innocent lost patience and turned to war. His decision came in 1208 when the papal delegate was murdered in Toulouse. Innocent held Count Raymond of Toulouse accountable both for his death and for the protection of the heretics in southern France and summoned the rest of France to take up arms. Some 20,000 knights and 200,000 foot soldiers responded. Their leader was the crusader veteran Simon de Montfort. Raymond lost no time in making peace with the papal forces, but Simon could never conquer the whole area of the Albigensians. Resistance was too entrenched, and Simon could only count on French troops for 40 days at a time, the terms of service that the church allowed for this crusade. Also, Simon was an outsider and extremely unpopular because of his brutality in war.

In 1213 Innocent seemed to recognize the folly of the crusade and called it off. The king of Aragon, a warrior renowned for his battlefield skills against Muslims in Spain, took up the cause of Raymond. In effect, the Albigensian conflict became a tug of war between Spain and France. Although the pope now supported

Raymond, the French nobles supported Simon. In the political melee that followed, another crusade was summoned. Though it was nominally against heresy, it was really against Raymond and his Spanish allies. On the battlefield the French-backed forces defeated the Spanish-backed forces. Simon's shocking brutality led to his excommunication by Innocent. He died in battle in Toulouse in 1218. His nemesis Raymond died in 1222. The Albigensians rebounded throughout these latter years, leading many Catholic and French officials to threaten yet another crusade. Raymond's son, however, was able to negotiate the Treaty of Meaux (1229), ceding the territory to Capetian France and institutionalizing Catholic influence everywhere. The church meanwhile found a new weapon to combat latent heresy: the INQUISITION.

MARK F. WHITTERS

Alcuin

(c. 735–804) *scholar*

Alcuin of York was an educator, poet, theologian, liturgical reformer, and an important adviser and friend of CHARLEMAGNE (c. 742–814 C.E.). He was a major contributor to the CAROLINGIAN RENAISSANCE, a ninth century C.E. intellectual revival within Charlemagne's domains that shaped the subsequent history of education, religion, and politics in the Middle Ages.

Alcuin was born in Northumbria, England, around 735 C.E. and educated at the cathedral school at York under its master, Aelbert. In 778 C.E. Alcuin became the librarian and master of the cathedral school at

Toulouse and Alba were the bastion cities of the heretics, and the main targets of the Albigensian Crusade. Carcassonne (above) is a walled city in southern France and was a stronghold of the Cathars during the conflict.

York, where his talent for teaching soon attracted students from other lands. Three years later, while in Parma (Italy), Alcuin met Charlemagne, who invited him to join his court. Excepting two journeys to his native England (in 786 and 790–793 C.E.), Alcuin lived and worked in the Frankish court from 782 C.E. until he retired in 796 C.E. to the abbey of St. Martin at Tours, where he was abbot until his death in 804 C.E. Although Alcuin never advanced beyond the clerical office of deacon, by the late 780s C.E. his aptitude as a teacher and his influence on royal administrative texts distinguished him among the clerics and scholars of the Carolingian court.

One of Alcuin's most significant (and original) contributions to medieval education lies in his mastery of the seven liberal arts and his composition of textbooks on grammar, rhetoric, and dialectic (the traditional arts of the *trivium*). Alcuin's literary output also includes commentaries on biblical books, a major work on the Trinity, and three treatises against the Adoptionism of his contemporaries Felix of Urgel and Elipandus of Toledo. Adoptionism was the heretical belief that Christ was not the eternal Son of God by nature but rather merely by adoption. Alcuin also composed a number of poems and "lives" of saints.

Alcuin contributed to the Carolingian Renaissance most directly as a liturgical reformer and editor of sacred texts. The various reforms that Alcuin introduced into liturgical books (books used in formal worship services) in the Frankish Empire culminated in his edition of a lectionary (a book containing the extracts from Scripture appointed to be read throughout the year), and particularly in his revision of what is known as the Gregorian Sacramentary (the book, traditionally ascribed to Pope Gregory I, used by the celebrant at Mass in the Western Church until the 13th century C.E. that contained the standard prayers for use throughout the year).

In addition to revising liturgical texts Alcuin edited Jerome's Vulgate in response to Charlemagne's request for a standardized Latin text of the Bible. His edition of the Vulgate was presented to Charlemagne on Christmas Day, 800 C.E., the very day on which the Frankish king became emperor. As abbot of St. Martin's, Alcuin supervised the production of several pandects or complete editions of the Bible. Alcuin's preference for the Vulgate likely contributed to its final acceptance as the authoritative text of Scripture in the medieval West. Alcuin died at Tours on May 19, 804 C.E., and his feast day continues to be celebrated on May 19.

FRANKLIN T. HARKINS

Alfred the Great

(849–899) *king of England*

Alfred the Great was the fifth son of King Ethelwulf (839–55) of the West Saxons (Wessex) and Osburga, daughter of the powerful Saxon earl Oslac. When Alfred became king of Wessex in 871, his small realm was the last independent Saxon kingdom in England. A massive Viking force from Denmark, known as the "Great Army," had landed in East Anglia in 865 and had quickly overrun the Saxon kingdoms of Northumbria, East Anglia, and, eventually, Mercia. During his older brother Ethelred's reign (866–871), Alfred had helped fight off an initial invasion of the Great Army into Wessex, but when his older brother died and Alfred inherited the throne, he was forced to gain peace by buying the Vikings off.

In 878 the Great Army returned, led by the Danish chieftain Guthrum. Alfred's fortunes were considerably augmented at this point by the fact that nearly half of the Vikings in the Great Army had settled down in Northumbria to farm and hence took no part in this new attack. Even so Alfred and his men were hard pressed to survive. Driven from his royal stronghold at Chippenham in Wiltshire in early 878, he retreated to the marshes around Somerset, where he managed to regroup his forces. In May of that year he inflicted a solid defeat on the Vikings at the Battle of Edington and quickly followed this up with another victory by forcing Guthrum and his men to surrender their stronghold at Chippenham. By the Treaty of Wedmore (878), which brought hostilities to an end, the Danes withdrew north of the Thames River to East Mercia and East Anglia; together with Northumbria, these lands would constitute the independent Viking territories in England known as the DANELAW.

Significantly, through this settlement Alfred gained control over West Mercia and Kent, Saxon lands that he had not previously controlled. In addition to acknowledging a stable demarcation between Alfred's kingdom and Viking lands, Guthrum also agreed to convert to Christianity and, shortly thereafter, was baptized. The significance of this cannot be overstated, because it made the eventual assimilation of the Danes into Saxon, Christian society possible.

With this latest Viking invasion having been thwarted, Alfred took steps to ensure the future safety of his people. Across his kingdom he created a series of fortified market places called burhs, which, in addition to aiding the economy of the realm, provided strong points of defense against Viking raids. These were strategically situated so that no burh was more than one day's march (approximately 20 miles) from another. Alfred also reorganized his army so that at any one time, only part of the fyrd, or levy, was out in the field or defending the burhs, while the men in the other half would remain home tending their own and their absent kinsmen's farms and livestock. This enabled Alfred to extend the time of service for which each half of the fyrd could be deployed, because it removed problems of supply and also relieved men from worrying about their families and farms back home. These measures proved immensely effective, not only allowing Alfred to successfully defend Wessex, but even enabling him to go on the offensive against the Vikings, so that by 879 much of Mercia had been cleared of Vikings, and in 885–886 he captured London. After the Danes launched a massive seaborne invasion against England in 892, the *Anglo-Saxon Chronicle* tells us that Alfred also created a new navy, comprised of large, fast ships, in order to prevent any such subsequent overseas invasions from being successful.

Having dealt with the Vikings, in the second half of his reign Alfred took steps to improve the administration of his realm as well as increase the level of learning and culture among his people. In doing so he showed himself to be a competent administrator and possessed of an inquiring and capable mind. He established an Anglo-Saxon law code, by combining the laws and practices of Wessex, Mercia and Kent, and he kept a tight rein on justice throughout his lands.

Like others of his time, the king had a deep respect for the wisdom and learning of the past, and he worked hard to make a variety of works available to his contemporaries for their religious, moral, and cultural edification. He took an active role in improving the spiritual and pastoral qualities of bishops and clerics throughout his realm by personally translating from Latin into the Anglo-Saxon language Pope Gregory the Great's late sixth-century work titled *Pastoral Care*. He showed a similar interest in philosophical and moral issues by rendering Boethius's early sixth-century treatise *The Consolation of Philosophy* into his native tongue, while sprinkling throughout his translation numerous personal observations. Alfred further engaged his passion for ethics, history, and theology by translating from Latin

into Anglo-Saxon the work of the fifth-century Spanish prelate Paulus Orosius known as the *Universal History*. This latter work undertook to explain all history as the unfolding of God's divine plan.

To help foster a sense of pride and awareness of Anglo-Saxon history, Alfred rendered (rather loosely) the Venerable BEDE's eighth-century work *Ecclesiastical History of the English People*. To this same end he ordered the compilation of the *Anglo-Saxon Chronicle* that was continued from his reign until the middle of the 12th century. Around 888 Bishop Asser of Sherborne wrote his *Life of King Alfred*, celebrating the king as a vigorous and brave warrior, a just ruler, and a man of letters and intellect as well.

The political, military, and cultural accomplishments of King Alfred the Great are significant, especially when viewed within the larger context of late ninth-century European history. As much of the CAROLINGIAN DYNASTY fell into the chaos of feudalism because of the raids of Vikings, Muslims, and Magyars and the infighting among Charlemagne's heirs, Alfred's victories over the Vikings, and his subsequent expansion into Mercia and Kent, began a process that would result in his successors uniting all of England under the House of Wessex and in a fusion of Anglo-Saxon and Viking culture. Thus he is credited with establishing the English monarchy and alone among all English rulers bears the title "the Great."

RONALD K. DELPH

Ali ibn Abu Talib

(c. 598–661) *founder of Shi'ism*

Ali ibn Abu Talib was the second convert to Islam. The son of Muhammad's uncle Abu Talib, Ali married his cousin Fatima, the daughter of the prophet Muhammad and Khadija. Ali and Fatima had two sons, Hasan and Husayn, who both played key roles in the history of Islamic society. Ali also fought courageously in the battles between the small Muslim community based in Medina and the Meccan forces prior to the Prophet's triumphal return to Mecca.

Because of his familial relationship with Muhammad, many of Ali's supporters thought he should be Muhammad's successor. Although the Prophet had not named a successor, some of Ali's allies claimed that Muhammad had secretly chosen Ali to rule the Islamic community after his death. However, after some debate the Muslim majority chose Abu Bakr to be the new leader, or caliph. Many members of the powerful Umayyad clan opposed Ali, and he had also feuded with A'isha, the Prophet's favorite wife. Thus when the next two caliphs were chosen, Ali was again passed over as leader of the Islamic community.

In 656 mutinous soldiers loyal to Ali assassinated the third caliph, Uthman, a member of the Umayyad family, and declared Ali the fourth caliph. But Muaw'iyah, the powerful Umayyad governor of Syria, publicly criticized Ali for not pursuing Uthman's assassins. A'isha sided with the Umayyads and raised forces against Ali. But she was defeated at the Battle of the Camel and forced to return home. Feeling endangered in Mecca—an Umayyad stronghold—Ali and his allies moved to Kufa, in present day Iraq. Ali's followers were known as Shi'i, or the party of Ali. This split was to become a major and lasting rift within the Muslim community. Unlike the schism between Catholics and Protestants in Christianity, the division among Muslims was not over matters of theology but over who should rule the community. The majority, orthodox Sunnis, believed that any devout and righteous Muslim could rule. The Shi'i argued that the line of leadership should follow through Fatima and Ali and their progeny as the Prophet's closest blood relatives.

The Syrians never accepted Ali's leadership and the two sides clashed at the protracted Battle of Siffin, near the Euphrates River in 657. When neither side conclusively won, the famed Muslim military commander Amr ibn al-'As negotiated a compromise that left Mu'awiya and Ali as rival claimants to the caliphate. The Kharijites (a small group of radicals who rejected city life and who believed that God should select the most devout Muslim to be leader) were outraged at Amr's diplomacy, Mu'awiya's elitism and wealth, and Ali's indecisiveness. According to tradition, they devised a plot to kill all three during Friday prayers. The attacks on Amr and Mu'awiya failed, but a Kharijite succeeded in stabbing Ali to death in the mosque at Kufa in 661. Ali's tomb in Najaf, south of present-day Baghdad, remains a major site of Shi'i pilgrimage to the present day. After Ali's death, his eldest son, Hasan, agreed to forego his claim to the caliphate and retired peacefully to Medina, leaving Mu'awiya the acknowledged caliph.

Ali's descendants as well as Muhammad's other descendants are known as *sayyids*, lords, or *sherifs*, nobles, titles of respect used by both Sunni and Shi'i Muslims. Within the various Shi'i sects Ali is venerated as the first imam and the first righteously guided caliph.

Almoravid Empire

North Africa's Berber tribes began converting to ISLAM with the commencement of the Arab conquests during the second half of the seventh century under the al-Rashidun and Umayyad Caliphates. Although Berber Muslims were active participants in the expansion of the Islamic state north from Morocco into Iberia, they remained subservient to Arab commanders appointed by the reigning caliph in the Middle East.

Around 1050 from the Sahara in Mauritania, the first major political-military movement dominated by BERBERS, the Almoravids, began to emerge. This revolutionary movement was founded and led by Abdullah ibn Yasin al-Gazuli, a fundamentalist Sunni preacher of the Maliki legal school who had been trained at Dar al-Murabitun, a desert religious school in the Sahara. Abdullah had begun his career as a preacher by teaching the Berber Lamatunah tribes in the Sahara, who had converted to Islam but remained ignorant of its intricacies, orthodox Sunni Islam. The origins of the Almoravid movement lay in the foundation by Abdullah of a small, militant sect that abided by a strict interpretation of Maliki ISLAMIC LAW. To join Abdullah's movement, new members were flogged for past sins, and infractions of Islamic law were severely punished.

The community was guided by the religious legal opinions of Abdullah and later by the legal rulings of Maliki jurists, who were paid for their services. In 1056

the Almoravids, who had developed into a strong and fanatical military movement, began to advance northward into Morocco, where they subjugated other Berber tribes and preached a strict version of Sunni Islam. Three years later, during a fierce war against the Barghawata Berber tribe, Abdullah was killed.

After the death of Abdullah, leadership of the Almoravid movement passed to two cousins, Yusuf ibn Tashfin and his cousin, Abu Bakr. In 1062 the city of Marrakesh was founded in southern Morocco, where it would serve as the Almoravid capital, followed in 1069 by the establishment of Fez. Under Yusuf and Abu Bakr, the Almoravid Empire expanded eastward into Algeria by the early 1080s. The conquest of Morocco was completed by 1084, and by 1075 Almoravid forces had expanded into the West African kingdom of Ghana.

While the Almoravids continued to expand their realm in North Africa, Christian states in Iberia began to chip away at the Iberian Muslim states. Under the leadership of Alfonso VI, the duke of Castile, Spanish Christian forces forced the Islamic city-states in the south, including Seville and Granada, to pay him tribute. In the late 1070s Iberian Muslims sent messengers to the Almoravids, requesting support against the Christians. However, it was not until 1086 that Yusuf crossed the Mediterranean into Iberia, where he defeated Alfonso VI's army at Sagrjas.

Between 1090 and 1092 Yusuf established Almoravid authority over the Muslim states in southern Iberia, forming a strong line of defense against further Christian expansion. Although the Almoravid leadership did not favor the secular arts, such as nonreligious poetry and music, other forms of art and architecture continued to receive government support. Christian and Jewish communities residing in the south were persecuted, and the cooperation and intellectual collaboration that had once existed between Iberia's Muslims, Christians, and Jews ended.

In 1106 Yusuf died of old age and was succeeded as Almoravid caliph by Ali ibn Yusuf. At the time of Yusuf's death, the Almoravid Empire was at the height of its power, stretching across Morocco south to Ghana, north into Iberia, and east into Algeria.

During his reign and that of his successor Ali, Maliki jurists served as paid participants in the government, and the influence of a strict version of Sunni Islam was increased. Although the Almoravids officially recognized the authority of the Abbasid Caliphate in BAGHDAD, Iraq, they ruled independently and without interference from Iraq. They also maintained generally cordial relations with the neighboring Fatimid Caliphate centered in Egypt.

The mosque and cemetery at Kairouan, Tunisia, is a Muslim holy city that ranks after Mecca and Medina as a place of pilgrimage.

Opposition to the Almoravid Empire had already taken root in North Africa by the time of Yusuf's death. The Almoravid caliph Ali's use of Christian mercenaries and foreign Turkish slave-soldiers raised the ire of a militant fundamentalist Berber movement, the Almohads, led by Muhammad ibn Tumart, a member of the Hargha tribe of Morocco's Atlas Mountains. The Almohads opposed the influence of the Almoravids' Maliki jurists, who Ibn Tumart argued had corrupted Sunni Islamic orthodoxy.

In 1100 Ibn Tumart returned to his native mountain village after spending years in Iberia and then further east studying Islamic theology, legal thought, and philosophy. He founded a mosque and school where he began to preach his interpretation of Sunni Islam. Ibn Tumart ordered that the call to prayer and the sermons during

Friday congregational prayers be delivered in Berber instead of Arabic, and it is reported that he wrote several religious treatises in Berber as well. The growing influence of the Almohads would continue and would come to threaten the authority and existence of the Almoravid Empire, which was further weakened in 1144 with the death of Caliph Ali.

It was during the reign of Ali that Almoravid power began to disintegrate, but it was under his successors that the empire would finally collapse. Faced with growing opposition in Iberia, the Almoravids were defeated in battle by Spanish, French, and Portuguese armies between 1138 and 1147, losing control of the cities of Zaragoza and Lisbon.

In Morocco, the Almoravid heartland, the increasing influence of the Almohads continued to loom, even after the death of Ibn Tumart in 1133. The successor to the Almohad throne, Abd al-Mu'min, supervised the final destruction of the Almoravid Empire, which finally collapsed in 1147 after the fall of its capital city of Marrakesh.

CHRISTOPHER ANZALONE

Andes: pre-Inca civilizations

Building on the economic, political, cultural, and ideological-religious developments that shaped Andean

prehistory from the Lithic Period to the mid-Early Intermediate Period (see Volume I), the eight centuries between 600 and 1400 C.E. saw the continuing expansion and contraction of kingdoms, states, and empires across large swaths of the Andean highlands and adjacent coastal lowlands. The three most prominent imperial states were the Huari, the Tiwanaku, and, later, the Chimor. These empires, in turn, laid the groundwork for the explosive expansion of the Inca Empire in the 15th century (see Volume III).

The Tiwanaku culture and polity, whose capital city of the same name was located some 15 kilometers southeast of Lake Titicaca, traced its origins to humble beginnings around 400 B.C.E., with the establishment of clusters of residential compounds along a small river draining into the giant lake. For the next eight centuries, the nascent Tiwanaku polity competed with numerous adjacent settlements for control over the rich and highly prized land in the Lake Titicaca basin, until the mid-300s C.E., when it came to dominate the entire basin and its hinterlands.

Lake Titicaca and its surrounding basin represent a singular feature in the mostly vertical Andean highland environment. The largest freshwater lake in South America (covering some 3,200 square miles and stretching for some 122 miles at its longest) and the highest commercially navigable lake in the world (at an elevation of 12,500 feet), Lake Titicaca tends to moderate temperature extremes throughout the basin while providing an ample supply of freshwater and a host of other material resources, especially reeds, fish, birds, and game. The basin itself covered some 22,000 square miles, significant portions of which were relatively flat and arable when modified with raised fields. All of these features rendered the zone unusually productive and highly coveted—not altogether unlike the Basin of Mexico—permitting it to support one of the highest population densities in all the pre-Columbian Americas.

Archaeologists divide Tiwanaku's growth into five distinct phases extending over a period of some 1,400 years, until the polity's collapse around 1000 C.E. Phases I and II saw the settlement's gradual expansion on the southern fringes of the lake. Phase III (c. 100–375 C.E.) saw extensive construction within the capital city. By Phase IV (c. 375–600 or 700), Tiwanaku had emerged as a true empire, dominating the entire Titicaca Basin and extending its imperial and administrative reach into windswept puna (high plains), throughout large parts of the surrounding altiplano, and south as far northern Chile. Phase V (c. 600/700–1000) was a period of grad-

ual decline, until the capital city itself was abandoned by around 1000. The empire's economic foundations were agropastoral, combining intensive and extensive agriculture with highland pastoralism.

The dominant feature of the capital city, a structure called the Akapana, consisted of an enormous stone platform measuring some 200 meters on a side and rising some 15 meters high. Evidently the ritual and ceremonial center of the city and empire, the flat summit of the Akapana held a sunken court with elaborate terraces and retaining walls in a style reminiscent of Chiripa and other Titicaca sites.

A nearby structure, called Kalasasaya, prominently displayed the famous Gateway of the Sun, chiseled from a single block of stone and featuring the so-called Gateway God, which some scholars interpret as a solar deity. A host of other buildings, walls, compounds, enclosures, and platforms graced the sprawling urban center, which housed an estimated 20,000 to 30,000 inhabitants. Like other Andean cities, Tiwanaku had no markets, its goods and services exchanged through complex webs of kinship networks and state-administered redistribution.

Covering a much larger territory than Tiwanaku was the Huari Empire, with its capital city Huari on the summit of Cerro Baul some 25 kilometers north of the present-day city of Ayacucho in the Central Highlands. The Huari state emerged toward the beginning of the Middle Horizon (c. 600 C.E.). At its height, around 750 C.E., the empire spanned more than 900 miles along the highlands and adjacent coastal plains, touching the northernmost fringe of the Tiwanaku Empire to the south and extending to the Sechura Desert in the north. The capital city, densely packed with walls and enclosures, covered around four square kilometers and is estimated to have housed some 20,000 to 30,000 people. The Huari elite ruled their vast empire through a series of administrative colonies or nodes that exercised political domination in the zones under Huari control.

The Huari Empire is perhaps best known for its extensive agricultural terracing and irrigation projects that spanned large parts of the highlands. Requiring enormous expenditures of labor, the Huari terraces, canals, and related reclamation projects transformed millions of hectares of steep arid hillsides into land suitable for cultivation.

Scholars hypothesize that the extensive terracing and irrigation works undertaken by the Huari state help to explain the empire's survival through the periodic El Niño-induced droughts and floods that comprise a

persistent feature of the highland and coastal environments, and that proved catastrophic for the Moche polity during the same period.

In order to acquire the vast amounts of labor necessary for the construction of such terraces, irrigation works, and other infrastructure, both the Huari and Tiwanaku Empires compelled subject communities to contribute substantial quantities of labor to the state—a kind of labor tax required of all subject peoples. Indeed, Andean polities were predicated on stark social inequalities and the division of society into two broad classes: elites and commoners. Public works such as terraces, canals, roads, and urban monumental architecture were built by commoners from ayllus and communities compelled to devote specified quantities of time annually to such endeavors. The state and its agents reciprocated by ensuring military security, food security, and other benefits, a reciprocity rooted, at bottom, in a fundamentally unequal relationship between the sociopolitically dominant and dominated.

With the demise of both the Tiwanaku and the Huari Empires by the end of the Middle Horizon, the Andes entered a period of political decentralization and reassertion of local and regional autonomies. An important exception unfolded along the North Coast and its adjacent highland, where the powerful Chimor Empire emerged around 900 C.E.

With its capital at Chan Chan near the mouth of the Moche River, at its height in the Late Intermediate Period the Chimor Empire spanned nearly 1,000 kilometers from the Gulf of Guayaquil in contemporary Ecuador to the Chillón River valley on the Central Coast. Like the Inca Empire that supplanted them in the mid-1400s, Chimor's rulers deployed a combination of conquest and alliance-building to bring large areas of both coast and highland under their dominion. The capital city of Chan Chan was a huge urban complex, housing upwards of 35,000 people and covering at least 20 square kilometers, while its civic core encompassed at least six square kilometers and housed some 6,000 rulers and nobility.

During the Late Horizon, the young and powerful Inca Empire swept down from its highland capital at Cuzco to bring Chimor, and the rest of highland and coastal Peru, under its dominion (see Volume III).

M. J. SCHROEDER

Anglo-Norman culture

The Anglo-Norman culture resulted from the fusion of the culture brought over with William the Conqueror when he killed the last English king of England, Harold Godwinson, at the Battle of Hastings in October 1066, with the culture that existed in England. In the 11th and 12th centuries the Normans not only conquered England but also established a kingdom in Sicily. English culture had developed relatively independent of continental Europe since the time of the coming of the Angles and Saxons in the fifth century, who in turn had been influenced by the native British culture. British culture was a mixture of the Roman culture, which had come with the Roman conquest under Emperor Claudius (41–54), with that of the original Celtic inhabitants.

The English culture at the time of the Norman Conquest of 1066 was dominated by the warrior ethos that the Angles and Saxons had brought with them from mainly what is now Germany. Classics of this period were the poem of “The Battle of Maldon,” as well as the better-known saga of *Beowulf*. Heaney describes this militaristic society when he writes of how “the ‘Finnsburg episode’ envelops us in a society that is at once honor-bound and blood-stained, presided over by the laws of the blood-feud... the import of the Finnsburg passage is central to the historical and imaginative world of the poem as a whole.” The Anglo-Saxon tongue began to lose out to the Norman French, which also included the influence of Scandinavia, where the Normans had originally come from before settling in France in the 10th century.

It was the rising Anglo-Norman culture that created a hero out of King Arthur. Based on earlier writings, authors like Geoffrey of Monmouth wrote *History of the Kings of Britain* between 1136 and 1138. Arthur was a native British chieftain who fought the Angles and Saxons, thus giving them little cause to celebrate him. But in seeking to give legitimacy to the Norman kings, writers like Geoffrey sought to trace the monarchy back to its earliest days and thus found inspiration in

the earlier accounts of Arthur. According to Helen Hill Miller in *The Realms of Arthur*, “the Anglo-Norman kings... needed an independent source for their British sovereignty: as dukes of Normandy they were subject to the heirs of Charlemagne,” the kings of France. Geoffrey used accounts written by the monks Nennius in the ninth century and Gildas, who may have lived in the time of the historical Arthur, in the sixth and seventh centuries.

According to Helen Hill Miller in *The Realms of Arthur*, “by January 1139, a copy from his rather heavy Latin into Anglo-Norman verse was promptly undertaken at the request of the wife of an Anglo-Norman baron in Lincolnshire. By 1155, a further translation, likewise in verse, had been completed by Maistre de Wace of Caen, a Jerseyman who spent most of his life in France.” Geoffrey wrote during the reign of Henry I (1100–35), perhaps the first Norman king to see himself as English first and Norman secondarily. Writing at the same time on Arthurian topics were Walter Map and Maistre [Master] Wace, who wrote the *Roman de Brut* and *Roman de Rou*.

Other writers applied themselves to building up the Anglo-Norman civilization. William of Malmesbury wrote *Acts of the English Kings* and *On the Antiquity of the Church of Glastonbury*. William, like Geoffrey, consciously fused the Normans with the Celtic past, because Glastonbury was the holiest site in Celtic Britain. Tradition had it that Joseph of Arimathea, he who had given his tomb for Christ to be buried in after the Crucifixion, founded a small church at Glastonbury. The pious at the time also believed that Joseph, who traditionally in England had been seen as a merchant for English tin, had even brought the young Jesus (Christ) of Nazareth to visit Glastonbury. The church served as another institution in building a rising new culture in England, as memories of the conquest of 1066 dimmed with the passage of time. Symbolic of this was the actual building of churches in the Romanesque architecture, which the Normans had mainly brought with them from France.

The institution of the church was put to use by Henry I. The Cistercian order of monks arrived in England in 1128 and began development of advanced agriculture and sheep raising. In order to cement the church as an instrument of royal development, the king named the great prelates who ruled the church, to assure their support for his reign. William began this policy after the conquest. Along with the great bishoprics like York and Canterbury, monastic orders also flourished under Anglo-Norman rule and would be a central part of both English culture and economy

until the monastic system was destroyed during the reign of Henry VIII (1509–47).

Using Normandy as a model, Henry I and the kings who followed him freely granted charters to towns, enabling the establishment of a town life that would be one of the hallmarks of England during the Middle Ages. London, where William built his White Tower, gained the ascendancy in England in commercial life that it still enjoys today. Towns, the estates of the great feudal lords, and the church establishments were the pillars that formed the foundation of the Anglo-Norman culture that arose after the conquest of 1066. Feudalism, the system of lords holding their lands at the will of the king, really came to England with William, who granted land holdings to those Breton, French, and Norman warriors who had come with him to fight the Saxon King Harold in October 1066. By the end of Henry I's reign in 1135, only some 70 years after the conquest, the fusion between the old and the new was complete, and the Anglo-Norman culture flourished in England.

JOHN F. MURPHY, JR.

Anglo-Saxon culture

The Anglo-Saxons were Germanic barbarians who invaded Britain and took over large parts of the island in the centuries following the withdrawal of the Roman Empire. They were initially less gentrified than other post-Roman barbarian groups such as the Franks or Ostrogoths because they had less contact with Mediterranean civilization. The Anglo-Saxons were originally pagan in religion. The main group, from northwestern Germany and Denmark, was divided into Angles, Saxons, and Jutes. German tribal affiliations were loose and the original invaders included people from other Germanic groups as well. Although some of the early Anglo-Saxon invaders had Celtic-influenced names, such as Cedric, the founder of the house of Wessex, the Anglo-Saxons had a pronounced awareness of themselves as different from the peoples already inhabiting Britain. Their takeover led to the integration of Brit-

ain into a Germanic world. Unlike other groups such as the Franks they did not adopt the language of the conquered Celtic and Roman peoples, but continued speaking a Germanic dialect.

The early Anglo-Saxons highly valued courage and skill in battle, as reflected in the most significant surviving Anglo-Saxon poem, *Beowulf*. Their pagan religion was marked by a strong sense of fatalism and doom, but also by belief in the power of humans to manipulate supernatural forces through spells and charms. They shared a pantheon with other Germanic peoples, and many Anglo-Saxon royal houses boasted descent from Woden, chief of the Gods. Their religion was not oriented to an afterlife, although they may have believed in one.

The Anglo-Saxons strongly valued familial ties—the kinless man was an object of pity. If an Anglo-Saxon was killed, it was the duty of his or her family to attain vengeance or a monetary payment, *weregild*, from the killer. Anglo-Saxon kinship practices differed from those of the Christian British, adding to the difficulty of the assimilation of the two groups. For example, British Christians were horrified by the fact that the Anglo-Saxons allowed a man to marry his stepmother on his father's death. Anglo-Saxons also had relatively easy divorce customs.

The cultural differences between the Britons and the Anglo-Saxons were particularly strong in the field of religion, as British Christians despised Anglo-Saxon paganism. The Anglo-Saxons reciprocated this dislike and did not assimilate as did continental Germanic groups. The extent to which the Anglo-Saxons simply displaced the British as opposed to the British assimilating to Anglo-Saxon culture remains a topic of debate among historians and archeologists of post-Roman Britain.

The conversion of the Anglo-Saxons to Christianity owed more to missionary efforts from Ireland and Rome than it did to the indigenous British Church. Paganism held out longest among the common people and in the extreme south, in Sussex and the Isle of Wight. Some Anglo-Saxons were not converted until the middle of the eighth century. Some peculiar relics of paganism held out for centuries. For example Christian Anglo-Saxon kings continue to trace their descent from Woden long after conversion. The church waged a constant struggle against such surviving pagan Anglo-Saxon customs as men marrying their widowed stepmothers. Reconciling Irish and Roman influences was also a challenge, fought out largely on the question of the different Irish and Roman methods of calculating the date of Easter. Not until the Synod of Whitby in 664 did the Anglo-Saxon church firmly commit to the Roman obedience.

Conversion led to the opening of Anglo-Saxon England, until then a rather isolated culture, to a variety of foreign influences, particularly emanating from France and the Mediterranean. The leader of the missionary effort sent by Rome to Kent to begin the conversion, Augustine, was an Italian, and the most important archbishop of Canterbury in the following decades, Theodore, was a Greek from Cilicia in Asia Minor. Pilgrimages were also important in exposing Anglo-Saxons to more developed cultures.

The first recorded visit of an Anglo-Saxon to Rome occurred in 653 and was followed by thousands of others over the centuries. Since pilgrims needed to travel through France to get to Italy and other Mediterranean pilgrimage sites, pilgrimage also strengthened ties between Gaul and Britain. Anglo-Saxon churchmen found out about innovations or practices in other places, such as glass windows in churches, and came back to England eager to try them out. Despite these influences, Anglo-Saxon Christianity also drew from Germanic culture.

Like other Germanic peoples the Anglo-Saxons tended to view the Bible and the life of Christ through the lens of the heroic epic. Christ was portrayed as an epic hero, as in one of the greatest Anglo-Saxon religious poems, *The Dream of the Rood*. *The Dream of the Rood* recounts the Crucifixion from the seldom-used point of view of the cross itself, and represents Christ as a young hero and the leader of a group of followers resembling a Germanic war band. Another remarkable example of the blending of Germanic and Christian traditions is the longest surviving Anglo-Saxon poem, the epic *Beowulf*. Telling of a pagan hero in a pagan society, the epic is written from an explicitly Christian point of view and incorporates influences from the ancient Roman epic, Virgil's *Aeneid*.

As the Anglo-Saxon Church moved away from dependence on outside forces, Irish or Roman, in the seventh and eighth centuries, the Christian Anglo-Saxon kingdoms produced their own saints, mostly from the upper classes. Anglo-Saxon saints such as Cuthbert (d. 687), a monk and hermit particularly popular in the north of England, attracted growing cults.

The highest point of Anglo-Saxon Christian culture was the Northumbrian Renaissance, an astonishing flowering of culture and thought in a poor borderland society. Northumbria was a kingdom in the north of the area of Anglo-Saxon settlement, an economically backward and primitive society even compared to the rest of early medieval Europe. It was also a place where Continental and Irish learning met. The Northumbrian Renaissance was based in monasteries, and

its most important representative was the monk BEDE, a historian, chronographer, and hagiographer. Bede's *Ecclesiastical History of the English People* is the most important source for early Anglo-Saxon history. Another Northumbrian was Caedmon, the first Anglo-Saxon Christian religious poet whose works survive. Northumbria also displayed a rich body of Christian art, incorporating Anglo-Saxon and Celtic artistic influences, and some from foreign countries as far away as the Byzantine empire. An enormous amount of monastic labor went into the production of manuscripts.

Despite the importance of Northumbrian Renaissance, Northumbria was not the only place where Christian culture reached a high point. Another area was the West Country, where the Anglo-Saxon kingdom of Wessex encroached on the British territories of Devon and Cornwall. Curiously, Kent, still headquarters of the archbishop of Canterbury who claimed primacy over all the "English," became a cultural backwater after the death of Archbishop Theodore in 690.

The influence of Anglo-Saxon Christianity and the Northumbrian Renaissance spread to continental Europe. Anglo-Saxons, in alliance with the papacy, were concerned to spread the Christian method to culturally related peoples in Germany. The principal embodiment of this effort was the missionary Wynfrith, also known as St. BONIFACE (680–754), who was born in Wessex. His religious efforts began with assisting a Northumbrian missionary in an unsuccessful mission to the Frisians. He then went to Rome to receive authority from the pope. Boniface made many missionary journeys into Germany, where he became known for converting large numbers of Germans, and for a physical, confrontational missionary style that included chopping down the sacred trees that were a feature of Germanic paganism. Many English people followed Boniface to Germany, where they exerted a strong influence on the development of German Christianity. Boniface was also responsible for a reorganization of the Frankish Church to bring it more firmly under papal control. On another journey to Frisia angry pagans killed him. Anglo-Saxons, along with other people from the British Isles, were also prominent in the circle of learned men at the court of CHARLEMAGNE. The leading scholar at Charlemagne's court, ALCUIN of York, was a Northumbrian.

This high point of Anglo-Saxon Christian culture was terminated by the series of Viking raids and invasions beginning in the late eighth century. Unlike Christian Anglo-Saxon warriors, who usually respected monasteries, the pagan Vikings saw them as rich

repositories of treasure, and monastic life virtually disappeared from the areas under Scandinavian control. By the ninth century the leader of the English resurgence, King ALFRED THE GREAT of Wessex, lamented the passing of the golden age of English Christianity, claiming that there was hardly any one in England who could understand the Latin of the mass book. Alfred, an unusually learned king who had visited the European continent, made various attempts to restore English monasticism and learned culture.

He gathered in his court scholars from throughout the British Isles and the continent, as well as writing his own translations, such as that of Boethius's *Consolation of Philosophy*. Alfred also sponsored the translation of Bede's *Ecclesiastical History* and other works from Latin into Anglo-Saxon. The period also saw the beginnings of the *Anglo-Saxon Chronicle*, a record of current events kept in Anglo-Saxon, eventually at monasteries. Like the political unification of England by Alfred's descendants, the creation of this body of Anglo-Saxon literature contributed to the creation of a common Anglo-Saxon or English identity. There was very little parallel for this elsewhere in Christian Europe at the time, when learned writing was almost entirely restricted to Latin. Alfred's patronage of men of letters was also important for the creation of his personal legend.

The unification of England did not end the Scandinavian impact on English culture, which revived with the conquest of England by the Danish king CANUTE in the 11th century. Canute, a Christian, respected the church and English institutions, and his reign was not destructive as the early Viking conquests had been. Scandinavian influence was particularly marked on the English language. Since it was already similar to the Scandinavian tongues, Anglo-Saxon or Old English adopted loanwords much more easily than did Celtic languages such as Irish. Since it was necessary to use English as a means of communication between people speaking different Germanic tongues, many complex features of the language were lost or simplified. English would make less use of gender and case endings than other Germanic or European languages.

Although Alfred had hoped to revive English monasticism, the true recreation of monastic communities would only occur in the 940s, with royal patronage and under the leadership of Dunstan, a man of royal descent who became archbishop of Canterbury and a saint. The English monastic revival was associated with the revival of Benedictine monasticism on the Continent, and the new monasteries followed the Rule of St. Benedict. Monasteries dominated the church in the

united Anglo-Saxon kingdom, with most bishops coming from monastic backgrounds and often serving as royal advisors.

The church generally prospered under the English kings—large cathedrals were built or rebuilt after the damage of the Scandinavian invasions. The copying and illumination of manuscripts was also revived, and reached a high degree of artistic excellence in Winchester. Continental influences preceded the NORMAN CONQUEST OF ENGLAND in 1066. The penultimate Anglo-Saxon king, Edward the Confessor, who had spent many years in France, built Westminster Abbey in a Norman Romanesque style.

Although Anglo-Saxon culture was displaced from its position of supremacy after the Norman Conquest of 1066, it did not disappear. At least one version of the *Anglo-Saxon Chronicle* continued to be compiled for nearly a century, and Anglo-Saxon poetry continued to be composed.

WILLIAM E. BURNS

Anglo-Saxon kingdoms

Following the decline of Roman power in Britain, political power rapidly decentralized, and several small kingdoms emerged to fill the political vacuum. These kingdoms, called the Anglo-Saxon kingdoms, competed among themselves and with Danish invaders for power from the late sixth through the ninth centuries. Eventually they melded into one large kingdom that governed most of England until the NORMAN CONQUEST OF ENGLAND in 1066.

Throughout the fourth and fifth centuries a number of Germanic peoples invaded England. Some came

with military objectives in mind, but many others came as settlers, seeking peaceful colonization. These people came from several tribes, but the most famous were the Angels and Saxons, many of whom came as raiders and mercenaries seeking employment in Roman Britain's undermanned military outposts. Beyond this, details of the invasion are unclear. The invaders stamped out all vestiges of Roman culture, but the complex transition to Anglo-Saxon England occurred gradually.

How many small kingdoms existed during the sixth and seventh centuries is unknown, but as larger kingdoms eliminated rivals, the number shrank. This consolidation of power has led historians to identify the movement toward a territorial state as one of the main themes in Anglo-Saxon history. As post-Roman chaos subsided, Anglo-Saxon England painstakingly settled into seven or eight major kingdoms and several smaller ones. The kingdoms centered on the Thames, Wash, and Humber, the main entry points for the migrations. Factors influencing the shapes and formation of the kingdoms also included geography, defensibility, and the degree of resistance the inhabitants offered the invaders.

Four kingdoms developed around the Thames estuary. In the southeast, Kent arose with unique artistic, legal, and agrarian traditions, influenced by Jutish and, possibly, Frankish culture. West and northwest of Kent three kingdoms associated with the Saxon invasions developed: Essex (East Saxons), Wessex (West Saxons), and Sussex (South Saxons). Settlers who entered via the Wash founded East Anglia, forming groups called the North Folk and South Folk, whose territories became Norfolk and Suffolk. Those who entered by the Humber formed Mercia, which dominated the Midlands, and Northumbria, north of the Humber River, that grew from the unification of the smaller kingdoms of Deira and Bernicia. These kingdoms are traditionally called the Heptarchy, a misleading term that implies seven essentially equal states. In fact at times many more than seven kingdoms existed, and the seven main kingdoms were rarely political equals.

Developments in the institution of kingship were vital in the political growth of the early kingdoms. Germanic peoples had a tradition of kingship, and as Roman institutions declined, they looked to their own heritage to replace Roman customs. The practical appeal of kingship is clear. It offered strong personal leadership and the kind of governing that led to success during the Anglo-Saxon invasion and settlement. The post-Roman political situation demanded similar leadership. Christian tradition held up biblical kings as examples of good leadership,

and as Anglo-Saxons converted, this bolstered Germanic notions about the institution.

By the mid-seventh century, royal houses had emerged, and a claim of royal lineage became necessary for a king to rule unchallenged. The bloodline was important, but other Western notions about kingship had not yet taken hold. The successor had to be both from the right line and the fittest to rule. How closely related to the previous king he had to be was debatable, and the right of the eldest son to succeed, the right to pass the succession through the female, the rights of a minor or female to inherit, or the right of a king to choose his successor were not guaranteed. In case of a disputed succession, kingdoms were divided or shared, which was risky but preferable to feud or civil war.

Toward the end of the seventh century a group of leaders emerged known as Bretwaldas. The first Bretwaldas were kings whose actions gained them fame and reputation and who had the political and military power to reach beyond their borders and collect tribute from neighbors. According to BEDE, by around 600 one king customarily received this title from his royal colleagues, giving him preeminence within the group. The position shifted from one dynasty to the next, with changing political and military successes. At first the title was largely honorary, and it is unclear whether other kings listened to the Bretwalda's demands, but as time passed the authority of the Bretwalda grew.

In the late sixth and early seventh centuries the eastern kingdoms had the political edge, but strong rivalries existed and power shifted frequently. England's population and prosperity grew in the seventh century, and much of England converted to Christianity. A common language, common social institutions, and, eventually, a common religion counterbalanced the political and military turbulence but did not stop it. As the seventh century progressed more powerful kingdoms absorbed smaller kingdoms, and by the end of the century Northumbria, Mercia, and Wessex dominated the island. Northumbria dominated affairs in the seventh century; Mercia led the way in the eighth century; and Wessex emerged to dominate the events of the ninth century.

After King Oswy's (642–670) defeat of Mercia in 654, Northumbria exercised lordship over the other kingdoms. Although unable to control Mercia after about 658, Northumbria nevertheless remained pre-eminent through its great moral authority. For example, Northumbrian support ensured the Synod of Whitby's (663) success in promoting Roman Christian traditions

over the Celtic Church throughout England. However internal dissent and external defeats steadily drained Northumbrian political and military power. Unrest, violence, and political coups throughout the eighth century doomed Northumbrian culture, culminating with the Viking sack of Lindisfarne in 793.

Mercia began its rise under King Penda (628–654), and its political domination culminated under kings Ethelbald (716–757) and Offa (757–796). Many factors contributed to Mercia's success. It held prosperous agricultural territory in the Trent Valley. The people in the east Midlands, the Middle Angles of the Fens, Lindsey, and around the Wash accepted the dynasty, as did settlers in the Severn Valley and along the borders of modern Chester, Shropshire, Herefordshire, and Gloucestershire. London and East Anglia fell to Mercia as well. After the death of King Ine in 725, no effective resistance to Mercia remained in Wessex. Eventually it subdued Kent and threatened Canterbury. This success led Ethelbald to claim he was king of all Britain. The actions of Mercian rulers bolstered the concept of kingship. Offa summoned papal legates, held church councils, created a new archbishopric in Lichfield, and asked the church to anoint his son Ecgfrith, all of which shows a practical desire to cooperate and benefit from relations with the church, but it also did much to strengthen his position and the theory of monarchy throughout the land.

Mercia retained power in the Midlands throughout the reigns of Cenwulf (796–821) and Ceowulf (821–823), but their popularity faded in the south and southeast following the harsh tactics they used in building a defensive system within England. Kent and East Anglia resented Mercian overlordship and led the way in uprisings in the early ninth century. The primary beneficiary of these uprisings was the kingdom of Wessex.

The rise of Wessex began with King Egbert (802–839), who defeated the Mercians in 825, winning control of Kent, Sussex, and Essex, and continued with the arrival of the Vikings. The Vikings had been making raids on England since the 780s, but in the mid-ninth century their attacks changed from raids to campaigns of conquest. In the 850s they stayed between campaign seasons, and by 865 thousands of Danes undertook a conquest that ended with their control over nearly all of England except Wessex.

ALFRED THE GREAT

ALFRED THE GREAT (r. 871–899) came to power just after the Danish onslaught started. He was a talented king, warrior, able administrator, patron of the arts,

and a good political leader, but it was a desperate moment in Anglo-Saxon history. Danes controlled the most fertile parts of north and east England. The south held out, but it seemed only a matter of time until it too fell. To buy time while he mustered his army Alfred made a truce with the Danes in 872. He then reformed his army, fortified towns, and built a navy to meet the Viking threat.

To control his kingdom Alfred depended upon his royal court, made up of bishops, earls, king's reeves, and some important thanes. Councils, called Wite-nagemots, or Witan, discussed issues such as raising military forces, building fortresses, and finances. The king made the decisions, but he relied on the Witan for advice, support, and help making decisions known. Ealdormen, noblemen of great status who managed the shires or districts of Wessex for the king, played especially important roles.

In 876, the Danish leader, Guthrum, renewed the attack on Wessex, and by winter 878 Alfred retreated to the Isle of Athelney. In the spring he took the fight back to the Danes, defeating Guthrum and forcing him to promise to cease his attacks on Wessex and convert to Christianity. Following this, Alfred repeatedly beat back Danish attacks and gradually regained lost territory. Around 886, Alfred and Guthrum created a boundary running northwest, along an old Roman road known as Watling Street, from London to Chester that became the Anglo-Saxon–Danish border. The cultural influences of the Danish side, the DANELAW, affected England for centuries. The boundary also freed a large section of Mercia from Danish control, and Alfred installed a new ealdorman to control the area and married his daughter to him, uniting the kingdoms and setting the groundwork for a united England. Clashes with Danes continued, but the most severe crises had passed by Alfred's death in 899. Under his heirs, resistance to Vikings and pagan forces came to be associated with the royal house of Wessex.

From 899 to 1016 Alfred's descendants held the throne. They continued developing royal institutions and expanded their power base. In the late 10th century new Viking attacks coupled with internal divisions among noblemen led to the overthrow of Ethelred "the Unready" (978–1016). The Witan installed a Dane as king of England. CANUTE (1016–35) successfully managed Denmark, Norway, and Anglo-Saxon England and became a powerful political figure in Europe. While Canute ruled with a Scandinavian touch, creating nobles called "earls," most Anglo-Saxon governing institutions functioned unchanged. He brought together

To control his kingdom, Alfred the Great depended upon his royal court of bishops, earls, king's reeves, and thanes.

Anglo-Saxon and Danish nobles and won the loyalty of the Witan. When Canute died his sons ruled briefly, but each died without heir, and the Witan selected Edward, the son of Ethelred, to be king.

Edward the Confessor (1042–66) was more Norman than Anglo-Saxon, because he lived from ages 12 to 36 in Normandy. He installed Norman nobles as advisers, a move deeply resented by the Anglo-Saxon nobles. The earls owed everything to Canute and were very loyal to him, but they owed Edward nothing. Resenting Norman influences at court, they soon began acting with autonomy. Edward's father-in-law, Godwin, earl of Wessex, and his son, Harold, led the opposition. Their lands made them more powerful than the king, and as their power grew, Edward became a figurehead. When Edward died childless in 1066, the Witan chose Harold as king, but he faced challenges from Norway and Normandy. William of Normandy proved too much for Harold at the Battle of Hastings, bringing an end to the Anglo-Saxon kingdom.

On the eve of the Norman Conquest, Anglo-Saxon England was prosperous and well-governed by 11th-century standards. It had a thriving church, effective

military, and a healthy, growing economy. The English-Danish division caused diversity in legal and social traditions, but it possessed great unity for its time. Continental kingdoms rarely knew unity and experienced almost constant internal warfare.

By comparison, Anglo-Saxon England had evolved quickly from the days of the Heptarchy and through the rise of Wessex and unifying onslaught of the Danes to become the stable kingdom of 1066 that was so attractive to those who claimed it upon Edward the Confessor's death.

KEVIN D. HILL

An Lushan (An Lu-Shan) Rebellion

The An Lushan Rebellion (755–763 C.E.) occurred at the midpoint of the TANG (T'ANG) DYNASTY, 618–909, and marked a significant turning point in the fortunes of the regime. The rebellion marked the Tang's irreversible decline after one and half centuries of good governance, economic prosperity, and military success. An Lushan's (703–757) beginnings were humble. He was half Sogdian and half Turk, of the Khitan tribe, and was born beyond the Great Wall of China in present-day Manchuria. At an early age he was sold to a Chinese officer of the northern garrison and rose to the rank of general and commander of a region on the northeastern frontier of the Tang empire. By the mid-eighth century C.E. most of the frontier garrisons were under foreign (non-Han Chinese) generals.

An was introduced to the court of the aging Emperor XUANZONG (Hsuan-tsung, also known as Minghuang, or "Brilliant Emperor") and rapidly ingratiated himself to his young favorite concubine, the Lady Yang (known by her title Yang Guifei, or Kuei-fei; *Guifei* means "Exalted Consort") who adopted him as her son. Gross and fat,

An became a frequenter at court events, entertaining the emperor and his harem with his clowning and uncouth behavior. He was rewarded with the title of prince and given command of the empire's best troops. Protected by Lady Yang and her brother who was chief minister of the empire, reports of General An's treacherous intentions were not only unheeded by the emperor but the men who reported them were punished.

In 755 C.E. General An rose in rebellion. At the head of 150,000 troops, among them tribal units (he commanded a total of 200,000 troops), he marched from his base near modern Beijing toward the heartland of the empire. His success was immediate. The eastern capital, Luoyang (Loyang), fell. With the main capital Chang'an (Ch'ang-an), poorly defended by unseasoned troops, Xuanzong and his court beat a hasty retreat, heading for refuge in the southwestern province of Sichuan (Szechwan). En route the dispirited troops escorting the emperor mutinied. They blamed Lady Yang and her brother the chief minister for their plight, killed him, and forced the emperor to hand Yang over to them and strangled her. These humiliations led to the abdication of Xuanzong and the ascension of his son and crown prince as Emperor Suzong (Su-tsung). The doting, aged emperor's love for his favorite, his neglect of his duties and indulgence in a sybaritic life with Lady Yang, the disastrous consequences of their love, their flight, and her tragic death have inspired many poems by famous Tang poets and were the subject of many paintings.

An Lushan's troops entered Chang'an unopposed, and he proclaimed himself emperor, but his rebellion made little progress after that. He soon became blind and was murdered by his son in 757 C.E. The son, too, was murdered by one of his generals, and soon the rebellion degenerated into chaotic civil war as some of his early supporters defected and other rebels bands rose as opportunities offered.

The new emperor rallied loyal troops who outnumbered the rebels, but were scattered in different garrisons. He also obtained help from former vassals and allies, most notably from a Turkic tribe called the Uighurs and others in Central Asia, and even some Arab troops sent by the Islamic caliph. Some of the help came at a high price, for example the Uighur khan who twice helped to recapture Luoyang was repaid by permission for his men to rampage through and loot the city, including the palaces and Buddhist temples, and which cost thousands of lives.

Peace was finally restored in 766; however, the empire would never recover its previous prestige and prosperity. The following are some important results of the rebellion:

1. Growing importance of the army and military leaders. The army expanded to over 750,000 men. The military would remain a significant force, and regional commanders would become powerful and able to resist central control.
2. Restructuring of provincial administrations that became semiautonomous through the remainder of the dynasty. This is especially significant in the decreasing amounts of revenue that local authorities would turn over to the central government, further curtailing its authority.
3. Ending the land registration and distribution system in effect since the beginning of the dynasty that had ensured economic equity for the cultivators, maintained local infrastructure projects, and provided men for military service.
4. Accelerating the large-scale shift of population from war ravaged areas in the Yellow River valley in northern China to southern provinces in the Huai and Yangzi (Yangtze) valleys whose productivity became crucial to the economy of the empire.
5. Grievous loss of territory in the border regions because troops were withdrawn to defend the core of the empire. Central Asia was lost to Chinese control, as were Gansu (Kansu) and Ningxia (Ninghsia) Provinces. Both crucial links to the western regions were lost to the rising Tibetan state.

Nothing about the An Lushan rebellion was inevitable. However, it caused enormous disruption to the Tang Empire and acted as a powerful catalyst for the changes that characterized the Chinese world. Although the dynasty survived until 909 C.E. it never regained the prestige and power it had enjoyed before the rebellion.

JIU-HWA LO UPSHUR.

Anselm

(c. 1033–1109) *philosopher and theologian*

Anselm was a philosophical theologian and archbishop of Canterbury who is often dubbed the Father of

SCHOLASTICISM. Scholasticism is the system of education that characterized schools and universities during the High Middle Ages (12th–14th century) and that aimed principally at reconciling and ordering the numerous and divergent components of an ever-growing body of knowledge with dialectic (logic or reason). Anselm is best known for making several major contributions to early Scholastic theology, namely, his distinctive method of “faith seeking understanding,” his ontological argument for the existence of God, and his classic formulation of atonement theory.

Anselm was born into a wealthy family in Aosta in northern Italy. After his mother’s death in 1056 he left home, crossed the Alps into France, and in 1059 entered the Benedictine abbey school at Bec in Normandy, where Lanfranc taught him. In 1063 Anselm succeeded Lanfranc as prior and was consecrated abbot in 1078. Toward the end of his priorate Anselm produced two significant works: the *Monologion* (*Monologue on Reasons for the Faith*; 1076) and the *Proslogion* (*Address [to God], first titled Faith Seeking Understanding*; 1077–78). Although both works are intensely contemplative, Anselm proposes philosophical or rational proofs for God’s existence.

In both works he begins with the first article of the Christian faith—namely, that God exists—and then seeks to understand it by reason (without further recourse to scriptural or traditional authorities). The basic argument of the *Monologion*, later called the “ontological argument,” runs thus: God is that being than which nothing greater can be thought. Yet “that than which nothing greater can be thought” cannot exist only in human thought or understanding. Rather by definition, “that than which nothing greater can be thought” must also exist in reality. Hence God necessarily exists in reality. In the centuries after his death, Anselm’s method of “faith seeking understanding” (*fides quaerens intellectum*) became the basic model of inquiry into the divine and remains the classic definition of theology.

During his abbacy at Bec (1078–93), Anselm produced the treatises *On Grammar*, *On Truth*, *On Free Will*, and *On the Fall of the Devil*. As archbishop of Canterbury (1093–1109), Anselm composed several apologetic works, including his greatest theological treatise, *Why God Became Man* (or *Why the God-Man*; 1097–98), *On the Virginal Conception and Original Sin* (1099–1100), and *On the Sacraments of the Church* (1106–07).

In *Why God Became Man*, Anselm presents “necessary reasons” for the Incarnation. He argues that God

had to become human in order for humankind to be saved because the first sin offended God’s honor infinitely, yet the guilty party (humanity) is finite. Even if they gave their entire lives to God, humans could not thereby pay the penalty for sin because even prior to sin they owed everything to their Creator. Although humans are obliged to make satisfaction, then, only God (who is not a creature and therefore owes nothing) is actually able to do so—hence the God-man. Anselm’s treatise, which rejected the widely held ransom theory, made the most significant contribution to atonement theology in the Middle Ages.

During Lent in 1109 Anselm became seriously ill and died on Wednesday of Holy Week, April 21, 1109. His cult became firmly established in the Late Middle Ages, and his feast day continues to be celebrated on April 21. In 1720 Pope Clement XI declared Anselm a Doctor of the Church.

FRANKLIN T. HARKINS

anti-Jewish pogroms

Jewry suffered a reversal of fate during the High Middle Ages that can only be compared to the destruction of Jerusalem 1,000 years before and the oppression by Nazis 1,000 years after. The turning point in the Middle Ages can be located in the pogroms carried out in May 1096 by gangs and mobs en route to the First Crusade. These events signaled that the stability that Jews enjoyed under Western Christendom during the first millennium was about to end.

There were telltale signs that things were about to change in the century before the First Crusade. Jews were accused of colluding with the Muslims to destroy the Church of the Holy Sepulcher in Jerusalem, undertaken in fact by the mad Caliph Hakim in 1009. For another thing, a pre-crusade campaign to cast out the Saracens from Spain in 1063 revealed that Jews did not take up the fight alongside of the Christian soldiers. In fact, Jews had prospered and integrated well under the Umayyads of Spain.

When Pope URBAN II issued the summons to fight for the Holy Land, the first to respond in France and

Germany were paupers and peasants who had been stirred up by monks and preachers. The church hierarchy did not effectively counter a populist piety that the killing of Jews expiated sins and atoned for the crucifixion of Christ. Mobs also felt that Jews were legitimate targets because they lived within Christendom and constituted an immediate threat, whereas the Muslims were far away.

The first pogroms broke out in Rouen in French Lorraine. Jews were forced into baptism or slaughtered. Though warnings were sent out from France to beware the onslaught of the mobs, the German Jews dismissed them and trusted in their fellow countrymen. When Peter the Hermit and Walter the Penniless led their forces there, their brutal intentions were quickly made known.

Though many bishops and priests tried to protect them, it is estimated that up to 10,000 Jews who lived in settlements around the Rhine and Danube Rivers perished. Cities affected included Treves, Meuss, Ratisbon, and Prague. The more disciplined crusader armies took anti-Semitism with them into the Holy Land when they finally arrived and burned Jews in their synagogues. Later crusades did not witness the same degree of bloodshed against Jews in Europe. Nonetheless, the earlier massacres unleashed bitterness and tension between the two religious groups, especially evident among the intellectuals and hierarchy, for the next few centuries.

When the Second Crusade was proclaimed, Pope Eugenius III (1145–53) suggested that Jewish moneylenders cancel the debts of Christian crusaders. Influential abbot Peter of Cluny wrote Louis IX of France that European Jews finance the war effort. A French monk named Radulph traveled around Germany—without his monastery’s approval—preaching that the Jews were the enemies of God.

At the risk of his life, the saintly and respected BERNARD OF CLAIRVAUX confronted and condemned Radulph but still urged that Jews not collect interest on crusaders’ debts. Since Jews could not count on the protection of the church, they were forced to accept a special legal status in the eyes of the civil government. This new identity meant that Jews now were quarantined in ghettos, bound to wear badges or unique clothing, and even kept from reading the Talmud. By the end of the Middle Ages, western European Jewry was in ruins, and Jews fled eastward to Poland and Russia.

MARK F. WHITTERS

Aquinas, Thomas

(1225–1274) *philosopher and theologian*

St. Thomas Aquinas was born at Roccasecca, Italy, to Count Landulf and Countess Theodora. From early on, Thomas was diligent in his studies and had a meditative mindset. He received his education from the monastery of Monte Cassino and the University of Naples. Thomas entered the Dominican Order and then studied in Paris from 1245 under the well-known philosopher Albertus Magnus (1195–1280). He spent 10 years visiting Italy, France, and Germany. In 1248 he lectured on the Bible at a college in Cologne, Germany. He was in Paris from 1252 C.E., eventually becoming a professor of theology and writing books. He was awarded the degree of doctor in theology in 1257. Between 1259 and 1268 he lectured as professor in the Dominican convents of Rome and Naples. Thomas also worked at the papal court as an adviser. He was a well-known figure by the time he came to Paris in 1269.

His intellectual inquiries about the relationship between philosophy and theology made Thomas a controversial figure. His Scholasticism made him an avid reader of works pertaining to Christian theologians, Greek thinkers, Jewish philosophy, and Islamic philosophy. Thomas wrote his first book as a commentary on *Sentences*, a seminal book on theology by PETER LOMBARD (1095–1161). Aristotle (384–322 B.C.E.) influenced him greatly, and his comments on *Sentences* contained about 2,000 references to Aristotle. Critics also associate Thomas with the doctrine of AVERROËS (1126–98), distinguishing between knowledge of philosophy and religion. The Dominicans sent Thomas to Naples in 1272 to organize a *studium generale* (a house of studies). The pope had asked him to attend the Council of Lyon on May 1, 1274, and to bring his book *Contra errores Graecorum* (Against the errors of the Greeks). In spite of his deteriorating health, he started the journey in January. He died on his way there on March 7, 1274, at the Cistercian abbey of Fossanova.

In Christian theology the 13th century was an important time, as two schools of thought were raging with controversy. The Averroists separated philosophical truths

Thomas Aquinas's *Summa Theologica* became the standard textbook in theology in universities all over Europe.

from faith. They did not believe in divine revelations and believed that reason was paramount. The Augustinians gave faith the predominant position. For Thomas both reason and faith were important. Both were complementary to each other, and the nature of their relationship did not conflict. He believed that the truths of philosophy and religion were gifts from God. The moderate realism of Thomas postulated that both the medium of thought and that of the senses led to knowledge of the intelligible world or the universal. Thomas was a sharp thinker, combining philosophical truths with theological postulations. His natural law accommodated the divine law. He synthesized Christian theology with the philosophy of Aristotle, the Stoics, and Ibn Rushd.

Thomas was a prolific writer, penning 60 works. His manuscripts were preserved in the libraries of Europe,

and multiple copies came out after the invention of printing. The first published work of Thomas was *Secunda Secundae* (1467). The *Summa Theologica*, one of his best-known works, was also printed. It brought out great debate between the rational inquiry of Thomas and the Catholic doctrines. He defended the Christian faith in *Summa de veritate catholicae fidei contra gentiles* (Treatise on the truth of the Catholic faith against unbelievers). In the *Quaestiones disputatae* (Disputed questions), he gave his opinion on various topics. The pernicious theory that there was only one soul for all persons was refuted brilliantly in *De unitate intellectus contra Averroistas*. He proved in *Opusculum contra errores Graecorum* that the Holy Ghost proceeded from the Father and the Son. His deep knowledge of the fathers of the church was found in *Catena Aurea*.

Pope John XXII canonized Thomas Aquinas on July 18, 1323. In 1567 he was made a Doctor of the Church. The *Summa Theologica* became the standard textbook in theology in the syllabus of universities all over Europe. There was renewed interest in his writings after the papal bull of 1879. Leo XIII, in his *Providentissimus Deus* (November 1893), took the principles behind his criticism of the sacred books from Thomas. St. Thomas Aquinas was the "Christian Aristotle" who wielded immense influence on future popes, universities, and academia. He combined the best of faith and reason with a careful synthesis.

PATIT PABAN MISHRA

Aquitaine, Eleanor of

(1122–1204) *duchess of Aquitaine, queen of France and England*

Eleanor of Aquitaine was born in 1122 to William X, duke of Aquitaine and count of Poitou, and Aenor, daughter of the viscountess of Châtellerault. At the death

of her younger brother, Eleanor became the wealthy heiress of Aquitaine. Groomed by her father, she frequently accompanied him on trips throughout his lands as he administered justice and faced down rebellious vassals. On his deathbed in April 1137, William entrusted her to his feudal lord, the Capetian monarch Louis VI, to arrange her marriage, which he did to his 17-year-old son and heir Prince Louis. When Louis VI died in August 1137 the young prince became King Louis VII of France and Eleanor his queen.

The two were ill-matched. Louis, as the second son, had originally been groomed for a career in the church. Eleanor had been raised in one of the most sophisticated households in all of Europe. Her grandfather William IX is credited with creating the literary genre of courtly love and had welcomed minstrels, poets, and troubadours to his court. Eleanor was frequently able to convince Louis to intervene in affairs that concerned her own interests, to the detriment of the crown. All of this might not have mattered had Eleanor been able to provide Louis with a male heir who would have inherited the lands of both his parents. Unfortunately Eleanor bore Louis only two daughters, Marie and Alix.

The breaking point in their marriage occurred during the Second Crusade, which both Eleanor and Louis agreed to undertake in 1146 in response to the preaching of St. BERNARD OF CLAIRVAUX. Their goal was to rescue the crusader-state of Edessa that had fallen to the Muslims. Presumably Eleanor's offer of a thousand knights from Aquitaine and Poitou had helped to assuage misgivings about allowing her and numerous other noblewomen to accompany Louis and his warriors on their journey. In March 1148 the French army arrived at Antioch, just to the southwest of the kingdom of Edessa. Here Louis and Eleanor were greeted by the queen's uncle, Raymond of Poitiers, ruler of the principality. Rumors began to circulate about an affair between Eleanor and her uncle. When Louis rejected Raymond's strategically sound plan of taking back Edessa in favor of marching on Jerusalem, Eleanor exploded against the king, and demanded that their marriage be annulled. Although Louis wrenched her away from Antioch and forced her to march southward on Jerusalem, their marriage was over. The two boarded separate ships and sailed for home in 1149–50. In 1152 their marriage was annulled on grounds of consanguinity, and Eleanor regained control of her lands.

Later in 1152 she married the 18-year-old count of Anjou, Henry Plantagenet, whose extensive land holdings in France also included the duchy of Normandy

Enameled stone effigy of Eleanor of Aquitaine from her tomb in the Abbey of Fontevrault, France.

and the counties of Maine and Touraine. Their marriage created a formidable counterweight to the authority and power of Louis VII of France. Moreover, in 1154 Henry made good his claim to the English throne through his mother Matilda. In December 1154 Eleanor was crowned queen of England, consort to HENRY II (1154–89) of the house of Plantagenet. Over the next 13 years Eleanor bore Henry five sons and three daughters, two of whom, RICHARD (1189–99) and John, (1199–1216) would rule England.

Initially Eleanor played a substantial role in administering their combined lands in France while Henry secured England, but as his power and authority grew, he had less use for his independent-minded queen. Disenchanted with Henry and perturbed by his numerous affairs, Eleanor left England with her two sons Richard and Geoffrey for Poitiers in 1168. Here over the next several years she established a flourishing court that became a cultural center for troubadours and poets singing of courtly love. Meanwhile Richard and Geoffrey increasingly chafed at their father's unwillingness to give them real authority in ruling lands that they nominally held.

They joined their older brother Henry in revolting against Henry II in 1173, with Eleanor's backing. Henry crushed this revolt, and for her part in it, he placed Eleanor under close house arrest in England for the next 16 years.

When Henry died in 1189 Eleanor resumed her active role in political and familial affairs. In 1189 her favorite son, Richard, became king of England, and when he departed on the Third Crusade in December of that year, he left Eleanor as regent in England. On his return from the crusade in 1192 Richard fell into the hands of his enemy the German emperor Henry VI (1190–97), and Eleanor took charge of raising his ransom and negotiating his release.

When Richard died in 1199 she supported her youngest son, John, as his successor, undertaking a diplomatic mission to the court of Castile, and coming to his aid when war broke out between him and PHILIP II AUGUSTUS, king of France, in 1201. She died in March 1204 at the age of 83 and is buried alongside Richard and Henry in the nunnery at Fontevrault in Anjou.

RONALD K. DELPH

Ashikaga Shogunate

This shogunate saw the Ashikaga family dominate Japanese society, ruling for much of the period from their headquarters in the Muromachi district of Kyoto. As a result the shogunate, or *bakufu* (“tent government,” in

effect a military dictatorship), with military power controlled by the *seii tai shogun* or *shogun* (“general who subdues barbarians”)—is called either the Ashikaga or the Muromachi Shogunate.

The Ashikaga Shogunate lasted from 1336 until, officially, 1588, although the last of the family was ousted from Kyoto in 1573, and it did not have much military power after the 1520s. The period when the Ashikaga family dominated Japanese politics reached its peak when Ashikaga Yoshimasa (1436–90) held the hereditary title of shogun (military dictator) of Japan from 1449 to 1473, although the last years of his shogunate were dominated by a succession of crises leading to the ONIN WAR (1467–77). Yoshimasa's period as shogun—or, strictly speaking, the time after his abdication—represented an important period for the development of Japanese fine arts.

The Ashikaga was a warrior family that had been prominent in Japanese society since the 12th century, when Yoshiyasu (d. 1157) took as his family name that of their residence in Ashikaga. They trace their ancestry back further to Minamoto Yoshiie (1039–1106), also known as Hachiman Taro Yoshiie, the grandfather of Yoshiyasu. From the Seiwa Genji branch of the famous Minamoto family, he was one of the great warriors of the Later Three Years' War that raged from 1083 to 1087.

Yoshiyasu's son took an active part in the TAIRA-MINAMOTO WAR of 1180–85, and six generations later Ashikaga Takauji became the first shogun, from 1338 to 1358. This came about after Emperor Go-Daigo (r. 1318–39) was exiled to the Oki Islands after being accused of plotting against the KAMAKURA SHOGUNATE that controlled the army. The emperor rallied some loyal forces with the aim of ending the dominance of the Kamakura family.

ASHIKAGA TAKAUJI

The emperor put his troops under the command of Ashikaga Takauji and sent them to the central provinces. The choice of Takauji was interesting, as he had taken part in plots against the shogunate in 1324 and again seven years later. Put in charge of an army to defeat the enemies of the shogun, Takauji changed sides and decided to support the emperor. He took Kyoto and ousted the shogun, ushering in what became known as the KEMMU RESTORATION. However, rivalries quickly broke out between Takauji and another warlord, Nitta Yoshisada. By this time the prestige of the throne was suffering after major administrative failures had clearly resulted in Go-Daigo being unable to protect his supporters. Takauji led his men to Kyoto, which he captured

in July 1336, forcing Emperor Go-Daigo to flee to Yoshino in the south.

In 1338 Takauji established what became known as the Ashikaga (or Muromachi) Shogunate, based in Kyoto. Takauji controlled the army and his brother Ashikaga Tadayoshi controlled the bureaucracy, with additional responsibility for the judiciary. The shogunate initially resulted in a split in the imperial family, with the Kyoto wing supporting it and Go-Daigo and his faction ruling from the southern court at Yoshino. This continued until 1392 when the policy of alternate succession to the throne was reintroduced. After a short period of stability, there was an attempt at an insurrection by Ashikaga Tadayoshi, who seized Kyoto in 1351. Takauji was able to drive him out, and Tadayoshi fled to Kamakura. Takauji established a “reconciliation,” during which Tadayoshi suddenly died, probably from poisoning. This left Takauji in control of the north, but he died in 1358 and was succeeded by his son Yoshiakira (1330–67), who was shogun until his death in 1367. There was then a short period with no shogun.

ASHIKAGA YOSHIMITSU

When Ashikaga Yoshimitsu (1358–1408) became shogun in 1369, a position he held until 1395, he was able to develop a system by which families loyal to him held much regional power, and the office of military governor was rotated between the Hosokawa, Hatakeyama, and Shiba families. Yoshimitsu may have been planning to start a new dynasty. This theory comes from the fact that he was no longer administering territory in the name of the sovereign. Certainly he did try to break the power of the court nobility, occasionally having them publicly perform menial tasks. When he went on long pilgrimages, he took so many nobles with him that the procession, to many onlookers, seemed to resemble an imperial parade. Yoshimitsu was able to build a rapport with Emperor Go-Kogon.

His main achievement, involving considerable diplomatic skill, was to end the Northern and Southern Courts by persuading the southern emperor to return to Kyoto in 1392, ending the schism created during his grandfather’s shogunate. Yoshimitsu also had to deal with two rebellions—the Meitoku Rebellion of Yamana Ujikiyo in 1391–92 and the Oei Rebellion of 1400 led by Ouchi Yoshihiro (1356–1400). Ouchi Yoshihiro had relied on support from pirates who had attacked Korea and also, occasionally, parts of China, but his rebellion came about when he did not want to contribute to the building of a new villa for the shogun. He had long

Ashikaga Yoshimitsu had a villa in Kyoto that combined Japanese and Chinese architecture. It is now known as the Golden Pavilion.

harbored resentment against the Ashikaga family, and in some ways the villa was merely an excuse for war. However, very quickly Ouchi Yoshihiro was betrayed by people he thought would support him, and after he was killed in battle, the rebellion ended quickly.

In order to ensure an easy succession Yoshimitsu abdicated the office of the shogun to his son Ashikaga Yoshimochi (1386–1428), who was shogun from 1395 to 1423, while he, himself, remained in Kyoto, where he made vast sums of money monopolizing the import of copper needed for the Japanese currency and negotiating a trade agreement with China in 1401. He also created a minor controversy by sending a letter to the Ming emperor of China, which he signed with the title “king of Japan.” In his latter years Yoshimitsu became a prominent patron of the arts, supporting painters, calligraphers, potters, landscape gardeners, and flower arrangers. Many of the artists that Yoshimitsu encouraged became interested in Chinese designs and were influenced by their Chinese contemporaries—this became known as the *karayo* style.

The system of control established by Yoshimitsu continued under Ashikaga Yoshimochi, and his son Yoshikazu (1407–25), who was shogun from 1423–25. However, it was also a period when the Kanto region of Japan started to move out of the control of the shogunate. Yoshikazu's uncle Yoshinori (1394–1441) succeeded him, taking over as shogun in 1428. Yoshinori had been a Buddhist monk from childhood and ended up as leader of the Tendai sect, having to give up the life of a monk when his nephew died. Because of his background, he was determined to establish a better system of justice for the poorer people and overhauled the judiciary.

He also strengthened the shogun's control of the military, making new appointments of people loyal to the Ashikaga family. Many nobles disliked him because he was seen as aloof and arrogant, and in 1441 a general from Honshu, Akamatsu Mitsusuke, assassinated Yoshinori. In what became known as the Kakitsu incident, Akamatsu Mitsusuke was hunted down by supporters of the shogunate and was forced to commit suicide. Yoshinori's oldest son, Yoshikatsu (1434–43), succeeded him and was shogun for only two years. With his death, there was no shogun from 1443 to 1449, when Yoshikatsu's 13-year-old brother, Ashikaga Yoshimasa, became shogun.

THE ONIN WAR

Ashikaga Yoshimasa was born on January 20, 1436, at Kyoto, and when he became shogun, the shogunate was declining in importance with widespread food shortages and people dying of starvation. Yoshimasa was not that interested in politics and devoted most of his life to being a patron of the arts. He despaired of the political situation, and without any children, when he was 29 years old he named his younger brother, Yoshimi (1439–91), as his successor and prepared for a lavish retirement. However, in 1465 he and his wife, Hino Tomiko, had a son. His wife was adamant that the boy should be the next shogun, and a conflict between supporters of the two sides—that of Yoshimasa's wife and that of his brother—started in 1467.

Known as the ONIN WAR, most of the fighting took place around Kyoto, where many historical buildings and temples were destroyed and vast tracts of land were devastated. More important, it showed the relative military impotence of the shogun, and the power of the military governors, and quickly changed from being a dynastic squabble to being a proxy war. It then became a conflict between the two great warlords in western Japan, Yamana Mochitoyo, who supported the wife

and infant son, and his son-in-law, Hosokawa Katsumoto, who supported Yoshimi. Both died during the war, and there was no attempt by either side to end the conflict until, finally, exhausted by the 10 years of conflict, in 1477 the fighting came to an end. By this time Yoshimasa, anxious to avoid a difficult succession, had stood down as shogun in 1473 in favor of his son. His son, Yoshihisa, was shogun from 1474 until his own death in 1489, whereupon, to heal the wounds of the Onin War, Yoshimasa named his brother's son as the next shogun. Yoshimi's son, Yoshitane (1466–1523), was shogun from 1490 until 1493.

In retirement, Yoshimasa moved to the Higashiyama (Eastern Hills) section of Kyoto, where he built a villa that later became the Ginkakuji (Silver Pavilion). There he developed the Japanese tea ceremony into a complicated series of ritualized steps and was a patron to many artists, potters, and actors. This flowering of the arts became known as the Higashiyama period. Yoshimasa died on January 27, 1490.

From the shogunate of Yoshitane, the family was fast losing its political power. Yoshitane's cousin Yoshizumi (1480–1511) became shogun from 1495 to 1508 and was succeeded, after a long interregnum, by his son Yoshiharu (1511–50), who became shogun in 1522, aged 11, and remained in that position until 1547. His son Yoshiteru (1536–65) succeeded him from 1547 to 1565, and, after his murder, was then succeeded by a cousin, Yoshihide (1540–68), who was shogun for less than a year. Yoshiteru's brother Yoshiaki (1537–97) then became the 15th and last shogun of the Ashikaga family. He had been abbot of a Buddhist monastery at Nara, and when he became shogun renounced his life as a monk and tried to rally his family's supporters against a sustained attack by Oda Nobunaga. In early 1573 Nobunaga attacked Kyoto and burned down much of the city. In another attack in August of the same year, he was finally able to drive Yoshiaki from Kyoto. Going into exile, in 1588 Yoshiaki formally abdicated as shogun, allowing Toyotomi Hideyoshi to take over. He then returned to his life as a Buddhist priest. In at least its last 50 years—and arguably for longer—the shogunate had become ineffective, and warlords had once again emerged, often financing their operations by not only pillaging parts of Japan itself but with piratical raids on outlying parts of Japan and Korea.

The Ashikaga Shogunate remains a controversial period of Japanese history. During the 1930s Takauji was heavily criticized in school textbooks for his disrespect to Emperor Go-Daigo. Many historians now recognize him as the man who brought some degree of

stability to the country. The attitude toward Yoshimasa has also changed. Because he concentrated so heavily on the arts, he neglected running the country. He is now recognized as heading an inept administration that saw great suffering in much of Japan. It would lead to a period of great instability that only came to an end when Tokugawa Ieyasu became shogun in 1603.

JUSTIN CORFIELD

Athos, Mount

Christian monasticism began in the eastern Christian world when St. Antony of Egypt, who exemplified the solitary form of monastic life, entered the Egyptian desert in the late third century C.E. Soon afterwards, Pachomius of Egypt and the Desert Fathers developed the communal life. From here, early monasticism spread to Palestine, Syria, and the West. Monasticism's birthplace was vastly affected by the Islamic conquests of the seventh and eighth centuries and declined in its wider historical significance. The heart of (Chalcedonian) Orthodox monasticism is Mt. Athos in northern Greece, on a rugged peninsula extending 35 miles into the Aegean Sea. It is the easternmost of three such "fingers" that stretch out from the Chalkidike Peninsula. The name of this promontory is derived from its highest peak, the nearly 7,000-foot Mount Athos. The Orthodox refer to this region as the "Holy Mountain" because of its spiritual significance over the past millennium.

In the eighth and ninth centuries monks journeyed to Mount Athos to find refuge during the controversy of Iconoclasm when the state forbade icon veneration. By the later ninth century C.E. the area was already becoming known for its reputation for holiness. In 963 C.E. the monk Athanasios of Trebizond created the first communal monastery there, the Great Lavra. Several Byzantine emperors supported Athanasios, endowing the monastery with wealth, privileges, and land. Other monasteries quickly followed. In less than 40 years, there were almost 50

monasteries, with the *hegoumenos* (abbot or presiding father) of the Great Lavra holding the preeminent position. Mount Athos sprouted communal monasteries as well as *sketes*, small groups of monks who lived separately from a general community but came together for worship and feast days. Mount Athos was also home to many *anchorites*, or hermits. Monastic life, in all its variety, blossomed on Athos, but it did so with strict gender separation, for, in 1045 C.E., the emperor banned all females and even female animals. Women were, and still are, excluded both as members and even as visitors.

Patronage continued from Byzantine emperors as well as from Slavic rulers in Serbia, Bulgaria, and Russia. Mt. Athos became a truly international community where monks from all over the Orthodox world mingled together: Italians, Greeks, Georgians (Iveron Monastery), Russians (Panteleimon), Serbs (Chilandar), Bulgarians (Zographou), and Orthodox Armenians. Theological ideas quickly passed, via Mount Athos, from one part of the Orthodox world to another. Such was the case in the 14th century when the controversy over Hesychasm (the "Jesus Prayer") led to its defense by Athonite Gregory Palamas and its spread throughout Orthodoxy. Its accumulated wealth made the peninsula attractive to invaders. In the 13th century Athos fell into the hands of western European crusaders and, after the 14th century, to the Ottoman Turks, who, after accepting tribute and depriving the monasteries of their estates outside, respected the autonomy of the region.

While Mount Athos was the heart of Orthodox monasticism, it was not the only center of monastic life—many other areas, Meteora in central Greece, for example, were well known. Monasteries (ranging in size from a few monks to hundreds) sprouted up wherever there were Orthodox communities. So, not surprisingly, when the town of Mystras, located west of ancient Sparta, became an important Byzantine cultural and political center in the 13th–15th centuries C.E., monasteries (like the Brontocheion) appeared as well. Unlike Athos, however, this region lost its wider importance after the Ottoman conquest of 1460 C.E.

MATTHEW HERBST

Averroës

(1126–1198) *religious philosopher*

Abu Al-Walid Muhammad Ibn Ahmad Ibn Rushd, Ibn Rushd for short, or Averroës, as he is known to the West, was born in Córdoba (Qurtuba), Spain, in 1126 to a family of distinguished Andalusian scholar-jurists. Ibn Rushd was to become a famous philosopher, theologian, physician, and royal consultant. He was a scholar of the natural sciences, namely biology, astronomy, medicine, physics, and the Qur'anic sciences.

His grandfather, after whom he was named, was a renowned chief justice (*qadi*) in Córdoba and an authority on Malikite jurisprudence, having written two famous books on the subject. At the same time, he was the imam of the Great Mosque of Córdoba. Ibn Rushd's father was also a judge. Having grown up in a family of scholars, Ibn Rushd received an excellent education in Córdoba in linguistics, Islamic jurisprudence, and theology.

He became very knowledgeable in these subjects, evident through his many writings. He was especially competent in the subject of *khilaf*, which dealt with controversies in legal sciences. Ibn Rushd had profound knowledge of Aristotelian philosophy, possibly introduced to the subject by one of his teachers or one of the leading scholars in Córdoba. He was educated in medicine and accomplished a major work known as the *Al-Kulliyat fi 'l tibb* translated as *General Medicine* in 1169. Ibn Rushd's writings were so widely celebrated at one time that it was claimed that medieval Islamic philosophy was an earlier version of the European Enlightenment.

In 1153 Ibn Rushd moved to Marrakech, where he met the Almohad ruler Abu Ya'qub Yusuf, who was very impressed with the young Ibn Rushd's intellect and deep knowledge of philosophy. It is interesting to note that Ibn Rushd was initially reluctant to reveal the extent of his knowledge to the prince because at the time strict Muslim leaders frowned on philosophy, which was considered anti-Islamic. Ibn Rushd had to fight against this prevalent belief by asserting that philosophy could be compatible with religion, if both were properly understood. He had nothing to fear with regards to the Almohad prince, who admired his wide knowledge. In fact, the ruler consulted Ibn Rushd on philosophical matters from then on and became his patron. It was also because of Abu Ya'qub's prompting that Ibn Rushd summarized the works of Aristotle in a clear manner. During this time he also provided detailed commentaries of

his Aristotelian philosophy, such that he is popularly known as the Commentator of Aristotle.

In Marrakech, Ibn Rushd remained active in other areas beside writing and philosophy. He also made astronomical observations. In 1182 he was appointed chief physician in Marrakech. He then became the chief justice in Córdoba. In 1195 Ibn Rushd fell out of favor with the new Almohad prince during the latter years of his reign. His works were considered contrary to religion, and the Caliph passed edicts forbidding their study. He was banished to Lucena near Córdoba but later returned to Marrakech. He died soon after in December 1198.

NURFADZILAH YAHAYA

Avignonese papacy

The Avignonese papacy (1304–78) and the Great Schism (1378–1414) are regarded as two of the most dramatic events in the history of Christianity that further undermined and diminished the prestige of the papacy and the authority of the Western Latin Church. The first episode refers to the nearly century-long pontificate of eight popes, who from the beginning of the 14th century until 1378 ruled the Christian world from the French town of Avignon, being held captive by PHILIP IV the Fair; because of its forced nature, the Avignonese papacy is also called the Avignonese Captivity, or Exile.

Historians attribute the cause of the Avignonese Exile of the papacy to the earlier conflict between Pope Boniface VIII and the young French king Philip the Fair in the preceding century, when the king and the pope were struggling to proclaim their rule over Europe. In the center of the conflict stood new military taxes the king levied on French monasteries, requiring new subsidies to fight his wars with the English. Boniface rejected the king's claims for financing his army

on account of the church in the bull *Clericis laicos* from 1290 and later paid for his stubbornness with his own life, literally terrified to death by the king's chancellor William of Nogaret. Boniface's direct successor, Benedict XI (1303–04), did not live long enough to pacify the spirits, supposedly having been poisoned by an unidentified monk; a new pope, old and gravely ill, Bertrand de Got, who assumed the name Clement V, led the papacy into exile. Residing in France at the time of his election, weakened by what was likely cancer, and discouraged by the fate of his predecessor, Clement V capitulated to Philip's demands that he should be crowned at Lyon. He established the tradition of the Avignonese papacy, never setting foot in the ancient city of Rome.

Clement's Avignon successors (seven popes, among whom the most famous were John XXII and Benedict XII) all remained loyal to the French rulers, playing whenever necessary against the German emperor and the English, which outwardly may have been seen as an ordinary state of affairs had it not been for the fact of direct influence the French kings exercised in the curia. Throughout the 14th century the Avignonese papacy was continuously showing signs of decline of papal authority, which was becoming increasingly undermined by the feudal monarchy. In 1312 the papacy surrendered to the will of Philip IV and dismissed the Order of the Templars, famous for its wealth, with thousands of its members accused of heresy, witchcraft, and sodomy and all its treasures

The Avignonese papacy refers to the pontificate of eight popes, who from the beginning of the 14th century until 1378 ruled the Christian world from the French town of Avignon. They built themselves a fortified palace within the walls of Avignon and lived in luxury.

confiscated by the crown. The fiscal oppression of the curia (chiefly through control over the sale of benefices and indulgences but also over tithes and annates) became more amplified during the Avignonese papacy, despite the heavy French presence in the College of Cardinals (seven out of eight Avignonese popes and almost all of the important cardinals were Frenchmen by the middle of 14th century).

In due course the popes built themselves a fortified palace behind the walls of Avignon and lived there surrounded by luxury in the midst of magnificent artificial gardens. The luxurious lifestyle of the popes was subject to constant complaints and gossip. Contemporaries, including such important thinkers as PETRARCH, Marsilius of Padua, and Catherine of Siena, relentlessly criticized the Avignonese popes. The image of the papacy during those years changed sharply, having lost its unconditional spiritual authority and its control over the brethren. Petrarch called the Avignonese papacy “the Babylonian Captivity of the Church” and Avignon popes “wolves in shepherds’ clothing.” The Avignonese papacy was detested by most social sectors—from peasants who suffered the ever-increasing taxation to intellectuals and theologians who wrote against the moral and spiritual degradation of the Holy Office. In the next centuries the Avignonese papacy was described as totally deprived of spirituality. Subservience to a secular ruler, nepotism, and rapacity of the “puppet-popes” seriously undermined the reputation of papacy in the eyes of Europe, marking at the same time the end of the reign of Church Universal and the beginning of a new epoch, where ultimate power belonged with the national ruler.

The Avignon church underwent a complete makeover. Despite criticisms, almost all Avignon popes undertook serious attempts at reform. They created a sophisticated and effective administration that surpassed anything previously known in the European states. The popes’ involvement in secular politics also grew during these years, despite the forced capitulation to France. Both developments effectively turned the church into a modern, secularized, and politicized organization. The last years of the popes’ stay at Avignon are also marked by their recurring attempts to strengthen their position in Italy. Quite unsuccessfully they tried to turn the outcome of the revolt of Cola di Rienzo in 1347 to their favor, but even after this failure popes continued to maintain close economic and political relations with Italy. Their final success and return to Rome is indebted to the activity

of Cardinal Albornoz and Pope Urban V, who gave constitution to the PAPAL STATES. Taking advantage of the difficulties France was experiencing during the HUNDRED YEARS’ WAR (1337–1453), Pope Gregory XI (1370–78) transferred the papal residence back to Rome in 1378, dying just a few months after this historic reunion of the church with its ancient capital. This move, however, was attempted too late to save the papacy from disaster: Its return was blackened by the shadow of the Great Schism.

Soon after Gregory XI died, the Roman people, fearing that a new pope might leave them for France once again, gathered under the walls of the conclave, demanding election of an Italian to the Holy See. Cardinals, the majority of whom were Frenchmen, chose the archbishop of Bari, a Neapolitan, Bartholomew Prignano, to be elected the next pope. He accepted the Holy Office, taking the name of Urban VI. No doubt that Prignano, who had previously held a position of a vice chancellor of the curia, seemed an excellent choice to the cardinals.

They were confident they could control the “little archbishop” (as they nicknamed their candidate), who would be grateful for this unexpected promotion. Later the cardinals would announce that they had elected Prignano under threats and for fear of the reaction of the angry mob that was raging on the streets surrounding the palace during the election.

From the very start the pontificate of the new pope was stained with a most bitter struggle with the cardinals and members of the curia of non-Italian origin. Harsh reform measures of the new pontiff, who was irritated at the slightest pretext, and physically assaulted cardinals on several occasions (publicly announcing their lifestyle of pomposity and splendor as sinful), caused the French party to flee from Rome. Urban soon found himself at daggers drawn with everyone around him, managing to deprive the Holy See of a number of its most loyal supporters, such as Joanna, queen of Naples; her husband, Duke Otto of Brunswick; and the powerful duke of Fondi, not to mention the king of France. On August 9, 1378, under a pretext that Urban’s appointment was forced, the conclave of the fugitive cardinals issued a lengthy document, entitled *Declaratio*, where they declared the election invalid and the Holy Office vacant. At the same sitting they unanimously voted for the Gallic cardinal Robert of Geneva, who assumed the office under the name of Clement VII (1378–94), thus becoming an “anti-pope.”

The following 40 years were characterized by almost constant warfare between pope and anti-pope, in which the Papal States were the chief playground. The schism left no one sitting on the fence. Having unparalleled impact on political allegiances, it reshaped European geopolitics, changing cultural boundaries and paving the way for the upcoming Reformation.

With every passing year the split went deeper. On the side of the “French” Pope Clement VII fought such powerful allies as the king of France, the kings of NAPLES and SCOTLAND, and half of the rulers of Germany; Urban was supported by England, PORTUGAL, and Hungary. The legal pope continued to be tactless and inconsiderate to his allies, and gradually his authority grew weak. Appointing new cardinals to replace the rebels was not a sufficient measure to keep discipline among the supporters; constantly suspecting treachery, Urban did not hesitate to send several cardinals to be executed for “disobedience” to his will. Isolated and defeated in most of his battles, Urban locked himself up in his castle—mainly to hide from the French king who had announced a huge prize for the pope’s head. In 1389 Urban VI came back to Rome, where he died, according to one source, surrounded by followers; according to another, he was poisoned by enemies.

Soon after Urban’s funeral it became clear that even the disappearance of one of the ruling pontiffs would not save the situation—the “Italian” party immediately appointed a successor. Thus receiving a precedent, the schism continued—Clement VII was succeeded by Benedict XIII (from 1394); Urban VI by Boniface IX (1389–1404), Innocent VII (1404–06), and Gregory XII (from 1406). The conflict deteriorated when the Council of Pisa in 1409 deposed both Benedict XIII and Gregory XII, selecting new pope Alexander V (1409–10). The deposed popes refused to recognize the decision of the Council, and the Holy See became occupied by three popes at once.

This development was very favorable to the heretical movements that rose in large quantities all across Europe, preaching noninstitutional evangelism and unbalancing the old feudal system. Secular lords and princes who supported the establishment and the unity of the church were greatly concerned, despite the fact that the decrease in the papal authority contributed to consolidation of power in the hands of secular rulers.

The schism continued well into the 15th century, until, finally, the COUNCIL OF CONSTANCE (1414–18) put an end to it, having deposed three popes at once: John XXIII (successor of Alexander V), Gregory XII, and

Benedict XIII, and selecting, to the great relief of everyone involved, a single pontiff—Martin V (1417–31).

VICTORIA DUROFF

al-Azhar

The Fatimids established al-Azhar, one of the oldest universities in the world, in Cairo in 970. Built around a large mosque with an open courtyard surrounded by columned walkways where classes were taught, al-Azhar quickly became one of the premier educational centers in the entire Islamic world, attracting students from Asia, Africa, and, in subsequent centuries, the Western Hemisphere.

Originally, the university focused on the tenets of the Isma’ili sect of Islam followed by the Fatimid rulers, but over the following centuries the university became a center for orthodox Sunni belief. By the 1600s the Shaykh al-Azhar, leader of al-Azhar, was chosen from among the shaykhs of the university. Generations of legal scholars and judges were educated in theology and ISLAMIC LAW at al-Azhar. In the 15th century C.E., the Mamluk sultan Qaitbey financed the construction of an inner gate and elaborate minaret overlooking the courtyard. Following sultans added further buildings and ornamentation to the sprawling complex, including living quarters for students, libraries, and the mosque. After the 1952 C.E. revolution in Egypt, Gamal Nasser modernized and instituted major reforms including the creation of a College of Islamic Women and the addition of colleges in medicine and engineering.

JANICE J. TERRY

B

Bacon, Roger

(1214–1294) *philosopher and theologian*

Known as *doctor mirabilis* (“wonderful teacher”), Roger Bacon was born to wealthy parents at Ilchester, Somersetshire, England in 1214. He was educated at Oxford and later went to Paris in 1235. Bacon was proficient in arithmetic, astronomy, classics, geometry, and music. After receiving his master of arts, he lectured on Aristotle. Between 1247 and 1257 he was deeply involved in study of alchemy and mathematics. He did not believe in claims made by contemporaries and loved doing scientific experiments. He argued strongly for his beliefs. Some give him credit for laying the foundation of modern science three centuries later. Bacon gave hints for making gunpowder. His experiments on the nature of light were notable. He observed the eclipses of the Sun by means of a device that projected images through a pinhole. A practicing alchemist, Bacon believed in the elixir of life and also tried to create the philosopher’s stone (which would change base metals into gold). His powers of observation led him to anticipate later inventions like flying machines, spectacles, steam ships, and microscopes.

Bacon was greatly influenced by the Franciscans in his student days and entered the Franciscan order in 1255. Bacon had contempt for those not sharing his views, and criticized them harshly. His works were banned by superiors, who directed their members not to publish anything without permission. He appealed to Pope Clement IV against this prohibition and it was revoked in 1266. Within two years he finished a three-

volume work, with volumes entitled *Opus Majus* (great work), *Opus Minus* (lesser work), and *Opus Teriliium* (third work). Clement IV was a supporter of Bacon, but after his death in 1268, Pope Nicholas IV condemned his ideas. The friars, having different views from their superiors of the Franciscan order, were put behind bars. Bacon was imprisoned in the covenant of Ancona, Italy around 1278. After 12 years he was released, and returned to England. Bacon had not changed his convictions in prison. He wrote about his sufferings in 1293 in his last book entitled *Compendium studii theologiae*. Some scholars do not believe that Bacon was really imprisoned.

Bacon held his views in spite of adverse circumstances. One of the greatest scholars, he was against subscribing to preconceived notions. Bacon tried his best to urge theologians to study the sciences, and called for reform in the study of theology. He recommended the study of language in order to read original documents. Bacon saw the Bible as the focus of attention, and not a minor distinction in philosophical discourse. The medieval monk and proponent of experimental science died at Oxford on June 11, 1294, a legendary figure in the world of scholarship and science.

PATIT PABAN MISHRA

Baghdad

The **ABBASID DYNASTY** founded the city of Baghdad as a new capital in 762, shortly after the overthrow of the **UMAYYAD DYNASTY**. This shift of the center of power in the Muslim world from Syria toward the Abassid support base in Persia allowed the young dynasty to establish its dominance under the leadership of the caliph, al-Mansur. However, the move from Syria also saw the caliphate's influence in Mediterranean affairs decline and rival dynasties emerge as far away as Spain, where the Umayyad dynasty regrouped, and as near as Egypt, from where the **FATIMID DYNASTY** dominated much of North Africa from the 10th through the 12th century.

The first two centuries of Baghdad's history were marked by political strife as the Abassids repressed revolts; the dynasty underwent civil war from 811 to 819. During this civil war the caliph Amin besieged the city. Despite this unrest, Baghdad found itself at the center of a Muslim cultural golden age during these centuries. In the 940s a group of soldiers, the Buyid princes, who had been gaining in strength for a decade, took power in Baghdad; lacking legitimate claim to rule, they become protectors of the caliphate and ruled through Abbasid puppet caliphs.

In 1055 the Seljuk Turk Toghrolbeg came to Baghdad and ultimately relieved the caliph of the Buyid protectorate. Toghrolbeg was named sultan, and the caliph was again reduced to little more than a puppet. But the Seljuk leader's ambitions led him to rule from outside of Baghdad, visiting only on occasion, and this would give future caliphs at least some small measure of freedom. The Crusades and internal turmoil challenged the Seljuks' control of the region, and the caliphs began to challenge their overlords. The breakup of Turkish rule in the late 12th century saw a renewal on a regional scale of the city's importance, but the city and the

region were continually plagued by conflicts between Sunnis and Shi'i.

THE MONGOLS

In faraway Mongolia, warring Turko-Mongol tribes were uniting under the leadership of one man, Temuchin. In 1206 an assembly of tribal nobility awarded him the title **GENGHIS KHAN**—Universal Ruler. From central Mongolia, Genghis set out on a mission of world conquest. He immediately began consolidating his power for an attack against the Chinese kingdoms to the south, but full control of China was far off. The Mongols would invade western Asia and establish a dynasty in Iran before they unified China under their rule.

During the early years of Mongol expansion Genghis Khan led armies against the sultan Ala ad-Din Muhammad, Khwarazm Shah, as a punishment for his challenge to Mongol authority in the region of Central Asia. Genghis's punishment of the Persian leader helped establish a reputation for Mongol brutality. The caliph in Baghdad, al-Nasr, felt threatened by the onslaught against Sultan Muhammad and appealed to the Ayyubids in Syria for aid. The Ayyubids were battling the crusaders and did not send aid, but the threat of Genghis Khan never materialized. Genghis died in 1227, and **OGOTAI KHAN**, his son, succeeded him.

In 1232 Mongol forces had penetrated as far as Azerbaijan, and the caliph annexed Arbela in Upper Mesopotamia, possibly as a defensive measure. In 1236 the caliph mobilized his armies against the Mongols, who were moving south into Upper Mesopotamia, and in 1238 the caliph went to Baghdad's great mosque and called for holy war against the invaders. This time Ayyubid reinforcements arrived, but the ensuing battle was a defeat for the caliph. The Mongols withdrew deep into Persia, and terms were reached, though raids into Mesopotamia continued with accounts of the period reporting various Mongol harassments of Baghdad.

The Mongol conquest of the Middle East began during the reign of **MONGKE KHAN**. In 1252 Mongke dispatched his brother **HULAGU KHAN** to take control of the region. Some sources suggest that the arrival of Hulagu in Azerbaijan was instigated by a mission by the Qadi of Qazvin, in an attempt to subdue the **ISMA'ILIS**, known as the Assassins for their frequent tactic of the same name. The Isma'ilis operated from their stronghold in the mountainous region of northern Iran. The repression of the Isma'ilis was one of Hulagu's first goals. Hulagu dispatched Baichu to the west to repress the Seljuk's in Rum, and in 1256 Mongol forces defeated the sultan and recognized his younger brother,

establishing Mongol overlordship of Rum. In the same year, the Mongols completed their mission against the Isma'ilis, destroying the last of their mountain strongholds and executing their leader, Khurshah.

Having secured his base and the vicinity to its west, Hulagu focused his attention on the caliphate in Baghdad. Hulagu sought to dominate both Baghdad and its caliph, despite their dramatic decline in prestige. The court of the caliph, al-Musta'sim, was divided over how to respond. The caliph, presented with an ultimatum, could surrender—saving his life, his position, and his city—or resist. Indecision left al-Musta'sim largely unprepared for the onslaught that would follow his disregard and disrespect of Hulagu and his armies. The Mongol forces besieged the city for several weeks before storming it on February 6, 1258. The damage to the city was extensive. Al-Musta'sim, his sons, and much of their entourage were killed; as it was against Mongol belief to shed royal blood on the ground, the caliph was rolled into a carpet and trampled to death by horses. Al-Musta'sim was the last Abbasid caliph of Baghdad.

From Baghdad, Hulagu's forces moved into northern Syria, taking Aleppo in January of 1260. The Ayyubid ruler in Damascus, An-Nasir Yusuf, fled his capital, and the city surrendered to Hulagu's general Kitbuqa. Hebron, Jerusalem, and Ashkalon were raided, and various Ayyubid princes submitted to the invaders. Again, much of the Mongol army was unilaterally withdrawn to Azerbaijan, where Maragheh was chosen as the capital of the new Il-Khanate (one of four khanates of the Mongol Empire). The Ayyubids's conquest by the Mongols marked the end of their dynasty, as they had already been replaced in Egypt by the Mamluk dynasty. General Kitbuqa remained to solidify the new conquests in Syria, while Hulagu became embroiled in the Mongol succession crisis and began to battle the Golden Horde to his north.

In the eastern Mediterranean region the crusaders in Jerusalem were not prepared to surrender to the Mongols and issued calls for reinforcements to the western European kingdoms, while they temporarily tried to appease Kitbuqa. When the crusaders did not dismantle their fortresses, however, Kitbuqa retaliated, sacking Sidon in August 1260. The crusaders responded by allowing the Mamluks of Egypt to dispatch troops through their territory and even provided the Muslim forces with supplies to battle the Mongols. In September 1260 the Egyptian army defeated the Mongols in Galilee, and Kitbuqa was either killed in the battle or executed after his defeat.

The Il-Khanid Mongols retreated beyond the Euphrates to their power base. Within the Il-Khanate,

Sitt Zummurud Khatun's tomb is the most famous mausoleum in Baghdad and was constructed before 1202.

Hulagu and his son Abaqa would enjoy stability despite threats at the border. The Il-Khanids continued to work diplomatically against their Mamluk enemies in Syria, at times approaching the crusaders to propose coordinated attacks. In 1299 Ghazan Khan, a Muslim convert, attacked the Mamluk forces, which retreated to Egypt in defeat. Syria and Palestine were briefly reoccupied until Ghazan withdrew to Mesopotamia, and it was not until 1320 that the Mongols made peace with the Mamluks. After the death of Abu Sa'id in 1235, the Il-Khanate disintegrated into rival, mostly non-Mongol, dynasties.

The Mongol leader TIMURLANE emerged as a great force in the region at the end of the 14th century, regaining Mongol control of Persia and doing battle as far east as the Ottoman Empire. But Timurlane's death in 1405 saw the Mongolian empire in Persia again disintegrate and effectively ended Mongolian influence in the region of the Middle East.

The immediate and lasting effects of the Mongols in the Middle East are varied in degree. The Mongol conquest of Hulagu ended two institutions of Islamic rule, finally ending the Abbasid Caliphate of Baghdad and Ayyubid dynasty, the realm of which was already confined to Syria and parts of Palestine. This allowed Mamluk rule to fill the power vacuum. A century and a half later that power vacuum would be re-created by Timurlane's temporary conquests and the subsequent disintegration of Mongol rule in the Middle East following his death, only to be filled by the Ottomans. Culturally, the impact of the Mongols was minimal, with the exception of Persia, to which area their lasting presence in western Asia was confined. It is in the period of the

Il-Khanate that the greatest impact of far eastern culture on Persia is witnessed.

JAMES A. GRADY

Bantu

The Bantu people of the African continent include some 400 different ethnic groups that cover most of sub-Saharan Africa and speak a tongue from a common language group. The first time the word *Bantu* (meaning “people” in many Bantu languages) was used in its current sense was by Dr. Wilhelm Bleek in his book *A Comparative Grammar of South African Languages* (1862). Up to that point, few linguists had tried to draw similarities between the different languages in Africa on such a wide scale. Much of what is known about Africa before the 11th century has been surmised by linguistic analysis, which, along with recent archaeology, has shown a clear picture of society and life in prehistoric Africa.

Before the spread of the Bantu much of central and southern Africa is believed to have been populated by the Khoisan-speaking people who still exist around the Kalahari Desert in modern-day Namibia and Botswana, and also in some isolated pockets of modern-day Tanzania. There were (and still are) pygmies in Central Africa, and the northern and northeastern parts of Africa were dominated by people who spoke Afro-Asiatic languages, who have retained their identity from the Bantu. Gradually from the first millennium B.C.E. to the first millennium C.E., the Bantu spread out throughout much of the African continent.

The origins of the Bantu were first raised by Joseph H. Greenberg (1915–2001) in 1963, based on linguistic theories. Using dictionaries and work lists of these lan-

guages, he was able to isolate the 500 different distinct languages of the Bantu subgroup. Many showed regional and geographical variations—including the names of crops and/or animals not found elsewhere in Africa—and Greenberg's thesis was that there was an original language, which he called Proto-Bantu, from which the others were derived. As the languages spoken in the southeastern part of Nigeria, and along the border with Cameroon, contain more words similar to those used elsewhere in the continent, and that the Bantu languages spoken further away have more variations, he concluded that the Bantu had their origins along the modern-day Nigeria-Cameroon border. However, the theories of Greenberg were quickly challenged by Malcolm Guthrie, whose research pointed to the Bantu language having originated in Zambia and the southern part of modern-day Democratic Republic of the Congo.

If the origins of the Bantu are disputed, the reason for the migration of the Bantu throughout Africa is generally accepted. George P. Murdock (1897–1985), an American scholar, argued that it was influenced by the availability of crops. Murdock felt that it was the Bantu acquisition of crops from the East Indies—through trade with Madagascar—such as banana, taro, and yam, which helped a spread westwards from the first millennium B.C.E. onwards. It was the cultivation of these crops, Murdock felt, that enabled the Bantu to start settling in the previously largely impenetrable tropical rain forest of central Africa, and from there southwards, establishing the civilization of Great Zimbabwe in the 10th century C.E. Others saw the migratory route, following the ideas of Greenberg, lay in the move east across the southern area of what is now the Sahara, into southern Sudan, and from there south past the Great Lakes.

If the Bantu originated in the area of southeastern Nigeria and the borders with Cameroon, they would have gradually spread eastwards to the Great Lakes, where, on Lake Victoria, the settlement of Katuruka has been dated to the fifth century B.C.E. A separate group also spread southwards through Gabon and the Congo and to modern-day Angola—the settlement at the Funa River, in modern-day Democratic Republic of the Congo, dating from 270 B.C.E. That group gradually spread south into modern-day Angola, while the eastern migration split south of Lake Victoria, with some heading for the coast and establishing a settlement near Kwale, near Mombasa. Another group moved south, along the eastern shores of Lake Nyassa, forming the civilization of Great Zimbabwe by the 10th century C.E., with a third group heading inland, into modern-day Zambia. The result of this migration was that, by about 1000 C.E., the Bantu domi-

nated central and southern Africa, except for much of modern-day South Africa, Namibia, and Botswana. The survival of the Khoisan people in these places is pointed to as further evidence of this migration.

Knowledge about the divisions within Bantu tribes is known from archaeological evidence. The existence of tribal chiefs can be assumed from early settlements where wealth inequality was seen through the existence of larger and smaller residences. Similarly the objects that were found, made from precious metals, and pots of intricate design, were too few to sustain an entire village with the view adopted by archaeologists that poorer members of Bantu tribes would have had wooden objects that have not survived. However, it is also clear that some tribes, such as the Kikuyu in modern-day Kenya, did not have hereditary chiefs but, rather, a person who assumed the role of an elder and was responsible for tax collection and family counseling.

Unlike the Khoisan and pygmies, the Bantu fought in conflicts and maintained armies. Many of the tribal chiefs maintained large numbers of wives and hence had many children who were often assimilated with commoners. The nature of the rule of the tribes has been surmised through linguistic evidence of the Bantu kinship terminology. Although some groups, such as the Masai, use the standard patrilineal system, many others follow matrilineal traditions. In addition the Mayombe people of modern-day Democratic Republic of the Congo believe that their “blood,” and hence their descent, goes through a woman, with villagers tracing the origin of their village to an ancestress. This is also believed to be the system used by the Bantu in the Kongo (modern-day Angola and the Democratic Republic of the Congo). As a result the chief in wartime was often the husband of the senior woman, with the government operating through the female line.

Few archaeological remains have been found of early Bantu civilization, when compared to Europe of the same period. This may have been because of the Bantu use of wood for their buildings. Some 85 million Bantu people now exist in Africa, with most divisions of the Bantu being largely linguistic. Although the term has been used for 150 years, because of its pejorative use by the apartheid government in South Africa—whereby blacks were designated as “Bantu”—it is not used much today except as a cultural term to describe the great migration that took place in ancient and medieval Africa.

JUSTIN CORFIELD

Bayezid I

(c. 1360–1403) *Ottoman sultan*

Bayezid I was declared sultan following the death of Sultan Murad on the battlefield at Kosovo in 1389. To ensure his uncontested succession to the sultanate, Bayezid had his brother Yakub assassinated; subsequently the practice of fratricide became commonplace among heirs to the Ottoman throne.

To cement Ottoman control over Serbia, Bayezid married a Serbian royal princess. Bayezid immediately embarked on a series of successful military conquests, personally leading his troops throughout Thrace. Under Bayezid’s rule, only the heavily fortified cities on the coast, including Athens and Constantinople, remained outside Ottoman control. Recognizing the importance of sea power in any attempt to seize Constantinople, the Ottomans began to build up their navy. Fearful of the mounting Ottoman threat, the Hungarian king and later Holy Roman Emperor Sigismund rallied Christian forces in Europe to attack the Ottomans at Nicopolis in 1396. The Europeans were resoundingly defeated by the Ottoman troops, who were personally led on the battlefield by Bayezid who then conquered virtually all of the Balkans, the Turkoman areas of Karaman, Anatolia, and the eastern Mediterranean. Because of his military prowess, Ottoman troops called Bayezid the “thunderbolt” (*yıldırım*).

However, Bayezid's love of luxury and increasing arrogance alienated many of his subjects and offended many traditional Muslims. Some amirs (local governors) fled to the court of TIMURLANE, whose mounting power posed a serious threat to Bayezid's conquests. In 1402 Ottoman and Mongol forces met on the battlefield at Ankara, where Bayezid was captured. Brought before Timurlane, Bayezid was initially treated with respect, but after a failed attempt to escape, he was placed in an iron cage; he died several months later. Timurlane went on to conquer the rest of Anatolia but divided his newly gained territories among four of Bayezid's sons. Although they pledged loyalty to Timurlane, upon his death three years later, they promptly resumed the Ottoman quest for empire.

JANICE J. TERRY

Becket, Thomas (Thomas à Becket)

(1118–1170) *archbishop, martyr, saint*

Saint Thomas Becket was the archbishop of Canterbury in England during the reign of King HENRY II. He was the son of Gilbert Becket, who was born in Rouen, but became a merchant in London. Becket received an excellent education despite his middle-class origins. He completed his degree at the University of Paris and then studied law at Bologna and Auxerre. Theobald of Bec, archbishop of Canterbury since 1139, made him deacon and assistant archbishop of Canterbury. Becket and Henry became close friends and spent considerable time together. Henry made Becket chancellor. Theobald was seriously concerned that the trappings of the royal lifestyle would turn Becket against the needs of the church. Upon Theobald's death in 1163, Henry offered Becket the position of archbishop of Canterbury, but he initially declined, realizing it would cause great havoc between Henry and himself.

Once Becket became archbishop in 1164, he set aside the hedonistic lifestyle, became excessively ascetic, and resigned as chancellor. His efforts focused on the

Becket was murdered by four knights of Henry II in Canterbury cathedral, which astonished and repulsed Christians.

church rather than on the interests of the man who had befriended and promoted him. In 1163 at the Council of Westminster, Henry passed a law that would try “criminous clerks” who had already been tried by the ecclesiastical courts. Some of the canonical laws were ambiguous, imprecise, and contradictory, and Henry wanted clearly stated laws that would govern accurately. Becket disagreed, but withdrew his dissent when Pope Alexander III (pope from 1159 to 1181) pressured him. Henry then implemented the constitutions of Clarendon to which Becket orally agreed. The constitutions accurately reflected traditional church and state relations, which Henry II wished to guarantee. When Becket discovered that some of the sections would reduce ecclesiastical power, he vehemently objected to the changes. However, several of the Crown's practices were quite divergent from canon law, so that Alexander refused to assent. Becket had little choice but to admit publicly that he had committed perjury regarding the Constitution of Clarendon.

Becket was forced to appear at the Council of Northampton in October 1164 and was charged with misappropriating funds during his chancellorship. He quickly contravened the Constitutions of Clarendon, denying its jurisdiction and declaring that the church and the pope had greater jurisdiction than the Constitutions. Becket had no option but to flee abroad.

While Becket lived in exile for six years, he garnered scant support from Alexander because the pope and Henry had their own disagreements to solve. Yet both Henry and Becket went to extremes to maintain their quarrel. The situation was exacerbated when

Henry, who was quite ill, had his son and heir, Henry the Younger, (1155–83) crowned as joint king by the archbishop of York in June 1170; this was a direct violation of customary practices. Becket threatened an interdict with Alexander's support and then aggravated the situation by suspending and excommunicating the bishops who had partaken in the coronation. The irate Henry then uttered the phrase "Will no one rid me of this troublesome priest?" Four knights took this phrase literally, traveled to Canterbury, and murdered Becket on December 29, 1170. This event astonished and repulsed Christians everywhere. Becket was canonized three years later; his tomb became a well-visited shrine. In 1174 Henry was forced to offer penance publicly at Becket's tomb.

ANNETTE RICHARDSON

Bede

(c. 673–735) *historian and scholar*

A monk, teacher, historian, and biblical interpreter usually called "the Venerable," Saint Bede was the most influential scholar from Anglo-Saxon England. At the age of seven, Bede was given as an oblate (child dedicated to religious life) to the monastery of Wearmouth, newly founded by Benedict Biscop. When Jarrow was founded in 682, Bede was transferred to this abbey and to Ceolfrith, its abbot. Bede was ordained a deacon at age 19 and a priest at 30. He never traveled beyond Northumbria (northeast England) and spent the remainder of his life at Jarrow reading, writing, teaching, and explicating Scripture.

Bede was a prolific writer whose interests and expertise were wide-ranging. He wrote treatises on grammar, poetry, computation, and natural phenomena (for example, *On Orthography*, *On Metrical Art*, *On Time*, *On the Nature of Things*). Each of these works survives in many manuscript copies, suggesting the important role they played in the medieval liberal arts curriculum. Bede was also well known as an hagiographer (a biographer of saints's lives), composing works on Saints Felix and Cuthbert as well as revising Jerome's *Martyrology*. Yet Bede was perhaps most renowned in the medieval period for his commentaries on biblical books, which were based largely on the prior interpretive work of Jerome, Augustine of Hippo, Ambrose, and Gregory the

Great. Bede composed commentaries on the Old Testament books of Genesis, Joshua, Judges, Samuel, Kings, Proverbs, Ecclesiastes, Song of Songs, Job, Ezra, Nehemiah, Isaiah, the 12 Minor Prophets, and Daniel. In the New Testament he commented formally on the Gospels of Mark and Luke, the Acts of the Apostles, the Catholic Epistles (James; 1 and 2 Peter; 1, 2 and 3 John; and Jude), and the Apocalypse (Revelation).

Bede is best known as a historian, and is sometimes described as the "Father of English History." His *Ecclesiastical History of the English People*, completed in 731, remains one of the great works of medieval historiography and the single most important source for our understanding of the religious history of early England. The *Ecclesiastical History* is also particularly noteworthy because it introduces *anno Domini* (abbreviated A.D., meaning "in the year of the Lord") as a way of dating events in the Christian era.

We know from the eyewitness account of one of his devoted students (the *Letter of Cuthbert on the Death of Bede*) that Bede continued to teach, write, and interpret Scripture until the end of his life. Cuthbert's letter to Cuthwin, another of Bede's disciples, relates that their teacher was producing an Old English translation of the Gospel of John when he died on May 26, 735. Bede was buried at Jarrow, the place of his death, but in the 11th century his relics (bones) were moved to Durham, where a conspicuous tomb in the cathedral still commemorates him. Within a century after his death Bede was honored with the title "Venerable," and in 1899 Pope Leo XIII declared him a "Doctor of the Church" (a title given since the medieval period to certain Christian theologians of outstanding merit and remarkable saintliness). Bede's feast day is celebrated on May 25 (formerly May 27).

FRANKLIN T. HARKINS

Benin

Extending at its peak from the Niger River in the east to the port of Lagos on the western coast, Benin was a dynastic kingdom in what is now southern Nigeria, in the West African forested region. Present-day Benin City (called Ibinu; it was founded in 1180) was once where the kingdom was centered, and the modern Benin kings trace their lineage to its original dynasties.

Early southern Nigeria had been inhabited since 9000 B.C.E., with the Iron Age beginning around the second

century B.C.E. Ironworking appears to have displaced Neolithic techniques without an intermediate bronze period, suggesting that iron smelting was probably introduced by outsiders, perhaps the Berbers of early antiquity. There is little information about the first millennium C.E. in the area, other than the prosperity and subsequent disappearance from the historical record of the Nok people in what is now northeastern Nigeria. The founders of the Benin kingdom were the Bini (an ethnic subgroup of the Edo language group to which many modern inhabitants belong), but they or their ruling dynasties had a significant relationship to the Yoruba people of Ife. According to one version of the founding of Benin, people called for the Ife prince Oranmiyan to come to their aid and displace the tyrannical rule of the Ogisos dynasty, which founded the city of Ibinu and had ruled the area for the previous few centuries or more (36 Ogiso dynastic rulers are known). Another version omits the plea for help, painting Oranmiyan as a simple invader.

At the time of the Ife incursion—whether it was invited or not—most of the power in Benin rested in the hands of the council of chiefs, the *uzama*. Beginning with Oranmiyan's son Eweka (1180–1246), the *uzama* was presided over by the oba, a war leader who over time became a more powerful monarch with religious significance. As the oba became paramount, the kingdom became an empire. Beginning with Ewuare (1440–73), the title of oba became a hereditary one, while Ibinu was rebuilt with military fortifications in order to protect the Benin center of power, as Ewuare's forces expanded to conquer the lands surrounding them. The port of Lagos was established around this time, and diplomatic and trade relations began with Europe, beginning with the Portuguese. Early trade was primarily in ivory, pepper, and palm oil, before the slave trade became prominent.

The kingdom of Benin is not related to the modern-day Republic of Benin, except insofar as that nation took its name in 1975 from the Bight of Benin, the bay along which both entities are or were situated.

BILL KTE'PI

Berbers

The Berbers are the earliest known inhabitants of northwestern Africa's Mediterranean coast, plains, and mountain ranges. Living as nomadic herders or farmers

in Morocco's Atlas and Rif mountain ranges, Algeria, the Sahara Desert, east into Libya and Egypt, the exact ethnic and cultural origins of the Berbers is unknown, though their languages, called Tamazight, belongs to a family of Afro-Asiatic languages. In ancient times, Berber religions were polytheistic.

Although ancient Berber history is sketchy because of the fact that there was no written form of their languages, references to them do exist in chronicles from ancient Egypt, Greece, and Rome. Beginning around 600 B.C.E. some Berber regions of North Africa came under foreign occupation, first by the mighty city-state of Carthage, and then by the Roman republic. Under Carthaginian and Roman rule, Berber merchants linked the Mediterranean coastal settlements with West Africa, trading in slaves, gold, and ivory. Under the Roman Empire, some Berbers residing on the Mediterranean coast became imperial citizens, though Berber communities living in the North African interior mountain ranges and other rural areas remained largely independent. After the collapse of the Roman Empire in the West, large sections of North Africa's seacoast remained under the control of the Byzantine Empire of Asia Minor.

After the rise of ISLAM in the first half of the seventh century C.E. Arab Muslim expansion into North Africa began in earnest, beginning in 642 during the reign of the second al-Rashidun caliph, 'Umar ibn al-Khattab. The new religion slowly spread among segments of the Berber tribes, replacing Byzantine Christianity, which many Berbers practiced in some form, and Judaism. Although many Berbers accepted the basic tenets of Islam, their method of practice generally remained unorthodox. This led to a growing level of tension between them and the Arab Umayyad Caliphate of Syria by the middle of the eighth century. A large number of Berbers joined the fundamentalist movement of the Kharijites, who opposed the Umayyads and preached that any qualified Muslim could lead the community. Berber opposition to the centralized power of the caliphate continued after the collapse of the Umayyads in 750 by the Abbasid Revolution. The Fatimids, an ISMA'ILI Shi'i movement that arose in 969, received substantial Berber support in their takeover of Egypt and parts of North Africa from the Abbasid caliphs in Baghdad, Iraq. During the FATIMID DYNASTY, there is evidence that there was an attempt to instill Arab culture within Berber societies, which had largely retained their own cultural practices and languages.

In 711 during the reign of the Umayyad Caliph 'Abd al-Malik, the first Muslim expeditions to the Iberian Peninsula were launched under the command of a Berber, Tariq ibn al-Ziyad, and other Berber Muslims. A mixed party of Arabs and Berbers under the Umayyad

Berber cave dwellings and mosque on a hill in Chenini, Tunisia. Berbers continue to live in modern North Africa and form a large segment of the populations in Morocco and Algeria, with some tribes continuing to reside in Mauritania, Tunisia, and Mali.

ad commander Musa ibn Nusayr followed al-Ziyad's landing the next year and Berber soldiers continued to play a major role in Muslim expansion throughout Iberia and southern France for centuries.

The first major Berber political-military state to emerge was the ALMORAVID EMPIRE, which was founded in Mauritania and the Sahara around 1050 and practiced a more orthodox form of Sunni Islam. With the founding of their capital city, Marrakesh, in Morocco in 1062, Almoravid expansion continued under the joint rule of Yusuf ibn Tashfin and his cousin, Abu Bakr. In 1086 Almoravid armies landed in Iberia, where Yusuf defeated Alfonso VI, the Christian king of Castile, which allowed the Berber empire to establish a fundamentalist Sunni Muslim state with control over much of southern Iberia, all of Morocco, and parts of West Africa.

By 1150 another Berber movement, the Almohads, under 'Abd al-Mu'min overthrew the Almoravids, taking over Morocco and southern Spain while expanding east across North Africa. Like their predecessors, the Almohads founded a fundamentalist and militaristic Sunni Muslim state, and Christians and Jews often faced imperial persecution. Unlike the Almoravids the Almohad Empire slowly broke apart into smaller states, and the last Almohad caliph, Idris

II, ruled only the city of Marrakesh before his murder in 1269. Under the Almoravid and Almohad periods, the majority of the Berber tribes converted to Sunni Islam, following the Maliki School of Islamic jurisprudence. Although the Berbers continued to hold onto aspects of their culture and continued to speak Berber languages, many also adopted some Arab cultural practices. Berbers continue to live throughout present-day North Africa and form a large segment of the populations in Morocco and Algeria, with some tribes continuing to reside in Mauritania, Tunisia, and Mali.

CHRISTOPHER ANZALONE

Bernard of Clairvaux

(1090–1153) *religious leader*

Saint Bernard of Clairvaux was born in 1090 in Fontaine (now a suburb of Dijon in Burgundy, France) of noble parents: Tescelin, a relative of the lord of Châtillon, and Aleth, daughter of the lord of Montbard. His five brothers trained for military careers, but Bernard had fragile health and enrolled in the religious institute of Saint-Vorles (at Châtillon) for instruction leading to an ecclesiastical profession. He studied there for 10 years. Hesitating about his future, he finally decided to embrace the monastic life. Even before he entered the monastery, he convinced many relatives and friends to join him in the preparation for religious calling. He entered the abbey of Cîteaux (close to Dijon) in 1113. The so-called New Monastery had been founded 15 years before by former Benedictine monks from Molesme, eager to follow the Rule of Saint Benedict more authentically. Cîteaux is the cradle of the Cistercian Order.

Two years later the abbot sent Bernard to be the founding superior of a new monastery, Clairvaux, in the region of Champagne. It rapidly became economically and spiritually prosperous. Bernard's zeal attracted many young people, and Clairvaux counted more than 60 foundations or affiliated religious communities at his death. This success disturbed some more conservative monks and involved Bernard in a controversy with the Benedictine abbey of CLUNY. Advised by his close Benedictine friend and first biographer William of Saint-Thierry, he wrote the *Apology* to defend the Cistercian reform.

Renowned as a reformer, he was often invited by councils bishops to help carry out policies of ecclesial change within the church. Civil authorities even consulted Bernard to find solutions that would bring peace and justice. In 1130, as the church faced a major crisis with the election of two popes, he was consulted about a way to reunite the church.

Innocent II, the pope confirmed instead of Anacletus II, then asked Bernard to accompany him throughout Europe and to consolidate the church by his skillful preaching. For eight years he served in this way. Meanwhile, he remained abbot of Clairvaux and kept on writ-

ing major spiritual works, especially his 86 *Sermons on the Song of Songs*.

In the last period of his life he was involved in various ecclesial forays. He formally criticized the writings of the theologians PETER ABELARD and Arnold of Brescia at the Council of Sens (1140), leading to their judicially questionable censure. He also participated in Gilbert de la Porée's condemnation in 1141. He defended the church against heretics. He preached on the eve of the Second Crusade at Vézelay in 1146. In spite of his powerful spiritual message and appeal to inner conversion, the crusade was a total failure and left Bernard embittered.

He died on August 20, 1153, and was recognized as a saint 21 years later. In 1830 he was declared a Doctor of the Church. Apart from his many treatises and sermons overflowing with biblical references, more than 300 of his letters are extant. His spiritual influence has been constant and extensive, even touching the Protestant reformer Martin Luther (1483–1546). His message inspires many scholars and religious teachers to this day.

EMMANUELLE CAZABONNE

bhakti movements (devotional Hinduism)

The word *bhakti* is derived from a Sanskrit word for "sharing." It was used to describe a new type of path to *moksha* ("liberation from the cycle of reincarnations"). Bhakti devotees (*bhaktas*) usually committed themselves to one of the Trimurti of Brahman ("the supreme spirit reality"). The three gods of the Trimurti are BRAHMA, Vishnu or SHIVA, or in many cases *bhaktas* devoted themselves to some *avatar*, like Krishna, of the Trimurti in an emotional way. This emotional commitment marked the *bhaktas* as followers of *bhaktimarga*.

Bhakti movements called people to ardent devotion to a god or goddess as a thankful expression of gratitude for benefits received. Or it could express the hope for aid to be received. Most commonly it took the form of a passionate love of the deity. As they developed the bhakti movements became the *bhaktimarga*, or one of the three Hindu paths (*margas*) for escaping from the

wheel of reincarnation. The *margas* were “paths” or “roads” or “ways” for achieving the final liberation of the soul from the karma-caused cycle of repeated reincarnations. The basic problem of human life was suffering. To escape the repeated cycles of reincarnation was the goal of life. Until the development of the *bhaktimarga* there were only the two paths of *karmamarga* (“religion of rituals and ethical deeds”) and the *gyanamarga* (*jnanamarga*, or “religion of the head through meditation”). The path of bhakti was the religious way of the heart, the way of loving devotion.

The bhakti movements arose in South India among Tamil-speaking people at some time in the seventh to ninth centuries. It provides its devotees salvation through loving devotion to the ultimate deity. The Alvars (“one who had dived” or “one who is immersed”) were Tamil-speaking poets whose works promoted bhakti worship in South India. The Alvars are counted as 12 poets of the bhakti movement who lived in South India between 650 and 940. They promoted the worship of Vishnu using poetry as a vehicle for expressing a passionate love of the god. The object of the writing was to show how any *bhakta* could express deep devotion to the god as a path to the god’s or goddess’s heaven. The Alvas and other wandering singers of the times included people from all castes. They used the inclusion of outcasts to show the potential for universal salvation (universalism).

Monotheistic challenges from ISLAM with its firm emphasis on the unity of God may have influenced bhakti movements in northern India. However, Hinduism, while not Vedic religion, takes its starting point from the Vedas, so bhakti scholars have found their roots in the Vedic worship of the Rig Veda god Veruna. Vedic knowledge was passed from guru to disciple through the centuries. This spiritual lineage is called *sampradayas*. Others see bhakti in portions of the Sanskrit texts the *Ramayana* or the Bhagavad Gita or in other portions of the *Mahabharata*. Still others see its origin in the Padma Purana. Bhakti worship tended toward monotheistic practice. Bhakti also suppressed the numerous iconographic expressions of the multiple expressions of the Brahma, which outsiders regarded as idolatry. Some bhakti movements were connected with Shiva, the god of sexuality, fertility, and destruction. Others are connected with Krishna worship. The defining characteristic of Tamil Bhakti was its expression of devotion in songs sung in vernacular languages. Singing in the languages of the common people was not only very egalitarian but also very emotional. Those who advanced in devotion became bhakti saints. Around them communities (*satsang*) of

good people would gather. It was believed that the gathering together of goodness would overcome evil and would also have the power to transform lives.

Bhakti movements combined songs (*bhajan*) with devotion. Two groups of singer-saints, the Alvars and the Nayanars, flourished in South India after the 600s. These two groups, the Alvars and the Nayanars, were devoted to promoting the worship of Shiva and the other the worship of Vishnu. At times the singing was chanting that continued for a very long period of time. Many of the *bhajans* contain elements of love expressed passionately and may be compared to the passionate love expressed in the Song of Solomon. Others are more explicitly sexual deriving their themes from the stories of Krishna cavorting with the *gopis* (cow girls) or Krishna as a divine lover. Some bhakti devotees have produced love poetry. For example, Jayadeva produced the *Gita-govinda* (Song of Govinda) in the 12th century. Women have been heavily involved in bhakti movements since the beginning, with some becoming poetesses. Other bhakti practices have included recitation of the name of the devotee’s God.

During the medieval period the bhakti schools developed devotional practices based upon the emotions of relationships. These emotional expressions were interpreted as analogous of the relationship of the devotee with the god. Among these emotional expressions is that of a woman’s love for her beloved. A feature of the bhakti movements was the making of bhakti saints. For example, Purandaradas (c. 1540) was a great literary figure of the bhakti movement. He was revered as the father of Carnatic classical that is called Karnataka music of South India. His classification of *swaravali*, *jantivarase*, *alamkara*, and *lakshana* factors are the standard today throughout South India.

Most Hindus chose the Trimurti gods of Vishnu or Shiva. Few chose Brahma. Those who chose Vishnu or his avatars are called Vaishnavites. Among Vishnu’s avatars were Krishna, Rama, and Buddha. Consorts included Radha the beloved of Krishna, and Sita an incarnation of Lakshmi. In the *Ramayana* Sita and Rama are presented as the perfect couple. Their mutual devotion in love is offered as the example to follow. *Bhaktas* who follow Shiva are called Shaivites. They are devoted to the lord of the dance who in Kapalakundala’ hymn in *Bhavabhuti’s Malatimadhava* has Shiva engaged in a mad dance that destroys worlds, but also renews them. Shiva’s consorts include Parvati who is kind and gentle, Kali who spreads disease and death, and Durga who is a warrior goddess that seeks sacrifices, including human sacrifices.

Another form of bhakti is yoga bhakti. In yoga bhakti the yogin meditates in order to find release into a meditative absorption with the deity. Many ascetics (sadhus) and yogins are devotees of Shiva because he is known as the great yogin. In the 16th century the famous saint Chaitanya (1486–1533) added devotional singing, chanting, and dancing in the streets. Along with his followers numerous Krishna temples were built. Chaitanya promoted Vishnu bhakti widely across northern India, particularly in Bengal. From this group came the International Society for Krishna Consciousness that is popularly known as the Hare Krishnas.

ANDREW J. WASKEY

Black Death

The Black Death (Black Plague, The Plague, Bubonic Plague) was so named because the skin on many of its victims turned black, a result of massive blood clots. Although there have been many plagues throughout history, the three most associated with the term *Black Plague* are pandemics (epidemics that affect huge geographic areas) that occurred in Byzantium during the sixth century B.C.E., throughout Europe and the British Isles during the 14th century, and in 1894 in Asia. The first outbreak in 540 C.E., often referred to as the Plague of Justinian, began in Egypt, according to Procopius.

The disease spread from the coasts to inland areas, killing thousands of people each day. Allegedly, corpses were put on ships and sent out to sea to be abandoned. The power shift from south to north and from the Mediterranean to the British Isles is attributed to this devastation. It was the second pandemic—a series of outbreaks that escalated from an early episode in 1331 to the disastrous events in 1346—that is most frequently referred to as the Black Death. In 1346 a Mongol prince and his armies attempted to lay siege to Caffa, in the Crimea. However, the soldiers were stricken with this dreadful disease and withdrew, but not before catapulting infected corpses over the city wall. The Christian defenders, who thought they were now safe from attack, left to return home but perished from the plague. The few who reached home spread the disease throughout Europe and as far north as GREENLAND. Within a year 80 percent of Marseille had died. According to various sources, the death rate varied from 12 to 50 percent. It is estimated that in Europe 20–25 million, and throughout the world 42 million people died.

There are three forms or types of the disease: bubonic, pneumonic, and septicemic. The most dramatic is the septicemic version. Immense numbers of bacteria cause DIC (disseminated intravascular coagulation), a condition where there is so much debris in the bloodstream, the blood hemorrhages under the skin and the afflicted person's body, or parts of it, becomes black. These victims died almost immediately, within one to three days after they showed symptoms of the disease.

GIOVANNI BOCCACCIO (1313–75), the author of the *Decameron*, a bawdy collection of stories that were told by Italian travelers trying to escape the plague in Florence, wrote, "They generally died the third day after the appearance without fever." In the bubonic form of the disease, victims were stricken with a headache, nausea, achy joints, high fevers, vomiting, and a general feeling of malaise. It took from one day to one week for the patient to exhibit the characteristic symptoms after being exposed.

The most painful symptom was swelling of the lymph glands in the armpit, groin, and neck. These enlargements would become buboes, painful abscesses; skin infections filled with pus. When the bubo broke and drained, the purulent material inside was infectious and therefore spread to whomever touched the patient or the anything the patient's clothing, bedding, or items that he handled. Boccaccio wrote, ". . . in men and women alike there appeared, at the beginning of the malady, certain swellings, either on the groin or under the armpits, whereof some waxed of the bigness

of a common apple, others like unto an egg, some more and some less, and these the vulgar named plague-boils . . . to appear and come indifferently in every part of the body; wherefrom, after awhile, the fashion of the contagion began to change into black or livid blotches, which showed themselves in many, first on the arms and about the thighs and after spread to every other part of the person . . . a very certain token of coming death . . .” Patients with the bubonic form spread the pneumonic form via fine droplets from a cough or sneeze. Although it was less lethal than the septicemic version, victims suffered from painful coughing episodes and eventually they coughed so much that the lining of their lungs became irritated and they coughed up blood.

People were so fearful of catching the plague that they abandoned their own family members, friends, homes, and public spaces in order to escape contact with anyone stricken with the disease. Doctors who were still willing to treat patients donned hoods with masks, beaks and hats in order to avoid breathing the air around a plague victim. They had no way of understanding the natural history or cause of this disease. They blamed an unlucky conjunction of astrological influences, such as Saturn, Jupiter and Mars, and poison from the tails of comets, or blamed Jews for allegedly poisoned the wells. But even after the wells had been sealed, people continued to get the plague. Some of the treatments such as cupping, purging and bleeding, although acceptable in the 14th century, did more harm than good and weakened anyone who remained alive after such insults to their feeble bodies. Amazingly some people survived and because of their illness, developed antibodies that provided immunity against a future attack.

THE SPREAD OF THE BLACK PLAGUE

This second pandemic was facilitated by a number of factors. Populations had reached such high numbers in Europe that there was not enough food to feed everyone. Consequently those who could not afford the rising cost of food lacked adequate nutrition, and became easy targets for any new threat to health. There were trade routes connecting urban centers and increased travel in the form of caravans. Returning crusaders were spreading Christianity and, at the same time, the plague.

The causative organism *Pasturella pestis* (now called *Yersinia pestis*) was already present in the burrowing rodents of the Manchurian-Mongolian steppes but did not create a plague until the black rat (*Rattus rattus*) spread to Europe with a specific kind of flea. *Rattus rattus* originated in Asia but reached Europe during the

early Middle Ages. They thrived in environments where people lived, near water, and traveled by ship. The black rat's flea *Xenophylla cheopsis* would bite the rat, but instead of being satisfied with its blood meal, its digestive tract would get plugged with plague bacteria, thus creating a constant hunger. It would voraciously bite anything in its path, including humans. When it found a human host, it spread the disease through repeated bites.

Europe had eradicated both the opportunity and the infection, but Asia suffered acutely. In the early 1890s an epidemic broke out in southern China, then in the city of Guangzhou in January of 1894, where 100,000 were reported dead. By May it had spread to the Tai Ping Shan area of Hong Kong. As in any epidemic high population density, poor hygiene, inadequate health education, and the government's inability to maintain a decent water supply and sewer treatment facility added to the poor defenses of the population. That year, 2,552 people died. Trade was affected and many Chinese left the colony. Plague continued to be a problem in Asia for the next 30 years.

The causative organism of the plague was not isolated and described until the third pandemic in 1894. Shibasaburo Kitasato and Alexandre Yersin simultaneously discovered the bacteria responsible for the plague, soon after they arrived in Hong Kong to assist in the eradication of the plague there. Originally named *Pasturella pestis*, the organism responsible for causing the Black Death was renamed *Yersinia pestis* after it was reclassified into a different genus on the basis of its similarities to other Enterobacteriaceae species.

LANA THOMPSON

Blanche of Castile

(1185–1252) *French queen*

Blanche was born in Palencia, present-day Spain, the third daughter of Alfonso VIII, the king of Castile, and Eleanor, daughter of English king HENRY II and

Queen ELEANOR OF AQUITAINE. She married Louis VIII (1187–1226) of France, the son of PHILIP II (1165–1223) of France, on May 23, 1200 at Portsmouth, in English territory, as part of a treaty between Philip and King John of England (1167–1216). The aging Queen Eleanor (1122–1204), her maternal grandmother, personally escorted the vivacious Blanche to France. John granted to Blanche as fiefs Gracay and Issoudun, as well as some English Crown lands. Blanche and Louis had 12 children over an 18-year period, but six children died. Their son LOUIS IX (1214–70) was the heir to the French throne and was later canonized as Saint Louis because of his pious and kind-hearted nature.

While waiting for the French crown, Louis claimed the English crown in Blanche's name and she offered him her avid support, although Philip dissented. Blanche worked tirelessly and organized the invasion from Calais. Louis's invasion of England was initially well received by the barons, but he later received only scant support from the other inhabitants. It was also unsuccessful because King John died, and after 18 months the novelty wore off and most people offered allegiance to young King Henry III (1206–72). The Treaty of Lambeth ended Louis's English adventure. Louis was crowned on July 14, 1223. He became ill with dysentery upon his return to Paris from the ALBIGENSIAN CRUSADE that he had quelled and died at Montpensier on November 8, 1226. Blanche was left to act as regent for 12-year-old Louis, and she served as legal guardian of the other children.

Seeing an opportunity, the barons and the counts of Champagne, Brittany, and LaMarche (to name a few) revolted against Blanche's somewhat suppressive hand, secretly aided by Henry. With astounding capability Blanche broke up the league of barons. She also repeatedly repelled assaults by Henry III, who fought to have lands obtained by Philip returned to England. Blanche forced Robert de Sorbon (1201–74), founder of the University of Paris, to accept her authority. Blanche also extended French territory by adding the area of the Midi to the Crown lands, and made beneficial alliances.

Upon Louis's service on the Seventh Crusade, Blanche served as regent from 1248 until 1250, when she served as co-regent with her son Alphonse until 1252. Blanche helped raise the exorbitant ransom for Louis's release from prison in the Holy Land. Her influence on Louis remained strong until her death. Blanche's health failed on November 1252 at Melun. She was moved to Paris but died soon thereafter and was buried at Maubuisson. Blanche is remembered as one of the most capable rulers of the Middle Ages.

Saint Louis, known in history as the best of France's medieval monarchs, was aided during his reign by Blanche's advice and determination.

ANNETTE RICHARDSON

Boccaccio, Giovanni

(1313–1375) *Italian humanist and author*

Boccaccio is the most recent of the three “great minds” of 14th-century Italian humanism, after DANTE ALIGHIERI and PETRARCH. He was a poet, a scientist, and, most important, a creator of the early modern short story genre. Boccaccio's ancestors were peasants, but his father became a wealthy merchant in Florence not long before his son's birth. Boccaccio's mother is unknown. Some reports suggest the writer's birthplace was Paris, but most historians agree that it was either Florence or Certaldo (Tuscany). Born illegitimately, Boccaccio was nevertheless officially recognized by his father, who was reported to have been a crude and ill-mannered man.

Wishing Giovanni to enter business, his father sent him to NAPLES to learn the profession. Soon, however, it became evident that the boy had no aspiration to follow in his father's footsteps and greatly disliked mercantile business. He was then ordered to study canon law, but this discipline was equally incompatible with Boccaccio's demeanor, which was better suited to the vocation of poetry and letters.

His father's money and position gave Boccaccio access to Naples's high society and introduced him into the literary-scientific circle gathered around King Robert of Anjou. Naples of the first half of the 14th century was one of the largest cultural centers of western Europe, and Boccaccio's affiliation with it, as well as his love affair with the king's daughter Fiammetta, greatly stimulated the young man's literary and poetic talent.

During this first Neapolitan period of creativity, Boccaccio wrote numerous poems eulogizing Fiammetta, then produced the novel *Filocolo* (1336–39) and two lengthy poems, *Filostrato* and *Teseida* (both finished in 1340). Today almost forgotten, these works were widely read by Boccaccio's contemporaries and played an

important role in the development of Italian literature. In 1333–34 Boccaccio was first exposed to the poetry of Petrarch, whose verses began to reach Naples. After having heard Petrarch's sonnets for the first time, Boccaccio went home and burned all his youthful works, disgusted with his own "petty" attempts at verse composition.

In 1340 two major Florentine banks collapsed, and Boccaccio's father lost almost all his savings; the young poet returned to Florence to assist his suddenly poor family. The BLACK DEATH of 1348, which took the lives of his father, stepmother, and numerous friends, crashed Boccaccio emotionally and took what was left of his family's money. In spite (or maybe because of) these disasters, the Florentine period was especially productive for Boccaccio. In Florence he created his most important works: *Comedia Ninfe* (1341–42), also known as the *Commedia delle ninfe fiorentine* (dedicated to Niccolò di Bartolo Del Buono); the first draft of *De vita et moribus domini Francisci Petracchi*; the first version of the *Amorosa visione* (1342–43); *Elegia di Madonna Fiammetta* (1343–44); *Ninfale fiesolano* (1344–45); and, finally, the *Decameron* (1349–51), Boccaccio's most mature masterpiece of witty satire that greatly influenced further development of Italian literature.

From the 1350s Boccaccio fell increasingly under the influence of Petrarch and began to write more in Latin and more on religious, devotional, and philosophical subjects. His last years were dedicated to Dante, whose works he studied and conducted a series of lectures on the *Divine Comedy*. Italian humanism is greatly indebted to the author of the *Decameron*. Boccaccio died on December 21, 1375 in Certaldo.

VICTORIA DUROFF

Bohemia

Bohemia was a kingdom in central Europe, a vassal from the 10th century and later an electorate of the HOLY ROMAN EMPIRE. The earliest known historical inhabitants

of the country were the Boii, a Celtic tribe, from whom Bohemia derives its name. By the first century Slavic tribes, including the Czechs, arrived, becoming predominant in the region from the sixth century. The only early Slavic rulers known by name are Samo, who defeated the neighboring Avars and Franks and established the first strong Slavic kingdom in Bohemia in the early seventh century, and the semimythical Krok, whose daughter Libusa, according to legend, married a plowman named Přemysl, founding the Přemyslid dynasty.

In the ninth century the still-pagan Bohemians were subject to increasing political and religious pressure from the Christianized Franks active in southwest Germany. Resistant to the missionary efforts of the German bishops, the Bohemians were more receptive to the Christian message delivered through Moravia by the Greek monks CYRIL AND METHODIOS. In 873 Methodios baptized the Bohemian duke Bořioj, leading to the rapid conversion of the Bohemians to Christianity. Continued disagreement in the Bohemian court about the degree of German influence led to the murder of Duke Václav (St. Wenceslas) by his brother Bolesław I in 935.

Under Bolesław I and his son, Bolesław II, Bohemian rule expanded to include Moravia, Silesia, and part of southeastern Poland. The establishment of the bishopric of Prague secured ecclesiastical independence. At Bolesław II's death, the kingdom was split by civil war among his sons Bolesław III, Jaromir, and Ulrich and lost territory to Bolesław I (the Brave) of Poland. In 1003–04, with Bohemian support, the Polish king briefly established his brother Vladivoj in Prague and consented to his vassalage to the German emperor as duke of Bohemia. This arrangement continued after Vladivoj's death, though Přemyslid rule of Bohemia was restored.

Under Břetislav I (1037–55), Bohemia recovered Moravia and Silesia, and the Bohemian nobles accepted hereditary rule in the Přemyslid dynasty. Břetislav's son Vratislav supported HENRY IV in the investiture struggle with Pope Gregory VII, obtaining recognition as king of Bohemia in return (1086). Emperor FREDERICK I Barbarossa made the title hereditary in 1156 as a condition for Vladislav (Ladislav) II's participation in his Italian campaigns. Vladislav II's abdication in 1173 was followed by an extended struggle for the crown. In this conflict, the nobles gained power at the expense of the contesting royal candidates, who were obliged to extend new privileges in exchange for continued support. German influence, too, increased in the absence of a strong and independent Bohemian monarch. In 1197 Otokar I defeated his rivals and emerged as the unchallenged ruler, reestablishing the sovereignty of the Bohemian king.

The medieval kingdom of Bohemia reached a height of power under Přemysl Otokar II. Otokar II's rule began with a brief struggle against his father, Václav I, followed by a reconciliation and orderly succession. During his reign he sought to reduce the influence of the nobles by encouraging the immigration of German settlers to towns to which he gave legal privileges. Otokar II also extended Bohemian rule over much of central Europe, through possession of the Austrian archduchies and the counties of Carinthia, Istria, and Styria. In 1260 he defeated Hungarian King Béla IV, his most serious rival. Otokar faced a stronger enemy in the first Habsburg Holy Roman Emperor, Rudolph I, who reclaimed for the empire most of Otokar's possessions outside Bohemia. At Dürnkrut in 1278 Rudolph's army defeated the Bohemian and Moravian forces; Otokar II was killed in the battle, leaving the kingdom to his seven-year-old son, Václav II. After a troubled regency during which the nobles again asserted their independence from the central authority of the crown, Václav II assumed personal rule in 1290. Under his rule, order was restored in the countryside and Bohemia regained a measure of its earlier power, subjugating Poland and intervening in the succession struggle that followed the death of András III of Hungary. Václav II died in 1305 while preparing for war with Archduke Albrecht of Austria (later Holy Roman Emperor), and his son Václav III was assassinated the following year, ending the Přemyslid dynasty.

A brief succession of royal candidates followed, with the Bohemian estates insisting on their right to elect the king, over the objections of Emperor Albrecht who declared the throne vacant and awarded the crown to his son Rudolf. The new king died within the year, followed by his father, but the Bohemian candidate, Duke Henry of Carinthia, proved to be unpopular and after a short reign was deposed by the estates in 1310. His replacement was John of Luxemburg, the husband of Václav II's daughter Elizabeth and the son of the new emperor, Henry VII. John spent little time in the kingdom during his long reign, preferring to involve himself in wars throughout western Europe. In his absence, the power of the wealthiest nobles and the church increased, leading to frequent feuds among the Bohemian nobles and towns. In 1346, aged and blind, John died fighting for France in the Battle of Crécy.

His son, Emperor Charles IV, succeeded him. Unlike his father, Charles devoted considerable attention to his Bohemian possessions, making Prague his chief residence. He founded the University of Prague and built the landmark bridge across the Vltava River, both of

which bear his name. Charles's extended presence in the country restored order, though the king was ultimately unsuccessful in reforming the kingdom's laws in the face of powerful resistance by the nobility. He rejected his father's support of France and opened closer relations with England, leading to scholarly exchanges between Prague and Cambridge. Charles promoted the early activities of religious reformers, including the popular preacher Ján Milíč of Kromeríž, laying the groundwork for subsequent theological debate.

The reign of Charles's son Václav IV was marked by a gradual decline in the authority of the crown and increasing tensions between the church and nobles on the one hand and religious reformers, lesser nobility, and townsmen on the other. Václav's weak efforts to retain his authority provoked further disputes, leading to the formation of a baronial party led by his cousin Jobst of Moravia. The barons twice captured the king and forced him to renounce his centralizing policies, which he quickly restored under pressure from the towns and gentry. Relations with the church were threatened by the execution of John of Nepomuk, the vicar of the archbishop of Prague, and Václav's support for religious reformers led by JOHN HUSS, a master of theology at the University of Prague. Huss and his colleagues and followers condemned the immorality of the clergy and the worldliness of the church authorities. Called by the church to recant certain of his teachings, Huss refused and was brought before the Council of Constance under a safe passage granted by Václav's brother, Emperor Sigismund.

The trial and execution of Huss by the council in 1415 provoked popular unrest in the kingdom. In July 1419 a public procession of Huss's adherents in Prague led to a riot in which the magistrates of the new town were thrown from the windows of the town hall (the Defenestration of Prague). Václav died soon after, and Sigismund claimed the crown, leading a crusade against the Hussites in 1420. Sigismund failed in this and in a second attempt in 1422. In subsequent crusades the Hussites easily defeated their enemies and even took the offensive, launching raids into Hungary and neighboring German states. Convinced of the impossibility of conquering Bohemia by force, Sigismund agreed to negotiations with the Hussites at the Council of Basel in 1431. A split within the Hussite movement between moderates and radicals ended in 1434 with the victory of the moderate party at the Battle of Lipany. This opened the path to a settlement with Sigismund and the church, by which the emperor was recognized by the Hussites as king of Bohemia. Hussites were granted

religious concessions by the council in return, ending the Hussite wars. Sigismund died in 1437, ending the reign of the Luxemburg dynasty in Bohemia.

BRIAN A. HODSON

Boniface

(c. 675–754) *missionary*

Known as the Apostle of the Germans, Saint Boniface was educated in England under the influence of Benedictine monasteries in the late seventh century. He could have followed in the steps of the Venerable BEDE, so polished was his Latin, but the monks instilled in him a zeal for spreading the Christian faith to the European continent, in the throes of the Dark Ages. He, along with many Anglo-Saxon and Irish missionaries, brought back to Europe a semblance of religion, education, and culture before the emergence of CHARLEMAGNE and the HOLY ROMAN EMPIRE.

His missionary career had three phases, punctuated by visits to Rome for consultation and patronage. First, the pope delegated him for work over a broad area, and he targeted Frisia, Hesse, and Thuringia (719–735). Second, he received a special papal commission to penetrate Germany, and he concentrated on Bavaria for establishing monasteries (738–742). Third, he settled in the western part of the Frankish territory (742–747), where he organized the church and encouraged accountability and training for its leaders. As an old man, he retired from his official duties and pioneered again as a simple missionary to Frisia on the German coast of the North Sea. Here he encountered fierce opposition from the natives, who martyred him along with 53 of his companions in 754.

Early on in his career (722) he gained advantages for his missionary program because of Charles Martel and his line. He had won their guarantees for safety during a time of constant invasion and terrorism by marauding tribes. In his initial work in Frisia legend has it that he cut down the sacred oak tree of Thor, and when no adverse reaction occurred, the locals flocked to him.

One of his most famous monasteries was the Abbey of Fulda, founded to consolidate the gains he had made in Bavaria. Fulda was put directly under the pope, and for centuries it was the center of German religious and intellectual life. Here Boniface's body was transported and buried. It is the site for the German Conference of Catholic Bishops.

Boniface epitomizes the return of civilization to Europe in several respects. First, he represents centralized discipline and accountability by his emphasis on unity with the Roman pontiff. It must be remembered that the people had long since seen the demise of the Roman Empire, and there was as yet no overarching political structure to unite the disparate towns and regions. Second, he represents culture by his embracing the Benedictine ideals of literacy and art in all of his monasteries. Again, the classical notion of the “good life” had been defunct for many generations, and the output of literary compositions and visual art had diminished considerably.

Third, he believed that all of his clergy must be educated. Boniface had to drive out rustic church leaders so that the Continental church could cooperate with his bishops and pope. In addition he set up institutions for women, who throughout this period had been denied the privileges of men, and he made education available. In his home country of England, it was the custom to train convent leaders (abbesses) to appreciate books and music and art so that they could run their own communities of women. This practice spilled over into Boniface's mission land of Germany.

MARK F. WHITTERS

Borobudur

Borobudur, the largest Buddhist monument in the world, is located in central Java. Surrounded by fertile rice fields and coconut plantations, the Buddhist stupa is located on a small hill above Kedu Plain.

It was built in 760 to resemble a mountain and was completed in 830. Borobudur is associated with two Buddhist powers—the Sanjaya rulers and the Sailendra

dynasty—which displaced the Sanjayas in 780, though the latter regained power in 850. The monument is made from more than a million blocks of stone, each weighing about 100 kilograms. These stones were arduously carried up a hill from a nearby riverbed. These blocks of stone were then cut and carved by skilled Javanese craftsmen to form rich artistic depictions of stories familiar to Buddhist pilgrims. These bas-relief panels relate ancient fables, fairytales, and the life of Buddha. The panel reliefs were based on earlier Tantric designs.

The complex meaning of Borobudur is found in deciphering the architecture and the reliefs carved into stone. Borobudur yields multiple layers of meaning rather than one single concept, although the skilful builders managed to combine different elements into a harmonious whole. The impressive structure was built in the Mahayana tradition of Buddhism, which focuses on the personal, solitary, ascetic journey to achieve Nirvana. Ancient pilgrims made their way up the stupa to attain spiritual merit. Borobudur has a simple structure, consisting of a series of concentric terraces.

An aerial view reveals that the Borobudur temple is actually a large mandala, often employed to initiate Buddhists into higher levels of consciousness and spiritual power. As Buddhist pilgrims progress upwards, they are moving through increasingly higher planes of consciousness, with the aim of ultimately attaining Nirvana. In order to achieve enlightenment, pilgrims had to make 10 rounds in the monument. At the summit, there is a large stupa surrounded by 72 smaller stupas. Built to visually stimulate, Borobudur enables pilgrims to forget the outside world, as the visitor walks through enclosed galleries. On the round terraces the pilgrim witnesses a view of surrounding green fields, feeling a sense of elation symbolizing enlightenment, the ultimate aim of such a pilgrimage. The awesome structure of Borobudur provides Buddhist pilgrims with physical space to achieve spiritual enlightenment as they pass through 10 stages of development. It was a place to achieve the practical end of becoming a *bodhisattva*, an exalted being who is actively seeking enlightenment.

Brahma

Brahma is one of the three major gods of the Hindu religion, together with SHIVA and Vishnu. Worship of Brahma began in the Vedic Age of Indian history and its importance was gradually outweighed by the worship of Shiva and Vishnu over time. Brahma the god should be distinguished from Brahman the embodiment of the universal spirit—the two words derive from a common source, but have been attached to separate concepts subsequently. Temples dedicated to either Shiva or Vishnu must contain a representation of Brahma, but temples specifically dedicated to him are rare, with only two still active in modern India. He is often remembered in rites for other deities.

Brahma is the creator god of the Hindu Trimurti (a triune of gods). He is commonly identified with the Vedic deity Prajapati, and the two share similar features. Brahma is most commonly represented with four faces and arms. Each face speaks one of the four Vedas, which are the most sacred of the Indian scriptures and is further redolent of the four ages of the world and the four classes in Indian society. His consort Saraswati, a female deity associated with learning, frequently accompanies him. His mount is a swan, which represents a spirit of discrimination and of justice. Brahma is also considered the lord of sacrifices and, by reference to the PURANAS, to have been self-creating; without parents. The Vedic deity Prajapati had become identified as the lord of creation and all of the creatures within it, through the performance of ascetic rites and feats known as *tapas*. The worship of Brahma eventually saw that god supersede the role of Prajapati, who became identified with a series of 10 children born from the mind of Brahma.

Brahma is represented in the great Sanskrit epics of Indian literature, although his role in intervening within the realms of humanity or the gods is limited. Once he created something, Brahma tended to permit the preservative force of Vishnu and the destructive force of Shiva to take the foreground. Modern scientists have used this conception as a metaphor for the nature of the universe, which exists according to particle physics in a form of stasis in which creative and destructive forces contend.

Brunelleschi, Filippo

(1377–1446) *architect*

Born the son of a lawyer in Florence in 1377, Filippo Brunelleschi rejected his father's choice of a law career and trained as a goldsmith and sculptor. After six years of his apprenticeship he passed the exam and officially became a master in the goldsmith's guild. During his apprenticeship, he was a student of Polo Pozzo Toscanelli, a merchant and medical doctor, who taught him the principles of mathematics and geometry and how to use the latest technology. Goldsmithing gave him the opportunity to work with clocks, wheels, gears, and weights, a skill that would come in handy for an architect destined to design his innovative dome of the cathedral in Florence. In 1401–02, he entered a competition for the design of the new Florence Baptistery doors, but he was defeated by another goldsmith and sculptor, LORENZO Ghiberti. This failure led him to architecture in addition to his artistic career.

In 1418 he entered another competition to design the dome of the Cathedral Maria del Fiore, (also known as the Duomo), in Florence. His design for the octagonal ribbed dome, not finished until 1434, is the work for which he is best known and one of his most important contributions to architecture and construction engineering. Brunelleschi designed special hoisting machines to raise the huge wood and stone elements into place. He solved the problem of constructing a huge cupola (dome) without a supporting framework and invented a belt-like reinforcement of iron and sandstone chains to stabilize the outward thrusts at the base of the great dome. His innovative brick-laying techniques were refined in response to the requirements of the steep angles of the vaulting in the dome. It remains the largest masonry dome in the world.

In 1430 and again in 1432 Brunelleschi visited Rome with his friend, DONATELLO, where he became interested in Roman engineering, especially the use of vaulting and proportion. Influenced by Roman architecture, he used ancient principles in his projects, using Corinthian columns, geometrical balance, and symmetrical order.

Brunelleschi's oeuvre includes the Ospedale degli Innocenti (Foundling Hospital, 1419–45), the reconstruction of San Lorenzo (1421–60), the Medici Chapel in San Lorenzo (1421), the New Sacristy at San Lorenzo (now known as the Old Sacristy; 1428), the Pazzi Chapel in the Cloisters of Santa Croce (1430), and Santo Spirito (1436). These works renewed the appearance of Florence. His architectural works in other cities include the Ponte a Mare at Pisa, Palazzo

di Parte Guelfa (1425), the unfinished Rotonda degli Angeli (1434), and the Pitti Palace (commissioned by Luca Pitti in 1440 when Brunelleschi was 60 years old) in Rome.

Brunelleschi's design for the Ospedale degli Innocenti is mathematically based on repeated squares, and by a series of arches supported on columns—a motif later widely borrowed by renaissance architects. Brunelleschi often used the simplest materials: local gray stone (*pietra serena*) and whitewashed plaster. The sober, muted colors give an air of peaceful tranquility to the walls of Brunelleschi's buildings. Brunelleschi reintroduced the pendentive dome (developed long before by the Byzantines) in the Old Sacristy. The arched colonnade from the Ospedale degli Innocenti is again repeated inside the Church of San Lorenzo.

After his death in 1446, Brunelleschi was buried in Santa Maria del Fiore in a tomb that, though it lay unrecognized for centuries, was identified in 1972. There is also a commemorative statue of the architect in the Piazza del Duomo, facing the cathedral. He was a well-known and widely respected designer during his lifetime, and his fame continued long after his death.

MOHAMMAD GHARIPOUR AND MARIETTA MONAGHAN

Bruni, Leonardo

(1370–1444) *Italian humanist*

Leonardo Bruni was one of the foremost humanists of the early 15th century in Italy. He dedicated himself to a career of studying and writing about classical Greek and Roman culture and drawing lessons from the era of the Roman republic that he felt could be applied to

the circumstances of his adopted city of Florence in the early 15th century. His translations of numerous classical Greek works made many of these available for the first time in Europe and helped to bring attention to several classical Greek authors whose writings had been lost during the Middle Ages. Because of his skills as an orator and his knowledge of Latin, Bruni twice served as chancellor of the Florentine republic (in 1410 and again from 1427–44) and also served as apostolic secretary for four different popes.

Born in Arezzo, not far from Florence, Bruni moved to the latter city at an early age, where he initially began studying rhetoric and law. However, he soon came under the influence of the Florentine humanist COLUCCIO SALUTATI (1331–1406) who represented the first generation of Florentine humanists who strove to renew the study of the Roman poets and historians and who polished their rhetorical skills by studying classical oratory. From Salutati, who served as an early apologist for the liberty and freedom of the Florentine republic, Bruni received his lifelong belief that humanism, with its emphasis upon rhetoric and classical learning, should serve the state. He, probably more than any other humanist in the Italian Renaissance, embodied the idea of “civic humanism.” In 1397 the Greek scholar Manuel Crisoloras took up residence in Florence and began teaching Greek there. He quickly attracted a group of young humanists around him, eager to learn the language, and Bruni was among them. Bruni subsequently made excellent use of his command of the Greek language, translating a number of the works of Aristotle, Plato, Plutarch, and Demosthenes into Latin.

One of Bruni’s most original and influential writings was his *Laudatio florentiae urbis* (*Panegyric to the City of Florence*, 1401–06), in which he attempted to refute the long-held notion that Florence had been founded by Julius Caesar. A strong backer of an independent republic of Florence, Bruni felt that it ill suited the city to tie its founding to a man he considered a tyrant and destroyer of the Roman republic. Basing his arguments upon the recently discovered manuscript of Tacitus’s *Historiae* and the writings of Sallust and Cicero, Bruni argued that Florence had been founded during the flourishing of the Roman republic by veterans of Sulla’s army. Direct heirs to these sturdy Romans from republican times, the Florentines were quick to defend their liberties against all aggression. In both this work and especially in his *Historiae florentini populi* (*History of the Florentine people*, 1414), Bruni helped to pioneer new standards in historical writing and scholarship. He eschewed the notion that providence was the driving

force behind causality and events, and instead looked to solid historical records and documentation to uncover the course of history, as well as to explain why events had unfolded.

Because of his learning and service to the republic of Florence, upon his death, he was given a state funeral and buried in the church of Santa Croce, with a marble tomb sculpted by Bernardo Rossellino.

RONALD K. DELPH

Bulgarian Empire

The origins of the Bulgarian Empire are usually traced to the Bulgaro-Slavic state established by an alliance between the Bulgar Khan Asparuh and the league of the seven Slavic tribes around 679. Although this state had been founded within the bounds of the Byzantine Empire, Emperor Constantine IV was compelled to make a treaty with Asparuh in 681, which acknowledged the existence of the Bulgaro-Slavic state and agreed to pay it an annual tribute. Slavs made up an overwhelming part of the population of the new state, but its leadership was Bulgar. What differentiated the Bulgars from the Slavs, apart from language and ethnicity, was their highly developed sense of political organization, in addition to a formidable military reputation. The assimilatory processes between the two groups were long and not always smooth, but by the 10th century the Slavic language had become the official language of the state, while Bulgarian became its official appellation.

The study of the Bulgarian Empire is generally divided into two periods: the First Bulgarian Empire (681–1018) and the Second Bulgarian Empire (1185–1393). In both periods, the Bulgarian Empire had to contend with external pressures coming from Byzantium in the south and various migratory invaders from the north, as well as domestic dissent among the aristocracy.

THE FIRST BULGARIAN EMPIRE

Initially the First Bulgarian Empire enjoyed almost a century of expansion. After Asparuh’s death, supreme power passed to Khan Tervel (700–721). He not only continued to expand the new state in the Balkans but

also intervened in the internal affairs of Byzantium. Tervel sheltered the exiled Emperor Justinian II and assisted him to regain his throne in Constantinople in 704. In 716 Tervel forced a treaty on Byzantium, which awarded northern Thrace to Bulgaria and reiterated Constantinople's annual tribute.

Because of this treaty, Tervel came to the aid of Byzantium during the Arab siege of the town in 717, crucial to averting the fall of Constantinople. Tervel's attack surprised the Arab forces, and many of them were slaughtered (some count 100,000). After Tervel's death the remainder of the eighth century was a time of internal strife, until the rule of Khan Kardam (777–802). Kardam inflicted a number of severe defeats on the Byzantine army and in 796 forced Constantinople to renew its annual tribute to Bulgaria. It was Kardam's successor Khan Krum (803–814) who achieved one of the greatest expanses of the First Bulgarian Empire.

Krum is believed to have spent his youth establishing his authority over large swaths of modern-day Hungary and Transylvania. When he became khan, Krum added these territories to Bulgaria. Thus his realm stretched from Thrace to the northern Carpathians and from the lower Sava River to the Dniester, and bordered the Frankish Empire of CHARLEMAGNE along the river Tisza. Krum's expansionist policy brought him into conflict with Byzantium. In 809 he sacked the newly fortified town of Serdica (present-day Sofia) and surged into the territory of Macedonia. The imperial army destroyed the Bulgarian capital at Pliska. Krum, however, besieged the Byzantine troops in a mountain pass, where most of them were massacred. Emperor Nikephoros I lost his life, and Krum ordered that Nikephoros's skull be encrusted in silver and used it as a drinking cup. After his military success Krum unleashed a total war against Byzantium, laying waste to most of its territory outside the protected walls of Constantinople. He died unexpectedly in 814 in the midst of preparations for an attack on the metropolis.

The emphasis on Krum's military prowess often neglects his prescience as state-builder. He was the first Bulgarian ruler that began centralizing his empire by providing a common administrative and legal framework. His son Khan Omurtag (r. 814–831) followed his father in further consolidating the state. Omurtag's main achievement was to improve the legal system developed by Krum. He was also an avid builder of fortresses.

Under Omurtag's successors, Malamir (r. 831–836) and Pressian (r. 836–852), the First Bulgarian Empire penetrated further into Macedonia. Their reign, however, saw an increase in the internal crisis of the state

because of the spread of Christianity. Both the Slavs and the Bulgars practiced paganism, but a large number of the Slavs had begun converting to Christianity. However, the Bulgars and especially their boyars (the aristocracy) remained zealously pagan. Krum and, in particular, Omurtag became notorious for their persecution of Christians. A new era in the history of the First Bulgarian Empire was inaugurated with the accession of Khan Boris (r. 852–888). Boris confronted the social tensions within his state as a result of the distinct religious beliefs of the population. In 864 he accepted Christianity for himself and his country. With this act, Boris increased the cohesion of his people. Internationally he also ensured the recognition of his empire, as all the powers of the day were Christian.

In 888 Boris abdicated and retired to a monastery. The throne passed to his eldest son, Vladimir (r. 889–893), who immediately abandoned Christianity and reverted to paganism, forcing Boris to come out of his retirement in 893. He removed and blinded Vladimir and installed his second son, Simeon, to the throne. The reign of Simeon the Great (893–927) is known as a golden age. Simeon extended the boundaries of the Bulgarian Empire west to the Adriatic, south to the Aegean, and northwest to incorporate most of present-day Serbia and Montenegro. He besieged Constantinople twice, and Byzantium had to recognize him as *basileus* (czar, or emperor); the only other ruler to whom Constantinople extended such recognition was the Holy Roman Emperor. In order to indicate the break with the pagan past, Simeon moved the Bulgarian capital from Pliska to nearby Preslav. In Preslav, Bulgarian art and literature flourished with unprecedented brilliance.

Despite these exceptional developments, Simeon's reign was followed by a period of political and social decay. His son Petar (927–970) was involved in almost constant warfare; the nobility was engaged in factionalist strife, and the church fell to corruption. The general corrosion of the state was reflected by the spread of heresies among the Bulgarians. By the end of the 10th century the Bulgarian Empire was in rapid decline. In 971 the capital, Preslav, and much of eastern Bulgaria was conquered by Byzantium. Under the leadership of Czar Samuil (997–1014), Bulgaria had a momentary resurgence, with the capital moving to Ohrid. Under Samuil the country expanded into present-day Albania, Montenegro, and parts of Thrace. However, in 1014 Emperor Basil II "Bulgaroktonus" (the Bulgarian-slayer) captured 15,000 Bulgarian troops and blinded 99 out of every 100; the remainder were left with one eye to guide their comrades back to their czar. When Samuil

saw his blinded soldiers he immediately died. By 1018 the last remnants of Bulgarian resistance were quashed and the First Bulgarian Empire came to an end.

THE SECOND BULGARIAN EMPIRE

The Bulgarian state disappeared until 1185, when the brothers Petar and Asen organized a rebellion against Byzantium. The revolt initiated the Second Bulgarian Empire, whose capital became Turnovo (present-day Veliko Turnovo). In a pattern that became characteristic of the reconstituted state, first Asen and then Petar were assassinated by disgruntled boyars. It was their youngest brother, Kaloyan (r. 1197–1207), who managed to introduce temporary stability to Bulgaria.

At the time, most of the troubles in the Balkans were coming from the crusaders. In 1204 they captured Constantinople and proclaimed that the Bulgarian czar was their vassal. Offended, Kaloyan marched against the armies of the Fourth Crusade and defeated them in a battle near Adrianople (present-day Edirne). Kaloyan captured Emperor Baldwin and took him as prisoner to his capital, Turnovo, where he died. The Bulgarian forces also decapitated the leader of the Fourth Crusade, Boniface. Kaloyan himself was assassinated shortly afterwards, by dissident nobles, while besieging Thessalonica.

After Kaloyan, Boril took the throne (1207–18). In 1218 the son of Asen, Ivan Asen II, returned from exile and deposed Boril. His reign (1218–41) saw the greatest expansion of the Second Bulgarian Empire which reached the Adriatic and the Aegean. Besides his military successes, Ivan Asen II also reorganized the financial system of Bulgaria and was the first Bulgarian ruler to mint his own coins. After his death, decline quickly set in. The external sources for this decay were the Mongol onslaught of Europe and the rise of Serbia as a major power in the Balkans.

The royal palace in Turnovo saw 13 czars in less than a century. Perhaps the most colorful of those was the swine-herder Ivailo, who rose from a common peasant to the Bulgarian throne. With a band of determined followers, he managed to defeat local detachments of the Mongol Golden Horde and push them across the Danube. In 1277 he entered Turnovo and personally killed the czar. His rule lasted only two years, and he was removed by troops dispatched from Constantinople.

The end of the Second Bulgarian Empire came during the rule of Czar Ivan Alexander (1331–71). He managed to consolidate the territory of Bulgaria, and the country enjoyed economic recovery. Ivan Alexander was also a

great patron of the arts. However, he contributed to the breakup of the Bulgarian realm. He separated the region of Vidin from the Bulgarian monarchy and set up his eldest son, Ivan Stratsimir, as a ruler there. He proclaimed the son from his second marriage, Ivan Shishman, as the inheritor of the Bulgarian throne. As czar, Ivan Shishman (1371–93) fought a losing battle both against the Ottoman Turks and against the breakaway ambitions of Bulgarian boyars. Turnovo fell to the Ottomans in 1393, and three years later Vidin also succumbed, causing the end of the Second Bulgarian Empire.

Bulgar invasions

The earliest records of Bulgar invasions in Europe come from the fifth century. In 481 Emperor Zeno employed Bulgar mercenaries against the Ostrogoths who had invaded the Danubian provinces of the Eastern Roman Empire. During the reign of Emperor Anastasius (491–518), the Bulgars made several incursions into Thrace and Illyricum. During the sixth century the Bulgars raided the Balkan Peninsula twice, and in 568 hordes of them surged into Italy from central Europe. Further invasions of Bulgars into present-day Italy took place around 630. At the time, the bulk of Bulgar invasions were focused on the lands of Byzantium south of the Danube River.

The original homeland of the Bulgars was somewhere between the northern coast of the Caspian Sea and the expanses of Central Asia and China. The name “Bulgar” is of Turkic origin—from the word *Bulgha*, which means “to mix.” This derivation underlines the complex ethnic makeup of the Bulgars and suggests that they were a hybrid people with a Central Asian, Turkic, or Mongol core combined with Iranian elements. The Bulgars were stockbreeders, who chiefly raised horses. The Bulgar army was dominated by its fast-moving cavalry. It is often argued that the semi-legendary leader of the Bulgars, Avitokhol, who alleg-

edly commanded them into Europe, was none other than Attila the Hun (406–453).

During the sixth century the Bulgars consolidated much of their European possessions into a state called Great Bulgaria, which extended over the North Caucasian steppe and what is now Ukraine. The capital of this state was at Phanagoria (modern-day Taman in Russia). The leader of Great Bulgaria was Khan Kubrat (c. 585–650). After his death his five sons divided the Bulgar tribes and continued invading European territories. The eldest son, Baian, remained in Great Bulgaria. The second son, Kotrag, crossed the river Don and settled on its far side. The descendants of either Kotrag's or Baian's Bulgars (or both) are reputed to be the founders of Volga Bulgaria in the eighth century, which is considered to be the cultural and ethnic predecessor of the present-day Tatarstan in the Russian Federation. Kubrat's fourth son, Kubert, moved to Pannonia and later settled in the area of present-day Transylvania. The fifth son, Altchek, moved on to Italy and took Pentapolis, near Ravenna.

Kubrat's third son, Khan Asparuh (644–701), moved his part of the Bulgar tribes in southern Bessarabia and established himself on an island at the mouth of the river Danube. From there he began attacks against the territory of Byzantium. By that time, Slavs had colonized most of the territory of the Balkan Peninsula. Asparuh entered into an alliance against Byzantium with the league of the seven Slavic tribes, which occupied the territory between the Danube and the Balkan mountain range.

Soon the Bulgars began settling in the territory south of the Danube River. Around 679 a Bulgaro-Slavic state was formed with its center at Pliska (in modern-day northern Bulgaria). Under the leadership of Asparuh the new state defeated the armies of Emperor Constantine IV in 680. This forced Byzantium to recognize the existence of an independent Bulgaro-Slavic state within the territory of its empire in 681. Although the Bulgar invasions were to continue in the following decades, these became wars for the establishment and enlargement of the new Bulgaro-Slavic state. The Bulgaro-Slavic state established by Asparuh grew into the BULGARIAN EMPIRE and became the predecessor of modern-day Bulgaria.

Burma

The classical civilization of Burma (Myanmar) is centered at Pagan. After the collapse of the Pyu state, the Mrammas (Sanskritized Brahma), or Burmans, founded their chief city, Pagan (Arimarddanapura or “City Where Enemies Were Exterminated”) around 849 C.E. The ethnic Chinese had pushed them back around the second millennium B.C.E. from Northwest China to eastern Tibet, after which they moved to Myanmar over several centuries. The first Burman center developed in the rice-growing Kyawkse Plain at the confluence of the Irrawaddy and Chindwin Rivers. According to the local chronicles, Pagan began as a group of 19 villages, each having its *nat*, or local spirit, which were later fused into a cult of a common spirit. Burmese legends speak of intrigue and bloodshed in the early Pagan history until the emergence of King Anawratha, or Aniruddha (1044–77).

Aniruddha conquered the MON country of Thaton in 1057 C.E., resulting in an infusion of Mon culture into Pagan. He maintained friendly contact with King Vijayabahu of Sri Lanka. The Cola ruler Kulottunga I was threatening the latter. Vijayabahu asked for help from the Pagan king, who sent military supplies. Sri Lanka's king sent Aniruddha the tooth relic of Buddha, which was enshrined in the Shwezigon Pagoda. Pagan was brought into the maritime trading network linked to the eastern coast of India.

Along with the Mon monk and scholar Shin Arhan, Aniruddha was responsible for spreading Hinayana Buddhism among his people. This quickly spread all over Myanmar and eventually to mainland Southeast Asia. Aniruddha also is credited with constructing a large number of pagodas, including the Shwezigon Pagoda. He visited the Bengal region and married an Indian princess. Aniruddha developed the small principality of Pagan into an extensive kingdom, and a distinct Burmese civilization grew based on Mon literature, script, art, and architecture.

The second prominent king of Pagan was Thileuin Man (Kyanzitha), who ruled from 1084 to 1112. He crushed the Mon uprising that had claimed the life of the earlier king's son and successor, Man Lulan, and made peace with the rival Thaton faction of the Mons through matrimonial alliances. The Thervada monkhood

flourished under his patronage. He even fed eight Indian monks daily for three months. Having heard about Buddhist monuments like the famous Ananta Temple in the Udayagiri hills of Orissa, he constructed the magnificent Ananda Temple in imitation. Kyanzittha also visited Bodhgaya and helped repair Buddhist shrines. He tried to bring assimilation of different cultural traditions prevalent in Myanmar, and the Myazedi pillar of 1113 C.E. had identical inscriptions in four languages: Burmese, Pali, Pyu, and Mon. He sent a mission to China, which recognized the sovereignty of Pagan.

The transition from Mon to Burman culture occurred during the rule of the grandson of Kyanzittha, Alaungsithu (Cansu I), who had a long reign from 1112 to 1165. He undertook punitive expeditions to Arakan and Tenasserim. Relations with Sri Lanka deteriorated over interference with trade between Angkor and Sri Lanka. Alaungsithu nurtured Buddhism and completed the imposing Thatpinnyu Temple in 1144. The last of the important kings of Myanmar was Narapatisithu (Cansu II, 1174–1211), who ended the Mon influence in the Pagan court. Relations with Sri Lanka improved, resulting in the end of the friendship of Burmans with Colas and a promise of noninterference by Pagan in Sri Lanka's trade over the isthmus region. The king also introduced reforms in monkhood. However his successors were unsuccessful, and gradual deterioration started in the Pagan kingdom.

The shrinking of central authority resulted in Arakan and Pegu becoming independent. The Thai people known as Shans began to enter Pagan. There were also subsequent Mongol expeditions against the kingdom. The last king of the dynasty, Narasimhapati (Cansu IV), was a boastful ruler, and his subjects murdered him for his flight during a Mongol invasion. Under the leadership of the Shans, the kings of Pagan were forced into a ceremonial role only. The problem facing Myanmar had been to hold together different ethnic groups, and this was evident in the Toungoot (Tungut) dynasty of the 16th century and the Konbaung dynasty (1792–1885).

The prevalence of Sanskritized names and commercial relations point to the close link between India and Myanmar. The region was geographically nearest to India among Southeast Asian countries, and there were land and sea routes through which cultural relations developed. From very early on Indians traveled these routes to Southeast Asia. Cultural intercourse between the two regions grew, probably through traders and Buddhist missionaries reaching lower Myanmar. Adopting Indian practices, women were given a higher place in society, and the caste system was rejected.

Though Buddhism dominated daily life, it was mingled with Brahmanism. At the site of King Kyanzittha's palace, *naga* spirits were propitiated, and the services of Brahmans were required. The king was proclaimed an avatar (incarnation) of Vishnu after his death. The name of one of the early cities of the Pyu people was Visnupura (modern Beikthano), and it was a center of Vishnuit influence. Images of Brahmanical gods such as Vishnu, BRAHMA, and SHIVA are found throughout Myanmar. Compared to Brahmanism, the influence of Buddhism in Myanmar was greater. In the Buddhist Jatakas there are frequent references to the sea voyage to Suvarnabhumi, or the golden land, which has been identified with Myanmar. Kings like Aniruddha and Kyanzittha were patrons of Buddhism, and because of their endeavor, the religion took firm roots in Myanmar.

Byzantine Empire: architecture, culture, and the arts

Byzantine history spans the period from the late Roman Empire to the beginning of the modern age. Constantine the Great, first Christian ruler of the Roman Empire, moved his capital to Byzantium in 330, renaming the city Constantinople. The state he ruled was Byzant, but the citizens called themselves Rhomaioi (Romans). The Byzantine Empire was heir to the Roman Empire. With the passage of time Byzantine civilization became distinct, as Greek influence increased and it dealt with the cultural impacts of Europe, Asia, and, after the seventh century, ISLAM. During the Middle Ages, when the concept of Eu-

rope developed, Byzantium was in decline and isolated from the West. Thus Europe came into being without Byzantium, the successor to the Roman Empire. By the time Europe was a full-blown concept, Byzantium was no longer a remnant of the Roman Empire, and Constantinople was part of the OTTOMAN EMPIRE.

HISTORICAL BACKGROUND

Constantine established Constantinople as Rome's capital, so the fall of Rome to the Goths did not end the empire, it merely relocated its center. Byzantine culture was a continuation of classical Greece and Rome but was distinctive in the way that it synthesized those influences with European and Islamic ones. The early Byzantine period saw the replacement of the ancient gods by Christianity and the establishment of Roman law and Greek and Roman culture. The golden age lasted until the Arab and Persian invasions in the seventh century and the ICONOCLASM of the eighth century. The Byzantine emperors instituted administrative and financial reforms. Eschewing the western approach of hiring foreign troops and lacking the tax base of the West, the emperors in Constantinople kept a small military. Although the western area lacked an emperor after 476, Byzantine emperors claimed to be rulers of the entire old Roman Empire, even though Byzantium's military was insufficient for the reconquest of the West.

For most Byzantine emperors the rhetorical commitment to recapturing Rome was sufficient. Justinian I (527–565) undertook expeditions with some success, taking North Africa and Italy, but Justinian's wars against the Ostrogoths destroyed Italy economically, devastating its urban culture. His wars were also a great burden on the treasury. Justinian's successors had to focus on reestablishing Byzantine finances destroyed by Justinian. They also had to deal with Persians in the east and Germans, Slavs, and Mongolians in the west. Heraclius I (610–641) settled Huns in the Balkans to thwart the western threat. Then he bested the Persians, ending that empire. The year of Heraclius's ascent to the throne, in Arabia MUHAMMAD first heard the message that would send the forces of Islam across the world. By the end of Heraclius's reign, the Muslim threat in Syria and Persia would force Byzantine attention away from the west and toward the east and south.

After initial Muslim successes in Syria and Egypt the Muslims took Persia and pressed into Byzantium several times in the seventh and eighth centuries. Leo the Isaurian (717–741) defeated the final Muslim effort to take Byzantium, and the empire stabilized. Taking advantage of unsettled conditions in the Muslim Caliphate the

empire retook most of Syria and reestablished itself as dominant until the 11th century.

After besting the Byzantines at Manzikert in 1071, the Seljuk Turks controlled Byzantium's eastern territory. Byzantium called on its coreligionists in Europe for help against the Turks, sparking the CRUSADES, which produced European kingdoms in Syria and Palestine and the taking of Constantinople in 1204. Byzantium continued in Greece and retook Constantinople in 1261, but the reestablished kingdom was a small city-centered entity, and Ottoman Turks absorbed it in 1453, renaming it Istanbul.

The empire was Christian but its Christianity differed from that of the West. The Latin popes won primacy in a Europe with no centralized secular ruler, but in Byzantium the emperor kept a powerful role in the church. The Byzantine retention of the Roman concept that the emperor was nearly divine would generate a split with the West, particularly through the Iconoclastic Controversy.

THE ICONOCLASTIC CONTROVERSY

During the fourth century in the Roman Empire, classical forms declined and eastern influences became more important. Constantinople became a new center for artists in the eastern part of the empire, especially Christians. Other centers included Alexandria, Antioch, and Rome. When the first two fell to the Arabs and Rome to the Goths, Constantinople was alone and supreme. The first great age came during the reign of Justinian I (483–565). He established a code of law that imposed his religion on his subjects and set the stage for absolutism. He built the Hagia Sophia and the Church of the Holy Apostles in Constantinople and the Basilica of San Vitale in Ravenna (in Italy). After Justinian the empire declined, with Justinian's conquests lost and Avars, Slavs, and Arabs threatening. Religious and political conflict also disturbed the capital.

In 730 Leo III the Isaurian came into contact with Islamic beliefs during his successful wars against the Muslims. Accepting the purity of the Muslim rejection of idols and images, he banned images of Jesus, Mary, and the saints. The Iconoclastic period lasted until 843. Iconoclastic theologians regarded the worship of icons or images as pagan. Worship was reserved for Christ and God, not for the product of human hands, during the Iconoclastic Controversy.

The Iconoclastic Controversy disoriented the Byzantine Church. Byzantine religious culture and intellectual life, previously known for innovation and speculation, were stagnant from that point. A wholesale destruction

Justinian I built the Hagia Sophia in sixth century. The minarets were added later by the Ottomans.

of art showing inappropriate figures occurred. Restrictions on content meant that ornamental designs and symbols such as the cross were about the limit of expression. Without human figures, mosaicists borrowed Persian and Arab designs, such as florals, and the minor arts remained vibrant.

The papacy adamantly rejected **ICONOCLASM** as a threat to the authority of the pope. Leo's son Constantine V (740–775) was more adamantly iconoclastic than Leo. Although Byzantium abandoned iconoclasm in the ninth century, the breach persisted. The end of iconoclasm brought about the Macedonian Renaissance, beginning under Basil I, the Macedonian, in 867. The ninth and 10th centuries were times of improved military circumstances, and art and architecture rebounded. Byzantine mosaic style became standardized, with revived interest in classical themes and more sophisticated techniques in human figures.

After the Iconoclastic Controversy resolved itself in favor of using icons, the empire flourished from 843 to 1261. During this period the arts prospered, the official language was Greek, and Christianity solidified its hold from the capital through the northern Slavic lands.

After the Macedonians came the Komnenian dynasty, starting in 1081 under Alexios I Komnenos. This dynasty reestablished stability after the major dislocations of Manzikert, which cost Byzantium Asia Minor. Between 1081 and 1185 the Komnenoi patronized the arts, and a period of increased humanism and emotion occurred. Examples are the Theotokos of Vladimir and the Murals

at Nerezi. As well as painted icons, this period saw mosaic and ceramic examples, and for the first time the iconic form became popular through the empire.

Excellent Byzantine work of this period is also found in Kiev, Venice, Palermo, and other places outside the empire. Venice's Basilica of St. Mark, begun in 1063, was modeled on the now destroyed Church of the Holy Apostles in Constantinople. The Crusades, specifically the **MASSACRE OF CONSTANTINOPLE** in 1204, ended eight centuries of Byzantine culture. The Frankish crusaders of the Fourth Crusade pillaged Constantinople, generating even more destruction of Byzantine art than did the iconoclastic period.

PALAEOLOGAN MANNERISM

The state reestablished in 1261 included only the Greek Peninsula and Aegean Islands. After the crusader period (1204–61), Byzantium had a final surge until the Ottoman conquest. The final bloom of Byzantine art, the Palaeologan Mannerism, occurred under the Palaeologan dynasty, founded by Michael VIII Palaeologus in 1259. This era saw increased exchange between Byzantine and Italian artists, new interest in pastorals and landscapes, and the replacement of masterful mosaic work such as the Chora Church in Constantinople by narrative frescoes. Byzantine culture included women and men alike, unlike practices in classical Greece and Rome or in medieval Europe. Women could not attend school, but aristocratic females received tutoring in history, literature, philosophy, and composition. The greatest Byzantine writer was the female historian Anna Komnene, whose biography of her father, Emperor Alexios, is among the best of medieval histories.

Byzantine art was underpinned by the art of ancient Greece, and until at least 1453 it remained strongly classical yet unique. One difference was that the ancient Greek humanistic ethic gave way to the Christian ethic. That meant that the classical glorification of man became the glorification of God, particularly Jesus. Byzantine art replaced the classical nude with figures of God the Father, Jesus (Christ) of Nazareth, the Virgin Mary, and the saints and martyrs. Byzantine art emphasized strongly the icon, an image of Christ, Mary, a saint, or Madonna and Child used as an object of veneration either in church or at home.

Byzantine miniatures showed both Hellenistic and Asian influences. Byzantine architecture rested on Roman technical developments. Proximity to the Hellenized East meant that Constantinople's architecture showed Eastern influences. The Basilica of St. John of the Studion, dating from the fifth century, exemplifies

the Byzantine use of Roman models. Some criticize Byzantine art as lacking in realistic depictions of humans. Byzantine art lacked some of the naturalism of ancient Greek art. Particularly in sculpture, technical expertise declined as emphasis shifted to Christian themes. However, Byzantine art had periodic technical revivals, and it maintained enough of the Greek classical influence to allow the Renaissance to happen. Rejecting sensual pleasure, pagan idols, and personal vanity, Byzantine artists worked to serve Christianity by showing not the external perfect human form but the internal, spiritual element of the subject. Stylized and simplified representations were appropriate to this purpose.

New techniques and new levels of accomplishment characterized Byzantine silver- and goldsmithing, enamel, jewelry, and textiles. Byzantine mosaics and icons showed high levels of originality. Architecture found its highest expression in the Hagia Sophia, superior in scale and magnificence to anything in the ancient world. Although skill levels fluctuated over time, in most Byzantine art forms certain usages, patterns, and practices remained constant. Mosaics served as the predominant decorative art for domes, half-domes, and other available surfaces of Byzantine churches.

Byzantine painting concentrated to a great extent on devotional panels. Icons were vital to both religious and secular life. Icons lacked individuality, their effectiveness resting on faithfulness to a prototype. Byzantine painting also included manuscript illumination. Byzantine art continues in some aspects in the art of Greece, Russia, and the modern Eastern Orthodox countries. Enamel, ivory, and metal reliquaries and devotional panels were highly valued through the Middle Ages in the West. Byzantine silk was a state monopoly and a highly prized luxury.

In Italy Byzantine art was a major contributor to the Romanesque style in the 10th and 11th centuries. In the HOLY ROMAN EMPIRE, CHARLEMAGNE had close ties to Byzantium; he and other Frankish and Salic emperors transmitted the Byzantine influence through their domains.

The official end to Byzantium came with the fall of Constantinople to the Ottoman Turks in 1453, but in the meantime the culture had diffused with Orthodox Christianity to Bulgaria, Romania, Serbia, and, most significantly, Russia, which took the mantle from Constantinople after 1453. The Ottomans allowed Byzantine icon painting and small-scale arts to continue. Byzantium transmitted classical culture to Islam and to the West. More important, Byzantine culture and religion strongly influenced the Slavs, particularly the Russians.

The interior of the Hagia Sophia (now a museum in Istanbul), considered more magnificent than anything in the ancient world.

Around 988 the Russian VLADIMIR converted to Byzantine Christianity. When Byzantium collapsed in 1453, Russia's rulers took the title "caesar" (czar), that of the Byzantine emperors. The Russian czar proclaimed Moscow the "Third Rome," after Rome and Byzantium. The Byzantines also preserved culture, pursuing science, philosophy, and classical studies. Byzantine basic education entailed mastery of classical Greek literature, including the works of Homer, largely unknown in the West. Byzantine scholars studied and preserved the works of Plato and Aristotle, making them available to first the Islamic world and then western Europe.

JOHN H. BARNHILL

Byzantine Empire: political history

The city of Constantinople, or Byzantium, was founded, according to legend, in 667 B.C.E., by Greeks from Megara and gradually rose in importance during the Roman Empire. Its initial importance was its position on the trade routes in the eastern Mediterranean, especially its close access to the land routes to Persia, Central Asia, India, and China, as well as guarding the entrance to the Pontus Euxinus (Black Sea).

During the second century the Roman Empire had grown so substantially that there were moves to split it into an eastern and a western empire. This concept was introduced by Diocletian, who looked to the past for ideas to resolve the problems facing the Roman Empire. His idea was that two emperors (each known as an *augustus*) would rule the two halves of the Roman Empire. Each *augustus* would then nominate a younger man, known as a *caesar*, to share the ruling of the empire and succeed to the post of *augustus*. This reduced the Roman emperors to the equivalent of chief executive officers who nominated their successors. Diocletian then moved his capital to Nicomedia in modern-day Turkey. The idea did work briefly, but there were enormous problems, and it was left to Emperor Constantine the Great to rework the system. In 330 Constantine established the eastern capital at Byzantium, which he called Constantinople. He also reintroduced a hereditary succession to try to stop the strife caused by contending *caesars*. Although his successors ruled over what became known as the Byzantine Empire, those living in Constantinople never saw themselves as Byzantines, the name coming from the Thracian-Greek name for the city. Instead they regarded themselves as Romans (or *Romaioi*), and direct lineal descendants of the power, traditions, and prestige of the Roman Empire.

ORIGINS OF THE BYZANTINE EMPIRE

Essentially the Byzantine Empire owes its origins to Constantine the Great who ruled from 324 to 337. The emperor drew up plans for enlarging his city with the building of a large palace, a forum, a hippodrome, and government departments. To protect the city from attack, Constantine also supervised the building of large walls across the isthmus. Constantine died at Ancyrona, near

Nicomedia, and his body was brought back to Constantinople, where it was buried. He was then succeeded by his eldest son, Constantius (or Constantine II), who reigned from 337 to 340. He was succeeded by his brother Constantius II, who ruled until his death in 361 and as sole emperor from 353 to 361. He died of fever near Tarsus in modern-day Turkey. The next emperor was Julian the Apostate, (r. 361–363). He was the son of Julius Constantius, half brother of Constantius II. The last pagan emperor; he tried to restore religious traditions of Rome in an effort to try to restore his empire to its former glory.

When Julian died in a battle against the Sassanid Persians, a prominent Roman general, Flavius Iovianus, was elected Roman emperor, becoming the emperor Jovian. He was a Christian and is best remembered for being outmaneuvered in a peace agreement with the Sassanids. He died on February 17, 364, after a reign of only eight months. His successors were Valentinian I, another successful general, and his younger brother Valens, Valens becoming emperor of the Eastern Roman Empire. Valens reigned for 14 years, and his first task was to withdraw from Mesopotamia and parts of Armenia, which Jovian had ceded to the Sassanids. However, Valens also had to deal with a revolt by Procopius, a maternal cousin of Julian. Procopius managed to raise two army legions to support his proclamation as emperor, and Valens considered abdicating to prevent a civil war. When Valens sent two legions against Procopius, both mutinied and joined the rebellion. However, by the middle of 366 Valens had managed to raise a large enough army to defeat the forces of Procopius at the Battle of Thyatira. Procopius was captured soon afterwards and executed.

The revolt of Procopius encouraged the Goths to attack the Eastern Roman Empire. This meant that Valens had to lead his successful army north, and after defeating a Goth army, he concluded a peace treaty that allowed Roman traders access to the lands controlled by the Goths. War with Sassanid Persia broke out, forcing him to lead his armies back toward Persia. His campaign was cut short when the Visigoths threatened the northern frontier. They had lost lands to the Huns and were anxious to compensate themselves with Roman lands. Eventually the Visigoths allied with the Huns, and along with the Ostrogoths, attacked the Romans. A massive Byzantine army moved against them, leading to the Battle of Adrianople, August 9, 378. The Goths and their allies destroyed the Roman army, and Valens was killed during the battle. It left the Byzantines exposed, and with Gratian, the 19-year-old nephew of Valens, as the emperor of the Western Roman Empire, there was the need for a strong ruler to save the empires.

THEODOSIUS I

Theodosius I, born in Galicia, in modern-day Spain, was the son of a senior military officer who was executed after being involved in political intrigues. Theodosius was made commander of Moesia, on the Danube (in modern-day Serbia and Bulgaria). After Adrianople, Gratian appointed him as the co-augustus for the East, and he co-ruled with Gratian and Valentinian II. On a political level, Theodosius was a Christian and made Christianity the official state religion of the Roman Empire. In 381 he helped convene the second general council of the Christian Church, held at Constantinople, where some of the decisions of the Council of Nicaea in 325 were confirmed.

The main task of Theodosius was to ensure the military survival of the Roman Empire, and he immediately went to war in the Balkans with the Sarmatians. He had defeated them six years earlier, and another victory led to his being proclaimed as co-emperor on January 19, 379. He was given the provinces of Dacia (modern-day Romania) and Macedonia, both areas having been attacked many times in the previous decades. Living at Thessalonica, Theodosius built up his army. To raise more soldiers, he allowed for Teutons to be recruited, rewarding many of them with senior administrative positions. Theodosius also sought a compromise with the Visigoths and assigned lands to the Goths in the Balkans in return for peace. It was the first time that an entire people were settled on Roman soil and able to maintain their autonomy. It avoided war with the Goths, many of whom converted to Christianity.

These moves were unpopular with some in Rome, and later historians have blamed these positions on making Rome vulnerable to attack. However, Theodosius was able to use this newfound military force to great effect. When a usurper, Maximus the Confessor, gained support in the Western Roman Empire and invaded Italy, Theodosius was the only commander with enough soldiers to check his advances. In 378 he defeated Maximus and, later, the forces of another usurper, Eugenius. Theodosius crushed his rebellion at the Battle of Frigidus on September 5–6, 394. By this time Theodosius was sole emperor. He was subsequently known to history as Theodosius the Great.

When Theodosius I died, his younger son, Honorius, succeeded him in the West, and his eldest son, Arcadius, succeeded him in the East. Arcadius appears to have been a weak ruler, and for much of his reign, a minister, Flavius Rufinus, a politician of Gaulish ancestry, made the decisions. With Honorius being dominated by his minister Flavius Stilicho, the position of emperor was

in danger of becoming symbolic. According to some accounts, it was rivalry between the ministers that led to Stilicho having Rufinus assassinated by Goths. However, a new minister, Eutropius, took over for Rufinus until, in 399, the wife of Arcadius persuaded her husband to remove Eutropius, who was later executed. The Praetorian commander, Anthemius, took over, with Arcadius retreating from the political scene until his death on May 1, 408. His son Flavius Theodosius, who became Theodosius II, succeeded him.

Theodosius II was only seven when he became emperor, but on the reputation of the military built up by his grandfather, the boy had a trouble-free minority, and the empire remained safe from attack through his long reign, which ended with his death on July 28, 450. His older sister, Pulcheria, whose interpretation of Christianity was anti-Jewish, heavily influenced Theodosius. Under Pulcheria's influence, the Christian Church condemned the Nestorian viewpoint of the dual nature of Christ as heretical, and Nestorius, its proponent, was exiled to Egypt.

In 425 the University of Constantinople was founded as a center for Christian learning. Theodosius II is best remembered for his codification of the laws of the Roman Empire. In 429 he ordered that copies of all laws be brought to Constantinople, and nine years later the *Codex Theodosianus* was published. Although the Eastern Roman Empire was safe, the Western Roman Empire crumbled during this period, resulting in much power reverting to Constantinople. During the last years of the reign of Theodosius II, the Byzantine Empire came under attack from Attila the Hun, and the Byzantines responded by paying large tribute to the Huns to stop the attacks.

On the death of Theodosius II in 450, Pulcheria chose as her brother's successor Flavius Marcianus, her husband, who became Emperor Marcian. Marcian stopped the payments to the Huns, who, by this time, were more concerned with attacking Gaul and Italy. Marcian also fortified Syria and Egypt to prevent attacks and was thought to have distanced himself from events in the Western Roman Empire. It appears that Marcian may have been involved in the death of Attila in 452, even though he did not send aid to Rome, which was sacked by the Vandals in 455. Marcian and his wife are both recognized as saints by the Eastern Orthodox Church.

Marcian died in 457, and Flavius Valerius Leo Augustus (Leo the Thracian) became the new emperor. He was a successful general who had led campaigns in the Balkans and against the Goths. Leo I sent a large army against the Vandals, under the command of his brother-in-law Basiliscus, but it was decisively defeated in 468. He died in 474 and was succeeded by his

An illustrated manuscript showing Byzantine cavalrymen overwhelming enemy cavalry and foot soldiers. The Byzantine Empire was officially dissolved in 1204, though its culture remained much the same for the next 200 years.

seven-year-old grandson, Leo II, who died 10 months later. Leo II's father, Zeno, became emperor. Initially he had success leading his armies against the Vandals and the Huns in the Balkans. In January 475 he was deposed by Basiliscus, who took control of Constantinople for his reign, which lasted 19 months. In August 476 Zeno took over again, exiling Basiliscus and his wife and son to Cappadocia, where they died from exposure. Zeno managed to build up the Byzantine finances. When he died in April 491, his widow, Ariadne, chose an important courtier, Anastasius, to succeed him.

Anastasius was involved in the Isaurian War from 492 to 496, where forces loyal to Longinus of Cardala, a brother of Zeno, revolted. Many rebels were defeated at the battle of Cotyaeum, and although guerrilla war continued for some years, Anastasius was never in serious danger from them again. From 502 to 505 he was involved in a war with the Sassanid Empire of Persia. Initially the Sassanids were victorious, but the war

ended in a stalemate. Anastasius then spent much of the rest of his reign building defenses. These included the Anastasian Wall, which stretched from Propontis to the Euxine, protecting the western approaches to Constantinople. Anastasius died on July 9, 518, the last Roman or Byzantine emperor to be deified.

Justin I was nearly 70 when he became emperor. He was illiterate but was a successful career soldier. The last years of his reign saw attacks by Ostrogoths and Persians. In 526 he formally named Justinian, his nephew, as co-emperor and his successor.

JUSTINIAN I

Justinian I was one of the most famous Byzantine rulers and is best remembered for his legal reforms that saw the establishment of a new legal code. He gained a reputation for working hard, being affable but unscrupulous when necessary. His early military moves were to try to regain the lost lands of Theodosius I. He failed

in this but quickly gained a reputation for surrounding himself with advisers who achieved their status through merit.

One of these was Tribonian, who had the task of codifying the law—the first time all of Roman law was written down in one code. At the same time Justinian's general Belisarius decided to launch an attack on the Sassanid Persians and against the Vandals in North Africa, recapturing Carthage. In what became known as the Gothic War, Belisarius retook Rome in 536, and four years later he took the Ostrogoth's capital, Ravenna. The 540s saw parts of the Byzantine Empire ravaged by bubonic plague.

In 565 Justinian I died and his nephew Flavius Iustinus became Emperor Justin II. The Byzantines lost land to the Sassanids in a disastrous war with Persia. Justin II became troubled by mental problems and may have been going senile. He appointed a general named Tiberius as his successor. Tiberius II Constantine was the first truly Greek emperor, and he continued the war with the Persians in Armenia. He was succeeded in 582 by a prominent general, Maurice, who subsequently married the daughter of his predecessor.

The Emperor Maurice reigned from 582 to 602, a time when the empire was constantly attacked. When the Romans intervened in a dynastic war in Persia, they were amply rewarded by the return of eastern Mesopotamia and Armenia. However, while the Byzantines were involved in Persia, the Slavs took control of much of the Balkans. In 602 a mutiny by troops led to a general called Phokas (Phocas) entering Constantinople and killing Maurice, after forcing the deposed emperor to watch the execution of five of his sons.

Phokas was from Thrace and was a successful general of obscure origins before he seized the throne. The seizing of power by Phokas was the first bloody coup d'état since Constantinople became the capital of the Eastern Roman Empire. Phokas was initially popular because he lowered taxes and introduced reforms that benefited the Christian Church. However, on a military front, the Eastern Roman Empire faced invasion, especially in the northern Balkans, and raiders did reach as far as Athens. In addition, King Khosrow II of Persia, installed by Maurice, started to conspire against the man who overthrew him. The Persians championed a young man whom they claimed was a son of Maurice, taking over some of Anatolia. In addition, trouble brewed in Egypt and Syria. In 610 Heraclius, the exarch (proconsul) of Africa, staged a rebellion that ended with Phocas being put to death.

Heraclius I was emperor from 610 to 641 and tried to reunite the empire that was still under attack in the

Balkans and from the Persians. The latter managed to capture Damascus in 613, Jerusalem in the following year, and in 616 invaded Egypt. Their raids deep into Anatolia caused Heraclius to consider moving the capital from Constantinople to Carthage, but his reorganization of the military allowed him to stop the invading forces. Much of this centered on land grants to families in return for having them serve in the military when the empire was in danger. In 626 Constantinople itself was attacked, but in the following year at the Battle of Nineveh, the Byzantines defeated the Persians, leading to the deposing of Khosrow II of Persia and the Byzantines gaining all the land they had lost.

Heraclius started to use the Persian title king of kings, and no longer used the term *augustus*, preferring *basileus*, Greek for “monarch.” During the 630s the Arabs proved to be a major threat to the Byzantines, who were decisively defeated in the Battle of Yarmuk in 636. Heraklonas's two sons succeeded him, Heraklonas Constantine (Constantine III) and Constantine Heraklonas (Heraclius). The former ruled for only four months before succumbing to tuberculosis. His younger half brother became the sole emperor; however, there were rumors that Constantine III had been poisoned, and a rebellion led to the deposing of Heraklonas four months later, and the son of Constantine III became Emperor Constans II.

Under Constans II, the Byzantines were on the retreat, having to withdraw from Egypt with the Arabs quickly capturing parts of North Africa. The Arabs also destroyed much of the Byzantine fleet off Lycia. Later the Arabs split into what became the Sunni and Shi'ite factions, and were unable to carry out their plan of attacking Constantinople. Constans II was assassinated by his palace chamberlain in 668, and a usurper, Mezezius, was emperor for a year until Constans II's son became Constantine IV and reigned until 685. By now the Arabs attacked Carthage, Sicily, and captured Smyrna and other ports in Anatolia. The Slavs also used the opportunity to attack Thessalonica. The Byzantines were able to successfully use Greek Fire against the Arabs at the sea battle of Syllaenum. Constantine was worried that his two brothers, crowned with him as co-emperors, would pose a threat to him, and he had them both mutilated. This allowed his son Justinian II to succeed to the throne (r. 685–695 and 705–711). In the interval two successful generals, Leontios and Tiberios III, were briefly emperors.

Justinian became increasingly unpopular and was killed by rebels, with Philippikos becoming emperor 711–713. He managed to stabilize the political situation

and was succeeded by his secretary Artemios, who became Emperor Anastasius II. After two years a rebel leader and former tax collector deposed him, capturing Constantinople and proclaiming himself Emperor Theodosius III. He only lasted two years; a rebel commander took control of Constantinople and forced Theodosius to abdicate. He later became bishop of Ephesus.

LEO III

The new emperor, Leo III, was able to stabilize the Byzantine Empire, and he remained emperor from 717 until his death in 741. He immediately set about a reorganization of the empire's administration. Much of this centered on the elevation of serfs to become tenant farmers. Making alliances with the Khazars and the Georgians, he was able to defeat the Arabs. Leo III, however, is best known for his **ICONOCLASM** when, from 726 to 729 he ordered the destruction of the worshipping of images. His son, who became Emperor Constantine V, succeeded him at his death. He reigned until 775, managing to continue with the reforms and iconoclasm of his father and also defeat the Arabs and the Bulgars. He died while campaigning against the latter and was succeeded by a son who became Emperor Leo IV. Although Leo IV only reigned for five years, he managed to send his soldiers on several campaigns against the Arabs. When he died, his son, aged only nine, became Emperor Constantine VI. Scheming led to him being taken prisoner and blinded by his mother, who succeeded as Empress Irene, the widow of Leo IV. Her finance minister deposed her in 802. He became Emperor Nikephoros I and continued the wars against the Bulgars and the Arabs until he was killed in Bulgaria in 811.

The son of Nikephoros I became Emperor Staurakios, but he reigned only for just over two months until he was forced to abdicate. He went to live in a monastery, where he died soon afterwards. His brother-in-law then became Emperor Michael I. Eager to become popular, Michael reduced the high levels of taxation imposed by Nikephoros I. He also sought a compromise with **CHARLEMAGNE**.

Abdicating, he retired to a monastery, and Leo V, an Armenian, became the next emperor. He was assassinated in 820, leading to the Phrygian dynasty of Michael II coming to power. Michael II was emperor from 820 to 829, and his son Theophilos succeeded him, ruling until 842. His wife then ruled, and then his son Michael III "The Drunkard," who was assassinated in 867, ushering in Basil I and the Macedonian dynasty.

Basil I was believed to have been of Armenian ancestry, and he lived in Bulgaria, leading an expedition against the Arabs in 866. He helped in the assassination of his predecessor and became one of the greatest Byzantine rulers. Apart from codifying the laws, he also built the Byzantines into a major military power. His reign also coincided with the Great Schism, in which Basil determined that Constantinople should remain the center of Christianity, not Rome. Basil allied the Byzantines to the forces of Louis II, the Holy Roman Emperor. Their combined fleets were able to defeat the Arabs, and although the Byzantines lost much of Sicily, the eastern frontier was heavily reinforced, and Arab attacks against the Byzantines were unsuccessful. When Basil died in 886, his son Leo VI succeeded him, although some accounts identify Leo VI as a son of Michael III.

Leo VI, who was the son of a mistress of Michael III and later mistress of Basil I, ended up at war with the Bulgarians, although his tactical alliance to the Magyars was successful for a period. The Byzantine defeat in 896 was a reverse that was followed by the Arabs capturing the last Byzantine-held bases on Sicily. A Byzantine expedition tried to recapture Crete but failed, and Leo VI died in 912, succeeded by his younger brother Alexander. Emperor Alexander was extremely unpopular, and his death after a polo match ended his reign of 13 months. Leo VI's illegitimate son then succeeded as Constantine VII in 913, inheriting a war with Bulgaria. Constantine was deposed in 920 by Romanos I, the son of a member of the Imperial Guard who was deposed in 944, leading to Constantine VII returning as emperor. He then reigned for 14 years, and when he died, his son Romanos II became the next emperor.

As soon as Romanos II took over, he purged the court of his father's friends, and allegations were made that he had poisoned his father to gain the throne. Although Romanos II was indolent and lazy, he left the army in the command of capable generals. He died after a reign of four years, succeeded initially by his five-year-old son, Basil II. Nikephoros II quickly deposed Basil, reigning for six years until he was assassinated. It was during his reign, in 961, that the famous monastery complex on Mount Athos was founded. The next emperor was John I, who reigned for six years, until he died. During his reign he trained ex-emperor Basil to rule, and Basil II became emperor again, reigning for 49 years.

Basil II formed a strong alliance with Prince **VLADIMIR I** of Kiev, and together they managed to stabilize the northern borders of the Byzantine Empire. Basil II also took back large parts of Syria, although he did not manage to retake Jerusalem. War in Thrace against the

Bulgarians saw the Byzantines destroy their opponents at the battle of Kleidion on July 29, 1014. Basil II was succeeded by his younger brother, Constantine VIII, who reigned for only three years, being succeeded by Romanos III, a great-grandson of the usurper Romanos I.

As the first in a new dynasty Romanos III tried to change many aspects of Byzantine rule. He financed many new buildings, including monasteries. He abandoned plans by Constantine VII to curtail the privileges of the nobles but faced many conspiracies, which led to his overthrow after a reign of fewer than six years. Michael IV, a friend of the daughter of Constantine VIII, ascended the throne. Military reforms were pressing, with the Byzantines under attack from Serbs, Bulgarians, and, more menacingly, the Arabs.

It was also a period when the Normans were a rising military power. Michael IV defeated the Bulgarians and died in 1041, succeeded by his nephew Michael V, who only ruled for four months. Deposed, blinded, and castrated, Michael V was succeeded by Zoe, his adoptive mother. Constantine IX, the son of a senior civil servant, ruled from 1042 until 1055. A patron of the arts, he was subject to scheming and internal revolts. He was succeeded briefly by Michael VI and then by Isaac I Komnenos. In 1059 Constantine X became emperor and inaugurated the Doukid dynasty. After his reign of eight years, his son Michael VII ruled for 11 years. For three of those years, Romanos IV, the second husband of Constantine X's widow, was also emperor. In 1081 Alexios Komnenos, nephew of Isaac I, restored the Komnenid dynasty. Alexios was worried about the Turks controlling the Holy Land and decided to ask Pope URBAN II for some military help from western Europe, resulting in the launching of the First Crusade.

Over the next two centuries, as battles with Turks continued over Asia Minor, the empire's relationship to the West deteriorated. During the Crusades the empire's lands were meant to be used as a staging ground for the

war to "reclaim" the Christian holy lands, but bored, undisciplined crusaders frequently wound up sacking and pillaging Byzantine cities when they were too impatient to wait for their arrival in Muslim territories. The Byzantine renaissance of the 12th century was an artistic and economic one—an inward-facing revival rather than a return to the sort of diplomatic fervor that had marked the empire's earlier centuries. At the turn of the very next century, the soldiers of the failed Fourth Crusade were hired by Alexios IV, the son of the deposed Byzantine emperor Isaac II, to restore his father's throne. Constantinople fell to the crusaders in 1204, and the Latin Empire was established to govern formerly Byzantine lands, with many territories apporportioned to Venice.

The Byzantine Empire was officially dissolved, though its culture remained much the same for the next 200 years—through shifting governments, as the Latin Empire never stabilized and was followed by brief-lived successors—until 1453, when the Ottoman Turks conquered Constantinople and all its lands.

Caesaropapism

Caesaropapism is the idea that the emperor had complete control over the Orthodox Greek Church in the Roman/Byzantine Empire, relegating the church to something like a department of state, subordinate to, rather than independent from, imperial power. This is a western perspective never found in Byzantine sources. In the Byzantine/Orthodox perspective there was, ideally, a harmony between emperor/imperial power (*imperium*) and church/ecclesiastical power (*sacerdotium*), not a domination and subordination, respectively.

The relationship of church and Roman state changed drastically after the conversion of Emperor Constantine the Great (d. 337). Up to this time Christianity had been a persecuted minority sect far from the wealth and power of the imperial palace and Roman aristocracy. By that time the church had developed a strong and effective organizational structure and leadership as well as a means of regulating problems (though these did not always prove successful) through local councils. After Constantine's conversion the church was raised to a new level of affluence and power, as bishops now became figures of wealth and influence. Imperial patronage of the church also meant imperial involvement in the church and, conversely, church involvement in politics.

The emperor was constantly concerned to ensure peace in the church and took action when theological controversies threatened to rend it into competing factions because these quickly devolved into quasi-political factions. The emperor did not decide such contro-

versies unilaterally. Instead, he relied on the church. The emperor, starting with Constantine I, summoned all bishops together to an ecumenical ("universal") council where they could officially establish Orthodox doctrine and practice. The Orthodox Church recognizes seven such councils (Council of Nicaea, 325; Council of Constantinople, 381; Councils of Ephesus and Chalcedon, 431, 451; Constantinople, 551; Constantinople, 680; Nicaea, 787). Nevertheless, these councils did not always lead to harmony, since those condemned often broke away (like Monophysites in Syria and Egypt after the Fourth Ecumenical Council). In the later fourth century Emperor Theodosius I (d. 395) proclaimed the Orthodox Christian faith the only legal religion of the empire. Afterwards, adherence to the Orthodox theology of the emperor was the measuring stick for loyalty and citizenship in the empire. Church and state in Byzantium were thoroughly intertwined.

The emperor's power was perceived as granted by God and visibly shown by his coronation at the hands of the patriarch in the great cathedral of Hagia Sophia. The emperor demonstrated his God-given duty by promoting Christianity, protecting the church, and enforcing its regulations. The emperor's role in the church continued beyond calling ecumenical councils. He also selected the patriarch of Constantinople, the leading cleric in the Orthodox Church. Usually the emperor selected him from a short list provided by a synod of clergy, but he could also choose another candidate altogether. Sometimes in fact, he chose a layperson, as he did with the ninth-century Patriarch Photius.

The emperor acted as an overseer of the church and was granted special privileges. He could enter the sanctuary (the area that is today behind the iconostasis), which was reserved only for clerics. He could also receive communion in the same fashion as priests. In addition, the emperor could preach sermons, as did Emperor Leo VI (d. 912), and bless the congregation. He also enacted legislation regulating church activities and even, at times, on theology. The emperor could not, however, celebrate the Divine Liturgy; that was reserved only for ordained clergy. Here was one area distinguishing imperial (*imperium*) and the clerical power (*sacerdotium*). Yet, as is clear, in Byzantium, church and state were linked together in an inseparable fashion. There was no clear-cut distinction between the impact of canon (*kanon*) and civil (*nomos*) law on the Byzantine community. In the 12th century canonist Theodore Balsamon declared that the emperor regulated both civil and canon law and argued that the emperor himself was not limited by canon law. Yet, this was only in theory.

In reality, the emperor was indeed limited in his control over orthodoxy. While he could remove bishops and appoint their replacements, he answered to the church. When the popular patriarch John Chrysostom was removed in the early fifth century, the rioting in Constantinople burned whole regions of the city. Moreover, the emperor could not permanently alter doctrine without the support of the church and especially the great defenders of orthodoxy, monks. In the seventh century emperors championed the doctrine of Monotheletism (which asserted that Christ had only one will for both his divine and human nature); despite their efforts it failed, because of the opposition clergy and monks, like Maximus. In the eighth and ninth centuries the controversy over ICONOCLASM was driven by the imperial palace and opposed fiercely by monks like JOHN DAMASCENE and Theodore the Stoudite. This too failed. In the 10th century, Emperor Nikephoros Phokas wanted the church to recognize as martyrs all Christians who died fighting Muslims. The patriarch rejected this. In the 11th century, tension between the bishops of Rome (of the Latin Church) and Constantinople (of the Greek Church) led to the Schism of 1054 that separated the Catholic and the Orthodox Churches—despite imperial efforts to prevent it.

In the 13th–15th centuries Byzantine emperors, desperate for military support from the west, attempted to submit the Orthodox Church to the papacy (at the Council of Lyons in 1274 and the COUNCIL OF FLORENCE in 1438–1939) but were foiled by monks and clerics unwilling to yield theologically. While the emperor

had a level of practical power, this power was checked by the tradition of the church and by the unyielding commitment to principle of monastic and clerical defenders. Finally, despite the name (Caesaropapism) emperors never claimed to have the authority over the church as the pope, the bishop of Rome, did in the west. Despite the power of the emperor, he did not have complete control over the church, as the word implies. He was not pope and emperor of the Orthodox Church.

MATTHEW HERBST

Caliphs, first four

Muslim leaders

After the prophet MUHAMMAD’s death in 632, the elder statesman Abu Bakr (r. 632–34) was selected as the new caliph or representative of the Muslim community. The first four caliphs were known as the Rashidun or rightly guided ones. Abu Bakr irritated Muhammad’s daughter, Fatima, and her husband, Ali, by declaring that the Prophet’s estate belonged to the Muslim community and not to the family. Although Ali’s supporters reluctantly accepted Abu Bakr as the caliph they would ultimately split from the majority Muslim community.

In what were known as the Ridda wars (wars against apostasy), Abu Bakr’s first major challenge was to put down a number of rebellions by tribal nomads who opposed the central control of the Islamic state. Within two years, the Muslim forces had secured the entire Arabian Peninsula and ruled from the capital of Medina. With Abu Bakr’s death Omar was selected as the second caliph in 634. For his achievements as a ruler and administrator, Omar has been called the second founder of Islam.

Under Omar (r. 634–44), the Arab forces, imbued with religious fervor and desire for wealth, embarked on a series of dynamic and swift wars against the neighboring Byzantine and Sassanid Empires. The plunder from these conquests was divided with one-fifth going to the state and the rest apportioned among the warriors.

Ownership of conquered lands reverted back to previous owners with payment of a tax or went to the state. As a result the new Islamic/Arab empire became increasingly wealthy.

At the Battle of Yarmuk the Arab Muslim forces decisively defeated the Byzantine emperor Heraclius and Damascus was taken in 636. The city's grand Byzantine church was turned into a mosque and subsequently expanded. The Muslim forces swiftly moved on to Palestine, taking Jerusalem in 637. Omar visited the city and proclaimed that Christians, the majority population at the time, and Jews, as people of the book, had protected status as *Dhimmis* under Qur'anic injunctions; they therefore were to be treated with tolerance and no forced conversions were to be undertaken. Although over time many willingly converted to Islam, the population of the area remained predominantly Christian until the Crusades. Although the *BYZANTINE EMPIRE* survived with its capital at Constantinople, the new Muslim/Arab empire now controlled the eastern Mediterranean coast and plains.

After initial reluctance Omar agreed that the commander Amr ibn al-'As could move on to the conquest of Egypt. Amr took Alexandria with relative ease in 642 and established Fustat, outside modern Cairo, as the new Muslim administrative center. His forces also pushed into Libya, taking the port of Tripoli.

Muslim forces were equally successful in their battles against the weakened Sassanid Empire in the east. They won a decisive battle at Qadisiyyah in 637 and moved on to the Sassanid capital of Ctesiphon, where the warriors collected enormous quantities of plunder in gold, silver, and jewels. In keeping with tradition regarding the apportioning of booty, the fabulous jeweled carpet from the palace was cut into pieces and given to the conquering soldiers. By 638 the Arabs controlled all of the Tigris and Euphrates and by 644 had effectively taken Persia (present-day Iran). Within a decade Persia had become a predominantly Muslim nation. The Muslim state absorbed many of the administrative and economic practices of both the older Byzantine and Sassanid Empires.

Following Omar's murder by a slave, the Muslim community again gathered to choose a successor. After some acrimonious debate, Uthman (r. 644–656), a member of the powerful Umayyad family, was selected as the new caliph. In his 70s Uthman was not as capable or popular a leader as his predecessors. After he appointed Muaw'iyah, a member of his own family, as governor of Syria, Uthman was accused of nepotism. Ali and his supporters were also angry that he had again been passed

over as caliph. Opposition to Uthman grew and in 656 rebellious troops returning from Egypt assassinated him and declared Ali (r. 656–661) the new caliph.

Muaw'iyah and the Umayyad family criticized Ali for his reluctance to prosecute the assassins; A'isha, the Prophet's widow, also opposed Ali and mounted troops to fight against him. However Ali and his supporters defeated A'isha at the Battle of the Camel in 656, but in face of the open hostility in Medina, Ali moved his capital to Kufa. As opposition from Syria continued to mount, Ali prepared to fight Muaw'iyah's opposing claims to the caliphate. The two sides met at the Battle of Siffin in 657. The fighting continued for several months and at one point Muaw'iyah's forces raised parts of the *QUR'AN* to demand negotiations in accordance with Muslim tradition. Mediators, including Amr ibn al-'As, declared that Ali would continue to rule from Kufa and Muaw'iyah would rule from Damascus; this essentially meant that the Muslim community now had two caliphs. Some seceders (Kharijites) blamed Ali for his willingness to negotiate and in 661 a Kharijite assassinated Ali in Kufa. However the division between the Muslim believers over who was the legitimate ruler proved to be a lasting one.

JANICE J. TERRY

Canute

(c. 995–1035) *king of England*

Canute was the younger son of Sweyn Forkbeard (c. 960–1014) and Princess Gunhild, and the grandson of Harold Bluetooth, king of the Danes. In 1013 Canute joined Sweyn on his third attempt to invade England. Sweyn forced the incompetent King Ethelred II the Unready (968–1016) to escape to the homeland of his second wife, Emma (c. 988–1052), daughter of Duke Richard of Normandy. The demoralized English Witanagemot (the governing assembly) acknowledged Sweyn as king. Upon Sweyn's death in 1014, the inexperienced 18-year-old Canute fled to Denmark when

Ethelred returned to England, reclaimed the throne, and was crowned on April 23, 1016. Ethelred died a few months later and his eldest surviving son, Edmund Ironside (c. 980–1016), was chosen as king by the Londoners, although the general population outside of London wanted Canute as king. Canute vanquished Edmund at the Battle of Assandurea (Ashingdon) on October 18, 1016. Edmund and Canute agreed to divide the country; Edmund took present-day Wessex, East Anglia, Essex, and London and Canute received all the other territories. This agreement ended the civil war. Edmund died on November 30, 1016. The Witangemot allowed Canute to succeed to the throne as king of a united England.

Canute's reign from 1016 to 1035 was initially problematic and engendered a considerable amount of bloodshed because of some resistance. Ultimately he was successful because he was deemed a Christian rather than a conqueror. Canute capably and fairly utilized the wealth of the immensely prosperous country. He gained the support of the aristocracy and realized his strength would lie in a strong alliance with England. Moreover, he respected England's Anglo-Saxon customs and institutions. Canute issued dooms, supported the church by erecting churches, granted the clergy lands, gave them considerable treasure, and a peaceful environment in their monasteries. He brought unity to a land previously torn apart by centuries of Viking invasions, thus obtaining both English and Anglo-Danish support.

Canute's greatest contribution to the administrative development of England was arbitrarily to declare the administrative districts of Northumbria, Wessex, Mercia, and East Anglia. He placed them under the authority of a Danish earl, or *jarl*, who were under Canute's firm control. After banishing his first wife and their son Sweyn, Canute married the strong-minded Emma, widow of Ethelred the Unready. They had a son, Harthacanute (1018–42), and a daughter, Gunhild, who would later marry Holy Roman Emperor Henry III. His other son was Harold Harefoot (c. 1016–40) by his mistress, Elfgifu of Northampton. Canute also introduced trained infantrymen known as *housecarls*. These elite, honored, and privileged men formed the basis of the future English army and soon became wealthy—the English people were heavily taxed to support them. The housecarls were an entity unto themselves; they had their own regulations, judicial system, and huge arsenal of weapons.

Canute promulgated a revised Anglo-Saxon legal code that respected Anglo-Saxon continuity. Economically, many towns emerged in England because of the vigorous North Sea trade. Socially the English people were content with their capable ruler. Harold,

Canute's brother, died in 1018 and Canute became king of Denmark. He was equally capable of ruling in Denmark as in England. Canute issued Denmark's first national coinage, separated the clergy from the realm, and declared peace and friendship between the Danes and the English. However England was forced to pay a Danegeld sum (tax) of £82,500 to Denmark. In 1027 Canute made a pilgrimage to Rome and visited holy places, sanctuaries, and the tombs of various apostles. He also attended the coronation of Holy Roman Emperor Conrad II (c. 990–1039). Conrad asked Canute to administer parts of present-day Germany. Canute gained control over the Danish parts of Norway in 1028 when the Norwegian nobles supported him in expelling Olaf II (Saint Olaf, 995–1030). Canute made his son Sweyn subking in 1029 with Sweyn's mother acting as regent. They were driven out in 1035.

Ultimately Canute's huge Scandinavian empire was only held together by a fragile allegiance and was financially supported by a bountiful England. Canute died in 1035 and was buried at Winchester. He had failed to leave a succession provision and his sons initially jointly ruled. Harthacanute took power in Denmark. Harold proclaimed himself king of England but died five years later after a calamitous reign. Harthacanute then took over as king of England. Canute's North Sea kingdom fell apart and his line ended in 1042. At Harthacanute's suggestion the Witangemot chose Edward the Confessor (1003–66) as its king in 1043.

ANNETTE RICHARDSON

Capet, Hugh

(c. 940–996) *French king*

The founder of the Capetian dynasty of French kings (987–1328), Hugh Capet was born the second son of Hugh the Great, duke of Francia and count of Paris, and Hedwig, sister of Otto I, the emperor of Germany.

In 961 he was made duke of Francia, holding vast fiefs in these regions and administering considerable power over the Neustrian nobility. Around 970 he married Adelaide, sister of William IV, duke of Aquitaine and Poitou. The union with Adelaide added influence and prestige to Hugh, whose powers already were superior to those of the nominal king of France, Lothair (954–986). Hugh's rising power provoked a conflict with the king, which became especially apparent from c. 980. In May 985 Gerbert of Aurillac, the future Pope SYLVESTER II (999–1003), spoke of Hugh as "king...not in name, but in effect and deed," while Lothair was "king of France in name alone." A year later Lothair died and his son Louis V the "Sluggard" ascended the throne, only to die a year later without an heir. Upon his death, on May 21, 987, Hugh was unanimously elected as the king and on July 3 he was crowned at Noyons.

His power extended over feudal domains and towns in the areas of Paris, Orléans, Senlis, Chartres, Touraine, and Anjou, while vassals, who might challenge his authority, held other parts of France. Shortly after his coronation Charles of Lorraine, Louis V's uncle, presented his claims to the throne, although Adalberon dissuaded him from using force against the new king. In 988 the townsmen of Laon handed their city over to Charles, and Hugh failed to recapture it. Hugh's power was challenged not only by his lay rivals, but also by some ecclesiastical authorities. In 989 Adalberon, bishop of Reims, died and his place was taken by Arnoulf, who refused to acknowledge the Capetian rule and attempted to restore the CAROLINGIAN DYNASTY, with Charles of Lorraine as the king. Gerbert switched sides too, for a brief time, proclaiming Charles as the legitimate king and calling Hugh the "interrex," or temporary king.

Charles had Laon and Reims in his hands. The significance of the control over the latter city was twofold, for Charles exercised his power not only over his secular subjects, but also over the archbishop, who crowned kings. The situation was highly unfavorable to Hugh, who acted decisively to restore his power. On March 991 Arnoulf and Charles were captured and imprisoned. In the same month the bishop of Laon returned to Hugh and left his town exposed to the king's mercy. The Council of St. Basle (June 17–18, 991) deposed Arnoulf and elevated Gerbert, who changed sides again, to the archbishopric. The deposition of Arnoulf and installation of Gerbert consolidated Hugh's royal power, while the cities of Reims and Laon seemed to stay loyal to him. Charles and his family died in captivity.

The papacy remained silent regarding the deposition of Arnoulf. It was probably under the influence

of Otto III, the German emperor (983–1002) that John XVI (985–996) banned the appointment of Gerbert. Hugh sought to gain the support of the French churchmen against the pope, who was in that time a puppet in the hands of the German emperor. He bequeathed lands to monasteries and defended their rights against lay lords and bishops. Between 991 and 996 Hugh and his son issued a number of charters. Most of Hugh's barons recognized his authority and suzerainty, but there was one last attempt to overthrow him. In 995 Odo of Blois and Adalberon, bishop of Laon, attempted to reinstall a son of Charles of Lorraine as the king. Their plan was revealed and crushed.

In order to consolidate the power of the nascent dynasty, Hugh sought a suitable mate for his son, Prince Robert, later Robert II the Pious (996–1031). After he failed to obtain him a bride from the Byzantine court, he married him to Rozola Susanna, the widow of the count of Flanders and daughter of a former king of Italy. The marriage likely took place in 989 and lasted until 992, when Robert divorced his wife, who was about 15 years older than he. Hugh died in October 996, while on a military campaign near Tours. Perhaps an insignificant figure compared to his later descendants, Hugh was remembered as a symbol of the French monarchy and was commemorated in the literature of the High and Late Middle Ages, chiefly in the *chanson de geste* genre, as well as in some English literary sources.

The Capetian dynasty ruled in France until 1328. Their authority was largely decentralized until the end of the 12th century, mainly because of the emerging power of the Norman dukes, who also ruled as kings of England since the NORMAN CONQUEST OF ENGLAND of 1066 and exercised control over Normandy, Anjou, and AQUITAINE from the ascension of HENRY II Plantagenet in 1154. The Aragonese Crown periodically encroached on some of southern territories. Royal power became increasingly centralizing under PHILIP II AUGUSTUS (1180–1223), who reconquered Normandy from the hands of John the Lackland of England (1199–1216) in 1204 and annexed considerable territories of Languedoc, in the course of the ALBIGENSIAN CRUSADE (1209–29) and the war against Pedro of Aragon (1213). Philip's heirs adopted the same policy of expansion and consolidation, including Louis VIII (1223–26), LOUIS IX the Saint (1226–70), Philip III the Bold (1270–85), and PHILIP IV the Fair (1285–1314). The latter had three sons, Louis X (1314–16), Philip V (1316–22), and Charles IV (1322–28), who died without heirs. As the result, the rule of the direct Capetian kings came to its end and the Crown passed to the dynasty of Valois, a branch

of the Capetian family. The death of the last Capetian led also to the outburst of the HUNDRED YEARS' WAR (1337–1453) between England and France.

PHILIP SLAVIN

Carolingian dynasty

The Carolingian dynasty was a family of FRANKISH TRIBE nobles who came to rule over much of western Europe from 751 to 987. The dynasty's most prominent member was CHARLEMAGNE. The family originally served as hereditary mayors of the palace of Austrasia, the northeastern section of the kingdom of the Franks comprising modern-day eastern France, western Germany, Belgium, and the Netherlands, under the ruling MEROVINGIAN DYNASTY. Pepin (or Pippin) I of Landen (580–640) assumed the position of mayor of the palace during the reign of the Merovingian king, Clotaire II (584–629). The post of mayor of the palace, known in Latin as *maior domus*, came to hold decision-making authority, while the king served as a reigning figurehead. Pepin I's daughter married the son of Saint Arnulf, bishop of Metz (582–640), uniting two of the most prominent Frankish noble families. Their son, Pepin II of Heristal (c. 635–714), continued the family's dominance, conquering Neustria, the western section of the kingdom of the Franks comprising most of present-day northern France, in 687.

He became mayor of the palace in Austrasia, Neustria, and Burgundy. The names used to identify the family (Pippinid or Arnulfing) derived from one of Pepin II's grandfathers. Later known as the Carolingian family, the Pippinid family made the post of mayor of the palace hereditary. The most famous Carolingian mayor of the palace was Charles Martel (686–791)—known

variously as Carolus Martellus in Latin or Charles "the Hammer" in English—who served as mayor of the palace of the three Frankish kingdoms. In 732 he won the Battle of Tours, which halted an advancing Muslim army from overrunning western Europe. According to Frankish custom, following Charles Martel's death, his position was divided between his two sons, Pepin III (714–768), known as "the Short," in Neustria, and Carloman (710–754) in Austrasia.

Pepin III secured papal and noble support to seize power. Pepin III, reuniting Austrasia and Neustria into one kingdom, usurped the Crown of the Merovingians to become the ruling king in 751. He became the founder of the Carolingian dynasty as King Pepin I. The pope anointed Pepin I, also granting him the title of Roman Patrician. Pepin I also created the PAPAL STATES out of conquered territory in central Italy, giving it to the pope to administer. Following Pepin I's death, his kingdom was divided equally among his two sons, Carloman (755–771) and Charlemagne (c. 742–814). Following Carloman's death in 771, Charlemagne became sole ruler.

Charlemagne (known as Carolus Magnus in Latin, Charles the Great in English, and Karl der Grosse in German) expanded the Frankish empire toward the south, conquering much of southern Germany, including Bavaria and Saxony, and northern and central Italy, to reunite most of the former Western Roman Empire. Charlemagne's empire came to include present-day France, Germany, Austria, the Netherlands, Belgium, Luxembourg, and parts of Italy and Spain. He continued his alliance with the pope in Rome, promoting religious reform and cultural growth. Consequently Pope Leo III (d. 816) crowned Charlemagne Roman emperor on December 25, 800. The coronation solidified the alliance between the Carolingian emperors and the pope, who provided his blessing on Frankish conquests, which resulted in the spread of Christianity.

In 806 Charlemagne created a plan for the division of his empire among his sons. However on Charlemagne's death in 814, his sole surviving son, Louis I (778–840), known as "the Pious," came to the throne. Both Charlemagne and Louis I worked to centralize authority throughout the empire. They appointed nobles as administrators, leading to the development of a feudalistic society under the emperor. After Louis I's death, his three sons, Lothair (795–855), Louis "the German" (804–876), and Charles "the Bald" (823–877), fought for control of the Frankish empire. In 843 the TREATY OF VERDUN divided the empire into three segments (West Francia, Middle Francia, and East Francia) among each of Louis I's sons. Under Carolingian rule, cultural and

linguistic divisions occurred within the Frankish Empire. The eastern Frankish people retained their Germanic dialects, while the western Franks spoke a language that developed into Old French, an amalgam of Gallo-Latin and Germanic dialects. The division of the Frankish Empire was not only a political delineation, but also a cultural and linguistic one. Following Lothair I's death in 855, Middle Francia was divided among his sons and renewed tensions arose between the various factions of the Carolingians. The Carolingians maintained control of Middle Francia, which became the kingdoms of Lotharingia and Provence, and Lombardy, the eldest retaining the empty title of emperor until 899.

Despite ensuing rivalries and invasions, the Carolingians retained control of the eastern portion of the Frankish Empire until 911. East Francia served as the nucleus for the later HOLY ROMAN EMPIRE, sometimes referred to as the First Reich (First Empire). Over time East Francia's political centralization dissolved into regional duchies, which operated as petty kingdoms. Such fragmentation continued, with local rulers promoting their own interests and autonomy within the kingdom as a whole. Following the death of Louis "the Child" (893–911), the last Carolingian ruler, nobles eventually elected Henry the Fowler (876–936), duke of Saxony, to succeed. Sometimes referred to as the Ottonians, after Henry I's son Otto I (912–973), who was crowned first Holy Roman Emperor in 962, the dynasty presented themselves as continuous successors to the Carolingians. The duchies' powers increased as the Holy Roman Emperors did not assume their position through a blood link, but rather by election from the rulers of the most prominent kingdoms within the empire. Consequently they ruled over a confederation of sovereign territories, rather than a feudal empire.

West Francia (known variously as Francia Occidentalis and the Kingdom of the West Franks), the western portion of the former Frankish Empire, was dominated by several feudal lords, who elected the count of Paris, HUGH CAPET (938–996), as king of France in 987 following the death of the last Carolingian ruler. He became the founder of the French royal house, the Capetians (987–1328), which included the later cadet branches: the Valois (1328–1589), the Bourbons (1589–1792, 1814, 1815–30), and the Bourbon-Orléans (1830–48).

ERIC MARTONE

Carolingian Renaissance

The Carolingian Renaissance is the name given to the revival of classical learning and culture that occurred during the late eighth and ninth centuries, a period that roughly corresponds to the rule of the Frankish emperor CHARLEMAGNE (768–814) and his successors during the CAROLINGIAN DYNASTY. Prior to Charlemagne's ascension to the throne, the MEROVINGIAN DYNASTY had established a court school (known as the *scola palatina*) in order to prepare young Frankish nobles for their future political roles. Literary education remained, however, the responsibility of the monastic and cathedral schools. Charlemagne vastly increased the responsibilities of the palace school, which became an important repository of learning and a center of educational reform. He also issued a series of royal decrees calling for the general improvement of all schools throughout the empire. To help him in these efforts, he recruited the English monk ALCUIN of York (c. 730–804) to become head of the palace school in 782.

With Alcuin's guidance Charlemagne initiated a generalized reform of the church. This bold venture began with the moral and intellectual schooling of the monastic and secular clergy. The famous edict of 785, known as the *Epistola de litteris colendis* (Epistle on cultivating letters), called for the clergy to study Latin to understand Christian doctrine. Charlemagne voiced his disapproval that many written communications received from his monasteries contained grammatical errors and uncouth language. Once they had mastered correct Latin syntax and style, he noted, the clergy must teach all those who were able and willing to learn. In 789 the Council of Aachen reinforced that each monastery and abbey ought to have a school. Charlemagne sought to make education available to all children throughout his territories, whether they intended to enter the cloister or not. The rise of Latin literacy among the lay population attests to the success of these efforts.

Charlemagne also understood that his clergymen could not become effective preachers if they did not have access to authoritative, reliable copies of the Holy Scriptures. He commissioned Alcuin to ensure that every monastery and church receive a copy of the Vulgate that was free from scribal errors. The copying and distribution of basic texts placed new pressure on the manuscript *scriptoria* (or "copying rooms"). In an effort to harmonize the quality of preaching, Charlemagne commissioned Paul the Deacon (c. 720–799) to compile sermons for all the feast days. These were to serve as models for the local priests to implement and

rework. Emphasis was also placed on monastic reform. In an effort to enforce the Rule of St. Benedict, Charlemagne ordered that an error-free manuscript of the Rule be brought from Monte Cassino in Italy, and that copies of it be distributed to all of his monasteries.

The school curriculum, inspired by the writings of Augustine of Hippo, focused on a close study of Christian doctrine and classical authors, which served as models of good style. Students studied and learned the Psalms and were initiated—through works like Martianus Capella's *Marriage of Mercury and Philology* (fl. 430), and Isidore of Seville's *Etymologies* (c. 615–630)—to the seven liberal arts. Special attention was given to the three arts belonging to Boethius's *trivium*: grammar, rhetoric, and dialectic. More advanced students were also introduced to the scientific arts of the *quadrivium*: arithmetic, geometry, astronomy, and harmony (or music). Ferrières gained renown for its meticulous study of classical literature; the schools of Laon and Fulda were centers of biblical exegesis; St. Wandrille surpassed all others in the study of music; Tours and Reichenau were famous for their copying and editing of manuscripts. Approximately 70 schools—located throughout Germany, France, Switzerland, Italy, and northern Spain—have left us some record of their activities during the ninth century.

Charlemagne's library included works of Horace, Lucan, Terence, Statius, Juvenal, Tibullus, Claudian, Martial, Cicero, Servius, Sallust, Virgil, Macrobius, Ovid, and Priscian. Abbots in the provinces could enrich their collections by ordering copies of books in the palace library, or in other surrounding monastic and cathedral libraries. Alcuin believed it was important to make manuscripts easier to read, by adopting punctuation and adding spaces between words. Furthermore since writing materials were scarce and expensive, developing a clear and compact script was a high priority.

Medieval scribes had inherited several scripts from the Romans, such as rustic capitals, uncial, half-uncial, and cursive. Rustic capitals are frequently found in inscriptions and law codes. The script consists of large, narrow capital letters placed side by side. Uncial and half-uncial used more rounded letters. All three of these scripts were cumbersome and occupied a large amount of space. In an effort to make the most out of an expensive sheet of parchment (sheep's skin) or vellum (calf's skin), legal documents and business records were generally written in cursive hand, which was particularly difficult to read. Irish bookhand, for example, was a beautiful and elaborate script, but it was difficult to write and the letters remained very large. In the

770s, the monks of Corbie—a sister-establishment of Luxeuil, the Irish abbey founded in the sixth century by St. Columba—developed a compact, rounded, regular and very legible script, which became known as “Carolingian minuscule,” because of its small size. Alcuin immediately introduced the script to the palace school and *scriptorium*, where it was used to copy the Bible, writings of the church fathers, and classical works. Carolingian minuscule quickly spread throughout the empire. During the 20th century, it continued to survive as the standard typewriter font, and it forms the basis of the Times New Roman computer font.

Carolingian scholars did not limit themselves to copying manuscripts. They also composed their own works: textbooks for the study of the liberal arts, biblical commentaries, dictionaries, glossaries, bilingual word lists, compilations, spelling handbooks, commentaries, and summaries of ancient works. An impressive body of hagiographical literature (such as saints’ lives) also dates from the Carolingian revival. Numerous political and historical writings inspired by classical models have survived, including Einhard’s *Life of Charlemagne* (based on the *Lives of the Twelve Caesars*) and Paul the Deacon’s *History of the Lombards*. Carolingian authors like Walafred Strabo (c. 808–899), Sedulius Scottus (fl. 848–874) and Lupus of Ferrières (c. 805–862), wrote more than 3,200 pages of original Latin poetry.

Although men remained the most active players in the Carolingian Renaissance, study programs for women were implemented in female monasteries, and women played an important role as teachers outside their religious communities. A female hermit educated St. Wiborada, and in the early 840s a woman named Dhuoba composed a *Liber Manualis* (a sort of grammar book) to instruct her son, William. The granddaughters of Judith, second wife of Louis the Pious, inherited part of their father’s library; female monasteries—like Chelles, Jouarre, Säckinggen, Remiremont, Herford, Poitiers, Soissons, Essen, and Brescia—had their own *scriptoria*.

Irish scholars (known as the *scholastici*) also played an important role. Toward the end of the ninth century the monk Notker—a teacher, scribe, and librarian at the Irish monastery of St. Gall in Switzerland—commemorated their influence in a famous anecdote. Two Irishmen, he claims, went to the court of Charlemagne and so greatly impressed the emperor that he extended his patronage to them. Einhard confirms that Charlemagne “held the Irish in special esteem.” After Alcuin’s retirement from public life to the monastery of Tours, an Irishman, Clement, became head of the palace school. The lasting relationship between Carolingian mon-

archs and the Irish continued long after Charlemagne’s death, under Louis the Pious, Lothair II, and Charles the Bald (who becomes the patron of the famous Irish scholar John Scotus Eriugena). Under Charlemagne and his descendents, the Frankish court became a center of interaction between scholars and poets from all over Europe. The influences of the Carolingian Renaissance continued to be felt well into the 10th, and even into the 12th century, as the cathedral and monastic schools continued to teach a curriculum based on the church fathers, the Latin authors, and the liberal arts.

K. SARAH-JANE MURRAY

Celtic Christianity

A variety of modern sectarian and special interest groups, from New Age cults to Irish nationalists to feminists to independent Christians, claim Celtic roots for their drive and inspiration. With so many competing claims it is difficult to clear away the partisan fervor from the historical realities surrounding Celtic spirituality and cultural identity. Among the giants in this tradition are the likes of Patrick (d. 461 C.E.), Brendan the Navigator (d. 577 C.E.), COLUMBAN (d. 615 C.E.), and Brigid (legendary). Among its gigantic achievements are the Book of Kells and a corpus of ballads and stories that make it one of the earliest European vernacular literatures.

Celtic spirituality is an inexact term reflecting the identity of an emigrating and outgoing people who adapted well wherever they wandered. It is usually applied to the native peoples of Ireland, Britain, and Brittany, bound by the language of Gaelic and (later) Hiberno-Latin. These people spread into ancient Gaul

(France), Spain, Italy, and even Galatia in present-day Turkey; their religious pilgrims were known in the ancient world for their visits throughout the lands of the Middle East. Eventually Christian preachers from Celtic lands were known for re-Christianizing and recivilizing Europe after the so-called Dark Ages, so it is no wonder that Celtic spirituality is claimed by many groups.

No one is sure when Christianity reached western Celtic parts, but some Christian presence must have been established by 431 C.E. when Pope Celestine I sent a bishop to Ireland. Perhaps shortly thereafter the Western Latin Church commissioned the legendary Patrick for missionary work on the island. Thus, though Celtic spirituality shows some native distinctiveness, it was from the beginning associated with the ecclesial structure and faith of the Western Church and not just an indigenous and autonomous Christianity. In fact the earliest artifacts discovered show Irish Christianity to be found among the wealthy classes, who used typical icons and conventional symbols to show their spirituality. Most likely they owed their faith to the fervor of the Western Church to spread Christianity, even if most of their land never was under the Roman Empire.

After the mid-400s C.E. when the Romans retreated from Britain to the European continent, contacts with the Western world diminished. The Celts were forced more wholly to reconnect with their native roots. This tendency was intensified when the Saxons arose in Britain and threatened to take Celtic lands. Meanwhile the minority Christian population repudiated residual Western Church influences because of the worldliness and corruption of many of its institutions and personnel. The church did not respond to the alienation of the Celtic Christians until 605 C.E. when Pope Gregory the Great sent Augustine of Canterbury to parley with the Irish. The pope recognized the need for a council, showing that Celtic Christianity was a force to be reckoned with. Unfortunately, the talks completely broke down. Finally in 640 C.E. the Irish Church acceded to some of the pope's requests.

Celtic spirituality developed in a window of time from the mid-fifth century to the mid-seventh century C.E. Its features included a different religious calendar (meaning that the Irish celebrated Easter on a different date), a different pastoral structure (meaning that the Irish had their own pastors and pastoral jurisdictions), and a different popular piety (meaning that native Irish myths became incorporated into Celtic Christianity).

The pastoral system of the Irish recognized the authority of pious monks and their monasteries and

did not pay attention to formal boundaries of parish and diocese as the Western Church normally did. Instead of bishops and theologies they esteemed abbots and superiors, both men and women, who proved that they could preserve cosmic order through their personal sanctity and mystical powers. The Celtic Church never rejected the office of the pope and institutions of the Western Church, but it tended to downplay their role and effectiveness in true spirituality. Its pastoral system bears remarkable similarity to that of the Desert Fathers and Oriental Orthodox churches (of the Copts, Syrian Orthodox, and others). There may have been limited and organic exchanges based on Celtic wanderings and pilgrimages.

The popular piety of the Irish shows the incorporation of mythic Celtic heroes into Christian stories. The story of St. Brigid, for example, founder of Kildare Abbey, may well be based on Brigid, daughter of the Celtic god Dagda, whose name graces so many places in Ireland. St. Brigid is not based on the traditional Mary, mother of Jesus, but on her namesake, who was a healer and creative force for the gods. Celts also had less a sense of the Latin notion of original sin. The world is not cursed with the fall of the human parents Adam and Eve, as the great Western Church thinker Augustine said. It is rather a place for humans to steward and show personal discipline so as to go to heaven.

There is a heightened sense of the nearness of the divine to the created order. The ideal Christian in Celtic spirituality is the monk in the monastery who lives a life of self-control and prayer: The monk shows that his or her life can be disciplined and the world can be civilized and ordered.

If nothing else, Celtic spirituality shows an alternative to the logic-driven and doctrinal approach of the West. It values independence of thought and the Power of personal sanctity. However, it is hardly nonstructured or spontaneous or wholly unique. It is not separate from the Christian religion, and probably is best viewed as a hybrid of Latin theology and native beliefs. By the 11th–12th centuries the special characteristics of Celtic spirituality were completely submerged in the Western Church, much as the Desert Father spirituality is a part of the Eastern Greek Church.

Chagatai Khanate

GENGHIS KHAN (c. 1167–1227) had four sons by his principal wife, Borte. The eldest son, Juji, and second son, Chagatai, were such fierce rivals that Genghis decided to bypass both in favor of his third son, Ogotai Khan as his successor khaghan (Grand Khan), and all of his sons agreed with his choice. Genghis also assigned territories to each son to govern, although all would acknowledge the leadership of the khaghan and cooperate with him in expanding the Mongol Empire. Juji received land farthest from the paternal homeland—the western territories that would include Russia and eastern Europe; his followers were called the Golden Horde. Chagatai received west Turkestan, the Tarim Basin, and the western Tian Shan (T'ien Shan) region. Ogotai received Dzungaria and part of Central Asia, while the youngest son, Tului, received the Mongolian homeland. This arrangement was confirmed just before Genghis Khan died in 1227. Two years later the Kuriltai (council of nobles) elected Ogotai the next khaghan.

Chagatai's allotment, which was enlarged later, also included the Ili River valley, Kashgaria, Turfan and Kucha in present-day northwestern China, and Transoxiana, including the towns of Bukhara and SAMARKAND. These disparate lands became known as the Chagatai Khanate. Except for the oasis towns most of the khanate was steppe land inhabited by various nomads, most of Turkic ethnicity. Chagatai was a warrior and also a staunch upholder of Mongol traditions. Genghis had appointed him guardian of the Mongolian law code called "Yasa" which he had sternly administered. Chagatai and his successors kept up a seminomadic lifestyle, changing from winter to summer camp as the seasons dictated. Whereas the Mongol realms under KUBILAI KHAN and his heirs in China, the YUAN DYNASTY (1279–1368), and the il-khanate of HULAGU KHAN and his successors in Persia and the Middle East had fixed boundaries, rich resources, large sedentary populations, and long established traditions of governance, the Chagatai Khanate had shifting boundaries, tribal populations with weak state institutions, and relatively sparse resources.

It was hemmed in by other Mongol dominions ruled by branches of Genghis Khan's descendants in three directions—the Yuan dynasty, the Il-Khanate, and the Golden Horde in Russia. The only direction for expansion was into Afghanistan and India. Beginning in the 1290s Chagatai Khanate forces took control of eastern Afghanistan from which they raided northwestern India. In 1303 an expedition of 120,000

men besieged Delhi for two months and devastated a wide area. Another force of 40,000 horsemen returned to India in 1304 but was defeated and 9,000 prisoners were trampled to death by elephants. A similar fate befell the men of the last attacking army in 1305–1306. Not able to expand outward the heirs of Chagatai were constantly embroiled in wars and rivalries of the other three branches of the family, and among themselves. Although the Chagatai Khanate was poor in resources, its central location along the Silk Road allowed it to collect abundant taxes and tolls. Frequent wars and predatory policy toward trade and sedentary people often resulted in the breakdown and ultimately decline in international trade by land routes. Major differences and incompatibilities divided the eastern and western halves of the khanate. The western part, originally part of the Khwarazm kingdom, was Islamized, urbanized, and more advanced than the eastern region, which was more pastoral, nomadic, and animistic. Lacking a cohesive government, each went its own way.

Chagatai died in 1242 and was succeeded by his grandson Kara Hulagu. Interference by the khaghan and involvement by the Chagatai Khanid rulers in the dynastic struggle of other branches of the family resulted in many upheavals. Leaders of the Chagatai Khanate became involved when Mongke Khaghan died in 1259 and a succession struggle erupted between his brothers Kubilai and Arik Boke; they sided with the winner Kubilai. Later they supported Kaidu Khan, a grandson of Ogotai, who challenged Kubilai for the throne of the khaghan. The destructive wars continued until Kaidu's death in 1301. Although Kubilai won against his rivals, the unity of the Mongol Empire was fractured forever, and even though the Chagatai rulers were not in contention for overall leadership, their central position in the line of communications between the different branches of the family played a significant role in the breakdown of unity of the Mongol Empire.

The frequent civil wars and changes of rulers (there were 30 khan up to 1230) fatally weakened the central authority at the expense of local leaders. As the Chagatai Khanate was disintegrating in 1369, there rose in Samarkand a Mongol-Turkic leader who claimed descent from Genghis Khan. His name was TIMURLANE (TAMERLANE), meaning Timur the Lame. His military career that ended with his death in 1403 would replicate that of his famous ancestor. In the 14th century Chagatai rulers converted to Islam, the religion of many of the Turkic peoples they ruled. The official language of the khanate was changed from Mongolian to Chagatai

Turkic. It continued to be used in the region they ruled until modern times.

Champa kingdom

According to Chinese texts, in 192 C.E., Champa was formed during the aftermath of the breakup of the Han dynasty of China. The Champa kingdom was situated along the coastal plains of present-day central and

An ancient Cham structure in central Vietnam, one of the remains of the Cham civilization that was conquered by foreign invaders.

southern Vietnam. The Chams shared many biological traits with the Malays and Polynesians. After years of fighting with rival Chinese factions in Tonkin, the Chams came to be under Indian cultural influence. Elements of Indian culture formed a huge part of Cham culture, as a result. The Champa kingdom was divided into four regions with Hindu names—Amaravati, Vijaya, Kauthara, and Panduranga. The four, which were already powerful, were reunited under King Bhadravarman in 400. Located between India and China, the Chams were in a strategic position to conduct trade between West and East Asia. The kingdom played a key role along this trade route, which became known as the Silk Route of the Sea. At the height of their success, they became a prosperous seafaring power that actively participated in commerce and piracy along the coastline.

Because of its strategic location, the Chams were constantly under threat of attack from their neighbors. Cham-Chinese rivalry persisted for centuries and featured prominently in Cham history. In order to stop repeated destructive Cham raids on their coasts, the Chinese invaded Champa territory in 446. Champa was made subservient to China but by the sixth century the Chams achieved independence from China rule. Champa trade and culture flourished during this era. Champa success was however disrupted by Javanese invasions in the eighth century, which they managed to stave off. In the ninth century under King Indravarman II, the Chams relocated their capital farther north in Amaravati. During this period, the Chams built beautiful temples and palaces, many of which survive today.

By the 10th century the Champa kingdom faced another adversary from Hanoi in the form of the Dai Viet, who wanted the territories of Amaravati and a few decades later, Vijaya. Later the Cambodians launched attacks on their kingdom, along with the Vietnamese. Even though the Cham king Harivarman managed to fend off attacks from these two invading forces in 1145, the Khmers returned under a new more aggressive king and managed to bring Champa under his leadership. But two years later, a new Cham leader successfully defeated the Khmers. In 1177 the next Cham king even invaded the Cambodian capital of Angkor.

This victorious period was extremely brief, as the Chams were once again subjected to Cambodian rule in 1190 until 1220. The Chams would never again experience a period of resurgence and instead suffered successive invasions by foreign forces. After 1220, Vietnamese kings, who were members of the Tran dynasty, attacked Champa. The Champa kingdom was further weakened by the Mongol invasion in 1284. By the end of the 15th

century very little of the Champa kingdom was left as their territories were being conquered by foreign invaders, who completed the conquest of Cham territory during the 17th century.

NURFADZILAH YAHAYA

Charlemagne

(c. 742–814) *king of the Franks and emperor of the West*

Charlemagne, or Charles the Great, was born the eldest son of Pepin the Short, king of the Franks (751–768), and his wife, Bertrada of Laon. Upon his father's death the Frankish kingdom was divided between Charlemagne and his younger brother Carloman in 768. When Carloman died suddenly in 771, Charlemagne seized control of his brother's lands and reunified the Frankish realm.

Charlemagne's kingdom grew to an empire under his relentless and resourceful military campaigns. Beginning in 772 he initiated a campaign to subdue the Saxons, a task he would only complete in 804. Soon after becoming sole ruler of the Franks, he invaded Italy and crushed the Lombard Kingdom, taking the Crown of the Lombards for himself (773–774). An initial foray against the Muslims into Spain in 778 ended in disaster when Charlemagne's rearguard was ambushed and destroyed at Roncesvalles, while returning home from this expedition. But by 811 Charlemagne had extended his sway south of the Pyrenees down to the Ebro River and had created the Spanish March to act as a buffer zone between the Moors in Spain and his own lands north of the Pyrenees.

On his eastern front Charlemagne deposed his onetime ally the duke of Bavaria (787), and incorporated his territory into his own lands. This brought him into contact with the fierce Slavic people known as the Avars, who held sizable lands in the areas of modern day Austria and Hungary. Charlemagne inflicted a massive defeat on these people in 796 and created another heavily defended march known as the Ostmark (Austria), to protect his eastern border against marauding Avars. In helping him overcome and rule such disparate foes and lands, Charlemagne was fortunate in having three capable and loyal sons. His son Charles (d. 811) ruled the northwest part of

Charlemagne's Frankish lands known as Neustria, while Pepin (d. 810) administered Italy, and Louis (d. 840) ruled over Aquitaine. The latter two in particular fought long, hard campaigns either with their father or on his behalf.

The strength of Charlemagne's empire depended in part upon his reputation and success as a warlord, together with the tight bonds of personal loyalty that existed between him and his chief administrators. In addition to his three sons who ruled as cadet kings, Charlemagne also relied heavily upon the margraves who ruled over the marks/marches that he created along volatile border areas. In less troublesome areas in the interior of his lands Charlemagne posted counts to keep the peace, administer imperial laws, and protect the realm. To ensure the loyalty of these and other top officials Charlemagne created the office of the *missi dominici*, whose duty it was to ride circuit throughout the realm inquiring as to the honesty and efficiency of his royal officials.

Another reason for Charlemagne's success was his approach to justice throughout his realm. Religion aside, he respected the traditions, tribal laws, and rights of the various Germanic peoples under his authority, and rather than replace tribal laws, he sought to codify them in writing. He did however issue a number of imperial laws called capitularies, which laid out regulations for his own royal officials or administrators or which touched upon religious issues. Historians have long acknowledged the important role that Christianity and the institutional church played in enabling Charlemagne to maintain a firm hold on both his throne and his empire. His conquest and eventual integration of Saxony into his empire are illustrative in this regard. Charlemagne relied upon a combination of military offensives against the Saxons and the missionary activities of Benedictine monks finally to pacify this belligerent tribe. In 782 he issued a series of laws forbidding the practice of pagan religion among the Saxons, with harsh penalties for those caught transgressing. The overall effect of these measures was slowly to saturate Saxon tribal culture with the religion and culture that Charlemagne endorsed.

Charlemagne also engaged in a vigorous attempt to improve the level of morality and education among the clergy throughout his realm. To this end he utilized the talents of ALCUIN of York (735–804), who, beginning in 781, undertook the arduous process of bringing discipline to the monastic houses throughout the empire and introducing the classical Roman program of the liberal arts as the educational curriculum used throughout the Carolingian monastic schools. For 15 years Alcuin himself oversaw a school at Charlemagne's palace at Aachen. The results of this educational program were impressive

and produced a flourishing of culture and learning that has been termed the CAROLINGIAN RENAISSANCE. A number of Carolingian Benedictine monasteries became vibrant centers of learning, such as Fulda, St. Gall, and Reichenau. Monks at these institutions assiduously set about learning classical Latin grammar and rhetoric and in the process copied and preserved for posterity numerous works from classical Rome. Scholarship and literature flourished in this era, as is evident from such works as Paul the Deacon's *History of the Lombards* and Einhard's *Life of Charlemagne*.

On Christmas Day in the year 800, Pope Leo III crowned Charlemagne Roman emperor (Imperator Romanorum). Historians have long quarreled over the significance of the coronation, and even whether Charlemagne himself approved. The Roman Empire at the time of Charlemagne's coronation referred to the Greek or Byzantine Empire, which was under the control of the empress Irene (797–802). Through his actions the pope may well have been seeking to curry favor with Charlemagne and ensure his aid in maintaining the pope's temporal control over recently annexed lands in Italy.

Or, absent a male ruler on the Byzantine throne, he may actually have thought he was creating a legitimate emperor who could unite the Carolingian territories in the west with the Byzantine lands in the east. If so, he seriously miscalculated, for initial overtures between Charlemagne's court and that of the empress Irene created an uproar among the people of the Byzantine Empire. Charlemagne himself actually disliked the title of emperor, and it certainly added nothing to his power or ability to rule over his own lands. At the same time, the fact that the pope felt emboldened enough to proclaim this Germanic king a Roman emperor provides clear evidence of the spectacular political, military, religious, and cultural achievements Charlemagne realized during his rule over western Europe. In 813 Charlemagne designated his son Louis I as coemperor and his successor and crowned him at Aachen.

RONALD K. DELPH

Chaucer, Geoffrey

(c. 1340–1400) *English author*

Geoffrey Chaucer was the son of John Chaucer, a prosperous wine merchant, and Agnes de Copton. Around 1355 his fairly wealthy parents secured a position for the young Geoffrey as a page in a household of royal rank, that of Prince Lionel, the earl of Ulster, the future duke of Clarence and son of Edward III. This provided a suitable environment to cultivate their son's talents as he was exposed to the world of aristocracy and developed an appreciation for manners of the court. Chaucer was known for his keen observation of his surroundings. In such a setting, he would have also acquired knowledge of French and Latin, and he made his first acquaintance with his future patron, John of Gaunt.

After serving as a page Chaucer joined military service and fought in France. In 1360 he was captured but was released upon payment of ransom by Edward III. From 1374 to 1386 Chaucer was a customs controller in the port of London. It was an important post as the king's revenue came mainly from customs duties. Later he became a clerk of the King's Works. In 1367 he became a yeoman in the king's household and two years later was promoted to esquire. Chaucer married Philippa Roet in 1366, the sister of the mistress and future wife of his patron, John of Gaunt. Philippa Roet served the queen as a lady-in-waiting. Their marriage lasted until her death in 1387. In his work for the king, Chaucer engaged in diplomatic missions to France, Italy, and Spain—centers of learning and literary production far more renowned than London at the time. It was in Italy that he met GIOVANNI BOCCACCIO, the Italian novelist, whose writings he admired. Not surprisingly, continental European influences are found in his works.

Early in his career Chaucer displayed a tendency to adopt the French style. He was heavily influenced by French works such as the *Roman de la Rose*, an allegory about love written in eight-syllable couplets by two poets—Guillaume de Lorris and Jean de Meun. In 1369 Chaucer wrote *The Book of the Duchess*, likely for John of Gaunt's first wife, Blanche, who died in the same year. While keeping the French influence, Chaucer began to be influenced by Italian authors such as DANTE ALIGHIERI and Boccaccio. One of his works, *Troilus and Criseyde*, was in fact based on Boccaccio's *Filostrato*. Boccaccio provides the basis for four of Chaucer's characters in his most famous work *The Canterbury Tales*. Chaucer died on October 25, 1400. His body was buried in Westminster Abbey and was later moved to Poets' Corner at the east aisle of the south transept.

The 14th century was a golden period when the literary arts flourished in England. During this era known as the Middle Ages, literature in the English language enjoyed an unprecedented popularity. The English language became a source of pride for the English people. The new status accorded to the language was due in no small part to Chaucer's choice of the English language as the worthy medium of his own artistic expression. The intellectual milieu during the Middle Ages was very much characterized by philosophical concerns provided by Christianity. Christian allegory thus became a major feature of medieval literature. Allegory is polysemous, in that multiple levels of meaning can be discerned. Sets of meanings are also intricately connected with other sets of meanings, creating a text that is significantly rich. All the meanings relate to a central theme, which is repeatedly alluded to in the text. Chaucer succeeded in marrying philosophical ruminations in a creative manner.

Chaucer wrote *The Canterbury Tales* between 1387 and 1400 during the aftermath of the BLACK DEATH and the PEASANTS' REVOLT. It is a collection of 24 tales recounted by different characters who are pilgrims. He adopts a powerful satirical style in writing *The Canterbury Tales*. Chaucer draws upon contemporary persons commonly found in medieval society, so his audience would be familiar with them. Chaucer's literary style was revolutionary in that he incorporated local dialects in his writing, such as in the "Miller's Tale," part of *The Canterbury Tales*. In the "Knight's Tale," the miller, who speaks in a drunken style, actually interrupts the protagonist. As a complex collection of stories of various characters from all social strata, male and female, *The Canterbury Tales* forms a valuable view of the workings of society during this volatile period in history.

NURFADZILAH YAHAYA

Chenla

Two successive kingdoms with strong Indian influence emerged during the pre-Angkorean centuries of Khmer history. These were the Funan, from the second to sixth centuries, and Kambuja (Chenla, Zhenla in Chinese) from

the sixth to the eighth centuries. A vassal state of Funan, Chenla emerged as an independent state in the middle of the sixth century. A sea route developed between India and China by this time. The shift from the coastal trade route coincided with the appearance of conquerors from the mid-Mekong area, the brothers Bhavavarman (r. 550–600) and Mahendravarman (r. 600–611). They focused on the rice-growing areas of the Mekong basin, rather than maritime trade. The new kingdom, called Kambuja, traced its origin from the sage Kambu Svayambhava and the daughter of Nagas, Mera

According to the Chinese chronicle the *History of Sui*, Chenla was a feudatory state of Funan, covering roughly northern Cambodia and southern Laos of modern times. Its capital was at Lingaparvata with a Hindu temple dedicated to the god Bhadresvara. Chenla became a separate state after seceding from Funan in 550 with the accession of Bhadravarman I as the first ruler of the newly independent kingdom. He was the grandson of Funanese ruler Rudravarman (r. 514–539) and had married a Chenla princess named Lakshmi, who was heir apparent to the throne. Bhadravarman became the independent king of Chenla in 550, when the ruler died. In his long reign, Chenla was engaged in warfare, and Chitrasena was in charge of the army. The kingdom of Chenla covered the whole of Cambodia, southern Thailand, Laos, and the Mekong Delta region.

Bhadravarman's brother Chitrasena, with the title of Mahendravarman, succeeded him and ruled for 11 years. He was a brave king and conqueror. The reign of his son Isanvarman I (r. 611–635) was marked by extension of the kingdom westward, and establishment of a new capital, Isanapura at Sambor Prei Kuk (the Kompong Thom province of modern Cambodia), in 613. Like his father, he followed a policy of friendship toward the CHAMPA KINGDOM and married a Champa princess. Bhavavarman II was the next ruler (r. 635–650), who was succeeded by Jayavarman (650–690). He consolidated the Chenla kingdom. After his death, Queen Jayadevi controlled the affairs of the state. Imminent civil war led to the disintegration of the Chenla kingdom.

Factional disputes in the court resulted in the splitting of the kingdom in 706 into Land Chenla (Upper Chenla) and Water Chenla (Lower Chenla). Upper Chenla, with its capital in the Champassak province of modern Laos, was a somewhat centralized state with 30 provincial headquarters operating as administrative centers. It also sent embassies to China. Lower Chenla, occupying the former Funan kingdom along the Mekong Delta and the coast, had a turbulent existence with constant pirate raids from Java. The minor

Khmer states like Aninditapura and Sambhupura were locked in rivalry over the control of Lower Chenla. Pressure also mounted against Chenla by the Sailendra kings of Java. The last of the rulers was killed in 790 and it became a vassal state of the Sailendras. A prince from Sambhupura, who was in Java, took the reins as a puppet ruler. But Jayavarman II asserted his independence in 802, becoming the founder of great Angkorean empire that lasted until the early 15th century.

The Cambodian civilization in Chenla, like that of the Funan and Angkor periods, witnessed a good deal of Indian influence. Indian elements were mixed with indigenous myths of the Moon and serpent. Building a royal *lingas* (phallus symbol of SHIVA) on mountains was a blending of the autochthonous mountain cult with Hindu beliefs. Shiva in his *linga* form was connected with *devaraja* cult, which was used by Jayvarman II afterward to proclaim his sovereignty from Java. The Chenla kings were deified. Lord Shiva was worshipped under different names such as Bhadresvara, Sambhu, Girisa, and Tribhubanesvara.

Inscriptions from Cambodia attest to the prevalence of Sanskrit. Rhetorical and literary conventions were well known to writers of epigraphs in Chenla. They were also well acquainted with Indian epics, *kavyas* and *puranas*. The inscriptions refer to the *Vedas*, *Vedantas*, and *Smritis*. Many Sanskrit words were absorbed into old Khmer, relating to geographical names, the names of divinities and persons, administrative terms, and terms relating to the calendar and numbers. Another Indian custom persisted in the marrying princesses to *brahmans* (Hindu priests). The *brahmans* played an important role in the religious life of the people.

The chief priest or *purohita* had a powerful influence on the royalty. This sacerdotal office passed from uncle to nephew in the maternal line, which was an example of an indigenous matrilineal social system. Kings sought to ally themselves to a particular priestly family by matrimonial alliance. Buddhism was also prevalent in Chenla. The Mahayana faith came to Cambodia from Java as well as India. Buddhist statues are found at the time of Bhavavarman II. Influences from India, the megalithic culture of Southeast Asia, China, and neighboring regions in Southeast Asia enriched the culture of Chenla.

PATIT PABAN MISHRA

Chinese poetry, golden age of

The three centuries of the TANG (T'ANG) DYNASTY (618–909) represent the golden age of Chinese poetry. Chinese poetry reached its pinnacle during the reign of Minghuang (r. 712–756, also known as XUANZONG (HSUAN-TSUNG)). About 3,000 poets' names have survived from the Tang dynasty; many of those works are extant. The Tang poets' brilliance and inspiration have never been surpassed and have been the model for poets of later eras to emulate. During the long reigns of Empress WU and Minghuang culture flourished and upper class life was cosmopolitan. Confucian philosophy provided moral grounding and objectivity, while Daoism (Taoism) favored introspection, and Buddhism brought otherworldliness to the era.

Most Chinese poems were short, with romantic love, a frequent theme of European poetry, rarely a subject. Friendship between men is a dominant theme and the emotional trauma of parting between friends is the inspiration of many poems. This is hardly surprising because most poets were educated men from among whom officials were drawn, and officials were regularly rotated throughout the empire. War as a subject of poems did not deal with heroism or conquest, but focused on the desolation and sorrows that accompanied invasions and losses. Nature is also often the subject of poetic inspiration. Among the galaxy of Tang poets this essay will feature three of the greatest: Li Bo (Li Po), also known as Li Taibo (Li T'ai-po), 701–762; Du Fu (Tu Fu), 712–770; and Bo Juyi (Po Chu-i) 772–846.

Li Bo was born in Sichuan (Szechwan) Province in southwestern China. A man of great vitality and a lover of nature, he traveled widely, studied Daoism, and characterized himself as an "an immortal banished from heaven." However, Li was best known as a heroic drinker and versified while sober and drunk. He is

believed to have written 20,000 poems; 1,800 among them have survived and are still widely memorized. Li briefly enjoyed court favor and lived in the Tang capital Chang'an (Ch'ang-an) for three years under the emperor's patronage. However he fell out of favor when a poem he wrote in praise of Minghuang's favorite, Lady Yang, was interpreted to be an insult. The story of his death, perhaps untrue, had him leaning out of a boat to embrace the Moon while at an outing with friends on a lake and drowning. The following short poem has Li celebrating the Moon and wine:

Drinking Alone in Moonlight
 Among the flowers, with a jug of wine,
 I drink all alone—no one to share.
 Raising my cup, I welcome the moon,
 And my shadow joins us, making a threesome....
 As I sing the moon seems to sway back and forth;
 As I dance my shadow goes flopping about.
 As long as I'm sober we'll enjoy one another,
 And when I get drunk, we'll go our own ways:
 Forever committed to carefree play,
 We'll all meet again in the Milky Way!

Du Fu was more serious than Li Bo and was considered a scholar's poet. He served the government but never attained major posts. Du and his family suffered terribly during the AN LUSHAN (AN LU-SHAN) REBELLION. The following is by Du describing the black goshawk, a forest hunting bird:

A black goshawk is not to be found staying among
 humankind;
 She passed over the seas, I suspect, coming from the
 North Pole;
 Her straightened quills beat the wind as she crossed
 over the purple borderland,
 At winter's onset she stayed some nights at the Solar
 Terrace.
 The foresters' nets were all out for her—but they
 applied their nets in vain;
 The geese of spring which go back with her surely
 see her with misgivings.
 A myriad miles in the cold void—it takes just a single
 day;
 But these golden eyeballs and these jade talons are
 of no usual stock.

Bo Juyi was a brilliant student, passing the doctoral exams at age 18, and he enjoyed a successful official career. He was noted for the simplicity of language in

his short poems. Reputedly he would read a new piece to an old peasant woman and would discard any that she could not understand. But he was most famous for a long poem titled "The Everlasting Sorrow," which recounted Minghuang's love for Lady Yang, their flight from Chang'an before An Lushan's rebel army, her execution by Minghuang's mutinous soldiers, and his sorrow and longing for her. The following poem celebrated Bo's passing the doctoral examination:

After Passing the Examination
 For ten years I never left my books;
 I went up... and won unmerited praise.
 My high place I do not much prize;
 The joy of my parents will make me proud.
 Fellow students, six or seven men,
 See me off as I leave the City gate.
 My covered coach is ready to drive away;
 Flutes and strings blend their parting tune.
 Hopes achieved dull the pains of parting;
 Fumes of wine shorten the long road....
 Shod with wings is the horse of him who rides
 On a Spring day the road that leads to home.

Poetry is very difficult to appreciate in translation because translations lose the form of the poem itself even when they successfully convey its spirit. But for those acquainted with the beauty of written Chinese the works of great Tang poets have never been surpassed.

chivalry

During the Middle Ages chivalry (derived from Latin *caballus*, "nag," and closely related to French *chevalier*, Spanish *caballero*, and English *cavalier*) denoted the class of knighthood and the ideals associated with it. The noble knight was distinguished from the peasant infantryman by several attributes: his horse, weapons

(sword and lance), banner, and attendants. Medieval chivalry became closely associated with the church and the CRUSADES. Whereas the early church believed Christianity and the profession of arms to be incompatible, medieval church leaders encouraged the development of a new, Christian order of knighthood. BERNARD OF CLAIRVAUX's treatise *In Praise of the New Knighthood* (c. 1128–31) commends the Knights Templar, a crusading order of soldiers who drew their strength in battle from their fervent faith.

Christian knights continued to swear allegiance to a liege-lord but also received a blessing from the church. This was known as the *Benedictio novi militis* (benediction for new soldiers). Before participating in the ritual a candidate typically confessed his sins, fasted, and prayed during a night-long vigil. His sword was placed on the altar and blessed. Kneeling and dressed in white, he swore the oath of chivalry and at the same time renewed his baptismal vow. Echoes of St. Bernard's exhortation to fight and live for Christ made their way into 12th century literature, as evidenced by Chrétien de Troyes's last Arthurian romance, *The Quest for the Grail* (*Perceval*) (c. 1190).

Chivalry was not only associated, however, with religion and the crusades. Certain 12th century vernacular poets—like Chrétien de Troyes and Marie de France—praised the virtues and courtesy of knightly society, thereby contributing to the rise of courtly romance, a genre that exalts the refined or pure love (*fin' amors*) between a knight and his lady. The audiences of these early vernacular works were largely feminine, and throughout the stories, women play an important role. This contrasts sharply with the relative absence of female characters from the French *chansons de geste* (such as the *Song of Roland*) and Germanic epics (such as *Beowulf*). The cult of *fin' amors* (or *courtly love*, as the 19th-century philologist Gaston Paris named it) originated in the 11th century with the lyric poetry of the troubadours and *trouvères*. (Troubadours wrote in the Provençal *langue d'oc* of southern France; *trouvères* composed their works in the *langue d'oïl* of the north.) These poets were typically noblemen, like William IX of Aquitaine, who is often described as the first troubadour. The works of several female troubadours—or *trobairitz*—have also survived (such as the countess of Dia).

Under the influence of powerful patrons of the arts—such as Queen ELEANOR OF AQUITAINE (granddaughter of William IX) and her daughter, Marie, countess of Champagne—the cult of courtly love spread throughout medieval Europe. At the end of the 12th century Andreas Capellanus, writing for the countess

Marie, composed a Latin treatise commonly referred to as the *Art of Courtly Love* (c. 1184–86). Andreas draws upon the writings of Ovid and the conventions of Provençal poetry in order to outline the proper behavior and attitudes of courtly lovers. According to Andreas, love is an “inborn suffering derived from the sight of and excessive meditation upon the beauty of the opposite sex,” which ennoble the lover's character and drives him to great accomplishments. Chrétien de Troyes's *Knight of the Cart* (c. 1180)—also dedicated to Marie of Champagne—provides a good case in point: Lancelot accomplishes great feats because his faithful (yet adulterous) love for Guinevere pushes him to surpass all other knights at King Arthur's court.

Courtly love relationships existed mainly outside marriage. Andreas insists that the man must initiate the love affair by declaring his devotion. He fully submits to the will of the lady, who has the power to accept or to deny her suitor. In either case, the knight will continue to serve her. The courtly love relationship thus mirrors the feudal bond between the knight and his liege-lord. At the end of his book, Andreas rejects love. For this reason, some scholars believe that his whole work constitutes a parody of courtly love and must not be taken seriously. Indeed later authors, like Alain Chartier in the *Belle dame sans merci*, do not hesitate to expose the excesses associated with courtly love, such as the unfair treatment of men by merciless and fickle women.

Much vernacular literature of the 13th and 14th centuries also celebrates the paradigms of courtly love. The *Romance of the Rose* by Guillaume de Lorris and Jean de Meun describes the efforts of the narrator to attain the love of “she who is worthy to be called Rose.” GEOFFREY CHAUCER (who translated the *Romance of the Rose*) makes the courtly love tradition the central theme of his *Troilus and Criseyde*. “The Knight's Tale” (from the *Canterbury Tales*) warns of the dangers of falling prey to the “amor de lonh.” Two male cousins, Arcite and Palamon, fall in love with a beautiful young woman they have spied from afar. This infatuation for the fair Emelye ultimately leads to the death of Arcite. Through the “Knight's Tale,” Chaucer mocks the place of the lady within the courtly relationship: Emelye is reduced to a passive bystander, forced to marry against her will. Although she is idealized and even worshipped by Arcite and Palamon, she has no control over her own destiny.

Chaucer's false idolatry provides a sharp contrast to DANTE ALIGHIERI's love for Beatrice, whom he woos in *La Vita Nuova*, and whose grace and beauty eventually

lead him to the contemplation of God in the third book of the *Divine Comedy*. For Dante, who draws on St. Bernard's treatise *On Loving God*, the courtly relationship guides the lover not only to accomplish great feats but also to grow close to God through his chaste and pure love for a lady. (Meanwhile lustful lovers who do not repent of their sins—like Paolo and Francesca—are condemned to eternal suffering in the *Inferno*.)

The influence of medieval chivalry and courtly love on western Europe was lasting and profound. In the 16th-century *Book of the Courtier*, Baldassare Castiglione models his advice for male and female courtiers in Renaissance Italy on knightly etiquette. Famous poets like PETRARCH, Ronsard, Donne, and Shakespeare continued to woo ladies in the fashion of the troubadours for centuries. In the 19th century Walter Scott and Tennyson contributed to a veritable rebirth of chivalric—and highly romanticized—literature; throughout the 20th century, stories of medieval knights fighting for the love of their ladies (such as White's *Once and Future King*) flourished.

Chola kingdom

The Chola kingdom was a medieval Indian state, which saw most of southern India being brought under a united government for the first time. At its greatest extent, Chola covered not just the south of India but also Sri Lanka, peninsular Malaya, western Borneo, and other islands of archipelago Southeast Asia. The Chola used

The Sri Brahdeeswarar Temple was built by the great Chola king Raja Raja I in the 10th century.

the Tamil language and religious and cultural concepts. The origins of the state are unclear, although the Chola King Raja Raja I invaded the southern Deccan region in 993 in a series of campaigns that lasted for nearly 30 years. This contributed to the downfall of the Calukya dynasty and provided opportunities for Chola and Deccan rulers to contest former Calukya territory. In 1070 Chola King Rajendra II united the existing holdings into a unitary state, which was then free to expand its holdings across the trade routes that stretched across the Indian Ocean to Southeast Asia.

The next centuries were something of a golden age for southern India, with religious and artistic expression reaching high levels of achievement. Although caste-based societies such as that of the Chola are often thought of as lacking social mobility and the ability to innovate, this was not the case. Instead, creation of new crafts and skills enabled the reordering of society and the classes within it to a considerable extent. The fact that so many different sets of people from many different homelands were a part of the Chola kingdom contributed to this mobility. The social mobility extended to women as well as men and a number of new occupations and ranks were made available to them. Specific areas of achievement included literature, bronze statuary and works, and architecture, particularly in terms of temple architecture. The temple of SHIVA at Thanjavur, which was completed in 1009, is regarded as a noted masterpiece demonstrating characteristic styles of southern India. The pantheon of Hindu gods provided numerous opportunities for artistic creativity, and the combination of creativity

and incoming influences helped to create a number of exquisite creations.

Inscriptions found on Southeast Asian islands show the progress of Chola domination across the ocean. Raja Raja and Rajendra both persecuted a fierce campaign against the SRIVIJAYA KINGDOM and ultimately destroyed it. This allowed Chola to take over a monopoly of trade in the region and to gain greater access to Chinese markets and the burgeoning city-states of mainland Southeast Asia. However, as in the case of the Indian homeland, evidence concerning the actual nature of who governed where and when is unclear. Inscriptions make grandiose claims, which in some cases are not substantiated. The end of the Chola empire is variously given as either in the 12th or 13th century, most often in 1279. The arrival of Mongol Yuan troops in Southeast Asia radically changed the balance of power in the region while, in India, the rise of Hosalya and Pandya polities ultimately eroded the economic basis of the Chola empire and it was subsumed by successors.

JOHN WALSH

Christian states of Spain

When the Moors from Morocco invaded Spain in 711, they easily managed to capture most of the Iberian Peninsula with the exception of the area around the Asturian Mountains in the north. When they did get around to attacking that region in 718, the Christians defeated the Moors at the Battle of Covadonga, near Asturias. The Moors decided to leave that part of Spain unconquered, marking what became the first battle in what the Spanish called the “Reconquista,” or RECONQUEST OF SPAIN for Christendom. Over the next centuries several Christian kingdoms emerged in Spain, notably Asturias, León, Castile, Aragon, and Navarre.

These gradually expanded and eventually managed to defeat the Moors using their alliances. They ejected them from the Iberian Peninsula in 1492, when Isabella, heir to the throne of Castile, and Ferdinand II, king of

Aragon, captured Granada, the last Muslim possession on the peninsula.

KINGDOM OF ASTURIAS

The kingdom of Asturias was, in origin, a Visigoth kingdom of Spain created by Pelayo (Pelagius), a grandson of King Chindaswinth, who had been defeated by the Moors. Pelayo established his capital at Cangas de Onis, securing his independence with a victory at the Battle of Covadonga. The Moors, rather than sending more soldiers into Asturias, headed into France and in 732 were defeated at the Battle of Tours. For the next century the Moors were on the defensive and this allowed Pelayo and his successors to rebuild their strength. Pelayo’s son, Favila, became king on his father’s death in 737 but died two years later in a boar hunt. He had no son so his brother-in-law was proclaimed King Alfonso I.

He enlarged the kingdom of Asturias by annexing Galicia in the west, and León in the south. He also extended his lands in the east to the borders of Navarre. When Alfonso died, his cruel son Fruela I came to the throne. One of Fruela’s first acts was to kill his own brother, Bimarano, who he thought wanted the throne. After reigning for 11 years, Fruela was murdered on January 14, 768, and was succeeded by his cousin Aurelius (son of Alfonso’s brother Fruela). He was, in turn, succeeded by Silo, a nephew, who had married Alfonso I’s daughter. Aurelius had managed to prevent the Moors from attacking by paying them tribute, and all that is known about Silo is that he moved the kingdom’s capital from Cangas de Onis to Pravia. This period coincided with CHARLEMAGNE’S invasion of Spain, and his capture of Barcelona.

Silo’s successor, Mauregato, was an illegitimate son of Alfonso I (his mother allegedly being a slave) (r. 783–788) and was alleged to have offered 100 beautiful maidens annually as tribute to the Moors. The next king, Bermudo I, a brother of Aurelius, had been ordained deacon and reluctantly accepted the position as king, abdicating three years later and allowing Alfonso II “The Chaste,” a son of Fruela I, to become king. Initially people were worried that Alfonso might try to avenge the murder of his father—instead he ruled for 51 years. He had been married to Berta, said to have been a daughter of Pepin, king of the FRANKISH TRIBE, but they had no children as he had taken a vow of celibacy.

During his long reign he stabilized the country’s political system and attacked the Moors, defeating them near the town of Oviedo, which they had recently sacked. Alfonso II was so impressed by the beauty of Oviedo that he moved his court there and proclaimed

it his capital. It was to remain capital of the kingdom of Asturias until 910, when León became the new capital. Work began on the construction of the Oviedo Cathedral, where Alfonso II was eventually buried. Alfonso's main achievement was that he conquered territory from the Moors, moving the reach of his Christian kingdom into the edges of central Spain. The Moorish king Abd ar-Rahman II (r. 822–852) was, however, able to check the advances of Alfonso, drive back the Franks, and stop a rebellion by Christians and Jews in Toledo.

The next king of Asturias was Ramiro I, a son of Bermudo I. He began his reign by capturing several other claimants to the throne, blinding them, and then confining them to monasteries. As a warrior he managed to defeat a Norman invasion after the Normans had landed at Corunna, and also fought several battles against the Moors. His son, Ordoño I, became the next king and was the first to be known as king of Asturias and of León. Ordoño extended the kingdom to Salamanca and was succeeded by his son Alfonso III "The Great." Alfonso III reigned for 44 years (866–910) and during that time consolidated the kingdom by overhauling the bureaucracy and, then fought the Moors. He managed to enlarge his lands to cover the whole of Asturias, Biscay, Galicia, and the northern part of modern-day PORTUGAL. The southern boundary of his kingdom was along the Duero (Douro) River.

KINGDOM OF LEÓN

Alfonso had three feuding sons who plotted against each other and then against their father. To try to placate them all, Alfonso divided his kingdom into three parts. Garcia became king of León, Ordoño became king of Galicia, and Fruela became king of Oviedo (ruling Asturias). This division was short-lived as wars among the young men resulted in all the lands eventually coming together under one ruler. García only reigned for four years before he died, without any children. Ordoño II ruled in Galicia before dying 14 years later and eventually Fruela II "The Cruel," Alfonso III's fourth son, who had outlived the others, reunited the kingdom in 924. However he died of leprosy in the following year, with Ordoño II's son's becoming King Alfonso IV. He did not want to rule and abdicated in order to spend the rest of his life as a monk. This allowed Alfonso IV's brother to become King Ramiro II. Soon after this, Alfonso tried to regain the throne, only to be taken by his brother, blinded, and left at the Monastery of St. Julian, where he died soon afterward. Ramiro II was succeeded by his elder son, Ordoño III, and then by a younger son, Sancho I "The Fat." There were two years when Ordoño IV

"The Wicked," a son of Alfonso IV, was king, but then Sancho I's only son became King Ramiro III. He was five when he became king and the Normans decided to attack again, destroying many coastal towns. Eventually he abdicated and allowed his cousin, Bermudo II, son of Ordoño III, to become king.

It was during the reign of Bermudo II that the Moors attacked and managed to get as far as León. When Bermudo II died in 999, his son Alfonso V was only five, and Don Melindo González, count of Galicia, became regent. In his 20s Alfonso V led his armies into battle against the Moors, recaptured much of León, but was killed in battle with the Moors at Viseu in Portugal, on May 5, 1028. His only son, Bermudo III, was 13 and during his nine year reign faced more threats from the neighboring Christian kingdom of Castile. In 1037 he was killed at the Battle of the River Carrion fighting King Ferdinand I of Castile, and the kingdom of León, as it was then known, was absorbed into Castile.

KINGDOM OF CASTILE AND GRANADA

The kingdom of Castile began as a dependency of León and was controlled by counts. However in 1035 Ferdinand I "The Great" was proclaimed king of Castile and two years later after defeating and killing Bermudo III, became king of Castile and León, ruling for the next 27 years. These new kings saw themselves as lineal descendants of the heritage of Asturias, even if not by blood. When Ferdinand I died he divided his lands among his children and Sancho received Castile, Alfonso received León and Asturias, García was given Galicia and northern Portugal, his daughter Urraca was given Zamora, and Elvira was given Toro. This was meant to end squabbling by them but only ended up with much fighting. At this time, a nobleman, Rodrigo Díaz de Bibar, emerged as the great Spanish hero EL CID. Interestingly he later tried to set up his own kingdom of Valencia, which ended in his death. Eventually Alfonso ruled all the lands as Alfonso VI "The Brave," king of Castile.

Alfonso VI launched a number of attacks on the Moors but most of these were overshadowed by the efforts of El Cid. In 1085 the Christians were able to capture the city of Toledo, and Alfonso reigned until his death in June 1109 at the age of 70. He had five or six wives. His daughter Urraca succeeded Alfonso VI. She married first Raymond, count of Burgundy, and later Alfonso I, king of Aragon. Her successor was Alfonso VII (r. 1126–1157), titling himself as "Emperor of All Spain." When he died his lands were divided between his eldest son, Sancho III "the Desired," who was given Castile; and his second son, Ferdinand II, who was given León.

Sancho III only reigned for a year and his only surviving son became Alfonso VIII, r. 1158–1214. In 1212 he defeated the Moors at the battle of Las Navas de Tolosa, giving Castile control over central Spain. When he died, Henry I, his youngest but only surviving son, succeeded him. He died and was succeeded as king of Castile by his nephew Ferdinand III. Meanwhile in León, Ferdinand II had reigned for 31 years, and when he died in 1188, his brother, Alfonso IX, succeeded him. Alfonso IX's first wife Teresa, from whom he was divorced, was later canonized as Saint Teresa in 1705. His eldest surviving son with his second wife was Ferdinand, who had already become king of Castile. When Alfonso IX died in 1230, the kingdoms of Castile and León were reunited.

Ferdinand III embarked on a series of wars against the Moors, managing to capture the cities of Córdoba (1236), Jaen (1246), and Seville (1248). With the capture of Seville, the "Reconquista" was almost complete—the Moors held only the city of Granada. The forces of Ferdinand were unable to take that city, although the emir of Granada did acknowledge his overlordship. Ferdinand III also founded the University of Salamanca, died on May 30, 1252, and was buried in Seville Cathedral. In 1671 Pope Clement X canonized him, and he became St. Ferdinand (San Fernando). Ferdinand's son, Alfonso X, had two titles, "The Wise," and "The Astrologer." During his reign he codified the laws, wrote poems, and had a large number of scholars produce a great chronicle of Spanish history. One of his advisers, Jehuda ben Moses Cohen, wrote that the king was someone "in whom God and placed intelligence, and understanding and knowledge above all princes of his time."

He was also elected as King of the Romans in 1257, renouncing the title of Holy Roman Emperor in 1275. However Alfonso X was faced with a dynastic succession crisis. His eldest son, Ferdinand de la Cerda, died in 1275, leaving two young sons, Alfonso X did not want a young boy on the throne so nominated as his successor his second son, Sancho. Ferdinand's wife championed the cause of her two boys, and Alfonso X's wife sided with her. The conflict continued when the French—Ferdinand's wife was a French princess—declared war on Sancho, who had the support of the Spanish parliament, the Cortes. War seemed inevitable, but when news arrived that Sancho was ill, Alfonso died of grief and despair.

Sancho IV "The Brave" became the next king, his illness being not as serious as was first thought, and after reigning for 11 years, he was succeeded by his son Ferdinand IV "The Summoned," who was only nine when he became king—his mother ruled ably as regent. Little of

note happened during Ferdinand IV's reign and he gained his title from sentencing to death two brothers who had been accused of murdering a courtier. They went to their execution protesting their innocence and "summoned" Ferdinand to appear at God's court of judgment in 30 days. As Ferdinand was only 26 years old at the time he was unconcerned, but on the 30th day after the execution his servants found him dead in bed.

His one-year-old son, Alfonso XI "The Just," became the next king and in 1337, when he was 13 years old, attacked the Moors of Granada. At the Battle of Río Salado on October 30, 1340, the Spanish, supported by the Portuguese, defeated a Moorish army. It was said to have been the first European battle where cannons were used. Alfonso XI reigned until 1350 when he was 39. Alfonso was married to Maria of Portugal but spent most of his reign with Leonor de Guzmán, a noble woman who had recently been widowed. Alfonso and Leonor had a large family but when Alfonso died, Leonor was arrested on orders of the queen and taken to Talavera, where she was strangled. The next king was the son of Alfonso and Maria, Pedro I "The Cruel," who reigned from 1350 until 1366.

During the reign of Pedro I he also married Blanche of Bourbon, cousin of the king of France, but fell in love with Maria de Padilla. Initially Pedro appointed Maria's friends and family to positions of influence, but some nobles forced the dismissal of supporters and relatives of Maria. In 1355 he had four of these noblemen stabbed to death, and apparently blood splattered over the dress of his wife, earning Pedro his title "The Cruel." In 1366 he was deposed by his half brother Henry II of Trastámara, "The Bastard," but managed to oust Henry and returned as king in the following year, spending the next two years in battles with his half brothers, and assisted by the English led by Edward the "Black Prince." These events formed the backdrop of the French novel *Agenor de Mauleon* (1846) by Alexander Dumas. Eventually Pedro was murdered and Henry II was restored to the throne. Over the next 10 years, until Henry died, attempts were made, ultimately successful, to prevent John of Gaunt from invading Spain.

Henry II's only legitimate son, was John I, 21 years old, and he became king when his father died. Some 11 years later, while watching a military exercise, John I fell from his horse and was killed. His 11-year-old son, Henry III "The Infirm," became the next king. When he died in December 1406, his one-year-old son was proclaimed John II. When he was 13 years old, the Cortes declared the teenager to be "of age," and John II ruled in his own right. The king had many favorites, one of whom was

Don Alvaro de Luna, who later writers suggested was a boyfriend of the young king, John II reigned until his death in 1454, was succeeded by his son, Henry IV, who reigned until 1474. He had a daughter and before Henry IV died, the heiress, Isabella, married Ferdinand of Aragon, uniting Christian Spain.

KINGDOMS OF ARAGON AND NAVARRE

The royal House of Aragon, in northeastern Spain, traces its origins back to Ramiro I (r. 1035–1063). His father, Sancho III, king of Navarre, had left him Aragon, as Ramiro was illegitimate. Ramiro was a warrior prince and quickly extended his lands, even briefly taking part in forays into the land of his half brother Garcia III, who had inherited the rest of Navarre. In a war with the Moorish emir of Saragossa over tribute, Ramiro was killed in battle on May 8, 1063. Ramiro's successor was his eldest son, Sancho I, who managed to recapture lands from the Moors, pushing the boundaries of Aragon to the north bank of the river Ebro. In 1076 when his cousin, the king of Navarre, died, Sancho succeeded to the throne of Navarre.

In June 1094 Sancho was killed during the siege of Huesca. His son and successor, Pedro I, then became king of Aragon and Navarre, carrying on the siege of Huesca for another two years. In 1096 he defeated a large Moorish army and its Castilian allies, at the Battle of Alcoraz, with help, legends state, from St. George. Pedro's two children died young, and in grief both he and his wife died soon afterward. Pedro was succeeded by his brother Alfonso I "The Warrior." Having no children he was succeeded by his younger brother, Ramiro II "The Monk." Ramiro was only king for three years, abdicating to spend the remaining 10 years of his life in a monastery.

His only child, Petronilla, became queen, when she was one year old. When she turned 15 in 1151, she married Ramon Berenguer IV, count of Barcelona. Twelve years later she abdicated the throne in favor of her son Alfonso II (r. 1163–96). His eldest son and successor was Pedro II, who was alleged to have kept scandalous company with many women. With the outbreak of the ALBIGENSIAN CRUSADE in France, and the persecution of the Cathars in southern France, Pedro II led his army into the region to demonstrate the historical ties of Aragon to the region. He tried to stop the carnage that was taking place around Carcassonne and urged the pope to recognize the area as a part of Aragon, not France, which would have ended the crusade. He failed and on September 13, 1213, at the Battle of Muret, was killed in battle with the crusaders led by Simon de Montfort.

Pedro's son James I "The Conqueror" was only five when he succeeded his father. After a terrible regency, James took control and led his armies in taking the Balearic Islands (1229–35), conquering Valencia from the Moors in 1233–45, and also in the campaign against Murcia in 1266. When James died his son, Pedro III, succeeded him, leading his armies against the Moors. He had a claim to the kingdom of Sicily through his wife and invaded the island in 1282, earning the title "The Great." He was badly injured in the eye during fighting with the French and died soon afterward to be succeeded by his son Alfonso III "The Do-Gooder." This interesting title came from the fact that he granted his subjects the right to bear arms. His brother and successor James II "The Just" conquered more land from the Moors and was in frequent disputes with the papacy. In 1310 he conquered Gibraltar, and possibly to placate Pope Clement V, two years later he suppressed the Order of the Knights Templar.

James II was succeeded by his son Alfonso IV "The Debonair" or "The Good." Most of his reign was spent in disputes over the islands of Corsica and Sardinia, which were captured by the Genoese. His son and successor, Pedro IV, held a huge coronation, apparently with as many as 10,000 guests, and earned the title "The Ceremonious." He managed to lead his army into Sicily, which he recaptured, and when he died in 1387, his feeble son John I succeeded to the throne. His wife, Iolande de Bar, was actually in control of the kingdom. John died after being gored by a boar during a hunt, and his younger brother Martin "The Humane" became king. It was during his reign that the famous *santo cáliz* was transferred to Valencia Cathedral, where it is still revered by many as the Holy Grail. It was said that St. Peter took it from the Holy Land to Rome, and it was taken to Valencia. Martin lost the throne of Sicily and when he died in 1410, there was a brief interregnum until Ferdinand I "The Just" was proclaimed king.

Ferdinand I was the son of John I and was elected king by the nobles. When Ferdinand I died in 1416, after reigning for just four years, his eldest son, Alfonso V "The Magnanimous," became king. There was a plot to overthrow him, and he refused to hear the names of the conspirators, allowing them to go unpunished. He spent much of his time and energy in his possessions in Italy: Naples and Sicily. When he died, his lands in Spain went to his brother John, who had been king of Navarre, and he became king of Aragon and Navarre. His Italian lands went to his illegitimate son Ferdinand. John II reigned from 1458 until 1479. His greatest achievement was arranging the marriage of his son, Ferdinand, to

Isabella, heir to the throne of Castile. They were married in 1469 at Valladolid. When John died on January 19, 1479, the Christian kingdoms of Spain were united with Ferdinand and Isabella as joint rulers. In 1492 the armies of Ferdinand and Isabella finally took Granada, the last Moorish part of the Iberian Peninsula, ending the “Reconquista.”

JUSTIN CORFIELD

Chrysoloras, Manuel

(c. 1350–c. 1415) scholar, humanist, and emissary

Manuel Chrysoloras was born in approximately 1350, in Constantinople, only about a century before the city—and its Eastern Roman Empire, or Byzantine Empire—fell to the Ottoman Turks under Mehmed II in 1453. He became a student of Georgius Gemisthos Pletho, who represented the Greek Church at the COUNCIL OF FLORENCE in 1439. The ITALIAN RENAISSANCE had brought to Italy a great respect for the teachings of the ancient world, which had been kept intact in Constantinople for over 1,000 years. Under Pletho’s inspiration, Cosimo de’ Medici founded the famous Academy in Florence.

In 1390 Chrysoloras went to Venice to try to rouse the western Europeans against the menace posed by the Turks, then ruled by Sultan BAYEZID I. He was sent as the personal emissary of Emperor Manuel I Palaeologus. There was much enmity between the west and the Byzantine Empire, and a large cause of it was the Fourth Crusade of 1204. Instead of sailing for the Holy Land to fight the Muslims, the ruling doge of VENICE, Enrico Dandolo, had used the crusaders to conquer and sack Constantinople, which Venice saw as its chief rival for trade with the east. Manuel’s Palaeologus dynasty had come to power in 1261, when the Byzantines rallied under Michael Palaeologus to throw the western European knights out of Constantinople, who had ruled it since the Fourth Crusade.

But as with Pletho before him any lingering ill feelings did not prevent the Italians from giving Chrysoloras a warm welcome. After his diplomatic mission,

he returned to Constantinople, but the impression he had made remained. In 1396 the chancellor of the University of Florence, COLUCCIO SALUTATI, invited him back to teach. He became a highly respected teacher in Florence, continuing to teach the works of Greece and Rome. He wrote the *Erotemata*, the original Greek grammar and vocabulary text. The *Erotemata* became the basic reader of the great humanists. Chrysoloras insisted on expressing a sentence in the same grammar of the translated language. Because of this he is considered to be the father of modern translation. He taught many people but had only five full-time disciples.

He became one of the leaders of the humanist movement in Europe and, as with Pletho before him, most likely represented a great stimulus to the revival of ancient learning that marked the entire Renaissance in western Europe. He spent the rest of his life teaching in the west, serving at the universities of Florence, Bologna, and Rome. Later in his career the scholar resumed diplomatic work. In 1408 he represented Manuel again in an embassy to the court of France’s King Charles VI. He was chosen to represent the Greek Orthodox Church in an embassy to the Emperor Sigismund of the HOLY ROMAN EMPIRE in 1413.

Chrysoloras sought a church council to help heal the wounds between the western and eastern Christian churches that dated from the Great Schism of 1054. This was especially needed after the failure of the crusade that had set forth in 1396 to fight the Turks. However, on his last diplomatic mission to see Emperor Sigismund, Manuel Chrysoloras died in the city of Constance, where the council was to be held, in 1415.

JOHN F. MURPHY, JR.

Cluny

At the end of the ninth and beginning of the 10th century, European society faced the turbulent effects of the destruction of central authority in civil government. This major crisis was not without repercussion in the

ecclesial sphere, including: schisms and scandals in the papacy, seizure of church power—even in monasteries—by the laity, and simony and sins against celibacy among the clergy.

Paradoxically a religious monastic movement marked the same period. The first and most influential center of reform was the Benedictine Abbey of Cluny (in Burgundy, France), founded in 910 by the monk Berno. The spiritual movement that began with Cluny promoted a renewal of religious life based on the Rule of Saint Benedict (sixth century) and contributed to the vigorous affirmation of the ideals proposed by Pope Gregory VII (c. 1020–85) for the reform of the whole church. Characteristics of this new monastic trend were regularizing monastic duties, development of liturgical ritual, monastic culture based upon the study of the Bible and the church fathers, and charitable activity.

To achieve exemption from control by lay people or even bishops, the Cluniac monks established a congregation of monasteries under the control and guidance of Cluny and placed themselves under the immediate jurisdiction of the pope. Thanks to outstanding abbots, Cluny and its congregation turned into something like a monastic empire and contributed to a most powerful reform of monks, diocesan clergy, and ordinary faithful. But the strength of Cluny became its weakness. The emphasis put on prayer became so exaggerated that there was no time left for the other monastic ideal of manual labor; this in turn opened the door of the monastery to feudal and political affairs.

To remedy the crisis of authority facing the church, Cluny chose a strongly hierarchical and centralized organization with a head (the abbot) that ruled over the local communities. It had nevertheless become too much involved in the political establishment linked to the ruling powers of civil society. Consequently the 11th century saw the development of a widespread desire for a simpler and less institutionalized monastic life. It led to the rediscovery of eremitical life, that is, the life of solitude, and produced a variety of new orders.

The Cistercians were one of them, ready to offer another solution to the problem. In 1098 Robert, the Benedictine abbot of Molesme (in Champagne, France), left his monastery with a score of brothers and established a new monastery at Cîteaux (near Dijon, about 30 miles away from Cluny). Their goal was to promote a community way of life involving greater separation from the feudal society, poverty, simplicity, return to manual labor, and authentic conformity to the Rule of Saint Benedict. At Cluny the abbot had become the head

of a congregation of monasteries with great temporal power; the dependent houses had no abbots. By contrast, each Cistercian monastery founded and guided by Cîteaux was autonomous and required its own abbot to live a regular monastic life. To guarantee the return to sound traditions, the network of monasteries held themselves accountable to their way of life: Every year, another abbot visited each monastery; all the abbots would also meet together annually. Both these measures aimed at mutual aid, assurance of regular observance, and remedying of abuses and failures. This federalist type of organization, as opposed to the centralization of Cluny, better safeguarded the spiritual and material interests of each monastery.

The difference of perspective however became a significant source of tension and jealousy among Cistercians and Cluniacs. It was epitomized in the correspondence, for over 20 years, between Saint Bernard, abbot (1115–53) of Clairvaux (founded by Cîteaux) and spokesman for the Cistercian order, and Peter the Venerable, abbot (1122–56) of Cluny. Both were proponents for change. Peter was aware of the need for change at Cluny. He had already modified obsolete customs, shortened some of the prayer services, and emphasized precepts concerning fasting, silence, and clothing. But Bernard and Peter could not agree on what constituted true monasticism.

What the Cistercians considered as an authentic return to the Rule of Saint Benedict, the Cluniacs perceived as novelty and self-righteousness. Bernard's impetuous character did not make the conflict easier. When the Cluniacs stressed moderation, he saw laxity. A well-known document of the controversy is Bernard's satirical treatise *The Apology* (1125), in which he actually also criticized those of his own monks who did not share his zeal for reform. Both men finally developed a more friendly relationship, but the rivalry between both orders lasted for quite some time.

In the 13th century the Cistercians' influence began to wane, partly because of internal decline. In the 15th century there were again serious efforts to reform Cluny. As for the later history of the Cistercians, it is largely one of repeated attempts at revival; the most famous began at the Cistercian monastery of La Trappe (France) in the 17th century by De Rancé. The houses that embraced his reform were called Trappists for the men, and Trappistines for the women. Nowadays, their official title is Cistercians of the Strict Observance.

EMMANUELLE CAZABONNE

Columban of Leinster

(543–615) *Irish missionary*

Also known as St. Columbanus, Columban of Leinster was born in West Leinster, Ireland, in 543. He died in Bobbio, Italy, on November 21, 615. Early in life, Columban entered religious life under Sinell, an abbot in Lough Erne. He then left for the monastery of Bangor and studied under St. Comgall. He embraced the Irish form of monastic life and undertook a life of fervor, regularity, and learning.

At the age of 40 Columban decided to leave the monastery and become a missionary, preaching the Gospel in foreign lands. In 585 he sailed with 12 companions and landed on the coast of Scotland, then moved on to France. The French people converted to Christianity in large numbers and clergy in that area were reformed from their worldly ways. The companions traveled together to Burgundy and with the blessing of King Gontram, settled in an old Roman fortress and began a monastery. So many noblemen and peasants flocked to Columban, wishing to join his monastery, that the saint was forced to start a second monastery at Luxeuil in 590. Columban spent much of his time in solitary prayer and fasting in a cave, but superiors of both monasteries remained subordinate to him. He wrote his rule of monastic life for these two communities while living in the cave.

In 602 Columban was at the center of a controversy over the right of monasteries in Gaul to be independent of the area bishops. The bishops of Gaul had retained control over monasteries in their territories, unlike the bishops of Ireland, who allowed monasteries varying degrees of independence. In 602 the bishops of Gaul met to judge Columban and his control of monasteries. His appeals to successive popes went unanswered and the question was never definitively answered.

Columban also advised the nobility of Gaul. In one instance, he sought to keep Thierry, heir to Burgundy, steadfast in opposition to concubinage, a policy set forth by the queen-regent to prevent the possible influence of another queen over her minor son's life. The queen-regent, Brunehild, had Columban and his monastic rules condemned by the Burgundian bishops.

Columban refused to conform to their decrees and was imprisoned, but escaped and returned to his monastery. Thierry, who had never followed the advice of the saint, conspired to have Columban and his Irish monks driven to the sea and sent back to Ireland. Their ship never got far from shore and was driven back by a storm. Columban escaped to Neustria and then to Austrasia in 611. He proceeded to Mainz and went into the countryside to preach the Gospel to the Suevi and Alamanni tribes. His zeal did not convert the Swiss and he was persecuted. He converted some in other regions and established at least one more monastery but was again persecuted and crossed the Alps into Italy.

Once in Milan, Columban was befriended by the king and began to argue against the Arian heresy. All he wrote against them has been lost. He also fought Nestorianism with Gregory the Great and submitted the Irish church to the decisions of the papacy, saying the Irish were disciples of St. Peter and St. Paul, not of heretics. For his efforts, the pope gave Columban a piece of land called Bobbio, near GENOA. On his way to settling this land, he preached so well at the town of Mombrione that the town changed its name to San Colombano. The monastery Columban founded at Bobbio was for centuries the center of Catholic orthodoxy in northern Italy. He died at Bobbio and his body is preserved in the church there.

RUSSELL JAMES

Constance, Council of

The Council of Constance was the last and most successful of a series of church councils called to heal the division in the Catholic Church between followers of the popes in Avignon and followers of the popes in Rome. By the time the council was actually convened, on November 1, 1414, there was also a third, consiliar papacy, set up by the Council of Pisa in 1409, in a failed attempt at a fresh start. Unlike Pisa the new council involved secular princes as well as ecclesiastics, convoked by the Holy Roman Emperor Sigismund as well as by the antipope John XXIII. John, who held the loyalty of the ecclesiastics attending the council,

hoped to use it to his own ends, but the council went against him, partly because of the scandalous life that made him seem unfit for the position of vicar of Christ. John's plan to have the council vote by head, which would enable him to use the majority of Italians loyal to him, was defeated in favor a plan to vote by nation. Each national delegation (Italian, German, French, and English) would decide its position, and a majority of nations would carry the vote.

After John fled the council and was forcibly returned, he was formally deposed in May 1415, and the church was declared without a head. The problem of the Roman line was settled when Gregory XII abdicated on July 4, although not before his representative had formally reconvened the council, giving it legitimacy in Roman eyes. The Avignon pope, Benedict XIII, never formally abandoned power. However, his (principally Spanish) allies quietly deserted him and generally acquiesced in the election of Cardinal Odo Colonna as Pope Martin V in 1417.

The other great problem the council faced was the growth of heresy, particularly that of the Wycliffites or Lollards in England and the Hussites in Bohemia. JOHN HUSS had traveled to the council on a vow of safe conduct granted by Sigismund. He hoped to explain and vindicate his positions, but once in Constance he found himself subject to an ecclesiastical trial carried on by the council. (There was a legal argument that church authorities were not bound by a safe conduct vow given by a secular prince like Sigismund to a man suspected of heresy.) Huss was burned on July 6, 1415. The next year Huss's disciple, Jerome of Prague, who had fled the council and been taken back in chains, followed him into the flames. The council also condemned JOHN WYCLIFFE's teachings and ordered his body removed from consecrated ground.

Some hoped that the council could reform the church and exert an authority superior to the popes'. The conciliar decree *Haec Sancta*, passed in 1415, declared that the council derived its power from Christ and that all Christians, including the pope, owed it obedience. In 1417 the council passed a decree providing for regular councils, but Pope Martin took a high view of papal supremacy over the church. A struggle between the council and the pope was averted when Martin offered concessions to national delegations in return for agreeing in the council's dissolution and declared the council dissolved in May 1418.

WILLIAM E. BURNS

Constantinople, massacre of

The Fourth Crusade had a devastating impact on the Byzantine Empire and its capital, Constantinople. For an enormous charge, the Venetians offered to transport the forces of the Fourth Crusade to Egypt to fight the Muslim "infidels." But the Venetians never intended to attack the Egyptian Muslim rulers, with whom they had an extensive and lucrative trade. Instead after some maneuvering, the Venetians convinced the crusaders to attack and take Zara, a strategic and rich Adriatic port. The spoils from Zara were divided among the Venetians and the crusaders.

The crusaders then ignored the orders of Pope INNOCENT III not to attack Byzantium. In 1204 the crusaders, aboard Venetian ships, landed at Constantinople, then the richest city in Europe. The aged Venetian doge, Enrico Dandolo, personally led the crusaders, mostly French, into the city. Hundreds of Muslim worshippers were killed as well as several thousand Greek Christians, considered as heretics by Latin Catholics. Having traded extensively with Byzantine merchants, the Venetians were familiar with the city and its treasures and embarked on extensive and systematic destruction, pillaging, and theft of the city's wealth. To the present day, many art collections in Venice, including the famous bronze horses overlooking Piazza di San Marco, were stolen from Constantinople in 1204. The crusaders installed Baldwin of Flanders as head of the new Latin Kingdom of Constantinople and replaced the Greek clergy with Latin clergy. The Latin Kingdom proved short-lived and after its collapse Greek Byzantine rulers returned to Constantinople, but the city never regained its former glory or power.

JANICE J. TERRY

Crusades

In 1095 Pope URBAN II incited the Crusades with a speech urging Christian armies to free the holy sites, especially Jerusalem, from Muslim control. The Crusades sparked a fire of religious fervor among thousands of young knights and other Christian believers. Other crusaders were adventurers, fortune seekers, and the poor and destitute. In part the Roman Catholic Church sought the return of the Holy Land to Christian rule because the Seljuk Turks could not ensure the safety of Christian pilgrims. The SELJUK DYNASTY also extracted high taxes from and sometimes persecuted Christian pilgrims. The success of the early Crusades also reflected the disarray and weakness of the Arab-Muslim world in the 11th century.

The First Crusade (1096–99) was preceded by the Peasant Crusade, a crusade of hungry peasants; most died on the way to the Holy Land. Some 30,000 soldiers, mostly Franks and Germans, participated in the First Crusade. The crusaders crossed the Anatolia Peninsula and took Antioch in 1097. They then moved on to take Jerusalem in 1099 where they massacred thousands of civilians, mostly Eastern Orthodox Christians, considered as heretics by the Catholics, and Jews. First hand accounts describe the city running with blood knee-deep for several days. After taking the city, the crusading knights gathered in the Church of the Holy Sepulcher and proclaimed GODFREY OF BOUILLON as king. Godfrey continued the war and extended crusader territory. Some knights settled more or less permanently in the new Crusader States, that at its greatest extent included the Syrian coast and Palestine.

The Crusader States replicated the feudal system prevalent in Europe. Fiefs were given to favored knights who were tied together for common defense. The crusaders built huge castles, often enlarging older Arab fortresses on high ground in strategic locations. Some of these castles, such as Beaufort Castle in Lebanon and the Krak des Chevaliers (Qala'at al-Husn) in Syria, still stand. Indigenous Arab villagers were little affected by the crusader rule as they were accustomed to giving tribute to local lords and fulfilling obligations of service during wartime. Likewise the Crusader States had little or no impact on the vast interior regions of the Arab-Muslim world. Under the crusaders, agriculture remained the mainstay of the economy. However the Crusader States were strategically and economically vulnerable. Church and military orders were exempt from taxation and the Italians enjoyed special extra-territorial rights. Indeed the ITALIAN CITY-STATES who provided transportation at high costs for many cru-

saders and financial backing, at high interest rates, for expeditions were among the chief beneficiaries of the Crusades. The Crusader States were also dependent on Italian city-states for supplies from Europe.

The Second Crusade (1146–48) led by King Louis VII of France and Emperor Conrad III followed the same geographic route as the First Crusade, but attempts to take Damascus failed. Conrad returned to Germany because of sickness, but Louis remained to make pilgrimages to the holy sites. At the time of the First Crusade Syria had been close to political collapse as rival powers struggled for ascendancy throughout the eastern Mediterranean after the collapse of the Abbasids. However Muslims challenged the crusaders and launched a series of counterattacks to regain control of Jerusalem and Syria. SALADIN proved the most formidable Muslim opponent. He united the Muslims and at the BATTLE OF HORNS OF HATTIN in the summer of 1187 stopped crusader expansion into the heartland of the Arab world. He then attacked crusader strongholds and took Jerusalem in 1187.

The fall of Jerusalem provoked the Third Crusade led by King RICHARD I of England, the Holy Roman Emperor FREDERICK I Barbarossa, and Philip II of France. Frederick drowned in Asia Minor in 1190 and after Philip and Richard quarreled, Philip returned to France. Without taking Jerusalem, Richard negotiated a truce with Saladin that ensured safe passage of Christian pilgrims into the city. Although Pope INNOCENT III called for new attacks on Jerusalem, the crusading zeal was beginning to wane. When the Venetians demanded a high price to take crusading troops to Egypt, the Muslim military stronghold, the crusaders moved against Constantinople, the famed capital of the Byzantine Empire. In the Fourth Crusade, the crusaders looted Constantinople and established a short-lived (1204–1261) Latin Empire there. The attack on Constantinople undermined the papacy and crippled the Byzantine Empire, which became more vulnerable to subsequent attacks by the Ottoman Turks. It also exacerbated animosities between Eastern Orthodox believers and the Roman Catholic Church. That schism persisted into the 21st century.

After Saladin's death, divisions within the Muslim world enabled the crusaders to retain tenuous control of their territory, but Mamluk rulers resumed attacks from Egypt in the mid-13th century. Sultan Baybars (r. 1260–1277) launched annual attacks against the Frankish kingdoms, taking most of the Palestinian coastal cities. He also defeated the Mongols, thereby preventing them from taking the coast. His military exploits were often favorably compared to those of Saladin. The Mamluks captured the city of Tripoli in 1289. The Mamluk Sultan

The Krak des Chevaliers, or knight's fortress, in Syria, built during the Crusades. Krak des Chevaliers was the headquarters of the Knights Hospitaller. It was expanded between 1150 and 1250; the fortress has outer walls 100 feet thick.

al-Ashraf Khalil took Acre, the last crusader outpost, in 1291. Signifying the end of the crusader presence, the city was looted and razed. Sultan Khalil was feted as a conquering hero on his return to Cairo. However as with many Mamluk rulers, rivals to the throne assassinated Khalil within a year of his victory.

The Crusades marked almost 200 years of intermittent warfare and sporadic coexistence between Christian Europe and the Muslim East. The exchanges fostered many negative cultural and religious stereotypes. Positive results included the introduction of many new goods, including brocades, perfumes, soaps, and foodstuffs, especially spices, to the West. Damascus retained its importance as a center for industry and commerce while Jerusalem was a religious center. Some crusaders remained, intermarried, and assimilated into Muslim society. The Italian city-states established long-lasting commercial ties that continued even during times of open warfare. The wealth from this trade helped to finance the cultural flowering of the Renaissance. In the long term, the Crusades worsened Christian-Muslim relations and intensified religious animosities. In spite of having been

under Muslim rule for over 400 years, most of the population in the eastern Mediterranean was still Christian when the crusaders arrived. However the massacres of Eastern Orthodox Christians by the crusaders and their rude treatment of the local population ironically contributed to a massive conversion of Christians to Islam after the fall of the Crusader States.

JANICE J. TERRY

Cyril and Methodios

Christian missionaries and scholars

The brothers Saint Cyril and Saint Methodios were born around 827 and 825, respectively, in the bilingual (Greek and Slav) city of Thessalonika to a prominent Byzantine family. They were educated in Constantinople, where Cyril was a professor at the patriarchal school, and Methodios entered the religious life, rapidly becoming an archimandrite (abbot) of one of the city's monasteries.

Their first missionary endeavor, to the Khazars north-east of the Black Sea, was a failure, with many of the Khazars converting to Judaism. In 862 Prince Rostislav of Great MORAVIA asked the Byzantine emperor Michael III for missionaries and Photius the Great, patriarch of Constantinople, sent Cyril and Methodios. Immediately the brothers set to translating the Byzantine liturgy and New Testament into a language later called Church Slavonic, even developing an alphabet based on the Greek alphabet for the Slavic tribes. In 863 the brothers arrived in Great Moravia and achieved extensive success.

This led to conflict with German bishops who claimed authority over the Moravian territory. Because of this dispute, the brothers were invited to Rome, where Pope Adrian II accepted the brothers' work and authorized the Slavonic liturgy. Cyril died in Rome on February 14, 869. Methodios returned to Great Moravia as the pope's representative and archbishop

of Sirmium. Unfortunately this did not end the abuse from the German bishops, who tried him for heresy and imprisoned him until he was ordered released by Pope John VIII.

In 880 he again traveled to Rome, where the pope again approved the liturgical innovations. After an 882 trip to Constantinople to attend a church council called to support the missionary effort, he returned to Moravia, where he died on April 6, 885. After Methodios's death Pope Stephen V forbade the use of the Slavic liturgy, and the disciples of the brothers were forced into exile outside Great Moravia. These disciples spread Byzantine Christianity to the Carpathian Mountains, Poland, and eventually distant Kiev in modern-day Ukraine, using the Slavonic language of Cyril and Methodios.

The Cyrillic alphabet, developed by the brothers, continues to be the basis of the alphabets used in a number of traditionally Byzantine Catholic and Orthodox countries. The original alphabet contained 44 letters. Today the modern languages of Russian, Ukrainian, Carpatho-Rusyn, Serbian, and Bulgarian have used modified versions of the Cyrillic alphabet. The Byzantine Church rapidly canonized the brothers for their missionary work and created their principal feast day on May 11. In 1880 the Roman Catholic Church began to celebrate their feast on February 14.

BRYAN R. EYMAN

D

Damascene, John

(c. 650–c. 749 C.E.) *theologian*

John Damascene is one of the great fathers of the church for the Byzantine East. His contributions include several influential, even fundamental theological works, apologetic literature, and hymnography, all in Greek. John was the son of a wealthy mercantile family that served at the court of the Umayyad caliph in Damascus. He received an education in Greek and Arabic but gave up his position in government and retired to the monastery of St. Sabas in the Judean desert. He was eventually ordained a priest. John was active during the iconoclast controversy of the Byzantine emperor Leo the Isaurian (717–741 C.E.). John strongly defended the ancient Christian practice of veneration of holy images and composed in his *Three Orations* a reasoned defense of this practice. His work supported the later defenders of the veneration of icons following the Second Ecumenical Council of Nicaea (787 C.E.). Since John was outside the Byzantine territory he could continue to write against ICONOCLASM and the iconoclastic Byzantine emperors without fear of reprisal.

His monumental work is the *Fount of Knowledge*, a collection of Christian knowledge in three parts. The first book, the *Dialektika*, is essentially a definition of philosophical terminology. The second is a compilation of HERESIES based on the *Panarion* of Epiphanius, the bishop of Salamis in Cyprus (c. 315–403 C.E.). The final section and the core synthesis of the work is entitled *On the Orthodox Faith* (*De fide orthodoxa*), a summary of

doctrinal positions on a wide array of theological topics designed to help Chalcedonian Christians respond to claims of ISLAM and other Christian churches. The theology of these responses is a summary of earlier Greek theologians. The most important figures in this summary are Gregory Nazianzen, Athanasius of Alexandria, and the Latin theologian Leo the Great of Rome. Since the theology of Jesus (Christ) of Nazareth's human and divine natures was the area of greatest disagreement among Christians, John addresses many doctrinal concerns in this area. *On the Orthodox Faith* was translated into Slavonic in the ninth century C.E. and into Arabic in the early 10th century C.E. Latin translations were made in the 12th and 13th centuries C.E., and THOMAS AQUINAS cited *On the Orthodox Faith* in the *Summa Theologiae* with significant frequency.

John composed the earliest Christian apologetic literature in Greek addressed to Islam, although it is uncertain to what form of the QUR'AN he had access. The influence of John was immediately felt on the Syriac theologian Theodore Abu Qurra' (fl. 780–820 C.E.), another monk of St. Sabas, who wrote defenses, of the veneration of images and apologetic literature addressed to Islam in Arabic, Greek, and Syriac, although only his Arabic and Greek writings survive. John made substantial contributions to the development of the Byzantine liturgical offices. The system of daily and weekly hymnography based on 12 tones in Byzantine liturgy known as the Octoechos is attributed to him. In addition, he composed hymnography for saints' days and for other occasions; a good portion

of this material is still sung as part of the Byzantine liturgy today.

ROBERT R. PHENIX, JR.

Danelaw

Danelaw encompassed the areas of northeast England where Danish customs had a strong political and cultural influence throughout much of the early Middle Ages. The area included Yorkshire (southern Northumbria), East Anglia, and the Five Boroughs, named for its main centers of settlement: Lincoln, Stamford, Nottingham, Leicester, and Derby. All these territories bore influence of Scandinavian culture from Viking invaders in the late-ninth century, who then became settlers and who drove the political leadership of the Anglo-Saxon kingdoms into retreat to the south and west.

In c. 865 an army of between 500 and 1,000 Vikings arrived in England and began a systematic attack on the island. Their leaders were three brothers, Ivar the Boneless, Ubbi, and Halfdan, who had allegedly come to avenge the death of their father, Ragnar. They secured horses in East Anglia and proceeded to York, finding that infighting among local Anglo-Saxon leaders made conquest easy in Northumbria. The invaders next attacked west into Mercia and by 869 defeated East Anglia. The following year Halfdan attacked the kingdom of Wessex, seizing Reading and fighting nine pitched battles against Wessex. The Anglo-Saxons won only one battle, and the onslaught devastated the ranks of their nobility. Despite their unequivocal success, when Wessex offered a treaty the Vikings readily agreed and refocused their efforts north toward the kingdom of Mercia.

Throughout the 870s the Danish army continued to conquer territory in England, dividing and redividing the lands they acquired. They split Mercia with a puppet Anglo-Saxon king, Ceowulf, who held the territory on their behalf from 874 to 877 while they completed their conquests. However by 876 Halfdan and his men had occupied and divided Northumbria, settled into

farming, and started a permanent settlement. In effect, the Danes had politically removed Yorkshire, Nottinghamshire, Lincolnshire, Derby, and Leicestershire from the rest of England. Historians believe that the Danish settlement proceeded in two waves and probably did not displace the English people living in the area. The first wave of Danish settlers came as invaders, increasing in number over time. The second wave came as emigrants from Denmark, who settled in the areas protected by the military forces of the first wave, and who subsequently pushed colonization into new areas.

Early in the winter of 878 a Viking leader named Guthrum launched an attack on the kingdom of Wessex, catching it almost completely off guard and forcing its king, ALFRED THE GREAT (r. 871–899), to retreat to the island of Athelney. The Vikings proceeded to conquer the lands of Wessex, while Alfred gathered support and built reinforcements in the southwest, preparing for a counterattack. Later in the year Alfred defeated the Danes at Eddington and drove them back to Chippenham. Eventually Alfred and Guthrum settled their differences and established a treaty for what would become the Danelaw, the main boundary for the division between English England and Anglo-Danish England. The area became a kind of “Denmark overseas,” which Danes organized and administered and which was different from the rest of England in ethnicity, culture, law, language, and social custom. Although the formal division lasted only about five years, through the 11th century Danish law and customs prevailed in this area and the rulers continued to recognize the special and separate nature of Danish England.

The term *Danelaw* first appears in the time of CANUTE (1016–35) to distinguish the area’s different legal system, but it is incorrect to categorize Danelaw as a homogeneous territory. The differences in custom, law, and political allegiance varied with the density of the Norse population, but the area’s internal divisions never trumped its separateness from English England. The Scandinavian language permeated the area, as is most commonly observed in the frequent place names ending in *by* or *thorp*. Cultural differences also appear in land tenure. Rather than dividing their land into units known as *hundreds* used to administer the English shires, Yorkshire and the Five Boroughs settlers divided their land into units known as *wapantakes*. The term, never used in Scandinavia, is related to “weapon taking,” the Viking custom of brandishing one’s weapon to show approval of council decisions and is unique to the Danelaw. Likewise, they divided agricultural land into *ploughlands*, rather than using the Anglo-Saxon unit known as *hide*.

The Danelaw's legal codes also showed a great deal of Scandinavian influence, not only in terminology but in concepts that differed from those of Anglo-Saxon England. For example, in the Danelaw, *wergild* fines related to a man's rank, rather the rank of his lord, and the laws punished violations against the king's peace more severely than in English territories. Courts and legal assemblies reflected Scandinavian roots as well. To investigate crimes, 12 *thegns* in each *wapentake* formed a jury of presentment, and the opinion of the majority prevailed in making its decision. They ultimately settled the fate of the accused by ordeal, as in Anglo-Saxon areas, but the notion of a jury of locals charged with investigating a crime was not an Anglo-Saxon concept.

Historians note the positive influence of the Scandinavian culture on the island, from the intensification of agriculture that made Lincolnshire, Norfolk, and Suffolk among the most prosperous shires of the period and the political success of King Canute to the regular commerce that emerged in the North Sea. Although the formal boundary of the Danelaw lasted only a few years, the impact of the Danes on England's culture, economy, and political system remained strong throughout the Middle Ages.

KEVIN D. HILL

Dante Alighieri

(1265–1321) *Florentine author*

Dante Alighieri was born in 1265 in Florence to a family of noble lineage. His father made a living through property rental and moneylending. His mother, Bella degli Abati, died when he was seven years old, and his father also died when he was young, before 1283. Dante found father figures in his mentor Bruno Latini, and in Guido Cavalcanti, both of whom shaped Dante's early cultural development. Dante was betrothed to his wife, Gemma Donati, when he was 12 years old, although he

An illustration by Gustave Doré of the guilty being buried head first, from a scene out of *Inferno*: Canto XIX.

had fallen in love with another girl named Beatrice Portinari. He married Gemma Donati in 1285 but Beatrice became his muse, even after her death at the age of 24 in 1290. His early 1292 work, *La Vita Nuova*, was a tribute to his love for Beatrice.

During his lifetime two powerful supranational institutions that had been prominent features of the medieval world, the Catholic Church and the empire, collapsed. These two entities faced challenges in the developing urban centers, as well as in the autonomous national state. Dante recognized the importance of these two events and dedicated his works to understanding the ambiguous connections between these two great powers, through the use of metaphor or historical examples in the form of allegory and other literary devices.

In his writing Dante wished to communicate philosophical and theological ideas to as many people as possible, unlike most contemporary scriptures, in which truth is mysteriously encrypted. The *Comedy* was written in Italian instead of Latin, as Dante intended to exalt the use of this vernacular language in literature. The *Comedy* successfully proved the ability of the Italian language in the hands of a skilled poet-theologian, for the language managed to express its complex ideas.

Dante's magnum opus was originally known as the *Comedy* (*Commedia*) even though it also contains elements of tragedy and satire. Dante explores the depths

of human actions and emotion in this Christian epic. The poem has a ternary structure, which highlights the importance of the number 3, associated with the theological concept of the Trinity. He began writing the epic in 1307 or 1308. In the Venetian edition of 1555, the work became known as the *Divine Comedy*, as it is commonly referred to today. This relates to Dante's view of his work as the "sacred poem." The poem, with over 14,000 lines of verse, tells of a pilgrim's fictional journey from hell to purgatory to paradise, in the year 1300. The pilgrim descends to Hell on Good Friday, only to leave it on Easter Sunday to reach Purgatory. Three days later he passes through the Earthly Paradise, before rising up to the limits of the universe to witness ethereal Godly visions.

NURFADZILAH YAHAYA

Delhi Sultanate

The influx of Muslim Turks into the Indian subcontinent began in the 11th and 12th centuries. It was spearheaded by a series of military dynasties, including the GHAZNAVIDS, who ruled parts of Persia and invaded northern India, and the Ghurids, who started off as allies of the great Ghaznavid ruler MAHMUD OF GHAZNI, but broke away after his death in 1030 and conquered much of northern India for themselves.

Aibak, a Turk born in Central Asia and taken to Nishapur as a slave of the Ghurid ruling house, served as a Ghurid administrator from 1192 until 1206, when he was freed and named sultan, or ruler, of a new dynasty based in the city of Delhi by his former masters. While in the service of the Ghurids, he led a series of military campaigns in India, expanding the empire's territory significantly and subjugating most of the land between the Indus and Ganges Rivers. Aibak's reign, during which he spent the majority of his time trying to establish political institutions and geographic boundaries, was relatively short and he died in 1210.

Aibak was succeeded by his son, Aram in Lahore, who had little experience in politics and was overthrown and killed in 1211 by Aibak's son-in-law, Shams ud-Din

Iltutmish, who was favored by the army. Immediately upon assuming control of the sultanate, Iltutmish was faced with military challenges from both the neighboring Ghaznavids and the Muslim state in Sind. In a series of wars against them, Iltutmish reasserted his authority and by 1228 had conquered all of Sind. According to the Muslim historian IBN BATUTA, Iltutmish was the first ruler of Delhi to reign independently of a larger state and in 1228–29 he received emissaries from the Abbasid Caliphate in Baghdad, the premier Muslim state, at least in name, of this period. Under his leadership, the Delhi Sultanate escaped destruction when the Mongol leader GENGHIS KHAN swept westward through Central Asia.

Iltutmish died in 1236 and was succeeded by a series of weak rulers and the Turkish nobility, nicknamed "the Forty," who controlled the sultanate's most important provinces. His son Rukn ad-Din Firuz Shah ruled for seven months before being deposed by his sister, Raziyya, whom their father had initially chosen as the new ruler before his death. The sultana had been trained in political administration during periods when her father went off on military campaigns and left her in charge of maintaining the government. Raziyya encountered stiff opposition from many of the sultanate's officials, and she was overthrown in 1240. Iltutmish's youngest son, Mu'izz ad-Din Bahram Shah, ascended the throne and worked to strengthen the northern frontier against the Mongols. He stopped an attempt by his sister to regain control of the sultanate. However he too was overthrown in 1242 by senior government officials and was subsequently executed. The new sultan, Nasir ud-Din Mahmud, was a recluse and granted political authority to Ghiyath ad-Din Balban, his slave and future son-in-law.

Under Balban, the sultanate continued to ward off Mongol raiding parties and stopped revolts by rebellious Hindu rulers. When Sultan Nasir ud-Din, who had no children, died in 1265, Balban formally assumed the title of sultan, ruling for two decades until 1286. The sultanate's army was reorganized and improved under Balban and he ordered the construction of forts in and around Lahore in order to present a defensive line against the Mongol leader HULAGU KHAN, who had invaded Iran in 1256 and was actively campaigning throughout Persia and the Arab Middle East during the second half of the 1250s. Between 1280 and 1283 one of the sultanate's governors, Tughril, rebelled against Balban and the sultan led a military campaign against him, which resulted in the governor's death during a raid by Balban's forces on his camp.

The early period of the Delhi Sultanate came to an end in 1290 when Balban's son, Bughra Khan, refused

the throne and Malik Firuz Khalji overthrew Balban's teenage grandson, Kaiqubad. The Turk Khaljids adopted Afghan customs after occupying Afghanistan and oversaw the rapid expansion of the sultanate, conquering Gujarat and Deccan during their reign from 1290 to 1320. Sultan Ala ud-Din Khalji (r. 1296–1316) enlarged the army and introduced economic and tax reforms. Upon his death, he was succeeded by a series of inept rulers and internal strife led to the downfall of the Khaljids soon after his death.

The TUGHLAQ DYNASTY (1320–1412) rose to power and Sultan Muhammad Ibn Tughlaq (r. 1325–51) founded a second capital city at Deogir in order to control an increasingly vast empire. By moving the active capital south, the sultan could oversee the continued military campaigns in Deccan. Under Muhammad a system of currency was introduced and taxes were increased to meet the sultan's military expenditures. Much of the later years of his reign was spent dealing with revolts, trying to head off dissension from the clergy (*ulama*), and handling external threats, which resulted in the reduction of the empire's territory.

Sultan Firuz Shah Tughlaq (r. 1351–88) was not as militarily successful as his predecessors, but was perhaps the dynasty's greatest administrator-ruler. He reintroduced the *jagir* system, which paid army officers in grants of land rather than cash salaries, and introduced a justice system that rigorously enforced the laws. Firuz Shah also focused on improving social services and opened up a large hospital, Dar us-Shafa, in Delhi and founded bureaus of employment and marriage. During his reign the state financed the expansion of existing cities, the construction of new ones, and the building of mosques, bathhouses, and canals. The religious policy of the sultanate under Firuz Shah was strictly Sunni and non-Muslims were required to pay the *jizya* tax and Shi'ite Muslims were placed under restrictions.

Upon Firuz Shah's death in 1388, a succession crisis led to the downfall of the Tughlaq dynasty. In the midst of this crisis, TIMURLANE (TAMERLANE) the ruler of SAMARKAND who was forging an empire in Central Asia, invaded India and captured and sacked Delhi in 1398. Famine and the spread of disease followed the Timurid invasion, with thousands of slaves and much of the city's wealth being taken back to Central Asia. The Tughlaq dynasty was no longer a single entity and several competing states were left to squabble over Muslim India. With the fall of the Tughlaqs, the Turkish sultanate of Delhi began its steady decline.

Despite periods of revival under the Sayyid dynasty (1414–1451) and the Lodi dynasty (1451–1526),

the centralized sultanate no longer existed and both dynasties were faced with opposition from India's Hindu population and rival Indian Muslim states. The sultanate was formally ended in 1526 when Zahir ud-Din Muhammad Babur, a Chaghatai Turk who ruled in Kabul, ushered in the period of the great Mughal Empire.

CHRISTOPHER ANZALONE

Dhimmi

In Islamic ruled territories, Dhimmis were those religious minorities, or People of the Book (*ahl al-kitab*), who were protected under ISLAMIC LAW. People of the Book included Jews, Christians (of all denominations), and sometimes Zoroastrians. As polytheists Hindus were not usually granted protected minority status.

Under Islamic law and customs adult males of sound mind who had protected status paid a poll tax in addition to the customary land tax but were exempt from military service. In Muslim societies nonbelievers were not forced to convert and had freedom of religious practice as well as extensive communal autonomy including education for their children; however, they were not considered as equals to their Muslim counterparts. Sometimes stipulations regarding the height of bell towers on churches and dress were enforced, particularly under intolerant or dogmatic rulers. Nor were nonbelievers allowed to proselytize. The treatment and status of nonbelievers in Muslim realms varied with

time and place but was usually more open and tolerant than anywhere in medieval Europe.

JANICE J. TERRY

Divine Caliphate and the Ummah

In June 632 the prophet MUHAMMAD, the founder and last prophet of ISLAM, died of natural causes. He left behind a nascent Islamic state within the Arabian Peninsula. Although some Muslim sources state that there had been a premonition of his death, the confusion and divisions within the Muslim community or Ummah suggest that Muhammad’s death was unexpected.

In the wake of the Prophet’s death the general consensus was that, since Muhammad did not leave explicit instructions on how to choose a successor, such a leader should be elected. Despite this consensus not all factions agreed.

One group, which later came to be known as the Partisans of Ali or Shiat Ali, claimed that ALI IBN ABU TALIB, Muhammad’s cousin and son-in-law, was designated as the prophet’s successor at a place called Ghadir Khumm during his last hajj pilgrimage. The four successors to Muhammad as leaders of the Ummah—Abu Bakr al-Siddiq, Umar ibn al-Khattab, Uthman ibn al-Affan, and Ali ibn Abu Talib—formed what is now known as the al-Rashidun or “Rightly Divinely Guided” Caliphate.

Originally many believed that the caliph was the political, but not the religious, successor to Muhammad. However other scholars have argued that the caliph, at least initially during the al-Rashidun period and Umayyad Dynasty, held both political and religious authority, though they did not claim prophetic powers, since Muhammad was considered the “seal” of the prophetic line that began with Adam, the first man in the Islamic tradition.

ABU BAKR AL-SIDDIQ

Umar ibn al-Khattab, Abu Ubayda ibn al-Jarrah, and Abu Bakr al-Siddiq, three of Muhammad’s closest companions and allies, decided that Abu Bakr should take over as head of the Ummah. As a member of the influential tribe of Quraysh, of which Muhammad was also a member, Abu Bakr was an early convert to Islam and father of A’ISHA, one of the prophet’s wives. In 622 when Muhammad was compelled to leave his native city of Mecca for the oasis city of Yathrib (later renamed Medina) to the north, because of the death of his uncle and protector Abu Talib ibn Abd al-Muttalib and threats from the city’s polytheistic leaders, Abu Bakr was his trusted lieutenant and traveling companion.

As word of Muhammad’s death spread throughout Arabia, several Arab tribes that had pledged allegiance to Muhammad refused to obey the new caliph, Abu Bakr, who ruled from Medina. Although some of these tribes openly rejected Islam, despite having converted during Muhammad’s lifetime, other rebellious tribes objected to the continuation of political subjugation to the caliphate in Medina. Abu Bakr moved swiftly against the rebels, stopping the rebellion with military force in what came to be known as the Ridda Wars, or the Wars of Apostasy. The struggle against the Hanifa clan, led by their leader Musaylimah, who claimed to be Muhammad’s prophetic successor, was the bloodiest, finally ending in 633 with the defeat of the Hanifa and the death of Musaylimah at the Battle of Aqraba.

The larger result of the triumph of the al-Rashidun Caliphate over its challengers was the first major expansion of the Islamic state since the death of Muhammad, as the Muslims were in firm control over the vast majority of the Arabian Peninsula. After his victory in the Ridda Wars, Abu Bakr turned his attention to the north and east, directing Muslim armies to begin moving against the Byzantine Empire and its Arab allies in Palestine and Syria and the Persian Sassanid Empire’s landholdings in Mesopotamia. The first Muslim military expeditions into Byzantine and Sassanid lands occurred during Abu Bakr’s reign. Before he was able to continue the caliphate’s expansion, Abu Bakr died of old age in August 634, after nominating Umar as his successor.

UMAR IBN AL-KHATTAB

Umar ibn al-Khattab, one of Muhammad’s greatest critics and persecutors before converting to Islam, oversaw the caliphate’s first great expansion. It was during his reign as caliph that Islam’s political and religious authority spread by leaps and bounds outside its Arabian homeland. In fairly short succession,

the Byzantine Empire was driven out of Syria, Palestine, Egypt, and parts of southern Asia Minor while the Sassanid Empire was pushed out of Mesopotamia by Muslim armies. After entering Iran and forcing the Sassanid government to flee farther east, the Muslims established new settlements at Kufah and Basra in present-day Iraq, which would act as garrisons to safeguard the caliphate's new conquests. Under Umar, the administration of the caliphate began to develop, with its soldiers paid varying rates according to the length and nature of their service, and local subjugated non-Muslim populations required to pay taxes, while Muslims were required to pay religious taxes. In 644 Umar was mortally wounded by Abu Lululah, a Persian slave, while leading communal prayers in Medina, for personal and not political reasons.

UTHMAN IBN AL-AFFAN

Before he died Umar appointed a six-member council of Muhammad's Companions, all members of the tribe of Quraysh, to elect the next caliph. Ali was offered the position if he would agree to follow the edicts of his two predecessors. After Ali declined, the council elected Uthman ibn al-Affan, an early convert to Islam and a member of the powerful Umayyad clan, as the new caliph. During his reign the authority of the central government in Medina was enhanced and a conference of scholars was called to codify an official version of the QUR'AN, placing the chapters in the order in which they appear today. During Uthman's reign the caliphate continued to expand, with Muslim armies moving farther east into Sassanid Iran. Through treaties and military conquest, the Muslims established their control over the region's urban centers, though in the mountains and rural areas, traditional societies continued to exist and non-Muslim peoples, such as the Turks of Central Asia, were prone to occasional revolt. The Sassanid empire, which had been in power since 224, was unable to maintain centralized control and by 651 it had collapsed.

Three regions in particular opposed Uthman's reign: Medina, where non-Umayyad members of the Quraysh were dismayed at the caliph's favoritism; and Kufah and Egypt, where the caliph had attempted to revoke longstanding privileges and increased taxation. In 656 opposition to the caliph came to a head when several hundred Muslim soldiers stationed in Egypt returned to Medina to protest Uthman's policies. He talked them into returning to Egypt but sent an order to that region's governor instructing him to punish the soldiers. The caliph's message was intercepted and the soldiers returned, enraged, and assassinated Uthman as

he sat reading the Qur'an. Uthman's nepotism led to his downfall and further divisions in the Muslim Ummah.

ALI IBN ABI TALIB

After Uthman's assassination, Ali became the fourth al-Rashidun caliph. Although he had not faced open opposition to his ascension to the seat of caliph, opposition to his rule soon coalesced around the Prophet's widow A'isha, and two of Muhammad's Companions, al-Zubayr ibn al-Awwam and Talha ibn Ubayd Allah, who objected to Ali's close alliance with prominent factions of Muslim converts. Fearing that the influence of the Quraysh would be eclipsed, A'isha, al-Zubayr, and Talha led a rebellion against Ali. In December 656 at the Battle of the Camel outside Basra in Iraq, Ali's forces defeated the rebellion, killing al-Zubayr and Talha. A'isha was sent back to Medina, where she was placed under house arrest.

The main bases of Ali's support were in Iraq; however in Syria, Ali was faced with open opposition from that province's governor, Muawiya, an Umayyad relative of Uthman, who criticized the caliph for refusing to punish Uthman's assassins. Muawiya was in command of a powerful military force and in 657 the armies of Muawiya and Ali met at Siffin. A full-scale fight eventually ensued, but was soon ended when Muawiya's soldiers held up pages from the Qur'an and called out for a peaceful settlement. Ali, to the dismay of some of his more zealous followers, agreed to have his dispute with Muawiya arbitrated. In the end Muawiya remained governor of Syria and Ali was left unchallenged as the caliph, though his position had been severely weakened. A group of zealots, the Kharijites, previously staunch supporters of Ali, claimed that by agreeing to arbitration, Ali had circumvented the will of God. Although he later defeated the bulk of the Kharijites's military forces, Ali failed to stamp out their rebellion. Kharijite assassination attempts against Muawiya and other senior Umayyad leaders failed, but in 661 Ali was mortally wounded by the Kharijite Abdur-Rahman ibn Muljam while leading the predawn prayers at the central mosque in Kufah. With his assassination, the al-Rashidun Caliphate came to an end and Muawiya and the Umayyad dynasty of Syria rose in its place. The Umayyads would continue expanding the Islamic state until the ABBASID DYNASTY overthrew them in a violent revolution in 750.

CHRISTOPHER ANZALONE

Donatello

(c. 1382–1466) *Renaissance sculptor*

Donato di Niccolode Bettto Bardi (Donatello) is one of the greatest and most famous Italian sculptors of the 15th century, whose work was greatly influenced by the early European Renaissance. He was born in Florence (or in its vicinities) between the years 1382 and 1387, in the family of Niccolò di Betto Bardi, a Florentine wool carder. He studied in the workshop of LORENZO GHIERTI, a bronze sculptor, who in 1402 had won the competition to make the doors of the Florentine baptistery. Donatello's first works, the marble *David* and *St. John the Evangelist* for the cathedral façade, show the influence of Ghiberti and of the Gothic style. The young sculptor's artistic development was greatly stimulated by his friendship with FILIPPO BRUNELLESCHI, a sculptor and an architect, who later stayed with Donatello during his years of studies in Rome. Most of his adult life was spent in Florence, where he worked under the patronage of first Cosimo, then Piero de' Medici, but during the years 1444–55 he lived in Padua, commissioned to work on bronze statue of a famous Venetian condottiere, popularly called Gattamelata, who had died shortly before.

Donatello's style may be described as classical realism: He had a strong proclivity to depict life as it is and, attempting to link between the medieval art and the classical antiquity, took great interest in the peculiarities of human body and facial expressions. (A closer study of the ancient models eventually taught Donatello to refrain from overly expressive radical realism.) It is possible to divide Donatello's work into two substyles: the pure realistic style and the neoclassical style, with great allusion to the Greco-Roman ideals. The statue of *Mary Magda-*

lene created for the Florentine baptistery in 1434 shows an old, skeletal, hairy woman, and Donatello's *King David*, nicknamed *Zuccone*, or pumpkin (1427–35) (for his large, bold head), may be grouped under Donatello's realistic style. These works tend to reject the traditional iconography. On the contrary, the *Triumph of Bacchus* in Museo Borgello, Florence, the bronze *David* (c. 1469), and the half-bust of *Selena* on a bronze vase (Kensington Museum, London) imitate ancient art.

The best of Donatello's works, however, are those in which he followed his own ideas, which in many ways corresponded with the pursuits and innovations of the Italian humanists—a careful exploration of human body and psyche, the interrelationship between human beings, and the human interaction with nature and the higher spheres. Donatello's genuine interest in psychology and his desire to bring to light the inwardness of things are evident in the statue *John the Baptist*, exhibited in Santa Maria Gloriosa dei Frari (Venice), which he created in Padua; this extraordinary figure clearly shows new insight into psychological reality as constantly plagued by emotional anxieties. Donatello is also credited with the invention of the *schacciato* (“flattened out”) technique, a new mode of bas-relief, applied to his marble panel *St. George Killing the Dragon* (1416–17) and other works. The technique involved more shallow carving than was customary, which created a sharp contrast between bodies and surrounding landscape, making the relief more dependent on visual perception.

Donatello's great fascination with human emotions continued throughout most of his work but was intensified after the artistic crisis he experienced during his last years in Padua. From the magnificent bronze *David* (influenced, apparently, by Etruscan figurines) to the dancing children in the relief of the Duomo di Prato (1434)—Donatello's creations are lively, energetic, and gracious. His works are rendered extraordinary for their individuality, and for their ability to create a dialogue between the composition and its onlooker. Donatello was said to treat human passions somewhat obsessively, more often than not showing them in repellent forms, as, for example, in the *Entombment of Christ*, a bas-relief made of painted plaster for the Church of St. Anthony in Padua. The same expressiveness can be discerned in Donatello's last work, which was finished by his pupil Bertoldo after the master's death—two great bronze pulpits showing the *Passion of Christ*, work of tremendous complexity. The great Renaissance sculptor died in 1466, being once again employed by his old patrons the Medici, and was buried with great honors

in the Church of St. Lorenzo, covered with the same bronze pulpits.

VICTORIA DUROFF

Dvaravati

The MON kingdom of Dvaravati (also called Siam) flourished in what is now Thailand from the sixth century C.E. to around the 11th century. The kingdom covered the political area of Nakhon Pathom (west of present-day Bangkok), U-Thong, and Khu Bua. Dvaravati extended outward from the lower Chao Phraya River valley, to the westward Tenasserim Yoma, and then southward to the Isthmus of Kra. The kingdom also consisted of towns immediately outside this perimeter that paid tribute to the kingdom, while not necessarily considering themselves under its direct rule. Dvaravati did not yield strong political influence on other established Mon kingdoms or states such as Myanmar or the Mon in northern Thailand. This was because of its isolated geographical location (surrounded by mountainous regions). Dvaravati is considered to be the epicenter of the spread of Indian culture in the region.

The Dvaravati kingdom's capital was Nakhon Pathom, a city archaeologists and historians believe to have been established around 3 B.C.E. Around 607 Chinese pilgrims wrote of a kingdom called To-lo-poti, which practiced Buddhism. It is widely believed that they wrote of Dvaravati. While the name *Dvaravati* is of Sanskrit origins, the kingdom was only referred to as such by the Western world in 1964 when anthropologists and archaeologists found coins in the area inscribed with the words *sridvaravati*. The presence of coins indicates trade, and the Dvaravati kingdom was famed for its trading culture with India, and its sophisticated economic infrastructure.

The kingdom of Dvaravati actively practiced Buddhism, albeit with a mixture of indigenous Mon and

Indic culture. Buddhist pilgrims belonging to Emperor Ashoka disseminated it within Southeast Asia. The kingdom was also the center of Buddhist devotion in Southeast Asia at that time. Numerous Buddhist artifacts have been found in Dvaravati and range in style and influence by the trends found within the Gupta empire (Hindu elements), Theravada, and Mahayana Buddhist tradition. Various objects have been found in Nakhon Pathom that point toward ritual offerings as part of the belief structure.

The period of Dvaravati rule was greatly influenced by Vedic and Indic principles within a Buddhist framework. It maintained strong cultural and religious ties to India, reflected through the use of architecture, art, and language. Pali and Sanskrit were spoken, as was the indigenous Mon language. Art flourished, as did intellectual pursuits such as literature and poetry. Dvaravati was a highly organized and political society and modeled itself upon the Gupta style of organization where minor princes ruled outer provinces and the king directly presided over his locality. Dvaravati employed the use of councils and administrative regions to govern the wide area. Moats uncovered by archaeological research point toward a sophisticated system of agriculture and as such agricultural development allowed the kingdom to be relatively self-sufficient. Dvaravati was able to sustain its population for centuries.

The kingdom of Dvaravati predated the Khmers by at least 100 years; however it was eventually eclipsed and absorbed into Khmer and Thai religion and culture. Dvaravati had a tumultuous history from the 10th century onward when it was first conquered by the Burmese, and then captured by the Khmer in the 11th century, who dominated the area right up to the 13th century when it was taken over by the Thai kingdom.

E

East African city-states

The BANTU migration from the central Sahara, perhaps the defining event in the history of Africa south of the Sahara, brought people to the region of East Africa as the nucleus of the emerging city-states. From the 10th century, Arab traders noticed the importance of such settlements to their trade. From the onset the city-states were fiercely independent, and no East African empires emerged in the way that GHANA, MALI, AND SONGHAI did in the west. As Richard Hooker wrote in *Civilizations in Africa: The Swahili Kingdoms*: “The major Swahili city-states were Mogadishu, Barawa, Mombasa (Kenya), Gedi, Pate, Malindi, Zanzibar, Kilwa, and Sofala in the far south. These city-states were Muslim and cosmopolitan and they were all politically independent of one another; nothing like a Swahili empire or hegemony was formed around any of these city-states. In fact they were more like competitive companies or corporations each vying for the lion’s share of African trade.”

However while the Arabs provided much of the impetus for economic and cultural development, the original settlements were definitely rooted among Africans. Joseph E. Harris writes in *Africans and Their History* that “the most important pre-Islamic commercial town on the coast seems to have been Rhapsa, about which little is known except that it was the center for the export of ivory that Arab merchants controlled. Rhapsa was probably located on the northern coast of Tanganyika [now Tanzania].”

The culture of the region became increasingly diverse, as Persians and Indians would join the Bantu Africans and the Arabs in the city-states. When Idi Amin Dada drove the Indians from what is now Uganda during his rule (1971–79), he was ending an Indian presence in his country that had its roots in the first traders from India hundreds of years before. While ivory, sandalwood, and gold were important exports, tragically the largest part of the economy was the slave trade. Zanzibar and Mombasa became the eastern terminus points for slaves the Arabs took out of Africa for shipment to Arabia and Yemen.

Kilwa emerged by the 12th century as perhaps the most powerful of the city-states, containing a mosque made from coral. The great Arab traveler IBN BATUTA stopped in Kilwa in 1331. It was ruled, as Harris notes, by the Shirazis, who had originally left the Persian city of Shiraz and intermarried with the Bantu population. Kilwa spread its influence south into the region of Zimbabwe and became a decisive factor in the trade in southern Africa as well. Symbolic of the wide-ranging trade was the voyage from Malindi to China in 1414. On that trip, the ruler of the city-state of Malindi sent a live giraffe to the Ming emperor of China, Emperor YONGLE (YUNG-LO). It was the early 15th century that saw the great MING DYNASTY exploring fleets sailing from China, perhaps even as far as the Americas, under Admiral Zheng He. Admiral Zheng would ultimately make seven historic expeditions from 1405 to 1433. The Chinese fleets made several stops on the East African coasts, making the Swahili city states part of a vast panoeceanic trading

Enormous ivory tusks are readied for sale at the local market. Arabs controlled the export of ivory in the African city-state of Rhapta.

economy. Trade was determined by the prevailing winds of the monsoon seasons. From November to March, Arabs, Indians, and Persians would sail south toward the Swahili coast and make their return voyages north between July and September.

The Indian Ocean trade would be monopolized by Arabs until the arrival of the Portuguese in 1498. It would mark the beginning of the end of the prosperous East African city-states. Mocambique, spelled also as Mozambique, would not be free from PORTUGAL'S imperial rule until 1975.

JOHN F. MURPHY, JR.

Edward I and II

kings of England

The origins of the modern British parliament can be traced to the reign of two medieval English kings: Edward I (1239–1307) and Edward II (1284–1327). Parliament had its roots in the king's Great Council, a primarily judicial and executive body in which prominent barons counseled the king and considered petitions for the redress of grievances. Although Parliament had legislative, judicial, and fiscal responsibilities, it was the fiscal duties, in the form of grants of taxation, that transformed it from a feudal council into a more representative body.

Prior to 1200 English kings drew most of their income from independent sources, such as land rents, judicial fines, and feudal aids. However by the ascension of Edward I in 1272, taxation provided most royal revenue. The wars of Edward I necessitated the frequent summoning of Parliament to approve the granting of taxes. However, taxation required the consent of Parliament, which became less forthcoming as the costs of Edward's military campaigns mounted. The need to secure tax revenue forced Edward to accept a Parliament that included not only barons and bishops, but also country gentlemen and burgesses from the towns. The result was the meeting of the Model Parliament in 1295, a landmark on the road to representative government in England.

Growing resistance to taxation forced Edward I to consent to further concessions. In 1297 Edward agreed to issue a confirmation of the charters of liberties, including the MAGNA CARTA and the Provisions of Oxford (1258), in exchange for taxation. The king promised to collect taxes only with the consent of Parliament. In the reign of Edward II (1307–27) the barons sought to recover the political power they had lost during the reign of Edward I. The barons regarded themselves as the king's rightful councilors and resented the influence of Piers Gaveston, a royal favorite.

Opposition to Gaveston grew until 1310, when the barons compelled the king to consent to the appointment of a committee of 21 to reform government and reassert baronial authority. The committee drafted the Ordinances of 1311, which placed restrictions upon royal power. In 1321 the barons rebelled against another

royal favorite, Hugh Despenser (1262–1326), but were defeated at the Battle of Boroughbridge in Yorkshire. In 1322 Edward summoned a parliament at York, which revoked the Ordinances and restored the authority of the king. Edward failed to redress the baron's grievances, and they soon joined with Queen Isabella and Roger Mortimer to invade England in 1326. Thereafter the barons summoned a parliament, which charged Edward with rejecting good counsel. A delegation from Parliament demanded his abdication in 1327, and he was murdered the following year. The community of the realm had served notice on future kings that they were to govern by the law, of which Parliament was the guardian.

BRIAN REFFORD

El Cid

(c. 1043–1099) *medieval Spanish warrior*

The title *El Cid* was given to a Spanish early medieval warrior called Rodrigo (or Ruy) Díaz de Vivar, also known as El Campeador (“the Champion”). After his death, he became a folk hero with many Spanish ballads written of his rise from obscurity to lead the Castilians against the Moors. He was born at Vivar, near Burgos, in the kingdom of Castile; his father a minor Castilian nobleman, but his mother was well connected and ensured that from a young age he attended the court of King Ferdinand I as a member of the household of king's eldest son, Sancho. When Sancho succeeded his father as King Sancho II of Castile, he appointed the 22-year-old Rodrigo Díaz de Vivar as his standard bearer as he had already achieved a reputation for valor in battle, taking part in the Battle of Graus in 1063. When Sancho attacked Sargasso in 1067, Rodrigo accompanied him and took part in the negotiations that led the ruler of Sargasso, al-Muqtadir, to acknowledge the overlordship of Sancho.

In 1067 Sancho went to war with his brother Alfonso VI, who had been left the kingdom of León. Some ballads portray El Cid as unwilling to support this invasion, which went against the will of Ferdinand I, but he was likely a willing participant. During the following five years El Cid was a vital military

leader on behalf of Sancho. Sancho was killed when laying siege to Zamora. Alfonso, deposed from León, was the heir, and the new king found himself in a difficult political position. Count García Ordóñez, a bitter enemy of El Cid, became the new standard bearer, but El Cid was able to remain at court, as Alfonso did not want such a tough opponent. It was probably Alfonso who planned the marriage of El Cid to Jimena, daughter of the count of Oviedo. They had a son, Diego Rodriguez, and two daughters. In 1097 Diego was killed in battle in North Africa.

Castilians who had supported Sancho were naturally nervous about Alfonso's becoming king, and these simmering resentments began to be expressed through El Cid, who served as a conduit for them. In 1079 El Cid was sent to Seville on a mission to the Moorish king. Coinciding with this trip, García Ordóñez aided Granada in their attack on Seville, but El Cid defeated the forces from Granada at Cabra, capturing García Ordóñez. His easy victory gained him enemies at court. When El Cid attacked the Moors in Toledo (who were allied to Alfonso), the king exiled him, and although he returned some years later, he was never able to remain for long.

El Cid went to work for the Moorish king of Sargasso, serving him and his successor for several years. This gave him a better understanding of Muslim law, which would help him in his later career. In 1082 he led the forces of Sargasso to victory over the Moorish king of Lérida and the count of Barcelona; two years later, undefeated in battle, he defeated the forces of the king of Aragon, Sancho Ramirez. When the Almoravids from Morocco invaded Spain in 1086 and defeated Alfonso's army, the two were briefly reconciled but soon afterward El Cid returned to Sargasso and did not help prevent the Christians from being overwhelmed.

Instead El Cid focused his attention on becoming the ruler of Valencia. This required political machinations and El Cid had to reduce the influence of other neighboring rulers. The importance of the counts of Barcelona came to an end when Ramon Berenguer II's forces were decisively defeated at Tebar in May 1090 by El Cid's Christian and Moorish forces. El Cid then utilized loopholes in Muslim law when Ibn Jahhaf killed al-Qadir, the ruler of Valencia. He besieged the city, which was controlled by Ibn Jahhaf, and when an Almoravid attempt to lift the siege in December 1093 failed, the city realized it could not hold out for much longer, and in May 1094 it surrendered.

El Cid then proclaimed himself the ruler of Valencia, serving as the chief magistrate and governing for both Christians and Muslims. In law El Cid still owed fealty

to Alfonso VI, but in practice he was totally independent of the king. El Cid's victories encouraged many Christians to move to Valencia and a bishop was appointed. El Cid ruled Valencia until his death on July 10, 1099. Had El Cid's only son survived him, there would have been a dynasty, and possibly a new royal house. However that was not the case, and Valencia was ruled by Muslims again until 1238. As he had never been defeated in battle, the story of El Cid, with increasing literary license, became a great ballad for Christians, who overlooked his years working for Moors and hailed him as the hero for the "Reconquista"—the retaking of Spain from the Moors.

JUSTIN CORFIELD

English common law

Common law developed after the NORMAN CONQUEST OF ENGLAND. In 1066 England was peopled with Angles, Saxons, Vikings, Danes, Celts, Jutes, and other groups who were suddenly ruled by French-speaking Normans. Most law at the time was customary law that had been handed down orally from generation to generation. In addition there were the legal code of ALFRED THE GREAT, which was biblical in nature, and the DANELAW of the Vikings and Danes. Most of the courts were communal courts (folk-moot), the hundred and shire courts, and baronial, or manorial, courts administering justice in the interest of the local nobility.

Immediately after the Norman Conquest the king would hear cases *coram rege* (before the king) that involved royal interests. However, the king with the royal court tended to be on the move in England or away in France. Consequently the legal work was soon delegated to an appointed tribunal, the Curia Regis. From it came the three royal common law courts that were used to unify the kingdom.

The first of the royal common law courts was the Exchequer. Originally concerned with the collection of taxes and the administration of royal finances, by 1250 it had become a court exercising full judicial powers.

The second royal common law court to develop was the Court of Common Pleas (or Common Bench), which was probably established during the reign of HENRY II (1154–1189). This court heard cases that did not involve the king's rights. It was firmly established at Westminster after King John was forced to sign the MAGNA CARTA in 1215. The third royal common law court to evolve from the Curia Regis was the King's Bench. Eventually this court heard cases involving the king's interests, criminal matters, and cases affecting the high nobility. It also developed the practice of issuing writs of error for review of cases decided in Common Pleas.

One factor promoting the development of the common law courts was their ability to settle land disputes. All of the land in England belonged to the king by right of conquest. He then awarded it to his vassals to hold and utilize in exchange for loyalty and for services. Because economic production was almost exclusively agricultural, title to the use of land was extremely valuable. Disputes over who was entitled to possess land created innumerable cases. As the justices in Eyre traveled their assigned circuits to hold court, they would decide cases using the Bible, canon law, and most especially reasoning applied to the customary law of that place. When the judges returned to London they would go to their places of permanent residence in taverns or cloisters. These residences of the judges, who were often monks or bachelors, eventually became the Inns of Court, where cases were heard and experts were trained in law. In the course of over 200 years the judges "discovered" the law common to all the people of England. The belief was that underlying the thicket of unwritten customary law was a common foundation that could be discovered by reason.

In effect the judges were developing legal principles or laws as they made judicial rulings in particular cases. Among the principles of the common law are *stare decisis* (let the decision stand). *Stare decisis* means that a judge in deciding a case should look to similar cases from the past for guidance. The use of similar cases is itself a legal principle, namely, that like cases should be tried alike. However in the absence of a precedent setting rule the judge would in effect "legislate" and create a new rule. This meant that the common law was case law or judge-made law created by legal reasoning about legal problems. It was well established centuries before the rise of Parliament.

The developing common law had the virtue of stability; however, it lacked flexibility. To bring a case into a common law court was often too costly for common people. The common law courts also moved slowly; that could mean that justice delayed was justice denied. To

lodge a complaint in a common law court an appropriate writ had to be obtained. If the wrong kind of writ were used, of which there were eventually over 100 kinds, the case would be dismissed. In addition some of the rules of the common law were injurious to justice. For example before bringing a suit for an injury to a person or to property in a common law court real injury had to be sustained. The common law lacked a mechanism for preventing irreparable harms from happening.

Since the king was believed to be the fountainhead of justice in England—that is, the person who ruled by divine right and through whom the justice of heaven flowed to the people—equity courts were established to restore fairness or equity to the legal system. People would appeal to the king for justice. In response the kings ordered the court chancellor to issue decrees of equity. Chancery courts developed to hear cases of equity and to correct the common law.

ANDREW J. WASKEY

Ericson, Leif

(c. 980–1025) *Icelandic explorer*

Leif Ericson was an Icelandic explorer who is believed to have been the first European to discover North America and, more specifically, the region that would become known as Newfoundland and then Canada. It is believed that Ericson was born around 980 to Erik the Red, a Norwegian outlaw and explorer who founded two Norse colonies in GREENLAND. During a stay in Norway in 999, Leif converted to Christianity, as did many other Norse around that time. He also traveled to Norway to serve King OLAF I (Tryggvason). When he returned to Greenland, he purchased the boat of Bjarni Herjólfsson and set out to explore the land that Bjarni had sighted, which later became

known as North America. In 986 Bjarni was driven off course by a fierce storm between Iceland and Greenland and sighted hilly, heavily forested land far to the west but never set foot on it.

One of the sagas, “The Saga of the Greenlanders,” states that Leif embarked around the year 1000 to follow Bjarni’s route in reverse. Leif was motivated by a sense of adventure and a desire to find more land to farm. The expedition made three landfalls. The first land they met was covered with flat rock slabs and was probably present day Baffin Island. Leif called it Helluland, which means “land of the flat stones” in Old Norse. Next he sailed to a land that was flat and wooded, with white sandy beaches, which he called Markland, meaning “woodland” in Old Norse. Markland is commonly assumed to have been Labrador.

Continuing south Leif and his men discovered land again, disembarked, and built some houses. They found the land pleasant. Salmon were plentiful in the rivers, the climate was mild, and the land was lush and green for much of the year. Leif’s 35-member party remained at this site over the winter. The sagas mention that one of Leif’s men, Tyrkir, a German warrior, found grapes. As a result, Leif named the country Vinland, meaning “land where the grapes grow” in Old Norse. Historians disagree on the exact location of Vinland. However, several sites along the eastern coast of the United States and Canada, from Newfoundland to Virginia, have been suggested. Many believe that the Norse settlement at L’Anse aux Meadows in Newfoundland was Leif’s colony. Others argue that Vinland must have been more southerly, since grapes do not grow as far north as Newfoundland; however, grapes may have grown there during the Medieval Warm Period. On the return voyage to Greenland, Leif rescued an Icelandic castaway and his crew. This deed earned him the nickname “Leif the Lucky” and made him rich from his share of the rescued cargo.

Another saga, “The Saga of Erik the Red,” asserts that Leif discovered the American mainland purely by accident. According to this saga, Leif was blown off course while returning from Norway to Greenland around 1000 and landed on the shores of North America. However the saga does not mention any attempt to settle there. “The Saga of the Greenlanders” is generally considered to be the more reliable of the two.

Leif’s father, Erik the Red, died shortly after his return home. As a result Leif stayed in Greenland to govern his father’s settlements. He died in 1025. All historical sources agree that Leif never returned to North America and his brother, Thorvald, led the next voyage

“The Discovery of Greenland,” an illustration for a 19th-century magazine, depicts Erik the Red’s exploration of Greenland. His son, Leif Ericson, is credited with discovering the North American continent almost five centuries ahead of Christopher Columbus.

to the new territory. Subsequent attempts to settle Vinland were unsuccessful because of friction between the Norse settlers and the native North Americans. Nevertheless Leif stands as one of history’s greatest explorers, besting Christopher Columbus’s discovery of the New World by almost five centuries.

SCOTT FITZSIMMONS

Ethiopian Empire

Ethiopia’s unique and venerable identity stems from its claims to have deep roots in the ancient and biblical world. On one hand it continued the ancient civilization represented by Axum, the trading intermediary for Rome and India on the Red Sea. And on the other hand, it promoted its mythical link to King Solomon

by keeping a tenacious grip on its Christian (and even Jewish) faith all through the Muslim period, and its strong church-state hegemony gave teeth to its claims. The Christian king of late Axum, El-Asham, distinguished himself in Muslim memory by giving sanctuary to followers of the prophet MUHAMMAD who were driven out of the city of Mecca in 615. Nonetheless conflict broke out when Muslims from North Africa moved southward in the eighth century and cut off Ethiopia from the Christian world. For the next 900 years the history surrounding Ethiopia would be muted in its contact with the West, and outlines of its history hinted at through folklore and archaeology. Hemmed in, the kingdom of Axum spread to the south into the highlands. Here non-Semitic peoples resided, the Agaws of Cushitic ethnicity.

For reasons unknown some had been previously touched by Jewish influences and called themselves Falashas, and others were Christians already or were converted gradually. The latter group merged with the Axum elites and eventually replaced the ruling house with the Zagwe dynasty. The Zagwes moved the capital 160 miles south to Roha. According to tradition they were especially devout, and one of their more venerated emperors, Lalibela (1195–1225), directed the construction of 11 churches hewn out of solid rock. These churches served as a pilgrimage destination for believers when they could not overcome Muslim refusals to visit the Holy Land. The dynasty following the Zagwes in 1270 returned to the age-old tradition that their kings had descended from King Solomon. Their epic tale, *Kebre Negast* (Glory of the Kings), speaks of their ancient ancestor and first king, Menelik I, being born of the queen of Sheba (Saba) and Solomon. The son Menelik returned to his native land with the Ark of the Covenant, having shrewdly taken it from his father. Ethiopians to this day believe that the

Ark is present in their country. Its presence guarantees a biblical covenant with their nation.

The new Solomonids were proactive, cultivating their biblical image. They merged their role in government with the role of the clergy in the church, putting their sons into a monasterylike community on Mount Geshen so that they would pray and learn while they waited for their call to govern the nation. Their reputation was one of priest-kings. By the mid-14th century they advanced against Muslims and pagans surrounding them. Their king, Amde-Siyon, was reported by one Arab historian, Al-Omari, to have a following of 100 kingdoms. Zar'a Ya'kob (1434–1468) achieved even greater status, aspiring to greatness by being crowned in ancient Axum. During his regime he developed new evangelistic campaigns to convert all subjects to the Christian faith. Church schools were opened up for priests, as well as ruling class students and seminarians. Ethiopian arts flourished, and these writings, artifacts, and murals still exist.

When Zar'a Ya'kob died the Muslims and outsiders rose up in rebellion. Sultan Ahmad Gran conducted a devastating jihad against the monasteries and churches (1527–43). Meanwhile for several centuries Europeans had heard reports of a legendary African emperor named Prester ("priest") John who would help out Christian armies in the CRUSADES against the Muslims of the Near East and Africa. In hopes that Ethiopia was Prester John's domain, 400 Portuguese troops were sent to put a stop to Sultan Ahmad Gran's campaign against Ethiopia.

MARK F. WHITTERS

fairs of Champagne

As the European economy grew during the 11th and 12th centuries overland trade between Italy and north-west Europe increased and merchants from these regions needed to meet to exchange their goods. During the period from the early 12th through the 13th century, this exchange was centered mostly in the Champagne region of France, at fairs held in the towns of Troyes, Provins, Bar-sur-Aube, and Lagny. A great deal of Flemish cloth made its way to Italy during the 12th century via the fairs of Champagne.

Fairs are usually linked with markets and medieval charters granting permission for fairs and markets to meet often link the two. However unlike a market, which usually met weekly to serve local needs and to exchange cheap or perishable items, a fair assembled only once or twice a year for days or weeks to exchange commodities from distant places between merchants from remote areas. Fairs provided a place for merchants to meet with other merchants to do business in an economy that did not have, and could not sustain, permanent trading centers. The fair gave regularity to a merchant's wanderings and offered a place where he knew he could find other merchants, trade for the commodities and supplies he needed, and sell commodities he was carrying.

The fairs of Champagne are perhaps the most famous of the medieval European fairs. They originated during the first half of the 12th century as a center for the sale of horses. They developed from local markets to regional markets and finally to fairs of Europe-wide importance.

Before fairs merchants traveled on trade routes between north and south that followed the Meuse, Saône, and Rhône Rivers. However, a more direct route between the Rhône Valley and West Flanders later emerged. It ran from the Saône across the upland of Langres to the headwaters of the Paris Rivers, and then north toward Lille and Arras. The four fair towns were on or close to this more direct route. Furthermore the counts of Champagne had unified this area by the early 12th century and could ensure safety and welfare of merchants and travelers who went to their lands. The guarantee of safety and the "liberal and constructive" policies of the counts toward the fairs were attractive to merchants and no doubt contributed greatly to their success.

The cycle included six fairs. Troyes and Provins hosted two fairs each, while Lagny and Bar-sur-Aube each hosted one fair. Lagny, near Paris, opened the New Year with its fair, and Bar-sur-Aube held its fair in spring at mid-Lent. The first Provins fair met in the week of the feast of Ascension and was followed by the first Troyes fair, which opened after the feast of St. John the Baptist. The second Provins fair opened September 14 and the cycle ended with the second Troyes fair, which opened November 2. Generally there was an interval of a week or two at most between fairs. The fairs in Lagny and Bar-sur-Aube appear to have been less important than those in Troyes and Provins.

The fairs followed a rigid schedule. The first week merchants set up their stalls along the streets of the town and prepared for business. The next 10 days merchants sold cloth, the 11 days following that they sold leather

and fur, and the next 19 days they traded a variety of other goods. The last few days of the fair merchants balanced their accounts, and all debt and credit was settled by notary bill, which allowed the merchants to travel without carrying a great deal of money. The fairs' importance did not persist beyond the end of the 13th century. By 1296 businessmen from Florence had taken their business to Lyons, and tax revenues from the fairs fell dramatically. Genoese carracks allowed the Italians to establish a regular sea link via Gibraltar to Bruges, Southampton, and London by 1297. At the same time the most-used overland routes shifted to the east, taking merchants away from Champagne.

The 14th century decline of the fairs reflected a breakdown in law and order, the absorption of Champagne into the domain of the king of France, and the outbreak of the HUNDRED YEARS' WAR. Goods had become increasingly standardized and it was no longer necessary to examine them before every purchase, and the banking houses of Florence and Bruges could handle financial transactions much more efficiently than a fair. Finally by the 14th century the wealthiest merchants, and perhaps many others, maintained agents in the places where they regularly did business. Couriers carried orders and commercial information back and forth, while professional carters moved the commodities in caravans that they arranged.

The "international fairs" declined in importance but did not disappear. Many returned to being regional markets, specializing in livestock, while some handled seasonal goods, wines, or preserved goods. Fairs in other regions grew in importance as those in Champagne declined, but the fairs of Champagne remained regionally important until the Hundred Years' War. The fairs of Champagne played a vital role in the development of the medieval economy.

They provided a center to the increasingly Europe-wide economy by offering long-distance traders a safe and secure place regularly to transact business, and they played a vital role in the development of Paris and France, whose culture, economy, and political system benefited from the international contact the fairs encouraged.

KEVIN D. HILL

Fatimid dynasty

The Fatimid dynasty (named after the prophet Muhammad's daughter Fatima, from whom the Fatimids claimed descent) was a Shi'i dynasty founded by Abd Allah. Although he was an Isma'ili, Abd Allah did not claim descent from the Imam Isma'il but from the Prophet's family. When his beliefs led to his persecution in Syria, where most were Sunni Muslims, Abd Allah fled to North Africa, where he established a stronghold in Tunisia. He declared himself the Mahdi and was known as Abd Allah al-Mahdi; he established his capital in the city of Mahidiya along the Tunisian coast. His followers crushed local rulers and branches of SHI'ISM that had gained support among the BERBERS. The Fatimids were especially opposed to the Kharijites, whose egalitarian principles were the opposite of their rigid religious hierarchy.

After three failed attempts to take Egypt with its rich Nile Valley, the renowned Fatimid general Jawhar al-Rumi, a former Greek slave, conquered Egypt in 969. Under Abd Allah's great grandson al-Mu'izz (r. 953–976), the Fatimids built Cairo on the outskirts of the old Arab capital of Fustat as their new religious and administrative city. Fatimid Cairo was a walled city of palaces, mosques, and army barracks. The Fatimids extended their rule over Palestine and Syria but were unable to overthrow the caliphate in BAGHDAD. At the zenith of their power, the Fatimids controlled the territory from the Orontes in Syria across North Africa. The Assassins, an offshoot of Isma'ili Fatimids, established strongholds in Syria and Persia seeking to undermine and, if possible, destroy Sunni belief and rulers.

Although they were zealous missionaries for their particular brand of ISLAM elsewhere, in Egypt the Fatimids were relatively benign and most of the population remained committed to orthodox Sunni practices. The Copts were retained as administrators over most of the financial affairs of state, as they had been since the Umayyad Dynasty. Caliph al-Hakim (r. 996–1021) was a notable exception to Fatimid tolerance in Egypt. Under his rule, Christians and Jews were persecuted and many churches and synagogues destroyed. His followers became known as the Druze. After al-Hakim was assassinated in 1021 his followers alleged that he had been hidden by God, not killed, much like the 12th

imam, and fled Egypt for the relative security of remote mountain areas in Lebanon.

The Fatimid navy played a key role in the dynasty's power and wealth as it controlled the central Mediterranean and the Red Sea routes. The Fatimids also increased trans-Saharan trade. The Fatimids traded luxury goods and agricultural products with the west and east as far as India. Fatimid rulers established al-Azhar University, which became famous throughout the Muslim world, as well as numerous public buildings and commercial centers.

Two branches of the Fatimids, the Almoravids and Almohads (Unitarians) led by Ibn Tumert, established separate dynasties in Morocco. To strengthen their armed forces the Fatimids imported slave and free Turkish soldiers but the growing dependency on outside forces gradually weakened dynasty. Thus SALADIN (SALAH AD DIN, YUSUF) had little difficulty in overthrowing the Fatimids and returning the territories to Sunni Muslim rule in 1171.

JANICE J. TERRY

feudalism: Europe

Medieval historians have traditionally understood feudalism to be a sociopolitical system that dominated European societies from the fall of the Roman Empire to the start of the Renaissance. This definition however has been thrown into question by myriad incongruous details, among which is the notable absence of the word *feudalism* from the medieval vocabulary. For although terms such as the Old High German words *fehu* "cattle," "property," or "money"; the Old English *feoh*, *feo*, *fee*; and the Latin *feodum*, all of which are precursors to our word *fief*, appear commonly in medieval sources, *feudalism* does not appear. It was first employed by 16th-century French and English jurists and legal historians to explain anachronistic property laws in their own societies. To them it denoted a framework in which political and military power were decentralized, private, and local. The system as they envisioned it was based in large part on the concept of the feu-

dal contract, in which land, the fief, was granted by the upper echelons of the military aristocracy to free nobles below them, their vassals, in return for fidelity or homage. This vision of medieval European society as a pyramid structure based on the exchange of land for services and fidelity continues in large part to dominate popular imagination.

In the 1970s historians began to highlight the conceptual flaws of the feudalism theory, pointing out that it existed not all over Europe, but only in a handful of locales, and only between the 10th and 13th centuries. It did not, therefore, dominate all of Europe for the better part of 10 centuries. When Roman imperial organization collapsed in the fifth century, political authority fragmented. In this early period as numerous groups such as Vandals, Goths, Vikings, and Muslims threatened to invade former Roman territories, features of what would later be called feudalism emerged. The first of these was a type of contract in which, in return for rewards and war booty, an armed retainer offered military aid to a lord. This was advantageous for the lord, since private armies were extremely expensive to raise and maintain. Without a central government to organize and pay soldiers the onus fell to individuals or family groups to muster as much force as possible.

Such techniques of dealing with a decentralized political situation were probably familiar to people on some level. In many ways, they were an amalgamation of preexisting Roman and Germanic customs. Romans, for example, had engaged in a system of patronage, in which powerful patrons would offer protection and services to clients in exchange for political support, loyalty, or gifts. This clientelism became mixed with a Germanic military custom in which an elected chief, after conquering territory with his army, distributed land and booty among his men in exchange for their continued allegiance.

While the armed retainer of the early Middle Ages was useful in situations of war and conflict, lords were eventually faced with the problem of housing and maintaining the young men in their service. A logical solution was to offer them a plot of land, on which they could live, and off which they could make a living other than war. It was in the eighth century that Charles Martel made the first land grants in exchange for military service. In theory, the feudal system was based on this type of land tenure in which a landowner, or suzerain, granted rights to a piece of land (a fief, or Latin *feodum*) to a vassal in return for specific obligations. In addition to land, rights or honors could also be granted as fiefs.

While the first fiefs were small, by the 12th century they were often estates employing large numbers of

peasants. The vassal receiving the fief had the right of ban, or command, over the peasants. The fief became inheritable property, and the vassals, as a result, became a landed aristocracy, meaning that their wealth was based in land. Upon inheriting a fief however the new tenant might have had to pay a fee, called a relief, before assuming it. The relief could be large, up to a year's income. In other cases the tenant might just seek written confirmation of his property rights to ensure, or to make public, his continued status. If the deceased vassal's heir was a child, the lord could take him as a ward and collect the income from the property until the child matured, or he could bestow such rights on another vassal. If the child was female, the lord could choose her husband. Since many men were eager to marry propertied heiresses, the lord could profit financially by offering her in marriage to the highest bidder. In some cases the heiress herself offered the lord substantial sums of money to avoid marrying a disfavored suitor.

By the high Middle Ages in some places in Europe, a ceremony had evolved by which lords and vassals formalized their ties. In this highly symbolic ceremony the vassal knelt before the lord, bowed his head, and put his hands, palms together, between the hands of his lord. After swearing an oath, the vassal became his lord's man or in French, *homme*. For this reason this ritual became known as homage. The lord then kissed the vassal on his lips and raised him to his feet. In addition the vassal might also be asked to swear fealty (a derivation of the Latin *fidelitas*, meaning faithfulness) to the lord, by which he contractually agreed to offer him *auxilium et consilium*, or military service and legal counsel. The latter he did by appearing in the lord's court, which functioned both as a court of justice and as an administrative council. The vassal also agreed to offer "feudal aids." These were monetary contributions for specific situations such as crusade, ransom, the knighting of his eldest son, or the marriage of his daughter. These contributions could become quite substantial if the lord went on an extended military campaign. Finally the vassal could be expected to hand over a portion of his harvest to his lord, or even to grind his wheat and bake bread in the ovens owned and taxed by the lord.

The lord had reciprocal responsibilities toward his vassals. First among these was maintenance. While the vassal was entitled to the fief's revenues, the lord was obliged to ensure that the land be maintained. Equally important was the responsibility the lord bore for offering the vassal physical protection and security. This he did by marshalling his military force when needed. The

feudal relations between vassal and lord as described probably did exist in medieval Europe, yet only in a handful of locales for limited periods of time. Surely more common were the innumerable variations on the classical model, some of which varied to such a degree that they could hardly be called feudal. Some instances have been found, for example, in which lords demanded feudal aids from nonfiefholding commoners rather than fiefholding nobles. In other instances, feudal aids were asked of newcomers to a region and not of long-standing inhabitants.

In addition, there were high levels of regional variation such that the classical model appears to have applied only to a small region of France during the 12th and 13th centuries. The king of France had little central authority and little or no power over the great land owning lords. In France therefore feudalism implied a fragmentary and localized structure whose reciprocal bonds of loyalty and protection did not extend to the very top of society. By the ninth and 10th centuries Italy from Rome northward exhibited similar characteristics to some French regions, but the growth of the commercial trading cities such as Florence and Venice in the 11th and 12th centuries introduced a money economy and an urbanized merchant class that did not fit the classic feudal model. Still the region north of the Po River, particularly the area around Milan, continued to adhere closely to the French pattern of feudal relations. Without a centralizing monarchy, northern Italian lords remained powerful and independent of royal authority.

Unlike in France and northern Italy the king in England was, from the 11th century on, the pinnacle and nucleus of the political hierarchy. All lords held their fiefs directly from him, and in return they owed him military and court service, and on occasion, financial aid. English feudalism was therefore much more an integrated system than elsewhere. Yet even here there were elements deviating from the classical model, for even though the great lords swore fidelity to the king, they did not perform homage to him. And since even in this circumstance peasants did not partake in the feudal contract, the feudal structure did not, in any explicit sense, permeate the lower rungs of society.

Societies with expansive open borders to defend, such as the German lands east of the Rhine and the frontier between Christian and Muslim Spain, developed different social structures generally marked by weak monarchies and powerful local nobilities. In some Slavic kingdoms, serfdom, in which peasants are tied to the land, became the dominant phenomenon. In other frontier societies such as Scotland, Wales, and Ireland,

enterprising barons could set up semi-independent lordships, though even there they were not entirely free from the king's authority. In the 11th and 12th centuries, the Crusader States in the Levant exhibited a kind of purified feudal tenure wherein the lords held supreme power in their local realms. Until its fall in the mid-13th century, the Norman kingdom in southern Italy exhibited a variant of French Norman feudal relations.

Medieval historians have revealed wide disparities over distance and time in the structure of social hierarchies and practices of land tenure. Caveats such as these have made them question whether the term *feudalism* is still useful for understanding medieval history. Since most historians now use the term with caution, *feudalism* is probably best used in a narrow sense to describe the relationship between lords and noblemen when they ritually exchanged protection for military and legal support. Despite more than a decade of debate, medieval historians still vary in their conclusions about the accuracy of the term *feudalism* for describing and understanding medieval European society.

ALIZAH HOLSTEIN

feudalism: Japan

When most people think of feudalism, medieval Europe from about the ninth to 15th centuries is most likely to come to mind. The term *feudalism* is of fairly recent origin, coined in the 17th century by lawyers and antiquarians who used it to describe rules of land tenure, legal customs, and political institutions that had survived from medieval times. For Marxist historians the key elements of feudalism are the relationships between the feudal landholders and their serfs, whom they compel by force, custom, or law to provide labor, money, or

tribute. Other non-Marxist historians define feudalism as a system of military and political organizations in which armed warriors or knights served leaders, who in turn provided them with land grants in return for personal service. Despite the fact that many of Japan's governmental structures and institutions were based in part on those of China, Japan's feudal culture was in many ways more like that of feudal Europe. By the 19th century, historians generally agreed that the warriors of Japan were the "Oriental" counterparts to the knights of Europe. The roots of Japanese feudalism can be traced back to the seventh century in Japan and extend through the medieval period of Japanese history.

Japan's political and economic order did not meet the definition of "full feudalism" until about the year 1300, which is much later than the onset of European feudalism. Many of the laws and institutions described as feudal protected privileges of the landholding aristocracy and allowed them to use their power over the peasant class. Feudalism from the modern historian's perspective has taken on negative connotations as being outdated, oppressive, or irrational.

The primary virtue in the Japanese feudal system was loyalty, because the entire social-political system depended on personal relationships. Contrary to the lord-vassal relationships of European feudalism that were based on mutual and contractual obligation, the Japanese emphasized morality. Loyalty to one's lord manifested from a belief that he was the superior moral leader. Unlike in China, where familial loyalty was the dominant ideology, in Japan loyalty to one's lord was paramount. This is not to say that family ties were unimportant in medieval Japanese society, as inheritance determined power and prestige as well as property ownership. Japanese feudalism also differed from European feudalism in that there was no cult of chivalry that put women on a romantic pedestal as fragile and inferior beings. Japanese warriors expected their women to be as strong as they were and accept self-sacrifice as part of their obligation to their lord.

The Japanese warriors, who were known as SAMURAI, or "servitors," placed great importance on the military virtues of bravery, honor, self-discipline, and the stoical acceptance of death. *Seppuku*, ritual suicide by disembowelment, became the dominant alternative to dishonor or capture. Warrior class-consciousness—a sense of the warrior class as a separate entity—did not materialize until the 13th century when the KAMAKURA SHOGUNATE (rule by a military generalissimo) took power. The new institution created a new category of shogunal retainers that held special privileges and responsibilities and

narrowed the scope of social classes the samurai class comprised. Its founder, Minamoto Yoritoto, consciously helped foster this new warrior ethos by holding hunts and archery competitions that helped to solidify the warrior identity. As the samurai served as the enforcers of feudal rule, their role in Japanese history was extremely important and the lord-vassal relationship was pivotal to feudal order.

Beginning in the early seventh century the Yamato court introduced several Chinese political and governmental practices in order to increase the power of the ruler. Within one century the Yamato court transformed itself into a Chinese-style monarchy. The main players in this governmental shift came not only from members of the ruling family, but also from powerful group leaders associated with the Yamato court. China provided both political ideals and a set of political institutions that extended further than the unsophisticated attempts at centralization begun in the sixth century.

Integral to the innovations of the seventh and eighth centuries was a new concept of ruler. Reformers borrowed the Chinese notion of an absolute monarch whose authority went beyond kinship ties. The monarch was considered “the master of the people and the master of the whole land,” and people pledged their allegiance to him and him alone. By the end of the seventh century the ruler was called *tenno*, or emperor, and the title brought with it increased authority. The establishment of an imperial capital also helped legitimize the emperor’s ruling status. The first capital was constructed in the southern end of the Yamato Basin but was eventually moved to Nara in 710. In 794 the capital was moved to HEIAN, later known as Kyoto, where it remained until the 19th century. However the monarchical state did not survive much beyond the eighth century.

Part of the demise of the monarchy can be attributed to the emphasis placed on heredity rather than meritocracy. The members of the Yamato clan were unwilling to share power, as it was synonymous with wealth in the form of land grants, household servants, and agricultural laborers. The old clan leadership was thus transformed into a new ruling class that was dependent on imperial supremacy.

Notwithstanding the departure of the monarchical state from the goals originally intended by the reformers of the seventh century, the emperor, the court, and the aristocracy at the capital survived for several more centuries largely because of the rise of private estates called *shoen*. Private estates became the primary source of aristocratic wealth and allowed court aristocrats to exert more power and control. By the end of the 12th

century, some historians estimate, more than half the cultivated land was owned privately.

By the late 10th and early 11th centuries warrior chieftains threatened political order and began to emerge with more regularity. Powerful chieftains like Taira Masakado, who owned vast landed estates in the Kanto region, capitalized on the imperial government’s weakness and challenged its authority. These challenges contributed to the breakup of the court into many aristocratic factions that competed for power and drew certain warrior families into capital politics. Most influential were the Seiwa branch of the Minamoto family and the Ise branch of the Taira family. By the late 11th century the Seiwa influence in the east and the Taira influence in the west had both established important connections in the capital. After a series of power struggles, Taira Kiyomori emerged with increased influence in the court and political power. With a lack of local authority, however, Kiyomori’s ascendancy ended with the outbreak of the GEMPEI WAR (1180–85). Minamoto Yorimoto and his followers succeeded in driving the Taira out of the capital and in 1185 their armies were defeated in the west. The victory meant that Yorimoto became the most powerful chieftain in Japan.

This victory was a defining moment in Japanese history because it resulted in the founding of the Kamakura Bakufu, or “tent government.” Yorimoto sought political independence and wanted to avoid immersion in court politics. Yorimoto’s success can largely be attributed to the lord-vassal bonds he established during the Gempei War. In 1192 Yorimoto took the title of shogun or “generalissimo.” This title brought with it the responsibility of preserving national peace and order. Eventually however the shogun became a warrior monarch whose power came from the imperial government and actually extended beyond it. Yorimoto remained in power until his death in 1199. His death started a crisis of sorts because Yorimoto, perhaps because he distrusted his closest kin, did not make effective arrangements for a successor. Hence power fell into the hands of the HOJO CLAN, where it remained until the end of the Bakufu in 1333. The Kamakura Bakufu marked a big step toward a purely feudal political order. The decline of Bakufu authority was integral to the onset of full political feudalism, and the Kamakura government was overthrown in 1334, driven by the anarchistic ambitions of Go-Daigo, who hoped to reinstate direct imperial rule. This demise combined with civil war brought the estate system to an end. Go-Daigo’s reign was short-lived and in 1336 Ashikaga Takauji, a powerful warrior leader, was named shogun by Go-Daigo’s successor.

Civil war ended in 1392, and, even though some order was restored, Japan was less unified. By the mid-15th century, social and political unrest led to the ONIN WAR IN JAPAN. The period after the Onin War is considered the beginning of the “warring states” period in Japanese history, a time when the ASHIKAGA SHOGUNATE was destroyed and a new group of feudal magistrates emerged from the local warrior class. Domains fell into the hands of feudal lords, known as *daimyo*, who used force and their loyal vassals to maintain their power, enforcing land taxes to keep the peasantry under much stricter control.

By 1500 the country was divided into the hands of roughly 300 *daimyo*. By the 1560s many of the more powerful *daimyo* sought power beyond their realms and some even hoped to control all of Japan. Unification, however, was largely the work of three men, sometimes called “the great unifiers,” Oda Nobunaga, Toyotomi Hideyoshi, and Tokugawa Ieyasu. Nobunaga seized Kyoto in 1568, allegedly in support of the last Ashikaga shogun; crushed the power of the lesser lords in central Japan; and destroyed the Buddhist monasteries. Nobunaga was assassinated in 1590 and power fell into the hands of his most able general, Hideyoshi. By 1590 Hideyoshi established control over the entire realm.

Hideyoshi never took the title of shogun but did assume high positions in imperial government. Hideyoshi monopolized foreign trade, had land surveyed, and confiscated weapons from the peasant class. These actions further divided the samurai and peasant classes while increasing Hideyoshi’s military might. In 1592 he set out to conquer Korea, a first step toward world conquest, which for him essentially meant China. However Chinese armies in northern Korea stopped the Japanese, and they were forced to withdraw after Hideyoshi’s death in 1592. Hideyoshi did not leave an heir, and power shifted to the victor of the Battle of Sekigahara in 1600, Tokugawa Ieyasu. Ieyasu took the title of shogun and moved his residence from Kyoto to Edo (modern Tokyo). He closed the country to foreigners and for more than 250 years, Japan remained in seclusion from the rest of the world.

While feudalism in Japan began later than in Europe, its demise was much more recent. In 1600 when Tokugawa Ieyasu took power, Japan entered the period of rule known as “centralized feudalism.” In this system, the Tokugawa Shogunate ruled Japan but gave relative autonomy to his vassal *daimyo* in exchange for loyalty. Tokugawa rule continued in Japan until 1868, when the Meiji Restoration ended feudal rule, abolished the warrior class, and opened Japan to the rest of the world.

ETHAN SAVAGE AND MOHAMMAD GHARIPOUR

Ficino, Marsilio

(1433–1499) *Italian Neoplatonist philosopher*

Marsilio Ficino was an important Italian Neoplatonist philosopher during the Renaissance and the mainstay of the so-called Florentine Platonic Academy, a circle of philosophers around him. His father was Cosimo de’ Medici’s personal physician, but few details are known of Ficino’s early life. He was trained in medicine and began study of Greek around 1456; these years in Florence were marked by the appearance of Greek philosophers who fled the Ottoman advances and reintroduced Plato and Greek literature to Italy. Exposure to such intellectuals may have fostered in Ficino a desire to synthesize Christianity and Greek philosophy.

In 1463 Cosimo gave Ficino a villa, where he planned to translate Plato’s dialogues into Latin but also translated the *Corpus Hermeticum* (a mélange of texts attributed to the Egyptian magus Hermes Trismegistus). In 1469 he completed a commentary on Plato’s *Symposium* which he called *De amore*, a text at the basis of most subsequent Renaissance theorizing on the theme of love. Ficino was ordained in 1473. His most important work, the *Theologia Platonica*, pursues the goal of uniting Platonism with Christianity as heavily influenced by Plotinus, who Ficino felt was Plato’s most important interpreter. Ficino published his Plato edition in 1484 after Cosimo’s death; it relies on the version of Leonardo Bruni. In 1487 Ficino was named a canon of Florence cathedral, but his orthodoxy was called into question by the 1489 publication of his *De triplici vita*, a treatise on the maintenance of human health rich in astrological and pseudomagical speculation. Threatened with investigation from the curia, he argued disingenuously but successfully that this work represented ancient views and not his own. His ideas thus probably seem more heterodox from our perspective than they did in his own day, a period of intellectual foment in

Christianity. He published a number of commentaries of Neoplatonism such as Iamblichus, Porphyry, Proclus, and Synesius. When he was drawn into the controversy around Savonarola, Ficino's early support for the preacher later turned to bitter attacks on him.

Historians attribute Ficino's influence to a number of factors: the exciting quality of his revival of Neoplatonism, an ecumenical quality to his thinking that may have attracted the more eclectic of Christian theologians, his willingness to sustain an elevated correspondence with hundreds of students and scholars at the highest level, and his willingness to use the printing press, which made him an early author of intellectual best sellers. Although early scholarship suggested that Cosimo de' Medici supported Ficino as a means of establishing Neoplatonism as a governing ideal in his contemporary Florence, recent scholarship has rejected Ficino's Neoplatonism as too incoherent to serve as such an ideology. Such scholarship also points out the largely informal character of the Florentine Academy. Interested readers without a background in Greek philosophy may turn to his letters as icons of the elegant Renaissance epistolary style.

SUSAN R. BOETTCHER

Firdawsi

(c. 935–c. 1020) *author and historian*

Abu Al-Qasem Mansur Firdawsi was a medieval poet, writer, and historian, best known as an author of the Persian grand epic *Shahnamah* (the Epic of Kings). This monumental work made him the most recognized and highly regarded writer among Persian-speaking people from Central Asia to the Middle East.

Despite his fame, little is known about his personal life and some facts are still disputed, as many accounts of his personal life were written long after his death. It is believed that Firdawsi was born in a small town on the outskirts of the city of Tus situated in Khorasan—the region that is now divided among Afghanistan, Iran, Tajikistan, Turkmenistan, and Uzbekistan. He was a relatively wealthy *dehqan* (landlord), who

was devoted to Persian history and poetry. He mastered several languages and had great knowledge of historical and poetic works. In his 20s he began writing prose and later successfully experimented with poetry. By the time he was in his mid-30s he undertook a monumental task—to compose a poem that would cover the history of the Persian world from ancient time to the seventh–eighth centuries C.E. According to some reports, Firdawsi spent his entire adult life, or about 35 years, completing this extraordinary task.

His major source of reference, on which he based his research and writing, was the *Khvatay-Nameh*, a Middle Persian (Pakhlavi) work created under the order of King Khosrow Anushirvan (590–628). His secondary source was a work by the Persian poet Daqiqi (d. c. 976), who attempted to write about early history of the Persian world at the time of the introduction of Zoroastrianism. Some modern literary critics claim that parts of the *Shahnamah* resemble a mere translation of some chapters of the *Khvatay-Nameh*. Others argue that he created a completely new work in verses, and that he only used other works as historical sources. As in earlier epics like *The Epic of Gilgamesh*, the *Shahnamah* deals with the struggle between the forces of good and evil. Its hero Rustam, with his trusty steed Rakhsh, rescues allies, vanquishes foes, and lives for over 500 years.

The first revision of the *Shahnamah* was completed in 994, and parts of it were shared with close associates. It took another 15 years before it was completed in about 1010. It consisted of between 55,000 and 60,000 couplets (*beits*) subdivided into 50 sections devoted to various ruling dynasties. According to the tradition of his era, Firdawsi sought to present his work to Sultan MAHMUD OF GHAZNI (Ghaznavi) (r. 998–1030), the ruler of Khorasan. Mahmud and his entourage doubted the significance of the work, deeply offending Firdawsi. There are many interpretations of this event, ranging from disapproval of the religious content of the book (Firdawsi describes the rise of Zoroaster) to inappropriate praise of the great pre-Islamic rulers of Persia. The conflict between the ruler and the poet forced the latter to leave his homeland and move to Heart, and after that to Mazendaran. There are reports that he spent his final days in BAGHDAD. Some sources indicate that he continued writing poetry but was not as productive as in his early days. Firdawsi died c. 1020, highly respected by his contemporaries, if not by the court of Ghaznavi.

RAFIS ABAZOV

Five Dynasties of China

The great TANG (T'ANG) DYNASTY, founded in 618, was wrecked by the Huang Zhao (Huang Ch'ao) Rebellion that lasted between 875 and 884. It was put down only with the help of regional warlords and Turkic allies (the Turks who lived to the north of China were called Shatou), who retained power. In 907 a Shatou chief slaughtered the last Tang emperor and most members of the Tang imperial family and proclaimed himself emperor of the Later Liang dynasty.

Thus began the Five Dynasties Era, 907–960. It was also called the Five Dynasties and Ten States Era, because none of the Five Dynasties controlled lands beyond the Yellow River plains of northern China whereas central and southern China were ruled by 10 regional states, each occupying about one province in that region. Later historians did not give any of the Ten States the status of a legitimate “dynasty” which succeeded one another throughout Chinese history. The Five Dynasties were

1. Later Liang (16 years, 907–923, three rulers)
2. Later Tang (T'ang) (13 years, 923–936, four rulers)
3. Later Jin (Chin) (10 years, 936–946, two rulers)
4. Later Han (three years, 947–950, two rulers)
5. Later Zhou (Chou) (nine years, 951–960, three rulers)

The first and last of the five were ruled by Han Chinese families; the remaining three were headed by men of Turkic tribes, but who were largely Sinicized. For example the Later Tang rulers had served the Tang dynasty as provincial governors and had been bestowed with the Tang imperial surname Li. All five dynasties were founded by military adventurers, and within each dynasty, family members or rivals assassinated many rulers. The wars and rebellions that ended the Tang dynasty had so devastated Chang'an (Ch'ang-an) that it would never be China's capital again. The center of political power

would shift eastward from Shaanxi (Shensi) province, which was the cradle of Chinese civilization, to Henan (Honan) province, where both Luoyang (Loyang) and KAIFENG (K'AI-FENG) (then called Bian or Pien) were located. Both cities were capital of some of the dynasties during this era, Luoyang because of its historic importance. Kaifeng is east of Luoyang, also on the southern side of the Yellow River, and was easily accessible by roads and the GRAND CANAL. It would remain the capital under the SONG (SUNG) DYNASTY, between 960 and 1126. However Kaifeng was without natural bulwarks and was thus vulnerable to attacks. Chang'an became the capital of the impoverished Shaanxi province and its name was changed to Xi'an (Sian).

The wars and invasions that so disrupted northern China in the ninth and 10 centuries also greatly diminished the long-entrenched leadership of the “eminent clans” that had dominated political and social life since the Han dynasty, because so many other members were killed in the conflicts. This would result in a profound social change and in the creation of a more egalitarian society. Another factor contributing to growing egalitarianism is the invention of printing. Block printing to produce books began in the seventh century (paper was invented in China in the first century). It was during the Five Dynasties, between 932 and 953, that the first complete printed edition of the 11 Confucian Classics (plus two supplementary works) totaling 130 volumes was produced, under government sponsorship of four dynasties. Luoyang, Kaifeng, and several cities in the south became centers of a vibrant printing industry. Cheaper printed books, as opposed to the expensive hand copied ones, increased literacy and enabled sons of middle-class families to compete in the state exams. This fact also contributed to the breaking of the lock on power by the “eminent clans.”

In contrast to the turmoil North China suffered from the late Tang through the Five Dynasties, southern China was relatively peaceful and continued to prosper. Many great poets and painters of the era came from southern China. This was a trend that would continue during the next 1,000 years. During the Han and Tang dynasties the frontier that had threatened China's security had been Central Asia, which included ancient lands called Sogdiana, Bactria, Transoxannia, and Ferghana in ancient Western texts (modern Afghanistan, Tajikistan, Turkmenistan, Uzbekistan, Kirghizstan, and part of Kazakhstan) to the Caspian Sea. The threat had shifted by the ninth century to a region called “Inner Asia” that extended from the Pacific Ocean westward for 3,000 miles to the Pamir Mountains and from the Great Wall of China

northward for 1,000 miles to Siberia in present day Russia; it included modern Mongolia, Chinese Manchuria, Inner Mongolia, Xinjiang (Sinkiang), Tibet, and Russia east of the Pamir Mountains.

In the 10th century two states dominated by pastoral nomads ringed northern China. They were the Khitan state called Liao rooted in the northeast, and the Tangut state called Xixia (Hsi Hsia) rooted in the northwest. The founder of the Later JIN (CHIN) DYNASTY ceded 16 prefectures in northeastern China, including the area around modern Beijing, to the Khitan Liao. This session bequeathed serious consequences to the Song dynasty; seeking to regain this historically Chinese land the second Song emperor would go to war with the Liao, with disastrous results. Another legacy of the Five Dynasties to the Song was the pivotal role of the army in the founding of each dynasty, since the Song too was founded as a result of a coup d'état, and seeking to end the cycle, Song Taizu (T'ai-tsu) would reorganize his army and put it under civilian control. The result was no more coups d'état, but also an incompetent Song army.

JIU-HWA LO UPSHUR

Five, or Six, Pillars of Islam

When THE PROPHET MUHAMMAD sensed that he was about to leave this earthly life, he summoned his followers to keep a code of five parts called the Five Pillars. Following are the pillars, given in their Arabic names, though each of the words has a long history in the Semitic world. Often another pillar is added as the sixth pillar.

FIRST PILLAR

The first pillar is the *shahada* or creed. The creed stands in contrast to those of conventional Christianity, for it is only one line and two parts: There is no God but Allah, and Muhammad is his prophet. Thus, entrance

to ISLAM is easy and direct and does not require mastery of a mass of information or details. However easy the words, the *shahada* must not be taken lightly, but with sincere heart. This line is something like the Jewish *shema* prayer (“Hear, O Israel, the Lord our God is one”), with an affirmation of God’s unity and uniqueness. What is different from the Jewish profession is that there is a second plank—“Muhammad is his prophet”—and this second line separates Islam from all other religions. Muslims believe that the line about Muhammad does not nullify all the prophets who spoke before Muhammad. The angel Jibril (Gabriel) first spoke these lines to Muhammad in the cave of Hira. The *shahada* is repeated 17 times in daily prayer, and ideally it is the first thing a newborn baby and the last thing a dying person hears.

SECOND PILLAR

The second pillar is *salat* or prayer. Ideally this pillar involves group or societal prayer, for Muhammad was interested in bringing people together into community. In accordance with this goal, the call to prayer comes five times a day through the mouth of the muezzin on top of a minaret. Muhammad’s Abyssinian slave, Bilal, is known to have issued the first call to prayer in Medina, and then later it is known to have occurred during the first hajj in 632. The main times for such prayers are dawn, noon, midafternoon, sunset, and nightfall, and the main prayer day is Friday, so that the community’s rhythm is centered on prayer throughout the day and week. If, however, a Muslim finds that prayer at the mosque is not possible, then prayer can be anywhere and solitary. The rituals and schedule surrounding prayer are not unique to Islam but show customs and traditions inherited from other Middle Eastern religions: The body, especially the hands and feet, must be washed; shoes must be taken off; prostrations, that is, a full bow to the ground; kneeling; veils for women; worship must face a particular direction; regular days and times for prayer; unison of activities.

THIRD PILLAR

The third pillar is *zakat* or purification. As time went on, the pillar came to be associated with tithing and almsgiving. The principle of charity is that all riches come from Allah, so that the tithe or alms is only a formal token that everything belongs to Allah, and again this is the same for Christians and Jews. The effect of this token offering is that the whole of the Muslim’s goods are purified, and hence the word *zakat* is appropriate. This concept of tithing is also found in rabbinic Judaism. The minimal amount required of Muslims is 2.5 percent of all

resources annually, but Muhammad intended that generosity would mark all the Muslims' dealings with their society. He once said, "Even meeting your brother with a cheerful face is charity." Muhammad also envisioned *zakat* as a device to help the poor and disadvantaged in his community of Arabs. It would force the rich to take care of the poor, and it would equalize human dignity because both the rich and the poor had to pay the same amount and had equal standing before Allah. In certain Islamic nations the *zakat* payment is automatically levied on all Muslim citizens. Many centuries later such practices, whether compelled or voluntary, could not fail to impress a recent convert like the American civil rights leader Malcolm X.

FOURTH PILLAR

The fourth pillar is *sawm* or fasting, which occurs during the month of Ramadan, the ninth month of the Muslim lunar calendar. The Muslim fasts not only from food, but drink and sex, though the fast does not continue past sunset each day. For people unable to maintain the rigor of the fast (the sick, elderly, travelers, and the pregnant), the same obligations do not apply. The fasting is part of a bigger personal program to purify thoughts and behavior. Ramadan is a joyful month in spite of *sawm*. It ends with Eid al-Fitr, a family occasion involving special foods and gift giving. During the month families will often come together after sunset to break the fast with a celebrative meal and then visit the mosque for evening prayer. Often the entire QUR'AN is recited over the course of the month. Muhammad's view was again that fasting would bring the community together in discipline and solidarity. Ramadan is somewhat like Lent, the Christian season before Easter, though the Christian emphasis on remorse for sin and mystical participation in divine suffering and resurrection is not in Islam. Spiritual growth is a priority during fasting seasons for all three Abrahamic religions, as is concern for the poor and needy.

FIFTH PILLAR

The fifth pillar is *hajj* or pilgrimage. The duty of every Muslim is to visit Mecca and Medina if time, strength, and resources allow. Some 2,000,000 people or more gather annually in Saudi Arabia to renew their faith, visit the holy sites, and solidify international acquaintances. Although authorities have poured billions of dollars into accommodations, crowded conditions and tense rivalries often result in violence and loss of life during the month of *hajj*. Usually the rituals of *hajj* begin 60 days after Ramadan. Pilgrims wear special garments

and spend their time in tent cities and in ceremonial walks and events. All of these features are calculated to equalize human distinctions among all the *hajjis*. They walk seven times around the Kaaba, a cube-shaped shrine set up for the Black Stone, an object considered sacred to Muslims.

Another pilgrimage involves walking seven times between two hills in Mecca, where supposedly Hagar, the Egyptian maid of the patriarch Abraham, searched desperately for water. Then the pilgrims stand together on the plain of Arafat, where Muhammad made his final speech, commanding the observance of these five pillars of Muslim faith. This event symbolizes the summoning of all people for the last judgment. The pilgrims spend the night nearby and gather stones. On the next day, they sacrifice a ram to remind them that a ram was substituted for Ishmael. A day later they use stones previously gathered and throw them at three upright rock slabs that symbolize Satan. The *hajj* ends with a final walk around the Ka'aba and the Black Stone.

The implication of *hajj* is that there is physical ground or space that is more sacred to Muslims than other places. The concept of pilgrimage is an ancient one, and Islam simply builds on the concept as it came from the Jewish and Christian faiths. Muhammad, or the angel Jibril, did not discover the sacredness of Mecca—it was already well known as a site of religious tourism with many statues and symbols already in place when Islam took control. The sacred Black Stone was an object of veneration that Muhammad, or Jibril, apparently did not see as idolatrous. What it is cannot be ascertained, but perhaps it is similar to the stones and natural objects such as meteorites or volcanic rock forms that other religions have long venerated.

SIXTH PILLAR

It is sometimes asserted that there is a sixth pillar: *jihad* or struggle. Muhammad did not teach this pillar as such, but somehow he inculcated his followers with a drive to spread their faith. *Jihad* was the byword for the campaign, but the sense of the word may not be military as much as spiritual. The "struggle" was not against other nations as much as against evil: evil in the soul, evil in the spiritual world, evil in society. Early Muslims in fact were remarkably tolerant of Christians and Jews, far more tolerant than medieval Christians were of non-Christians. Muslims found many ways to spread their faith without engaging in armed conflict, though their *jihad* applied pressures on the Jews, Christians, and Zoroastrians to convert.

MARK F. WHITTERS

Florence, Council of

The Council of Florence, which ran from 1438 to 1445, was a council of Roman Catholic bishops and other church officials that convened to reform the church and deal with the issues of the east-west schism.

The year 1054 marks the date of the schism that broke Christendom into its western (Latin/Catholic) and eastern (Orthodox) branches. Their differences were first brought to light in the ninth century when eastern missionaries (like CYRIL AND METHODIOS) working among the Slavs and Bulgars encountered western missionaries, as Constantinople and Rome vied for influence in Central Europe and the Balkans. These differences included the Eucharist (unleavened bread for the west, leavened for the east) and *filioque* (the addition of the phrase *and the son* to the Nicene Creed, which first appeared in the west in the sixth century and was adopted by the papacy in the 11th century).

Eastern Christendom, on the other hand, adhered to the official and original creed promulgated by the fourth century Ecumenical Council, and the papacy (which in the west was understood as the head of the church, while in the east it is given primacy of honor, but viewed as only equal in power to the patriarch of Constantinople). Other differences emerged later, such as clerical celibacy (required in the west, while in the east priests could be married prior to ordination, though monks and bishops could not) and the doctrine of purgatory (accepted in the west, but not in the east).

The gulf between east and west was driven home to the Orthodox Church during the CRUSADES, as wave upon wave of western Christians passed through the empire, often pillaging and threatening violence. The Fourth Crusade resulted in the Western Christian conquest of Constantinople and much of the Byzantine Empire in 1204. After the Orthodox reconquest of Constantinople in 1261, the east continued to view western

Christendom with great suspicion. Yet, as the political situation in the east grew more endangered, Emperor Michael VIII Palaeologus offered to submit the Orthodox Church to the Western Church at the Council of Lyons in 1274. Michael achieved his political objective when the pope stopped the invasion of Byzantium by the west. Despite the emperor's efforts, the union was not accepted in Byzantium and was repudiated by his successor in 1282.

Byzantium continued to endure political and economic troubles, exacerbated by the rise of the Ottoman Turks in the early 14th century. As the Ottomans expanded their control over Anatolia and the Balkans, Constantinople was caught in an Ottoman vise. In desperate need of help, Emperor John VIII Palaiologus turned to the west. The price, as before, was submission to ecclesiastical union. An Orthodox delegation of 700, including the emperor and patriarch, journeyed (at Pope Eugenius IV's expense) to Italy. The council opened in Ferrara in October 1438 and was moved to Florence in February 1439 for security reasons. The aforementioned issues were discussed and, as at Lyons, the Orthodox Church submitted to the Western Church. The emperor, the patriarch, and all the delegates signed the Union of the Churches—with the notable exception of Mark Eugenikos, metropolitan of Ephesus.

Many recanted, including George Scholarios—later the monk Gennadios—who, after the fall of Constantinople in 1453, became the first patriarch under the Ottoman Turks. The emperor had hoped that the union would bring about the security of the empire, but Sultan Murad II defeated a western crusade at the Battle of Varna in 1444, and in 1453 the Ottomans conquered Constantinople. The Orthodox Church repudiated the council shortly afterward, although the Catholic Church continues to view this as an ecumenical council. After the union was signed, the council tried to reconcile the Catholic Church with the oriental orthodox churches, including the Armenians, Syrian “Jacobites,” Nestorians, and Maronites. Although widespread union was not achieved, the interaction of the council members encouraged connections between east and west.

MATTHEW HERBST AND BRYAN EYMAN

Florentine Neoplatonism

Florentine Neoplatonism is the ITALIAN RENAISSANCE revival of Neoplatonism, led by MARSILIO FICINO (1433–99) and GIOVANNI PICO DELLA MIRANDOLA (1463–94), that flourished in 15th century Florence. This renewed interest in Neoplatonism, or the philosophy formulated by Plotinus (205–270 C.E.) and founded upon the thought of Plato (427–347 B.C.E.), was due both to the waning religious values of the time and to the aristocratic shift of emphasis under members of the Medici family from worldly affairs to a life of contemplation. Plato's portrayal of Socrates in the *Republic* as a sage critical of Greek democracy and devoted to meditation on timeless and immaterial truths lent itself so well to the new social sentiment that it supplanted the Roman statesman as the ideal of human life. Fascinated by the humanist rediscovery of classical ideals Cosimo de' Medici selected his doctor's gifted young son, Marsilio Ficino, to become a Greek scholar and Platonic philosopher.

An intellectual giant whose mind comprehended and synthesized complete philosophical systems, Ficino opened his Platonic Academy, not a school in the formal sense, but a salon where he oversaw the scholarly discussions of friends and visitors, at Careggi in 1466. Two years later he edited the entire corpus of Plato, published by the Aldine Press in Venice, and translated Plato's *Dialogues* into Latin. In 1469 Ficino composed his commentary on Plato's *Symposium* and translated various treatises of Plotinus, Proclus, Porphyry, and Dionysius the Areopagite. From 1469 to 1474, he developed his "pious philosophy" or "learned religion," an elaborate Neoplatonic philosophical edifice, in his masterpiece, the *Theologia Platonica*. Emphasizing that divine poetry and allegory furnish the veil of true religion, which can only be expressed mystically and not in precise syllogisms, Ficino's system proved quite congenial to several Renaissance poets, authors, and artists.

Central to Ficino's system were the twin suppositions that the individual constitutes the center of the universe and that the goal of human life lies in the internal ascent of the soul toward the divine or God. Drawing heavily on Plotinus's *Enneads*, Ficino pictured the cosmos and everything within it as a great hierarchy of being and described the "One," or God, as the absolute universal essence. God is the *coincidentia oppositorum*, or the reconciliation of all opposites, in whom all things find unity. Embracing infinity within himself, God brings the lesser orders into being through emanations from his substance, resulting in a ladder of bodies,

natural attributes, souls, and angelic minds that delineates the way of ascent to the One. At the center of this ladder, humanity is bound to the material realm by the body and to the intelligible, or spiritual, realm by the soul, which facilitates its rise to divine reunion through contemplation. For Ficino such philosophical contemplation comprises a spiritual experience in which the soul retreats from the body and from all external things into its own being, learning that it is a product of divine emanation and that God is therefore immanent.

Derivative from this conception is the immortality of the soul, as Ficino insists that no mortal entity can partake of the beatific vision. At this juncture Ficino imports Christian theology into his system: Where Plotinus had envisaged a mediator, or demiurge, between the untainted One and the subdivided intelligible and material realm, Ficino identified this mediator with the divine Logos, or Christ, "the Word who became flesh and tabernacled among us" (John 1:14). As the intermediary between God and humanity, Christ both serves as an archetype of sanctified humanity and leads fallen humanity to love God. Moreover Christ's atoning sacrifice on the cross proves God's unfailing love for humanity and frees all human souls for the ascent to God.

In order for the individual to reach the divine, however, Ficino contended that the soul must make a leap of spiritual love by loving God for his own sake, thereby attaining participation in the One, who is, by nature, love. This notion of "Platonic love" is the nucleus of Ficino's philosophy, since the universe is formed and ruled by the ideal of love. Accordingly, four spheres of aesthetic values find their center in the good, the moral nature of God, which is immovable and emanates divine majesty throughout the universe.

Ficino maintained that body and soul could only be inseparable, as they will be in the general resurrection, if they are merged into the activity of love. Therefore love originates in God and manifests as spiritual love in the angelic minds and becomes sensual, pleasurable, and erotic love in the corporeal realm. Since humans possess free will, they can choose between the spiritual love of the intelligible realm and the erotic love of the physical domain. Ficino postulated a "light metaphysic" in which light is the laughter of heaven and expresses the joy of the communion of saints. This cosmology harmonized nicely with prevailing astrological theories already exerting a profound influence on many Renaissance thinkers.

Most brilliant of Ficino's pupils was Giovanni Pico della Mirandola, the youngest son of Francesco Pico, count of Mirandola and Concordia, a small principality just west of Ferrara. Although matriculating at the

University of Bologna at 14, he longed for international travel and left on a “student wandering” that took him to universities throughout Germany and France. At Paris he became fascinated by the study of Scholastic theology and linguistics, learning Latin and Greek, but also Hebrew, Arabic, and other Near Eastern languages. He then took up study of the Kabbalah, or Jewish mystical tradition, and the Talmud. Cultivating his interest in mysticism, the Kabbalah enabled Pico to view the world and all states of affairs therein as revelations of the immanent presence of God.

In 1486 Pico journeyed to Rome, where he published 900 *Conclusiones*, as a thesis for a public disputation he wished to hold. Pope Alexander VI deemed several of Pico’s theses as heretical and blocked distribution of his small book. In his defense Pico drew up an *Apolo-gy*, which convinced Alexander to exonerate Pico from the anathema and confirm his orthodoxy. As a rhetorical preface to the *Conclusiones*, Pico wrote his famous “Oration on the Dignity of Man,” perhaps the most influential essay of the Renaissance. Exceeding the anthropological assessment of his teacher Ficino, Pico asserted that humanity is the king of creation and the product of unique divine design rather than merely the middle link in the great chain of being. Such greatness is based on the human ability to renounce the material and direct all attention and energy to the spiritual aspect.

Attempting to reconcile Neoplatonic philosophy with the Jewish scriptures, Pico followed a line of Jewish exegetical tradition ranging from Philo of Alexandria (30 B.C.E.–50 C.E.) to Moses MAIMONIDES (1135–1204) by interpreting its narratives as symbolic of a deeper and hidden meaning. In 1491 Pico composed the *Heptaplus*, a mystical commentary on the Genesis creation account, and *Of Being and Unity*, a philosophical treatise on the relationship between God and the world. He was drawn to the preaching of the friar Savonarola. Savonarola’s accent of human sinfulness and demands for reform in the church provoked Pico to reflect on the darker side of human life. Pico wrote lamentful commentaries on selected Psalms, including the seven penitential ones (Pss. 6, 32, 38, 51, 102, 130, 143), and on the Lord’s Prayer, where he underscored human dependence on God and the desperate human need for divine grace.

For the next two years Pico devised a new way of interpreting classical myths and themes by combining pagan motifs with Christian symbols. For Pico the only correct reading of ancient myths and stories was allegorical, as their true meaning was only to be understood by thorough analysis. Such a meaning, when found, would always lie within the domain of Christian

theology, thus illustrating the harmony of God’s natural revelation through the Gentiles and special revelation in the Bible. The myth of Mars and Venus, for example, foreshadowed the Christian moral sentiments that love triumphs over violence and that reason should control passion. This method would greatly influence Florentine humanism and art and is perhaps most clearly seen in the mythological paintings of Sandro Botticelli (1444–1510). In 1494 Pico died of a fever, when King Charles VIII of France went to Florence during his invasion of Italy and Savonarola took over governance of the city.

Based on their uniting of “profane wisdom,” or classical myths, with “sacred wisdom,” or Christian teachings, Ficino, Pico, and their followers devised a Neo-platonic theory of symbolism, according to which each symbol not only displays the meaning and effect of what is represented, but also becomes interchangeable with it. By sharing that which is portrayed, art and literature can move the soul to the transcending appreciation of beauty. The Florentine Neoplatonists substantiated this view through a circular relationship of beauty, love, and happiness, where beauty induces love and love generates *voluptas*, or pleasure. This circle was explained through both Christian theology and Greek mythology.

In Christian thought love is beauty and divine, the longing God has for the salvation of all souls. This love flows out of God and is carried off into the world, transforming the love of God for the world into the love of a person for God; thus beauty is converted into love. The person becomes a vehicle for God’s love, loving other people for the sake of God, at which point love becomes felicity. The circle is complete when this felicity returns to its Creator in affective piety. For these reasons, the Florentine Neoplatonists regarded both humanistic learning and religion as paths to spiritual life, both culminating in the apprehension of God.

Frankish tribe

The Franks were a group of Germanic peoples who lived northeast of the northernmost part of the Rhine frontier of the Roman Empire. References to the Franks first appeared in the mid-third century in Roman sources listing them among the German tribes raiding across the Roman frontier. Eventually, they settled within the Roman Empire and came to hold respected positions in both the Roman military and Roman society, and emerged as the only Germanic kingdom to outlive Rome.

Perhaps more than any other barbaric people, the Franks had no common history or common ancestry. Initially, the umbrella term *Frank* covered a variety of groups, including Chamavi, Chattuari, Bructeri, Amisvarii, Salii, and possibly the Usipii, Tubanti, Hasi, and Chasuari. These groups maintained separate identities but at times pulled together for a common purpose, usually an offensive or defensive military action. However as a group they were so loosely connected that some historians believe it is incorrect to consider them a confederation, while others who do not wish to rule out the possibility of a confederation prefer to use the term *tribal swarm*. When they drew together they identified themselves as Franks, a term historians believe meant the hardy, the brave, or perhaps the fierce. Later, *Frank* came to mean the free. At first however the Franks, as an unimportant and divided group living in the shadow of Rome, were anything but free.

In the mid-third century the Franks and other German tribes launched a series of destructive raids into Roman territory, prompting an apparent increase in Roman fort building efforts. The Franks also attacked by sea, raiding the Channel coast, striking deep into Gaul via rivers, and attacking occupied Spain. Soon, however, the Franks and the Romans collaborated. The Roman general Postumus enlisted the help of one group of Franks to restore order in Gaul and drive out another group of Franks and other Germans. Internal feuds and jealousy among the Frankish factions led to shifting alliances with Rome, and over the next 200 years the Romans and Franks operated by turn as enemies and then allies. In the late third and early fourth centuries, the emperors Constantius Chlorus and Constantine the Great brutally suppressed a flurry of Frankish rebellions, fed the barbarian leaders to wild animals in the arena, and took vast numbers of the barbarian warriors into the imperial army. Their long relationship with Rome influenced Frankish cultural, military, and political structures. Serving in the imperial army increased the soldier's identity with Rome, as well as his identity as a Frank.

Eventually the Salian Franks settled in the modern Netherlands, cleared the land, and began farming, providing the Romans with both a buffer between the less civilized tribes to the north and a steady source of recruits for the imperial army. Despite the harsh treatment they sometimes received from the Romans, the Franks remained loyal allies of the empire. Over the years many Franks rose to high positions within the Roman army. Loyal service brought further rewards, and in the fifth century the empire allowed the Franks to move from buffer regions into modern Belgium, northern France, and along the lower Rhine.

Throughout the fifth century under the leadership of Chlodio, Merovich, and Childeric, the Salian Franks came to dominate the other tribes of the Frankish confederation. Childeric, in power by 463, was the final Frankish commander to serve as an imperial German. Driven into exile after arguing with his Roman commander, he remained closely involved. Childeric emerged as a leader in his own right, maintaining relations with the Gallo-Roman aristocracy while negotiating to keep peace with other powers, such as the Visigothic kingdom. He often cooperated with Roman commanders and the Gallo-Roman bishops, enhancing his position with his Frankish warriors and the Roman power structure and building a secure power base for his son Clovis.

The reign of Clovis (c. 481–c. 511) was critical for the development of the larger Frankish identity. Through diplomacy, treachery, and military action, he eliminated the political independence of the various Frankish subgroups and led as king of the Franks. Following several successful military campaigns under Clovis, the Franks emerged as the most powerful of the Germanic groups. His acceptance of Roman Christianity subsequently brought all the Franks in line with the Western Church and won him the unqualified support of the Gallo-Roman clergy. Thereafter nearly all surviving historical sources on the Franks come from Gallo-Roman clerics, who owed their positions in the church to Clovis or his descendents, the MEROVINGIAN DYNASTY, and because of this influence they may have stressed the tribal unity of the Franks in their writing.

Following these developments the meaning of *Frank* began to change. Gallo-Romans and other subjects of the Frankish kings adopted many Frankish customs, and the Franks adopted many of their customs and their language, Latin. The line between Frank and Gallo-Roman blurred. In addition the political control of the Frankish kings and their agents led subjects to think of themselves, at least partially, as Franks. Loyalty to the primary tribe persisted, some assert, until as late as the

eight century east of the Rhine, but in the kingdom of Francia, Frank indicated a political allegiance, regardless of one's tribal origin. By the mid-eighth century most of the Gallo-Roman inhabitants of Francia called themselves Franks, and everyone from outside the kingdom called all its inhabitants Franks.

The events that built the Franks from a "tribal swarm" into one essentially unified kingdom, as well as the relationship they established with the Roman Church, left them in a position to emerge at the end of the transformation of the Roman world as the most powerful group in Europe. The actions taken by their leading families, the Merovingians and later the CAROLINGIAN DYNASTY, helped form the medieval world and strongly influenced the development of European culture.

KEVIN D. HILL

Frederick I

(1122–1190) *Holy Roman Emperor*

Frederick I, called Barbarossa (Italian for "Red Beard"), ruled the HOLY ROMAN EMPIRE from 1152 until his death in 1190 while on the Third Crusade. He was elected emperor upon the death of his uncle, Conrad III, in 1152, when the empire was in decline. He led several expeditions to Italy to regain control over the northern part of the country. In Germany he broke up the duchy of Saxony when its duke, Henry the Lion, refused to support the emperor on one of his expeditions to Italy. The duchy was divided between the emperor and the lesser nobles of the area in 1180. Germany then experienced a period of peace and prosperity. In 1189 Frederick set out on the Third Crusade, marching his army through the Balkans and Asia Minor. During 1190 while in Asia Minor, Frederick drowned in the Saleph River.

Frederick I was born in 1122 and became the duke of Swabia when his father died in 1147. He accompa-

nied his uncle, Emperor Conrad III, on the Second Crusade and took part in the aborted siege of Damascus. As Conrad neared his death he designated Frederick as his chosen successor. Thus when Conrad died in 1152 Frederick was elected emperor. The election took place in Frankfurt-am-Main on March 4, 1152. Between 1154 and 1183 he led six expeditions to Italy. On the first, he restored the pope's authority in Italy and was crowned Holy Roman Emperor. During the second, he captured Milan and placed friendly governors in several other cities. He also supported the antipope and was excommunicated by Pope Alexander III. For the third expedition, Frederick planned to conquer Sicily but was stopped by a league of Italian states. His fourth expedition saw him storm Rome and place the antipope on the throne. The plague broke out in his army, forcing him to return to Germany. The fifth expedition ended in failure when Henry the Lion, duke of Saxony, refused to accompany the emperor to Italy, where the emperor's army was defeated. After his defeat, Frederick made peace with Pope Alexander III. His last expedition to Italy saw him make a lasting peace with the Italian states and marry his son to the heiress to the Norman lands in Sicily.

During this time Frederick was also working to keep the peace in Germany. Many of the German princes continued to feud with their neighbors and tried to expand their holdings. One of the more successful princes was Henry the Lion. Upon his return to Germany Frederick had Henry tried in absentia and stripped of his lands. Some of his lands went to the emperor, while the rest was divided up among various nobles. Frederick had initially been married to Adelheid of Vohburg, but he had the childless marriage annulled. He married again on June 9, 1156, this time to Beatrice of Burgundy. Because of this marriage, he gained control of the kingdom of Burgundy. They had several children, including Frederick's successor, Henry VI.

Answering the call for a new crusade Frederick assembled his army at Regensburg in May 1189. The army marched through Byzantine lands, arriving at Constantinople in the fall of 1189. Advancing through Asia Minor during the spring of 1190, he defeated the sultan of Iconium. He continued his advance and it was during this advance that he drowned. The exact circumstances of his death are not known.

DALLACE W. UNGER, JR.

Fujiwara clan

The Fujiwara clan rose to power as a result of the coup d'état of 645 that overthrew the Soga, which had dominated the Japanese government until then. The period between c. 857 and 1160 is called the Fujiwara period. Even after losing power it continued to monopolize positions in the imperial court at Kyoto until 1867.

In 645 a nobleman named Nakatomi Katamari helped a prince, who later became Emperor TENCHI (TENJI), to overthrow the politically dominant Soga clan. In gratitude Tenchi granted a new surname to his ally, who became Fujiwara Katamari (Japanese list their surnames before personal names). He was the founder of the Fujiwara clan and assisted Tenchi in launching the TAIKA REFORMS that continued Prince Shotoku's policy to Sinicize Japan's government. They sponsored five embassies to China between 653 and 669 that sent young Japanese to learn about every aspect of the Chinese civilization.

Katamari's descendants continued to accumulate power in the court of Emperor Tenchi's successors through marrying their daughters to each generation of emperors. As a result almost all emperors since that time were sons of Fujiwara women, and the few whose mothers were not Fujiwara made no headway in restoring power to the imperial family. Initially Fujiwara men were content taking important government positions, but after 858 Fujiwara Yoshifusa went a step further—he placed a grandson on the throne and became regent. This pattern of ruling through a nominal emperor continued even when the emperor became adult, because then the regent just took another title, as *kampaku* or civil dictator, and continued ruling. This practice continued until 1867.

The Fujiwara clan proliferated into five branches by the 13th century, each named after the area in Kyoto where their palaces were located. They were the Konoe, Kujo, Nijo, Ichijo, and Takatsukasa. Each branch kept a meticulous genealogy. One descendant of the Konoe

house served as Japan's prime minister at the beginning of World War II.

The Fujiwara used their government positions to accumulate huge estates throughout the country and became the richest family in Japan, richer than even the imperial family. They also used their court positions to become protectors of other nobles, taking a cut of each protégé's income. However the Fujiwara never attempted to usurp the throne. This is because of the deep reverence all Japanese felt for the emperor as descendant of the sun goddess and therefore Shinto high priest.

Fujiwara power began to decline by the mid-1100s, partly because of the growing impotence of the central government. On the other hand the provincial nobility who had to gain protection by organizing armies became more powerful; they then withheld revenues meant for the central government and their Fujiwara patrons. Rivalries between different branches of the Fujiwara clan also weakened all of them. As a result two new groups rose to undermine their dominance. One group was the retired emperors (adult emperors were often induced to retire and take up monastic life in favor of their young sons, who were easily controlled by their Fujiwara maternal grandfathers or uncles), who tried to reassert power by forming a shadow government from their retirement palaces. The other group consisted of provincial nobles who were no longer content with their subservient status.

In the 12th century the provincial military class banded behind the banners of two great noble houses, the Taira and Minamoto, each descended from a cadet branch of the imperial family. In two great wars in the late 1100s the Taira and Minamoto would in succession gain ascendancy and thus control of the court. In victory the Taira attempted to mimic the Fujiwara by moving to Kyoto and marrying their daughters to the emperors. But they soon succumbed to the decadent life at court and were eliminated by the Minamoto in 1185. The victorious Minamoto leader Yoritomo did not move to Kyoto but established his headquarters at a town called Kamakura, where he ruled as Seii-tai-shogun, or "Barbarian Quelling Generalissimo." The Fujiwara were allowed to regain their monopoly of supplying empresses and concubines to the emperors in a court that no longer held power but retained its religious and ceremonial functions.

The Fujiwara era was one of decline of central authority in Japan but also one of flourishing high culture, especially at the imperial court in the capital HEIAN (later Kyoto). Although frequent contact with China continued, the Japanese became increasingly

confident and began to experiment with innovations. Buddhism became popular throughout Japanese society, but with Japanese characteristics, assimilating elements of native Shintoism and identifying with local deities. Rejecting earlier Buddhist schools, which identified with the upper classes, a Japanese monk, Ennin, returned to Japan after a lengthy stay in China in the late ninth century and popularized a school called Pure Land Buddhism.

The Japanese also developed a new writing system based on simplified Chinese characters used for their sound. It was called *kana* and was a phonetic syllabary system used for writing Japanese. Kana was popular with court ladies, who wrote a new genre of literature—novels and witty commentaries that described court life and romances between noble ladies and courtiers who no longer governed and had been reduced to

social butterflies. The most notable works of the genre were *The Tale of Genji* by MURASAKI SHIKIBU and the *Pillow Book* by Sei Shonagon; both authors belonged to the Fujiwara clan. The Fujiwara clan was important in Japanese history for dominating the imperial family for many centuries. It also presided over a period that initially imitated Chinese ways and then developed into a unique Japanese culture.

JIU-HWA LO UPSHUR

Gempei War

Part of the TAIRA-MINAMOTO WARS the Gempei War in Japan lasted from 1180 until 1185. It was fought between the Taira clan, which was losing influence, and the Minamoto clan, which hoped to replace the Taira clan. It resulted in a victory for the Minamoto clan, and the emergence of Minamoto Yoritomo as the shogun (“general who subdues barbarians”) in 1192. The name *Gempei* came from a contraction of the names *Genji* and *Heike*, which were the kanji characters for “Minamoto” and “Taira.”

The Minamoto clan previously tried to topple the Taira, in the Hogen War of 1156 and the Heiji War of 1159–1160. In the first the Minamoto had supported a rival claimant to the throne and lost. In the second, they staged a surprise coup but were decisively defeated by the Taira. In the Gempei War in 1180, as the Minamoto were gaining strength, the Taira attacked first. Taira supporters surprised Prince Mochihito, the claimant to the imperial throne and favored by the Minamotos, at a temple near Kyoto. Deciding that it was impossible to defend the temple, they fled across the Uji River, removing the planks on the bridge across the river. However the Taira forces were able to ford the river and cornered their opponents. Yorimasa, injured by an arrow, committed ritual suicide by seppuku, disemboweling himself—the first known time this had taken place. Soon afterward Prince Mochihito was killed.

The Taira then capitalized on their victory at Uji by attacking NARA, the base of warrior monks opposed

to them. Although the monks were in strong defensive positions, the Taira used their cavalry to great advantage, capturing and then destroying all the temples in Nara except Enryakuji. It is reported that 3,500 people were killed during the sacking of Nara. Following this, Minamoto Yoritomo, assisted by men from the Miura clan, tried to regroup, but the Taira launched a quick attack and routed them at the Battle of Ishibashiyama. Soon afterward Minamoto Yoritomo rallied his troops and turned on the Taira. At the Battle of Fujigawa, it was said that when a flock of birds surprised the Taira, they fled in panic.

In 1181 Minamoto Yukiie attempted to attack Taira Tomomori, whose army was encamped along the Sunomata River. The Minamoto were driven back with heavy losses and retreated across the Yahagigawa River, pursued by the Taira. When Tomomori fell ill, the Taira pulled back. After a lull in fighting, in 1183 Taira Koremori launched an attack on a Minamoto castle at Hiuchiyama. The fortifications were capable of withstanding a siege, but a traitor from within the castle tied a message to an arrow and shot it into the Taira camp, showing how they could breach a dam around the castle. The Taira attacked and the Minamoto forces fled. Although the Taira won the first part of the war, their leadership had grown arrogant and annoyed smaller clans, who were won over by the Minamoto.

Making the most of this victory Taira Koremori pursued the Minamoto to Kurihara (also known as the Battle of Tonamiyama). Minamoto Yoshinaka cunningly split his forces and ambushed the Taira as they

went through a mountain pass. By disguising the strengths of the three wings of the army, Minamoto Yoshinaka surrounded the Taira. It was the turning point in the war, as many of the Taira forces were killed, and they were forced to withdraw their garrison from Kyoto and fled along with their ally Emperor Antoku to Shikoku.

On November 17, 1183, Minamoto Yoshinaka sent his ships against the Taira in the Battle of Mizushima—the first naval battle of the Gempei War. The Taira were victorious, but soon afterward a Minamoto army captured the castle of Fukuryuji, which had been held by a supporter of the Taira. The Minamoto then tried to press their military advantages by engaging the Taira in another battle at Muroyama but were defeated.

A struggle suddenly broke out with Minamoto Yoshinaka trying to wrest power from his cousins Minamoto Yoritomo and Minamoto Yoshitsune. Yoshinaka captured the Hojoji Palace in Kyoto, took Emperor Go-Shirakawa prisoner, and named himself shogun. Soon after the rest of the clan surrounded him, forcing him to choose between inevitable defeat in battle or flight. He chose the latter and his men fled across the Uji River, but Yoshitsune's cavalry forded the river and in the second Battle of Uji, Yoshinaka was defeated. He made a final stand at Awazu and was killed by an arrow.

With Yoshinaka dead the Minamoto concentrated on the final defeat of the Taira. At Ichi-no-Tani, the Minamoto attacked a Taira fortress near modern-day Kobe. The battle became legend in Japanese folklore, with many famous warriors engaging in combat. Eventually the 16-year-old Taira leader, Atsumori, was killed, later dramatized in plays and works of fiction. The Minamoto then followed up their victory by attacking and defeating Taira allies at the Battle of Kojima.

The last two battles of the war were both at sea. At Yashima on March 22, 1185, Minamoto Yoshitsune launched a surprise attack on the Taira. Bluffing that he had far more men, Yoshitsune sent the Taira into premature retreat, abandoning their fortifications at Shikoku. Most of the Taira fleet escaped, but at the Battle of Dannoura, off the southern tip of Honshu island, on April 25, 1185, the Minamoto attacked their outnumbered opponents—it was estimated that the Minamoto used 850 ships against their opponents' 500.

At a crucial time a Taira ally switched sides and told the Minamoto which ship the six-year-old Emperor Antoku was hiding on. The Minamoto attacked it, killing the emperor along with his grandmother, a member of the Taira clan.

With the Taira totally defeated, Minamoto Yoritomo, the older half brother of Yoshitsune, became

the first shogun in Japanese history and established what became the KAMAKURA SHOGUNATE. It was not long before Yoshitsune, Yoshiie, and Yoshinaka were killed by orders of Yoritomo or were forced to commit suicide. The system of rule by the shogun continued, in several different forms, until the Meiji Restoration of 1868.

JUSTIN CORFIELD

Genghis Khan

(c. 1167–1227) *Mongol conqueror and ruler*

Genghis or *Chinggis Khan* means “universal ruler.” He was born Temuchin, the son of a minor Mongol chief, and overcame early obstacles to conquer the greatest empire of the world to date, which he bequeathed to his sons. Some believe he was a greater military strategist than Alexander the Great, Hannibal, Julius Caesar, and Napoleon Bonaparte. At the time of his birth the varied people of the steppes (Turkic, Mongol, and others) lived in mutually warring tribes, raiding one another for animals and women and looting nearby sedentary populations. The harsh environment of the steppes where they lived provided little opportunity for agriculture, limiting the peoples to a nomadic lifestyle of herding and hunting.

His father, Yesugei, died of poisoning at the hands of foes when Temuchin was eight years old, en route home after betrothing him to a girl from his mother, H'oelun's, tribe. H'oelun and her sons were cast out to fend for themselves after Yesugei died; thanks to Temuchin's cunning and ruthless determination, they survived.

Eventually he married his betrothed, named Borte; received help from his father-in-law in establishing himself with followers and animals; and won allies. Borte was the mother of four sons (Juji Khan, Chagatai Khan, OGOTAI KHAN, and TULUI KHAN) and a daughter. Juji was born around the time his mother was rescued from captivity (she had been captured in a raid by Temuchin's enemy), casting doubt on his paternity. These four sons became Temuchin's principal heirs.

FROM TEMUCHIN TO GENGHIS KHAN

In complicated wars Temuchin and his allies won against tribes named the Naiman, Merkid, Oyirad, Tartar, Kereyid, and others, becoming master of the Mongolian plateau by 1205. A great council or *khuriltai* was convened in 1206 to signal the formation of a confederation at Burkan Khaldan, the holy mountain of the Mongols under Temuchin, and to give him the title *Genghis Khan*. From this point on all his followers, regardless of tribal affiliation, were called Mongols. In Mongol ideology the elevation of Temuchin to Genghis Khan was blessed by heaven and therefore it was his right to conquer and to bequeath his conquests to his family.

Genghis Khan's first great achievement was to organize his men into a unified army. He used the decimal system: Each 10-man group had a leader; 10 of these formed into a 100-man unit under a leader, and so on up, each commander being responsible for 10 men under him. In time the Mongolian component of his army grew to between 105,000 and 129,000 men. As his empire expanded, subject peoples incorporated into his infantry and cavalry followed the same organizational rules. The Mongolian army did not possess weapons or technology superior to those of its enemies. Its superiority lay in its discipline, mobility, coordination, and maneuverability.

Records were necessary to administer his people, so in 1206 he ordered the creation a script for the Mongol language, and since the man designated for the task was an Uighur, he used the Uighur alphabet for that purpose. Genghis did not learn to read but ordered his sons to learn the written language. He also promulgated a code of laws and regulations in 1206, called *yasa* or *yasaq*, that provided severe punishment, for example, the death penalty applied to murder, major theft, adultery, malicious witchcraft, and other offenses. The severity of the laws resulted in an obedient society, which visitors observed with awe.

CONQUEST OF XIXIA, JIN, AND KHWARAZM

Genghis Khan's conquests began in 1209 and his first target was the Tangut kingdom to his southwest called XIXIA (HSI HSIA), leading his army personally. After withstanding a siege of their capital city the Xixia accepted peace terms: submission to Genghis Khan and a pledge to support him in future campaigns, and the king's daughter given to Genghis as wife. After this demonstration of force two sedentary Turkic peoples, Uighurs and Qarluks, came to offer surrender. Both would go far under Mongol rule.

Genghis Khan's next victim was the Jurchen JIN (CHIN) DYNASTY in north China. He set out against it in 1211 with three of his sons and 50,000 cavalymen. Although no longer the ferocious fighters of a century ago, the Jin still had a 150,000 strong cavalry of Jurchen soldiers and an infantry of 300,000 to 400,000 Chinese men. Moreover the Jin Empire had over 40 million people, three million of whom were Jurchen, opposed to the Mongol nation of not much over a million people. In 1211–14 the Mongols devastated much of northern China and looted three of Jin's five capitals, until Jin submitted to a humiliating peace. Among the captives taken during this campaign was YELU CHUCAI (Yeh-lu Ch'u-ts'ai), a learned man of Khitan background who had served in the Jin government. He would later play an important role in the government of Genghis and his son Ogotai that benefited their Chinese subjects. North China suffered enormously between 1214 and the final fall of Jin in 1234, the result of Mongol raids, uprisings against Jin, and war between Jin and Southern Song (Sung).

Meanwhile commanders under Genghis conquered the state called Khara Khitai, situated to the west of Mongolia, in 1218. This cleared the way for Genghis to march against Khwarazm (or Khwarizm), a Muslim state that included Afghanistan and northern Iran, in 1219. It involved taking heavily fortified cities such as Harat and SAMARKAND, for which Mongols used the bloody tactic of using captured prisoners as human shields and moat fillers for their assaulting forces. By 1223 Khwarazm had been subdued and Mongol governors had been installed and garrisons put in place. While his generals proceeded westward across the Caucasus and into western Eurasia, defeating the Russian princes, Genghis returned to Mongolia in 1225. There he planned the destruction of Xixia, which had earlier promised to supply Genghis with men and supplies in his future campaigns but had refused when he began his war against Khwarazm.

Never forgiving anyone who had betrayed him, Genghis personally led the campaign against Xixia in 1226, destroying cities and the countryside and wrecking the irrigation works that rendered the land cultivable, and besieging its capital. Genghis Khan died in August 1227 because of complications from a fall while hunting in 1225. According to his wishes the war against Xixia continued until its destruction. His last orders were "The Tangut people are a powerful, good and courageous people, but they are fickle. Slaughter them and take what you need to give to the army. . . . Take what you want until you can take no more." Genghis Khan's body was returned to Mongolia; en route anyone who

saw his cortege was killed. He was buried on Burkhan Khaldun; the exact burial place was kept secret and has not yet been found. Before his death he had divided his conquests among his four sons, who were his principal heirs, and other relatives, and appointed his third son, Ogotai, his successor as Grand Khan, subject to confirmation by the Khuraltai.

THE BRUTAL MILITARY LEADER

Genghis Khan was unequaled as a military leader and conquered the largest empire yet seen and with unprecedented cruelty. He was a shrewd strategist who used many means to achieve his goals. He was a good psychologist who used terror and precedence to induce his enemies to surrender because any city that resisted would be razed and its people killed. He was a good organizer who militarized his whole people and saw to the logistical side of campaigns. He was adept at using spies and probing actions to take the measures of his enemies. He also used diplomacy to prevent his enemies from uniting or forming alliances. Finally he learned new military technologies and adapted to new needs, for example employing Middle Eastern siege engineers to help him take walled cities.

To Christian Europeans he was the anti-Christ and Scourge of God. China had never experienced such brutal conquerors, who threatened to turn the agricultural country into pastureland for their horses. He was especially cruel to cities and city dwellers. In his sweep across north China in 1212–1213 over 90 cities were left in ruins. The Jin capital in modern Beijing burned for three months. Those persons his forces let live because they had skills became Mongol slaves or were allowed to return to their ruined homes to serve their new lords.

JIU-HWA LO UPSHUR

Genoa

The city of Genoa (Genova), in Liguria in northern Italy, was an important Roman port that was founded in

the fourth century B.C.E. It is believed to have gained its name from the Latin word *ianua*, meaning door, as it served as an entry point for many goods being shipped to nearby places. During the medieval period Genoa emerged as an important maritime republic controlling trade in much of the Mediterranean.

The Roman connections with Genoa were largely severed in 641 C.E. when the Lombards invaded the region and captured the city. Over the next few centuries it weathered attacks by Barbary pirates from modern-day Algeria, who attacked much of the coastline and operated from bases in the nearby islands of Corsica and Sardinia. The citizens of Genoa put together a large naval force, captured the pirate bases on Corsica, and then attacked Sardinia and captured the island with the help of Pisa after 1284.

It was during this period that Genoa emerged as a major power, establishing colonies in North Africa, Syria, at Morea in modern-day Greece, and even as far away as the Crimea. This resulted in a strong trading position aided by the CRUSADES. They were also eager to increase trade with northern Europe. In 1379 a Genoese merchant was murdered in London when members of the “London mob” heard that he wanted to develop Southampton as a Genoese port.

Consuls controlled political power in Genoa until 1191; however, the system ended and power shifted to the *podesta* (mayors) and then the Capitani del Popolo (Captains of the People), who ruled from 1258 until 1340, except for short periods when foreign leaders ruled them. During the 12th century work began on the construction of the Cattedrale di San Lorenzo, in the center of Genoa. With a black and white striped Gothic marble facade (in part Romanesque and early Renaissance), now heavily identified with Genoese architecture, it included a Chapel to St. John the Baptist, designed by Semenico and Elia Gagini and built from 1451 until 1465. It was said to have housed relics from St. John the Baptist, and a polished quartz platter on which Salome is said to have received the head of John the Baptist. It also held the Sacro Catino, a sacred cup that was supposedly given by the queen of Sheba to King Solomon, and later used by Jesus at the Last Supper. Salome’s plate and the sacred cup are currently in the cathedral’s museum.

During this period the Venetians became jealous of the Genoese trade monopoly, and in 1298 the Genoese managed to defeat the Venetian fleet at the Battle of Curzola. During the battle the Genoese captured a Venetian nobleman called MARCO POLO (1254–1324) and imprisoned him in Genoa for a year before sending

Genoa in the medieval period: The city emerged as an important maritime republic, controlling trade in much of the Mediterranean. This provoked jealousy from the Venetians, which led to the battles between the two cities.

him back to Venice. It was during his imprisonment that he wrote his *Divisament du Monde* (The Travels), about his visit to China.

In 1340 the Genoese decided to follow the Venetian custom of electing a doge, and the first was Simone Boccanegra. Under him and his successors Genoa flourished, and Genoese mercenaries became prominent in wars in Italy and in France. The money these mercenary bands earned massively enriched the city coffers. In 1358 when the poet and humanist PETRARCH visited the city he described it as “superb.” Two of the great seafarers of the 1490s were also born in Genoa. Christopher Columbus was born there in 1451, the son of a wool comber. He went to sea at the age of 14 and fought the Barbary pirates. When he was 19 he was shipwrecked and ended up working in PORTUGAL, later offering his services to the king of Spain. Giovanni Caboto, “John Cabot,” was also born in Genoa in 1425. He moved to England in 1490, settling at Bristol. After the voyages of Columbus, he led English voyages across the Atlantic.

As with other city-states, the great families of Genoa fought each other for political power. The struggles among the Grimaldi, Dora, Spinola, and Fieschi fami-

lies weakened the state and foreign powers vied for control of the city. Giovanni Visconti took control of the city government by force in 1353, holding it until 1356. In 1393 there were five doges, and in 1396 France overran the city. Genoa managed to free itself from French rule in 1409 and was then controlled by Teodoro di Monteferrato. Twelve years later Filippo Maria Visconti took control of it. The French returned in 1458, but six years later the Sforza family was given control by France. The Sforzas were finally forced to flee in 1478 when the city rose up against them, but nine years later it was taken by Milan. Finally Andrea Doria (1466–1560), one of the great Genoese naval leaders, put together a constitution for Genoa that freed it of foreign domination but resulted in a dictatorial government that came to power after the Fieschi and the Cibo tried to seize power in 1547–48.

JUSTIN CORFIELD

Ghana, Mali, and Songhai

Ghana, Mali, and Songhai were three of the greatest western African trading states. Beginning with Ghana as early as 300 C.E. and ending with the conquest of the Songhai by Morocco in the 16th century C.E., they dominated the trade of gold, salt, and merchandise between North Africa and sub-Saharan Africa. Arab scholars and merchants as far away as Baghdad marveled at the wealth of these African states. The geographer al-Ya'qubi claimed that "gold is found in the whole of this country." But the trade of gold and salt was not the only basis for West African civilization. Remarkable cultural, intellectual, and cultural achievements made Timbuktu and other cities famed centers for the production of books in theology, history, and science, books whose weight was often valued more highly than gold.

Ghana, Mali, and Songhai were successful and well-organized states that overcame tribal divisions and fused traditional beliefs with the universal ambitions of ISLAM. The internal strength of these West African empires was what made the gold trade so successful. An intricate system of silent trade, transport, safe passage for merchants, and control over a vast array of tribes and different geographical zones from the Sahara desert of modern Mauritania to the thick jungles south of the Niger River kept the lifeblood of trade flowing. When these empires declined, so too did the trade in gold.

The historical sources for the empires of Ghana, Mali, and Songhai are written Arabic sources with a bias against non-Islamic beliefs, oral histories passed down by African *griots* or storytellers, and archaeology. Archaeological digs continue to reveal surprising secrets about the richness and strength of Ghana, Mali, and Songhai, sometimes confirming stories that were once dismissed as fantasy. Both written sources and oral traditions speak of the wealth and fame of the ancient kingdom of Wagadu. Arabic sources call the kingdom *Ghana*, a name that means "king" in the Soninke language. The vast kingdom included the modern-day countries of Mauritania, Senegal, and Mali. The climate of West Africa was dramatically different 1,000 years ago. Archaeological evidence suggests that the parched climate of the Sahara drastically expanded south after 800–1050 C.E., when the empire of Ghana was at its

height. The capital of Ghana, Kumbi-Saleh, once the wealthiest city in West Africa, is now a remote archaeological site in the middle of the Sahara. Climate change had a dramatic impact on West Africa as the center of power moved from near Ghana in the north, to Mali in the center, to the Songhai farther in the south.

The kingdom was matrilineal, meaning that the king inherited the throne through the mother's line; his sister's son succeeded the king. Matrilineal inheritance and the powerful position of women were constant features of traditional Saharan society. According to Al-Bakri, the king of Ghana followed traditional African beliefs but respected Muslims who came to trade in his kingdom, often putting them under his personal protection. The Almoravids, Berber, Muslim nomads from the desert attacked Kumbi-Saleh in 1076 C.E. and weakened much of the empire of Ghana. Nevertheless, Ghana remained strong until it was annexed by Mali, an even wealthier and larger trading empire that formed south of Ghana.

The empire of Mali was founded by Sundiata, a king who not only overcame external enemies but his own physical disabilities to construct an empire second only to the vast Mongol horde of Asia. According to legend, Sundiata's brothers were massacred by Suman-guru, king of the Sosso people, rivals of the Mandinke, and the people of Mali. Sundjata, considered a harmless invalid who could not even walk, was spared. Accounts tell how he was treated as an animal and taunted by other children. He learned to walk on iron braces and became one of the strongest warriors and hunters.

In 1230 C.E., some 18 years after the massacre of his brothers, the young Sundjata organized an army and overthrew Sumanguru of the Sosso at the village of Kirina in 1235 C.E. The dramatic Battle of Kirina is still recounted by *griots* as a struggle between two great magicians.

Sundjata, the hero, seemed to have both the power of Allah and the traditional African nature gods on his side. After his victory Sundjata united the Mandinke chieftains and gained control over all the southern ends of the trans-Saharan trading routes. The successors of Sundjata, including a former palace slave named Sakura, expanded and consolidated the empire, conquering the cities of Timbuktu and Gao.

A pilgrimage to Mecca was one of the FIVE, OR SIX, PILLARS OF ISLAM and necessary for all believers who could afford the journey. Mansa Musa, who reigned from 1312 to 1337 C.E., made the most famed royal pilgrimage to Mecca. Egyptian scholars give accounts of an enormous and extravagant royal caravan that visited Cairo on the way to Mecca. The chronicler

Al-Maqrizi said that he paid so much gold in his purchases of fabrics, slaves, and provisions that he caused the value of gold currency in Cairo to drop dramatically. Mansa Musa not only returned to Mali from Mecca with greater devotion to Islam, but he brought several scholars and architects home with him, including the Andalusian architect al-Sahili, who helped transform the traditional architecture of Mali.

Although he did not force the conversion of his people, he encouraged the growth of Islamic schools and developed a more methodical form of government using written Arabic. It could be argued that this tolerant fusion of West African and Muslim civilization made Mali one of the most advanced civilizations in the world. Using Eastern models, Mansa also established administrative and bureaucratic districts, keeping a close hold on his vast territories. The death of Mansa Musa (c. 1337 C.E.) led to a succession of kings unable to manage Mali's enormous size. BERBERS in the north threatened Timbuktu, while the Songhai people in the south began their rise as the last and most powerful of the West African empires: the kingdom of Songhai.

The backbone of Songhai power was the mighty Niger River. As the empires of Ghana and Mali rose and fell, the Songhai fishermen slowly expanded from a region south of the great bend of the river Niger. The Songhai founded the bustling trading city of Gao just south of this bend in the 1300s C.E. Most of the Songhai became clients of the Mali empire until 1435 C.E. when two Songhai princes, sensing the decline of Mali's fortunes, demanded independence. They established a new dynasty called the Sunni.

Muslim chroniclers remember the Muslim Askia Muhammad Touré as the most famous king of the Songhai. Using the message of Islam to rally his followers, he expanded the borders of Songhai into the east of Africa, connecting his empire with the Indian Ocean trade that went as far as China. Mahmud al-Kati, who wrote a major history of the Songhai, claimed that Askia lived for some 125 years.

Although that may be an exaggeration, Askia and the river people of the Niger created a strong and magnificent empire that was not seriously threatened until the invention of firearms. Firearms gave the Moroccan army a significant advantage when the Moroccan sultan Ahmed al-Mansur invaded the Songhai during the 1580s C.E. Half of the Moroccan army died of thirst and starvation as they crossed the Sahara. Still, the Songhai warriors were no match against the firepower of the Moroccans. Soon, Songhai, the last of the great trading empires, was in ruins.

ALLEN FROMHER

Ghaznavids

The Ghaznavid dynasty ruled eastern Afghanistan and parts of Iran and Pakistan from 977 to 1186. Sebuk-Tigin (r. 977–997), a former slave, founded the empire, ruling from the city of Ghazna, from which the dynasty obtained its name. Sebuk-Tigin had been a slave of the Turks and the military force that he led to supplant the previously ruling Samanid dynasty was also Turkish in origin. The Samanids were Iranian Muslims and the Ghaznavid Empire was also Muslim dominated, especially under subsequent rulers who were keen to Islamize the pagan-leaning Turks. The founder expanded his territory to the borders of India, with his son MAHMUD OF GHAZNI (r. 998–1030). Eventually the Ghaznavids in the west and the Qara-Khanids to the east replaced the Samanids, with the Oxus River marking the border between them.

It was during Mahmud's reign that the Ghaznavid Empire reached its greatest extent, spanning from the Oxus to the Indian Ocean. However the death of Mahmud and the succession of Masud (r. 1031–41), ousting the short-term ruler Mehmed, proved the turning point of Ghaznavid fortunes as increasing pressure by the Seljuk Turks resulted in the Battle of Dandanqan in 1040, a disastrous defeat for Masud. Despite the much larger numbers of Ghaznavid troops, the more mobile cavalry of the SELJUK DYNASTY denied them access to water and other supplies and destroyed their morale. The battle caused the loss of the gained Iranian and Central Asia territory. The Ghaznavid Empire persisted until 1186, but its influence was greatly reduced and it is remembered largely by its artistic and cultural achievements rather than its temporal power.

One of the most famous of Persian or Iranian poets was FIRDAWSI, whose masterpiece the *SHAHNAMA* (The epic of kings) was completed under the patronage of Mahmud. The epic tells the history and traditions of Persia and the stories of its rulers. It is considered a central

part of Iranian culture and one of the world's great works of literature. Mahmud's patronage enabled him to recreate the Ghaznavid Empire as an Islamic state, which strengthened faith across the region the Ghaznavids controlled. The resulting artistic influence can be seen in the cultural production created within the Seljuk world. This included architectural forms and figurative painting styles. Ghurids captured Ghazna in 1149 and the last remaining outpost of Lahore in 1187. The city of Lahore was greatly increased by this and subsequently become a significant urban and cultural center.

JOHN WALSH

Ghazzali, Abu Hamid Muhammad, al- (1058–1111) *Muslim theologian*

Al-Ghazzali (al-Ghazel in Latin) is one of the foremost Muslim theologians, comparable to Saint Augustine or THOMAS AQUINAS in Christianity. He was born in northeastern Iran and studied science and theology. As a young man, he was appointed by the Seljuk vizier Nizam al-Mulk to teach at the Nizamiyya *madrasa* (government sponsored school) in Baghdad. A popular professor, al-Ghazzali gave lectures that were widely attended and he became known in his lifetime as an expert on law and theology. He was familiar with classical Greek philosophy as well as Christian thought.

Al-Ghazzali's written works in Arabic number into the hundreds and include songs and poetry. His *Incoherence of the Philosophers*, a critique of the classical Greek philosophers and of Muslim philosophers such as IBN SINA, who accepted classical thought, was read throughout the Islamic world and was translated into Latin. In *The Revival of the Religious Sciences*, al-Ghazzali attacked the thought of the Greek philosopher Socrates. The latter work has been compared to the *Summa Theologiae* of St. Thomas Aquinas. However, Ibn Rushd (AVERROËS), the great Islamic philosopher based in Córdoba, Spain, vehemently disagreed with al-Ghazzali's refutation of Greek philosophy

and wrote a blistering critique, *The Incoherence of the Incoherence*, in which he demolished al-Ghazzali's assertions, one by one.

In arguments that have resonance in the contemporary debate between secularists and supporters of religious thought, al-Ghazzali posited that the world was a creation of the divine being and disputed assertions that the world had no beginning or end. A crisis of faith around 1095 c.e. caused al-Ghazzali to quit teaching, and, after traveling to Jerusalem and Mecca, he returned to Iran, where he immersed himself in SUFISM (Islamic mysticism). He wrote an autobiographical account of his spiritual journey in *That Which Delivers from Error*. Al-Ghazzali ultimately returned to teaching and became a foremost proponent of orthodox Sunni Islamic belief that, he argued, could be compatible with Sufi religious practices. Although they disagreed on specific points, both al-Ghazzali and Averroës sought to understand the interrelationship of philosophy and religion.

JANICE J. TERRY

Ghiberti, Lorenzo (1378–1455) *Italian sculptor*

Lorenzo Ghiberti was born in Florence and trained as a goldsmith by his father, Bartoluccio Ghiberti, and as a painter prior to taking up sculpture. Ghiberti rose to prominence in 1401, with the announcement by the Opera of the Baptistery of a competition to construct a second set of bronze doors for the Baptistery in Florence. The competition, to be supervised by the powerful woolen cloth guild, the Arte di Calimala, required the set of doors to illustrate scenes from the Old Testament. In addition, the doors had to complement the first set of doors completed by Andrea Pisano in the 1330s by continuing the quatrefoil design of the scenes. The doors designed by Pisano illustrated the life of John the Baptist, a patron saint of Florence. Abraham's sacrifice of Isaac was chosen as the competition subject. The allure

of such an important commission drew a number of entries from noted artists including Jacopo della Quercia and FILIPPO BRUNELLESCHI.

The young Ghiberti impressed the judges with his design and the fact that, save for the figure of Isaac, Ghiberti's entry was cast in one piece. A work that required fewer castings required less bronze and was cheaper to produce. Ghiberti's ability as a caster was cited by Giorgio Vasari in his *Lives of the Painters, Sculptors & Architects* as his reason for placing Ghiberti in front of DONATELLO and Brunelleschi as a sculptor. Art historians have struggled to date the beginning of the Renaissance, and many set it at 1401 and the competition for the Baptistery in Florence because of Ghiberti's attention to illustrating depth, the use of classical references such as the nude Isaac, and the importance of patronage.

While the competition was to illustrate the Old Testament, the subject was changed to the New Testament once Ghiberti was awarded the contract. Ghiberti's winning Abraham panel was included in the third set of doors completed in 1452. The door contains 28 quatrefoils in seven rows of four scenes. The lowest two rows illustrate the four Evangelists and the four Fathers of the Church, while the New Testament scenes begin with the Annunciation. Now known as the North Doors, the commission for the New Testament scenes was completed in 1425.

In addition to the Baptistery, Ghiberti received importance commissions for the niches at Orsanmichele. The Orsanmichele in Florence is an unusual building that served both as a granary for the city and as a shrine. The outside of the building contained niches that were assigned to various guilds to decorate with statues of their patron saint. The Calimala guild commissioned a bronze sculpture of their patron, John the Baptist, for their niche. Standing nearly eight feet tall the completed *John the Baptist* exhibits naturalism in its stance and the drape of the clothing that is one of the hallmarks of the Renaissance art. In 1419 the Arte del Cambio, the banker's guild, commissioned for their niche a bronze *St. Matthew* noted for its classical style and exquisite gilding.

In 1425 Ghiberti returned to the Baptistery to work on the North Doors commonly referred to as the Gates of Paradise. Focusing on the Old Testament, Ghiberti abandoned the preferred quatrefoil plan of partially gilded 28 scenes in favor of 10 fully gilded square scenes. In addition, in his own *Commentaries* (c. 1450–55) Ghiberti wrote regarding the doors: "I strove to imitate nature as clearly as I could, and with

Ghiberti rose to prominence in 1401, winning a competition with his bronze door designs for the Baptistery in Florence.

all the perspective I could produce, to have excellent compositions with many figures." With the completion of the Old Testament series, Ghiberti retired in 1452.

Giotto di Bondone

(c. 1276–1336) *Italian artist*

The early life, artistic training, and attributed works of Giotto di Bondone (commonly referred to as Giotto) are all shrouded in mystery and legend. In his *Lives*, Vasari provided the first biography and chronicle of the works of Giotto. Giotto was born in 1276 in the village of Vespignano outside of Florence to a farmer named Bondone. While still a boy Giotto developed the ability, without formal training, to draw from nature using whatever material was available, such as the ground,

Giotto di Bondone's "Stigmatization of St. Francis" painted in 1300 using tempera and gold

stones, or sand. Giotto would make these drawings to pass the time while tending to his flock of sheep.

Vasari tells us that his natural talent was so great that when Cimabue spotted his works while passing through his village he immediately sought the permission of Giotto's father to take the 10-year-old Giotto to Florence to study with Cimabue as a member of his workshop.

Giotto has received credit from art historians as being among the first to abandon the medieval artistic tradition in favor of the early development of naturalism—a style that would be fully realized during the ITALIAN RENAISSANCE. Giotto received praise by such luminaries as DANTE ALIGHIERI in *Divine Comedy*, GIOVANNI BOCCACCIO in *Decameron*, and Vasari for breaking from what Vasari refers to as the "crude manner of the Greeks." In his *Lives*, Vasari recounts two stories that illustrate the talent of Giotto. According to Vasari, Pope Benedict IX sent an emissary to Tuscany to see Giotto and to judge his fitness for a papal commission. The courtier asked Giotto for a small drawing to take to the pope. Giotto, without using a compass or moving his arms, drew a perfect circle and instructed the shocked courtier to take that simple drawing back to the pope. Pope Benedict immediately recognized Giotto's greatness and sent him papal commissions. This story is also credited with giving birth to the Italian proverb "Thou art rounder than Giotto's circle."

The second story recounted by Vasari supports the claim that Giotto had a great gift for naturalism. As a boy in Cimabue's workshop, Giotto painted a fly on the nose of a figure painted by Cimabue. Upon his return to the workshop Cimabue tried to shoo the fly away before realizing that it was just a painting.

One of the earliest works successfully attributed to Giotto is the crucifix (c. 1295) of Santa Maria Novella in Florence. Giotto's crucifix followed the design seen in Cimabue's earlier crucifix with Christ flanked by images of the Virgin Mary and John the Evangelist. Giotto deviated from Cimabue with form clearly moving toward three-dimensional in its effect. The figures are also imbued with a humanity and emotion missing from earlier works. Italian Renaissance art historian Bernard Berenson credits him with the birth of modern painting particularly with regard to the portrayal of the human form.

Throughout his career Giotto received commissions from patrons in Rome, Naples, Ravenna, and Padua. In 1305 he executed frescoes commissioned by Enrico Scrovegni for his chapel commonly known as the Arena Chapel. While the entrance wall is covered by a fresco

of the Last Judgment, a popular theme in medieval Italy, the remainder of the walls are devoted to a series of frescoes illustrating scenes of the life of the Virgin Mary and Jesus Christ. In these frescoes Giotto employed simple but dramatic architectural and landscape elements to focus our attention on the massive forms and the story being told. This simple, but dramatic, style would influence future fresco painters such as Michelangelo.

Art historians have long debated whether or not Giotto is responsible for the frescoes chronicling the life of St. Francis at his basilica in Assisi. As early as 1313 a chronicle written by Riccobaldo attributes the St. Francis cycle to Giotto. The attribution to Giotto was further supported in later centuries by the writings of LORENZO GHIRIBERTI in the 15th century and Vasari in the 16th century. In addition to painting, Giotto was also an architect and sculptor. As an architect, he is credited with the initial design and construction of the campanile of Saint Maria del Fiore (also known as the Duomo) in Florence. Giotto's involvement with the construction ended upon his death, and construction continued under his former student Taddeo Gaddi. Giotto died in 1336 and was buried with honors within Saint Maria del Fiore.

ABBE ALLEN DEBOLT

Godfrey of Bouillon

(c. 1060–1100) *king of Jerusalem*

One of the first European nobles to depart on the First Crusade in 1095 was Godfrey of Bouillon. Godfrey led his troops from France to Constantinople and fought alongside other armies through Asia Minor to Jerusalem. After the crusaders took the city, they elected Godfrey as their ruler. Godfrey of Bouillon was the second son of Count Eustace of Boulogne and Ida, the daughter

of the duke of Lower Lorraine. Godfrey's mother designated him her heir, but when her father died Emperor HENRY IV confiscated the duchy, leaving Godfrey the county of Antwerp and the lordship of Bouillon in the Ardennes. Godfrey nevertheless served the emperor loyally in his campaigns in Italy and Germany, and as his reward in 1082 Henry invested him as duke of Lower Lorraine, but as an office rather than a hereditary fief.

Cluniac monastic influences permeated Lorraine, and their pro-papal teachings may have influenced Godfrey to take up the cross. Godfrey's administrative skills were not sharp and perhaps he realized his future as a duke was limited and saw the CRUSADES as a way to achieve more. Although he never gave up his imperial office, he sold and mortgaged some of his lands, an indication that he had no intention of returning from the Holy Land. Each of these reasons, and a genuine enthusiasm for the cause, probably influenced his response to the pope's call. After blackmailing Jewish communities and selling parts of his holdings, Godfrey amassed funds to equip a large force. The number of men following him gave him a great deal of prestige among other crusade leaders and drew more men to him. He was personable and with his tall, athletic frame and blond hair he appeared the ideal northern European knight and a perfect leader.

By the time the crusaders took Jerusalem, there were only two viable candidates to lead the city, Raymond of Toulouse and Godfrey. Age, experience, and his relationship with the church probably made Raymond of Toulouse the better candidate, but he was unpopular. He too openly considered himself the secular leader of the crusaders, and his comrades viewed him as arrogant and too friendly with the emperor in Constantinople. The electors initially offered the leadership to Raymond. He refused, and said he would not wear a crown in the city where Christ wore his crown of thorns, hoping the comment would discourage others from taking the throne.

The electors offered the role to Godfrey, who hesitated, and then said he would accept the position on the grounds that he would not have to take the title of king, but could be known instead as *Advocatus Sancti Sepulchri*, a phrase that has been translated as "Advocate of the Holy Sepulcher" or "Defender of the Holy Sepulcher." Godfrey appeared sincere in his belief that the church should be the ultimate ruler in the Holy Land. After he accepted his role as ruler, Godfrey tricked Raymond into giving over control of the Tower of David, the military key to Jerusalem. Raymond, powerless and furious, left on a pilgrimage. Initially Godfrey's forces included approximately 300 knights and 2,000 infantrymen. He had to defend Jerusalem, the port of Jaffa,

and other towns, including Lydda, Ramleh, Bethlehem, and Hebron, from hostile native forces that occupied the countryside between towns. After falling out with Raymond, Godfrey's relations with his nobles cooled, but most answered his call to defend the kingdom. Gradually Godfrey extended his power over the rural areas of Judea and Samaria. His reputation increased rapidly.

As his powers in the Levant increased, Godfrey's powers in his own lands waned and he found himself increasingly at the mercy of other nobles in the Holy Land. His vassals used his cordial nature to their advantage, while churchmen knew he could not deny the church and used his trust to undermine his authority. He needed replacements and ships, his nobles wanted political favors, and Godfrey was in no position to resist their demands. In June 1100 after a period of intense negotiations and travel, Godfrey collapsed at a hostel in Jaffa.

Rumors of poisoning passed through the court, but he likely had typhoid. He hung on for nearly a month while politicians hovered around his sickbed, ready to take what they could on his death. He died July 18, 1100. Godfrey of Bouillon, at times a weak and unwise ruler, was nevertheless successful in his attempts to establish and expand his kingdom and earned respect for his courage, modesty, and faith. He was buried as the first Christian ruler of Jerusalem on the hill of Golgotha, in the Church of the Holy Sepulcher, the site of the Crucifixion.

KEVIN D. HILL

gold and salt, kingdoms of

For those who knew how to survive it, the Sahara was not an impenetrable desert as much as it was a vast, navigable ocean. Like ships on the ocean, large camel caravans have crossed vast distances on waves of sand for centuries, stopping at island oases along the way. The *sahel*, the Arabic word for shore, describes the semiarid region just below the Sahara. It was upon this

inland shore that Arab and Berber traders deposited their most valuable goods: solid blocks of salt. Salt from the sea would not work as it quickly dissolved in the humid and vast region of West Africa. Only solid salt bars from the desert could be carried without spoiling. Salt was needed to replace fluids in the body and for preserving food in a tropical climate where meat spoiled quickly. Salt was so valuable to the people of western Sudan that some were willing to pay the price of gold for salt. Gold was plentiful south of the Sahara. Ibn al Hamdhani, an Arab geographer, described gold growing there like carrots in the ground.

Similarly salt was plentiful in the Sahara. The buildings in the town of Taghaza in the middle of the Sahara were built from blocks of salt. While the West Africans needed the salt for their diet, the North Africans needed gold for currency. Kingdoms, wealthy merchants, great empires, and kings would rise and fall on both sides of the Saharan shore, their fortunes largely dependent on the trade of salt and gold. With plentiful salt in the north but a lack of gold, and plentiful gold in the south with a lack of salt, the conditions for trade were perfect. Ironically the gold and salt miners almost never saw each other face to face. Merchants from the west and north traded, while the great empires of the south, GHANA, MALI, AND SONGHAI, managed the trade. The gold miners, the Wangaran people, did not want to give up the secret locations of their mines deep in the dense rainforests of West Africa and would swear not to reveal information about the gold mines if captured.

The gold and salt trade had an important impact on both the culture of the northern traders and sub-Saharan. Gold introduced the Mediterranean world to the enticing natural riches of Africa and fueled an economic boom. The sub-Saharan rulers similarly gained from the salt and from the new ideas and religious practices introduced by the northern traders, allowing them to create unified states around ISLAM.

ALLEN FROMHERZ

Golden Bull of 1356

Holy Roman Emperor Charles IV (r. 1346–78) established a kind of constitution for the HOLY ROMAN EMPIRE in 1356, calling the document in which the new rules were laid out the “Golden Bull” (*Bulla Aurea*). It was called by that distinctive name for two reasons: first, because of the medieval practice of affixing to official documents and important such declarations seals (Latin, *bullā*), the Latin word was transliterated into the English word *bull* and came to signify such official documents themselves; second, because the particular seal on this important document was cast in gold it is the “Golden Bull.” However its significance does not lie primarily in its name, but in its fundamental importance to the Holy Roman Empire’s future.

The Holy Roman Empire was at different times a loose confederation of central European principalities. The various princes of the region cooperated to some degree as sovereigns and practiced election of an emperor. The year 1346 marked Charles IV’s election as emperor. By 1356 Charles IV, also king of BOHEMIA, realized that unlike in France and England, where monarchy had more firmly established itself and created more unified states, the Crown of the Holy Roman Empire was relatively weak to unify the mostly German principalities. Lacking the ability to forge unity, and seeing the Holy Roman Empire as a confederation of states and the emperor as first among princes of equal stature and power, Charles IV formulated the Golden Bull in 1356.

The document sought to bring an imperial peace and more stable form to this confederation of mostly German principalities, which was characterized by diverse cultures, customs, ways of life, and languages. As a reform and restatement of the ancient constitution of the Holy Roman Empire, it would form a basis of government for the empire as the foundational constitutional document, until the empire was dissolved by Napoleon Bonaparte in the year 1806. Though some see the Golden Bull as creating anarchy in the name of constitutionalism, and others call it the MAGNA CARTA of the German states, it was primarily concerned not with individual rights, but with the duties and rights of the princes who elected the emperor and helped him rule the empire.

Articulated in 1356 at imperial diets at Nuremberg and Mainz, it formed the basis of imperial elections and set the number of electors at seven. It gave the seven electoral princes extensive rights including the privilege of both nomination and selection of the emperor. Stipulating that the king of Bohemia, who was then Charles

IV, was to be one of the electors, it also elevated him over the other elector princes. In addition to the king of Bohemia, other electors were to be the archbishops of Mainz, Trier, and Cologne; the margraves of Miessen and Brandenburg; and the counts Palatine of the Rhine. Charles IV’s hope was that this arrangement would not only create unity among the elector princes and a balance of power, but also ensure hereditary succession through the regulated process of election.

Producing the “king of the Romans,” as the Golden Bull called the elected emperor, it limited participation to the seven elector princes, even disallowing any direct participation by the pope. Voting was regularized specifically, and a majority of four votes was sufficient for election, which would culminate in coronation by the pope in Rome. It also strengthened the individual positions of the seven electors within the empire. These “pillars” became a “college,” above the various legal estates of clergy, townspeople, and nobility. To alleviate the temptation to divide up electoral votes, the territories of the seven elector princes were made indivisible by inheritance. The princes also gained powers that accrued to them personally, such as the right to capital justice, and control of local mining, tolls, and coinage.

Seven copies of the Golden Bull of 1356 still exist, having been preserved by several of the electoral princes and the cities of Nuremberg and Frankfurt. An interesting document, it limited government in the Holy Roman Empire, if only by ending the legal possibility of a hereditary empire in favor of an elective, if still very exclusive position as “king of the Romans.”

JOHN FARRELL

Gothic and Romanesque styles

The term *Romanesque* is applied to architecture in medieval Europe during the 11th and 12th centuries which attempted to connect the early Middle Ages with the architecture of the Roman Empire, both in the materials used and in the form achieved. Building on

Cathédrale Saint-Pierre d'Angoulême in Charente, France, is one of the best remaining examples of Romanesque architecture.

the Norman style, Romanesque became popular and was the first style to be used throughout Europe since Roman times, with examples being found across medieval Europe. Many of these buildings were religious structures, especially cathedrals and churches.

The aspects of the Romanesque style, especially the round arch, make it similar to later Roman design with the use of thick walls, narrow openings, and stone vaulting as a method of support. Columns were replaced by piers, and there was intense use of geometry and rigidity in design. Romanesque cathedral design uses barrel and supporting vaults, and a cruciform layout. This system of construction seems to have first appeared in the Iberian Peninsula with the cathedral of Santiago de Compostela and the cathedral of Jaca being two of the more notable examples.

In France, the abbey of Cluny, which no longer remains, was perhaps the epitome of Romanesque architecture. Elsewhere in Europe, there are many examples of Romanesque architecture in Italy, including the towers at San Gimignano; the cathedrals of Monreale, Palermo, Pisa, and Cefalu in Sicily; and parts of St. Mark's Cathedral in Venice. In France, the monastery church of

Notre-Dame-du-Port in Clermont-Ferrand, the church at Périgneux in the Dordogne, and the Abbey of Senaques are among many examples.

The Gothic style, from about 1150 until 1250, using the pointed arch, followed from the Romanesque style, with the term *Gothic* originally being used as a pejorative term in the 1530s to describe buildings, mainly cathedrals, that were seen as “barbaric.” The style actually has nothing to do with the Goths, but rather included characteristic features such as the pointed arch, ribbed vaults, and flying buttresses on the outside of buildings. The earliest significant building in the Gothic style appears to be the abbey church of Saint-Denis, near Paris, built around 1144. It was partially designed by Abbot Suger (1081–1151), who wanted to create a physical representation of his interpretation of Jerusalem and was criticized by contemporaries for his infatuation with the use of light that was to become influential in differentiating the Gothic style from that of the Romanesque. Much of this use of light was achieved by the use of stained glass, and the style started to become popular in northern France and then in England. It gradually spread throughout the rest of France, the Low Countries, Germany, Spain, and some parts of northern Italy.

The major Gothic cathedrals in France are Notre-Dame de Paris, Amiens cathedral, Beauvais cathedral, Chartres cathedral, Reims cathedral, Rouen cathedral, and the cathedral of Laon. In England, the cathedrals at Canterbury, Ely, Gloucester, Lincoln, Peterborough, Salisbury, and Wells; Westminster Abbey; and York Minster are all in the Gothic style. In Germany and Austria, the main Gothic cathedrals are at Cologne, Freiburg, Regensburg, Ulm, and Vienna; the main ones in Spain are Burgos, León, Seville, and Toledo. In Italy, the cathedrals in Florence, Milan, Orvieto, and Siena are all Gothic in style. In Belgium, Antwerp cathedral is in the Gothic style, with the Town Hall at Ghent, and parts of the Cloth Hall at Ypres being secular representations of Gothic architecture. In Italy the Palazzo Vecchio and the Ponte Vecchio in Florence, and the Doges' Palace in Venice; and in France part of Carcassonne, part of Mont Saint-Michel, and numerous chateaux are secular buildings in the Gothic style. There was a Gothic revival movement in the mid-18th century, influencing the building of cathedrals and churches, many university buildings, and major secular and civic buildings.

JUSTIN CORFIELD

Grand Canal

Next to the Great Wall of China the Grand Canal was the most important engineering feat in ancient China and was undertaken during the SUI DYNASTY (581–618). Earlier, during the Qin (Ch'in) dynasty and Han dynasty major canals had been built for land reclamation and irrigation and short canals for transportation. Sui Wendi (Sui Wen-ti), unifier of China after three centuries of division, began the Grand Canal. He re-

built and extended the old canals to link up the Yellow River with his capital Chang'an (Ch'ang-an) on the Wei River, then southward to the Yangzi (Yangtze) River at Yangzhou (Yangchow) in central China.

His son Yangdi (Yang-ti) expanded the system to Hangzhou (Hangchow) on the coast south of the Yangzi, and northward to near modern Beijing, totaling 1,250 miles. The Grand Canal, completed in 605, symbolized the reunification of the empire, economic growth, and integration. Over the centuries the growing wealth of the south became crucial to the defense of the nation's vulnerable northern frontier. China was politically divided during the SONG (SUNG) DYNASTY. With the loss of all northern China at the end of the Northern Song in 1127, the Grand Canal fell to disuse. In 1264 KUBILAI KHAN, grandson of GENGHIS KHAN, proclaimed himself grand khan and ruler of a new YUAN DYNASTY in China, with the capital city at modern Beijing, which he named Dadu (T'a-tu, meaning Great Capital).

Kubilai needed grain from the Yangzi valley for his capital and had two choices for routes, by sea, where ships were subject to loss in storms, or via a safer inland waterway, the Grand Canal. He chose the canal route, which entailed repairing the old canal including a 135-mile-long section near Dadu. Three million laborers were drafted for the task, which was completed in 1289. Maintenance was expensive and the canal again fell to disuse as the Yuan dynasty declined. The silted up sections were repaired in the early 15th century under the MING DYNASTY. The Grand Canal fulfilled several functions. It brought grains, cloth, tea, wine, and other products of the increasingly developed southeast to the politically dominant north. In integrating the country economically, it also played a vital role in the political unification of China. The Grand Canal was built and maintained at a huge cost. Sui Yangdi conscripted over a million people for this project during his reign and labor became so short that women were also conscripted. However the million plus number was the grand total of all laborers, not the number at work at any time, because each laborer had to work for the government for only 20 days per year.

Nevertheless the huge labor demands for Yangdi's many projects caused widespread discontent that brought down his empire. Silting, currents, and the need to pull canal boats in areas of steep elevation posed difficult problems for supplying Chang'an's 2 million people during the height of the TANG (T'ANG) DYNASTY. The fact that boats were fully laden on the journey north but returned south mostly empty posed economic problems that were never solved. The difficulty of supplying Chang'an was a major factor in abandoning it as the capital of China

after the 10th century in favor of Luoyang (Loyang), KAIFENG (K'AI-FENG), and Beijing.

JIU-HWA LO UPSHUR

Gratian

(d. 1160) *Byzantine monk and scholar*

Little is known about Gratian. He was probably born at the end of the 11th century in Chiusi in Tuscany and died in Bologna around 1160. Around 1140 he completed his *Decretum Gratiani*, which made him one of the most renowned canonists of all time. The *Decretum Gratiani* not only replaced the preceding decrees but also provided a systematic and logical ordering of documents taken from existing collections supplemented by prescriptions of the popes Paschal II (1099–1118) and Innocent II (1130–1143) and of the Second Lateran Council (1139). Until the Code of Canon Law was published in 1917, it remained a standard work for canon law.

Gratian was the first who taught canon law as an autonomous science, although the Byzantine Code of Justinian I had already served as a model in combining civil and religious laws into one code. *Canon* comes from the Greek word *kanon* and means a stem or a reed and a long and straight piece of wood, a wooden rule used by masons and carpenters, or a rule with which straight lines are drawn. Figuratively it is the rule of an art or of a trade, a model, a type, or a definitive list or catalog.

With the rise of Christianity, *kanon* received a new meaning: commandments of God, or in Latin *regulae fidei* (norms of faith) and *regulae morum* (behavioral rules). It is in this sense of *regulae morum* that canon was taken up into law. These behavioral rules began with the Bible and the *Didachē* (Teaching of the Apostles). As new questions about the faith were posed, heretical and otherwise, church councils and synods were called to answer these questions. This was especially true of the first seven ecumenical councils, which tackled questions on the divinity of Christ, the divinity of the Holy Spirit, the two natures of the one person of Christ, and Mary as the Mother of God, as well as the Council of Trent (1545–63), which answered the many

questions of the Reformation. The answers in the form of decrees would be added on to the list of canons governing behavior of clerics and lay people alike. Over the course of time, as the church grew and branched out, and it became necessary for a rule of conduct to be collected for uniform interpretation and implementation of divine law spelled out in the sources cited. This was the basis of canon law.

Gratian worked with a set method in which three parts may be clearly distinguished. The first part deals with the sources of the law. It also treats subjects concerned primarily with the ecclesiastical hierarchy and the clergy. The second part deals with procedure, secular property, religious orders, marriage, and confession. The last part deals with the rules on the sacraments, except for matrimony, and sacramentals.

Prior to the middle of the 12th century only systematic collections of church prescriptions had existed. With his *Decretum*, Gratian published the first synthesis of the universally applicable canon law. At the same time he provided the later popes with a foundation upon which their decrees could rest. In spite of its renown and the great authority of the *Decretum Gratiani*, it remained a private collection with no universal force of law. The ecclesiastical authorities never officially recognized or approved the collection.

THOMAS URBAN

Greenland

It is said that on a good day one can glimpse distant Greenland from Iceland. This may be an exaggeration, but the existence of links of land across the North Atlantic played a key role in Norse exploration, along with the development of new types of ships and new navigational technology and knowledge. The Faeroe Islands, not far from Britain and probably already known to the Romans, were settled first, early in the Viking age. From there the Vikings settled in Iceland, perhaps known to the ancients and certainly to the Irish, starting in the ninth century after evicting a few stray Irish monks. From Iceland the Norse continued west to Greenland in the second half of the ninth century, and then to the islands and coasts of North America by around 1000 C.E.

The Greenland of the Norse age of exploration was warmer and had more open land, allowing a limited agriculture. It was also uninhabited. The Eskimos and similar groups had yet truly to settle the area when the Norse came, although they did begin to penetrate south after their arrival and may have been a factor in the final extinguishing of the colony in the 15th century. It was thus not misnamed, but in the ninth and 10th centuries was truly a green land and eminently suited for the Norse way of life with its fjords, turf, and sea-carried wood from what is now Canada.

Greenland was also known for its fisheries and marine mammals, including the narwhal, a source of valuable ivory that later became the principal export of the Norse colony and was highly prized in medieval Europe.

According to Icelandic tradition, mainly from his saga, it was Eiríkur Raudi, or Erik the Red, who was the motive force behind Norse settlement of Greenland, trying to outrun his own legal problems (he carried outlaw status in both Norway and Iceland). Over time two distinct settlements emerged there: Vestribyggd or Western Settlement, and Eysribyggd or Eastern Settlement. The former was the first settled, in 986, and was located near modern Nuuk. The latter was around what is now Narsarsuaq and began a decade later. Scattered settlements arose in other places where conditions were favorable for fishing or hunting.

Both settlements prospered into the 12th century when a downturn in average temperature began, briefly arrested by an improvement during the 14th century. By then it was too late, and the viability of the Norse of Greenland had declined to the point that survival was difficult, if not impossible. The Western Settlement was abandoned in the mid-14th century and the Eastern Settlement died out in the late 15th century. Ultimately isolation and a progressively more difficult environment with the beginning of the Little Ice Age (which put more icebergs into the seas, making travel more difficult) doomed the Eastern Settlement. Both settlements left behind substantial archaeological remnants, including fragments of the material culture of the era, preserved by the cold. This included clothing, in some cases in the latest European fashion. From these fragments it is clear that the Norse of Greenland tried to maintain at least the semblance of their European culture and its values.

Also associated with Norse Greenland is evidence of wider contact with the islands and mainland of North America. The most famous example of this is the brief Norse settlement in Canada, Vinland (L'Anse

aux Meadows, Newfoundland). In addition archaeology and an examination of written sources have suggested Norse presence not only all and up down the Greenland coast, but on Baffin Island and at points north and south and even farther into the interior. At some of these locations, Norse from Greenland came into contact with Native Americans, including the Eskimos, who were to replace the Norse in Greenland, perhaps by force. It is conspicuous that the only North American culture to make bronze was one in close contact with the Greenland Norse, who knew how to work with bronze.

PAUL D. BUELL

Gregory Palamas

(1296–1359) *theologian and bishop*

Gregory Palamas was born in the city of Constantinople in 1296. His father was a prominent official under Byzantine emperor Andronicus II Palaeologus. His father died while Gregory was an infant, and the emperor actively took a part in Gregory's formation and education. Intelligent and hard working, Gregory was destined by his imperial patron for government service. But at the age of 20, Gregory left government service to take up monastic life at MOUNT ATHOS.

Advancing in monastic life under his spiritual mentor (St.) Nicodemus of Vatopedi, he eventually became a priest and hermit at the small monastery of Glosia on Mount Athos. During this time he absorbed the teachings of such church fathers as Evagrius of Pontus, Macarius of Egypt, and Simeon the New Theologian. Moving to Thessalonika, he became a noted priest, preacher, and teacher while maintaining a strict monastic regimen. He gathered a small community of solitary monks around his church and began actively to teach the "Hesychast" (from the Greek *hesychia* meaning "calm, silence") method of prayer and theology.

During the 1330s Gregory was called to Constantinople to defend the Hesychasts against the "Scholastic"

teaching of the Italo-Greek monk Barlaam of Calabria. Barlaam taught that one could not “know God” through mental prayer. Influenced by THOMAS AQUINAS he insisted that knowledge of the existence of God could only be appropriated through intellectual activity. He ridiculed the teachings and prayer methods of the Hesychasts and attempted to disprove the Hesychasts’ claim to experience God through “the light of Tabor.” (Tabor was the place where Jesus [Christ] of Nazareth experienced his “transfiguration” into divine brilliance and energy.) Palamas’s most extensive written response to Barlaam was *Apology for the Holy Hesychasts*, commonly called the *Triads*.

Palamas’s defense established the theological basis for the whole human person’s (body, spirit, and soul) being involved in the mystical experience. The whole person can be deified or united with the divine energies of Christ’s Tabor experience. This deification or “theosis” ultimately includes body, soul, and spirit, so a person enters into a real, but mystical union with God. In this incarnational way Palamas and the Hesychasts attempted to experience the presence of God through “divine energies.” Palamas helped to define the difference between the “divine essence” (which cannot be known) and “divine energies” (which can be known through how humans experience God’s presence).

Palamas’s teachings were accepted as orthodox at the Council of Constantinople in 1341, and Barlaam was condemned as a heretic and fled to Calabria. This did not end Palamas’ troubles, as Barlaam’s followers among monks and high clergy continued to dispute Palamas. He was imprisoned from 1344 to 1347. But after his release by Patriarch Isidore, he was elected archbishop of Thessalonika. During one of his trips to Constantinople, he was captured by Muslim pirates. He was beaten and tortured for preaching the Gospel to his fellow captives and Muslim captors. After a year he was ransomed and returned to Thessalonika.

Palamas performed many miracles during his reign as archbishop, including healing many illnesses. He died on November 14, 1359, and was canonized by a church council in 1368. He is commemorated in the Byzantine Church on November 14 and the second Sunday of the most solemn season of the church, the Great Fast or Lent.

Gutenberg, Johann

(1397–1468) *inventor*

The dissemination of knowledge occurred more quickly after Johann Gutenberg invented the printing press in 1440. Gutenberg, the son of a businessman named Friele Gensfleisch zur Laden, was born in Mainz, Germany, and was a goldsmith by profession. Movable type made of wooden blocks had been developed by the Chinese but was a time-consuming process. In Holland and Prague, experiments on a sophisticated printing process were already taking place. Gutenberg’s goal was to reproduce medieval liturgical manuscripts by using movable pieces of metal blocks for each letter. Many copies of a book were printed without loss of color and design. An assembled page was placed into a frame, and afterward a heavy screw forced the printing block against the paper. He combined paper technology along with oil-based ink. With the financial backing of a rich German lawyer, Johann Fust, Gutenberg established the first printing press, ushering in an era

Page of the Bible printed by Gutenberg in 1456. The illuminated border is typical of a manuscript.

of enlightenment. A large portion of society received an opportunity to read, and literacy was not confined to church, monastery, and nobility. The labor-intensive hand copying of books was no longer necessary, while the printing of books became fast and inexpensive.

Gutenberg published the 42 Line Bible, or the Gutenberg Bible, in Mainz in 1445 after two years of hard labor. Each column had 42 lines, and the whole Latin Bible had 1,282 pages. He printed 180 copies, out of which 47 are still extant. The words from the original Bible were not changed. He sold copies of the *Biblia Sacra* at the Frankfurt Book Fair of 1455. Adolf of Nassau, the elector of Mainz, gave him a benefice in 1465. Gutenberg printed indulgences, slips of paper used by the church. He also produced parts of Aelius Donatus's Latin grammar, *Ars Minor*, which had 24 editions. Persons trained by him established their own printing presses. Within a span of 50 years about 100,000 publications emerged. In libraries, books were to be distinguished from archival materials. Very soon, literacy expanded with the printing of maps, posters, pamphlets, and newspapers. Novel ideas of Renaissance Europe were fostered and preserved. National languages replaced Latin, a change important for the creation of nation-states.

The invention of the printing press was received with opposition from the Catholic Church. The printers of Mainz fled after an attack from soldiers of the archbishop of Nassau in 1462. But European cities benefited from the printers' skill. Some of the elite did not want to keep printed books along with hand-copied manuscripts in libraries. This dissipated gradually, and the printing press spread all over Europe. In 1476 William

Caxton established the first printing press in England at Westminster. He published Thomas Malory's *Le Morte d' Arthur*. In the 1480s, a printing press opened in Andalusia, Spain. By the end of the 15th century, the printing industry existed in 250 cities of Europe. The 1,000 printing presses published 35,000 titles and 20 million copies. Afterward, Roman type styles replaced Gothic types and metal screws were used in place of wooden ones. The printing press in the 15th century was modest compared to a modern press. A standard press having five workers could publish only five books a year, but an important discovery had been made in the history of human civilization.

Statues of Gutenberg adorn many places in Germany and notable institutions are named after him. Gutenberg is credited with transforming medieval Europe into a modern society, bringing about a scientific revolution.

PATIT PABAN MISHRA

Habsburg dynasty (early)

Although the Habsburg dynasty became especially prominent after the election of Rudolf of Habsburg as king of the Romans in 1273, its history goes back to the 10th century. Emperor Otto I (936–973) had a subject named Guntram the Rich (c. 930–990), who was grandfather of Radbot of Klettgau (c. 985–1035). The latter built the castle of Habichtsburg, or the Hawk's Castle, in the Swiss canton Aargau. One son, Werner I (c. 1030–1096), was styled count of Habsburg, while his other son, Otto I, became count of Sundgau. Werner's son Otto II (c. 1040–1111) was the first to use the title *Habsburg*. The wealthy Habsburg dynasty acquired vast territories in German-speaking parts of modern Switzerland, southeast Germany, Alsace, and Austria. This expansion became visible especially during the days of Albrecht III the Rich (d. 1199). After his death, the House of Habsburg was inherited by Albrecht IV (c. 1239), father of Rudolf, the future King Rudolf I.

RUDOLF I

Rudolf was born on May 1, 1218, from the union of Albrecht IV of Habsburg and Hedwig of Kyburg. His godfather was Emperor Frederick II Hohenstaufen (1212–1250). When Albrecht died in 1239, Rudolf inherited his holdings in Alsace and six years later (1245) he married Gertrude, daughter of the count of Hohenberg. Gertrude brought a large dowry, which expanded the dominions of the Habsburgs. Rudolf was on excellent terms with Emperor Frederick II and his son Conrad

IV (1250–1254), which allowed him to receive a series of imperial grants to augment his estates. This expansion continued during the Interregnum (1254–73), especially after the death of Rudolf's maternal uncle Hartmann VI of Kyburg (1264). His prominence, wealth, and influence made him a worthy candidate for the royal crown and on September 29, 1273, the assembly of German princes, the *Kurfürsten*, elected him king of the Romans. Although he was never crowned emperor by the pope in Rome, Pope Gregory X recognized his election, provided that Rudolf renounced all his territorial claims in Rome, Sicily, and the PAPAL STATES in Italy. Alfonso X of Castile followed Gregory, elected king of the Romans in 1257.

While Rudolf's coronation did not seem to provoke negative emotions outside his kingdom, the first challenger to his rule came from inside. It was Otokar II, king of BOHEMIA, who failed to win the majority of the *Kurfürsten* electors to be crowned the king of the Romans. He refused to acknowledge Rudolf's election and to surrender his estates in Austria, Carniola, Styria, and Carinthia that were seized from the imperial crown during the Interregnum. The provinces were won back after Otokar's defeat in 1276. Otokar resumed his hostilities against Rudolf, having allied himself with Polish chieftains. His attempts to challenge Rudolf were crushed in 1278, when he was killed in the Battle of Dürnkrut and Jedenspeigen. Rudolf spent much time restoring domestic peace. He invested two of his sons, Rudolf II (1271–90) and Albrecht I (1255–1308), as counts of Austria and Styria. With the death of Rudolf II in 1290, Albrecht became the sole male heir to the throne.

ADOLF OF NASSAU, ALBRECHT, AND FREDERICK I

During his brief reign (1291–98) Adolf did not achieve anything significant and in the later years of his rule some German magnates rebelled against him and chose Albrecht as their new king. Albrecht marched with his army against Adolf, who did not recognize the election, and defeated him in the Battle of Göllnheim (July 2, 1298). The throne was restored to the Habsburgs—but only for a short time. The marriage of Albrecht to Elizabeth, daughter and heiress of the count of Gorizia and Tyrol, augmented the demesnes of the Habsburgs. During his reign (1298–1308), Albrecht attempted to seize territories in the Low Countries, as well as on the Burgundian frontier. These attempts to expand his control westward provoked a quarrel with PHILIP IV of France.

After Albrecht's murder (May 1, 1308), Henry VII of Luxembourg was elected as the new king of the Romans (1308–13), while Albrecht's heirs were deprived of the crown. His eldest surviving son, Frederick I (1286–1330), tried to regain the royal title at the cost of war against emperors Henry VII (1308–13) and Louis IV (1314–28). In 1322 Louis crushed Frederick's army in the Battle of Mühlendorf, with the latter taken captive. He was released in 1325 and made coruler with Louis. The year after, he withdrew from the joint rule of the empire and came back to rule Austria proper, until his death in 1330. During his struggle with the emperors, Frederick was strongly supported by his younger brother, Leopold (1296–1326), ruler of Farther Austria. The latter insisted on having Frederick crowned as king of the Romans and fought by his side in Mühlendorf.

AUSTRIA'S CONSOLIDATION AND VIENNA

Frederick I's two sons, Albrecht II the Wise (1298–1358) and Otto the Merry, succeeded him in 1330. Although not a monarch, Albrecht gained considerable influence on the international scale. He was asked by Pope Benedict XII and Philip VI of France to mediate in their conflict with the emperor. He never switched allegiances and remained with Louis until the latter's death in 1346. In domestic matters, Albrecht paid much attention to the law, codifying the rules of inheritance of the Habsburg lands in Austria and issuing constitutions for Styria and Carniola.

Frederick's son Rudolf IV the Founder (1339–65) was married to Catherine of Bohemia, daughter of Emperor Charles IV (1346–78). Rudolf paid a good deal of attention to the development of his hometown, Vienna, where the bishopric and cathedral of St. Stephen were established. In 1365 the University of Vienna

was founded, in a response to the establishment of the Charles University of Prague (1348). In 1363 he inherited Tyrol from the childless Countess Margaret of Tyrol and annexed the county to the Habsburg domain. He is also credited with the establishment of a stable currency, the Vienna penny, and the invention of the title *archduke of Austria*.

Rudolf's son, Albrecht III (1349–95) continued the expansion of the University of Vienna. In 1379, rule over the Habsburg territories was divided between Albrecht and his only surviving brother, Leopold III (1351–86). The former retained Austria, while the latter received Farther Austria, Tyrol, Carinthia, and Styria. He also acquired Freiburg (1386), Feldkirch (1375), and Trieste (1382). After the death of his son, William the Ambitious (1370–1406), the possessions of the Leopoldian line of the Habsburgs were divided between William's younger brother Ernest the Iron (1377–1424), who inherited Styria, Carinthia, and Carniola, and William's son Frederick IV (1382–1439), who succeeded in Tyrol and Further Austria.

Albrecht V (1397–1439), the future King Albrecht II (1438–39), succeeded the Habsburg dukedom after the death of Albrecht III's son Albrecht IV (1377–1404). He spent his youth in the company of Emperor Sigismund, who was also king of Hungary and Bohemia and fought by his side against the Hussites of Bohemia. In 1422 he married Sigismund's daughter Elizabeth, who descended from noble Hungarian and Slavic lines. After Sigismund's death in 1437, he inherited the kingdom of Hungary and Bohemia, although he was not able to gain control over the latter. In March 1438 he was elected king of the Romans, returning the German crown to the Habsburgs. Having been crowned king, Albrecht spent the last two years of his life fighting Bohemians and Poles, as well as defending Hungary from the Ottoman Turks.

VIENNA CONCORDAT

Frederick V of Austria, son of Ernest the Iron, succeeded Albrecht as Frederick III (1440–93). He was unsuccessful in battle, but an outstanding diplomat. He signed the Vienna Concordat in 1446, which established and defined relations between the the empire and papacy. In 1452 he was crowned emperor by the pope in Rome. In the same year he married Eleanor of Portugal, inheriting a considerable dowry. In 1475 he arranged the marriage of Mary, daughter of Charles Bold of Burgundy, to his son Maximilian. Despite all these achievements, his rivals challenged Frederick's power more than once. Between 1458 and 1463 Frederick was involved in a bit-

ter struggle with his brother, Albrecht VI, over Austria. He also fought with his nephew, Ladislaus Posthumus, over Bohemia and Hungary. But the main threat came after Ladislaus's death, with the ascension of Matthias Corvinus (1458–90) to the Hungarian throne. This powerful king seized various Habsburg possessions in Austria, Moravia, and Silesia. In 1485 Corvinus captured Vienna and resided there until his death in 1490. It was only his death that saved Frederick's rule and perhaps the imperial rule of the Habsburgs.

Frederick's son Maximilian (r. 1493–1519) succeeded his father, controlling vast territories. He inherited the Free County of Burgundy from his father-in-law, Charles the Bald, together with some parts of the Low Countries. In 1490 he acquired Tyrol and parts of Austria from his half-uncle, Sigismund, son of Frederick IV of Austria. Maximilian's rule over the Free County of Burgundy provoked tensions with the French Crown, which led to the Italian Wars (1494–1559). In 1499 Maximilian's army was badly beaten by the Swiss Confederation, resulting in the imperial recognition of the Swiss independence. His grandson, Charles V of Spain, succeeded Maximilian. During his reign (1519–56), the Habsburg house rose to the premier authority and influence in Europe, holding dominions in the central Europe, Germany, the Low Countries, parts of Burgundy, and Spain with its vast American colonies. After his death, the Habsburg holdings were divided among his heirs. The Habsburg dynasty ruled Spain until the death of Charles II in 1700, while the Austrian lineage did not cease until 1918, when the last emperor Karl, or Charles, resigned and Austria was proclaimed a republic.

PHILIP SLAVIN

Hafiz

(1320–1389) *Persian poet*

Hafiz, a pen name for Khajeh Shamseddin Mohammad Shirazi, was born in Shiraz in present-day Iran. Following the death of his father, a merchant, Hafiz lived in poverty until his poetry earned him the patronage of several Persian rulers. He is perhaps the most admired poet among Persians, who, up to the present day, memorize and quote extensively from his lyric poems. He is best known for his over 500 *Ghazals* (sonnets) collected in his *Diwan*. His lyricism is captured in the following portions of the sonnet “My Bird”:

My soul is a scared bird, the highest heaven his next
Fretting within its body-bars, it finds on earth its nest

Hafiz often wrote about his favored hometown of Shiraz. Other poems are highly erotic, while others are clearly influenced by Islamic mysticism or SUFISM. His many references to wine and drinking from the cup are believed by many to be symbolic of Sufi belief in mystical intoxication. Others argue that the language is not symbolic. Hafiz had an enormous influence on Arabic and Turkish literature and his poems have also been translated into many Western languages. Authors as diverse as the American essayist Ralph Waldo Emerson and the German writer Johann Wolfgang von Goethe admired the poetry of Hafiz.

JANICE J. TERRY

Hangzhou (Hangchou)

Hangzhou is situated near the West Lake and the coast in southern China. In 605 Emperor Yangdi (Yang-ti) of the SUI DYNASTY had the GRAND CANAL extended from Yangzhou (Yangchou) on the Yangzi (Yangtze) River to Hangzhou. As a result an already fast-developing area of the lower Yangzi and the southeastern coast grew by leaps and bounds. Hangzhou became the capital of a prefecture of the same name.

The Lijue Pagoda in Hangzhou was built in 970 but was destroyed by war. The current structure dates to 1152.

In 1126 KAIFENG (K'AI-FENG), the capital of the SONG (SUNG) DYNASTY, fell to the Jurchen nomads who had been ruling northeastern China through the JIN (CHIN) DYNASTY. The Jurchen captured the Song emperor and more than 3,000 members of his court, deporting them to the wastes of northern Manchuria. A Song prince escaped capture and rallied resistance from several temporary capitals, then settled on Hangzhou because of its location south of the Yangzi, and in the midst of numerous lakes, where the nomadic cavalry could not be effectively deployed. Peace was made around 1136 with northern China under the Jin and land south of the Huai and the Yangzi valley under the Song, now called the Southern Song (1126–1379).

Hangzhou was capital city for a century and half; it also became a great commercial center and the most populous metropolis in the world. The existing city wall was expanded, new palaces and public buildings were built, and with the population increase (to over a million by 1275 from under 200,000 before 1126), large suburbs extended beyond the city limits. As a contemporary writer noted: "The city of Hangzhou is large, extensive and overpopulated. The houses are high and

built close to each other. Their beams touch and their porches are continuous. There is not an inch of unoccupied ground anywhere." MARCO POLO wrote about Hangzhou (which he called Quinsai) after the fall of the Southern Song, when the city was past its prime, thus: "This city is greater than any in the world. . . . [It] has twelve principal gates; and at each of these gates at about eight miles are cities larger than Venice or Padua might be, so that one will go about one of those suburbs for six or eight days and yet will seem to have traveled but a little way." Other descriptions paint a gay life with lamps lighting up places of entertainment such as restaurants, shops, taverns, and teahouses until late in the night. Pleasure boats, some 180 feet long, plied the West Lake.

Numerous canals intersected the city and environs, making transportation of people, merchandise, and provisions easy. Fleets of barges also carried away the waste of the city. Major roads also linked the city and beyond to many scenic spots, where rich men rode on horseback and ladies were carried in sedan chairs. Hangzhou was also noted as a center of the silk industry, of fine ceramic kilns whose output supplied the court, and of the best teas grown and processed in its environs. The growing economy of the region also began to support the best academies. Many of the activities of this multiple-function city survived the demise of the Southern Song; however Hangzhou never became a national capital again.

JIU-HWA LO UPSHUR

Hanseatic League

The Hanseatic League, or Hanse, was an association of German merchants, and later of towns, that dominated trade in northern Europe from the 13th through the 15th century. During this time the Hanse comprised around 75 member towns plus around 100 associate towns. The word *hanse* means an association, but the entity called the Hanse was far more. Its members were middlemen, both geographically and economically. They controlled trade between the Baltic and North Seas, in part because their ships, called *cogs* (depicted on the seals of many Hanseatic towns), were much superior to earlier ships. Using this technological advantage German merchants

were able to exact economic privileges from rulers along the Baltic and North Seas who came to depend on their trade. But as their economic power grew, they also took a more active military and diplomatic role in shaping the politics of northern Europe. Eventually the structural weakness of this loosely organized transnational community became apparent, as witnessed by the growing divergence in the interests of the member towns. The Dutch, English, Spanish, and Portuguese merchants, who traded not only throughout Europe, but also throughout the world, had already long eclipsed the Hanse when it finally dissolved in the mid-17th century.

Frisians, Flemings, Scandinavians (Vikings were traders as well as raiders), and the Slavic and Baltic peoples living along the south and east Baltic littoral dominated long-distance trade on the Baltic and North Seas before the arrival of German merchants. The main centers of trade were Haddeby in Schleswig-Holstein, Birka in Sweden, Truso on the Vistula River, and Stettin and Jumne on the Oder River. These trading centers provided the groundwork for the later Hanse.

By the 12th century Visby, on the island of Gotland, had emerged as the main emporium in the Baltic Sea. Its merchants established a trading outpost in the important Rus town of Novgorod, and they were granted extensive privileges by Emperor Lothair II (1125–37) to trade throughout his realm. This emperor's grandson, Henry the Lion, duke of Saxony (1142–80), was also interested both in developing trade and in pushing the bounds of his lordship farther east. Along with Albert the Bear, margrave of Brandenburg (1134–70), Henry played an important role in what has come to be known as the *Drang nach Osten*, or “push to the east.” This involved not only the military conquest and conversion of the Slavic pagans to the east of the Elbe River, but also the colonization of the conquered lands with peasants and burghers from overpopulated western lands. They were aided in this project by other nobles, including Count Adolf II of Holstein, who in 1143 founded a town, Lübeck, at the confluence of the Trave and Wakenitz Rivers, at almost the narrowest point of the isthmus dividing the Baltic and North Seas.

The native Slavs had long recognized the strategic and economic importance of this site, whose town a few miles downstream (from which Adolf took the name for his own town) had been destroyed in 1138. Henry the Lion complained that the town's success was causing his own economic projects to fail, as the chronicler Helmold relates. In 1157 Henry forced Adolf to give him the town, and Henry endowed it with expansive privileges and encouraged foreign merchants to trade there.

In 1180 Emperor FREDERICK I Barbarossa (1152–90) stripped Henry of his possessions for failing to submit to his judgment. Frederick I confirmed the town's privileges in 1188, and in 1226 Emperor Frederick II made Lübeck an imperial city, free from the jurisdiction of local lords. This status as the only imperial city east of the Elbe, along with Lübeck's geographical position, heralded the future greatness of the city that would become the capital of the Hanse, displacing Visby as the center of Baltic trade.

Because of the privileges granted to the Gotlanders, German merchants, especially those from Lübeck, were permitted to trade in Visby. These merchants formed an association and were recognized by authorities as “the merchants of the Roman Empire frequenting Gotland.” They elected leaders to speak on their behalf and in time established trading posts, or Kontore, in Novgorod, Bergen, Bruges, and London, four of the most important markets in northern Europe. During the 13th century dozens of towns were founded beyond the Elbe River according to “German law.” Many of these towns were new settlements, but there were also a large number of preexisting towns, like Gdansk and Kraków in Poland, that were reorganized according to the new social (“*Stadtluft macht frei*,” or “town air makes you free”) and spatial (a checkerboard pattern of streets around a market square) ideals of their mother cities.

As more merchants from these new towns became involved in trade, they became wary of the other merchants' leadership of the Kontore, and they wanted towns to take over the leadership of the Hanse. During the late 13th century a transformation took place—this association of merchants became an urban league. The Hanse was not the first urban league. Others emerged in the empire during the 13th century, as imperial power declined and towns looked to each other for protection from predatory lords, pirates, and other threats. But these other leagues proved ephemeral, dissolving after the immediate threat had passed. With Lübeck at its head, the Hanse continued to display its economic and military might throughout the 13th and 14th centuries. It forced the surrounding rulers, including the kings of Norway, Denmark, England, and France, to grant the Hanse ever more extensive privileges, allowing them to monopolize trade between the Baltic and North Seas.

In 1356 the first Hansetag, or general assembly of all the Hanseatic towns, was held in Lübeck. The Danish king Valdemar IV had been jeopardizing their trade routes by conquering lands throughout the Baltic, including Visby. The Hanse resolved to put an end to this. In 1362 they financed a fleet to oppose the king through the imposition of a toll on merchandise,

called the Pfundzoll. This venture, however, ended in defeat for the Hanse, and its leader was executed in the Lübeck town square for his failure. In 1367 a new Hansetag convened, this time in Cologne, because the Hanse needed the help of the Dutch in defeating the Danes. This “Cologne Confederation” of the Hanse, the Dutch, and Sweden sacked Copenhagen and forced Denmark to accept the Peace of Stralsund in 1370. The confederation won the right to occupy all Danish fortresses guarding access between the Baltic and North Seas for 15 years as well as the right to choose the next king. In 1388 the Hanse authorized an embargo of England, Flanders, and Rus and won privileges in all three lands, taking control of the Kontore in these lands. These however would prove to be pyrrhic victories.

The late 14th century marked the apogee of the Hanse’s power. It monopolized trade between the Baltic and North Seas and had imposed its will on lands in which it traded through a combination of military and economic measures. Yet even at the height of its power, it was the beginning of the decline of the Hanse. Many inland towns and some coastal towns did not take part in the “Cologne Confederation.” It was expensive to send representatives there, and the goals of individual towns were not always in line with those of the general assembly. The interests of the eastern towns and the western towns as well as those of the coastal towns and the inland towns continued to diverge.

Next because the Hansetag met so infrequently, the Lübeck town council functioned as the de facto head of the Hanse. When a revolt broke out in 1408 against its rule by the Lübeck burghers, it demonstrated not only the institutional weaknesses of the Hanse, but also the fact that frictions existed between the town councils and the burghers they were representing. In an organization as amorphous as the Hanse, there existed the problem of “freeriding,” that is, merchants from towns who did not belong to the Hanse trying to claim its privileges.

In addition to this internal fragmentation, the Hanse also faced external challenges. The rulers of Hanse lands sought to develop their sovereignty by limiting the Hanse’s privileges or forcing towns to withdraw from the league. In 1442 the margrave of Brandenburg forced Berlin-Cölln’s withdrawal. Also English, Dutch, and south German merchants began to take a larger share of the northern European trade. The Hanse continued to decline throughout the 16th century, and in the first half of the 17th century the Thirty Years’ War (1618–48) decimated central Europe to an extent not seen since the BLACK DEATH. Two decades after the Peace of Westphalia (1648), argued by many political

theorists to be the origin of the modern state system, the association convened its last Hansetag.

The extent of the Hanse’s economic and political power has led some historians and political theorists to draw comparisons to the European Community, forerunner of the European Union. These scholars suggest that because a transnational polity like the Hanse presented serious challenges to the emerging territorially sovereign states of the late Middle Ages, useful examples might be found for the future of the sovereign state in a world in which transnational organizations are once again challenging its supremacy. For nearly four centuries the Hanse was a major economic, political, and social factor in the formation of Europe—it facilitated the exchange not just of commodities, but also of people and ideas. Dozens of preserved medieval marketplaces in towns around the Baltic littoral, from Tallinn, Estonia, to Gdansk, Poland, to Lübeck, Germany, bear witness to the greatness of the Hanse during its heyday.

PAUL MILLIMAN

Harsha Vardhana

(590–647) *Indian king*

Harsha Vardhana was a king of northern India who reunited some of the small city-states that had become independent after the fall of the Gupta dynasty and who used his position to reinvigorate the practice of Buddhism throughout his territory.

Harsha Vardhana was a son of Prabhakaravardhana, the king of Thanesar in the eastern Punjab, and

was not first in the line of succession. At the age of 16 his elder brother Rajyavardhana was assassinated on the orders of the king of Gauda, Sasanka, and, inspired by the bodhisattva of Avalokitesvara, he assumed the position of regent and eventually of king. He spent a number of years fighting against Sasanka and although he was not fully successful in defeating Gauda he was able to expand his territories across five countries bordering his base in what is now Uttar Pradesh. The identity of the five countries may have equated to Sind, Magadha, Kashmir, Valabhi, and Gujarat. This would represent a considerable expanse of territory, and the labor and potential for taxation that it yielded had enormous potential for development. Harsha Vardhana's rule is often identified as the time at which the ancient Indian world gave way to the medieval world, in which a system of centralized comparatively small kingdoms gave way to larger, decentralized empires composed of multiple centers with diverse ethnicities and religious and cultural practices.

Harsha Vardhana's attempts to improve his state included the establishment of diplomatic relations with China and the creation of numerous Buddhist institutions. Notable among these were the monastic center or university at Nalanda, to which Harsha Vardhana made some sort of contribution. The Chinese pilgrim Hsuan-Tsang visited and studied at Nalanda during his journey to India. Establishments aimed at helping the sick, the poor, and those traveling across his territory were created. Harsha also convened national meetings at the confluence of the rivers Yamuna and Ganges at which the fruits of his rule could be distributed among the people. After his death, Harsha Vardhana's territory was fragmented and parts of it came under control of the Guptas. The golden age that is considered to be his rule soon came to an end.

Harsha Vardhana is one of the best known early Indian kings, largely because accounts of his life and times have been preserved. These include the chronicler Bana and the Chinese pilgrim Hsuan-Tsang. The king acted as a patron of the arts and fostered an environment in which literature could flourish. He himself is believed to have written three plays in Sanskrit that expound Buddhist beliefs. Despite all that is known about him, interpretation of Harsha Vardhana's life and times remains controversial. Bana's description contains convincing personal details of his character and life but is also composed in a very flowery style suitable for the depiction of the kings and great people of the time, with numerous encomia and exaggerations.

JOHN WALSH

Harun al-Rashid

(c. 763–809) *Abbasid caliph*

Harun al-Rashid (r. 786–809) came to power as the fifth Abbasid caliph after his brother Musa al-Hadi died under mysterious circumstances, perhaps on the order of al-Khaizuran, al-Rashid's mother. While still in his teens al-Rashid had led successful military advances against the Greek Byzantine empire in Anatolia. He ruled at the zenith of Abbasid power and wealth. The Abbasid capital, Baghdad, with 1 million inhabitants, was a center for learning, the arts, and conspicuous consumption. A keen patron of the arts, especially poetry, al-Rashid maintained a lavish court with vast palaces and gardens adorned with jewel-encrusted tapestries and fountains. The lavish lifestyle of the royal court was popularized in the long series of fanciful tales in *The Thousand and One Nights*, known in the West as the *Arabian Nights*. Although his court enjoyed poetry, music, and sumptuous feasts, Harun al-Rashid was a practicing Muslim who made the pilgrimage to Mecca accompanied with a large entourage. According to legend, he also went out on the streets of Baghdad in various disguises to talk with his subjects and learn their opinions and reactions to the government. His mother, Khaizuran, who had been a Yemeni slave, exerted considerable influence in the political life of the court and was a rich landowner in her own right. His favorite wife, Zubaidah, dominated palace life, holding enormous parties and celebrations. Harun al-Rashid also received ambassadors from the Holy Roman Empire and China and showered them with exotic and expensive gifts. But amid the luxury there were signs of economic decline, as agricultural productivity in Iraq slowed and the farming out of tax collecting to private individuals led to corruption and inefficiency.

As caliph, Harun al-Rashid put down rebellions in northern Iran and Syria and led his forces deep into Anatolia in 791 C.E. where he demanded and received huge monetary tributes from the BYZANTINE EMPIRE. When these payments ceased in 802 C.E. Harun al-Rashid quickly moved against the Byzantine emperor, defeating

him on several occasions. These conflicts increased the religious enmity between these two great empires.

In 789 C.E. after a palace scandal, Harun al-Rashid imprisoned and killed key members of the important Barmakid family. Of Persian origin, the Barmakids had often acted as extremely able viziers (ministers) for the Abbasid rulers. Over his North African territories (present-day Tunisia and Algeria) al-Rashid appointed Ibrahim ibn al-Aghlab as governor in 800 C.E. He went on to establish the Aghlabid dynasty, ruling until 909 C.E. when the FATIMID DYNASTY based in Egypt replaced it. Harun al-Rashid died on military maneuvers to quell a rebellion in northern Iran in 809 C.E. After his death his sons immediately began to fight over power and territory, thereby marking the beginning of the decline and disintegration of the Abbasid empire.

JANICE J. TERRY

Hausa city-states

The early origin of the Hausa people is shrouded in mystery. Some scholars believe they originally came from the Sahara, as did the BANTU, while others feel that they migrated from the region of Lake Chad. Still another school believes they were the region's original inhabitants. The rise of the Hausa city-states dates from approximately 500 to 700 C.E. In a unique arrangement, the city-states were centered on their place in the general Hausa society and did not owe their prominence to specific political power as in the Bantu (Bantu) Mutapa kingdom. Cotton grew readily in the great plains of these states, and they became the primary producers of cloth, weaving and dying it before sending it off in caravans to other states within Hausaland and to extensive regions beyond. Biram was the original seat of government, while Zaria supplied labor.

The region was largely united between Lake Chad and the Niger River to the west, opening up to Hausa traders a vast part of Africa. Daura is the first known truly unified kingdom. It was around the 12th century

that the Hausas became the dominant nation in this region, although they were threatened by KANEM BORNU, which had replaced the earlier realms of GHANA, MALI, AND SONGHAI. Dominant in Kanem, the Kanuri people embraced ISLAM and began a series of jihads, or Islamic holy wars, to widen their kingdom. Among the Hausas, Islam appeared at the same time but was spread peacefully by traders and missionaries, unlike the jihads of the Kanem empire. At the same time, native Hausa beliefs continued to be held by the majority of the population. Because of their wide trading influence, Hausa became the common language of West Africa as Swahili did on the east coast. Hausa trade caravans would stop at places called *zongos*, which eventually developed into centers of Hausa habitation throughout West Africa. *Zongos* also became the Islamic centers of each town, associated with mosques, madrassas (schools), and *waqfs* (charities).

However strong an influence culturally, the Hausas in modern Nigeria came under increasing pressure from the Fulanis, a militarized Islamic society determined to conquer by jihad. The Fulanis appeared in the region by the fifth century, apparently also after a long migration from the Sahara, as it became a desert. They reached Mauretania by the beginning of the first century, and from the fifth to the 11th centuries in what was then the Senegambia region. The Fulanis, also known as the Fulbes, were one of the first African cultures to convert to Islam, formed their own class of Muslim imams or clerics, the Torodbe. This occurred between the eighth and 14th centuries in the Takrur region. The Fulanis set their imperial goals on conquering the Hausas. By the early 1800s, the Hausas had become absorbed politically—but not culturally or socially—into the Fulani Kingdom in Nigeria. The Fulanis went on to found the Islamic caliphate of Sokoto. Under the rule of Usman Dan Fodio, Sokoto would become perhaps the most powerful Islamic state in the region.

JOHN F. MURPHY, JR.

Heian

The term *Heian* is derived from modern-day Kyoto's previous name of *Heian-kyo*, a city founded in 794. The

literal translation of *Heian-kyo* is “Capital of Peace and Tranquility” and was meant to reflect its peaceful and protected surroundings. The literal translation of *Heian* is “peace” in Japanese. Located near the village of Uda, between the Katsura and Kamo Rivers, and with Mount Hiei providing spectacular natural geographical protection, the new capital was similar in design to the Chinese city Chang’an and was built according to Chinese feng shui principles. Heian-kyo was the center of political power and the capital of Japan until 1868, when the Meiji Restoration saw Emperor Kammu move to the city of Edo. Edo was then renamed as *Tokyo* (Eastern Capital) to illustrate the shift in power. The Imperial Court remained at Heian-kyo. The Heian period witnessed the emergence of a Japanese identity that was distinct from Chinese influences and is often regarded as a golden age of Japanese culture.

The Heian period can be broken into three distinct eras. The first period, referred to as the Early Heian era, witnessed the foundation of Heian-Kyo in 794 B.C.E. and extended to around the late 960s B.C.E. The Middle Heian period extended to 1067 C.E. and was characterized by the rule of the FUJIWARA CLAN and their courtly behavior. The Late Heian period extended to 1192 and is known for the *insei* (cloistered government) and for providing the framework for the establishment of the feudal system in Japan.

The move to Heian-kyo from the capital Nagaoka was necessary to curb the increasing struggles over the throne. The ongoing clan struggles resulted in Emperor Kammu taking drastic political and social reforms to try to stabilize the situation. As a result the Heian period experienced one of the longest periods of sustained peace in classical Japanese history. Four noble families attempted to control the political scene during the Early Heian period. The Minamoto, Tachibana, Taira, and Fujiwara families all tried to influence the political atmosphere for the benefit of their own interests and pursuits. During the Middle period the Fujiwara family clearly dominated the government and because of familial ties influenced the imperial family. The families required the services of the warrior classes to provide protection (much like security guards) thus creating the initial surge in the SAMURAI and *bushi* numbers. Another important family that emerged during the Late Heian period, the Taira, eventually overthrew the Fujiwara family. The Minamoto clan then overthrew the Taira.

The Early period was also defined by the start of a clear religious doctrinal change. There was movement away from the Chinese influenced NEO-CONFUCIAN-

ISM toward a Buddhist religious perspective that echoed aspects of Japan’s indigenous religion Shinto. The imperial court adopted Mahayana Buddhism relatively quickly and it in turn merged with aspects of Shinto to create an essentially Japanese religion (called *Shinbutso Shugo*) that flourished. It was during this period that Shinto architecture and art started to transform and mass temple building began. Buddhist artisans were abundant and produced sculptures as religious objects, but also as art objects for wealthy families. Stoneware and bronze were used by both the imperial households and the lay people, while the emperor preferred silver for monastic and royal events. Metal craft reached its pinnacle during the Heian era, particularly during the Middle to Late periods, where samurai armor incorporated various motifs (according to the house that they served) and swordsmiths began to engrave their swords with their names. Armor was held in such high regard that the most powerful families and warlords offered them to Shinto shrines as holy relics.

The Early period also witnessed the introduction of new Buddhist sects called the Tendai (Heavenly Terrace) in 805 B.C.E. by Saicho and the Shingon (True Word), and in 806 B.C.E. by Kukai. The introduction of these sects contributed to stylistic changes in architecture—for example, Shingon temples adopted the use of the pagoda. Pure Land Buddhism also began to take root within Heian society and around the same time Korean monks started introducing the now well-known ZEN (or CH’AN) BUDDHISM. Gardens were used as contemplative areas and there was a movement toward meditative practice. Cultural festivals (Buddhist, Shinto, and Confucian) shaped the whole Heian period, and more festivals were introduced and conceived, including the Cherry-Blossom Feast and the Feast of Red Autumn Foliage.

The concept of art underwent a transformation during the Heian periods—it was used for aesthetic as well as religious purposes, and new art practices were created. Art for art’s sake was encouraged and artists, poets, and writers began to create and recognize a distinct Japanese identity. Secular paintings and art have been referred to in literature of the day; however very little survived to the present. Japanese artists would paint sutras (Buddhist writings) or intricate landscapes onto folding fans, which became highly desirable and exported items during this period.

Literature also started to become fashionable, especially diaries of court providing details of life inside the palace. The most popular book of the early era was *Makura no soshi* (The Pillow Book) written by Sei Shonagon. Sei came from a literary family, her father Kiyohara Motosuke (a poet) and her great-grandfather

the well-known Fukayabu. It in turn influenced many other writers to pen their experiences in the imperial household, thus creating a distinct phase of early Japanese literature. *Monogatari-e* (illustrations for novels) emerged during the late 10th century and was viewed as the perfect coupling of prose and painting. It became the preferred pastime of those in the imperial household and during the Late Heian period, art competitions and shows were commonplace.

The Heian Middle to Late period is generally viewed as the most productive sociocultural period in Japanese history, as it marked a move away from Chinese influence on culture, society, and religion toward the creation of an essentially Japanese identity. The Middle Heian period witnessed a flourishing of literary and artistic pursuits and is often described as the “early” history of Japan. During the late stages of the Early Heian period and blossoming during the Middle period, a new writing system was developed. Based upon syllables (*hiragana* and *katakana*), the new *kana* writing system allowed for the creation of Japanese literature and texts without depending upon *kanji*. It initiated a new sociocultural identity, a unique Japanese perspective that would profoundly influence Japanese life.

Calligraphy and calligraphers were attached to imperial offices and were required to provide calligraphy for things as diverse as imperial temple walls and hanging scrolls. New calligraphy styles such as “Women’s Hand” became widely recognized because of their use in calligraphic poems. It was also popular to determine one’s character by the style of writing, and use of medium. A favorite pastime of imperial ladies was to swap poetry in elaborate folded pieces of paper, using different fasteners to convey hidden meanings. Decorative paper was highly prized and paper collages became an art form that has continued to the present time. The majority of lay people (other than the warrior classes) were not exposed to such hobbies as most were illiterate.

Literary forms experienced change with the advent of court diaries and their tendency toward long sections of prose and observation. The Middle to Late Heian period witnessed a further flourishing of literature. The establishment of an office of poetry by the imperial court in 951 accounted for the initial explosion of interest in *waka* (traditional Japanese poetry). Diplomatic ties were increasingly cut with the Chinese T’ANG (T’ANG) DYNASTY during the Middle Heian period and thus there was a movement away from the Chinese style of poetry (*kanshi*). There were frequent poetry contests between noble contestants—the imperial palace often acting as a backdrop to the proceedings. Although the

Heian court demanded its subjects write in Chinese, they compromised by writing sections of their poems with Japanese script toward the end of the prose.

A popular literary writer of the Middle to Late Heian period was MURASAKI SHIKIBU, who created a sensation with her novel *Genji Monogatari* (*Tale of Genji*). Written around 1000 to 1008, it is often credited as the world’s first novel. The novel relates the customs and practices common to the Heian era. Men and women of high status powdered their faces white. The imperial households wore stately robes, which were modeled on Chinese state robes. Several types of hats were worn, depending upon rank and the formality of the events. Women in the court would wear white silk with heavy brocade jackets and wore their hair long, often with the aid of wig attachments. It was fashionable to leave it unfastened so it flowed freely.

The Late Heian period witnessed what could be described as an elitist form of social hierarchy; it was highly formalized and exclusive. Although the Heian period underwent enormous social and cultural change it was economically stagnant; thus the majority of people were poor and uneducated. Little social or cultural change occurred within this class with the exception of the rise of the warrior class, which was able to exist on the fringes of both classes with relative ease. Despite this, the Heian period left a great cultural heritage and contributed toward the social and cultural psyche of modern Japan.

SAMAYA L. SUKHA

Henry II

(1133–1189) *king of England*

Henry II was the first of the Plantagenet kings of England, reigning from 1154 to 1189. He was born in 1133 in

LeMans, France. From his mother, Matilda, he inherited a claim to the English throne, as she was the daughter of Henry I of England (r. 1100–35). From his father, Geoffrey, he gained the titles of count of Anjou and duke of Normandy, in France. His power and influence in France were considerably enhanced in May 1152 when he married Eleanor, duchess of Aquitaine, who two months earlier had divorced King Louis VII of France. Eleanor's lands included Aquitaine, Tourraine, and Gascony. Together, Henry and Eleanor controlled more land in France than did the French king, from whom Henry nominally held the duchy of Normandy as his vassal.

Henry's ascension to the English throne was not easy because the Crown had been usurped by Stephen of Blois (1135–54) upon the death of Henry I. King STEPHEN I fought Matilda and Henry vigorously, but when his son and heir died, Stephen agreed to terms that allowed Henry to ascend to the throne after his reign ended. Henry did so in October 1154 at age 21, and then quickly moved to establish his authority over the feudal lords of the realm, demanding that they tear down their illicit castles and fortification built under Stephen.

Henry's goal was to restore royal power and prerogatives to what they had been under his grandfather, Henry I. He succeeded in reviving several royal institutions that Henry I had established, most notably the system of royal justice and the exchequer. In the case of the former, he pushed the system of royal justices riding circuit throughout England into a powerful tool through which he earned the loyalty of the freemen and burghers of the realm. His courts used a standardized or "common" law throughout the realm, providing a welcomed alternative to the courts presided over by the local feudal lords, who were notorious for protecting their own interests. Henry's judicial system utilized a jury of 12 sworn men who testified concerning criminal activity or contentious issues in their locale. These elements of royal justice were codified by the Assize of Clarendon in 1166. Another major innovation under Henry was the paying of "scutage" or a monetary fee in lieu of military service by a vassal of the king. Not only did this system enhance royal revenues, it made the king less reliant upon the feudal levy when going to war. While Henry was still very much a feudal king and the government dependent upon his forceful and energetic personality, his reforms put into place a solid royal bureaucracy, which, under his Plantagenet successors, would give a tremendous degree of stability to the English monarchy.

Henry's efforts to extend royal justice to include the English clergy met with considerable resistance by THOMAS BECKET, his onetime friend and chancellor.

Appointed archbishop of Canterbury in 1162 by Henry, Becket surprised the king by defending the independence of ecclesiastical courts and the immunity of the clergy from royal justice. Henry issued the Constitutions of Clarendon in 1164, which reaffirmed the right of the king to punish "criminous clerks," and forced Becket to sign the document. Shortly thereafter, Becket fled the realm (1164) only to return in 1170. When he again began to oppose the king over the issue of royal versus ecclesiastical authority, he was murdered by four of Henry's vassals. Public sentiment swung against Henry at this point, and he was forced to back down, agreeing to allow clergy to be both tried and sentenced in ecclesiastical courts.

In his later life Henry faced numerous rebellions by Eleanor and his sons, mostly of his own making. His long-running extramarital affairs enraged Eleanor, and his attempts to strip Eleanor and his son Richard of Aquitaine led to open conflict in 1173–74. War again broke out between the king and his sons Richard and John in 1189, which concluded with the defeat of the king. He died shortly thereafter on July 4, 1189.

RONALD K. DELPH

Henry IV

(1050–1106) *king of Germany*

Henry IV was the eldest son of Henry III of Germany, from the Salian (Frankish) dynasty, and Agnes de Poitou, the daughter of William V of Aquitaine. He was born in 1050 and at the age of three was elected by the German assembly of nobles as his father's heir to the throne—a succession not guaranteed in the German kingdom by birth. In 1054 the archbishop of Cologne crowned the four-year-old Henry, and in 1056 his father died suddenly. Henry's mother was appointed regent, a short-lived position thanks to Archbishop Anno of Cologne, who took the regency away from her and assumed power. Anno and his cohorts spent the next decade plundering the royal coffers for their own benefit, a situation that ended in 1066 when Henry, having reached maturity and assuming his position as king, dismissed them. Also in 1066 Henry married Bertha of

Maurienne, the daughter of Count Otto of Savoy, with whom he fathered five children.

Since 962 when Otto I of Germany had assisted Pope John XII in defending the PAPAL STATES against King Berengar II of Italy and had been rewarded by being crowned Holy Roman Emperor, the German kings had become the claimants to the Roman imperial throne. Under Otto I and his successors, the HOLY ROMAN EMPIRE was expected to function as the secular counterpart to the papacy and ensure the unity and protection of Western Christendom. The partnership, however, often resulted in major power struggles between the two entities. In 1075 Pope Gregory VII sought to diminish imperial power by removing the right of secular rulers to appoint clerics.

Lay investiture, as the practice is called, benefited rulers financially as individuals would pay to obtain these appointments. This is referred to as simony and considered sinful by the church. The fact that rulers could appoint loyal individuals who would act in their favor was also a major benefit. In his *Dictatum Papae* (Papal Dictum), Gregory declared that the sanctity of the pope was inherited from St. Peter, whom Christ had charged with establishing the papacy in Rome. Therefore, all Christians were subject to the pope, and only he could appoint or depose clerics and exercise supreme legislative and could judicial power. With this began what is known as the Investiture Controversy.

To retaliate against the pope for having tried to undermine his authority over the German Church, Henry IV nominated his own clerics in Germany and also in Milan, Fermo, and Spoleto on Italian soil. In 1076 he convened an assembly of church officials at Worms in which the pope was deposed and where Henry called for his abdication. Gregory responded by excommunicating Henry, declaring him deposed, and releasing his subjects from allegiance to him. The German nobles embraced Gregory's actions. They were interested in limiting absolutist imperial power and needed an excuse to continue a rebellion that had begun at the First Battle of Langensalza in 1075, where Henry had defeated the Saxons. In 1077 they elected Rudolf of Swabia as antiking, initiating a civil war that was to last until 1122.

Henry had no choice but to beg for Gregory's forgiveness. He traveled to Canossa in northern Italy to meet with the pope and there he stood in the snow for three days until the pope finally took pity on him and lifted his excommunication. In 1080 however Gregory renewed Henry's excommunication and recognized Rudolf of Swabia as the rightful king of Germany.

Henry responded by convoking a council of imperial bishops at Brixen in which Gregory once again was deposed and Guibert, whom Henry had appointed archbishop of Ravenna, was elected antipope Clement III. In the meantime, Rudolf of Swabia died and his supporters elected Count Herman of Salm as his successor.

After several failed attempts to enter Rome, Henry was finally able to do so in 1084. He ran Gregory out of the city and installed Clement III on the papal throne. As a reward, Clement crowned Henry Holy Roman Emperor. Four years later, Henry deposed Herman of Salm, but his support of the antipope turned his family against him, because they believed that he was jeopardizing the monarchy. In 1104 Henry's son Henry V rebelled, had his father imprisoned, and forced him to abdicate in the following year. Henry escaped, only to die in Liège in 1106.

The Investiture Controversy continued under the reign of Henry V. In 1110 Henry V invaded Rome; arrested Pope Paschal II, who had been elected in 1099; and forced him to reinstate the secular right to appoint church officials. Paschal agreed and was given no choice but to crown Henry V Holy Roman Emperor. In 1116 however he renewed the prohibition of lay investiture, leaving the dispute unresolved until 1122 when, after heavy negotiations, Pope Calixtus II and Henry signed the CONCORDAT OF WORMS, which declared that the election of bishops and other members of the clergy in Germany would take place in Henry's presence, without simony or violence. Henry would only grant secular authority and act as a judge between disputing parties, while the pope would confer the sacred authority. In 1123 Calixtus convoked the First Council of the Lateran. In front of 300 bishops and more than 600 abbots, he ratified the Concordat of Worms and abolished the Holy Roman Emperor's ability to interfere in papal elections. With this, Calixtus secured the freedom of the church from imperial intervention.

Henry V

(c. 1387–1422) *king of England*

Henry V of England and Agincourt was the son of Henry IV Bolingbroke, from the House of Lancaster, and Mary de Bohun, the daughter of the seventh earl of Hereford. At the age of 12, King Richard II knighted him as duke of Lancaster. In that same year he became heir to the throne of England when his father imprisoned Richard and had himself crowned as his successor. By 16 years of age Henry was engaged in crushing revolts alongside his father. Provoked by economic discontent and unjust laws, the Welsh, led by Owen Glendower, self-proclaimed prince of Wales, revolted against the English Crown. So did the Percys of Northumberland, who had helped Bolingbroke to remove Richard from power, and who were now displeased by the fact that the Cumbrian lands Bolingbroke had promised them were instead given to their rivals.

Though Henry was seriously wounded in the face by an arrow in 1403 at the Battle of Shrewsbury, the confrontation resulted in the death of Harry Hotspur, the leader of the Percy revolt. Much of the success in ending these rebellions had to do with Henry's military abilities. By 1410 Henry had gained almost complete control of the English government, as his father, who would live for another three years, suffered from a severe skin condition believed to have been either syphilis or leprosy, and possibly also epilepsy, which prevented him from fulfilling his royal obligations.

Bolingbroke died in March 20, 1413, and Henry officially succeeded him as king of England. Henry immediately took actions to gain the support of his people. He pardoned his father's enemies and restored their lands, including Edmund Mortimer, fifth earl of March, whom the childless Richard II had named heir apparent to the English throne and whom Bolingbroke had imprisoned when he took the crown. Henry also had Richard II's body exhumed and reinterred at Westminster cathedral. His second funeral included all the royal honors he had been denied earlier. With this Henry appeased Richard's supporters. He was also responsible for introducing English as the language of government instead of Latin and French, which had been used in official documents for centuries. With this, he encouraged the notion of England as an individual nation, with traits distinct from others, including its language.

Upon taking the throne Henry was faced with both domestic and foreign issues. On the domestic front, the Lollards, a heretic religious sect that considered the Catholic Church to be corrupt and who denied the authority of priests, revolted (1413) when Sir John Oldcastle,

Henry's close friend, was brought to trial for professing Lollard beliefs. Oldcastle escaped and led an uprising against Henry. The rebellion failed, and Oldcastle was recaptured and executed. In retaliation, Henry stepped up the persecution of the Lollards, which had begun in the early years of the 15th century. In 1415 Henry again had to deal with a plot devised against him—the Southampton Plot, meant to murder Henry and replace him with Edmund Mortimer. The plot was discovered, and its leaders—Edmund's brother-in-law Richard Conisburgh, third earl of Cambridge; Sir Thomas Grey of Heaton; and Henry Scrope, baron of Masham—were executed.

On the foreign front Henry had his eye on the conquest of France. The French king Charles VI suffered from bouts of mental illness, and his kingdom was dealing with strife between the nobles of Armagnac

King Henry V died in 1422 while on campaign pursuing his claims to the French throne. Wood engraving c. 1900.

and Burgundy, weaknesses that Henry rightly believed would work to his advantage. Henry played the two factions against each other to achieve his goal. In 1415 he engaged in war against the French, winning the decisive victory at Agincourt. In 1417–1419 he conquered Normandy and Rouen and in 1420 he forced the French to sign the Treaty of Troyes, which recognized him as heir to the French throne and regent of France and gave him the hand of Catherine of Valois, Charles VI’s daughter. With this union Henry legitimized his claim to the French crown.

The Armagnacs however rejected the treaty and Henry continued his campaign against France. In 1422 during the Siege of Meaux, Henry became seriously ill with dysentery. He died at Bois de Vincennes in August of that year without attaining the French crown. His infant son, Henry VI, eventually succeeded him as king of England, while the French crown went to Charles VII of France, Charles VI’s son.

The twists and turns of Henry V’s life inspired William Shakespeare to write his play *Henry V* two centuries later. The opinion of historians regarding Henry’s submission of France into signing the Treaty of Troyes is anything but flattering, as is their view of Henry as a cruel and fanatical ruler. However Henry demonstrated great valor in battle and had strong political skills, the ability to forge alliances to appease his opponents, and the intelligence to strategize against his enemies to attain his goals.

LILIAN H. ZIRPOLO

Henry “the Navigator,” Prince

(1394–c.1460) *Portuguese explorer*

Prince Henry the Navigator, the duke of Viseu, was the third son of João I, who began the famous Aviz dynasty in PORTUGAL (1385). Henry’s mother, Philippa of Lancaster, was the daughter of John of Gaunt, a prominent English nobleman. The marriage of Philippa and João I started a centuries-long commercial and political rela-

tionship between Portugal and England. Henry’s fame, embodied in his moniker, the Navigator, resulted from his fascination with the sea and with robbing the Muslims of their rich trade routes in Africa. It is said that he convinced his father to attempt the famous raid on the North African city of Ceuta in 1415 and that it was here Henry first saw the wealth worth conquering the lands of the Muslims. Ceuta is thought by most historians to have served as the jumping off point for a century of exploration that would result in the discovery of a route from Europe to Asia, and the discovery of the New World.

In 1419 the Portuguese, under the direction of Henry, sailed down the West African coast in search of gold, slaves, and a Christian ally against the Muslims. The legend was that a Christian king, known as Prester John, resided in Africa and was surrounded by great wealth. It was believed that an alliance with this ruler would enable the Europeans to outflank the Muslims from the south, realizing a goal nearly three centuries old—the conquest of the Muslim world. On May 25, 1420, Henry was given the governorship of the Order of Christ, a successor to the Knights Templar and a source of great wealth. The Order of Christ had set up its headquarters in 1413 near the southwestern tip of Portugal at a town called Sagres. It was here, near the Cape of St. Vincent, that Henry gathered the material and men who would realize his dream of exploration and conquest.

In 1420 João Gonçalves Zarco and Tristão Vaz Teixeira rediscovered the Madeira Islands. Henry encouraged settlers to colonize the islands, which they did. This greatly enhanced Henry’s revenue once the colony was up and running, and trading regularly with Portugal. In 1433 Henry’s father died and Duarte, Henry’s older brother, granted Henry a “royal fifth” from all the trade occurring in the lands that had been and would be discovered. In addition, Henry was given the sole prerogative to sail south of Cape Bojador, which was the southernmost point that the Portuguese had reached up to that time. Duarte died five years into his reign and as a reward for supporting the regency of Pedro while Afonso V came of age, Henry’s claim to the “royal fifth” was reaffirmed. It was also during Pedro’s regency (1439–48) that Henry colonized the Azores, which had been discovered, possibly by Gonçalo Velho, in 1427.

At Sagres Henry continued to gather around him the best map makers and seafaring men of the age. In time Sagres became noted as a place for the study of geography and navigation; it had an excellent observatory and a naval arsenal, and it served as a base for the development of new seafaring technology.

The port of Lagos, which lay close by, served as an excellent jumping off point for Portuguese exploration, and it became a popular location for shipbuilding. This collection of seasoned sailors and navigators made it possible for the Portuguese to succeed in a feat that had not been done for 2,000 years—they sailed south of Cape Bojador, just south of the Western Sahara region.

By the time of Henry's death the Portuguese had sailed as far as present-day Sierra Leone and had successfully circumvented the desert caravan trade of the Muslims. The gold that poured into Portugal as a result of the trading activity of the Portuguese along the West African coast made possible the coining of the first *crúzados* in 1452, a gold coin celebrating the Portuguese victory of the Muslims. The Portuguese also founded the Cape Verde Islands in 1455.

What made most of the Portuguese discoveries possible was the incorporation of the Arab lateen sail to the small Portuguese caravel. The caravel was a light and very maneuverable craft that could even sail up shallow rivers if need be. The lateen sail made it possible to tack against the wind, making the voyage back to Europe less difficult.

Although much of Henry's time was spent contemplating the riches and glory that lay beyond the sea, he was not unconcerned with what was going on in Europe. The continued campaign against the Muslims of North Africa intrigued Henry. In an ill-fated attempt to take Tangier in 1437, Henry's brother Fernando was captured by the Moroccans. Fernando would spend the rest of his life as a prisoner since the payment for his release was the return of Ceuta to the Muslims, a prize the Portuguese were unwilling to give up. Prince Henry was instrumental in setting the stage for even greater discoveries, both by the Portuguese and the Spanish. In 1488 Bartolomeu Dias rounded the Cape of Good Hope at the southern tip of Africa, making it possible for Europeans to reach Asia, where they would have direct access to the spice trade. Vasco da Gama built on the work of Dias by sailing all the way to India from 1497 to 1499. This journey laid the foundation stone for the future Estado da India, or State of India, which would bring significant wealth to the Portuguese Crown during the 16th century. The intrepid Portuguese would also discover Brazil (1500), a great source of mineral wealth for them in the late 17th century.

JEFFERY L. IRVIN, JR.

heresies, pre-Reformation

In the centuries before Martin Luther led Christian dissent into an alternative faith of the 16th century, there were other progenitors for reform. In southern France and northern Italy there was a movement associated with the Albigensians that took deep root and provoked a crusade against them in the early 13th century. This group included some who were no longer Christians, the Cathari and Bogomils, and others who were misunderstood as heretics, the Waldensians. Yet another group arose later in England, the Lollards, associated with JOHN WYCLIFFE. The seed of the Lollards took root in central Europe under the Bohemian JOHN HUSS. What unites these peoples is that they existed before the Protestant Reformation and were severely persecuted by the official church.

The Cathar sect claimed its roots among "pure" devotees of the distant past. Perhaps they originated from the Manicheans and or the Christian dualists (Gnostics), who used the Greek word *catharos* (pure) to describe themselves in their teachings. Their territory and tribal background were in contact with Arianism as championed by fourth-century missionary Ulfilas. More directly the Cathari benefited when crusading armies returned from the East and brought new ideas and contacts with them. In 1167 a religious leader from Constantinople named Nicetas visited Italy and France. Nicetas represented several non-Orthodox communities who affirmed Manichean or

Gnostic beliefs. He gave lectures throughout the region around Toulouse, France, and anointed several more bishops for like-minded devotees before going back to the East. Other itinerant preachers from the East soon followed Nicetas.

The doctrines of the Cathari are dualistic: God rules the spiritual world, and Satan rules the material one. The Catharist goal is to escape from the body of death in order to unite with God in the spirit. Christ appeared in the world to show the way to escape the physical world, and many Cathari myths tell this tale. The Cathari attracted followers who were disenchanted by the worldliness and corruption of the Catholic clergy. Many were nobles who wanted freedom from the controls of the remote centralized state and church, but peasants were impressed at the rigorous lifestyles of the Cathari. At the heart of the sect were the “perfected,” who were inducted through a ceremony called the “consolamentum.” They would renounce the church of Rome and agree to follow rules involving chastity, diet, and companionship.

Other Albigensian groups often lumped in with the Cathari—and massacred along with them in the ALBIGENSIAN CRUSADE (1208–29)—did not accept heretical doctrines. Among them were the Waldensians, also called “Poor Men of Lyons,” followers of a pious merchant of Lyons named Peter Valdes (Latin, Waldo). Valdes renounced possessions and took up a lifestyle of itinerant preaching. He made such an impact that he received an audience with the pope at the Third Lateran Council (1179). The pope commended the Waldensians for their faith and simplicity but restricted them in their preaching. This limitation was unacceptable to Valdes and his followers, and eventually the Waldensians came to reject Catholic sacraments and male priesthood, purgatory, and conventional church ideas on just war, oath taking, and even the need for churches.

The group however did not stay unified. Some turned against the hierarchy of the church and were condemned at the Council of Verona in 1184. Others stayed loyal and actually were active in their opposition to the Cathari. Still others went into hiding and formed a shadowy church with its own rituals and dogmas. Unfortunately the differences among the Waldensians did not exempt them from severe repression in the Albigensian Crusade and the Inquisition that followed. In 1487–88 war broke out against them, and a settlement was not reached until 1509. Even so, hostilities continued throughout the 1500s and drove most of them into the arms of the Reformed Church. One Italian faction, the Lombard Waldensians, organized themselves into a separate denomination.

Another tiny and pilloried faction among the Albigensians were the Bogomils. They are named after an Orthodox priest named Bogomil who lived in the Balkans, the same area where the Cathari were settled in the 800s. Bogomil had contempt for the official Orthodox Church, rejected the Old Testament and the sacraments, and retained only the Lord’s Prayer as valid. His critique was lashed to the Cathari dualistic views that the world was evil and demonic, but the spirit was good and divine. Bogomils found their way to Constantinople and became more heretical in their views. Many Albigensian Bogomils migrated out of southern France and northern Italy. They went to the land of their spiritual forebears. In Bosnia, they held their own and forced the Franciscans to leave. As late as 1875 there was evidence of them there.

After the Albigensian Crusade the leadership of the Cathari shriveled and moved out of France into Italy. Some hid in the Pyrenees or migrated elsewhere. Even there they disappeared as the Catholic hierarchy found better ways of competing for the hearts of the common folk through the popular preaching of the Jesuits, the Cistercians, and the Dominicans. Mockers gave the Lollards their name. It comes from Middle Dutch and means “mumbler” perhaps “idler” in Middle English. John Wycliffe (c. 1330–84), a professor at Oxford, inspired this group with his teachings against the elitism of the church. At first the Lollards consisted of educated priests who had known Wycliffe as a theologian. When the archbishop suppressed the priests, leadership passed on to humbler members of the English Catholic Church, who were fed up with hypocrisy among the hierarchy. Few nobles identified with the movement. When its champion, Sir John Oldcastle, was hung as a traitor and heretic in 1417, the demoralized commoners were now without a leader, and they disintegrated by 1431.

John Huss adopted Wycliffe’s ideas and was burned as a heretic in 1415. His disciples, the “Hussites,” grew popular among Slavic commoners. The COUNCIL OF CONSTANCE condemned Wycliffe formally, and his bones were exhumed and burned as a sign of his soul’s irredeemable condition. Against Huss and his ilk on the Continent, a long and bloody crusade (1418–37) was approved. Both Wycliffe and Huss laid the foundation for the emergence of the Protestant Reformation in the next century.

MARK F. WHITTERS

Hildegard of Bingen

(1098–1179) *theologian and visionary*

Hildegard of Bingen was an abbess, theologian, scientist, musician, preacher, and visionary who wrote major theological works. She was also called Sybil of the Rhine. She was the last and 10th child of Hildebert of Bermersheim and Mechthild of Merxheim. The wealthy couple had promised her as a tithe to the church, which was a traditional practice at the time. Some sources indicate that Hildegard received a religious, but very basic education from a kindly anchoress, Jutta, daughter of Count Stephen of Sponheim. She learned some Latin but always felt inadequate in the language. Her exposure to religious music enabled her to compose songs later in life. Some sources state that Hildegard stayed at Count Stephen's estate until she took the veil at 14. When Jutta died in 1136 Hildegard became the abbess of what had become a Benedictine convent at Disidodensberg. Years later in her book *Scivias*, Hildegard disparaged the practice of making young children oblates to the church.

Hildegard had visions as early as age three but told no one. She eventually told Jutta, who was accepting of the visions. She also confided in Volmar, a monk who shared her trials and tribulations. Modern medical knowledge has ascertained that Hildegard suffered from severe migraine headaches. At the age of 42, when Hildegard had a particularly brilliant vision, she accepted her gift and was instructed by Pope Eugenius (1145–53) to publish what she saw; the result was *Scivias*. Hildegard's convent grew in size, compelling her move to nearby Bingen. She also founded a convent at adjacent Eibingen. Hildegard occupied herself by writing music and plays. She also wrote more visionary books: *Liber vitae meritorum* from 1150 to 1152 and *Liber divinorum operum* in 1163, which contained her ideas of microcosm and macrocosm. She argued that man was God's most perfect creation, thus a reflection from which the macrocosm was replicated.

Hildegard also wrote nonvisionary works. *Physica* discussed natural history and *Causae et Curae* (1150) discussed medical history and elaborated how natural elements could cure illness. Together they are known

as *Liber subtilatum*. She was ahead of her time in discussing female sexual pleasure during intercourse and deemed the male responsible for producing strong offspring with healthy semen. Hildegard believed that music was a divine instrument given to Adam after the Fall so that God would be appropriately worshiped. She wrote numerous hymns that honored virgins, saints, and Mary. Much of her music has been recorded, especially in honor of her 900th anniversary. Hildegard also maintained a wide-ranging correspondence with many political leaders and bishops. At one time five emperors heeded Hildegard's advice.

ANNETTE RICHARDSON

Hindu epic literature

The most famous Hindu epic literature arose in India during the Vedic period (c. 1000–c. 500 B.C.E.), which helped define the essentials of Indian belief and culture. While Hinduism is not the sole religion in the region, these texts set forth many of the ideas and practices held sacred by many people throughout the world. Hindu epic literature is still very much treasured in modern times.

It was during the Vedic period that four of the most treasured sources of Hindu spiritualism arose. In the ancient language of Sanskrit, *veda* means truth or knowledge. The Vedic library, which lends its name to this era, contains hundreds of texts. Four of the main texts of Hindu epic literature are the Upanishads, the *Mahabharata*, the *Ramayana*, and PURANAS. While the Upanishads are in fact religious texts, when combined with the other two, the foundations of Hindu beliefs are firmly expressed.

The Upanishads was written between approximately 600 to 300 B.C.E. The word Upanishads means sitting down near, or sitting reverently at the feet of, and contain over 300 pieces. These texts defined the core of Hindu beliefs, while not being philosophical texts themselves.

The Upanishads are the cornerstone of Hindu spirituality, exploring the interaction of humanity with the universe. The overall concepts involved in the Upanishads consider how people can discern what is truth, knowledge, and inner peace. The many sections of the texts address the attainment of wisdom, consciousness, and the operation of the universe. In ideas that would especially be addressed in future texts, attaining a true, perfect self was paramount. In the idea of reincarnation, what actions a person performs in his current life will determine what happens in his future existence.

The idea of the self, and attaining sense of the self, is especially important in these scriptures. Performing selfless acts for the benefits of others is what helps one to achieve knowledge of the self. Good and evil acts are addressed, as are examples of proper and improper behavior.

The *Mahabharata* and the *Ramayana* are considered to be the two greatest epics in Hindu literature, carrying on the ideas first expressed in the Upanishads. The *Mahabharata* is an epic poem with over 90,000 verses, close to 2 million words. It is more than 10 times the length of the Christian Bible. Considering the length of the epic, the amount of time spent in composing it is under scrutiny. The composition has often been subscribed to Maha Rishi Veda Vyasa, but the time span that many believed was used in creating this piece ranges from 6 B.C.E. to the first century C.E.

The *Mahabharata*, which can be translated into the Great Book of the Bharatas, is a tale of two warring families, both of whom claimed to be descendants of Bharat, believed the founder of the Indo-Aryans. The events described in the *Mahabharata* most likely took place somewhere around the time of the 12th century B.C.E. The story both begins and ends on the battlefield, although along the way there are numerous digressions. Many of the ideas and the spirituality in texts such as the Upanishads are related again in the *Mahabharata*.

One of the important aspects of the *Mahabharata* is often separated as its own text called the Bhagavad Gita, which translates into the Song of the Lord. The much revered Hindu God Krishna is mentioned prominently in the *Mahabharata*, while previously left out of other Hindu texts. Krishna is one of the 10 avatars of the Hindu god Vishnu, who often assumes a new form in order to descend to earth in times of troubles.

In the *Gita*, Krishna is a charioteer to Arjuna, a central character. Krishna previously kept his divinity a secret from Arjuna. The *Gita* begins on the field of

battle when Arjuna is preparing for what will be an incredibly violent and devastating conflict. There, on the field of battle, Arjuna reflects upon his sadness upon having to fight, and kill, members of his own family, as well as friends in his attempt to defend the claim his elder brother had to the throne of the Kurus. Krishna serves Arjuna as both a charioteer and adviser. As the battle is about to begin, the blind king Dhritarashtra learns of the entire exchange through Sanjaya, who is able to relate what is going on.

In revealing his true self to Arjuna, Krishna enlightens Arjuna about the nature of the self, life and death, and the importance of proper behavior. First and foremost, Krishna describes how the body may die but the self does not. The soul is eternal and will assume a new form in the next lifetime. While people may face bodily death, the soul will never die. Again the concept of how what one does in his current life will affect what happens in the next is related.

Krishna also describes to Arjuna the concept of duty. One has a responsibility to action, but not to enjoy the fruits of those actions, similar to the idea that Jesus later related in Christianity, that is, one does good not for reward but because of how it benefits others. Krishna also relates to Arjuna the importance of choosing the right path, being self-controlled, and having the desire to serve others. Those who can detach themselves from the desires of the world will attain the perfection of the self.

When Krishna reveals his divinity to Arjuna, he also instills the concept of devotion and love. Those who devote themselves to him, and seek true reality, will achieve the best state possible. Krishna especially tells Arjuna the power and importance of meditation, which will help one both renounce the results of actions as well as attain immediate peace. One should never waver in the desire to achieve spiritual perfection.

Krishna is still, to this day, one of the most popular of the Hindu gods. One of the misunderstandings of Hinduism is that of the number of gods. Quite often, it is simply one god merely manifested in different forms. There are some who argue that Krishna and Jesus Christ are one and the same. Many of the messages presented in the *Gita* are identical to those in the New Testament, such as devotion, and doing good for its own sake and not for any reward.

Alongside the *Gita*, *Mahabharata*, and Upanishads is the epic tale the *Ramayana* which translates often into, The Travels of Rama, or The Story of Rama. Written in Sanskrit, the *Ramayana* is believed to be work by the poet Valmiki, who produced the tale

around 300 B.C.E. Over the following centuries, even into contemporary times, the story of Rama has been told and retold in various forms and languages. As in the *Gita*, and like Krishna, Rama is an avatar of the god Vishnu.

The principal characters in the *Ramayana* are Rama; his wife, Sita; his brother, Laksmana; Hanuman the monkey king; and the demon Ravana. Ravana had received a boon from Brahma, the principal Hindu god, that he could not be killed by any other divinity or demon, in return for his penance of 10,000 years. Immortality could not be granted to Ravana, and since he did not believe a man could kill him, this was left off of his requested boon. Ravana, with 10 heads and 20 arms, becomes a feared demon, the king of Lanka, and begins to lay waste to the earth. Vishnu again returns to earth in the form of a man, Rama, in order to kill the demon.

When Rama is born and grows into a man he is immensely popular both within his household and within the kingdom of his father, Dasaratha. Rama is to be the next king. Rama is wed to the beautiful Sita, who herself is a reincarnation of Laxmi, the wife of Vishnu. Dasaratha is tricked by one of his wives to exile Rama to the forest for 14 years. As is revealed, Dasaratha once accidentally killed a man and was told that he himself would be separated from his own son. Rama accepts the exile and leaves along with Sita and Laksmana, who refuses to abandon his brother.

Ravana sees Sita and immediately falls in love. Sita, however, is faithful. In using trickery of his own, Ravana kidnaps Sita and takes her to Lanka. Despite being held captive, Sita never wavers in her love and devotion for Rama. The rest of the story is how Rama, Laksmana, and eventually Hanuman track down Sita and rescue her. There are numerous epic battles along the way, and eventually Rama slays the demon Ravana. Although they are reunited, Rama banishes Sita to the very forest where they were once exiled together, where she maintains her innocence and devotion to Rama and gives birth to twins. At the end of the tale the two are reunited as they shed their mortal bodies and return to their celestial world.

The *Ramayana* still plays an important part in contemporary religious beliefs. This is a tale of love, devotion, and the battle between evil and good, as well as accepting the consequences of one's actions. Devotion to Rama remains as strong as ever for many, as are the moral lessons embodied in the tale. In some places the *Ramlila*, The Play of Rama, is an important annual event.

In terms of devotion to specific gods, Puranas takes the concepts and characters explored in previous texts and expands upon them. *Puranas* is believed to have been composed between 300 and 1200 C.E. When compared to the other texts, the historical content in these writings may not be as accurate or factual historically, but many of the concepts remain the same, especially the epic battles between good and evil. Not just gods are described, but also kings and sages. Some gods may have from one to 12 different pieces dedicated to them.

Many parts of Hindu epic literature continue to be performed throughout the world. The *Mahabharata* and *Ramayana* remain as popular as ever. New translations of these works continue to be produced, although in the case of pieces such as the *Ramayana*, finding a definitive text from which to work is often a difficult chore. These works continued to be enjoyed, and revered, by people everywhere. These writings help spread, and preserve, Hindu beliefs throughout the centuries. In fact many believe that it was not so much the Upanishads as it was the *Mahabharata* and *Ramayana* that promoted Hindu spiritual beliefs and kept them alive for so long, even though the historical accuracy or factuality is often in question, something that is part of any religion's background. Regardless of these issues, Hinduism continues to be a major religious presence with millions of followers worldwide.

MITCHELL NEWTON-MATZA

Hojo clan

Members of this Japanese family were warriors or warlords during the KAMAKURA SHOGUNATE and rose to the rank of *shikken* (hereditary regents) from 1203 until 1333. They traced their descent from Taira Sadamori, with the founder of the family, Tokiie, taking the surname Hojo while he was living in Hojo, in Izu Province (modern-day Shizuoka prefecture). As the Hojo are therefore descended from the Taira, it makes them

distantly related to the Japanese imperial family. However, with their base in the province of Izu, in the east, they were far from the center of power in Kyoto.

Hojo Tokiie had a son Tokikata, and Tokikata's son, Tokimasa, helped the Minamoto family after they were defeated in 1160. The head of the clan, Minamoto Yoshitomo, was executed, but his three sons were spared. Two were sent as monks to monasteries, while the eldest, Yoritomo, was exiled to Izu where he was looked after by the Hojo. The boy was only 13 years old at the time. In 1180 Yoritomo married Tokimasa's daughter Hojo Masako, tying the two families together. As a result when the GEMPEI WAR broke out in 1180, Tokimasa supported his son-in-law in what became a rebellion against the rule by Taira Kiyomori, in spite of a distant familial connection with the Taira. At the end of the Gempei War in 1185, Yoritomo was clearly worried about his own safety and decided not to go to Kyoto straight away. Instead he sent Tokimasa to Kyoto with the intention of capturing Minamoto Yoshitsune, brother and rival of Yoritomo. However he managed to persuade the court to allow Yoritomo to be given the power to appoint military governors.

This and various other moves allowed Yoritomo to establish the Kamakura Shogunate, which was officially formed in 1192. When Yoritomo died in 1199, Tokimasa and his daughter Masako conspired against the next shogun, Minamoto Yoriie. Yoriie despised the Hojo family, who he felt were too powerful. Yoshiie's first move was against Kajiwara Kagetoki, governor of Sagami, who was executed in 1200. Although most scholars believe that Yoshiie was behind the death, Tokimasa benefited by being able to seize the territory of Sagami. Tokimasa then decided to move first and forced the new shogun to give him (Tokimasa) the office of regent in 1203. His plan was to form an alliance with Minamoto Sanetomo, who would become shogun when Yoshiie died, and divide the country between Yoshiie's son and Sanetomo. A plan was drawn up by the shogun to assassinate Tokimasa, but the *shikken* acted first. He had Yoshiie's son, Ichiman (who was also Tokimasa's grandson), and then went to Kamakura, where Yoshiie, gravely ill and in bed, abdicated and was then murdered in the following year.

This left Minamoto Sanetomo as the new shogun. Tokimasa embarked on another conspiracy at the urging of his second wife, Maki Kata, who wanted to get rid of Sanetomo and replace him with her son-in-law Hira-ga Tomomasa. This time Masako and her brother Hojo Yoshitoki decided this was one step too far and eased Tokimasa from office with Yoshitoki taking on the office

of *shikken* in 1205. Tokimasa retired to a Buddhist monastery in Kamakura and died 10 years later, aged 78.

Yoshitoki (1163–1224) had fought alongside his father in the Gempei War and in various political machinations until 1205 when he and his older sister managed to oust their father. After several years of consolidating his power base, Yoshitoki decided to attack the Wada family in 1213, becoming head of the Board of Retainers, a position that had previously been held by Wada Yoshimori. Masako and Yoshitoki then decided to seize power, their position made easier by the assassination of Minamoto Sanetomo, the shogun, in 1219. In the Jokyu disturbance of 1221 the retired emperor Go-Toba tried to overthrow the Kamakura Shogunate and the Hojo family, who at that stage were in real control, but failed, leaving most believing that the real power in the land now rested not with the emperors but with the shogun and the *shikken*. Yoshitoki quickly extended the power of the shogun over the entire country. In 1224 Yoshitoki died suddenly of an illness, aged 61. Yoshitoki's first child, Hojo Yasutoki, succeeded him as *shikken*. His sister Masako died in 1225 aged 69.

Hojo Yasutoki (1183–1242), the third *shikken*, immediately set out to strengthen the political position of the Hojo clan. In 1218 he had become chief of the samurai *dokoro* (military office) and three years later led the shogun's forces against the imperial palace in Kyoto. Remaining in Kyoto, he oversaw the capital until the death of his father, when he took over the running of the regency. He appointed his uncle Hojo Tokifusa as the first *rensho* (cosigner) and in 1226 established the Hyojoshu (Council of State). In 1232 he promulgated the Goseibai Shikimoku, which codified the shogunate for the first time, ensuring that the system of shogun would not be challenged until the Meiji Restoration in 1868. When he died in 1242, his son Tokiuji had predeceased him, and his grandson Tsunetoki succeeded him.

Tsunetoki (1224–46) was the fourth *shikken* but died after four years in office, to be replaced by his younger brother Tokiyori (1227–63), who became the fifth *shikken*. As soon as Tokiyori came to power he was faced with a coup planned by a former shogun, Kujo Yoritsine, and a relative, Nagoe Mitsutoki. Tokiyori was married to a daughter of the commander, Adachi Kagemori, and he sent his grandfather against his opponents, who were defeated at the Battle of Hochi. His uncle, Hojo Shigetoki, was then recalled from Kyoto and appointed *rensho*. In 1252 Tokiyori had sufficient power to depose the shogun and replace him with Prince Munetaka.

Tokiyori wanted administrative reforms and in 1249 established the Hikitsuke, which served as a high court

for the country. However three years later he stopped official discussions in the council of the shogunate and instead held meetings at his house. In 1256 he decided to step down as *shikken* and become a monk. It is said that in the years before his death in 1263, he traveled around Japan in disguise to see for himself the actual conditions of the people in the countryside.

The next *shikken*, Nagatoki (1230–64), was a cousin, being the grandson of Yoshitoki, the second *shikken*. He was regent until his death in 1264 and was replaced by his uncle Masamura (1205–73), who was the seventh *shikken* from 1264 until his resignation on April 12, 1268. He was succeeded by Tokimune (1251–84), the eldest son of Tokiyori. He had been *rensho* before becoming *shikken* in 1268. His term as regent was extremely difficult as Japan was faced with the constant threat of a Mongol invasion. KUBILAI KHAN had sent an embassy in 1268, but the Japanese treated his men with some disdain. Preparations were made for the invasion of Japan and Tokimune had to strengthen defenses around the southwestern coast of Japan, repairing forts and building new ones.

In November 1274 the Mongols attacked Japan with 30,000 soldiers in 800 ships. The initial Japanese response was weak and they were surprised by the Mongol and Korean methods of fighting. The Mongols took over several Japanese islands on their way to Kyushu. Some of the SAMURAI facing the Mongols advanced forward, and the Mongols, who charged as a large mass, overwhelmed them. Those who survived sent frantic messages to Kyoto that a mighty invasion force was on its way. By the time the Mongols reached Kyushu, the locals had prepared defenses and the invaders were short of supplies. Their fleet, in Hakata harbor, was vulnerable, so to prevent a night attack, the Mongols pulled out their fleet. A typhoon smashed the Mongol fleet, destroying many ships. The Mongols left on land were quickly surrounded and cut to pieces by the Japanese. The Mongol fleet limped back to Korea having lost 13,000 men, and Tokimune received much credit from the Japanese people for having saved the country from its first attempted invasion.

Tokimune, worried about another attack, quickly built a long stone defensive wall along Hakata Bay. In 1581 the Mongols attacked again, this time with 200,000 men and more than 4,000 ships. The southern fleet, from southern China, left a month earlier than the northern (or eastern) fleet, which sailed from Korea. This time the Japanese were waiting for them. Once again weather intervened and the invaders again lost a large part of their fleet in a storm.

It was said that nearly two-thirds of the attackers were killed. The Hojo government faced a new problem of rewarding the samurai who had fought the Mongols, and also building shrines to pay tribute to the supernatural forces that had defeated the invaders. Although best remembered for his role in preventing two invasions, Tokimune was also involved in the building of the Engakuji temple in Kamakura in 1282.

Tokimune died in 1284 and was succeeded by his son Sadatoki (1271–1311). Tokimune was the last strong *shikken* and after his death the Hojo clan was on the decline. Sadatoki was only 14 when he became *shikken* and was placed under the guardianship of Taira Yoritsuna. At this point the Adachi family decided to challenge the Hojos, but some scholars suspect that the plot might have been concocted by Taira Yoritsuna to get rid of Adachi Yasumori (who was Sadatoki's grandfather-in-law), who had become a serious rival. In 1285 an attack on the Adachi family, known as the Shimotsuki Incident, resulted in the death of some 500 members of the family and its retainers.

Eight years later, men loyal to Sadatoki killed Taira Yoritsuna and some 90 of his followers in what became known as the Heizen Gate Incident. In 1301 Sadatoki handed power over to his first cousin Morotoki (1275–1311), who became the 10th *shikken* from 1301 until his death in 1311. For many years, Sadatoki continued to run the country until his own death at Engakuji.

The 11th *shikken* was Munenobu (1259–1312), a distant cousin, who was only *shikken* for less than two years. Another distant cousin, Hirotaki (1279–1315), succeeded him as *shikken* for three years. Then another cousin, Mototaki (d. 1333), became *shikken* for two more years. Sadatoki's son Takatoki (1303–33) then became *shikken* from 1316 until 1326. He was the last effective *shikken*, dominating the shogunate even after he retired, and was succeeded by a distant cousin, Sadaaki (1278–1333), who became the 15th *shikken* in 1326. The 16th, and last *shikken*, was Moritoki (d. 1333), who a great-grandson of Nagatoki, the sixth *shikken*, r. 1326–33. In 1333 the two lead army commanders, Ashikaga Takauji and Nitta Yoshisada, turned against the Hojo family and supported Emperor Go-Daigo and the imperial restoration movement, which became known as the KEMMU RESTORATION. Faced with inevitable defeat, the 14th, 15th and 16th *shikken* all committed suicide, in addition to many relatives.

JUSTIN CORFIELD

Holy Roman Empire (early)

Following the death of Emperor Louis the Pious (814–840) and the Frankish civil war (840–843), the Carolingian Empire was divided among three sons of Louis. On the eastern ruins of the empire a new kingdom, that of Germany, had emerged, stretching from Holstein in the north down to the Alps in the south, from Lorraine in the west up to the Elbe in the east. The first Carolingian kings of Germany struggled for the survival of their fragile kingdom. Their power was challenged not only by foreign invaders, the Slavs, Magyars, and Vikings, but also by rival rulers of France, as well as by some domestic opponents. In 911 the last Carolingian offspring, Louis the Child (900–911), died and the German nobility elected Conrad, duke of Franconia, as their new king (911–918). Conrad's son, Henry I (918–936), and later his grandson, Otto I the Great (936–973), succeeded to restore law and order in their kingdom, by bringing different tribes under their control and beating off the invasions.

OTTONIAN DYNASTY

After the victory over the Magyars in the Battle of Lechfeld (955) and successful intervention in Italy (951–961), Otto had established himself as undisputed ruler over vast territories in western and central Europe. On February 2, 962, Pope John XII crowned him emperor in Rome. The new Roman Empire, ruled by the German emperor, had been founded. Its very title Holy Roman Empire derives from the fact that the act of the imperial coronation, performed by the supreme head of the Christian believers, the pope, was sacral in its character and hence also a sacral character of the imperial dignity and power. The coronation of Otto was by no means an outstanding achievement: The papacy lacked both influence and power in those days and was largely subjugated to the goodwill of the German rulers.

Otto II (973–983) succeeded Otto and was married to the Byzantine princess Theophano. The latter introduced a series of Byzantine imperial ceremonies, which

were adopted in the Ottonian court. Just as his father before him, Otto II attempted to increase the imperial control over Italy. His invasion of Calabria ended with the defeat of his army by the Arabs in 982. Otto III (983–1002) spent much energy on consolidating the imperial influence in the east. He created the archbishopric of Gniezno and made Boleslas the Brave, duke of POLAND, patrician. During Henry II's reign (1002–24), he had undertaken three military campaigns into Italy, the first of which (1004) intended to punish his unfaithful subject Arduin of Ivrea, who proclaimed himself king of Italy. The second campaign (1013–14) resulted in his imperial coronation by the pope. Following the third invasion (1020), the imperial power over Italy was firmly established and new German officials were installed for ensuring the imperial control in the region. The warfare with Boleslas I, in which Henry was allied with the pagan Ljutizi, ended in the peace of 1018, by which Henry gave up BOHEMIA.

SALIAN DYNASTY

The death of Henry II marked the end of the Ottonian dynasty, which gave way to a new dynasty, the Salians. Its first ruler was Conrad II (1024–39), elected by the German magnates after the death of Henry, despite some opposition that wished to have William III, duke of Aquitaine, crowned as a new king. After his imperial coronation on Easter 1027 his power was reasserted. He now turned his attention to legal matters, codifying ancient Saxon customs. In 1028 he was victorious in his war against the rebellious Mieszko II, duke of Poland. With peace achieved, Mieszko surrendered all territories conquered by him and his predecessor from the empire. In 1032 Rudolf III, the last king of Burgundy, died, commanding his kingdom to Conrad. Burgundy was annexed to the empire, assuming the name *kingdom of Arles*.

Conrad and his heirs, Henry III (r. 1039–56) and HENRY IV (r. 1056–1106), attempted to centralize the imperial power, as well as to diminish the influence of regional nobility, lay and religious alike. This led to frequent conflicts and an occasional revolt. The imperial interference with spiritual matters was clearly demonstrated in Henry III's attempt to reform the papacy. Between 1046 and 1049 he appointed, one after another, four German bishops as popes, to make German control ubiquitous and to have the emperor as a dominant figure in church matters. Although praised by some churchmen for his efforts to reform the papacy, Henry attracted fierce criticism from among more radical circles in Rome.

During the minority of Henry IV, the Roman movement was led by an energetic cardinal, Hildebrand, the future Pope Gregory VII (1073–85). In 1059 Hildebrand had decreed that no temporal ruler is authorized to install or depose the pope, who is to be chosen by a college of cardinals. This may have marked the beginning of the Gregorian Reform, which indulged in a bitter struggle with the Crown known as the Investiture Controversy. The first blow delivered upon the emperor was his humiliation at Canossa (January 1077), with him excommunicated and his empire placed under the interdict.

The first stage of the controversy ended with the CONCORDAT OF WORMS (1122) between Henry's son Henry V (1106–25) and Pope Calixtus II. By the concordat, Henry gave up his authority to invest bishops but kept his right to oversee and take part in the Episcopal elections. The weakness of the emperor was utilized by the German nobility, which elected Lothar of Supplinburg as their new king Lothar II (1125–37), putting an end to the Salian dynasty. Lothar's and subsequently Conrad III's reign (1138–52) is marked by social and dynastic struggle.

FREDERICK I BARBAROSSA AND FREDERICK II

With the election of FREDERICK I Barbarossa (1152–90), a new chapter in the history of the German Empire began. Frederick's primary objective was to restore the imperial control in Italy, over both the rebellious Italian communes and the pope, who had allied himself with King William I of Sicily. The first Italian expedition of 1155 did not produce any significant fruits, while the second campaign (1158) resulted in the reduction of Lombardy into a royal province and rebellion of the Milanese commune. The fervent Pope Alexander III (1159–81) and the king of Sicily backed the Italian city-states, while Frederick was supported by most of the German magnates and the antipopes. During his fourth Italian march (1166–67) he seized Rome and only an outbreak of malaria, perceived as a divine punishment, forced him to retreat.

In 1174 Frederick led his fifth expedition and despite some agreement reached with the Lombard League, the war resumed, resulting in the imperial defeat in the Battle of Legnano (May 29, 1176). After this, Frederick turned to diplomacy and the conflict ended with the Peace of Constance (1183). Along with Italian policy, Frederick paid attention to domestic matters. He expanded the imperial domains by annexing lands of extinct German dynasties and seizing the properties of Henry the Lion, duke of Saxony and Bavaria, in 1180. It was during his

reign that the imperial chancery started using the adjective *holy* to denote the Roman Empire.

Frederick died on his way to the Holy Land leading the Third Crusade. His son Henry VI (1190–97) was married to Constance, the aunt of childless William II, king of Sicily, and upon his ascension he invaded Italy to be crowned in Rome and to claim his Sicilian kingdom. The Sicilian campaign ended in a failure because of the high summer heat and Henry retreated, leaving Sicily ruled by antiking Tancred, William II's cousin. After Tancred's death in 1194 Henry launched another campaign into Sicily, which resulted in the conquest of the Norman kingdom and Henry's coronation as king of Sicily on Christmas 1194. Once home, Henry attempted to transform the empire into a hereditary monarchy ruled by the House of the Hohenstaufen.

Upon his death (September 28, 1197), Henry VI left a two-year-old son, the future Frederick II (1212–50). He was raised in Sicily with Pope INNOCENT III (1198–1216) serving as his guardian. The latter brilliantly exploited the social and political chaos following Henry VI's death and annexed vast territories in Italy to the papal demesnes. Philip of Swabia, Henry VI's brother, was elected as a new king (1198–1208) and his reign is characterized by a continual struggle with his archenemy, Otto of Brunswick. The German and Sicilian nobility, as well as the church with its leader Innocent III, changed sides frequently during the war between the two rivals.

After Philip's murder, Otto was styled as Otto IV (1208–18). He won Innocent's support, thanks to his promise to recognize the papal territories in Italy and to allow free episcopal elections, but his failure to carry out these promises led to his excommunication by the pope (November 18, 1210), which ironically coincided with the excommunication of King John of England in 1209. In the meantime, Frederick II was elected as a new king (September 1211). Frederick had easily won Innocent's support by confirming Otto's concessions of 1209. Otto's declining power was finally crushed after the Battle of Bouvines (July 27, 1214), where the armies of two excommunicated rulers, John of England and Otto of Brunswick, were defeated. Otto died excommunicated in 1218.

The good relationships between pope and emperor were doomed after Innocent's III death. Frederick failed to keep his promise regarding the separation of Sicily from the German Empire. He instead had his young son Henry crowned King Henry VII of Germany in 1220 and retreated to his native Sicily. In 1227 Gregory IX excommunicated Frederick for his failure to take the cross. This resulted in the expedition to the Holy Land known as the

Sixth Crusade, where Frederick brilliantly restored Jerusalem to Christian control through his masterful diplomacy. Frederick's success and the support of many German princes contributed to the Peace of San Germano, achieved between pope and emperor in 1230.

By this peace Frederick recognized papal territories in Italy and Sicily; however the peace did not last long. In 1237 Frederick renewed imperial hostilities toward the Lombard League, crushing the communal armies in November that year. Gregory excommunicated Frederick in 1239 and called for a church council to depose the emperor, who was seen as the Antichrist. Frederick invaded Rome in 1241 only to find Gregory dead. Gregory's successor Innocent IV followed the policy of his predecessor and in 1245 the First Council of Lyon, deposed the emperor. However Frederick's rule was strong enough to survive this symbolic deposition.

While Frederick was perceived as the Antichrist by the papal circles, his Sicilian companions saw him as a keen promoter of arts and sciences, the founder of the University of NAPLES (1224); as an open-minded personality, who was equally tolerant to Christians, Jews, and Muslims, Germans, Normans, and Greeks; and as a man of an extraordinary learning, speaking as many as seven languages and possessing progressive views on economics and government. His extraordinary personality earned him the nickname *Stupor Mundi*, the Wonder of the World.

Frederick died on December 13, 1250, and his mighty empire collapsed. After the brief reign of his son Conrad IV (1250–54), the German Empire submerged into two decades of political and social chaos, with no recognized king or emperor. During the interregnum period of 1254–73, the Swiss cantons attempted to break free from the imperial control, Charles of Anjou conquered the imperial possessions in Sicily and southern Italy, while France threatened the German territories.

HABSBURG DYNASTY

In autumn of 1273, an assembly of German princes, the Kurfürsten, elected a new king, Rudolf of Habsburg, son of Albrecht IV, count of Habsburg, and Hedwig, daughter of Ulrich of Kyburg. Rudolf is thought to have been a prominent figure well before his crowning, possessing lands and estates in Switzerland and Alsace. Pope Gregory X recognized his election, provided that Rudolf renounce his claims to the imperial title and rule in Rome, Sicily, and the papal lands. Alfonso X of Castile also acknowledged Rudolf's election. Challenge to his authority came from within, in the face of Otokar II, king of Bohemia, who refused to surrender

Crowned emperor in 1355, Charles IV did not strive for the revival of the Christian Roman Empire, unlike his predecessors.

his territories in Austria, Styria, Carinthia, and Carniola to Rudolf. After a war that lasted five months, Rudolf seized the aforementioned provinces in November 1276. Otokar retained Bohemia and the peace was consolidated by the betrothal of Otokar's son Wenceslaus to Rudolf's daughter. The peace, however, did not remain long, with Otokar allying himself with some German and Polish princes against Rudolf.

The latter, having made an alliance with Ladislaus IV of Hungary, met his enemy on the river March on August 26, 1278. The outcome of the battle was the defeat and death of Otokar and subjugation of MORAVIA. Having overcome the Bohemian challenge, Rudolf turned his attention to consolidating his authority in the Austrian provinces, where he invested his two sons, Albrecht and Rudolf, as dukes of Austria and Styria. In doing so, Rudolf expected to establish dynastic rule in his kingdom. At the same time, he attempted to restore peace and order in Germany and Switzerland. In 1289 he marched into Thuringia, where he subdued some rebels. His wish of having his son Albert crowned as German king did not come true, with the electing princes refusing to do so. Rudolf died on July 15, 1291.

The assembly elected Adolf, count of Nassau, as the new king. Unlike his predecessor, Adolf lacked power and influence, being from minor nobility. This choice may have been made because the princes, having tasted power in the House of Habsburg, preferred to install a

weak ruler. Crowned as king of the Romans in Aachen on June 2, 1292, and never anointed Holy Roman Emperor by the pope, Adolf did not achieve any significant accomplishment throughout his brief reign (1292–98). His attempts to subdue Thuringia to his rule failed, and his former supporters deposed him, electing Albrecht of Habsburg, Rudolf I's son, as their king. Adolf refused to recognize Albert's election and led his army against him, only to be defeated and killed in the Battle of Göllnheim (July 2, 1298).

Albert I's reign (1298–1308) is characterized by the growing international importance of the House of Habsburg. His attempt to annex territories over the Burgundian frontier led to a conflict with Philip IV the Fair of France (1285–1314). However, a lack of papal support urged him to abandon his claims in this region. A treaty between the two kings was signed in 1299, by which Albrecht's son Rudolf was to marry Philip's daughter Blanche. In 1303, Pope Boniface VIII had finally acknowledged Albert as the German king and Holy Roman Emperor, regarding him as his ally in the conflict with the French Crown. In 1306 he made his son Rudolf king of Bohemia. He failed to subdue Thuringia, and his army suffered a heavy loss in 1307. Albert was killed on May 1, 1308, on his way to Swabia, where a revolt had broken out. Most contemporary sources depict Albert as a harsh though just ruler as well as a protector of Jewish communities, persecuted in those days.

LUXEMBOURG DYNASTY

Henry VII of Luxembourg succeeded Albert, was acknowledged by the pope, and was crowned by him as emperor on June 29, 1312. At this time the princes' assembly was torn between the Habsburg and Luxembourg parties. While in Italy, Henry imposed imperial power on rebellious Florence and interfered in the ongoing war of the Guelphs and Ghibellines, supporters of the pope and emperor, respectively, in Tuscany. He also attempted to subdue his vassal Robert, king of Naples, only to die on August 24, 1313, near Siena.

Upon his death, the Luxembourg party of electors' assembly elected Louis, or Ludwig, IV Wittelsbach of Bavaria, against the wishes of the Habsburg party, which attempted to install Frederick the Fair Habsburg. Louis's coronation in 1314 led to a violent conflict between the latter and the Habsburg heir. Frederick's army was defeated in 1322 in the Battle of Mühlendorf. Having eliminated his rival, Louis set out to consolidate his authority. He went to Rome in January 1328, and was crowned by an old senator, because of the absence of the pope in the Eternal City. While there he deposed Pope John XXII on

the grounds of heresy and appointed a Spiritual Franciscan as antipope Nicholas V, who was deposed as soon as the emperor left Rome in early 1329.

While at home Louis acted as the patron of antipapal intellectuals, such as Marsilius of Padua and William Ockham. In 1338 the princes' assembly had decreed that the king, chosen by the assembly, did not need papal authorization or coronation. This antipapal policy provoked a harsh reaction of the pope, who was then allied with the French king. In order to withstand the papal-French coalition, Louis made an alliance with Edward III of England. In his domestic policies, he relied much on his power and lands in Bavaria. In 1340 he united Lower and Upper Bavaria, while two years later he annexed neighboring Tyrol. His increasing authority over smaller territorial rulers led to an inevitable conflict with the latter. In 1346, a year before his death, the electors' assembly, with the support of Pope Clement VI, chose Charles IV of Luxembourg and Bohemia as an antiking.

Louis IV died on October 11, 1346, and the Crown passed to Charles IV. Although crowned emperor in 1355, Charles, unlike his predecessors, did not strive to revive the idea of the universal Christian Roman Empire, ruled by the German emperor. Instead, he invested his powers and resources in the cultural development of Bohemia, his native land, and Prague, where he resided, in particular. In 1348 he founded and patronized the Charles University of Prague, which attracted scholars and students with its humanist studies. The emperor corresponded with PETRARCH and even invited him to settle in Prague, while the Italian humanist called on Charles to return the imperial throne to Rome. Under Charles's patronage, some of the finest monuments of Old Prague were built.

While most of the emperor's attention was concentrated on Bohemia, other parts of the empire, especially Germany, suffered from a social crisis following the epidemics of the BLACK DEATH (1348–51). Charles issued his famous GOLDEN BULL OF 1356, which attempted to define the procedure of imperial election and the annual diet held by the electoral princes. Raised and educated at the French royal court, Charles was related to John II (1350–64) and Charles V (1364–80) of France and supported them in the French struggle against England.

Charles IV died on November 29, 1378, and the titles of the king of Bohemia and king of the Romans passed to his son, Wenceslaus (known as Wenceslaus, or Vaclav IV the Drunkard). Just as his father, Wenceslaus devoted much of his attention to his native Bohemia. His Bohemo-central policy provoked a rebellion of the

German princes, who deposed him as king in August 1400, electing the German Rupert, count of Palatine. Wenceslaus did not give up the title of the king of the Germans and continued reigning in Bohemia until his death in 1419, without acknowledging his deposition and the crowning of Rupert. This also marks the beginning of animosity between Bohemia and Germany, on political, national, and cultural levels. It was under Wenceslaus that the Hussite movement started by JOHN HUSS started gaining ground in Bohemia.

After Rupert's death in 1410 the princes' assembly elected Sigismund of Luxembourg, margrave of Brandenburg and king of Hungary. Soon after his election, Wenceslaus of Bohemia, his half brother, renounced his claim to the title of king of the Romans and Sigismund was universally recognized as such. During his reign, the history of Hungary became interwoven with that of the Holy Roman Empire. The two main objectives of his early reign were to put an end to the Papal Schism (1378–1417) and to crush the Hussite movement in Bohemia. Both problems were solved at the COUNCIL OF CONSTANCE (1414–17), where Sigismund was a key figure. The two leaders of the Hussite movement, John Huss and Jerome of Prague, were burned at the stake on July 6, 1415, and May 30, 1416, respectively.

The Papal Schism was ended by the deposition of three rival popes and election of a new one, Martin V. The martyrdom of Huss and Jerome resulted in street riots in Prague, which swiftly transformed into a civil war. In the meantime Wenceslaus died and Sigismund inherited the title of king of Bohemia. In 1420 he attempted to restore peace and order, only to be rejected by the Bohemian nobility and repulsed by the Hussite army, led by some remaining commanders. The Hussite wars continued until 1436, devastating various eastern regions of the empire. Only a later schism within the movement itself allowed Sigismund to take over. In 1437 a short time before his death, the local nobility accepted him as the king of Bohemia.

Albrecht II Habsburg of Austria succeeded Sigismund, ruling briefly for two years (1437–1439). He also inherited the reigns of Hungary and Bohemia. The Bohemian nobility rejected Albrecht as their king, allied itself with the Poles, and rebelled against him. As king of Hungary, he spent his energy defending the realm against the OTTOMAN EMPIRE.

FREDERICK III AND MAXIMILIAN

After Albert's death, Frederick III was elected as king of the Germans in 1440. To consolidate his power,

he signed the Vienna Concordat with the papacy in 1446, which codified the relationships between the emperor and the pope. Frederick was crowned emperor in 1452, the last imperial crowning in Rome. While unsuccessful in battle, Frederick achieved brilliant results through diplomacy. In 1452 Frederick married Eleanor of Portugal, receiving a considerable dowry. In 1475 he forced Charles the Bald, duke of Burgundy, to marry his daughter to Frederick's son, Maximilian. Despite this, his rivals frequently challenged Frederick's power.

The first challenge came from Albrecht VI, his brother. Between 1458 and 1463 the two fought each other over the control of Austria. The struggle with his nephew, Ladislaus Posthumus, over Hungary and Bohemia, resulted in the capture and imprisonment of the latter. His main rival, however, was a powerful Hungarian king, Matthias Corvinus (1458–90), who seized some of Frederick's possessions in Austria, Moravia, and Silesia and then took Vienna in 1485. The collapse of Frederick's power was prevented only by Corvinus's death in 1490. The last 10 years of his life, Frederick ruled jointly with his son, Maximilian, who had been crowned the king of the Romans in 1486 and inherited his father's imperial title after the latter's death in 1493.

Maximilian held vast territorial possessions well before his ascension to the throne. In 1477 after the death of Charles the Bald of Burgundy, he had inherited the Free County of Burgundy, along with the Netherlands. In 1490 he acquired Tyrol and some parts of Austria from his half-uncle Sigismund.

In 1494 the emperor entered into a conflict with France over the intervention in Italy, which led to the Italian Wars of 1494–1559. He did not live to see his armies beat the French enemy. In 1499 the empire suffered heavy losses in the Battle of Dornach at the hands of the Swiss Confederation, which forced the emperor to acknowledge the independence of the Swiss cantons.

While at home Maximilian tried to reform the imperial constitution. In 1495 the Reichstag of Worms had issued four documents, known as the *Reichsreform*, which created and legalized two legal establishments: the Reichskreise (Imperial Circle), whose main function was to collect taxes and organize a common defense, and the Reichskammergericht (Imperial Chamber Court), the highest judicial institution of the empire. Under Maximilian, and perhaps even under his father, Frederick III, the Holy Roman Empire began to rise to be the premier power in Europe. With

the election of Maximilian's grandson, Charles V of Spain, the empire became the largest territorial unit in Europe, encompassing central Europe, Germany, the Low Countries, parts of Burgundy, and Spain with its vast American colonies.

PHILIP SLAVIN

Honen Shonin (Honen Bo Genku)

(1133–1212) *Buddhist philosopher*

A Japanese Buddhist philosopher and the founder of the Jodo Shu (Pure Land Buddhism), Honen Shonin was born in the Mimasaka province on the southern part of Honshu Island, Japan. His father, Uruma Tokikumi, was a provincial official, and his mother was from the Hada clan, her family being descended from Chinese silk merchants. Honen was their only child. Uruma was appointed to police Mimasaka and in 1141 was assassinated by Sada-akira, an official sent by the emperor Toba. On his deathbed Uruma told his eight-year-old son not to avenge his death but to become a monk and honor his father's life with good deeds. Hon-

en became a monk in the following year at a monastery run by an uncle and at the age of 15 began studying for the priesthood at Enryakuji, near Kyoto.

Honen became convinced to dedicate the rest of his life to Buddhism. Honen Shonin spent 12 years there and was recognized as one of the brightest students. Early on during his time at Mount Hiei, Honen Shonin became influenced by the "Pure Land" doctrine and left Mount Hiei in 1175, going on to study at the Kurodani temple, where he was taught by Ajari Eiku. He gradually moved away from the Tendai sect.

After his training, Honen worked for the monk Genshin, author of *Ojoyosho* (Essentials of salvation), and learned more about the Pure Land doctrine. He rapidly became one of the leading propagators of the doctrine, abandoning the Tendai sect. This Pure Land doctrine, which Honen first postulated in 1175, effectively setting up his Pure Land sect, saw Jodo as the Pure Land, which humans could enter only after long periods of prayer.

On a spiritual level Honen felt that man was unable to attain salvation through his own efforts but could only be saved by relying on forces outside himself. One had to accept that faith could come only through the original vow of Buddha. Some of these teachings were not new and came from the works of Genshin, under whom he had studied, and also the Chinese Pure Land philosopher Shan-tao (known in Japan as Zendo), who wrote the *Kuan-ching-su* (Commentary on the Meditation Sutra) in the seventh century.

In 1198 Honen wrote his major work, the *Senchaku hongan nembutsu-shu* (Collection on the choice of the nembutsu of the original vow), sometimes known as *Senchaku-shu*. It involved the classification of all Buddhist teachings in two sections: *Shodo* (Sacred way) and *Jodo* (Pure land). The former involved the inner character of people with Buddha, demonstrating that enlightenment could be achieved by good behavior, meditation and knowledge, as well as by abandoning, the evils of the world. Honen was convinced that sin, avarice, and lust would remain in many people, making it impossible for him or many others to achieve salvation this way. Therefore people like him would have to follow the Pure Land path in which salvation would be achieved by a vow to Amida Buddha, the lord of the Sukhavati. This involved faith expressed by repeating the name of Amida with the utmost sincerity—on one occasion Honen is known to have repeated the name of Amida as many as 60,000 times a day. One of Honen's most famous pupils was SHINRAN (1173–1262), who adapted the teachings and later claimed that a single

sincere call of the name of Amida was sufficient for a person to receive salvation.

His departure from the Tendai sect and his attack on the Buddhist hierarchy were not without controversy. By the late 1190s Nonen, who had moved to Otani, in Kyoto, attracted many listeners. By 1204 he had some 190 disciples, some being SAMURAI, and also had support at court from powerful people such as the imperial regent, Kujo Kanezane (1149–1207). This led to complaints being made against Honen, especially by the temple of Kofukuji in NARA. They petitioned that Honen should be exiled as some of his supporters, undoubtedly, it was claimed, had attacked rival Buddhist temples that did not support Amitabha. Honen was exiled for a year to the island of Shikoku in 1206, along with eight of his closest adherents, by the monks from Mount Hiei, and Shinran was also exiled; some of their supporters were not so fortunate and were beheaded. He was forced to use the nonclerical name Fujii Motohiko and was forbidden to return to Kyoto.

Honen traveled around distant provinces to refine and spread his teachings but was unable to meet again with Shinran. In 1210 Honen finally returned to Kyoto, where he built the temple of Chionin, and he died in 1212. He was given the posthumous title *Enko Daishi*. In 1680 the Honen-in Temple was built in Kyoto to preserve his memory. The Pure Land sect is now the second largest in Japan, in terms of the number of adherents, while those who follow the teachings of Shinran are the largest sect.

JUSTIN CORFIELD

Horns of Hattin, Battle of the

The Battle of the Horns of Hattin occurred on July 4, 1187, and resulted in the almost complete annihilation of the forces of the crusader army of Guy de Lusignan, king of Jerusalem (r. 1186–92), by the Muslim forces led by SALADIN (SALAH AD DIN, YUSUF). The destruction of Guy's army opened the way for the reconquest of not only Jerusalem, but also the other cities that had been captured during the First Crusade (1096–99), including Tiberias and Acre. The response to these de-

feats in the west led to the calling for and undertaking of the Third Crusade (1189–92).

The position of the crusader states had become precarious. The defeat of the Byzantine army at Myrioccephalon in 1176 resulted in the end of effective Byzantine-crusader cooperation and, in subsequent years, Saladin managed to isolate the states further by retaking surrounding towns. Possession of towns and cities was crucial as they had supplies of fresh water and food that were almost completely absent from the arid, desertlike intervening territory. Crusader armies, which traveled wearing heavy armor and supporting large warhorses, were very difficult to maintain in this territory and were always vulnerable to disruption of supplies. An additional destabilizing factor was the importance of a number of significant, often divisive factions within the crusader court. These included the Templar and Hospitaller knights, which had individual aims and intentions, as well as different aristocratic families jostling for power. These divisions brought the crusader states into a state of considerable tension and it may have been to deflect the possibility of civil war that Reginald of Châtillon attacked a caravan in an act seemingly set on ending the truce that had been established with Saladin (Salah ad Din).

Declaring *jihad*, Saladin brought troops up from Egypt to threaten Tiberias. His intention was to lure the crusaders into the open, where their supplies would soon be depleted and his own lightly armored horse archers could harass the enemy from a distance, inflicting a constant trickle of injuries. Initially Guy resisted the temptation to attack but probably as the result of internal struggles, decided to lead his troops on a night-long march toward Saladin's forces. The night march was disastrous as the troops were without water and suffered greatly in the hot, dry atmosphere. Saladin's forces set fire to the vegetation to intensify this suffering.

The so-called Horns of Hattin were the two rocky hills that were part of an extinct volcano, on which Guy camped his troops, who by then were, it is said, almost maddened with thirst. There followed a day of fighting between the approximately 20,000 men on either side. The bulk of the crusader forces were armored infantry, conditioned to fighting in dense formations against similarly equipped foes. They were unable to get to grips with the mobile enemy and eventually they broke, fled, and were cut down on the battlefield. Only Guy and some of his aristocrat companions were spared by Saladin, who ultimately ransomed them in exchange for the port of Ascalon. The Battle of the Horns of Hattin revealed the military inferiority

of crusader technology and organization in a hostile environment and established a pattern of warfare for the rest of crusader history.

JOHN WALSH

Huasteca

Much of what is known about the Huasteca, or Huasteca, before the Spanish conquest of Hernán Cortés is because of the work of Dr. Gordon F. Eckholm, who was curator of Mesoamerican (Middle American) archaeology at the American Museum of Natural History from 1937 to 1974. Eckholm began his work on the eastern coast of Mexico in 1941, with the original intention of tracing possible Mesoamerican cultural influences on the southeastern United States.

Although Eckholm later modified his point of view, his fieldwork established that the Huastecans had “developed in a wide area that extends without precise boundaries through the actual states of Tamaulipas, northern Veracruz, San Luis Potosí, Hidalgo, and some parts of Queretaro and Puebla. Realizing that there were abundant archaeological sites and materials in the region that had been neglected,” Eckholm developed a timeline that showed that the Huastecans had developed a flourishing culture, which began sometime in the early Christian era.

The Huastecans appear to be descended from the Mayans and became isolated in their region around the year 100 by stronger peoples, the Nahuas and the Totonacs. Ake Hultkrantz advanced the thesis in his *The Religion of The American Indians* that all Mayans, including the Huastecans, “spread from Huehuetenango in northwestern Guatemala, where a corn-farming community was in existence as early as 2600 B.C.E.” In this enforced exile from their Mayan homeland (possibly among the Mayans of the Yucatán peninsula in Mexico), their language developed its own character. The Mexican archaeologist Lorenzo Ochoa felt that the Huastecans eventually broke out of their insularity and established contacts with the dominant cultures of Mexico.

The Preclassical period of Mexican history is considered to have existed from 2000 B.C.E. to 300 C.E., the Classical period from 300 C.E. to 900 C.E., and the Postclassic from 900 C.E. to 1520 C.E., the year before Cortés crushed the last major indigenous kingdom, the Aztec Empire, thus ending the independent rule of Mexicans. Some of the Huastecan centers identified by Eckholm were at Las Flores, Tampico, Pánuco, Tuxpan, Tajin, and Tabuco. Unique among cultures like the Toltec, Mayan, and Aztec famed for their use of rectangles and squares, the Huastecans built oval structures, like their temple at Las Flores. Eckholm advanced the thesis that the cult of QUETZALCOATL actually began among the ancient Huastecans.

The Huastecans, as with other Mesoamerican peoples, used the bow and perhaps the sharp obsidian-edged sword used by Aztecs in warfare. Mesoamerican warriors also used the atlatl, or spear-thrower, which was used to add great range to darts that they fired with its aid.

Shields, often brightly covered with bird feathers, were also a common feature among Mesoamerican armies. Hassig observes, “The use of body paint in warfare extended throughout Mesoamerica and was practiced inter alia by Mayans, Tlaxcaltecs, Huastec, and Aztecs.” Among the Aztecs at least, wrote Hassig, “the use of special face paint was a sign of martial accomplishment.”

The Aztecs had emerged by the 15th century as not only the dominant warriors of Mexico, but were also renowned for their trading ability. This, of course, evoked jealousy among the other kingdoms of Mexico. The Gulf Coast of Mexico where the Huastecans lived, known to the Aztecs as the “hot lands,” was a natural target for Aztec merchants. In 1458 Huastecans murdered Aztec merchants in Tziccoac and Tuxpan. In revenge, the Aztec emperor Moctezuma I launched a campaign to punish the Huastecans. It also gave the Aztecs a cause to conquer some of the richest lands in Mexico. As Peter G. Tsouras writes in *Warlords of the Ancient Americas*, the region produced “cotton, brilliant feathers, and jewels, and ocean products such as various prized shells, and exotic foods like chocolate and vanilla.”

The Huastecans, like the Aztecs, were a warrior people, and the Aztecs were wary of the encounter. For one thing, their military strategists were not familiar with the geography of the Gulf Coast area. To bolster the spirits of the Aztec army, Tsouras notes, on the eve of the battle with the Huastecans, an Aztec captain declared to the soldiers, “Contemplate your death and think of nothing else. You have come here to conquer

or die since this is your mission in life.” Moctezuma I decided to leave nothing to chance.

The night before battle some 2,000 of his knights covered themselves up with grass, ready for a massive ambush of the Huastecan army. On the next day, when the Huastecans attacked, Moctezuma’s men bolted and pretended to run away in panic. When the Huastecans followed, shouting for victory, the waiting warriors sprang up and attacked them, defeating them completely. The Aztecs fought largely to gain prisoners for human sacrifice, not to kill, as did the Spanish. After the victory of Moctezuma, many—if not all—of the Huastecan captives had their hearts cut out by obsidian knives to feed the thirsty gods of the Aztecs.

When Hernán Cortés landed on the gulf coast at what is now Veracruz, it seemed impossible that he would ever achieve his goal of conquering the Aztec Empire. Yet, many of the subjugated peoples, hating the Aztecs for their exorbitant taxation and human sacrifices, joined him in his war. In 1521 the Aztec Empire fell, its last emperor Moctezuma II either stoned to death by his people for appearing to collaborate with the Spanish or garroted by the orders of Cortés.

Huizong (Hui-tsung)

(1082–1135) *Chinese emperor*

Huizong was the reign name of the eighth emperor (r. 1101–1125) of the SONG DYNASTY. His misrule led to the nomadic JIN (CHIN) DYNASTY’s conquest of northern China, ending the Northern Song dynasty (906–1126). Chance brought him to the throne when his elder brother Zhezong (Che-tsung) died without heir in 1100 at age 24. Huizong was a talented painter and noted calligrapher. He brought many artists and musicians to his court at KAIFENG (K’AI-FENG) to work in an imperial academy that he established. His official kilns made the finest por-

celains in the world. He was also a voracious collector of paintings, 6,000 of which perished when the Jin sacked Kaifeng. Not only did he neglect his duties in favor of his aesthetic pursuits, he appointed some of the most corrupt ministers to misrule the country until major popular rebellions broke out. His extravagance in pursuit of his elegant life bankrupted the treasury. For example hundreds of boats were engaged just to transport exotic rocks and rare plants from southern China via the GRAND CANAL to Kaifeng to decorate his luxurious palaces and gardens. His answer to an empty treasury was to issue more paper money, resulting in high inflation.

He showed no concern about the rise of a new power to the northeast led by fierce nomads called the Jurchen. Then he pursued short-sighted and disastrous diplomacy by offering an alliance with the Jurchen, now called the Jin dynasty, to wage a two-pronged campaign against their mutual enemy, another nomadic state called Liao, which was situated immediately to the northeast of the Song and to the south of Jin. The terms of the treaty were to destroy the Liao, after which the Song would recover the 16 counties that it had lost to Liao over a century ago. When war began the Jin forces did most of the fighting; the poorly led Song were ineffective.

After Liao was destroyed Song and Jin began to bicker over the spoils. Feeling that they had been treated in a high-handed manner, Jin forces turned on Song and marched on Kaifeng. Huizong hurriedly abdicated in favor of his son Qinzong (Ch’in-tsung) and fled south. Kaifeng was besieged twice in 1126. In January 1127 Qinzong surrendered unconditionally. After looting the city Jin forces loaded their booty and marched the two emperors (Huizong was captured en route south), most of the Song imperial family, and courtiers, totaling 3,000 people, to their homeland in Manchuria. A younger son of Huizong escaped and eventually rallied Song forces in southern China; he became known as Gaozong (Kao-tsung), founder of the Southern Song dynasty.

The march to the Jin capital in Manchuria took one year. Huizong and Qinzong suffered numerous humiliations, including being awarded titles as Duke of Stupid Virtue and Marquis of Double Stupidity, respectively. Huizong’s six daughters were given as wives to men of the Jin imperial household. The prisoner emperors were kept alive as possible bargaining chips in negotiations with the Southern Song government but were not ransomed. Huizong died in 1135 and Qinzong died in 1156. The Northern Song collapsed quickly despite a large army, mainly because of the degeneration of the government under a quarter century of Huizong’s rule.

JIU-HWA LO UPSHUR

Hulagu Khan

(d. 1265 C.E.) *Mongol leader*

In 1251 MONGKE KHAN, a grandson of GENGHIS KHAN, became the grand khan of the Mongols and convened his three brothers and close relatives in a meeting to divide the vast territories that had been conquered. To his brother KUBILAI KHAN, who would eventually play host to MARCO POLO, he gave southern China. Mongke gave northern Persia to his brother Hulagu, with instructions that the area from Persia to Egypt should be subjugated to Mongol rule. Although Mongke was the supreme leader of the Mongols, he parceled out regional control to others, who would rule as lesser khans or *il-khans* with their states being known as *il-khanates* or lesser khanates.

Hulagu set off with an army of at least 100,000 troops in early January 1256, heading first for the mountain fortresses of the Assassins, a feared and radical Ismaili Shi'i Muslim sect that had terrorized other Muslim rulers for over a century. After besieging the Assassins' fortresses of Mazanderan, Meimundiz, and Alamut, the Mongols captured the sect's leader, Rukn ad-Din Kurshah, who was later murdered. By late December the last Assassin fortress of Alamut surrendered to Hulagu. Hulagu then turned his attention to Iraq. He sent a message to the Abbasid caliph al-Mustasim that demanded his acceptance of Mongol supremacy. Hulagu was enraged when the caliph, the symbolic head of Sunni Islam, refused. Mongol forces headed toward Iraq, receiving support from some of the Abbasid Caliphate's Shi'i Muslim subjects, who had been angered by disrespect shown toward their community by al-Mustasim. Cities with substantial Shi'i populations, such as Mosul, Najaf, and Karbala, surrendered without a fight and were spared by the Mongols as a result.

By November, segments of Hulagu's army had begun arriving outside the Abbasid capital city of BAGHDAD and on January 17, 1258, his entire army had arrived. That same day the small Abbasid army was destroyed in battle outside of the city and the siege of Baghdad commenced.

Within two weeks the Mongols had overrun sections of the city's defenses after battering down the walls with massive siege engines. On February 10 after Hulagu had refused to negotiate a peaceful handover of the city al-Mustasim came out of Baghdad and surrendered. Ten days later, the caliph was executed by being rolled up in a carpet and trampled to death. The Mongols were superstitious and wary of shedding the blood of a monarch.

Baghdad, which had stood for six centuries, was sacked, with many of its architectural marvels, including the caliph's palace and the grand congregational mosque, burned to the ground. The city's libraries, which were filled with thousands of scholarly manuscripts on subjects ranging from the sciences to literature and philosophy, were also destroyed and their holdings were either burned or tossed into the Tigris River. The majority of Baghdad's citizens were massacred, with most sources placing the number of deaths between 90,000 and 250,000. Hulagu spared the city's Christians and Shi'i Muslims. He reportedly was sympathetic to the former group, possibly because both his mother and his favorite wife were Nestorians, members of an eastern Christian sect considered heretical by the Roman and Byzantine churches.

As news of the fall of Baghdad and the slaughter that followed spread throughout the Middle East, many neighboring Muslim states surrendered without resistance to Hulagu, hoping to avoid the fate of al-Mustasim. The Mongols' next target was Syria, which was ruled by the waning Ayyubid dynasty, which had been founded in the late 12th century by the Kurdish Iraqi Sultan SALADIN (SALAH AD DIN, YUSUF). Although the Ayyubid sultan An-Nasir Yusuf had submitted to Mongol authority, Hulagu still entered Syria with his army. He first defeated al-Kamil Muhammad, a young Ayyubid commander, whose city was captured and who was then tortured to death.

On August 11, 1259, Mongke died while campaigning against the Southern Song (Sung) in China. A succession crisis in the Mongol east pitted Kubilai against his brother Arik Boke, the ruler of Mongolia. Although Hulagu did not claim the position of grand khan for himself, he supported Kubilai. Thereupon he set out for China with the bulk of his troops, leaving a small garrison in the Middle East. In return Kubilai confirmed Hulagu as the *il-khan*, ruling over Persia and the Middle East.

A greater threat to Hulagu was his cousin Berke, the Khan Kipchak, who some sources claim converted to ISLAM or, at the very least, was heavily sympathetic to the religion and was angered at Hulagu's destruction of

Baghdad. Fearing an invasion by Berke, Hulagu withdrew back into Persia with the bulk of his army. In Syria, he left behind between 10,000 and 20,000 troops under the command of Naiman Kitbuqa, his best general and a Nestorian Christian.

After negotiating an alliance with the remaining European crusader states along Syria's Mediterranean coast, Kitbuqa then proceeded to besiege or capture other Syrian cities, including Aleppo, which fell on February 25, 1260. The northern Syrian cities of Hama and Homs surrendered to Hulagu soon thereafter, as did Damascus after Sultan an-Nasir had fled toward Egypt. By early April the last vestiges of Ayyubid resistance in Syria had been crushed and the Mongols proceeded to conquer much of Ayyubid Palestine in the following months.

The inexorable wave of Mongol expansion, however, began to wane soon after Kitbuqa's conquests in Palestine. Later in 1260 his alliance with the crusader states ended after European nobles from the city of Sidon attacked a Mongol scouting party. Kitbuqa responded by besieging and then sacking that city. When news of this rift reached Cairo, the capital city of the Mamluk Turks, their sultan, Qutuz, sent one of his generals, Baybars, to Palestine with a large army. On September 3, the Mamluk army, which was made up of professional and highly trained troops, unlike that of their adversaries, defeated Kitbuqa's smaller force. The Mongol general was captured and executed. The Mamluks recaptured Palestine and Syria and repulsed a Mongol invasion force in December. Hulagu's dreams of a Middle Eastern empire that reached Egypt were dashed, though he was able to solidify his control over Persia before his death in February 1265.

The dynastic line he founded, the Il-Khanids, would remain in power over Persia and parts of Central Asia until 1335. Within a few generations after Hulagu's death, his successors converted to Islam and became some of history's greatest patrons of Islamic art, architecture, and literature.

CHRISTOPHER ANZALONE

Hundred Years' War

In battles fought from 1337 to 1453 primarily by England and France for control of France and the French Crown, England initially had the upper hand, but in 1429 the French, inspired by JOAN OF ARC, regained all areas of France that they had lost except for Calais. England and France had been at war several times before the Hundred Years' War because of the landholdings of the English Crown in France. Through several wars, the French had slowly been regaining control of these lands. With the beginning of the Hundred Years' War the French found themselves losing ground against the English. Militarily the English longbow proved especially devastating to the French and led to the English victories at Crécy and Agincourt. The English believed that they were secure in their victory but found the tables turned on them in 1429 by Joan of Arc. The French were able to retake much of the land the English had captured up to that point in the war. The Burgundians switched sides, joining the French, and the English found themselves pushed back even more. The English would continue to send armies to France and were, at times, able to retake lost territory; the war had definitely turned against them. The final years of the war saw the English lose all their territory in France except Calais. With France's control over all the previously controlled English lands in France, the war ended in 1453.

EARLY ENGLISH LANDS IN FRANCE

The English and the French had been at odds over the relationship of their kings to each other because of the English Crown's control over lands in France. In England the English king was sovereign, yet in France he was a vassal of the French king and accountable to the French king. This accountability was used, usually on trumped up charges, by the French kings to try to take land away from the English. The French did this in 1202 and when the English king did not show up at the French court to answer charges brought against him, the French king declared his lands to be confiscated and war followed. During the war (which lasted

until 1204), the French conquered Normandy, Maine, and Anjou from the English. With the signing of the Treaty of Paris in 1259 the English had been reduced to control of just Aquitaine. The English king also reconfirmed his status as a vassal of the French king with respect to his lands in France.

The French trumped up charges again in 1294 against Edward I and again declared his lands confiscated and launched an invasion of those lands. The war lasted until 1298. This war also saw the Scots allied with the French against the English in 1295. A new peace treaty, the Treaty of Paris, was signed, returning the lands lost by the English during the war to them. Isabella, the daughter of the French king PHILIP IV, was married to the English heir, Edward II. At the time this seemed to be a way to create lasting peace between the two kingdoms but ended up causing more problems by later giving the English king a claim to the French throne during the Hundred Years' War.

In 1324 the French again provoked the English and summoned the English king to the French court. When the king did not show up, the French again declared the province of Aquitaine confiscated from the English and the two countries went to war again. The war did not last long and in 1325 Edward II's son, Edward III, and his mother went to France so Edward III could pay homage to the French king, Charles IV. Returning to England in 1327, Queen Isabella had Edward II deposed and Edward III, only 14 years old, crowned king. With such a young king, the English ended up agreeing to a peace treaty that favored the French, allowing them to keep the land they had conquered. In 1328 the English were forced to make peace with the Scots and Charles IV, third son of Philip IV, died. None of Philip's three sons had a male heir. Succession ended up going to the cousin of Charles IV, Philip of Valois. While neither Edward nor his mother made any claim to the French throne at this time, Edward had himself crowned king of France in 1340. In French law, Edward had no claim to the Crown since French law did not recognize any claim by a female, or her offspring, to the throne of France.

The early years of Edward's reign saw him pay homage to the French king, since he could not afford a war with France. Focusing on Scotland with the death of the Scottish king, Robert I, Edward was able to gain the upper hand there and bring SCOTLAND back under England's control. However, being an ally of the Scots, Philip had an interest in what was happening there and tried to link negotiations for continued peace between France and England with the war in Scotland. In 1336 France had put together a fleet that was to take a French

crusade to the Holy Land. However, Pope Benedict XII canceled the crusade because of the problems of the French, English, and Scots. Instead it seemed to the English that the fleet would be used to invade England. While there was no invasion of England, the fleet did conduct raids on parts of the English coast and convinced the English that war with the French was coming. Using the same ploy they had before, the French king summoned the English king, as the duke of Aquitaine, to turn over the French king's brother, who had taken refuge in England. In 1337 when Edward did not comply with Philip's order, Philip declared Edward's land confiscated again and the Hundred Years' War began.

BEGINNINGS OF THE HUNDRED YEARS' WAR

The war began with the French invading Aquitaine in 1337. The French fleet continued raiding the English coast. The English were finally able to defeat the French fleet at Sluys in 1340, which gave the English control of the English Channel, making it easier for them to move troops to France. During this time Edward made alliances with the Low Countries and the German emperor and arranged to have his soldiers join theirs for a campaign against the French. However the date for the campaign kept being delayed until 1340. The Flemish joined with Edward, who had himself crowned king of France on January 26, 1340. While the English laid siege to the town of Tournai, the French moved against the allied army but did not engage it. The war shifted to Brittany in 1341 with the death of the French duke. Succession to the title was disputed and the English took the chance to support the side the French king opposed. Neither side was able to gain the upper hand and control of the entire province. The fighting continued for several years to come. In 1343 a truce was called, lasting until 1346.

Edward decided to conduct the campaign in 1346 with an English army and not rely on his allies for soldiers. Edward's army landed in Normandy hoping to draw the French army away from Aquitaine, which it did. Marching first to the Seine River and then along it toward Paris, the English army raided the countryside and towns as it marched. The French had destroyed most of the bridges across the Seine River and had a chance to trap the English army but instead allowed the English to cross the river and march away. The French would have the same chance again when the English army reached the Somme River and again the French allowed the English to cross the river and escape. Edward finally stopped retreating and chose the area around Crécy to give battle to the French on August 26, 1346.

Edward picked an easily defended spot that forced the French to attack him uphill. He also deployed his archers to have a clear field of fire against the advancing French. The French arrived on the battlefield late in the day, yet chose to attack instead of waiting until the next day. The French also did not attempt to organize a massed attack against the English; instead, they attacked as they arrived on the battlefield, thus leading to approximately 15 independent assaults on the English position. The English archers cut down each assault with few of the French knights actually reaching the English men at arms. French casualties were estimated at over 1,500 knights and nobles and up to 20,000 infantry and crossbowmen. English casualties were about 200 men. With his victory, Edward moved against Calais, which he laid siege to in September 1346 and captured in August 1347. The next several years would see only minor fighting, and even a truce for a short time. Philip VI died in August 1350 and John II became the new French king. Under the new king, the French and English engaged in peace negotiations, but these were broken off in 1355 by the French.

TREATIES AND RAIDS

The English responded to the break in negotiations by launching raids into France. The most successful raid was in 1356, led by Edward's son, Edward the Black Prince (so named because he wore black armor). Launching from Bordeaux, he marched his army toward the Loire River but turned back before crossing the river. As he moved back to Bordeaux, he was blocked by a French army led by King John at Poitiers. On September 19, using the terrain to his advantage, the Black Prince was able to defeat the French using the terrain and his archers to cut down the attacking French. More important was the capture of the French king by the English. With his capture, the French found themselves in a civil war between the dauphin and Charles of Navarre over who should control France. In 1359 Edward brought an army to France in an attempt to capture Reims. When he was unable to capture the city, he considered marching on several other cities, including Paris, but in the end decided to return to England.

The English and French signed a treaty on May 8, 1360, that released King John from English captivity and recognized English sovereignty over Calais, Poitou, and Aquitaine. Also part of the treaty was a clause where Edward agreed to stop calling himself the king of France. It looked as if the English had won the war. Even with the peace treaty in place, the French

and English continued fighting on a low level. This included the French civil war, which did not end until May 1364 with the defeat of Charles of Navarre. The French and English also found themselves on opposite sides of the fighting in Castile where the English, under the command of the Black Prince, prevailed. Unfortunately the fighting forced the Black Prince to raise taxes in Aquitaine. The people of Aquitaine then appealed to the French king, Charles V (who had become king in 1364 when his father, John, had died). Therefore in November 1368 Charles V declared the English land confiscated again. Edward tried to negotiate a settlement with Charles, but when that failed Edward again declared himself king of France and the two countries were at war with each other again.

The French made significant gains in recovering territory they had given up in 1360. They were even able to launch raids on the English coast, whose defenses had been neglected after the peace treaty in 1360. This raised concerns that the French might actually invade England. In response, the English launched raids on cities they thought the French might use to stage their invasion.

By the end of 1369 English actions had eliminated the possibility of a French invasion. Over the next several years the English would continue to launch raids into the French-controlled territory, but they also lost territory to the French. Both sides continued to raid each other's territory and avoid a set piece battle. In 1376 Edward the Black Prince died; in the following year, 1377, Edward III also died. This left the Black Prince's son, 10-year-old RICHARD II, as king of England. Small scale fighting continued through the 1380s until both sides agreed upon a truce in June 1389. The truce would last, with the usual intermittent raiding, until 1415.

HENRY V AND CHARLES VI

Starting in the early 1400s the French gave support to Scotland and Wales in their struggle against the English. They also launched several raids against English ports. However the French king, Charles VI, who came to power in 1380, suffered from insanity. Because of this, he was unable to keep his nobles controlled and in 1407, a civil war broke out between the Orléanists and Burgundians. Both sides asked the English for aid. In 1413 HENRY V was crowned king of England. While his father, Henry IV, had provided some support to the Burgundians, Henry V determined to take full advantage of the chaos in France. Thus in 1415 an English army of 12,000 men invaded France.

Landing in Normandy, Henry first laid siege to the town of Harfleur, which took over a month to capture. Henry lost about half his men during the siege. Henry then decided to march over land to Calais. Henry left his siege equipment behind so he could move fast. The French set out in pursuit of Henry with an army of 30,000 men. Although Henry was moving fast, even in the rain, he had trouble finding a crossing to get across the Somme River, which allowed the French to get ahead of him. They chose the area near the castle of Agincourt to try to stop Henry. While the sides tried to negotiate a settlement, neither side was interested in budging from its position.

On October 25, 1415, the two sides fought the Battle of Agincourt. The French commander had originally wanted to fight a defensive battle since the English were short on supplies, but the French nobles convinced him to attack since they had a numerical superiority. The English took up a position with forests on either side of them. They had about 5,000 archers and only 800 men at arms. The archers placed sharpened stakes in the ground in front of them as protection from the mounted French knights. The ground between the two armies was wet and freshly plowed, which made it hard to move across. The French nobles were unwilling to wait for the English to attack and eventually convinced the French commander to order an attack. With the wet, plowed ground slowing them down, the French took terrible losses from the English archers. Approximately a third of the French troops were in the initial attack and most were either killed or captured. The next two attacks by the French were also thrown back by the English, although they did not meet the same fate as the first attack since they withdrew before being destroyed. Exact French losses are not known for sure, but estimates put their losses at 6,000–8,000 men. There is also no exact record of English losses, but they were few compared to the French.

Henry's next campaign started in 1417 and went until 1419. This time he completed the conquest of the Normandy region. The Burgundians, still English allies, were able to gain the upper hand in their civil war and capture Paris. In May 1420 the Treaty of Troyes was signed; it declared Henry to be Charles VI's heir and required him to continue to support the Burgundians in their civil war against the Orléanists, who were now supporting the dauphin. Henry died in 1422 and his nine-month-old son became the new king of England. Even with Henry's death, the English continued their war against the Orléanists. Charles VI died two months after Henry V. With Charles's death, Henry VI was crowned king of France.

JOAN OF ARC

The war took a sudden change for the better for the French with the appearance of Joan of Arc in 1429. She led an army to victory against the English, laying siege to the town of Orléans in May 1429. This was the first of many victories that led to the coronation of the dauphin as Charles VII. Joan was captured and turned over to the English in May 1430. The English had her put on trial for witchcraft, convicted, and burned at the stake. The English had hoped to strike a blow against the French morale but only succeeded in inspiring them. In September 1435 the French civil war was ended and with it the alliance between the Burgundians and the English. The French continued to retake territory from the English, including Paris, which fell in April 1436. Both sides agreed to a truce in 1444, which lasted for five years.

The French used the truce to reorganize their army, so that when the truce ended in 1449 they were ready to end the war. Starting with an invasion for Normandy in 1449 that was completed by 1450, they pushed the English out of France over the next several years. The conquest of Aquitaine would take longer. The initial invasion began in 1451 but was slowed in 1452 when the English sent troops there in an effort to stop the French. While the English were successful in slowing the French, the French were able to defeat the English army in July 1453 and by October 1453, with the fall of Bordeaux, they completed their conquest of Aquitaine and ended the Hundred Years' War. The only French soil still controlled by the English was Calais, which they controlled until 1558.

DALLACE W. UNGER, JR.

Huss, John (Jan Huss [Hus])

(c. 1369–1415) *religious leader*

John Huss was a forerunner of the Reformation. He was born into a prosperous peasant family in the small southwestern Bohemian town of Husenic (Goose-town), close to the Bohmerwald and not far from the Bavarian frontier. Little is known of Huss's early life except that his parents died while he was young. He was first educated at Husenic and then later in the neighboring town of Prachaticz. Huss entered the University of Prague around 1388. In 1392 he received his bachelor of arts degree and, in 1394 a degree for a bachelor of theology. He was granted his master's degree in 1396. In 1398 Huss was chosen by the Bohemian "nation" of the university to hold the post of *examenship* for the bachelor's degree. In that same year he began to lecture on philosophy.

Huss was ordained a priest in the Roman Catholic Church in 1400 and in 1401 he was appointed dean of the philosophical faculty. From October 1402 to April 1403 he held the office of rector of the university. In 1402 he was appointed rector or curate (*capellarius*) of the Bethlehem Chapel in Prague. The chapel had been erected and endowed in 1391 by citizens in Prague in order to provide preaching in Czech. It was also a place of congregational singing with the music of several tunes painted on the walls for all to see and to use for singing. Preaching at the Bethlehem Chapel deeply influenced the religious life of Huss, leading him to a study of the Bible. From it he developed the deep conviction of its value for the life of the church. It also taught him a deeper respect for the philosophical and theological writings of JOHN WYCLIFFE.

The study of scripture and its proclamation in a vernacular tongue had been condemned in England by opponents to Wycliffe's teaching and to their spread by his Lollard supporters. Huss's sympathy with Wycliffe did not immediately involve him in any conscious opposition to the established doctrines of Catholicism or with church authorities. He translated Wycliffe's *Trialogus* into Czech and promoted its reading. Huss probably became aware of Wycliffe's teachings when Czech students who had studied at Oxford University under Wycliffe returned to Prague. Anne of Bohemia was at the time the wife of King Richard II. She had scholarly interests of her own, which may have encouraged Czech students to study in England.

Eventually Czech students copied all of Wycliffe's works and took them to BOHEMIA. Persecution against Wycliffe would eventually leave the only surviving cop-

ies of some of his works in Bohemia. Wycliffe was very controversial in England because his teaching called for the translation of the Bible, then only available in versions of the Latin Vulgate, into the vernacular. In addition Wycliffe was a severe critic of the corruption of the clergy. Wycliffe died at home; however after his death his body was exhumed and burned along with his books. In addition, his lay supporters, the Lollards, were persecuted. The same thing was to happen in Bohemia and MORAVIA despite the preaching of Huss for reforms.

In 1409 the king of Bohemia reorganized the voting control of the University of Prague. The university was governed by the nations. The Germans had the most votes, but the Czechs were more numerous. The king's reform gave the Czechs representation in proportion to their numbers, and also effective control. However, the move so angered the Germans that most of them quit the university at Prague and moved to other German universities in other cities with one group founding the University of Leipzig. They also engaged in a slander campaign against Huss because of the change. Among the slanders was the charge that Huss was a heretic.

Huss wrote a number of philosophical and theological works, including *De ecclesia*. The book was critical of many medieval church practices. He charged that the lucrative but unbiblical practice of granting forgiveness through the issuing of indulgences was harmful to the souls of innocent Christians. Because of his attack on indulgences Huss was excommunicated in 1412. In 1414 Huss went to the COUNCIL OF CONSTANCE that met in Constance, Germany, under the safe conduct protection of the Holy Roman Emperor.

After an unfair trial in which Huss was not allowed to present a proper defense, he was condemned to death for heresy despite the pledge of safe conduct. The most damning charge against Huss in the eyes of his judges was his claim that Christ is the head of the church and not Saint Peter. Before Huss was taken to the place of execution, he was subjected to ceremonial degradation. He was stripped of his clerical vestments and his tonsure was erased. He was then defrocked to revoke his ordination as a minister of the Gospel. Then his books were burned in front of the cathedral. Finally he was led to a place outside of Constance where he was martyred by being burned at the stake on July 6, 1415.

When the news of the martyrdom of Huss reached Prague the people of Prague rose up against the religious rule of the Roman Catholic Church. Soon all of Bohemia and Moravia were united in support of the teachings of Huss as the true Gospel. In a movement of nationalistic

and religious fervor the Hussites reformed the church on the basis of Huss's teachings. Among the many changes in liturgical and ecclesiastical practices was the giving to the people in Eucharist the elements of both the bread and wine as *sub utraque specie*. The medieval practice of the Latin Church was to give only bread to the people. The desire among the Bohemians and Moravians for this change has been traced to Saints CYRIL AND METHODIOS, who had been the first missionaries to convert the Bohemians and Moravians during the 800s at the time of the Great Moravian Empire. They were missionaries of the Eastern Orthodox Church, where the elements were served in both kinds.

The Hussites quickly developed into three groups: the Ultraquists, the Bohemian Brotherhood, and the Taborites. All were in favor of taking communion in both kinds, that is, both the bread and wine as *sub utraque specie*. The Ultraquists or Calixtines (*calix*, the communion cup) leaned toward the Roman Catholic communion. The Bohemian Brotherhood, influenced by Peter (Petr) Chelčický, was scattered and pacifist. The Taborites were the most reformist and did much of the fighting. The Hussites defeated all the Roman Catholic armies sent to suppress their Christian beliefs. On July 14, 1420, the Hussites led by John Ziska of Trocnov, then aged 61 and blind in one eye, defeated the Holy Roman Emperor Sigismund's army numbering more than 100,000 at Vysehrad (now Ziska Hill). A second crusade was sent against the Hussites in 1421 and a third in 1422. Both were defeated. However, on October 11, 1424, Ziska was killed in battle. Andreas Prokop replaced him (Procopius the Great, and in Czech, Prokop Veliky [Holý]). He soon defeated an army of 130,000 sent against the Hussites.

Hussite religious zeal disciplined the Czechs. The whole country was organized into two lists of parishes. Men from one list were called to battle while those from the other would remain at home to protect, farm, and aid the lands of their warring brethren. The Hussites, led by John Ziska of Trocnov, were able to defeat the German and Hungarian knights and infantry sent against them. Ziska had fought against the Teutonic Knights in the ranks of the Polish army. There he had learned of Russian noblemen who often circled the wagons of the baggage trains into defensive forts called a moving fortress (*goliaigorod*). At first the Hussites put men with muskets into farm carts and wagons. Eventually they developed specially constructed war wagons that could be chained together. These war wagons had thick wooden sides to provide some protection to the men inside. The Hussite war wagons were placed in circles on hillsides in a

After an unfair trial, Huss was condemned to death for heresy despite a pledge of safe conduct from the Holy Roman Emperor.

defensive position. In order to attack them, the imperial knights had to attack uphill, charging on horses that soon wearied of the uphill exertion of carrying a heavily armored knight. Hussite musket blasts cut down the knights as they drew near. Dead and wounded knights and horses hampered renewed attacks.

The Hussite soldiers' use of musket and cannon fire to defend themselves against heavily armored knights on horseback was similar to the English longbow men and the Swiss pike men of the time. The Hussites also prepared the way for new forms of military tactics and arms of the age of gunpowder. Using pikes or muskets in combination with cannons the Hussites were able to develop offensive tactics that could defeat the old armies of knights.

Eventually Hussite forces raided the German areas of Bavaria, Meissen, Thuringia, and Silesia. They then

returned to their mountain fortresses in Bohemia and Moravia. The more radical Hussites gathered into strongly fortified towns like Tabor. However strife between the Ultraquists and the Taborites led to war between them. The strife arose from the diplomatic success of the Roman Catholics in dividing the Ultraquists and the Taborites. The Hussites agreed to attend the Council of Basel with the Roman Catholic Church. The outcome was the *Compacta of Basel*. It pulled the Ultraquists away from Hussite reforms. The Taborites however refused to accept the *Compacta*. They were defeated in the Battle of Lipany (Battle of Cesky Brod) on May 30, 1434, by a combined Ultraquist-Catholic army. Procopius was killed and the Taborite army was destroyed on the field.

The defeat was due to a tactical error that occurred when the Ultraquists retreated and the Taborites left the safety of their war wagons to pursue. The Battle of Lipany ended the Hussite Wars; however, in 1618 the Thirty Years' War began in Prague when fighting broke out between Hussites and their opponents. At the end of the Thirty Years' War most of the Hussites had fled or were dead. Scattered Hussite elements or Unity of the Brethren (Unitas Fratrum) continued to exist in both Bohemia and Moravia after the Thirty Years' War. Living in remote locations they secretly practiced their faith despite persecution.

Early in the Thirty Years' War, Johannes Amos Comenius, a famous educator and Hussite bishop, was

forced to flee Moravia. As he departed he called the Hussite remnant the "hidden seed." Beginning in the early 1720s many of the "hidden seed" fled to Saxony, where they found refuge on lands of Count Nicholas Ludwig von Zinzendorf. Founding the village of Herrnhut near Zittau they became the revived Moravian Church in 1722.

ANDREW J. WASKEY

Ibn Batuta

(1304–1368) *traveler and writer*

Ibn Batuta (also Ibn Battuta), Muhammad Ibn ‘Abd Alah, born in Tangier, Morocco, was one of the greatest Arab travelers in the 14th century. A descendant of a scholarly family that produced many judges, he was educated in Tangier. As other travelers from Morocco, he began his travels by undertaking a pilgrimage to Mecca and to centers of learning in Egypt and Syria. But he soon became restless and wished to explore other parts of the world. For some 28 years Ibn Batuta traveled to many countries in the Islamic world, to Armenia, Georgia, the Volga region, Central Asia, Constantinople, India, the Maldives, Indonesia, parts of China, and East and West Africa. He performed his pilgrimage to Mecca four different times. It is from Ibn Batuta’s journals that we know so much of these lands in his time.

During his travels he became acquainted with sultans and rulers in many parts of the world. At times he held important positions in foreign lands and became an influential judge in Delhi during the rule of Muhammad Tughluq. He also played an important role in the Maldives. In 1353 he returned to Morocco. At the request of the sultan he dictated his book *Rihla* to a writer by the name of Ibn Juzzay, who died in 1355 after having completed and edited the text. At the end of his life Ibn Batuta served as a judge in a Moroccan town and was buried in Tangier.

Since someone else wrote Ibn Batuta’s travel account, it is difficult to ascertain at times his own voice or char-

acter. It is likely that Ibn Juzzay was not altogether faithful to what he heard from his interlocutor; furthermore, one must be careful about the traveler’s memory in reconstructing past events, episodes, and dates. Ibn Batuta’s travel account is a major medieval document that sheds light on the historical, cultural, and social life in many parts of the world, particularly India, the Maldives, Asia Minor, and East and West Africa.

SAMAR ATTAR

Ibn Khaldun

(1332–1406) *intellectual, historian, and sociologist*

‘Abd al-Rahman Ibn Muhammad Ibn Khaldun was born in Tunis and died in Cairo. The greatest Arab historian, he developed the philosophy of history and laid the foundation of sociology in his masterpiece, the *Muqaddima*. He was also a politician and diplomat. According to his autobiography, *Al-Ta’rif bi Ibn Khaldun*, his family was originally from Yemen and settled

in Spain after the Arab conquest. They played an important political role in Seville during the ninth century. Just before the fall of the city they moved to Tunis in 1323 and continued to hold important administrative posts. Here Ibn Khaldun was born and educated. In 1349 his parents died during a great plague.

After working for the court in Tunisia, Ibn Khaldun moved to Fez to serve the sultan of Morocco. But he fell into disfavor and moved to Granada, Spain, where Ibn al-Khatib, a renowned writer and statesman, was vizier. Ibn Khaldun was sent on a mission to Seville to conclude a peace treaty with Pedro I the Cruel of Castile. In Granada his enemies intrigued against him and he was forced to return to North Africa. He changed employment several times but then became weary of the dangers posed by political life.

In 1375 he spent four years in the castle Qal'at ibn Salama in Algeria, where he wrote his first draft of *Muqaddima*, or introduction to history, and part of the book, *Kitab al-'ibar*, the best source on the history of North Africa and the BERBERS. Illness and the necessity to check sources in urban centers forced him to return to Tunis. In 1382 he sailed to Egypt, settled in Cairo, and began teaching at AL-AHZAR, the famous, Islamic university.

The Mamluk ruler of Egypt, Barquq, appointed him chief judge of the Maliki rite but he again had trouble with the ruler. The most significant event of his life occurred in 1400 when he accompanied the new sultan of Egypt, Faraj, to Syria at the time of the Mongol invasion. When the sultan had to return hastily to Cairo to quell a revolt, Ibn Khaldun was left behind in besieged Damascus. He was lowered from the city wall by rope and went to meet with the Tatar conqueror, TIMURLANE (TAMERLANE), and spent seven weeks in his camp. In spite of Ibn Khaldun's efforts, Damascus was sacked and its great mosque was burned; however, Ibn Khaldun was given permission to return to Egypt.

As a theorist on history Ibn Khaldun identified economic, social, political, psychological, and environmental factors as key in the rise and fall of all states. He analyzed the dynamics of group relationships and demonstrated how social cohesion fortified by a religious ideology can help a group ascend to power. History is seen as a science that examines the social phenomena of human life. It seeks causes and effects and probes the complexities of human nature. Ibn Khaldun showed that by applying scientific principles it is possible to formulate general laws and to predict trends in the future. Arnold Toynbee, the late

British historian, described the *Muqaddima* as the greatest work of its kind.

SAMAR ATTAR

Ibn Sina

(980–1037) *Muslim philosopher, scientist, and doctor*

Abu 'Ali al Husayn Ibn Sina, or Avicenna, was born in northern Persia (present-day Iran) and as a youth studied both mathematics and medicine and expressed a keen interest in philosophy. His five-volume *al-Qanun fi'l tibb*, translated into Latin with lists of known diseases, treatments, and medicines, was the standard medical reference work in the Christian and Islamic worlds for several centuries. Ibn Sina not only was a clinician, but also sought to synthesize the entire body of medical knowledge of the age. He approached the study of medicine as a science, not just as a practical profession.

Ibn Sina's vast oeuvre, mostly in Arabic but also in Persian, dealt with philosophy, psychology, musical theory, autobiography, and even two short stories. Although Ibn Sina and other Muslim philosophers often did not know classical Greek, they were familiar with the classics through translations made by Christian Arabs. Ibn Sina accepted much of Platonic thought and attempted to harmonize it with eastern belief systems in a form of Neoplatonism. In this regard Ibn Sina carried on the approach of Abu Nasr al-Farabi (c. 878–950), an earlier Muslim philosopher to whom Ibn Sina paid homage. As part of a chain of Islamic scholars, Ibn Sina's ideas were expanded and reworked by AVERROËS.

In his encyclopedia of philosophy, *Kitab al-shifa*, Ibn Sina argued for the need to understand the natural world and supported the application of rational thought. Nor, he argued, were rational thought and religious belief necessarily contradictory. He disagreed with accepted Islamic thought regarding cosmology and

expressed a low view of the intellectual ability of society in general. Ibn Sina and other Muslim philosophers accepted the QUR'AN as the holy revealed text of ISLAM but believed it was open to interpretation (*bid'a*) and that every word need not be accepted literally. Many Sunni scholars accepted Ibn Sina's approach and his works had a long-term impact in Islamic thought. Others, in particular the later IBN TAYMIYYA, vehemently denounced Ibn Sina's approach. In the last years of his life, Ibn Sina served as a *wazir* (minister) to the Buyid dynasty that gained control over parts of the Muslim territory as the ABBASID DYNASTY in Baghdad disintegrated. In Europe, Ibn Sina's ideas and his review of Aristotle's work in *Kitab al-shifa* had an impact during both the Middle Ages and the Renaissance.

JANICE J. TERRY

Ibn Taymiyya

(1263–1328) *Islamic theologian*

Taqi al-Din Ibn Taymiyya was born in Syria and spent most of his life in Damascus. His father was an Islamic scholar and Ibn Taymiyya became a teacher in ISLAMIC LAW and tradition when he was still a young man. Ibn Taymiyya followed the puritanical Hanbali school, the most conservative of the four major schools of Islamic law.

In direct contrast to AVERROËS and even al-GHAZZALI, earlier Muslim scholars, he rejected rationalism and the study of philosophy. Ibn Taymiyya thought that Islamic schools of law had become too rigid but he also argued that they had been corrupted by outside influences, particularly those of classical Greece and SUFISM (Islamic mysticism).

Ibn Taymiyya lived in an era when Islamic society was threatened by external enemies, particularly the Mongols, and internal political divisions. He championed a pure application of Islamic practice based on faith and rejected innovation (*bid'a*). He also exhorted true Muslims to wage jihad (holy war) to fight internal and external enemies. In *The Correct Answer to Those Who Have Changed the Religion of Christ*, a huge

book of over 1,000 pages, Ibn Taymiyya used textual exegesis to challenge the divinity of Christ.

Because of his more extreme polemics and vocal opposition to many common Muslim practices, for example, veneration of saints' tombs, authorities jailed Ibn Taymiyya several times and he died in prison in 1328. However, his numerous writings on the QUR'AN and Islamic law (*fiqh*) continued to influence Muslim scholars and political leaders, including Muhammad ibn Abd al-Wahhab, the founder of the Wahhabi puritanical sect that emerged in the Arabian Peninsula in the 18th century. Modern-day Saudi Arabia is founded on Wahhabism with its strict application of the letter of the law. Ibn Taymiyya is often viewed as the spiritual mentor of 19th and 20th century Islamists.

JANICE J. TERRY

iconoclasm

Iconoclasm (Greek for "image-smashing") was a religious movement against icons (religious portraits) in eighth–ninth century Byzantium. Christian art proliferated in the fourth century because of the patronage of newly Christian emperors and aristocrats. While the majority of Christians accepted this tendency, a minority, influenced by the biblical injunction against "graven images," was in opposition. Bishop Eusebius of Caesarea, for example, author of the first work of church history (*Ecclesiastical History*), was in the latter group and rejected the depiction of Christ in art. This movement, called iconoclasm, expanded in the seventh century when it emerged in Armenia and reached its largest phase in the Byzantine (Eastern Roman) Empire in the eighth and ninth centuries. (The West experienced its own iconoclastic crisis during 16th century Protestant Reformation.)

Icons vastly increased in popularity in Eastern Christendom in the sixth and seventh centuries, a period when the empire was wracked by Slavs and Bulgars who removed much of the Balkans from imperial control, and

by Muslims who seized Syria, Palestine, Egypt, and North Africa. Imperial prestige was greatly reduced and imperial power was weakened by coups, civil strife, and theological controversy. In this period, people turned for help not to the hapless emperor, but to the icon (a portrait of a saint, angel, or Jesus) found in churches, monasteries, as well as private homes. Icons were often credited with miraculous powers, such as healing from illness or keeping a city safe from enemies.

In the eighth century two bishops in Asia Minor condemned this proliferation of icon prestige among Christians. Emperor Leo III (717–741), who had stopped the Muslims in their siege of Constantinople in 717–718, championed their cause. Believing that God had given him success and a warning (when a volcanic explosion devastated the island of Thera), he removed the icon that hung before the imperial palace, appointed an iconoclastic patriarch in 730, and issued an edict calling for the destruction of images. His son and successor Constantine V (741–775), also successful on the battlefield, pressed the iconoclastic cause by persecuting opponents, particularly monks. He also sought to establish a firmer theological basis for iconoclasm by summoning a church council in 754.

Monks like JOHN DAMASCENE, abbot of St. Sabbas Monastery in Palestine, who wrote several treatises defending icons, led opposition to the iconoclasts. The emperor could not arrest John since he lived under Muslim control. John explained that before Jesus, God could not be represented in an icon, but once God became flesh in Jesus, he could be depicted. Moreover when the icon is used in devotion, the matter is not venerated, but the God of matter who made it. John also distinguished between worship (*latreia*), which is reserved for God alone, and veneration (*proskynesis*), which Christians can give to saints and angels. He explained clearly that icon veneration was not idolatry, but true Orthodox practice.

Every pope also opposed iconoclasm. This caused a break of relations between Constantinople and Rome. Emperor Leo III failed in his attempt to arrest the pope but succeeded in removing southern Italy and the Balkans from papal jurisdiction, transferring them to the patriarch of Constantinople. During this tense period, Rome could not turn to Constantinople for military support against the German Lombards who threatened it. The pope now turned to the Franks, forging an important German-papal alliance that would influence much of the Middle Ages. In 800 the pope established the precedent of proclaiming the emperor by crowning Frankish king CHARLEMAGNE as Roman emperor. Byzantium opposed

this act since it viewed the Roman emperor as reigning in Constantinople and crowned by the patriarch.

The first phase of iconoclasm came to an end when IRENE, widow of Leo IV (775–780), ruled for her young son Constantine VI. Irene was an iconophile (supporter of icons) and summoned the Seventh Ecumenical Council in Nicaea (787), which declared icons Orthodox. Iconophile emperors ruled from 780 to 813, a period marred by military defeat that led many to believe that God was revealing that iconoclasm had been the “true” doctrine.

An iconoclast general (Leo V) seized the throne and in 815 began the second phase of iconoclasm, deposing the patriarch and summoning a council to restore iconoclasm. Once again the iconoclasts were militarily triumphant. In 820 a coup brought Michael II to power, establishing the Amorian dynasty (820–867). His son, Theophilos (829–842), was the most educated and passionate of the ninth-century iconoclasts.

The great challenge to ninth-century iconoclasm was not foreign adversaries, but internal monastic opposition. Monks were now well organized and they were popularly viewed as heroes. The leading figure was Theodore the Stoudite, abbot of the Stoudios Monastery in Constantinople, whose 1,000 monks were loyal and obedient. Theodore’s network of support spanned the empire and he worked ceaselessly against iconoclasm. Emperors exiled, beat, and imprisoned him but could not silence him. He died in 826, just prior to the restoration of icons for which he had fought.

The final restoration came in 843 when Empress Theodora ruled as regent for her young son Michael III, successor of Theophilos. By this time the link between iconoclasm and victory had been shattered by a military defeat late in Theophilos’s reign. Theodora appointed Methodios as the new patriarch, and together they restored adherence to the Seventh Ecumenical Council. This is commemorated each year in the Orthodox Greek Church as “Orthodox Sunday,” on the first Sunday of Lent.

The iconoclast controversy stimulated a revival of learning as iconoclasts searched for manuscripts of the Fathers of the Church to defend their position, while iconophiles, like John Damascene and Theodore the Stoudite, wrote their own treatises. It also led to monasticism’s increased prestige, as monks became the premier champions of Orthodoxy.

The period did—in the end—increase imperial power inasmuch as iconoclast emperors had stabilized the empire against foreign threats and strengthened imperial power domestically. Finally after iconoclasm,

the resources for and against iconoclasm, imperial and monastic, respectively, were united together in a great age of missionary activity in central Europe, the Balkans, Russia, and beyond.

MATTHEW HERBST

Île-de-France

The history of the Île-de-France, the true heart of Paris, began in the third century B.C.E. when a group of Gallic Celts built a settlement there for safety. They surrounded their settlement with a wooden palisade, at least one gate, and watchtowers. Buildings were made of wood, or wattle, mud, and sticks, and had either wooden or thatched roofs; thus fire was a constant danger. In 52 B.C.E. in his wars against the Gauls, Julius Caesar established a base there.

By the third century C.E. barbarian tribes forced the abandonment of the settlement on the Left Bank of the Seine, forcing people to seek refuge on the Île-de-France as their ancestors had nearly six centuries earlier. In 451 during the decline of the Western Roman Empire, the Île-de-France and the growing city of Paris faced its worst threat. In that year Attila the Hun attacked the Western Roman Empire with a huge army. The city of Metz was sacked as he entered France, and Paris, according to legend, was only spared the same fate by the intervention of Saint Genevieve. By the time Attila laid siege to Orléans, the main Roman field army led by Aetius confronted him with Visigoth allies, enemies of the Huns. During the Battle at Châlons the Huns were turned back.

In 476 the last Roman emperor of the West, Romulus Augustulus, was deposed, and Paris was left to look after its own defenses. The FRANKISH TRIBE was one of the German tribes to invade France during the Roman Empire's decline, and in 508 Clovis, king of the Salian Franks, captured Paris. He converted the Franks to Christianity after winning a battle over a rival tribe, the Alamanni, sometime between 495 and 506. Paris suffered an era of decline when CHAR-

LEMAGNE decided to make Aachen, Aix-la-Chapelle, the capital of his HOLY ROMAN EMPIRE, when he was crowned emperor in 800.

In the ninth century Vikings from Scandinavia began their onslaught on western Europe, and they sailed up the Seine to imperil Paris. In 911 in order to relieve the threat, King Charles III granted the land around Rouen to the Viking leader Rollo. Since "northmen," *normand* in French, was another term for Vikings, this was the beginning of Normandy, from which Duke William would sail to conquer England in 1066. In 978 HUGH CAPET became king—because he usually wore a cape, or *capa*, his line became known as the Capetian dynasty.

One of the greatest of all Parisian landmarks, the Cathedral of Notre Dame, was established in 1163. King PHILIP II AUGUSTUS, who reigned from 1179 to 1223, did much to develop the Île-de-France and Paris. He built walls around the growing city, including the settlements on the north and the south bank. By a royal charter for the University of Paris (1200), he stated that Paris was now a city of three parts, the Left Bank, the Île de Paris (now known as the Île de la Cité), and the Right Bank. In 1200 Philip began construction of a fortress on the Seine, built to defend against the English, that would later become the famed museum of the Louvre. In 1301 King Philip IV built a royal palace on the Île de la Cité, reaffirming its position as the heart of Paris, although by this time the history of the Île de la Cité had merged into the history of the entire city of Paris.

JOHN F. MURPHY, JR.

Innocent III

(c. 1160–1216) *pope*

Innocent III was born into the noble family of Scotti and named Lothar. Aided by his familial ties to Pope Clement III, Innocent rose rapidly through the curia. The popular debate regarding the pontificate of Innocent III can best be summed up in the title of a series of essays edited by James M. Powell regarding the life and pontificate of Innocent III entitled *Vicar of Christ or Lord of the World*. While the reign of Innocent is viewed as the high point of medieval papal power, both religious and secular, the debate continues as to whether Innocent's involvement in the secular world was for his own benefit, or because of his own view of papal authority.

The young Lothar received the scholastic education expected of young nobles of his day, studying in Rome, Paris, and Bologna before being elevated to the rank of cardinal-deacon at the age of 29. Innocent was elected pope on the very day, January 8, 1198, that Pope Celestine III died. The Orsini Celestine III, in a display of family politics that dominated medieval Rome, campaigned from his deathbed against the potential candidacy of Innocent. Political uncertainty because of the recent passing of Emperor Henry VI led many cardinals, who were concerned for their own personal safety, to abandon the dying Celestine III in the Lateran for the more secure Septizonium of Septimius Severus, the site of the papal election. Legend has it that cardinals concerned that Innocent III was too young were reassured when a white dove landed on his shoulder during the voting. Innocent's consecration ceremony was delayed seven weeks until the deacon could be ordained into the priesthood and then installed as a bishop.

Innocent provided the 13th century with a model of an active, reforming pope. Innocent turned his reforming intention first to the curia, where he reduced the size of the bureaucracy and the luxurious lifestyle of its members. In response to concerns over the quality of men appointed to the episcopate, Innocent excluded candidates for being too young or for lacking an adequate education. He also enforced the strict observance of celibacy and, in order to bring an end to the accumulation of multiple benefices by priests, enforced residency requirements. Innocent may be best remembered for recognizing new religious orders such as the Franciscans and the Dominicans during his reign.

Innocent did not reserve his reforming zeal simply for the religious. In an age where rulers routinely requested the dissolution of marriage vows to rid themselves of an inconvenient spouse, Innocent refused to dissolve marriage vows for the rulers of France, Castile, Bohemia, and Aragon. Innocent was the author of several treatises both before and after his election to the papacy. As a scholar his interest in the Eucharist resulted in the treatise *De sacro altaris mysterio* (*On the Sacred Mystery of the Altar*) and in the adoption of the doctrine of transubstantiation at the Fourth Lateran Council. Innocent also decreed that a Catholic must perform the sacraments of Holy Communion and confession at least once a year.

The largest area of controversy surrounding the reign of Innocent III lay with his views of the papacy regarding secular affairs. A few months prior to his election, the seat of the emperor was left vacant by

the death of Henry VI. Early in his papacy Innocent asserted the right of the pope to evaluate the merits of the two leading candidates for emperor: Philip of Swabia and Otto of Brunswick. Innocent's involvement in election politics would continue for most of his papal reign. As the guardian to Frederick, son of Henry VI, Innocent aligned himself with King PHILIP II AUGUSTUS of France against Emperor Otto III in support of Frederick's claim to the throne. Innocent's strong assertion of papal supremacy in secular affairs continued the policy of popes NICHOLAS I and Gregory VII.

Innocent based his view of the papal role in secular affairs on the belief that bishops were in part responsible for the souls of their kings and that the pope was successor of Peter and vicar of Christ. Innocent asserted papal temporal authority in several fields including the appointing and deposing of kings, the right to intervene in kingly conflicts that potentially involved the commission of a sin, to protect the interests of widows and orphans, to protect crusaders, to confirm agreements between rulers, and to hear appeals from persons in the absence of appropriate temporal courts. The notion of the pope's hearing appeals led Innocent to hold public hearings three times a week. The continued existence of heresy in southern France combined with the unwillingness of local rulers to deal with the issue led Innocent to call for the ALBIGENSIAN CRUSADE in 1208. Innocent would die in 1216 before he had the opportunity to fully implement his reforms, and while remembered as the most powerful pope of his era, he would not be granted the title of "great" by the church.

ABBE ALLEN DEBOLT

Inquisition

From the time of Charlemagne (800–814) and beyond, the peoples of Europe were united by the teachings and practices of the Western (Latin) Church. So deep and abiding was this consensus that any deviation from the

common faith was felt to be a serious threat to the community itself. From time to time individuals rejected this heritage and preached separatist religious doctrines and canons. This break with the status quo would be seen as not only an attack on the church but also an attack on society.

Usually these individuals formed no organized sects and their followers dispersed after their deaths. To the extent that they denied articles of the Catholic faith they were termed "heretics." By the early 12th century the Western Latin Church had a firm basis for definition of orthodox belief, and the laws of the state provided sanctions against those who deviated from it.

In the second half of the 12th century, however, there appeared two groups that seriously challenged the basic tenets of Christendom. The Albigensians, or the Cathari, believed in Christian dualism (gnosticism) where there were two gods, one good and one evil. The good god made the spiritual world including the human soul and the evil god made the material world, including the human body. The group rejected certain basic institutions of the status quo, including the sacrament of penance, the liturgy, and prayers for the dead. A second group, the Waldensians, maintained basically a Christian position. They were fundamentally interested in spreading Christianity, dedicated to living the Gospel in poverty. They did reject, however, prayers and liturgies for the dead and the authority of the Roman Church and taught that unordained people have the right to preach.

The Inquisition originated with Pope Gregory IX (1227–41). The Inquisition was an extraordinary court established by the papacy to investigate and adjudicate persons accused of heresy. The purpose was to bring order and legality to the procedure for dealing with heresy, since there was much inconsistency in the prosecution of religious scandals and misconduct. On the one hand, the attitude in southern France was one of benign indifference or even approval of heresy, while in the north, on the other hand, particularly in Germany, there was the tendency for mobs to burn alleged heretics without the aid of a court.

In the course of their investigation of the presence of heresy in the regions designated by their appointment, the inquisitors interviewed literally thousands of people. After the actual trial had been completed, the evidence was weighed. The local bishop was given the record, and he and the inquisitor agreed on an appropriate penance, if the accused accepted it. If not, then the person was declared contumacious and his property was confiscated. The penances handed down were

such things as pilgrimage to a famous religious shrine, the wearing of yellow cloth crosses (the most used penance), ritual flagellation, fines, demolition of houses and confiscations, and imprisonment. Shame and humiliation were the preferred methods of discipline, though the death penalty was invoked in special cases.

The inquisitor tried to explain the true doctrine and to correct erring members. If, however, individuals refused to repent, the church formally recognized its inability to bring about change. Then it would declare erring members heretics, withdraw its judicial protection, and abandon them to the secular authority, which proceeded to apply its own law. This secular punishment involved mutilation and death in various forms.

The most extensive and influential inquisitorial investigation took place in Toulouse, France, 1245–46. Actions were drawn up against 5,471 men and women; only 207 verdicts were issued by the judge-delegates, of which 23 were given "life sentences" (usually seven years' imprisonment), and the rest were given yellow crosses to wear on their clothing. No one was executed, and no property was confiscated. Toulouse served as model for later and more concentrated inquisitions.

At various times sensational inquisitions arose against particular individuals or groups. These cases include JOAN OF ARC, Meister Eckhardt, Galileo, and the Jews of Spain who had converted to Catholicism. The most serious injustices were inflicted against the Jews, where perhaps at least 2,000 were burned. Nonetheless, it should not be forgotten that safeguards and conditions of prisoners in inquisitorial investigations were superior to those of secular courts. The controversy and notoriety surrounding the Inquisition far exceed what historians have been able to uncover as facts surrounding its actual exercise.

Founded in 1542 by Pope Paul III with the Constitution *Licet ab initio*, the Congregation for the Doctrine of the Faith was originally called the Sacred Congregation of the Universal Inquisition as its duty was to defend the church from heresy. The congregation promotes in a collegial fashion encounters and initiatives to spread sound doctrine and defend those points of Christian tradition that seem in danger because of new and unacceptable doctrines.

Pope Pius X in 1908 changed the name to the Sacred Congregation of the Holy Office. It received its current name, Congregation for the Doctrine of the Faith, in 1965 from Pope Paul VI. Its duty is to promote and safeguard the doctrine on the faith and morals throughout the Catholic world.

REV. THOMAS URBAN & MARK F. WHITTERS

Irene

(1088–1124) *princess of Hungary*

Irene of Constantinople (also referred to as Princess Piroska) was the daughter of King LADISLAS of Hungary, who ruled from 1077 C.E. He was the son of Béla I of Hungary and Richeza, princess of Poland. Ladislav astutely used the political divisions of 11th century Europe to carve out a position of importance for his kingdom. His daughter Princess Irene of Hungary became the wife of the Byzantine or Eastern Roman Emperor John II (1087–1143) of the Komnenus (Comnenus) dynasty, whose father was Emperor Alexios I. John II became emperor on the death of his father in 1118.

Irene was born in 1088 in Esztergom, Komarom, Hungary. After her father died, his brother Kalman (Koloman) succeeded him on the throne. King Kalman continued the expansion of Hungary begun by his brother and annexed Croatia to his dominion in 1097. He arranged Irene's marriage to John II of the BYZANTINE EMPIRE, gaining immense reputation from the match. The marriage was beneficial to both states, as it formed an alliance against the SELJUK DYNASTY of the Turks, who had posed a dangerous threat to the Byzantine Empire since their victory over a Byzantine army at Manzikert in 1071.

When Irene went to Constantinople for her royal marriage, she converted from Roman Catholicism to the Greek Orthodox Church in order to marry the emperor. Afterward, she was often referred to as Irene Prisca, which was the name of an earlier saint in the church. She gained a great reputation for piety toward pilgrims on their way to the Holy Land, especially those coming from her native Hungary. She and her husband founded the church of Saint Savior Pantocrator. The church they built became the largest in Constantinople after the Hagia Sophia.

When Irene was empress the Holy Land was in great peril from the Turks, and Pope URBAN II called the First Crusade in 1096 to save Jerusalem. The Byzantine forces of Emperor John, after an initial struggle with the crusaders coming from western Europe, provided invaluable support to them with the large Byzantine navy and their knowledge of siege warfare. The

crusaders conquered Jerusalem in 1099. The crusaders established their own states in the Holy Land and often were in conflict with Emperor John II. In 1137 and 1142 he entered the crusader kingdoms, reaching as far as Antioch, in a show of force to assert his power over them.

By the time of Empress Irene's death in 1124, only the southern part of the Pantocrator was built, and there she was buried. The Greek Orthodox Church noted her care of pilgrims, and she would be canonized as Saint Irene. The role that Irene played in Byzantine history was recognized when she was placed in a mosaic portrait with her husband and her son, the future emperor Manuel I, in the Hagia Sophia.

JOHN F. MURPHY, JR.

Irish monastic scholarship, golden age of

The golden age of Irish monastic scholarship spans the sixth through ninth centuries' flourishing of art, literature, calligraphy, manuscript preservation, and research that transpired primarily in the newly established monastic schools following the fifth-century advent of Christianity in Ireland. During this same period, the collapse of the Roman Empire and the so-called barbarian invasions into Europe by such tribes as the Goths, Huns, Lombards, and Burgundians caused the Continent to experience a tremendous decline in learning and culture. Not only was the Irish church the brightest spot culturally in the West at this time, but many historians postulate that the great heritage of Western civilization, ranging from the Greco-Roman classics to Jewish and Christian works, would have been utterly vanquished were it not for the religious women and men of Ireland.

The golden age is best known for the scriptorium, in which biblical manuscripts were preserved, copied, and beautifully illuminated. Because of the medieval development of the Bible into an object of veneration and point of contact with divine power, the copying of Scripture became a favored avenue for creativity. Illuminated man-

uscripts accompanied the sacred text with colorful and detailed graphic representations of the events being narrated and were bound in ornately tooled covers of precious metals, inlaid with jewels. Remarkable poet-historians synthesized the nation's pagan histories with its new faith, by retelling these legends in light of Christian theological concepts, especially providence, grace, and redemption. Moreover the missionary scholar Adamnan of Iona (624–704) prefigured England's Venerable BEDE (673–735) as among the first writers in the new genre of critical history and biography, which made distinctions between primary (firsthand or eyewitness) and secondary (based on firsthand or eyewitness) sources and employed criteria of authenticity that attempted to separate fact from fiction.

Although Christianity furnished the institutional catalyst that triggered the golden age, the potencies for its radiant growth of art and literature lay already embedded in the pre-Christian Celtic veneration for people of learning. In Celtic mythology, the god of literature, Ogmia, attracted humans with golden cords fastened to his tongue. Ancient Irish customs stipulated that the benevolent or malicious power of the poet should be respected above weaponry, and that the education of a prince in the skills of the mind was as important as his training in the art of warfare. The respect for the written word in no way diminished with the rise of Christianity; rather, the new religion transmitted the two priceless treasures of a written language and the legacy of Greco-Roman classical culture. Scholars from Europe began immigrating to the island in the early sixth century to escape the "barbarian" invaders, and Ireland came to enjoy a Continental reputation as a refuge where beleaguered academics could find all the customary comforts of civilization.

In exchange for this wholehearted welcome, the immigrants brought a great wealth, their books, to their new home, which became the foundation of Irish monastic libraries. Disavowing the European ecclesiastical fear of the pagan classics, manifested by the decree of the 436 Council of Carthage that no believer should study Gentile writings, Irish monks instilled their students with both an appreciation of the Greco-Roman poets and philosophers and a well-rounded worldview that integrated the theology of Scripture and the church fathers with the ethics of Aristotle and metaphysics of Plato. This produced a new breed of scholars characterized by a Scholastic mindset and a formidable accumulation of classical knowledge that was treasured and utilized in their civic and ecclesiastical endeavors.

These humanists imported many Latin grammatical structures and syntactic devices into the Irish language,

thereby vitalizing a literary tradition in desperate need of renewal. For instance, while the pre-Christian method of writing, *ogam*, was so cumbersome that it was scarcely used outside of carved funerary or ceremonial inscriptions, an updating of the alphabet based on Latin script rendered writing easy and motivated educated people to transcribe their native lore and create new masterpieces. The result of the linguistic revisions was that secular learning thrived alongside religious, and a monumental corpus of Irish vernacular literature developed that painted a portrait of an ancient pagan civilization unmatched elsewhere in the West. Not only was this recording of the oral tradition historically significant, but a further consequence of the conflation of Christian and pagan learning in Ireland was the rise of a new type of literature. Eventually the imaginative spirit gripped the scribes, who were responsible for meticulously copying Christian and classical works but subconsciously absorbing their concepts and themes in the process, leading them to formulate their own tales enriched by indirect influence from these ancient sources. The traditional voyages to seek Tir na n'Og (the Land of Youth, which greatly resembled the new heaven and new earth in New Testament thought) were supplemented by borrowings from Homer and given substance with the current geographical information to yield the famous Christian epic *The Voyage of St. Brendan*. Furthermore the intimate and touching poetry devised by monk-poets furnishes modern historians with a unique and introspective vision of the lives of cloistered anchorites, encompassing their love of nature and animals, the mystical nature of their religious experience (Latin *unio mystica*, or mystical union with God), the stringency of their communal discipline, and even their irritated boredom.

Although the monastic schools were indebted to the European body of knowledge bestowed by refugee scholars, a far greater influence was exerted by the long indigenous tradition of education. In Ireland, learning found its mythological origin in Connla's Well, a fountain in Tipperary over which grew nine hazel trees that simultaneously sprouted flowers and crimson nuts. Mastery of the fine arts and poetry gave substance to the flowers, while the nuts were filled with knowledge of all the sciences. Instituted upon this primordial foundation, the pagan schools required 15 years of study and were run by poets and historians of the *filid* class (an order of historians, lawyers, eulogists, and satirists) and the druids.

Members of the *filid* class migrated with their students from village to village while the druids were sedentary in key cultic centers. They shared a common method of pedagogy: Teachings and folk tales were transmitted in

fixed oral forms governed by patterns in style and meter, and repetitions of words and sentence structures that facilitated memorization. In addition a reciprocal relationship of compassion was fostered between teachers and students: Teachers corrected students without harshness and provided their physical sustenance (food and clothing), while students adopted a lifelong obligation to protect their teachers from poverty and support them in old age. The conjunction of instructional method and empathetic teacher-student bonds supplied the necessary motivation for students to master a dizzying array of disciplines, including grammar, law, genealogy, history, astronomy, geography, and metrical composition.

After St. Patrick converted the majority of Celts from the druid religion to Christianity and established monasteries to oversee each new believing community between 432 and 461, pagan schools were transformed into monastic schools, retaining the same teaching techniques and quality of humaneness between masters and pupils. The biblical doctrine of Christian equality as sisters and brothers before God in spite of class distinctions introduced an element of democracy into education. Although early medieval Ireland could by no means be identified as a democratic nation, the bishops established laws through which all people, women as well as men, could earn money to attend monastic schools regardless of the capacities of their families. One such law stipulated that a child whose parents could not afford the expenses of a school could pay one's way by waiting on the children of the wealthy, who were obliged to accept such service and finance the child's education. These laws fostered a demographic reversal from the pagan schools, such that most students at the monastic schools came from the lower and middle classes instead of the wealthy farmers and chieftains.

The 15 years of study were split into two segments: a five-year general education track, consisting of literature, history, law, and science, and an ensuing 10-year track for advanced students who wished to pursue the "Seven Orders of Wisdom." Most students ceased education after the first five years, while those wishing to pursue either a career in the church, greater learning, or both proceeded to the Orders. These included a comprehensive and detailed knowledge of the Bible, the essentials of Christian theology, mathematics, astronomy, and the three technicalities of written composition (grammar, criticism, and orthography). Since most graduates of the academic Seven Orders embraced their spiritual counterpart—holy orders—and later served as teachers themselves, the church procured a monopoly of Irish scholars while perpetuating its educational institution.

So many students were attracted to the monastic schools that there was not accommodation for them, and they were forced to erect huts outside the monastery walls. Gathering out of doors, the teacher, who typically sat or stood on a knoll, alternated his reading, translating, and expounding from books in distinct memorizable forms—which students would learn by rote—with questions that assisted students in understanding what they recited.

In addition to the monks and nuns, students at the monastic schools worked for varying lengths in the scriptoria proportional to their level of training. The beginner practiced with a metal-pointed stylus on long narrow tablets of yew wood coated with wax, which could be flattened clear and used repetitively. After the copying was completed, the student bound the tablets together with a pivot pin at one end so they could be opened and closed like a fan. The student then wound leather thongs around the tablets, leaving the ends of the cords dangling for use as a handle. Skilled scribes made their reproductions on parchment (cow, sheep, or goat skin) and vellum (the younger and finer skin of these animals). They copied seated with the writing material resting on the knees or, if engaged in elaborate illumination, on a table.

For calligraphy the pen was a quill made from the wing of a goose, swan, or crow. The inkstand was made from part of a cow's horn, and the ink was composed of thick and time-defying liquid carbon—characters on the medieval codices are still piercingly black today. Completed books were sheathed in leather, labeled, and hung on pegs on the walls of the monastery library. The more precious, such as the renowned Book of Kells and Lindisfarne Gospels (both lovely illuminated manuscripts of the Gospels in Latin), were encased in elegantly tooled leather covers and decorated, jewel-encrusted containers.

The greatest legacy of the golden age lay in the missionary activity of its monastic scholars, who spent as much time teaching within the Irish schools as traveling abroad to share the humanity of their education with the Continent and the Christian Gospel with their pagan neighbors. Irish philosophers, scientists, and classicists were sought after by the courts of Europe and returned to the West disciplines of learning that had been obscured during the "barbarian" centuries of cultural stagnation. Under influences from Columba's monastery, St. Aidan (590–651) carried the Christian message to the Northumbrians of the northeast coast of England. He became friends with the Anglo-Saxon ruler Oswald, who had spent time in exile among the Irish and grown attracted to the life of these Celtic Christians. With Oswald's cooperation, Aidan then journeyed to the people of Northumbria in 635 and founded a monastery on the island of Lind-

isfarne, thereafter styled as Holy Island, which became a center of evangelism that firmly established Christianity in northern England by the mid-seventh century.

KIRK R. MACGREGOR

Islam

Islam emerged out of the Arabian Peninsula (modern-day Saudi Arabia) in the seventh century. Prior to this, Arabian tribal peoples had practiced a wide variety of pagan beliefs, living in a time Muslims called *jabiliyya* or ignorance. The *Ka'aba* (probably a meteorite) in Mecca was one of the early sites of religious pilgrimage for Arabian tribes and the merchants of Mecca had long made lucrative livings off the trade generated by the pilgrims. The *Ka'aba* became the holiest site in the Muslim world and the center for the annual pilgrimage or hajj to Mecca.

Although Muslims accept the validity of all of the Old and New Testament prophets, including Jesus, they believe the prophet MUHAMMAD is the last and the greatest of the prophets. As strict monotheists Muslims do not accept the resurrection of Jesus because that would have made him divine and for Muslims God or Allah is indivisible. However Islam, as the third major monotheistic religion, forms part of the Judaic-Christian-Islamic tradition.

The Muslim holy book, the QUR'AN, contains the words of Allah as revealed to the prophet Muhammad. The Qur'an places great emphasis on knowledge and the first word in the Qu'ran is *Iqra* or "read." The Hadith and Sunna, traditions and sayings of the Prophet, also provide guidance for proper behavior and practice. Muslims follow the Five Pillars of belief and practice and are called to prayer five times a day by the muezzin from the minaret, a tall tower, attached to a mosque. The mosque serves not only as a place of worship but often as a center for social gatherings and as a school.

On Friday, the Muslim holy day, the imam delivers a sermon to the faithful. Unlike Christianity, orthodox Sunni Islam does not have an established clergy. Any devout believer can serve as an imam. However, the mullahs form an established, hierarchical clerical caste in Shi'a Islam. The community of believers is known as the *umma*; religious scholars or *ulema* continually provide interpretations and reinterpretations of religious texts and practice.

As with Judaism and Christianity, Islam began as a patriarchal society. However ISLAMIC LAW improved the lot of women, who were granted extensive legal and property rights. Polygamy was permitted as with most of the world at the time. A Muslim male could have four wives at one time but he must treat each equally in terms of lifestyle and the time spent with her. Thus only the wealthy could usually afford more than one wife.

As the number of Muslim converts grew under Muhammad's charismatic leadership, the established wealthy merchants in Mecca began to persecute the new believers. Led by Muhammad the Muslims migrated (or made a Hijra) from Mecca for Medina in 622. In Medina the Muslims had extensive interactions with three Jewish tribes; although the prophet Muhammad had fairly cordial relations with some of these tribes he failed to convert them. Some of these tribes also openly sided with the rival Meccans and even joined forces with them in military battles. Consequently the Jewish tribes were either expelled from Medina or killed. Muhammad created a new religious and political society heavily influenced by tribal practices in Medina.

In 624 the Meccans were defeated at the Battle of Badr but they retaliated by winning the Battle of Uhud in 625. In a third confrontation, Muhammad's strategy of building a large ditch to stop the Meccan cavalry helped the Muslims to defeat the Meccans at the Battle of the Trench in 627. Muhammad then negotiated a treaty between two cities, but after the Meccans violated the settlement, Muhammad led over 1,000 Muslim forces against the city. He took Mecca without bloodshed or forced conversions in 630. Muhammad returned to Mecca as the unquestioned leader of a growing and dynamic new community. Within two years Muslim campaigns had incorporated much of the Arabian Peninsula and had taken several Byzantine centers near the Gulf of Aqaba, north of Medina. Recognizing the growing power of the Muslims, other Arabian tribes soon sent envoys to negotiate alliances or conversions with Muhammad at Mecca. Muslims also moved into Yemen and along the Persian Gulf in the east.

In 632 Muhammad died and since he had left no chosen successor the community gathered to select by consensus a new leader or caliph to represent the Muslims. Under the next four “righteous” caliphs, the Muslims embarked on one of the most dynamic expansions in human history. Within 100 years the Islamic/Arab empire expanded from the banks of the Indus River in the east to northern Africa and Spain in the west. Much of the spread of Islam in Asia and Africa occurred not through warfare but trade. The Muslim annual pilgrimage to Mecca was another extremely effective way for the vast community of believers to establish trade and business relationships with one another and to exchange ideas and new technologies.

Although religious tolerance was practically unknown at the time, Islam enjoined its believers to treat people of the book (Jews, Christians, and usually Zoroastrians) kindly and not to force conversions unless they took up arms against the Muslims. As an open, universal religion that stresses the equality of all believers, Islam continues to hold great appeal and in the 21st century remains one of the world’s fastest growing religions.

JANICE J. TERRY

Islam: art and architecture in the golden age

Islamic art and architecture is that of the Muslim peoples, who emerged in the early seventh century from the Arabian Peninsula. The Muslim empire reached its peak during the golden age of ISLAM from the eighth to the 13th century. Literary and archaeological evidence reveals that the early architecture of the Muslim communities in Medina and Mecca, presented through the prophet MUHAMMAD’S mosque and residence in Medina and through other smaller mosques, continued the indigenous building style based on a rectangular structure with an open internal courtyard and a covered area. Older structures such as the Ka’aba in Mecca continued

the ancient Arab architectural style found among the Nabataeans in Petra, Palmyra, South Arabia, and Hatra in Mesopotamia.

In pre-Islamic times, the inhabitants of the Arabian Peninsula and its surrounding regions lived in scattered minority communities of Jewish, Christian, and Zoroastrian peoples among a majority of pagans or polytheists. To these people, great legendary architectural palaces, castles, temples, and churches were still-vivid memories signifying power and prestige. They were recorded in poetry and other literary forms and associated with famous cities such as Petra, Palmyra, Hatra, Hira, Madain Salih, Kinda, Najran, Marib, and Sana.

Pre-Islamic records and literary evidence attest to the existence of visual art forms, especially sculpture and painting, which were employed primarily to disseminate copies of icons and sculptural depictions of the many deities and idols worshipped in the region. For example monumental statues of major deities like Hubal, Allat, Al-Uzza, and others were still standing in public locations and temples on the eve of the advent of Islam prior to 630. Small-scale statues and figurines were abundantly available among the pre-Islamic population, and makers of images were active in such cities as Mecca and Taif. Wall paintings from the early Islamic secular buildings in Syria, Jordan, and Iraq reveal important examples of a blending of Mesopotamian, Sassanian, Hellenistic, and indigenous Arab styles. Architectural planning of early Muslim mosques in Egypt and North Africa reveals borrowing from ancient Egyptian architecture.

EARLY ISLAMIC ART AND ARCHITECTURE

The prophet Muhammad died in 632 and within a few years the newly emerged Islamic state expanded quickly and swiftly claimed the realms of both the Sassanian and Byzantine Empires. In less than 100 years the new politicoreligious model reached the steppes of Central Asia and the Pyrenees in Europe. As the Muslim community expanded, the need for a central place of worship emerged and was realized by the development of the mosque—a French distortion of the word *masjid* or “place of prostration.” Islam, a nonclerical, nonliturgical faith, does not employ ritualistic surroundings and the first mosque was actually the open courtyard of the house of the prophet Muhammad in Medina. It functioned as a meeting place and community center.

Later this tradition expanded to the establishment of a central mosque called al-Masjid al-Jami—“the great mosque”—in every major city. With it developed the characteristics of the mosque and its components: an

open courtyard (*sahn*); a roofed area for prayer (*musallah*) with a dome (*qubba*); a niche in the wall of the prayer area (*mihrab*) to indicate the direction of prayer (*qibla*) toward the Ka'aba in Mecca; an elevated platform (*minbar*), from which the congregational leader delivered the sermon; a tower (*minaret*), from which the call to prayer (*adhan*) was issued; and an ablution place for performing the ritual washing before each prayer (*wudhu*). This basic arrangement of functional space found in early mosques in Basra, Kufa, and Wasit in Iraq, and later in the Great Mosque of Damascus and the Aqsa Mosque in Jerusalem, and elsewhere, became the prototype of traditional Islamic mosque architecture.

The rapidly growing state demanded a new Islamic architectural style that developed gradually, acquired new forms, and incorporated diverse methods of visual expression. During the golden age of Islamic civilization a blend of architectural designs and motifs from South and North Arabian, Byzantine, Hellenistic, Indian, Chinese, and other origins was employed in a new building program throughout the Islamic world. Whatever the variety of its components, the final result always presented a unique Arab Islamic style, especially in the early period, where the architecture and art were unified by strong Arab characteristics that can be detected in the art of the Umayyads in Syria, the Andalus in Spain, the Abbasids in Iraq, and the Fatimids in Egypt.

The Arabic language, derived from the Semitic Aramaic language, played a decisive role in the formation of Islamic culture and art. Arabic was the official and original language of the QUR'AN, the holy book of Islam. Arabic was a powerful cultural and literary vehicle with which to disseminate Arab culture throughout the new and diverse Muslim communities in the recently expanded regions of Central Asia, Anatolia, the Mediterranean coasts, Sicily, and Spain. Verses of the Qur'an were inscribed in elegant Kufic and Thulth calligraphic styles on the interior and exterior of major mosques in Jerusalem, Damascus, Basra, Fustat, Tunisia, Sicily, and Spain in a variety of techniques such as stucco, wood carving, and ceramic tiles. The mosque thus became a unifying architectural form and symbol of the monotheistic concept of Islam.

Islam adopted an aniconic style in art that does not promote figurative representation. In the Qur'an, the *sunna* (manners, ethics, behavior, and social practice of the prophet Muhammad), and *hadith* (collection of sayings of Muhammad pertaining to a variety of topics, and everyday life situations), depiction of living forms is discouraged and according to certain interpretations is banned altogether, especially in religious environ-

ments such as mosques. Sunni orthodox interpretation of figurative representation characterized it as an act of defying the power of God, who alone was ascribed the ability of creation. Furthermore the depiction of human beings was also thought to be reminiscent of and an encouragement of pre-Islamic idol worship. These sanctions prompted Muslim artists to create a new form of expression based on the use of Arabic calligraphy—literal meaning and visual composition—and decorative ornamentations. The corroboration of these two powerful visual vocabularies with the already developed conventional Islamic components characterized Islamic art distinctly and continuously.

UMAYYADS: 661–750 C.E.

Borrowing, blending, and modifying motifs, forms, and techniques from Byzantine and Sassanian sources and incorporating them into the indigenous Arabic style characterize the art and architecture of this formative period. This approach was presented through the architectural planning and iconographic design in major buildings, both religious and secular.

In the eastern Mediterranean region a new blend of styles and motifs was incorporated in the early Umayyad buildings. Mosaic decoration, a preferred Byzantine medium, is evident in the case of the Dome of the Rock in Jerusalem, completed in 692; the Great Mosque of Damascus, completed in 715; and the desert palaces in the Syrian regions. Presentation of power, triumph of the new religion, and the emphasis on Islamic theology in early Islamic art were realized through the use of monumental architectural forms, calligraphy, and the ornamental aniconic patterns as in the case of the Dome of the Rock, or the figurative representations in painting and sculpture at the desert palaces Qusayr Amra, Khirbat al-Mafjar, and Mshatta in the Syrian region, and during the early Abbasid period in palaces in Samarra and BAGHDAD in Iraq.

ABBASIDS: 750–1258 C.E.

Beginning around the 10th century the synthesis of Islam and Arab culture was modified by the emergence of decentralized, mostly non-Arab political powers such as the Samanids in Iran and the GHAZNAVIDS in Afghanistan, the SELJUK DYNASTY in Anatolia, the FATIMID DYNASTY in Egypt and Tunisia, and the ALMORAVID EMPIRE (al-Murabitun) and Almohads (*al-Muwahhidun*) in the western areas of Islamic lands. These dynasties and mini independent states contributed to the spread of Islam and consolidated their political power in the Andalus in Spain and established bases in the heart of

The interior of the al-Aqsa Mosque, built in 708 in Jerusalem. A blend of new elements from the recently acquired territories was incorporated in the design of mosques, hospitals, schools, tombs, shrines, palaces, and gardens.

India with the DELHI SULTANATE in 1206. Traders and merchants carried Islam as a religion and culture deep into Africa and Central Asia, and across the sea routes to Indonesia. These new political powers with their cultural trends added new riches to the diverse collection of Islamic science, literature, art, and architecture. Baghdad, the capital of the ABBASID DYNASTY, became the center of knowledge and scientific development.

THE ISLAMIC RENAISSANCE

The Islamic renaissance, which witnessed tremendous advances in every field, prompted architects, visual artists, calligraphers, and artisans of all sorts to collaborate in the production of a vast body of monuments, masterpieces, and manuscripts. A great number of these manuscripts were embellished and illustrated with fine visual presentations, such as the 13th century *Maqamat al-Hariri* illustrated by Mahmoud bin Yehya

al-Wasiti, whose style set a standard for what is conventionally known as the Baghdad school of al-Wasiti. The diverse cultural input of new ethnic groups from Iran, Anatolia, Central Asia, India, and the Mediterranean region enriched the Islamic art repertoire. Figurative illustrations gradually populated manuscripts, especially those of a literary or scientific nature. Figurative representation was used during the Abbasid, Fatimid, Seljuk, Mamluk, and later periods as well. It is important to note that depictions of human figures, although employed by both Shi'i and Sunni artists and patrons, were most common with Shi'i and Sufi art.

In architecture, a blend of new elements from the recently acquired territories was incorporated in the design of mosques, hospitals (*maristan*), schools (*madrasat*), Sufi foundations (*khanaqah*), tombs, shrines, palaces, and gardens. This incorporation furthered and enhanced the definition of a distinct Islamic

style. Muslim architects developed and employed the pointed arch as early as 776 at the al-Ukhaydir palace in Iraq and the al-Aqsa Mosque in Jerusalem in 780. The pointed arch concentrates the thrust of the vault on a narrow vertical line, reducing the lateral thrust on foundation and allowing for higher walls. The double tier arch and the horseshoe arch were developed and used in the Great Mosque of Damascus in 715 and transmitted later to the Andalus in Spain and employed in the Great Mosque of Córdoba.

The square minaret appeared for the first time at the Great Mosque of Damascus and was transmitted later to North Africa and Spain. The pointed arch, horseshoe arch, and the square minaret impacted European architecture and were adopted in Romanesque churches and monasteries and especially in the Gothic cathedral and its towers. Much of the Islamic golden age achievement passed on to Europe through Sicily, Spain, Jerusalem, and other important centers in the Islamic world.

Muqarnas is probably the most distinct and magnificent architectural decorative element developed by Muslim architects around the 10th century, simultaneously in the eastern Islamic world and North Africa. *Muqarnas* is a three-dimensional architectural decoration composed of nichelike elements arranged in multiple layers. Soon after its appearance, *muqarnas* became an essential architectural ingredient in major buildings of the Islamic world in Iran, India, Afghanistan, Iraq, Syria, Egypt, Sicily, North Africa, and Spain. *Muqarnas* structures, augmented with the elegant Arabic calligraphy, floral design, and geometric patterns typically called *arabesque*, produced a dazzling visual composition that characterized the beauty of such places as the interior of the Dome of the Rock in Jerusalem or the Masjid al-Jami' in Isfahan, among other examples.

This composition, accentuated by bands of the Kufic and Thulth styles of Arabic calligraphy, added spiritual and poetic dimensions to the adorned buildings and objects. Qur'anic texts usually cover the exterior and interior of religious buildings with verses and chapters at various locations in the building. Poetry, proverbs, and celebrated sayings may cover secular buildings and nonreligious objects such as dishes, plates, and jewelry boxes. The continuous patterns and repetition of ornaments covering walls and ceilings, running along naves, arcades, and archways, echo a rhythmic tone that originates from one pattern and multiplies in endless, complex, repeated, and variant patterns. It defines the unity in multiplicity of Islamic decorative style. This attractive visual system was so impressive that some early Renaissance artists could not resist copying and imitat-

ing bands of Kufic inscriptions to decorate the clothing of the figure of the Virgin Mary and other biblical figures and angels in paintings of the period.

The golden age of Islam witnessed the emergence of elegant visual art and magnificent architectural achievements that had a major influence on succeeding periods, with its characteristics echoing throughout the Safavid, Mogul, and Ottoman periods.

HASHIM AL-TAWIL

Islam: literature and music in the golden age

Arabic literature developed and dominated the Islamic cultural scene during the eighth to the 13th century and beyond, from BAGHDAD to Córdoba in the Andalus. Arabic language, the youngest and the most widely spoken of the ancient Semitic languages, is the language of the QUR'AN—the sacred book of Islam that culturally unified not only the Arab people, but also non-Arab Muslims. Islamic teaching presented in the text of the Qur'an and the *Hadith*, the sayings of the prophet MUHAMMAD, encouraged learning and praised learned people and the quest for knowledge. The Arabic language has a peculiar regularity and coherent grammatical and structural system that lend to it the ability to express in creative and diverse literary forms such as *Shir* (poetry), *Nathr* (prose), *Adab* (a genre of socioethical literature), *Balaghah* (eloquence), and *Maqamah* (assembly).

In pre-Islamic times the Arabic language was the medium of communication especially in the transmission of oral tradition, poetry, and stories. As early as the fifth century, odes or *Qasidah* (plural *Qasaid*) were composed and the most celebrated were called *Al-Muallaqat* (the suspended), for they were honored and recognized by being displayed on the walls of the Ka'aba in Mecca. Famous among the pre-Islamic poets are Imru al-Qays, Tarafa ibn al-Abd, Zuhayr ibn abi Salma, Labid, Amr ibn Kulthum, Antara, and al-Harithah ibn Hillizah.

During the early Umayyad dynasty celebrated poets emerged with diverse ethnic and religious backgrounds who composed masterpieces of Arabic poetry such as Al-Akhtal, Jarir, and al-Farazdaq.

With the expansion of the Islamic empire during the Umayyad and throughout the Abbasid dynasty, Arabic became the literary language of the era, the liturgy language of Islam, and a powerful literary vehicle to disseminate Arabic culture. Many talents contributed to the legacy of Arabic literature; scholars, linguists, writers, and poets of Arab and non-Arab descent wrote in the Arabic language. During the Umayyad and Abbasid periods scholars gathered and collected the sources for Qur'anic studies and the collections of the *Hadith*. Ibn Ishaq (d. 767) wrote *Sirat Rasul Allah* (Life of the messenger of God), which was later revised by Ibn Hisham (d. 834).

UMAYYAD PERIOD LITERATURE

With the expansion of Islam the Arabic language was refined, first during the Umayyad era with Abu al-Aswad al Duali (d. 688), who founded the Arabic grammar and diacritical color-coded points Tashkeel. The dotting system and vowels signs developed by Al-Khalil ibn Ahmed al-Farahidi (d. 786) soon replaced that system. Al-Farahidi was the first Arab philologist who compiled the first Arabic dictionary; he was credited with the formulation of the rules of Arabic prosody. His major work was *Kitab al-Arud* (Book of prosody). His student Sibawayh (d. 793) codified grammatical rules. Later Al-Mubarrad (d. 898) wrote *al-Kamil fi al-Lughah wa al-Adab*, which was an invaluable collection of references to Arabic philology through poetic quotations. His rival al-Thaalibi also contributed to this field with his major work *Yeteemat al-Dahr*, a bibliography of poets and writers of Arabic. Another outstanding scholar in this field was the Andalusian linguist Ibn Malik (d. 1274), who composed the famous *Alfiyah* in which he compiled and analyzed all Arabic grammatical rules in 1,000 verses of poetry composed in a single poetical masterpiece. Other scholars worked on the subjects of jurisprudence, theological discourse, fundamentals of Arabic grammar, lingual terminology, rhetoric, and *adab*. Bayt al-Hikmah in Baghdad was the departing center for the quest of Hellenistic and Eastern knowledge in science, mathematics, philosophy, geography, astronomy, and literature.

Historians and biographers worked diligently on documenting the history of the Islamic state, pre-Islamic period, and ancient civilizations. Early transmitters of

accounts are Kab al-Ahbar, Hammad al-Rawiyah, and Wahb ibn Munabbih from the eighth century. The list of important early historians includes Ibn al-Kalbi (d. 820) and his major work *Kitab al-Asnam* (Book of idols); Al-Waqidi (d. 823), who was affiliated with the Abbasid court in Baghdad and who wrote *Kitab al-Maghazi* (Book of the raids of the prophet); Ibn Sad (d. 845) was al-Waqidi's secretary and wrote a major biographical dictionary called *Kitab al-Tabaqat* (The book of classes [of persons]); Al-Azraqi (d. 865), a native and historian of Mecca, wrote an extensive history of Mecca, *Akhbar Mecca*. Al-Bukhari (d. 870) was a historian and the famous *Hadith* compiler and interpreter. His major work was the collection of the sayings of the prophet Muhammad known as *al-Jami al-Sahih*; Al-Baladhuri (d. 892) was a great historian and companion of the Abbasid caliph al-Mutawakkil and wrote many treaties; the most famous was *Futuh al-Buldan* (History of the Muslim conquests).

Al-Yaqubi (d. 897), a historian and geographer, wrote a history of the world known as *Tarikh al-Yaqubi*, and *Kitab al-Buldan* (Book of countries). Al-Tabari (d. 923) was another noted historian, lexicographer, and scientist. His major work is *Tarikh al-Rusul wa al-Muluk* (History of the world); Al-Masudi (d. 956) was born and lived in Baghdad and traveled widely; most of his works were lost and only one survived: *Muruj al-Dhahab wa Maadin al-Jawhar* (Fields of gold and mines of jewels), which was a short history of the world down to the end of the Umayyad period; Ibn al-Nadim (d. 990) was the son of a book dealer born in Baghdad. His massive work *al-Fihrist* was intended to be an index of all books written in Arabic from early Islam up to Ibn al-Nadim's time. The vast majority of the books mentioned in his *Fihrist* are given with information on the authors and subjects. Ibn Khaldun was perhaps the most famous Arab historian and sociologist, who changed the course of interpreting historical events and set the mode for modern methodology in historiography with his influential book *al-Muqaddimah* (Introduction).

Arabic prose flourished in Baghdad with Ibn al-Muqaffa (d. 757), who translated many Pahlavi works and was famous for his *Kalila wa Dimna*, a collection of didactic fables in which two jackals offered moral and practical advice. Originally derived from the Sanskrit *Fables of Bidpai*, *Kalila wa Dimna* was the inspirational source for La Fontaine's *Fables*. From Basra came Al-Jahiz (d. 869), who developed Arabic prose into a literary vehicle of precision and elegance and was one of Baghdad's leading intellectuals. He wrote over 200 works; the most famous of them were

Kitab al-Hayawan (Book of animals), *al-Bayan wa al-Tabyeen*, and *al-Bukhala*. Equally important was Abu al-Faraj al-Isbahani (d. 967), also called al-Isfahani, who was an Arab historian, intellectual, and poet. His monumental book *Kitab al-Aghani* (Book of songs) is an anthology of songs and poems from the earliest epoch to the author's own time. These were especially those were popular in Baghdad during HARUN AL-RASHID's reign.

ABBASID PERIOD LITERATURE

The early Abbasid period witnessed the birth of new genres in poetry where politics, eroticism, and blasphemy mingled. The emergence of a political trend geared toward undermining the dominant Arab culture in what came to be called *Shuubism*, or anti-Arabism, led to a new genre of literature. An adamant leader in this trend was the renowned blind poet Bashshar ibn Burd (d. 783). Other poets also excelled in various genres such as Muti ibn Iyas (d. 787), Abbas ibn al-Ahnaf (d. 808), Muslim ibn Walid (d. 823), Abu Nuas (d. 813), and ibn al-Rumi (d. 896).

Many poets revived classical Arabic poetry such as Abu Tammam (d. 843), al-Buhtari (d. 897), al-Mutanabbi (d. 956), and al-Maarri (d. 1057). The art of the genre *Maqamat*, an assembly of rhymed prose of amusing anecdotes narrated by a vagabond who made his living by his wit, was associated with two famous names, al-Hamadhani (d. 1008), who invented the genre, and al-Hariri (d. 1122), who elaborated on the style and excelled in composing linguistic virtuosity where the literary form was more important than the content. The talented visual artist Mahmoud bin Yehya al-Wasiti, who established a distinct and influential artistic style in 13th century Baghdad, illustrated al-Hariri's *Maqamat*.

Storytelling literature had flourished since the early period of Islam. Storytellers were street preachers who used old Arab folk tales mixed with religious flavor; they spoke to enthusiastic and attentive audiences in mosques and other public places. Remains of this folk art are found in the form of al-Hakawati in present-day Cairo, Damascus, and Marrakesh. A favorite literary subject of these storytellers was the epic tale of Arab bravery presented in such work as *Sirat Antara*.

Out of this type of oral tradition and sometime around the 15th century evolved the most famous Arabic literary work in the West: *Alf laylah wa Laylah* (Thousand and One Nights, or Arabian Nights). It revealed a blend of legends, fables, and fairy tales derived from many cultures such as the Mesopotamian, Persian, Greek, Indian, Chinese, Turkish, and Arabic,

traditions integrated and reintroduced through tales and legacies correlated with Abbasid times.

In the western part of the Islamic state al-Andalus, a similar cultural revolution took place and built widely on the eastern Islamic prototype. One particular form of literature was distinctly Andalusian, *al-Muwashshahat*, which was a love poem performed with singing and music. Among the brilliant names associated with this art are Ibn Sahl, Ibn al-Khatib, and Ibn Hazm. As early as the 12th century Muslim Spanish academies, similar to Bayt al-Hikmah in Baghdad, were opened for translating Arabic into Latin. Scholars from France, England, Germany, and northern Europe converged in the Andalus to study Arabic literature and other subjects.

As early as the second half of the ninth century a new type of literary work emerged throughout the Abbasid Empire, that is, geohistorical writing accentuated with traveler observations and accounts. Major examples of this type were Ibn Fadhlān, Abbasid ambassador to the Viking kingdom, and his account *Rihlat ibn Fadhlān* (Travels of Ibn Fadhlān) in 922; in Baghdad, Ibn Hawqal (d. 969) wrote *Surat al-Ardh* (Description of the Earth), where he described Spain, Italy, and the Byzantine territories. In 1154 Al-Idrisi was commissioned by the Norman king Roger II in Palermo and composed a geographical account of the world called *Nuzhat al-Mushtaq fi Ikhtiraq al-Afaq* also known as *Kitab Rodjar*.

Yaqut al-Hamawi (d. 1229) wrote a major geographical dictionary, *Mujam al-Buldan*, which contained significant biographical, cultural, and historical data on the known world. Al-Qazwini (d. 1383) wrote in Baghdad his cosmographic work *Ajaib al-Makhlūqat wa Gharaib al-Mawjudat* (Marvels of things created and miraculous aspects of things existing).

The book was very popular and was translated into Farsi and Turkish and was often illustrated lavishly. Al-Qazwini also wrote an important geographical account. IBN BATUTA traveled extensively through Africa, Europe, and Asia and recorded his accounts in his *Rihlat Ibn Batuta* (Travels of Ibn Batuta), a classic in Arabic literature.

The Arabs learned papermaking technology from the Chinese in the eighth century and substituted mulberry bark and other organic matter with linen as raw materials, and the first papermaking factory was established in Baghdad in 793. This was a turning point in the spread of education and the development of Arabic literature throughout the Islamic world. Expensive parchment and fragile papyrus were replaced by paper that was affordable, practical, and durable. Libraries were common and were open to the public. Booksellers gathered around

major mosques and markets with their shops stocked with volumes of desirable works; shops became popular gathering places for scholars and writers. Specialized workshops of manuscript copying were manned with professional and efficient copyists, calligraphers, illustrators, and linguists.

The fall of Baghdad to the Mongols in 1258 marked the beginning of the decline of the golden age of Arabic literature as well as other scientific activities. However the massive destruction of books by the invading armies of GENGHIS KHAN, HULAGU KHAN, and later TIMURLANE (TAMERLANE) prompted Arab scholars to compile, digest, codify, and abridge major encyclopedic and collection works, hence preserving Arabic literary heritage with such authors as Al-Qazwini, Yaqut, Ibn Malik, Ibn Khaldun, Ibn Batuta, Abu al-Fida, and Al-Zabidi.

HASHIM AL-TAWIL

Islam: science and technology in the golden age

Science, technology, and other fields of knowledge developed rapidly during the golden age of Islam from the eighth to the 13th century and beyond. Early Abbasid caliphs embarked on major campaigns seeking scientific and philosophical works from eastern and western worlds. BAGHDAD, the capital of the Abbasid Empire, became the center of intellectual and scientific activity. The first academy, Bayt al-Hikmah (House of Wisdom) was established by the Abbasid caliph HARUN AL-RASHID and was expanded by his son the caliph al-Ma'mun (d. 833). By the ninth century, Baghdad had become a center of financial power and political prestige and intellectual pursuits flourished in numerous colleges, schools, hospitals, mosques, and libraries.

Baghdad attracted visitors, ambassadors, and students from all parts of the empire.

THE BEGINNING

During the seventh century the Arab empire and Islamic domain included the realm of the old Persian Empire and most of the Byzantine Empire. This resulted in access to the wealth and heritage of both Hellenistic and Eastern philosophy and knowledge. During the immediate pre-Islamic period (fifth–seventh centuries), Hellenistic science and knowledge passed to the Arab people through Alexandria in Egypt, Nasibis in Syria, and Antioch and Edissa in northern Mesopotamia and Asia Minor. Through these centers much Greek philosophy and science was preserved by Coptic, Nestorian (Eastern Orthodox), and Jacobite Christians.

In Persia, Jundi-Shapur was another important pre-Islamic center for the quest of scientific knowledge. It was established during the Sassanian period and was located in Khuzistan, not far from the Abbasid capital of Baghdad. Home to many Nestorian and Zoroastrian scholars, it was conquered by the Arabs in 636. Abbasid caliphs summoned many of these scholars to serve on the faculty of the newly established Bayt al-Hikmah.

Harran was another important intellectual center. Situated in eastern Anatolia, Harran was a center for Sabaeans, a pre-Christian monotheistic Semitic people who preserved both Babylonian and Hellenistic heritages. Therefore several agencies worked to develop and extend Hellenistic and Eastern heritage.

QUEST FOR LEARNING

During the seventh and eighth centuries as Arabs conquered new lands they preserved, assimilated, and transformed the cultures of their subjects. Beside the Arabic speaking scholars there were also Nestorians with knowledge of Greek and Syrian languages (dialect of Aramaic), Sabaeans who spoke a dialect of Aramaic, Zoroastrians who used Pahlevi (an old Persian language related to Aramaic), Indians knowledgeable in Sanskrit, and Jews fluent in Hebrew. However Arabic was the literary language of both the Umayyad and Abbasid Empires as well as the liturgy language of ISLAM.

Hence Arabic became the literary and scientific lingua franca of the time. By virtue of its root relation to the different Aramaic dialects, Arabic unified the collective intellectual effort of scholars into one dialect. Furthermore, the new Arab/Islamic authority related easily to these diverse groups and shared many of the same cultural values. Records indicate that Nestorian scholars translated Greek philosophical treatises to Syriac

and Arabic during the Umayyad period in the eighth century; they also studied Aristotelian logic, metaphysics, and medical and scientific works.

Empowered by the new Islamic state and fueled by the quest for knowledge that was encouraged by many Qur'anic verses and Hadiths advocating the pursuit of knowledge, Caliphs Harun al-Rashid and al-Ma'mun sponsored envoys to Byzantine and Christian authorities in Europe to gain access to Greek manuscripts, hitherto kept in basements and attics of churches and monasteries. Countless manuscripts, especially in Greek, were collected and stored at Bayt al-Hikmah. Early scholars went to Baghdad from diverse areas and backgrounds and enjoyed considerable respect and religious tolerance from their Muslim colleagues.

Caliph al-Ma'mun encouraged the translation of Greek and other texts into Arabic. The caliph surrounded himself with learned men, legal experts, rationalist theologians, lexicographers, and linguists. Yuhanna bin Masawayh (d. 857) and his student Hunayn ibn Ishaq (d. 874) and a host of others headed the program at Bayt al-Hikmah.

Works of Greek philosophers such as Porphyry, Aristotle, Galen, and Hippocrates were translated to Syriac and then to Arabic. The bulk of these materials were exhaustively analyzed and consequently codified and reintroduced with a particular Islamic Arabic identity.

In 751 the Arabs learned the technology of papermaking from the Chinese; the first paper mill was established in Baghdad around 793. The knowledge soon spread to Jerusalem, Egypt, and the Andalus in Spain, which was instrumental in transmitting the technology to Europe. Bayt al-Hikmah developed a vast library and a systematic program of translation and study. For the next 300 years, Baghdad remained a center of knowledge. Córdoba in Spain was an equally active scientific center.

SCIENCE AND MEDICINE

Islamic scholars expanded on the works of Greek physicians such as Galen. Al-Razi (Rhazes, d. 925) was an alchemist, physician, and clinician who wrote the first medical description of smallpox and measles; he combined psychological methods with physiological explanations. He also developed the discipline of pharmacology, found treatment for kidney stones, and used alcohol as an antiseptic. In his medical encyclopedia he included 50 contraceptive methods for women. The Latin version of his work was published and used as a text in Milan, Venice, and Basle. IBN SINA (Avicenna) was a philosopher, poet, and physician who wrote a vast canon of medicine. Ibn Sina's writing was held in high

repute in Europe and was appreciated by Saint THOMAS AQUINAS and ROGER BACON.

In Spain, Ibn al-Khatib (Ibn al-Jatib, d. 1375) of Granada composed a treatise on the theory of infection. Ibn Zuhr (Avenzoar, d. 1162) of Seville was another prominent physician. Al-Zahraw (Alzahravius, d. 1013), a famous surgeon, left the first descriptive account of hemophilia. Ibn al-Nafis (d. 1288) was the first to describe the anatomy of the pulmonary vessels; his medical writing was translated to Latin. Ibn al-Haytham al-Khazin (Alhazen, d. 1039) wrote *The Book of Optics*, in which he gave a detailed treatment of the anatomy of the eye and correctly deduced that the eye receives light from the object perceived, thereby laying the foundation for modern photography.

PHARMACOLOGY

In the field of therapeutics, Yuhanna bin Masawayh (d. 857) started a scientific and systematic method in Baghdad. Hunayn outlined methods for confirming pharmacological effectiveness of drugs by experimenting with them on humans. He also emphasized the importance of prognosis and diagnosis of diseases. Other famous names in this field were al-Biruni and Ibn Butlan. Pharmacies were open in towns and cities and were regulated by the government. Much of the repertoire of modern pharmaceutical and chemical terminology derives from Arabic, including *alchemy*, *alkali*, *alcohol*, *elixir*, *saffron*, *zenith*, and *zero*. Famous Arab scientists in this field include Ibn al-Bitar (d. 1248), who was born in Malaga, worked in Damascus, and served as chief inspector of pharmacies in Egypt.

Arab scientists introduced Greek medicine to India and Central Asia in the ninth century and that knowledge flourished under dynasties following the Mongol invasion through the 17th century. Islamic medical practice transformed the theological and superstitious and talismanic rituals inherited from medieval culture to methodical hospitals equipped with educated and certified physicians. Hospitals in Baghdad, Damascus, Jerusalem, Cairo, and Córdoba were equipped with pharmacies and libraries; they incorporated innovations such as fountains to cool the air, storytelling to ease pain, and the sound of music to treat mental illness. Throughout the Islamic world mental institutions were built and were equipped with baths, drugs, music therapy, and occupational therapy.

APPLIED SCIENCE AND TECHNOLOGY

The wealth of knowledge and scientific achievement spread to different centers in the Islamic world and

was reflected in the lifestyle, public education, health service, commercial activity, and military as well as in art and architecture. Schools, libraries, hospitals—both permanent and mobile—courthouses, shopping centers, parks, and public baths were regular features of life in medieval Arab and Muslim cities. Observatories, textile factories (Tiraz), metal and copperware manufacturing centers, and manuscript production centers were widespread. The astrolabe, pendulum, clock, sphere, and many other engineering tools and mechanical devices were commonly used.

In the field of science and mathematics, the three brothers Banu Musa—Muhammad, Ahmad, and al-Hasan—were pioneers and were the first to translate Greek mathematics in the ninth century. They extended their patronage to others and their work was later translated into Latin. Jabir Ibn Hayyan (Geber, d. 815) was a pioneer in the field of applied science and was considered the father of chemistry. Among the achievements of Muslim scholars during this period were the invention of spherical trigonometry and advances in optics. Famous scholars in this field were AVERROËS (Ibn Rushd) and Al-Kindi (Alkindus, d. 873). Al-Farabi (Alpharabus, d. 950) made notable contributions in the fields of mathematics, medicine, and music. Al-Khwarizmi (d. 840), with a Zoroastrian background and knowledge of Sanskrit, made major contributions in the fields of trigonometry, astronomy, and cartography. He founded algebra and developed the concept of algorithms (which are named after him) and introduced the Arabic numeral system to the world. Al-Idris (d. 1166) was born and educated in the Andalus and was famous as a botanist, geographer, and medical scientist. He worked as the personal scholar for the Norman king Roger II and produced advanced maps of the world as well as an important geographical encyclopedia.

MECHANICAL ENGINEERING

The Arabs also developed two types of mechanical inventions: for everyday use things such as mills, water rising devices, and war machines; and automat, devices for pleasure, novelty, and wonder. The latter category included innovations such as self-trimming lamps, multifluid dispensers, musical fountains, and calculating devices. Water clocks were major technological inventions. In this field, the 13th-century scientist Al-Jaziri is well known for his book *The Book of Knowledge of Ingenious Mechanical Devices*. He also researched the development of steam engine and pumping machinery. Waterwheels to lift water from ground level to higher levels, based on the manipulation of the pressure of the

water, were common in Syria, Egypt, and Spain during the golden age of Islam.

Elaborate underground water channels, *qanats*, were widespread. Islamic inventions and knowledge, along with artistic and architectural knowledge, passed to Europe through many channels. Inventions like paper, the silk loom, astrolabes, compasses, waterwheels, and windmills, as well as agricultural crops like cotton (*qutn*), sugar (*sukker*), rice (*ruzz*), oranges (*burtuqal*), tea (*shai*), and coffee (*qahwa*), were transmitted to Europe. The collective efforts of Muslim scholars helped pave the way for scientific development in photography, gunpowder, marine warfare, and mechanical engineering.

In 1258 the Abbasid Caliphate ended when the Mongols, under GENGHIS KHAN's grandson HULAGU KHAN, conquered all of Central Asia, Iran, and Iraq. The Mongols massacred tens of thousands of people including many scientists; they destroyed Baghdad with its libraries, schools, mosques, and residential quarters. The coming of the Mongols marked the end of the golden age of Baghdad as a center of scientific and literary achievement of the Muslim world. But the echoes of that renaissance continued to reverberate in other parts of the Islamic world. Much of the Arab-Islamic scientific heritage passed to Europe through the crusaders, the Normans in Sicily, and the Mozarabic (Musta'rabeen) in Spain. Arab-Islamic science, medicine, mathematics, and technology were transmitted to Europe in written forms, especially the translation of the Greek heritage into Latin that was generated by Arab scholars in Salerno, Palermo, Toledo, Seville, and Córdoba.

HASHIM AL-TAWIL

Islamic law

Shari'a is the collection of Islamic law that developed and was enlarged upon over a number of centuries. In Islamic society, *fiqh*, jurisprudence, was considered the queen of sciences and was held in extremely high esteem.

Under the Abbasids Shari'a evolved as a codified system of Islamic law. The Shari'a was based on the word of God as given through the QUR'AN, Hadith, and Sunna. The compendiums of law included aspects of customary tribal law as well as religious law as given in the Qur'an. In spite of variations in interpretation, the Shari'a united Muslims across continents and influenced every aspect of their lives. Much of the law dealt with family matters (marriage, divorce settlements, inheritance) but also provided guidelines for the treatment of slaves, business matters, usury (forbidden), and the oversight of *waqf* (plural *awqaf*), or religious foundations. The law implied, in varying degrees, some measure of *ijtihad*, human judgment or interpretation. In Islam as in Christianity, scholars and theologians debated the degree of independent thinking allowed. Some permitted a greater degree of human interpretation while others argued that the sacred texts were to be implemented literally word by word.

The *ulema*, Muslim scholars, provided interpretations of the texts based on extensive research and study. *Qadis*, well-trained judges, were appointed by local rulers to pass judgments and issue verdicts on specific cases. When jurists could not agree on an issue or case the *muf-tis* or a so-called Sheikh al-Islam delivered *fatwas* or legal pronouncements. The issues dealt with in fatwas varied from weighty theological matters to matters of dress or the legality under Islam of drinking coffee.

Muslim scholars were divided over when or if the gates of *ijtihad* closed. Many held that by end of the 12th century *ijtihad* was no longer permissible; however, others argued that independent thought was an ongoing process and that the law was constantly being reinterpreted and reassessed. Qadis often engaged in *taqlid* or imitation of earlier judgments.

By the 1300s there were four recognized schools of Sunni law. The Shafi'i, named after Muhammad Idris ibn al-Shafi'i (d. 820), was applied in Southeast Asia and much of Syria, Palestine, and Jordan. The Maliki, after Malik ibn Anas (d. 795), was fairly conservative in its interpretations and became prevalent in Egypt and North Africa. The Hanbali, after Ahmad ibn Hanbal (d. 833), was the most conservative and mandated the strict adherence to the letter of the law. It became the law applied in modern Saudi Arabia. The Hanafi, after Abu Hanifah al-Muman ibn Thabit (d. 767), was considered the most liberal of the schools of law. Hanafis used *ra'y*, or opinion, and questioned many of the Hadiths; it was adopted by the Ottoman Empire and became the most widely applied school of law.

Technically a Muslim could choose any one of the four schools but in practice nation-states tended to apply a single one and individuals usually followed the one applied in their nation-state. The Shi'i in Iran evolved their own legal codes implemented through mullahs, the established clergy. Among Shi'i scholars, as within the Sunni community, there was a lively debate over *ijtihad*. Among the Shi'i the debate continued into the 17th century with the community generally following the guidance of the imams on issues of interpretation and practice.

Isma'ilis

The Isma'ilis are a sect within Islamic SHI'ISM. Also known as Seveners, the Isma'ilis split from the Twelver Shi'i in 765 when they chose to follow Isma'il, the second son of the sixth imam.

Early Isma'ilis were avid proselytizers and revolutionaries who attacked and sometimes even killed Sunni leaders. To protect themselves from prosecution from the ruling Sunni government they practiced *taqiyya* or dissimulation to conceal their true beliefs and affiliation. Some other Shi'i sects also used *taqiyya* to protect themselves and their communities. In 909 the Isma'ilis established the FATIMID DYNASTY, which ruled large areas of the Muslim world from their new capital Cairo in Egypt. In the 16th century, Shah Ismail of the Safavid dynasty in Persia also claimed to be a Sevenser imam.

The Assassins were a much dreaded offshoot of the Isma'ilis. Based in a fortress stronghold on Mt. Alamut in northern present-day Iran, the Assassins were led by the so-called Old Man of the Mountain or Grand Master. They assassinated Abbasid leaders and the fear they aroused in both Muslims and Christians gave rise to numerous legends regarding their prowess and secret society.

In the 1800s the Isma'ili imam acquired the honorary title of *Aga Khan* through a marriage alliance and moved to India. The present-day Aga Khan, Prince Karim Aga

Khan IV, is the 49th imam in the chain of Isma'ili leaders. Believed to be continuation of the living imam, he continues to interpret Islam to fit present-day needs. Although there are scattered communities in Africa and elsewhere around the world, most present-day Isma'ilis live in India, where they form a rich merchant class.

Italian city-states

The history of Italy is the history of cities. This was especially true in the late Middle Ages and early Renaissance when Italian cities gained such economic and political prominence that, independently of one another, many were considered actors on the European political stage. Generally defined, city-states were cities that had won their independence from the HOLY ROMAN EMPIRE or the papacy. Instead of recognizing the pope or emperor as the highest authority, they held popular sovereignty as a guiding principle.

They tended to prioritize controlling the region surrounding the city, called the *contado*, such that some

Padua was an Italian city-state—a region controlled usually by one family, centered around a major metropolitan area.

eventually became large territorial states. The Italian city-states of the 14th and 15th centuries are recognized today for the profound influences that they had on the development of the Western political, economic, artistic, and literary tradition.

Throughout the Middle Ages the Italian peninsula (especially its northern half) was one of the most urbanized areas of Europe, with up to 30 percent of people living in cities. Some such as Rome, Naples, Florence, Milan, and Venice were larger, while others such as Perugia, Siena, Pisa, Ferrara, Urbino, or Verona were small.

In the Middle Ages almost all these cities owed allegiance and taxes either to the Holy Roman Emperor or to the papacy. Imperial cities generally adhered to the Ghibelline party, and papal cities, to the Guelf. The emperors' and popes' repeated demands for military and financial support for endless wars exhausted city dwellers and spurred movements for independence. The first great victory for the cities came in 1183, when the German emperor FREDERICK I at the Treaty of Constance recognized the independence of the northern Italian cities. The papacy's 14th-century departure for Avignon in southern France allowed many disgruntled cities to proclaim independence.

The city-state was a phenomenon of northern Italy. It did not appear in the south, as both Naples and Sicily remained firmly under the power of the royal houses of Aragon and Anjou. In the north, the major city-states to emerge were Florence, Venice, and Milan. Rome achieved a similar status in the 14th century while the papacy was in Avignon but in the 15th century was brought again under papal control.

After throwing off the traditional lordship of pope or emperor, many cities turned to ideas of popular sovereignty at the expense of traditional elite prerogatives. They developed complex political processes to bar elite families from governing. New advances in commerce and banking, such as the concepts of credit, insurance, and bookkeeping, aided the development of an urbanized merchant class. These new sources of wealth reduced the dependency on land and, as a consequence, the power of the traditional landed nobility. These changes were bolstered by developments in legal theory. The 1293 Ordinances of Justice, for example, prohibited elite participation in Florentine politics. In Rome, the popular leader Cola di Rienzo (c. 1313–54) led a movement aimed at curtailing the privileges of the city's noble families.

Although 19th-century historians liked to see in the Italian city-states nascent forms of democratic rule, pop-

ular regimes were hardly ever open to the lower echelons of society, or the *popolo minuto*. Most were in fact headed by what was often termed the *popolo grasso*—the educated lawyers, successful merchants, and nonnoble landowners with the financial and social wherewithal to bring them to the forefront of the political stage. Only isolated occasions such as the 1378 Ciompi revolt in Florence brought the *popular minuto* to power, and their political lifespans were inevitably short.

Despite efforts at curtailing noble power, elite families were never entirely sidelined from most civic governments. In Venice, for example, participation in government was reserved for the hereditary elite. Some families, such as the Visconti, and later the Sforza in Milan, the Carrara in Padua, and the della Scala in Verona, became the de facto lords of the city. Even Florence, arguably the most republican, had by the 1430s in all but rhetoric accepted the Medici as the city's primary power.

In response to the complex diplomatic conditions of the time, political thought in the Italian city-states flourished. Thinkers such as the notary Bruno Latini (c. 1220–94), Marsilius of Padua (c. 1275–1343), and the jurist Bartolus of Sassoferrato (1314–57) all elaborated political theories that justified and paid tribute to republican government. Others such as the Florentines Coluccio Salutati (1331–1406) and LEONARDO BRUNI (1370–1444) wrote highly rhetorical pieces aimed at illuminating the ideological struggle between what they saw as virtuous republican government and the champions of tyranny in the *signoria* of other cities such as Milan. And Niccolò Machiavelli, whose political acumen derived from observing the civic strife of Florence and her neighbors at the turn of the 16th century, left an indelible imprint on Western political thought with his theories of republican and princely government.

Art and architecture flourished as well in the Italian city-states. Economic prosperity allowed for great public building projects such as cathedrals, libraries, and government *palazzi*, all of which proclaimed the city's greatness. Artists like Ambrogio Lorenzetti illustrated the benefits and ills of good and bad government in his 1338–39 frescoes in Siena's Palazzo Pubblico. Venice from the late 15th century on was at the forefront of printing press technologies, while Rome in the same period served as a center for a mature humanistic culture.

ALIZAH HOLSTEIN

Italian Renaissance

As the opening two phases of the grand cultural and intellectual rebirth (literal meaning of the French term *Renaissance*) of the late medieval period, the Italian Renaissance, or Quattrocento (Italian for 1400s), and early northern renaissance sparked tremendous achievements in literature, art, architecture, and music that were inspired by creative interaction with rediscovered sources of classical antiquity. Launched from Florence, the Italian Renaissance concentrated its energies in the northern regions of Italy before moving south to Rome, where its spirit was embraced by the Renaissance popes. It reached its zenith in the late 15th century prior to its dissolution, aggravated both by an ecclesiastical backlash against its perceived secularism and sensuality and by the series of Italian Wars, or foreign invasions against Italy, starting in 1494. The Renaissance fervor was not to be extinguished, however, as its ideals migrated northward to France, then to the Low Countries and Germany, and finally to England and Scandinavia by the close of the 16th century.

Most common people of the time were unaffected by these innovations and did not view their age as distinctive. Producers of its main aesthetic streams, such as authors, artists, and their patrons, willfully rejected the culture of the preceding era (the Middle Ages) and set out to create a new one. Sensing only a limited attraction to the courtly motifs of the medieval secular literary tradition and disillusioned by the elaborate argumentation of SCHOLASTICISM, the sophisticated urban ruling classes searched for a new culture that would enable them to cope with the quandaries of human existence and empower them to deal with and even manipulate other people.

Perfectly suited for this aim was the literature of ancient Rome, with its strongly political and ethical outlook and the prominence it placed upon oratorical and rhetorical training. To gain a deeper understanding of Latin literature, the urban elites were quickly drawn to the Greek literature that Roman authors frequently cited and presupposed of their readers as background knowledge. Hence the classical Latin and Greek texts of antiquity served as a common springboard for the era's multifaceted and interdisciplinary cultural shift.

The hand of God almost touching the hand of Adam, a detail from Michelangelo's frescoes on the Sistine Chapel in Rome. The Sistine Chapel stands as perhaps the single greatest work of High Renaissance painting.

SOCIAL ORIGINS

While formally beginning in the 15th century, the social origins of the Italian Renaissance can be traced back to the economic, social, and political developments in Italian society during the 12th through 14th centuries. The 12th and 13th centuries comprised an age of expansion and prosperity directed by the capitalistic noble classes, or *grandi*, who often resided in the cities and invested in business but whose cultural traditions were military and feudal, giving preference to the chivalric and courtly literature of France. This changed in the late 13th century when the nonnoble classes, led by rich businessmen, seized control of many town governments and drove the *grandi* from power. However the 14th century experienced a series of disasters that, paradoxically, modified the structural foundations of Italian society so as to promote the flourishing of artistic and literary endeavors.

Amidst the HUNDRED YEARS' WAR between England and France, King Edward III of England disclaimed his debts in 1345, leading to the collapse of the two largest Florentine banks, owned by the Bardi and Peruzzi fami-

lies. From 1347 to 1350 the BLACK DEATH, or bubonic plague, exterminated one-third of Europe's population, which triggered an economic depression followed by a lengthy period of stagnation. While these events prevented the founding of new fortunes, they left the wealth of established rich families largely intact, creating a new social condition. Since the relatively high degree of social mobility that kept business enterprise open to new talent and preoccupied with acquiring new wealth had evaporated, the dominant business class was converted from a group of self-made men to a group of men who had inherited their wealth and who had been raised in luxury that they intended to preserve but they could largely take for granted.

Rich businessmen, who retained their active participation in politics to defend their material interests from radical movements spawned by working-class agitation, now devoted an equal amount of time to public affairs, especially the patronage of art and literature. Looking to Greco-Roman antiquity as a model of administrative effectiveness and intellectual genius, the thinkers, writers,

and authors of the age, collectively known as humanists, founded a new approach to scholarship, the mission of which was to restore “true” civilization in place of the prevalent “barbarous” civilization. This view of history was spearheaded largely by PETRARCH (1304–1374), who proceeded to synthesize it with his new anthropology, or doctrine of humanity, that humans were rational and sentient beings, intrinsically good by nature, with the power to think and choose for themselves. With this blatant denial of the Christian doctrine of Original Sin, the humanists provoked fresh insights about reality that questioned the church’s philosophical perception of the universe and the role of humanity within it.

Before the 13th century, Italian was not the language of literature in Italy, as most works were composed in Latin, French, or Provençal. However, in the late 13th and early 14th centuries before the rise of Renaissance humanism, a number of masterpieces in the vernacular catalyzed the transition of Italy from a cultural backwater to the leader of European culture. The nation’s first great literary figure, DANTE ALIGHIERI (1265–1321), wrote his magnum opus, *La divina commedia* (The Divine Comedy), in Italian, which reflected the social and political life of the Florentine people and amassed great popularity. Petrarch became the second great figure of Italian vernacular literature through poems capturing the attention of both refined courtly society and the common people. The master of the Italian sonnet, Petrarch is best remembered for his highly personal and subjective love poetry, most notably the *Canzoniere*, a collection of sonnets addressed to his unrequited love, Laura.

The third great figure of 14th century Florentine literature was Petrarch’s disciple, GIOVANNI BOCCACCIO (1313–75), whose principal work, the *Decameron*, featured 100 stories recounted by 10 storytellers who fled to the outskirts of Florence to evade the Black Death. His work was heightened by motifs reflecting everyday life, including satire against corrupt clergymen, amusing treatment of human idiosyncrasies, and tales of marital infidelity. Unfortunately the trend toward classical humanism in the first half of the 15th century temporarily stifled the germination of the vernacular tradition, which deterrence was removed by the major revival of the vernacular in the second half of that century.

Under the influence of Florence’s leading family, the Medicis, Italian resurfaced as a medium for important literary work and came to the fore when Lorenzo de’ Medici, the first of the family educated from an early age in the humanist tradition, formalized Medici rule over the city with his creation of the new Council of Seventy, over

which he appointed himself head, in 1469. Lorenzo was a lyric poet of great ability who set the stylistic parameters for both secular and religious poetry in the vernacular. The Florentine Petrarchan tradition experienced great development under the Venetian cleric Pietro Bembo, a leader in the movement attempting to restore the purity of the Latin language embodied in Cicero, when he embraced its highly refined sentiment and technical mastery of intricate verse forms for his Italian poetry.

Popular literature of a less aristocratic flavor often applied French chivalric and courtly themes to Italian characters. Recasting the French heroic knight into the Italian Orlando, Italian courtiers such as Luigi Pulci (1432–84) adapted this material for consciously humorous verse. Medieval French chivalric themes were discussed more seriously in the poem *Orlando innamorato* (Orlando in Love) by Matteo Boiardo (1441–94), a noble at the refined court of the dukes of Ferrara who invented a new style integrating humanistic classical topics with medieval chivalric interests. This style received further advancement under Ludovico Ariosto (1474–1533) in his *Orlando furioso* (Orlando’s Insanity) and reached its pinnacle in the 16th century with Torquato Tasso (1544–95), whose *Jerusalem Delivered*, an epic of the CRUSADES, revamped this popular medieval theme into a major literary production that influenced practically all other 16th-century literature.

Brunelleschi is renowned for his octagonally designed dome base for the cathedral of Santa Maria del Fiore in Florence.

The most brilliant example of Italian prose in the High Renaissance (the early 16th century) is the work of Niccolò Machiavelli (1469–1527) on politics and history. His two principal books, *The Prince* and *Discourses on the First Ten Books on Titus Livius*, drew heavily on the author's firsthand experience as a leading Florentine diplomat and civil servant in the Florentine republic (1494–1512). Although *The Prince* is notorious for its advocacy of political self-seeking through deceitful tactics, Machiavelli regarded a balanced republican government, typified by Rome, as the best and most durable form of government and trusted the public spirit and wisdom of the common citizens more than that of princes and aristocrats.

In the artistic sphere, GIOTTO DI BONDONE (1266–1336) took the first steps toward the Renaissance, completely forsaking the flat and nonrepresentational appearance of the prevailing Byzantine art in favor of the illusion of three-dimensional form on the two-dimensional painted surface. He was the originator of “tactile value,” portraying his space as an extension of the real space out of which the spectator looked and giving his figures a three-dimensional depth that appeared as if the spectator could reach in and grasp them. Moreover, each of Giotto's works features the visual representation of one unifying idea instead of a spectrum of meticulous details. The Renaissance style in sculpture was created by DONATELLO (1386–1466), who assimilated the basic principles of ancient sculpture, such as *contrapposto* (with weight shifted to one leg) and the unsupported nude, into a framework creating the appearance of movement and furnishing accurate anatomical structure of his figures.

Michelangelo Buonarroti (1475–1564) brought this style to maturity with sculptures independent of any surrounding architectural support, including the *David* and the marble figures he carved for the tomb of Pope Julius II at Rome and for the tombs of the Medici family at Florence. The striking aspect of his approach is its portrayal of robustness and monumentality in the human body, often styled “Dionysian” after the Greek god known for his unbridled power. His spectacular frescoes on the ceiling of the Sistine Chapel stand as perhaps the single greatest work of High Renaissance painting, and his redesigning of St. Peter's crowned his prominence as an architect.

Two other Florentine-trained artists, Leonardo da Vinci (1452–1519) and Raphael Sanzio (1483–1520), further defined the High Renaissance style. A universal genius with interests in nature, physics, and engineer-

ing, Leonardo is most renowned as a painter, revolutionizing his field with the invention of both atmospheric background and *sfumato*, the “smoky” effect achieved by blurring the outlines of figures to make them softer with an environment of shadow tones. He experimented greatly with new paints even at the expense of the traditional fresco style, seen most prominently in *The Last Supper*. Intensely interested in studying the human personality and portraying it on canvas, Leonardo attempted to capture the fragile, fleeting, and illusive qualities of human facial expressions in his *Mona Lisa* and *Virgin and Child with St. Anne*. His plans and sketches proved greatly significant for architecture, as they constitute the blueprints for buildings later erected by his friend Bramante (1444–1514).

Raphael's images, including his many Madonnas, the *School of Athens*, and *Disputa*, rank among the world's most beloved artistic treasures and are noteworthy for their sense of peace and serenity. Furnishing inspiration in architecture as well as in literature, the ideals of classical antiquity experienced restoration in the work of FILIPPO BRUNELLESCHI (1377–1446) and Leon Battista Alberti (1404–72). Brunelleschi's designs for two Florentine churches, San Lorenzo and Santo Spirito, reflect his intense study of ancient Roman buildings, as both employ the early basilica form and classical columns. Further he is renowned for his discovery of the mathematical rules of perspective and his innovations in shape, seen most clearly in the octagonally designed dome base for the cathedral of Santa Maria del Fiore in Florence. Alberti revitalized the ancient brick architecture of Roman times, as portrayed by his San Andrea church in Mantua, and established the Renaissance standard use of flat roofs, overhanging cornices, and prominent horizontal lines.

Ironically 15th century music saw little advancement and primarily continued in the genres conceived by Francesco Landini (1325–97), who despite his blindness from childhood became a leading composer and music theorist. Celebrated as a composer of secular works for voice and accompaniment, Landini developed the *ballata*, or rhythmic dance song; the *caccia*, a “chasing” song of enjoyment; and, most importantly, the *madrigal*, a high art form in which poetry was sensitively set to music and so guaranteed that the music would serve as an appropriate vehicle for conveying the spirit and emotional content of the text. Italian Renaissance church music reached its zenith during the 16th century in the works of Giovanni da Palestrina (1525–94), choirmaster of St. Peter's in Rome, who composed more than 600 religious pieces,

including 102 masses. Typified by the *Agnus Dei* from his *Pope Marcellus Mass*, Palestrina achieved a stunning sense of serenity in his works through balance, purity, and arrangement of texts that made the words clearly understandable during performance.

EARLY NORTHERN RENAISSANCE

With the free exchange of scholars and students between European universities and political exploits, such as the French invasion of Italy in 1494, which brought new contact between cultural elements, Italian concepts and discoveries were reaching into the rest of the Continent by the late 15th and early 16th centuries. The reorganized and powerful monarchies of the north quickly found that Renaissance thought suited their needs, as its endorsement of social class and military prowess enhanced their status, and its emphasis on public service, personal merit, and learning furnished an attractive substitute for the traditional manners of the uneducated and disorderly feudal classes. Moreover, the invention of the printing press at Mainz by JOHANN GUTENBERG in 1456 changed the course of history by making possible the rapid dissemination of ideas to a populace moved by the spirit of the age to become increasingly more literate.

Disillusioned by corruption in the late medieval church, including simony (buying and selling of church offices), sinecures (receiving the salary from a benefice, or region to be served by a clergyperson, without overseeing it), pluralism (holding more than one office), clerical concubinage, and the selling of indulgences, the bourgeoisie or rising upper-middle class of merchants found the Renaissance rejection of the recent past and the desire to return to the original sources of antiquity tremendously appealing. This interest sparked a northern movement of biblical humanism, which exalted ethical and religious factors over the aesthetic and secular ideals typical of Italian humanism and was primarily interested in the Christian past, or Judeo-Christian heritage, rather than the classical Hellenic heritage of Western Europe.

More interested in the human being as a spiritual than a rational creature, these biblical humanists applied the techniques and methods of humanism to the study of the Scriptures. This exegetical approach was spearheaded by John Colet (1466–1519), a pious English cleric who, after visiting Renaissance Italy, soon afterward began in lectures at St. Paul's Church to expound the literal meaning of the Pauline Epistles, a novelty because former theologians interpreted Scripture allegorically with an almost total unconcern with the meaning originally intended by its authors.

Borrowing his notion of biblical humanism from Colet, Desiderius Erasmus of Rotterdam (1469–1536) became the greatest of all the northern humanists and an internationally renowned scholar. Unlike the later reformers who vehemently denounced the evils in the church, Erasmus's scholarly spirit inclined him to oppose its abuses through clever satire in his *The Praise of Folly* (1511) and *Familiar Colloquies* (1518). His most outstanding contribution both to scholarship and to the future course of church history was his publication of the *Greek New Testament* (1516), in which he applied humanist rules of textual criticism to the extant Greek biblical manuscripts of his day, accompanied by a new Latin translation directly from the original language and by notes. As a result, scholars were now in a position to make accurate comparison between the New Testament church and the church of their day, with the assessment decidedly unfavorable to the latter.

A necessary complement to the work of Erasmus, Johannes Reuchlin (1455–1522) expanded the humanistic brand of scholarship to the Jewish Bible; in 1499 this prince of German humanists traveled to the Jewish community in Bologna to study Hebrew language, literature, and theology under the Jewish rabbinic scholar Obadiah Sforno. The fruit of Reuchlin's scientific study of the Christian Old Testament was his 1506 *Of the Rudiments of Hebrew*, a combined Hebrew dictionary and grammar, which enabled others to study the text in its original tongue. The humanist enterprise also spread to Spain through Jiménez de Cisneros (1436–1517), a former resident of the papal curia in Rome. He established the University of Alcalá both to train clergy in the Bible, establishing a trilingual college to provide the classical Latin, Greek, and Hebrew instruction that humanists like Erasmus regarded as essential for any sound theology, and to form virtuous character grounded in earnest Christian piety.

The ideals of Italian Renaissance architecture took root in France under King Francis I, when Italian architects and artisans were invited to France for renovations and new building projects for the king. Deciding to make his Fontainebleau Palace into a center for the arts in the 1530s, Francis invited two Italian interior designers, Giovanni Rosso and Francesco Primaticcio, to create a new style of decoration using a mixture of painting and high-relief stucco molding known as strapwork. This new technique created a dramatic effect in a long gallery room in Fontainebleau known as the Gallery of Francis I. Francis also embarked on major building projects at châteaux Blois and Chambord,

both designed in an Italian Renaissance style adapted to French taste with steep roofs, clusters of tall chimney pots, and the placing of vast elongated windows above one another.

Clement Janequin (1485–1560), who developed the Parisian chanson as a vocal ensemble form, made significant developments in music during Francis's reign. His approximately 300 chansons are programmatic works, where the musical setting narrates the text using sound effects, such as battle noises, and imitations of natural tones, such as bird calls, to augment the effect of the story. When social dancing became a prevalent form of entertainment, composers were commissioned to write instrumental music to accompany the dances. In the 1589 treatise *Orchesographie*, a French priest writing under the pseudonym of Thoinot Arbeau (1519–95) designed two broad dance categories arranged for fife and drum, *haut* (fast and lively) and *bas* (slow and stately). Most famous was the *gagliard* dance from the *haut* category, featuring a quick duple rhythm with each beat divided into three subunits.

Artistic cultivation found its most fertile soil north of the Alps in the Low Countries and Germany. For example, Geertgen tot sint Jans (1465–93), a monastic painter from St. John in Haarlem, fashioned his famous *Virgin and Child*, where the figures are completely encircled by a wreath of smaller figures and objects, including several popular musical instruments. One of the leading Flemish mannerist painters was Pieter Bruegel (1525–69), who developed the ideal of “realism toward the peasants,” in which nonaristocratic figures and objects were rendered in flat areas of color without extensive attention to detail or modeling of human figures. Bruegel remains remembered for his scenes of peasant life illustrating many aspects of their dress, customs, and forms of entertainment. His paintings were often concerned with disclosing how biblical themes are revealed in the everyday world, as portrayed by his *The Parable of the Blind Leading the Blind*, which shows the helplessness of afflicted peasants.

The German painter Hieronymus Bosch (1453–1516), who reflected the widespread pessimism of his age provoked by the Black Death and the Hundred Years' War, devised the style of mannerist fantasy. This cynicism transferred over into Bosch's theological deliberation, fueling his fiery preaching against the evils of the world. Observing animal instincts, appetites, and the evil of overindulgence in humanity, Bosch attempted to warn his contemporaries through

his art, renowned for its overwhelming detail and morbid quality, that, save for repentance, salvation lay beyond their reach. To this end, his *Seven Deadly Sins* depicts its human subjects, engaged in folly and gluttony, as pitiable and foolish, and his *Concert within the Egg*, in a paradoxical depreciation of a related art form, casts music in a diabolic light by depicting several persons standing inside a broken eggshell singing a profane song.

This low view of music is shared by his best-known altarpiece, *Garden of Delights*, a triptych exhibiting scenes of a highly moralistic nature where musical instruments, such as the lute, harp, hurdy-gurdy, bombard, fife, cornet, and drum, serve as instruments of torture for lost souls in hell who had used music for immoral purposes during their earthly lives. At the same time, Albrecht Dürer (1471–1528) grew distinguished for his masterful woodcuts that perfected the technique of crosshatching, where a fine gridwork of lines would be employed in creating light and shadow effects. Two additional German artists of note were Mathias Grunewald (1460–1528), whose *Isenheim Altarpiece* depicts the birth, Crucifixion, and Resurrection of Jesus using medieval symbolism and a harsh realistic style, and Hans Holbein the Younger (1497–1543), known for his ability to capture the character and personal attributes of his human subjects.

In both northern and southern Europe, the Renaissance generated lasting effects in the social and religious realms. Looking back to the civilizations of ancient Greece and Rome as furnishing the paradigms for humanity's greatest achievements, much of the literature and fine art produced in this period depicted humanity as beautiful and godlike and exhibited tremendous concern with the emotional life. While the ideal of the person as an independent entity with the right to develop according to individual preferences undermined the medieval ideal of one who was to be saved by assuming a humble role in the corporate hierarchy of the church, the return to and scientific study of the primary sources of antiquity made possible a far more accurate knowledge of the Bible. Both of these somewhat divergent factors contributed to the Reformation, with its critique of medieval religion and exaltation of Scripture over tradition. In the political realm, the rhetorical models of Cicero displaced the perceived scholastic logical wrangling of Aristotle, facilitating improved communication, centralization of power, and administrative effectiveness among the aristocrats of ITALIAN CITY-STATES and the rising nation-states of northern Europe. For all its achievements, Renaissance

culture stands as one of the primary creative foundations of the modern Western tradition.

KIRK R. MACGREGOR

Jin (Chin) dynasty

The people who ruled the Jin dynasty were called Jurchen; their language belonged to the Tungustic family related to Manchu and they were the first among the Tungustic people to form a major dynastic state. Their original homeland was in present day Jilin (Kirin) province in northern Manchuria, where they hunted, fished, raised livestock, and also farmed living in semisubterranean log cabins. Jurchen were organized into tribes, which were subdivided into clans. Early accounts call them fierce warriors, heavy drinkers, and believers in shamanism. As with many other tribal peoples in eastern Asia, a man married his father's widows (other than his own mother) and also his brothers' widows. After the 10th century some Jurchen moved to southern Manchuria and became vassals to the SONG (SUNG) DYNASTY and the LIAO DYNASTY. These Jurchen began to learn from the more advanced culture of the Khitan (Liao) and Chinese and were called "civilized Jurchen" as opposed to their northern kin, who were called "wild Jurchen."

JURCHEN TREATY WITH THE SONG DYNASTY

In the early 12th century Jurchen erupted to power under Wanyan Aguda (Wan-yen A-ku-ta), 1068–1123. He raided Liao frontier posts and defeated Liao forces sent against him. Emboldened, he announced the creation in 1115 of a dynastic state called Jin, which means gold, after a river of that name. He then sent envoys to negotiate a treaty with the Song government,

his nominal overlord, jointly to attack Liao, their common enemy, until its destruction, and then to divide the spoils. Under the terms Song would get the 16 prefectures in northeastern China that they had failed to win in previous wars against Liao and would pay to Jin annually the 200,000 ounces of silver and 300,000 bolts of silk it had been paying to Liao. The war began with Song armies attacking from the south and Jurchen from the northeast. While Song armies did not do well against Liao on the southern front, Jin forces advanced relentlessly, taking Liao capitals and capturing the last Liao emperor in 1225, ending that dynasty.

Jin turned over to Song the 16 prefectures, which included a Liao capital in present-day Beijing. But their alliance soon collapsed. Jin forces advanced on Song territory until reaching its capital, KAIFENG (K'AI-FENG). The inept and unprepared Emperor HUIZONG (HUI-TSUNG) then abdicated, leaving his son Qinzong (Ch'intsung) to cope. After sustaining a long siege and out of food and supplies, Qinzong capitulated and agreed to Jin's harsh terms in 1125. When the Song government was unable to meet the demands for payment, Jin resumed its attack in 1126 until Kaifeng surrendered unconditionally. After thoroughly pillaging the city, Jin forces carried Huizong, Qinzong, and 3,000 members of their family and court as prisoners to northern Manchuria. The debacle ended the first part of the Song dynasty, retroactively called Northern Song, whereas the period 1127–1279 is called Southern Song.

One of Huizong's younger sons escaped, rallied Song troops, and continued to fight, finally establishing

his capital in HANGZHOU (HANGCHOU) on the coast south of the Yangzi (Yangtze) River. Jin cavalry found fighting difficult in the Yangzi area because of the rivers, canals, and lakes. Song loyalists, most notably general YUE FEI (YUEH FEI), were able to carry the offensive to the Yellow River valley. Finally Jin and Song signed a peace treaty in 1142 that led to coexistence, in which Song ceded all the Yellow River drainage area to Jin, with the Huai River as the border. Song also accepted vassal status to the Jin (the Song emperor was forced to address the Jin emperor as uncle) and agreed to annual payment of 200,000 ounces of silver and 200,000 bolts of silk to Jin. The payments were altered twice during the next century as a result of two brief wars between the two states, varying according to the outcome of each conflict.

CULTURE AND INSTITUTIONS

Although he did not live to see Jin victory against both Liao and Song, Aguda was responsible for transforming Jurchen society, leading to its success. Jurchen had no written script and had used Khitan (Liao) writing until Aguda ordered a Jurchen writing system created in 1120. It was called the Jurchen Great Script and was based on the Khitan system. In 1038 a Jurchen Small Script was introduced. Neither gained widespread usage, few surviving examples and no complete books of either have survived, and not all words have been deciphered. Initially, literate Jurchen continued to use the Khitan writing system; later they preferred to use Chinese and did not record their oral traditions or write literature in their own language. Jin diplomatic correspondence with Southern Song and all other states was written entirely in Chinese and it seems no Song official learned Jurchen.

The Jin empire at its peak in 1207 had 8.5 million households and 53 million people. The Southern Song empire had a comparable population, which made them the two most populous states in the world at that time. There exist no precise figures on the ethnic identity of people of the Jin empire, but experts agree that Jurchen constituted less than 10 percent of the total. As Liao, Jin was set up as a dual administration, with a north-facing government to govern Jurchen people under tribal laws, and a south-facing one to administer their Chinese subjects under modified Tang (T'ang) laws that it inherited from Liao. Similarly to Liao, Jin ruled from several capitals, a Supreme Capital in their homeland in northern Manchuria, the Eastern Capital in Luoyang, Western Capital in Datong (Tatung), Central Capital in modern Beijing, and Western Capital in Kaifeng. Jurchen military colonies were established at strate-

gic locations across northern China and Jurchen were encouraged to migrate from their homeland to northern China. This policy reduced the reservoir of Jurchen in their homeland and even though they were a privileged group, often as landlords, it made their assimilation to Chinese culture more rapid. Jurchen living amid Chinese quickly became bilingual, and later solely Chinese speakers.

The Wanyang clan ruled the Jin Empire, and within the empire, Jurchen people enjoyed primacy. The military was dominated by the cavalry and was made up almost exclusively of Jurchen. Chinese conscripts and volunteers formed the infantry, but the higher officers were Jurchen. Jin needed large numbers of officials to administer the populous empire. Most of the lower ranks of the civil administration were made up of Chinese, but few Chinese were admitted to the higher ranks of the civil government. Where there were two officials of the same rank, Jurchen always enjoyed greater privileges than Chinese. Even the examination system that was inherited from Song times was modified with a parallel system of academies and examinations. The one for Jurchen scholars was held in Jurchen language and script and was easier than the one for Chinese scholars. Moreover a higher percentage of Jurchen candidates passed than Chinese candidates. Sons of Jurchen officials were also able to receive appointments without passing the exams. Just as Song China's official ideology was Confucianism, it too was the Jin official ideology, and it was also based on the interpretations of the Northern Song scholar-official WANG ANSHI (WANG AN-SHIH); and Confucius's lineal descendant was given ducal rank in Jin. The Jin state in fact proudly counted itself as the valid heir of Chinese achievements and of Northern Song's cultural greatness. Jurchen, became Buddhists and adopted Chinese-style Buddhism.

Jin rulers since Aguda had adopted Chinese reign titles and imperial ceremonies. The official ethnic policy of Jin, however, changed several times through the dynasty. Initially Jin tried to impose Jurchen clothes and hairstyles on its Chinese subjects. These rules were unenforceable and the reverse took place. Even at the height of the dynasty, during the reign Emperor Shizong (Shih-tsung, r. 1161–89), Jurchen were forbidden to wear Chinese-style clothes. He also ordered them to give up Chinese names that they had adopted. He also ordered Jurchen, including his own family members, to return to their tribal habits, including hunting, and to speak in Jurchen. He was moved to tears when one of his grandsons spoke several sentences in Jurchen, because by then most had forgotten how to speak it. In 1191 his successor issued

an order that forbade his Chinese subjects to refer to Jurchen as *fan*, which is derogatory, with the connotation of “barbarian.” These and other attempts to make Jurchen retain their culture were futile, and they assimilated to the Chinese way of life. Only those who remained in their homeland in Manchuria retained the Jurchen language and way of life, and they came to be called “wild Jurchen.”

The expanding Mongol empire under GENGHIS KHAN began to war against Jin in 1212, initially as plundering expeditions, then forcing Jin to abandon land and move to Kaifeng as the remaining capital. It was totally destroyed in 1234 after Genghis’s death by his youngest son, TULUI KHAN. Jin was already in decline, its economy weakened by flooding of the Yellow River, its control weakened by revolts and internal dissent. It nevertheless resisted for 20 years until it was finally ground down and its territories destroyed.

Joachim of Flora

(c. 1135–1202) *historiographer, monk, and mystic*

Joachim of Flora, or Joachim of Fiore, was an Italian monk, mystic, and biblical exegete who was the principal medieval proponent of apocalypticism or millenarianism (generally, any doctrine, usually based on the Book of Revelation, concerning the end of the temporal world, the Second Advent of Christ, and his thousand-year reign). Joachim stands as one of the most significant theorists of history in the Western tradition.

Joachim was born at Celico in Calabria (southern Italy) around 1132. His father placed him at an early age in the service of the Sicilian court at Palermo. While on pilgrimage to the Holy Land, Joachim seems to have had an experience of spiritual illumination and conversion, after which he returned to Calabria and entered the Benedictine monastery of Corazzo around 1171. In 1177 Joachim was elected abbot and, in his quest for the perfect realization of the monastic life, worked to

incorporate Corazzo into the recently founded Cistercian order. Toward this end, around 1183 he traveled to the important monastery of Casamari south of Rome. While there Joachim had mystical visions that illuminated his mind regarding the concordance of the Scriptures and the mystery of the Trinity. These visions not only launched Joachim’s writing career but also compelled him (dissatisfied with the Cistercian order of his day) to found his own religious house, the monastery of San Giovanni, at Fiore around 1190. In 1196 Joachim’s congregation became an officially recognized religious order, the Order of Fiore, which had a rather undistinguished history until it was reunited with the Cistercian order in 1570. Joachim himself died at San Giovanni on Holy Saturday in 1202 (March 30).

In his three major works, namely, *The Book of Concordance of the Old and New Testament*, *Exposition of the Apocalypse*, and *The Psalter of Ten Strings*, Joachim uses biblical prophecy to develop a trinitarian understanding of history that draws on, but diverges significantly from, the traditional Pauline and Augustinian scheme of “before the law,” “under the law,” and “under grace.” Joachim finds the triune God in a more sophisticated system of three historically oriented “states of the world” (*status seculi*), each characterized by a manner of life, an order of the elect, and a certain part of sacred Scripture.

The first state, beginning with Adam and extending to Christ, is that of the Father. It is characterized by living according to the flesh, by the married order (established so that humans can become images of the Father by creating children), and by the Old Testament. The second state, spanning from Elisha the prophet to Joachim’s day, is that of the Son. It is characterized by living between the two poles of flesh and spirit, by the order of clergy (who bear the image of the Son by preaching and teaching the Gospel), and by the New Testament. The third state, beginning with St. Benedict (c. 480–c. 550) and running to the consummation of the world, is that of the Spirit. It is characterized by living according to the Spirit, by the order of monks (who, by despising the world and devoting themselves wholly to the love of God, bear the image of the Spirit, who is the very love of God), and by the spiritual understanding that proceeds from both the Old and New Testaments.

Joachim understood himself and the spiritual men who constituted his Order of Fiore as those upon whom this spiritual understanding was being poured out as a sign of the coming end of history. It is in this concept of a third stage still to come that Joachim made his most original and lasting contribution to the theology

of history generally and millenarianism in particular. Although certain doctrines of Joachim were officially condemned at the Fourth Lateran Council (1215) and the Council of Arles (1263), his notion of a third state continued to influence visionaries and theorists of history during the late Middle Ages and beyond.

FRANKLIN T. HARKINS

Joan of Arc

(1412–1431) *French heroine*

Joan of Arc (Jeanne d'Arc), the national heroine of France, was born at Domrémy village on January 6, 1412, to Jacques Darc and Isabelle. Joan exhibited a pious character and was often absorbed in her prayers. At 13 years old, she started hearing inner voices calling upon her to drive the English out of France. A civil war was going on in France and the English were supporting the Burgundians. The assassination of Louis of Orléans by the agents of Burgundy had escalated the conflict. Domrémy was with the Orléanist (or Armagnacs), the party of Charles of Ponthieu (later known as King Charles VII, r. 1422–61). Joan supposedly received heavenly commands from St. Margaret, St. Catherine, and the Archangel Michael to rescue Orléans.

The English ruler Henry VII (r. 1422–61), claimant to the French throne, occupied Paris in 1418. The major cities of northern France ceased to be under Charles VII's control. The situation was becoming critical after the English lay siege to Orléans, the last Armagnac stronghold, on October 12. Joan, with her mandate from God, saved the situation for the French king. Dressed in male attire, she rode for 11 days with her escorts to meet Charles. Joan called herself as La Pucelle (the Maiden or Virgin) as she had promised the saints to keep her virginity. She believed that Charles was the true heir to the French throne.

An ecclesiastical commission headed by the archbishop of Rheims, Reginald of Chartres, supported her cause after thorough interrogation. Joan had shown remarkable calmness before the theologians and her reputation as another saint was spreading. Charles was convinced of her simplicity, honesty, and intuition.

Joan dressed as a knight, commanding a large force against the English and Burgundians. With her piety and simplicity, Joan restored the confidence of the French. She advised the English to leave France per the desire of the son of Saint Mary. Joan entered into Orléans in May 1429 and defeated the English. Some of the English soldiers deserted, thinking that they were being opposed by the supernatural prowess of Joan. She portrayed the Orléanists as patriots, the Burgundians as traitors, and the English as the enemy of France. In June the towns of Jargeau and Beaugency fell. Joan defeated the troop led by Sir John Fastolf of Meung in the battle of Patay. The archbishop of Embrun declared in June that she was divinely inspired and requested Charles to seek her advice pertaining to war.

Joan urged Charles to declare himself as the legitimate ruler of France. Reginald of Chartres performed the coronation ceremony on July 17, 1429, at Rheims, place of traditional crowning of the French kings. She began her second mission as inner voices urged her to take back Paris from Burgundians. Charles and his adviser the archbishop did not support her. The king was more interested in a political rapprochement with the Burgundians. Joan and the duke of Alençon, along with new recruits, marched toward Paris on August 23. The vacillating policy of the king and advisers had given enough time for the English and Burgundians to regroup.

Meanwhile Joan was trying to persuade the inhabitants of many towns to rally behind the king. The stories of her miracles came in March and April 1430 amid war. At Lagny-sur-Marne, she and the virgins of the town revived the dead body of a baby temporarily to be baptized. On Easter Day of April 22 she had visions from the saints that the enemy would capture her before Saint John's Day, on June 24. She also had the premonition of her inevitable demise on the day of her capture on May 23 at Compiègne. She was imprisoned and sold to the English for a sum of 10,000 livres by the Burgundians.

A sham trial began at the headquarters of the English at Rouen. Pierre Cauchon was in charge of the trial, and the bishop of Beauvais was the presiding officer. The former had the reputation of bribing officials, and the latter had lost his bishopric because of Joan. Anybody speaking in favor of the defendant was imprisoned. The trial by inquisitorial tribunal increased the reputation of Joan because of her brilliant answers to the accusation that her voices were inspired by the devil. She was pronounced a relapsed heretic and burned at the stake on May 30, 1431. In her last

breath Joan forgave the accusers and uttered the name of Jesus. Jean Tressard, secretary to the king of England, commented that they had burned a holy person. The executioner, Geoffroy Theragew, was apprehensive that he was damned because he had burned a saint.

The unification of France came after her death. Charles restored her name and declared the trial illegal. Even dispensing with the supernatural factors associated with her, the fact remains that she became a living symbol of French nationalism. Her role was a major contributing factor for separating the English from Burgundians, reviving confidence among the French, and driving out the English from France. The papacy declared in 1456 that Joan was wrongly convicted. It pronounced her as martyr and the trial judges as heretics. She was beatified on April 11, 1909, and canonized as a saint 11 years afterward on May 16. The feast day of St. Joan falls on the second Sunday in May. The spirit of St. Joan lived on. During World War I, the Allied soldiers paid tribute to her. Both the Vichy regime and the French resistance used her symbol in World War II.

PATIT PABAN MISHRA

Joan of Arc was burned at the stake on May 30, 1431. In her last breath Joan forgave her accusers and uttered the name of Jesus.

K

Kaifeng (K'ai-feng)

Kaifeng became the capital city of the Northern SONG (SUNG) DYNASTY c. 960–1126, when it was also called Bian (Pien) and was located south of the Yellow River on a rich agricultural plain in modern Henan (Honan) Province. Kaifeng was close to the GRAND CANAL, which made the wealth of the south easily accessible. The down side to its location was that it had no natural defenses and had to rely solely on massive city walls for protection. Kaifeng was wealthy and cultured, with a population of around a million people. It had China's oldest synagogue and Jewish community, immigrants from Persia, whose descendants survived as a distinct group until modern times.

The Song dynasty was never militarily powerful; it lacked good horses for its cavalry and was surrounded by strong and hostile neighbors. One was the nomadic Khitan from Manchuria who ruled northeastern China as the LIAO DYNASTY, with a capital city at modern Beijing. After defeating it in war the Liao extracted heavy tribute from the Song as condition for peace. In time the Liao were threatened by new nomads from farther north called the Jurchen, who established the JIN (CHIN) DYNASTY. In 1118 the Song formed an alliance with the Jin and they jointly attacked and destroyed the Liao. Soon the Song-Jin alliance collapsed over the division of spoils. Jin forces then besieged Kaifeng, until famine forced it to capitulate in 1126.

Song was forced to cede territory, pay an immense indemnity, and agree to other onerous terms; then

the Jin army withdrew. When Song could not pay its indemnity, Jin attacked again, this time thoroughly pillaging Kaifeng and carrying off Emperor HUIZONG (HUI-TSUNG), his heir, and 3,000 men and women of his court to exile in northern Manchuria. The loot from the government treasury amounted to 54 million bolts of silk, 15 million bolts of brocade, 3 million ingots of gold, and 8 million ingots of silver. Another son of Huizong escaped and eventually established a court in Hangzhou (Hangchow) in southern China; it was called the Southern Song dynasty. Hangzhou soon became the premier city in China.

Within a quarter-century the leaders of the Jin dynasty had become so Sinicized that they had abandoned their original capital in northern Manchuria and established two new capitals in the heartland of China, one in modern Beijing, another in rebuilt Kaifeng. In the early 13th century Jin was attacked by the Mongols, the most terrifying conquerors the world had seen. In 1132 the most powerful Mongol general, SUBOTAI, besieged Kaifeng. The siege was notable in the history of military technology as the first time that gunpowder in grenades and flame throwers was used. After terrible privations Kaifeng surrendered. Subotai demanded the right to destroy the city and massacre its inhabitants. Fortunately Grand Khan OGOTAI KHAN was dissuaded from allowing it on the advice of YELU CHUCAI (Ye-liu Ch'u-ts'ai), who had himself been a prisoner of the Mongols but had risen to high office under them because of his skills as an astrologer. Yelu calculated that if spared, the people of Kaifeng and

surrounding lands could produce more wealth for their Mongol masters. Thus the people of Kaifeng suffered looting and massacre, but most were spared. Kaifeng never became a capital city again.

JIU-HWA LO UPSHUR

Kamakura Shogunate

The Kamakura Shogunate was a government established by Minamoto Yoritomo at the end of the GEMPEI WAR, which had lasted from 1180 until 1185. The shogunate lasted from 1185 (or 1192, when it was formally recognized by the emperor) until 1333. Because the Minamoto family lived at Kamakura, the new order was called the Kamakura Shogunate, although many sources refer to the period as the Minamoto Shogunate, after the founder's surname.

MINAMOTO CLAN

The Minamoto clan emerged during the 12th century as a challenge to the Taira clan, who controlled Japanese politics. After a series of wars, the Minamoto clan had been defeated, and when the Gempei War broke out, the Taira were certain of their eventual victory. They launched a series of preemptive strikes against the Minamoto and easily defeated them. However because of their easy victory, the Taira did not follow up all their military advantages and this allowed the Minamoto to rally their depleted forces. They also managed to get other smaller clans to support them, and, worried that the Taira were about to become too powerful, the Minamoto gradually gained support, which allowed them to defeat the Taira. At the naval battle of Dannoura on April 25, 1185, the Minamoto attacked their outnumbered opponents and killed the six-year-old emperor, whose grandmother was a member of the Taira clan.

This final victory over the Taira ensured that Minamoto Yoritomo, the leader of the Minamoto clan, and the victor of the Battle of Dannoura, would take control of Japan. He created *shogun* (general who subdues barbarians), which established a military rule over Japan called *bakufu* (tent government) whereby the emperor

and regents held civil authority, but military affairs were conducted by the shogun under the authority of the emperor. This made Minamoto Yoritomo dictator of the country.

The Minamoto clan descended from Saga, the 52nd emperor (r. 809–829). As with their rivals, the Taira, sections of the imperial family were cut off from the imperial line and took surnames. The Minamoto include descendants of the younger children of Saga, but most of them were descendants of Prince Sadazumi, the son of Seiwa, the 56th emperor (r. 858–876). Minamoto no Yoritomo (1147–99) was the great-grandson times 7 of Prince Sadazumi. In January 1160 his father had taken part in an unsuccessful coup attempt against the Taira and was then exiled to eastern Japan, where he stayed with Hojo Tokimasa, head of the HOJO CLAN, allies of the Taira. While there he married Hojo Masako, a daughter of Tokimasa, who tied the Minamoto to the Hojo. During the Gempei War the Hojo provided much support for the Minamoto, and when Yoritomo became the shogun, the Hojos were the second most important family.

Minamoto Yoritomo made his supporter Kujo Kanezane (1149–1207) the *sessho* (imperial regent) and soon faced challenges from his family. He began to feel threatened by his brothers, especially Yoshitune. Yoshitune fled to the north of Japan where he took refuge with Fujiwara no Hidehira. Yoritomo threatened to attack Hidehira, who decided that the easiest solution was to get Yoshitune to commit suicide. This death did not, however, prevent Yoritomo from attacking Hidehira's lands, which were destroyed. On his return south, Yoritomo officially became shogun and established the system of government that was to dominate Japan until the Meiji Restoration in 1868.

MINAMOTO NO YORIIIE AND SANETOMO

The stability that Yoritomo brought to Japan was brief. He was shrewd, but ruthless, and was responsible for the deaths of two additional half brothers, Yoshiie and Yoshinaka. When Yoritomo died in 1199, his eldest son was only 17. In 1202 when Minamoto Yoriie was 20, he became shogun. However the Hojo clan usurped his power in the following year when they established the head of the Hojo clan as the *shikken* (hereditary regent), a system that operated until 1333. In 1203 Yoriie became ill and his lands were divided between his infant son Ichiman and his brother Sanetomo.

Angered by the power of the Hojo clan, in spite of his mother's being Hojo Masako, Minamoto Yoriie tried to reassert himself. He started conspiring with Hiki Yoshikazu, who was, in fact, the adopted son of Minamoto

Yoritomo, making him Yoriie's brother by adoption, as well as being his father-in-law. Unfortunately the plot between Yoriie and Yoshikazu was discovered, the Hojos attacked, and Yoshikazu was assassinated. Yoriie's son, Ichiman, was murdered and Yoriie was replaced by his more compliant brother, who acquiesced in the domination of the political scene by the Hojo. Yoriie was confined at Shuzenji on the Izu Peninsula and was murdered in the following year by his grandfather.

Minamoto Sanetomo (1192–1219) became the third shogun of the Kamakura Shogunate. He was aged 11 and because of the nature of his coming to power, he would never wield any real power. Instead he devoted himself to cultural matters. He had started writing poetry from the age of 14, and when he was 17 he sent 30 of these poems to Fujiwara no Teika, one of the well-known court poets of the period. Teika disliked them as they were too close to the Japanese poems of the seventh and eighth centuries, but some were included in an anthology, now held in the Imperial Collection in Tokyo. Sanetomo was also involved in promoting *kemari* (kickball), a game involving eight players who kick a deerskin ball around a court, ensuring that it never touches the ground. In 1219 Kugyo, the son of Yoriie and nephew of Sanetomo, assassinated the shogun.

HOJO CLAN AND THE SHIKKENS

In spite of the political problems that ensued from the death of Minamoto Yoritomo, the Kamakura Shogunate resulted in a shift of political power away from Kyoto to Kamakura. In spite of the Hojo regency, by the middle of the shogunate, the importance of Kyoto had waned, although it retained its reputation as a place of sophisticated culture and the location of the residences of most of the nobles. In contrast, Kamakura, farther north, was a center that revolved around the Minamoto clan, even if not the actual nominal head of it. The fishing port, which had existed when Yoritomo was young, had become an important city where some 2,000 *gokenin* (housemen) swore fealty to the clan. As a result many of the emerging Buddhist sects of the period started erecting temples in the town.

For the rest of the Kamakura Shogunate, the Hojo clan curiously chose not to take up the shogunate but operated the regency with the head of the Hojo clan being the shikken. In 1221 Emperor Go-Toba decided to use the demise of the Minamoto family as an opportunity to try to restore direct imperial rule. In 1221 he issued a message to ask warriors loyal to him to rally and attack the Hojo clan. However few were willing to take on the Hojos and very few supporters made an

appearance in what became known as the Jokyu disturbance. On those who did, the wrath of the Hojo clan descended with a large Hojo-financed army taking over Kyoto and arresting Go-Toba. He was exiled to the island of Oki, and the Hojo, in the name of the shogunate, moved their headquarters to Kyoto, which became the legal and administrative center until the end of the shogunate in 1333. The lands of the nobles who answered the call of Go-Toba were seized and redistributed to supporters of the Hojos, who emerged as the unchallenged rulers of the whole of Japan.

With all of the killings in 1219, the line of Minamoto Yoritomo was extinct and therefore the Hojos decided to appoint Kujo Yoritsune in 1226, a scion of the FUJIWARA CLAN, and a distant relative of Yoritomo, as the next shogun, with Hojo Yoshitoki actually controlling the government. Kujo Yoritsune (1218–56) was eight years old at the time of his appointment and was deposed when he was 26. Kujo Yoritsugu (1239–56), who was only five years old, replaced him, and was deposed seven years later. For the next shoguns the Hojo clan chose members of the Japanese imperial family with Prince Munetaka (1242–74) as shogun from 1252 until 1266, Prince Koreyasu (1264–1326) as shogun from 1266 until 1289, Prince Hisaki (1276–1328) as shogun from 1289 until 1308, and Prince Morikuni (1301–33) as shogun from 1308 until his death. All were appointed shoguns when they were children, and most were deposed as young men. They were all puppets of the Hojos and were chosen only out of regard for their lineage.

In 1232 the shikken, Hojo Yasutoki, drew up the *Johei Shikimoku* (Johei Formulary), which laid down 51 articles defining, for the first time, the legal powers of the shogunate that ruled through the *Hyojo-shu* (Council of State). Some 17 years later a judicial court was established to allow legal decisions to be made more quickly and with greater fairness. With the Kamakura Shogunate effectively controlled by the Hojos, and with the very easy quelling of the Jokyu disturbance, the greatest challenge to the whole system of government in Japan was not any internal force but the emerging threat of a Mongol invasion, which took place in 1274.

MONGOL INVASIONS AND SOCIETY DURING THE KAMAKURA SHOGUNATE

The Japanese managed to prevent the Mongols from encroaching too far inland and were saved when a storm destroyed many of the Mongol ships, forcing them to retreat. The invasion in 1281 was more serious, with the Mongols sending two fleets to Japan. However these

faced not only a much stronger Japanese force behind entrenched positions at Hakata Bay, but also a typhoon, which destroyed much of the Mongol fleet, again forcing them to quickly withdraw. The defeat of both Mongol invasions did show the military supremacy of the Japanese, but also the intervention of the weather on both occasions was seen as a divine message. However concern about future invasion resulted in vast expenditures on weaponry and defensive positions, as well as a move to isolate Japan from China and Korea, from which the invading Mongol navies had sailed.

The importance of the Kamakura Shogunate was certainly not in the political power that was wielded by the shoguns—for most of the time they were puppets—but in the societal changes, or to some extent the lack of them, that occurred in Japan. The Japanese feudal system was entrenched with warriors—the SAMURAI class—ruling unchallenged, spending their time in training, military exercises, occasional fighting, and for a small number, in learning and the arts. The samurai ruled unquestioned over villages where peasants labored in the fields to produce the crops, and a small number of skilled artisans made the implements necessary for agriculture and war. Any move to create a large middle class in Japan was quashed, and there was no real incentive for innovation. Samurai were occasionally rewarded with extra land, but as the fighting ceased, less and less land was redistributed by the shikken. It was only in times such as the Jokyu disturbance that the shikken managed to confiscate enough land to placate ambitious samurai. There were regular disputes between the samurai and the farmers and hence the legal codifications of the Hojos during the 1230s and 1240s managed to establish rules for dealing with these problems.

The only other development from the Kamakura Shogunate was the increase in the belief in ZEN (OR CH'AN) BUDDHISM and also NEO-CONFUCIANISM ideas that had come from China. These led to great changes in religion and the emergence of a large number of Buddhist sects, some of which preached extreme asceticism.

Kanem Bornu

By 1200 C.E. the earlier African kingdoms of GHANA, MALI, AND SONGHAI had passed. The dominant power in western Africa was Kanem Bornu. Another term for this region, since it encompasses part of central Africa, is Sudanic Africa. The first major leader of these kingdoms was Hummay, the *diwan* or *mais* of Kanem Bornu. (The term *diwan* attests to the Islamic and Arab influence since later on in the Ottoman Turkish Empire, *diwan* or *divan* came to mean the seat of government.) Hummay ruled around 1075 and marked the appearance of ISLAM as a major force. In Africa as in Southeast Asia, particularly Indonesia, Islam was fostered as much by traders and wandering imams, or clerics, as it was by holy war, or jihads of conquest.

Living in a semiarid region, trade, as seen in the use of vast caravans, was the way to wealth, since agriculture in this forbidding climate was a challenge at best. Therefore Hummay, and the following kings of his Sefuwa dynasty, carried on a protracted struggle to gain control of the caravans and trade routes from their capital at Njimi, northeast of Lake Chad. Of course, waterborne trade on the lake was also an object of their mercantile ambitions. Trade in gold grew to become a major source of wealth—and conflict—in the entire region. It was first spurred by Arab traders, who shipped it to North Africa, where a mint to make dinars had been opened in Kairouan in today's Tunisia. Later, as John Reader wrote in *Africa: The Biography of the Continent*, “the trans-Saharan trade [in gold] was further boosted when Europe began minting gold coins for the first time since the disintegration of the Roman empire” in the 13th century.

During their struggles for trade, the Sefuwa kings, especially in the region of the Fezzan, in what is now southern Libya, came into conflict with the Berber warriors from the Sahara. However while pursuing trade, the rulers of Kanem Bornu also realized that making alliances with more sedentary, agricultural peoples would provide them with a steady source of food and thus kept good relations with the farming peoples of the Lake Chad region. Another source of wealth for the Sefuwa kings was in the form of slavery, which under them became a major part of their economy. The height of the power of Kanem Bornu came in the reign of Hummay's descendant Dunawa Dibilani (r. 1210–48). There had been a diluting of Islamic influence in the decades following Hummay, and Dunawa set about restoring Islam. He also carried out a series of jihads between the Fezzan and Lake Chad, which not only increased the power of the kingdom, but

also provided him with a lucrative income from the sale of slaves in the Muslim markets to the north.

The death of Dunawa brought with it nearly two centuries of internal unrest and external invasions, at the same time as the Hausa peoples from what is now Nigeria attempted to expand their territory in the same general region. Ali Gaji (c. 1497–1515) finally succeeded in establishing the old Kanem Bornu kingdom again, with a new capital at Ngazargamu. The kingdom would flourish for nearly 300 more years until, as the Hausas, it fell under the power of the imperialistic Fulanis.

JOHN F. MURPHY, JR.

kanji and kana

The Japanese language supplanted that of the Ainu and is considered part of the Altaic group of languages. It is similar to Korean and may contain elements of South-east Asian languages. Until the fourth century Japanese had no written form and the introduction of written Chinese provided an early model. Buddhist monks probably traveled to Japan with Buddhist texts that had been originally obtained in India, and then translated them into Chinese. The use of Chinese characters to represent Japanese words or syllables is known as *kanji*. Since *kanji* do not represent various markers for tenses and prepositions required by Japanese, *hiragana* markers often accompany them, fulfilling this purpose, and they may also indicate the pronunciation of *kanji*. Only later were *kanji* introduced to represent distinctively Japanese words. The *manyogana* writing system adopted Chinese characters on the basis of sound rather than meaning. Subsequently, *kanji* were developed that were similar in meaning (*kokuji*) or else different in meaning (*kokkun*) from Chinese originals. Many *kanji* have multiple pronunciations and contextual meanings, which may be broadly divided into native-derived (*kunyomi*) and foreign-derived (*onyomi*) words.

Over the next centuries two additional systems were developed to help with portraying Japanese words for

which appropriate *kanji* did not exist. These are the *hiragana* and *katakana* systems that, together, are referred to as *kana*. *Hiragana* symbols are written in a cursive script that was known at the end of the first millennium as *onna-de* or woman's script. Its function is primarily grammatical and *hiragana* symbols frequently accompany and modify *kanji* symbols. *Katakana* symbols tend to be more angular in style and are used for foreign words, for children's books, or for large public notices. Both types of *kana* were based on Chinese characters, simplified to represent sounds. Foreign loanwords were initially converted into *kanji* characters, but in the modern age have been converted into *katakana* symbols on a mostly onomatopoeic basis.

Both *kana* and *kanji* have the virtue of conveying meaning from the sounds and meanings associated with them, but also within the shapes used to make them. Literature, especially poetry created using them, has a tendency to convey multiple meanings from minimal word usage. Poetry such as the haiku, which is a development of earlier forms and for which the 17th century poet Basho is perhaps the best-known exponent, combines strict limits on numbers of syllables while offering considerable ambiguity and multiplicity of meaning. Various attempts have been used to rationalize the *kana* and *kanji* systems, which pose some problems because of the different mental requirements of the systems and because of the sheer number of characters. Although some streamlining has been made, the Japanese people and state have so far resisted wide scale change. The many foreign words integrated into the system demonstrate its flexibility and ability to respond to change.

JOHN WALSH

Kemmu Restoration

In 1185 the young Japanese emperor Antoku, some seven or eight years old, was drowned in the Battle of Dannoura in the Inland Sea by his grandmother, rather than be captured by their enemies. The power of the Taira clan, with which he was allied, was destroyed,

and the victors were the Minamoto clan. Their leader, Minamoto Yoritomo, saw the death of the emperor as an opportunity to establish the first shogunate, or military government, in Japan. Although the Minamotos would still pay lip service to the institution of the emperor, which was considered divinely inspired by the Japanese, there was no doubt that Yoritomo was the real ruler of Japan. Prudently Yoritomo enlisted the support of the retired emperor, Go-Shirakawa, to give his blessing to the new regime that has been called the Bakufu, or tent government, because the SAMURAI, the military class, controlled the country.

When Yoritomo died in 1199 his widow, Masako, having two weak sons, was able to transfer the power of the shogunate to her own clan, the Hojos. The HOJO CLAN proved capable military rulers and in 1274 and 1281 fought back the Mongol invasions of KUBILAI KHAN from China.

In 1281 the second invasion fleet (lacking a maritime tradition, the Mongols had to rely on Koreans for their navy) was destroyed by an immense typhoon that entered Japanese history as the *kami-kaze*, or “divine wind,” which saved Japan. In struggles fought within Japan, like the war between the Taira and the Minamoto, there had always been the wealth of the vanquished to be dispersed among the followers of the victors. However because both Mongol operations were amphibious landings, there was no real booty to be disposed of among the victorious samurai.

The discontent among the samurai, and their *daimyo*, or lords, grew over time. With the growing antagonism of the samurai warrior class, the bonds of loyalty to the shogunate and its tent government began to loosen. In 1318 a new emperor, Go-Daigo, ascended the throne. A fully grown man, unlike the hapless Antoku, Go-Daigo was determined to be emperor. Luckily for him, the Hojo shogun at the time was more in favor of pleasure than power, and the new emperor was able to quietly make his plans.

As Turnbull remarks in *The Book of the Samurai: The Warrior Class of Japan*, “by the 1330s resentment against the Hojo began to come into the open . . . and the unifying force proved to be, of all things, the emperor, in an anachronistic attempt to restore the long-lost prestige of the throne.” In a bid for control, the retired emperor Go-Uda helped Go-Daigo. In 1331 Go-Daigo attempted an uprising against the Hojos, but he was taken prisoner by the Hojos. He was exiled but managed to escape, most likely with the help of followers in the Hojo camp. Within a year, in 1332, Go-Daigo was ready to make another attempt.

The Minamoto triumph in 1185 had set a dangerous precedent in Japan. Any feudal *daimyo* could ascend to the shogunate, if he proved he had enough military force and could secure the support of the emperor. The Hojos sent their best commander, an ambitious *daimyo* named Ashikaga Takauji, to Kyoto to try to make Go-Daigo cower before a show of force. But following in the footsteps of the Minamotos and the Tojos, Ashikaga Takauji now proclaimed himself the defender of Emperor Go-Daigo. Ashikaga, with the help of Nitta Yoshisada, was able to attack the seat of the Hojos at Kamakura and topple their Bakufu. The era that followed is known as the Kemmu Restoration. Once the Hojo power was broken, Ashikaga revealed that supporting Go-Daigo was only a means to an end. Rather than restoring the emperor to his rule, Ashikaga had only coveted the shogunate for himself. The era that has become known as the ASHIKAGA SHOGUNATE opened in Japan.

However Go-Daigo, the 96th emperor of Japan, had no intention of sharing power with Ashikaga Takauji. As a result Ashikaga drove Go-Daigo out of the imperial city and found a more pliant member of the imperial family who dutifully appointed him as the shogun. Rather than surrender Go-Daigo fled into the mountains of Yoshino south of Kyoto, determined to continue the fight. The period that ensued was known as the Nambokucho War and would last for 60 years, the longest single war in Japanese history. While some *daimyo* and their samurai followed Ashikaga, others remained loyalists to Go-Daigo. Among these was Kusunoki Masashige, who died fighting for Go-Daigo in the Battle of Minatogawa in 1333.

Although there were two imperial courts, the northern one with Ashikaga in Kyoto and the southern under Go-Daigo in the mountains, after 1337, Ashikaga Takauji was really in control of Japan. In 1392 the southern court returned to Kyoto, and the period of two imperial capitals ended. Ashikaga established his own shogunate, which would rule for less than a century.

Khmer kingdom

Until 802 the Khmers were organized into a number of warring independent kingdoms. They often fought among themselves and against foreign enemies such as the Chams located in present-day central Vietnam. King Jayavarman I, also named Parameshvara posthumously, united these disparate kingdoms. He first appeared in historical sources in 709. The Khmer empire was to span most of present-day Cambodia and had vassal states in parts of Thailand, Laos, and Vietnam.

JAYAVARMAN I, II, AND III

According to text inscribed on a stela (stone or wooden slab) King Jayavarman I originated from Java, though the Malay Peninsula has also been suggested by scholars as a possible place of origin. From his initial base in Indrapura, most likely situated northeast of Phnom Penh, he launched attacks across the Mekong and on Sambhrapura, Wat Phu, and onward to Phnom Kulen, a sacred place for the Khmers, where he settled in 802. At the time it was known as Mahendravaparta. It was here that the sacred rites were performed on Jayavarman by Brahmin priests of the Shivaite sect proclaiming him the universal monarch of the world, or *chakaravartin*, a rite based on Hindu tradition from India.

The system of dynastic succession within the Khmer kingdom was highly complex. Both men and women could become rulers. More importantly, kingship was passed through other family members of the same generation rather than to sons upon the death of a ruler, although there was often strong opposition to this. The next king, Jayavarman II, was responsible for laying the spiritual foundations within the Khmer Empire. After the death of Jayavarman II in 834, Jayavarman III succeeded him. Harihalaya became his capital, southeast of Angkor. The civilization of Angkor was unique as it was a mixture of two influences—Indian and Javanese.

INDRAVARMAN I

The second king built many shrines, but the next ruler, Indravarman I, also called Isvaraloka, was credited for contributing the most to the religious environment within the Khmer empire. Indravarman laid the foundations for the now centralized Angkor state. Indravarman II ascended to the throne in 877 and ruled until 889. His period of rule was relatively peaceful, even though he succeeded in extending the borders of the Khmer Empire. An ancestral temple, Preah Ko, was built in the imperial capital of Hariharalaya and was consecrated in 880. It was a shrine consisting of a set of six brick

temples dedicated to his ancestors and past kings. The temple is considered a piece of art with beautiful male and female divine figures, structural elements such as colonnades, and other embellishments.

Another major building project was the state temple, south of the ancestral temple. This temple, known as Bakong, resembled a stepped pyramid and symbolically was regarded as a mountain. Hindu temples in the Khmer kingdom were often built as mountains as they were seen as earthly representations of the divine mountain, Mount Meru, home of the gods in Hindu mythology. A precursor to the spectacular Angkor Wat and Angkor Thom, the temple had a complex structure and was surrounded by a huge double moat, a feature of Angkor Wat as well. At the same time Indravarman set into place a system of irrigation for cultivated rice fields. Large agricultural projects were undertaken, such as building a huge reservoir.

YASHOVARMAN AND SURYAVARMAN II

King Yashovarman, who ruled from 889 to 900, established the city of Yasodharapura (also known as Angkor) as the new capital. Between 900 and 1200 Angkor achieved great prominence because of the rise of impressive temples in Angkor, including the famous temple that became known as Angkor Wat. It was built in the 12th century during the reign of Suryavarman II, who ordered it to be built. Suryavarman II, dubbed one of the greatest Khmer kings, was a warrior-king and launched many attacks on the Dai Viet, which was highly resilient and resisted subjugation. Suryavarman had gained the throne through the violent means of killing his great uncle, King Dharanindravarman.

The architecture of Angkor Wat is in classical Khmer style. It was also a temple-mountain surrounded by a wide moat, crossed by a causeway on the east side. The state temple was dedicated to Vishnu, whom Suryavarman II considered the Protector of the Khmer empire, a departure from earlier rulers, who regarded SHIVA as the protector of their kingdom. The 11th century witnessed a general rise in Vaisnavite thought in religious and philosophical life in India, and since travel between India and Southeast Asia was frequent, Angkor Wat could have been a reflection of the contemporary trends in Hindu philosophy. The external appearance resembles descriptions of Mount Vaikuntha, home of Vishnu.

JAYAVARMAN VII

The city of Angkor Thom was built by another great king, Jayavarman VII, in 1181, after he defeated the Chams who had captured Angkor in 1177. Instead of

Angkor Wat is a temple at Angkor, Cambodia, built for King Suryavarman II in the early 12th century as his state temple and capital city. It has become a symbol of Cambodia, appearing on its national flag, and it is the country's prime attraction for visitors.

reclaiming the old Khmer spirituality before the Cham defeat, Jayavarman pursued a course of reinvention. He enacted a major change in the Khmer Empire by replacing Hindu religion with Mahayana Buddhism as the official state religion. The power of the Hindu aristocracy within the empire was seriously undermined. It is said that Jayavarman VII was following the example of Ashoka, the model for all Buddhist rulers. The imposition of Buddhist cosmology led to an extensive reworking of religious, political, and military organization within the Khmer kingdom. Jayavarman VII was responsible for organizing the capital, Angkor Thom, into a mandala, which is a symbol of the universe and its energy. The construction of Angkor Thom, based on this highly regulated pattern, took about a decade. It was an awesome feat as the mandala was extremely difficult to replicate in the form of a city.

The new capital city was known as Angkor Thom Mahanagara, or simply Angkor Thom. The site of the city coincided with that of an earlier city, Yasodharapu-

ra, built more than two centuries before. Right in the middle of the city is the Bayon, the state temple built by King Jayavarman VII, in the exact center of his capital of Angkor Thom. Every road from the city gates leads directly to the Bayon. The Bayon, which was covered in gold and orientated toward the east, according to a Chinese account, was also known as the Assembly Hall of Gods. According to the concept of the mandala, the gods would gather there on certain days. Jayavarman VII was at the peak of his reign, and he assumed supreme rule.

INDRAVARMAN II AND JAYAVARMAN VIII

The decline of Angkor began soon after Jayavarman's death. His son, Indravarman II, who ruled from 1219 to 1243, withdrew from many provinces previously conquered from the CHAMPA KINGDOM. Their neighbouring rivals, the Thais, were also gaining more power, strengthened by the establishment of the kingdom of SUKHOTHAI. The Khmer once again lost their hold on Thai provinces.

Soon, the Thais emerged as the chief rivals of the Khmers, replacing their former enemies, the Chams. The Mongols under the leadership of General Sagatu also presented a threat to the Khmers, but the Khmer rulers were careful not to go to war against such a powerful force.

Jayavarman VIII ascended to the Khmer throne in 1243. He was a Hindu rather than a Buddhist like his immediate predecessors. He was a violent anti-Buddhist and went on to destroy many Buddhist sculptures and converted the Bayon temple into a Hindu temple. His son-in-law, Srindravarman, who usurped his throne in 1295, was a Buddhist, though he was a follower of Theravada Buddhism. Later Khmer kings were adherents of this faith.

The Thai Ayuttaya kingdom replaced the Sukothai kingdom in 1350 and succeeded in diminishing Khmer power through several attacks. By 1431 the Thais had conquered Angkor. Despite being weakened, a line of kings managed to rule from Angkor and a separate line of Khmer kings continued to rule in Phnom Penh. The latter line achieved more prominence because of the rise of Mekong as an important trade center, leading to the fall of Angkor.

NURFADZILAH YAHAYA

Kilkenny, Statutes of

In 1366 C.E. the Anglo-Irish parliament met in Kilkenny and produced a body of royal decrees that became known as the Statutes of Kilkenny. The statutes aimed to prevent English colonists living in Ireland from adopting Irish culture and mandated that the Irish conform to English customs before they could obtain certain social, legal, and religious rights. In particular, the statutes prohibited marriage between English and Irish; ordered the English to reject Irish names, customs, and law; prohibited the Irish from holding positions in English churches; and limited the mobility of peasant laborers. The statutes also sought to prevent the colonists from waging war without the consent of the English

Crown. Penalties for noncompliance were severe and included death, loss of property, and excommunication. Although they were not ultimately successful, the Statutes of Kilkenny foreshadowed the continuously troubled relationship between England and Ireland in the following centuries.

England's involvement with Ireland followed from the Norman (French) defeat of the English at the Battle of Hastings in 1066. After occupying England the Normans' proximity to Ireland naturally led to involvement with their neighboring country. Ironically an Irishman helped pave the way for English occupation. In 1166 the defeated Irish leader Dermot MacMurrough fled to England to seek allies. To gain support, Dermot offered his Irish inheritance to an Anglo-Norman lord, Richard de Clare, earl of Pembroke, known as Strongbow. Strongbow consequently invaded and defeated the Irish high king, Rory O'Connor.

King HENRY II of England arrived in 1171 and gained the allegiance of Strongbow and many of the Irish rulers. However before returning to England he was unable to ensure a peaceful coexistence between the Irish and the colonists from England. By 1360 Dublin and the surrounding areas (later called the English Pale) were under the control of the descendants of English colonists, the Anglo-Irish; land beyond the Pale was generally free from direct English control.

Lionel of Clarence, son of King Edward III and lieutenant of Ireland, summoned the 1366 parliament in an effort to reclaim English lands in Ireland. The Statutes of Kilkenny dealt with three distinct groups: the Anglo-Irish colonists known as the "English by blood" or "middle nation"; the "English by birth," often either imported English administrators or absentee lords who ruled their Irish estates from England; and the native Irish. In addition to revealing aspects of the relationship between the ruling English and subordinated Irish, the Statutes of Kilkenny show internal divisions between the English groups.

In the two decades prior to 1366 rebellious Anglo-Irish colonists had become an increasing problem for England. English taxation, absentee English lordship alongside demands for protection of English interests, and close contact with Irish culture lessened Anglo-Irish allegiance to the Crown. The BLACK DEATH of the mid-14th century and the HUNDRED YEARS' WAR with France may also have greatly reduced the influx of English immigrants, making the colonists more susceptible to Irish influences.

The statutes' attempts to uproot Irish elements in the Anglo-Irish sought to create not only distance from

the native Irish, but also a greater sense of connection between the Anglo-Irish and those born in England. The statute prohibiting England-born colonists from discriminating against Anglo-Irish colonists shows that such divisions must have often occurred.

The statutes also placed restrictions on native Irish living in English-controlled areas: Irish men and women were not allowed to participate in English churches, Irish minstrels were forbidden among the English, and common laborers were forbidden to travel without permission.

Yet in order to promote peace in lands under direct English control, the statutes also granted limited protections to loyal Irish. English authorities mandated a warning period before enforcement of selected statutes, forbade the English to war against the Irish without consent of the Crown, and warned against unlawful imprisonment of the Irish for another man's debt. In this way, English forces could focus their military presence on the greater threat of the outlying Irish.

Statutes concerning the native Irish followed a long line of prior legislation. In 1297 one of the earliest Irish statutes ordered English colonists to shun Irish dress and hairstyles; in 1310 religious houses were told to deny entrance to Irishmen; a 1351 ordinance prohibited Brehon law and Irish-English alliances; and in 1360 limitations were placed on Irish holders of municipal and religious offices. Yet the Statutes of Kilkenny did not prevent Anglo-Irish colonists from being affected by Irish culture and custom. They instead showed the inability of the English colonists to subordinate Ireland successfully. Although the statutes remained in effect for centuries, historical records indicate that Irish and English alike overrode them in the decade following the 1366 parliament. The Statutes of Kilkenny now form part of both the historical record of colonization and the English-Irish conflict that continues into the 21st century.

JENNIFER M. HUNT AND K. SARAH-JANE MURRAY

Knights Templar, Knights Hospitallers, and Teutonic Knights

At the time of the First Crusade (1096), Christian monasticism had been in existence since the third century after Christ. What developed out of the crusade, however, was a unique melding of Christian monasticism with the idea of crusade against the Muslims. The most spectacular result was the founding of the three most famous orders of “warrior-monks,” the Knights Templar, the Knights Hospitallers, and the Teutonic Knights.

The Knights Templar (originally the Poor Knights of Christ and the Temple, which is in Jerusalem) were founded around 1118 to help the newly established kingdom of Jerusalem defend itself against its Muslim enemies and to protect the large numbers of Christian European pilgrims traveling to Jerusalem. The Templars were organized as a monastic order, following a rule devised for them by BERNARD OF CLAIRVAUX and taking the traditional threefold vow of poverty, obedience, and chastity. Nonetheless, the Templars were primarily a military order, living under a grand master (elected by the members and serving for life) who was directly responsible only to the pope.

It did not take long for the Templars to become a powerful religious and secular movement in medieval society. They were granted several extraordinary endowments by popes, including the ability to levy taxes and control tithes in the areas under their direct control. Contributions of money and property from members joining the order, along with loaning funds to pilgrims, ensured that by the end of the 11th century the Templars had extensive wealth in money and land holdings stretching from the Holy Land to England. By the 13th century they were the most successful bankers in Europe. Recognized by their white surcoats with the distinctive red cross on the heart or chest, they were in many ways the most powerful force in Europe until the beginning of the 14th century.

The fall of the Templars was probably the result of the animosity harbored against them by the king of France, PHILIP IV (the “Fair”), when the order refused to make him a loan to finance his wars. Philip pursued them with a bloody vengeance, eventually persuading the pope, Clement V, to excommunicate the order. The dissolution of the Templars in 1312 effectively broke the order, and much Templar property was transferred to the Hospitallers.

The Knights Hospitallers (or Order of the Knights of the Hospital of St. John of Jerusalem) began as a Bene-

dictine nursing order founded in the early 12th century about the same time as the Templars. As the Templars, they were originally conceived as a protective and medical force for pilgrims to the Holy Land. They, too, were a monastic order, adopting a black surcoat with a white cross, and would eventually compete with the Templars for prestige and influence throughout Europe.

After the fall of Acre in 1291, the order moved to the island of Cyprus. Difficulties there forced the Knights to move to the island of Rhodes, which, after two years of campaigning, they captured in 1309. Based on Rhodes, the Knights (now known as the Knights of Rhodes) did significant damage to Muslim shipping and Barbary pirates. Nonetheless, the Knights withstood two invasions by the Turkish empire, one in 1444 by the sultan of Egypt, and a more impressive attack by the Turkish sultan Mehmed II in 1480. In the summer of 1522 however the Turkish sultan Suleiman the Magnificent besieged Rhodes with a force of over 200,000 men against some 7,000 Knights. After a six-month siege the Knights eventually capitulated. The remaining Knights were allowed to leave Rhodes, eventually settling on the island of Malta. Now known as the Knights of Malta, they were attacked by Ottoman Turkish forces, eventually destroying the Ottoman navy at the Battle of Lepanto (1571).

When Malta was captured by Napoleon in 1798, the Knights lost their island stronghold. In 1834 the order established a new headquarters in Rome, known today as the Sovereign Military Order of Malta.

The Teutonic Knights were founded in 1190 at the time of the Third Crusade by German lords fighting in the Holy Land. Like that of the Templars and Hospitallers their original purpose also included the care and welfare of pilgrims. It was not long, however, until they transferred their interest from fighting in the Holy Land to fighting Muslims in Germany's eastern frontier. Wearing a black cross on white surcoats, the Teutonic Knights fought equally against Christians and heathens in eastern Europe and were essentially a state in the guise of a religious order, conquering Prussia from the Slavs and pushing into Lithuania, Estonia, and Russia.

In 1410 at the Battle of Grunwald (Tannenberg), a Polish-Lithuanian army defeated the order and effectively ended its military power. In 1809, Napoleon dissolved the order and it lost its last secular holdings. The order operates today primarily as a charitable organization.

PHILLIP A. JACKSON

Kojiki and Nihon Shoki

Kojiki means *Record of Ancient Matters* and *Nihon Shoki* means *Chronicles of Japan*. They were written in 712 and 720, respectively, and are the earliest works of Japanese myth and early history based on ancient oral traditions. They were produced on orders of the government to exalt the ruling imperial line that claimed descent from the sun goddess through the Yamato clan that ruled Japan.

These two works are the earliest extant works on early Japan, from the creation of the cosmos, the mythology of the deities and the beginning of Japanese history, working forward toward verifiable history. Their background is the massive borrowings from the advanced Chinese civilization beginning in the sixth century. They included the introduction of Buddhism from China via Korea in the mid-sixth century and accelerated under the leadership of Prince SHOTOKU TAISHI (r. 596–622), who was an enthusiastic Buddhist and also an admirer of Confucius and the great Chinese empire under the SUI DYNASTY and TANG (T'ANG) DYNASTY. He sent three embassies to China to learn its ways and ideals, which included great reverence for history. Since there was no indigenous written Japanese, Japan adopted the Chinese written script. The advantage is that educated Japanese gained access to nearly 2,000 years of Chinese literary and historic tradition. Prince Shotoku reputedly began to compile the first history of Japan in 620, but that work was lost during a political upheaval after his death; hence another effort was ordered late in the seventh century, with two simultaneous works as a result.

Both works begin with creation, which they divided into three stages. The first stage involved the creation of heaven, earth, Japan, and the first *kami* (deity). The second stage saw the birth of the sun goddess Amaterasu, who was the ancestor of the imperial clan, and her unruly brother (ancestor of a rival clan). The third stage dealt with Amaterasu's dispatch of her grandson to rule Japan with instructions to pass the throne to her descendants thus linking the imperial clan to the sun goddess. The *Kojiki* is the shorter of the two, with only three volumes, and ends in 628 with the death of Empress Suiko. It is mainly devoted to mythology and

ancient history and interestingly used a mixture of Chinese and Japanese syntax.

On the other hand the *Nihon Shoki* is an official history and it is much longer—30 volumes. It was written in the tradition of Chinese dynastic history, chronicling events that began with mythology and giving a detailed genealogy of the Yamato line as descendants of the sun goddess, ending with the abdication of Empress Jito in 697. It was written in literary Chinese and included numerous quotations from Chinese literature. It also recounted the introduction of Buddhism to the Yamato court by an envoy sent from Korea. The *Nihon Shoki* set an example of history writing in the Chinese tradition. Just as China had its dynastic histories (there were 24, one for each legitimate dynasty beginning with the Han dynasty, 202 B.C.E.–220 C.E.), five more officially commissioned histories were written of Japan. Together they are called the *Six National Histories*.

Koryo dynasty

The kingdom of Koryo (or Goryeo) in Korea was named after the dynasty that ruled from the fall of the SILLA DYNASTY in 935 C.E. until the Yi dynasty overthrew it in 1392. The English name *Korea* is derived from the word *Koryo*. The kingdom of Koryo was an empire until it was forced to take the status of a kingdom when dealing with the YUAN DYNASTY (1279–1368) in China. The kingdom of Koryo traces its origins back to the weakening of Silla during a civil war in the early 10th century. Major rebellions against the Silla rulers had been led by Kung Ye, Ki Hwon, Yang Kil, and Kyon Hwon, with Kung Ye forming the kingdom of Hugoguryo (the Later Kingdom of Koguryo) and Kyon Hwon establishing Hubaekje (the Later Kingdom of Paekche). It was the first of these, the Later Kingdom of Koguryo, that would emerge as the kingdom of Koryo.

When Kung Ye led his rebellion against Silla, he wrested from their nominal control much of central Korea and established his capital at Kaesong (Songak) in 901. Soon afterward another rebel, Wang Kon (or

Wanggeon, or Wang Kien), emerged to help the rebellion. He was from a merchant family and drew support from nobles who had watched the stagnation of the Silla with horror. Kung Ye recognized the leadership qualities of Wang Kon and appointed him the prime minister of the new government based at Kaesong. However in 918 Wang Kon overthrew Kung Ye and placed himself at the head of the rebellion. Wang Kon obviously realized that even though the Silla were weak, he did not initially have the military force capable of defeating them. As a result it was not until 934 that Wang Kon decided to attack the Later Kingdom of Paekche at Hongson (Unju).

Wang Kon's victory was quick because in 935, Kyon Hwon surrendered to him. The Later Paekche king had designated his fourth son as his heir and this had annoyed his eldest son, Sin-gom, who drove him from the kingdom. Wang Kon easily overcame Sin-gom's army and the Later Kingdom of Paekche became a part of the emerging kingdom of Koryo. In December 936 the Silla king, Kyongsun, realizing that his forces would be unable to defeat Wang Kon in battle, also surrendered and Wang Kon became the king of the Korean Peninsula, ruling from Kaesong.

Wang Ko, better known by his posthumous title, King T'aejo, decided to be magnanimous and gave exiling Kyongsun the highest position in his new government, marrying a daughter of one of the Silla rulers, which helped legitimize his rule in the minds of many nobles. Furthermore he left most of the nobles in charge of their lands. When he died, after a reign of only seven years, his son became King Hyejong (r. 943–945), and succession was unchallenged. For many people, their connection with the court was through a Buddhist hierarchy that controlled much of the countryside.

The first external challenge faced by the new Koryo dynasty was a series of invasions by the Khitan peoples to the north and the west of Korea. They controlled many of the lands on the north of the Yalu River and claimed to be descendants of the original leaders of Korea. The Koryo tried initially to conclude an agreement with the Khitan but soon realized that this tribe actually wanted nothing less than control of most of the Korean Peninsula. In China, the new SONG (SUNG) DYNASTY was entrenching itself in power and sought an alliance with the Koryo.

Realizing that they would soon have enemies on both sides of them, the Khitan attacked in 983, 985, and 989 in a series of raids across the Yalu River. They decided to invade the Korean Peninsula before the Chinese could conclude an alliance with Koryo, and in October 993

a large Khitan army, estimated by some historians as being 800,000, led by Hsiao Sun-ning, attacked Koryo. The Koryo king, Songjong, took command of his soldiers at Pyongyang and held up the Khitan advance. Recognizing that the Khitan would not be able to win a long and protracted war in enemy territory, the Khitan negotiated a peace agreement and withdrew.

A similar problem arose in 1115 with the Jurchen (Manchu) tribe in Manchuria. The Jurchen leader had occupied southern Manchuria and proclaimed himself the emperor of China. They attacked the Khitan kingdom of Liao, and with help from the Sung, managed to destroy the threat of the Khitans sacking Liao in 1125. The Jurchen then attacked the Song, who were forced to retreat to southern China. With the Koreans uncertain who was going to win this war, and worried the Jurchen might become too strong and decide to annex Korea, the Koryo kings were more careful in not getting involved in the war in China.

In 1126 there was a major dispute over the focus of the kingdom. One group wanted to keep the capital at Kaesong and preserve the status quo. The other, led by Myo Cheong, wanted the capital moved back to Pyongyang, which would allow Korea to expand to the north. In 1135 the Myo Cheong rebellion failed. However 35 years later Jeong Jung-bu and Yi Ui-bang launched a coup d'état against King Injong, who was exiled, and Myongjong became the next king, reigning until 1197. For much of that time he was a puppet who served the interests of contending generals such as Kyong Taesung (r. 1177–84). In 1197 Choi Chungheon, another general, deposed Myongjong, and replaced the king with Sinjong (r. 1197–1204). He then ousted Sinjong and put Huijong on the throne. However Choi Chungheon deposed Huijong in 1211, and a new king, Kangjong, ruled for two years. Choi found the next king, Kojong, more compliant, and he outlasted Choi, reigning until 1259.

In 1202 GENGHIS KHAN was elected leader of the Mongols and attacked first the Jurchen and then the Chinese. Mongols chased some escaping Khitan refugees to Pyongyang and in 1279, having conquered China, established the Yuan (or Mongol) dynasty, moving the capital of China to Beijing. The Koryo kings decided not to challenge the power of the Mongols and tried to maintain some semblance of independence but at the same time dispatched tribute to the Mongols, sending royal hostages to Beijing, and some of the kings had to marry Mongolian women. Three of the later Koryo kings, Chungnyol, Chungson, and Chungsuk, spent most of their time at the Mongol court, leaving little

time to manage their own kingdom. It was a diplomatic balancing act but did ensure that the Mongols, with their well-known bloodthirst and penchant for revenge, did not pillage Korea in the way that other areas were destroyed by them.

However when the Mongol emperor of China, KUBILAI KHAN, wanted to attack Japan in 1274 and again in 1281, the Koreans had to provide many soldiers and use their manpower to build the Mongol navy. The first attack was launched from Hapoo (Masan) on the southern coast of Korea. The fleet of 900 ships carrying 40,000 soldiers sailed to Tsushima, and then onto Kyushu, where they fought the Japanese in Hakata Bay. The second invasion force, also including many Koreans, involved two fleets, one of which left from Korea—a total of 4,400 ships and 142,000 soldiers. Tens of thousands of Koreans were killed by the Japanese during these futile attacks or died when the ships in both attacks were hit by freak typhoons. With so many of the soldiers having been Korean levies, the loss struck a major blow against the Korean economy and on the Koryo dynasty, which had, in name, supported the attack.

Many of the later rulers of the Koryo dynasty were young, with six of the last nine being teenagers or younger when they became king. King Chunghye (r. 1330–32, 1339–44), and King U (r. 1374–88) spent most of their reigns chasing wild animals in hunts, being involved in drunken parties, or having affairs with countless women. King Kongmin (r. 1351–74) was the only one of the latter Koryo kings who provided any stability to the country. However after the death of his wife, he spent much of his reign obsessed with finding an auspicious place for her to be buried, and where he could also be interred.

He eventually settled on a spot about nine miles west of Kaesong where, on a steep hill, he built two matching burial mounds, one for himself, and the other for his wife. It is said that several astrologers were killed for displeasing Kongmin in his search for an auspicious site, including those who actually found the chosen location—slain in error by royal guards after Kongmin spent so long on the mountainside that they thought he had once again been taken to a location he did not like. The tombs of Kongmin and his wife were pillaged by the Japanese during their invasion of Korea in 1592 but have since been restored.

Although the Mongols dominated the kingdom of Koryo, when their power in China declined, it was a nervous time for the Koryo rulers. In 1382 the Chinese MING DYNASTY started and the remnants of the Mongols and

the other tribes that had supported them fled north, with some making their way to Manchuria with Ming armies following them. In equipping an army to hold off any moves across the Korean border, the Koryo rulers put a large armed force under the command of General Yi Song-gye. Rather than securing the border, Yi Song-gye moved on Kaesong and seized the kingdom for himself, ushering in the Yi dynasty.

JUSTIN CORFIELD

Kosovo, Battle of (1389)

The Battle of Kosovo was a turning point in Ottoman control over the Balkans and a major defeat for the Serbs. As the Muslim Ottoman army moved deep inside Balkan territory, The Serbian ruler LAZAR I, with the solid backing of the Serbian Orthodox Christian Church, formed a coalition with other Balkan peoples including Bosnians and Albanians to raise an army that was equivalent in size to the Ottoman forces. Lazar then challenged Sultan Murad I, who, ever eager to take the offensive, met him on the Kosovo battlefield in the summer of 1389 C.E..

Lazar and Murad commanded their troops from the centerlines. Murad's son BAYEZID I led the left flank and his other son, Yacoub, led the right. Lazar's nephew and the leading feudal Serbian knights led the Serbian cavalry charges. Initially the Serbs gained against the right flank, but Bayezid's left flank held firm. In the midst of the battle, Miloš Obilić (Milosh Obilich) pretended to be a deserter; he gained access to Murad's tent and stabbed the sultan. Murad's guards then killed Obilić. On the battlefield the tide turned in favor of the Ottomans and Lazar was captured. Although fatally wounded, Murad lived long enough to pronounce a death sentence on his enemy, who was then beheaded.

Bayezid I was proclaimed the new sultan and to prevent any rival claims to the throne, he promptly had his brother assassinated. Following a custom practiced by many conquerors over the ages, Bayezid I then married Olivera, the daughter of his vanquished foe Lazar.

Serbia was formally annexed as part of the Ottoman Empire in 1459. Many Serbian knights, including Bayezid's new Serbian brother-in-law, fought side by side with the Ottomans in subsequent battles, particularly against TIMURLANE (TAMERLANE).

The Battle of Kosovo had a catastrophic impact on Serbia and marked the end of medieval Serbian knight-hood. The battle also became a major event in Serbian historiography and numerous folk ballads, known as the Battle of Kosovo cycle, have been passed down through the centuries to the present day. These poems celebrate the Serbian heroes of Kosovo and keep the battle, characterized as the forces of Christianity against ISLAM and good against evil, very much alive in the popular Serbian national imagination.

JANICE J. TERRY

Kubilai Khan

(1215–1294) *Mongol leader*

Kubilai or Khubilai was born in 1215, the second son of TULUI KHAN (youngest son of GENGHIS KHAN) and Sorghaghtani Beki, who was a Kerait (a tribe that Genghis had conquered) and a Nestorian Christian (his principal wife, Chabi, was also a Kerait and Nestorian Christian). His mother was very influential in all her four sons' upbringing; she had them learn to read Mongol (but not Chinese) and to administer as well as ride, hunt, and fight. When OGOTAI KHAN (Tului's elder brother) became khaghan (grand khan), Sorghaghtani Beki obtained *appanages* (fiefs) for both herself and Kubilai in north China.

While his elder brother MONGKE KHAN participated in the great Mongol campaign to conquer Europe that began in 1236, Kubilai remained behind, learning to administer his appanage and learning about ZEN (CH'AN) BUDDHISM and Confucianism from prominent scholars in both fields. These experiences marked him as a different kind of leader from most of his relatives. He also realized the harm that the wars and Mongol plundering armies had done to

the Chinese economy and society, and how granting appanages to Mongol lords harmed the authority of the central government.

The election of Mongke as the fourth khaghan in 1251 became Kubilai's stepping-stone to power. In his quest to expand the Mongol realm, Mongke appointed one brother, HULAGU KHAN, to conquer the Middle East, and Kubilai to conquer a kingdom called Nanchao or Dali (T'a-li) in present day Yunnan province in China. Kubilai completed his task in 1254, and Dali was put under Mongol control. In 1258 Mongke launched his main campaign against the Southern SONG (SUNG) DYNASTY in which he and Kubilai each led a wing of the invading army.

Mongke's death in the next year precipitated a succession crisis. Traditionalist Mongols and supporters of Arik Boke, Tului's youngest son, convened a *khuriltai* or council that had representatives from the other branches of Genghis Khan's clan, which elected him khaghan. Kubilai also convened a *khuriltai*, in his appanage, attended by his supporters that elected him to the same position. In the ensuing civil war Kubilai had the support of Hulagu and also the greater resources of China. Arik Boke surrendered in 1264 and died two years later under Kubilai's supervision.

Kubilai's ascension marked his transition from Mongol khaghan to emperor of China. In 1254 he had chosen a site in northern China located 200 miles north of present-day Beijing as his capital, arguing that it was logical to be located where he governed. It was called Shangtu meaning "supreme capital" in Chinese. It became the secondary capital in 1264 when he moved the seat of his government to the former Liao and Jin (Chin) capital, which he rebuilt and renamed Datu, or Tatu ("great capital" in Chinese); its location is present day Beijing. As a result Karakorum, built by Ogotai Khan as capital of the whole Mongol Empire, was relegated to the backwaters.

From this time on Kubilai chose a Chinese reign name, proclaimed a calendar, adopted many Confucian rituals of state, and in outward form at least became a Chinese-style ruler. In 1271 he proclaimed himself the founder of the Great YUAN DYNASTY (1279–1368) and claimed that it had received the Mandate of Heaven as the latest in the succession of Chinese dynasties. Between 1267 and 1279 his forces finished off the Southern Song, capturing its capital HANGZHOU (HANGCHOU) in 1276.

Several campaigns occupied the remainder of Kubilai's reign. One was to subjugate Korea, whose king had been subservient until a coup in 1269 brought in an independent leader. It ended in 1273 with Korea

Marco Polo presenting a letter to Kubilai Khan. Kubilai's ascension marked his transition from Mongol khaghan to emperor of China.

back in the Mongol fold. Kubilai also launched two expeditions to force Japan to accept tributary status. The first one in 1274 landed at Hataka on the eastern coast of Kyushu island and met with resistance and disaster because of a gale-force storm. A huge second expedition, two armadas of 140,000 men, mostly Koreans and Chinese plus a Mongol cavalry, were devastated by a typhoon.

A naval expedition against Java in 1292–93 was also a fiasco. Land invasions of Burma and Vietnam were more fortunate and secured their vassalage. The wars against Kaidu Khan (1235–c.1301) were more difficult and reflected the division between the different branches and ideologies among Genghis Khan's descendants. Kaidu was Ogotai Khan's grandson and his cause showed the resentment of that branch of the family on its eclipse. Kaidu's allies were princes from the Chagatai and Tului families who objected to Kubilai's identification with his sedentary Chinese subjects. Their causes failed but they continued to be troublesome.

Kubilai needed to be accepted as sovereign of China while remaining leader of the Mongols. Therefore he continued the shamanitic practices of his ancestors

while turning to Tibetan Buddhism and ordered the creation of a new alphabet based on Tibetan for writing the Mongolian language (an earlier script was based on Uighur). While favoring non-Chinese Central Asians in top posts in his government, he also honored Confucius and continued Chinese traditions such as authorizing historical writings and cultural activities. Kubilai Khan's administration was by Mongols and for the benefit of Mongols. The death of his wife Chabi in 1281 and son and heir Prince Zhenjin in 1285 was a personal and dynastic loss, because Zhenjin had been given a good Chinese education and had he lived there might have been improved relations between Mongols

and Chinese. Kubilai increasingly took to feasting and heavy drinking in his last years and died in 1294.

JIU-HWA LO UPSHUR

Ladislás

(1040–1095) *king of Hungary, saint*

Ladislás was king of Hungary and the second ruler of the Árpád dynasty to achieve sainthood. At the end of the 10th century the Magyar leader Géza and his son Stephen began the conversion of the pagan Magyars to Christianity and the foundation of Hungary as an independent Christian kingdom. In 1000 Pope Sylvester II crowned Stephen king of Hungary, establishing the country's independence from the HOLY ROMAN EMPIRE (EARLY).

Neither Christianization nor the foundation of the state was fully complete at Stephen's death in 1038, and the succession struggle demonstrated both the strength of pagan religious practice in the country and the vulnerability of the kingdom to foreign, particularly German, influence. In the following 40 years Hungary was subject to two pagan uprisings and nine invasions from Germany, Bohemia, and Poland. The crown changed hands eight times and between 1044 and 1046 the kingdom was ruled directly by Henry III as a fief of the empire.

Ladislás (Hungarian, László) assumed power in 1077 following the death of his uncle, Géza I, but only secured his rule by defeating the deposed King Salamon and his Cuman allies in 1083. Ladislás pursued policies that strengthened the Christian Church, increased the kingdom's independence from German influence, and extended its power in southeastern Europe. In the investiture struggle between Pope Gregory VII and Emperor HENRY IV, Ladislás supported the pope and his German

allies. As part of the anti-imperial alliance he married Adelaide, the daughter of Duke Welf of Bavaria.

Henry IV's continued troubles allowed Ladislás to extend his control over southern Hungary, Transylvania, and Croatia. In a series of campaigns along the lower Danube he defeated the Pechenegs and their allies among the remaining pagan Magyars. In Transylvania, he established the fortress of Gyulafehérvár (Alba Iulia) and settled Magyar-speaking Szekler tribesmen in the southeastern corner of the country, giving them communal rights in exchange for military service as frontiersmen. After the death of his brother-in-law King Zvonimir of Croatia, Ladislás occupied Slavonia and incorporated it into the kingdom of Hungary, establishing four new counties between the Drava and Sava rivers.

To consolidate the church and complete the process of converting the Magyars and other inhabitants of the kingdom to Christianity, Ladislás founded new bishoprics in Nagyvárad (Oradea) and Zagreb. It was in Ladislás's reign that Hungary's first king, STEPHEN I, and his son Imre were sainted. The earliest Hungarian chronicle, the *Gesta Hungarorum*, which recounted the early history of the Magyars and their conquest of the country, was composed at his court.

In 1095 Ladislás died while preparing to join the First Crusade. Soon after the first miracles associated with him were reported. For these and his contribution to completing the Christianization of Hungary he was canonized in 1191. A number of legends surround the life and deeds of Ladislás, many of them clearly adaptations or repetitions of older pagan Magyar myths,

retold with a Christian hero. After St. Stephen, Ladislas made the most significant contribution to the foundation of the kingdom of Hungary and its conversion to Latin Christianity.

BRIAN A. HODSON

Lalibela

(d. 1207) *Ethiopian king*

When the Axumite empire, believed to have been established by the son of King Solomon and the queen of Sheba, fell in the 11th century, the Zagwe dynasty took power. Of non-Solomonic origins, the Zagwe moved the Ethiopian capital from Axum to Roha (present-day Lalibela about 400 miles north of Addis Ababa). King Lalibela was the most famous of the Zagwe monarchs. Much of his life is shrouded in myth. His name means “the bees recognize his sovereignty,” after the legend that upon his birth, bees representing soldiers surrounded him to protect and serve their monarch.

King Lalibela, (r. 1167–1207) was a devout Christian; his subjects believed he had traveled to Jerusalem as well as having been transported by angels to the heavens. Lalibela sought to create a new Jerusalem in his capital traversed by a small river named the Jordan. Over the course of 25 years, Lalibela constructed 11 churches hewn out of solid rock. The churches are connected by a maze of tunnels and underground pathways, dotted by caves used by monks. Beit Giorgis, named after Saint George, the patron saint of Ethiopia, was carved under ground level. It is 12 meters high, with a cross-shaped floor plan, covered by a roof decorated with carved crosses. King Lalibela is buried in the Beit Maryam church while another, Beit Medhane Alem, is thought to be one of the largest monolithic churches in the world. As with Gothic architecture in medieval Europe, these monuments represent a fusion of religious belief and political power.

The Zagwe dynasty collapsed in 1270 when it was overthrown by an heir to the Solomonic line of Ethiopian rulers.

JANICE J. TERRY

Lateran Councils, Third and Fourth

In the 12th, 13th, and 16th centuries in the Lateran Palace in Rome, the Roman Catholic Church held five councils. The first took place in 1123 to ratify the CONCORDAT OF WORMS (1122), while the second took place in 1139 to reaffirm church unity after the schism of 1130–38. The Third Lateran Council (1179) was called by Pope Alexander III to end the schism (1159–77) of antipope Calixtus III and his predecessors and to establish procedures for the election of popes. The Fourth Lateran Council, the most important of the five, was the culmination of the Lateran effort, with the fifth being largely unproductive.

In March 1179 about 300 church fathers met at Rome for the Third Lateran Council. The Third Lateran Council was to ratify an earlier agreement between the pope and the Holy Roman emperor. Alexander and Emperor FREDERICK I (1152–90) had agreed at Venice in 1177 to end the long-standing schism in the church. Frederick had supported Victor IV over Alexander as pope and declared war against the Italian states and Roman church. The schism lasted long enough to bring into power two additional antipopes, Paschal III (1164–68) and Calixtus III (1168–78), both opposed to Alexander. Alexander finally prevailed and, as he promised at Venice, called the general council to end the schism and the dispute with the emperor. Having resolved the schism, the council established procedures for election of the pope; electors were to be only the College of Cardinals, the Sacred Conclave, and election required a two-thirds majority of all cardinals voting. Having undone the damage done by the antipopes and settled the election of the pope, the church fathers condemned the Albigensians and Waldensians as heretics.

Also known as the Poor Men of Lyons, the Waldenses or Waldensians or Vaudois were led by Peter Waldo, a Lyonnaise merchant. Waldo gave away his property in 1176 and began a life of itinerant preaching of apostolic poverty as the route to perfection. Waldensians believed only in the Bible, and simple Bible reading, sermons, and the Lord’s Prayer constituted their services. They rejected the papacy, indulgences, the Mass, and

purgatory. They also believed that all Christians contained the Holy Spirit and could preach; lay believers could replace priests. Their doctrines are contained in the Waldensian Catechism of 1489. Similar pre-Reformation groups include the Humiliati. The Albigensians took another heretical approach. Because the church barred lay preaching, in 1179 the Waldensians met with Alexander III, who blessed them but prohibited their preaching without approval from their local clergy. The Waldensians preached anyway. Lucius III declared them heretics in 1184, as did the Fourth Lateran Council in 1215. In 1211 at Strasbourg, more than 80 Waldensians were burned as heretics.

The Albigensians were French Cathars, probably named for the southern town of Albi, which was the center of their movement. Labeled by INNOCENT III as dualists, they were followers of the old Mediterranean-area Manichean belief that good and evil had their own divinities. They believed that existence is a struggle between good and evil, Jesus Christ and God against Satan. Material objects—food, wealth, and the human body—belonged to Satan, who had imprisoned the soul in a body. A good life could free a soul, but a failed life meant that the soul was reincarnated to try again. Believing that the church was a tool of Satan, they refused to become Catholic. The ALBIGENSIAN CRUSADE (1208–29) was Alexander’s answer to their refusal to join the church. Simon de Montfort also crusaded against them until 1218. In 1233 the Dominican inquisition effectively ended the Albigensian heresy, although persecution of survivors persisted into the 14th century.

In Italy until 1184 local bishops were responsible for dealing with heresy. In that year Pope Lucius III and Emperor Frederick I met at Verona and issued a condemnation of various sects, including the Cathars, Humiliati, and Patarines. The pope issued the bull *Ad abolendam*, which set out penalties for heresy by clerics and laymen while establishing a process of inquisition by the bishops. The legislation against French heresy applied equally to Italy. There were no missions or CRUSADES in Italy as there had been in France. Heresy remained a problem despite the best efforts of the church leaders at the Third Lateran Council. Innocent III would have to address it again at the Fourth Lateran Council.

Although one of the youngest popes ever elected, Innocent was perhaps the best pope of this period. He built the PAPAL STATES, reduced the power of his possible rivals in Hohenstaufen Germany, elaborated a theory of papal authority, and defined the relative limits of kingship in relation to that authority. He sponsored the Fourth Crusade, planned the Fifth Crusade, and took

measures to eradicate heresy. Most of this work was part of the Fourth Lateran Council.

Innocent was the author of the position that “there is but one Universal Church, outside of which there is no salvation.” He felt the power of the papacy increasing, but he also knew that the Crusades were going badly, with the Children’s Crusade of a few years earlier being the worst. He needed a council to reinforce the defense of the faith, aid the crusaders in Palestine, and reaffirm freedom of the church from lay interference. He sent church and secular rulers his bull of April 19, 1213. Pope Innocent III called the Fourth Lateran Council in 1215. This council was the most important of the Lateran Councils. More than 1,000 churchmen attended. Some 71 patriarchs and metropolitans (including two from the Eastern church), 412 bishops, 900 abbots and priests, and many representatives of European rulers responded and met at the largest council ever.

The council issued 70 decrees that dealt with penalties for heresy and procedures against heretics and those who protected them, a proclamation of papal primacy, and order of succession through the various sees—Constantinople, Alexandria, Antioch, and Jerusalem. The council established rules for the clergy concerning hunting, drunkenness, attendance at performances, performance of surgeries, and conduct of trials by combat or ordeal.

It also dealt with taxes, litigation within the church, matrimony, tithing, simony, and Jews. It barred the establishment of new monastic orders. It defined the Easter duty, *utriusque sexus*, that required confession at least annually, and it prescribed that Muslims and Jews had to dress in such a way that they were distinguishable from Christians. The council defined the Eucharist to include transubstantiation for the first official time. It made official that transubstantiation was the mysterious change of bread and wine becoming the body and blood of Jesus Christ.

The council affirmed that Frederick II, not his rival Otto, was the Holy Roman Emperor. It also promoted a new crusade in the Holy Land as well as one against the Albigensians and Waldensians. This council was the peak of the medieval papacy’s prestige. The Fourth Lateran Council was a summary and reaffirmation of existing laws regarding heresy. When Innocent died in 1216 the church had everything it needed, including the precedents for the INQUISITION.

JOHN H. BARNHILL

Latin states of the Crusades

The history of the first crusading kingdom of Jerusalem commences with the conquest of Jerusalem by the Christian army, led by GODFREY OF BOUILLON, duke of Lower Lorraine, on July 15, 1099. The crusading host stormed the city and, having slaughtered the native population, captured the Church of the Holy Sepulcher. Although the religious mission was accomplished, the political goals of the crusading leaders were yet to be achieved. Following Jerusalem, other towns fell to the crusaders: Haifa in 1100, Arsuf and Caesarea in 1101, Acre in 1104, Sidon in 1110, Tyre in 1124, and finally, Ascalon in 1153. At the same time the crusading leaders established their control over some trans-Jordan areas, as well as by the northern coast of the Red Sea.

Godfrey of Bouillon never assumed the title of the king, addressing himself merely as a "defender of the Holy Sepulcher." He died childless on July 18, 1100, and on Christmas Day of the same year, his brother Baldwin of Boulogne was crowned as Baldwin I. It was under him that the crusading army captured most of the aforementioned towns. He died on April 2, 1118, and the kingship passed to the hands of his cousin, Baldwin of Bourcq, crowned as Baldwin II (1118–31). Upon his death, his son-in-law, Fulk, count of Anjou, succeeded the crown.

His reign (1131–43) is characterized by political and social unrest in the kingdom, which was divided between the "king's party" supporting Fulk and the "queen's party" following his wife, Melisende. With Fulk dead, Melisende attempted to rule on her own, provoking anger of her young son, Baldwin III (1143–63), and his supporters. The latter forced the queen to give up her intention. Among Baldwin III's achievements were the conquest of Ascalon (1153) and rebuilding of the Church of the Holy Sepulcher (completed in 1149).

His younger brother Amalric (1163–74) initiated three Egyptian campaigns against Nur al-Din, capturing Bilbais on November 1168. Amalric's son Baldwin IV the "Leper" (1174–85) was surrounded by court intrigues and conspiracies. At the center of these intrigues stood Baldwin's sister Sibylle with her second husband, Guy of Lusignan, and Raymond III, count of Tripoli. Baldwin died in May 1185, leaving the Crown to Sibylle's son Baldwin V, still a boy. The latter died on September 13, 1186, and Sibylle was crowned with Guy, who was captured by the Muslim leader SALADIN (SALAH AD DIN, YUSUF), in the Battle of Hittin (July 4, 1187).

Despite their political control over vast territories, the crusading kings could never achieve continual peace and their rule was permanently threatened by the Muslim enemies, as well as their Christian rivals—Frankish nobility. The Islamic threat became evident with the conquest of Edessa in 1144 by a Muslim warlord Zangi, while the crusaders' weakness was proved by inability of the Christian forces to cope with the Muslim army, which eventually captured Damascus on April 25, 1154. The failure in the north was followed by a similar failure in the south: a new Muslim leader, Salah ad Din, also known as Saladin, (1138–93), repelled the crusading forces in 1169 in Damietta, and 1174 in Alexandria.

Having subdued his Muslim rivals between 1174 and 1186, Saladin moved on the attack against the Christians. On July 4, 1187, he defeated the crusading army led by King Guy in the Battle of Hittin, leaving the rest of the Christian towns exposed to his threat. Acre was captured on July 10, 1187, while Jerusalem capitulated on October 2 of the same year. The first crusading kingdom came to its end.

THE SECOND CRUSADING KINGDOM OF ACRE (1189–1291)

The disaster of Hittin and fall of Jerusalem provoked a strong reaction in western Europe, whose leaders rose to a new crusade. Led by RICHARD I the Lionheart of England, PHILIP II AUGUSTUS of France, and FREDERICK I Barbarossa, the German emperor who died on his way to the Holy Land, the crusading host had arrived before the walls of Acre in the summer of 1189. After two years of siege the city was recaptured on July 12, 1191. The Christian unity did not last long; Philip Augustus decided to return to France, while Richard remained in Palestine. He failed to capture Jerusalem and on September 2, 1192, the Christian and Muslim armies came to a settlement. The coastline stretching between Jaffa and Tyre came into the hands of the crusaders, while Jerusalem remained under Muslim control, with holy

The crusading host stormed the city of Jerusalem and, having slaughtered the native population, captured the Church of the Holy Sepulcher. Although the religious mission was accomplished, their political goals were yet to be achieved.

sites accessible to pilgrims. Acre effectively became not only a political capital of the new crusading kingdom, but also its cultural and economic center. The city was strongly multicultural in character, being home to Italian, French, English, German, Greek, Muslim, Jewish, and Eastern Christian communities.

The struggle with the Muslims resumed in 1219, when John of Brienne, king of Jerusalem, and his army penetrated into Egypt, capturing Damietta. From there they moved to Cairo, which they failed to reach, having suffered a defeat at the hands of the Ayyubid sultan al-Kamil (1218–38) on August 30, 1221, near al-Mansura. The crusaders' lives were spared in exchange for Damietta.

The next crusading initiative came from the German emperor Frederick II (1212–50), who came to Palestine in September 1228 with a large army. Fear-

ing Frederick's military advantage, al-Kamil offered a treaty, which granted the crusaders Jerusalem, Galilee, and part of Sidon and Toron. Jerusalem remained in Christian hands until 1239, when the Ayyubids briefly captured it, only to be restored to the Christians in 1240. The Christian rule of Jerusalem came to its end four years later, with the conquest by the Khorezmian Turks in the summer of 1244.

The crusade of Louis IX of France (1229–70) did not aim at the reconquest of the Holy City. On June 6, 1249, his forces seized Damietta and moved on to Cairo, only to suffer the fate of their predecessors of 1221. On April 6, 1250, his army was badly beaten at al-Mansura and as the result the king and his men were taken captive.

The Latin population of Acre did not always live in peace. The tensions were especially apparent between

the Venetian and Genoese communities, who struggled over commercial supremacy in the region. The War of St. Sabas broke out in 1256 and lasted until the Genoese defeat in 1258. Following the defeat the Genoese were forced to leave the city and their territory was overrun by the Venetians.

In the meantime a new threat had emerged from the Mamluks, who in 1250 overthrew the Ayyubid Sultanate in Egypt and established their own military rule. Faced with the crusading presence and the Mongol threat, under Sultan Baybars (1260–77) and his heirs, the Mamluks conquered the remaining towns, villages, and forts of the crusading kingdom, forcing its inhabitants into exile. The European population of the Outremer sharply fell, resulting in the inability of the crusaders to stop the Mamluks, and led to the final fall of the kingdom. On May 18, 1291, the inhabitants of Acre, the capital town of the kingdom, surrendered and those not slain by the conquerors returned to Europe, mainly France and Italy. The town was laid to waste and remained so until it was rebuilt in the 18th century. The history of the Latin kingdom in the Holy Land came to an end.

MINOR CRUSADING STATES

The conquest of Jerusalem on July 15, 1099, may signify the establishment of the first crusading kingdom, but not the first crusading state. As early as March 1098, Baldwin of Boulogne, the future king Baldwin I of Jerusalem (1100–18), forced the Armenian principality of Edessa to accept him as its new master. Baldwin assumed the title of count of Edessa, establishing the first Latin principality in the Near East. Two years later upon the death of his brother Godfrey of Bouillon (July 18, 1100), the first ruler of the kingdom of Jerusalem, Baldwin changed his title to king of Jerusalem. Baldwin of Bourcq was also crowned as Baldwin II of Jerusalem (1118–31). While Baldwin II exercised full control over both the kingdom of Jerusalem and the county of Edessa, his successor handed the lordship of Edessa to the hands of the family of Courtenay.

The first count of the Courtenay dynasty was Joscelin I (1119–31), who was succeeded by Joscelin II (1131–49). It was under the latter that the Muslim leader Zangi captured the principal town Edessa in 1144 and forced the Christian ruler and his family to desert it. Zangi killed the male Christian population of the city, reduced the women and children into slavery, and decimated the city in 1146. Joscelin moved to Turbessel, where he had established his power, only to be captured by the Turkish sultan of Konya, Masud, in 1149. The

latter handed Joscelin over to Nur al-Din, who took him captive to Aleppo, where the count died in prison in 1159. His wife, Beatrice, granted the remains of the county to the Byzantine emperor. The son of Joscelin and Beatrice, Joscelin III, retained the title, without ever ruling the county.

The history of the county of Tripoli goes back to 1102, when Raymond of Saint-Gilles, a crusading leader, named himself as count of Tripoli. He did not live to capture the town itself, which surrendered in July 1109. A struggle between Raymond's cousin William Jordan of Cerdagne and his eldest son, Bertrand, followed the conquest of the town. The rivalry ended thanks to the intervention of Baldwin I of Jerusalem, who installed Bertrand as his vassal. The latter died in 1112 and soon after, the county passed to his young son, Pons, who attempted to set himself free from the authority of Baldwin II, his suzerain. Pons's rebellion was crushed in 1122, although he retained his county. He ruled until 1137 when the townsfolk of Damascus killed him. His successor, Raymond II, faced a political challenge from Bertrand, the illegitimate son of Alfonso Jordan, son of Raymond of Saint-Gilles. He eventually overcame his challenge with the aid of Nur al-Din.

After his murder by the Assassins in 1152, the rule passed to his son, Raymond III (1152–89). In 1164 he was captured and imprisoned by Nur al-Din, while on a campaign to relieve the siege of Harim, along with Bohemond III of Antioch and Joscelin III of Edessa. During their imprisonment, Amalric of Jerusalem was regent of the county. Raymond III was released in 1172 and two years later rose to the position of regent of Jerusalem. He died in Tyre in 1187, having installed his godson, Bohemond IV, prince of Antioch, as his successor. The two baronies were united, with a brief exception of the years 1216–19, until the fall of Antioch in 1268. After the death of Count Bohemond VII in 1287, the county sank into political and social chaos, which was exploited by the Mamluk sultan Qalawun. The city fell into his hands in 1289, after a siege.

The origins of the principality of Antioch go back to the conquest of the city in 1098 by Bohemond of Taranto, the first prince of Antioch. The latter died in 1103 leaving the principality to his young son, Bohemond II, while Tancred of Hauteville and Roger of Salerno acted, respectively, as his regent until 1119. In October 1126 Bohemond was married to Alice, daughter of Baldwin II, king of Jerusalem (1118–31). The union of two crusading families did not last long: His Muslim enemies killed Bohemond in February 1130. Bohemond left a young daughter, Constance, whose regent was Raymond of

Poitiers. In 1136 Raymond had officially assumed the title of the prince of Antioch and remained in power until his death in the battlefield on June 29, 1149. During his rule, the Byzantine emperor John Komnenus invaded Antioch in 1137 and captured towns that threatened the principality. The campaign was repeated in 1142 and the integration of the principality into the empire was hindered only by John's death in 1143.

In 1153 Constance married Renaud of Châtillon-sur-Loing, a man of well-established knightly family, who was taken captive by his Frankish enemies in 1161. As a result, the magnates of Antioch forced Constance to hand the title of the prince to her son, Bohemond III. The latter joined Raymond III, count of Tripoli, in a military campaign against Nur al-Din. The result of this campaign was a complete defeat of the Christian army in 1164. According to the Muslim sources, Nur al-Din was advised to capture Antioch, which he did not do. Raymond was ransomed by the emperor and restored to the principality. However, the real ruler of Antioch was King Amalric of Jerusalem. In the course of Saladin's campaigns of 1280–90, the territory of the principality had been reduced to the surroundings of the town of Antioch. The Armenian prince Leo exploited the weakness of Bohemond III, attempting to capture the city. The local population in 1194, however, drove out his army.

Upon Bohemond's death in April 1201, his older son Bohemond IV succeeded him, also reigning as count of Tripoli, being adopted by Raymond III of Tripoli. The two Latin baronies were united under one prince. Unlike the kingdom of Jerusalem, Antioch survived the assault of Saladin, with the assistance of the ITALIAN CITY-STATES, but afterward did not play any important role in the subsequent Crusades. After Bohemond IV's death in 1201, the principality was torn by a power struggle between the two rivals, Bohemond of Tripoli, the future Bohemond V (1207–23), and Raymond-Ruben of Armenia, Bohemond III's grandson. The struggle between Antioch and Armenia ended with the marriage of Bohemond VI and an Armenian princess, Sybille. The city and the entire principality fell to the Mamluks in 1268. The title *prince of Antioch* passed to the king of Cyprus, after the fall of Acre in 1291.

Although not European countries, the Latin states of the Near East played an important role in the political, social, economic, and cultural life of Europe in the High Middle Ages. The very idea of the crusading knight became the ideal of the European nobility. The encounter with the Orient and its culture, different from that of the West, had enriched the horizons of the Europeans.

The Outremer states, at times through the mediation of Italian city-states, maintained vital mercantile connections with Europe, acting as the supplier of African gold and spices.

PHILIP SLAVIN

Lazar I

(d. 1389) *Serbian ruler*

Since at least the 19th century Serbs have memorialized the defeat and death of Lazar I at the Battle of Kosovo in (1389) as an event of central significance in the nation's history. The defeat of Lazar's forces by the army of Ottoman sultan Murad I is frequently used to mark the end of independent, medieval Serbia and the beginning of Turkish rule. Popular songs and poems dating back to the 16th century or earlier recount the martyrdom of Lazar, who according to tradition was visited by an angel the night before the battle and offered a choice between a heavenly and an earthly kingdom. Choosing the former he was then betrayed by a rival prince secretly allied to Murad. Some versions of the story include a Serb nobleman who demonstrated his true loyalty by sneaking into the Ottoman camp and killing the sultan before the battle. The traitorous prince is commonly identified as Vuk Branković and the loyal noble as Miloš Obilić, both supposedly sons-in-law of Lazar and rivals for his

attention. Nationalist writers have used this tale of divine selection, betrayal, loyalty, and deceit to symbolize the historical destiny of Serbia and explain its subsequent incorporation into the OTTOMAN EMPIRE: 1299–1453.

Between the 12th and early 14th centuries Serbia was united under the Nemanjich dynasty, which consolidated Serb control over much of the central Balkans. The last ruler of the dynasty, Czar Stephan Dušan (r. 1331–55), built a short-lived Serbian empire, extending his control over Albania, Macedonia, and much of Greece, and promoting the elevation of the archbishop of Ipek to the position of patriarch of the Serbian Orthodox Church. Following Dušan's death his son Uroš proved unable to maintain his father's legacy, and real authority quickly slipped into the hands of a number of regional lords. In 1371 one of his supporters, Vukašin, was killed at the head of a large Serb army in battle with the Turks on the Maritsa River. Uroš died two months later, ending the Nemanjich dynasty and with it any real hope for the revival of the Serb empire. The country disintegrated into a number of independent but weak principalities, each vying for territorial control.

The strongest of the remaining Serb rulers was Lazar Hrebeljanovic of Kruševac. In 1374 a gathering of Serb nobles at Ipek recognized him as their leader. Lazar consolidated his position by concluding marriage alliances with the leading nobles in Kosovo and Montenegro, Vuk Branković and Gjergj Balsha. He also developed close relations with King Tvrtko of Bosnia, the strongest ruler in the region. To further bolster his position, he cultivated the support of the Serb patriarch by granting the church additional lands and founding the monastery of Ravanica. Though successful in establishing and defending his role as the leading prince in Serbia, Lazar was unable to reunite a Serb state.

As for other Serb rulers, Lazar's relations with the Ottoman Turks were complicated. In the 14th century Ottoman influence in the Balkans was growing rapidly, capitalizing on the internal disorder and decline of the Byzantine, Bulgarian, and Serbian empires. Numerous Christian rulers entered into alliance with the Turks or accepted vassalage in return for Ottoman support in their struggle with neighboring princes. Christian forces were commonly found fighting on the sultan's campaigns and Turkish soldiers were occasionally lent to Christian princes. Throughout, the Ottomans steadily gained territory and strength, emerging as the leading power of the region.

In 1386 Murad seized Niš from Lazar and two years later raided Bosnia. The following spring the Ottomans

prepared to occupy Lazar's possessions in Kosovo as a prelude to an attack on Bosnia. Lazar called on the assistance of Tvrtko, who provided a large force, as did Lazar's son-in-law, Vuk Brankovic. The two armies met at Kosovo Polje on June 15, 1389. Both armies suffered heavy casualties and Lazar and Murad died in the battle, at the end of which Lazar's army fled. Though the Ottoman army controlled the field, Murad's son BAYEZID I abandoned the campaign in the Balkans and led the remaining Turkish forces against his brother in Anatolia in order to secure his succession to the throne.

There is no direct historical evidence supporting the details of the popular legends associated with the Battle of Kosovo. The identification of Vuk Brankovic as Murad's secret ally in the battle and the betrayer of Lazar is unlikely given his subsequent, firm resistance to the Ottoman advances in the region. Similarly the suggestion that Lazar's defeat marked the end of the medieval Serb empire and the beginning of Ottoman rule fails to account for the dissension of the Serb nobles following Dušan's death, their continued independence in the half-century following the battle, and their frequent cooperation with the Turks throughout the period.

Though it was likely not the epic confrontation described in Serb folk traditions, Lazar's defeat in the Battle of Kosovo, as the battle on the Maritsa in 1371, marks the gradual decline of Serb resistance to Ottoman expansion in the late 14th and early 15th centuries. In both cases, the Serbs suffered large casualties. After the battles Serb princes were divided in their reaction to Ottoman victory, with some continuing to resist and others seeking to accommodate the Turks.

BRIAN A. HODSON

Le dynasty of Annam

At the same time that the Chinese MING DYNASTY sent its vast fleets across the Indian Ocean to Africa, it also mounted an invasion of Annam, today part of the Democratic Republic of Vietnam. The sudden Ming incursion caused the native Vietnamese Ho dynasty to collapse. The Ming attack had been precipitated by the

coup of Le Qui Ly onto the throne of the Ho dynasty in 1400. He reorganized the kingdom and set about building an especially strong military system, something that the Ming emperor Jianwen (Chien-wen, r. 1399–1402) did not see in the interests of Chinese security.

The occupation of Annam continued until 1407, when Emperor YONGLE (YUNG-LO, r. 1403–24) brought back the Chinese troops, perhaps because the expense was taking money from his gigantic project of building a large, ocean-going fleet. The impetus for the withdrawal of the Chinese was the rise of Le Loi, who began a fierce resistance struggle against Chinese occupation, which Yongle did not want to see consume his imperial treasury. Calling himself Prince of the Pacification, Le Loi established what became the Le dynasty in 1428. At that time, Le Loi took the royal title of *Le Thai To*. He renamed the country *Dai Viet* and began the process of rebuilding his country after the Ming occupation.

With the Chinese threat removed, he demobilized much of his army to free money for the reconstruction of the country's infrastructure, which had virtually been destroyed by the Ming. However he followed the Chinese pattern in establishing the new administration for Vietnam. China was governed by the scholar class, recruited through extremely hard examinations. Thus the emperor governed imperial China through an effective civil service. To reorganize Annam, Le Loi established the College of National Sons to train a civil administration for his kingdom. Entrance to the college was virtually free of influence of birth, thus opening a career of government service to large numbers who would otherwise have been denied entry.

On the death of Le Loi (Le Thai To) in 1443 the country suffered a period of disorder until his son, Le Thanh Tong, was able to assert his claim to his father's throne. He ruled from 1460 to 1497. Le Thanh Tong built on the administrative foundations laid by his father. At the same time, he carried out the expansion of his kingdom.

To the south, he invaded the CHAMPA KINGDOM. However Le Thanh To was careful about antagonizing China and was scrupulous about his payment of tribute to the Ming court. At the same time on his western frontier, he repelled raids from the Lao people, from whom modern Laos derives its name. It was clear in his conquest of Champa that he intended to colonize, not just raid. Le Thanh established military colonies of Annamese veterans in the region to weld it to his kingdom. Moreover, the opening of Champa served as a "new frontier" for the Annamese people of Dai

Viet, giving many peasants the opportunity to farm land there, which they did not have in their original homeland.

Upon Le Thanh's death in 1497 the Le dynasty entered a period of fatal decline. In 1527 Mac Dang Dong, one of the administrative mandarins, seized the throne after having already been effective ruler for a decade. The Nguyen and Trinh families, loyal to the Le dynasty, rebelled against Mac Dang Dong. The realm of the old Le dynasty was destroyed from within.

JOHN F. MURPHY, JR.

Liao dynasty

The Liao dynasty (916–1125) was founded and ruled by a people called Khitan (Ch'i-tan), originally hunter-gatherers living in southern Manchuria along the Liao River valley, who gradually learned farming and herding. The Khitan were vassals of the Chinese TANG (T'ANG) DYNASTY (618–907) in an unstable relationship. Because of their location on the frontier of the Chinese empire, they were also involved with other nomadic groups, most notably the Turks. In the ninth century around 50 Khitan tribes coalesced under the dominant Yelu (Yeh-lu) clan, transforming them into a dynastic state.

The Khitan religion was shamanism, many of whose features were retained even after they adopted Buddhism in the ninth century. Scholars still debate over the linguistic affiliation of the Khitan language, which was probably traceable to several sources: Mongolian, Turkic, and Tungusic. Because there was no written Khitan until the 10th century, early records of them were solely from Chinese sources that go back to the fourth century. A written script was first invented in 920, called the Khitan Greater Script, adapted from Chinese, but was not mutually intelligible and is mostly deciphered. A Khitan Lesser Script adapted from Uighur writing was invented in 924. Texts carved on stone in both scripts exist alongside Chinese texts; therefore some of the words have been deciphered. Written Khitan was not used after the dynasty fell and died out.

KHITAN EXPANSION

The Khitan seized the opportunity offered by a disintegrating Tang dynasty to begin their expansion. In 901 a powerful Khitan chief led an army of his people and began to conquer into northeastern China, seizing 16 prefectures in present Hebei (Hopei) province, including the city that would later be called Beijing. In 907 the chief of the Yelu tribe named Abaoji (A-po-chi) assumed the title of emperor and proclaimed his state the Great Liao. He created a dual empire, part sedentary and part nomadic. The sedentary part was called “south-facing”; it was bureaucratic, headed by a southern chancellor, and staffed by Han Chinese who had surrendered to him. It would rule the sedentary Han Chinese people under the Liao, based on a modified and harsher version of Tang laws. The southern chancellery’s task was to collect taxes from the Chinese subjects and to oversee their production of items the Khitan court required. The Tang style examination system was even instituted later, but the Chinese were treated as a subservient caste. Chinese people were recruited to serve in the infantry that supported the Khitan cavalry and as a labor corps. The Khitan tribal people were to retain their tribal and nomadic traditions under a “north-facing” administration headed by a northern chancellor. They were ruled under their tribal laws. This dual system of government functioned for 200 years.

Abaoji built walled cities throughout his lands. He also built five walled capital cities. The Supreme Capital was in central Manchuria, where the Khitan people originated according to their legend. The Eastern Capital was also built in central Manchuria, where modern Liaoyang is located. A Central Capital was 100 miles south of the Supreme Capital and its function was to administer a newly conquered tribe; the Western Capital was the old Chinese city Datong (Ta-tung) along the Great Wall of China in modern Shanxi (Shansi) province. The Southern Capital was the renamed Chinese city called Yan (Yen), at modern Beijing. Even though the cities conformed to Chinese concepts of city planning, large areas were left vacant to accommodate the yurts (tents) of the Khitan.

SINICIZATION OF THE KHITAN

The Liao court moved from capital to capital, reminiscent of their nomadic ways. Despite resistance to Sinitization, the Khitan adopted many Chinese ways and began to enjoy the numerous luxuries their Chinese subjects offered. On the other hand such Khitan customs as the levirate (a man’s right to take his brother’s widows as his wives) and the sacrifice of many human victims

when an important man died continued. Even Abaoji’s powerful chief wife, who was also mother to his heirs, was asked to kill herself to be buried with him. She refused, claiming that her young adult sons still needed her guidance, but cut off one of her hands to be buried with her husband. Nor did the Khitan fully adopt the Chinese rule of succession by primogeniture (where the eldest son of a ruler’s wife succeeded him on the throne) but continued to select one among the deceased man’s sons by consensus and acclamation, with the result that murderous succession struggles followed each ruler’s death, causing political instability.

Whereas few Chinese learned Khitan, the elite among the Khitan soon became fluent in written Chinese. Chinese was the international diplomatic language among the East Asian states and all treaties and diplomatic correspondence were in Chinese. Even the Northern Chancellery produced few if any documents in Khitan, and there are no drafts in Khitan of Liao correspondence with the Song (Sung). The educated Khitan had much to gain from learning Chinese because of the abundance of written works produced in that language. When most Khitan became Buddhists in the 10th century, learning Chinese also gave them access to the teachings of Buddhism. In time the Khitan elite came to call those of their own people who strictly adhered to their nomadic traditions as “wild Khitan.”

In the 10th century the Liao state confronted two enemies among its sedentary neighbors. One was Korea, where a long-lasting dynasty was established over the unified peninsula in 918 called the KORYO DYNASTY. It would last until 1392. Liao invaded Koryo in the 890s and 990s and forced the Koryo kings to become Liao vassals, following the widely accepted Chinese tradition of interstate relations with its neighbors.

LIAO AND SONG (SUNG) RELATIONS

Liao’s main neighbor and adversary was the SONG (SUNG) DYNASTY in China (960–1279). The initial peaceful relationship between the Song and Liao ended in 979 when Song emperor TAIZONG (T’ANG-TSUNG) attempted to recover the 16 prefectures in the Beijing area the Liao had earlier conquered. He was beaten back, and later for a second time. In 1004 the two sides finally made a peace treaty, called the Treaty of Sangyuan. It fixed their borders to reflect Liao’s control of the 16 prefectures, stipulated the opening of several markets for trade between the two states, and declared the two states equal to each other and their rulers as “brother” sovereigns; both promised not to build fortifications along their border. Significantly the Song agreed to give

the Liao annually 100,000 ounces of silver and 200,000 bolts of silk. Song records called it a “gift” to save face and argued that the cost was cheaper than war. The Liao however called the mandatory one-way gift a “tribute.” A new treaty between the two in 1042 increased the Song mandatory gift by 100,000 units in each category, justified in official Song accounts as “extending gentle kindness to faraway peoples to win the hearts.”

The century-long stability between the Song and Liao after the Treaty of Sangyuan provided stability and prosperity for both states. Until 1031 strong rulers with long reigns also ensured Liao power. Thereafter rulers of lesser ability, some youths, ascended the throne. The lack of a certain set of rules on succession resulted in power struggles within the ruling Yelu clan and among its allied clans that weakened the monarchy. The Liao state was further weakened by the unresolved strains caused by factions that either supported or opposed Sinicization.

The Liao also had to deal with nomadic tribal groups along its frontier. North of the Khitan homeland there lived a primitive people called the Jurchen, who began their entry into history as the oppressed vassals of the Khitan. Then appeared a powerful Jurchen chieftain named Wanyen Aguda (Wan-yen A-ku-ta) (1068–1124), who coalesced his fierce warrior followers in eastern Manchuria and began raiding Liao outposts. In 1114 he defeated a Liao army sent against him. Emboldened he proclaimed himself emperor of the JIN (CHIN) DYNASTY in the following year. The Jurchen had long sent tributes to the Song, traveling by sea to the Song controlled coast in order to bypass Liao territory. Since both Song and the Jurchen had long held grudges against the Liao, they made a treaty jointly to attack the Liao and destroy it totally, then to share the spoils. Mainly because of the fighting qualities of the Jurchen warriors and with little assistance from the Song, the Liao dynasty ended in 1125.

JIU-HWA LO UPSHUR

Lithuania, Grand Duchy of

The Grand Duchy of Lithuania was the last pagan state in Europe. Landlocked and protected by dense forests and impassable wetlands, Lithuania was spared the fate of the other Baltic peoples, who were either converted or killed by German and Scandinavian colonizers between the late 12th and early 14th centuries. Their geographical location also protected the Lithuanians from Russian armies and the Golden Horde, who conquered much of eastern Europe in the mid-13th century. Yet Lithuania's position on the Nemunas River system would also later make it an important economic crossroads in the trade between eastern and western Europe. During the 14th century Lithuania flourished under a series of able rulers, called “grand dukes,” in imitation of their neighbors to the east, the rulers of Rus. Based out of the ancient (and present) capital of Vilnius, the nascent state began to expand east, into the Russian lands abandoned by the retreating Tartars. By 1323 they had conquered Kiev, the ancient Russian capital.

The survival of this pagan state on the frontiers of Christendom deeply disturbed the papacy, which made numerous attempts to convert the Lithuanians. Despite their best efforts, the permanent conversion of Lithuania came not at the instigation of papal legates, but rather at the request of Polish nobles, who offered Grand Duke Jogaila the hand of Queen Jadwiga and the throne of the kingdom of POLAND. In 1386 Grand Duke Jogaila became King Władysław (Ladislas) II of Poland. Lithuania, which had been called the “the spawn of Satan” by Christians in the 13th and 14th centuries, now together with Poland became the “bulwark of Christendom,” defending it first from the Tartars and later from the Ottoman Turks. The Lithuanian state was the largest in Europe at that time, stretching from the Baltic Sea to the Black Sea. Even after the death of the last member of the dynasty in 1572, the state they had created remained an important player in European politics.

EARLY LITHUANIA

The first mention of Lithuania in western sources occurs in an entry in the *Annals of Quedlinburg* for 1009, which states that the missionary Bishop Bruno of polish “el” Querfurt was martyred there. Historians, however, do not know much about Lithuania before the mid-13th century. Its geography made it almost impassable for armies in all but the coldest months of winter, which spared it from the first waves of western European expansion along the Baltic littoral, as well as from the territorial ambitions of various Russian princes and the

ravages of the Golden Horde. Lithuanian society at this time was governed by a loose association of clans based on hill forts, who supported themselves mainly through agriculture, but also through trade and plunder. In the early 13th century power coalesced around the leaders of one of these clans—Ringaudas, whose son, Mindaugas, ruled Lithuania for 25 years (1238–63).

During Mindaugas's reign he began to take a more active interest in the affairs of his western neighbors. He granted German merchants the right to trade in his lands, and even allied himself with his former enemies, the Teutonic Knights, against western Lithuanians who did not wish to submit to his rule. This alliance with his German neighbors was symbolized by Mindaugas's baptism in 1251. Two years later he was crowned by Pope Innocent IV, becoming king of Lithuania. In this same year, Christian, a member of the Teutonic Knights, was enthroned as bishop of Livonia in the new cathedral in Vilnius.

Mindaugas's conversion however, while a feather in the cap of papal diplomacy, did not have a far-reaching impact on Lithuania for a couple of reasons. First very few of Mindaugas's subjects followed his example. Second, the new policies that followed his conversion, including allying with the Teutonic Knights, succeeded in further aggravating nobles who were already displeased with Mindaugas's rule. In 1259 the frustrated bishop left his seat, and a year later the rebelling western Lithuanians dealt the Teutonic Knights a crushing defeat. The following year Mindaugas apostatized, but some of his subjects were not easily placated. Two years later in 1263, the first great ruler of the Lithuanians was assassinated.

Mindaugas's death was followed by seven years of civil war, which included the assassination of three of his successors. In 1270 a new ruler emerged, Traidenis, a member of one of the rival clans of Lithuanian nobles. A staunch pagan, Traidenis ruled Lithuania until he died of natural causes in 1282. There is a gap in the historical evidence in the years following his death, but by 1290 a new dynasty emerged that would govern Lithuania (and after 1385 Poland as well) until 1572.

Lithuanians worshiped a pantheon of gods, led by Perkunas, the equivalent of the Scandinavian Thor. The few literary sources describing the religion of the Lithuanians were written by Christians, who often were not neutral observers of pagan practices, which they often tried to fit within the framework of their own belief system. One example of this was the claim made by the Teutonic Knights' early-14th century chronicler, Peter of Dusburg, that a pagan "pope" led the Lithuanian cult.

Using these sources and other descriptions of Baltic religion and archaeological sources, historians have argued that Lithuanian religion was loosely organized and based on the worship of nature. Priests and priestesses practiced divination both by casting lots and through animal sacrifices. The brief appearance of Christianity in Vilnius does seem to have had some impact on Lithuanian paganism, as archaeological excavations of Vilnius cathedral have demonstrated that a pagan temple was erected on the site of Mindaugas's church after his demise. The ostensible leader of the Lithuanian cult was the grand duke, and it appears that rulers after Mindaugas learned that a monumental religious building could be a powerful expression of central authority. The most likely builder of the temple was Gediminas, who reestablished Vilnius as a political capital in the first years of his reign.

ESTABLISHMENT OF THE GRAND DUCHY

The founder of the new dynasty, Pukoveras, did not have a great impact on Lithuania, because of his brief reign (1290–95). During the reigns of his sons, Vytenis (1295–1315) and Gediminas (1315–42), on the other hand, Lithuania would dramatically expand politically, geographically, and economically to become one of the most important states in east-central Europe.

In 1298 during a dispute between the archbishop and burghers of Riga and the Teutonic Knights, Vytenis offered the Rigans a Lithuanian garrison to defend this important commercial center from their common enemy. Although the Rigans were finally compelled to expel the pagan garrison in 1313, diplomatic and economic relations between the Lithuanians and Rigans continued. Gediminas continued these policies when his brother died in 1315.

Gediminas built up the Lithuanian economy, inviting foreigners to settle in villages and towns by sending letters to the numerous German towns. He also granted German merchants generous privileges throughout his realm and guaranteed their safety along certain routes, called the *vredelant*, or "land of peace." Although trade with the pagans was condemned by the papacy, especially the trade of military supplies, commerce prevailed throughout the crusading period, even between the Lithuanians and the Teutonic Knights. In fact trade between these two states helped to finance their wars with each other.

Gediminas was aware of the necessity of forming military alliances with his Catholic neighbors, the Rigans and the Poles, against their common enemy, the Teutonic Knights. But he had to be careful about

offending his subjects—the pagan Lithuanians as well as the Orthodox Rusians, who were quickly becoming the majority of those living in the Lithuanian state. The Lithuanians had long taken an active role in the affairs of their Russian neighbors, and some prominent Lithuanians had been baptized according to the Eastern rite.

For example one of Mindaugas's sons became an Orthodox monk, eventually becoming the patron saint of Pskov, while another of his sons, Vaisvilka, also retired to an Orthodox monastery after ruling Lithuania for three years (1264–67). In addition lacking a written culture of their own, Lithuanian rulers used the language of their Orthodox subjects, Chancery Ruthenian, at their courts.

During Gediminas's reign these contacts intensified. Through a combination of conquest and marriage alliances, Lithuanian rule was extended farther into Russian lands, as the Lithuanians filled the power vacuum left by the retreating Tartars. By 1323 Gediminas had conquered Kiev, the ancient capital of Rus. In 1315 Gediminas established a separate metropolitan for Lithuania in Novgorodok, which would free his Orthodox subjects from the ecclesiastic control of a Muscovite metropolitan. During the course of the next century, this Lithuanian metropolitanate would be reduced to the rank of a bishopric and then elevated again as the patriarch of Constantinople sought to manipulate the political landscape of Rus.

At the same time that he appealed to the head of the Eastern Church, Gediminas was also actively seeking the help of the leader of the Western Church to orchestrate a truce with the Teutonic Knights. The price for this truce would be the conversion of Lithuania. Gediminas informed Pope John XXII of his intentions in 1322 and joined his longtime allies, the archbishop and burghers of Riga, in condemning the atrocities committed by their common foe, the Teutonic Knights. His letter outlined the history of Lithuania's relationship with Latin Christianity, noting Mindaugas's conversion as well as his brothers' defense of Riga.

When the papal envoys arrived in 1324, however, Gediminas had changed his mind, which led some earlier scholars to argue that his letter to the pope was a Rigan forgery. Gediminas had been reminded of Mindaugas's fate by some of his pagan and Orthodox subjects. When the papal legates departed in 1325, Gediminas looked to the west for a new ally and found King Władysław Lokietek of Poland, who was also involved in a dispute with the Teutonic Knights. In this same year Aldona (baptized Anna), one of Gediminas's daughters, was married to Władysław's only son, Casmir (Kazmierz). Although

the Polish-Lithuanian alliance dissolved after Anna's death in 1339, the memory of this union would have a tremendous impact on the destinies of both states.

After Gediminas's death in 1342, his son, Jaunutis, assumed the grand ducal throne. Despite the fact that he was his father's chosen heir, his reign was brief (1342–45), because his brother, Algirdas, drove him into exile in Moscow. Grand Duke Algirdas's reign proved to be lengthy (1345–77), in part because he reconciled his position not only with Jaunutis, to whom he granted land from his patrimony, but also with his six other brothers. His youngest brother, Kestutis, was his greatest ally, and he was given the important task of defending Lithuania's western border from the Teutonic Knights. Algirdas continued his father's program of expansion into Rus, attacking Moscow and trying to reestablish the metropolitanate for the Lithuanian Rus. He also followed in his father's footsteps of offering to be baptized—this time to both the pope in Avignon and the patriarch of Constantinople—and then denying these intentions.

Despite these ploys, he, like his father, was tolerant of the Christians who lived in his realm, at least as long as they respected Lithuanian religious practices. Five Franciscans found this out the hard way when they were executed for proselytizing.

When Algirdas died he wanted his throne to pass to his son, Jogaila, but Kestutis challenged his nephew's succession. In 1381 Kestutis overthrew Jogaila, but the usurper was assassinated a year later. When Jogaila returned to power in 1382, he considered taking a Muscovite princess as his bride in the hope of eventually fulfilling his father's pretensions to the title of grand prince of All Rus. The resurgent power of the Tartars, however, signaled by their sack of Moscow in 1382, caused the young grand duke to turn west for a bride, to the kingdom of Poland, with which his grandfather had been allied and which had also just lost its king.

UNION WITH POLAND

When King Casimir III the Great of Poland died without a son in 1370, his crown passed to his nephew, Louis of Anjou, king of Hungary. Following his death in 1382, the nobles of the two kingdoms were divided as to who should succeed him. After two years of fighting it was decided that his older daughter, Maria, would succeed him in Hungary, while his younger daughter, Jadwiga, would succeed him in Poland. In 1384, at the age of 10, Jadwiga was crowned queen. Although she had previously been betrothed to Wilhelm von Habsburg, prince of Austria, the Polish nobles rejected this marriage and

instead looked east to pagan Lithuania. This was not such an odd decision, however, considering the historical relationship between the two states, and King Casimir's first wife was a Lithuanian princess. When Grand Duke Jogaila accepted Christianity in 1386, which was one of the preconditions of his assuming the throne, he took the Christian name *Władysław*, the name of Casimir's father, the ally of his grandfather, Gediminas, and the restorer of the Polish kingdom. The following year *Władysław II* returned to Vilnius and established a bishopric there to manage his pagan subjects' conversion to Christianity.

When the childless Jadwiga died in 1399, the Polish-Lithuanian state faced a dilemma. In two important assemblies in 1401 and 1413, the Polish and Lithuanian nobles decided to make the Krevo Union (named after the place in which it was created in 1385) permanent. In fact, unlike other contemporary mergers of states, such as the Kalmar Union, which united the Scandinavian kingdoms in 1397, the Polish-Lithuanian union would prove to be lasting, even surviving the demise of the Jagiello dynasty (named after the Polish version of Jogaila's name—Jagiello) in 1572.

Building upon this consensus *Władysław II* led an army against the perennial enemies of Poland and Lithuania, the Teutonic Knights, dealing them a crushing defeat at the Battle of Grunwald in 1410. His second son, Casimir IV (his first son, *Władysław III*, having been killed trying to stop the advance of the Ottoman Turks into Europe at the Battle of Varna in 1444), was a ruler equal to his father, in both ability and longevity—while his father ruled Poland-Lithuania for 45 years (until 1434), Casimir ruled for 48 (until 1492). He also defeated the Teutonic Knights in the Thirteen Years' War (1454–66) and annexed many of the Knights' possessions, which had formerly belonged to Poland. Some scholars have called him “the father of Central Europe,” because his sons ruled the neighboring kingdoms of BOHEMIA and Hungary in addition to Poland-Lithuania, and his grandson was Albrecht von Hohenzollern, the last grand master of the Teutonic Knights, who secularized the order in 1525 and founded the dynasty that was to rule Prussia (and later Germany) until the end of the First World War. The eminent scholar Jan Długosz, who wrote the first comprehensive history of Poland, educated these children.

Casimir's fourth son, Zygmunt I “the Elder,” as his father and grandfather ruled for more than 40 years (1506–48) and expanded his kingdom at the expense of the Teutonic Knights, who in two stages (1525 and 1561) were incorporated into the kingdom. His

reign, however, was marred by the growing power of his two neighbors to the east—Moscow and the OTTOMAN EMPIRE. Because of these threats, Zygmunt looked west to the Habsburg empire for aid. In 1515 at the Congress of Vienna, a double wedding was arranged. Zygmunt's son, King Louis of Hungary and Bohemia, would marry the emperor's daughter, while the emperor's son would marry Zygmunt's daughter, Anna. Unfortunately for the territorial ambitions of Poland-Lithuania, the childless Louis died trying to defend Hungary from the Ottomans at the Battle of Mohacs in 1526. The Habsburgs now controlled what was left of Hungary as well as Bohemia.

Following this disaster Zygmunt had his son, Zygmunt II August, crowned co-ruler in 1529 at the age of nine. He and his father ruled together for nearly two decades—“the Elder” in Kraków, and Zygmunt II in Vilnius. In the years following his father's death, the childless and ailing Zygmunt II was anxious to see that his family's legacy as rulers of a united Polish-Lithuanian state did not end with his death. Near the end of his life he convened the Sejm (parliament) nearly every year in an attempt to convince the Polish and Lithuanian nobles to form a united republic, ruled by an elected monarch. On July 1, 1569, the religious and secular magnates of Poland and Lithuania swore to Zygmunt to uphold the Union of Lublin, which combined their two lands. Three years later the last of the Jagiellonians died.

The legacy of the state created by Jogaila, however, would endure long after the demise of his dynasty. The last pagan ruler in Europe had transformed his state into the “bulwark of Christendom,” and several of his descendants gave their lives in its defense. But Poland-Lithuania was also a multiethnic and multireligious polity, the survival of which necessitated toleration. In 1573 the Confederation of Warsaw guaranteed the religious rights of all the subjects of Poland-Lithuania—Catholic, Orthodox, and Protestant Christians, as well as Jews and Muslims. The largest state in Europe at that time, the republic created by Zygmunt II would endure for more than two centuries, until it was finally partitioned among Russia, Prussia, and Austria in the late 18th century.

PAUL MILLIMAN

Lombard, Peter

(c. 1095–1160) *theologian and author*

Peter Lombard, best known for his *Sententiae in quatuor libris distinctae* (*The Book of Sentences*), was born in northern Italy between 1095 and 1110. Lombard began his formal education close to home at the Cathedral School of St. Mary's in Novara and continued his studies in Lucca before heading to France in 1133. Three years later on the recommendation of St. Bernard, Lombard was sponsored for further studies in Paris. By 1144 Lombard was recognized throughout Paris as a prominent theologian. Records indicate that he was appointed canon of Notre Dame in 1145 and participated in the Council of Rheims in 1148. He became an archdeacon in 1156 and was consecrated bishop of Paris in 1159. His reign as bishop lasted no longer than a year, at which point Maurice de Sully replaced him. Most scholars believe this abrupt replacement marks his sudden death in July 1160.

The public works of Peter Lombard include two biblical commentaries, sermons, and his monumental *Book of Sentences*. Lombard's first biblical commentary, *Glossa in Psalmos* (*Commentary on the Psalms*), was completed early in his career while he was studying in Rheims. The first draft of his second commentary, *Collectanea in Epistolas Beati Pauli* (*Commentary on the Pauline Epistles*), was written a few years later. This document was used in his lectures at Notre Dame and his 1155 revisions incorporated the insights he gained from the comments and criticisms of his students.

Lombard's interest in theological instruction is best expressed in his masterpiece, *The Book of Sentences*. Written and revised at the end of Lombard's life (1155–58), it appeared at an important moment in Christian history. During the 12th century Christian theology was moving in the direction of the SCHOLASTICISM that would dominate the coming centuries. Books of sentences were written by numerous theologians and constitute a unique genre of theological literature. These works represent attempts to arrange, systematize, and synthesize the writings and opinions of the most important church fathers (hence the Latin *sententia*, which literally means "opinion"). Lombard and others believed these one-volume compilations would be more accessible to theology

students. Lombard's work was similar in function and style to the more famous *Summa theologica*, produced by THOMAS AQUINAS over a century later.

Lombard's *Book of Sentences* was originally divided into four books that were further divided into numerous small chapters. Between 1223 and 1227, however, Alexander of Hales grouped these small chapters into topical units that became the standard "distinctions" now associated with each book. In its present form, book one covers 48 distinctions related to the "mystery of the Trinity." These distinctions synthesize positions on each person of the Trinity, including positions on God's knowledge and will. Book two includes 44 distinctions on the doctrine of creation, with a special emphasis on the creation of woman and the doctrine of Original Sin. The nature of Christ, the Incarnation, and the virtues are addressed in the 40 distinctions of book three and book four addresses the sacraments in 50 distinctions.

The content of Lombard's *Book of Sentences* places him squarely within the Augustinian tradition. Of the many church fathers cited in *The Book of Sentences*, Augustine is referenced 680 times. By comparison, the next most referenced theologian (Ambrose) is quoted only 66 times. This heavy reliance on the writings of Augustine has led some scholars to argue that *The Book of Sentences* is nothing more than a 12th century reformulation of the ideas of this fourth-century master. Nonetheless his work had a profound influence on the history and development of Christian theology.

The legacy of Peter Lombard and his *Book of Sentences* rests on the fact that this text served as the primary textbook in Christian theology for almost four centuries. Beginning with the Fourth Lateran Council of 1215, every promising theologian had to respond to *The Book of Sentences* in the form of a lecture. These lectures were then published and included within the theological works of the various commentators. This process continued until Aquinas's *Summa theologica* replaced *The Book of Sentences* in the 16th century. Thus almost every theologian who lived and studied between the 13th and 16th centuries produced an extended commentary on Lombard's work. In fact, apart from the Bible, there has been no piece of Christian literature commented upon more often than Peter Lombard's *Book of Sentences*. Some of the most famous commentators include St. Bonaventure (1217–74), Thomas Aquinas (1225–74), Duns Scotus (1266–1308), and Martin Luther (1483–1564).

ELIZABETH A. BARRE

Louis IX

(1214–1270) *king of France and saint*

Zealous and *dashing*, *chauvinistic* and *impulsive* are all terms that describe the reign of Louis IX, king of France. He showed heroic virtues of character, but he also seemed blind to the contributions of people who did not share his own values. He took action against corruption, but he also had complicated relations with Jews and Muslims. He wanted to imitate the poverty of Jesus by living as a monk but contented himself with making penitence and humility his aim in life. He engaged in self-flagellation to curb his desires for food and sex and even gossip, and he wore a hair shirt under his royal robes. He was famous for showing mercy to his foes and generosity to the poor. He was the patron of French universities and several times invited THOMAS AQUINAS to dinner. When deathly ill in 1244, he promised God that he would fight a crusade if healed, and so he did in 1248. Captured in 1250 he was freed when he pledged to give up his conquest in Egypt and pay a huge ransom. He remained in Syria, attempted to draw the Mongols into the conflict on the side of the Europeans, and tried to stir up divisions among Muslims in the Middle East.

His conduct in battle reflected his piety. He opened up investigations against the crimes of the resident crusaders and paid restitutions. He ordered that Muslims should be captured alive. He worked hard to convert Muslims and brought many of them back with him to France, where he supported them. He told his fighters that they would go to paradise if they died in battle

because they were martyrs—a teaching that ironically has adherents among certain Muslims today. When he was not piously fighting on the battlefield, he was piously applying his morality to domestic affairs. He limited his own officials from encroaching unduly on the jurisdiction of the aristocracy. He set up a system of ombudsmen (*enquêteurs*) to hold nobles accountable for their conduct in local settings. In this way he tried to standardize government administration. He reformed the national currency and asserted the right of the state to regulate money. He allowed the judiciary a degree of independence, and the Parliament was formed.

In France he was intolerant of Jews and heretics, especially those called the Cathars. He forbade usury, permitted no obscenity at court, ordered all blasphemers to be branded, and discouraged trial by combat. Against the Jews he was particularly prejudiced, allowing the public burning of the Talmud and ultimately requiring that Jews wear a red badge on their chest, eerily prescient of the Nazi practice of identifying French Jews by a yellow star. He embarked on another crusade in the late 1260s but was diverted to Tunis (North Africa), where he died in 1270. He was worn out by his self-imposed religious exercises, as well as by illness and dysentery. As he lay dying he summoned the Greek ambassadors and urged them to reconcile with the Church of Rome. His body was sent back to France. Wherever his body went, miracles were reported among the Christian faithful. He was promoted for canonization and named a saint in 1297.

MARK F. WHITTERS

M

Magna Carta

Rebellious barons required that King John of England approve the Magna Carta (Latin for “the Great Charter”) in 1215. Many consider the document to be the foundation of English constitutional government and individual liberties. By the end of the Middle Ages the charter had become binding legal precedent in the English law courts and a check on royal authority as it was reaffirmed, with modifications, by successive monarchs. The Magna Carta is viewed as the first public act of an emerging nation-state and a revolutionary declaration of not only the privileges of powerful lords, but also the judicial, political, and commercial rights of Englishmen of every rank. Moreover it is seen as a subsequent barrier to absolutism in England, through recognition of a collective national will and the concept of the rule of law, and the forerunner to parliamentary supremacy and future democratic achievements, including the Constitution of the United States. Others view it as chiefly an affirmation of existing feudal obligations forced on an administratively able, yet unlucky king by self-interested barons.

The roots of the Magna Carta are traceable to the reign of John’s father, the energetic and imaginative HENRY II, the first ruler of the Plantagenet dynasty and “the father of the common law.” As a part of his successful centralization of power following years of civil war and chaos, Henry II forged a national legal system through uniformity of legal rules and roving royal courts at the expense of manorial tribunals applying haphazard local customs and dominated by individual lords. Ironi-

cally this concentration of power by regularization of the law would be the impetus for constraining Henry’s less just son. Although deprived of their judicial power, the baronage came to appreciate predictable legal standards, impartial courts, and objective regulation of feudal obligations, especially after John abused them.

These abuses included unprecedented taxation, exorbitant feudal fines, misuse of royal authority over warships and marriages, illegal confiscation of baronial lands, and arbitrary judicial rulings. Discontent with John’s rule, limited to the lords, the lower aristocracy and many townspeople objected to his oppression, taxation, and disregard of custom. Therefore barons sought to preserve the law as a way to curb John and prevent the consolidation of a tyrannical order. Thus what was once a method of Henry II to extend royal authority became the means of limiting it. The Magna Carta can be seen as a conservative reaction to Henry’s misrule.

John is not totally to blame for the debacle of 1215, for he came to the throne in 1199 without the popularity of his charismatic brother and predecessor, the crusading RICHARD I the Lionhearted and was encumbered with an empty treasury, rampant inflation, and the moniker “John Lackland” because of the absence of a bequest of territory from his father. Hindered by a reputation for untrustworthiness, rumors that he had usurped the throne by murdering his nephew, and his excommunication in 1209 over disputes with the church, John saw his loss of his possessions of Normandy and Anjou, the heart of the Angevin empire, to the French King PHILIP II AUGUSTUS become disastrous. With these military defeats

King John never intended to abide by the Magna Carta, which became an indelible part of the English constitution.

of 1203–04, a humiliated John turned to strengthening his control of England and raising funds to finance a new French campaign. When this campaign failed miserably and he was forced to pay tribute to the French king, John returned to England discredited, broke, and determined to squeeze all the funds he could from his English domain.

Unlike earlier disputes between English kings and their barons, discontent involved neither rival claimants to the Crown nor jealous factions of the royal family. This proved beneficial to the barons, for instead of fighting for a personage or power, they claimed to be defending the entire realm and its traditions. At a conference with the king in January 1215 at London, the barons demanded that John reaffirm his coronation oath and institute reforms. But John, who had asked the pope to side with him and was preparing for battle, demanded that the barons make a new oath of allegiance. Instead the barons mobilized for war and renounced their fealty to the king at Northampton on May 5. Under the leadership of Robert FitzWalter, the rebels were welcomed into London by the populace on June 10 as John fled to his

stronghold of Windsor Castle. After much negotiation, and the departure of disgruntled northern lords, John consented to terms on June 15 in the meadow of Runnymede near Windsor and his seal was affixed to the document. On June 19 the barons reaffirmed their loyalty.

The Magna Carta, first known as the “Articles of the Barons,” contained 63 articles restricting royal power, clarifying feudal responsibilities, and guaranteeing certain rights, including those of the church. More particularly it provided redress of grievances concerning land, asserted the authority of the Great Council to block abusive taxation, required that the courts stay fair and open, asserted commercial rights beneficial to middle-class merchants, and required the restraint of royal officials. It even protected widows from being compelled to marry. It was remarkably visionary in that it recognized the judicial due process rights of all Englishmen, not just the aristocracy. Enforcement was provided through a council of 25 barons with the legal authority to make war on the king if necessary.

In keeping with his reputation John never intended to abide by the document and was only buying time. He soon prepared for renewed resistance and won a pronouncement from the pope declaring the Magna Carta void because he agreed to it under duress. But there was no turning back. Although it failed as a peace treaty, the Magna Carta swiftly commanded a reverence and majesty of its own and became an indelible part of the English constitution. John died in 1216, while once again fleeing his barons.

RUSSELL FOWLER

Magyar invasions

The Magyars, Hungarian ancestors, began raiding into western Europe in 862 against the outposts of the Frankish kingdom in the Danube Valley. Under pressure from the Pechenegs, they moved westward, eventually mov-

ing into the Carpathian Basin in 895. Over the next 10 years, they gained control of the entire basin. From here they continued to raid Europe over the next 55 years, reaching as far west as the Pyrenees mountains. During this time, their raids were successful enough that the Byzantine Empire and several other kingdoms chose to pay off the Magyars to gain relief from invasion. Their raids were finally brought to an end in 955 at the Battle of Augsburg when King Otto I of Germany defeated the Magyars. The prehistory of the Magyars, because of lack of written record, has been constructed from their language, which is part of the Finno-Ugric language group. Other languages in this group are Finnish and Estonian. It is believed that the Magyars were originally part of a group of people who lived in western Siberia. Today most of the peoples in this group live in Russia, except the Hungarians and those living in the Baltic region and Finland. The name *Magyar* is taken to mean “speakers” and is derived from the Finno-Ugric *mon*, which means “speak,” and *er*, which means “man.”

Sometime during the 10th century B.C.E., the Magyars moved south out of western Siberia into the area between the Ural River and the Aral Sea. They lived in this area until sometime during the second century B.C.E. when they moved westward into the Don Basin. During the first century C.E., the Magyars moved into the region near the Azov Sea and the Black Sea and discovered the use of iron and horses, most likely from their exposure to their neighbors the Scythians and Sarmatians. Interaction with these Iranian peoples can be seen through the incorporation of Iranian words into their language. They then came under the influence of Turkish peoples. In the sixth century the Magyars joined the Onogurs, a Turkish tribal alliance made up of 10 tribes. (*Onogurs* means “10 peoples.”) The Onogurs, including the Magyars, were then incorporated into the Turkish empire in 552, but then the Magyars gained their independence again in the early part of the seventh century, only to be incorporated into the Khazar Khanate in 630.

The Magyars gained their independence from the Khazars in 830—at the time settled in the area between the Don and Lower Danube Rivers. In 862 they launched their first raid against a western European kingdom and raided the FRANKISH TRIBE. These raids continued over the next several years, sometimes launched alone, and other times while allied with other kingdoms, such as the Turkish Kabars and the Moravians. In 894 they allied with the Byzantines under Emperor Leo the Wise. The Byzantines were involved in a war with the Bulgars under Czar Simeon. The campaign that year was a success for the Magyars and Byzantines. Unfortunately for

the Magyars, they set themselves up for their own defeat. In 894 there was a massive movement of Turkish peoples from the east that pushed the Pechenegs from their homeland. Fleeing the Turkish invasion, the Pechenegs moved west into Magyar land and signed an alliance with the Bulgars against the Magyars. With the Magyar armies away fighting the Bulgars, the Pechenegs had little trouble overrunning the Magyars, who found themselves caught between the hostile kingdoms of the Bulgars and the Pechenegs. The Magyars had little choice but to flee to the west to avoid their destruction.

Under the leadership of their chieftains Árpád and Kurans, the Magyars moved across the Carpathian Mountains into the middle Danube valley. Over the next 10 years, the Magyars would secure control over the valley, including destroying the Moravian kingdom in 906. With the death of Kurans, caused by Bavarian intrigue against the Magyars in 904, Árpád became the sole ruler of the Magyars and their tradition of dual rulers ended. Arpad died in 907 and was succeeded by his son. The Magyars finished the conquest of their new homeland and they continued raiding. Their raid into Italy in 899 was at the invitation of the emperor Arnulph of the eastern Frankish kingdom. Looking for help against his rival King Berengar I of Lombardy (who had a claim on the imperial crown), Arnulph sent 5,000 warriors on a raid into Italy. While the Magyars’ initial attack on Venice was repulsed, the Magyars were able to defeat Berengar in battle at the river Brenta.

With the death of Emperor Arnulph in 899, the Magyars saw their chance to raid the Frankish empire, which was in turmoil because of the emperor’s death. In 900, the Magyars launched their first raid into Bavaria. The raids into Bavaria continued over the next 33 years and became more destructive. In 910 the Magyars defeated the Germans at the Battle of Augsburg, where they led them into an ambush by pretending to flee. The Magyars, like most of the nomadic peoples from the steppes, were excellent horsemen. They were also very proficient with bow and arrow. They would launch a sudden attack and then pretend to flee from the enemy. They drew their enemy into a trap, where they could encircle the enemy and destroy them with arrows in close combat.

Another part of the success of the Magyars was due to the weakness of the western kingdoms, who were engaged in internal fighting (in Germany and Italy) fending off other external threats (in France the Normans and Saracens). Even the Byzantine Empire found it more useful to submit to the Magyars, using them as an ally against the Bulgars. A standard Magyar strategy was repeatedly to raid an area to compel the

ruler to pay the Magyars to leave the area alone. In 924 the Magyars launched a raid into western Europe. Raiding through Bavaria, Swabia, Alsace, Lorraine, and Champagne on the way west, they then crossed the Rhine and raided Franconia before returning home. At this point King Henry the Fowler decided to buy nine years of peace from the Magyars and used this time to reorganize and strengthen the German cavalry better to defend against the Magyars.

In 926 the Magyars launched a raid into northern Italy. Moving through Venetia and Lombardy, they were repulsed in their attempt to cross the Pennine Alps by soldiers from Burgundy and Vienne. They crossed the Maritime Alps and raided into Provence and Septimania in southern France all the way to the Pyrenees. Returning through the Rhone Valley, they fought several inconclusive battles with the troops from Burgundy and Vienne before returning home. When the nine-year truce King Henry had purchased in 924 expired and he refused to renew it, the Magyars turned their attention back to Germany in 933. The Magyars sent an army into Germany to convince them to continue paying tribute. Meeting the German army near Merseberg, the Magyars suffered a defeat at the hands of the Germans, resulting in the loss of German tribute money. Henry and his son Otto I the Great fortified eastern German to protect it from the Magyars.

The Magyars turned to easier targets to the south of the Carpathian Basin, raiding the Balkans region and the Byzantine Empire. Launching a campaign into this area in 934 and in 942 against the Byzantine Empire, the Magyars began receiving regular tribute from the Byzantines and others in the area. The Byzantine tribute would continue until 970, when the Magyars allied themselves with the prince of Kiev, who invaded the Balkans and was defeated by the Byzantines. In 951 Prince Henry of Bavaria defeated the Magyar troops in northern Italy and then raided their province of Pannonia. A civil war in Germany (953–955) between Otto I and his son Ludolf allowed the Magyars to raid western Europe again. With a force of between 50,000 and 100,000 warriors, the Magyars raided through Franconia and Bavaria. Then with help from Conrad, duke of Lorraine, who was allied with Ludolf, the Magyars crossed the Rhine River at Worms and moved into Lorraine, then moving into northeastern France, Rheims, Chalons, and into Burgundy. From there they moved into northern Italy, raided Lombardy, and finally returned home.

In 955 with a force of 50,000, the Magyars moved into Bavaria and laid siege to the city of Augsburg. The Magyars believed that Ludolf and Conrad were still at

war with Otto. Instead, the rebels had made peace with Otto and joined him in attacking the Magyars. With a force of about 10,000 heavy cavalry, the Germans moved to attack the Magyars, who lifted their siege and prepared for battle with the Germans. The battle was fought on August 10, 955. The Magyars were initially successful and captured the German camp. Otto repulsed the Magyar attack and then had his forces attack and drive the Magyars from the field with heavy losses, including the capture of the Magyar camp. During the final attack Conrad was killed. At the Battle of Augsburg (also known as the Battle of Lechfeld), the Magyar raids into western Europe finally ended. With their defeat at the hands of the Byzantines in 970, the time was ripe for the Magyars to cease their raids. The Magyars turned to farming and became influenced by the Roman Catholic Church.

DALLACE W. UNGER, JR.

Mahmud of Ghazni

(d. 1030) *sultan and conqueror*

Mahmud of Ghazni, founder of the Ghaznavid Empire, was the son of Sebuk-Tigin, a Turkic slave soldier who rose through military service to lead a small client state of the ABBASID DYNASTY in Afghanistan. Mahmud assumed control of this state in 997 after defeating a challenge from his brother Ismail.

Although the state he inherited was small, Mahmud moved aggressively to expand his landholdings, launch-

ing military expeditions into eastern Iran. Ghaznavid forces conquered Khurasan in 999, which led to the collapse of the Samanid dynasty, and in 1009, the Iranian province of Sijistan also fell. The GHAZNAVIDS defeated their only rivals to power in the eastern Islamic lands, the Khwarazmians, in 1017. Mahmud pushed as far west as the Iranian province of Rayy—ruled by the Buyid confederation based in BAGHDAD—and conquered it in 1029.

Despite his substantial conquests in eastern and central Iran, Mahmud's greatest legacy was the expansion of Muslim power eastward into South Asia. Beginning in 1001 Ghaznavid armies campaigned in India, occasionally returning to Iran to beat back incursions by nomadic Turkic tribes from Central Asia. Mahmud went as far south in India as the state of Gujarat, though he was only able to establish firm control over the northern region of Punjab. Although he used Hindu Indian auxiliary troops, Mahmud also ordered or allowed the destruction of Hindu temples. However as a fundamentalist Sunni Muslim, he also ordered the persecution of Shi'i Muslims, both in the Indus Valley and in Rayy, which had been ruled by the Shi'i Buyids. Mahmud's military successes were balanced out by his patronage of certain Muslim scholars and philosophers, including the famous historian and anthropologist Abu Raihan al-Biruni, who wrote a lengthy and detailed study of the Indian subcontinent.

At its height, during the reign of Mahmud, the Ghaznavid Empire stretched from the Caspian Sea in the west to the Punjab and northern India. After Mahmud's death in 1030, his son Masud assumed the throne. However the empire's centralized structure began to disintegrate, as Masud concentrated on further expanding Ghaznavid authority in India while failing to recognize the threat posed by the SELJUK DYNASTY, which began to move into Ghaznavid lands in Iran. Masud tried to stop the Seljuk advance but was defeated in 1040 at the Battle of Dandanqan and was overthrown the next year. The Ghaznavids remained in power until 1187, though their landholdings were steadily reduced until they included only the city of Ghazna in Afghanistan and small sections of that region.

CHRISTOPHER ANZALONE

Maimonides

(1135–1204) *philosopher and rabbi*

Maimonides, or Moses ben Maimon, was born into a scholarly Jewish family in Córdoba, when southern Spain or Andalusia was ruled by Islamic dynasties. Along with AVERROËS he became the most well-known intellectual from MUSLIM SPAIN. His family fled Spain for Fez, Morocco, when a repressive Berber Muslim dynasty came to power in Spain. To escape religious persecution the family claimed to be Muslims but ultimately moved from Morocco to Palestine and Egypt, where they finally settled in Cairo.

Maimonides was a well-known rabbi as well as a doctor and scholar. He served as the physician to the son and vizier of SALADIN (SALAH AD DIN, YUSUF) and became head of the large Jewish community in Cairo. Maimonides was a prolific writer on many subjects. He wrote 10 medical works in Arabic giving advice on diet, sexual intercourse, and healthy lifestyles. Written in neo-Hebrew, one of his greatest works, *Mishna Torah* (Repetition of the law), detailed all the laws of the Torah and other Jewish texts. His *Guide to the Perplexed* (1190) was written in Arabic with Hebrew characters but was subsequently translated into Hebrew and Latin. The guide was one of Maimonides's most controversial works, causing widespread and acrimonious debate over the interrelationships of religion and rationality in Christian, Jewish, and Islamic communities.

Maimonides attempted to reconcile devout religious practices and faith with rational, scientific tenets. He posited that the future coming of a messiah was one of the 13 tenets of Jewish belief and believed in the divine word but argued that rationality should be applied to legal precepts and the conduct of everyday life. He also rejected Ptolemaic astronomy that argued that the Sun and stars revolved around Earth. He argued that humans should not be forced to choose between religion and reason and, in his prolific writings, discussed issues of immortality, creation of the universe and humankind, and free will. He died in Cairo and was buried in Tiberias, Palestine.

JANICE J. TERRY

Majapahit kingdom

After the decline of the Srivijayas, who were based in Palembang, Sumatra, the Singahsari dynasty tried to assert their authority in the Malay Archipelago. Unfortunately for them the powerful Mongol warrior KUBILAI KHAN interfered with their efforts by trying to subjugate them. He initially sent peaceful missions to make the Singahsari ruler pay tribute to him. When the last Singahsari ruler, Kertanagara, refused, Kubilai Khan sent a military force to Java to subdue him forcefully. By the time the Mongols reached Java, the Singahsari ruler Kertanagara had been assassinated by the forces of his brother-in-law, Jayakatwang of Kediri, who coveted the throne. In 1292 Nararya Sanggrama Wijaya, later known as Kertarjasa Jayawardhana, the son-in-law of Kertanegara, went on to establish his own line of dynasty, known as the Majapahit dynasty. He managed to do so through an early alliance with the Mongols, who had come to attack him. After defeating his uncle, Kertarjasa managed to expel the Mongols in 1293.

The Hindu-Javanese Majapahit dynasty reigned from about 1293 to 1500 from eastern Java. The name *Majapahit* is derived from a bitter fruit. Their empire included Borneo, Sumatra, Bali, and the southern part of the Malay Peninsula. It stretched from Irian Jaya in the east to Langkasuka in Malaya in the west. Either a king or a queen was able to rule. The royal family consisted of the king's parents, sisters, their husbands, aunts, and uncles, and their respective spouses shared in the administration of the kingdom. They formed the Royal Advisory council, and the Royal Privy councils were consulted by the king before he made any decision.

The Majapahit kingdom achieved great prosperity especially in the 14th century. A key figure in the Majapahit era is Gadjah Mada, who acted as regent and prime minister from 1331 to 1364. Queen Tribuana Tungga-dewi, regent for her son Hayam Wuruk, appointed him

prime minister. Gadjah Mada was a skilful politician and was responsible for the glorious period of Majapahit rule. His famous oath, known as Sumpah Palapa, was recorded in the *Pararaton* or the *Book of Kings*. He swore to conquer the rest of the Malay Archipelago before indulging in the pleasures of life. In fact, he named specific locations in his oath, such as Bali, Tumasik (present-day Singapore), Pahang, and Palembang. He succeeded in spreading Majapahit rule in the Malay Archipelago, beyond present-day Indonesia. His conquests even extended to the Muslim city-state of Palembang Sumatra, effectively ending Srivijaya rule. True to his word, he headed a military expedition that conquered Bali in 1343.

In 1350 Queen Tribuana Tungga-dewi stepped down and Gadjah Mada served her son, Hayam Wuruk, who ruled until 1389. The young king, who was only 16 years old, gave free rein to his prime minister. Thus Gadjah Mada was free to conquer as many places in the archipelago as he wanted. During this time he succeeded in gaining the islands of the Indonesian Archipelago under Majapahit rule. During the early 15th century Majapahit rule declined with the rise of the Malacca Sultanate, who were becoming increasingly powerful. Toward the end of their rule, many members of Majapahit aristocracy moved to Bali, where they lived in isolation till the island was colonized.

NURFADZILAH YAHAYA

medieval Europe: educational system

One of the most important intellectual developments in western Europe during the High Middle Ages was the growth of urban schools and universities in which fee-paying students were able to acquire a basic education in the liberal arts. The system of education known as SCHOLASTICISM resulted from the rigorous application of the liberal arts and their principles to the study of God and the traditional teachings of the church. These educational transitions were characteristic of the period

that Charles Homer Haskins and subsequent scholars have dubbed “the renaissance of the 12th century,” a time of intense cultural flourishing spanning from around 1050 to 1215 and made possible by the rapid growth of cities and the emergence of a cash economy.

Since the time of CHARLEMAGNE two types of schools had existed in western Europe: monastic and cathedral. Monastic schools trained oblates (that is, children given to the monastery and the monastic life by their parents) in the scriptural, theological, and spiritual traditions of the church. Monastic education emphasized acceptance and assimilation of what was known about God rather than investigation of the unknown. Cathedral schools, which were under the control of the local bishop, trained young men for careers in ecclesiastical or secular administration by providing a basic education in reading, writing, rhetoric, and documentation. Here again the curriculum was oriented toward the practical rather than the speculative.

In the first half of the 12th century a new type of school began to appear in burgeoning cities like Paris. These urban schools, which were open to all fee-paying students, served a clientele that did not necessarily have aspirations to serve the church or government in the traditional ways. The interpretation of sacred Scripture and the study of God remained, however, at the center of the curriculum of these new schools. Teachers at the urban schools certified to give authoritative interpretations of revelation were officially designated masters. Masters such as Anselm of Laon, Bernard of Chartres, and Hugh of St. Victor sought to use the liberal arts as tools in the interpretation of revelation and to teach their pupils to do the same. Thus the urban-school student would first read in the seven liberal arts before moving on to a higher discipline such as theology or law. In the 13th century the medieval university would come to be defined by a school of theology, a school of law, and a school of medicine beyond the liberal arts curriculum.

The seven liberal arts were divided into the *trivium*, the three arts proper, and the *quadrivium*, the four sciences. The trivium consisted of grammar, rhetoric, and dialectic or logic. The quadrivium consisted of arithmetic, astronomy, geometry, and music. About a millennium and a half before the birth of the medieval university, Aristotle maintained not only that all the arts and sciences are subservient to “first philosophy” (that is, the science of the end or the good), but also that they constitute the parts of philosophy as preparation for that highest wisdom that determines the end of all things and orders them accordingly. Thus subsequent pagan thinkers such as Cicero and Seneca insisted on

Monastic schools trained oblates in the scriptural, theological, and spiritual traditions of the church.

the necessity of a liberal arts education for the formation and perfection of humankind. Ancient Christian thinkers such as Augustine of Hippo and Jerome, also having been trained in the liberal arts, similarly insisted on the use of the arts in the interpretation of Scripture. The tiered curriculum of the medieval urban schools and universities owes much to Augustine’s understanding of the liberal arts as certain ordered steps intended to lead the student from corporeal to incorporeal things.

Hugh of St. Victor (c. 1098–1141), an early Scholastic theologian and master at the urban school of St. Victor in Paris, was known as the “Second Augustine,” even during his lifetime, because he used Augustine’s basic idea to develop a holistic well-ordered philosophy according to which the student is led from the time-bound words of humans to the eternal Word of God. According to Hugh, it is the ordered study of the liberal arts that ultimately leads the reader to the eternal Word or wisdom, the second person of the Trinity, who reorders and perfects the human student after the fall into the disorder of sin. In the urban schools the liberal arts were constitutive of philosophy, which Hugh and other medieval masters understood primarily as the love of that wisdom in whose image human beings are created and in whose image they are restored.

Liberal arts study intends to restore within fallen students the divine image, in Hugh’s view. The four major branches of philosophy into which the Victorine Master divides the arts arose as antidotes to humankind’s sickness because of the fall of Adam. First the

theoretical arts (theology, physics, and mathematics, the last of which includes the quadrivium) seek to heal ignorance and restore humans to the knowledge of truth. Second the practical arts (ethics or individual morals, economics or domestic morals, and political science or public morals) seek to heal concupiscence and restore humans to the love of virtue. Third the mechanical arts (weaving, armament construction, commerce, agriculture, hunting, medicine, and theatrics) seek to alleviate bodily weakness (an antidote to mortality). Finally the logical arts (the trivium), which arose last of all, seek to provide a form of polished discourse on which the other branches of knowledge rely. The logical arts are therefore to be studied first, after which the student is to learn, in order, the practical, the theoretical, and the mechanical arts.

The second major phase of Hugh's pedagogical program is the study of sacred Scripture, for which the pupil is to use the recently acquired tools of grammar, dialectic, and the other arts. The 12th-century application of grammar and dialectic to the study of God was central to theology's becoming a science or academic discipline. The most important theological and ecclesiastical works of the 12th century resulted from the rigorous application of the principles of dialectic to the enormous and disparate body of statements of the fathers and councils of the church on innumerable questions of faith and doctrine: for example, Peter Abelard's *Yes and No*, the *Ordinary Gloss*, PETER LOMBARD's *Four Books of Sentences*, and GRATIAN's *Concordance of Discordant Canons (Decretum)*. Whereas various "questions" about God and God talk first developed out of the biblical witness and closely followed its narrative structure (as in Hugh of St. Victor's *On the Sacraments of the Christian Faith*), in the following centuries theological reflection would take the standard form of the "questions" themselves systematically arranged in *summae* (as in the *Summa theologiae* of THOMAS AQUINAS).

FRANKLIN T. HARKINS

medieval Europe: sciences and medicine

The Latin West in the early medieval period was too poor and rural to produce significant theoretical science and medicine. The near-total loss of the scientific language of antiquity, Greek, also hindered Western science. What remained were the Bible and the voluminous but unsystematic and uncreative Latin works of Roman and a few early medieval compilers, such as the Elder Pliny's *Natural History* or the encyclopedic writings of Isidore of Seville.

Medieval science built on the tradition of Greek natural philosophy and medicine. Ptolemy in astronomy (and astrology); Galen in medicine; Euclid, Archimedes, and Apollonius in mathematics; and Aristotle (along with works falsely ascribed to him) in logic and natural philosophy composed a body of ancient authority that underlay medieval science. They were joined by numerous writers from the Islamic world, particularly influential in the field of medicine, but important in many other areas as well. Leaders among these included the philosopher-physicians IBN SINA (980–1037), known in the Latin West as Avicenna; Ibn Rushd (1128–98), known as AVERROËS or "the Commentator" (on Aristotle); and Moses MAIMONIDES (1138–1204). Physicians and philosophers from the Islamic world, who included Jews like Maimonides and Christians as well as Muslims, had further developed and systematized Greek thought as well as innovating.

The revival of Western science can be traced to the growing prosperity of the West in the 11th century, which stimulated interest at first in the Roman writings, and then in an influx of translations from the Arabic, both of originally Greek texts translated into Arabic and of originally Arabic ones, beginning late in the 11th century. The principal avenue for scientific translation was Spain, where many Muslim areas with developed scientific traditions were coming under Christian rule. (There were also translations directly from the Greek being made in the Sicilian kingdom, an area that had never lost its connections to Greek culture.) The most important translator of the 12th century was Gerard of Cremona (1114–87), an Italian who worked in Toledo, Spain. Gerard's translations of Arabic versions of Greek works included Ptolemy's *Almagest*, Euclid's *Geometry*, and Archimedes' *Measurement of the Circle*. Arab works he translated included Avicenna's *Canon of Medicine* and the commentary on Galen by Haly Radoan, both of which became standard medical texts. The 12th and 13th century discovery of these Greek and Arab writers

had a radical impact on European culture, making the physical universe an object of scholarly interest.

By the late 12th and 13th centuries, the vehicle for disseminating science and medical theory in Latin Christendom was the university, particularly the undergraduate arts faculty and the medical faculty. The intellectuals who worked in these universities are referred to as Scholastics. Scholastics did not view qualitative science as a discipline divorced from philosophy but as a sub-discipline within philosophy, called natural philosophy. Natural philosophy was taught in universities principally by commenting on Aristotle's genuine and spurious scientific works along with previous commentaries and other texts. Among the most important centers for the study of nature was the University of Paris. Leading Scholastic philosophers with an interest in natural philosophy included the 12th century William of Conches and Albertus Magnus (1200–80). More mathematical aspects of science, such as astronomy and optics, were taught outside the natural philosophy curriculum.

Scholastic natural philosophers faced the challenge of reconciling Aristotle's thought, produced in the culture of pagan Greece, with Christianity. The most common approach was to subordinate Aristotle to Christian doctrine, denying such Aristotelian claims as the eternal existence of the world as unbiblical. A very different strategy based itself on the philosophical works of Averroës. By asserting the autonomy of philosophy, including natural philosophy, from Christian theology, the Latin Averroists such as Siger of Brabant (c. 1240–c. 1284) at the University of Paris attracted a great deal of suspicion from church authorities. The bishop of Paris, Etienne Tempier, reacted to the perceived threat of the Averroists by condemning many Aristotelian ideas as irreligious in 1277. The Aristotelian denial of the possibility of multiple worlds, for example, was thought to be a heretical limitation on God's power.

The scope of Tempier's condemnation reached to the works of many philosophers trying to synthesize Aristotle with Christianity, such as the Paris professor THOMAS AQUINAS (c. 1224–74). The effect of this condemnation was limited; it did not, nor was it intended to, stop the study of nature. It did encourage a greater focus on God's omnipotence, with a greater willingness to discuss hypothetical, non-Aristotelian cosmologies. These discussions were not assertions of physical reality but remained speculative. When the Parisian master Nicolas Oresme (c. 1320–82), for example, discussed the anti-Aristotelian idea that the Earth rotated, his influential arguments were directed at demonstrating that it was possible, not that it was actually happening.

Somewhat apart from the mainstream of Scholastic science was experimental work. Its most notable practitioner in the Middle Ages was the Franciscan friar ROGER BACON (c. 1219–c. 1292), whose optical and alchemical experiments won him a bad reputation as a magician. Another experimentalist was the French nobleman Pierre de Maricort, who experimented on magnets. The most active experimental program was probably that carried out by alchemists, particularly in distillation. As the university scientists, they drew on Greek and Arabic science, but their discipline was passed on outside the academy and aroused some suspicion from church authorities.

One of the most intriguing developments in late medieval science was the increasing quantification of Aristotelian physics. This was initially the work of a group of scholars at Oxford University, many of them associated with Merton College, the so-called *Calculatores*. Leaders in this early effort to create a mathematical physics were Thomas Bradwardine (c. 1300–49) Richard Swineshead (d. 1365), and William Heytesbury (d. c. 1372). The project was also advanced by avant-garde masters at the 14th century University of Paris, notably Oresme, Jean Buridan (1300–58) and Albert of Saxony (c. 1316–90). Their brilliant work continued to be expressed in the form of commentaries on Aristotle's works, modifying the Aristotelian system rather than overthrowing it. Their most notable conceptual innovation was "impetus," a quality of a moving body that kept it in motion. This differed from the Aristotelian theory that a body's motion was maintained by the medium in which it moved.

Although professional healing continued in early medieval Europe, it was not based on mastery of textual sources. The transmission of the Greek and Arab tradition in medicine to Latin Europe began in the late 11th century, with a group of translations from the Arabic associated with the Benedictine monastery of Monte Cassino. These translations, made by an otherwise unknown monk named Constantine the African, included works of the ancient Greek physician Hippocrates, Galen, and Arab physicians. The new body of texts was instrumental in the re-creation of medicine as a learned profession, as well as ensuring that the Western medicine would follow Arabic medicine into adopting a basically Galenic framework. The first recorded institution devoted to medical education in the Latin West was a medical school at Salerno in southern Italy, which developed a body of texts that would form a basis for medical learning throughout the medieval period.

With the development of the university system in the 12th century, medicine was taught alongside law

and theology as one of the three higher disciplines. As they did in science, universities benefited in medicine from the flood of Spanish Arabic translations of the mid-12th century, the most influential work being Avicenna's *Canon*, a massive systematization of Galenic medicine that eventually served in Latin translation as a medical textbook. A third wave of medical translations in the 13th century was led by the royal physician Arnould of Villanova and included a higher proportion of translations directly from the Greek. Latin Christians also began to write medical treatises, commentaries, and compendia of their own, although nothing to challenge the intellectual authority of Greek and Arabic works.

In addition to Paris and Montpellier in southern France, the most important universities for medicine were mostly Italian, particularly Bologna and Padua. The bachelor of medicine degree took about seven years, the M.D. about 10. As the medical curriculum developed, textual study began to be supplemented with other forms of medical education. Some universities required medical students to get practical experience working with a physician, and beginning in the 14th century some Mediterranean universities began to require attendance at dissections. The Galenic medicine taught in the universities was based on a theory of the four "humors" of the human body: yellow bile, black bile, phlegm, and blood. A healthy body was one where the humors balanced. This led to the popularity of bloodletting as a therapy, as it allegedly relieved the distress caused by an excess of blood. Although Galen differed from Aristotle on some biological questions, Galenic medicine was mostly compatible with Aristotelian natural philosophy, and physicians were educated in natural philosophy as well as medicine proper. It was also considered important for a physician to know astrology to choose the best times to perform medical procedures.

Largely outside the university tradition were Jewish physicians, some of whom served as personal physicians for the most powerful Christians in Europe. Also outside the university tradition were women writers on medicine such as the nun HILDEGARD OF BINGEN (1098–1179). Her *Book of Simple Medicines* includes information on the curative power of herbs and jewels. There was also a mysterious woman medical writer at Salerno named Trotula, but she had no successors on university faculties.

One set of rivals to the physicians, as educated medical professionals, were the surgeons, who in addition to practicing what is now called surgery were also active in the treatment of skin disease. (Italy was

exceptional in that physicians were trained as surgeons as well.) Surgery was not taught at the university, but through apprenticeship, which eventually led to the formation of a guild system. Physicians, a tiny minority among Europe's medical practitioners, distinguished themselves from surgeons (and other healers like midwives and herbalists) through a focus on why the body became sick, rather than merely on the cure. Physicians often emphasized maintaining health through proper diet and the observance of astrological moments rather than healing the sick.

By the late Middle Ages a network of medical institutions outside university medical faculties had begun to develop. Surgeons organized themselves into guilds such as Paris's College of Saint Cosme, founded in 1210. Governments established systems of licensing practitioners, although unlicensed practitioners continued to flourish. Cities, beginning in Italy, hired public physicians. Hospitals, originally places for the sick to die or recover, started hiring physicians as attendants.

WILLIAM E. BURNS

Mehmed I

(1389?–1421) *Ottoman ruler*

Mehmed I came to the Ottoman Turkish throne at perhaps the most desperate time in the dynasty's history. Up until the reign of his father, BAYEZID I, the Ottoman rise to power had been meteoric. His grandfather, Sultan Murad I, had defeated the Serbian King LAZAR at Kosovo in 1389, opening up the Balkans to Ottoman conquest. Yet, at the moment of victory, one of Lazar's lieutenants, Miloš Obilić, as Caroline Finkel relates in her *Osman's Dream: The History of The Ottoman Empire*,

“approached him, pretending that he was defecting to the Ottoman. Instead he stabbed the sultan dead. Lazar was soon captured and decapitated in Murad’s tent.”

After the death of Murad on the battlefield of Kosovo, where 600 years later Serb leader Slobodan Milošević would ignite the spirit of Serb nationalism and begin a new series of Balkan wars, Murad’s son Bayezid I became sultan.

Bayezid was an energetic warrior, determined to build on the patrimony of his father, Murad. He earned the nickname of *Yilderim*, “Lightning,” for the speed and decisiveness of his movements. In the First World War when Turkey was an ally of imperial Germany, an elite division trained by General Liman von Sanders and other German advisers would become known as the “Yilderim Division.” In 1396 armies from Christian Europe gathered for a crusade to save Constantinople, the capital of the Byzantine, or Eastern Roman, Empire, from its growing encirclement by the Ottomans. However at Nicopolis, the impetuosity of the French knights, which had doomed them in 1346 and 1356 fighting the English at Crécy and Poitiers, and would also lead to their defeat by the English archers again at Agincourt in 1415, gave Bayezid an opening in which he was able to destroy the entire Christian army. As Lord Kinross wrote in *The Ottoman Centuries: The Rise and Fall of the Turkish Empire*, “the finest flower of European chivalry lay dead on the field of Nicopolis or captive in the hands of the Turks.”

SIEGE OF CONSTANTINOPLE

Two years earlier in 1494 Bayezid had already begun his siege of Constantinople, also called Byzantium. But its ancient walls, combined with some help brought to Emperor Manuel II Palaeologus by the French Marshal Jean Boucicaut, who had survived the slaughter at Nicopolis, enabled Constantinople to withstand Bayezid’s siege. A final assault by some 10,000 Ottomans, most likely from the elite Janissary, or *yeni cheri*, corps, ended in defeat.

However Bayezid was determined to try another assault on the city when an even greater threat loomed from the east. For several years Bayezid had been involved in a cold war with the Turkish warlord TIMURLANE (TAMERLANE), or Timur the Lame, who was carving out with his sword a vast empire in Central Asia. Finally taunting words between the two warrior sultans led to open warfare in 1399, when an expedition led by Bayezid’s son Suleiman captured one of Timurlane’s vassals, Kara Yussuf, and took him prisoner.

Timurlane immediately struck back and took the Ottoman-ruled town of Sivas, burying alive thousands of

The Fatih Camii (mosque) of Sultan Mehmed in Constantinople: Mehmed was known as al-Fatih, or the conqueror.

its citizens. A sudden paralysis seized Bayezid, who did nothing in return. Emboldened by his rival’s lack of action, in 1402 Timurlane invaded the heartland of the growing Ottoman Empire, Anatolia. There on July 28, 1402, the two great Eastern armies met at Ankara, with Bayezid’s 85,000 troops, according to Finkel, outnumbered by the 140,000 of Timurlane. It appears that Bayezid felt his Janissaries could win the day for him, and he positioned himself at their head in the center of the Ottoman army. Suleiman commanded the left wing, as Kinross relates, while the Serbian ruler Stephen Lazarevitch led the right. Mehmed, Bayezid’s favorite son, commanded the rear. By virtue of his position of command, the year of Mehmed’s birth seems in question.

If he was born in 1389, it is unlikely that Bayezid would have entrusted such a command to a prince who was only 13 years old at the time. The battle, which Bayezid had all hopes of winning, turned into a disastrous defeat for the Ottomans. Some of the Anatolian princes, newly conquered by the Ottomans, simply failed to fight for him. Timurlane took Bayezid alive. Although some stories claimed Timurlane exhibited the captured sultan in a cage, these seem fanciful by modern accounts. Justin Marozzi in his *Tamerlane: Sword of Islam, Conquerer of the World*, quotes Timurlane’s chronicler Sharaf ad-din Ali Yazdi that Timurlane actually had intended to restore Bayezid to his throne. Wrote Yazdi, Timurlane “had resolved...to raise the dejected spirit of Bayazid by

reestablishing him on the throne with greater power and magnificence than he had enjoyed before.”

If Yazdi was accurate, Timurlane may have felt that it was better to have an Ottoman sultan on the throne, in his debt, than another who would be hungering for revenge. But what is true is that in 1403, Bayezid did die, either by his own hand or by natural causes. Ironically his great conqueror, Timurlane, died two years later in 1405, while planning the conquest of China.

CIVIL WAR

The capture and subsequent death of Bayezid set in motion a complex civil war, in which his sons struggled for his power. Amazingly Christian Europe, perhaps still remembering the disaster at Nicopolis, did little to exploit this interregnum to deliver what could have been a decisive blow upon the chaotic Ottoman realm.

Timurlane, according to Marozzi, actually made one of the first moves. After assuring, in Yazdi’s words, that Bayezid would be buried “with all the pomp and magnificence” due a ruler of his rank, Timurlane paid a surprise visit to Bayezid’s son, Musa Çelebi, who, Marozzi notes, received from the conqueror “a royal vest, a fine belt, a sword, and an [arrow] quiver inlaid with precious stones, thirty horses, and a quantity of gold.” Apparently, before his death, Timurlane had the idea of grooming Musa to take his father’s place. Musa was given to the wardenship of the emir of Germiyan, who later handed him over to Bayezid’s son Mehmed, who had retreated to north-central Anatolia, where Timurlane left him in peace.

In fact Timurlane seems to have determined that whoever inherited Bayezid’s throne would be in his debt. In fact according to the online *Encyclopedia of the Orient*, in the entry for Mehmed I Çelebi, it notes, “1403: Following the death of Bayezid I, Timur Lenk divided the defeated Ottoman empire between 3 of Bayezid’s sons, Murad in Amasya (center of today’s Turkey), Isa in Bursa (western Turkey) and Süleyman in Rumelia (Balkans).” Nevertheless in 1404–05, Mehmed defeated Isa and took Bursa for his own. (However, Finkel states that Isa was killed by Suleiman in 1403.)

After Ankara, Timurlane did not pursue Suleiman, when he withdrew to the west in the Turkish part of the Balkans, Rumelia, where he established his own realm among the Balkan Christians, counting more on their loyalty than that of the Muslims of Anatolia. At the same time Suleiman ended with the Treaty of Gelibolu in 1403 the state of war that had existed between Constantinople and the Ottomans since Bayezid had begun his siege of the city in 1494. Indeed the diplomatic alliances between Christians and Muslims in the Balkans 700 years ago stand in

stark contrast to what today is being called a “clash of civilizations” by some in both religious camps.

Prince Suleiman, in fact, felt so secure with his Christian alliances in the Balkans that in 1404 he crossed the Dardanelles to attack his own brother Mehmed in his small kingdom in Anatolia. Mehmed was forced to retreat before his brother, who may have brought some of his Serb or other Christian allies to strengthen his army.

In 1409, however, as Finkel writes, Prince Musa staged a surprise attack on Suleiman by crossing over from Anatolia into Rumelia. Mircea, the voivode, or prince, of Wallachia, formed an alliance with Musa, affirmed through the marriage of Mircea’s daughter to Musa, and joined in the attack on Suleiman. Mircea, in fact, was the grandfather of the historical Dracula, Vlad the Impaler, who would also rule as voivode of Wallachia, although he was born in Transylvania, then part of Hungary. Musa proved a more competent warrior and soon captured in 1410 much of the land Suleiman had seized in the Balkans, including the city of Edirne. In 1411 at Musa’s orders, Suleiman was executed, removing one candidate for the throne. He was strangled, most likely with a traditional silken scarf, in keeping with the Ottoman taboo about shedding royal Ottoman blood when a member of the dynasty was executed.

With Musa now ruling Suleiman’s domains as well as his own, the other forces in the civil war, the Byzantine emperor Manuel II, the Serb Stephen Lazarevich, began to see Musa as a greater threat than was Mehmed. Consequently they threw their support to Mehmed, which was in large degree due to Musa’s own fault. Musa broke the treaty of 1403 with Constantinople by attacking the city in 1411, when Suleiman’s son, Orhan, as Finkel writes, had taken refuge with the emperor. In 1413 Musa would capture Orhan but for some reason released him. In spite of this act of mercy, the civil war continued.

NEW ALLIANCES

In a daring move Mehmed entered into a new alliance with Emperor Manuel II to gain his support against his brother, Musa. In 1412 envoys of Manuel had sealed the pact with Mehmed at his Anatolian capital at Bursa. With the Byzantine navy still the strongest fleet in the eastern Mediterranean, Manuel offered it to Stephen and Mehmed to convey soldiers and supplies for the coming campaign against Musa, which would be fought in Europe, not Turkey.

Each Byzantine ship was able to fire the feared “Greek fire,” at enemy ships, a flammable substance that, as napalm today, would start a blaze that virtually nothing

could extinguish. In 1412 supported by the Byzantines and the Serbs, Mehmed met Musa at Camurlu in Serbia on July 5, 1413, and won a smashing victory. After his triumph Mehmed had Musa strangled in his turn. After his victory Mehmed remained true to his treaty with Emperor Manuel. John Julius Norwich quotes him in *A Short History of Byzantium* as sending this message to Manuel: "Go and say to my father the Emperor of the Romans that from this day forth I am and shall be his subject, as a son to his father. Let him but command me to do his bidding, and I shall with the greatest of pleasure execute his wishes as his servant."

In 1413 Mehmed was officially enthroned as Sultan Mehmed I. For the remainder of his life, Mehmed remained true to the pact he made with Manuel II. He now attempted to make peace with some of the Anatolian nobles who had supported Musa or Suleiman against him in the civil war. A large number had supported him from the beginning; the others he now sought as allies.

Two years later in 1415, Mehmed faced a revolt led by either his brother, Mustapha, who apparently had been killed at the Battle of Ankara in 1403, or by a very convincing imposter. Mustafa, in fact, began negotiations with Emperor Manuel and with the ruling doge of Venice. Sensing a real threat, Mehmed struck at Mustafa and at Cuneyd of Aydin, an Anatolian noble who turned against him after he had first made peace. Mehmed quickly defeated the two of them and, when they sought sanctuary in the Greek city of Thessalonica, Manuel remained true to his treaty with Mehmed and imprisoned them both. Mustafa was imprisoned on the island of Lesbos.

MYSTICISM

Yet still there was no peace for Mehmed, who could now justifiably be referred to as Mehmed I. Just as the dynastic struggle within his own family seemed to have come to an end, he was faced with an uprising by the Islamic mystic Sheikh Bedreddin in 1416. The sheikh threatened to become a rallying point for all who were still disaffected with Mehmed's rule; thus it was imperative he strike decisively. Mysticism, especially SUFISM, had a wide, if secretive, following in the Ottoman Empire, and Mehmed could not risk the sheikh's preaching a religious jihad, or holy war, against his rule. Mehmed swiftly attacked Sheikh Bedreddin, who was unceremoniously put to death in the marketplace at Serres.

Because Mircea of Wallachia had apparently leaned toward Bedreddin, if only to gain greater freedom

from central Ottoman rule, Mehmed required hostages from him for his good behavior. As Finkel observes, "One of these boys was Vlad Drakul, later known as the 'Impaler.'" Indeed it was from the Turks that Vlad learned the punishment of impaling. In 1416, Mehmed made Wallachia a formal vassal state of the Ottoman Empire.

For five years Mehmed governed with little opposition to his rule. Removed from the need of carrying on far-flung wars, he established himself as a patron of the arts and a great builder. On May 26, 1421, Mehmed I died in Edirne. However he was buried in Bursa, in the Anatolian heartland of his Ottoman Empire.

JOHN MURPHY

mendicants

In the 12th and 13th centuries Italy was a loose collection of cities, each with its own government and rules. Society was divided sharply between people with money and power (the *majores*) and those who lived as indentured servants (the *minores*). Cities fought against each other for domination. It was an era when knights (wealthy young men) would destroy an entire city to conquer it for further economic gain. The church had recovered from the invasions of the barbarians but was in ruins internally. Clergy were not as concerned for the spirit of Jesus (Christ) of Nazareth as they were about amassing their own fortunes. They were seen as licentious drunkards. The papacy was fighting the emperor for control over various city-states. Ordinary people were not given an education in the Gospel or their faith. Heretical and sectarian groups were springing up as an antidote to this dangerous situation.

Many sectarian groups originated as a reaction to the abuses of the clergy at the time. Rather than

demand payment for religious services, these groups depended on the generosity of others, claiming the Gospel imperative to “take nothing on the journey,” and “the worker is worth his keep.” Some of these (such as the heretical Catharists) had a dualistic view of the world. Only things that were spiritual were deemed good. Anything involving the body or the Earth was corrupt. These groups encouraged people to lead a life of perfection that involved abstinence from much food and any sexual activity. They disapproved of the church and any authority coming from the church.

Also in response to the times were the mendicant orders. They were groups of unmarried Christian men who were organized by a spiritual rule and, as their name suggests, were beggars. In contrast to the aforementioned groups, the followers of St. Francis and St. Dominic sought the approval of the popes. They received papal permission to preach in every church when the local bishop gave consent. Both founders encouraged obedience to the Roman Church, even when they could easily see its abuses. They believed that Jesus had established the “universal church” on the weak shoulders of the early apostles and their successors, the popes, and church leaders.

Both orders, as mendicants, begged only for what they needed to eat for that day. They trusted that God would provide for their needs. Unlike the earlier monastic orders, the mendicants were itinerant; they did not live in the restricted environment of a monastery. Rather they lived in loose groups on the road, open to the needs of the people whom they encountered. They agreed to live together in a common life, under a common constitution (the “rule”), with common possessions and clothing (the “habit”), and offering common prayer (the “Divine Office”).

Their aim was to spread the message of Jesus to all who would listen. Their lifestyle was part of that message, namely, that God would care for all real needs. A common, democratic meeting, called a Chapter, held their obedience to each other together. Unlike the monks, who had one father abbot, the friars called their official religious superior their “minister” or “servant.”

Dominic Guzman in 1203 was an ordained priest for the cathedral of Osma, Spain. One day while accompanying his bishop, he found lodging at an inn where the innkeeper was an adherent to the beliefs of the Cathari. Being a simple man, the innkeeper was not rejecting the Catholic faith, as he had never been taught it. Dominic opened this man’s mind to the goodness of God found in the simple creed of the Catholic faith. Dominic later discovered that the people who were charged by the church to spread the ideas of Christian-

ity to the public were failing. Upon examination the reasons seemed apparent. These church delegates were traveling with great expense and were uninspiring in their preaching. Dominic received the papal approval to preach to the Cathari. He founded a new kind of religious order based on the missionary pattern of the apostles. His followers would be well trained. They would preach with charity the “fruits of their (prayerful) contemplation.”

Dominic and Francis differed in their reasons for choosing poverty. For Dominicans poverty was not their romantic ideal, but a necessary state to allow mobility and credibility. Dominic made the communication of Christianity a priority. From their prayerful study they would preach a convincing word that would be matched with an equally persuasive simple lifestyle. His followers would not preach the Gospel out of greed.

The followers of Francis of Assisi gathered almost by accident. Francis had a profound conversion that pulled him out of his middle-class background to align himself with the *minores*, those simple people living in grinding poverty. His joy at following Jesus in his original poverty influenced Francis’s peers among the *majores* to leave all they had and follow Christ. Francis called his group the Order of Friars Minor (Fratres Minores, or Lesser Brothers). His conversion happened in stages but was marked by key personal events, culminating in a powerful religious experience of embracing a man who was leprous.

This community of men held values that were contrary to their families and their world. They sought humble stations in life, allowed their personal relationship with Jesus to be their primary joy, and held creation dear. Instead of marriage they idealized poverty as their spiritual “bride.” The humility of Jesus, being born in a stable, dying on a cross, and by faith coming back in the bread and wine of Communion, inspired them to pour out their own lives in the same poverty.

The Franciscans and Dominicans (orders of Friars Minor and Preachers, respectively) were a convincing alternative in the Middle Ages to a corrupt clergy, divided social class, violent culture. These simple beggars helped to beckon the worldly church to its original spiritual calling. Their members included the learned Franciscans St. Anthony and St. Bonaventure and the very famous Dominican St. THOMAS AQUINAS. It was a new and controversial form of religious community that was highly persuasive among Christians of the late Middle Ages.

MARK SOEHNER

Merovingian dynasty

The Merovingian dynasty emerged as the Roman Empire was declining. The name *Merovingian* was derived from the name *Merovius*, the founder of the Merovingian dynasty, who was the powerful leader of a group of Franks known to the Romans as Salians from 448 to 457. Because of their penchant for wearing long hair, the Merovingian kings were known as the long-haired kings. The Merovingian dynasty ruled parts of present-day France and Germany from the fifth century until the eighth century, more specifically from c. 448 to 751. They are often regarded as the first kings of Frankish (or French) race.

The Merovingian kings had a reputation as builders of the greatest of the early medieval successor states. The origins of France were first discerned in the fifth century, when the Merovingian dynasty was in power over the Frankish kingdom. They also set the stage for CHARLEMAGNE's later success in building his empire. The Franks were a minority in the Merovingian kingdom, which expanded as King Clovis I conquered neighboring regions. He was responsible for uniting most of Gaul situated north of Loire in 486. War was waged on multiple fronts over many years against the Visigoths, the Saxons, and the Alamanni. In the Battle of Vouille in 507, the Visigoths were defeated at Toulouse. Burgundy was captured in 534 and the alpine region of Alamanni was added to their realm in 536 after multiple campaigns. As a result of this rapid expansion under the Merovingian dynasty, Gallo-Roman and Germanic subjects surrounded the Franks.

Adhering to the law of the Franks, when a father died, his land was divided among his sons. Since the entire kingdom was considered the king's land, Clovis I partitioned his realm among his four sons. Upon his death there were four kings who ruled his kingdom, but they remained united. However subsequent partitions and repartitions complicated matters as rivalries concerning land often resulted in bloody wars on issues of political succession, especially toward the end of Merovingian reign from 561 to 613.

The Merovingian kings were outwardly Christian after Clovis I converted to Catholicism, following

the conversion of his wife in 497, but their practices veered toward paganism. The royalty was thought to have divine powers, mixed with a strong sense of charisma and a magical allure. The most important consequence of this landmark conversion was that the Frankish tribes soon followed suit and adopted Christianity. By converting to Catholicism, an alliance was forged between the Frankish kingdom and the Roman Catholic Church. Saint BONIFACE (675–754), an eminent English missionary, is credited with converting the Germans to Christianity.

As the Merovingian dynasty declined in the eighth century, the mayor of Austrasia who actually served in the name of the Merovingian king gained more power for himself. The mayor, Charles Martel, grandfather of the future emperor Charlemagne, led the Frankish army to a victory against the Muslim invaders in 732 at the Battle of Tours. Although Charles Martel never adopted the royal title himself, his son Pepin the Short became the first king of the CAROLINGIAN DYNASTY, which succeeded the Merovingian dynasty.

NURFADZILAH YAHAYA

Mesoamerica: Postclassic period

Postclassic Mesoamerica (900–1500 C.E.) encompassed four principal geographic regions: the Maya zones to the south and east; the central highlands, centered on the Basin of Mexico; the Zapotecs of the Oaxaca Valley; and the Mixtec polities in the region north and west of Oaxaca. Sometimes called “The Time of Troubles,” the Postclassic period in these regions was characterized by several broad and overlapping trends. The most important were political fragmentation and the rise and decline of new polities; a heightened emphasis on militarism, aggression, and violence, accompanied by the political supremacy of an ascendant class of warrior elites; the institutionalization of the practice of human sacrifice; increased

movements and migrations of peoples; and the disruption and reconfiguration of regional and long-distance trade and commercial networks.

TOLTEC

In the Basin of Mexico and the central highlands, the Postclassic period was inaugurated by the decline and collapse of the great city of Teotihuacán around 650; the expansion and contraction of the city-states of Cholula, Xochicalco, and El Tajín; and the subsequent political fragmentation of the region into numerous competing city-states. Around 900 another polity saw a rapid rise to prominence in the central highlands: the Toltecs. Originating somewhere in the northern deserts, probably around the present-day Mexican state of Zacatecas, the Toltecs were but one of several waves of migrants from the arid northern regions to whom the settled peoples of the central highlands applied the generic name Chichimeca, meaning “lineage of the dog” and connoting both their martial skill and their “barbarism.” The later Aztecs would also be called Chichimeca.

According to Toltec legend, their semidivine founder Mixcóatl (Cloud Serpent) swiftly defeated his adversaries in his inexorable march into the Basin of Mexico, where he established a capital city at Culhuacán. Mixcóatl’s brother then treacherously assassinated him, after which his pregnant widow fled into exile, where she bore his son, whom she named Ce Acatl Topiltzín (Prince One Reed). As a boy, Topiltzín became a devout follower of QUETZALCOATL (the Plumed Serpent), the principal deity of the former great city of Teotihuacán. Topiltzín took on Quetzalcoatl’s name to become Topiltzín-Quetzalcoatl; the man-hero slew his uncle (his father’s assassin) and around the year 968 founded a new city in the northern section of the Basin of Mexico, Tula, which would become the capital of the Toltecs. Topiltzín-Quetzalcoatl, in turn, became the font of all the stunning achievements of the Toltecs, including the cultivation of maize, the invention of writing, the introduction of the ritual calendar, and all of the other attributes of the Toltec civilization.

Meanwhile a power struggle emerged within the Toltec capital of Tula between devotees of the two principal rival gods, Quetzalcoatl and Tezcatlipoca (Smoking Mirror). The latter craftily tricked Topiltzín-Quetzalcoatl into engaging in an incestuous relationship with his sister and forced him into exile in consequence of this disgrace, first to Cholula and then into the Maya region. In this way, according to legend, Tezcatlipoca

became the preeminent god of the Toltecs. A capricious, whimsical deity who reveled in exposing the frailties and pretensions of human beings, Tezcatlipoca was said to require for his propitiation ritual human sacrifice. This is how, according to legend, the practice of human sacrifice arose among the Toltecs. It is more likely that, as among other polities before and after, ritual human sacrifice emerged as a way for the Toltec ruling classes, particularly its warrior elite, to legitimate and consolidate their dominion and to strike fear into their actual and potential enemies. The Toltecs ruled a substantial portion of the Basin of Mexico until the mid-1100s, when a combination of drought, famine, and endemic warfare fatally weakened the still-forming polity. By the mid-1100s they had abandoned their capital city of Tula, which became the site from which the later Aztecs claimed direct lineage.

ZAPOTEC

Among the Zapotec-speaking peoples of the Valley of Oaxaca, the decline of Monte Albán between 700 and 900 (the terminal phase of Monte Albán IIIb and the beginning of Phase IV) was followed by political fragmentation and the rise of numerous competing polities. Among the most prominent of these was centered at the ceremonial complex of Mitla, southeast of Monte Albán, where construction began in the early- to mid-900s, around the same time as Tula to the north and west. The ruins at Mitla have long captured the imagination of archaeologists and visitors, with their elegant lines, precision stonework, and complex geometric ornamentation. While the palaces and courtyards of Mitla were built in an open area, a nearby fortress testifies to the heightened militarism that characterized the Oaxaca Valley polities long after the site of Monte Albán itself had been largely abandoned and become mainly a site for pilgrimage and ritual.

Scholars have yet to decipher the Zapotec inscriptions that grace the ruins of Monte Albán and other sites in the Oaxaca Valley. It is hypothesized that specific hand gestures represent verbs; that noncalendric glyphs were intended to convey information regarding political, military, and ritual affairs; and that as-yet undiscovered connections exist among Mayan, Zapotec, Mixtec, and Aztec writing systems. Investigations into these and related arenas of Zapotec history continue.

MIXTEC

The mountainous zones lying north and west of the Valley of Oaxaca were home to numerous Mixtec (Cloud People) polities that emerged during the Postclassic

period. By the 1200s these Mixtec states had extended their influence south and east into areas traditionally controlled by the Zapotecs—including periodic occupations of Monte Albán and Mitla. The Postclassic Mixtec developed one of the most extreme systems of social stratification in all of pre-Columbian Mesoamerica. While all Mesoamerican polities placed a high degree of emphasis on purity of lineage, birth order, and elite status, these attributes were especially salient among the Postclassic Mixtec. For instance inscriptions record at least four cases of full brother-sister marriage among the descendents of the Mixtec lord named Eight Deer—an evident effort to retain purity of lineage. Among both the Mixtec and Zapotec Postclassic polities, there was little of the elaborate administrative and bureaucratic hierarchy that characterized other states during this period, including the Aztecs. Instead the word of the ruling lord was deemed law, carried out by a second tier of elite lords who ruled subject polities under the main lord's dominion.

The Aztec state, which emerged in the Basin of Mexico during the middle of the Postclassic period, exhibited all of the principal features characterizing the Postclassic polities of the central and southern highlands, particularly the heightened emphasis on militarism, warfare, human sacrifice, and conquest of lesser polities in the formation of a tributary empire.

Mesoamerica: southeastern periphery

Southeastern Mesoamerica has been so little understood that even the two Mayan sites in the area, Copán and Quirigua, which flowered from the fifth to the ninth centuries, were thought of as the creations of itinerant Mayans rather than having been created by the Mayans indigenous to the region. However, as Dennis Tedlock,

the translator of the *Popol Vuh*, the holy book of the Quiché Mayans of Guatemala, has noted, the Mayan culture not only embraced Chiapas Province and the Yucatán in Mexico, but also Guatemala, El Salvador, and Honduras. According to Tedlock, “inscriptions on stone monuments [sometimes called stelae] first appeared in the ‘highlands of Chiapas’ in the first century B.C.E.” Ultimately the inscriptions spread throughout the entire area. While it was believed that the Mayans were essentially a peaceful people, more recent excavations, like that at Bonampak, have shown them to be as warlike as those who followed them, the Toltecs and the Aztecs.

Southeastern Mesoamerica, as noted in the *Popol Vuh* by Tedlock, became a fertile area for Mayan development. Uaxactún, in the Petén region of Guatemala, became established as a ceremonial center in the first or second centuries, and El Mirador, in northern Guatemala, was founded around the same era. The term *ceremonial center* is an ambiguous one in Mesoamerican studies. Although it refers to an archaeological site that was used for religious ceremonies, certainly an urban population had to exist there permanently in order to provide the needed support for ceremonies in accordance with the Mayan calendar. Contemporary with the Mayans, the MIXTEC AND ZAPOTEC cultures flourished in the Oaxaca valleys in Mexico, while the great center at Teotihuacán dominated the Mexican highlands. City-states flourished when a particularly strong and talented ruler held sway, much as the golden age of ancient Athens is associated with Pericles.

Mayan civilization was not driven by a great need for centralization, as was later seen with the Aztecs. Instead, Mayans formed city-states like Copán and Tikal, which seemed to be locked in almost perpetual warfare with each other. A comparison can be made to ancient Greece, with its wars among city-states like Athens and Thebes, and ancient Rome, with the centralization that would produce one of the world's greatest empires.

With the end of the Classic period, Mayan culture gravitated away from the southeastern periphery of Mesoamerica to the Yucatán peninsula of Mexico. Chichén Itzá, Uxmal, and Mayapán became the centers of Mayan culture in the Postclassic period, after 900. The civilization and form of government, however, remained virtually unchanged from the heyday of southeastern Mesoamerica. Individual leaders dominated Mayan city-states. Traditional accounts of Mayan civilization have usually referred to these rulers as priest-kings, since they presided over both affairs of

state and religion. However their position in Mayan society was tenuous.

During the Postclassic period, there was peace among Chichén Itzá, Uxmal, and Mayapán for about a century, until in about 1100 Mayapán went on a war of conquest and seized the other two Yucatán Mayan city-states. For about 200 years Mayapán controlled what may have been the closest political organization to a kingdom that the Mayans evolved. Yet in 1441 Uxmal threw off the rule of Mayapán. From then on the Mayan city-states became embroiled in a series of civil wars that would only end with the Spanish conquest that followed the arrival of Hernán Cortés in Mexico in 1519.

JOHN F. MURPHY, JR.

Ming dynasty

The Ming dynasty, which spanned 1368–1644, can be divided into two segments. The first part, between 1368 and c. 1450, was a period of great achievement, growth, stability, and prosperity; the latter part, from c. 1450 to 1644, was characterized by weak and unstable rulers, corruption, and abuse of power that culminated in rebellions and overthrow. The Ming dynasty has an important place in Chinese history because of its longevity and rule over unified China, and because it was the last Chinese imperial dynasty not founded and ruled by peoples of nomadic origin.

MING TAIZU (T'AI-TSU)

China was in ruins by the mid-1300s under the Mongol YUAN DYNASTY (1279–1368). It suffered from a collapsing economy, wrecked by financial mismanagement, runaway inflation, natural disasters, famine, and plague. Numerous rebel movements rose to topple the Yuan dynasty, among them one led by an impoverished peasant named Zhu Yuanzhang (Chu Yuan-chang). Zhu focused on consolidating his power in the Yangzi (Yangtze) River valley in southern China, establishing his capital in NANJING (NANKING), a city rich with historic significance, from which he invaded the north, sending the last Yuan emperor in flight to

Mongolia in 1368. It was the second time in Chinese history that a commoner had ascended the throne (the first was Liu Bang, who founded the Han dynasty in 202 B.C.E.). He chose the dynastic name *Ming*, which means “brilliant.” He reigned for 30 years (1368–98), chose for himself the reign title *Hongwu* (*Hung-wu*), which means “bounteous warrior,” and is also known by his posthumous title *Taizu*, which means “Grand Progenitor.” He and his immediate successors worked to restore Chinese prosperity and prestige after the humiliation and exploitation of Mongol rule.

Emperor Hongwu’s policies put his stamp on the dynasty. He restored the economy by freeing people enslaved by Mongols and resettling them on ravaged lands, especially in northern China. He gave tax breaks to the peasants, repaired irrigation works, rebuilt granaries, and adopted a tax policy that favored the poor. He gave much authority to localities for maintaining law and order by organizing them into the *baojia* (*pao-chia*) system: 10 families formed a *jia* under a leader and were responsible for each other, and 10 *jia* formed a *bao* in which 100 families were responsible for each other. This system of local organization persisted in China into modern times.

CONFUCIAN EDUCATION

Hongwu ordered the founding of schools throughout the empire, based the curriculum on Confucian teachings, and reinstated the examination system to recruit officials. His son the emperor YONGLE (YUNG-LO) followed up on this by ordering the foremost scholars to compile an official version of the Confucian classics and commentaries to guide students in their studies. In 1415 *The Great Compendium of the Five Classics and the Four Books* was published, followed by the publication of *The Great Compendium of the Philosophy of Human Nature* in 1417. These works reflected the officially accepted Neo-Confucian philosophy as interpreted by the Song philosopher ZHU XI (CHU HSI) and became textbooks in schools in China, Korea, and Japan. Another major contribution to learning was the *Yongle Dadian* (Yung-lo ta-tien) or *Great Literary Repository of the Yongle Reign*.

It contained 22,277 volumes, whose index alone ran to 60 volumes. Too large to be printed, it was preserved in manuscript sets in imperial libraries. Such great government-sponsored works reflected and resulted in huge national interest in learning, which made the Ming a great period in human history. Economic prosperity permitted wider and growing literacy, from which the printing industry also benefited.

DEFENSE AGAINST THE MONGOLS

Emperor Hongwu established a highly centralized administrative system that combined features from the previous TANG (T'ANG) DYNASTY, SONG DYNASTY, as well as the Yuan dynasty. But he abolished the position of chief minister, so that the autocratic ruler held all the reins of power. Recognizing that abuse of power by eunuchs contributed to the decline and fall of earlier dynasties, he forbade eunuchs to interfere in government. He established a million-man professional standing army that was hereditary. He gave government-owned land to each garrison, requiring the soldiers to till the land in their spare time so that they would not be a burden on the treasury. This did not work in practice and the treasury had to allocate funds to the army regularly. The army units were rotated in guarding the capital region, the Great Wall, and at strategic locations throughout the empire and were trained by special tactical officers. The division of authority between garrison commanders and tactical commanders prevented the development of warlordism and precluded revolts by the army during the dynasty.

Reflecting the deep resentment most Chinese felt toward Mongols, he forbade Mongol dress and customs among Chinese and ordered those Mongols remaining in China to adopt Chinese names and to become assimilated. Emperor Hongwu, his sons, and generals led campaigns that drove remnant Mongols to the Lake Baikal region in present-day Russia. They also regained all Chinese lands including modern Manchuria, Inner Mongolia, Yunnan, Sichuan (Szechwan), and Xinjiang (Sinkiang) and accepted the vassalage of Korea, Vietnam, and Central Asian states.

EMPEROR YONGLE (YUNG-LO)

Hongwu left the throne to his young grandson, who was, however, ousted by his uncle the prince of Yan (Yen), fourth son of Hongwu. After a civil war that lasted between 1399 and 1402 and ended with the burning of the palace in Nanjing it was presumed that the young emperor and his family had died. The victorious prince of Yan became the emperor Yongle (Yung-lo), r. 1402–24. Yongle is also known by his posthumous title *Chengzu* (Ch'eng-tsu), "successful progenitor," and is sometimes called the second founder of the Ming dynasty. He moved the national capital to Beijing (Peking) in 1421, after rebuilding it from the ruined Yuan capital Dadu (Ta-tu); the palaces, temples, and city walls of that city date to his reign. He had repaired the silted up GRAND CANAL to connect to Beijing to bring supplies from the south to the capital. A

seasoned general, he personally led five campaigns into Mongolia to prevent the resurgence of Mongol power. Another Ming army intervened in Vietnam in 1404, annexing that area to the Ming Empire. However Vietnam regained its autonomy after 20 years and became a Ming vassal state. Troubled by Japanese pirates he intimidated the shogun of Japan into accepting vassalage for the first time in history. Yongle was also famous for authorizing huge armadas to show the flag, promote trade, and enroll vassal states across Southeast Asia, the Indian Ocean, to as far as the northeastern coast of Africa.

The eunuch admiral ZHENG HE (CHENG HO) commanded seven expeditions (the last one set out after Yongle had died). In appointing Zheng He and other eunuchs to high positions Yongle violated his father's strong injunction. Although he kept them under firm control, later weak Ming rulers would rely on them for advice, undermining the bureaucracy and resulting in corruption and abuse of power, with disastrous effects. For example, in 1449 a weakling emperor appointed his favorite eunuch commanding officer, and together they went to war against a Mongol chief, only to suffer defeat and capture, throwing the government into chaos in the process.

CHINA RECOVERS

Government policies that favored land reclamation and economic activities resulted in growing prosperity, and the gradual repopulation of northern China and migration to the south and southwest, driving aboriginal peoples to remote mountainous regions. Production of silk was encouraged and became widespread in areas south of the Yangzi River. Women and girls were in charge of growing mulberry trees and tending silkworms and also worked in silk weaving factories, bringing additional income to farm families. The cultivation of cotton and manufacture of cotton cloths also expanded during the Ming, providing clothes for ordinary people. Crafts also flourished, with metal, lacquer, and paper industries leading the way. True porcelains were first made in China during the Song dynasty, hence the name china. Its manufacture continued to advance during the Yuan, but it was under the Ming that Chinese porcelain manufacture reached its apogee. Under state encouragement, Jingdezhen (Ching-te-chen), the porcelain manufacturing center, had 3,000 government and privately owned factories.

Four emperors followed Yongle up to 1450. They and most subsequent Ming rulers were mediocre; many were also eccentric. They abandoned the militant foreign

policy of the dynastic founders and resorted to defensive tactics, mainly reflected in rebuilding the Great Wall into the formidable monument that survives to the present. Although later Ming lost its earlier dynamism, the institutions and policies set by the dynastic founders worked to continue its survival until 1644.

JIU-HWA LO UPSHUR

Mixtec and Zapotec

The Zapotec and Mixtec were groups of Mesoamerican people who inhabited land at different times in the valley of Oaxaca in Mexico. This area lay south of today's Mexico City on the west coast of the country and was rich in natural and cultural resources. Monte Albán was one of the first cities in the New World. Now a ruin, it once served as a magnificent ceremonial site with ball courts, plazas, tunnels, tombs, and buildings. Archaeologists have evidence that these people knew about irrigation because there are terraces to allow spring water to flow down and maintain their crops. As other Mesoamerican groups they practiced ritual human sacrifice. The ceremonies were complex, using obsidian knives to cut out the beating heart of the victim from on top of a pyramid. Tombs have been excavated where the remains of kings and priests were buried with ornate grave goods, some with precious metals. Monte Albán was ideal as a ceremonial center because it was near the juncture where three arms of the Oaxaca Valley met.

The time periods of these cultures are defined in terms of Mesoamerican chronology. The Formative is divided into three groups: Early, Middle, and Late (300 B.C.E.–150 C.E.) and the Classic into four: Early (150–650 C.E.), Late Classic (650–900 C.E.), Early Postclassic (900–1200 C.E.), and Late Postclassic (1200–1521 C.E.). The Zapotec and Mixtec occupied Mexico's valley of Oaxaca from the Late Formative to the Late Postclassic period.

THE ZAPOTEC

Early Zapotecs lived during the Middle Formative period (Preclassic period) 500–400 B.C.E. One of the first pieces of archaeological evidence found was a gruesome message in the form of carvings on stelae (stone monuments). It was a bas-relief (raised carving) of a dead man, stripped of all clothing with blood coming out of his chest and some scrolls with glyphs (decorative writing) between his legs. He probably represented an enemy who had been sacrificed. The style of art, known as *Danzantes*, or dancers, is unique to the Zapotec culture, and typical for that time period. The style differs from other Mesoamerican art because the human figures are curved, not angular, without clothing, body decoration, or jewelry.

They are shown in active rather than in posed-type positions that were characteristic of rulers from other time periods. These dire figures are captives, in agony because they have been ritually tortured and are being sacrificed. Their eyes are closed, their tongues are protruding, and their hands and feet are limp. It is thought that they represent high-level individuals who were killed by other rulers because they are depicted as old, with beards and without teeth.

The glyphs, combination of phonetic symbols, numbers, and ideographic elements, were the first in Mexico. The Zapotec had a calendar based on a 260-day year and a 52-year cycle. Their pottery included spouts or hollow three-legged bowls fashioned from fine gray clay. It is estimated that this early Monte Albán I culture supported a population of about 10,000 to 20,000.

From about 200 B.C.E. to 250 C.E. (Early Classic period), the Zapotecs lived in relative harmony and comfort. A few new buildings were constructed. One of them might have been an observatory because it was oriented in the direction of a bright star known as Capella. Another building (referred to as building J) has many narrow dark hallways that connect at a common apex. On the outside, there are more typical glyphs with elaborate headdresses, but they have closed eyes.

It is believed that these heads and symbols represent both date notations and records of victory over neighboring enemies when a particular town was attacked and conquered. Older cultures often documented wars in this way. Although contact with the Maya was evident in elements from Mayan art incorporated in their pottery, in the Classic period, there was more influence from Teotihuacán, the gigantic complex northeast of Oaxaca. The Zapotec continued to build terraces and maintained their Zapotec language, which remained dominant. They had a lively

Monte Albán was one of the first cities in the New World. Now a ruin, it once served as a site for complex ceremonies using obsidian knives to cut out the beating heart of the victim from on top of a pyramid.

pantheon: the rain god, Cocijo; the maize (corn) god, Pitao Cozobi; a feathered serpent; a bat god; a fire god; and a water goddess. The Zapotec thrived in Monte Albán until about 700 B.C.E., at which time they abandoned the site, probably because of new invaders from the northwest.

The Zapotec moved 25 miles southwest of Oaxaca to an area called Mitla, from the Nahuatl word *Mictlan*, which means Place of the Dead. However, they called it Lyobaa, Place of Rest. They built five palatial buildings, guarded by a fort on a strategic hill. These buildings still stand; unfortunately after European contact, the church destroyed and replaced indigenous religious structures. A colonial period church was built right on top of one of these structures.

THE MIXTEC

Mixtec comes from an Aztec word that means Place of the Clouds, but the people, the Mixe, used the word *Ayuk* to describe themselves. It meant “word” or “language,” a word related to *ha*”*yyu:k*, “people of the mountains.” They are best known for their elegant books called codices in which they drew figures that resembled cartoons. These deerskin books unfolded to form a long strip, which could be read phoneti-

cally. Eight Mixtec codices have survived from before the conquest.

Around 850, during the Early Classic period, the Mixtecs lived in hilltop settlements of northwestern Oaxaca. During the Postclassic, around 1000, they moved into adjacent areas and then down to the valley of Oaxaca because they felt that Monte Albán was safe from invaders. The Mixtec’s best-known cities were Tilantongo and Teozacualco. They had superb artistic skills in carving, metalworking, painting, and silversmithing. There is a life-sized skull fashioned from a huge piece of quartz, which is Mixtec in origin, on display in the Inah Anthropology Museum in Mexico City.

The huge centers built by the Mixtec were primarily residential. Everyday activities took place on the valley floor but the hilltops were reserved for ceremonial sites. By the Postclassic period, most of the prior Zapotec territory was under their control. Their success is attributed to the way in which they organized social groups and interacted with others. The heredity ruling class (*caciques*) were the highest; next were a hereditary noble (*tay toho*), a working class (*macehuales*), and in certain areas, a servant-tenant class (*terrazgueros*) that could be compared to the European

feudal serf in status. As in any hierarchy the upper strata had privilege and power, hence more than one wife and control of natural resources, although gender did not play a strong part in social structure. Bilateral kinship lines determined lineage, which was more important to the Mixtec. Macehual women as well as men could own land.

Their language had unique symbols representing sounds as compared to other written languages that used glyphs and rebuses to communicate. The names of animals figured prominently in titles of their rulers such as *Eight Deer*, *Three Alligator*, *Four Tiger*, or *Jaguar Claw* because of their symbolic significance. Births, deaths, marriages, and land conquests are documented. Rank, occupation, and social status were defined by special ornamentation. The best known and powerful ruler, Eight Deer, had five wives, and his life is elaborately documented in the Codex Nuttall.

By 1350 C.E. the Mixtec had intermarried and taken control of the Zapotec sites. At the time of the conquest, great wealth and high culture abounded. Tombs attested to kings with their courts buried with gold, silver, turquoise, amber, coral, pearls, and carved jaguar bones. Unconquerable by their neighbors, they survived until the Europeans arrived.

LANA THOMPSON

Mon

The Mon may have been the first human inhabitants of Myanmar, better known as Burma. The Mon are also known as the Taliang people. They migrated, perhaps pursued by enemies, to South Burma, where they lived near the Salween River, which empties into the Bay of Bengal, not far east of the border with Thailand. Their population spread into Thailand as well.

In 573 two Mon brothers named Prince Samala and Prince Wamala created the kingdom of Hongsavatoi, which is located near the modern city of Pegu. The Mon realm enjoyed independence for several centuries. However by the middle of the 11th century, the Mon peoples came under the influence of those we now call Burmese, who had formed the kingdom of Pagan. A Buddhist monk of the Mon people converted the first king of Pagan, Anawratha (r. 1044–77), to Theravada Buddhism. This religion was common in Southeast Asia, so the Pagan takeover may have been less of a conquest, and more assimilation.

Both the Mon and the Burmese were under the strong influence of India and used Indian Sanskrit in some of their writings. The Pagan kingdom refused to pay tribute to the conquering Mongols, believing their distance from Mongol-controlled China would provide protection. In 1287 KUBILAI KHAN, the founder of China's YUAN DYNASTY (1279–1368), sent an army south, which virtually destroyed Pagan in revenge. At this time the Mon, with the reduction of Pagan, came under the rule of an adventurer from the Thai people, who established the Mon kingdom of Râmaññadesa, which was formed from the three provinces of Bassein, Pegu, and Martaban; the city of Pegu became the new kingdom's first capital.

The Râmaññadesa kingdom was brutally attacked in 1540 by the Burmese from Taungu, who went on to virtually unite all of modern Burma. With this invasion, Mon political independence was extinguished, but their cultural and nationalist identity remained strong, as it has until today. In the 18th century the Mon temporarily threw off Burmese rule, only to invite a brutal repression in return. At the same time as Robert Clive was expanding British rule in India, the Burmese ruler U Aungzeya began a genocidal invasion of the Mon heartland.

As Dr. George Aaron Broadwell writes, the invasion "devastated the Mon kingdom, killing tens of thousands of Mon, including learned Mon priests, pregnant women, and children. Over 3,000 priests were massacred by the victorious Burmans in the capital city alone....The surviving priests fled to Thailand, and Burman priests took over the monasteries. Most of the Mon literature, written on palm leaves, was destroyed by the Burmans. Use of the Mon language was forbidden, and Burman became the medium of instruction. Mon people were persecuted, oppressed, and enslaved, and countless people were burned in holocausts, like the Jews before the Nazis. Mon properties and possessions were looted and burned throughout Burma. Mons

fled further south into Burma's Tenasserim Division and east into Thailand."

Afterward the Mon remained firmly under Burmese control. The Alompra Burmese dynasty in the 18th and 19th centuries continued U Aungzeya's policy with a policy of forcibly eradicating the Mon language and culture, attempting a compulsory assimilation into the Burmese majority. The Mon managed to preserve their culture, and records of the kingdom of Râmaññadesa were written and preserved in the Mon language. The Burmese came under British rule in the 19th century, after the First Burma War (1824–26), Second Burma War (1852–53), and the Third Burma War (1885–87). The British ruled Burma, with a hiatus during World War II, until independence in 1948. After independence the Burmese continued their oppression of the Karen, Shan, and Mon peoples. For her opposition to Burmese military rule, Daw Aung San Suu Kyi received the Nobel Prize in peace in 1991. Mon people exiled from their native land have continued to battle for international recognition of their culture, language, and freedom.

JOHN F. MURPHY, JR.

Mongke Khan

(r. 1251–1256) *Mongol leader*

Mongke Khan was the eldest son of TULUI KHAN (fourth son of GENGHIS KHAN) and Sorghaghtani Beki and fourth khaghan or grand khan of the Mongol empire. He was a famous warrior and commander and was also noted for his devotion to the Mongol way of life. He had served on the campaign in eastern Europe under his cousin Batu Khan's leadership and gained the latter's goodwill. The good relations between Batu's (leader of the Golden Horde) and Tului's families were reinforced when OGOTAI KHAN's son and successor Guyuk Khaghan (r. 1246–48) planned to ambush Batu, and Mongke's mother secretly warned Batu of the plot, even though nothing came of it because Guyuk soon died.

In the struggle among the grandsons of Genghis Khan to be his successor, Batu successfully sabotaged regent Oghul Khaimish's (Guyuk's widow) attempt to

have the Mongol council elect one of her sons the next khaghan. Batu was not interested in being khaghan, but as the descendant of the eldest son of Genghis, he wanted the role of kingmaker and was successful in having Mongke elected the fourth khaghan in 1251. Mongke immediately consolidated his position by ruthlessly purging and killing his cousins and other relatives from the Ogotai and Chagatai (Genghis's second son) branches of the family and their supporters.

Anticipating his election, Mongke established a shadow government. Thus he was able to move quickly to fulfill his grandfather's mandate to conquer the world. Ruling from Karakorum in Mongolia when not on the move, Mongke relied on Mongols in top positions in his government, assisted by people from the conquered ethnic groups. He made important reforms needed to mobilize resources and manpower by unifying the tax collection system, stopping many abuses, and rebuilding the economies in some already conquered lands. Starting in 1252 he began a census of the peoples and resources of his lands from China to Iraq to assess taxes, control resources, and identify skilled craftsmen.

In 1252 Mongke began a three-pronged campaign. One brother, HULAGU KHAN, commanded an army that headed west, successfully targeting Kashmir, the Assassins in the Caucasus, Iran, and the Abbasid Caliphate, and taking BAGHDAD in 1258. A relative from the Golden Horde headed for Korea, subduing it in 1259. Another brother, KUBILAI KHAN, set out to conquer the Nanchao or Dali (T'a-li) kingdom located in modern Yunnan Province in southwestern China, securing its surrender in 1253. His youngest brother, Arik Boke, remained in Mongolia. In 1256 Mongke announced his goal of conquering the Southern Song (Sung) in which he would take personal command with a three-pronged attack from the north, west, and south. In the midst of the campaign, Mongke died in August 1256, of either wounds or dysentery. Mongke's death gave the Southern Song a 20-year reprieve because Kubilai immediately halted the campaign to secure his succession as khaghan. The ensuing civil war between Kubilai and his brother Arik Boke involved his other brother, Hulagu, and various cousins. The Mongol empire reached its apogee under Mongke and would never recover from the succession crisis.

Mongol invasions of Japan

KUBILAI KHAN, Mongol ruler and founder of the YUAN DYNASTY (1279–1368) in China, twice attempted to invade Japan, in 1274 and 1281, with huge armadas launched from Korea and China. He failed both times mainly because of weather. Japan thus never suffered under Mongol rule. The Japanese attributed their deliverance to the divine wind, *kamikazi* in Japanese. In 1260 Kubilai Khan seized leadership of the Mongol empire on the death of his elder brother, MONGKE KHAN, in a disputed succession. Kubilai Khan established his capital in North China, at the site of the former JIN (CHIN) DYNASTY capital, which he called Dadu (T'atu), meaning great capital in Chinese (present-day Beijing). He continued his brother's unfinished work of destroying the Southern SONG (SUNG) DYNASTY and embarked on a new adventure even before that task was completed in 1279.

In 1268 he sent his first embassy to Japan demanding tribute. The Japanese emperor, by then a figurehead residing in Kyoto, was willing to acquiesce. But real power belonged to the shogun or military commander and his court at Kamakura, which rebuffed the repeated Mongol demands. Thus Kubilai Khan decided to invade Japan to force compliance. His Korean subjects were ordered to build 400 large and 500 small ships, which set sail from Pusan in Korea in November 1274. The invasion force had 15,000 Chinese and Mongol soldiers, 6,000–8,000 Korean troops, and 7,000 Korean sailors. The defending Japanese warriors (samurai) were far less numerous and suffered serious losses in the battle fought at Hataka on Kyushu Island. However they were saved by a fierce storm that blew in. The Korean sailors persuaded the Mongol troops to board their ships and sail for safety in the open seas. The storm, however, damaged and sank many of the ships and 13,000 lives were lost; the survivors eventually limped home.

Kubilai Khan finished the destruction of the Southern Song in 1279. Then he focused on subjugating Japan. In 1281 he dispatched a huge force, reputedly of 140,000 men, in two armadas that sailed from

China and Korea for Hataka. Anticipating the Mongols' return the Japanese had mobilized and built a wall to the interior of Hataka Bay. After about two months of desultory fighting, another fierce storm or typhoon blew in and destroyed most of the Mongol fleet. Some survivors fled back to Korea; the rest were slaughtered or enslaved by the Japanese. Kubilai prepared for a third invasion, but the effort was abandoned after he died in 1294. However the shogunate continued a state of military alert until 1312. The cost of the defenses fell mainly to the people of Kyushu Island. The discontent generated eroded the power of the HOJO CLAN of the KAMAKURA SHOGUNATE. Japanese credited the kamikazi for their deliverance and tried to resurrect this idea during the last days of World War II for salvation from defeat by the Allies.

JIU-HWA LO UPSHUR

Mongol rule of Russia

The almost 250-year Mongol rule over Russia was precipitated by two separate invasions. Following a successful invasion of the Caucasus in 1221, the Mongols invaded a small part of Russia in 1222. Although a small contingent of the Mongol army succeeded against the ruling princes, they did not establish control over Russia and instead disappeared into the steppe. It was not until 1237 that a sizable Mongol army commenced its invasion of Russia proper, to which all of Russia fell and came under the dominion of the Golden Horde.

Having conquered the Muslim empire of the shah of Khwarazm, Jalal-ad-Din Mengubirdi, otherwise known as Sultan Muhammad II, GENGHIS KHAN charged his capable generals Jebe and SUBOTAI to march through the hazardous Caucasus Mountains in the direction of Russia. The Caucasian tribes, the Alans (Ossetians), the Circassians, and the Lezgians, together with the Polovsti, formed an alliance and put up a fierce resistance to the Mongol invaders on the southern Russian steppe in 1221. The first battle between the Mongols and Cau-

casian alliance proved indecisive, but Jebe and Subotai had no intentions of withdrawing from the engagement. Instead the Mongol generals resorted to using the strategy of divide and conquer. Jebe and Subotai persuaded their nomadic brethren, the Polovsti, to remain neutral by reminding them of their common Turkic-Mongol fellowship and also by promising to share with them the spoils of victory over the Caucasian tribes. With the success of the subtle diplomacy, the generals returned to battle the Caucasian tribes with greater ferocity and overwhelmingly crushed the stubborn resistance.

The Mongol generals then turned against the Polovsti, who, in defeat, fled in the direction of Galacia and Kiev and appealed to the Russian princes—Mstislav Staryi of Kiev, Mstislav Udaloj of Galacia, and Vladimir of Suzdal—for intervention. Two sets of crucial factors persuaded the Russian princes to join forces to help the Polovsti. First Prince Mstislav Udaloj was obliged to help because Kotian, the khan of the Polovsti, was his father-in-law. And second according to the Novgorodian First Chronicle, the Mongols were unknown to the Russians—they did not know where they came from, what religion they practiced, or what language they spoke. Fearing that the Mongols would grow stronger if they did not intervene, the princes Mstislav and VLADIMIR I (VLADIMIR THE GREAT), together with the Polovsti, forged the Russo-Polovsti alliance.

In early 1222 the Mongols received news of the Russo-Polovsti alliance and sent a 10-member diplomatic envoy to negotiate with Princes Mstislav and Vladimir. The Mongols claimed to have no desire to war with the princes and did not harbor any intentions to conquer their lands or cities. In the manner similar to the way they isolated the Polovsti from the Caucasian tribes, the Mongol diplomats urged the princes to defeat the Polovsti and take the spoils of victory for themselves and offered to enter into a peace treaty with the Russians. The princes, suspecting a Mongol trick, executed the diplomatic envoy, an act that was considered by the Mongols to be unforgivable.

A strong Russian-Polovsti army of 30,000 soldiers amassed on the Dnieper. Outnumbered by more than 10,000, Jebe and Subotai ordered the Mongol army to retreat. They dispatched a second diplomatic envoy to meet with the Russians and reproached the Russians for the murder of the first delegation. The second envoy returned unharmed and carried a message for the Mongol army—the Russians feared that, after conquering the Polovsti, the Mongol army would attack them. Hence, they would only be happy if the Mongol army returned to the steppe.

As the main Mongol army retreated from the forest, its rearguard kept a watchful eye on the Russian mobilization. War-hardened and accustomed to being outnumbered, Jebe and Subotai managed to evade the Russians for more than nine days. This contrasted sharply with the attitudes of the Russian princes. The Russian army lacked strategic coordination because Mstislav of Galacia and Mstislav of Kiev disputed over the ways to engage the Mongol army. In pursuit of the Mongol army, the Russians were led farther and farther into the steppe and away from their supply lines. Prince Mstislav of Galacia, accompanied by Daniil of Volhynia, commanded the first Russian battle with the Mongol army, defeating the Mongol rearguard at the east of the bend in the Dnieper.

Wanting to claim the glory all for himself, Prince Mstislav Udaloj decided to pursue the main Mongol army. Without informing the rest of the Russian army or waiting for reinforcements to arrive, the prince took his army, the Volynian and Polovsti soldiers, across the river Kalka. Overconfident from his victory over the Mongol rearguard, Prince Mstislav failed to consolidate his defenses after crossing the Kalka and fell into a Mongol trap.

The Mongol retreat was a strategy aimed at isolating the army commanded by Prince Mstislav of Galacia from those commanded by Prince Mstislav Staryi of Kiev, which was concentrated some distance away from the river Kalka. In mid-June 1222 Jebe and Subotai seized the advantage and ordered an all-out assault on the Russian front and flanks. Prince Mstislav of Kiev watched from the western banks of the Kalka as the Mongols launched a ferocious attack against the forces of Mstislav of Galacia. As the Polovsti fled and confusion set in within the Russian ranks, the army of Prince Mstislav of Galacia, unable to maneuver effectively in the marshy terrain, was cut into pieces. The prince, along with the wounded Prince Daniil of Volhynia, a small remnant of his troops, and what remained of the Polovsti, managed to escape.

Realizing that a hasty retreat from a swift army is guaranteed to be fatal, Prince Mstislav of Kiev ordered his forces to fortify themselves on a commanding hilltop. But before the prince could securely establish his defenses, Jebe and Subotai attacked. After three days of ferocious Mongol assault, Prince Mstislav of Kiev surrendered on the condition that he and his army would be permitted to return to Kiev unharmed. The Mongol army accepted, but, as soon as the Russian army disarmed, Prince Mstislav of Kiev was executed and his forces slaughtered.

Fearing that the Mongols would cross the Dnieper, Prince Mstislav of Galacia and his remaining forces destroyed all the ships. The forces of Jebe and Subotai never crossed the Dnieper and, instead, returned to join the main Mongolian army stationed in the steppes east of the Syr Darya River. Thus by the end of 1222 the first invasion of Russia ended as swiftly as it had begun.

In the winter of 1237, well after the death of Genghis Khan in 1227, the Mongol army returned. In the context of a greater invasion of Europe, the Mongol army, headed by the veteran Subotai, amassed some 150,000 to 200,000 warriors. The large army crossed the frozen Volga and attacked the Russian eastern principality of Riazan because it was considered the weakest. As the Mongol army advanced, Prince Roman rushed to Suzdal to ask Prince Yuri for help, which was denied. Instead Grand Prince Yuri suggested that the four princes of the vassal state, Princes Yuri, Oleg, Roman, and Yaroslav, end their squabbling and join forces against the Mongols. After defeating the Russian army at Riazan, the Mongol army constructed a wooden palisade that encircled the town capital of Riazan. After five days of bitter fighting, Riazan was finally captured. The trapped princes and their families were executed, the young women and nuns were systematically raped, and the entire population was massacred.

In the winter of 1237–38, under the command of Batu Khan, the Mongol army attacked Suzdal and its capital Vladimir. Although his territory and its city came under siege, Grand Prince Yuri did not intervene. Batu Khan targeted Novgorod while Subotai attempted to draw Grand Prince Yuri into battle. Novgorod, particularly the fortress of Torzhok, fought and resisted the forces of Batu Khan. The ensuing battle lasted two weeks, enough time for an early spring to arrive. The spring thaw flooded most of the southern terrain and made it impossible for Batu Khan to advance. Batu Khan was forced to abandon his siege on Novgorod and retreat to the southern steppe.

In March 1238 Grand Prince Yuri and the Suzdalian army perished at the decisive battle against Subotai on the river Sit. With the strongest section of Russia conquered within several months, the Mongolian army sacked the state of Chernigov. Through the summer of 1239 and for one and a half years, the Mongol army rested and sought comfort in the lush steppeland of western Ukraine, in preparation for another campaign.

In summer 1240 the Mongol army resumed their offensive against Russia. The cities of Chernigov and Pereyaslav were captured. On December 6, 1240, Batu Khan arrived with his army at Kiev to reinforce the

Mongol vanguard commanded by MONGKE KHAN. After Dimitri, the governor of Kiev, had executed the Mongol ambassadors, the Mongol army stormed the city. Apart from the cathedral of Saint Sophia, the entire city was leveled and its population exterminated.

By 1242 the Mongol army had captured all of Russia. Batu Khan chose Old Sarai, in the lower Volga, to establish the headquarters of the Mongol dominion over Russia, which became known as the Golden Horde.

The Golden Horde, as a center for the Mongol administration of Russia, endured for almost 250 years. A *daruga* handled Russian political affairs and the collection of an annual tribute. To become eligible to take office, Russian princes had to journey to the Golden Horde to pay obeisance to Mongol overlords. Contented with being overlords, the Mongols never established a dynasty in Russia. Occasionally, Russian military units had to serve alongside the Mongol army. Despite an attempt by Prince Dimitri of Moscow to wrestle Russia from Mongol control in 1330, they managed to rule and exact tribute for a further century. Ivan III of Moscow finally broke Mongol rule over Russia in 1480. Failing to check the emergence and rise of the Muscovite state, the seed of modern Russia, the Mongols ceded control.

SANTI SUKHA

Moravia

Moravia was an independent Slavic kingdom that ruled the middle Danube in the ninth century C.E.. Very few historical records exist to document its history, and the precise origin and territorial extent of the kingdom of Moravia are not known. Byzantine emperor Constantine VII Porphyrogenitos in his political geography *De administrando imperio* (c. 950) identified the kingdom

as consisting of the territories surrounding Morava, referring either to the Morava River in present-day Moravia or to a so-far unidentified city of Morava, perhaps near the Sava River in northern Serbia.

Slovak historians consider the kingdom of Great Moravia to have included lands along the Morava and Danube Rivers and stretching across modern-day Slovakia. Other historians have placed the center of the kingdom farther south, in Hungary and Croatia. The earliest known inhabitants of the region were Celts, who were joined and ultimately displaced by Slavs arriving sometime before the sixth century. Historical sources mention the brief existence of an independent Slav kingdom along the Frankish border in central Europe in the second quarter of the seventh century. Following the defeat and destruction of the Avar empire by CHARLEMAGNE at the end of the eighth century two political centers emerged in the region, the principalities of Nitra and Morava. In 828 Prince Pribina of Nitra invited the archbishop of Salzburg to send missionaries to the principality and establish the first Christian church. Five years later Prince Mojmir I of Moravia defeated Pribina and forced him into exile in the Frankish kingdom. Mojmir then united Nitra and Morava to form Great Moravia.

In 863 or 864 Mojmir's successor Prince Rastislav asked the Byzantine emperor to send missionaries to Moravia. By turning to Byzantium for support, Rastislav hoped to strengthen his position and secure independence from the Frankish kingdom. The emperor sent the brothers CYRIL AND METHODIOS, Byzantine church officials who were conversant in Slavic languages. To promote Christianity in Moravia, Cyril developed an alphabet for the Slavs and translated the Gospel into their language. The written form he introduced, Old Church Slavonic, served as the basis for subsequent Slavic literary development. The Cyrillic alphabet he invented is used in many Slavic languages, including Russian, Bulgarian, and Serbian.

Between 871 and 894 Prince Svätopluk I led Great Moravia, successfully resisting Frankish attacks and defending Methodios's missionizing efforts (Cyril died in 869) from interference by the archbishop of Salzburg. In 880 Pope John VIII recognized Methodios as the head of an independent archbishopric in Great Moravia, appointed a bishop for Nitra, and sanctioned the use of Old Church Slavonic as a fourth liturgical language, alongside Latin, Greek, and Hebrew. Great Moravia reached its height at the end of Svätopluk's reign, controlling BOHEMIA and parts of Hungary and southern POLAND, as well as present-day Slovakia.

Following Svätopluk's death, his sons Svätopluk II and Mojmir II fought each other for control of the kingdom. Their struggle weakened the state and left it vulnerable to the attacks of Magyar raiders entering the region from across the Carpathian Mountains. Both princes were killed in battles with the Magyars sometime between 904 and 907. The defeat of the Bavarians by the Magyars near Bratislava in 907 marked the permanent settlement of Magyar tribes in the middle Danube and the clear end of Great Moravia as an independent force in the region.

Moscow: Third Rome

The civilization and culture of the BYZANTINE EMPIRE with its capital of "New Rome" (Constantinople) greatly influenced the development of Russia. Christian missionaries were sent from the Christian empire to Russia in the ninth century. Their work bore fruit when, in 988, Prince VLADIMIR I (VLADIMIR THE GREAT) of Kiev looked to "New Rome" for spiritual direction and was baptized into Christianity. Vladimir converted Russia to the Christian world. The patriarch of Constantinople appointed a bishop for Kiev and continued to appoint the highest-ranking prelate in the land until the 15th century.

In 1054 the religious division of "Old Rome" and "New Rome" became permanent as Catholic and Orthodox Christianity parted company. Russian Christianity was firmly rooted in the Orthodox sphere in theology, ecclesiology, literature, and liturgy. In the 13th century Western crusaders conquered Constantinople and much of the Byzantine Empire in the Fourth Crusade and sought to impose Catholic Christianity on the Orthodox empire, while Orthodoxy in Russia suffered a blow as the Mongols destroyed Kiev and established their hegemony that lasted into the late 15th century.

With the destruction of Kiev and the Mongol dominance of the Slavic southern region, the northern city of Moscow began to rise in prominence in the 14th century. In the first quarter of the 14th century the metropolitan of Russia (the highest ranking Orthodox bishop, formerly

at Kiev) chose to settle in the city of Moscow. With the support of the church, Dimitri Donkoi, grand duke of Moscow, defeated the Mongols at the Battle of Kulikovo in 1380. Though their hegemony lasted another century, the Mongol hold on northern Russia was weakened and the prestige of Moscow greatly enhanced.

Moscow viewed itself as upholding the mantle of Orthodoxy against the hostile forces of Catholic Christianity, which had been attacking Orthodox Russia via Teutonic, Knights, Swedes, Poles, and Lithuanians in the 13th and 14th centuries as well as non-Christian forces, such as the Mongols. Up to this time, the metropolitan of Russia was selected by the Orthodox patriarch of Constantinople. This changed however after the Council of Ferrara-Florence in 1438–39, when the Byzantine Empire, faced with the overwhelming threat of the Muslim Ottoman Turks, submitted the Orthodox Church to the papacy. Moscow and Russian Orthodoxy rejected this church council and its submission as antithetical to true Christianity. Henceforth, the Russian church was independent from Constantinopolitan control.

In 1453 Constantinople or “New Rome” fell to the Ottoman Turks. Russian czar Ivan III “the Great” (reigned 1462–1505) married the niece of the last Byzantine emperor and inherited the mantle of the Christian empire that had been established by Constantine I (d. 337), the founder of “New Rome.” The Russians understood that God had allowed “Old Rome” to be sacked by Germans in the fifth century and shifted the imperial and religious center of Christendom to Constantinople. Now God had decreed that Second Rome should fall. With the other Eastern Patriarchates (Alexandria, Antioch, Jerusalem) also in Muslim hands, it appeared to the Russian church that it clearly stood as the champion of Orthodoxy and the heir apparent to Orthodox Christian leadership: It was the Third Rome.

Russian monk Philotheus of Pskov articulated this most clearly in his letter to Czar Basil III in 1510: “Two Romes have fallen, but the third stands and a fourth there shall not be.” The czar of Moscow became the new protector of Orthodoxy and in the later 16th century the metropolitan of Moscow was promoted to the rank of patriarch.

MATTHEW HERBST

Muhammad, the prophet

(c. 570/571–632) *religious leader*

Muhammad was born in Mecca to the Hashim branch of the major Qureish tribe. He was raised in a poor household by his grandfather and as a young man married Khadija, a wealthy widow who was also a successful businesswoman. Working with Khadija, Muhammad earned a reputation for honesty.

The couple had one daughter, Fatima, who married Ali. While Khadija lived, Muhammad remained monogamous, although polygamy was the usual practice throughout Arabia. After Khadija’s death, Muhammad married a number of times. In keeping with customs throughout the world, these marriages were often made to cement tribal, religious, and political alliances or to give widows protection and support. However, Muhammad’s marriage to A’ISHA, the daughter of Abu Bakr, an early Muslim convert, was by all accounts an alliance of love.

As Muhammad became increasingly religious he began to meditate; in 610, he received the first revelations from Allah (God) transmitted through the angel Gabriel on Mount Hira. In one vision or dream he even traveled on a winged beast, Buruq, to Jerusalem, which was to become the third holy city in ISLAM after Mecca and Medina. The revelations would ultimately be set down in the QUR’AN, the Muslim holy book. The new religion was known as Islam or submission to God. Within a year, Muhammad began to preach the word of Allah and converted Khadija, Ali, his freed slave servant Zaid, and his uncle Abu Talib. The new converts were known as Muslims, or those who surrender or submit to the will of God. They followed the Five Pillars of Islam as the articles of faith.

As the fledgling Muslim community grew, the wealthy merchant families in Mecca, especially the Umayyads, grew alarmed that the new religion might threaten the lucrative pilgrimage trade from those visiting the holy Ka’aba, a rock in Mecca that Arabian tribal peoples had venerated for centuries. Subsequently they began to persecute Muslim believers and even jailed Muhammad for a time. Some of the new believers fled to the Christian kingdom of Abyssinia (present-day Ethiopia), where as other monotheists they were warmly received. Fearing increased persecution or even death, Muhammad accepted an invitation from the people of Yathrib, later known as Medina, to settle in that city. In 622 the Muslim community migrated or made a *hijrah* to Medina. The Muslim lunar calendar begins with that date. The Meccans swore revenge but were badly defeated by the Muslims at the Battle of Badr in 624. Although the

Muslims lost a following confrontation, ably led by the prophet Muhammad, they ultimately triumphed and returned to Mecca with Muhammad as the acknowledged new leader of most of Arabia.

Muhammad died in 632 in the city of his birth. Muhammad had no sons who lived to adulthood and left no instructions as to who should lead the Muslim community after his death. Following the Prophet's death, the community gathered and in a remarkably open and democratic fashion chose, by consensus, Abu Bakr to be their new caliph or representative.

JANICE J. TERRY

Muhammad of Ghur

(1149–1206) *sultan*

The victory of Muhammad of Ghur over the Rajput king, Prithviraj Chauhan III (r. 1178–92), was a turning point in the history of South Asia. ISLAM began to pervade the northern portion of the Indian subcontinent, in present-day India, Bangladesh, and Pakistan. It was Muhammad of Ghur who prepared the groundwork of the establishment of political power. Muizzuddin Muhammad of Ghur, also known as Shahbuddin, came from the Ghur region located in modern Afghanistan. In the rivalry between the house of the GHAZNAVIDS and Ghurids, the latter under the leadership of Alauddin Husain (r. 1149–61), emerged victorious. Muhammad's early career began with the conquest of Ghazni in 1173. He was ambitious and bent upon a career of territorial aggrandizement. Muhammad could not expand toward the west because of the presence of the powerful Khwarizm dynasty of Persia. He found the Indian subcontinent ruled by regional kingdoms, with no unity among themselves to check external aggression. Prevailing social tensions, apathetic attitude of the common people, and advanced military technology facilitated his conquest.

In 1175 Multan fell into the hands of Muhammad, and afterward he occupied Uch and the lower Sind.

Three years afterward he faced defeat at the hands of the Chalukyas of Gujrat. Bhimdev II defeated Muhammad near Mount Abu. Muhammad planned an attack through the Punjab region, where Ghanazvid king Tajuddaula Khursav Malik (r. 1160–86) ruled. By 1179 he was master of Peshawar, Lahore, and Silakot. Most of the areas in present-day Pakistan were under his sway. His territorial border was contiguous with Prithviraj III, the Chauhan ruler of Delhi and Ajmer. At the first Battle of Tarai in 1191, he defeated Muhammad. The latter was captured and brought before Prithviraj, who released the vanquished as an act of magnanimity. Prithviraj was not friendly with the Gaharwar ruler of Kannauj, Jaychandra (r. 1170–93), and Muhammad exploited it. Jaychandra sided with the Ghur ruler, as he was bitter over Prithviraj's forced marriage with Princess Sanjukta.

The Rajput control over North India was over after Muhammad defeated Prithviraj in the second Battle of Tarai of 1192. The defeated Rajput ruler was taken as a captive to Ghur and ultimately he was blinded and killed. The rule from the northwest began, which culminated in establishing the political kingdom of the DELHI SULTANATE. Muhammad controlled much of northern India and parts of Gujarat and Gwalior.

Qutubuddin Aibak (r. 1206–10), the general of Muhammad, was put in charge of Delhi and Ajmer. He made Delhi capital and conquered Ranthambhor, Bulandshahr, Aligarh, and Meerut. Muhammad returned to the Indian subcontinent in 1194. He defeated his erstwhile ally Jaychandra in a decisive battle fought on the banks of the Jamuna River near Chandawar. Within a year Muhammad was master of northern India after occupying Bayana, Varanasi, and Gwalior. He returned to Ghur leaving his generals, who consolidated and further expanded the territory of Muhammad. Even outlying provinces like Bengal, Bihar, and Gujarat felt the onslaught of a new rule. While Muhammad's lieutenants were busy on the Indian subcontinent, he returned to settle the affairs of his parent kingdom. His elder brother Ghiyasuddin had died in 1202 and Muhammad became the ruler of Ghur. After three years Alauddin Muhammad (r. 1199–1220), the Khwarizm Saha ruler, defeated him in the Battle of Andhkhud.

Muhammad came to India again in 1205 to suppress the rebellion of the Ghakkar tribe in the Punjab. On his way back home during the next year, Muhammad made a stop at Dhamyak on the banks of the river Jhelum.

He was stabbed and killed while offering evening prayers in the Ghokkar territory. Some authorities believe that the Isma'ili sect were responsible for his death. Qutb ud-Din Aibak took control of Muhammad's

territory in India, declaring independence from the Ghurids. The Ghurids continued to rule the Ghurid kingdom until 1211, when Alauddin annexed their kingdom. The territorial extent of the Khwarazm dynasty extended from Turkistan in the east to the borders of Iraq in the west. The Mongols conquered part of Ghurid territory in Afghanistan. Earlier victories of Muhammad bin Qasim (712) and the raids of MAHMUD OF GHAZNI (1000–25) had not resulted in establishment of political power. Major areas of present-day India, Bangladesh, and Pakistan came under the reign of the Delhi Sultanate, who ruled after Muhammad.

PATIT PABAN MISHRA

Murasaki Shikibu

(c. 11th century C.E.) *Japanese novelist*

Murasaki Shikibu was a noblewoman of the dominant FUJIWARA CLAN in Japan. Fujiwara women had a monopoly of being wives and concubines of the emperors, while the men ruled in the sovereigns' names. She was lady in waiting to the empress and author of a novel titled *Tale of Genji*, which is acclaimed as a great and pioneering literary work.

The Japanese language belongs to the Altaic family group; it is polysyllabic and is related to Korean. Since there was no native written script, the leaders of Japan adopted the Chinese writing system in the sixth century. For several centuries afterward upper-class Japanese men put great focus on learning Chinese and copying Chinese works and Buddhist manuscripts. Japanese government documents, historical and legal works, and literary and poetic works were all written in Chinese characters and indistinguishable from works on similar subjects in Chinese. When writing Japanese names they had to employ Chinese characters not for their meaning, but as phonetic signs. In the ninth century a phonetic style of writing that used abbreviated Chinese characters selected for their sound was created. These

Murasaki Shikibu's *Tale of Genji* (illustrated above) portrays the frivolous court life of the time in Japan.

syllables were called *kana* and they were convenient for writing down spoken Japanese.

Although Chinese culture remained very prestigious in Japan, the Japanese court decided to end sending embassies to China in 894, reflecting disorders in China as the TANG (T'ANG) DYNASTY neared its end, and also the growing maturity of Japanese institutions. In 710 a first permanent capital was established in NARA, modeled on China's capital Chang'an (Ch'ang-an). Nara was abandoned in favor of a new capital called HEIAN (later Kyoto) in 794. Heian became an opulent city where wealth and culture flourished. While men continued to write in Chinese, noble ladies in Heian, who were not burdened with learning literary Chinese, began to write rambling novels, memoirs, and poetry using the *kana* script.

The most famous writer was Murasaki Shikibu, who wrote *Genji Monogatari* or *Tale of Genji*, between 1008 and 1020. It is a romance of the life and loves of an imaginary Prince Genji and portrays the frivolous and decadent court life of the time. It is a sophisticated depiction of Heian society and has great literary merit and psychological insight. It is the first novel in Japanese literature written in *kana*. Another work by a court lady, Sei Shonagon, is called *Pillow Book*, which consists of observations and comments on manners and mores of the Japanese court. Both ladies and their works have been influential in inspiring later works of the same genre.

See also KANJI AND KANA.

JIU-HWA LO UPSHUR

Muslim Spain

In 711 the Muslims had conquered the southern parts of the Iberian Peninsula. By 714 following the decline of the Visigoths, the Muslims had gained a strong grip on virtually the entire Iberian Peninsula. The parts in southern Spain that were under Muslim rule were called al-Andalus. The vast region was divided into five administrative provinces—Andalusia (including the capital Córdoba and Seville), Central Spain, Galicia and Lusitania, and the Ebro region. The administrative system was subject to change as the Christians regained more power over parts of Muslim Spain in the following centuries. However Muslim Spain was not restricted to the region named al-Andalus. The Muslims also controlled parts of Aragon-Catalonia and Navarre. Parts of southern France fell briefly under Muslim rule but a strong French military force under Charles Martel managed to drive them away in 756.

Although Córdoba was not the capital city of previous rulers such as the Byzantines and the Romans, it lay at the crossroads of important trade routes. Moreover the city possessed rich agricultural resources. From there the caliphs ruled parts of North Africa and the Iberian Peninsula. The Muslims had, in fact, amassed a vast empire stretching from Spain to India and ruled diverse groups of people, who contributed to the later development of a sophisticated culture in a cosmopolitan setting found in Muslim capitals such as Córdoba. By 757 al-Andalus had been clearly established as a Muslim polity with a mainly Arab and Berber population, but also with many converts. Within Muslim Spain, the Umayyad Dynasty ruled over Arabs from various locations as well as Berbers, Jews, Christians. The lingua franca used by diverse groups of people within al-Andalus was Arabic.

UMAYYAD DYNASTY

In 750 after a series of rival wars between various Muslim factions, the Umayyad Abd al-Rahman Mu'awiya, also known as Abd al-Rahman I, refused to acknowledge the Abbasid Sunni Caliphate based in Baghdad. By this time the Abbasid Dynasty was considered corrupt and

weak. This led Abd al-Rahman to set up his own dynasty of emirs of Córdoba, first by ousting the previous ruler, Yusuf al-Fihri. Abd al-Rahman proclaimed himself the first emir of Córdoba in the mosque of Córdoba on May 14, 756. The powerful FATIMID DYNASTY, based in Egypt, opposed the installation of the Umayyad Caliphate on Córdoba. The Fatimid dynasty had a strong hold over North Africa. Abd al-Rahman thus enlisted the help of the Zanata Berber tribe enemies of the Sinhaja tribe, allies of the Fatimids. Pro-Umayyad rebellions against the Fatimids were quashed and Abd al-Rahman was unable to advance into North Africa, as he was preoccupied with skirmishes with the Christians.

He ruled independently of the Abbasid Caliphate for 33 years, consolidating sufficient support for Umayyad authority to ensure the longevity of his dynasty. Abd al-Rahman succeeded in fending off Yusuf al-Fihri's allies as well as the supporters of the Abbasid Caliphate within al-Andalus. Later on the emirate became known as the Umayyad Caliphate, which was in fact modeled upon the older Abbasid Caliphate. The Umayyads, who were members of the prophet MUHAMMAD's tribe Qureish, claimed to be descendants from the prophet Muhammad. Prior to conquering parts of the Iberian Peninsula the Umayyads had already ruled a huge part of the Muslim world including the important city of SAMARKAND at the eastern edge of their kingdom. Their conquests stretched to al-Andalus in the west with its capital in Córdoba. By the time of Abd al-Rahman I's death in 852, al-Andalus was already a major diplomatic power in the Mediterranean with emirates established over North Africa. Links had also been established with the Byzantine emperor, another major player in Mediterranean politics.

VISIGOTH RESISTANCE

Initially the Muslim power that was responsible for the great wave of Muslim expansion was based in their distant capital city of Damascus. In Muslim Spain, however, Córdoba was made the capital, where the Muslim invaders settled down as property owners soon after their victory over the Visigoths. One way land was acquired in Córdoba was through marriage with important members of the Visigothic aristocracy. This had the added advantage of staving off potential opposition from the Visigoths, who had been the ruling class in Córdoba before their defeat at the hands of the Muslims.

Despite the Visigoths' apparent truce with the Muslims within Spain, members of the Visigothic aristocracy who had fled up north of the Iberian Peninsula continued to resist Muslim rule in the south. This was an impetus for the Muslims to invade the northern

mountainous region of the peninsula, as well as France. The Muslim invaders were especially looking to gain resources in France rather than the inaccessible regions in northern Spain. These attacks were launched in order to gain booty, because at that time the Muslim rulers in Spain possessed a booty or *ghanima* economy. This system came to an end when the three major military expeditions to France during the eighth century ended in disastrous defeats.

Umayyad caliphs in al-Andalus had a policy of tolerance toward the non-Muslims under their rule. Non-Muslim residents had to bear the heaviest burden of taxation. They had to pay a poll tax (*jizya*) and a land tax. Thus the greatest source of revenue, which went toward financing the caliphs' military campaigns, was the non-Muslim inhabitants of al-Andalus. This contributed to the policy of tolerance of the Christian and Jewish population. Conversion to ISLAM escalated under the reign of the Umayyad Caliphate. This is despite the fact that Islamic proselytizing was minimal during this period. Thus it has been suggested that social or economic forces, rather than any active missionary pressure on the part of the Muslims, motivated conversion. During the ninth century mass conversions took place. The benefits of conversion included employment opportunities in government. Not only did Muslims pay significantly less tax than non-Muslims, they could also gain better positions in the bureaucracy.

In fact the unifying bonds between the various groups of people were culture and literature, rather than religion, which created a harmonious setting. There was a large Christian group within Muslim Spain known as the Mozarabs, who settled mostly in Seville. They adopted a Muslim lifestyle, in terms of fashion, architecture, and literature, without converting to Islam. These Mozarabs suffered religious persecution in 1139 by fellow Christians after the raids of King Afonso I (Henriques) of Portugal on Seville, as they were not considered true Christians.

UMAYYAD DYNASTY OF CÓRDOBA

The caliph of Córdoba, formerly known as the emir of Córdoba, ruled Spain for slightly more than a century, from the year 929 to 1031, beginning with the reign of the most powerful Muslim ruler, Abd ar-Rahman III, who claimed the caliphate in 929. The caliph was especially skilled at projecting his image as a powerful Arab leader. Abd ar-Rahman III made sure he was visible to his people in the many ceremonies and processions organized for him. He was Hispano-Basque (grandson of a Christian Basque princess) and was only a quarter

Arab. In order to look more like an Arab, it has been said, he dyed his hair black. The caliph presented himself as an effective leader of his own military troops. In his image campaign, newsletters and poems were glowingly written of his military prowess and piety.

During this period, in addition to having a reputation as an illustrious commercial center, al-Andalus also became an eminent center of knowledge and learning. Al-Andalus was a great civilization, compared with the rest of Europe at that time. Many Islamic works of art were produced during this era of Muslim rule. Umayyad caliph Abd Al-Rahman III had a keen interest in the arts, as well as the religious and secular sciences. He amassed many books from other intellectual centers such as BAGHDAD, which were then stored in the library. Scholars were also hired to supplement further the amount of written knowledge imported.

Drawn to the bastion of knowledge and culture, many philosophers and scientists began to migrate to al-Andalus, making it a renowned center of learning. Intellectual life in Córdoba peaked during the reign of Al-Hakam II, who was in power from 961 to 967. He was responsible for establishing a massive library filled with hundreds of thousands of volumes, a useful repository of knowledge in the Mediterranean world. During this period several intellectuals achieved prominence in Muslim Spain. Spanish Muslim intellectuals excelled in the fields of mathematics, medicine, and astronomy. The most famous example is Ibn Rushd, otherwise called AVERROËS, who was a philosopher, theologian, physician, and sometime royal consultant, born and educated in Córdoba.

CHRISTIAN RECONQUEST

Simultaneously the territories owned by the caliph of Córdoba decreased just as aspects of commerce and culture thrived. Internal dissension among different Arab factions weakened the Umayyad power base in Córdoba as they disintegrated into warring divisions. The lack of Muslim unity proved crucial to Christian success. During the reign of Hisham II, the Umayyad Caliphate disintegrated into party-kingdoms in 1009. He was executed in 1013, only to be succeeded by another weak ruler, Hisham III, the last caliph of Córdoba. Hisham III was exiled to Lerida. Nominal rule continued under the short-lived Hasanid dynasty until 1054. The further remaining territories dwindled into mere Muslim principalities, better known as independent *taifas*, ruled by mainly Berber rulers, though there were also non-Berber rulers. With their defenses weakened because of lack of unity, these *taifas* often had to hire mercenaries

from North Africa or Christian mercenaries to protect their principalities, which were constantly at war with each other. This chaotic situation in the Muslim states was conducive to Christian reconquest.

Christians in the northern parts of the Iberian Peninsula had already begun to consolidate their military and political power as early as the eighth century, and into the latter half of the ninth century. Under the reign of Alfonso II (791–842), the Christians in the northern region had stabilized themselves. He was able to install Visigothic institutions in his kingdom with his capital in Oviedo. The Christians viewed the reconquest of southern Spain (al-Andalus) as justified, since they were reclaiming what rightfully belonged to the Visigoths. Further impetus was provided by the discovery of the tomb of St. James the apostle, a patron saint around whom the Christians could rally.

From the eighth to the 10th century the Christian north had possessed an inferior economic system and cultural milieu compared to al-Andalus in the south. However they were already clearly formed political entities with military forces that were able to stave off attacks from their enemies from the south. This enabled

them to reconquer Muslim Spain upon its disintegration during the 10th and 11th centuries.

In 1056 the ALMORAVID EMPIRE took over as the rulers of Muslim Spain. They were replaced by the dynasty of Almohads in 1130. The decline of the Almohads in 1269 enabled the Christians to conquer parts of Muslim Spain with more ease. The important cities of Córdoba and Seville had already fallen into Christian hands in 1236 and 1248, respectively, leaving only Granada as the last Muslim stronghold. In 1469 through the union of Ferdinand of Aragon and Isabella of Castille, much of Spain was united. By 1492 a stronger Christian Spain finally took over Granada.

N

Nalanda

Nalanda was the most renowned center of Buddhist learning in India in the fourth–12th centuries. A Buddhist monastic center and major university were located at Nalanda, which is in Baragaon, Bihar state, in east central India, about 90 miles southeast of the state capital of Patna. The village's association with Buddhism predates the establishment of the university and monastery: Legend has it that the Gautama Buddha visited the Nalanda village several times and delivered sermons there, and that one of his principal disciples, Sariputta, was born near Nalanda village. Nalanda University was established in the fifth century and grew, with more than 10,000 students from many different countries attending the university at the time of its destruction in the 12th century. The Chinese pilgrim and scholar XUANZANG (HSUAN-TSANG) studied at Nalanda University in the seventh century and left detailed accounts of it in his writings. Besides Theravada and Mahayana Buddhism, instruction was offered in medicine, astronomy, and art.

Nalanda, along with many other Buddhist monasteries and temples, was sacked by Turko-Afghan Muslim invaders led by Bakhtiyar Khalji in the 12th century. The monastery and university were destroyed and many of the monks either were killed or fled to other parts of Asia, in particular Nepal and Tibet. This invasion marked the virtual end of Buddhist culture in India until the 1950s, although Buddhism continued to flourish in other Asian countries such as Tibet, China, Japan, and

Southeast Asia. In fact Buddhism in those countries was partly nourished by monks from Nalanda who sought refuge. Many historians also believe that destruction of Buddhist centers of higher learning at this time caused the abrupt demise of ancient Indian scientific thought in areas such as mathematics and medicine.

The ruins of Nalanda are frequently studied by scholars today because of their central importance in the history of Buddhist history, culture, and art. Currently excavated ruins cover an area of about 150,000 square miles, and it is estimated that this constitutes only 10 percent of the total area that was developed in the 12th century, as described by Xuanzang. Nalanda is also the name of the administrative district where the ruins are located. The name *Nalanda* means “the place that confers the lotus” and survives as the name of a Buddhist monastery near Lavaur, France, and two colleges, one in Toronto, and one in Sri Lanka.

SARAH BOSLAUGH

Nanjing (Nanking)

Nanjing means “southern capital” in Chinese. The city that is currently named Nanjing has had several names through history, and several other cities in China have also had that name. It is located on the southern bank of the Yangzi (Yangtze) River in a rich agricultural plain, close to the sea. When China split three ways after the fall of the Han dynasty in 220 C.E., one of the states called Wu that controlled the Yangzi valley and the southern coast set up its capital at Nanjing; Wu was destroyed in 280. Chaotic conditions in China led to successive invasions by nomads called the Xiongnu (Hsiung-nu) and Toba (T'o-pa), who destroyed the two capitals of the Han dynasty, Luoyang (Loyang) in 311 and Chang'an (Ch'ang-an) in 316.

For the next two and half centuries China was divided, the Xiongnu and other nomadic tribes ruling the north, while Chinese refugees from the north set up dynasties in the south. This era is known as the era of Division of the Northern and Southern Dynasties, during which Nanjing was capital of the southern dynasties. As a result Nanjing gained the position as the bastion of Chinese rule, while nomadic barbarians ruled the north. In the 10th century, when China was again briefly divided, Nanjing was capital of one of the southern states. When the Jurchen JIN (CHIN) DYNASTY (a nomadic tribe from Manchuria) defeated the SONG (SUNG) DYNASTY and conquered northern China in 1127, the remnant Song court fled south and briefly established its capital in Nanjing. But it was vulnerable to Jin attacks and the Southern Song finally chose to establish its court in HANGZHOU (Hangzhou), located still farther south.

In mid-14th century, as the Mongol YUAN DYNASTY (1279–1368) was disintegrating, many rebel groups rose up in southern China. The most successful and farsighted rebel leader was Zhu Yuanzhang (Chu Yuanchang), who established his headquarters in Nanjing in 1356. By 1368 the Mongols had been driven back to Mongolia, and China was under the MING DYNASTY (*Ming* means “brilliant”). Zhu, now called Emperor Hongwu (Hung-wu), which means “Bountiful Warrior,” was concerned that Nanjing had never been the capital of unified China. He briefly considered making KAIFENG (K'AI-FENG) the Song capital, the capital city again, but he settled on Nanjing. A great city wall 25 miles long was completed that incorporated sections of earlier walls, extended to the shores of the Yangzi River. It averaged 40 feet high and was 25 feet wide at the top, built on foundations of huge slabs of stones that could withstand gunpowder barrages.

The walls were faced with large fired bricks and filled with rubble. There were 13 gates with immense multiple portcullis gate enclosures, topped by gate towers. Construction of palaces and government buildings continued to the end of Emperor Hongwu's reign in 1398.

Civil war erupted when Hongwu's grandson and successor was challenged by his uncle the prince of Yan (Yen), whose army took Nanjing in 1402. The prince of Yan became Emperor YONGLE (YUNG-LO), and because his power base was in the north and Nanjing held bad memories for him, he had the ruined Yuan capital Dadu (T'a-tu) rebuilt; it became capital of the Ming dynasty, called Beijing (Peking). Nanjing remained the second capital, but no Ming emperor resided there again.

JIU-HWA LO UPSHUR

Naples

According to myth the city of Parthenope was established in 1000–900 B.C.E., with the city of Neapolis (New City) created three centuries later nearby. The climate and beautiful location of the city had long attracted attention, with the Roman emperor Tiberius retreating to the nearby island of Capri in 27 C.E. The former became Pompeii, which was destroyed in the eruption of Mt. Vesuvius in 79 C.E., with some of the surviving people moving to Neapolis. Although there is evidence of Christianity in Pompeii, it was not until the latter half of the fourth century that Christianity became widely accepted in Naples, with Bishop Septimius Severus building the first parish church, now San Giorgio Maggiore, in 500.

In 536 the Byzantine general Belisarius managed to capture the city of Naples after leading his army through the aqueduct, and in 553 Naples officially became a part of the Eastern Roman (Byzantine) Empire. Over the next few centuries the city survived attacks by the Goths and the Lombards; the latter laid siege to it in 600. As Byzantine control in the region waned in 763, Naples became an independent and hereditary duchy,

nominally under Byzantine rule. It then sustained a number of attacks by the Saracens, who, in 902, were heavily defeated at the Battle of Garigliano.

In 1139 to gain better protection from the Turks, the people of Naples handed control of their city—and hence the protection of it—to Roger II, the Norman king of Sicily. Naples was the first of the southern duchies to receive Roger and cheered him as he entered the city. His successor, William I (r. 1154–66), was very different. He fortified the city and started work on the construction of Castel Capuano in 1165. This not only was where the military garrison were based, but also became a royal residence for the subsequent rulers of Naples until the mid-16th century. William however had been brought up by Arabs and established his own harem and eunuch guards, which offended many people, earning him the title of “William the Bad.” His successor, William II, by contrast, gained the title “William the Good” and reigned until 1189. A succession crisis followed, and the local barons chose Tancred, an illegitimate son of William II’s brother. However Henry VI Hohenstaufen, the son-in-law of Roger II, and the Holy Roman Emperor, decided to take the city and on his second attempt captured it, executing many of Tancred’s supporters. He then established Naples as his base from 1194.

Frederick II founded the University of Naples in 1224, and 42 years later Charles I of Anjou took control of the city, making it the capital of his Angevin kingdom. In 1282 the Angevins lost control of Sicily but retained Naples. His son Charles II succeeded him, and then the throne went to Robert. In normal circumstances the throne should have passed to Robert’s older brother, Louis of Anjou (1274–97). However Louis, who had spent seven years in captivity in Barcelona as a hostage, gave up his right to the throne to take monastic vows as a Franciscan, wanting to spend his life doing good works. He became the archbishop of Toulouse but died six months later. During that time, and in his earlier church career, he had earned such respect that in 1317 he was canonized as Saint Louis of Toulouse. Robert died in 1343 and was succeeded by his granddaughter, the 17-year-old Joanna, who became Queen Joan I. She married four times, probably murdered one of her husbands, and was deposed and murdered in 1382 by her second cousin, Charles I, king of Hungary, who became Charles III of Naples.

The university and other places of learning in Naples, as well as the flamboyant court, attracted many great artists and thinkers, including the writer GIOVANNI BOCCACCIO, who visited the city. The poet and humanist PETRARCH visited Naples in 1343 and stayed at San

Lorenzo, returning two years later. All of this laid a foundation for the great cultural center that the city was to become in the next 200 years.

In 1386 Charles III’s son Ladislas succeeded him, then died childless in 1414. He was succeeded by his sister Joanna—Joan II, who had a terrible reputation. In 1421 Joan II, who had no children, named Alfonso V of Aragon in Spain as her successor. However before she died in 1435, she had changed her will to leave the city to René of Anjou, in whose name the city government acted until 1442, when Alfonso of Aragon came to Naples to take over the city in line with Joan’s earlier will. René of Anjou offered to face Alfonso in single combat but the Aragonese replied that he would not risk his life for something that he would get anyway. He led his soldiers through an aqueduct and easily took the city. Alfonso V of Aragon then became Alfonso I of Naples, ruling until his death in 1458.

After the fall of Constantinople in 1453, Alfonso V encouraged many refugees to settle in the city, and Lorenzo de’ Medici visited Naples in 1479–80. In 1456 an earthquake shook the city, damaging many old buildings. In 1496, threatened by the French and the Spanish, the king of Naples ceded the city to the French but remained as its ruler until the end of the Aragonese dynasty in 1516.

JUSTIN CORFIELD

Nara

Nara is a city and prefecture in central, inland Japan that acted as the capital between 710 and 784. Prior to the Nara period, the capital of Japan was moved from city to city at the behest of an incoming emperor. However the accession of Shomu, who had been brought up in the expectation of and preparation for rule, changed this custom and set about developing the cultural and administrative

The Chinese monk Ganjin visited Nara, helped to establish Buddhism in the state, and helped create the great temple of Toshodaji.

basis of the state. His city, Nara Heijokyo, was modeled on the great Chinese city of Chang'an and it was decorated with imposing Buddhist temples. In particular, the Todai temple was established as the central temple of the state in 752 and it was adorned at considerable expense with its Daibatsu or giant statue of Gautama Buddha. Two years later the Chinese monk Ganjin visited Nara, after years of travail, and he helped to establish Buddhism in the state and to create the great temple of Toshodaji. Several schools of Buddhist thought flourished, but Naran emperors particularly favored the Sutra of Golden Light, which focused on the Lord Buddha as the essence of universal law in addition to his human nature. Most Japanese in this period were involved in agricultural activities and pursued forms of Shinto beliefs, which center on the worship of or respect for animist nature spirits known as *kami*. Buddhism and Shinto were able to exist together in syncretic form.

Buddhist thought was spread throughout the state by means of building a *kokobunji* regional central temple in every province, which would be the home of monks and nuns, spread learning, and act as repository for the

people's devotion and donations. In later years, some of these *kokobunji* and their controllers obtained considerable wealth and influence and acted to counter imperial power. They contended at the imperial court for favor with other important figures, including the FUJIWARA CLAN, who had acted as imperial court-appointed regents since the time of Emperor TENCHI (r. 661–671).

Additional administrative improvements included the creation of infrastructure, especially roads, and the decentralization of power, which enabled the growth of *shoen*, which were landholding estates able to yield taxes in a much more efficient manner than had previously been possible. Writing in the Japanese language was further developed and this assisted efficiency of rule. Society under Naran emperors exhibited a degree of social mobility that was almost unprecedented, and the many changes in the governance of society and in personal and state philosophies represented opportunities for enterprising individuals.

The court of Nara maintained very cordial relations with the TANG (T'ANG) DYNASTY emperors, although this was interrupted by the AN LUSHAN (AN LU-SHAN) REBELLION, which hindered communications and the power of the Tang emperors. However relations with Silla on the Korean Peninsula deteriorated, partly as a result of the ascendancy of Paekche in the north of the peninsula. Sovereignty was claimed, but no attempt to enforce it was realistically possible. The Nara period ended in 784 when the new emperor Kemmu, less welcoming of Buddhism, transferred the capital to Nagaoka and then 10 years later in 794 to HEIAN, after which the subsequent Heian period (794–1185) is named. Nara is now a designated World Heritage Site and the Nara period is regarded as something of a golden age.

JOHN WALSH

Neo-Confucianism

Neo-Confucianism was a Chinese revival of Confucianism in the SONG (SUNG) DYNASTY (960–1279) that, after the Buddhist domination of popular religiosity and political corruption in the late TANG (T'ANG) DYNASTY

(618–906), called the nation back to its ancient worldview and attempted to reform civil service while synthesizing widespread Buddhist doctrines with Confucianism. Whereas the great Buddhist temples previously constituted the intellectual centers of China, now academies supervised by one or another eminent teacher attracted students in large numbers.

One of the central Neo-Confucian ideas developed in the academies was *tao-t'ung*, or transmission of the Way, which posited that the Way, or universal principle and moral standard of sage-rulership, was passed on from teacher to student in an unbroken chain from Confucius to Mencius, at which point it was lost for over a millennium. Consequently, the Neo-Confucian scholars endeavored to restore the transmission by returning to the teachings of Confucius and Mencius, serving as moral preceptors of youth, and stressing a close teacher-disciple relationship as essential to education. Foremost among these new teachers was Hu Yuan (993–1059), whose primary interest lay in the application of Confucian ethics to the problems of government and everyday life.

HU YUAN

Hu Yuan maintained that the Way comprises three aspects: *di* (*ti*, substance or basis), *wen* (literary expression), and *yong* (*yung*, function). *Di* is a foundation that cannot change over time, such as the bond between prince and minister and between father and son. *Wen* is the collection of sacred texts, including the *Classics of Odes* and *Documents*, the dynastic histories, and writings of the philosophers, which perpetuate the right example down through the ages. *Yong* is the activation of *di* by putting it into practice throughout the empire, enriching the life of the populace, and ordering all things to imperial perfection. Through his trichotomous conception of the Way, which modifies the categories of Neo-Daoist (Taoist) Buddhist philosophy and Tientai (T'ien-t'ai) metaphysics to fit a Confucian mold, Hu formulated both the theological infrastructure and the textual hermeneutic in which Confucian thought would be deepened and enriched in the process of encountering Buddhism and Daoism.

Hu maintained that the *wen* must be studied as *ti*, or deposits of unalterable truth, instead of antiquarian repositories, and that the true aim of classical studies was to bring these changeless principles, valid for all places and times, to bear upon both individual behavior and the solution of contemporary problems. By contrast no endeavor to solve such problems could succeed unless it was rooted in these principles and undertaken by people committed to them. However Hu argued that

the only way that either classical teaching or a practical program of reform could transpire was through the mastery of literature and writing, in which writing would be employed as a medium for preserving and communicating the truth in all its forms rather than merely a means of displaying the intricacies of form and style emphasized by the literary examinations. Resonating with the late Tang criticism of the literary examination system, Hu denounced it as a corrupter of scholarship and mother of a mediocre officialdom.

In order to foster excellence in public service Hu insisted that political, economic, and social thought must be coupled with study of the Confucian classics and philosophical inquiry. For this reason Hu established two study halls in his school, one for the classics and the other for practical studies, the latter including government, military affairs, water control, and mathematics. Moreover Hu recommended practical measures to enhance the people's well-being, to fortify military defenses against the barbarian tribes in the north and west, to raise agricultural production by expanding irrigation projects, and to encourage the study of mathematics and astronomy.

Therefore, although Neo-Confucianism was more strongly inclined to the humanities than the natural or pure sciences, specialized and technological studies found powerful support within the movement as well. This fact explains the multifaceted character of the revival and the versatility of its leading intellectuals across the various disciplines. For example Wang Anshi's (Wang An-shih) pedigree as a brilliant writer and classicist in his day has been eclipsed by his renown as a statesman, while Sima Guang (Ssu-ma Kuang), his chief political antagonist, is reputed today as one of China's prominent historians. These figures, as well as many others, were indicative of the creative and all-embracing vitality of the Neo-Confucian movement.

Since Hu's teaching responsibilities precluded his involvement in national affairs, at court political reformers Fan Zhongyan (Fang Chung-yen, 989–1052), Ouyang Xiu (1007–70 C.E.), and WANG ANSHI (WANG AN-SHIH) (1021–86) continued his movement. Battling against the perceived evils of Buddhist escapism and literary dilettantism, these statesmen tirelessly cultivated the implications of their watchword that "literary activity just benefits oneself, while political activity can affect the situation around us."

FAN ZHONGYAN

During the reign of Renzong (Jen-tsung, r. 1023–63), Fan attempted as prime minister to implement a 10-point

program featuring administrative reforms to: eradicate entrenched bureaucrats, official favoritism, and nepotism; promote examination reform; encourage parity of official landholdings to guarantee an adequate income for territorial officials and to discourage bribery; support land reclamation and dike repair to increase agricultural output and facilitate grain transport; form local militia to heighten national defense; decrease mandatory labor service for the people. The reforms pertaining to education and the examination system wielded the most significant effect.

In his memorial Fan petitioned for the establishment of a national school system aimed at recruiting and training worthy individuals for the civil service. While devised more to meet the needs of the government, this system constituted the first genuine attempt to furnish universal public education in China and was a major departure from the prevailing social order of dynastic tradition.

One of his most illuminating suggestions was to discontinue the pasting of a piece of paper over the candidate's name on the examination, a practice intended to ensure impartial evaluation by the grader. The rationale behind this proposal stemmed from the significance that Fan attached to personal integrity in both teaching and politics: It was just as important to know the candidate's moral character as his literary and intellectual abilities, and character could not be assessed apart from personal knowledge.

As a result of his suggestions, Renzong reformed the civil service system by dividing the examinations into three sections, with priority given to problems of history and politics, then to interpretation of the classics, and finally to composition of poetry.

WANG ANSHI (WANG AN-SHIH)

The political reformation reached its pinnacle under the leadership of Wang Anshi, one of China's most celebrated statesmen. While he strongly believed that a return to the principles of *wen* would solve China's problems, Wang had no interest in overturning the social order and restoring the institutions described in scripture. Rather his strategy was to appropriate the objective principles epitomized by those institutions for his own time, making due allowance for radically different circumstances. In addition, Wang was a practical statesman, not a social revolutionary or utopian, who was primarily concerned with the welfare of the state and only secondarily with the interests of the people. Accordingly his initial reforms were geared toward the reorganization of state finances, with the purpose of engendering greater economy and budgetary autonomy.

At the same time Wang perceived, contrary to most Chinese emperors and statesmen, that in the long run the fiscal interests of the state depended on the basic economic welfare of the people and the construction of a dynamic and expanding economy. Hence although few of his mandates were highly novel, his attitude was bold and visionary in the sense that he viewed reform as extending into practically every aspect of Chinese life, leading his program to be broader in scope than anything previously attempted. Wang's *Xinfa* (or *Hsinfa*, New laws) included a system of crop loans to furnish peasants in the spring with the necessary seed and implements, which would be repaid at harvest time. This enabled peasants to avoid the clutches of usurers at a difficult time of the year, while generating revenue for the government from the interest paid on the loans.

In the Song, armies were maintained with taxes supplying the resources for employing police and soldiers. To abolish the tremendous cost of these mercenaries, who were inactive much of the time, Wang created a militia system where each territory would be coordinated for self-defense and self-policing, with families grouped in units of 10, 100, and 1,000 arranged in a pyramid structure and taking regular turns at providing service. This represented a system of both collective security and collective responsibility in each locale, as the members of each group would be held mutually accountable for the wrongdoings of any individual. Surprisingly, Wang employed precisely the opposite method to realize the same goals of economy and efficiency in the performance of local government functions. Previously the minor civic tasks, which were sometimes menial and often onerous, were carried out on an unpaid, draft basis. Wang regarded this as a system that prevailed too heavily on individuals and families to whom the duty fell. Instead of the draft services, which amounted in principle to a labor tax, he substituted a graduated money tax to "soak the rich," from which funds people were hired to administer these official functions.

Although Neo-Confucianism is characterized by its many contributions to a spectrum of disciplines, it made its most lasting impact in the realm of theology, especially through its new metaphysics and the doctrine of human nature to which the former gave rise. In formulating these metaphysics, known as the Learning of the Way and the Way of the Sage, Song Confucians confronted major philosophical challenges, including the need for a more coherent and systematic cosmology on which to base its conception of human nature and to defend the objectivity of values against the Buddhist doctrines of impermanence, emptiness, and moral

relativism. By denying the existence of the “self” and “self-nature,” these Buddhist ideas undercut the prime Confucian concern with the moral person and practical self-cultivation. Responding to these challenges, the Neo-Confucians devised a new cosmic infrastructure governed by *li* (principle) and *qi* (*ch’i*, vital force), coupled with a theory of human nature as intrinsically good, moral, and rational.

Up to this time Confucianism had presented the Way of the sage kings or noble person as relevant only to the social and political elite. Now through universal education and a neoclassical curriculum, both of which were promoted by the spread of printing and literacy, the Neo-Confucians universalized the Way and formulated methods by which all persons could reach the spiritual ideal of sagehood. Foremost among these constructive theologians were Zhou Dunyi (Chou Tun-yu, 1017–1073), Zhang Zhi (Chang Chi, 1020–1077), Cheng Hao (Ch’en Hao, 1032–1085), and Cheng Yi (Cheng I, 1033–1107), all of whose techniques were integrated and expounded by the master synthesizer of the movement, ZHU XI (Chu-Hsi, 1130–1200).

ZHOU DUNYI

Zhou Dunyi perhaps did more than any other Song thinker to assimilate popular Daoist concepts into the Confucian worldview. His greatest contribution to Neo-Confucianism was his brief *Taijitu Shuo* (*T’ai-chi-tu Shuo*, Explanation of the diagram of the supreme polarity), which was controversial in his day since the diagram was composed by Chen Tuan (906–989), an eminent Daoist master, and since key terms of the treatise—*wu-chi* (nonpolar) and *tai-qi* (*t’ai-chi*; supreme polarity)—were borrowed from Daoism. In Daoist works, *wu-chi* symbolized a state of primordial chaos prior to the division of yin and yang. Following *wu-chi* in Daoist cosmogony was *tai-qi*, which literally refers to an end point before a reversal, and a pivot between bipolar processes. Hence *tai-qi* designated a phase of chaos later than *wu-chi* in which yin and yang have differentiated but have not yet become manifest.

In Daoist meditation, the diagram was read from the bottom up, whereby practitioners would attempt to reverse the aging process by generating within their bodies the spark of the primordial *qi*, or psychophysical vital force, and return to the primordial state of chaos from which the cosmos developed. By contrast Zhou attached a distinctly Confucian meaning to the diagram by reading it from the top down and arguing that human nature is a microcosm of the evolution of the universe. In the diagram, after the manifestation of *tai-*

qi as yin and yang, these in turn generate the Five Phases of water, fire, wood, metal, and earth, which finally give rise to the myriad things in the world. Correspondingly, humans receive the finest *qi*, which manifests itself after birth as spirit and intelligence.

Spirit and intelligence actualize the Five Constant Virtues of *ren* (*jen*, humanity), *yi* (*i*, rightness), *li* (ritual decorum), *zhi* (*chi*, wisdom), and *xin* (*hsing*, trustworthiness), through which all humans have the ability to manage a plethora of personal and interpersonal affairs and thereby become sages. In so doing the sage’s virtue equals that of heaven and earth, and his timeliness matches that of the four seasons. By introducing this Daoist structure into Confucian theology, Zhou aimed to demonstrate that the Confucian role of humanity in the cosmos was only seemingly but not actually opposed to the Daoist worldview, as Confucianism was inclusive enough to embrace a primordial chaos while still asserting the reality of the differentiated and phenomenal world.

ZHANG ZAI (CHANG TSAI)

The next major set of conceptual underpinnings essential to the Neo-Confucian system was formulated by Zhang Zai, who posited the unity of all creation based on their common psychophysical substance of *qi*. In refutation of Buddhism, Zhang argued that the universe and all phenomena are not illusory effects of the mind or ephemeral products of an all-pervading emptiness, but rather the manifestations of the original life force emerging from *tai-qi*. Zhang expanded the notion of *qi* by defining it as an energy encompassing both spirit and matter that displays itself dynamically by consolidating to form all creatures and states of affairs and that, in the ordinary course of time, disintegrates back to the original undifferentiated void. The doctrine that all creation is formed from and united by this one underlying essence carried profound ethical implications.

For Zhang all human beings and all heaven and earth must be joined together as creatures of one flesh and blood and ruled, as socially proper to their kinship, by the principle of unselfish and humane love. Without undermining the social order, therefore, Zhang fostered a theological egalitarianism in which the emperor is one’s older brother and simultaneously the eldest son of heaven and earth and thus rightful ruler of China—hence rulers are ontologically equal to but positionally greater than their subjects. The outworkings of unselfish and humane love include respecting the elderly, showing goodwill toward the orphaned and weak, and easing the burdens of the tired, infirm, crippled, and sick.

No distinction was made between private and public morality—people must not do anything shameful in the secrecy of their homes any more than they would commit those acts public.

Finally the notion of equality in diversity rendered all emotions and socioeconomic positions as analogous but intrinsically entailing different rewards and penalties. While wealth, honor, blessing, and benefit are meant for the enrichment of temporal life, they are at best neutral and at worst detrimental to one's spiritual life and cultivation of the Five Constant Virtues. Conversely, poverty, humble station, care, and sorrow, although temporally unpleasant, are "helpmates to fulfillment," which convey assistance on the path to sagehood and fertilize the seeds of virtue embedded in one's nature.

CHENG HAO AND CHENG YI

The brothers Cheng Hao and Cheng Yi, commonly grouped together in Asian religious discourse because of their theological concurrence, conjoined the doctrine of *li* as the inner structure or directive principle of things with Zhang's developed idea of *qi* (*ch'i*). According to the Cheng brothers, *li* was the paradoxically unified yet diversified uninstantiated essence or pattern for both the entire universe and every organism.

Resembling a genetic coding, *li* provided the creative life structure, or *shengsheng*, which created all things upon being filled out by the life substance of *qi*. In people, *li* manifests as human nature (*hsing*), equivalent to the moral nature (*dehsing*) or heavenly nature (*tianxing* or *t'ien-hsing*), the fulfillment of which was *ren*, or the virtue of humaneness. By identifying *li* as the genetic and magnetic growth principle of the Way, moreover, the Cheng brothers contended that the joint metaphysical ground of every actual thing or affair was a shared physical existence and an intrinsically good moral nature.

For the Cheng brothers, a mixture of two approaches could fulfill human destiny: investigation of the principles in things and introspection of principles in the mind. However the lines of objective inquiry and judgment could never be pursued separately, but the convergence or unity of *li*, in both its rational and moral dimensions, must be experienced in the realms of contemplation and action.

The twin methods of studying the classics and quiet sitting enabled humans to attain their destiny of sagehood. During quiet sitting, the typical examination of one's *xin*, or heart-mind, amid an active engagement with society, the Cheng brothers emphasized reverence and ethical concern instead of mental passivity.

Through such attention to *li*, practitioners could discriminate between desires and motives that served the common good (*gong*) and those that were selfish or prejudiced (*si*). As manuals for this meditation, the Cheng brothers recommended the *Daxue* (*Ta-hsueh*, *Great Learning*) and *Zhong Yong* (*Chung-yung*, *Doctrine of the Mean*). Although the Cheng brothers had many followers, their radical claim to speak authoritatively for the Way because of their personal conviction springing from immediate experience of the Way within themselves incited powerful opposition and imperial condemnation of their *daoxue* (*tao hsueh*), or learning of the Way. This *daoxue* survived solely through its approval by Zhu Xi, who posthumously pronounced the Cheng brothers as orthodox and canonized their insights for future generations.

ZHU XI

The greatness of Zhu Xi consisted in his ability to adapt in a unified system of thought the individual contributions of his Song predecessors. His remarkable powers of analysis and synthesis allowed him to combine ideas and articulate each of them with greater clarity and cogency than their originators had achieved. He delineated with greater precision such doctrines as *li*, *qi*, *xing* (the nature of all things), *xin*, and *tai-qi*. His philosophy is often identified as the Cheng-Zhu school, since the forerunner whose work he most appropriated was Cheng Yi.

Zhu compared *li* to a seed of grain, as each seed partakes of both commonality and diversity by possessing its own uniqueness but also displaying generic and organic elements of structure, growth pattern, direction, and functional use. In a slight departure from his forebears, however, Zhu modified the concept of *qi* by postulating that *qi* is not found equally in all people, and the fact that people have various endowments of *ch'i* accounts for their ethical differences.

Resembling the idea of a Buddha mind, Zhu introduced the new concept that, while all humans have the potential for perfection, evil arises through the clouding effect of *li* being shrouded by *ch'i*. Zhu argued that the mind of every person contains two dimensions: the mind of the Way, or the original intrinsic principled goodness that links the person directly with the *tai-qi*, and the human mind, or the *qi*-filled arena where conflict arises between *xinxing* (the original mind) and carnal desires. Zhu's approach for overcoming this psychophysical imbalance consisted in the investigation of things, a four-fold process including apprehending the principles of things, reading and reflecting on the Classics, becoming

a lover of learning, and performing an “exegesis of one’s life” by studying the causes of one’s experience.

The end result of this approach was the optimal development of the virtue of humaneness, or *ren*. For Zhu, it is through *ren* that one overcomes selfishness and partiality, and thus unites oneself with the Mind of the universe, which is love and creativity itself. Zhu’s greatest contribution to Neo-Confucianism was his completion of the second wave of canonizing Confucian learning. He codified as basic texts of the Confucian school the *Four Books*—the *Mengzi* (*Mencius*), *Daxue* (*T’ahsueh*), *Zhong Yong* (*Chung-yung*), and *Analects*—and wrote exhaustive interpretations of every sentence in the *Four Books*, called the *Annotations*. After Zhu’s death, the *Four Books* and the *Annotations* became the official standard for the Chinese civil service examinations from 1313 until 1905.

As a movement concerned primarily with this world and its perceived nucleus in human nature, Neo-Confucianism recapitulated in an all-embracing manner, extending both to religion and the multifarious realms of society, what Confucius and his disciples had consistently proclaimed—that the human sense of order and value does not alienate one from the universe but constitutes the channel through which one can commune with it.

Accordingly the being of ethics, history, and politics is not empty, contra Buddhism, but an unfolding growth process and world of creativity with the principle of goodness as its foundation. This conviction furnished Neo-Confucianism with its copious vitality and a degree of universality that rendered it quite appealing to people not only in China but also in Mongolia, Korea, Japan, and Vietnam, who similarly searched for assurance that their lives had meaning and value.

KIRK R. MACGREGOR

Nevsky, Alexander

(1220–1263) *Russian king*

Alexander Nevsky, a Russian prince named after his victory over the Swedes on the Neva in 1240, was the son of Grand Prince YAROSLAV THE WISE (Vsevolodovich), who was apparently poisoned by the Mongols. During Alexander’s early life, independent Russia had three major enemies—encroaching Swedes, Teutonic Knights, and the Mongols. Alexander chose to tolerate, and even collaborate, with the latter but took seriously the threat from the north and west and became a leader in the struggle against both western enemies. He defeated a large Swedish invasion when just 20 years old, and on April 5, 1242, he stopped an even larger invasion by the Teutonic Knights.

The Teutonic Knights were an order first formed during the Third Crusade, similar to the better-known Knights Hospitallers of Saint John, but unlike the latter order, it quickly shifted its attentions to eastern Europe. Initially in connection with privileges granted by King Andrew the II of Hungary (1211), the Teutonic Knights fought against that king’s enemies, the Turkic Quman of the south Russian steppe and nearby areas. Later (from 1230) it took the lead in fighting against the pagan Russians and then, after the order had absorbed the Livonian Sword Brothers, the Teutonic Knights began to get involved in Russian affairs, acting against the city of Novgorod. It was in this connection that Alexander, a proven military leader, was recruited by Novgorod to become its prince and fight against the Teutonic enemy. The result was the famous defeat on the ice of Lake Peipus of 1242 in which the invading army was all but destroyed by cleverly positioned and deployed Russians who knew the landscape better than their rivals. Possibly Alexander had Mongol allies, since archery played an unusual role in the battle. The Teutonic Knights remained a power in eastern Europe but were never a direct threat to Russia in the way that the order was in 1242, so the results of the victory lasted.

Alexander’s young adulthood was disrupted by the reappearance of the Mongols and their conquest of virtually all of Russia. The Mongols had first come into contact with Russian forces on June 16, 1223, during a

clash on the Kalka River. In 1237 an even larger Mongol army launched an invasion of Russia. Among the first Russian city-states to fall was Ryazan, in December 1237, followed by Vladimir, in February 1238, and in March 1238, Torzhok, which offered fierce resistance. By then spring came and the ground was too wet for effective campaigning, but the Mongols returned again, after some campaigning in the steppe against the Turkic peoples during the winter of 1240. Their advance seemed unstoppable and Kiev, the leader of the coalition of princes that was then Russia, was taken on December 6, 1240, ending an era of Russian history.
